Dear Guests...

Welcome to the 4th International Conference of New Horizons in Education-2013.

"The International Conference of New Horizons in Education-2013 (INTE-2013)" is an international educational activity for academics, teachers and educators. It promotes the development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conference activities, the conference proceeding book. This year, INTE-2013 received almost 830 applications. The conference academic advisory board accepted 760 applications.

The International Conference of New Horizons in Education-2013 aims to diffuse the knowledge and researches among academicians and lead to development in educational sciences.

We have lots of participants from 38 different countries. Some of these countries are Austria, Australia, Brazil, Canada, Croatia, Czech Republic, China, Egypt, Denmark, Finland, Germany, Greece, Hungary, Malaysia, Mexico, New Zealand, Philippines, Poland, Portugal, Romania, Russian Federation, Saudi Arabia, Slovenia, Slovakia, Spain, Switzerland, South Africa, Turkey, United Kingdom and United States

Should you have any enquiries regarding INTE conference, please do not hesitate to contact with us for any additional information you may require.

Finally, we would like to wish you all a pleasant stay in Rome and safe return back home. I hope that INTE-2013 will be a meeting you will pleasantly remember.

We hope we will meet again at the International Conference of New Horizons in Education 2014 in Paris/France.

Thank you...

Assoc. Prof. Dr. Ahmet ESKİCUMALI
Coordinator of INTE 2013

Prof. Dr. Aytekin İŞMAN
General Coordinator of INTE

General Coordinator

Prof. Dr. Aytakin İŐMAN

Conference Coordinators

Prof. Dr. Colleen SEXTON, Governor State University, USA
Prof. Dr. Teresa FRANKLIN, Ohio University, USA
Prof. Dr. Carlos De Sousa REIS, Instituto Politecnico da Guarda, Portugal
Assoc. Prof. Dr. Ahmet ESKICUMALI, Sakarya University, Turkey

Conference Associate Coordinator

Assist. Prof. Dr. Mubin KIYICI, Sakarya University, Turkey

Conference Secretary

Lec. Onur İŐBULAN (Sakarya University)
Lec. Ali KIRKSEKIZ (Sakarya University)
Lec. Aydın KİPER (Sakarya University)
Lec. Selçuk Sırrı TERCAN (Sakarya University)
Res. Asst. Mehmet UYSAL (Sakarya University)

Advisory Board

Aaron DAVENPORT, Grand View College, United States	Işık GÜRŞİMŞEK, Eastern Mediterranean University, North Cyprus
Abbas TÜRNÜKLÜ, Dokuz Eylül University, Turkey	Izzettin KÖK, Yzmir University, Turkey

Learning architectural history by movie making: Ottoman architecture

Zafer Sagdic^{a*}, Ipek Kosova^b

^a*Yildiz Technical University, Faculty of Architecture 34349 "Istanbul", Turkey*

^b*Yildiz Technical University, Faculty of Architecture 34349, "Istanbul", Turkey*

Abstract

This paper describes collaboration among Architecture, Modern Arts as Movie Making and History. *Creating a movie of one problematic of Ottoman Architecture* by using the Knob's experimental learning theory, was given to students on the upper-graduate lecture titled Civilization and Cultural History of Ottoman Empire of the History of Theory of Architecture Upper-graduate Program on the Department of Architecture, Yildiz Technical University.

Thus, the paper will have not only the process of a movie making, but also make searches on Ottoman history and architecture and put their ideas through and discuss their ideas in a group by using the experimental learning theory.

Keywords: history, Ottoman architecture, experimental learning

1. Introduction

It is a common way to give some search titles to upper-graduate students of history on architecture upper-graduate program on a classical education point of view, till today. For their researches students were using power-point presentation program and during their day of presentation almost each of them could not tell their search title because of anxiety and excitement that they have.

To solve this main problem, one instructor and one assistant guided 15 upper-graduate architecture students used the experimental learning theory to create their own documentary movie to share and present their researches during 15 weeks long spring semester of 2012-2013.

2. Methodology: Experimental Theory

We shall not cease from exploration

And the end all our exploring

Will be to arrive where we started

And know the place for the first time.

T. S. Eliot, Four Quartets

Rather than most known method on education of Jeffrey and Craft's *teaching creatively and teaching for creativity* method, there is another well known theory of Kolb, which is called as *experimental learning theory*. Kolb's *experimental theory* offers a fundamentally different view of the learning process from that of the behavioural theories of learning based on an empirical epistemology or the more implicit theories of learning that underlie traditional educational methods, which are for mostly based on a rational idealist epistemology (Kolb, 1984, 20). This perspective on learning is called "experiential" for two reasons, says Kolb. The first is to tie it clearly to its intellectual origins in the work of Dewey, Lewin and Piaget. The second reason is to emphasize the central role that experience plays in the learning process. This reason differentiates experiential learning theory from rationalist and other cognitive theories of learning that tend to give primary emphasis to acquisition, manipulation, and recall of abstract symbols, and from behavioural learning theories that deny any role for consciousness and subjective experience in the learning process. According to Knob, this theory suggests through experiential learning theory a holistic integrative perspective on learning that combines experience, perception, cognition and behaviour (1984, 21).

Experimental learning theory proceeds from a different set of assumptions. Ideas are not fixed and immutable elements of thought but are formed and re-formed through experience. Learning is described as a process whereby concepts are derived from and continuously modified by experience. According to Piaget (1970) the creation of new knowledge is the central problem of genetic epistemology, since each act of understanding is the result of a process of continuous construction and invention through the interaction process of assimilation and accommodation. According to Kolb (1984, 26), learning is an emergent process whose outcomes represent only historical record, not knowledge of the future. The tendency to define learning in terms of outcomes can become a definition of non-learning, in the process sense that the failure to modify ideas and habits as a result of experience is maladaptive. According to Friere (1974) the education is an act of depositing, in which the students are the depositories and the teacher is the depositor. Instead of communicating, the teacher issues communiqués

and makes deposits, which the students patiently receive, memorize and repeat. Thus, to eliminate negativities of this According to James (1890) knowledge is continuously derived from and tested out in the experiences of the learner on the classical system and to have new opportunities it is always better to have a kind of interact education in the class. Thus, learning involves transactions between the teacher and the students. According to Kolb (1984, 36), also learning is the process of creating the knowledge. Also knowledge results from the transaction between these objective and subjective experiences in a process called learning. Hence, within the parallel to Piaget method, Kolb (1984, 37) says that to understand knowledge, first epistemology must be understood - the origins, nature, methods, and limits of knowledge. He found that epistemology essential to take into account the nature of the subject matter in deciding how to help students learn the material at hand. Trying to develop skills in empathic listening is a different educational task, requiring a different teaching approach from that of teaching fundamentals of statics (Kolb, 1984, 37).

3. Content And Context Of The Lecture

The 15 weeks long semester had 5 different educational phases,

1. Speaking about the history of Ottoman Empire out of important architectural examples such as palaces, traditional wooden Turkish-Ottoman houses, religion architecture, etc. from the 15th century, till the 20th century for the first 4 weeks,

2. Defining a problematic of Ottoman Architecture, (the group chose titles mostly of the 18th century of the Ottoman Architecture; only two group chose titles of the 19th century of the Ottoman Architecture)

3. Having 2 seminars about movie making digital programs- (Scenery Writing by Miller, W.(2009); Making of Movie by Worthington, C.(2011); Scenery Writing by Marland, J., Richards, J. (2012)).

Speaking of scenery writing,

Speaking of selecting of images,

Speaking of selecting of music,

4. Creating of documentary movies,

Writing of the scenery of the documentary movie,

Defining chapters of the movie,

Choosing of the images related with the chapters,

Adding of the voice which reads the research documentation of the movie,

Adding of the right music piece with the right tempo and the mood to the documentary movie,

5. Making presentations on the auditorium,

6. Discussions of each presentation.

4. The Process

In order to be fair presentation dates have been selected and organized by draw. Duration of presentation has fixed to be thirty minutes. The students dubbed most of the presentations and some students preferred to use subtitles and have their own experimental memories.

The group of upper-graduate students had some historical records as on the theory of Knob, as oral history study, which is about the interviews with the writers of original history text that they used, and having researches on Ottoman archive and trying to build up their own experimental scenarios.

Mostly they choose the visual material from Internet and some combined their own fractions of shootings. Basically the students use three books as reference. The sources were those describing fundamental principles of scenario writing and film making;

1. Scenery Writing by Miller, W. (2009);
2. Making of Movie by Worthington, C.(2011),
3. Scenery Writing by Marland, J., Richards, J. (2012)

Following research on the topics, students wrote their reports and scenarios. According to the scenarios, they prepared their visual material they shot, added the music chosen and finalized by dubbing.

Contents of the presentations were chosen amongst the texts, articles, papers and books of the researchers studying on Ottoman Architecture. Additionally, the students were expected to criticize the subject and to append their review on the presentation. In this context;

1. External reading is expected for each article (conveying features of the article.)
2. Conveying the article for internal reading,
3. Conveying other articles on the same subject written by different researchers and their opposing views,
4. Criticizing and reviewing the article chosen,
5. Giving reference for the articles used are expected.

5. Movies And Discussions

Three best presentations amongst all are as follows:

1.The Palace and Festivals of Sadabad; 2.Myths, Fantasies and The Realities; 3. Women and Space on Ottoman Daily Life on 18th Century

5.1. *The Palace and Festivals of Sadabad*

(The title is about the history of the Palace of Sadabad and the development and changes on the daily life of the 18th century on public spaces):

Fig. 1. A gravure that shows entertaining women on the garden of Sadabad Palace, Kagithane.

The movie starts by telling about the brief historical background of location of the Sadabad Palace; Kagithane. The narrator tells about the every Ottoman Emperor Period with their portraits as the scene and gives information of the every era. Then narrator starts to talk about Tulip Era, which includes the period of the design and construction of the Palace. It shows the drawings of the palaces from France that has been used as an inspiration for the project. Then the movie continues with the decisions in the project by showing their drawings from Ottoman Archives. While telling about the architecture and importance of the project where public space and private space of Empire gets alongside, the movie shows paintings, engravings and drawings from this era to enable the viewer imagine and understand the project better. The movie tells about the Palace till today's remains after its demolition and shows for five minutes a self taken video by zooming in and out to surroundings, ending by telling the importance of the project from Ottoman Empire's Westernization Period where administrative, social, cultural and architectural changes were reflected.

5.2. *Myths, Fantasies and The Realities*

(The title is about the myths and fantasies on Ottoman history writing):

Fig. 2. A miniature that shows a scene of a mother tells a mythical story to her child.

The movie starts by questioning the terms knowing, learning, understanding, criticizing, thoughts and information. It goes on with the discussion of the importance of teaching critical thinking in architectural education for the first year students. While the narrator talks about the issue, scenes from different architecture school's ateliers are being shown. It shows students' different processes of designing and critics they take from the professors. The narrator from this discussion passes to the topic "Menkibe". Origin of the word *menkibe* comes from Arabic and it means: narrative about the extraordinary events. In the scenery it shows parts from Persepolis and TV programmes of Turkish historians. Narrator tells that because of the reason that there was no printing press at the beginning of Ottoman Empire, the historical facts were narrated by *menkibes*. The film ends by narrator saying responsibilities of historians and social scientists is fighting, questioning and establishing realistic historical sense.

5.3. Women and Space on Ottoman Daily Life on 18th Century

(The title is about how woman figure is becoming transparent on the public space at 18th century on Ottoman daily life):

Fig. 3. A picture, which was coloured afterwards, shows Ottoman women entertaining on a public recreation place on the 18th century.

The narrator starts to the movie by talking about gender mainstreaming and space relation. It goes on by telling that the Ottoman Empire women's movement in town, transportation and clothes were restricted by the imperial order. On the scenes dominantly the paintings and miniatures about the women from the 18th century supports the facts. The narrator especially tells about the ban of woman entering into recreation spots and that they were only able to visit excursion spots which was only possible on Fridays. Another important restriction was about the clothes and from veil to shoes it was defined by imperial rules. Ending the movie by a part of a film with a

woman walking on the street in modern days, the narrator says that there is not only gender hierarchy on woman but also it is a place where the ideologies are being produced and governance is being sustained.

6. Conclusion

Among multiple benefits of the movie making process some that stand out are: (1) students participated in searching a problematic of Ottoman Architecture, (2) students learned to work on an estimated time period, (3) students familiarized themselves with digital movie making programs while thinking on history of architecture, (4) students learned to appreciate different point of views on the time period of world history, (5) students were able to visualize their ideas to discuss on a group with using of a new medium, movie making (6) students learned 3 important movie making digital programs.

1. Introduction

It is a common way to give some search titles to upper-graduate students of history of architecture upper-graduate program on a classical education point of view, till today. For their researches students were using power-point presentation program and during their day of presentation almost each of them could not tell their search title because of anxiety and excitement that they have.

To solve this main problem, one instructor and one assistant guided 15 upper-graduate architecture students used Jeffrey and Craft's *teaching for creativity- teaching creatively theory* to create their own documentary movie to share and present their researches during 15 weeks long spring semester of 2012-2013. Each student selected a problematic of World Contemporary Architecture from 1970's, till today.

On modern educational programs there are 2 main methods. One is offered by Jeffrey and Craft (2004) and named as *teaching for creativity- teaching creatively* and the other is offered by Kolb (1984) and named as an *experimental learning*. Here, the first one was chosen and movies were created according to the references that were taken from the method, which is pointed out by the related theory.

According to Jeffrey and Craft (2004), the former is defined as 'using imaginative approaches to make learning more interesting and effective' (Craft, 89) and *teaching for creativity* involves *teaching creatively* (Craft, 90) and notes that, "young people's creative abilities are most likely to be developed in an atmosphere in which the teacher's creative abilities are properly engaged" (Craft, 90).

There is a great deal of research and conceptual analysis, on an architectural education parallel to the researches and developments on educational field, which has explored aspects of pedagogical approaches which foster pupil creativity around the world especially on USA. (Torrance, 1984; Shallcross, 1981; Kessler, 2000; Hubbard, 1996, Halliwell, 1993; Fryer, 1996; Edwards and Springate, 1995; Craft, 2000; Beetlestone, 1998; Balke, 1997). However, none of these studies has, examined the relationship between these two facets of creativity not only in the university, but also on architectural education.

2. Methodology

The data, which was drawn upon by Jeffrey and Craft (2004) comes from a research of 1971 and is now internationally famous with reciprocal connections with schools in Sweden, relations with communities in Gambia and the recently retired head teacher has lectured in the United States and recently visited China.

On their example, data collection was through qualitative methods, consisting chiefly of interviews with teachers, support workers, students and families. The research focused on the learners' experience of creative teaching in general, focusing on their perspectives, recorded through extensive field notes. Relevant documentation was collected such as governors' and inspectors' reports, timetables, and test results. Photographs were used

extensively as data and as stimuli for exploring children's[†] perspectives. At one stage, students were given cameras to select their own observations for discussion. By comparing the various different kinds of data, both within and across cases, we were able to identify prominent issues and themes connected to the major subject of creativity in education and the effect this had on the various participants.

Thus, a kind of similar method was used on upper-graduate students. Each student selected a problematic of World Contemporary Architecture to discuss the important styles and examples of architecture on a contemporary agenda. The group of upper-graduate students, which were taking the lecture of Contemporary World Architecture, were asked to create a documentary movie by not only preparing the scenario, but also by creating and selecting the imaginary data from internet and on digital programs, as well.

3. Teaching Creatively And Teaching For Creativity

The relationship between *teaching creatively* and *teaching for creativity* can be seen by using a framework based on Woods' (1990) features of creative teaching - relevance, ownership, control and innovation.

3.1. Teaching Creatively

According to NACCCE (1999) report, imaginative approaches should be used to make learning interesting and effective during the semester for teaching creatively. A major effect for students was an immediate experience of the dynamic, appreciative, captivating and caring ethos (Jeffrey and Woods, 2003). The construction of this type of ethos has many 4 objectives but in terms of teaching and learning one of the school's major aims was to make the learning experience relevant to learners, to make it interesting. According to Jeffrey and Craft for students this meant an ethos that was dynamic and active:

Learners appreciated the qualitative aspects of each focus of learning. Thus, history learning is also made exciting, literacy experienced as a whole range of delights and emotional journeys through history, and architecture is developed as a passion for designing, discovery and experimentation are felt during the process of technology provided intensely focused activity involving, frustration and satisfaction and the arts were valued as opportunities for expression, as well.

During the students are formulating their curriculums, the knowledge to be investigated on the process and the contexts in which not only teaching and learning took place, but also personal creativity was tired to be pushed up to set a framework for creative engagement.

The group experienced the process between lectures as adventures just on the example of Jeffrey and Craft. The lecture's '*hands on*' approach was a paramount feature of making learning relevant and encouraging ownership:

The group was told the story of how the practice of 'making a movie and discussed the ideas on it' developed - the setting up the parish boundaries on the upper graduate students.

[†] The group of students are from priliminary school, which were selected as group members on Jeffrey and Craft's example).

The instructor and the assistant of the lecture prioritised strategies that engaged the learner[‡] and they acted creatively to adapt the strategies to the appropriate age range, context and individual. The focus was on the professional relevance of the lecture to the architectural background of the student, which was to be learnt or experienced during 15 weeks long semester. This is related with the exemplified the description of teaching creatively which was given by NACCCE, in 1999.

3.2. Teaching For Creativity

The instructor also enacted those *teaching for creativity* principles according to (NACCCE, 1999), as follows: encouraging the group to believe in their creative identity; identifying the group creative abilities not only architecturally, but also related with art; fostering creativity by developing some of the common capacities and sensitivities of creativity such as curiosity, recognising and becoming more knowledgeable about the creative processes that help foster creativity development and providing opportunities to be creative. This was done by firstly having 4 weeks long teaching of the history of Ottoman architecture and encouraging ownership of learning and then by passing back control to the learner and encouraging by making students' own movies as innovative contributions. Control of learning by a young person is not a new experience (Pollard 1996). Being on this process is an opportunity to have ideas, which are innovative and expressive.

One of the major characteristics of creativity itself is, as Craft argue on 2002 possibility thinking (Craft, 2002) and it was referred also that it was used at the education in technology-based activities on the group of upper-graduate students such as on this example, movie making to encourage the group to take control and act innovatively, as well.

According to Wood and Jeffrey (1996), the group experience and imagination would be a major part of the process of investigating knowledge using such devices as possibility knowledge (Woods and Jeffrey, 1996) and possibility thinking (Craft, 2002) and according to Lucas (2001), as well. *Teaching for creativity* could involve generating 'learner inclusive' pedagogy, according to Jeffrey and Craft where the learner is encouraged to engage in identifying and exploring knowledge. This idea is tried to develop further here, on this selected group of upper-graduate architecture students (Craft and Jeffrey, in press; Craft, 2003).

3. Content And Context Of The Lecture

The 15 weeks long semester had 5 different educational phases,

1. Speaking about the theorem of *Simulacr and Simulation* by Jean Baudrillard to discuss the World Contemporary Architecture and the affects that the World Contemporary Architecture is under effected by, such as neo-liberal economies, globalisation, bureaucratically changes on all around the World, and etc. for the first 4 weeks as discussing the most important architectural examples of famous architects such as Toyo Ito, Jean Nouvel, Oscar Neimeyer, etc.

[‡] Here, upper-graduate students.

2. Defining a problematic of World Contemporary Architecture, (students chose titles mostly of the European Architecture; a group chose an important partnership of architecture field, Renzo Piano and Richard Rogers; two students chose titles from Japan geography; one student chose a title from Brazil; one chose an architect of East; one chose an architectural style; and one other chose a title of an interior design)

3. Having 2 seminars about movie making digital programs, and presenting three reference books about scenery writing and movie making - (Scenery Writing by Miller, W.(2009); Making of Movie by Worthington, C.(2011); Scenery Writing by Marland, J., Richards, J. (2012)).

Speaking of scenery writing,

Speaking of selecting of images,

Speaking of selecting of music,

4. Creating of documentary movies,

Writing of the scenery of the documentary movie,

Defining chapters of the movie,

Choosing of the images related with the chapters,

Adding of the voice which reads the research documentation of the movie,

Adding of the right music piece with the right tempo and the mood to the documentary movie,

5. Making presentations on the auditorium,

6. Discussions of each presentation.

The presentations of the semester are listed below:

BIG (An important architectural office of Denmark),

Toyo Ito (An important Japan architect),

Jean Nouvel (An important French architect of De-constructivism),

Deconstructivism (An important architectural style of 1980's world),

Norman Foster (An important architect of today's De-constructivism),

Karim Rasid (one of the famous interior designer of the world),

Oscar Neimeyer (A Brazilian Architect of 1970's),

Santiago Calatrava (The important and famous architect of Spain by his creations as if from outer space),

Renzo Piano-Richard Rogers (A partner group of 1980's),

Zaha Hadid (The important woman architect of De-constructivism Architectural Style)

Rem Koolhaas (The important and famous architect of Holland by his de-constructivist projects),

Richard Meyer (The famous architect of 1980's)

Daniel Libeskind (The important and famous architect of Deconstructivism Architectural Style)

Kisho Kurokawa (An important Japan architect of 1980's),

Hasan Fethi (An important modernist architect of East).

5. Movies And Discussions

Three best presentations amongst all are as follows:

1. Deconstructivism (An important architectural style of 1980's world),
2. Kisho Kurokawa (An important Japan architect of 1980's),
3. BIG (An important architectural office of Denmark),

5.1. BIG

(An important architectural office of Danimark),

Fig.1. A view of Denmark office of BIG.

The one hour long movie of BIG consists of multiple fractions of videos from BIG archives used as office advertisement that shows dominantly Bjarke Ingels, former of BIG Architecture Office, when he talks about their projects with well-made animations. Since Bjarke Ingels tells continually about their projects and design methods, moviemaker tries to balance the video with views from realized projects with music at the background. The movie shows office videos always from their own perspective without canalizing the viewer's thoughts. The moviemaker only expresses his own thoughts in his report of movie as, "There are many thoughts about scale issue; the general approach is that scale is not focused on human scale. When looking to that issue, I do not think that this problem can be only about Bjarke, it is a general problem of today."

5.2. Deconstructivism

(An important architectural style of 1980's world):

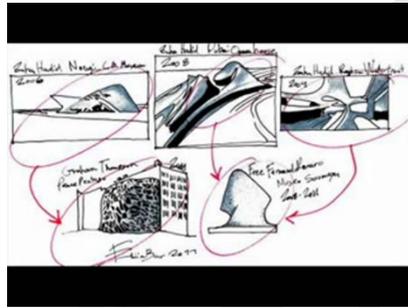

Fig.2. A group of de-constructivist drawings.

The movie starts with telling about the background of Deconstruction Movement with an illustration showing the names of the architects that were part of it. After that movie shows a part of the film Deconstructivist Architects including conversations with architects. It goes on by showing projects images and drawings with the narrators voice talking about each project. Then, a part from a film about Zaha Hadid is shown with shootings of the projects from interior and exterior. The narrator ends the movie by saying "Humanbeing has fight with nature for hundreds of years and now it needs to experience new existences over knowledge. For that reason it can be seen that deconstructivist projects are really important."

5.3. Kisho Kurokawa

(An important Japan architect of 1980's),

Fig.3. A scene that shows Kisho Krukawa is telling his architectural background on the design of Nagakin Capsule Tower.

The movie starts with the scenes from 1960's student movements and then it goes on showing the architecture movement Archigram from England and its followers from Japan forming the group Metabolism Movement. After showing several utopic project drawings of the groups, movie starts to focus on the architect Kisho Kurukawa. The narrator talks about the projects of Kurukawa to let the viewer understand the projects through the drawings and schemes. On the next scenes the fragments of the movie, At the Nagakin Capsule Tower: Demolition and Preservation, is shown and in between scenes the narrator gives further information about the project.

6. Conclusion

Among multiple benefits of the movie making process some that stand out are: (1) students participated in searching a problematic of World Contemporary Architecture, (2) students learned to work on an estimated time period, (3) students familiarized themselves with digital movie making programs while thinking on history of architecture and contemporary buildings and styles, (4) students learned to appreciate different point of views on the time period of world history, (5) students were able to visualize their ideas to discuss on a group with using of a new medium, movie making (6) students learned 3 important movie making digital programs.

4th International Conference on New Horizons in Education

Learning Lessons on Location

Anne Weisenberg*, Mary Borba

California State University Stanislaus, Turlock, CA, 95382 USA

California State University Stanislaus, Turlock, CA, 95282 USA

Abstract

Teacher training is more important than ever with high expectations by schools and society. This paper describes how two University professors provide training at elementary school sites for teacher candidates that integrates theory and practice. The focus is on developing passionate, engaging, knowledgeable, and well-trained teachers that are prepared for the realities of professional teaching.

Keywords: Teacher Education; transfer, fieldwork.

1. Background

This paper provides an overview of two teacher education professors' experiences while preparing teacher candidates for the elementary classroom. Our days as classroom teachers and reading specialists contributed to our present desire to make a difference in the lives of children through teacher training at the university level. With today's pressure on teachers to increase academic achievement for all students, quality teacher training is more important than ever.

We are committed to do what we can, so that all children will become proficient readers and writers to ensure their success in society. Our role is to provide quality training, with teacher candidates leaving our Multiple Subjects Credential Program well prepared to respond expertly to this challenge.

As we instruct teacher candidates, our challenge is to assist them in applying the learning from coursework to practice with children. In order to prepare our future teachers for the challenges of teaching, we have provided a unique experience in our literacy methods course that bridges the gap between theory and practice.

2. Introduction

Fieldwork has been found to be the most powerful learning experience for teacher candidates. In their teacher preparation program, Weisenberg, Won, & Roe (2010), found that there was a "mismatch" between what was learned during coursework and what occurred during student teaching. Many students were unable to apply what they had learned during their coursework to their fieldwork. Darling-Hammond and Bransford (2005) found that teacher candidates who learned theory concurrent with fieldwork opportunities were better prepared to see the

Email address:

match between theory and practice. The Blue Ribbon Panel's 2010 report urged, "We must place practice at the center of teaching preparation" (p. 3).

The heart of instructional reform is for teachers to be able to transfer instructional understandings gained from professional development opportunities into classroom practices that foster increased student achievement (Lyons and Pinnell, 2001). The authors believed that this could also apply to teacher credential programs. Candidates' ability to transfer learning from their coursework to their fieldwork would foster student learning and help them be more successful in the classroom.

Darling-Hammond (2006) found that the most powerful teacher preparation programs included more fieldwork time throughout the program that simultaneously had candidates learning and applying strategies. She reported that research confirmed that "teachers-in-training who participate in fieldwork with course work are better able to understand theory, to apply concepts they are learning their course work and support student learning" (p. 307).

Levine's Educating School Teachers (2006) report was a wake up call for teacher preparation programs. His extensive study surveyed alumni and principals across the nation and revealed that sixty-two percent of alumni did not believe their teacher preparation program prepared them for the real classroom, their administrators corroborated this. "Many students seem to be graduating from teacher education programs without the skills and knowledge they need to be effective teachers" (p. 3).

Kagan (1992) cites that lack of transfer from teacher candidate to professional teacher is the gap between theory and practice. Candidates learning about theory and then not seeing it demonstrated or having the opportunity to practice it was the problem. In order to alleviate this, we had to ensure that our students had ample opportunities to participate in their own learning and work with students, not just simulate their work with each other. Wlodkowski (2003) stated, "Unless adults participate, they cannot learn, and without learning there is no possibility for transfer" (p. 40). Wlodkowski (2003) perceived transfer as part of a logical triangle including participation, learning, and transfer to the classroom. This triangulation was what we sought for our methods courses.

Teacher education must shift "to programs that are grounded in clinical practice and interwoven with academic content and professional courses" (p. ii, Blue Ribbon Panel, 2010). Aspiring teachers will be most successful when they are learning about theory and pedagogy and putting into practice what they learn immediately. At our University methods courses typically emphasize coursework loosely linked to school-based experiences. We sought to find a way to more closely match these to produce better-prepared teachers.

The purpose of this study was to determine the impact that teaching methods courses at an elementary school site with simultaneous fieldwork opportunities would have on teacher candidates. The research questions guiding our exploration were:

1. Did the embedded fieldwork experience help the students with the transfer from theory to practice?
2. Did these experiences assist them in applying what they learned to their student teaching?

3. Method

A case study approach was used to determine the impact teaching a methods course at an elementary school site had on pre-service teachers ability to more closely match theory to practice.

3.1 Setting

Hollins and Guzman (2005) found that there was a great need for teaching candidates to have the opportunity to work with diverse learners. The school sites chosen for this research took that into consideration. Each of the school sites utilized offered a diverse population of students including English learners, multiple ethnicities, and special needs students.

3.2 Participants

The participants for this study were the credential candidates in each of the Reading Methods courses taught by the authors. The Multiple Subjects Credential Program (MSCP) at our university is designed as a one-year program in teacher education. Like many other K-8 credential programs, our pre-service teachers take four methodology courses: reading; mathematics; social studies and visual and performing arts; and science and health. Additional courses include: technology, educational foundations, multicultural education, and special education. In order to apply for their preliminary credential, they must maintain a 3.0 GPA and receive no grade lower than a "C" in any course or assignment. They must also pass the Reading Instruction Competence Assessment (RICA) and all four tasks of the California Teacher Performance Assessment (CA TPA). In these tasks, pre-service teachers must demonstrate their understanding and application of lesson planning, assessment, reflection, and instructional accommodations for focus students such as the English Language Learner and students with other special needs. The knowledge and skills needed for these tasks are aligned with the objectives and goals throughout their various credential courses and the Teacher Performance Expectations (TPEs).

After successful completion of the four methods courses, most pre-service teachers commence a full-time student teaching placement for 16 weeks. They are placed in student teaching assignments and are evaluated regularly by their university supervisor and their cooperating teacher. Student teachers are observed a minimum of 8 times by a university supervisor, with two formative assessments and a summative assessment at the end of the semester. A classroom management course is taken during the student teaching semester.

3.3 Process

The primary purpose of the Multiple Subject Credential Program (MSCP) at our University is to prepare future teachers to work effectively with students from diverse backgrounds and to implement pedagogy that values the backgrounds of all students and allows them to succeed to their ultimate potential. The MSCP is a fairly short, fast-paced program. One can complete coursework, including student teaching, and be eligible for a preliminary credential in one year. This schedule leaves little time to make sure that the theory learned in methods courses transfers to applications in the classroom (student teaching).

Each methods course in the MSCP requires a number of fieldwork hours, but there is not a standard way of implementing these hours. Most fieldwork done by the students is done on their own time, at locations of their choice, with no opportunity for the instructor of the methods course to observe or provide feedback. The main fieldwork component of the program is done during student teaching and is usually cited as the most important feature of the program.

In response to the concerns we had with the lack of transfer from theory to practice, we both approached different principals at neighboring elementary schools. These principals supported our request to have our

weekly university literacy methods course on their school campus. In return, we would provide weekly instruction for challenged readers and writers. For the past few years, our literacy methods courses have met weekly on an elementary school campus for five hours of instruction. We model primary and intermediate lessons for our new teacher candidates to observe, and these university students plan for and then teach small groups of students for 45 minutes to an hour of our class sessions. These aspiring teachers plan and deliver a reading or writing lesson each week as we observe, coach, and give feedback. These observations assist us in determining what the needs are for our next training session together.

When the university students return to the classroom to debrief the lessons taught, it was fascinating to note the levels of learning they experienced. The conversations went down many paths, which included classroom management techniques, effective questioning strategies, the importance and skill in selecting quality materials, characteristics of excellent mentor texts, ways to engage all students in discussions, techniques for expanding language and vocabulary development, strategies for reaching English learners, ways to deepen comprehension, the power of “wait time,” and how to encourage productive and rich dialogue among the children. This debriefing time was powerful for self-reflection and growth for all in the group.

3.4 Data Sources

As a case study to inform our own practices we limited data sources to ones that would be collected as a part of the program. Our own observation notes during planning, teaching, and reflection were taken. We collected teachers’ written reflections after lessons were delivered, and End-of-program surveys completed by each teacher candidate were used. Comments from the back of formal course evaluations were also gathered. Data analysis included reading and coding comments into categories.

4. Results

There were three major themes that emerged from the data. Students found that having the methods courses on campus allowed them to apply theory to practice and helped them with transfer. It also allowed them to see the practical applications of what they were learning and then doing with the students. Finally, the feedback they received from both instructor and peers was powerful and assisted in their own self-reflection. Some quotes are used to illustrate each theme:

4.1 *Transfer from theory to practice*

"Really enjoyed working with students. Got to put to practice what we learned in the classroom. It was a great experience."

"Working with real live humans was very fun. It gave us a chance to apply our knowledge and what we learned."

4.2 *Practical applications*

"Working with real live children and knowledge that I can and will use in my own classroom".

"Interaction is the best tool to learn from".

"Working with the real live humans made the experience more meaningful and comprehensible when we were able to "experiment" what we had learned on children vs. just reading about it in a text book".

"There is no comparison to what I have learned from class and practicing it with children".

"Learning these concepts and tests abstractly would not have made as much of an impact on my learning".

4.3 *Feedback*

"I valued the peer and instructor feedback on lessons demonstrated".

"Being with the rest of the class and learning together and from each other has been very helpful".

"The feedback and constructive criticism received by peers and professor was paramount".

"Getting immediate feedback while the lessons were fresh helped in editing and rethinking the lessons".

Data from the MSCP end-of-program survey confirmed this positive impact of teaching the methods courses at an elementary school site. The Reading Methods courses were ranked highest of all MSCP courses. On the Teacher Candidates' Perceptions of Preparation for Teaching question, 96% of the students believed that they received excellent to good preparation from their Reading Methods course. The next highest course was 82%. In their comments they referred to the courses being taught at the elementary school sites and having fieldwork concurrent with theory as being the most effective way of learning. They attributed this opportunity in assisting them during their student teaching placement and making them more prepared and successful.

5. **Conclusion**

Teachers are the most critical factor in student achievement, far more powerful than class size, race, socioeconomic level, and classroom homogeneity (Allington, 2011). Our approach to instructing these aspiring teachers promotes the understanding that teaching children to read and write is complex and requires expertise. Children differ and teachers must be equipped to differentiate instruction to support their learning. Having the opportunity to match theory to practice is essential for this.

The challenge for us is to teach our students well enough that they have learned and applied theory and can recognize when their teaching is not working and improve upon it. These teacher candidates are fortunate to have the experiences described in this paper. Each week they observe us teach real kids, and they teach real kids as we and their peers observe. We have productive conversations about teaching and learning centered on these

shared experiences. Our hope is that they leave the university prepared for today's diverse classrooms and with the commitment to continue to seek further learning and become the expert literacy teachers their students deserve.

Learning Objects for Numerical Analysis Courses

Marta G. Caligaris*, Georgina B. Rodríguez*, Lorena F. Laugero

Facultad Regional San Nicolás, Universidad Tecnológica Nacional, Colón 332 (2900) San Nicolás, Argentina

Abstract

The “Virtual Laboratory of Numerical Analysis” is a collection of customized applications that let students work with all issues that are studied in different courses of Numerical Analysis at Facultad Regional San Nicolás from the Universidad Tecnológica Nacional of Argentina. As windows were developed to present a simple interface, easy to interpret and manipulate, there is no need of hard training to use these tools.

The aim of this paper is to show some of the visual tools that have been designed for working on the numerical solution of nonlinear equations, numerical integration and resolution of initial value problems.

Keywords: Learning Objects; Numerical Analysis; Scilab

1. Introduction

The “Virtual Laboratory of Numerical Analysis” of the FRSN (Facultad Regional San Nicolás) is a collection of customized applications developed by the authors in the software SCILAB, and covers all topics studied in Numerical Analysis’ courses. These tools were developed taking into consideration the students’ learning styles. This laboratory covers numerical methods for solving the following issues: nonlinear equations, systems of linear equations, systems of nonlinear equations, interpolation and curve fitting, numerical integration, ordinary differential equations and partial differential equations. When students use these tools for solving problems by different numerical methods, they have the advantage of analyzing the results directly, without having to program the code, at least at the beginning.

E-mail address: gie@frsn.utn.edu.ar

As windows were developed to present a simple interface, easy to interpret and manipulate, there is no need of hard training for using these tools. This enables students to focus on mathematical concepts or skills that the professors want to deepen or highlight, without the need to master the software syntax used.

This laboratory has been enriched since its initial design in 2007, and is constantly evolving, taking into account the experience of its use with different groups of students. Initially the windows were designed in MAPLE. Currently all applications are developed using the free software SCILAB. All the tools that are part of this lab are available on the websites corresponding to the themes developed in the Numerical Analysis subjects held on the FRSN. It is possible to reach them by pressing the button **Resources** on the website of the research group, www.frsn.utn.edu.ar/gie.

The aim of this paper is to show some of the visual tools that have been designed for working on the numerical solution of nonlinear equations, numerical integration and resolution of initial value problems. It is assumed that the methods used in the different windows are known, and therefore their description is not included (Hoffman, 1992; LeVeque, 2007).

2. Learning Objects

The term learning object (LO) was introduced at the beginning of the '90. Although after that many authors have defined the concept in different ways, one of the first established and widespread definitions is given by Wiley (2000), who considers that a LO is “any digital resource that can be reused to support learning”. In order to ensure quality in the development of LO, a number of properties have been established. Learning objects should have the following characteristics (Naharro et al., 2007):

- **Digital Format:** LOs have the ability to constantly update and/or change. LOs are used from the Internet and accessible to many people simultaneously from different locations.
- **Educational Purpose:** The purpose of LOs is to ensure a successful learning process.
- **Interactive Content:** LOs involve interactive participation of each individual, teacher or student in the exchange of information. Thus, it is necessary that learning objects include activities (exercises, simulations, diagrams, videos, graphics, etc.) to ease the assimilation process and track the progress of each student.
- **Independent and indivisible:** LOs must make sense in themselves and be self-contained. Furthermore, LOs cannot be decomposed into smaller parts.
- **Reusable:** LOs must be able to be used in educational contexts other than that for which they were created. Reusability is the most important characteristic of learning objects.

The design of a LO is a challenge for teachers because, besides choosing the content, they should create the appropriate ways of presenting, depending on the characteristics and learning styles of the addressees.

3. Interfaces Description

The latest versions of commercial programs as MAPLE, MATHEMATICA and MATLAB offer the possibility to design custom graphical interfaces. Also with SCILAB, a free software, GUIs (Graphic User Interfaces) can be created. These windows applications allow using the calculation and graphing power of the available software in a friendly way, without worrying about the commands needed to get the solution of the proposed tasks.

In this way, students can not only focus their attention on the object under study but, through visualization using the windows, they can compare the methods studied, analyze advantages and disadvantages, discover

mathematical concepts and conjecture generalizations. That is, students would develop and promote a different kind of mathematical thinking.

The current “Virtual Laboratory of Numerical Analysis” is a collection of SCILAB GUIs. SCILAB is a free software, available from www.scilab.org, with an environment similar to MATLAB that was developed in 1990 by researchers from INRIA (Institut National de Recherche en Informatique et en Automatique) and ENPC (Ecole Nationale des Ponts et Chaussées). Today is maintained and developed by a consortium created in 2003.

3.1. Nonlinear equations

In Figure 1 the application designed to work with nonlinear equations is shown (Caligaris et al, 2010). It presents the four methods that are studied in the course to achieve the approximation of a root of these equations: bisection, Newton, secant and false position.

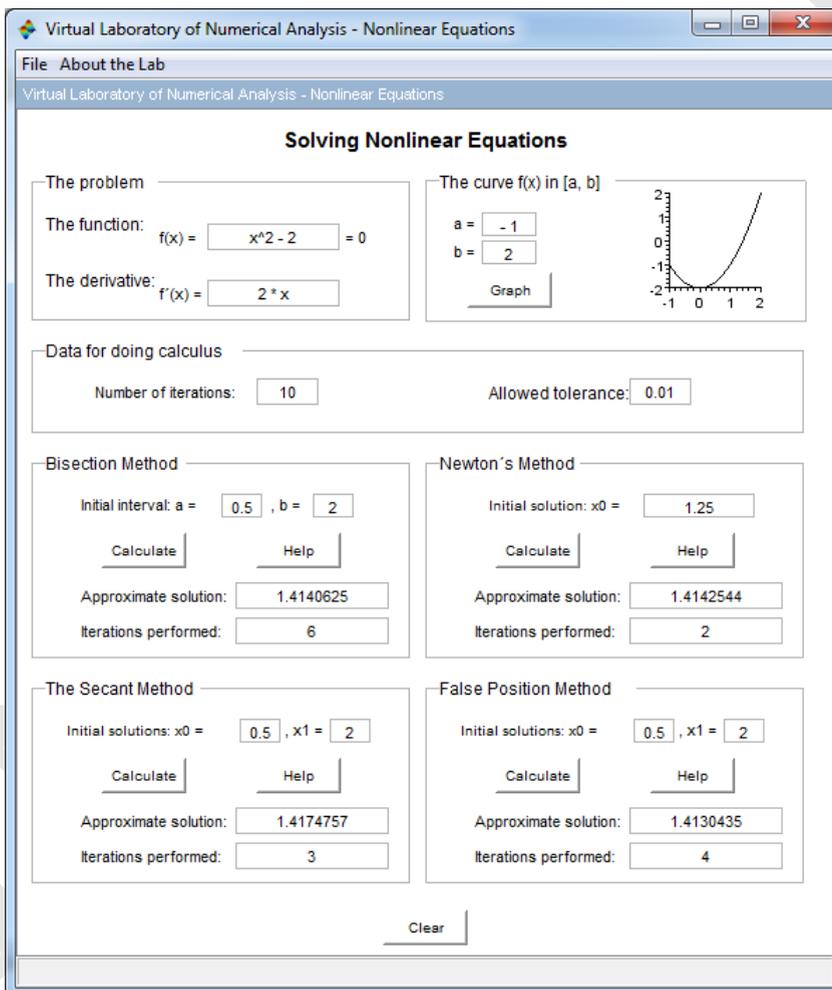

Fig. 1. Application for resolution of nonlinear equations

It should be mentioned that SCILAB does not calculate derivatives symbolically, so the expression involving the first derivative of the function associated with the equation must be loaded. Also, the desired tolerance and maximum number of iterations must be determined.

All methods require one or two initial data for execution, as it can be seen in Figure 1. These can be estimated by the graphical, using with the **Graph** button in an appropriate interval.

Results of each method may be obtained by entering the required data, and then clicking on the **Calculate** button. The approximation obtained and the number of iterations performed will be shown, if the conditions for each method are accomplished. Otherwise, an error message is returned. Besides, if the maximum number of iterations or the allowed tolerance is taken and the desired approximation is not reached, an alert message appears informing the user to increase the number of iterations or decrease the allowed tolerance.

3.2. Numerical integration

Figure 2 shows the application designed for working with numerical integration (Caligaris et al, 2012). It presents the four methods that are studied in the courses to achieve an approximation of a definite integral. To use this interface, the corresponding function, the integration interval and the number of subintervals or points, as required, to be considered in each method must be entered. By pressing **Calculate**, each of the approximations is shown. Also, using the **Graph** button, the graph of the function, in the specified range, is displayed.

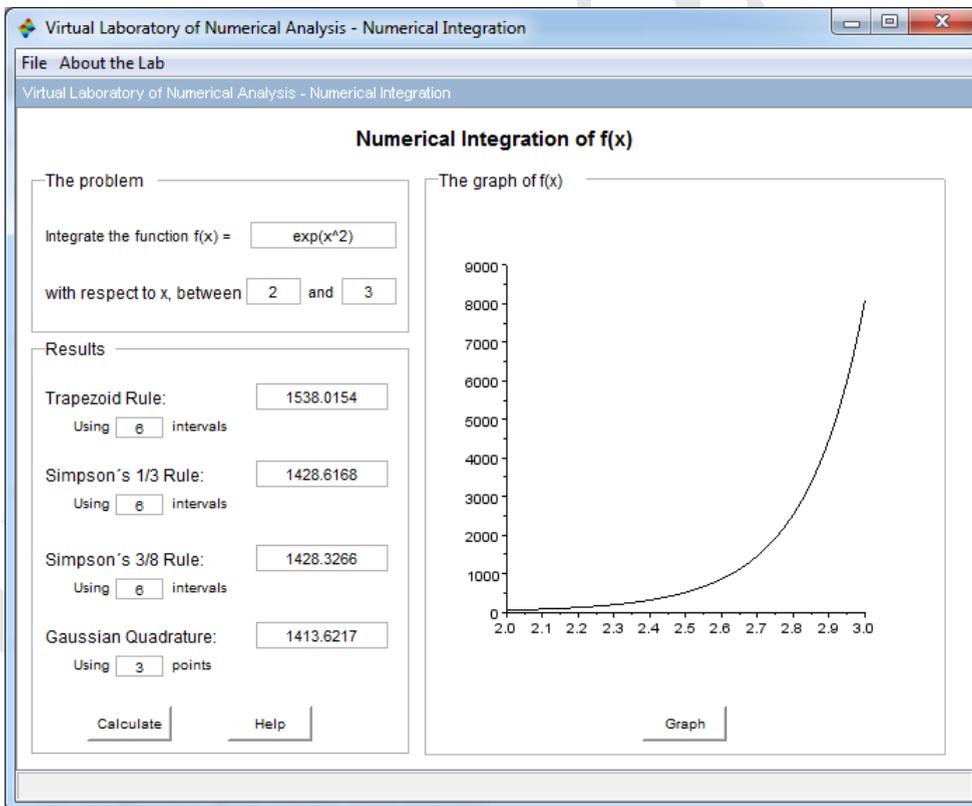

Fig. 2. Application for numerical integration

3.3. Initial value problems

To solve Initial Value Problems (IVP) some different interfaces were developed, each one pointing at specific issues. The corresponding applications are:

- **Initial Value Problems: One-step Methods.** It allows to solve first and second order IVP, using the following methods: Euler and Runge-Kutta of second order and of fourth order. (Caligaris et al., 2011).
- **Initial Value Problems: Multipoint Methods.** Also first and second order IVP can be solved here, using Adams-Bashforth or Adams-Bashforth-Moulton methods.
- **Systems of First Order Initial Value Problems.** It solves first order IVP systems with one-step methods.
- **Initial Value Problems: Error Analysis.** It shows, both in tables and graphs, the local and global truncation errors in Euler and Runge-Kutta methods.

Figure 3 shows the interface corresponding to multipoint methods. The interface corresponding to one step methods is very similar to this one. Only the proposed methods change.

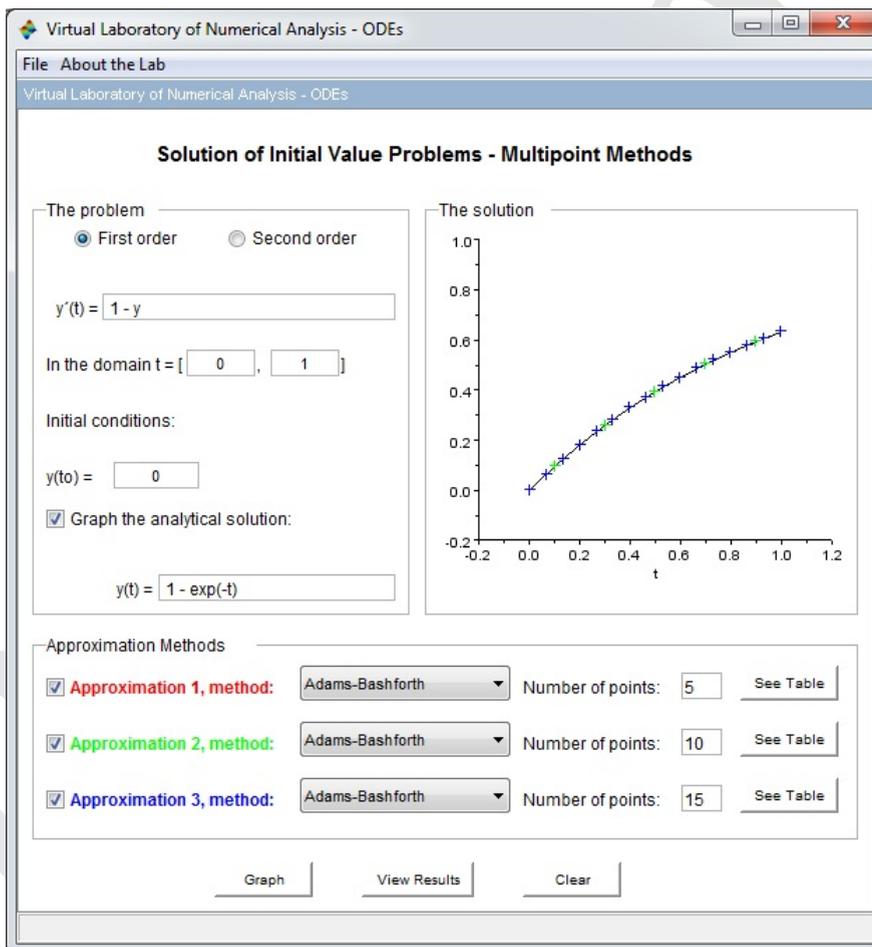

Fig. 3. Initial Value Problems: Application for multipoint methods

To obtain an approximate solution of a particular IVP in the window shown in Figure 3, the order of the problem to be solved must be indicated at first, by choosing the appropriate radio button. This will enable the fields needed to load the problem data, according to its type: the coefficients of the equation, the initial conditions and the range where the solution will be obtained. It is possible to enter the law of exact solution of the IVP -if it is known or it can be obtained- to make comparisons and analyze errors.

A list (t_i, y_i, w_i) or (t_i, w_i) -whether analytical solution of the problem is known or not- for each method will be obtained by pressing the corresponding **See Table** button. In this case, w_i corresponds to the approximate value of the solution at the point t_i , and y_i is the value of the analytical solution at the point t_i . These data are displayed in a new window, with a format similar to a spreadsheet. To compare results obtained by different methods, for common abscissa points, the **View Results** buttons can be used.

The interface corresponding to systems of first order IVP is shown in Figure 4. At the bottom of any of the mentioned windows, up to three options for performing simultaneous approximations can be selected.

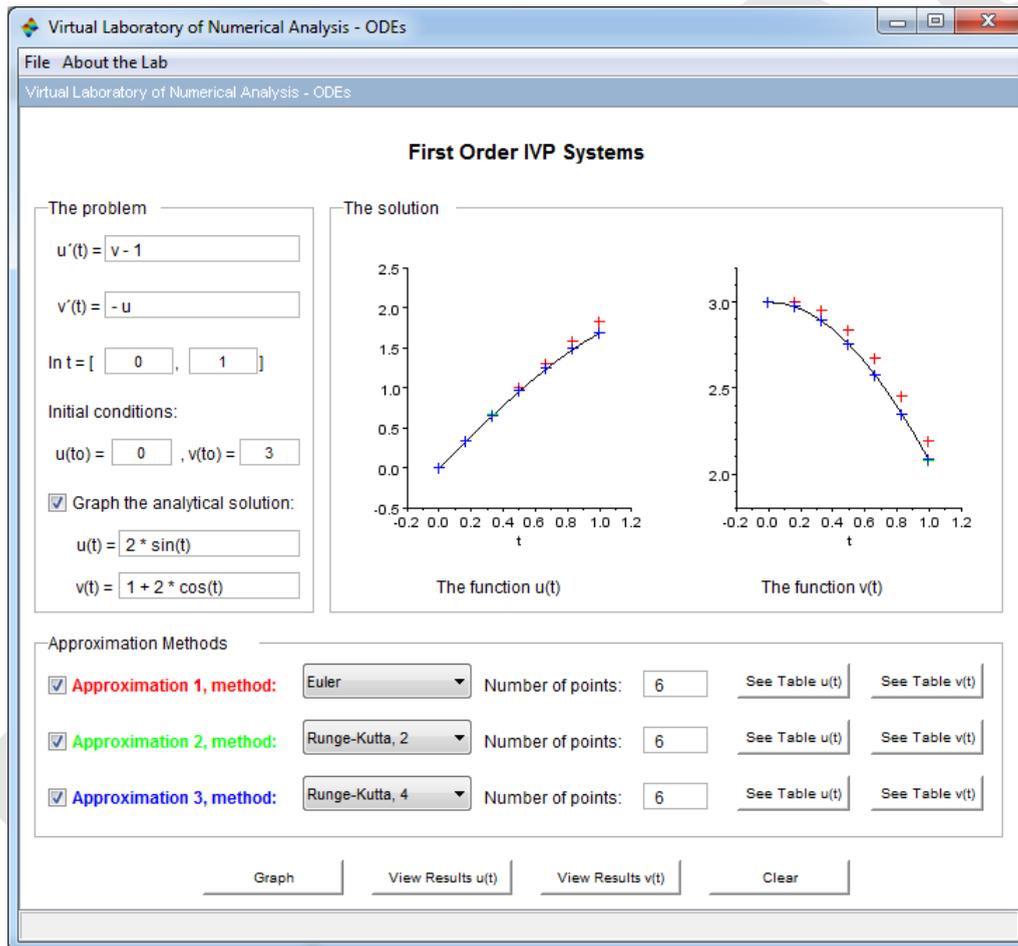

Fig. 4. Application for systems of first order initial value problems

Each of the windows mentioned above allows the user to choose a method from a drop down list, and the number of points where the solution will be computed. In these windows it is possible to choose applying the same method with different steps (Fig. 3), or different methods with equal (Fig. 4) or different steps. By pressing **Graph**, a chart for the unique solution in the window in Figure 3 in the variables (t , y), will be obtained in the "solution" sector, showing the points corresponding to the different approximations, in different colors, as indicated at the bottom of the window.

When solving a first order system of IVP with the window shown in Figure 4, two approximate solutions are obtained. The values of each solution at the points of the net, for each of the methods selected, can be obtained by pressing the corresponding buttons **View Result** for each solution. The list of values obtained is shown in two spreadsheets as shown in Figure 5.

4. Use of the tools in the classroom

Since its creation the different tools that constitute the "Virtual Laboratory of Numerical Analysis" have been used in Numerical Analysis courses in the Facultad Regional San Nicolás and have been well received by students.

The use of these tools, both in lectures and practical classes, can generate new learning spaces, which promote interactive engagement of students with the content of the laboratory, thus enabling understanding and learning of the issues involved. Usually different examples, properly selected, are shown so students can easily understand certain concepts as well as analyze the advantages and disadvantages of each of the numerical methods. The teacher's role in this context is to provide, through the design of teaching sequences, a meeting between the student and the environment for the emergence of knowledge; it is in the interaction and experimentation when the student understands deeply the concept to be taught.

5. Conclusions

Any professor interested in the learning process of the students must recognize when difficulties arise in teaching. By studying the learning style of students, good basis for developing teaching strategies in line with the habits of the students is obtained. Based on the study in Numerical Analysis courses at Facultad Regional San Nicolás, visual applications like those shown here were developed to let students interact in the process of incorporation of numerical methods, allowing them to analyze results instead of wasting time with tedious calculations. Therefore, the authors consider the design of teaching sequences supported by these tools is an alternative for students to build a comprehensive and meaningful learning, managing to interest students in order that they can find meaning and taste the experience of learning and actively participate in the process of acquiring knowledge.

4th International Conference on New Horizons in Education

Learning styles in physics education: introduction of our research tools and design

Blanka Zajacova*

Charles University in Prague, Faculty of Mathematics and Physics, Ke Karlovu 3, Prague 12116, Czech Republic

Abstract

In this contribution we summarize the main approaches to learning styles and their definition. We clarify the characteristics of the learning style and several related terms (learning strategy, cognitive style, etc.). We also present characteristics of some existing tools for learning styles research, such as MSLQ or LSI questionnaires. We specify the dimensions these tools focus on and we illustrate the differences between them with several examples of actual items. We introduce the design of our scheduled research in physics education field.

Keywords: learning styles; physics education; LSI; MSLQ

1. Introduction

The theory of learning styles maps the differences in how the pupils learn new things. It has been discussed mostly in pedagogy and didactics of arts yet and we find it important to concern with this topic also in natural sciences because learning of natural sciences may include its particular specificities. (Marin-Suarez & Alarcon, 2010) We suppose it would be beneficial to find out if there is some learning style preferable in learning physics. It could allow teachers to follow the recent trend to respect the different needs of individual pupils and to choose appropriate methodical tools and provide good physics learning environment to different types of students. Moreover including learning styles in physics education is also chance to improve the educational process of this subject and to increase the motivation of pupils to learn physics.

2. Theoretical framework

Several different approaches to learning styles and their definition can be found in the literature because of a large number of researchers in the area of learning styles, especially in psychology and pedagogy. These approaches differ in a number of topological variables. There exists a variety of definitions, interpretations and models related to this topic. To illustrate this ambiguity we introduce some of the learning styles models and classifications and then we set the boundaries of our own research.

2.1. Learning style models

The plurality of learning style models is evident from several overviews such as Cassidy (2004) or Hartley (1998). There are different aspects and processes involved in the definition of learning style depending on

* Corresponding author. Tel.: +420221912430; fax: +420221912406.
E-mail address: zajacova.blanka@gmail.com

the author of the appropriate model. We introduce the best known learning style models and clarify the aspects they focus on.

2.1.1. Curry's Onion model

Curry (1983) uses an onion as a metaphor to illustrate inner and outer layers of the learning style. There are three main layers included in this model (see Figure 1):

- Instructional preference layer
- Information processing style layer
- Cognitive style layer

The instructional preference layer refers to individual's preferred choice of learning environment, which includes items such as furniture, noise, presence of other pupils etc. This layer is the best observable one.

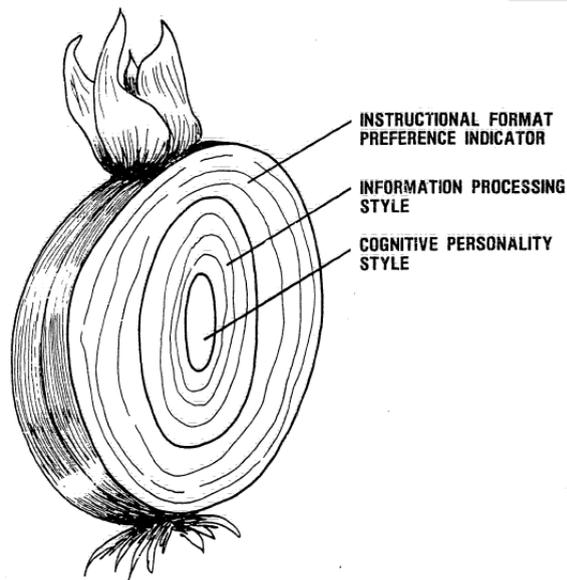

Fig. 1. Curry's Onion model. (Curry, 1983)

The second layer, information processing style, includes the individual's intellectual approach to the processing of information.

The most robust layer is the inner one. The cognitive style is a relatively permanent dimension and it is apparent only when the pupil is observed across more different learning situations.

In spite of the real onion these three layers are not independent but they are connected and able to communicate with each other.

2.1.2. Marshall's Topological model

This learning style model is similar to the Curry's one but there are some more variables added.

Fig. 2 that is translated from Mareš (1998) shows a scheme which illustrates this model. Three layers known from Curry's model are supplemented by other characteristics. For each layer there is its relation to the learning process expressed and also its stability volume which means how suggestible that particular layer is. According to this learning style model the inner cognitive layer is fixed and stable and it is also resistant to the persue of teachers and couchs or instructors. (Marshall, 1987)

2.1.3. Kolb's Experiential learning model

Kolb's learning styles model is based on the comprehensive theory of learning and development where the main source of individual's learning and development is experience. (Kolb, 1981)

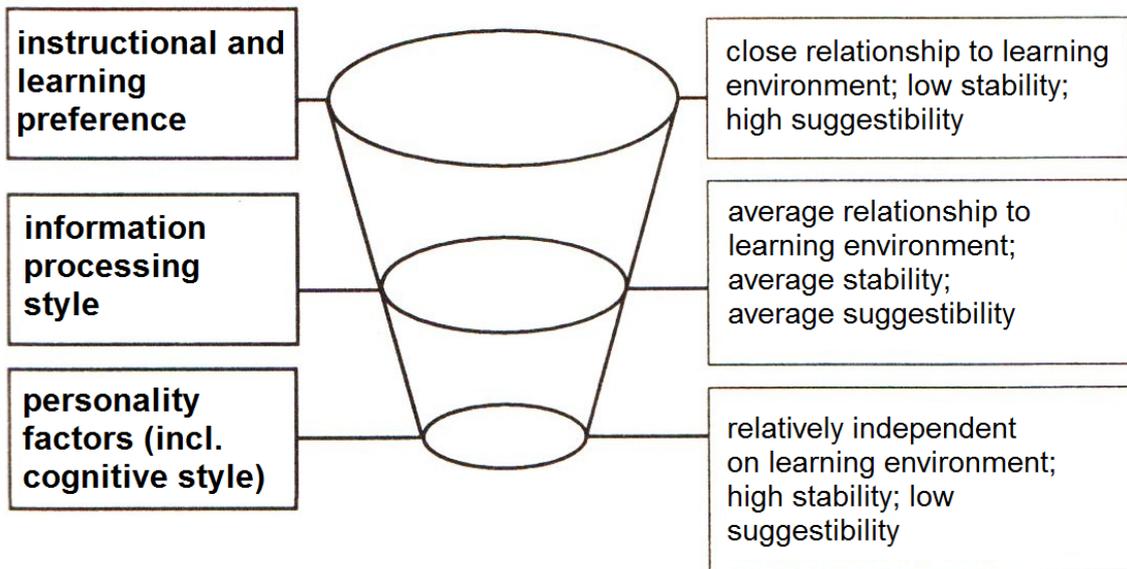

Fig. 2. Marshall's Topological model. Translated from Mareš (1998).

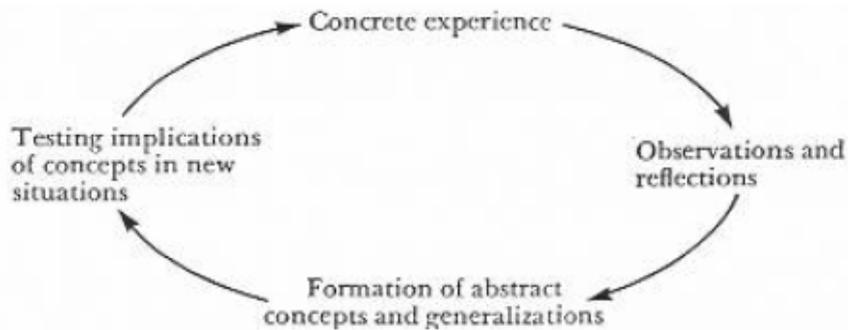

Fig. 3. Kolb's Experiential learning model. (Kolb, 1981)

Due to this model individual differences in learning are based on the learner's preference for employing different phases of the learning cycle that is illustrated by the Fig. 3. There are four learning styles according to the Kolb's learning style model:

- Diverging: combines preferences for experiencing and reflecting
- Assimilating: combines preferences for reflecting and thinking
- Converging: combines preferences for thinking and doing
- Accommodating: combines preferences for doing and experiencing

2.2. Learning style classifications

There are many classification systems of learning styles. Some of them are based on neurological and neuropsychological research, others describe the ways how individuals perceive, organise and process the information. We summarize the best known systems:

- The four-modalities classification: visual, auditory, kinaesthetic and tactile learners.
- Ambiguity in/tolerance classification: describes how learners work with some informations that disagree with their existing knowledge and concepts.
- Field-dependency classification: field-independent learners perceive the components of the task separated from the field while field-dependent do not.
- Classification based on hemispheric dominance: left-brain and right-brain dominated learners, where left hemisphere is considered to be the centre of analytical, logical and systematic processes, while the right hemisphere is said to be rather holistic, intuitive and imaginative.
- Classification based on approach to finding solutions of the problem: impulsive/reflective learners.

2.3. Key terms definitions

The variety of learning style models and the ambiguity of related definitions of the learning style affect definitions of other terms used in learning styles research. For our own research especially the terms "learning style" and "cognitive style" are important. For this purpose we focus on their delimitation. The two mentioned terms are really close to each other and there are four main possibilities of their relation. According to Curry (1983), James & Gardner (1995), Dunn, Dunn and Price (1995) and also Mareš (1998) we accept the idea that the concept of learning style is wider and that it exceeds cognition. Cognitive style is only one part of learning style then. This idea is illustrated by the Figure 4.

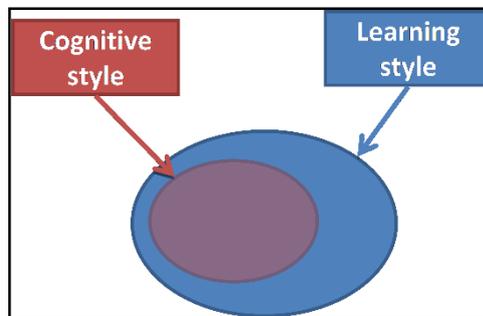

Fig. 4. Relation between learning style and cognitive style in our research.

We understand cognitive style as a mostly inborn and only hardly suggestible part of learning style. Some other specific differences between these two terms are shown in Table 1.

Table 1. Learning style and cognitive style comparison. Translated from (Mareš, 1998).

	Cognitive Style	Learning Style
Origin	mostly inborn	mostly obtained
Activation	mostly spontaneous	initially spont., later conscious
Content dependency	minimal	stronger
Situation dependency	average	strong
Outer suggestibility	little	potentially strong
Inner suggestibility	little	potentially strong

There are several definitions of the term “learning style” itself. They are usually bounded on some learning style model. Some authors define learning styles as the ways or predispositions of approaching different tasks, others describe them rather as a complex manner that includes also conditions such as the learning environment. (Sarasin, 1998; Hartley, 1998; James & Gardner, 1995). Hereafter and for the purpose of our research the learning style is read as a characteristic that has a number of components and is defined according to Keefe as: “the composite of characteristic cognitive, affective and physiological factors that serve as relatively stable indicators of how a learner perceives, interacts with, and responds to the learning environment.”(Keefe, 1982)

Cognitive style is then the term that we use for fairly fixed characteristic of an individual to describe his/her typical or habitual mode of problem solving, thinking, perceiving and remembering. We incline to Riding, Glass and Douglas, who define cognitive styles as “static and relatively in-built features of the individual”. (Riding & Glass & Douglas, 1993)

We also distinguish “learning strategy” in our terminology as a strategy that students adopt while studying. Learning strategy means some particular method. It is an obtained behaviour of how the learner approaches the

task. In accordance with Hartley (1998): “Different strategies can be selected by learners to deal with different tasks. Learning styles might be more automatic than learning strategies which are optional.”

On the basis of the previous definitions learning style is a predisposition to create and/or adopt some learning strategies and to incline to some methods and processes.

3. Diagnostics of learning styles

Measuring the characteristics of learning styles and the learning styles diagnostics is a sophisticated process because of the complexity of this issue (many variables that are hardly controlled). Various qualitative and quantitative methods such as observation, interview or questionnaire are used by psychologists in the learning styles research.

For the purpose of our research we choose to diagnose learning styles by a learning styles questionnaire. We consider it advantageous because of the complex nature of obtained data and because there is a variety of questionnaires the validity and reliability of which was tested and studied thoroughly.

3.1. Learning Styles Inventory (LSI)

The LSI questionnaire was developed by R. Dunn, K. Dunn and Price. The authors of this tool define learning style as: “The way in which each learner begins to concentrate, process and retain new and difficult information. That interaction occurs differently for everyone.” (Dunn & Dunn & Price, 1995)

In consistency with this definition each individual’s strengths and preferences are identified across the full spectrum of twenty elements that are grouped into five categories: environmental, emotional, sociological, physiological and psychological stimuli. These elements and categories are visualized by scheme in Figure 5.

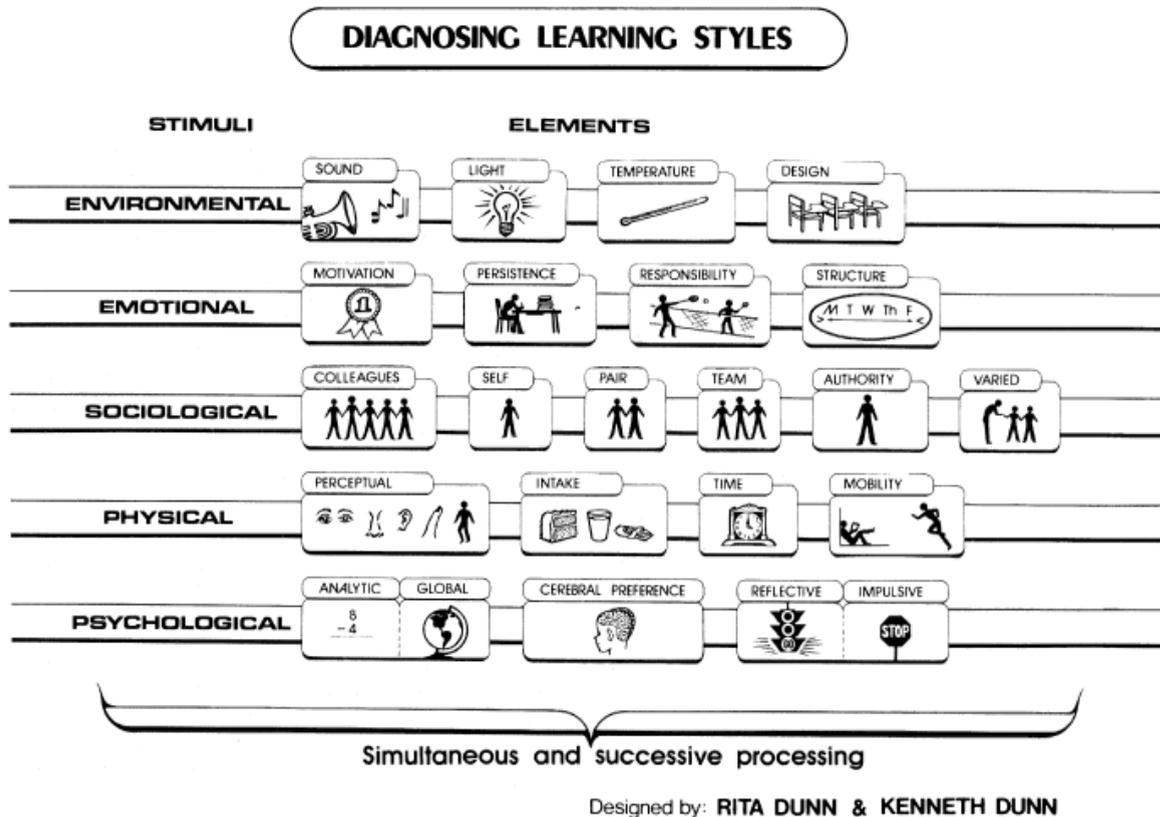

Fig. 5. Elements and categories of the learning style model of Dunn, Dunn and Price. (Dunn R., 1984)

LSI versions for primary and secondary school children and for adults were developed. Reasonable reliability described by Hoyt's coefficient 0.76 and good validity data have been demonstrated in existing studies. (Cassidy 2004; Mareš 1998)

This questionnaire was also translated into Czech by J. Mareš and V. Slavík. This Czech version was constructed for 3rd to 12th grade students and it was verified with 891 secondary level students and 402 high school students. Compared to the original version this adaptation has only 71 items and less strict limits of the scale for 5th to 12th grade students.

3.2. Motivated Strategies for Learning Questionnaire (MSLQ)

The MSLQ tool was developed by P. R. Pintrich and T. Garcia for testing secondary and high schools students. It is designed to measure student's motivational orientations and their use of different learning strategies. This questionnaire consists of 81 items, which are formed by 81 different statements. For each statement the participants of the research rate themselves on a 7-point Likert scale where 1 indicates that the statement does not at all represent the way they normally carry out their tasks and 7 signifies that the statement characterizes very well the way they normally carry out their tasks.

Components of the MSLQ are divided in two categories: motivation section and learning strategies section. These categories and their sub-scales are summarised in Table 2.

Table 2. Components of MSLQ. (Artino, 2005)

Part 1: Motivation Scales		Part 2: Learning Strategies Scales	
Scale	# of Items	Scale	# of Items
1. Intrinsic Goal Orientation	4	1. Rehearsal	4
2. Extrinsic Goal Orientation	4	2. Elaboration	6
3. Task Value	6	3. Organization	4
4. Control of Learning Beliefs	4	4. Critical Thinking	5
5. Self-Efficacy for Learning & Performance	8	5. Metacognitive Self-Regulation	12
6. Test Anxiety	5	6. Time/Study Environmental Management	8
		7. Effort Regulation	4
		8. Peer Learning	3
		9. Help Seeking	4
Total Number of Items	31	Total Number of Items	50

3.3. Several examples of actual questionnaire items

LSI questionnaire items (see Fig. 6) are rated through the 5-point Likert scale (Fig. 7). Items showed in Fig. 6 refer to environmental preferences of the learner.

- I study best when it is quiet.
- I study best at a table or a desk.
- I can ignore most sound when I study.
- I like to study by myself.

Fig. 6. LSI items. (Dunn & Dunn & Price, 1995)

Strongly Disagree	Disagree	Undecided	Support	Strongly Support
1	2	3	4	5

Fig. 7. LSI Likert scale.(Dunn & Dunn & Price, 1995)

Figure 8 illustrates one MSLQ questionnaire item with the 7-point Likert scale. We should note that the expressed statement is related to the content of the course because this fact is significant for MSLQ items.

1	2	3	4	5	6	7	
<i>Not at all true of me</i>						<i>Very true of me</i>	
32. When I study the readings for this course, I outline the material to help me organize my thoughts.							

Figure 8. MSLQ item example.(Artino, 2005)

From previous information it is obvious that LSI questionnaire can provide answers to the questions about the learning environment of the learners, their preferred learning situations or about their reactions to the assigned tasks. In contrast, MSLQ is more narrowly focused. It encompasses students' motivation and their learning strategies, so it provides different information than LSI.

4. Our scheduled research

Three main tools are intended to be administered to the participants of our research: Learning style questionnaire, Epistemological Beliefs Assessment for Physical Science (EBAPS) and Conceptual Test in Optics originally developed for this research. The development is in progress and detail description will be provided for example within ICPE 2013 conference. For the diagnosis of learning styles used by pupils during learning physics we will use one of already existing and validated learning styles questionnaires. From the wide spectrum of tools, overviewed e.g. by Mareš (1998), the final choice will be taken only from two mentioned questionnaires LSI and MSLQ because of the following reasons. LSI is one of the most widely used questionnaires that diagnoses many aspects of learning styles such as learner's environment or emotional processes. Outcomes obtained by this questionnaire could answer the questions about preferred learning environment, social perspective of learning (pupils' learning with/without friends or other classmates), learners' reactions on the tasks etc. In contrast, MSLQ is more narrowly orientated. It concerns about the pupils motivation and their learning strategies so the outcomes obtained by MSLQ will represent preferences in these areas. Different outcomes mentioned above will have different impacts on the real teachers' praxis. That's why the final choice of the instrument for learning styles diagnosis will be done after a discussion with experts in physics education.

The respondents of our research will be Czech high school students in their last two years of studies.

The main goal of our project is to obtain detailed description of the learning styles used among Czech high school students in physics - optics. Our research is aimed at optics because of two reasons: 1. it has not been explored in terms of learning styles and it contains topics with both a low level of abstraction (geometric optics) and a high level of abstraction (wave optics). 2. in the Czech republic optics is usually thought in the last two years of high school studies, when the students probably have their learning strategies fixed as reactions to their preferred learning style.

The research will also compare learning styles and strategies of students with excellent and below-average results in physics. Expected diversity in students' approaches will be presented to the wide expert public and recommendations for teachers and students will be formulated. It will allow teachers to choose appropriate methodical tools to provide good physics learning environment to different types of students.

5. Conclusion

The article describes learning styles and strategies of secondary level students and the design of the research aimed at student's learning styles in physics, particularly optics. In expert community there are several different approaches and definitions of learning styles used. We introduce some of the main approaches and definitions and we delimit the terminology used in our own research.

In our research we understand the learning style as “the composite of characteristic cognitive, affective and physiological factors that serve as relatively stable indicators of how a learner perceives, interacts with, and responds to the learning environment,” in accordance with Keefe (1982). We use the term “cognitive style” as a part of learning style in our research and as a fairly fixed characteristic of an individual. We also distinguish “learning strategy” in our terminology as an obtained behaviour of how the learner approaches the task so it includes methods and processes that students adopt while studying.

Our research is aimed at physics and the main goal of this project is to obtain detailed description of the learning styles used among Czech high school students in physics - optics. We decided to use one of already existing and valid questionnaires to diagnose typical students' learning styles. The final choice will be done from one of the two mentioned learning styles questionnaires LSI and MSLQ after a discussion with experts in physics education. By the research we will also compare learning styles and strategies of students with different level of physics concepts knowledge. Outcomes of this research will be presented to wide expert public and recommendations for teachers and students also will be formulated.

Local Ceramic Stoneware Body Exploration as Alternative Artificial *Walet* Swiftlets Nest

Syaza Abdul Rahim^{*a}, Rusmadiyah Anwar^b, Oskar Hasdinor Hassan^c

^{a,b,c}Universiti Teknologi MARA, Faculty of Art & Design, Department of Industrial Ceramics, 40450, Shah Alam, Malaysia

Abstract

Recently, *Walet* industry used artificial template nest which produced by plastic. It happens to be as new production method to increase the production of swiftlets nest. Unfortunately, those materials gave negative effect to the nest. Plastic materials can irritate the respiratory system, aggravate asthma and lung diseases, permanent lung damage, and affect the immune system. Because of that, natural source based on composition of ceramic materials such as stoneware incorporate with limestone (Calcium Carbonate) will be use to substitute these artificial materials. The objective of this research is to get the appropriate stoneware composition based on its physical properties such as shrinkage, strength and water absorption. In laboratory test, stoneware was divided into five groups which differentiated by the firing temperature; 700°C, 800°C, 900°C, 1000°C and 1200°C. All test pieces prepared as test bar with a press mould technique due to the production application suggested. The physical reaction shows a significance result where the strength and water absorption of the stoneware reduced due to the increasing of firing temperature. The production flow does not show any defect of crack or broken while drying or firing was implemented. Those results became as a major guideline in producing a new artificial nest based on natural material from stoneware body. These result will derived into the actual design of *Walet* nest template.

Keywords: Swiftlets, template nest, stoneware , limestone, modulus of rupture

1. INTRODUCTION

Aerodramus Fuciphagus or also known as *Walet* in Southeast Asia region produce the bird nest that contain 90- 95 % of saliva, 5- 10% of feathers and purities (Ibrahim, Teo and Baharom, 2009). The bird nest is a healthy food and give good effects for curing tuberculosis, dry coughs, alleviating asthma, stomach ulcer, relieving gastric troubles and general weakness of bronchial ailments. Consuming bird nest regularly can give a person exuberant physical and mental strength as well as to restore one's youthfulness. The bird nest are assumed to improve skin complexion and acted as anti aging (Lee and Lamini, 2011).

Recently, the industry used several methods to attract *Walet* to build the nest. One of the method by using a template nest. In the market, there are various template nest made from different type of materials such as plastic, silicone, rubber, metal and paper. One of the favourite material that have been use to make a template nest is plastic. However, these plastic materials will give negative effect to the *Walet* nest. Plastic materials can infuriate the respiratory system, irritate asthma and lung diseases, cause permanent lung damage, and affect the human immune system (Lithner, 2011).

*

Fig. 1. Template nest made from plastic

This research will use Stoneware body as a main material because of its strength and it can be fired to very high temperatures of 1200- 1300°C (2192- 2372° (Atkin, 2005). S.Salehi et- al also stated that the ceramist used stoneware body as a material in their artwork because of its strength (Salehi, Zainuddin, Anwar and Hassan, 2012). Through similar research has been done by R. Anwar et- al, it can be the ceramic materials has been used to replace the other materials to increase the structure of the material composition (Anwar, Kamarun, Vermol and Hassan, 2011). The stoneware body will mix together with Calcium Carbonate (Limestone) to attract *Walet* to built the nest because of Limestone comes from *Walet* habitat which is Limestone cave. It can reducing odors and neutralize the acid (Smith, Orlando and Fla, 1987). the other study had been proven that the strength of the stoneware body was increasing by adding the flux. it can achieved the high percentage of Modulus of Rupture and low rate of water absorption (Wannagon, Sornlar and Choeycharoen, 2012).

The main objective of this is to obtain the best composition of Stoneware body which will be use to produce *Walet* template nest. the stoneware will mix with different ratio Calcium Carbonate because of its based on natural materials from the *Walet* habitat (cave). Furthermore, Calcium Carboante also have its own characteristic such as reducing the odors and neutralizing the acid. The composition was chosen based on low rate of water absorption and high strength of the body. the shrinkage result will be the guideline to get the right size when producing the model of ceramic template nest.

2. METHODS

The materials that have been use are Stoneware body and Calcium Carbonate (Limestone). The Stoneware body was mixed with Calcium Carbonate with different ratio of composition, which are 0% of Calcium Carbonate, 30% of Calcium Carbonate, 50% of Calcium Carbonate, and 70% of Calcium Carbonate. Those two materials were sieved to get same particle size which is 100 μ . Then, all the materials were mixed together with specific amount of water. After that, the mixture were wedged into a dough. Then, the test bars with dimension of 100mm x 100mm were produced made by press mould technique and dried at room temperature for 3 days. The dried test bars fired in electrical kiln at different range of temperature which are 800°C, 900°C, 1000°C, 1100°C and 1200°C. The fired test bars were measured to determine the shrinkage from dried body to the fired body. Water absorptions of the test bars were determined by Archimedes method where the measurements required the test bars being immersed in the cold water for 24 hours (Khalaf and DeVenny, 2005). The mechanical strength or

Modulus of Rupture of the fired test bar was determined via 3 points bending test. The stress applied on the bars is described in Modulus of Rupture (MOR). The formula was stated below;

$$\sigma = \frac{3FL}{2bd^2}$$

Where σ (N/mm²) is the stress required to rupture the bars, F is the load (N) at the fracture point, L (mm) is the length of the support span, b (mm) is width and d (mm) is thickness [6]

3. RESULTS AND DISCUSSION

3.1. Shrinkage

Reported in Table 1. are the shrinkage result of the Calcium Carbonate percentage adding into the Stoneware body. The lowest shrinkage values was recorded for 70% of Calcium Carbonate followed by 50% of Calcium Carbonate.

Table 1. Shrinkage, temperature and percentage of Calcium Carbonate adding in the Stoneware.

Temperature (°C)	Percentage of Calcium Carbonate (%)			
	0	30	50	70
800	4.60	0.00	0.00	0.00
900	5.20	2.60	0.00	0.00
1000	5.60	2.40	1.60	0.00
1100	8.00	1.00	0.00	0.00
1200	12.60	9.20	1.60	0.00

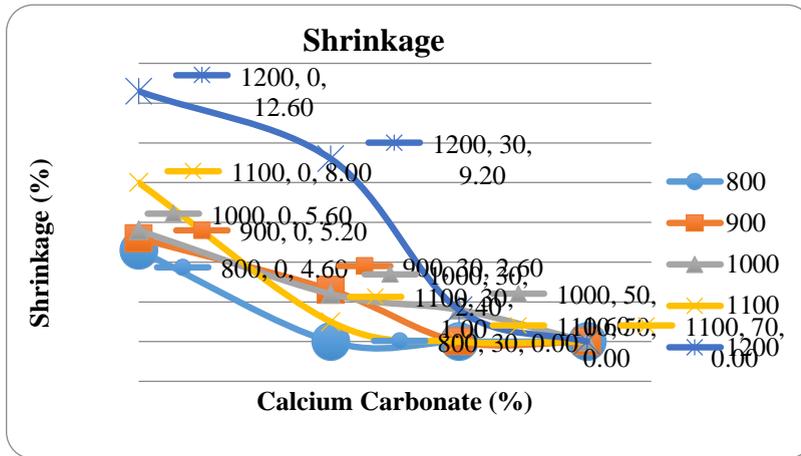

Fig. 2. Shrinkage vs percentage of Calcium Carbonate at different range of temperature.

The flow curves of shrinkage is reported in Fig 2. It can be seen that the shrinkage decreased with sequenced with additional percentage of Calcium Carbonate and 800°C of temperature shows the lowest percentage of shrinkage. This result indicates that the presence of Calcium Carbonate in the stoneware body was decreased the shrinkage of the composition.

3.2. Modulus of Rupture (MOR)

The Modulus of Rupture, temperature and percentage of Calcium Carbonate adding in the Stoneware, summarized in Table 2. the 1200°C of temperature recorded the highest percentage of Modulus of Rupture same as the 30% and 50% of Calcium Carbonate.

Table 2 : Modulus of Rupture, temperature and percentage of Calcium Carbonate adding in the Stoneware.

Temperature (°C)	Percentage of Calcium Carbonate (%)			
	0	30	50	70
800	0.04	0.00	0.00	0.00
900	1.49	0.69	0.00	0.00
1000	9.37	4.81	4.39	0.00
1100	11.61	8.36	7.33	0.00

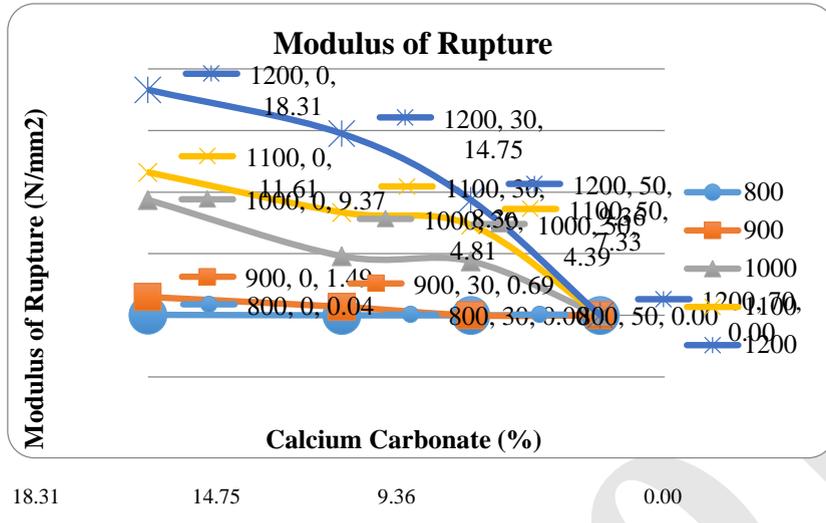

Fig. 3. Modulus of Rupture vs percentage of Calcium Carbonate at different range of temperature.

Reported in Fig. 3 is the behaviour of the Modulus of Rupture as a function of percentage of Calcium Carbonate, for the different range of temperatures. The strength of the test bars decrease slightly with additional percentage of Calcium Carbonate on temperature of 800°C and 900°C. Nevertheless, the strength jumped rapidly started from 1000°C to 1200°C. From the result, it can be concluded that the Stoneware body will lost its strength when mixed together with the Calcium Carbonate. The 100% of Stoneware body achieved the highest result of strength test which is 18.3N/mm² with the temperature of 1200°C.

3.3. Water Absorption

Table 2. collects the water absorption, temperature and percentage of Calcium Carbonate adding in the Stoneware. It was recorded that the low percentage of water absorption was recorded at 800°C of temperature in all the composition.

Table 3 : Water absorption, temperature and percentage of Calcium Carbonate adding in the Stoneware.

Temperature (°C)	Percentage of Calcium Carbonate (%)			
	0	30	50	70
800	0.04	0.00	0.00	0.00
900	1.49	0.69	0.00	0.00
1000	9.37	4.81	4.39	0.00
1100	11.61	8.36	7.33	0.00
1200	18.31	14.75	9.36	0.00

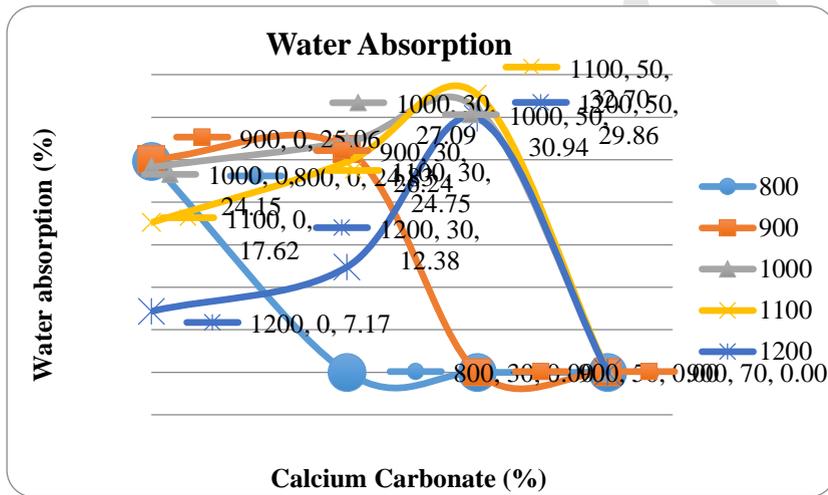

Fig. 4. Water absorption, temperature and percentage of Calcium Carbonate adding in the Stoneware.

In Fig. 4, the water absorption values of the percentage of Calcium Carbonate fired with different range of temperature are shown above. It can be seen that 100% of Stoneware body reached the lowest percentage of water absorption at the firing temperature of 1200°C. It can be conclude that the low temperature such as 800°C, 900°C and 1000°C were contained wide pores and it were absorbed a lot of water . The water absorption decreased with declined percentage of Calcium Carbonate.

CONCLUSION

In sum, the Stoneware body was proved as the highest percentage of Modulus of Rupture. Unfortunately, these body have high percentage of shrinkage. Due to the high temperature of firing which is 1200°C, the Stoneware body achieved lowest percentage of water absorption among other composition.

ACKNOWLEDGEMENT

We would like to acknowledge the generous participation of the interaction designers in the research. This study was conducted in Form Giving Design Research Lab established by Research Management Institute, Universiti Teknologi MARA (UiTM). This issue has finalized in collaboration with the contributing authors, and with support from Malaysia Minister of Higher Education for *Tenaga Pengajar Muda* Scholarship and research fund of ERGS project. Including UiTM for the financial support under Research Excellent Fund Scheme. In addition, two anonymous reviewers provided insightful and of an earlier abstract of this paper.

Loopholes of plagiarism detection software

András Károly Kiss*

University of Pécs, Faculty of Science, 7624, Pécs, Hungary

Abstract

Nowadays, information becomes more and more important for our society. We can get information from everywhere easily and fast. The release of translation software eliminated the problems of translating a document. As a result of the continuous development, recent software are handy and sophisticated. This new way of getting information simplified stealing other people's spiritual work. Plagiarism becomes frequent. The number of students who submit other's work as their own is constantly increasing. The Internet gives them this opportunity. This growth won't stop as far as we don't try to detect plagiarism.

The scandals of recent past made plagiarism detection a popular issue. The topic has chosen, because the further aim of this work is to develop a software, which meets our world's requirements. Throughout my work some software have been tested, in a few cases, those failed in finding plagiarism, so now it is well-known, what the loopholes of these systems are. The future work is supposed to fix these problems, making my software reliable in order to stop plagiarism among universities.

The first tested software was the KOPI online plagiarism detector, which is developed and operated by MTA SZTAKI Department of Distributed Systems. The system compares documents with the ones found in its own database, which contains other users' documents and articles from the English and the Hungarian Wikipedia.

Plagiarism detection with KOPI has four steps. It chunks the document into 40-60 characters long fragments. Storing these fragments results a huge amount of data, so it creates fingerprints digesting the original chunks. The software uploads these to the database and compares it with the fingerprints of other documents, checking the originality of the work.

Plagiarized documents have been made using the Internet. The text of these documents is copied, so if the system works well, it will show the result of 100% plagiarism. First of these documents is copied from Wikipedia. After the application checked the text, the result was 68%. It is a very disappointing result. After checking more documents with several types of products, it is a fact, that most of the software solutions fail to find all type of plagiarism.

Keywords: plagiarism; detection; software; loopholes

* Corresponding author.

1. Introduction

In the 21st century information become more and more important in our everyday life. Internet brings us the opportunity to get information about any topic and also eliminates the obstacles of physical distances (Rebecca Moore Howard, 2007). We can scan for information on the furthest universities' sites without leaving our room. Different languages can't raise difficulties due to new, more sophisticated and accurate translation software. This rapid and easy way of getting data can lead to plagiarism. Students often copy other people's work and submit it as their own, so they can finish their paper fast and avoid hard work. Plagiarism becomes common and popular, meanwhile the time spent with assiduous research decreases. It is convenient to copy great people's thesis and so a tough row to hoe to make your own, especially when there is no difference between the evaluations. The number of people using Internet for this purpose is constantly growing during these days and this tendency won't stop until we make efforts in order to stop this misuse of the World Wide Web.

What plagiarism exactly means? Not as easy question as it should be, the answer is very dim. A lot of researchers take up this question. Maurer gives us the best overview of the issue (Hermann Maurer & Frank Kappe & Bilal Zaka, 2006). As the result of his work, we can pronounce the we are talking about plagiarism, when someone copy the content – it can be words or an idea – of an other people without any reference to the original author of the work. Looks like an easily understandable rule, but it defines three types:

- Coping the text from word to word
- Paraphrasing
- Plagiarism after translation

Coping everything the same way like you can find it in the original article is very often. If you do this, you have to use quotation marks and also have to mark the writer of the quoted text. In case of missing any of these two, you commit plagiarism. Usually, it happens in some cases, when nobody cares about the quality of the work, and no one is supposed to check our work. Due to technology in our time it could be a simple task. Plagiarism detection software deal efficiently with this task. Every teacher should use one of these!

Paraphrasing is a much more complicated question. It means coping other people's ideas or reproduce the text using other words. In this case you have to refer to the author of the paraphrased text. Forgetting to mark the writer means plagiarism. This is a more sophisticated way of stealing other's intellectual product. It occurs when the requirements are greater and someone expected to inspect the paper. Current applications unable to detect paraphrasing. The next generation of plagiarism detection software must solve this problem (Maria Kashkur & Serge Parshutin & Arkady Borisov, 2010).

Plagiarism after translation is also a difficult issue. If you translate the text to the language of your work, it is also a copy of the original work. That case, you have to put the name of the person who wrote the article after the quoted part. Missing reference can cause you trouble, because it is also plagiarism. Usually happens in scientific articles, when advanced information unavailable in the topic, because most of the researches documented using foreign languages. Recent software cannot bring a solution this problem. It should be solved in later versions of the software.

Of course, any kind should be prevented. As mentioned before, lots of people have written about the topic, but no one ever mentioned the danger of plagiarism. It can damage our future carrier if it is revealed. There was numerous incidents when politicians, novelists, researchers and journalists have lost their job because someone brought to light their secret. Let's see a few example from the recent year's scandals. Anette Schavan, German Federal Minister of Education and Research had to give up his work as minister. President of Hungary, Schmitt Pal also had to quit his job, after a journalist found plagiarism in his thesis (György Miklós, 2012). Written media is also full with such incidents. Jayson Blair, the writer of New York Times, had a very short career. He was talented, the readers liked his articles, but one day came to the lime light, that he plagiarized other's work.

Maureen Dowd also wrote to the Times (Online Classes, 2009). The plagiarism also destroyed his image. Last, but not least, some examples from scientific life. Stephen Ambrose was a well-known historian. The value of his work has decreased, when the truth turned out (Jessica Gopalakrishnan, 2012). The same thing happened with Jonah Lehrer (Jonathan Bailey, 2012). Truth will out and it will stigmatize the plagiarizer, which sign will never disappear.

2. Motivations behind plagiarism

Research has been made in order to find out why plagiarizing is so popular. This research started with a personal experience. Throughout education from elementary school to university plagiarism detection has never been made on papers. Presentations, essays has been created on different topics, but nobody was interested in the source of the work. This is where plagiarizers born.

The lack proper education about plagiarism leads young student to copy from the Internet. They do not know what exactly plagiarism is. The teacher's responsibility is to introduce this topic to the class, it is too late to teach them about this issue at the university. All students must know that intellectual thieving is almost like stealing a car, get good grades and gratitude due to other's work is not a real honor. On the other hand it is also essential to learn the right way of quoting. It is hard to write essays without sources, so schools should take time to teach children, about the art of writing a scientific article, however it is a short essay.

Furthermore, schools and universities miss to make the necessary steps in order to detect plagiarism. None of the schools use plagiarism detection software, universities only use it on theses. It is a well-known fact. Students do not have to fear of detection. Institutions like this should start to use plagiarism detection software. There always will be people, who will choose the easier way of working. The number of opportunities of plagiarizers are continuously increasing as a result of technical development. The only way to deal with is to implement the technological support of the software.

It is also a huge problem, that despite the institution using plagiarism detection software, it cannot work properly. Nowadays applications rarely meet the expectations of the environment. These software cannot deal with paraphrasing and plagiarism after translation. It is a huge incompleteness, because changing a few word or using a translator do not results own ideas, it is still plagiarism. Developers should assess the requirements and start to make more efficient and user friendly programs.

The biggest motivation is the convenience. Coping is a simple way of making a research. For these people research actually means nothing. They do not have an own idea about the chosen topic. Plagiarizers do not have to use their brains. It also faster to steal text, than making our own. Personal thinking about hard and substantial work is the biggest problem.

Both side have to change in order to eliminate one of the main problem of recent education. It is a well-known fact, that numbers of plagiarisms is still increasing, and this tendency continues as far as we will not make efforts to stop this. People, who do not deserve their degree, should never let finish the university. This is a very actual topic, due to recent events. The lack of solutions and the effect on our society makes this issue so important and interesting. The concentration on plagiarism in education does not mean that other fields which is full with copying is not important, but this is the core of the problem. Plagiarizing is an old problem, but nowadays it is big enough to spend time and money on it (Salha M. Alzahrani & Naomie Salim & Ajith Abraham, 2012).

3. Plagiarism detection software's test

The best way of finding plagiarism is using a software. It makes the procedure faster and easier, while it is also more efficient than human detection and allows you to compare the paper with huge amounts of articles (José L. Bernal-Agustín & Rodolfo Dufo-López, 2011). A list of criteria a plagiarism detection software meets (Roman Lukashenko & Vita Graudina & Janis Grundspenkis, 2007):

- Scans and compares huge amount of data fast
- Uses internet connection to find sources on the world wide web
- Has a database to store old documents
- Handles quotations, links and references
- Handles pictures and tables occur in the text
- Makes understandable and substantial reports, shows the original source

During this research 4 software have been tested with 4 types of document. The following 4 software are tested:

- Google
- KOPI Plágiumkereső
- Plagiarism Detector
- Plagiarism Checker

The software are tested with following types of documents:

- Copied from Wikipedia
- Long article from the Internet
- Translated text
- Old thesis

3.1. Google

Google is the world's most famous search engine (Wikipedia, 2013). It is a very useful program for searching relevant articles that is the main reason, why Google became the best tool for plagiarizers. Using Google is free, that fact is a key element of its popularity. There are two reasons of the test of Google. First, this application gives the opportunity for searching after sources. It is interesting, because the copied article is found with Google, so it must find the source of a document. Second, the results are good basics to the results proven by other software.

First of all, the texts copied from Wikipedia have been checked. It is not reasonable to use Google for plagiarism detection, because only 32 word long text is allowed to search for. If we know the exact place of the copied text, Google is a good tool, but it is hard to choose the tested sentence.

Checking the long articles with Google bring the some problems. Searching for fragments always showed results, but it is hard to compare the two texts. We cannot decide that how many common sentences exists in both documents.

Translated plagiarism is hard to find like this. Google does not have a built in translator, if we use Google to retranslate the sentences to its original language and then we search for articles with these keywords, it can show good results.

To analyzing theses is also difficult with Google. Every sentence results potential source articles, but comparing these sites rarely shows overlapping. Google is a useful tool for proving the fact of plagiarism, but hard to use for finding it.

3.2. KOPI Plágiumkereső

KOPI is a plagiarism detector developed and operated by MTA SZTAKI Department of Distributed Systems. The project started in 2011, after 3 years of hard work it has started to work online. In 2011, it is improved for searching plagiarism after translation. This is the one and only plagiarism detection software which is made by Hungarian programmers. KOPI requires registration, but after, it is free to use, until you reach the limit. If you want to search more than allowed, then you have to pay for it. Before detection, you have to upload every document. There are 3 options: monolingual search, multilingual search or compare own documents. Monolingual search has two types. First version searches for possible sources only in the database of Hungarian Wikipedia, second option tries to find similar articles in the database of documents uploaded by users. Multilingual search check the English Wikipedia after the translation of the document. Compare function analyses the overlapping between our documents.

Checking documents provided interesting results. In the beginning, the Wikipedia related documents have been tested. Comparing with other users' documents works well, every time the database contained contents like mine, the software found it, but if there is no similar data in the database, that does not mean that the content is original. Checking Hungarian Wikipedia for articles was disappointing, however, this is the core competency of KOPI. Despite that, the average result is 68% plagiarism. It is a very bad result, because the whole text is copied from Wikipedia and no changes were made to the text.

Testing long articles has no result. KOPI does not search on the internet. It is easy to pass the plagiarism detection, if only Wikipedia's articles' content is checked. The only opportunity to find Internet plagiarism is other users' documents. Imagine how small Wikipedia when we compare it with the whole web. The chance of finding copied content is as small as Wikipedia.

In real situations, like theses, KOPI is not reliable. Checking these documents brings no results. It only found overlapping in proper nouns. That proves nothing. In that case it only shows the suspicious sentence, but you cannot check it in the real context.

The last tested option was the best. Comparing own documents is the best component of the program. It compares every selected document with each other, so it is easy to find conformity in the submitted works. Each student have to work on his own, no overlapping allowed between these. It is rarely happens that two people have the same idea with the same words on a topic.

3.3. Plagiarism Detector

Plagiarism Detector is designed by Skyline, Inc. Programmers made this program cooperated with numerous university. The development began in 2005. The software has won several prizes between 2008 and 2010. Thousands of teachers use this application, but mostly in the European Union and the USA. Before we start, the software needs to be download and set up on our computer. No registration required.

First of all, Wikipedia's articles are checked. Plagiarism Detector is very handy and easy to use. After selecting a document, the software has started to check it. This software outperformed KOPI both in speed and efficiency, finding 79% of the text plagiarism. It is still not good enough. The result is interesting because it found the source on the internet, but serious error occurred during the compare.

After that, the long articles have been tested with the software. These documents confused the software. It found the original text, but was unable to compare the properly. The result was 19%. That is not true of course, the whole article is copied from the internet. The mistake caused by the overlap detection algorithm.

Then, the translated texts have been checked. Plagiarism Detector gives no opportunity to find this kind of plagiarism. It found the whole text original, despite that it is copied from the Internet. A translator is a missing part of the software. Nowadays, when online translators are widely used it is a very huge imperfection.

Last of all, these have been examined. Using the application for this purpose is very convenient. It is easy to use Plagiarism Detector, even for those, who are not familiar with computers. The program found copied sentences and showed its possible sources. It also checks references, but this function does not work well. In case of right and similar links, the program does not recognize all of them. It is a huge mistake, because it counts. Correctly referred quotation is acceptable, plagiarism is not.

3.4. Plagiarism Checker

The last tested software was Plagiarism Checker, which is developed by Plagiarisma.Net. A lot of famous high schools and universities use this program. Just a few of them: Benjamin Franklin High School, The University of Michigan, Harvard University. Before detection, we have to download the software or visit their website. Desktop application and online version are also available, registration required. The program checks the documents using a search engine. We have 3 options: Google, Babylon and Yahoo.

First, the articles from Wikipedia have been checked, just like everywhere else. Using different search engines proved different results. Google found 91%, Yahoo 92% and Babylon 100% plagiarism. It is noticeable, that this is the first perfect result. Another interesting thing that meanwhile Plagiarism Detector failed to compare the two texts, Plagiarism Checker almost successfully compared them.

After that the long articles from the internet have been tested with the applications. The same situation happened like before. It provided two different results. Google found 94% plagiarism, meanwhile Yahoo and Babylon found the whole text plagiarized. Plagiarism Checker outperformed both of its opponents.

Searching plagiarism in the translated documents led to no result. We can pronounce that neither Plagiarism Detector, nor Plagiarism Checker are prepared for dealing with these types of plagiarism. As mentioned before, it is a huge disadvantage for those, who use these software.

The very last task was to check the theses with Plagiarism Checker. It has proved the same results like Plagiarism Detector. It found a few possible sources, but showed that the greater part of the text is original.

3.5. The results

The following table contains the average results of the software. In Google's row "+" means good results, "-" means bad results, due to Google does not show the percentage of overlapping.

1. Table: Test results

Name	Wikipedia related articles	Long articles from the Internet	Translated documents	Theses
Google	+	+	-	-
KOPI	68%	0%	0%	0%
Plagiarism Detector	79%	19%	0%	1%
Plagiarism Checker	94%	98%	0%	1%

4. Other Aspects

The results below only show the overlapping between two or more separated texts. Actually, this is not plagiarism detection, but searching overlapping between texts. Plagiarism detection is much more than this, it also includes the examination of references. Using other people's work is allowed, but there are rules for it. Plagiarism detection software should take care about this. Nowadays, when different institutions accept different reference to the original author it is very hard to make this happen. It is almost impossible to include the right test of all kind of reference. A uniform system should be established for referencing to make it possible. Plagiarism checker try to check these references, but it fails. The software counts the amount of text which is between quotation marks. Using quotation marks is necessary but enough to a correct reference.

The possible sources of plagiarism is much bigger than we think. It is easy to see, that searching in Wikipedia's database is not enough, but we have to admit that searching on the internet neither. Written media, text books and other books can be good sources for a plagiarizer. It is not possible to detect, because there are rarely digitalized version of the content. This is another big problem, plagiarism detection software cannot search paper-based data. For example, scientific articles should be digitalized.

Storing recently checked document is essential. Older thesis could be a great basic to a new. If we let the old one disappear in our system, we will not be able to detect text copied from it. It is really useful for someone, who checks documents from the same field of science. Collecting these document on a central server is hardly suggested, but it is also important to let the user see the older document.

Comparing own documents to each other is another simple function, that can make the software better and improve its efficiency. Searching overlapping between classmates' works usually prove results. A classmate is very frequently the source of the text. Combining the last and this function is also useful.

The availability to the application is a fascinating question. Plagiarism detection software are for institutional purpose. The problematic issue is the public availability. Those who not copied text foully could check their work, but those, who plagiarized may use this for other reason. They probably would check their work in order to find the weaknesses of their work. If they know where the fact of plagiarism is obvious, they may try to mask it, instead of referencing.

As mentioned in the beginning, there other fields of plagiarism, so other adaptations are possible. Every situation when people have to submit a paper, and it requires personal work is a potential place for plagiarizing. Just a few idea: written media, CV, motivation letter, advisement or expert's report.

Graphic User Interface is the least important from the aspect of plagiarism detection. Well-known cliché, that it should be simple, memorable, perspicacious, so briefly user friendly. Defining what it actually means is a very hard task. Y generation grew up with computers, but the etalon should be the older generations, after all, they are our teachers.

5. Summary

Plagiarism is not only the 21st century's problem, it is the problem of education. In our days, we cannot ignore this problem. Early software unable to deal with the task. More development is necessary in order to keep up with plagiarizers. This document is about to introduce the background of the problem. Current software have been tested, and it proved the incompleteness. Further works are planned in order to create a new alternative.

Low temperature transparent glaze study in sustaining luminescence substance for local ceramic craft

Siti Nor Azila Noordin ^{*a}, Rusmadiyah Anwar^b, Oskar Hasdinor Hassan^c

^{a,b,c}Universiti Teknologi MARA, Faculty of Art & Design, Department of Industrial Ceramics, 40450, Shah Alam, Malaysia

Abstract

Malaysia, as a country with significance heritage were always attempted to discover a novel method or investigation in order to preserve these valuable craft. In this work, we attempted to investigate the possibility of luminescence glaze to be applied as a novel surface treatment for local ceramic craft. Literally, the application of borax acid as flux to lower the glaze melting temperature is determined to the temperature of the glaze composition itself. Borax acid reacts as a melting agent that allows low temperature ratings to decrease further. The goal of this study is to match the glaze effect with stoneware body. Borax acid was used as composite with the characteristic of melting point of approximately 573°C. These study was done by stoneware clay was casted using plaster mould into solid round samples with the dimension of diameter 40mm³. Then, the samples are indicating to high bisque sintered in electrical kiln at 1000°C for 8 hours. Common decorating method; on glaze was applied on high sintered bisque samples. The composition of glaze with a high amount of borax acid as flux is applied on samples. An appropriate amount of the glaze materials was weighted in 100 gram for each batch the percentage of flux content. Then glaze sintering consecutively at 800°C, 850°C, 900°C and 950°C for 6 hour in a mild oxidation atmosphere. Noteworthy between the firing temperatures and percentage of flux in glaze composition with borax acid as flux intended for determine low temperature glaze proved by sustaining luminescence substance. As a result; the most accurate formulation of glaze composition is with the content 80% of borax acid to reach matured range. It's sustained the glow of luminescence substance SrAl₂O₃:Eu²⁺,Dy³⁺.

Keywords: stoneware, borax acid, low temperature, glaze

1. INTRODUCTION

As silica, fluxes and alumina are combined in a eutectic mixture and fired to a high enough temperature, a glossy transparent glaze results. In a eutectic, the melting temperature is lower than that of either of the component materials (silica or alumina) alone. A combination of several different fluxes also helps to melt the glaze. In glossy glazes, the alumina to silica ratio should be around 1:9. A stiff, stable glaze with a ratio of around 1:7 is preferable for painting with oxides or under glazes. To make the glaze matt, excess alumina can be added so that the alumina to silica ratio is around 1:5. The addition of any of the alkaline earths such as magnesia can also cause the glaze to become matt. Any excess material not involved in the melt remains suspended in the glass or crystallizes out on cooling. Crystals form in fluid glazes with low alumina (Muller, Kristin, Zamek, Jeff, 2011).

Currently, long lasting phosphorescence have attracted much attention in a assortment of applications, such as lighting source, storage devices, medical instruments, pigments, arts and craft. Several attempts were initially

used for synthesis route, such as conventional solid state reaction, sol-gel method, combustion, and microwave heating synthesis. Typically, the synthesis process will be more complex to obtain a good phosphor that consists of high intensity and long persistence glowing properties in an efficient, cheap, and simple way. Solid state reaction process has been extensively used for phosphor synthesis (A. Nor Nazida, M. N. Ahmad-Fauzi, M. Nazarov, A. Azizan, K. Shah Rizal, 2012). Nevertheless this process often results in poor homogeneity leading to high calcination temperature, irregular morphology, and long calcination period (C.H. Lu, P.C. Wu, 2008). It has been reported that strontium aluminate phosphors were generally prepared at high temperatures (1400 - 1600°C) for developing a well crystallized structure.

Labu Sayong is one of a local craft which originated along district of Kuala Kangsar, Perak (F. Kendut, 2006). The soil used for *Labu Sayong* making is white, black, buff and yellow in color (A. T. Ahmad, 2010). The soil can be categorized as earthenware or low temperature body which has a sintering temperature of 1000°C – 1180°C (Atkin, 2005). Since pre-historic period *Labu Sayong* was applied with a conventional decoration (K. Abd Aziz, F. Z Abdullah, 2011). The current situation of local craft in Malaysia is using as a souvenir rather than kitchen equipment in pre-historic. The most popular local craft symbolize Malay culture is *Labu Sayong*. Currently, *Labu Sayong* makes use of as souvenir for wedding occasion and producing in miniature size. Therefore, the enhancement of decoration method for *Labu Sayong* must be deed. As discussed by Noordin (2012) another interesting approach for *Labu Sayong* decoration effect is the use of luminous-glaze. Figure 1 shows *Labu Sayong* which is *gelugur* types. Function as water vessel until nowadays.

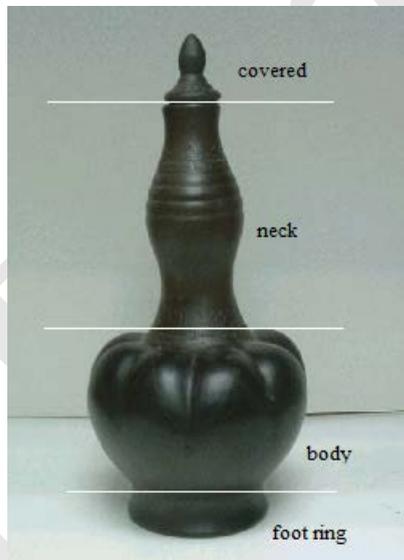

Fig 1. *Labu Sayong Gelugur* (S.N.A Noordin et al, 2013)

The main goal of this work is to determine the low temperature transparent glaze and studying the range of temperatures. This paper reports low temperature transparent glaze splitting studies. Moreover it sustained the luminescence substance glow as decoration method for low temperature ceramic body.

1.1. Flux

In ceramics in support of glaze forming process, the addition of a flux lowers the melting point of the body or glaze. In particular they affect the melting point of silica (SiO_2), which melts to form a glassy phase during sintering process, which bonds the ceramic body or forms the basis of a glaze.

The addition of a flux also promotes fusion or vitrification (development of a glassy phase) at lower temperatures than would otherwise be possible without the use of a flux. Some common fluxes are Nepheline Syenite, Barium carbonate (BaCO_3). Another group of fluxes are alkali metal oxides and alkali metal containing feldspars such as potash feldspar ($\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$), soda feldspar ($\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$) and lithium feldspar ($\text{Li}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 8\text{SiO}_2$). Lead compounds are also in the fluxes category (Warshaw, Josie, 2005).

1.2. Luminescence ($\text{SrAl}_2\text{O}_3:\text{Eu}^{2+}, \text{Dy}^{3+}$)

Luminescence is emission of light by a substance not resulting from heat; it is thus a form of cold body radiation. It can be caused by chemical reactions, electrical energy, subatomic motions, or stress on a crystal (B. Valeur, Mrio N., B. Santos, 2011). Photoluminescence is the type which occurred by ceramic chemical reaction. As revealed by A. Nor Nazida et al (2011) green phosphor $\text{SrAl}_2\text{O}_4:\text{Eu}^{2+}, \text{Dy}^{3+}$ with improved properties was successfully synthesized by solid state reaction and the optimum sintering temperature was greatly reduced to 1250°C . In this work, the low temperature body of ceramic was used. Therefore, the luminescence substances require being banded in low temperature glaze.

2. EXPERIMENTAL

2.1. Material

The standard conventional method is mostly used for the preparation of low temperature glaze. Low temperature glazes were prepared by standard glaze mixing approach using borax acid (B_2O_3), potash feldspar ($\text{Al}_2\text{O}_3 \cdot 2 \text{SiO}_2 \cdot 2\text{H}_2\text{O}$) and kaolin ($\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$) as materials. The raw powders were mixed. An appropriate amount of the starting materials was weighed and mixed. The weight is 100 gram for each batch.

2.2. Method

First, the dry milling was used for 20 min, and then an amount of water was added according to the fluidity. After fully mixed, the mixing was not fully dissolved because of the borax acid. As the concentration of mixing is high, a plastic spatula was used to apply on stoneware sample which has indicated by bisque sintering at 1000°C and then sintered consecutively at 800°C , 850°C , 900°C and 950°C for 6 hours in a mild oxidation atmosphere. The physical parameters, such as heating rates of 7°C per minute, routine cooling furnace and a heating time of 6 hours, were the same for all samples. Subsequently, during the sintering stage; the soaking stage at 573°C for 30 minutes and soaking at 800°C , 850°C , 900°C and 950°C , were also the same for all firing processes.

In order to compare the performance of low temperature glaze, the tests are carried out by dividing the base into four batches, which consist of the same material with different percentages.

Table 1. Glaze Composition

Sample ID	Material	Borax Acid	Potash Feldspar	Kaolin
Batch 1	Composition (wt%)	80%	10%	10%
Batch 2		90%	5%	5%
Batch 3		95%	2.5%	2.5%
Batch 4		96%	2%	2%

3. RESULT AND DISCUSSION

3.1. Percentage of Material

The glaze composition discussed in this paper is based on materials weight of 100 gram. The objective of this research is to study the temperature and percentage of material to fabricate a low temperature glaze composition. Therefore, the material for all batch are same yet different in percentage. Based on common glaze composition as stated in Table 1 previously, slight percentage adjustments were made to the formulation in the material content. This is due to the low temperature of the glaze during the firing process.

3.2. Heat Circulation

Heat circulation is different depends on the dimension of furnace. In heat circulation, significant effect of air bubblers on glass circulation patterns and the enhancement of heat transfer are from the combustion space (Ungan & Viskanta, 2005).

3.3. Experimental

Experiments have been performed in order to analyze which composition of glaze proficient to achieve low sintering temperature. Once the sintering completed at a temperature of 800°C, 850°C, 900°C and 950°C, physically the samples of each batch appear with approximately of all the samples achieve the mature range. The samples of batch 1 are shows in Table 2. The glaze layer of samples with ID; 1, 5, 9 and 13 shown the glossy and shine layer of transparent glaze. The shrinking and cracking was occurred on the glaze layer, however it is controlled. Subsequently, Table 2 was also explained on batch 2 which is also shown the layer of glaze composed by 90% Borax Acid, 5% Potash Feldspar and 5% Kaolin were attained the mature range. The sample ID for batch 2 is 2, 6, 10 and 14 defected by glaze failure; cracking was effect on the surface of the samples, yet it is controlled.

Table 2. Sintering Experiment

Temperature	Sample ID 1	Sample ID 2	Sample ID 3	Sample ID 4
800°C	1	2	3	4
850°C	5	6	7	8
900°C	9	10	11	12
950°C	13	14	15	16

Followed by batch 3 as also shows in Table 2 above were sintered at temperature 800°C, 850°C, 900°C and 950°C. The samples achieve the melting point; however it is shown the melting of the glaze layer. Yet it is still glossy and shines. Next is batch 4 which is also described in Table 2. The samples were indicated to the sintering process; 800°C, 850°C, 900°C and 950°C. The layers of glaze reach the mature range, yet the glaze failure; cracking was occurred on the samples. The result of low temperature glaze shown the batch 1 is the most mature at a low temperature. The mixing composed by 80% Borax Acid, 10% Potash Feldspar and 10% Kaolin shows the layer of glaze less glaze failure; cracking, glossy and shines without cloudy effect.

After all the sintering experimental was done, the batch 1 with temperature 800°C has been decide on sintering with luminescence substance $\text{SrAl}_2\text{O}_3:\text{Eu}^{2+},\text{Dy}^{3+}$. The result show that the batch 1 were successful sustained the luminescence substance of $\text{SrAl}_2\text{O}_3:\text{Eu}^{2+},\text{Dy}^{3+}$ in typical stoneware samples. Figure 2 revealed the result of sintering process.

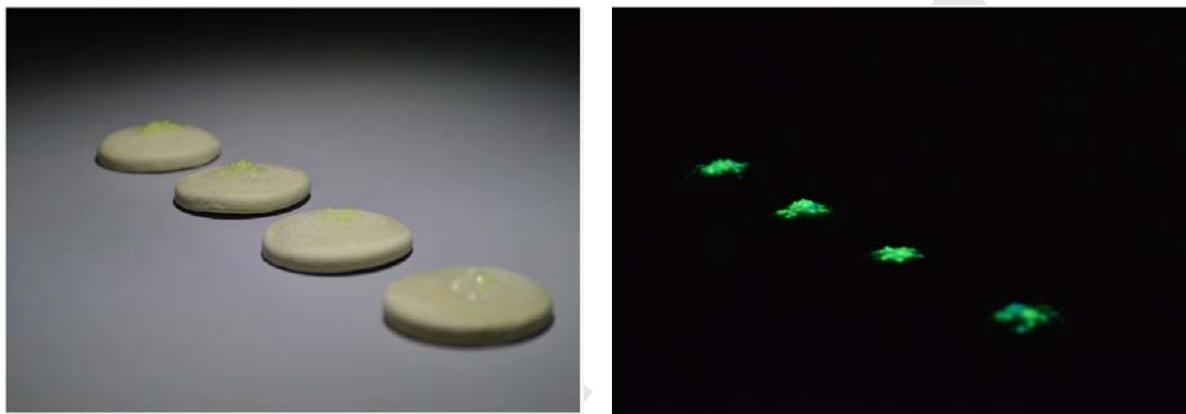

Fig 2. Samples of $\text{SrAl}_2\text{O}_3:\text{Eu}^{2+},\text{Dy}^{3+}$ with batch 1; temperature 800, samples ID 1.

3.4. Sintering Graph

The firing graph is significant to ensure the result of glaze maturity. The core motivation is to determine the optimum sintering temperature which will be used for further low temperature glaze characterization. The composition of glaze which is divided in four batches annealed at different firing temperatures of 800°C, 850°C, 900°C and 950°C for 6 hour in oxidation atmosphere. The firing profile started with 43°C increase to 573°C in 2 hour. Subsequently, at temperature 573°C the temperature maintains in soaking stage for 30 minute. The significant of soaking stage at 573°C is inversion of quartz occurred at this temperature. The quartz crystals change from an alpha (α) crystal structure to a beta (β) crystal structure (Muller et al 2011). After 30 minute, the temperatures again increase from 573°C to 800°C, 850°C, 900°C and 950°C in 3 hour. Yet again the temperature of 800°C, 850°C, 900°C and 950°C have to maintain in 30 minute for soaking stage. The purpose of soaking stage at this temperature is to equalize the heat to the whole furnace. Figure 3 shows the sintering graph that has been employed toward the all four batches.

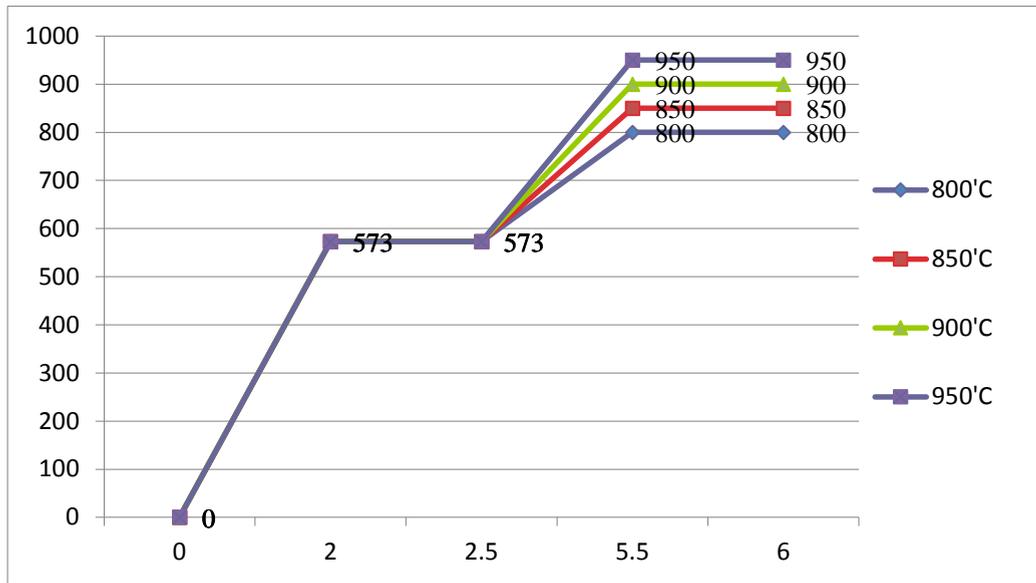

Fig 3. Sintering graph of 800°C, 850°C, 900°C and 950°C

4. CONCLUSION

In conclusion, after all the experimental have been completed, the result and discussion revealed that the experimental have obtained the successful outcomes. The experimental on temperature and glaze composition capable to fabricated low temperature glaze with mature range as early as 800°C. The batch 1, sintered at 800°C is the best result of glaze composition for low temperature transparent. The layer of glaze was glossy and shines. The equal heat circulation during firing stage gave an influent to the mature range of the glaze. Furthermore, the positions of sample during firing stage are also contributed into the successful outcomes and significant to ensure the validity of the outcomes. The goal to achieve low temperature glaze in order to sustained luminescence substance $\text{SrAl}_2\text{O}_4:\text{Eu}^{2+}$, Dy^{3+} with batch 1 at 800°C in purpose of decoration for low temperature ceramic body which is local craft *Labu Sayong* was successful achieved.

Acknowledgements

We would like to acknowledge the generous participation of the interaction designers in the research. This study was conducted in Form Giving Design Research Lab established by Research Management Institute, Universiti Teknologi MARA (UiTM). This issue has finalized in collaboration with the contributing authors, and with support from Malaysia Minister of Higher Education for *Tenaga Pengajar Muda* Scholarship. Including UiTM for the financial support under Research Excellent Fund Scheme. In addition, two anonymous reviewers provided insightful and of an earlier abstract of this paper.

Mathematics Pre-Service Teachers' Metaphorical Perceptions about Statistics in Turkey

Assist.Prof.Dr. Dilek Sezgin Memnun*

Uludag University, Bursa, Turkey

Abstract

The research is aimed to reveal the thoughts the elementary mathematics pre-service teachers about "Statistics" concept through metaphors. A total of 62 mathematics pre-service teachers, taking statistics courses at a public university in Turkey in the spring semester of 2012-2013 academic year, participated in this qualitative research. The data of the research was obtained by having pre-service teachers answer the phrase of "Statistics is like.....because.....". The data gathered from pre-service teachers have been analyzed using descriptive statistics and content analysis method. Research results revealed 32 metaphors and 3 categories about statistics.

Keywords: Statistics, metaphor, content analysis, mathematics pre-service teachers.

1. Introduction

Statistics is an important issue in all areas of daily life. It is concerned with the analysis of data and depends on mathematics and computing. It is essential for economic empowerment and decision-making about the issues such as economy, education, health that effect life (Utts, 2003). Statistical includes five basic knowledge; "knowing why data are needed and how data can be produced, familiarity with descriptive statistics, familiarity with graphical and tabular displays, understanding basic notions of probability, and knowing how statistical conclusions or inferences are reached" (Gal, 2004; Cited in Ozen, 2013: 9). It requires posing a research question, collecting data, analyzing data and interpreting. All of these encourage individuals into a variety of statistical thinking.

The development of the statistical thinking begins in early grades. The necessity of the statistics knowledge in every grade is emphasized by National Council of Teachers of Mathematics (NCTM, 2000). In additionally, the importance of the statistical thinking and applications is increasing in these recent years in Turkey. The reforms in elementary school mathematics education programs have been carried out. Statistical thinking involves the understanding statistical concepts, analyzing the collected data and learning the ways to students by

* Corresponding author. Tel.: +90-532-720-91-72 Tel. 2: +90-532-611-23-03
E-mail address: dilekmemnun@gmail.com, dsmemnun@uludag.edu.tr

in-service teachers (Jacobs, 1999). Teachers play a crucial role in developing students' statistical thought processes (Pfannkuch, 2008). Teachers must be aware of and build on their students' thinking about statistical concepts. Because of that, teachers need to develop their knowledge and skills about statistics and foster their students' statistical abilities. On the other hand, students must construct their own individual meanings for mathematical concepts encountered within classrooms have an impact on the sort of meaning that are constructed (Presmeg, 1992). Students' thinking could be influenced by the metaphors implicit in teachers' presentations of subject matter else. Educators in the fields of mathematics and statistics education have recommended the use of metaphor and other teaching devices. Educators must assistance the construction of richer personal metaphors of students (Groth & Bergner, 2005). Because of that, it is very important that pre-service teachers could learn and teach statistics effectively. Nevertheless, our review of the literature display few different studies (Grant & Nathan, 2008; Groth & Bergner, 2005) have been carried out with pre-service teachers on metaphors about statistics. Grant and Nathan (2008) have been aimed to displays that graduate students use more than one metaphor for confidence limits which one of the implications for the statistical knowledge and applications. Groth and Bergner (2005) have been described personal metaphors of pre-service teachers' for the statistics concept by constructing metaphors for the sample concept and discussed its relationship to their knowledge of the concept. Therefore, it is aimed is to reveal the mathematics pre-service teachers' metaphorical perceptions about statistics in this research. Accordingly, the following research questions have been explored:

1. What are the elementary mathematics pre-service teachers' metaphors about statistics?
2. Under which conceptual categories could the elementary mathematics pre-service teachers' metaphors about statistics be classified when their common features are considered?

2. Methodology

The conceptual categories related to metaphors about statistics have been exerted in this section.

2.1. Research Method

The phenomenology design has been used in this qualitative research. Phenomenology design comprises a suitable context for conceptual research because it focuses on the phenomenon that we recognize but do not have detailed understanding (Yıldırım & Şimşek, 2006).

2.2. Participants

The research has been carried out with total of 62 elementary mathematics pre-service teachers, who were studying as juniors at a public university in Turkey. These volunteered pre-service teachers participated in this research in the spring semester of 2012-2013 academic year.

2.3. Data Collection

Mathematics pre-service teachers were asked to complete the phrases of “Statistics is like.....because.....” to reveal pre-service metaphors about statistics. Pre-service teachers were asked to write their thoughts by focusing on just one metaphor for each concept. Mathematics pre-service teachers were asked not to write their names on their answer sheets to obtain their real feelings and thoughts. It took approximately 15 minutes to complete this phrase about statistics concept.

2.4. Data Analysis

The metaphors developed by the mathematics pre-service teachers were analyzed and interpreted in five steps as; determination of metaphors, classification of metaphors, development of the categories, providing the validity and reliability, transferring data to the computer.

Metaphors developed by mathematics pre-service teachers were listed and coded according to alphabetical order in determination of metaphors step. Metaphors were analyzed to find similarities and common features with other metaphors in classification of metaphors step. Target metaphors were determined by analyzing the connection between the metaphors. In this step, a total of 32 available mental symbols were obtained. Metaphors were analyzed in terms of common characteristics that they had relations with the statistics concept in development of the categories step. In this step, 3 different conceptual categories were created in relation with a particular theme according to any metaphors produced by pre-service teachers’ perspectives. Two different researchers opinions have been applied to confirm whether metaphors under 3 conceptual categories represent in question to any conceptual category or not. These researchers were given metaphors and conceptual category list and matched these metaphors and categories. After that, the matched lists compared with each other revealed by both of the researchers. It has understood that almost all of the metaphors in category lists of these researchers were the same.

3. Findings

The content analysis results that were performed to reveal the mathematics pre-service teachers’ metaphorical perceptions about statistics have been reported in this section.

3.1. Metaphors about Statistics

The elementary mathematics pre-service teachers, who were studying as juniors at a public university in the spring semester of 2012-2013, developed 32 valid metaphors related to statistics as indicated in Table 1.

Table 1. Elementary mathematics pre-service teachers' metaphors about statistics

	Metaphor	f	%		Metaphor	f	%
1	General view	5	8.93	17	Real life	1	1.79
2	Real	5	8.93	18	Gulf	1	1.79
3	Sorting data	5	8.93	19	Sky	1	1.79
4	Puzzle	3	5.36	20	Construction	1	1.79
5	Future	3	5.36	21	Complex skein	1	1.79
6	Maze	3	5.36	22	Classical music	1	1.79
7	Ocean	3	5.36	23	Ships in ocean	1	1.79
8	Analyze	2	3.57	24	Braid	1	1.79
9	Soup	2	3.57	25	Scrip	1	1.79
10	Philosophy	2	3.57	26	Watch	1	1.79
11	Graphic	2	3.57	27	Chess	1	1.79
12	Computer	1	1.79	28	Exam	1	1.79
13	Mountain	1	1.79	29	Question mark	1	1.79
14	Grain of sand	1	1.79	30	Chance game	1	1.79
15	Universe	1	1.79	31	Train	1	1.79
16	Awareness	1	1.79	32	Time	1	1.79

The most repeated metaphors developed by elementary mathematics pre-service teachers are; general view, real, sorting data, puzzle, future, maze and ocean.

3.2. Conceptual Categories related to Metaphors about Statistics

Elementary mathematics pre-service teachers' metaphors about statistics are classified into 3 categories; structure of statistics, solving process and difficulty and complexity of statistics. Structure of statistics category consists of 13 (40.6%) metaphors and 23 pre-service teachers. The most repeated metaphors are; general view, real, analyze and graphic for this first category when considering the frequency distribution of metaphors. Solving process category consists of 6 (18.8%) metaphors and 14 mathematics pre-service teachers. The most repeated metaphors are sorting of statistics, puzzle and future for the solving process category. Similarly,

difficulty and complexity of statistics category consists of 13 (40.6%) metaphors and 19 pre-service teachers and the most repeated metaphors are; maze, ocean, soup and philosophy for the difficulty / complexity of statistics category (Table 2).

Table 2. Mathematics pre-service teachers' metaphors about statistics according to categories

Structure of Statistics			Solving Process			Difficulty / Complexity		
Metaphor	f	%	Metaphor	f	%	Metaphor	f	%
General view	5	21.77	Sorting data	5	35.72	Maze	3	15.80
Real	5	21.77	Puzzle	3	21.43	Ocean	3	15.80
Analyze	2	8.70	Future	3	21.43	Soup	2	10.53
Graphic	2	8.70	Computer	1	7.14	Philosophy	2	10.53
Grain of sand	1	4.34	Complex skein	1	7.14	Mountain	1	5.26
Universe	1	4.34	Chess	1	7.14	Gulf	1	5.26
Construction	1	4.34				Sky	1	5.26
Awareness	1	4.34				Classical music	1	5.26
Real life	1	4.34				Braid	1	5.26
Ships in ocean	1	4.34				Watch	1	5.26
Scrip	1	4.34				Question mark	1	5.26
Exam	1	4.34				Chance game	1	5.26
Train	1	4.34				Time	1	5.26

It was understood that a large part (33.9%) of the metaphors were about the difficulty and complexity of statistics category while many of the metaphors (41.1%) were about the structure of statistics category as indicated in Table 2.

CONCLUSION

This research has examined to reveal the metaphors of elementary mathematics pre-service teachers about statistics. Results have shown that a total of 32 metaphors and 3 categories are determined in order to explain statistics concept. The mathematics pre-service teachers used metaphors related to structure of statistics (40.6%), solving process (18.8%) and difficulty and complexity of statistics (40.6%). In other words, statements emphasized the structure and complexity of statistics in general. Statistics stated as general view, real, analysis, graphic, sorting, puzzle, future, maze, ocean, soup and philosophy in this research. This situation indicates that the statistics concept could not be expressed in a single mental image. Different factors such as instruction of teacher, social environment or individuals' interest could be effective on these individual metaphors of mathematics pre-service teachers. Because of that, teacher educators must be conscious of designing instruction to expand and revise the personal metaphors of pre-service teachers. Teacher educators might encourage pre-service teachers to share their individual metaphors about statistics with one another to motivate them on considering in great detail (Groth & Bergner, 2005). Educators may use more effective activities teaching statistics to their students using metaphors in their courses and encourage them to learn about everyday statistics through performance tasks.

4th International Conference on New Horizons in Education

May 28th world play day activities in Turkey since 2010

Işık Kamaraj^{*a}

^aAssist. Prof. Marmara University, Faculty of Atatürk Education, 34722, "Istanbul", Turkey

Abstract

The idea of "World Play Day" came out first in the meeting of 8th International Toy Library Association (ITLA) in Tokyo in 1999 and today and every year, it is celebrated by various countries all around the world in May 28th. World Play Day activities have been celebrated in Turkey since 2010. The aim of this research is to explain activities World Play Day in Turkey since 2010. For examples: 1.Conference, Panel, Symposium about World Play Day, 2. Parade with theme 3.World Play Day Message between 2010-2012, 4. Playing in play fields.

Keywords: May 28th World Play Day (WPD) of ITLA, World Play Day in Turkey.

1. INTRODUCTION

The idea of "World Play Day" came out first in the meeting (8th International Toy Library Conference-Japan) of International Toy Library Association (ITLA) in Tokyo in 1999 and today and every year, it is celebrated by various countries all around the world in May 28th. The mother and the creator/founder of the idea of "World Play Day" is Dr. Freda Kim from South Korea. Also, International Toy Library Association (ITLA) asks United Nations for this day as being a formal "International World Play Day". Since 1999, it has been expressed that about 30 countries who have toy libraries is are celebrating "World Play Day" (<http://www.docstoc.com/docs/19839442/world-play-day-concept>). Today, and through the entire week, playing activities are being done in various countries. Everybody including the children, the young, the parents, grandparents, the teachers, the disabled and all the people from all ages can join these activities.

Dr. Freda Kim writes a "World Play Day Message" and sends it to all countries who celebrate this day. "World Play Day Song" is also written by Dr. Freda Kim to make it sung today (http://www.itla-toylibraries.org/pages/world_play_day/).

*This research was supported by Marmara University grant EGT-D-150513-0213.

1.1. The importance and meaning of “world play day” activity for Turkey

1.1.1. To support the execution of article 31(child rights contract) as marmara university

Article 31:

1.Member Countries give the right to the child to rest, spend spare time, play and do activities suitable to his/her age and join freely the cultural and art life.

2.Member Counties know the right of the child to join fully the cultural and art life and promote the suitable and equal opportunities on about art and culture to make them spend spare time and rest.
<http://www.istabip.org.tr/icerik/cocuk-haklari-beyannamesi/>.

To support as Marmara University and enable the children to join this activities for the execution of Article 31 in Child Rights Contract which Turkey also signed and accepted in 1989 is very important on preparing activities suitable to the children’s ages and giving them the right to join freely to this activities (Kamaraj, 2012a).

1.1.2. To support the progress of being a “child-friendly” university internationally of marmara university

It is very important to discuss “the importance of playing” in academic meetings (panel, conference etc.) in order to promote children to join democratically to “World Play Day”, to use our sources for children as Marmara University, Kadikoy Municipality, International Child Centers, Unesco and other universities, to work in collaborative Project with national or international participants (Kamaraj, 2012a).

1.1.3. To provide the prospective teachers with play culture

This activity in Marmara University in which being just a participant is important as well as being an active participant gives the prospective teachers the responsibility to live and celebrate it with their own students in their own institution and to prepare it. It is thought that this activity has a big role in creating “the play culture” for prospective teachers. However, play culture can be part of our life only if actively involved (Kamaraj, 2012a).

1.1.4. To celebrate it every year by traditionalizing it in marmara university

World Play Day is celebrated all over the world in May 28th. First time in Turkey in Marmara University, Assist. Prof. Dr. Isik Kamaraj as the head of it, this activity has been celebrated since 2010 and being celebrated for 3 years to make it traditionalized every year by adding new activities. In 2010, the activity was 1-day-long but in the following years, it became 2-day-long. World Play Day Celebration Activity was starting always academic activity: 1. Conference, Symposium, Panel about World Play Day”, 2. Parade with theme, 3. World Play Day Message, 4. World Play Day Card, 4. Playing in play fields, 5. Closing ceremony (Kamaraj, 2012a).

1.1.5. To raise awareness in the community with world play day theme headlines decided every year

In World Play Day, a new theme is determined every year. The theme is decided considering the researches done in Turkey and all over the world and the reports from various institutions and establishments. (E.g. IPA, ICCP). The aim is to focus on this concepts and raise the communal awareness. For the first year (2010), the theme is “We walk to play”, second year (2011) “Our traditional plays and toys and the third year (2012) “outdoor plays and play grounds” (Kamaraj, 2012a).

1.1.6. Celebrating world play day with large masses to spread it to whole city (istanbul) and Turkey.

Though the activity of World Play Day is started in Marmara University, it can be celebrated with the large masses, too. For example, students from other campuses can join the celebrations. Also, schools (pre-school and elementary schools, high schools, vocational schools students, teachers and the parents) can join Marmara University activities or make their own activity for this day. Again the other campuses can celebrate this day in their own area. Children, their teachers and their parents from special education centers can join. Toy Museums may prepare “theme trips” to their visitors. It can also be celebrated in Toy Libraries participated by the children and their parents. Local government can prepare play fields in squares and seaside to get the attention of every part of the community (Kamaraj, 2012a).

1.1.7. To foster international institutions and establishments to celebrate this day

Turkey who is among the countries signing the Child Rights Contract in 1989 is responsible to fulfil the he responsibility of this contract. If article 31 which is in Child Rights Contact is adopted and celebrated in various activities (panel, conference, exhibits, workshops) by Ministry of Education, Ministry of Culture, Social Services and Child Protection Institution, Unicef, Unesco, education faculties of universities, toy libraries, child libraries, local governments, non-governmental organizations, Turkey will achieve its own legitimate responsibility (Kamaraj, 2012a).

1.1.8. To make Turkey be one of the countries celebrating this day internationally

Dr. Freda Kim, the mother of idea of World Play Day said in Singapore on 28 May 2009, in her speech, “World Play Day Forum”, today is being celebrated in Australia, Austria, Belgium, Brazil, Croatia, France, Germany, Hungary, India, Israel, Italy, Japan, Korea, Malaysia, Mexico, Nigeria, Romania, Russia, Singapore, South Africa, Spain, Sweden, Switzerland, Turkey, Uganda, England and USA (Kim, 2009). Turkey’s being among the countries celebrating this day has a very big role on this activity being celebrated internationally (Kamaraj, 2012a).

1.1.9. To foster the celebration of “national play day”.

World Play Day activity is an international activity celebrated in various countries but “National Play Day Activity” can also be arranged. Each city can organize celebration locally. Toys from every city’s history can be played with the participation of children, the parents and educators in squares and outdoor. By this way, we can re-learn our own culture with our own plays and we maintain our own culture with living and making it lived (Kamaraj, 2012a).

2. The 1st world play day (wpd) in Turkey, 28th may 2010

The First World Play Day was celebrated at Marmara University, Atatürk Education Faculty Early Childhood Education Department in Istanbul/Turkey on 28 May 2010. World Play Day activities has gone all day. Firstly Dr. Isik Kamaraj was made “World Play Day Speech” to early childhood education department university students and listened to the World Play Day song. The Celebration of The First World Play Day in Turkey: Theme was “We walk to play”, 1. Conference “I. World Play Day”, 2. Parade with theme, “We walk to play”, 3. World Play Day Message-2010, 4. Playing in play fields, 5. Closing ceremony.

Then, we had a “toy parade” participating with 19 early childhood education department university students and the accompany of preschool educationist my twin sister. We had 43 pupils as voluntary for World Play Day

events. Moreover, our art department university students made a poster: “We are walking for play” and a pamphlet to hand out during the toy parade. I put on a Snow White costume for the parade. My students brought toys such as Eyüp toys (Turkish traditional toys), balls, and dominoes. The parade visited the faculty dean and deputies also university rector building. My students demonstrated how to play with the toys during the visits. We presented our faculty dean and deputies with gifts of toys. I asked them which were their best toys and games when they were children. In the afternoon, we decorated the garden with balloons and red paper heart with the help of students. My students showed games to other students in the afternoon. They showed traditional Turkish games such as handkerchief catch, corner catch, istop game, Eyüp toys, rope and games found all over the world such as ludo, jenga, dominos, puzzles, scrabble, blocks etc. Our students had a t-shirt done to put on that day. We gave to students a participation certificate. The day was joyful, enthusiastic, exciting and happy for all participants, because, this is the first celebration in our country (Kamaraj, 2010, p. 13).

3. The 2nd world play day (wpd) in Turkey, 25th-26th of may 2011

We celebrated WPD, May of 25-26 2011 for two days at Marmara University. Our main topic was “Our Traditional Toys and Games” in 2011 about WPD. We celebrated the day based on this main topic. The Celebration of The Second World Play Day in Turkey: Theme was “Our Traditional Plays and Toys” 25-26 May 2011, 1. Panel “II. World Play Day”, 2. Parade with theme “Our Traditional Plays and Toys”, 3. World Play Day Message-2011, 4. Playing in play fields, 5. Closing ceremony (Kamaraj, 2011a, p.10; Kamaraj, 2011b).

Firstly, we made a meeting with two groups of my university students (Both Early Childhood Education Department and Special Needs of Children’s Department) at the beginning of the term. Meanwhile, one of my colleagues in early childhood department was preparing “The Turkish Traditional Eyüp Toys” with participation of all students in WPD. My other colleague was preparing “Traditional Games” with the same department. And another colleague of mine from the art faculty was preparing “statue of traditional toy which is name Cambaz”. The other lecturer made “World Play Day Pamphlet”. We wrote “The message of WPD in 2011” to deliver to the students (Kamaraj, 2011a, p.10; Kamaraj, 2011b).

We prepared WPD Panel which is name “traditional games and toys” in the morning May of 26, 2011. Four colleagues made presentations about the importance of “Traditional Toys and Games” in WPD Panel. The names of our presentations were “The Importance of World Play Day for Turkey”, “Traditional Games in World Play Day”, “Traditional Toys in World Play Day” and “The Effect to Child Culture of The World Play Day”. In the afternoon, we made “Eyüp Toy’s Parade” with the participation of Early Childhood Department Students and Special Needs of Children Department students as every year in our university campus. We had 23 pupils as voluntary for World Play Day events. All students said “tongue twister” loudly during traditional toys parade. All of my students dressed a special t-shirt which was prepared for that day. The students separated into five groups to walk for toy parade. Two groups carried statue during toy parade. Also, all students carried with by yourself made Eyüp toys. After, we went on celebrating the day with students. We prepared “play corners” about Turkish traditional games in the garden. The university students participated to play with World Play Day. The leader students of groups showed other students “how to play these traditional games”. Then, we asked for write of their feelings from participating students on paper red heart. The participants wrote for example: “The World Play Week, hmmm reminded me my childhood and I felt so happy. Jumping rope, dominoes to bring us comfort and joy”. “I am so delight and also I am looking forward this day”. “Super”, “After seventeen years, you reminded me my childhood “I went back to my childhood”. In the afternoon, we made closing ceremony

with the participants from our department. We gave certificate of attendance to students and one candy on 26 May as a gift (Kamaraj, 2011a, p.10; Kamaraj, 2011b).

4. The 3th world play day (wpd) in Turkey, 17th-18th of may 2012

We celebrated WPD, 17th-18th of May, for two days at Marmara University/Istanbul/Turkey. Our main topic was “Outdoor Play and Outdoor Playground” in 2012 about WPD. We celebrated the day based on this main topic. The Celebration Program was The Third World Play Day in Turkey: Theme was Outdoor Plays and Play Fields 17-18 May 2012, 1. Symposium “III. World Play Day”, 2. Parade with theme “Outdoor Plays and Play Fields”, 3. World Play Day Message-2012, 4. World Play Day Card, 5. Playing in play fields, 6. Conference “Frederich Froebel: Outdoor Play”, 7. Closing Ceremony (Kamaraj, 2012b).

Firstly, we made a meeting with two groups of my university students (both Early Childhood Education Department and Special Needs of Children’s Department) at the beginning of the term. Every student groups was prepared “outdoor play area” and also their “play materials” to use that day. We had 41 pupils as voluntary for World Play Day events. Meanwhile, one of my colleagues in art department made “The Third World Play Day Pamplet”. We wrote “The message of WPD in 2012” to deliver to the students in our campus. We prepared WPD Symposium which was name “Outdoor Play and Outdoor Playground” May of 17th, 2012. After the symposium one of my colleagues and his students from art department was given concert which is name “Toy Symphony” prepared by made Leopold Mozart. All audience was effected that presented works. The next day, we started “our traditional parade” with the participation of Early Childhood Department students and Special Needs of Children Department students as every year in our university campus. All of my students dressed a special t-shirt which was prepared for that day. The students separated into nine groups to walk for toy parade. Every group carried with by you made “outdoor play materials” during toy parade. All students said “tongue twister” loudly during traditional toys parade. After parade, we came back to outdoor playgrounds. Our students prepared “outdoor playgrounds” in our department garden. We had seven outdoor play corner: 1. kite making, finger print, 2. swing, snake and latter, 3. ludo and peg top, 4. toys car and mangala game, 5. mikado sticks and, hula-hoop, 6. fishing, 7. target area, circle. At the 11.00, one of kindergarten schools with students came to participate our department garden to play at that day. There were almost 50 kindergarten children with their parents also three preschool teachers. University students who were preschool department also special needs of children’s department thought how to play this outdoor playground. It was so joyful day for children’s also their parents. Then, we asked for write of their feelings from participating childrens, parents and university students on red heart paper. The participants wrote for example: “We thank all people who organized this nice activity as Primary School, class ‘Bulutlar’. You have us to go back to our childhood. (As mothers)”, “The child slept in my heart awoke. Games, games and games... Also, that day one of my students department of special needs of children and I presented conference which was named “Frobel’s Gifts and Outdoor Play”. In the afternoon, we made closing ceremony with the participants from our department. We gave certificates of attendance to students and one cock candy on 18 May as a gift (Kamaraj, 2012b).

Acknowledgements

This research would like to special thank to the Early Childhood Department students and Special Needs of Children Department students of Marmara University who have participated as voluntary for World Play Day at Marmara University, between 2010-2012 events. The research would also like to thank Işıl Kamaraj who is working at the corporate communications of Marmara University for her assistance at our WPD, Lecturer Uğur

Akbulut who is working Fine Arts Department of Marmara University for his graphic design of our WPD, and Lecturer Cahit Cengizhan who is working Computer and Instructive Technology Teacher Department of Marmara University for his website design of our WPD, between 2010-2012 events.

4th International Conference on New Horizons in Education

Media and television in child education

Esme Özdaşlı^{a*}, Mine Göl^b

^a*Mehmet Akif Ersoy University, Faculty of Economic and Administrative Sciences 15300, "Burdur", Turkey*

^b*Mehmet Akif Ersoy University, University, Gölhisar Vocational School of Healty Services,15300 "Budur", Turkey*

Abstract

The level of children's addiction to media and television, more precisely formation of using these habits should only be provided by family. Getting children adopt television habit sufficiently and as it should be by the collaboration of parents and teachers will be helpful for keeping children away from television's detrimental effects.

Key Words: Child , Media, Television

1. INTRODUCTION

Mass media has shaping and relatively guiding effect on social life. Communication instruments' role and efficiency have expanded in a growing spiral since they appeared. They have been nearly society's eyes to see, ears to hear and tongue to say something.

Media has a big percentage in society's people affecting each other in large scale. Society's behavioural patterns, values and way of thinking are gained with the help of mass media and it helps internalising what learnt. Power of mass media is based on ability of transmitting same message to different people in a great number and in different messages.

2. Process of Child's Development

It's possible to say that children's value is one of the signals of societies' development level in today's world. Therefore child and child's development appear to be more and more emphasized terms inasmuch as child is accepted as one of the most valued properties that will ensure societies' persistence and improvement, convey the culture heritage to following generations. Childhood is the first scene which induct man into humanity and an important environment in which man's abilities and weaknesses are improved slowly yet clearly. (Yavuzer,1996:36)

Child is not a living thing that can be formed as required or a sample of minituarized adult. Perception and explication of his environment is completely different. Child is addicted, selfish and behaves without knowing how to be patient. His emotions have ebbs and flows, his reactions are acute. Child is a living that learns by trial-error and asking questions constantly. By this way; he apprehends true-false terms and

* Corresponding author: Tel: 05449482188

E-mail address: eozdasli@mehmetakif.edu.tr

improves a superego, a conscience that controls himself. Accordingly, Françoise Dolto says " A child subject, seemed as a potential to be enhanced, is an energy that will individualised instantly." Dynamism that will be provided is to form child through the future. (Işık,2007)

Child is affected by the cultural, social and economical structure of the current era. Thus there is a childhood understanding which is described and formed over again in every social structure. Nowadays, dynamism of globalization brings along a new period in which many understandings are formed about childhood over again. (Güler,1991:62)

This understanding makes communication, the most important item of our era, indispensable. The social and individual importance of communication, making contacts successfully is an essential necessity for society and individual. Limits should be pushed into contribution of child's socialization and teaching how to make communication via communication instruments in their inner circles such as children themselves, their families, friends, teachers and in the same society but the other ones who live in the distant places.

The reality of there is not only a factor but also there are many factors in individuals personality development especially there should be aural, visual, tactual and social stimuli for improvement of children's exploring and learning abilities designates television's important role in our lives. Television is one of the factors that takes part in process of learning,based on observation and repetition. In this sense, the ability of television sending aural and visual stimuli to many people increases effect level and offers a new structure that develops child's understanding.

(Yavuzer,1986)

3. Media and Television

The term "media" which is used as "mass medium" is derived from Latin "medium" term and means tool, central, atmosphere,mediator.(Nalçaoğlu,2003:51) At the beginning of 20th Century, television became the most important mass media that change an average one's life as telephone. The essential tool of our homes; black box; our electronical caretaker prepossess our minds by question of what kind of a situation do we come across if it is analysed in terms of children education. Television is a media that not only can be used as socialisation corporation instead of family but also takes family in the centre of nature as context. Hence the effects of the television upon family members especially children is questioned.(Batmaz ve Aksoy,1995) With the advent of television bounds and geographical constraints are disappeared and in one sense word has become a small village. For this reason, an event that is occurred anywhere in the world can become a current issue in a while and an innovation can widespread quickly through the world.

As well as the upsides of television, it can affect children negatively by providing transformation of unnecessary and harmful information quickly.This situation can be considered as "television paradox" as an attribution to "internet paradox" that is conceptualized by Karaut vd. the good intentional use of mass media helps children about their socialization, taking advantage of different and rapid sources and contributes to stay

away from monotype education for individual personality and liberalization of education and management. (Tuncer, Yalçın, 1999;27-34)

Çakmaklı expresses that television broadcasts have specific purposes and in accordance with these purposes television programmes have main types such as news, education, culture, advertisement. This classification generally indicates the reality of the socio-economic development of countries will change according to their development and underdevelopment.

Consequently television finds the materials that reflects a society's culture and becomes a part of it at the same time. These materials provides culture's perpetuity and improves mass culture of it. Television informs about which elements of a society will maintain and which of them will change. Concordantly our habits, speaking manners, relations with society changes to the extent of images and messages that television conveys us. Maybe because we find the charming and delighted life in it or it reflects the life we live in, we live as addicted to it.(Işık,2007)

Television has a position that pictures the strange world to us from our homes we seize intimately. People watch television programmes which includes events that are related to their lives.

The positions of television receivers at homes plays an important role in programmes ratings. (Gönenç,2005) The people's interests in television broadcasts vary according to their educational background. As the cultural level rises, the amount of information they get from broadcasts decreases. Nowadays, watching television's become the prior activity for all people who live all around the world.(Serhatlıoğlu,2006)

On the other hand, unnecessary and plentiful usage of mass media affects children's physical and mental development negatively. Heim and the others claim in their experimental studies that media affects socialization and social interaction negatively. (Heim ve Diğerleri,2007;52) As for Morgon and Gross prove that there is an inverse propotion between advanced television watching and school success. (Heim ve Diğerleri,2007; 52) Similar epistemological researches indicates watching television decreases physical activities and affect especially mental health negatively. (Heim ve Diğerleri,2007;52) According to Yavuzer(1986) television affects negatively child's personality development through decreasing mental images formation, capacity that is necessary for narration formation with reference to written expression by means of weakening language acquisition.

Televiwers' age is another factor that affects television's influence. Even the reasons using television of children and adults are different, everything is accessible for everyone on screen. For this reason, television has an affect which states child's attitude and behaviours via not only children programmes but also programmes, news and advertisements for adults. Along with not knowing the affects of programme that child watches on child development, it can not be estimated how he perceives and understands the messages from that programme.(Tekinalp,1990) Therefore television producers produces their programmes by specifying their televiwers' cultural levels, life styles and their interets.

Children are exposed to numerous graphic violence on television everyday. According to a research that is done in USA, children watch more than 1000 graphic violence every year in America. As to Tuncer and Yalçın's research from Hacettepe University, 31% of children spend at least 4 hours on weekdays by watching television, this ratio increases up to 71.7% at the weekends in Turkey. (Tuncer, Yalçın, 1999:27-34) This state makes children more aggressive in their social lives. (Zolten, 2006)

The tendency of children acting like cartoon characters that we've come across on news constantly in recent years is closely related to the high level of environmental exposure. Girls' dressing up like Barbie dolls or boys' metaphysical behaviours like Pokemon, He-Man, Spider Man can be examples of this situation. As well as affecting children about increasing tendency to violence, television causes children to have negative role models. Besides its psychological effects on children it has been revealed that television affects them physically too. Especially, obesity is one of those remarkable ones in this respect recently. (Turam, 1996)

Because spending time in front of television leads children to do less physical activity. (Zolten, 2006) The one who eats by watching television tries to catch programme by eating more quickly. Furthermore, foodstuff products that take part in advertisements aimed at children are rich in calories matters more at this point. (Zolten, 2006)

However, it is a scientific fact that making television useful is on the hands of parents. The reality of watching television with parents can be useful is showed up by some researches. (Heim ve Diğerleri, 2007; 52) Especially, the control of broadcasts that are harmful for children's physical and mental health is notably important. Children believe that everything is normal on tv and is affected negatively. Television programmes affect children physically, socially and psychologically and lead them into an anxiety that even the adults can handle with difficulty. (Işık, 2007)

Turam (1996) puts emphasis on that since the children don't have worldview yet, it is possible to get one for them by television which is a close factor to them and claims that since they don't have personal experiences, they don't have the ability to question what they watch and accordingly they are exposed to television's effects more than adults.

In today's world which is considered as technological era, there are national and international legal arrangements to keep children away from television's negative effects. First of these; "Convention on the Rights of the Child." It came into force on 2 September 1990. According to aforesaid convention; media companies can not abuse children's fundamental rights and obligations. (Convention on the Rights of the Child, 1990) This convention came into force on 9 December 1994 and at the 17th clause of it has been foreseen that mass medium's studies about children's mental and physical development should be promoted. (Conventions on the Rights of the Child, 1990)

Republic of Turkey made a stride with 41th the clause, entitled as "protection of family", ; "Every child has right to take advantage of protection and nursing, unless it is contrary to his high benefit, to contact personally

and directly with his parents and to maintain this relation. Government takes precautions to protect children against all kind of abuse and violence."(T.C Anayasası,1982) in it's constitution to prevent children from every kind of abuse. At this point, the studies are done to protect children for communication spaces that can be accessible easily and abuse-liable such as television , internet.

When we think about all, it is obvious that regardless of how educational television programmes are, they are harmful physically and psychologically for children especially under the age of 3 years. If we consider that we live in technological era, the importance of children channels are undeniable.

4. Result and Suggestions

The era that we live in is called as communication and media era. No one can isolate himself from the era's requirements. Every child faces with media as of he comes into the world. If we suppose that every house has 1 - 2 television, we learn that television is as important as child's parents and teachers about forming of children. Although media and television can be a tool that helps child's development, supports him, enriches his learning environment and stimuli, it can also be a phenomenon that keeps child away him from his socialization competences and leads him to have a low self- esteem.

It is the biggest mistake to leave child in front of the television indefensible and put it in the centre of his life for spare times. Leaving child to electronic carer while doing daily chores is another mistake that mothers do. Directing children reading, doing physical activities and to social circle will be beneficial for their development. The time that children spends in front of tv should be limited during both pre-school and primary education period.

Channel managers and producers play an important role as well as that parent- teacher association plays. They should pay attention to the programmes that will provide children to whom we will resign our future to be healthy and conscious during their development. If necessary broadcasting programmes that are prepared under the conditions of pedagogue should be compulsory. Instead of ideological, biased programmes that will do harm children's mental health, it shouldn't be utopic to broadcast programmes in accordance with strategic objectives that can go paralell with training activities.

The thing that should not be forgotten is; television is an activity that passivates child and keeps him away from interaction. Even if it includes teaching programmes after a while it prevents child from thinking and makes him a direct receiver. Child should communicate with his parents closely and live his emotional development about childhood. While preparing educational children programmes the sound, image, speech, features of effects should be controlled and the things that disturbs children's senses should be avoided.

4th International Conference on New Horizons in Education

Mentoring new faculty

Abigail Mitchell Dhed, Msn, Rn, Cne* & Michelle Mollica, Ms, Rn, Ocn

D'Youville College, Director of Graduate Nursing, 320 Porter Avenue, Buffalo NY 14201, USA
D'Youville College, RN-BSN Program Coordinator, 320 Porter Avenue, Buffalo NY 14201, USA

Abstract

According to an AACN Press Release 9-2010, the faculty vacancy rate continues to climb. Currently at a rate of 6.9%, the nurse faculty vacancies will continue to climb over the next ten years. Greater than 90% of these vacancies either prefer or require a doctoral degree and unfortunately, there are a limited number of doctoral prepared nurses. Along with the lack of doctoral, prepare nurses schools of nursing also have difficulty competing with healthcare and research organizations that can provide a limited pool of doctoral prepared nurses with higher salaries and benefits. Schools of nursing are also facing the impact of the nation's economic situation and with budget cuts and hiring freezes are not able to provide nurse faculty for their increasing enrollments. According to an AACN Press Release 9-2010, the faculty vacancy rate continues to climb. Garbee & Killackey 2008 article: A recent study investigating the variables for nurse faculty intent to stay employed in academia concluded that years 1-3 are critical for retention methods and interventions. In fact, nurse faculty that were mentored or had "peer- support" and were doctoral prepared were the most committed to working in academia. It has been stated in numerous research Studies regarding nurse faculty, mentoring enables the novice nurse faculty member to balance work and life effectively and remain satisfied in an academic role. Race and Skees article 2010: Race and Skees noted several challenges with mentoring novice faculty; time management, toxic mentoring, mentor-mentee mismatches and variations in learning needs can poorly influence the mentor/mentee relationship and novice faculty intent to stay in academia. In this article, the authors conclude that an individual approach is necessary and that each mentoring relationship needs to be well planned and individualized to be successful. The lack of nurse faculty is directly affecting that demand for RN, and in return, we will be unable to meet the greying nations healthcare needs because of a lack of nurses. Novice nurse faculty face several new stressors when entering academia. First is the change of role and autonomy that is often a new experience for nurses. Students come with all types of challenges: from the student with personal problems to the behaviour of students within the classroom setting. Learning to manage the challenges of students can become extremely stressful. The entire academic environment can be a cultural shock for some novice faculty. For example learning the "academic pace" when one is used to the pace of a hospital environment can become frustrating and challenging for many. A formal mentoring program is the answer to success. Recruitment of qualified nursing professors and retention of these individuals is a hot topic.

INTRODUCTION

Where has all of the nursing faculty gone? According to an AACN Press Release 9-2010 the faculty vacancy rate continues to climb, currently at a rate of 6.9%; the nurse faculty vacancies will continue to climb over the next ten years. Greater than 90% of these vacancies either prefer or require a doctoral degree and unfortunately, there are a limited number of doctoral prepared nurses. Along with the lack of doctoral, prepare nurses schools of nursing also have difficulty competing with healthcare and research organizations that can provide a limited pool of doctoral prepared nurses with higher salaries and benefits. Schools of nursing are also facing the impact of the nation's economic situation and with budget cuts and hiring freezes, they are not able to provide nurse faculty for their increasing enrollment.

What we do know is that it is estimated that nationally by 2020, healthcare organizations will face a shortage of one million nurses (AACN, 2012). The Obama Care, Patient Protection and Affordable Care Act, will impact nursing care and nursing retention. Millions of currently uninsured Americans will gain health insurance coverage throughout the next decade and by 2016, it is estimated that 32 million are expected to have healthcare insurance. In 2021, is estimated that 34 million people will have healthcare insurance. More people with insurance will increase the demand for health care, which equals the need for more nurses, which in turn equals the need for more nursing faculty. According to AACN's report on 2011-2012 Enrollment and Graduations in Baccalaureate and Graduate Programs in Nursing, U.S. nursing schools turned away 75,587 qualified applicants from baccalaureate and graduate nursing programs in 2011 due to an insufficient number of faculty, clinical sites, classroom space, clinical preceptors, and budget constraints. Almost two-thirds of the nursing schools responding to the survey pointed to faculty shortages as a reason for not accepting all qualified applicants into entry-level baccalaureate programs.

According to a Special Survey on Vacant Faculty Positions released by AACN in October 2012, a total of 1,181 faculty vacancies were identified in a survey of 662 nursing schools with baccalaureate and/or graduate programs across the country (78.9% response rate). The factors that contribute to the nursing faculty shortage includes: aging, lack of degrees, money, lack of support, and the hours spent outside of the classroom (academia requirements). According to AACN's report on 2010-2011 Salaries of Instructional and Administrative Nursing Faculty in Baccalaureate and Graduate Programs in Nursing, the average ages of doctorally-prepared nurse faculty holding the ranks of professor, associate professor, and assistant professor were 60.5, 57.1, and 51.5 years, respectively. For master's degree-prepared nurse faculty, the average ages for professors, associate professors, and assistant professors were 57.7, 56.4 and 50.9 years, respectively. (AACN, 2012). As the baby boomer generation is preparing for retirement this will also lead into the issue of lack of nursing faculty.

The other issue is the lack of salary compensation. According to the AACN 2011 March report, the higher compensation in hospitals and other healthcare organizations lure nurse educators away from teaching. According to the American Academy of Nurse Practitioners, the average salary of a nurse practitioner, across settings and specialties, is \$91,310. By contrast, AACN reported in March 2011 that master's prepared faculty earned an annual average salary of \$72,028. However this salary reported is high compared to salaries listed in the higher education academia annually report.

Stress factors also impact retention of the novice faculty member. Novice nurse faculty faces several new stressors when entering academia. First is the change of role and autonomy that is often a new experience for nurses. Students come with all types of challenges: from the student with personal problems to the behaviour of students within the classroom setting, and learning to manage the challenges of students can become extremely

stressful. In many cases, student related stressors that are new to novice nurse faculty are mostly related to the consumer expectation of this generation of college students. This generation feels that they are paying you for a service and degree. At times they feel and state that if they are having difficulty and failing than it is the faculty fault. This generation has lost the accountability factor. Learning styles differ across each generation span. Managing and motivating individuals of different generations are all about gaining respect for their unique attributes (Mitchell, 2012). Along with the consumer attitude and new technologies, the classroom experience can be a shock to novice faculty. Not knowing how to manage a classroom can lead to awful experiences with challenging students. Then there are the students with personal baggage the ones that always seem to have an issue or personal crisis at hand. Novice faculty may not be aware of the resources available for these students and may attempt to assist the students in need causing more work related strain.

The entire academic environment can be culture shock for some novice faculty. For example learning the “academic pace” when one is used to the pace of a hospital environment can become frustrating and challenging for many of us. The academic setting is an entirely different environment than the hospital. For many novice faculties learning the organizational structure and who really has the power can be challenging at time. The academic pace, when in comparison to the hospital pace can be shocking and almost impossible to handle for some. Although most are nurses are accustom to constant change with the external variables (like the economy) influence nursing education, uncertainly related to the job and job expectations can become stressful to the novice faculty.

Then there is the unwritten “closed door” policy that novice faculty will face in many schools of nursing. Nothing can be more stressful and frustration than asking and searching for help in a new environment than having the door continuously closed in your face. The coldness and lack of some faculty to share or to assist novice faculty will continue to hinder retention in nursing education. Finding the right environment is another factor that can be stressful for the novice faculty member. Many novice faculties may be unaware that not all school of nursing has the same mission or agenda. All schools of nursing should offer mentoring for the novice faculty. Mentoring can assist with questions, concerns, support and retain the novice faculty member. According to Patricia Benner (1984), “very few people ever make it along. We all need someone to lead the way, to show us the ropes, to tell us the norms, to encourage, support, and make it a little easier for us.” Mentoring is a fundamental form of human development in which one person invests time, energy, and personal knowledge to assist another person in his or her development and growth. Benner uses the Dreyfus’s Model, which is based on the idea that individuals must pass through five stages. Faculty with a mentor will be able to advance from one stage to the next with a smooth transition.

A mentor needs to be able to reflect on both experiences and abilities. Characteristics of mentoring can include willingness to share knowledge (correct policy & procedures), competency in their own area, positive attitude (not typical considering the gossip), and allow the novice nurse to grow and develop into an advanced beginner. Mentoring benefits include: higher levels of job satisfaction, organizational commitment, recognized organizational norms and expectations, and positive student outcomes. A benefit for a faculty mentor includes career revitalization, social recognition, mutual feelings of satisfaction, accomplishment, companionship, professional and organizational success. Benefits to a novice faculty member includes: feelings of empowerment, sense of belonging to the profession, promotion of self-esteem, confidence in the workplace, intellectual stimulation, knowledge sharing, and professional and organizational success. Mentoring is the missing puzzle piece to recruiting and retention of nursing faculty.

4th International Conference on New Horizons in Education

Mentors' and novices' perception of teachers' professional career start in Slovakia and in the Czech Republic

Zdenka Gadusova*, Miluse Viteckova

Faculty of Arts, Constantine the Philosopher University in Nitra, Stefanikova 67, Nitra, 94974, Slovakia
Faculty of Education, South Bohemian University, Jeronýmova 10, České Budějovice, 371 15, Czech Republic

Abstract

The paper tackles the question: how do Slovak and Czech mentors and novices perceive the early start of teachers' professional careers? Its aim is to present a clear overview of the current state of novices' induction into their teaching careers and its legislative aspects. Besides this, it presents the data and results of research that was carried out in 2012 in Slovakia and is currently being carried out in the Czech Republic. Respondents to the questionnaire were both novices and mentors, but to have a deeper insight into the issue semi-structured interviews with selected respondents were completed as well.

Keywords: teacher; novice teacher; mentor; induction period; expectations and needs of novice teachers

Introduction

The question of mentors and novice teachers is a topic that is equally being dealt with in Slovakia and the Czech Republic but is not being solved in its entirety. It seems that in Slovakia they have more systemic solutions for the induction of novices into teaching. In 1996 they codified this issue into legislation (§4) when Decree N°42 concerning the Further Education of Teachers was passed. Currently Act N°317/2009 concerning Teachers and Special Employees is valid and as for novices, they are addressed in §28. In 2009 also the Decree N° 445/2009 about continuous education, credits and attestations of teachers and other school staff as well as Guideline N° 19/2009-R concerning a Adaptation Education Framework Programme were introduced. The official status of the mentoring of novices and introducing them into teaching practice is indisputable and a highly desirable tool. In the abovementioned act the position of a mentor is briefly stated; something is said about their function and role and manner of nomination. As for this career position, it is defined as follows: *a mentor or special employee is a person who performs specific activities together with teaching and who is responsible for the induction period of a novice teacher, which (s)he closely and systematically monitors.* This position may be entrusted to an independent teacher or a special employee with the first attestation (In Slovakia there is a system of exams for promotion of teachers which are called *Attestations*, the first one can be passed after 5 years of teaching practice.). While some specific activities and duties for this position are partially stated in the act, the way in which a mentor should be trained for this position is not stated. It is assumed that several years of teaching at school and the first attestation is sufficient preparation for this role. In the Czech

 Email address: zgadusova@ukf.sk, mviteckova@pf.jcu.cz

Republic one of the attempts to systemically solve this issue was the issuing of Decree N°79 of the Ministry of Education of the Czechoslovak Socialist Republic on 26 October 1977 concerning the Unified System of Further Education of Teachers and Other Teaching Staff at Primary, Secondary and Tertiary Schools. Mentoring of novices was dealt with in §3, which precisely stated that each novice had to have an assigned mentor. It also stated who was responsible for their nomination, what their responsibilities were, who observed and evaluated the first steps of a novice at school and how it should be done. This decree, however, had an obvious ideological subtext. Nevertheless, the systemic measures of the decree, which are currently absent at all levels of schooling in the Czech Republic, are beyond doubt. The help and support to novices is nowadays provided according to personal discretion and the decision of headmasters in different schools.

As for the supporting materials for novice teachers, in Slovakia the help for novices and their mentors is mostly provided by Methodology and Educational Centres (so called MPC – Metodicko-pedagogické centrum) in all regional cities (9) all over Slovakia. These centres publish special publications and display some current useful information on their web-pages. In the Czech Republic one can find *Advice for Novices* e.g. at the portal www.rvp.cz (see <http://rvp.cz/informace/rady-pro-zacinajici-ucitele>). There are also other possibilities which different universities offer, as for example, a methodology course for supervising teachers of English. This one-year course is for teachers of English who work or would like to work as supervising teachers of English for would-be-teachers during their teaching practice at schools. The course is accredited by the Ministry of Education, Youth and Physical Education as one of the LLL/CPD courses to deepen teachers' professional qualification. The course originated within the project DOVU (Další odborné vzdělávání učitelů – Further professional education of teachers) and was developed by the Faculty of Education, Palacky University in Olomouc. Other courses are offered by the National Institute for Further Education (NIDV - Národní institut pro další vzdělávání) both for novice teachers to help them with adaptation at the beginning of their teaching career and for school managers organising the induction period for novices to upgrade their training. Furthermore, mentoring is the subject of discussion and a solution within the development of quality standards for the teaching profession too. As supportive material it is also possible to use the book *První kroky učitele* (First Steps of a Teacher) written by Podlahová (2004).

In Slovakia as well as in the Czech Republic the research connected with the subject – primary and lower secondary school teachers and their problems during the first year(s) at school – was carried out, for example, by Černotová (2010), Majerová (2011), Šimoník (1994) and Prokešová (2000), who together with their teams carried out quite wide research in this field. Their research was based on the assumption that the complicated entry into teaching at primary and lower secondary schools for the majority of graduates from teacher training programmes was caused among other things by the fact that they are confronted with three relatively autonomous but long-established concepts. These are teacher training institutions' visions of real teaching practice, ideas and expectations of a specific school and the individual expectations of a novice teacher, and his/her idea of successful practice of the profession. The answers of respondents have shown that the least frequent source of subjectively perceived failures is a lack of expertise or mismanagement of basic teaching skills. However, they are taken by surprise by the fact that there are high demands on educational and social competences. They feel "unprepared for the reality" of "such intense and constant contact with children", "contempt of parents for opinions, views and advice of teachers", etc. In addition, novice teachers according to this survey very much prefer experiencing empathic contact with colleagues and a sense of their acceptance by colleague-teachers. The same study also shows that induction into teaching would be welcomed by 71% of newly qualified teachers who have had two years of experience at schools and 77.5% of teacher training programme graduates who are just about to start their teaching career. According to respondents the most important criterion

for mentors prior to the professional aspects was their human qualities such as willingness to cooperate, empathy etc. (Prokešová, 2000).

Anyway, many experts, who from different points of view express their thoughts and findings about specific features resulting from the modification of the social and professional status of a teacher during his/her teaching career (e.g. Kolláriková, 1993; Kasáčová, 2002), as well as those who describe the analysis and classification of professional competences of teachers, their acquisition and development of teaching skills (e.g. Spilková, 1994; Vašutová, 2001; Belz & Siegrist, 2001; Švec & Trna, 1999; Švec et al., 2002; Švec, 2005; Blaško, 2009) have mutually agreed that the area of respecting the needs of teachers is still little explored and even less taken into account when content of continuous education is designed and education is conducted.

Our research is one of those that is specifically focused on the needs of novice teachers, and namely in the context of previous academic training and perceptions of those needs by mentors. At the same time, it is expected that its results will have an impact on course provision and adding relevant content of continuous education courses respecting the recently identified needs of novices and mentors.

Methodology

Since 2012, a Slovak team of lecturers at the Faculty of Arts, Constantine the Philosopher University in Nitra has been implementing project VEGA 1/0677/12 (Key Competencies of Mentors Necessary for the Efficient Mentoring of Newly Qualified Teachers), the goal of which is the most satisfactory and most comprehensive answer to many questions about mentors' needs and on their basis to identify the key competencies necessary for successful mentoring of novice teachers.

In 2012 in connection with this project a questionnaire survey was carried out, in which 132 novice teachers and 127 mentors from different types of primary and secondary schools from all over Slovakia took part. Two-thirds of mentors were teachers with more than ten years of teaching experience, and almost half of them had been mentors for at least six years. The majority of the mentors (93 - 75%) were officially appointed to this role and except for two, all of the mentors (98.43%) had never participated in any education aimed at the professional performance of this position.

At the same time semi-structured interviews were conducted in both groups of respondents. The number of these interviews was 23 with novices and 25 with mentors. At the beginning of 2013 cooperation with a researcher from the Czech Republic (Faculty of Education, South Bohemian University in Ceske Budejovice) was established, who carried out the research during the spring of 2013 using the same methods, the same questionnaire and interview scenarios and the research will continue in the following months (the researcher has managed to get the answers from 19 novices and 4 mentors). Due to the low number of completed questionnaires from mentors in the Czech Republic, the results in the text are not compared and only the most interesting facts are presented (as stated by novices, they had rather found their mentors by themselves; mentors were not officially appointed to them).

Results

In Slovakia as well as in the Czech Republic (CR) the majority of participants in all groups of respondents were women (total of 233:49), equally representing different levels of school education. Most of the addressed novice teachers in both countries have chosen their profession intentionally (51.66% said: "for sure yes" and 33.77% - "somewhat agree") and in most cases the respondents wanted to remain in educational system (89.18%). In 75% of cases mentors were officially appointed (most of them were told what their obligations in the role of mentors were). Approximately the same number of them stated that they wanted to become mentors and they wanted to do that job in the future. However, 98% of them did not participate in any kind of education related to their position. The impact of novices on their professional development, a chance to learn something from them, admits 95% of mentors.

Regarding reflection of how novices were prepared for practice by their higher education training institutions, the results observed in the Czech Republic and Slovakia diverge. Slovak respondents evaluate their preparation and expertise in the subjects they teach mainly as "excellent" (39.39%) and "very good" (36.36%). In the Czech Republic most of the respondents marked this area as "very good" (9) and "average" (6). The same regards also the preparation in methodology of teaching the subjects – novices from Slovakia rated it better (as "very good" - 43.94% and "excellent" - 13.64%) than novices from the Czech Republic - the most frequent response in this area was "average" (10) and "weak" (4).

As for the level of teaching practice during their higher education training both the Slovak and Czech respondents evaluated it as "average" (40.91% of Slovak respondents and 10 Czech respondents). In the Czech Republic, however, second place is taken by the evaluation "weak" (6), while with the Slovak respondents it was "very good" (29.55%). Training in evaluation during the higher education studies is assessed in most cases as "average" (44.7%), in the Czech Republic again one level worse - as "weak" (7 respondents). Awareness about the work with pedagogical documentation was evaluated on both sides as the worst – "not sufficient" were stated by 43.94% of Slovak respondents and 10 Czech respondents. The same results were achieved as regards knowledge on how to solve stressful situations (43.18% of Slovaks and 10 Czechs). Similarly, training in the use of a textbook was almost consistently rated as "average" (40.91 Slovaks and 10 Czechs). Awareness about how to use information and communication technologies was again rated lower in the Czech Republic - as "weak" (8 Czech respondents). Only training with integrated pupils in the Czech Republic seems to be better carried out in the CR – the questionnaire results showed an evaluation of "average" (8 respondents) and "weak" (6) compared to Slovakia – "weak" (40.15%), "average" (37.88%).

During the first year of their school practice both Slovak and Czech novices have faced the least misunderstandings and problems with mentors and colleagues, and with establishing a relationship with the school management. What appears to be problematic is the area of work with pedagogical documentation, selection of appropriate teaching strategies, teaching methods and techniques. These results were also confirmed by follow-up interviews in which respondents noted: *"Despite the very friendly and generous environment that my new colleagues created for me, I had a constant feeling that there still is something I do not know ... am not aware of ... I am not sufficiently familiar with the school legislation ..."*.

No insistence in the area of perception of novices' needs was apparent in any of the options offered. All the needs suggested in the questionnaire were assessed as: "to some extent". If we order the suggested needs in this area, then the greatest emphasis was put on the emotional support of family members, friends and colleagues (which is identical to the abovementioned research results of Prokesova, 2000), handling administrative duties,

the acquisition of educational communication, professional and methodological support and advice, and development of methodological skills. The least emphasis was put, on the contrary, on the improvement of communication and interpersonal skills. In the interviews with novices the topic "how to motivate students" occurs primarily and then "solutions for crisis/critical situations" occurs.

Respondents from both countries equally expect a professional approach of mentors towards them, above all, friendly and accommodative behaviour (89.39 % of Slovaks and 13 Czech respondents). Other very much appreciated qualities of mentors were a high level of expertise and professional experience (82.58% Slovak novices and 12 Czechs), a willingness to solve problems and time for discussions (69.7% and 12). At the opposite end, there was a willingness to provide supplementary teaching materials as inspiration for lesson planning (12.88% of Slovaks and 3 Czech respondents marked the answer "I do not expect"). From this question, it is clear that novices expect from their mentors helpful behaviour and positive personality traits more than inspiration in the form of material, concrete advice (which has been mentioned earlier, this follows from the previously address area - what they perceive as necessary). When introducing novices into real teaching, mentors consider "provision of professional support" (67.19%) their most important role. Interviews with mentors confirmed the importance of professional support: *"Pass on to novices the maximum of experience, subject knowledge and perceive and treat novices as equal to themselves, they are not scared to learn something from novices."* In the Czech Republic more emphasis was placed on provision of personal support, which can be attributed to the fact that teachers who have decided to become mentors have taken this decision mainly because of the personal support they wanted to provide to novices and this decision has been voluntary. Another very frequently stated role, regarded as important, is monitoring of the novice's progress (identification of their strengths and weaknesses). It was identified as "very important" in 33.59% and as "important" in 64.06%. The same attitude was expressed towards such features as promotion and development of their self-reflection and counselling. Since the publication of the groundbreaking work of Kyriacou (1991) on key teachers' competences, with the emphasis on the need for reflection and self-reflection as a tool for effective remediation in teaching, university staff and scientists, theoreticians and methodologists have dealt with this issue more closely. At the same time, however, it is possible to say that many teachers often lack this skill. Even a mentor, who should guide a novice to self-reflect, doesn't have to have this skill fully developed. In this context the novices' awareness of the need for support and development of self-reflection, expressed by more than 92% of respondents, is a significant fact. One third of mentors (31.25%) consider this role to be necessary and 60.94% of teachers to be important. To compare novices' and mentors' perception of induction, what novices expect from their mentors is shown in Table N°1. Perception of mentors' roles while mentoring novices is presented in Table N° 2.

Table 1: Expectations of novices

I expect ...	mostly			to some extent			I do not expect		
	Slovakia		CR	Slovakia		CR	Slovakia		CR
	N°	%	N°	%	N°	%	N°	%	N°

other	1		1					

Compared to Slovakia, in the Czech Republic the decision on nomination of mentors is in the hands of headmasters. The questionnaire survey and interviews with two novices who, although, they had their mentors, show that these mentors were not officially nominated for these novices, they "found each other", or their mentor was a family member who is also a teacher. In the Czech Republic the questionnaire in this area will be modified, supplemented by a question designed to find out who that mentor is, whether he was nominated, or whether they are willing colleagues, family members or someone else. If novices evaluate their relationship with mentors, they refer to it as "excellent" (44.67% of all the respondents), followed by "very good" (29.33% of all respondents). When assessing positive collaboration of novices with mentors, they could have indicated more options in Slovakia. The top positions achieved such qualities as constructive criticism (65.15%), followed by instructions for assessment (63.63%) and lesson planning (62.12%). In the Czech Republic the most frequent response in this

area was "instructions for assessment" (11), as well as instructions for lesson planning (10) and use of teaching aids (9). The most significant differences in collaboration of novices with mentors in both countries was observation of mentors at novices' lessons - in the Czech Republic a very frequent response was "within longer time intervals, randomly" (15), though "never" also appeared very often. In Slovakia observation was reported in 50% of cases as "regular and systemic". Regularity and system of work was most often referred to in Slovakia: professional (66.66%) and personal support (65.91%), and provision of feedback (63.63%) and frequency of contact (58.33%). The answers of mentors show a noticeable lack of mentors' interest in new and innovative methodological and didactic approaches in novices' lessons (37.88%). Mentors state that mainly in the areas of consultancy, provision of professional and personal support did they feel self-confident.

The induction period for novices in Slovakia is usually finalized in the form of observations carried out by school management (58.33%) or mentor (42.42%). Among the answers of Czech respondents terms like "silence along the path", "nothing" or "contract for next year" were often detected. The analysed data show that mentors are fully aware of their role. The opinions expressed in the semi-structured interviews can be summarized into three areas:

1. Communication between mentor and novice must be active, established on the basis of mutual trust, asking questions, creating partner relationship and learning from one another.
2. Mentors must provide their knowledge, experience and skills related to the organization of work, school documentation and creating school education plans, student assessment. Some respondents even suggest a specific procedure: *"In the ideal case the mentor will analyse with the novice each of his/her lesson plans, showing him/her how he would teach that lesson (even having the novice at the mentor's lesson), will provide or offer his lesson plans, will record the novice's lesson on video, and then will analyse it."*
3. There must be constant appeal to continuous personal and professional growth of teachers, while it is necessary to call for the renewal of the status of teachers, their social recognition and adequate financial remuneration.

As for the evaluation of the first year of teaching experience at schools novices feelings expressed in the semi-structured interviews varied from "exhausting, stressful, confusing" through "despite the mixed feelings also joyful", and "anticipation of stress and natural fears" up to "successful start." The areas they perceive as problematic are: "time consuming preparation for lessons, extensive documentation, managing of parental meetings, acceptance and integration into a new school, Roma pupils, teaching status and school facilities."

Conclusion

The results of the research show that the most important factor at the start of a teaching career for both groups of respondents are mainly relationships - relationships not only between the novice teacher and colleague-teachers at school but also between the novice and mentor. A novice enters school practice in majority cases with enthusiasm, expectations, willingness to work, but of course, also with some fears and hesitation, and therefore it is very important to avoid disappointment at the beginning of their careers, so that they do not have to face the "shock of reality." Mentoring is undoubtedly a very important element at the start of the teaching career of novices. We consider it a very positive fact that the role of mentors in Slovakia has some legislative basis in comparison with the situation in the Czech Republic. The current research data show that the role of mentor is perceived as very important. The interviews show that if a headmaster or someone from the school management does not nominate a mentor, novices try to establish a closer relationship with some of their colleagues who fit

this role, are willing to help and give advice. Bearing in mind that in the Czech Republic only a small pilot of this research has been carried out, it will be interesting to compare whether the data obtained in the pilot will confirm what has been established so far or whether other respondents will respond differently. As recognized from the research in Slovakia, Slovak mentors are fully aware of their role and show an effort to meet the expectations of their younger colleagues - novices. They can formulate their duties, they are aware of their responsibilities, and know the strengths and weaknesses of carrying out their tasks and roles. Many sense the importance of their role; they feel their work brings them pleasure and a feeling of reward. However, they rely mostly on their own knowledge, experience and strengths but lack meaningful and focused guidance. Last but not least, they are not adequately paid, which can act as a de-motivating factor. Mentors therefore call for support from school managers and for systematic, purposeful training.

Meshk: As a Tradational Method of Turkish Music Education

Cemal Karabaşođlu*

University of Sakarya, State Conservatory, Department of Basic Sciences. Esentepe Campus, Serdivan, Sakarya 54187, Turkey

Abstract

Education of traditional fine arts like Calligraphy, Decorative arts, Qiraat (Reading Quran), especially Music was performed by the method of Meshk. As a correlative method of teaching realized by teacher and pupil, Vocal training, saving of verbal and instrumental repertoire together with transferring from generation to next had been achieved by this method. Until the first quarter of 19th century, education of Turkish Music was based on this method. Later on Meshk has been practiced partially in some music institutions such as conservatories ect. established by Westernize influence. The most important advantage of meshk method for student is learning by his teacher's style and characteristic and then carrying on a song, instrument or a performing type of music how his teacher instructed. In this presentation, practicing of meshk method, its types, pre-qualifications of the student to be acceptable for education, its duration, location and institution to exercise, qualifications of teacher to make meshk, positive and negative aspects of this method will be mentioned.

Keywords: Turkish Music, Education of Music, Method of Meshk, Traditional Music Education, Conservatory.

1. Introduction

Successors described music as a language of love and nutrient of the soul in the mean time an obvious indicator of a nation in terms of civilization. Music of Turks before the Islamic era was composed of folk poems generally song with an instrument. Musicians of that era in the mean time were artless poets look like each other, carrying an instrument called kopuz. They were traveling tent to tent and singing in general and special meetings about epics of old heroes and national legends or composing new songs on contemporary affairs. Principles of rhyme were very simple and primary in that era when the music and poet weren't separated yet. (Köprülü, 1981:11-12). However some notation systems –abjad–were improved in the most music books of theory after Islamic era when the writing tradition grew up, these systems were never used in musical education and saving repertoire. The meshk method, providing a lot of easiness for education and transmission of Turkish Music appropriate to the conditions of nomadic society, has sustained its existence until the end of 19th century. In this study, the brief information about history of meshk-an indispensable method of oral and written traditions-, application, places where applied, positive and negative properties will be mentioned.

2. A Brief History of Meshk

As an educational and transitional method that Turks used from central of Asia, the most historic information about constitutional application of meshk belongs to Ali Ufki Bey (Wojciech Bobowski): “*Meshk-khane is the name of the room where the music is learned. Room and military musicians come to this room until the evening. The most spectacular songs are taught by Teachers sit across the students Sometimes with and sometimes without of an instrument. Knowing the tunes they compose new songs by using them. Music is learned by memorizing, writing of music is nearly a miracle.*” (Behar, 1990: 44-45).

After Sultan Mahmud the 2nd western effects started to appear in the traditional musical enjoyment. Just after repealing of janissaries and closing of Mehter-khane, musical direction had changed by Muzika-i Humayun concerts. In that century, Classical Turkish Music had existing its command in different sites starting from palace furthermore Classical Western Music also hold a place. Up to that time firstly Enderun-ı Humayun then dervish lodges, mosques, kiosks, special classrooms, Darulelhan, music ensembles and coffee houses became the clear places where the music to learn and perform.

At the end of 19th century it obviously seems that the meshk and notation had been started to use together in the education of Turkish Music. The head-neyzen of Galata Mawlawi lodge, Mehmed Emin Dede had learnt from his teacher Hafız Ishakzade Sadık Bey a lot of masterpieces starting from works of Hammamizade Ismail Dede in mode of neva. At the end of the lesson he wrote down the notes of new songs. He also copied music of his second teacher Bolahenk Nuri Bey's composition of Mawlawi rituals in the modes of karcigar and buselik. (Şeker,2013:568-569/ Inal,1958:176-177). This case shows the notation was not used by predecessors for music education and transition, it was used as a tool just for remember the melodies easily.

3. Implementation of Meshk

The student attributes required for acceptance are beautiful voice, earring for music, rhythmic sense and so evident music ability. In addition to these, the student should be willing and intent to learn music. “*Hacı Arif Bey...were repeating his song to his student fifteen times, if the student could not learn he would end the teaching.*” (Inal,1958:70) And also the student's admiration and love to his teacher was a speeding factor for learning music. “*Emin Dede was listening his master Huseyin Dede in deep appreciation when he playing ney.*” (Şeker,2013:568/ Inal,1958:177).

Knowledge of theoretic in Turkish music of all teachers is equal but the teachers are specialized on the matter of different kinds and forms. “*Zekai Dede advised his student Kazım Bey to his learn the performing style of na’'ts and duraks from Behlul Efendi, one of the famous musician of the time.*” (Inal,1958:104-105).

Characteristic and performing style of the forms should be reflected for a successful performing. Because of this, to make meshk all kinds and forms from one teacher is not possible for a student. So he should find the best performer teacher of different forms. (Şeker,2013:568/ Inal,1958:46).

Meshk for a student providing prerequisites is a simple method for music training. The most important technical requirement in this method is to realize the training by always playing rhythmic structures. Lyrics of the song is written by the student or written/issued lyrics book is benefited. The student continues the rhythm by beating his right and left hand then the teacher read the song by making rhythm, then the student repeats.

The teacher makes the student read the song partially (zemin, nakarat, meyan, terennum etc.) and as whole many times until he memorizes it completely and makes him repeat until hesitations and mistakes disappear. So the student sit down in front of his teacher, watches what he says, does, shows carefully then repeats. The teacher makes required warning and corrections in these repeats. The main purpose is to put the song into the student’s memory. (Behar,2003:16). Student must memorize all that were transferred to him and remember them.(Ak;23). Notes were never used in this system in which music theory, performing techniques, performing style and repertoire were used together.

Lyrics books and rhythm implementations are aspects to strengthen the mind while making meshk and performing a song. This situation is also expressed by Charles Fonton as follows: Especially rhythmic structures are the most important assistant for the mind to locate the song into the memory and remember them.(Fonton,1987:71).

Rhythm in the instrument group was provided by some kind of drums such as kudum, bendir; while meshk of student-teacher, they play rhythm without using any instrument but by beating hands on their knees. The expression “beating knee” in meshk method means this implementation.

Meshk of instrument students was implemented depending on memory because of especially having no lyrics for the instrumental songs and making rhythm while performing were the complicating factors. Because of this difficulty even most skillful instrument players could know nearly hundred peshrev after long time spending effort. (Fonton,1987:66).

Sometimes masters of music came together for different aims (Şeker,2013:567), performances in these meetings were also called meshk. This kind of meshks provides masters having a repertoire composed of thousands of songs to refresh their minds and not to forget them. The most of famous Turkish musicians had continued joining that kind of periodic meshk meetings(Inal,1958:104-105), in case of not to forget repertoire in the length of time. (Ergun,1943:632). Training without using notes but depending on memory in the meshk method as the most important disadvantage caused changes in and loss of thousands of songs. Another reason for the loss of songs is death of the people who memorized the unwritten songs. (Ak:23).

4. Musical Education Institutions Applying Meshk

4.1. Enderun-ı Humayun

It is a palace institution for education established in the Ottoman Empire in the middle of the 15th century. Students having a certain level and capability were accepted to this school in which Civilian and military administrators were mostly trained. Music and other kinds of art (İpşirli:185-187) were taught in addition to the courses on the Islamic culture and religion, civilian and social information, foreign languages and sports; a lot of artists and composers were graduated.

4.2. Dervish Lodges

Lodges of different parts of Sufis such as Khalveti, Qadiri, Rifai, Gülşeni, Bektaşî especially the ones belonging to Mawlawis (Mawlawi-khanes) played important role in music and instrument training by meshk method in the classical and religion music. Mawlawi rituals (Özcan:464-466) -the most precious form in Turkish Music- and the other forms such as na‘t-ı şerif, taksim, peshrev, semai, kıraat, tekbir and salat were all taught by meshk method in Mawlawi-khanes (Gölpınarlı, 1963:75-109), which spread to all Ottoman land from the Sufi thought around Jalaladdin Rumi in 13th century, then they are transferred to the next generations. Mawlawi-khanes in Istanbul acted as a conservatory in 18th and 19th centuries and was the school of the most famous names of classical Turkish music. Buhurizade Mustafa İtri, Ali Nutki Dede, Abdülbaki Nasır Dede, Kutbunnayi Osman Dede, Hammamizade İsmail Dede, Zekai Dede, Hüseyin Fahrettin Dede, Sultan Selim the 3rd and Rauf Yekta Bey are the famous mawlawi musicians trained in these institutions in which sema and music were taught by meshk methods. (Tanrıkorur:474)

Obviously all specialties of Turkish classical music were meshked in the meetings organized in the mawlawi-khanes. If we have a look into the lives of musicians from every class, probably each of them visited these places. The greatest composers of Ottoman Music raised from dervish lodges, so that their masterpieces are carrying different colors of mysticism. (Çetinkaya,1999:50).

4.3. Mosques

The forms of Turkish Religion Music such as ezan, kıraat, kamet, sala, tekbir, tesbihat, temcid, tevshih, mevlid, miraciye, kaside ve ilahi have special performing style and also are performed spontaneously in the mosque. The main aspect in the performing style of these forms is using tunes of mode while reading text depending on human voice with no instrument. Most of these texts constituting lyrics are Arabic and are read by slow rhythms and ascetic characteristic. Students made meshk by forms of mosque music, characteristic and performing style, application of voice and modes are made within the tradition of memorizing the Koran.

4.4. Mehter-khane-i Humayun

Turks, who were using music as a military aspect until the oldest period of Turkish and Islamic history, continued to use military music as “Nevbet” tradition under the shelf of mehter-khane in the term of Ottoman Empire. Music, which was used as an item providing command of army in the war in addition to its physiological affect, was learned by meshk method in the mehter-khane. Zurna, boru, kurrenay, mehter dudugu, kos, davul, nakkare, tabılbaz, def, zil ve cevgan were the most known instruments of mehter.(Sanal,1964:65). The head of each instrument, called “aga”, was the master of the other players of the same instrument. This person was responsible for teaching music and the instrument, transition of repertoire to the players of the same instrument. Nefiri

Behram Aga, Hasan Can Celebi, Shahkulu, Kemani Hızır and Mustakim Aga are said to be important composers of mehter music that has rhythms special to itself and rhythmic performing style. Musical activities of Mehter had continued until the institution of Muzika-i Humayun.

4.5. *Special Classrooms And Home Meetings*

In the history of Turkish Music, famous musicians made meshk at their homes with their desiring students sometimes one-by-one and sometimes all together. Some of them also instituted music schools. An example for this, as Bolahenk Nuri Bey, Hacı Faik, Zekai Dede, Hacı Kirami, La Mekani Mustafa, Yenikoylu Hasan Efendi, Hacı Arif Bey-master of music masters- had benefit from meshks made in the Kiosk of Halim Pasha and collection of rare songs composed by the Pasha. Hacı Arif Bey was teacher of instrument ensemble of the kiosk in Bebek belonging to Princess Emine Hanım -mother of Egyptian Abbas Hilmi Pasha-, provided Shehzade Cemalettin Efendi made musiqi meshk. (Şeker,2013:571-575/Inal,1958:74) Behlul Efendi -one of the famous musicians of the last century-, Yenikoylu Hasan, Tanburi Behor, Bestenigar Ziya Bey, Musullu Ama Hafız Osman, Malak Hafız Efendi- zakirbaşı of Nureddin Cerrahi- were coming together in the small kiosk in Pashabahce belonging to Sheyhulislam Sahib Molla Bey and made meshk. (Inal,1958:104-105). Examples of this application that became tradition have come through today.

4.6. *Darulelhan*

The first music school instituted with Darulbedayi in Ottoman Empires in 1914 was Darulelhan. In this school which had two different curriculums; Eastern and Western music, the aims of Eastern part were to save the classical music from being forgotten and deformation, to improve in order to be useful for theater, to translate the classical songs into notes, to make the songs alive and to spread the music enjoyment to the society. In the curriculum of this school, courses of violoncello, piano, composition and history of music were present in addition to theoretics, solfegé, Turkish Religion Music, Turkish Music rhythms, Turkish Music instruments, singing as an art.

Darulelhan had also attributes such as to make scientific studies, to issue the valuable songs after translating them into notes, to make researches about folklore. In this perspective, notes of classical Turkish Music songs had issued under the name "Darulelhan Kulliyati". Latter on it continued its activities under Music Conservatory of Istanbul and Istanbul Municipal Conservatory. (Özcan:518-520). In this institution, meshk method had been applied practically in addition to training depending on notes.

4.7. *Music Comities and Ensembles*

Daruttalim-i Musiki (Özcan:9-10) and Shark Musikisi, Darulfeyz-i Musiki, Music Ensemble of Uskudar (Tanrıkorur,2004:167) that were instituted by Fahri Kopuz to improve Turkish Musiqi, to train voice and instrument artists are the most famous ensembles. Music training had been carried out with meshk and note together in all of these ensembles.

4.8. *Coffee Houses*

It has been reported that teachers and pupils had come together and made musiqi meshk in the coffee houses. Rauf Yekta Bey -student of Zekai Dede- is telling Zekai Dede had made meshk with his teacher Eyyuplu Mehmed Bey at a coffee house in Eyup at the 1840's. (Yekta,1318:22-23). Another example Hacı Kirami Efendi, one of the famous music teacher lived at the end of 19th century, was performing periodic meshk at a coffee

house in Tashkasap. (Ergun,1943:II,468). In the same century Incesaz groups also aroused from coffee houses. (Özalp:I,223).

5. Positive And Negative Properties of Meshk

Not having auxiliary materials such as lyrics books -gufte mecmuaları- has increased the number of lost songs in the meshk of instrumental compositions, differentiation in the songs has raised in addition to no change in the present repertoire.

Because it is a method depending on memory; it caused changes in different forms such as Kar, ayin, miraciye and to forget them after a while by complicating learning and transition of them. However, this change in the repertoire can be explained with the musical enjoyment that can be changed periodically, also changes and improvements in the modes and rhythm perceptions. Another opportunity is that; base level songs in that era were excluded from the repertoire and then lost because they were not worth to meshk to the pupils. So, the meshk of the songs chosen by the teachers corresponding to their aesthetic worries is because of the songs that were thought not to have permanent value or have problems have not been transferred.

Instead of the negative properties of meshk, the explanation of Sadettin Nuzhet Ergun about using meshk is important: He declares notation never contains local performing styles and characteristic. So that real teachers of Turkish Music did not use notes only. (Ergun,1943:II,629). This explanation shows transition of characteristics and style in the meshk method was provided more perfectly so the music authorities in that era preferred it instead losing and changing in the songs.

6. Conclusion

Meshk; a teaching method prioritizing the memory, has not lost its validity till old nomadic Turkish societies. Due to the Turkish music types are able to carry over properties of their characteristics and performing style; it's being used since notes were started to be used for performing and transition at the end of the 19th century.

Meshk method had been used in training of Turkish music and instruments within the historical periods; it has kept its validity until now as a traditional teaching method in different institutions and different types of music. Because of the meshk realized practically and mutually between the teacher and the pupil; repertoire, characteristics and performing style have been transferred by the music training.

Meshk of musiqi masters realizing by themselves can be said that it provides remembering and reflecting the correct characteristics and performing style to the listeners instead of teaching. Additionally, their meshk provided to fulfill the listeners.

Songs always needed to be performed with their rhythms in the meshk method used in the traditional teaching of Turkish Music. This situation had provided the song to locate in the memory and performing it successfully. Rhythm problems appearing in the Turkish musical performances realizing at the present day may be explained with rejection of kudum; the main aspect of the meshk, by some instrument ensembles. This also can be evaluated as a problem caused by not applying the meshk method in the present Turkish music training.

Abstract

Of family variables contributing to children's school achievement, parent expectation was singled out by researchers to be the most salient and powerful force. Existing literatures have reported that Chinese parents overseas highly expect for their children's education, and actively involve themselves in associated activities. Based on information collected from 322 questionnaire survey and 30 face-to-face interviews with parents, this research attempted to investigate what expectations Chinese parents in Mainland China have for their children's education, and how to understand their educational expectations for their children, then to add in-depth understandings of Chinese parent involvement into the growing literature.

Keywords: Chinese, parental expectations, children's education, understanding

1. INTRODUCTION

Parent expectations are beliefs or aims that parents hold about their children's future performance and are mainly focused on achievement-related areas such as educational, professional (Barber & Rao, 2005). Of many family variables, parental expectations have been singled out as the most salient and powerful force contributing to children's school achievement (Hoge, Smit, & Crist, 1997; Patrikakou, 1997; Peng & Wright, 1994; Seginer, 1983), especially parental expectations for children's educational attainment (e.g., whether or not attend college) have been found to be significantly related to both the child's current achievement and later achievement (Fulgini, 1995; Marjoribanks, 1988). Considerable evidence have been provided by previous studies for the link between parents' high expectations for their children's academic pursuits and children's educational outcomes (Eccles, Wigfield, & Schiefele, 1998; Englund, Luckner, Whaley, & Egeland, 2004; Fan & Chen, 2001; Ganzach, 2000; Juang & Silbereisen, 2002; Pomerantz, Ng & Wang, 2006). Children with higher scores on measures of achievement, competence, and intelligence have turned out to have parents with higher educational expectations and aspirations for them (Sandefur, Meier & Campbell, 2006).

Existing studies of Chinese parenting have reported that Chinese parents not only have higher expectations for their children's academic achievement, but also place a high premium on their children's education and academic success (Li, 2001; Chao & Tseng, 2002; Shek, 2006; Cheng and Sally, 2009). However, most of these researches targeted at Chinese parents overseas, or in the areas of Hong Kong and Taiwan. Currently, there is limited literature investigating Mainland Chinese parents' expectations for their children's education, and how they

E-mail address: wuying.zou@my.jcu.edu.au

involve themselves in their children's education. This research attempts to address the gap and add new knowledge of Mainland Chinese parental expectations and parenting to the growing literature. As Social Reproduction Theory (Bernstein, 1975) advised that the apparently neutral academic standards are laden with specific cultural resources, typically from the dominant classes — middle class, acquired at home, this study focused on exploring middle-class Chinese parents' expectations for their children's professional performance and education attainment in the future, and their practical parenting pattern.

2. AIM OF THIS STUDY

Drew on 322 questionnaire survey plus 30 face-to-face semi-structured interviews with parents, and grounded in Chinese social cultural context, this study aimed to address the current insufficiency of research on Mainland Chinese parental expectations, and to add in-depth understandings of Chinese parenting and Chinese culture to the growing literature. Guided by the aim and the core research, this study investigated three questions:

- What expectations do Chinese parents have for their children's education and future?
- Why do they have such expectations?
- How are they involved in their children's education to help fulfil these expectations?

3. RESEARCH DESIGN

3.1 Method

This study adopted a mixed method of using quantitative questionnaire survey and qualitative in-depth face-to-face interview. Questionnaire survey in this study served as the main resource of data, aiming to collect information in a broader range. It included three sections. The first one was about parent's basic demographic characteristics, i.e., gender, age, education level, occupation, and yearly income, etc. The second part looked at parents' specific expectations for their children's professional future, followed by the last section investigating how parents were involved in their children's education to help fulfill their expectations, i.e., time spent on homework supervising, frequency of talking about school issues to their children, extra-curricular lessons currently registered for their children. The face-to-face interview was designed to triangulate information collected from questionnaire survey, and to deepen understandings of Chinese parental expectation. It investigated parents' expectations for their children's education attainment and the reasons for their expectations. Quantitative data and qualitative information gathered were respectively analyzed by descriptive statistical technique and content analysis method (Johnson & LaMontagne, 1993).

3.2 Research site

Data collection was undertaken in Changsha, the capital city of Hunan Province, located in the Centre of Southern China. Although as medium-sized city, it holds the population of more than 6 million. With a higher rate of graduations enrolled into universities, the city has had a high prestige for its successful basic education. Parents here have been greatly involved in scaffolding their children's education achievement. Findings obtained in Changsha, could be generalized to a broad range and added into the literature for better understanding of Chinese parent involvement and Chinese culture.

3.3 Participants

This study shed lights on middle-class Chinese parents' expectations for their children's education. Initially, 415 parents consented to be involved in the questionnaire survey with children studying in year 3 or year 6 in the 4

primary schools deliberately selected from the urban area in Changsha. After doubly filtered by the criterion of having education level no less than 12 years, and family yearly income more than 100,000 RMB (Statistics, N.B.O. 2002), there were 322 parents left to actually participate in the present study. Except 11 parents' gender missing, they were 213 mothers, and 98 fathers. Besides the questionnaire survey, 30 parents, of them, 28 mothers and 2 fathers, were randomly selected to undertake the face-to-face interview.

3.4 Sampling & Procedure

Under the standard of having middle-class meanwhile from diverse background parents, this research purposively selected 7 schools from 1024 primary schools in the urban area of Changsha. Principals of these schools were initially contacted with by phone and email for their interest in attending the project. Positive response was received from principals of 4 schools. Within these 4 schools, there are 3 public schools, one affiliated to a "key" university with students mainly from highly-educated families; another one affiliated to local government whose majority of students were born in civil servant families; the last itself is a comprehensive "key" school mainly serves diverse but middle class families. The rest of these 4 schools is a private school, having students predominantly from business background family. The 4 schools selected have students mainly from middle class but different family background, could be regarded as ideal samples for this research. Then detailed information sheet and consent letter were sent to principals to sign. In each school, year 3 and year 6 were selected as sample year level, as both of them play significant role in China's basic education system. Start from year 3, curriculum becomes more comprehensive, and year 6 is the critical year for students to well prepare for the difficult entrance-exam for secondary school. Parents greatly involve themselves in their children's education in these two years. Looking into these two years' parenting could help capture the typical feature of Chinese parenting and better understand Chinese parent involvement.

From each year, 1 class was respectively randomly selected to attend the research. 8 classes in total were selected to complete the questionnaire survey. Information sheet and consent letter for parents were sent to and be handed over to parents by the classroom teacher.

In each class, among parents who consented to participate in the research, five parents, 40 in total, were randomly invited to undertake the interview. 30 of them were pleased to do the face-to-face interview, and were further contacted with about the schedule of interview. All interviews were conducted in Chinese at times and in places nominated by parents. 90% of them were completed within 1 hour. Before interviews started, parents were promised that the information they provided would be confidential; no name of participants, their children, or schools would be reported.

3.5 Instruments

Fan (2001) understood that parent expectations are parental beliefs in their children's academic achievement ability. However, according to Barber and Rao (2005), it should also include parent's views about their children's professional performance. On the basis of previous understandings of parents' expectations for their children's education, this study looked insight to both children's professional performance and education attainment in the future.

As a multifaceted concept, parent involvement includes a broad range of parenting practices. Throughout the majority of the literature, Epstein's Model (1986, 1995) has been widely accepted as a typology and fundamental framework for investigating parenting activities (Cheng & Sally, 2009). This model defines parent involvement at six levels: parenting (addressing daily life needs and material support for children's study); communicating (talking with teachers/schools about school programs and children's progress); volunteering (assisting with

schools events); learning at home (supervising children's learning); decision making (participating in school's decision-making); collaborating with community (to access education-related services in community programs). Based on Epstein's Model, meanwhile grounded in China's context, this study specifically investigated three types of parenting significant in Chinese education system: homework supervising, extra-curricular lessons parents registered for their children and parents' communicating school issues to children (as well as their perceptions of the importance of education and test results).

4. FINDINGS

Findings presented in this study focus on:

- Participants' demographic characteristics
- Chinese parents' expectations for their children's professional and academic future
- Typical types of Chinese parent involvement
- Understanding of Chinese parent involvement

4.1 Parent's demographic characteristics

Information about participants' demographic information could be found in Table 1. As indicated, two thirds of the group was mothers, which is highly consistent with findings of previous studies (Lau, 2006; Cheng & Sally, 2009) that mothers are the ones who shoulder a large portion of parenting. However, this study found that Chinese fathers, nearly one third of the sample (30.5%), also actively participated in parenting. All parents in this study were mid-aged, ranging from 29 to 52 years old, with most of them younger than 46 years. It also could be found from the table that this group of parents was well-educated. More than half of them (52.8%) completed at least 16 years education and held bachelor & above degrees. Almost another 28% of these parents obtained diplomas from their senior or junior college study.

Except 4 housewives, 7 labors and 6 unemployed parents, the majority of this well-educated sample had decent occupations. Almost half of them were on the managerial positions, as civil servants (9.6%), professional managers (9.3%), administrative officers (10.2%), and business owners (8.4%). Within almost another half of these parents, 31.1% of them were professionals, working as doctors, engineers, designers, lawyers, teachers, journalists, movie directors, etc., with the rest 7.8% of them was professional freelance. From the information of family income shared by 43.5% parents of the group, we could find that these middle class participants were wealthy. The average yearly family income is 304,000RMB. More than half of them have yearly salary more than 100,000RMB but less than 200,000RMB. Slightly less than another half of these parents earned more than 200,000RMB per year, with 2.2% even more than 1,000,000 RMB.

Table 1. Demographic Characteristic of Parents (n=322)

Variable	Number	Percentage %	Median	Average
Gender	Mother	213	66.1	
	Father	98	30.5	
	Information Missing	11	3.4	
Age (29-52) (Yrs)	[29,35]	66	20.5	38

	Business owner	27	8.4	
	Housewife	4	1.2	
	Labor	7	2.2	
	Unemployed	6	1.9	
	Missing	59	18.3	

4.2 Parents' expectations for their children

Information could be found in Table 2 of parents' expectations for their children's professional future and education attainment. More than two third of parents (67.7%) clearly expressed their expectations for their children's professional future. Most of them expected their children either to be skill-oriented "professionals", (52.8%), such as doctor, engineer, lawyer, etc., or to do managerial jobs, i.e., "government officers", or "business

managers/owners”, or to be one of these two groups (7%). Only 0.5% parents considered manual labors could be their children’s career in the future. Although 24% parents did not clearly mention what they would prefer their children to be/do in the future, there were 17% held positive response to this question. Nearly 10% indicated they would respect their children’s own choice, with another 7% hoped their children to be a capable, happy person, and to do their own contribution to the society. Only 7% of all parents held relatively passive attitude about it, either letting the nature take the course or so far lacking of actual consideration.

Similar to parents’ expectations for their children’s professional future, in the face-to-face interviews, 19 out 30 parents (63.3%) clearly expressed that they wanted their children to complete at least university level education, moreover, 23.4% parents reinforced it should be a “key” university or first-class university. Among those parents who did not exactly share the related information, there were two 10% parents respectively wished their children be a professional, or to grasp a certain skill to be financially self-supported.

Table 2. Parents’ expectations for their children (n=322/30)

Parents’ expectations	Category	Number	Percentage%	
Clearly-mentioned (67.7%)	Professional (only choice)	170	52.8	
	Professional or Government officer	11	3.4	
	Professional or Business managers	5	1.6	
	Government officers	11	3.4	
	Business managers, owner	13	4	
	Government or Business managers	6	1.9	
	Professional future (N=322)	Labour	2	0.5
		Respect Children’s interest & dream	30	9.3
		Happy, capable citizen, contributing to the society	24	7.5
		Let the nature take the course	13	4
Common citizen		2	0.5	
Haven’t considered		8	2.5	
Missing		28	8.6	
Education attainment (N=30)	Bachelor and above	9	30	
	Clearly-mentioned (63.3%)	Key university	2	6.7
	First-class/Overseas university	5	16.7	
	Master degree	2	6.7	
Not clearly-mentioned (24%)	Not clearly-mentioned (24%)			
	Not clearly-mentioned (24%)			
	Not clearly-mentioned (24%)			

	Doctor degree	1	3.3
	To be professionals	3	10
Not clearly-mentioned (36.7%)	Good study habit	1	3.3
	Be healthy & happy	4	13.3
	To be self-supported	3	10

4.3 Parents' involvement in their children's education

Table 3 described how these parents were involved in children's education. Three types of parent involvement were examined. Of homework supervision, almost 90% parents actively involve themselves in daily supervising their children's homework from less than half hour to more than 3 hours. The associated time for 36.3% parents was less than 30 minutes; while to another 33.2% parents, it was more than half hour but less than 1 hour. However, there were 12.4 parents spending 1 to 2 hours a day helping their children with home learning, while to another 3.1% and 2.3% parents, it was respectively 2 to 3 hours or more than 3 hours each day.

Having extra-curricular lessons is a must-do educational activity for Chinese children, with time and money heavily invested by their parents. As shown in Table 2, except 8.1% parents failed to share their information, almost all of them currently registered one to six, with the average of two, extra-curricular lessons for their children. Slightly more than 50% of these parents' children were engaged in 2 to 3 training lessons, with another 21.1% had one subject, and 15.8% had 4-5 subjects. There was even 0.6% of the sample registered more than 6 lessons for their children. Of these lessons, 52.4% focused on enhancing children's academic performance; only 8.8% was to develop their interest in arts and sports; another 32.4% were related to both. Besides completing homework assigned from school, 32.6% of these parents' children had to weekly spend 5 to 10 hours on such training lessons. To another 5% children, the time was 10 to 15 hours. 1% children even spent 15 to 20 hours a week on this after-school training. Fortunately, to 53.7% of children, the time was less than 5 hours per week.

Table 3. Parents' involvement in their children' education (n=322)

Involvement Type	Scale	Number	Percentage	Average	Median
Involvement	Yes	289	89.8		
	Not	21	6.5		
	Missing	12	3.7

	2-3hrs	10	3.1		
	≥3hrs	7	2.3		

	Missing	41	12.7		
	1	68	21.1		
	2-3	175	54.4		
Amount of subject [1,6]	4-5	51	15.8	2.47	2
	6	2	0.6		
	Missing	26	8.1		
	Academic	155	52.4		
Area of subject	Arts & sports	26	8.8		
After school courses	Mixed	96	32.4		
	(,5]	173	53.7		
Weekly hrs spent (by children) [0.5, 20]	(5,10]	105	32.6	5.25	5
	(10,15]	16	5		
	(15,20]	3	1		
	Missing	25	7.7		
	[960, 6,000)	130	40	7,800	6,000
	[6,000, 10,000)	78	24.2		
Yearly Expense ¥ [960, 30,000]	[10,000, 20,000)	70	21.7		
	[20,000,30,000]	70	21.7		
	Missing	32	9.9		
	Daily	64	19.9		
	Often	221	68.6		
Frequency	Occasionally	23	7.1		
	Rarely	7	2.2		
Communicating	Never	0	0		
study to children	Missing	7	2.2		

Plus time, money also was generously invested on these lessons by parents. To 40% of the sample, the yearly expense was less than 6,000RMB, but to another two 21.7% of parents, it was respectively between 10,000 ~ 20,000RMB; and 20,000 ~ 30,000RMB. There were another 24.2% parents spent less than 10,000 but more than 6,000 on their children's training courses.

In addition to hours and money spent on children's homework supervision and training courses, for these Chinese parents, communicating study to their children also served as an important type of parenting. As information revealed in Table 3, Chinese parents highly concerned their children's study by communicating with them frequently. Nearly 20% of them did it every day, while presumably another 70% did it "often". Only about 10% of these parents seldom or rarely mentioned these issues to their children. There was no parent never has talked about study to their children.

4.4 Parents' understanding of their expectations for their children's education

As described in Table 4, most of parents considered that education was important to their children. It was "significantly important" to 63.4% parents, 'relatively important' to another 10% parents. However, to the minority of these parents, it was "Relatively not important" or "Not important at all". 53.3% of those parents who appreciated the value of education regarded it as an effective means of enhancing their children's social status. Similar to this view, another 13.3% parents considered that education was an important way for their children to learn, and to know more about the world. In the rest of 33.4% parents' opinion, education was crucial for children's whole life. While being asked the reasons for their expectations for their children's education, half of the group claimed that it was to well prepare their children for the high competition of workforce. Another 30% parents contributed it to the influence of Chinese cultural tradition, where parents highly respect education and expect for the next generations' future. Different with this, another 20% parents think it was caused by the university-entry system, where students have to pass the difficult entry-exam to get enrolled into a university.

Table 4. Parents' involvement in their children' education (n=30)

Variables	Parents' perceptions	Number	Percentage %
Importance of study to children	Significantly important	19	63.4
	Relatively important	3	10
	Relatively not important	7	23.3
	Not important at all	1	3.3
Significance of education	Means of enhance social status	16	53.3
	The way to learn, know the world	4	13.3
	Crucial for children's whole life	10	33.4
Reason of emphasis on education	Cultural tradition: respect education, parents' high expectation	9	30
	preparation for the competitive workforce	15	50
	Impact of university-entry system	6	20

5. DISCUSSION

Different from previous research focusing on Chinese parents overseas, or in Hong Kong, and Taiwan (Chao and Tseng, 2002, Shek, 2006; Li, 2001), this study looked insight to middle-class Chinese parents in Mainland China, and aimed to explore an in-depth understanding of Chinese parents' expectations for their children's education. Based on Epstein's model, combined with information collected from questionnaire survey and face-to-face interviews, this study investigated middle-class Chinese parents' expectations for their children's education, the reasons for their expectations, and the pattern of their parenting.

From information shown in the above tables, this study found that Chinese parents at home, as their peers overseas, put children's education in a critically important position (Li, 2001; Cheng & Sally, 2009), and seriously concerned on their children's learning (Pearce, 2006). The majority of parents in this research considered education as "crucial" for their children's whole life, and valued education's function as the way for their children to learn more about the world, to enhance their social status in the future.

Closely related to their philosophy of education, more than two thirds of parents expected their children to complete at least university level education, and almost all parents wished their children work as professionals, business managers or civil servants. Only 2 parents in this big sample did not mind if their children work as a manual labor.

In order to fulfill the high expectations for their children's future, parents in this study were found to be highly committed to their children's learning and school success, and actively involved in their children's education. About 90% of this group not only daily supervise their children's home-learning, but also communicate study to their children in a high frequency. Quite different with their peers overseas, 100% of these middle-class parents heavily invested in their children's extra-curricular training lessons. More than two thirds of these parents registered at least 2~3 courses for their children, and the yearly expense is more than 10,000 RMB, even up to 30,000RMB. Most of these lessons focused on improving their children's academic performance.

While asked about the reason for their expectations, 50% parents attributed it to the realistic context where the younger generation was under overwhelming pressure from the workforce. With more and more people could afford to study in university, it becomes highly competitive for undergraduates to find a decent job and to live comfortably. In order to make their children win the fierce competition, to lead a comfortable life, what parents in this study wanted to do was to push their children study hard and study well. As Taylor et al. (2000) noted that parenting cannot be understood unless it is placed within its economic, social, political, and historical context. In Chinese context, children's education is somehow a business for the whole family.

As another 20% parents noted, the current university-enrolment system is also a powerful force pushing them actively engage in their children's education. According to China's education policies, children cannot get enrolled in universities, especially "key universities" unless they can successfully pass the difficult university-entry exams. Slightly inconsistent with previous research, where Chinese parents' high educational engagement was attributed to Chinese culture tradition; in this study, only 30% parents thought they were culturally motivated to participate in their children's education, and influenced by the cultural tradition where people highly respect education, and expect for their children's academic success.

Take all together, it could be safe to make a conclusion that Chinese parents in this study not only highly expect for their children's education, but also actively involve themselves in their children's learning by extensively supervising home learning; frequently communicating school issues to their children and generously investing in

children's after-school training lessons. The most powerful driving force of their involvement was the high expectations for their children's future and the fierce competition coming from the workforce.

However, considering the sample of this research as middle-class Chinese parents, and the cultural and economic diversity in mainland, China, it would be cautious while generalizing the findings of this research to parents from other classes and other areas of China.

4th International Conference on New Horizons in Education

Modern methodological approach to teaching business economics for it students

Mária Ďurišová*

*University of Žilina, Faculty of Management Science and Informatics, Department of Macro and Microeconomics,
Univerzitná 8215/1, 010 26 Žilina, Slovak Republic*

Abstract

Effective performance of a university teacher involves not just the proper lecturing competence, but the application of the right methodological strategies to meet student's needs. As for the field of business economics, informatics plays an important role in information processing. The current labour market effects the university education to a large extent requiring a graduate of interdisciplinary knowledge and with the skills to find the solutions to both technological and economic issues. Project teaching method is one of the research methods oriented to students creativity, self- solution and integrated knowledge from several subjects. The process of project teaching method can be defined with the contents of individual activities. The projects activities are accomplished with their solutions and are followed by its evaluation. Of course, the project teaching method has both positives and negatives, but in terms of the effectiveness evaluation, the positives are prevalent.

Keywords: teaching methods, project teaching method, economics, informatics, university education

1. Introduction

There exist many teaching methods distinguished by a number of aspects (source of knowledge, level of student's active approach, operations of thought etc.). They transform the content of education into a particular teaching process. The university education in the Slovak Republic is perceived by both the experts and the general public in a traditional manner, which means that the education methods and forms are combined. A lecture, description and explanation are used the most. The current development trends of building the knowledge society and applying the knowledge management principles result in changes to the university education. The participatory methods and methods of experiential learning have been gradually promoted. "The main obstacle to applying the knowledge management principles in the Slovak institutions is unwillingness of people to share knowledge and make changes in their customary procedures and methods" (Sujová, 2012, p. 96)

From the viewpoint of content the changes to the university education relate to building connection between the disciplines required by the needs of practice. An example of connection between the disciplines is teaching economics in informatics. This means that the students will be educated in informatics, i.e. acquire knowledge for building the systems for supporting the decision-making, programming, applying the procedures and instruments for installing, implementing, operating and assessing the systems of information and communication technologies. In addition to the informatics-related knowledge and skills the students will be able to understand

* Assoc. Prof. Mária Ďurišová, PhD. tel.:+421 41 513 44 00,

E-mail address: maria.durisova@fri.uniza.sk

the system of economic information and its immediate connection to the business management process. By using information from the corporate information system and external sources they will create knowledge from the data, use them and demonstrate the output sets. In order to teach economics in informatics it is suitable to apply the project teaching approach. This method effectively contributes to development of creativity and flexibility in thought and conduct, which at present is a usual requirement in recruiting the university graduates by any company that attempts to increase its competitiveness and performance.

2. Teaching Methods

A teaching method is primarily characterised as the procedure for achieving the objectives of education. “A teaching method is the coordinated system of a teacher’s activities and students’ learning activities focused on achieving the objectives set by a teacher and accepted by the students”. (Maňák, 1990, p. 14)

Classification of methods is diversified; below is provided a systematic overview (according to Harausová, 2011, p. 8):

- Verbal methods, which include monologic (description, explanation, narration, lecture, interpretation), dialogic (debate, discussion, dramatisation) and methods of working with a textbook, book, text.
- Methods of illustrative demonstration include observation of objects and phenomena, showing objects, models, experiments, activities, demonstration of static images, dynamic and static screening, training of locomotive and work-related skills, students’ work in laboratories, work-related methods etc.
- Teaching methods according to the activity of a learning student are divided into narration and discussion, individual work of students, investigative and research activities.
- Teaching methods according to the operation of thought include comparative methods, inductive methods, deductive methods, analytical and synthetic methods.
- Teaching methods according to the teaching phases include motivational methods, exposure methods, fixation methods, diagnostic methods, application methods.
- Teaching methods according to the teaching forms of didactic tools are a combination of methods with teaching forms and combination of methods with teaching aids.
- Critical thinking development methods - Socratic method, the method of questioning, writing, essays, case studies, scenario method, the EUR thinking and learning strategy, etc.
- Methods of creative thinking development – heuristics DITOR, TRIZ, challenging questions method, checklist method, IDEALS, Quickstorming, Brainstorming, project method etc.
- Other teaching methods.

The essence of any teaching method stems in the way of achieving the required status. As illustrated in Fig. 1, the cooperation of three elements is necessary, namely a teacher, student and the content of curriculum. In the teaching process a university teacher acts as a facilitator of the content, helps a student in acquiring knowledge, explains knowledge through examples using an adequate selected teaching methods, points out at common features and connections, explains logical structure and connectivity. “A university teacher should be an excellent pedagogue, should have teaching skills and should be willing to apply them in teaching the students. A teacher should be a professional, who updates and makes lectures and exercises more attractive in order to make them as clear as possible for students and beneficial for the development of their personalities.” (Blašková, M., Blaško, 2012, p. 40)

A student acquires knowledge through an active approach. The level of a student’s active approach is directly proportional to the teaching method selected by a teacher, which has material impact on achieving the goals. Teaching method is therefore a way how a teacher performs activities affecting the way the student acquires

knowledge. “There is no clear-cut guidance on how to select the most appropriate and the most effective method. Selection of the appropriate method depends on the circumstances. It is advisable to alternate the teaching methods, which can be a part of the general change in the culture; however, the impact of the teaching methods on the content must be taken into consideration.” (Vodák, Kucharčíková, 2011, p. 111)

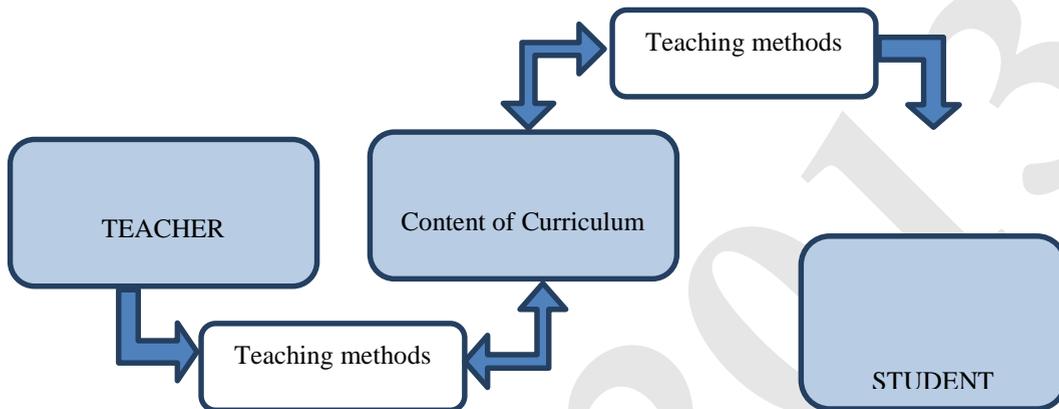

Fig 1. Interaction of Teaching Methods

Given the historical development the universities apply the teaching forms of a lecture, practical exercises, seminar, where in particular a lecture, description and explanation are used. They represent a combination of the teaching methods and forms.

3. Teaching Business Economics In Informatics

The current development trends in the area of informatics divide the discipline into the informatics based on the technologies and the informatics based on information. Teaching of the business economics is substantiated in informatics focused on processing information. The graduates of the Informatics program will be active in the area of economic application of the information systems (business entities, economic departments of the state administration authorities or self-government etc.) in the positions of users, administrators, IT professionals implementing information system settings according to the requirements of users in the business, and to a lesser extent they will work as creators of new information systems. At present the business information systems are based on the ERP systems (Enterprise Resource Planning), which are standardised systems, while creation of the information systems on the basis of business analysis is rather exceptional. They can be employed in both the private and public sectors. The curriculum content of informatics is focused on learning and using the methods and instruments of informatics and information technologies for managing, administering and economising the processes. As a practical discipline the business economics provides the entrepreneurs, economists and managers with information on how to run their business to achieve the highest possible performance and efficiency and how to ensure the status in the market in a challenging market environment (competition). The business economics is a social science discipline dealing with the internal business environment, namely explaining the objectives of a business, phenomena and processes occurring in the business, identifying and explaining positive

and negative consequences of certain conduct, and dealing with management. It is also focused on specification of production, banking, transportation enterprises, business connections and business enterprises.

The conditions for employment of the university graduates in the labour market are as follows:

- permanent education,
- knowledge obtained from several disciplines,
- ability to engage the managers' attention with the products, which can resolve their problems and contribute to growth of sales, reduction in costs, increase of workforce productivity and profit of the business,
- ability to look at the problem solving from the technological and business viewpoints.

Given the employment opportunities with a company, a graduate of the Informatics program will have competition advantage, if in addition to the knowledge of the information and communication technologies such graduate will use the technologies for creating the output sets concerning the business economics and subsequently will be able to assess and interpret them. The teaching process should react to the continuous interconnection between education and employment opportunities in the labour market. The graduates will add value to the information by its interpretation and identification of the context.

4. Project Teaching

The modern education trends put emphasis on the changes in the process of acquiring knowledge focused on building the student's abilities to survey, search and select required and electronically processed information and synthesise such information in coherent knowledge. "Knowledge represents successfully applied information and from the viewpoint of a business the relationship between information and knowledge is very important" (Jacková, 2008, p. 49). Introducing the exercise to students involves describing the activity itself, identifying objectives, providing key definitions, outlining procedures, giving examples, and then questioning to verify student understanding. (Johnson, Johnson, and Smith, 1991, p. 64-65; Barkley, Cross, Major, 2005, p. 67-70) The emphasis is put on building the ability of the students to deal with the huge quantity of new information and ability to use the information. Project teaching is one of the research methods characterised by the highest level of independence in the process of acquiring knowledge.

Project teaching represents an effective teaching method using progressive didactic methods and cooperative forms of work. The main objective is active participation of a student in the cognitive process. It is based on acquiring knowledge through activities, active relationship of a student with the natural, economic or social environment, where the problem is being solved. It is focused on student's experience and it develops thinking structures in association with the processes. Project teaching is the opposite of classical teaching methods, where a student is provided with particular isolated pieces of knowledge. In the project teaching the greatest emphasis is put on creativity of students and their own solution of the assignments, integration of knowledge and experience from several subjects and real life in resolving a particular problem. They learn the abilities of self-presentation, communication and independence.

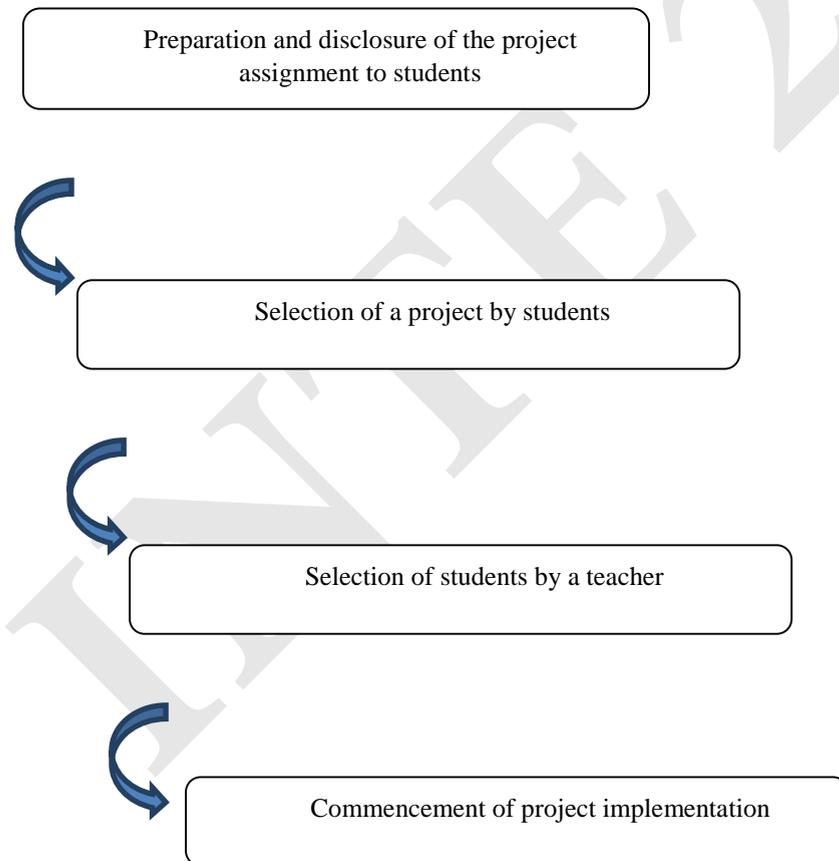

The project teaching represents a difficult process of preparation, process and evaluation of education. The summary of the individual activities is described in Fig. 2 Procedure of the project teaching.

In the preparation phase of the project teaching a teacher prepares the project assignment by defining a problem, setting the objectives to be achieved, partial tasks for achieving the objectives and working methods. This is followed by electronic publication of the project assignment on the faculty's website or school's intranet. The students have several weeks to get acquainted with the content of the individual projects and subsequently choose one of the projects at their own discretion. The project assignments are available to all students. The

number of students that sign up for a project may exceed the limit set by the teacher, who will then select the students for participation in the project teaching. Recommended number is two to five students per project.

The process of implementing the project commences by an introductory discussion of the teacher and students on the problem to be resolved. The students present their ideas how to resolve the issue, since they have information on the project assignment. During the project resolution phase the students consult the teacher and the teacher checks from time to time whether the resolution is on the right track. The teacher focuses on assessing and managing the elements and causal links of the problem (structure and content), decomposition into individual components, calculation methods, tools, methods, re-connection the analyzed phenomenon in the modified whole (system).

The last phase of the project education is evaluation of the implemented project. The students present their methods of resolving the problem and deduced conclusions. The time and place of presentation are disclosed in advance, hence the presentations can be observed not only by the project supervisor, but also by the opponents, other students and other interested persons. “An integral part of education is evaluation, i.e. comparing the objectives (desired behaviour) and outcomes (final performance) of the education. It is a feedback concerning effects of the education activities. Evaluation is important in order to take measures for improving education or ensuring effective application of the learned knowledge and acquired skills.” (Kucharčíková, 2009, p. 175)

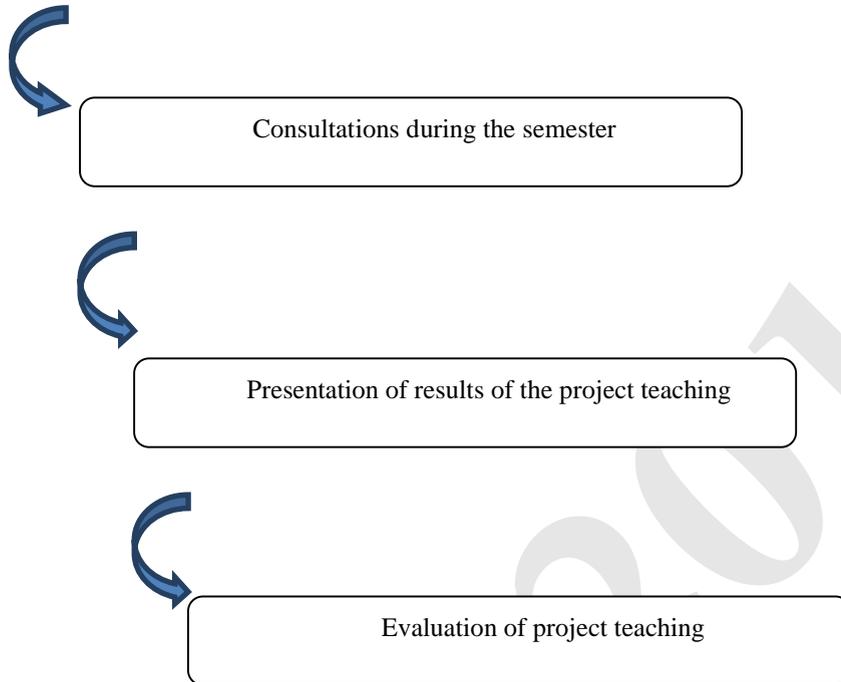

Fig. 2. Procedure of project teaching

The project teaching is motivational, relates to everyday life, it has investigative and research character, all of which represent its benefits. The project scenarios are of general nature and they are further elaborated in cooperation with the students in resolving the problem. Project teaching supports creativity and imagination.

Positives of project teaching	Negatives of project teaching
<ul style="list-style-type: none"> • Building the students' ability to be independent in the process of acquiring knowledge, dealing with huge quantity of information, teamwork, creation of coherent knowledge, creation and interpretation of information. 	<ul style="list-style-type: none"> • Time consuming for a teacher: outlining the project assignment, providing consultations from time to time, working with a small number of students
<ul style="list-style-type: none"> • Connecting knowledge from several disciplines 	<ul style="list-style-type: none"> • Time consuming for students • High professionalism of the project supervisor

5. Conclusion

Teaching methods mean the procedure how a university teacher renders new knowledge to students. The companies select those university graduates which possess knowledge and skills from several disciplines. In practice we record refraining from hiring employees narrowly specialised in programming only. Interconnecting the disciplines has become a trend. Corporate information systems reflect reality of an enterprise. They are based on the modular principle, where the individual modules reflect economic areas of an enterprise. For reasons specified above the article deals mainly with justification of the need to strengthen teaching of the business economics in informatics. The article also includes brief description of the teaching methods and their classification; it justifies use of the project teaching due to its positives. Project teaching is divided into three phases: preparation of the project teaching, course of project implementation, evaluation of results. Each of them includes description of the performed activities.

^bDepartment of Human,Philosophical and Educational Science, University of Salerno, 84084, "Fisciano", Italia

Abstract

On December 27th, 2012 was signed the Directive on "Interventions Tools for pupils with special educational needs and territorial organization for school inclusion", which gives a clear outline on the inclusive strategy of the Italian school in order to fully realize the right to learning for all pupils and students in a difficult situation. The Directive extends to all students facing difficulties the right to an individualized and personalized path, drawn up in a Personalized Learning Plan, which aims to define, monitor and document the most appropriate intervention strategies and criteria for evaluation of learning. From this, first of all, it was felt necessary to build specific protocols for the identification of different categories of SEN and, in reference to that, our working group has decided to use the motor activity context (Motor Literacy Project in Primary School) as an exclusive acquisition and recognition resource: motor activity seen as free and total expression of personality, identity, creativity. Wondering if, previously, someone has already made a collection of evaluation tests aimed at this identification and, considering the division into seven SEN categories draw up by Ianes Dario (physical condition, body structures, personal skills, academic skills, environment, personal context), was processed through the list of some possible tools (tests) useful for the assessment of the presence or not of a hypothetical SEN category.

Keywords: SEN, tools, identification, motor activity, assessment.

1. Introduction

On December 27, 2012 was signed the Directive on "Tools intervention for pupils with Special Educational Needs and territorial organization for school inclusion", which specifies the inclusive strategies of the Italian school in order to fully realize the right of learning for all pupils and students in a difficult situation.

The directive redefines the traditional and comprehensive approach to school integration, based on the certification of disability, extending the scope of intervention and responsibility of the educational community, to the entire area of Special Educational Needs (SEN), which includes: social and cultural disadvantage, specific learning disabilities and/or specific developmental disorders, difficulties arising from the lack of knowledge of the Italian language and culture, being members of different cultures.

The Directive therefore extends to all struggling students the right to an individualized and personalized path, drawn up in a Personalized Learning Plan (PLP), which aims to define, monitor and document, according to processing collegial, the most appropriate intervention strategies and criteria for evaluation of learning, referring explicitly to the principles set out in Law 53/2003.

The concept of Special Educational Need is a macro-category which includes all possible educational difficulties of pupils, the situations considered traditionally as a mental, physical, sensory disability, deficits in specific learning (dyslexia or attention deficit disorder) and several other problematic situations such as psychological, behavioral, relational, socio-cultural.

All these situations are different from each other, but in their diversity, there is a fact that makes them substantially equal in their right to receive individualized attention and effective education: all these people have few problematic aspect, which makes them more difficult to find an adequate response to their needs.

According to the World Health Organization, health is not the absence of disease, but a bio-psycho-social well-being: this is strongly related to social, cultural, economic, racial, religious dimension, that are not biostructurals.

A force that pushes in this direction is the strong and convincing spread that the ICF model (International Classification of Functioning, Disability and Health) of World Health Organization has had and still has in Italy, unlike other European countries.

The ICF model is radically bio-psycho-social and this forces us to consider the totality and complexity of the operations of the people, and not only the biostructurals aspects. It is outlined as a classification that aims to describe the health status of individuals in relation to their areas of life (social, family, work) in order to grasp the difficulties that can cause disability in the socio-cultural context.

Therefore, the ICF will not describe people, but their daily life situations in relation to their environment and emphasize the individual not only as a person with illness or disability, but especially highlight the uniqueness and totality.

The first innovative aspect of the classification emerges from the title. Unlike previous classifications where it was given ample space to the description of the individual diseases, using terms such as illness, disability and handicap (used in negative sense), in the last classification, the World Health Organization refers to terms that analyze health in a positive light (functioning and health).

Ianes Dario (2005) carries out the evaluation of the student according to the model ICF (International Classification of Functioning, Disability and Health, 2001), highlighting specific difficulties in seven main areas: physical condition, body structures, body functions, personal activities, social participation, environmental and personal contextual factors.

Body functions are the physiological functions of body systems, including psychological functions; body structures are anatomical parts of the body such as organs, limbs and their components; activity is the execution of a task or action by an individual; participation is the involvement of an individual in a situation of life; environmental factors are the characteristics of the social and physical world, and the attitudes that may impact on the performance of an individual in a specific context.

As we can see, the body plays a crucial role: through movement is possible for all discuss, questioning, meet each other, relate, perceive and communicate. This shows, in effect, that the subject does not manifest his being only through the forms of thought, but always and at the same time, through the modes of sight, perception, action (Canevaro A., 2007).

Movement in its educational form set, as its objective, the social collaboration, through which the subjects do not only act in a cooperative way, but they relate to each other through a process shared and consolidated. Physical activity becomes, therefore, for the disabled person, the exaltation of his residual capacity, of what he can do and what it can be (Gomez Paloma F., Sgambelluri R. 2012).

Starting from February 2010, as a pilot project, the government issued a Motor Literacy Project in primary school, implemented jointly by the Ministry of Education and CONI with the aim to promote and transmit the value of sport in the social fabric, as a factor of individual well-being and cultural and economic development.

The activities are aimed at the acquisition of motor skills and active lifestyles, in accordance with the Ministerial Directions for the Curriculum.

Through movement, therefore, the child can explore space, know his body, communicate and relate to others; physical education, lived in playful and fun form, then, becomes an opportunity to promote cognitive, social, cultural and emotional experiences.

Analyzing this context, and through the identification and administration of psycho-motor test, it will be possible, then, measure the level of skills and attitudes of the subjects, outlining the presence of any deficits or abnormalities in SEN area.

Normally, however, is not given to a unique and comprehensive test, but to a battery of tests that, measuring the different capacities, can provide a synthetic and analytic assessment, because each specific test contributes to the overall final assessment.

2. Objective

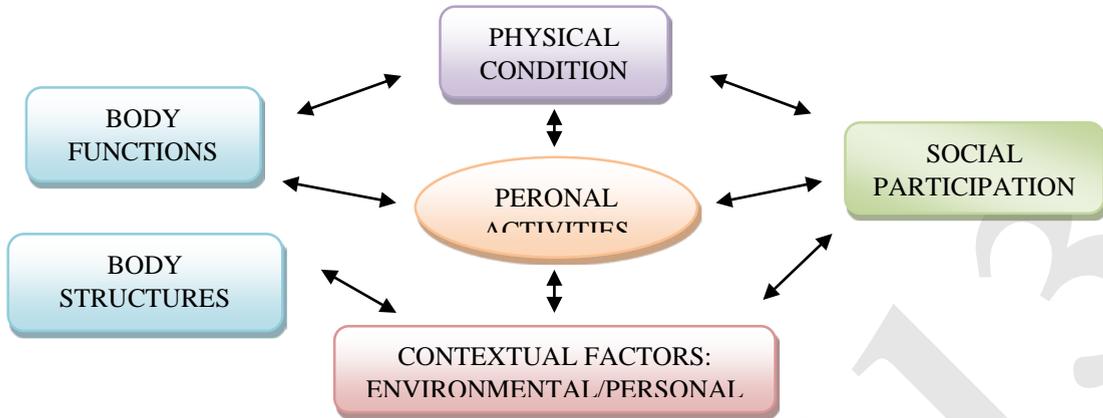

Wondering if, previously, someone has already made a collection of assessments tests useful for the identification of a presumed special needs in a student within a motor context (Motor Literacy Project) and, considering the division into seven categories of SEN by Ianes Dario, dividing it into two major categories (a clinical-physic area and a psycho-relational area), we have created a list of tools (tests) useful for their recognition.

3. Method

Based on a thorough analysis of the Directive cited above, considering, then, the Special Educational Needs that Ianes Dario, analyzing the ICF model, broken down into seven specific areas (physical condition, body structures, body functions, personal activities, social participation, environmental and personal contextual factors) and, dropping our attention in the context of the Motor Literacy Project in primary school, we made a collection of functional assessment tests useful to identify these areas.

However, to simplify the selection, there has seemed appropriate to make a further subdivision of the areas, according to two categories: one covering the clinical physics area and including the difficulties related to the physical conditions, the functions and structures of the body and the other concerning the psycho-relational area and including, however, the problems related to personal activity, social participation and personal and environmental contextual factors. Finally for some tests has been assessing both the advantages and disadvantages of administration.

Fig. 1. ICF model (2001); SEN identification (Ianes D., 2005)

4. Results

Among the assessment tools of the clinical and physical area we have chosen the TGMD (Test of Gross Motor Development), the ABC MOVEMENT (Movement Assessment Battery for Children), the VMI (Visual-Motor Integration) and the LAP (Learning Accomplishment Profile). This first group of tools is useful to identify and quantify any difficulties in movement that could compromise the educational and social integration of a pupil. As regards, instead, the assessment of the psycho-relational component, we have chosen the PSDQ (Physical Self Description Questionnaire), the PSPP (Physical Self-Perception Profile), The PASES (Physical Activity Enjoyment Scale) and the PSES (Physical Self-Efficacy Scale). Each of these tools is useful to assess all of this aspects that concern the motivation sphere, self-efficacy, self-esteem, emotionality.

Table 1. Clinical and Physical area

Test	Authors	Year
TGMD	Dale A., Ulrich	2000
ABC MOVEMENT	Henderson and Sugden	1992
VMI	Beery and Buktenike	1967
LAP	Sanford and Zelman	1984

Table 2. Psycho-relational area

Test	Authors	Year
PSDQ	Marsh et all.	1994
PSPP	Fox and Corbin	1989
PACES	Kendzierski, De Carlo	1991
PSES	Colella, Morano, Bortoli	2008

TGMD

The Test of Gross Motor Development (TGMD, Dale A., Ulrich, 2000) is a standardized test that measures gross motor abilities that develop early in life.

The test is used to:

- a) identify children who are significantly behind their peers in gross motor skill development,
- b) plan an instructional program in gross motor skill development,
- c) assess individual progress in gross motor skill development,
- d) evaluate the success of the gross motor program, and
- e) serve as a measurement instrument in research involving gross motor development.

The TGMD test kit includes the Examiner's Manual and a supply of Profile/Examiner Record Forms. The manipulatives used in the administration of the test need to be supplied by the examiner and consist of materials commonly found in schools and gyms and are available for purchase commercially.

It looks at 12 gross motor skills divided into two subtests:

- 1) Locomotor (run, hop, gallop, leap, horizontal jump, and slide);
- 2) Object Control (ball skills such as striking a stationary ball, stationary dribble, catch, kick, overhand throw, and underhand roll).

The child is given 1 for a pass, 0 for a failed attempt. There are no partial marks. Add the two trials together to get the total score for each performance criteria. Add the total scores for each criteria to get the skill score. At the end of each Subtest (Locomotor and Object Control) add up the 6 skill scores to get the Subtest Raw Score. High scores indicate better performance than low scores.

Strengths:

Test items are familiar activities and easy to explain

- Short time to administer (15-20 min.)
- Materials are commonly available in schools or child development centres and are inexpensive to purchase
- Detailed performance criteria increase reliability when scoring
- Each skill component is analyzed which can pinpoint areas in need of intervention
- User friendly illustrated guide for administration found in Appendix A
- Test items are a good composite of gross motor skills

Limitations:

- Needs a lot of room and a wall
- Test reliability – even at a coefficient of .95 there is still a 15% error built in.

Need to be cautious about making a judgement solely on the test results as they do not tell the whole story of why a child performed at that level on that particular day in that situation. There are other factors to consider such as poor motivation, inexperience, developmental disability etc.

ABC MOVEMENT

The ABC Movement (Henderson and Sugden, 1992) is the most commonly reported norm-ranked assessment used to determine the presence of Developmental Co-ordination Disorder (DCD) in school-aged children. The assessment provides quantitative and qualitative data about a child's performance of age-appropriate tasks within 3 subsections: Manual Dexterity, Ball Skills, and Static and Dynamic Balance. Performance is compared with established USA norms for children aged 4 to 12 years. The Movement ABC is a minimal task set designed to screen for motor impairment rather than provide a profile of a child's motor performance. It takes approximately 30 minutes to administer and requires no special training.

The test is administered according to 4 age bands, each with 8 age appropriate physical test items. Quantitative performance of each item (e.g. time of completion) is scored from 0 (best) to 5 (worst) and qualitative aspects of performance (e.g. body posture) are recorded using standard cues. Item scores are summed producing subsection scores, which are compared to normative tables to determine whether subsection performance is typical, suspect, or definitely impaired. Subsection scores are summed creating a total impairment score, to determine overall performance using the same scales.

Strengths:

The ABC MOVEMENT can be used by many professionals including therapists, teachers and nurses. Its testing procedures are straight forward and do not require interpretation. It provides some guidelines as to how to use the findings as a basis for intervention, which may, for example, suggest the therapist targets, 'static and dynamic balance' or 'ball skills'. If a cognitive operations approach is used in isolation (i.e. targeting only the actual problem activity) then such limited information may be of use for treatment planning.

Limitations:

Unfortunately the ABC MOVEMENT only reveals that a child cannot perform, without indicating why this is so. Further, it is unable to identify children with specific motor co-ordination difficulties such as poor handwriting and poor kinaesthetic abilities and does not provide information on motor planning, bilateral integration, or sequencing. Finally this tool is limited because the subtest scores were not sensitive to change (and should not be used to measure change), even though the total score may reflect change.

VMI

The Developmental Test of Visual-Motor Integration or VMI (Beery-Buktenica, 1967) is designed to identify deficits in visual perception, fine motor skills, and hand-eye coordination. It may be used to diagnose cognitive development disorders in young children through an analysis of visual construction skills. It can be administered to individuals from age two through young adulthood and can also be used to test adults of all ages, particularly those who have been disabled by stroke, injury, or Alzheimer's disease.

The Beery-Buktenica VMI test is used by physicians, psychologists, neuropsychologists, learning disability specialists, counselors, educators, and other professionals. It can be effectively used for the following purposes:

- to identify individuals who are having visual-motor difficulties
- to help diagnose visual-motor deficits
- to make referrals to specific professionals or services
- to test individual learning levels and educational programs
- to monitor the progress of individuals with known visual-motor or developmental difficulties

Limitations:

- Appropriate for Ages 0-6
- Child behavior can affect results
- No single test score is sufficient for making a diagnosis

Strengths:

- Serves as a research tool
- Assesses the effectiveness of educational and other intervention programs
- If identified early on the test makers offer tons of resources to help children get to the level they need to be.

LAP

The Learning Accomplishment Profile (LAP, Sanford and Zelman, 1984) provides a systematic method for observing the skill development of children functioning. The purpose of this criterion-referenced assessment is to assist teachers, clinicians, and parents in assessing individual development. The LAP contains a hierarchy of 414 developmental skills arranged in chronological sequence in six domains of development:

- gross motor (90 items)
- fine motor (73 items)
- cognition (105 items)
- language (59 items)
- self-help (49 items)
- social-emotional (38 items)

As a norm-referenced assessment, the LAP has a number of useful applications for the evaluation and instruction of young children. LAP results may be used in the following ways:

- to determine a child's developmental age in relation to his/her chronological age in the various domains;
- to provide individual skill development information for planning developmentally appropriate activities at home and school based on a child's performance relative to a standardized score. Identification of developmental levels assists teachers in determining the appropriate "starting point" in curriculum planning;
- to evaluate a child's entry and exit skills and/or to validate the intervention program. As a pre-assessment measure, the LAP is a consistent record of the skills the child has mastered prior to admission into the program. As a post-assessment measure, the LAP is useful for the determination of a child's progress and may be useful to parents, teachers, and program evaluators in determining if the instructional program is having a beneficial effect on the child's development,
- to conduct research on the development of preschool, kindergarten, or special needs children;
- to train teachers, paraprofessionals, clinicians, and parents on developmentally appropriate assessment practices.

PSDQ

The Physical Self Description Questionnaire (PSDQ, Marsh et al., 1994) is a 70-item scale designed to measure 10 facets of physical self-concept, along with general self-esteem. More specifically, the instrument is composed of 11 subscales, nine of which are designed to tap perceptions of self related to specific areas of physical fitness and competence, one that measures self-perceptions of global physical competence, and one that

measures global self-esteem. Each of the 70 PSDQ items is a simple declarative statement, and individuals respond on a 6 point true–false scale. The purpose of this test is to see how people describe themselves physically, asking to think about themselves physically. For example, how good looking they are, how strong they are, how good they are at sports, whether they exercise regularly, whether they are physically coordinated, whether they get sick very often and so forth.

It is not necessary to provide identifying information such as names, however, the data should include, age, gender and the country or area of administration and some general description of the respondents, or teachers, or psychology students, etc.

PSPP

The Physical Self-Perception Profile (PSPP, Fox, 1990; Fox & Corbin, 1989) is a 30-item inventory that consists of four specific scales and one general physical self-worth factor. The PSPP was developed to document the physical self-perceptions of college students. It consists of five 6-item scales of sport (perceived sport competence), body (perceived bodily attractiveness), strength (perceived physical strength and muscular development), condition (perceived level of physical conditioning and exercise), and physical self-worth.

PACES

The Physical Activity Enjoyment Scale (PACES) was originally developed by Kendzierski and De Carlo and was made up of 18 items with responses on a 7-point bipolar scale. The scale proposed to assess in general the degree to which an individual liked to practice any kind of physical activity. The new version consists of 16 items with scores given on a 5-point Likert scale, from 1 (completely disagree) to 5 (completely agree). A high score on the positive scale and a low score in the negative one indicate a high pleasure in physical activity. It is also possible to calculate a total score, reversing the scores of negative items and adding them to positive ones, with this procedure, the total score of the PACES can vary between 16 and 80 points.

PSES

The physical self-efficacy (PSES, Colella, Morano, Bortoli, Robazza, 2008) is a 6 items scale based on the physical self-efficacy scale to assess children perception of personal strength, speed, and coordination. Response options ranged from (1) to (4) point format, for example the fourth item, (1) I move very slowly, and (4) I move very rapidly. Children were asked to think of themselves when playing or when involved in physical and sporting

activities. Items 1, 3, and 5 are scored 1-4; whereas scores of items 2, 4, and 6 are reversed. Making the total score to be ranged from 6-24. Higher scores indicate greater self-perception of physical ability.

5. Discussion/conclusion

Through the identification and administration of psycho-motor test, it will be possible, measure the level of skills and attitudes of the subjects, outlining the presence of any deficits or abnormalities in SEN area. Being

aware of the presence of a pupil in difficulty recognizes the latter the full right to an individualized path, drawn up in a Personalized Learning Plan that aims to define, monitor and document the most appropriate intervention strategies. Moreover, in the future, thanks to the collection, analysis and standardization of tests data, it is possible to create an online platform accessible to all, which are selected for each category, ranges of values indicating the positivity or negativity of a specific category.

4th International Conference on New Horizons in Education

Multimedia educational programs for improvement of occupational safety awareness in construction industry

Maria Kozlovska^a, Zuzana Strukova^{a*}*^aTechnical University of Kosice, Faculty of Civil Engineering, Vysokoskolska 4, 042 00, "Kosice", Slovakia*

Abstract

One of the most effective ways to improve health and safety conditions in construction sites rests in sound education and training of people incorporated in construction planning, managing or executing. In our region, the creative approaches are essential to encourage new methods to teach health and safety in a stimulating way. In the paper are presented two multimedia educational programs, both centred on development of construction safety awareness through unconventional teaching techniques. The first one is addressed particularly to designers or future designers and is focused on implementation of well known concept of "Prevention through design (PtD)". The second educational program was prepared and realized within practitioners from construction companies participating in construction projects execution as project managers, site managers or workers. The last part of the paper deals with the effectiveness of safety education in Civil Engineering students.

Keywords: construction, occupational safety, safety education and training, virtual building modelling, teaching techniques

1. Introduction

The construction is one of the most physically demanding and risky sectors. Despite many efforts to enhance site safety performance, construction in European Union still accounts for a disproportionate number of occupational related injuries. The most common results of accidents are absenteeism, productivity loss, and permanent disability and even construction site fatalities. The majority of construction fatalities in the worldwide results from falls from height, burial by earth collapse during excavations, struck by a moving vehicle, motor vehicle, etc. The poor health and safety records in construction are generally influenced by these reasons (Fung et al., 2010): high-risk nature of construction work, building terms decreasing, insufficient health and safety solutions in phase of construction preparation, low demands on site facility according to law, complicated contractor system with big amount of subcontractors, thin exertation of collective protection and technical safety by reason of the building costs increasing, low level and absence or malfunction of safety management and control systems especially in small construction companies and tradesman, as well as low knowledge and a serious lack of construction safety risk awareness of persons in industry. It is not unusual that poor safety conditions at the site are caused by unsuitable behaviour of the workers in their tasks performance and by wrong decisions made by their supervisors, site managers. Going around building sites, we can see insufficient using of personal or other (collective, technique, etc.) protection equipments, what can be known as high gambling with workers health and lives. All the same, it is routine that people at the site are not able to recognize the

E-mail address: zuzana.strukova@tuke.sk

occupational safety risks covered in the building project, they are oblivious of right manipulation for example with toxic materials, etc. Even though, workers and managers from these sites have passed some “occupational safety trainings”, usually based on many rules memorizing.

One of the most effective ways to improve health and safety conditions in construction sites rests in responsible development of construction safety risks awareness and sound education and training of people incorporated in construction projects planning, managing and executing. Sound safety training is a credit for strong safety performance and it is an essential element in developing excellence. According to Vredenburg (2002), a well-designed and administered training programme should emphasize safe work safe work practices and be derived from a true assessment of need. By doing preliminary pilot study to the industry using interview questionnaire survey, Sulastre and Faridah (2012) concluded that an effective safety training belongs to ten major factors that can give positive impetus towards improving safety compliance in the construction industry. Training and education programs play a significant role in enhancement of safety in construction and are important to increase safety awareness (Ghani et al., 2010) and change behaviour of employees (Wong et al., 2000).

2. Multimedia-based educational program aimed at implementation of Prevention through Design concept

2.1. Construction Hazard Prevention through Design

The necessity of incorporating the question of safety into the construction process early on has been an over again theme through more than last twenty years. The ideal situation for the safety of the construction workers is to make this an important parameter for the planners and designers of the conceptual and preliminary design phase (Toole and Gambatese, 2008). Prevention through Design (PtD) is a fundamental concept within the field of occupational safety and health. When designing a work environment, it is better to design out the health and safety hazards than to simply protect the workers from, or warn them of, the hazards (Manuele, 1997). Application of the PtD concept in the construction industry is challenging. The PtD denotes mostly considering the safety of construction workers in the design of a construction project and being conscious of and valuing the safety of construction workers when performing design tasks.

The European Union have appreciated the beneficial impacts of PtD and is leading the way through European Union (EU) directive of 1992 (Council Directive 92/57/EEC of 24 June 1992) concerning minimum demands for health and safety at temporary construction sites. In the directive, the role of the building planner, be it the client as well as the architects and designers, is emphasized as having the responsibility for taking account of the general principles of prevention concerning safety and health during the stage of designing and preparing the project. The directive principles were transposed to the Slovak legislation in 2001, when the Slovak Republic had been preparing to join the EU.

Unfortunately, the idea of workers safety consideration in designing phase of construction projects is often remaining only on the level of legislation article and its implementation in construction practice is rare. Most designers in Slovakia are still satisfied that they are not responsible for construction workers safety. Few of them have recognized the process of incorporation the workers safety issues into construction project design phase, but they misunderstand how to provide it in their practice. They are convinced of their too low construction safety awareness. Their knowledge about the ways to detect and eliminate the construction safety risks is minor for construction workers safety respecting in their architectural, constructional and technical solutions in the design phase.

2.2. Development of the program in the Faculty of Civil Engineering in Kosice

In Slovakia, only students of construction management field of study attend the course intent on construction health and safety knowledge. There is the absence of safety education and training of future architects or designers. No or minimal construction site safety in designer education and training and lack of knowledge of how to design for safety belong to the most meaningful barriers to PtD implementation (Gambatese, 2012). The successful implementation of PtD concept into practice surely depends on design engineer experience and training in the field of construction safety. The creation of suitable supporting tools focused on effective development of skills for early detection of construction safety risks in the design stage and consistent revision of the design solutions or protection equipment planning is inevitable. This need is in the Faculty of Civil Engineering in Kosice satisfied by development of the multimedia-based educational program centered on implementation of PtD concept through increasing the designers' construction safety awareness. According to Gambatese et al (2008), PtD education efforts should cover not only university education but also continuing education. The materials of the presented educational program are convenient for construction safety skills and competences development through lifelong education of practicing designers. The objective of the program comes from the need of establishing the multidisciplinary approaches in construction project design education. It assuredly contributes to increasing the designers and future designers' competences for construction safety risks elimination in the early stage of construction project. The main objective of the program consists in integration of construction safety risks issues into education centred on buildings design. The educational program is developed as the multimedia-based interactive source for e-learning.

2.3. The role of digital design technologies in safety education of designers

The innovative approaches to construction safety management, as well as consideration of construction workers safety in the design phase, are (Zhou et al., 2012) deeply connected with application of digital design and in particular with the building modeling in virtual environment (particularly 4D Computer Aided Design and Building Information Modeling). The potential of digital technologies widely used in designing buildings for creation of design/construction visualization tools focused on design for construction safety implementation is clear.

In the Faculty of Civil Engineering in Kosice are good conditions for application of digital design technologies to enhance designers' skills for PtD implementation. There is an excellent virtual laboratory equipped by high-efficiency computers including right software available for various approaches to construction projects design, operative planning and management. For example, Tekla Structures, Autodesk Navisworks, Revit, 4D Google SketchUp, Solibri Model Checker, etc. (enabling 3D coordination, 4D planning, photorealistic visualization, dynamic simulation and accurate analysis) suit to creation of tools for automated detection and elimination of construction safety risks in designing stage. Such tools can present the base for designers training through unconventional teaching techniques in order to increase their awareness for implementation of PtD concept.

2.4. The complex of the program objectives

In order to realize the mission of designers safety awareness increase, the program involves several partial objectives, among those belong:

- drawing attention to imperativeness associated with establishment of approaches into construction safety risks reduction through building design,
- modifying form and contents of educational and didactic materials and tools in compliance with development

of progressive attitudes to solutions of construction safety risks issues during building lifecycle emphasizing the sustainable construction safety and health,

- facilitating construction safety risks analysis and building designs assessment from health and safety point of view through building information modelling (BIM),
- creating the conception for implementation of occupational safety planning approaches in designing stage into integrated building designing within inventive seminars focusing on occupational injuries prevention,
- enforcing the utilization of digital technologies potential for purpose of creating the tools for automated detection and elimination of construction safety risks in designing stage,
- pressing for incorporation of innovative construction safety planning approaches into lifelong education of architects and building designers,
- ensuring the integration of construction safety risks minimization issues into education focused on building designing in design studio seminars,
- promoting innovations of teaching process by creation of interactive distance educational resource for e-learning,
- allowing learners the creation and communication in an interactive virtual educational environment and so developing their logical and critical thinking,
- motivating learners (by unconventional innovative education technique) to increased concern over creation of self logical verdicts and solutions in field of building designing from construction safety point of view,
- allowing training of variant solutions for complex construction conditions encompassment from construction safety point of view
- realizing the support for the knowledge base development by sharing the pieces of knowledge from foreign internet portals containing the newest information about approaches to construction safety improvement through building design.

2.5. *The contents of the program*

The before mentioned objectives of the educational program are going to be reached by multimedia file of educational sources involved in the program. These sources support the performance of the developed program idea. The multimedia-based files of educational sources include:

- the interactive training tool “Virtual Prevention through Design Tool (VPtDT)”, supporting the effective skills development in field of automated construction safety risks detection and elimination during building designing in dynamic, virtual designing environment (the tool is developed on building information modelling platform and is aimed at selected fields from the key construction safety risks point of view, e.g. excavations, work at height, demolition works, etc.) ;
- the instructional module “Prevention through Design Manual (PtDM)”, containing the set of directions that navigate the learners (users of VPtDT) to its effective exploitation;
- the collection of virtual building models “Virtual Building Models (VBM)”, destined for training and verification of active participating skills in construction safety arrangements’ planning by means of VPtDT;
- the set of educational virtual (multidimensional) presentations simulating the model situations of construction process “Construction Safety Case Study (CSCS)”, that are utilizable for attitudes to construction safety risks reduction training by so called “experiential learning”.

The most meaningful benefit of the program for the Faculty of Civil Engineering in Kosice consists in innovation of educational material (sources) and methods centred on designers training and education from occupational safety risks elimination point of view. Digitalization and accessing of these teaching aids is going to support the presentation as well as the distance form of learners’ education.

3. Developing practitioners skills in construction health and safety and prevention

Although many construction companies in our country have introduced safety and health management system, such as OHSAS 18001 and have discovered the productivity and performance advantages of this approach, success has not been universal. Practically, managing working conditions change is impossible without employee participation and participation is impossible without understanding. This understanding allows the employees to participate in the safety management effort, and helps improve the safety performance of a company. In safety and health management initiative of a company the employees are the ultimate actors and play an important role, they implement the changes in behaviours and routines that are required to reach the targeted improvements in safety and health performance of the company. Employees' participation is important, they should be an important source of knowledge, expertise, and ingenuity when it comes to the company, its procedures and its equipment. In a construction company, participation that leads to better safety and health performance relies on utilization of project managers, site managers and workers knowledge.

Construction companies in Slovakia are in last twenty years inevitably required to adapt to an increasing social demand for safety and health awareness. One of key aspects or necessary conditions for a successful occupational safety management effort in company is the presence of effective safety education and awareness training initiatives. This provides employees, at all levels of the company, with the tools and understanding necessary to conduct themselves in safety aware manners. As much, work-related injuries are often associated with insufficient knowledge and unsafe behaviours of both, employers and employees. Employees tend to have poor attitudes toward safety and health cognition and do not have enough training to manage their risks in the workplace; they have low occupational safety knowledge and mainly low safety perception. Employees should be brought to understand how they may contribute to the efforts for safety performance improvement endorsed by the company. Without their ingenuity and expertise, the safety management initiatives of company may be limited to a number of technical improvements and omit large efficiency gains initiated by the work force. Occupational safety education and awareness training programs are an important part of changing the way businesses conduct their activities. All construction companies should find it necessary to train their staff in safety issues if they wish to survive in a market where it is no longer sufficient to excel in price competitiveness exclusively, but where quality, service, environmental and safety standards also play an important role.

3.1. Teaching techniques in safety education in construction sector

In terms of employees' education and trainings in a company, the target group should be divided upright, according occupational safety responsibility: managers, front managers, ordinary employees divided following the work done type, eventually according to work position. Different work positions require different safety trainings and methods to obtain efficient training results. The aspects of training that need to be considered imply (Faridah et al., 2012): regularity/ time, new employees, effectiveness, performance requirement and specific job safety/ need.

People have assumes, sensual, mental and physical strengths to approach an education consciously, to seek purposely to acquire the needed knowledge and information in favour of themselves and their company. The contents and division of curriculum should be in accordance with previously acquired knowledge of learners and with their overall level. Safety education should be performed in direct relation to employee` professionalism and work activity. Education does not consist only in curriculum providing, it must be adopted and established so that the workers (learners) could retrace and use it at any time. The principle of permanent approach is known as the need of education continuity, continual renewal of knowledge so that the employee was able to react adequately

to changing work conditions and requirements. This principle is applied in safety re-trainings of employees. Education comes from practice, after theoretical reasoning it returns to practical application of theoretical knowledge. So, the most mentioned didactical principles of safety education involve (Kozlovská & Struková, 2010): principle of awareness and activity, principle of illustration, principle of adequacy, principle of durability, principle of systematic and permanent approach and principle of theory and practice unity.

According to Mollahoseini and Shahrooz (2012), the effectiveness of training depends on well designing and implementation of training, learner involvement, learner attitude change, provides opportunity to application new skills and knowledge in workplace, job commitment, top managers views for training, and connection training to organization's vision and strategies.

Teaching techniques in safety education in our construction companies are traditionally based on memorizing the standards and regulations concerning occupational safety in construction. There are still preferred lectures that are considered as a way to introduce new information to a group of learners. But the goals of safety education and improvement of awareness should be better achieved through some forms of practices, by creation and analysis of model situations, eventually by modern information campaigns and promotion actions (posters, eye-catchers etc.). Lectures are often one-way, monotonous, directive and so encourage passivity. Furthermore it does not promote interaction in most cases; the view of the speaker dominates. Many trainers had been teaching their modules for a long time, they are reluctant to change the tried and tested formula and they are not keen to experiment with different types of learning as opposed to the traditional “talk” method. Hence, teaching styles and techniques in safety education should be changed and noticeably moved from lecture-based activities towards more learner-centred activities. People can learn more effectively when are actively involved in the learning process.

The case studies demonstrate successful application of problem-based learning in civil engineering, planning and urban development amongst others (Centre for Education in the Built Environment, 2005). Teaching through case studies is considered as an increasingly popular form of teaching and have an important role in developing skills and knowledge of learners. Through a carefully planned and staged sequence of problems within a professional context, learners can acquire subject knowledge and practical skills in certain problem domain. Problem based learning allows the development and application of student-centred activities using a series of problems or scenarios. At the first stage of problem-based learning, learners are encouraged to use their prior knowledge and discover what issues associated with the new knowledge need further study. Then, learners are activated to search for additional resources to study those identified issues. This approach is one way in which active learning strategies can be implemented in real situations. Case studies can be used to allow the application of theoretical concepts to be demonstrated, thus bridging the gap between theory and practice and encourage active learning. Many case studies are group-based. Learning to collaborate is a useful skill and the ability to produce a group output is an important part of this. Learners are required to produce one or more outputs between them and to present their work in a variety of formats, mainly in oral presentation that improves their presentation skills. Group working has other benefit of allowing students to share their personal knowledge and experiences. This method can be known as the opportunity to provide someone`s experiences to the group in the form of a case study. These experiences are reflected upon and analyzed by the learners to then extract or arrive at new principles. The learners` own experiences, values and feelings form the basis for analyzing others` experiences.

The discussion within the group is done on the basis of learners own past experiences, attitudes and values, from which they arrived at new knowledge and new insights.

Another one non-formal teaching method that could be applied for safety education is a role-play. This method can be used in a variety of ways. One of the ways is that a role-play is a re-enactment of past experiences. All learners are involved to enact an issue or a situation about which they are familiar in their past working at some construction site. This approach is particularly useful where learners share a somewhat similar experience and that experience or issue is difficult to recall because of its emotional valence.

3.2. The educational program for improvement of company employees awareness in occupational safety

Occupational safety and health education of company staff is usually delivered through some educational program and should seek to change the learners' cognitive, affective and participatory knowledge, skills and behaviour. The educational program that we have prepared and realized lately among construction sector practitioners is in general intent on improvement of occupational safety awareness in the sector. Project managers, site managers and workers from a well known and successful construction company acting at our region market took the courses where some unconventional teaching methods (in particular role-playing, paper-based and skit-based case studies and audio-visual methods) were applied. Training methods and topics are tailored to different work positions. The mentioned company is heavy engaged in occupational safety management efforts. It is many years seeking to be an industry leader in occupational health and safety, ethics and environment. This part of the paper deals with our experience of implementation of this training activity type.

The activities within the courses, based on topics demonstrating theoretical concepts in an applied setting, have been centred on learners, on their creating and individual approach to problems solving. Such method of education refuses the legislation memorizing; it develops awareness and inculcates consciousness to the people about the occupational safety and health. Thus, they have more ideas of how they could enhance their participation in promoting all means of positive ways that could benefit them and their working environment. Using of authentic audio and visual information about real events bring more intensive optical, acoustic and sensational perception, what usually leads to better health and safety prevention training. Hence, it is not just about learning, it is about understanding the safety issues and changing workers behaviour, so they can build healthy and safe working environments at the sites. There is anticipation for creation of safety responsibility sense in each worker in the sector.

Our role of coordinator consisted in preparing the manual of training course, the activities within it, in planning the schedule for the day, in planning how to work within and working through the exercises and activities. As trainers-facilitators we instructed, motivated and guided the participants by demonstrating enthusiasm for the topics covered in the course and for the work that the participants were doing and we were receptive to each participant's question and needs. We tried to promote a friendly co-operative environment and usually responded positively to the question put up by the participants. The training program for 400 employees has been designed as a 160 hour course (20 days per 8 hours). Each day another group of 20 employees (separately project managers, site managers or workers) attended the eight-hour course. In addition, the learners solved a few of cognition and attitude tasks pertinent to the problems of occupational safety in construction project execution. For this goal, the group of 20 employees was divided into 4 small groups. People in groups were clearly instructed about the task, time for solution and the form of the results presentation. Each small group presented its results and discussions to other three groups. Discussions and the task solution within one small

group without subsequent presentation and summarization are not worth having. It allowed the learners to be in control, in respect of pace, content and focus. People had opportunities to express themselves. So they could validate their knowledge and skills and clarify, reflect and reconfigure their experiences. Learners seem to learn better or solve more problems correctly when they collaborate with other people, especially when the task is conceptual and complex.

In the end of each course day, the participants completed a questionnaire where they answered few closed and open-ended questions, where they could declare whether such educational approach is meeting the objectives set for it in terms of increasing learners' enjoyment, motivation, content coverage and depth of learning. Participants were invited to fully explain their views and justify their answers. Method of case study dealing with analysis of cases rising from real and simulated situations became the most preferred technique among learners. The learners were keen to discuss among themselves about concrete problems connected with the case. Participants learned each other and sometimes were able to devise original before unknown approaches into some problem solution. The participants appreciated that few of audiovisual case study shots were recorded at their own workplaces, construction sites. This resembled to one perfect unconventional non-formal prevention tool based on watching instructional films made in real construction site where these people work. Learners well know the site, activities and working people. Therefore the problem of occupational safety was perfectly implemented to real situations in which they are everyday. They could find there themselves and could see with hindsight what was done bad or good and so they could learn from that. Such "mirror" presentation and following heated discussion by employees, why did they something so and why no differently, certainly made in their minds more permanent knowledge. Similar "films" could be shown also to workers of subcontractor or to tradesmen so that the company can communicate them by such informal way, what approach to occupational safety is required.

4. Effectiveness of occupational safety education in Civil Engineering students

In order to compare the effectiveness of conventional vs. unconventional teaching method in safety and health education in Civil Engineering students, we decided to conduct a small experiment. Students from our faculty attended the lessons aimed at occupational safety risks reducing in excavation works, concreting works and works at height. Forty students divided into two groups (twenty students in each group) passed their lesson within two different courses. Teacher was the same and time duration of education was the same in both cases. In the first group, the teacher applied the conventional lecture based educational method. During two-hour lecture, the teacher explained the main safety rules of excavation, concreting and at height works and the principle of identification, assessment and controlling of occupational safety risks relating to before mentioned construction works. Education of students in the second group was different. The teacher applied the video scenes, visualising the various situations from the site during excavation, concreting works and works and height. The role of the teacher consisted in commenting these situations and in supporting the educational value of the scenes by providing the beneficial information about health and safety risks perception, identification, assessment and controlling during construction works. After lessons the level of the all students knowledge was checked, in particular their ability to perceive the safety risks in real situations from construction site was estimated. The teacher showed all of them seven different video scenes (not before presented) representing the situations/cases from a real construction site. On the basis of introduced shots, the students from both groups were asked:

- to identify all occupational safety risks covered in the situations from construction works execution and
- to suggest the most suitable measures to avoid the identified risks.

The results of the students' occupational safety awareness, estimated based on the mentioned methodology, is presented in Table 1. There are the percentages of students those solutions of two presented tasks was right.

Table 1. The percentages of students with right answers

Cases/Shots	Topic	Identification of occupational safety risks		Suggestion of suitable measures	
		First group (Lecture based)	Second group (Video scenes)	First group (Lecture based)	Second group (Video scenes)
Case no. 1	Sheeting	55 %	80 %	40 %	55 %
Case no. 2	Foundation pit	30 %	85 %	15 %	75 %
Case no. 3	Excavators	70 %	75 %	30 %	60 %
Case no. 4	Reinforcing	65 %	95 %	65 %	90 %
Case no. 5	Formwork	80 %	70 %	40 %	55 %
Case no. 6	Roofing	35 %	60 %	20 %	60 %
Case no. 7	Multi-story building	75 %	75 %	45 %	65 %

From the results in Table 1 is evident that the right answers/solutions of tasks answered on the basis of presented video shots were more frequent in students from the second group. These are the students which were educated by using of video scenes as one of effective unconventional teaching method.

5. Conclusion

The ideal situation for the safety of the construction workers is to make this an important parameter for the planners and designers of the conceptual and preliminary design phase. But, no or minimal construction site safety in designer education and training and lack of knowledge of how to design for safety belong to the most meaningful barriers to implementation of PtD concept. Construction health and safety education of practitioners in our country is seldom linked to the immediate workplace of the participants and practical solutions are seldom promoted in this education. Teaching practices in practitioners' safety education often tend to be limited to the transmission of knowledge rather than to promote a critical examination of safety problems. The result is that people know legislation concerning their work. But application in construction site is worse. Principles of environmental protection and occupational safety must be embedded mainly in all people awareness (from top managers to "last" assistant laborer), not only in law. The effects of non-formal approaches and techniques in practitioners' education are considerably higher than formal approaches effects. People much actively discuss about some problems if they are applied in real case or real situation. Evenly they submit by themselves their own cases – situations from sites leading to injuries.

In the paper are mainly discussed the two educational programs, both centred on development of construction safety awareness through unconventional teaching techniques. The first one is addressed particularly to designers or future designers and is focused on implementation of well known concept of PtD. In order to the mentioned concept implementation is inevitable to create the supporting tools to effective skills development for detection of construction safety risks through virtual building modelling and for relevant building design revise or protective equipments planning. The second educational program has been prepared and realized in practitioners from the

construction company, participating in construction projects execution as project managers, site managers or workers. The idea of the program prefers the motivation to construction safety risks issues understanding rather than memorizing the legislation principles. Moreover, the brief estimation of safety education effectiveness in Civil Engineering students is presented. The estimation acknowledged that the perception of construction safety risks is higher in students educated by innovative non-formal teaching techniques.

Abstract

There have been extensive studies regarding the use and efficacy of multimedia in education. Although testing and evaluation is another important stage of teaching and learning processes, few studies have been identified in the literature that examine the use of multimedia while measuring students' achievement. In this study we used two different multimedia in presenting an English achievement test. The question items were either presented with static graphics and text or with animated graphics and text. Two different formats were compared in terms of response time and response accuracy. Findings are addressed and discussions are made in the paper.

Keywords: multimedia learning, cognitive load theory, multimedia in testing.

1. Introduction

Cave drawings state people have been fond of using visual images since prehistoric times to express their feelings and thoughts. After a few thousand years following prehistoric times, visual images were transferred from from cave walls to printed books. Nowadays, with the advancement of digital technologies, visuals are not only in printed books but in every aspect of our life. It is for sure that we are living in a more visualized world than a few decades ago (Avgerinou, 2009). Academy has raised a question about this phenomenon: "Why do we use visuals in books and such other learning resources?"

Mayer (2001) answered the aforementioned question with a brief sentence: "People learn better from words and pictures than words alone". He coined the term multimedia learning which refers to the learning from words and pictures (Mayer, 2009). There have been a vast amount of researches focused on the use of multimedia in learning environments. Findings revealed some general rules about how to use multimedia effectively in designing instructional materials. Modality (Kalyuga, Chandler and Sweller, 2000), split attention (Chandler & Sweller, 1992), redundancy principles (Kalyuga, Chandler & Sweller, 1998) are some good examples of these general rules. The principles of multimedia learning are in line with two other theories which explain human cognitive architecture: Working Memory Model (WM) and Cognitive Load Theory (CLT).

The working memory model proposes there are two codes processed by human mind: verbal code and visual code (Baddeley & Hitch, 1974). Phonological loop, visuospatial sketchpad and central executive are the three main components of the Baddeley's WM model. While phonological loop processes speech-based information,

E-mail address: mdindar@anadolu.edu.tr

visuospatial sketchpad processes visual or spatial information. The role of central executive is to develop strategies in merging and integrating verbal and visual codes processed separately by phonological loop and visuospatial sketchpad (Reed, 2006). Baddeley (2001) also introduced the Episodic Buffer component which is able to translate visual and verbal memory codes to each other “such as mentally forming a visual map from verbal directions” (Reed, 2006). In working memory or short term memory, people are able to process two or three items of information at the same time (Kirschner, 2002). Therefore there is a need to regulate information presented to the learners not to exceed their limits of short term memory. Humans also have a Long Term Memory (LTM) where our permanent knowledge is stored and is believed to be unlimited (Kirschner, 2002). WM model had substantial impacts on human cognition architecture theories, specifically in the development of CLT.

The history of CLT goes back to 1980s and the theory had a significant development in 1990s (Paas, Renkl, Sweller, 2003). CLT is concerned with means to overcome the limitations of the working memory. Because human working memory is limited (Baddeley, 2001) and can only process at most 7 elements of information at a time (Miller, 1956), the cognitive load in the working memory should be altered to assist passing of information from limited WM to unlimited LTM. There are three different cognitive loads present in the WM.

Intrinsic cognitive load is about the inherent nature of the learning material (Kirschner, 2002) which depends on the interactivity of elements that should be processed simultaneously in the WM and expertise of the learner (Van Merriënboër & Sweller, 2006). High interactivity among the elements refers to a high intrinsic cognitive load and low interactivity refers to the low intrinsic load. Think of a new vocabulary word you have just faced with. You will just relate it to its meaning in your language and transfer it to the LTM. The mental effort devoted for this activity will be low. On the other hand, think of a Maths equation you are dealing with (Sweller, 1998). There will be several variables interacting with each other and should be processed simultaneously in the mind. Such a situation will cause a high intrinsic load in the WM. Extrinsic cognitive load is not necessary for learning (van Merriënboër and Sweller, 2005), and is caused by the presentation format of the instructional material to the learner (Paas et.al, 2003). If information is not presented in line with the human cognitive architecture, it will cause an unnecessary extraneous load which will interfere with learning. Although organized information or in other words schemata are stored in LTM, first they are processed in WM. The germane load is the devotion of cognitive resources to schema acquisition and automation (Moreno and Park, 2011). While extrinsic load should be kept as minimum as possible, germane cognitive load should be kept high but within the limits of the WM for a better schemata construction and automation.

The announcement of CLT, has also raised an interest to measure the cognitive load. The methods used in measuring cognitive load are grouped as subjective and objective measures (Brünken, Plass and Leutner, 2003). In subjective methods, after being exposed to the learning material, learners are asked to rate their mental effort while learning with the material. Participants fill a 9 item Likert scale to report their cognitive loads from “Very High”to “Very Low”(Paas, Tuovinen, Tabbers & van Gerven, 1994). On the other hand, several objective indicators of cognitive load were proposed in the literature (Brünken, Seufert and Paas, 2003).

Measuring learning outcomes as indicators of cognitive load have been popular in in multimedia studies. Many experiments mentioned in Mayer (2001) and Mayer (2009) are ends with transfer and retention tests which assess the learning outcomes of different multimedia interventions. The biggest objection to the use of a tests in measuring cognitive load is we cannot be sure whether the difference in learning outcomes of control and experiment group was a result of different levels of cognitive load. Another indicator of cognitive load is time invested on the learning material (Brünken et.al, 2003). According to this approach if cognitive load of a material is high, learners will spend more time to comprehend it and vice a versa.

2. Research rationale

There is a vast amount of studies in the literature which examine the use of multimedia features in learning environments. However there is a big gap in the literature to understand the role of multimedia in evaluation process, especially in test items (Saß, Witter, Senkbeil and Köller, 2012). In the current study, our aim was to compare two different multimedia which uses same WM resources in a testing environment: Static graphics plus text and animated graphics plus text formats. Our main intention to compare static graphics and animations was to see whether there is any difference between these two interventions in terms of response time and response accuracy. Since both interventions use same verbal and visual channels, we assume there will be no difference in response accuracy among two groups. However we also assume using animations in presenting questions will cause redundancy and animation group's response time will be higher than the static graphics group.

3. Methodology

An English achievement test was developed for Turkish pupils who learn English as a second language. Test contained 12 multiple choice questions. 116 8th Grade pupils from three different government primary schools in Eskisehir city participated in the study but 4 students could not finish the test due to technical problems. Participants' ages differed between 13 and 14. Pupils were randomly assigned to static graphics plus text group (N=58) and animated graphics plus text group (N=54). The last frame of the animations were given as question item to the static graphics plus text group to provide consistency in both groups. English test was delivered to the pupils in a web based environment where questions were presented in a random manner to avoid cheating.

Fig. 1. An example of question items presented in achievement tests

The test was applied in computer rooms of schools. Students attended computer rooms in groups consisted of 8-12 individuals. While one group was taking the test in computer room, the other group stayed in the classroom with their teachers and followed regular schedule in the school. Students' responses to each questions were recorded separately in millisecond units by the web based environment.

4. Findings and discussion

The Cronbach alfa was calculated to estimate the reliability of the test and found to be ,71. It can be inferred from the Cronbach alfa score that the test is a reliable tool to measure students' achievements. An independent samples t-Test was conducted to examine the difference between response accuracy of static graphics group and the animated graphics group (Table 1). Although animation group scores were higher, no statistically significant difference was observed in terms of response accuracy between statics group and the animation group.

Table 1. Response Accuracy of Static Graphics and the Animated Graphics Group

	n	X	SD	t	df	p
Static graphics	54	5,30	2,879	-1,689	110	.0,94
Animated graphics	58	6,19	2,717			

With the aim of addressing our second research question, an independent samples t-Test was conducted to compare the response times of static graphics group and the animated graphics group. Results show that total response time (in milliseconds) in animation group (N=58, M=273714, SD=87167) was higher than the static graphics group (N=54, M=223356, SD=65384), (t (110) = -3,439, p=001). Results for each question item are also displayed in Table 2.

Table 2. Comparison of Static Graphics Plus Text Group and Animated Graphics Plus Text Group

Group	N	Mean	SD	t Test
Item 1				
Static	54	18819	9673	t=-2,521 df=110, p=,013
Animated	58	23702	10752	
Item 2				
Static	54	17336	7134	t=-3,469 df=110, p=,001
Animated	58	23336	10684	
Item 3				
Static	54	18131	10487	t=-,693 df=110, p=,490
Animated	58	19480	10108	
Item 4				
Static	54	18263	9301	t=-2,229

Item 5	Animated	58	22062	8741	df=110, p=,028
	Static	54	24042	12011	t=-2,926 df=110, p=,004
Item 6	Animated	58	30858	12599	
	Static	54	20741	11551	t=-0,30 df=110, p=,976
Item 7	Animated	57	20953	50670	
	Static	54	18739	9340	t=-4,293 df=110, p=,000
Item 8	Animated	58	27306	11564	
	Static	54	18133	9791	t=-1,949 df=110, p=,054
Item 9	Animated	58	21410	7962	
	Static	54	20245	10275	t=-1,459 df=110, p=,148
Item 10	Animated	58	23141	10704	
	Static	54	15894	8550	t=-1,746 df=110, p=,084
Item 11	Animated	58	19499	12723	
	Static	54	16612	9161	t=-1,247 df=110, p=,215
Item 12	Animated	58	19036	11212	
	Static	54	16400	11416	t=-2,957 df=110, p=,004
	Animated	58	22931	11919	
	Static	54	16400	11416	t=-2,957 df=110, p=,004

The findings support our hypothesis that there will be no difference in response accuracy among the groups. There are four types of graphics defined in the literature. Decorative, representative, organizational, interpretive and transformational graphics (Carney and Levin, 2002). The graphics used in our study are representational since they depict the context of the scene in test items and assist students to comprehend the situation presented

in the question. The contexts depicted by both animated and static graphics groups are same. Therefore our research results assert that animating representative graphics without improving the context has no significant advantage to displaying them in static graphics format in terms of response accuracy.

Findings also support our second hypothesis that response time will be higher for the animated graphics group. According to the CLT, it can be assumed that if performance outcomes (response accuracy) are same for the two groups, then the cognitive load caused by graphics and the animated graphics would be same (Brünken et al, 2011). However measurements of time on task (response time) does not support this assumption. Animation group spent more time on answering questions than the static graphics group which implies that cognitive load was higher for the animation group.

The incongruity between two indicators of cognitive load might be explained by Paivio (1986)'s dual coding theory and redundancy principle (Mayer, 2009). The dual coding theory proposes that incoming information is processed in different channels in the WM according to its modality. Speech is processed in verbal channel and texts and graphics are processed in visual channel. In our study both statics graphics and animated graphics were processed in visual channels. There was no superiority in terms of presenting the information to the students in animated format or in static graphics format. However in animation group students were exposed to more bits of information to be processed in WM than the static graphics group due to moving graphics. This situation might be the main reason of higher response time in answering questions. The similarity of response accuracies in both groups postulates that animating graphics would have caused a redundancy effect. Redundancy refers to "eliminating any redundant material results in better performance than when the redundant material is included" (Kalyuga, Chandler & Sweller, 1998). With reference to the broad definition of redundancy effect, it can be inferred that animating graphics was redundant, therefore produced higher cognitive load and resulted higher response time for the animation group. However cognitive load caused by animating graphics did not exceed the capacity of WM and did not hinder the response accuracy of the animation group. Although not significant, animation group even outperformed the static graphics group.

The results might also suggest that animations can generate germane cognitive load on individuals which results in increased learning outcomes and also more time on processing information in WM. However, these findings should be dealt with caution because the issue of cognitive load is quite complicated and controversial. Further studies should be initiated to determine the role of animations in cognitive load generation and in learning outcomes.

^c Academic Department, University of Colima, Mexico

Abstract

A common and known problem among students on higher education (in general throughout the scholar life) is the difficulty of learning math. Nowadays the teaching methods for learning math remain relatively the same. Though, with the emerging of new technologies like portable devices (smart phones and tablets) and movement interaction devices (Nintendo WiiMote, Microsoft Kinect and PlayStation Move), learners and teachers have big interest on new ways of interacting through the teaching-learning process. In this sense the Natural User Interactions (NUIs) offer a great potential to facilitate new ways of computer enhanced learning, these have the potential to enhance classroom interactions, by increasing learners participation, facilitating the teachers' presentations and creating opportunities for discussion. We present a system that combines gestural and touch interactions to support teaching math across multiple personal devices and public displays to enhance and support math education for college students. In a formative usability study, learners and teachers were positive about the interaction design and the learning possibilities for math education. Thus, this created good intentions in the users of continuing using it.

Keywords: Learning Technnology; Math Education, Natural User Interfaces, Human Computer Interaction.

1. Introduction

Since education is closely linked to the creation of information and communication of knowledge, it is not surprising that the Information and Communication Technology (ICT) present great opportunities in education.

Because of its huge penetration, the first idea that comes to mind when thinking about ICT is perhaps the personal computer in which the interaction occurs through devices such as the mouse, keyboard and screen.

Taking advantage of the advances that have been made in the development of interfaces tangible, gestural, auditory and the release of programming tools for the Kinect sensor and some additional libraries can facilitate the incorporation of the Natural User Interfaces (NUI) to support teaching tools, to facilitate and expedite its use by teachers and students, we can define NUI as those that allow users to interact with systems in the same way they interact with the real world (Widgor, 2011).

A common and known problem among students on higher education (in general throughout the scholar life) is the difficulty of learning math. Nowadays the teaching methods for learning math remain relatively the same. Though, with the emerging of new technologies like portable devices (smart phones and tablets) and movement interaction devices (Nintendo WiiMote, Microsoft Kinect and PlayStation Move), learners and teachers have big interest on new ways of interacting through the teaching-learning process. In this sense the NUI offer a great potential to facilitate new ways of computer enhanced learning, these have the potential to enhance classroom interactions, by increasing learners' participation, facilitating the teachers' presentations and creating opportunities for discussion.

By nature of mathematics have an area of significant opportunity for NUI.

This paper presents the development of a prototype, and its evaluation to support the teaching of mathematics for engineering that allows the use of natural user interfaces under the scheme of user-centered design.

2. Background

The 2011 Horizon Report mentions that are 6 technologies to be used in universities for teaching, learning, research and creative expression. Among them, gesture based computing with an estimate time of adoption of 4-5 years.

3. Methodology

3.1. 3.1 Context of use

The context of use is determined as a result of a process of direct observation and interviewing those who could be potential users of the application: mathematics teachers working with groups of different levels.

3.2. 3.2 Design

The design comes from the need felt by teachers, who for several years have taught and have experienced benefits and limitations of various tools used in the classroom. They suggest some points according to their experience (see Fig. 1).

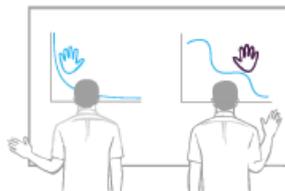

Fig. 1. Proposed interaction.

3.3. 3.3 Prototype

In the first prototype raises two different scenarios: the first one covers the topic of functions, their identification and graphing, the second one covers algebra topics.

3.4. 3.4 Evaluation

Once finished the first prototype, we proceeded to perform a preliminary evaluation which focused on the ease of use of the application and its user experience.

4. Preliminary evaluation

A first prototype was created to test the reaction of students when a system with natural interaction is presented to him, the way he might interact with it and see if it generates any interest in the user, we called this prototype MathNUI see it at Fig. 2.

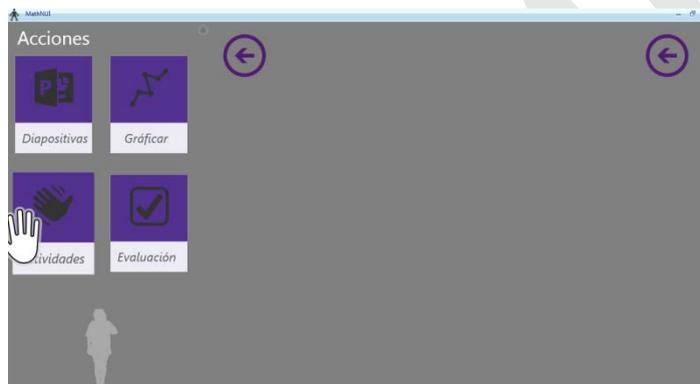

Fig. 2. First prototype: MathNUI.

4.1. 4.1 Testing the first prototype

The potential advantages of natural user interaction cannot be perceived until they are situated in an interaction context.

Preliminary evaluations are an ideal mechanism to go beyond current practices and allow us to get involved in the design process and visualize new schemes of application in a simple and economic way (Santana, 2005).

To explore the feasibility of the conceptual design, a preliminary evaluation was conducted, testing the scenario of use and the prototype with three students from the School of Telematics of the University of Colima (see Fig. 3). These evaluations were video recorded and photographed. The Technology Acceptance Model (TAM) was used. Developed by (Davis, 1989) and the System Usability Scale (SUS) for measuring usability (Brooke, 1996). 25% of the students were men and 75% women.

100% are Software Engineering students, 66.6% of them said that they have not used system with natural interaction.

Fig. 3. Preliminary evaluation.

5. Results

5.1. 5.1 TAM

The purpose of TAM is to explain the causes of the acceptance of the technology by the users. Proposes that perceptions of usefulness and ease of use by an individual in an information system are conclusive in determining their intention to use the system.

For the perception of ease of use, 80% believe that the system is easy to use, 60% agree it is easy to learn, while 40% strongly agree and 60% agree that is clear and understandable, and finally by 100% believe (agree and strongly agree) that is easy to find information on it (see Fig. 4).

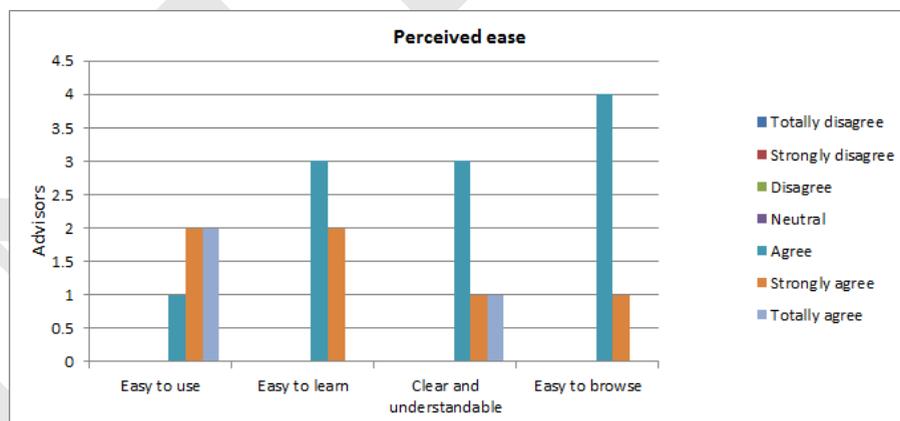

Fig. 4. Results about the perception of the easy to use of the platform.

In the area of the utility perception, of the responders, 60% believe that the system is efficient, 40% said it improved their performance, while 80% said it improved their productivity, and 80% believe that was useful (see Fig. 5).

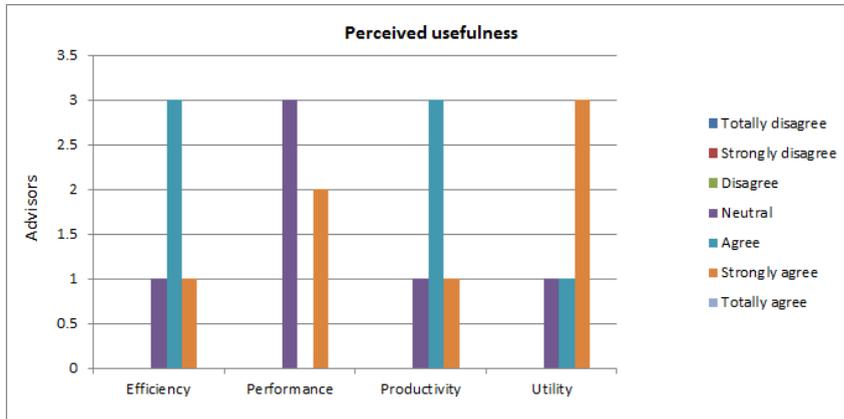

Fig. 5. Results about the perception of the utility of the platform.

Regarding the attitude towards the use, a positive response was obtained for the system: 80% agree that it seems a good idea it software (see Figure 6).

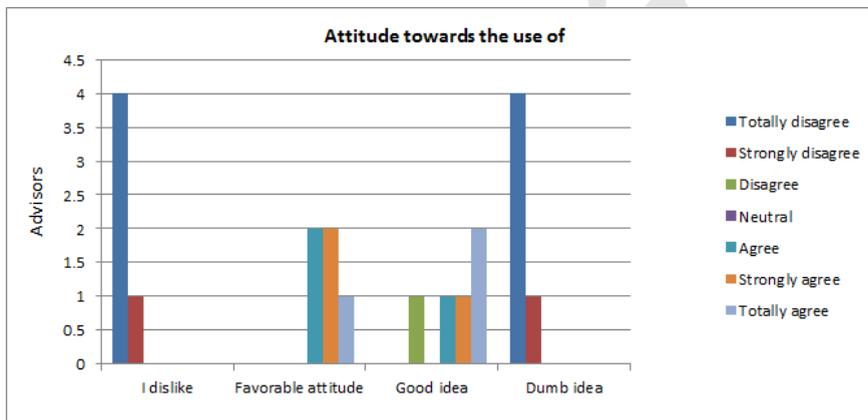

Fig. 6. Results about the attitude toward the use of the platform.

Finally the answer on the intended use, 80% of the users said they would use the system in their courses, use it again and have the intention of use it (see Figure 7).

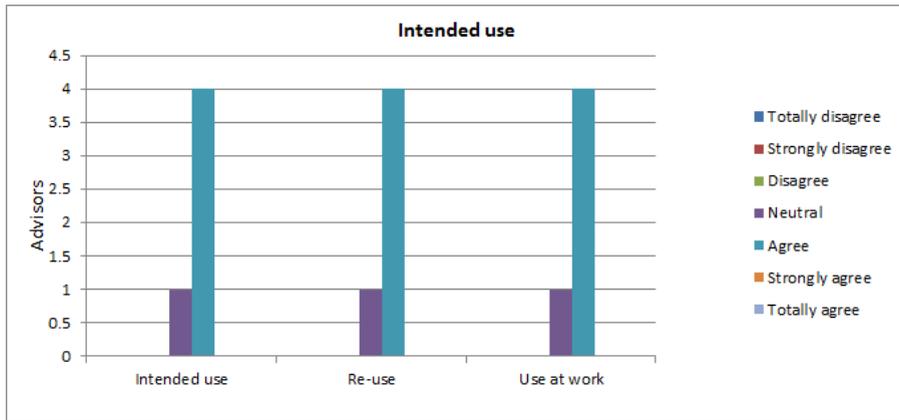

Fig. 7. Results about the intention of use of the platform.

5.2. 5.1 SUS

The SUS is a simple, ten-item scale giving a global view of subjective assessments of usability, has proved to be a robust and reliable evaluation and correlates well with the usability metrics.

The results exposed a frequency of the distribution of SUS scores showed in Fig. 8 from which we can infer that the platform evaluated, at least in the System Usability Scale is going in the right way because 100% of the participants consider their needs satisfied with this platform: between 61 and 100 points of satisfaction.

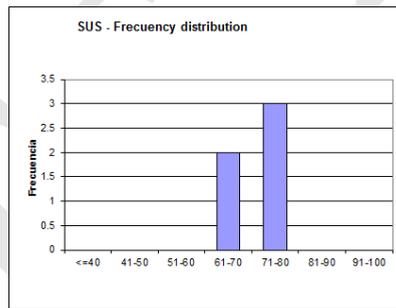

Fig. 8. SUS distribution.

6. Conclusions

This work presents the creation of a NUI math learning system called MathNUI at the University of Colima, for learning mathematical concepts through the use of natural user interactions.

The evaluation of this platform gave as a result that the platform is useful and allows a greater performance and efficiency, and it is also considered a good idea. Thus, this created good intentions in the students of using it again.

As a general conclusion we can say that the use of natural user interfaces to develop math applications for education is adequate.

Acknowledgements

We want to thank the students of the 2013 class of Testing and Usability Methods for their help in the realization of the tests.

This project was sponsored by the IBM Students for a Smarter Planet Initiative through the project “Smart classroom through ambient intelligence and natural interactions”.

Fourth International Conference on New Horizons in Education

Necessity of a dictionary of contemporary art in theory and practice concerning art education

Berna Coşkun Onan*

Doctoral Student, Anadolu University Yunus Emre Campus, Eskişehir 26470, Turkey
Research Ass. Uludağ University, Bursa

Abstract

Technological and scientific developments affecting all disciplines have been infinitely effective in both theoretical studies and application approaches especially among all fields of social sciences beginning from the second half of the 20th century. Reflections of postmodernism, considered as mentality of the era, on educational institutions of social sciences were mentioned as a paradoxical complexity similar to its theoretical applications. Differences in approaches regarding applications by modern and anti-modern viewpoints in education cause an increase in studies focused on theory. In this sense, being places where connection of postmodernism with the art is excessively occurred, higher art education institutions are in interaction with both modern and postmodern structures such as theoretical knowledge acquisition, acquisition of artistic skills based on intellectual foundations and reflecting acquisitions on educational status. For instance, contemporary art courses dealing with today's art with dominance of art historical progress, is important on the one hand in creating application through theoretical foundations and in terms of perceiving how sociological constitutions of periods affect the art; on the other hand in the analysis of similar applications and reflecting theoretical acquisitions on works in studio courses. There are several classes and subject fields supporting each other contents in programs of educational institution of undergraduate level. The purpose of this study is to piece together content similar to a dictionary that may help effective understanding theoretically of the structure of contemporary art related to disciplines such as visual art, linguistics, semiology, sociology and psychology. In this study, which employs qualitative research methods, considering the extent of the scope the study, participants are chosen among instructors of graduate education in the field of art education. Information gathered from the studies of undergraduate instructors is processed using document analysis and data acquisition methods, and finally analysed via concept analysis. Concluding with final commentary on the issue, the research suggests the necessity of such a comprehensive structure, namely a dictionary of contemporary art, for students and instructors of higher education.

Keywords: education; art; contemporary; postmodern; dictionary

1. Introduction

Postmodernism is thought to begin with the end of modernism, namely era of manifestations, a period that started with art impressionism and meant continuous progress in science after the age of enlightenment. It is an understanding and expression method based on the criticism against paradoxes of modernism such as progressive viewpoints, rationalism and being scientific. Within the postmodern art both adopter and critic of modern thinking, theory of gathering from past and combining with the present is applied quite effectively. With the art

* Tel: +0 536 688 8756
e-mail address: onanberna@hotmail.com

losing its functionality as a discipline and wrapping up in interdisciplinary function, we may talk about the same context for all fields with horizontal relation in terms of perception of artistic studies and their socialization. Beginning from the second half of the 20th century, technological and scientific developments effecting all disciplines vertically and horizontally have been infinitely effective in both theoretical studies and application approaches especially among all fields of social sciences. As a way of thought and expression of the era, it is possible to speak of postmodernism as a paradoxical complexity stemming from the differences in treatment of artistic applications by modern and anti-modern views within the context of reflections on educational status as a social sciences field. This paradoxical situation causes increase in effort for developing theories on the relationship between art and education. In this sense, being places where connection of postmodernism with the art is excessively occurred, higher education institutions of art education are in interaction with both modern and postmodern structures such as theoretical knowledge acquisition, acquisition of artistic skills based on intellectual foundations and reflecting acquisitions on educational status. For instance, modern art class that deals with today's art with dominance of art historical progress, is important on the one hand in creating application through theoretical foundations and in terms of perceiving how sociological constitutions of periods affect the art, on the other hand in the analysis of similar applications and reflecting theoretical acquisitions on works in studio courses. For this reason, we can say that postmodernism has extensions in both theory and application.

Another vital issue at the point of reflection of postmodernism on education status is the studies that combine cultures with common experiences in a structure. At this point, postmodern expression shows parallelism with subjects of pluralism and liberation of individual that are based on 'culture' fact. Becoming prominent with the devastation of social culture concept, the notion of cultural socialisation (Akay, 2010) has become a frequently encountered situation in fields of art and education along with sociology. Cultures as separate values and as the most important element forming societies come closer during education process. As a result of individuals' understanding of multiculturalism with their distinct cultures and association of these values in educational applications in pluralistic way, we can come across with effects of multiculturalism in exhibitions and works.

Together with proliferation of this new way of thinking and perception condition, there arises necessity to define new aesthetic perceptions in terms of perception of art. This means disclaiming current aesthetic understandings, just like experienced during Renaissance period in proliferation and approval of new aesthetic understanding with elements of perspective through denying the limits of iconographic and ideological viewpoints of Middle Ages. Aesthetic understandings of reflective theory popularised with the Renaissance left their place to relationality and positionality with the coming of modernism enabling present postmodern works to have formalist aesthetics and then rich variety in terms of material and formation. At this point, as a result of ontological shift that separated from superficial and imaginative fictions and that urged for a perception of location, eclectic assemblies occurred in objects used in emplacements in addition to superficial and fictive eclecticism. Along with this ontological change in the structure of art object, we need to speak of new aesthetic paradigms in perception of the object and changing definition of artist. Artist has now become a person who is questioning the nature of art just like a philosopher and this thinking reminds of Hegel's thesis end of art. In this respect, Hegel inserted "art invites us to intellectual thinking; reason for this is not to create a new work of art but to know in philosophical sense what art is" (Quoted from Hegel: Danto, 2010, p.37).

Considering these changes from the point of criticism of art, works of postmodernism are though not to be explained with words such as reminding and questioning. Even there is a difference between times of creation and final product of an artistic work; it seems natural that certain differences among personal perceptions may arise. As can be understood from here, meaning is continuously postponed and never absolute and unique. Explaining this situation within the relation between language, art and postmodernism, Derrida explained all these differences with the concept of 'difference in interpretation' and '*differance*' (Şaylan, 2002). Conveying all changes in art to individuals through art education plays an important role in the interpretation of contemporary art.

1.1. Problem Status

Included in programs of departments of faculty of educational sciences training art teachers on bachelor's degree and with their contents in parallel with contemporary art, current contemporary art classes and theoretical courses have objectives of comprehending various paradigms of today's art. As a result of technological, sociological and cultural events of last fifty years of the 20th century effecting art infinitely, the art has gained a complex state. This complex structure urges the usage of educational applications gathering several disciplines in class contents and education methods. Because of direct or indirect joining of visual elements of many disciplines into education environments through art, students have difficulty in making sense of concepts belonging to different disciplines, in connecting them with art and in using those concepts among several dimensions such as artistic applications and criticism. These students experience trouble in conveying these non-current and inadequate information. For instance, recently it is possible to come across with anti-modernist language in many artworks biennials and one should have a sociologically critical point of view in better perception of this particular language.

Dictionaries are one of the most important educational materials necessary for creating educational conditions and reconfiguring this information with a social and cognitive understanding. In this context, scanning the related literature, while there exist publications consisting of information about classical and modern periods, technical terms and lives of artists, we have not come across with not any dictionary type publications consisting of information related to postmodern period, certain concepts and lives of artists and also consisting of interdisciplinary terms. For the students who are trying to familiarize with and experience the artworks and artists of current period with the help of course contents, there is an increasing necessity for a dictionary in which they can make sense of concepts related to different disciplines.

1.2. Dictionary as an educational material

In terms of constructivism, material designs and education technologies, aimed at reconfiguration of information gather from education environments and outside, were constructed in accordance with a certain book, educational level and location. According to this understanding, learning is "reconfiguration of past understandings of an individual into a more complex and more valid state and internalisation of acquired learnings with various symbols, images, graphics or models" (Sakalli, 2011, p.49). For this reason, students experience problems in interpretation of several concepts when they combine the reflection of social culture into classes and their cognitive experiences. In the face of these problems, constructivist teacher is in the position of directive and guidance counsellor, urging students to question through questions but does not tell what and how to think. In this case, gaining characteristic of an active researcher, the student feel the necessity for materials that show connections with other disciplines for different approaches and that supports making sense of these concepts. While concentrating on reading for ensuring better learning seems a way of first priority, after reading, it is necessary to conduct activities such as using this knowledge in sentences and real life in practice. Considering the main objective of activities based on reading as understanding the message, at this point the importance of extent of vocabulary emerges. Yılmaz and Koçmar (2009) suggest that "vocabulary is the primary effect on success of a student in understanding what s/he reads", and point out that habit of reading dictionary is one of the various ways of increasing this comprehension. Dictionaries can either comprise of word assets including all words or comprise of all words related to a particular information field (Quoted from Sayal: Yılmaz and Koçmar, 2003). For this reason, they can be utilized as an education material in achieving certain objectives in training.

Dictionary is "a work of art in various qualities and scope that compiles and defines word assets or a certain part of word assets in a language in accordance with an objectives, that exemplifies on the basis of written texts and that sometimes includes grammar explanations" (Kaya, 2007).

When dictionary preparation process is considered in terms of certain discipline and its theoretical and practical paradigms are determined, all the rest subheadings will be integrated with the concept of lexicography. Dictionary preparation purposes are divided into three; training-education oriented, multilingual and scientific-technical dictionaries. In this study, social objectives of lexicography are adopted and a necessity for a dictionary of educational and training purposes is proposed. (Quoted from Мартынюк: Usta 2010, p.97) In forming the education status, dictionary of contemporary art;

- Since it was prepared oriented to a certain context, as a material it provides students with wide point of view in real life usage.
- It should provide students of art education opportunity to comprehend situations they may come across with instances outside the class and in real world and to react actively. Since dictionaries are prepared directed towards educational fields, its priority in adoption to real life should come to forefront and accepted as an objective.
- It should assist students and preservice teachers in having a sense of adequacy and self-confidence with the help of interdisciplinary comprehension style rather than temporary knowledge acquisition.
- It may ease training process and enrich the content with visuals and different connections for words that are difficult to comprehend, and keep enthusiasm of students of art education.
- One of the objectives of dictionary preparation should be its quality as an assistant for students and the society to learn Turkish language better and correctly use it throughout their lives.
- It should support to expand their vocabulary and their art criticism abilities with the words and definition it contains.
- Referring to basic sources, it should teach students where to find required information and resource access in their researches.

In this sense, since materials are not prepared directed towards a target group or a student group, they cannot serve the purpose. Including definitions of art concepts and terms and having characteristic of a primary source as a separate discipline, current dictionaries are class and out of class materials prepared oriented towards supplying students with comprehensive information regarding a certain theoretical and practical field. Dictionaries that aim at explaining word assets of a field and their connections with other fields are called thematic dictionaries. According to Actual Turkish Dictionary of TLA (Turkish Language Association) (2013), theme means major subject, basic motif and staple topic. According to science and art dictionary of TLA (2013), main idea bears the meaning of saturation or unsaturation provided by interaction between a certain pulse and requirement. Related to training, a syllabus means a thought or a recurring subject adopted in terms of an education unit and an educational activity.

Aksan divides dictionary types into two as per their status whether it is based on alphabetical order or not, and they are called alphabetical dictionaries and concept (concept field) dictionaries (Quoted from Aksan: Mutlu 2009, p.816). From the statements of Mutlu, it can be understood that he suggests a methodological unity for thematic dictionaries in a similar alphabetical order like regular dictionaries have. According to Mutlu, "in thematic dictionaries, basic subject and staple topics (headings) should be determined and words should be organized in lexical and listed entries" (2009, p.817). For instance, while basic headlines for the theme, Turkish, are society, science and technology, universe, art, language and literature, abstract terms and things, subheading for this theme is Art: cinema, archaeology, drawing, sculpture and architecture. In this sense, analysing the related art dictionaries, they may be regarded as prepared in a thematic and alphabetical way, however this theme

in question transforms into actual, close to real life and interdisciplinary structure when it comes to contemporary art. It is known that there are many subheadings (of related disciplines) supporting this theme. Some of the subheadings are: linguistics, semeiology, sociology, psychology, philosophy, art history, criticism, psychoanalysis, architecture, public space, technology, museology, aesthetics and artistic application. Since art comes closer to life with postmodernism and continuously in relation with various disciplines, several concepts are added to its word assets. Some of the them are: deferred action, non-centrality, deterritorialisation, deconstruction, simulation, simulacra, appropriation art, parallax, relational aesthetics, meta-instrument, sous-sature, paralogy, metaphor, rhetoric, praxis, axiom, metalanguage, genealogy, society of the spectacle, the law of displacement, artistic aura, reciprocal action, the artist-author, space-time, random materialism, eclecticism, code, codelessness, actionist, installation, video installation, curator, memory, postmodernism, pastiche, parody, uncanny, majority, spatial aesthetics , artefact, text, intertextuality, context, postepistemologic, vulgarized, popularized, supreme, hyper-realism, assemblage, archetype, anthropometric, manifesto, sub-culture, high culture, ready-object, cold art, process art, in situ, happening, conceptualism, serial principle, decollage, famage, material action, making reference, situationism, body art, metaphorical, the art of information, specific object, reductive aesthetic, cultural object, environment, collective memory, to marginalize, multi-cultural, identity oriented art, ironic approach, images of popular culture, graffiti, neo-imagism, the indicator manipulator, social sculpture, decadence, an object of consumption, chromatic, monitor, hybridization, pickup object, rhetoric, not to culture, banality, anthology, catastrophe, fetishism, plain meaning, connotation, synthetic proposition, internalisation, the other, marginalisation, eddy, the neo-geometry... Because of such a discipline variety, it is necessary to apply for primary source and refer to main sources in order to enhance the quality of such an art dictionary with an abundance of concepts. While writing the definitions and explanations of words in thematic dictionaries, it is necessary to benefit from various sources by means of extensive literature review. Literature review, while explaining literary terms, should help readers in understanding depths of terms and in comprehending thanks to several viewpoints of concepts.

1.3. Objective of the research

Aim of this study is find answers to following questions regarding preparation of consitutional structure similar to a thematic dictionary as an education material that may help effective comprehension of the structure of today's art in accordance with its relation with branches of science such as visual art, linguistics, semeiology, sociology and psychology:

- For which reasons is there a necessity for a thematic dictionary that can combine concepts from various disciplines?
- What should this particular dictionary of contemporary art contain different from other art dictionaries?

1.4. Importance of research

Scanning the related literature, there are several dictionaries published in Turkish within the area of art. Through analysing contents of these dictionaries, it can be inserted that these dictionaries contain terms and concepts about various different artistic applications ranging from Mesopotamia art to Fluxus. These comprehensive publications bringing explanations to several understandings, application method, technical materials and terms belonging to history of art meet an important deficit for individuals interested in art. Along with these studies including archaic, traditional, modern and postmodern periods and as a main source for researchers in an inquiry, there are not any dictionaries of contemporary art that contain information and concepts oriented towards providing theory and application unity about today's art. In a survey including visual arts course teacher candidates attending art education on bachelor's degree, Çoşkun Onan (2011) indicated that students

experience difficulties in comprehending certain basic concepts used in contemporary art and criticism of art lessons such as minimalism, pop art, curator, postmodernism, fluxus, manifesto, performance, installation, video installation, post, new art objects, kitsch and conceptual art (Coşkun Onan, 2011, s.15).

Because of field reviews, there have not found any publications with contents based of relationship between modern art and other various fields such as linguistics, sociology, psychoanalysis or urban and regional planning. Compiling of Dictionary of Contemporary Art in such a thematic structure and in an alphabetical form is considered to become a assistant source for visual arts preservice teachers and active teachers, instructors in faculty of educational sciences, students of faculty of fine arts and instructors, also all individuals interested in art.

2. Method

Research was conducted based on qualitative research methods. In qualitative researches based on explanatory tradition, main concern is to analyse limited phenomenon and facts in a most possible depth and descriptiveness. In this research, reason of using qualitative methods is to pioneer the hypothesis applications by thoroughly investigating dimensions related to a current theory. Results obtained from this study are expected to provide depth, detail and meaning to qualitative data. In this sense, a researcher analysing a certain situation with a limited number of participants and creating analytical generalization from acquired results may start to develop a theoretical model or to form a theory (Yıldırım and Şimşek, 2008, p.310).

6.1. 2.1. Research Pattern

This research is conducted fully with qualitative research methods and data are patterned through analytical research. In accordance with analytical method, two distinct data sets of the research (instructor writings and literature data) were analysed with document analysis-data collection technique. Among research methods, there are also other studies conducted without these two qualitative or quantitative classifications. These are analytical (analyser) studies. "Analytical study is a research type that investigates facts, thoughts, concepts or structures with the help of documents, records, voice records or other media" (Mc. Millan, 2004, p.12).

6.2. 2.2. Sample

In the research, three different samples were used. Firstly, eight people from different universities were chosen among instructors who serve in different theoretical and practical courses in Fine Arts Education departments and who combine qualities of educator-researcher and artist all together. Reason for creating a sample based on maximum variety is not to generalize but to find out any common or shared facts among these ranging situations and depending on this variety to put forward different dimensions of these facts (Yıldırım and Şimşek, 2008, s.108). Second sample was form out of 10 sources chosen from theoretical and applied literature of contemporary art with a basis of maximum variety. As a third sample, three art dictionaries published in Turkey were analysed in order to determine the count and ratio of determined concepts. These sources are given in sources section.

6.3. 2.3. Data collection method

As a main data collection method of the study, document analysis method was used. *Document analysis*: It is used in qualitative researches when direct observation and discussion are not possible. It includes analysis of other visual materials such as written material and film, video, photograph regarding required fact or facts. Which materials are of importance depends on the main problems of research (Yıldırım and Şimşek, 2008). In this study,

three types of document were analysed with document analysis data collection method. These are art dictionaries, books from different disciplines forming the literature of contemporary art and writings of instructors.

- *Art Dictionaries:* Adnan Turani's Dictionary of Art Terms (With the code A), Nimet Keser's Art Dictionary (With the code N), Metin Sözen and Uğur Tanyeli's Dictionary of Art Concept and Terms (With the code U).
- *Writings of instructors:* Instructors are asked to fill a form consisting three open ended question such as "About which concepts of contemporary art do you experience difficulty in teaching?".
- *Literature about disciplines related to contemporary art theory:* Art criticism, art, philosophy, art history, types of artistic practice, criticism, sociology, psychology, aesthetics, public space are chosen temporarily in this phase of the research. These fields may be increased in number during preparation and application of dictionary of contemporary art. Determined sources are given in Sources sections of the study.

6.4. 2.4. Data analysis process

In the research, dictionary indexing technique of lexical unit (m) was chosen arbitrarily as a data analysis unit. Analysis of data was conducted with two basic processes. First process is to find out which concepts include (m) lexical unit in contemporary art theory literature, dictionaries and writings of instructors. Second process is to compare the findings with a table and interpret them. Concepts bearing (m) lexical units are given below. Among these concepts, related concepts that will be possibly included in a dictionary of contemporary art are emphasized by underlining. The sample group of terms chosen from dictionaries are given according to alphabetical lexical listing from Turkish dictionaries without translations; main reason for such choice is to interpret statistical data for (m) lexical units in numbers from those dictionaries.

In A dictionary: (chosen from M units in Turkish) mabet, mabeyn, macun, maça, maço, madalya, madalyon, maden mavisi, Madonna, Magdalanien Sanatı, Mağara Devri Sanatı, mağara tapınağı, mahçe, mahfil, mahmuz, mahya, mahya aşığı, mahya kiremidi, mahya örtüsü, mahzen mezar, majolika, makas, maksüre, malakari, malikhane, manastır, manastır tonozu, maniyere, maniyerizm, mansard, manzara resmi, markiz, Mars, mask, maske, mastaba, mastar, mastar çekmek, matraka, Moussoleion, Mavi Atlı Grubu, mavi çini, mazgal, mazgal dişi, mazgal siperi, meandr, Medüz/Medüza, megalit mezarları, megaron, menhir, menora, merkezsel yapı, mertek, mescit, metop, mezar hücresi, Mezolitik, mih, Mısır dor düzeni, mihenk, mehenk ya da mihenk taşı, mihrap, mimarlık, minare, minber, mine, Minerva, minimal sanat, minyatür, mit, mitoloji, mizbah, mobil, mobilya, modelaj, modern, modernizm, modle etme, modülasyon, moloz döşek, moloz duvar, moloz taşı, monografi, monogram, monokrom, monolit, monopil, monopter, monotipi, monumental, motif, mozaik, mozaik sıva, mucarta, Mudekhar üslubu, muhakkak, mukarnas, mulaj, mum heykel, mumlu boya, mumlu kil, Müdejar üslubu, mühür oyma, müz, müze, müzehhip.

In N dictionary: (chosen from M units in Turkish) macenta, Madonna, maesta, mağara resimleri, mail art, majik gerçeklik, maket, mandala, manifesto, maniyere olmak, maniyerizm, Marksist estetik, maruflaj, massürrealizm, matriks, Mavi Atlı Grubu, Mac art, mecaz, medium, mekan, mekanik sanatlar, merdane, metafizik sanat, metaphor, metal uç, metamorfoz, metanimi, mezopotamya sanatı, mezotint, mısır sanatı, mimesis, mine, minimalizm, minyatür, mit, mitoloji, mobil heykel, model, modelaj, modernist sanat, modle etme, modülasyon, modülasyon kadanse, mono baskı, monogram, monokrom, monokromatik, monotip baskı, monoton akromatik renk, monoton kromatik, montaj, motif, mozaik, mulaj, multimedia, mum, mum yok etme tekniği, mural, mürekkep, Müstakil Ressamlar ve Heykeltraşlar Birliği, müze.

In U dictionary: (chosen from M units in Turkish) mabet, mabeyn, mablak, macellum, macun, macun tekniği, maça, maço, madalya, madalyon, madırğa/matraka, Madonna, maesta, mafraş, mafsal, magribi, mağ, mağara resmi, mağaza, mahalle, mahçe, mahfil, mahmuz, mahrama/makrama, mahya, mahya kiremidi, mahya kirişi, mahzen, mahzenmezar, mail, majestas domini, majik gerçekçilik, majolica, makam-I ali, makas, makas kirişi,

makat, maket, makılı, makina estetiği, makrama, maksem, maksure, makta, mala, malakar, malakari, malta bıçkısı, malta taşı, maltız, manastır, manastır tonozu, manazır, mandala, mandapa, mandorla, mangal, maniera greca, maniera tedesca, manifesto, manken, mansard çatısı, mansiyon, mantarağacı, mantar döşeme, manueline, maniyerist sanat, manyerizm, manzara bahçesi, manzume, maristan, marketöri, markiz, marley, maroken, Mar grubu, marsilya kiremidi, martyria, martyrium, masa, masgala, masif, mask, maskala, maskaron, maske, maslak, mastaba, mastar, mastos, maşallah, maşraka, mat, matbah, matrab, matraka, maun, mavi-beyaz çini, Maya sanatı, mazgal, meandr, medici vazosu, medine, medrese, medium, mefruşat, megalit, megalitik, megalopolis, megaron, megastrüktür, mekan, mektep, menazır, meneviş, mengene, menhir, mensa, menteşe, menzilhane, menzil taşı, merdiven, merdiven boşluğu, merdiven kovası, meremmetçi, meridyen koltuk, merkezi plan, merkezi yapı, mermer, mermer sıva, mertebani, mertek, merz, mescid-i cuma, mescit, mesire, mesken, mesmet, meşe, meşk, meşk kağıdı, meta, metafizik resim, metop, metraj, metris, metro, metropol, metropoliten, mevlevihane, meydan, meydanlık, meydan odası, mezar, mezarlık, mezar taşı, Mezopotamya sanatı, Mısır sanatı, miskala, miğferli aryballos, mihada, mihenk taşı, mihrabiye, mihrap, mihrap duvarı, mihraplı, mihrap-önü kubbesi, Miken sanatı, mikleb, miktal, milli mimari, mimar, mimar çapı, mimar-i sani, mimari, mimariye, mimarlar odası, mimarlık, min, minai teknik, minare, minber, minder, mine, mineli, minemsi teknik, minimal sanat, minkar, minos sanatı, mişar, minyatür, minyatürcü, mirkat, miskab, mismar, misra, mistik delta, mi'şar, mi'tede, mithraeum, mitoloji, mitolojik, mitra, mixed media, mizab, mobil, mobilya, moda, model, model kalıbı, modernist, modernizm, modern mimarlık, modern sanat, modlaj, modle, modele etmek, modül, modül, modüller, modüller koordinasyon, modüler planlama, modül ızgarası, mo-fang, moloz duvar, moloz taş, moncuk, monografi, monogram, monokromi, monolit, monolitik, monopil, monopter, monostil, monotip, morbidezza, mortuarium, motel, motif, mound, movimento nucleare, mozaik, mozaik sıva, mozarabik sanat, mozeta, mozole, mucarta, muderaaj üslubu, mudra, mu-fang, muhaccer, Muhafaza-i Asar-ı Atika Encümeni, muhakkak, muhavvata, mukarnas, mulaj, mum makası, mumya, mumya portresi, murakka, murç, musakkafat, musalla, musalla taşı, musandıra, musanna, musattah, musavvir, muskalı, mutalla, mutfak, mutulus, muvakkithane, mucahir alan, mücellid, mücevveze, müezzin mahvili, mühendishane-i Berri Hümayun, mühre, mükebbire, mülebbin, mülemma şemse, meülevven şemse, Müstakil Ressamlar ve Heykeltraşlar Birliği, müşebbek şemse, müşrefiye, müştemilet, müze, müzehhep, müzehhip, müzeyyen, müzikalistler.

From the books of contemporary art theory literature, 'm' unit concepts are: mail art, manifesto, manipulation, marginalize (to), Marxism, Marxist aesthetics, mass media, matte key, materialaction, materialism, maximal interpretation, metaphor, meditative, medium, media, media art, media and society, space, illusion of space, merkezsizleştirme (decentralized), meta, meta-instrument, metaphor, metaphorical, metonymy, text, intertextuality, mimesis, mimetic, hybridization, and minimalism / minimal art, furniture-sculpture, modeling, modern, modernity, modernism, modern culture, modernist ideology, monatlaştırmak, monitor, monochrome monologue, multi-media, author / artist, mülksüzleştirme (dispossession), museum.

Concepts with 'm' lexical unit chosen from writings of instructors are: manipulation, Marxism, media art, metaphor, modern, montage, mutation, multivision, monochrome, modernism / modern art, modernity, mail art, minimalism / minimal art, moulage.

Table 1. Concept Analysis Table (concepts with 'm' lexical unit)

Analysed data set	Acquired unit count	Common in A dictionary	Common in N dictionary	Common in U dictionary	Total words
Literature data	46	3	10	5	18 (5%)
Reviews of instructors:	14	2	3	3	10 (%2,7)
Total	60	5	13	8	360 (%100)

3. Conclusion and Discussion

3.1. Conclusion

- According to analysis results acquired, ten sources chosen as literature were scanned and several concepts that explain, support and concern contemporary art from the point of different disciplines were found. Among these concepts, those starting with 'm' unit are found to be 46. Of these 46 concepts, their exact match count is 18 with a ratio of 5% within the 360 concepts starting with 'm' in three dictionaries.
- Concepts instructors inserted with (m) lexical unit were 14 units. Of these 14 concepts, their exact match count is 10 with a ratio of 2.7% within the 360 concepts starting with 'm' in current dictionaries.
- The ratio of including contemporary art terms is 7.7% in these three dictionaries including all concepts from various historical art periods.

3.2. Discussion

- This study suggests that contemporary art class are added to educational programs in order to provide Turkish visual arts preservice teachers with more aesthetic, sociological, philosophical and critical approach to contemporary art and with a closer watch on artistic developments. Because of comprehensive structure of these lessons, additional sources are needed to support both theoretical and practical information of students. Therefore, a dictionary of contemporary art is regarded as similar source.
- Total assets of current dictionaries regarding contemporary art are low in quantity with a ratio of 7.7% found through numerical analysis. Similarly, it seems impossible to suggest that current dictionaries help students of higher education in the course of comprehending and self-development regarding contemporary art. Accordingly, a necessity emerges for dictionaries that include information oriented towards theory and practice regarding contemporary art.
- This planned dictionary of contemporary art is thematic since it will include information about art starting from the second half of 20th century to present; it is interdisciplinary since it will have connection with several fields closely or remotely in relation with contemporary art; and it is alphabetical as an educational material for continuous consult by students of art.

4th International Conference on New Horizons in Education

Network affordances through online learning: Increasing use and complexity

Karim Hajhashemi^{a*}, Neil Anderson^a, Alireza Shakarami^b^a*School of Education, James Cook University, Cairns 4878, QLD, Australia*^b*Department of English, Kazerun Branch, Islamic Azad University, Kazerun, Iran*

Abstract

Computers, mobile devices and the Internet have enabled a learning environment described as online learning or a variety of other terms such as e-learning. Researchers believe that online learning has become more complex due to learners' sharing and acquiring knowledge at a variety of remote locations, in a variety of modalities. However, advances in technology and the integration of ICT with teaching and learning settings have quickened the growth of online learning and importantly have changed ways of learning and course delivery. Hence, there is a need to weave together the ICT experience of teachers to integrate ICT for appropriate and augmented learning.

Keywords: course delivery; ICT; network affordances; online learning

1. Introduction

The advent of computers, mobile devices and the Internet in particular, has enabled a learning environment called online learning. Researchers (Ramli, Darus, & Bakar, 2011) believe that online learning has become more complex due to learners' sharing and acquiring required knowledge at a variety remote locations. However, advances in technology and the integration of ICT with teaching and learning settings have quickened the growth of online learning and primarily have changed the way of learning and course delivery. The internet and networked technologies have well prepared the ground for flexible approaches to learning. In 2000, some higher education courses delivered on-campus were beginning to see the benefits of blending face to face with online delivery, but now all subjects at many universities and institutions of higher education mandate the inclusion of an online component, regardless of their mode. For example, the number of students who took at least one online subject was more than 1.6 million in 2002 and within six years (i.e., in 2008) the number rose by almost three-fold to 4.6 million (Allen & Seaman, 2010) with a compound annual growth rate of 19 percent. As a primary source for learning, the Internet has provided the availability of free and open enrolment in a variety of courses through massive open online courses (MOOCs). Considering the changes in educational aspects in parallel with technological innovations and different types of ICT resources, it is vital to consider the integrated innovations to facilitate the most effective learning and teaching. This paper will explore current trends in the literature pertaining to online learning in higher education.

2. Literature Review

Increasing use of the Internet and almost constant online connection has attracted the attention of researchers to the use of online implications for educational purposes. Accordingly, the use of online learning has grown significantly around the world and has provided abundant opportunities for school-leavers and higher education applicants to fulfill their dreams with reduced anxiety about time management, location, and pace of progress off-campus issues. Online learning has made it possible for the educational institutions to increase the accessibility and opportunity of learning for those whose access was limited in the past. For instance, online education has become a fast growing sector of higher education in the United States (McBrien, Jones, & Cheng, 2009). Sun, et al. (2008) believe that “e-learning’s characteristics fulfill the requirements for learning in a modern society and have created great demand for e-learning from businesses and institutes of higher education” (p. 1184).

Thirteen years ago McNabb, Valdez, Nowakowski, and Hawkes (1999) argued that technological modes of instruction should be utilized as learning environments to enhance and expand learners’ capabilities, and therefore, to better accommodate the needs and requirements of learners and to assist them to reach higher levels of achievement and knowledge construction. Owing to the growth of new technology, online learning has shifted “from the domain of distance education to encompass all modes of educational delivery” (Anderson & Baskin, 2002, p. 136). For instance, Radford (2011) states that the number of students taking at least one online course has been increased from 8 percent in 2000 to 20 percent in 2008. Exploring students’ reasons for taking online courses, Braun (2008) claims that the most prevalent ones are related to financial reasons, flexibility, and the ability to complete course assignments, readings, and other requirements from home. Jensen (2011, p. 298) also speaks of the ‘almost universal access’, ‘increased flexibility’, and ‘preference among young adults’ as the factors contributing to the appeal of online courses. Any change in education systems as claimed by Farrell (2001) is mostly happening to achieve one or more of the following goals: improvement of access to educational opportunities, enhancement of quality in terms of both standards achieved and the learning process, and improvement of efficiencies such as increased productivity, greater return on invested capital and cost reduction or containment.

However, providing students with the opportunity of complementing internal classes with the online alternative has been one of the crucial developments. Traditionally, courses were offered in internal or face-to-face mode. Today, however, owing to the growth of technology, some courses are offered fully or partially online. This use of the internet improves the accessibility of tertiary education for all. This mode of internet learning and teaching would be also beneficial to those students who otherwise could not participate internally. For instance, in James Cook University both internal and external courses are offered in order to respond to the distinct demands of students; the internal courses include both face-to-face contact and online material whereas in the external subjects the students only study online. These modes of delivery may never entirely replace direct face-to-face involvement, but they have the potential to augment traditional instruction. For instance, Cooper and Sahami (2013) claim that online learning can serve as an effective means to students when other forms of delivery are not available. Accordingly, universities have utilized a number of online affordances to support learning and teaching.

Contention exists about which mode of learning delivery is superior. While some believe a face-to-face mode of instruction is superior to an online mode of delivery, others suggest that online courses should be used as a replacement or supplement to face-to-face classes. A third argument is that a blended learning experience that integrates technology-media supported and web-based applications is superior. As defined by Bath and Bourke (2010), blended learning is “effectively integrating ICTs into course design to enhance the teaching and learning experiences for students and teachers” (p. 1). Further, the authors state that blended learning engages both

teachers and students “in ways that would not normally be available or effective in their usual environment” (p. 1). Two recent research publications (Angiello, 2010; Bakia, Shear, Toyama, & Lasseter, 2012) have reported on this issue. The findings of both meta-analysis reports reveal that the performance of students taking all or part of their courses online is better than their face-to-face counterparts. Likewise, they report that a combination of online and face-to-face instruction has more advantage relative to merely face-to-face instruction or solely online instruction. Accordingly, Richardson et al. (2012, p. 98) suggest that “online learning deserves more serious and more rigorous study” to identify the properties of successful learning environments.

Online learning has the potential of generating new revenue and providing learning opportunities for those with limited access to traditional courses. This mode of learning works best for people who are well-organized, self-motivated, and able to manage their time (Gansler, 2007). Furthermore, online affordances and web tools give more communication chances to students who seem to be shy and introverted through giving them more chances of communicating and expressing themselves. The online environment gives them the privacy and space that they do not find in ordinary face to face interaction (Dewar & Whittington, 2000). Taking part in the online interactive communication makes them feel more positive about their learning abilities as they do not need to take turns to speak or worry about interruptions. However, online learning has also shown to have the disadvantage of high dropout rates and failure in the competitive market (Sun et al., 2008). Some users stop their online learning after an initial experience (Sun et al., 2008). Curless (2004) enumerates lack of finance and time, isolation and lack of self-discipline and motivation among the reasons of dropouts.

Online affordances, web tools and new technological innovations are typically designed to improve the quality of learning and teaching. However, the reverse could be true. Thus, it is important to consider the advances in contemporary pedagogy in parallel with technological innovations and different types of ICT resources.

2.1. Net-generation students

The emergence of the Net-generation indicates that universities have to address and include the role of technology in their teaching and learning. Net-generations are born into and grown up in an era of computers and the Internet and frequently use them. They have grown up in a highly wired environment (Ismail, 2010; Oblinger, 2008; Worley, 2011), are almost always connected via new devices and social networking interfaces. The Net-generations are “demanding a change in the classroom because of their ability to gather information faster than any other generation” (Sheskey, 2010, p. 197). Dede (2005) also believes that as the result of growing up in a rapidly changing world, Net-generations are fast and like quick response times in all the acts of their life, for example, playing a game or responding to an instant message (IM). They place more value on speed than on accuracy. Their different learning patterns as well as reasoning principles may head them in a different way of learning compared to their previous cohorts (Shakarami, 2012). They are exposed to oceans of information on the Net and it is this immersion in virtual environments that may make their learning different from those of earlier generations. According to Windham (2005), although online communication is often viewed as contrary to personal interaction, it is not certainly seen as such for the Net-generation. The Internet has become a medium of interaction for them through its global reach that provides vast international resources and enables learners to access useful learning material and opportunities. In a survey conducted by Terrell (2005), it was revealed that considering the computer and Network facilities handy to Net-generation, it is not surprising that they possibly expect technology to support their learning. The Internet provides them with the chance to get in touch with friends, take part in online talks, and share videos and clips with friends all around the world. In short, it allows interaction with people and material to a great extent. According to Prensky (2001), Net-generations have more tendency to communicate visually, integrate virtual and physical, learn better through exploring, like instant

responses and can quickly change their attention from task to task. They like online socialisation, blogging, and interactive activities. They often perceive the Internet as an indispensable part of their life in that it makes things faster, facilitates learning, helps shy students express their ideas, and lets students cooperate more in their online interactions and most importantly, keeps them connected to the outside world at all times.

Although Net-generation learners spend so much of their time online and are plausibly expected to have a strong preference for online courses, the reality is sometimes otherwise. Oblinger and Oblinger's (2005) survey study found that "face-to-face" interactions were preferable to online options (p. 2.11). According to the researchers, "the implication is that colleges and universities should not assume that more technology is necessarily better" (p. 2.11). In their perspective, utilizing the technology "to increase customization, convenience, and collaboration is well received; however, its integration into most courses or curricula is not as deep as into students' personal lives" (p. 2.11). In another study (Kvavik, 2005) carried out among 4000 students, they were found to have a "moderate preference for technology" with regard to teaching and learning. They also had "mixed feelings" towards use of technology in the classroom, and believed many of the ICT skills necessary for learning were acquired at college (p. 7.17). In this regard, the relative efficacy ICT and technology in online and face-to-face courses is still under question and needs to be revisited.

2.2. *Massive Open Online Courses (MOOCs)*

Massive Open Online Courses (MOOCs) are a relatively recent online learning phenomenon in modern education delivery that has significantly attracted the attention of media and higher education providers. MOOCs are free courses delivered through the net to a large number of students and were first introduced in 2008 by Dave Cormier (Yuan & Powell, 2013). MOOCs have the potential to take advantage of the changes that are currently happening in higher education due to globalisation of education, constrained budgets and the new demands of the information age and Net-generations. The existing wave began in 2011 with the enrolment of 450,000 students for three courses delivered by the university of Stanford (Vardi, 2012). Over the last five years, many prestigious universities have introduced MOOCs (e.g., Harvard, Stanford, MIT, Berkeley), with many more investigating the feasibility of this mode of education (Paldy, 2013). Recently, the University of Melbourne became the first Australian university to offer free online courses in higher education. The University's first MOOCs was offered in 2013 and is heavily subscribed with more than 148,000 enrolments. Through MOOCs, the university attempts to reach a wide and diverse range of learners who otherwise may not have the chance to set foot on a university or college or may not care about credits.

Despite its recent growth and popularity among some prestigious universities, the authors believe that MOOCs will not replace universities and cannot be considered as an alternative credential to the traditional degree. MOOCs have the potential to assist higher education in solving some of the problems to control their unsustainable costs, increase their enrolment rates, increase their graduation rates, and to compete and win the attention of students in order to survive among multiple higher education providers. However, MOOCs are still in their infancy. They are suffering from the lack of serious pedagogy (Vardi, 2012), the market value of certification of courses (Cooper & Sahami, 2013; Yuan & Powell, 2013), short of credit awards (Yuan & Powell, 2013) and plagiarism (Cooper & Sahami, 2013) and other yet to be revealed factors. Vardi (2012) states that "the enormous buzz about MOOCs is not due to the technology's intrinsic educational value, but due to the seductive possibilities of lower costs" (p. 5). Thus, the current trend of learning and its impacts on the quality of learning and course delivery needs further investigation.

In summary, the changes happening in higher education are inevitable. With the advent of new technologies and demands of the new generation learners we should expect more educational changes in higher education. There is no doubt that the courses can still be delivered without considering the new changes and the integration of new technologies brought about by the Internet. However, there could be a severe disconnection between the teachers and their students as the way that they will be taught in universities and schools will differ from the world that they live in. We also believe that implementing any change or integrating any new technology in education has its own challenges and complexity, like anything new and that strategies to support implementation should be backed up by high quality, empirical evidence provided by research to avoid wasting potentially expensive resources or by not using digital technologies in a way that will ensure that they reach their potential in scaffolding learning.

4th International Conference on New Horizons in Education

New approaches in design and vocational education: impact of the internet design education and digitalize

Nursan Korucu Tasova^{a*}

^aIstanbul Aydin University, Faculty of Fine Arts, Istanbul 34295, Turkey

Abstract

Research...Read...Examine...Writing...Take a photo...Blog writing...Twitter... Instagram craze...Chat...Nudge...Plant feed on Facebook...Learn... Teach... Changing concepts of today, transformation with the change occurring in the world can not be prevented, brought in the name of education and art education in the digital world, our lives are we able to use our favor?

Nowadays, communication, technology and internet have an important role in life and especially in education. Nowadays, students generally use technology for communication also education.

Given the technological development process and the implications of this process, the result of the future will be computer-aided schools. This form of education, without a doubt, the new education system, as well as a new show that will emerge educator and practitioner profile. Now educators, to learn, to invention, to think, to try a position to teach (Gökaydin, 2003).

Internet access in conjunction with the globalized era, McLuhan the "global village", referred to as undertake greater responsibilities in today's world of artists and designers. Changing and globalizing world that the Internet that brings digitalize Digitalization and the transformation progresses, in the future a nested formation will come up with the Internet Digital media is growing rapidly in Turkey as in all over the world.

Nowadays, communication is the focus of digitization. Designers can play an important role in ensuring that communities and people to adapt the process of digitalization Individuals, political, technological, cultural perspectives have effects in the direction of the correct knowledge Visual communication designers and designers with digitization through the internet masses of the provision of communication, designs to achieve a wide audience, a universal approach to review and have authority to interpret.

To ease the digital conversion brought with it also raises different issues. In this context, study, and selected as the typical example on the internet As concept visual language and design of a particular language and identity is the universe of research institutions with the digital designs. Data to be collected in accordance with the sample examined, the results obtained will be examined in accordance with the concepts of digitization conversion, and solitude

Digitization process, the positive / negative aspects will be examined. Emergence of new approaches will be studied to be determined.

This study, together with the process of digitalization of the concept of visual culture, art, design, internet publishing and digital broadcasting is to investigate the effects and rewards of ownership.

Keywords: education, digitization, transformation, communication, technology

Introduction

The first reason that the necessary restructuring of teacher training institutions in Turkey is changing and evolving world of new professional roles and responsibilities in the process revealed. (Council of Higher Education [YÖK], 1998).

In today's conditions in the twenty-first century, one of the most important factors that determine the levels of development is possessed international human power attributes. Skilled manpower training is especially the task of education and vocational training institutions. Vocational education and training should also benefit from innovation to carry out the task effectively.

The need is increasing day by day for qualified individuals who mainly with scientific, economic, cultural and contemporary dimensions, equipped in accordance with the requirements of the era in all area of life itself and contribute to the environment with these accessories.

In this environment, the educational institutions has a position that specially obliged to perform the essential functions such as providing social, economical and cultural continuity of nations and socialization of individuals , transfer them the culture of the society, providing harmony between raised generation and the political structure of society, generating young people with leadership abilities and training of qualified manpower. (Bursalioglu, 1998, p. 37).

1. Purpose

In this study, the positive / negative aspects of the process of digitalization will be examined and the emergence of new approaches will be looking for. New approaches to the design and vocational training along with the digitalization process; occurred with effect of internet on digitalization , new approaches in education and benefits are aimed to be investigate.

2. Method

The screening model was used in this study.

3. Theoretical Framework

3.1. History of Internet

Internet is an essential part of today's life but it has a very short history. Basis of today's virtual realm came from a project initiated by the American Ministry of Defence and some American universities.

This project, called Arpanet was launched in 1970. At the beginning, ARPANET consisted of a network of interconnected 15 computers only and closed to private users. Rapid development of the Internet was the idea of the 70s.

E-mail appeared and the Queen of England sent her first e-mail in 1976 as the idea of internet began to become popular.

The 80s was the scene of technologically important steps. In 1984, the first domain names began to be used but host number was only 1000. The time of the explosion of the Internet is undoubtedly the 1990s.

Internet world as we know with 'World Wide Web' statement was introduced in 1991. Number of hosts was exponentially increasing each year. By 1994, the number of sites on the Internet 10 thousand, the number of hosts had reached 3 million and in this new world entrepreneurs realized new earning doors.

Banks and shopping malls began to open virtual branches. The first internet radio launched. Governments and then many organizations opened website. A brand new understanding of marketing and economics was born.

In 1994, the first ad on the internet was on the screens. The first hacker arrested in Hong Kong in 1995. The domain name was paid in 1995. Software wars began between Netscape and Microsoft. (www.ntvmsnbc.com)

3.2. Internet and Education

According to Boldt, Gustafson and Johnson (1995), the Internet is an excellent tool to use in order to enrich students' learning habits and experiences. The first target of the use of this tool is introducing students to the Internet and helping them to create a worldwide attitude of being a part of this network. In the more advanced levels, in this network, to enable students to benefit from project-based working environments efficiently (Akbaba-Altun, 2011).

3.2.1. The Importance of Lifelong Training for Vocational Education. (www.mebnet.net)

- Nowadays, companies all over the world are now able to compete with qualified employee.
- Qualified employees are more important than materials and technology.
- There is a need of qualified employees who implement all kinds of life-long training program, easily adapt to business changes and closely monitor and implement the the technology. It is very important to gain these achievements in vocational education institutions. In the short term, these achievements to be gained via "CERTIFIED TRAINING"

- Training in the universities and then applying it in the workspace last two years with outcome of the training program. When asked to companies they say they don't have such time.
- Employer-oriented programs to be developed and training evaluating education programs should be established.
- In this case, a more compact education package, with short-term returns for business life can be given based on "certification system"
- Companies can hire more quickly the employees of this nature.
- While this structure is creating; because learner will be thrown into a career after graduating; employer to be in the front and create a structure based on employer's ideas. In the meantime, while creating the scope of vocational training, it should be done with consensus of ministry of employment, the ministry of health, municipalities, universities, industrial companies, public opinion and the Council of Higher Education.
- Because of their structure design education and vocational training have dynamic content. Education which is given should be keep up with the dynamic structure to satisfy employer expectations.

Qualifications need to bring somebody under MEYAP Vocational Education Restructuring Project are as follows: (These competencies are similar and the priority sequence varies in each country).

- Sense of Social Responsibility / Skill
- Communication Skill
- Technology Skill

Scope of Social Responsibility Skill: individual acquire skills to take the job, to conclude and to identify a source of the problem and solutions.

Scope of Communication Skill: The project-based training should be established. For ability to communicate, data should be determined for being transmitted and understood correctly.

Scope of Technology Skill: We should accommodate the technology. Educational institutions should be included skills training courses for businesses.

With each individual is valued move, with the principle that there must be an area to be successful in and the area should be discovered. Otherwise, it is pushed out of education life for individuals, for the sector also they remain at risk of extinction.

3.3. Digitalization / Digital Publishing

Following the restructuring process at the end of November 2009, Adobe has decided to expand its investments in the field of digital publishing. As a first step in the organization, books, newspaper and magazine publishers will be focused on. According to experts, another step is to move even higher positions what InDesign (popular tool for known publishers) do with VDP (Variable Data Printing) and other similar publishing technologies. Adobe has all the technologies like Adobe Reader Mobile SDK (ebook improvement tool), Adobe Content Server and Adobe Digital Editions to move digital newspapers, digital magazines and digital books to the next stage. Now it is easier to understand the size of this market when we look at reading device wars abroad, between Amazon and consumer electronics giants such as Sony.

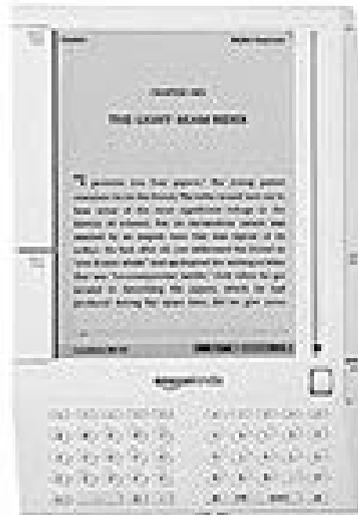

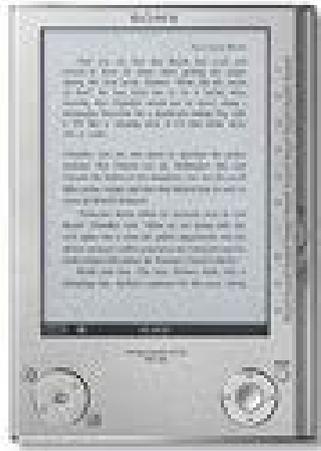

Fig. 1. Example of “Open Screen Project”

Acceleration of OpenScreen Project led by Adobe and after flash applications in mobile phones, Adobe has found its market position. In this respect, Adobe's special organization to be worked on digital publishing is last piece of the puzzle working on since the beginning of this year. Adobe allocated an important budget on this issue since 2010. Because they knew instead of paper, newspapers, magazines and books will be read out on every screen. Whether membership / subscription or advertising, whether through direct sales new distribution methods would be less costly and faster to reach a wider audience.

Moreover, the money for this bet is not just from Adobe. New York Times use AIR-based application that delivers out of the newspaper, media's most prestigious worldwide publishers share this vision of Adobe. In Turkey, we can see the reflection of this vision with more importance from the giant publishers' to websites and the success of interactive agencies which are recently tried to keep out of the advertising market. When you think in the frame of this vision, the acquisition of Omniture which has ratings of the digital world, play an important role for the companies giving importance to the privacy (www.adobegunlugu.com)

3.3.1. Company Examples for Digitalization:

3.3.1.1. Use of the Internet and the increasing recognition of Brand: Rowenta Case

Rowenta vacuum cleaner is a well known brand in Turkey, but was not satisfied with the situation. Rowenta is well known on the global markets with innovative products also in the category of personal care, but in Turkey Rowenta is known only with vacuum cleaners. It was not enough for the brand so company officials acted.

In the internet campaign Of Rowenta, selected group of consumers was between the ages of 15-24. It reached the target audience via Internet and retail outlets. Facebook, Google and Youtube are used effectively. Following these studies, the results of research carried out by survey via the Internet showed an average 16 percent increase in brand awareness., Those who want to buy a product before and after the Internet-based campaign has been increased of 41% on average compared to rate. (www.capital.com.tr)

3.3.1.2. "Pure New Media"

Burak Gözalan founded the Agency 27 9.5 years ago. 6 years ago he saw the potential of the digital sector and has launched Pure New Media. In 2010, he merged these two companies. By doing this, a digital agency was joined with a traditional agency. (www.capital.com.tr)

3.4. Internet-Based Education: The Case of vidobu.com

Vidobu's website is an example of the reflection of the Internet on education. In the framework of this website , as well as theoretical and practical training at universities, people watching project-based application videos and learned a lot via internet. These applications are realized by watching the recorded videos. Number of members as of May 2013 was around 23 160 +. It has a total of 2454 training videos and 91 education sets.

Category titles of education within the framework of this database are as follows;

- Digital Publications,
- Photography,

- Graphic Design,
- Interactive Design,
- Internet / Social Media,
- Operating System,
- Mobile Programming,
- Office / Information Worker,
- Video Production,
- Web Programming,
- Web Design

From here, it is possible to say that the internet has positive effect in design education.

One of the sectors affected and changes direction inevitably with the development of the internet is education sector. This sector remains face to face with both positive and negative inputs of Internet and digitalization. If you take a negative point of view there are only two negative returns. A group of students in the project / assignment preparation / lesson preparation: being addicted to the Internet, and creating (copy + paste) student profile.

However, there is quite a lot of positive gains if we look. One of them is the use of digitalisation and the Internet in education. Internet, serving as "distance education" in some education systems is also the executive in the education.

3.4.1. Contribution of Internet to Education

Internet is a great tool to enrich students' learning habits and experiences. The Internet network provide project-based studying environment. Extensive use of the Internet in schools brings these achievements to the students. (yunus.hacettepe.edu.tr)

- Internet creates an environment of mutual information sharing, and offers the opportunity to discuss their ideas with other users.
- Internet provides the ability to communicate with people in different regions within the framework of common interests.
- Internet, give students skills like research on this network and search skills. Proper techniques for effective use of the information accessed can also be used.

Wilson and Marsh II (1995), draws attention to two important inputs of accessig to the Internet. The first of these, students' Internet communications, research, access to information, and sharing capabilities. In this case, the individuals prepare themselves for information-based technology environment after graduation. In this case, the Internet, give students a constructive role and each student as an individual learner, a researcher, communicator and as individuals who are willing to work together, to form their own sets of information (Pektaş, 2011)

Other important input, the access to the Internet removes all the boundaries also the classroom walls. Thus, they gain self-confidence for communicating. (Pektaş, 2011)

According to Parnley (1994), the Internet enables students to share their ideas with classroom projects, and reach the necessary critical thinking skills to use information as individuals

4. Method

In the study "screening model" is used. Model is describing an incident somebody witnessed and telling without unnecessary detail and efforts to find formulas and symbols to summarize. (Karasar, 1984.79). The method used in this study is screening model.

Screening model is a research approach which describes a condition that existed in the past or present as it is and aims to identify it. Whatever the subject of the research , there is no effort to influence and change them. Desired things are evident. The aim is to identify and observe those things correctly. The main purpose is to observe without attempting to change. (Karasar, 1984.79) In screening model, the purpose is not only to collect data, but also process and interpret them.

5. Result and Conclusion

Graphic design and advertising industries are one of the sectors most affected by the communication facilities provided by computers.

From previous years, the scientific advances of the 20th century has continued to increase, as a result of scientific discoveries emerging technology products has become greatly affect on people's lives. Simplifying access to information through technology, and to be the first one to use it and make it usable, has an advantageous position compared to others. In old times, most valuable people were the people who knows everything but it replaced by people who knows where the information and how to access it when we need.

Research examples of the brand / promotion / education continue its activities over the internet and the companies said there is positive contribution of the Internet.

(According to Akbaba and Altun ,2011) students in the use of the Internet in schools is thought to provide the following achievements:

- Internet creates an environment of mutual sharing the information for people, and offers the opportunity to discuss their ideas with other users.
- Internet provides the ability for a particular group of students and teachers to communicate with people in different regions within the framework of common interests.
- Internet gives students search and research skills to make their own search on the network around the world. Proper techniques for effective use of the information can also be used.

If learner participates actively in the learning process, learning takes place more easily. (Gokce, 2010).

- For learners it is easier to learn meaningful and logical issues.
- Easier learning takes place if there is a motivation created with individual's interest.
- Repetition is very important for learning of skills.
- If learner establishes connections of relationships between topics learned, learning becomes more permanent.

To give an example of the reflection of the Internet on education institutions, egitimsiteleri.gen.tr, vidobu.com, adobegunlugu.com, sanalkurs.net sites can be counted.

In the framework of this websites, as well as theoretical and practical training at universities, people watching project-based application videos and learned a lot via internet. For instance, as of May 2013 Vidobu has the number of users 23160 +’s around.

Technology education is important in vocational education and design.

Education model which gives individuals technological culture and values is important.(Gordon, Hacker and Vries 1995: 225). Accordingly;

- Development of culture of technology,
- Exposing individual interests and skills,
- Gaining purchasing power to select the technological products and services to buy.
- Developing the competencies for using technological products and services,
- Required by working life and professions, skills and attitudes essential to gain.

6. Recommendations

- Design education should focus on a critical mindset compatible with communication tools
- Design education should support communication and collaboration strategies.
- Design education should prepare learners more in accordance with the requirements of change.
- Now the world is progressing in the process of digitalization. Electronic devices, phones, tablet PCs, internet applications are available to the individual at this point.
- Design education transferred into three dimensions from two dimensions. Digital devices, programs for internet applications, the sound, image, video, motion and typography are together. Therefore, multi-media education is to be addressed in design education.
- New concept in design promises to arrange nature, people, and technology, and provides a balanced harmony between the east and west, north and south, past, present and the future. This is the meaning of great harmony. (Karamustafa, 2003).
- Thinking power about the near and far future, will be an essential part of the design. Concept of thinking and designing skills should be given to the individual.
- Internet also provides the possibility to easily access the data. According to Clemmit (1996), internet provides access to information in a wide perspective of science, not only in teaching art education, but also in science and social science. Dyril and Kinnamen (1995), claims that there is no such an application can provide the Internet's easy and effective communication between students and teachers and models for real-life for student-teacher relationships.
- When learners share a text via the Internet, share their reading skills of analysis, give them synthesis skills as well as activities that improve reading skills on the internet For this reason, online courses / internet alternatives in educational systems are also useful.
- Internet gives students active learning skills.
- It contributes to student-centered education.
- Internet improves problem-solving skill.
- It supports the activities of having first-hand information.

6.1. Benefits of Internet for Education Institution

- Communicate via e-Mail
- Families can access to information about school and student with a password.

- Global education activities
- Registering for classes and learning grades remotely
- Monitoring Developments
- Equal Opportunity
- Transparency in management.

6.2. *Benefits of Internet for Education*

- Student-centered
- Exploring
- Resources
- Technology support for education
- Global education
- Cooperative (collaborative) learning
- Individual learnings
- Rapid spread of information
- Global libraries
- Versatile and global communication
- Equal opportunities in education
- Different opinions
- Project-based teaching
- Cultural exchanges
- Information storage and virtual library.

4th International Conference on New Horizons in Education

New horizons in teacher preparation

Abdelmonem Moheyldeen Elsayed

*Tanta University ,Tanta , Egypt .**

Abstract

Scientific and technological revolution has had a significant impact on all aspects of life, which made the organizers of the education required to search for new methods and new educational models to face many challenges. Education is no longer depending on the traditional methods which depends on the teacher in transferring knowledge to pupils' requirements and accommodate with large numbers of individuals at all levels. The purpose of this paper is to explore the new forms of teacher preparation, such as virtual teacher, based on the principle of freedom from the constraints of time and place where pupils can learn, according to their time, and in the place of their choice. The merger teacher which meets the requirements of normal pupils and those with special needs.

Horizons ,Teacher, Preparation ,Merger,Virtual.

Introduction

Present scientific and technological revolution has a significant impact on all aspects of life. Therefore the organizers of education have to search for new methods and educational models to face challenges resulted from this revolution. Education is no longer depending on the traditional methods which make the teacher the only tool in transferring knowledge to pupils . This has led to the emergence of new forms of education and teachers, such as virtual learning, merger learning, shadow teacher and mobile teacher. Virtual learning based on the principle of freedom from the constraints of time and place where pupils can learn, according to their conditions and suitable time and place. The merger learning meets the requirements of normal pupils and those with special needs. The shadow teacher who cares of a specified number of pupils in the classroom. The mobile teacher who is taking care of specific number of schools. All these and other formulas became necessary for attracting educational systems attention. In present paper I will deal only with two of these forms ; merger and virtual teachers.

New Roles For Teachers

It should be emphasized that a specific approach adopted to determine the roles of teacher linked to the cultural context. Education , as a general social affair, are associated to cultural determinants which include social , political, and economic dimensions .

* Corresponding author. Tel: 00201222505075 fax: 0020403359368.

E-mail address: abdel2013@yahoo.com

Now the question is, what are the most important variables and challenges that affect the cultural context of the world in the post-globalization, and imposed these challenges on teacher preparation institutions to carry out their new roles?

1 - Variables that led to the Emergence of New Horizons for the Teacher.

The following are the most important variables and challenges that affect the world's cultural context, and imposed new roles on the teacher and new preparation as well , these variables are :

a -Globalization and the Emergence of the knowledge Societ

The modern economy, based on science and technology, is moving towards globalization, which had different reactions towards it in different countries. Shift to a knowledge society means that society encourages innovation , creativity and scientific research. Responding to technological information and coping with transition to a knowledge society faced several challenges such as achieving a democratic knowledge - to avoid authoritarian, and development cosmic intelligence - to cope with the rapidly changing global circumstances.

b-The Communications Revolution.

Communications revolution constitute a variety of sources and technological tools used in the transfer of innovation and dissemination, storage and management of information . These operations are an integral part of the educational process as it can be used as follows:

- Connect the subjects and information quickly to students with no regard to place or time.
- Working to make the connection between teachers easier will lead to more cooperation . This will affect the teachers preparation for the future society based on knowledge.

c - Growing Interest In People With Special Needs :

Countries that believe in the rights of the children with special needs, has started a new trend toward them. A specific technique appeared to provide opportunities for those children to engage them in educational systems. In light of the framework of the new models of education systems, which started to emerge, we can monitor some new formulas, that are expected to be common and spread in the new century .

New formulas For Teacher Preparation Merger Teacher

It was controversial results which witnessed, in the past decades, the field of special education that made researchers in this field agree on the need to rethink of the traditional special education programs. Specifically, there is a consensus now to the need to shift from separate education institutions to integrated forming in general education schools which have to rethink of the preparation and qualification programs presented to teachers. There is now an urgent need to find a special quality of teachers can deal with categories (normal and those with

special needs) at the same time in the same classroom. This means that a teacher must have knowledge, information and tools which will be used by him to deal with the two groups; and meet their needs in the same classroom.

Requirements of Merger Teacher Preparation

The merger teacher preparation needs to acquire numbers of skills and abilities to help him to deal with two very different categories; namely normal pupils and pupils with special needs. We can mention these requirements as follow :

- a - The ability to deal with differences and individual needs of the two categories in order to meet their requirements.
- b - The ability to use teaching methods and means of various educational conform with the two different categories in the classroom.
- c - The ability to participate in the assessment of the capabilities and needs of pupils using a variety of assessment tools.
- d - The ability to modify the curriculum, materials and teaching aids to suit pupils' needs.
- e - The ability to observe and record the behaviour of each pupil in the classroom situations which may result from the presence of two different categories in the same classroom.
- f - The ability to organize classroom environment to allow pupils to benefit from each other and participate in the same educational activities.

Efficiencies For Merger Teacher.

Teachers have to acquire many skills to work in merger classroom in order to meet the requirements of the application integration policy, such as cognitive skills, competencies skills and competencies related to teacher's trends and attributes to merger policy.

In light of the above we can determine the qualifications of teachers merger as follows:

A - Cognitive Skills:

They are kinds of knowledge, information and concepts that must be owned by a merger teacher :

- 1 - The teacher must be familiar with the trend which calls for the integration of pupils with special needs in the merger classes.
- 2 – Having a general knowledge of the principles of merger education.
- 3 - The teacher must know how to provide services to adapt and modify the curriculum and teaching methods and varied measurement methods suits the individual needs of pupils.
- 4 - The teacher must have gain knowledge of individual differences and types of special needs.
- 5 - The teacher must have an understanding of the procedures related to merger education.
- 6 - The teacher has to know the nature of the disability, and the level of employment of life experiences.
- 7 – Teacher must be familiar with other aspects related to special education, such as different growth areas (social, emotional and oral language development), communication, behavioral, social and job skills.

- 8 - The ability to observing and recording of pupils' behavior in merger classroom situations.
- 9 – Knowing the basic principles of the tools used by children with special needs.
- 10 - Sufficient knowledge about prohibited activities for each category of pupils with special needs.
- 11 - Find out effective ways to modify ordinary children attitudes towards their colleagues with special needs.
- 12 -The ability to build helpful relationships with the families of pupils with special needs.

B - Competencies Skill:

Competencies are needed for teachers who deal with pupils with special needs for the success of the process of education, side by side, with their normal peers in the same classroom, which include basic skills in the techniques and methods of teaching as follow:

- 1 - The ability to communicate constantly to both pupils in the merger classroom.
- 2 - Planning and supervision of individual education plans.
- 3 - Knowing accurate measurement to the needs of the pupils within the merger classroom.
- 4 - Being able to management the merger classroom.
- 5 - Being able to use technology for pupils with special needs in order to increase their participation in the classroom activities .
- 6 -The ability to keep up with what's new in the field of merger education.
- 7 -The power to solve the emergent problems.
- 8 - The ability to promote positive relations between pupils with special needs and their peers in the community of learning by giving them learning tasks to help them understand disparate contributions that can be implemented by each pupil.
- 9 - Working as an active member in the multi-disciplinary team that designed and implemented and assesses the merger programs.
- 10 - The ability of the diversification of teaching methods that suit the pupils in the merger classroom.
- 11- Understanding the principles of growth for special needs and ordinary pupils.

We can say that , in the light of global trends towards the policy of merger, the merger teacher is an important formulas and has to perform many duties .

Virtual Teacher

The challenges of the present time, has been emerged new forms of education. The most recently of them is Virtual Education, as it aims to transfer and deliver various types of knowledge to pupils in different places of the world using technology information without being bound by the limits of time and place.

Therefore the role of the teacher in this educational process, has changed. That's why the teacher needs a specific kind of preparation for his new roles in the virtual education.

Requirements for Virtual Teacher Preparation.

a - Designer of Learning Activities.

The design of the virtual learning is a process which means planning, construction and development of education. Teachers have an important role in the design expertise and educational activities offered to the pupils, and the design of virtual learning environments to suit the interests of pupils.

b - Technologist.

In the light of rapid developments of distance technological education , and the emergence of virtual schools, the teacher must be efficient in using technological innovations and computers to be able to use the network in the learning process.

c – Researcher

Teacher must be concerned with all what is new and related to the subject matter presented to his pupils, as well as evaluating courses through the network .

d - Facilitator.

Teacher is no longer the main source of information, and no longer function to transfer content to learners . His role became facilitate access to information, and guidance and counseling learners during their learning through the network, or through their dealing with each other in the study of decision, or with the teacher.

e - Director and leader of the educational process.

The teacher in the virtual education system is the educational director of the position, who locates the greatest burden in enrolment decisions and determines the dates of virtual meetings, methods of display content, evaluation methods, and the dialogue way educated together.

f - Encouraging pupils interaction.

The virtual teacher ,also, must encourage pupils to interact, and acquire knowledge. There are four types of interaction in the virtual education, namely:

- learner interaction with content:

The interaction of the learner with the knowledge leads to the acquisition of knowledge. This interaction depends on the previous educational experiences for learners and the learner's ability to interact with the content presented to him.

- learner interaction with the teacher:

Perpendicular interaction depends on the willingness of the learner and the teacher to communicate. This type of interaction is often associated with the fact that the distance puts us in new roles, hence it must be a merger between the learner and the teacher for a learning process. The teacher must support and encourage each learner to interact with him.

- learner interaction with the learner:

An horizontal interaction between learners, where pupils interact with each other, will integrate and improve their motivation to learn.

- learner interacts with himself .

The learner's ability to use technology in general and the technology of virtual reality in particular ,will make them interact with themselves easily . No doubt that the training and experiences are the perfect solution to get rid of pupils' fear of using technology .

G - Rectifier

pupils assessment in the traditional system depends on exams that measure often the pupil's ability of memorizing . But in the virtual classroom system evaluation process is different . Therefore the teacher must consider the following :

- Assigning pupils some different duties such as looking for information through the virtual libraries.
- The teacher through virtual classrooms can urge his pupils to practice activities in the virtual laboratory.
- The teacher classify pupils to many projects groups to help them to interact.
- Develop rules and procedures sufficient to prevent cheating, and make sure to match the results of pupils with their actual levels.

Competencies Required For Virtual Teacher.

Competency can be defined as the body of knowledge, skills and attitudes owned by the teacher to achieve educational goals, and access to the desired results at the lowest cost of effort, time and money.

Therefore, the efficiencies of virtual teacher means : information, skills and trends in the field of virtual education technology necessary for the teacher, to reach the degree of perfection in his performance for his roles in the virtual education.

In light of the above efficiencies for virtual teacher can be identified as follows:

First: the efficiencies related to computer skills.

- 1 –Dealing with Windows programs with high efficiency.
- 2 - Use regular files and compressed files.
- 3 - Dealing with magnetic laser discs such as CD and DVD discs.
- 4 - Using a scanner.
- 5 - The ability to determine the appropriate computer software and video programs.
- 6 – knowing the different methods of communication network.
- 7 - Knowing problems and technical malfunctions .
- 8 - Using of the different Internet browsers and Data Protection Software .
- 9 - Download and upload files to and from the network.

Second: Efficiencies as a designer.

Teacher in virtual education should provide themselves with designer educational skills in order to be able to design subject studied in the virtual education system . These skills are represented in:

- 1 - The development of educational programs and curriculum, projects and lessons, that ensure the achievement of the desired goals.
- 2 - Familiarity with everything that is new in the virtual education.
- 3 - Familiarity with everything that is new in the field of internet, and how to design web sites and pages and all kinds of multimedia.

Third : Efficiencies as a consultant and facilitator :

- 1 - Attention to respond to pupils' inquiries.
- 2 - Notice the performance of pupils to determine their progress.
- 3 - Determine the level of pupils to guide them.
- 4 - Advise pupils with the skills they need.
- 5 - Clarify the behaviour over the network.

Fourth : Efficiencies as a Manager and Leader Of The Educational Process :

- 1 - Develop notebook time to accomplish tasks.
- 2 - Encourage interaction by means of interaction.
- 3 - Scheduling meetings and activities.
- 4 - Management of discussion during the learning process.
- 5 - Identify methods of interaction between learners.

Fifth : Efficiencies as an Evaluator :

- 1 - Prepare tests for certain targets.
- 2- Use methods and tools of measurement and evaluation suited to measuring and evaluating teaching skills.
- 3- Using the results reached by various measurement tools in determining the strengths and weaknesses of pupils.
- 4 - Plans for remedial action using feedback.
- 5 - Uses continuous assessment, which occurs after every step of the educational process, and closing calendar, which occurs at the end of each teaching situation.
- 6 - Evaluation of electronic hardware and software.

Finally , we can say that not every teacher candidate can work in a virtual learning environment, where he faces many challenges, and has certain responsibilities, which require him to perform many duties.

New insights into human aging and their daily lives in textbooks for teaching the mother tongue- intergenerational education

Michalina Kłeczek-Marek*

Uniwersytet Pedagogiczny im.KEN, ul. Podchorążych 2, 30-084 Kraków, Polska

Abstract

Societies of the old continent are aging and we are facing the challenge of building a "living bridge" between seniors and juniors. At the same time the model of extended family, in which children would naturally gain the knowledge and ability to live together with their grandparents, is fading away. Therefore, how should we sensitize children to the problems of the elderly? How to create in them the attitude to show willingness to live in an aging society? The paper is an attempt to discuss the actual image of the elderly man in various works published in mother tongue textbooks (on the basis of the study of the Polish language) and present a postulate of a novel concept of contemporary life and the problems of the golden-ages.

Seniors and juniors; senility, problems of the golden-ages

1. Main text

Today's professionally and socially active generation has to think about its autumn of life right now, both in the context of the current generation of aging parents and grandparents, as well as in the context of its own future. Old age is naturally inherent in human life, making the man *a homo viator*, perpetually travelling towards the end of his earthly existence. Statistics clearly indicate that at present we are dealing with a phenomenon called *population aging*. This demographic shift is particularly visible in European countries. In the coming years, we should implement social programmes which will fundamentally and measurably include aging citizens and seniors within the group of active population. In these processes, particular attention should be paid to the intergenerational integration, which should play a crucial role in holding the young and the old together, and also in "buffering" the adaptive states. The education of children must therefore skilfully develop their progerontological attitudes. Continuing education for seniors could focus on issues concerning the life of young people. With such "bridges," based on the knowledge about the needs and the routine of everyday life, it is possible to build a conscious and fully tolerant mixed-age population.

In the literature, predominantly in the books which combine the disciplines of economy and sociology, one may encounter a thesis stating that senior citizens use resources which should be intended for children. There are statements that define the elderly as those who take social goods (mainly health services and financing the basic necessities of life) away from the young generation. The budget of an aging country increasingly moves funds towards the programmes aimed at the elderly. This happens at the expense of funds which could otherwise be

* Corresponding author.

Email address: michalinamarek@Onet.Eu

allocated to investment programmes for children. Taking this into account, one could conclude that this demographic change will affect children, because they will lose a chance of successful entry into the adult social life (Uhlenberg; 2010).

It is therefore necessary to redefine the currently perceived intergenerational relations and to think how senior citizens can influence the welfare of the younger generation. Another noteworthy aspect of reformulating the image of coexistence between children and the elderly (fewer children as compared to the number of seniors) is the issue of young people's attitudes toward those whose days of productive professional life are long behind them.

Hence, I call for taking a closer look at children's primary education, on which several hours are spent every day, and which, if carefully designed, can become not only a lesson at school, but, above all, a lesson in humanity and building a conscious society.

In September 2012 in Poland, the Ministry of Education introduced a new core curriculum for primary schools, grades IV-VI, which is the second stage of primary education. The new core curriculum is being implemented in all Polish schools and concerns all subjects. I decided to analyse the theme of old age in new Polish language textbooks. Being a Polish language teacher myself and therefore having the greatest number of hours with one particular group of pupils, I believe that I am able to use the content of literature to shape children's social attitudes and to humanise their learning. Therefore, I have analysed the available textbooks from the gerontological perspective and the general conclusions are as follows: most of the sixteen Ministry-approved textbooks raise the issues of aging or of the relationships with grandparents at the minimum level (it is limited to a short poem to celebrate the Grandparents' Day) or do not raise such issues at all. Such curriculum assumptions clearly exclude the topic of old age from classroom discussion, leaving it to the good will of a teacher. What is also worrying is the fact that in upper grades, this issue is not obligatory according to the curriculum, while this is the age when students become more willing to discuss social issues, are able to express their opinions on the observed phenomena, and can objectively and subjectively refer to the questions they are asked. Their emotional sensitivity allows them to specify their relationship to someone else. Not only do they know how to express their own judgments, but they can support them with reasonable arguments. Hence, my observation is that it is at this level of education when the attitudes of young people towards the ageing society can be shaped safely and effectively.

I will take the liberty of presenting a few instructions and tasks which I have found in the Polish language textbooks for elementary school, approved by the ministerial sieve:

- "This is how my great-great-grandmother and my great-great-grandfather had met... ." Let your imagination run wild and invent fairy-tale origins of your own family (Łuczak and Murdzek; 2012);
- Talk about what you imagine an ideal grandfather is like (Łuczak and Murdzek; 2012);
- Explain what the grandfather wanted to teach his grandson under the cherry tree? (Łuczak and Murdzek; 2012);
- What good things do you think grandchildren can learn from their grandparents? Write your answer in a few sentences (Łuczak and Murdzek; 2012);
- Talk about for what children value adults the most (Łuczak and Murdzek; 2012);

- Fragments of the book "Grandma Bridget and her crazy trip around Kraków" (Łuczak and Murdzek; 2012);
- Based on the poem, explain what the role of a grandfather in a child's life should be (Derlukiewicz; 2012);
- Write down the things you associate with your grandmother. Explain why (Derlukiewicz; 2012);
- A task which concerns the content of a poem: Why was the grandma longing for a letter from her grandson? Why has she read it a hundred times? (Derlukiewicz; 2012);
- Choose the words which best describe an elderly lady (Derlukiewicz; 2012);
- In groups, work on a list of things in which you can help your grandmother (Składanek; 2012).

Above, I presented the most interesting exercises which include the topic of old age in the curriculum of the Polish language education. They were all subjectively selected by me. To my great amazement, I have to admit that there are new books which do not raise this issue in their sets of tasks at all. There are also those which only briefly mention a grandmother and grandfather in the context of their holiday, celebrated in Poland on 21 and 22 January. Lack of innovation strengthens the literary clichés which present adults as:

- Sages who accept their old age with humility and awareness of its consequences;
- Old people who cannot find their place in the new reality, feeling sorrow over the lost youth;
- Old people who make mistakes and do not go beyond the framework of social clichés and norms;
- Old people who overcome their individual weaknesses, believe in their latent abilities, wait for love and joy (Grabowska; 2004).

I am very happy to say that there are also books which talk about old age, offering engaging literary texts and inspiring tasks. Sadly, they are in the minority.

Concluding my demands and considering all the formally approved materials to work with children which I managed to collect, I wish to point out clearly that apart from the socio-economic regulations concerning senior citizens, in order to take care of the social welfare, an effort must be made to educate the youngest citizens and raise them "into the old age."

One stereotype which is still present is showing an elderly person as someone waiting for death, who, deprived of their dreams, is a nuisance to the environment. Additionally, mass media perpetuate the image of an old man whose only passion is to search for the best false teeth adhesive, the best orthopaedist, or the best physical therapist. However, it should be kept in mind that seniors are worthy of special attention, for they possess the richest life experience and knowledge. *The wisdom achieved during the development of an adult person is of transcendent nature. In contrast to practical knowledge, which is based on common sense and experience, transcendent wisdom is directed more towards the inside of a man (...)* *The best sign of having reached transcendent wisdom is no fear of death* (Łosiewicz; 2004). Each period of old age is unique and individual. It is time that sets its limits. For some, time marches inexorably on; for others, it stops in one place so that they can enjoy the here and now. According to A. Kamiński, who is the Polish precursor of the issue of creative old age, raising someone to understand old age means helping them to acquire interests and aspirations as well as skills and habits which, when retirement comes, will assist them in implementing a lifestyle conducive to the prolongation of youth and full of rewarding activities (Ilnicka; 2006). As for my deliberations, I believe the

young generation should be involved in the area of their grandparents' activities: hobbies, leisure activities, or social and cultural initiatives. Old age does not have to be tantamount to saying idle goodbye to the previous lifestyle. When properly organised, it can contribute to the fulfilment of a yet unfulfilled dream, to meeting new people, or to opening up to the needs of others. Emotional strengthening of the elderly can be multidirectional; special attention, however, should be paid to their relationships with their grandchildren.

A grandchildren-grandparents relationship brings benefits to both sides. Children feel recognised and taken care of, while the elderly can engage in a retrospective of their life and indicate life's meaning to the younger generation. Despite the modern model of a young family, where parents usually live away from grandparents, a contact with the latter is one of the first contacts a child makes after it is born. In this respect, a special role is played by grandmothers, who share the care of a new-born. Thanks to their maternal instinct, they support young mothers. It is usually later when grandparents become actively involved in childcare. Grandma and grandpa teach a child basic activities, thanks to which a toddler becomes increasingly independent. They talk to a child and teach him how to speak, think, memorise, etc. Hence, it is important that grandparents narrate fairy tales that they know to their grandchildren. Grandparents, thanks to their patience and bigger time availability, become comforters, guardians, and confidants of children's worries, because a young man must trust the person he confides in. He must be certain that the older, wiser person will understand him. A generational difference between a child, a parent, and a grandparent allows for the full process of bonding to occur. The patience grandparents have for their grandchildren is bigger than that which they had for their children. Particularly, during the period of rebellious adolescence, a young man rejects the opinion of his parents in order to find his own way and a role model. He often finds him in the person of the family's patriarch. Without parental overprotectiveness and with an adequate degree of trust towards the child, a grandparent can be a source of approval and praise. He can be the one in whom the child will find interpersonal warmth and the simple ability to spend time together, with no requirements and need of commitment. In 1998, Helen Bee identified three types of grandparents, based on the nature and context of an intergenerational relationship:

1. Distant relatives – they keep their emotional distance towards grandchildren, treating them as a burden; they rarely meet with them and do not help the parents to take care of them;
2. Caregivers – they offer children a place which is their second home; they are emotionally attached to them; they actively support their upbringing; sometimes they take over the childcare;
3. Companions – they care about their grandchildren; the relationship is close, warm, and regular; there are frequent visits; their children's children become their pride and joy (Brzezińska; 2001).

Each relationship of a child with their beloved grandmother and grandfather plays a vital role in his life. The attitude a person nurtures towards the elderly in his adult life also derives from childhood memories, in which grandparents can play a positive or a negative role. It is worth pointing it out both to grandparents, for whom having a successful relationship with their children gives them a sense of being needed and useful, and to parents, whose children have a chance to create healthy, positive social references. *Intergenerational transmission forms a hierarchy of values, which from now on will be a reference point when evaluating the social situations one finds himself to be in* (Falkowska; 2002). On the other hand, T. Gadacz, in the text entitled *Wychowanie jako spotkanie osób* (~Upbringing as the meeting between people), emphasises that there should be two perspectives on upbringing: upbringing in the context of functioning, and upbringing in the context of an individual. Both of these approaches may be a reference point for a relationship between the oldest and the youngest family members. *The first perspective concerns upbringing in accordance with the generally accepted models of life*

which are distinctive of a given ideology or social system. The second perspective is a meeting of two people – the master and the student, which opens the horizon of values by which one becomes a man regardless of an ideology or social system (Małecka; 1997). Some people say that if there weren't grandmothers and grandfathers, we would have to invent them. Seniors are often an invaluable source of support, help, and advice. Unlike parents, grandparents can spoil their grandchildren, fulfil their desires, and indulge their childish whims. It is an absolutely natural process; therefore, I believe that protesting against such behaviours of grandparents is unfounded. As long as children do not exceed the limits of respect for their grandparents, there is no unhealthy spoiling. Instead, we can talk about building beautiful childhood memories and the sense of usefulness in the life of an elderly man. Thanks to such a laid-back relationship, the two extreme generations simply love spending time together. They can derive pleasure from the very fact of being in each other's company. This is as honest and simple as that. And this is possible when children are open and truthful, and the grandparents are genuine and experienced. Unadulterated in their experience, seniors help children understand the hierarchy of moral values and support their scientific and social undertakings. With their wisdom, they lead the youngest ones through the paths of earthly existence. *Grandparents are ahead of their grandchildren on the roads of life. It is from them that young people can learn how to deal with difficulties, a disease, or other limitations; how to accept natural changes connected to the aging process (...)* It is thanks to great-grandparents and grandparents that we gain a sense of belonging, so important for young people who are only starting to shape their identity (Brzezińska and Appelt; 2006). The pace of life constantly changes, but so does the quality of leisure time. Local traditions and customs are dying down. Then, it often happens that a grandma and grandpa are left out, pushed away, their role is reduced. Meanwhile, it is the grandparents who create the atmosphere of holidays and family celebrations, which I believe should be particularly emphasised by schools. They are willing to talk about their lives, about their distant and close family. They teach others, so that the increasingly mainstream detraditionalisation does not dominate Polish households. *You could say that such relationships provide an opportunity to maintain a dynamic balance between volatility, better tackled by young people, and stability or continuity, the source of which is in the elderly* (Brzezińska and Appelt; 2006).

The meetings of children and seniors should be a link within which the socio-cultural knowledge is expanded and a separate, unique view of the world is built. School education, its new curriculums, and modern textbooks should include the content which educates a child to be able to engage in an intergenerational dialogue, and to create a contemporary, authentic image of an elderly man. Combined with the skills of a teacher, multiple methodological strategies may promote the importance of seniors in the stage of a child's development. Love that is gentle and derives from devotion alleviates children's fears and senile melancholy. The child-senior interaction may lay down the general shape of social references. *Seniors may have a significant, positive impact on a child's development, and that depends (...) on normal, lively and intensive contacts of seniors with children and on their mental and physical abilities (...)* Grandparents play a socialising and upbringing role in a child's education; they show the child how the society functions (Andrzejewska; 2006). Therefore, there is no denying that we should read texts about old age with our students. We should teach them about literary seniors (both text characters and authors). Let us not be afraid to talk about old age cheerfully. *During Polish language classes today, teachers are increasingly promoting the model of older generation as a group of wise guides, empathic counsellors (...)* Seniors can be considered the real masters of life (Podemska-Kaluża; 2010). It is possible that, thanks to letter-writing tasks in class, some of our students will write the most genuine letter to their grandmas. Perhaps one of our students will start to help her ailing elderly neighbour. Maybe one day, when grey strands of hair appear on our heads too, we will be helped by a good young man. We should think about our senior years now in order to prepare our children for it. The hedonism of youth gives way to the peace of mind and composure

of old age. Such educational vision is a challenge. It has a demanding goal, but the one that gives hope for a happy old age for future generations. Let's make sure we educate sensitive, socialised children who will complement our human happiness.

4th International Conference on New Horizons in Education

New possibilities of mobile ICT in education at low operating costs

Jiří Kysela^{a*}, Pavla Štorková^b^aUniversity of Pardubice, Faculty of Electrical Engineering and Informatics, 532 10 Pardubice, Czech republic^bUniversity of Pardubice, Faculty of Arts and Philosophy, 532 10 Pardubice, Czech republic

Abstract

This article deals with new possibilities of teaching course which is focused on new media. The course will be partly realized during teaching outdoors, therefore it will be necessary to ensure the mobility of users were using of modern ICT (Information and Communication Technologies). For teaching and using new media is necessary to ensure mobile devices (tablet, smartphone, etc.) and mobile internet. Mobile internet is required for connection with main new media. The actual problem is big costs of mobile internet for a lot of students. Authors vision is to provide mobile internet for more mobile devices at very low operating costs which will not encumber the budget of the university. The suitable solution is to use so-called tethering, which is a method of sharing a single mobile internet connection usually within local wireless network for more students. The benefit of this paper is innovation through the reduction of operating costs for teaching outdoor the course while maintaining the mobility, and the use of mobile ICT when working with new media in education.

Keywords: tethering; new media, education; mobile devices; ICT; mobile internet

1. Introduction to new media and mobile communication

Statistical data about today's state of the internet connection access according to source (Accenture, 2012) shows that 69 percents of users around the world uses mobile internet. According to source (ITU, 2013) the development between 2007-2013 clearly shows that it is a long-term trend with permanent significantly growing character. The ability of mobility is therefore crucial and still more and more required of modern internet connection. ICT courses within education organizations should reflected on this fact and provide conditions for students to enable them to learn how to use ICT which comply with the trend of mobility. This goal is pursued by a new course at the University of Pardubice (Czech Republic) - Introduction to new media and communication. Apart from this the course aims to introduce students to the area of new media that are connected with mobile ICT so that using mobile ICT was not as end in itself. In order to put theory into practice part of the course will be held outdoors. Means of ICT chosen for the course are mobile devices (tablet and smartphone) and also mobile internet using mobile and wireless data technologies.

The main aim of this article is to provide description of possibilities of teaching mobile ICT and maintaining low costs at the same time with regard to scarce sources in academic field. To achieve the goal it is necessary to solve the problem of very high costs of mobile internet connections for large amount of students that attend the course. Authors of this article aim to provide internet for mobile devices for all students that attend the course

* Corresponding author. Tel.: +420 466 037 095.

E-mail address: jiri.kysela@upce.cz

and maintain low operational costs so that the university's budget will not be encumbered. A possible solution examined by authors of this article could be using a so-called tethering, a method of sharing mobile internet connection through WiFi network for students of the course. The benefit in this case would be an innovation through low operational costs while lecturing the course outdoors and maintaining the mobility of the Internet connection when using mobile ICT to learn about new media.

1.1. New media

Nowadays Media and communication greatly influence both social and professional life and belong to the dynamically developing field that affects many sectors (Jirák & Köpplová, 2003). The course Introduction to New Media and Communication responds to this trend and offers students information on how present media works, what kind of means they use and how they affect the society. The aim of this course is to present students the new media, methods and communication trends with use of current information and communication technologies, which will be subsequently used in practice, for which the University is preparing. New media is one of the frequently cited term today, however, fixed definition of this term does not currently exist. New media are understood at several levels then. In general, new media can be characterized as follows (Pavliček, 2010):

- promote communication or feedback,
- are based on the digital platform,
- are interactive,
- use of computing power.

The course Introduction to New Media and Communication presents students definitions, history and significance of current new media and mass media and explain what role ICT represents in their support. New media influence communication at all levels and thus have a significant impact on society and market. The current society is in the network age (Pokorný, 2002) in which Internet has become a phenomenon that is accompanied by a trend of mobility in this time.

All students (of University of Pardubice) from last year of information and communication technologies master's program were asked the questions in the questionnaire and based on their answers authors found out, that despite the globalization of the media, these students have no clear awareness about the term New media and only some of them worked with the mobile devices using new media (The questionnaire results: Only 45% of students correctly oriented in the definition of new media and only 24% worked with mobile tablet devices. 82% of students worked with smartphones. However, 98% of students used social or geo-social networks and 73% of them worked with mobile internet.).

The course Introduction to New media and Communication enable them to complete these deficiencies and prepare them to practice in which they these devices and new media will meet.

1.2. Required technologic base for tethering

Technological base used for education purposes should reflect trends of today's means of ICT used in practice. The ability of mobility and wireless communication constitute a potential for the future of mobile ICT. Following technologies were specified as necessary for the needs of the course:

- Mobile multipurpose devices.
- Location and positioning technologies GPS, Gyroscope, Accelerometer, Electronic compass or QR-codes.
- Wireless data technologies WiFi, Bluetooth, NFC.
- Mobile data technologies of generation 3G (CDMA, UMTS, HSUPA/HSDPA).

1.2.1. Mobile devices

The market of mobile devices has been very dynamic in recent years (see Fig. 1) which is why only those ICT devices should be chosen that fulfill the ability of mobility and are sufficiently spread and have a growing trend of sales in the market of last years. Figure 1 shows that these requirements are satisfied by tablets and that is only why they were purchased for the lecturer and students of the course. The market of mobile operating systems is very heterogeneous these days and therefore only devices with operating systems with a growing trend (see Fig. 2) in the market should be chosen when contemplating a suitable platform for education. Efficient support through available applications and therefore a potential for the future should also be taken into consideration. Mobile operating systems Android and Windows rank among devices with these characteristics. These operating systems are the only that have a growing curve in the market and for which there are also important online shops for mobile applications (Google Play and Microsoft Store). On the basis of these requirements a tablet with both of these operating systems (in their actual versions Android 4 and Windows 8) were purchased.

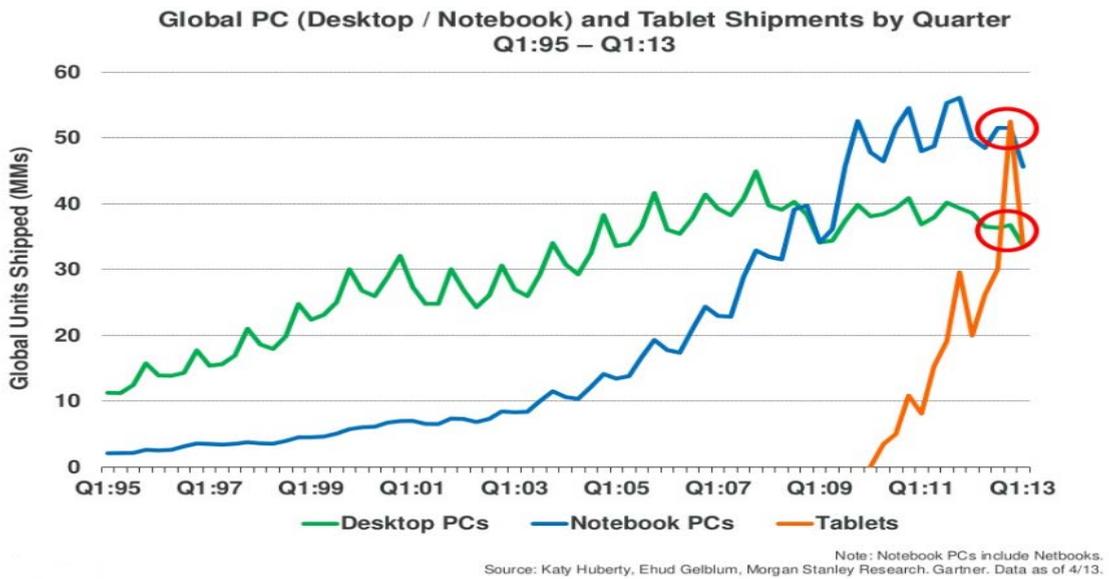

Fig. 1: Desktop/Notebook/Tablet Shipments by Quarter Q1:1995-Q1:2013 (Meeker & Wu, 2013)

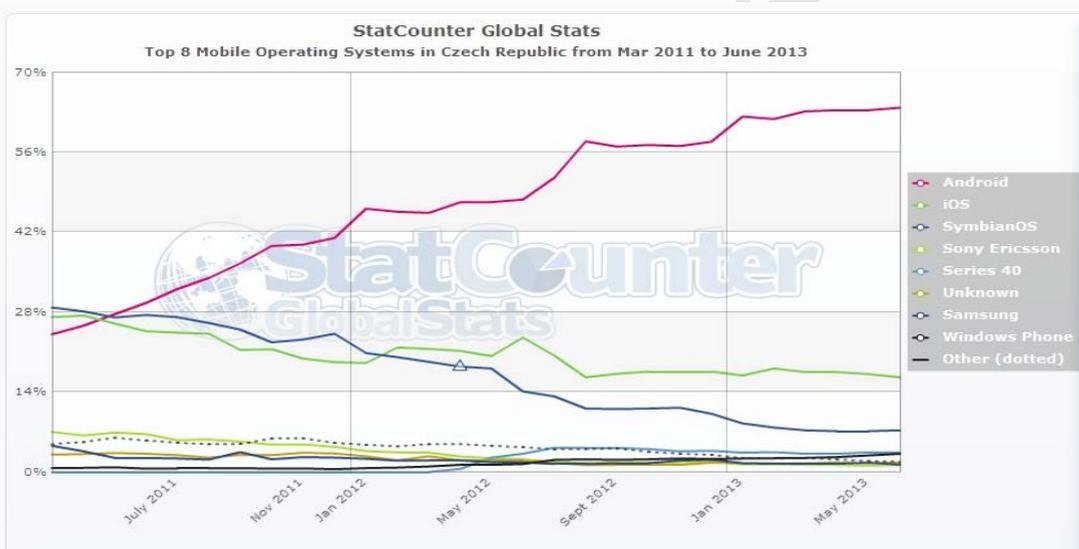

Fig. 2: Global Statistics of Mobile Operating Systems in Czech Republic (StatCounter, 2013)

1.2.2. Mobile connection and tethering (mobile internet, tethering)

Mobile connection for the needs of the course is provided by mobile and wireless data technologies. These two technologies differ in the ability of mobility (e. g WiFi technology is usually used as stationary).

Tethering is a method that enables sharing mobile connection to the Internet within network of several devices (see Fig. 3). In the case of this course it is considered to share a mobile 3G connection via hotspot based on WiFi or Bluetooth technology. Each one of these technologies (according to its specification) offers a different transmission speed. In order to put these technologies in compliance it is necessary to level out their parameters of maximal transmission speed. Table 1 shows that the throughput of WiFi 802.11b technology is sufficient for speed limits of mobile data technology UMTS. WiFi 802.11g technology at least should be used in order to prevent the degradation of the HSPA technology's transmission speed and WiFi 802.11n should be ideally used for the LTE technology. There are several ways of arranging tethering:

- Tethering natively supported by mobile operating system (supported by Android 4 but not by Windows 8. It is expected to be supported since Windows 8.1).
- Tethering run by a third side's software (e. g. Connectify in the case of Windows).

Table 1: Parameters of mobile and wireless data technologies (Kysela, 2012).

Technology	Downlink speed	Uplink speed
3G – UMTS	2 mbps	2 mbps
3G – HSPA	42 mbps	7.2 mbps
3G – LTE	100 mbps	50 mbps
WiFi – 802.11b	11 mbps	11 mbps
WiFi – 802.11g	54 mbps	54 mbps
WiFi – 802.11n	150 mbps	150 mbps
Bluetooth 1.2	721 kbps	721 kbps
Bluetooth 2.0	3 mbps	3 mbps
Bluetooth 3.0	24 mbps	24 mbps
Bluetooth 4.0	24 mbps	24 mbps

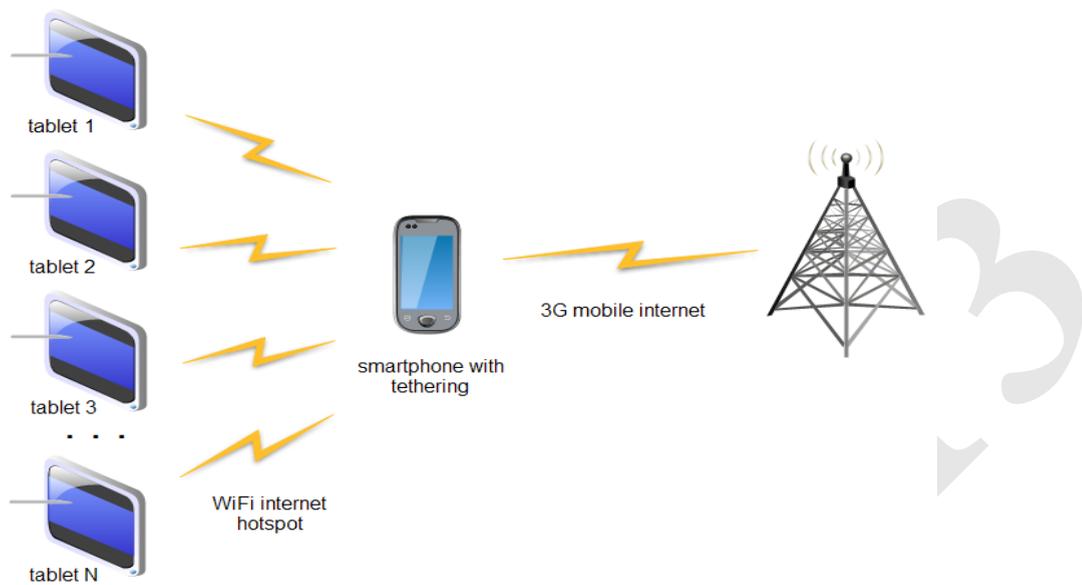

Fig. 3: Sharing of mobile internet connection by method of tethering via WiFi

2. Teaching new media outdoors

The course Introduction to New Media and Communication apart from lectures also contains tutorials in which students will work with new mobile devices and other ICT means in practice, both indoors and outdoors. New media are increasingly connected with mobility and therefore mobile devices such as tablet or smartphone on different platforms (Windows, Android, iOS, Symbian, BlackBerry OS, etc.) are used.

Within the course mobile devices like tablet with widespread platforms in their current versions of Android 4 and Windows 8 are available. During tutorials students get to know the functionality of multipurpose mobile devices, with their characteristics and usability for new media and modern mobile and wireless communication. They learn specifics of technologies (location and positioning, wireless and mobile data) supported in current mobile devices which students can use in their future practice. Lecturer further explains usability of mobile data technology infrastructure and the possibility of sharing a mobile Internet connection via tethering method by creating of own mobile WiFi hotspot outdoors. These tutorials demonstrate use of multipurpose mobile devices and mobile or wireless data technologies to access the Internet for work with mobile applications of new media. Tutorials allow students practical use of technologies supported in multipurpose mobile devices. Based on these technologies students can use mobile applications of new media:

- Wiki systems.
- Social networks.
- Photo and video sharing.
- Mobile applications of location based services (geosocial networks, navigation and maps with additional local information, augmented reality etc.).

2.1. New possibilities of mobile ICT in education at low operating costs

Tutorials held outdoors demonstrate students the possibilities of mobile internet and its subsequent use. Selected tethering is used as a method of sharing one connection to a mobile Internet for more mobile devices via WiFi or Bluetooth technology with the advantage of reduced costs. WiFi technology usually works as a stationary. Tethering, running on mobile device with sharing of the mobile connection via WiFi hotspot, adds WiFi a characteristic that the mobility at this technology is ensured.

For using of the mobile internet in teaching outdoors it was necessary to choose between the available offers of mobile connection providers. Seven mobile or virtual operators exist in the Czech Republic in June 2013, who offer these services (virtual operators don't have own mobile network infrastructure, but they rent it from mobile operators). Considering that one tutorial has 20 students, it was necessary to choose such a service that can provide required parameters of a mobile connection. The authors have defined parameter values as follows:

- Mobile data technologies coverage at required territory.
- Mobile data technologies, at least third generation (3G).
- FUP (Fair User Policy limits data traffic of internet connection) higher than 80 MB/day.
- Lowest possible price.
- Mobile services without subscription.

For use of tethering between more users the tariff with FUP of at least 10 GB per month would correspond the most. At all providers in the Czech Republic the FUP is mediated with a subscription for at least one year and minimally monthly costs €19.36. Then it would cost the University at least €232.32 per year per person.

Given that the course lasts one semester per year it is not necessary to use annual tariff and it is sufficient to get a prepaid service without subscription. Mobile and virtual operators offer various possibilities of mobile internet with different level of FUP and price. There are three official virtual mobile operators on the prepaid service market now: MOBIL.CZ, Bleskmobil and Tesco Mobile and also three major mobile operators Telefónica O2, T-Mobile and Vodafone. The mobile operator U:fon offers a mobile internet only through mobile data technology CDMA, for which no compatible devices are available within this course. All operators met the first two conditions, namely coverage with mobile data technologies in the desired territory (Pardubice city) and availability of mobile data technology at least third generation (3G) in required territory (see fig. 4, 5, 6).

After all offers had been evaluated, the best offer from the company Telefónica O2 was chosen. This company offers mobile internet for three months for the price of €38.76 per connection with the option of using 3 GB of data per month with limited FUP 100 MB/day (see Table 2). This ensures that students can not exhaust data limit during one tutorial other students, who have tutorials in other days. The course Introduction to new media and communication includes in fact one lecture and 3-4 tutorials during a week. Company Vodafone provides an interesting offer as well. It offers FUP 500 MB for two days for the price of €2.93. This offer would be only suitable while short-term mobile internet use (e.g. a week to a month). Other operators have not offered mobile internet in the required parameters yet.

The University will save not only for annual tariff package, which would be activated throughout the year, but mainly for another twenty connections for students, which will be saved by mentioned tethering due to mobile internet sharing via WiFi technology. In total the University will save up twenty times the amount due to the method of tethering, which is €775.20 per semester.

3. Conclusion

The main aim of this article was to describe the possibility of teaching mobile ICT on university with maintaining low costs at the same time with regard to scarce sources in academic field. To achieve the goal it was necessary to solve the problem of actual very high costs of mobile internet connections for large amount of students that attend the course. Authors of this article aim to provide internet for mobile devices for all students that attend the course and maintain low operational costs so that the university's budget won't be encumbered. A possible solution examined by authors of this article was using tethering. This innovative solution has brought a significant reduction in operating costs during outdoor training of course while maintaining mobility and required quality of internet connection for all students in the course. Reducing operating costs of University thanks to the use of tethering method was in the case of tutorial course with 20 students, a total of twenty times, making a total savings of €775.20 per semester.

4th International Conference on New Horizons in Education

Novel trends in physiology towards individualized veterinarian education at the University Of Veterinary And Pharmaceutical Sciences Brno

Ivana Uhríková^{a*}, Eva Matalová^b, Jaroslav Doubek^a

^aUniversity of Veterinary and Pharmaceutical Sciences Brno, Palackého tř. 1/3, 612 00 Brno, Czech Republic

^bInstitute of Animal Physiology and Genetics AS CR, v.v.i., Rumburská 89, 277 21 Liběchov, Czech Republic

Abstract

Physiology is a very dynamic discipline and also physiology education should be flexible and creative. Moreover, specific needs of different faculties and individual requests of students should be taken into account. Customized materials in printed and electronic forms allowing for selecting and puzzling of knowledge seem extremely welcome. The presented project “Creative Approaches in Physiology Classes – Integrated Educative Programs” aims to tackle the problem and provide novel study materials for veterinary students customized for the Faculty of Veterinary Medicine at UVPS Brno (Czech Republic).

Keywords: physiology; practical works; veterinarian education

1. Main text

Physiology represents a dynamic discipline closely connected with medicine. As such it has a privilege of Nobel Prizes being annually awarded for important discoveries. To keep up with recent knowledge, education of physiology requests creative approaches. Moreover, physiology is a very broad discipline and therefore, selected chapters are emphasized at different faculties with respect to their specific needs.

Fig. 1. Project logo

University of Veterinary and Pharmaceutical Sciences (UVPS) Brno thanks to its Faculty of Veterinary Medicine is the only university within the Czech Republic providing veterinary education. Physiology is included among pre-clinical disciplines forming a background for further clinical education. Recently, the curriculum at the University has been innovated to respect overall current trends in veterinary education within Europe. The changes stem from current education needs for working opportunities of the graduated veterinarians. Due to increasing stress on clinical disciplines without an overload handicap for students, pre-clinical disciplines have been rescheduled. The students should pass their exams in anatomy already in the close of the first year and there is a semester overlap with histology along with physiology. To fit all these critical disciplines into the hour funds, the shortage in direct education based on student – teacher contact has been proposed. However the amount and content of knowledge must be maintained. To achieve these slightly controversial goals, indirect form of education (particularly self study) must be exploited. To make such approach effective, specific study materials must be provided for students. Specific study materials mean to be customized in several aspects. First, they must fulfill criteria of the university education thus providing the most recent knowledge. Second, they must be adapted for veterinarian students, thus working particularly with clinically important topics. And last but not least, they must be attractive for students to let them feel satisfied during studies. To tackle these aims, a project titled Creative Approaches in Physiology Classes – Integrated Educative Programs supported by the European funds (CZ.1.07/2.2.00/15.0252, Fig. 1) has started two years ago to be completed in 2014. The first step in the project was to get together specialists from different universities and research institutes to create a strong team and share expertise. To cover broader geographical region, the project gathers partners from the city of Brno and Olomouc, holding the oldest universities in Moravia (a historical part of the Czech Republic). The second step was to highlight essential issues for graduated students from the respective universities (including the UVPS) and to outline the customized materials. To cover both, theoretical and practical education, an important goal of the project is to connect knowledge directly with hands-on experience, which means a direct application of theory into practice. To work in the proposed modular way, several approaches must be applied for material preparation thus creating

presentations, text, pictures, figures, video-sequences and particularly their dynamic connections in interactive schemes along with protocols, interactive flowcharts, educative games, test of knowledge, glossaries etc. In the next step, the material must be tested in close cooperation with the students. Therefore, several pilot subprojects have been engaged to find the best way of topics presentation to students to build a solid background of physiology knowledge for their further learning particularly in pathological physiology and clinics. The last step will be the material finalization and its communication not only in printed but also in electronic versions.

In the latest academic year (2012/2013) the interest was focused on integration of theoretical and practical knowledge. The recent concept of physiology is based on the principle day-one skills modified for a week education (there is a maximum 20 students in each study group and more than 200 students to go through the course each week). The project proceeded according to recent syllabus of the discipline approved by the scientific board of the faculty and university. As in the new curriculum, practical program in physiology has been shortened, the project aims was adapted to this fact. In the first semester of the academic year, first creative materials were tested in the pilot project. The major chapters were: cellular physiology and application of modern approaches, such as organ explant cultures, physiology of blood and body fluids with a special focus on erythrocyte, leukocyte and thrombocyte complexes. First, the materials were prepared in a draft form and offered to students for self-study prior the practical course. The aim is to catch up the missing hour from shortened schedule by perfect preparation of students by studying of

Fig. 2. Physiology I - cover

methods and experimental design ahead the course. To see the level of understanding, two types of tests

were applied. Test of knowledge was for the teacher to check the degree of preparation and ability to connect knowledge from the lectures with the practical course. The questionnaire was a chance for students to express their opinion about the prepared material and suggestions for modulation. In the second step of the pilot projects, the tests were evaluated, materials modified accordingly, consulted with other experts and issued in the final form. The first book, Physiology I – practical courses by E. Matalova et al. (2013) (Fig. 2), was issued under ISBN 978-80-263-0351-0 in February 2013 and was thus ready for the first year students following the new curriculum starting physiology in the second semester of the year 2012/2013. Along with the paper form, electronic version of the textbook was open free on the website together with accompanying material such as quizzes, games, and other forms of interactive e-learning. To prepare the second part of the book in time, the pilot part of the project was running simultaneously in the second year classes. Here, the attention was paid to physiology of systems, particularly cardiovascular, respiratory, digestive, excretion, inner secretion (endocrine), motoric and nervous. The second textbook, Physiology II – practical courses is due to be printed in September 2013 to be distributed by the start of the new academic year (and second semester of physiology according to the new curriculum). By the end of the project, two complex textbooks for veterinary students focused on theoretical background of physiology are expected to fit with the practical protocols and the website (<http://kreativnifyziologie.upol.cz>, Fig. 3) containing plenty of diverse study materials to be selected based on the preference and needs of the students.

The screenshot displays the website interface for 'KREATIVNÍ FYZIOLOGIE'. At the top, the title is written in large, colorful letters. Below it, a navigation menu lists: Domů, O projektu, Řešitelský tým, Studentské prezentace, Virtuální procházky, Fotogalerie, Výkladový slovník, and Pilotní výuka. A 'FOTOGALERIE' section shows a photo of a person. The main content area features a text block about the project's goals, a 'Publicita projektu (.ppt)' section, and a 'Propagační leták' section with four posters: 'Kreativní fyziologie ve výuce', 'Partnerské projekty', 'Obecná fyziologie', and 'Fyziologie živočichů'. The footer contains logos for ESF, Evropská unie, MŠMT, OP Vzdělávání, and Univerzita Palackého.

Fig. 3. Project website

We thank project partners, Faculty of Science of the University of Olomouc, the Institute of Animal Physiology and Genetics, v.v.i. of the Czech Academy of Sciences, external consultants and particularly students involved in the pilot project for a fruitful cooperation, stimulating communication and help with achievement of the project aims. We hope that the prepared material will help students not only with preparation for the exam but also for their further (clinical) education and later practice.

Number relationships on students with mild mental retardation

Tamer Aydemir*, Hüseyin Cahit Kayhan**

*Pamukkale University, Faculty of Education Faculty, Kinikli Campus, 20020, Denizli, Turkey

**Pamukkale University, Faculty of Education Faculty, Kinikli Campus, 20020, Denizli, Turkey

Abstract

The purpose of this study is to investigate the number relationships of students about “The More-The Same-The Less” concepts. The students with mild mental retardation are handicapped children who need special education and their ability in number relationships have been recognized according to concrete-representational abstract (CRA) instructional approach.

Qualitative research approach have been used in the study Case study design have been carried out. The study is planned by studying with one participant and it has been multiple case study by including a few similar students with mild mental retardation in the study. Three students with mild mental retardation from a special education school were attended to the research. The participants of the study were selected among the students with mild mental retardation according to predetermined prerequisite skills. In the research to determine the ability of students with mild mental retardation, “The More”, The Same“ and “The Less” concepts were used in concrete-representational-abstract instructional abstract. For collection data assessment sets containing number relationships were prepared for each level of CRA and Interview, content analysis and think aloud methods were used to collect data. In the analysis of data, techniques of phenomenography were used in order to reach the concepts and relationships that can explain data related to sub-problems. According to the research’s findings, students were recognized as inadequate in number relationships and also suggestions to teachers at the end.

Key Words: Special Education, Mild Mental Reterdation, Number Relationships

1. Introduction

Mathematics skills, while very important prior condition for the students with intellectual disabilities to proceed in academic life, daily life, vocational field, is the leading skill which students with intellectual disabilities have difficulty to understand (Kroesbergen & Van Luit, 2003; Perie et al.,2005). This problem is multiplied by the factors. These factors are especially about mathematics skills which requires cognitive skills, difficulties in literacy, not allowing enough time teaching concepts, not providing students with enough opportunities and low motivation of the students (Vaughn et al., 2003).

Along with all these reasons, one of the reasons of not being able to gather mathematics skills for the students with intellectual disabilities is helix structure of mathematics. In other words in mathematics,

* Corresponding author. Tel.: 00 90 506 314 5778

E-mail address: taydemir@pau.edu.tr

E-mail address: hckayhan@pau.edu.tr

acquisition of each skill depends on other skills that are prerequisite. From this perspective, especially the acquisition of the concept of number is one of the most important prerequisite skills for students to be successful in mathematics. National Council of Mathematics (2000) also proves that: “All the mathematics proposed for prekindergarten through grade 12 is strongly grounded in numbers”. From research in literature, studying with students in numerical concept show that students gaining numerical concepts are recognized more successful in place value, numbers operation, computation, time telling and problem solving skills (Case & Griffin, 1990; Fischer, 1990; Griffin, Case, & Siegler, 1992; Kamii & Dominick, 1997; Resnick, Lesgold, & Bill, 1990).

Numerical concepts are very abstract and become more complex for students (Fuson, 1988) and conceptually understanding of numbers teachers based on three phase: Counting, Number Relationships and Numeral Writing & Recognition. (Van de Walle, 2007). Teachers should regard these three phase in the process of acquisition of numbers. In these phases students with mental retardation having counting and numeral writing skills; have difficulties in number relationships consists of cognitive process. Especially they have difficulties in acquisition the provision of the numbers containing multiplicity. So conceptually understanding of number relationships should teach to the students with evidence based strategies such as concrete to abstract models in the early years of life (Jung et al., 2013). However number relationships take part in early childhood academic skills in literature, should teach to the students with mild mental retardation regardless of their age. There are four types of number relationships children need to learn. These are (Van de Walle, 2007):

1. *Spatial Relationships*: Children need to recognize visual patterns, arrange the number of objects or organize objects into pairs visually without counting them. Children can develop a better understanding by looking at spatial relationships.
2. *One or Two More, One and Two Less*: Understanding that 6 is one more than 5 and two more than 7 leads to a better understanding of the basic facts students are required to memorize by 2nd grade.
3. *Benchmarks Of 5 and 10*: The numbers 5 and 10 are important to understand because they are so important in the base 10 system. Children need to understand how other numbers are related to 5 and 10, such as “8 is 2 less than 10, so $8 + 1$ is less than 10.”
4. *Part-Part-Whole Relationships*: Children need to recognize that numbers can be thought of as a whole which is made up of parts. For example, the number 7 can be made up of different parts, such as 3 and 4 or 5 and 2. Part-whole understanding leads to improved understanding of all mathematical operations.

Also according to Baroody (1987), for conceptually understanding of number relationships students need to develop three features. These are; Subitizing, Parts-Whole Relationships and More-and Less Relationships. Subitizing refers to the process of instantly seeing a number without counting like Walle (2007)’s spatial relationships. Teachers should make lots of concrete activities with students with mental retardation in subitizing process. But sometimes they aren’t able to know the real sequence of counting words represents the total quantity of a collection (Fuson, 1988). So the only subitizing process isn’t not enough for number relationships and teachers should organize Parts-Whole Relationships activities. In Parts-Whole Relationships students divides the whole into two parts by eyes and they add the part on the other. But they may have difficulties to understand explicitly the logical relationships. So teachers should organize an appropriate activity that connects missing addends and initial concepts of subtraction involves counting out items and then having a child hide some of them under a thing. And also they should encourage children to see all possible parts-whole compositions for a given number (Jung, 2011). The last feature of number relationships is More-and Less Relationships. It consists of more, less, and the same phases and it’s accepted as successful way in helping children develop the overall concept of number (Van de Walle, 2007). In this feature organizing a pair of collections with different quantities, students able to judge collections as “more”, “less” and “the same” for whether they understand the multiplicity and the symbol of numbers’ quantity.

From researches; Baroody (2000), determine that students aren't be able to understand parts-whole relationships will have difficulty in addition, subtraction, and other mathematics problems (Jung, 2011). Also Fischer (1990) recognized that students have this feature are more successful in basic number concepts, addition and subtraction problem solving, and place value. While there are lots of findings to acquire the conceptual understanding of number relationships and many guidelines for students who need conceptual understanding of number relationships, number relationships aren't cared about by teachers in special education. Usually teachers access numbers of operations after students begin to count and recognize the symbol of numbers. However teachers suppose that students who count and make operations are able to do these features (Jung, 2011), they should spend more time in these features before accessing the acquisition of numbers operation and they should place continuous assessment processes in sessions.

The aim of this research is to determine the ability of students with mild mental retardation in number relationships. For this reason questions below are seeked to be answered:

1. How is the ability of students with mild mental retardation in number relationships in concrete level?
2. How is the ability of students with mild mental retardation in number relationships in representational level?
3. How is the ability of students with mild mental retardation in number relationships in abstract level?

2. Method

In this research, qualitative research approach is used and the research is designed as a case study.

2.1. Participants

Three students, 2 boy and a girl, with mild mental retardation have attended the research who were selected according to their prequisite skills. Prequisite skills were reading & writing numbers and counting. Also they could do addition and subtraction operations individually. They were also volunteers and have taken permission by parents. In the research participants called as their imaginary names Ali,zeynep and Mehmet.

2.2. Data collection

In this research assessment sessions were designed as parallel with the instructional guiddelines of Van De Walle (2007). To determine the ability of the students in number relationships, assessment sessions are designed according to "More", "The Less" and "The Same" concepts of number relationships and also they were represented according to Concrete-Representational-Abstract (CRA) instructional approach. In assessment sessions 10 different number of sets were represented to each participant according to each level of CRA.

Figure 1. The materials used in assessment session

Concrete Level

Representational Level

Abstract Level

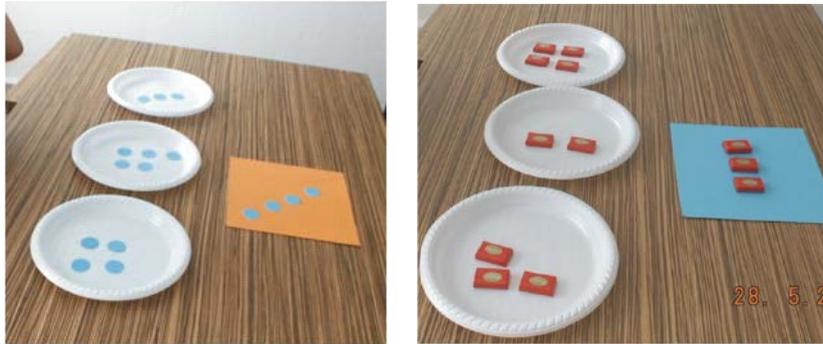

The assessment sets of number relationships concept were given in Fig. 1. In number of sets, a target number in the above and three different numbers in the below were took place and expected to answer the questions (Which one is the same?, Which one is the less? and Which one is more?) correctly by the participants. In the concrete level chocolate packets were used to represent the numbers; coloured circles were used in the representational level and also symbol of numbers were used in abstract level CRA. In abstract level strips drawn by pencil were used as semi abstract target number.

In the research 10 different directive sets were used to determine the ability of number relationships. In the sets five of them were prepared consecutively (like 4-5-6) and given randomly. The other five of them were prepared in twos (like 3-5-7) and given also randomly to each students in each level. 10 different assessment sets were used in each three level of CRA and each concept of “The More, The Same, The less”. Assessment sets were given in Table 1.

Table 1. Assessment Sets

Level	Patterns	1	2	3	4	5	6	7	8	9	10
CRA	Target	3	4	5	6	7	4	8	5	6	7
	Given	2-4-3	4-5-3	6-4-5	6-5-7	7-6-8	6-4-2	9-6-8	3-7-5	6-4-8	7-5-9

In these sets consists of multiplicity, target number was represented with different patterns from given numbers to avoid memorization and determine how participants compare the sets.

Figure 2. Examples Of Different Patterns

In the assessment sessions reinforcements weren't used for the participants and also no feedbacks were used response to their answers but reinforcements were allowed by the researchers when the sessions completed before the beginning other level.

2.2. Data analysis

All assessment sessions were recorded by video camera and after completing the research, researchers watched records and redacted to the table. Also researchers observed the students how they do the number of sets. Finally datas were analysed by using content analysis method according to the research questions.

3. Findings

3.1. The ability of students with mild mental retardation in number relationships in concrete level

In the first sub-question it was sought to find an answer to the question "How is the ability of students with mild mental retardation in number relationships in representational level?". When the results of the study were considered, the statement of the three of the participant students were found as follows.

Ali was able to count the concrete objects given to him correctly through recognizing by touching. When he was given multiplicity of objects around 2, 3 or 4, Ali can easily show the plate with the amount of the same, the less and the more multiplicity (even if they were given in successive order or not). However, when the amount of the multiplicity was increased, even if they were given in regular pattern, he sometimes counted the number of the multiplicity. That was, he could make mistakes like missing the order, recounting the ones that he already counted or miscounting the objects.

When the objects were given randomly without any pattern, he has difficulty in counting them correctly. Even more, he mostly fails to count correctly. Another interesting thing with Ali was that when he was required to show the plate with the less and the more amounts, he feels a need for recounting them each time even if he was able to recognize the one with the less visually. When he was asked to show the plate with the same one, even if he can primarily count the same one randomly, he cannot decide on the other plates before counting them. This was because Ali feels a need to recount the plate, forgetting all the time that he has already counted.

Zeynep can accomplish counting correctly by touching each of the given objects. However, she can sometimes make mistakes while subitizing without touching them. She was required to compare the target multiplicity provided by the researcher in the other plates. Zeynep was able to determine the multiplicity through counting one by one. She was able to show the correct plate with the same multiplicity. However, when she was asked “which one is more” or “which one is less”, she showed the same plate again. This indicated that Zeynep knew the concept of “the same” but she couldn’t know the concepts of “the same” and “the less”.

It was seen that Mehmet cannot recognize the quantity of the chocolates by subitizing. He failed to subitizing, which was the first expectation of the researchers, but tried to decide the quantity of the chocolates by touching. During this process it was seen that he had a difficulty in continuing from where he stopped when he skipped a chocolates in the pattern. It was also seen that he had the same difficulty when he was comparing the target number with the plate he counted in the touching sessions. Generally, when analyzed, the results showed that he provided correct answered for the questions asked in the concrete level while he failed to provide correct answers for the questions about the concepts of the less and the more.

Table 2: The answers of students in number relationships in concrete level

Participant	Instructions	1	2	3	4	5	6	7	8	9	10
Ali	The Less	+	+	+	-	-	+	+	+	+	+
	The Same	+	+	+	+	+	+	+	+	+	+
	The More	+	+	+	-	+	+	+	+	+	+
Zeynep	The Less	-	-	-	-	-	-	-	-	-	-
	The Same	+	+	+	+	+	+	+	+	+	+
	The More	-	-	-	-	-	-	-	-	-	-
Mehmet	The Less	-	-	-	-	-	-	-	-	-	-
	The Same	+	+	+	+	+	+	+	+	+	+
	The More	-	-	-	-	-	-	-	-	-	-

The answers of the students at the concrete level is seen in the Table 2. In Table 2, the signs “+” and “-” show the students’ answers to the questions in accordance with the instructions. As seen in table , concrete level, Ali, unlike his two other friends, gave correct answers almost in all instructions.

3.2. The ability of students with mild mental retardation in number relationships in representational level

The second sub-question sought an answer for the question “How is the ability of students with mild mental retardation in number relationships in representational level?”. When the findings of the participants are considered, three of the participants’ situations were found to be as follows:

It was seen that Ali repeated the same mistakes that he did at the concrete level. As he corrected his miscounts at representational level, he was found to be more successful in showing the less, the same and the more multiplicities.

Zeynep has difficulties in distinguishing the concepts ‘the same’, ‘the less’ and ‘the more’. She counted the target multiplicity and stated that they were the same, pointing out one of the other three plates. It was seen that Zeynep failed to provide correct answer for any of the instructions at the concrete level. Generally speaking, although Zeynep has prerequisite skills, she couldn’t have a precise understanding of the concepts of “the less” and the more”. As for the term “the same”, it might be inferred that although she had an idea about what “the same” was, her correct answers did not necessarily mean that she knew the quantity of it but probably because they were represented with the same numbers. The fact that she showed the one with what she shoed for “the

same”, when she was asked to show “which one is more?”, indicated that she did not quite perceive the term “the same” clearly.

Mehmet was also asked to compare the number of counting circles in the tables with the target number. However, he could not distinguish the counting circles at this level either and he pursued the activity feeling the need for touching. At the concrete level, although he provided correct answers to the term “the same”, it was seen that he provided wrong answers to some questions about the term “the same”. The main reason for this was found that he felt the need for recounting the target multiplicity in order to relate the counting circles and target multiplicity.

Tablo 3: The answers of students in number relationships in Representational level

Participant	Instructions	1	2	3	4	5	6	7	8	9	10
Ali	The Less	+	+	-	+	+	+	+	+	+	+
	The Same	+	+	-	+	+	+	+	+	+	+
	The More	+	+	+	+	+	+	+	+	+	+
Zeynep	The Less	-	-	-	-	-	-	-	-	-	-
	The Same	-	-	+	-	+	+	-	+	-	-
	The More	-	-	-	-	-	-	-	-	-	-
Mehmet	The Less	+	-	-	-	-	-	-	-	-	-
	The Same	+	+	+	+	-	-	+	+	+	+
	The More	-	-	-	-	-	-	-	-	-	-

The answers of the students’ at the representational level were given in Table 3. As seen in Table 3, at the representational level, Ali again unlike his other two friends, provided correct answers to all instructions.

3.3. The ability of students with mild mental retardation in number relationships in abstract level

In the third sub-question, it was sought to find an answer for the question “How is the ability of students with mild mental retardation in number relationships in abstract level?” The results of the findings about the three students were found to be as follows:

It was seen that Ali experienced almost similar experiences as he had at the concrete and representational levels. On his confusing “the less” and “the more” for the questions 4 and 6, to the researcher’s question “which one is bigger 9 or 7?”. He replied as 7. This might be resulted from the fact that confusing the quantity of numbers as a symbol.

Zeynep had difficulties in gathering her attention. Although she was able to define the number of sticks correctly, when she was asked to show which one of the number of counting cards placed on the plates was the same with the number of the sticks, “which is less” and “which is more”, she pointed out all of the plates. Therefore, she failed to provide appropriate answers. That she answered as 8 for the question “which is bigger 8 or 6” and answered as “6” for the question “which is bigger 6 or 8” and same inconsistencies for such kind of questions indicate that Zeynep had difficulties in understanding abstract expressions.

Since Mehmet recognized the numbers during the evaluation of the abstract stage, he was able to provide correct answer for the question “which is the same?” However, it was seen that he failed to provide inconsistent answers for the questions “which is more” and “which is less?” particularly, changing the places of the patterns and his tendency of doing the exercise by rote contributed negatively to his answers. Following the answer for “the same”, when the plate was distanced from the environment, he felt it necessary to recount the lines again.

Table 4: The answers of students in number relationships in Abstract level

Participant	Instructions	1	2	3	4	5	6	7	8	9	10
Ali	The Less	+	+	+	-	+	-	+	+	+	+
	The Same	+	+	+	+	+	+	+	+	+	+
	The More	+	+	+	-	+	-	+	+	+	+
Zeynep	The Less	+	-	-	-	-	-	-	-	-	-
	The Same	+	-	-	-	-	-	-	-	-	-
	The More	+	-	-	-	-	-	-	-	-	-
Mehmet	The Less	+	-	+	-	-	+	-	-	-	-
	The Same	+	+	+	+	+	+	+	+	-	+
	The More	+	-	-	-	-	-	+	+	-	+

Status of the students' responded to the instructions are seen in the table 4. As can be seen in the table 4, at the representational stage, Ali, unlike his two friends, was seen to provide correct answers for almost all of the questions in the instructions. Mehmet, on the other hand, was seen to be successful in showing the reference multiplicity and the same multiplicity as he was in other two levels.

In general, the symptoms of students with mild mental retardation of showed itself also in the study. Every student had knowing numbers and counting prerequisite skills. All of the students participated in the study had no problems while finding "the same" in the other multiplicities with the given target multiplicity after they counted them. This situation was available for all of the three levels of CRA. However, except for Ali, it would be a mistake to state that the other two students had a clear understanding of the concept "the same". At the concrete stage, although there were some certain individual differences, in general it was seen that they had similarities in their making mistakes and calculating processes. Among the most common mistakes in calculating process were found to be recounting the objects and miscounts. This was also the same for the situations given in patterns. It was also seen that the counting level of the students were at the initial stage (counting by touching the objects one by one).

At the representational and abstract levels, it was found that two of the participants (Mehmet & Zeynep) had problems because of the fact that they failed to gather to do by subitizing. In general, although Mehmet has prerequisite skills, he was found not to have precise information about "less" and "more". Although he was aware of the term "the same", it has been thought that he answered correctly not because he knew the multiplicity of it but probably because they were pronounced same. Therefore, it was possible to conclude that he cannot use the term quite consistently. Particularly, one of the participants, (Zeynep) was found to be not aware of the fact that she needed to consider the target multiplicity in order to choose the plate with the less or the more multiplicity while deciding the same multiplicity based on the target multiplicity. It would be quite possible to conclude that she caught the right answer during the pronunciation of the number while counting the multiplicities in the plates when she was asked to choose "the same" one. Ali, on the other hand, was aware of three of the concepts "the less, the same and the more".

At the abstract stage, while Mehmet showed the plate with the same multiplicity, he could not show the others. Zeynep, was able to show the plate with the same multiplicity for only one instruction. Both the participants were found to be insufficient in showing the "the more" and "the less". Ali on the other hand showed a good performance in this stage as he did in the other two levels.

Results and Discussion

A general assessment of findings showed that participants failure in subitizing and counting the objects caused negative impact in ability of comparing the multiplicity. Although they could do addition and subtraction skills in assessment of prerequisite skills in the class, they were recognized as in the beginning of counting skills. Also despite of being given to participants in the form of clusters of patterned sets of multiplicities are strangers. The numbers of these children with mild mental disability appeared to be very inefficient at seeing relationships.

In the research the ability of number concepts until fifth patterns were expected to determine and after fifth pattern subitizing were expected by looking the multiplicity of patterns. But participants prefer to count all items in the patterns than subitizing in each level of CRA. Just Zeynep tended to show “the same” but she also counted after this attempt. This findings showed consistency with Muldoon, Lewis & Towse (2005) research found participants refer to count the items if they are visible.

Among participants just Ali showed expected performance and he answered the instructions with less mistakes owing to better counting skills. Also the participants showed expected performance in the concept of “the same”. But during the sessions it was recognized that it was caused by telling the same number verbally rather than understanding the multiplicity, According to Van De Walle (2007), concepts of “The more” is easier to use than the concept of “The Less”. But in the results there weren’t any result to support this idea (see Tables 2-3-4). An assesment of CRA levels, in concrete level researchers were expected more success. But in concrete level, just Zeynep had more correct answers in the concept of “The same” and there weren’t any difference among the others.

In this research, researchers expected the idea of acquiring how the teaching of mathematics in special education schools with students with mild mental retardation and defining what educators may do in the future in the classrom. However studying with the participants who had the same prerequisite skills, each participant showed different characteristics in need of special education. During sessions each participants were different mistakes depend on different sources. But their results and their attempts to answer the instructions may generalize to the literature and their abilities in number relationships recognized as not enough to gain more complex mathematics skills. This finding also showed that activities in the classroom to develop childrens’ ability in number relationships aren’t enough. So teachers should give place to appropriate activities based on literature to develop number relationships and shouln’t begin another skills without assessing students performance. This research also should do in the preschool and in the first grade of elementary school with students.

Objectivity of learning performance evaluation evaluated by school age pupils as an assumption of achievement motivation and school success

Dana Malá^{a*}, Marcela Verešová^a

^a*Constantine the Philosopher University in Nitra, Faculty of Education, Department of Pedagogical and School Psychology, Dražovská 4, 949 74 Nitra, Slovakia*

Abstract

In the submission are presented research findings of relationship between perceived adequacy of school age pupil's evaluation to their learning motivation and school success. The research was conducted on 140 pupils of 5th – 9th grade of primary school through success in Mathematics, items from Kozéki's questionnaire (1980) and propositions of Q-sorting (Stephenson, 1935) of perceived evaluation objectivity. It is possible to state that school success is the assumption of achievement motivation; however the learning performance is not related to perceiving evaluation objectivity presented by school success.

Keywords: achievement motivation, learning performance, school success, evaluation objectivity

1. Achievement motivation and school success

The motivation to performance is common for all activities, as it represents a general desire for success. Performance motivation is relatively stable characteristics of an individual and various people are distinctive by various strength of motivation to performance (related to the desire for success) which decides about their engaged activity. Performance motivation has situation and disposition components which determine the selection of targets, stamina and the amount of effort involved (Nákonečný, 1992). Typical representatives of performance motivation theory can be considered the theories of McClelland (1961), Ryan a Deci (2008), Keller (2010).

McClelland (1961) assumed that human motivation consists of three dominant needs: the need for performance, need for power and need for affiliation. McClelland characterized people motivated to performance as being able to set high and unattainable aims, oriented towards personal performance and not towards recognition, desiring feedback based on evaluation of performance.

Self-determination theory is considered to be the macro-theory of human motivation (Ryan & Deci, 2008). Its authors create it in a close relationship with personality development, self-regulation, life targets and aspirations, vitality, unconscious processes, personal well-being but also with universal psychological needs. Ryan and Deci (2008) consider the universal psychological needs, participating on efficient operation and psychological health of a person, to be a triad of needs, where belongs the need for competence, need for autonomy and need for relations. This means that except freedom and social interactions, the authors perceive the need for production of performance to be a crucial need.

Keller (2010) defines his ARCS motivation model through four dimensions: attention (A), relevance (R), confidence (C) and satisfaction (S). All variables are always saturated by three sub-dimensions. Attention is saturated by perception arousal, information arousal, and variability. Relevance is saturated by orientation to targets, choice of motives, confidence. Confidence is saturated by requirements on learning, opportunities of success, personal control. Satisfaction is saturated by inner strengthening, outer rewards, and justice. From the point of motivation to performance is important process side consisting of concentration on performance, understanding the importance of the task, personal well-being and personal gain from production of performance.

Learning motivation can be understood as a specific part of performance motivation. A key representative of this perspective is Kózeki (1980) whose ideas are presented in chapter 3.

Within performance motivation we meet with success as a reflection of the result of performed activity, also connected with the experience of success. Similar situation happens by failure and related experience. These repeated experiences with success and failure go back to childhood where they are mostly connected with the experience from school environment.

School success can be defined in two ways:

In a more general understanding, it is the degree of utilization of individual pupil's potential – degree of using individual abilities, competences, his relationship to school or subject, learning motivation (Čáp, 1993; Helus, 1982;), while it reflect also its conditional factors (Čáp & Mareš, 2001) and to the most basic can be included the school environment and effect of the teacher and perception of this effect by pupil. In the level of school practice is the concept of school success related to the criteria of school success defined for the student by the teacher. Except explicit and implicit classification of school success criteria is the key factor the teacher's subjective perception of pupil's activities and their fulfilment. Teacher's subjective perception and the verification result of pupil's fulfilment of tasks reflect back in school success and identically in pupil's perception and understanding about this process. The perceived teacher's objectiveness is always interpreted subjectively by the pupil where the pupil doesn't have to take into consideration the objective indicators of education standards. Question remains whether such a representation influences the performance itself, success and motivation.

In a narrower understanding, it is defined especially through the level used in school practice and authors use the term school success equivalently with the term school result, performance (Helus, 1982). A differentiated operationalization of this term is reflected also in the differentiation of tools for its measurement and is reflected in the grades, marks or their averages.

2. Method

The research sample consisted of 140 participants whose average age was 12.6. They were the pupils of 5th – 9th grade of elementary schools, concretely the pupils of the lower secondary education.

In the research, we operated with three variables: school success, perceived objectivity of the learning performance and learning motivation. As an indicator of the school success we chose the mark of the Math, because (according to Vágnerová & Klégrová, 2008) the learning outcomes[†] of the Math are the best predictors of the self-concept and also the school successfulness in the school age. This relation was confirmed in our earlier study (Malá & Čerešník, 2011). The goal was the differentiation of the pupils into two groups. The first group was the group of the successful pupils. Their mark from the Mathematics was 1 (means excellent) or 2 (means very good). The second group was the group the less successful pupils. Their mark from the Mathematics was 3 (means average) or 4 (means sufficient).

Perception of the teacher's objectivity in the process of the evaluation was measured by Q-methodology (Stephenson, 1935 in the modification of Sexton, Snyder, Wadsworth & al., 1998). It consisted of 20 items related to teacher's objectivity (according to relevant literature) in the orthogonal configuration which were

[†] Learning outcomes are explicitly defined expectations of the knowledge amount the students have to understand and apply after the process of the education. For more information see for example Verešová (2013), Verešová, Čerešník (2013).

assessed by pupils on the scale from strong agreement to strong disagreement. On the base of their choices, we made the order of the items. In the next step, we subtracted the item value chosen by the concrete pupil from the average value of the item in the whole group. We acquired the concrete positive or negative values which determine if the pupil perceived the evaluation of the teacher as objective or not. So we can divide the research sample into two groups. The first was the group which perceived the evaluation of the teachers as objective and the second group perceived it as not objective.

For the learning motivation diagnostics, we used Kozéki's questionnaire (1980). The selection of this research method was inspired by the research of Čerešník (2012a) which was focused on learning motivation differences measurements in the different cultural contexts and also on age specifics of the learning motivation. The questionnaire consists of three basic dimensions of learning motivation (affective, cognitive and effect) which he divides into sub-dimensions (we specify their description):

- A affective dimension – represents emotional relationship to people from the closest vicinity,
 - a1 emotional relationship to parents, effort to keep good relations with them,
 - a2 emotional relationship to educator, effort to keep trust of own idol, authority,
 - a3 emotional relationship to classmates, effort to gain and keep good feeling of belonging to class,
- C cognitive dimension – represents relationship to knowledge, possibility to develop own abilities,
 - c1 autonomy and independence, motives of individual reality recognition, trust in own powers,
 - c2 intellectual motivation, need for knowledge, competence, pleasure in cognitive process, influence of self-perfection motives,
 - c3 activity, interest as a main motive,
- E effect dimension – represents relationship to expectations of the environment, motivation influence of adopted norms and their harmony with own behaviour,
 - e1 motives, resulting from self-evaluation, from the effort to keep self-esteem; motives coming from tension between real and expected performance based on self-evaluation,
 - e2 motivation influence of adaptation to group, team regulations, influence of personal responsibility for team results; norms and values of surroundings are becoming main motives for learning,
 - e3 motivation influence of moral standards and value system in a given society, its evaluation opinion on learning; motives resulting from the effort to approach the norms of society, mutual ideal.

We hypothesized that:

Hypothesis 1: there the differences exist in the learning motivation of the children in the relation with their school success.

Hypothesis 2: there the differences exist in the learning motivation of the children in the relation with perceived objectivity of the learning performance.

3. Results

To test our hypothesis we used Statistical Program for Social Science 16.0. We used Mann-Whitney test and t-test for two independent samples to test differences between research groups. As a critical statistical value which indicates the statistical significance, we appointed the standard value of $p \leq 0.05$.

The results are presented in Tables 2, 3, 4. All significant differences are emphasized by Bold.

legend: CKQ = components of Kozéki's questionnaire; Mark = mark of the Math; N = count; AM = average mean; SD = standard deviation; U = value of Mann-Whitney test; p = significance; abbreviations of the learning motivation components are defined in chapter 3

When testing hypothesis 1, we discovered that (table 2.):

there exists a difference between learning motivation of successful and less successful children (measured by the mark from the Math) in all dimensions and sub-dimensions of Kozéki's questionnaire, except the sub-dimensions e1 (self-evaluation motive) and e2 (motive of group regulations, norms). T-value was fluctuating between 2.527 and 4.749 and significance value from 0.013 to < 0.001.

In two cases was the average value of measured motive negative in the group of less successful children. This was motive a2 (emotional relationship to authority, teacher) and cognitive dimension of learning motivation (C). in one case we discovered in both groups of children a negative motive value. This was motive c2 (need for knowledge).

Regardless statistical significance, less successful children always scored lower than successful children.

When testing hypothesis 2, we haven't discovered any significant differences (table 3.) in learning motivation on relation to perceiving objectiveness of teacher's evaluation. We repeatedly discovered that motive c2 (need for knowledge) is negative.

Based on above stated findings we evaluated set hypotheses as follows. We can confirm Hypothesis 1 and we cannot confirm Hypothesis 2.

Despite the relative closeness of the findings we decided to examine the relation of school effectiveness (mark from Mathematics) by perception of teacher's evaluation and learning motivation (table 4.). We discovered that: children that perceive the teacher's evaluation as objective differ in all dimensions and sub-dimensions of Kozéki's questionnaire except motives c3 (interest in motive), e1 (self-evaluation motive) and e2 (motive of group regulations, norms) which is a very similar result to testing Hypothesis 1 (also in the sense of motive quality and size of discovered differences). We discovered no significant differences in the group of less successful children in five motives: a1 (relationship to parents), a3 (relationship to classmates), c1 (independence), e1 (self-evaluation motive), e2 (motive of group regulations, norms). We again discovered demotivating influence of need for knowledge (c2) in both age groups.

4. Discussion

When analysing the learning activities of pupils divided according to their school effectiveness represented by their Mathematics mark, we discovered the existence of identical motivation and demotivation factors. Based on the average values we identified the identical motivation factors, specifically the motive of following moral standards (e3), interest (c3) and relationship to parents (a1). They seem to be key factors because despite the children's Mathematics effectiveness they include all important levels influencing motivation, specifically the relationship to oneself, relationship to close people and relationship to society. The demotivating factors are identical in both groups: need for knowledge (c2) and relationship to teacher (a2). The difference between successful and less successful children represents the third identified factor. In case of successful children it is the following of regulations (e2) and in case of less successful children it is the trust in own powers (c1). More successful children are therefore more demotivated by realization of outer limitations and less successful children by the inability to perceive subjective control. Similar findings are presented by Čerešník (2012b) using a sample of university students.

The demotivating influence of need for knowledge (c2) in both tested groups can be considered specificity. We assume that this fact is caused by the expansion of external factors. A primary prototype factor influencing the thinking, feeling and behaviour is considered the family environment which is (in optimal conditions) the source of emotional support and psychical stimulation. It is presented by a unique bond which influences the attitude towards oneself, towards other people, towards one's surroundings and has influence on human motivation in the sense of selecting preferential activities. In ideal conditions, it stimulates curiosity which comes from the feeling of safety and fulfilment of basal social needs. In pessimistic conditions it is more upsetting; it leads to deprivation, or sub-deprivation. Therefore we believe that the quality of family environment is a factor which could strongly influence the exploration activity which in this period shows in the need to new understanding and knowledge.

The relationship to the teacher represented by the factor (a2), located among demotivating factors in both groups indirectly points to the relation between school effectiveness and relation to authority. This factor can't be perceived as positively motivating in either group. It has a neutral effect at successful children and it acts negatively at less successful children. The relationship to the teacher is independent from the teacher's objectiveness of evaluation in the sense of stimulation to learning performance.

We can state that school success is the assumption of achievement motivation; however the learning performance is not related to perceiving evaluation objectivity presented by school success.

4th International Conference on New Horizons in Education

Online enhancement of English language training at a business college in Prague

Karel Helman*

Private University College of Economic Studies, 1 Lindnerova, Prague 180 00, Czech Republic

Abstract

Having stressed the role of ICT in tertiary education, the present paper highlights the online learning/teaching impact upon language training effectiveness. It briefly reports on grant projects pursued at the Private College of Economic Studies in Prague, Czech Republic, co-financed by the European Social Fund. The paper focuses on a digital learning tool for Business English, developed at PUCES language department. The modular structure of the e-learning content and on-line tutoring experience in the blended learning environment are highlighted, preconditions of successful course administration, management and completion being pointed out. An internal survey of PUCES undergraduates' satisfaction and general e-learning feedback is also mentioned.

Keywords: ESF-funded projects; foreign language teaching; e-learning; blended learning; online tutoring

1. Introduction

Academic efficiency and student comfort are general requirements that have to be met by universities and other higher education institutions. The employment of new communication technologies that make learning more interactive and thus rewarding and challenging is one of such helping ways. Non-standard learning tracks have been built alongside traditional roads to knowledge, skills and expertise. Self-paced e-learning – a by-product of a more individualized education process – makes them accessible regardless of distance and time, focusing on an individual student with his/her own pace, needs and timetable. The virtual learning environment (VLE) in which digital tools are created and shared has expanded the range of delivery modes and learning experiences beyond usual face-to-face approaches. It liberates learners since digital resources make it possible for them to schedule their own learning pathways, share them with others and get immediate feedback. That is why schools introduce new stimulating models of learner support tailored to their students' needs.

Computer-aided teaching and computer-based instructional materials have become commonplace, their advantages and drawbacks being widely debated. Plentiful websites provide abundant opportunities for those who want to study and improve their skills. However, online teaching and blended learning programmes run by universities are both more creative and controlled.

Before students can log on, enrol in a course from their PCs and mobile devices, following a web-link, passable learning roads have to be designed, built, tested, provided and maintained, which is a long and costly process. The development and maintenance of quality e-learning provision (including appropriate level of academic staff development and student online support) is expensive and time-consuming. Applying for the

European Union grants is a good solution for smaller educational establishments whose financial and human resources are limited.

2. EU-funded projects at PUCES

The Private University College of Economic Studies (PUCES) in Prague, the Czech Republic, is a small independent business school operating in the field of tertiary education since 2001. It has been developing its own e-learning/teaching aids for seven years. Thanks to four consecutive grant projects[†] co-financed by the European Social Fund, CR government and Prague municipality budgets, the college was able to finance necessary innovations and launch its own e-portal.

Effective running of e-learning courses requires not only substantial funds but also a creatively managed team of authors, administrators and tutors. Skilfully designed project plans and good team management proved to be the keys to success. The first projects were pursued in partnership with the University of West Bohemia in Pilsen. Having been trained by experienced UWB colleagues, PUCES project administrators and course-designers adopted a proper external author tool – a well-tried ProAuthor scripting engine – compatible with Moodle, the most appropriate Learning Management System (LMS) for the development, maintenance and administration of e-learning. The college departments were in charge of particular course-content structure, technical background and graphical design support having been provided by the IT division. The chosen undergraduates took part in the e-course development as assistants and testers. PUCES academic staff were involved both in the creation and pilot phases. The course drafts and proof reading procedures having been finished, the completed e-courses were piloted and follow-up changes incorporated. Pilot cycles were subject to appraisal reviews based on data provided through questionnaires. This feedback was used for fine-tuning the e-courses and carrying out necessary alterations before they were posted onto the e-portal.

More than forty online courses have been created and made accessible so far. Most of them are predominantly customized to PUCES undergraduates' needs, the e-learning content having been developed in a variety of subjects taught at the college. They became organic parts of the blended learning environment, integrating face-to-face teaching and learning methods with on-line approaches (Littlejohn, 2006), creating the "mixture" of tutorials, off-line learning aids and online tutoring supplemented with e-learning stimuli. Some of the e-courses can be used as full distance learning units as well, thus extending PUCES portfolio of lifelong learning programmes. They are available on PUCES e-portal, using LMS Moodle software standard. The portal offers online support for the selected disciplines (e.g. accounting, finance, management, business law, computer science), including foreign languages.

Since language training is one of the profiling components of economic studies and an integral part of PUCES curriculum, the language department took an active part in the above mentioned projects. Six independent topic-based modules for business English and an e-course of general Spanish have been developed and put into operation on the college e-portal.

This paper focuses on a module-structured e-learning tool *Business English* designed, piloted and run by PUCES language department.

3. Online language learning/teaching support

Business English (I and II) comprises six self-contained modules, offering more than 50 hours of self-study materials and integrated activities loosely linked to a seven-semester business English course. They are primarily

[†] First two projects ("PUCES E-learning Provision Development" and "Accounting and Taxation E-courses for Disabled Self-employed Workers") were run between 2006 and 2008. The follow-up project ("PUCES Educational and Pedagogical Potential Development") started in February 2009 and finished in April 2010. The current project within the Prague – Adaptability Operational Programme, entitled "The Innovation of Undergraduate Programme Economics and Management", has been underway since 2012.

designed for PUCES part-time students (majoring in economics and management) who attend intermediate business English courses. They can be updated and modified to meet the changing needs of different undergraduate classes, since they contain both self-study and classroom materials and activities. They may be used as supplement reference courses in full-time classes as well. The intermediate level of language proficiency and knowledge is expected; that is why the objectives, instructions and assignments are given in the target language only.

The online learning modules are used in specific teaching situations, employing methodology different from that of standard direct instruction. They are intended to supplement and follow up work done in regular language tutorials (held once a week), helping students become more confident and accurate. They are provided to raise learners' awareness, practising and consolidating relevant linguistic devices – lexis useful for selected communication skills (e.g. writing reports and summaries, making phone calls, holding meetings, talking about processes and operations, making arrangements, running marketing campaigns) as well as the targeted grammatical items (e.g. passive vs. active, infinitive vs. gerund, modal verbs, articles, comparatives). The aim is to provide a balance between the extended linguistic content and some professional skills, as well as those of reading, listening and writing, which the required communication standards are based on.

3.1. Module structure and e-learning content

Each module is divided into small units of nine different types (pre-test, explanations and examples, exercises, reading and vocabulary practice, listening and vocabulary practice, writing assignments, Internet search, discussion forum, revision test), covering various aspects of given topics and activities. Learning objectives are indicated at the beginning of each unit. Particular activities, exercises and tasks are designed to take from 10 up to 40 minutes. Much of the material is adapted from relevant sources that are referred to in footnotes. (Podcasts lessons are borrowed and adapted with the permission of EnglishPod.com. and ESLpod.com.)

As an example, see the contents of one of the modules (“Business meetings”) in Fig. 1 below:

- ✓ [The passive vs. active I \(pre-test\)](#)
-  [The passive I \(explanations and examples\)](#)
-  [The passive vs. active II \(exercises\)](#)
-  [The passive II \(writing assignment\)](#)
-  [The passive vs. active III \(revision test\)](#)
-  ['Working or meeting?'](#)
-  [Holding business meetings \(reading and vocabulary practice\)](#)
-  [Opening and closing a meeting \(listening and vocabulary practice\)](#)
-  [Management culture \(reading and vocabulary practice; writing assignment\)](#)
-  ['Useful or useless?'](#)
-  [Making suggestions and managing interruptions \(listening and vocabulary practice\)](#)
-  [Running meetings effectively \(writing assignments\)](#)
-  ['Listening or speaking?'](#)
-  [Getting back to topic and holding a vote \(listening and vocabulary practice\)](#)
-  [Language of formal meetings \(writing assignment\)](#)
-  [Holding a meeting \(revision test 3B\)](#)

Fig. 1. Module structure

The above example shows a standard module structure. Each module begins with a self-test, followed by short grammar presentations, practice exercises (with answer keys) and written assignments (to be sent to the tutor) based on chosen business situations. The second part of each module contains extended general and professional lexis, introduced and contextualized through the reading texts and listening exercises (podcast lessons). Several discussions follow naturally from the activities. The modules contain revision tests, checking both selected grammar points and writing skills. There are also some internet (re)search tasks and recommended website links for further vocabulary extension and extra grammar practice available throughout the units. (See the respective module icons in Fig. 2 below.)

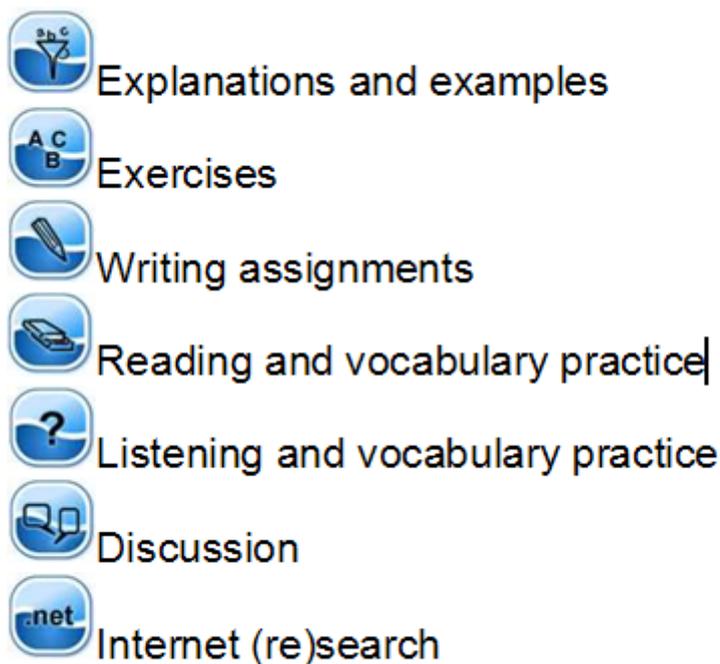

Fig. 2. Module icons

3.2. *How to proceed and succeed...*

Since the independent grammar review sections are based on traditional presentation-practice-production sequence, students are recommended to do all the activities and exercises in the given order, starting with initial pre-tests. However, particular units, pairs or trios of them (explanations, exercises, writing assignments, listening and reading texts) can be dealt with out of sequence if a specific need arises.

The most important precondition for successful course management, administration and completion is smooth and regular student-tutor communication. Written tasks should be attended to and sent to the tutor regularly. They provide opportunities for freer practice and individual corrective feedback from the tutor, and – last but not least – students have to score points in order to pass. It stands to reason that revision tests have to be taken after finishing the preceding practical tasks. So as to foster a good online group dynamic, students are invited to take part in some discussions and share views on the topic-related issues.

A reasonable pass mark was pre-set. In order to get semester credits, it is necessary to achieve at least 70% of all the points for the written assignments (checked by the tutor) in each module, participate in at least one discussion and pass the revision tests.

4. PUCES online learning/teaching experience

The college project team carried out an internal follow-up research on PUCES undergraduates' overall satisfaction with on-line learning support. Assessment questionnaires were designed for the reflection of students' experience of working with all the newly launched e-courses.

Both educational approaches and outcomes – students' achievements (i.e. knowledge and skills acquired) in relation to learning goals were assessed. PUCES students evaluated how the exercises, review questions, self-tests, test cases, contributions to discussion forums, assignments submitted to the tutor, etc. met the requirements for the feedback on their progress. Aesthetic and technical aspects of new e-courses as well as the language and stylistic level were appraised. Course administration and timetable (tutorials, outcome registers, individual and group support, tutor's leadership and expertise, etc.) was also given full attention. Both PUCES graduates and tutors judged the frequency and quality of mutual communication, the level of social interaction within study groups as well as motivation and other subjective factors influencing students' activity. The respondents appreciated both e-courses' structure and learning content, having required proper tutors' management and timely and frequent feedback on written assignments.

The online tutoring phase proves to be a key, personalized stage of the learning process. It is rather demanding – and, in the end, rewarding – for both the tutor and the enrolled student. The former is more of a mentor on the website, checking the assignments, monitoring progress and ready to help, the latter waiting for and relying on the tutor's feedback. (According to the internal survey – see below –, PUCES language teachers provide the fastest, most comprehensive continuous feedback of all the tutors.)

The tutor's role is that of a facilitator who conducts tutorials, provides online feedback on students' progress, setting appropriate tasks. Most online students do well and enjoy taking part in e-learning courses, however, those who lag behind or lack in "faith" deserve tutor's encouragement. Continuous support and commitment seems to be the crucial success factor.

5. Conclusion

Virtual learning environment has expanded the range of learning experiences beyond usual face-to-face methods. It liberates learners in terms of mode of study, offering them a wider choice as to when, where and how they learn. Digital resources and devices make it possible for undergraduates to schedule their own study, share it

with others and get immediate feedback (through self-assessment tools). That's why schools introduce new stimulating models of learner support customized to their students' needs.

E-learning delivered through VLE, however, makes greater demands on undergraduates' independence and sense of responsibility as well. No wonder that study programmes with a higher share of online learning are much sought after by part-time students in whose own interest it is to coordinate their school, job and family commitments.

Electronic coverage by distance-learning aids has become an essential complement of part-time study programmes in particular, indicating further steps that have been taken from teacher-centred to autonomous learner-centred training. The development and maintenance of quality e-learning provision (including appropriate level of academic staff development and student support) is costly and time-consuming. Moreover, teachers – transforming themselves into materials developers and tutors – still have to rise to the challenges and potential benefits of digital tools. Necessary changes cannot be fuelled only by technological advances, a reasonable level of computer literacy being only a precondition. Sound didactics seems to be equally important to achieve positive learning outcomes, making the most of what internet technologies offer.

4th International Conference on New Horizons in Education

On the two connected concepts in secondary school mathematics: algebraic expressions and linear equations

Sinan Aydin^{a,*}, E. Soner Çelikkol^b, Mustafa Of^c, Celal Mutlu^d^{a,b,c,d}*Kocaeli University, Kocaeli Vocational High School, Kocaeli, Turkey*

Abstract

Algebraic expressions and linear equations are a vital part of the secondary school mathematics. A substantial amount of research has shown that students have some difficulties recognizing the structure of both of these concepts. In this study, it is analyzing the students' understanding of the differences and similarities between algebraic expressions and linear equations. For this purpose, six eighth grade students were interviewed and observed as they worked with various mathematical tasks relating to algebraic expressions and linear equations. The data collected in this study showed that these students simplified algebraic expressions and solved linear equations with one unknown, arriving at the correct result. But, they still had difficulties indicating a relation between algebraic expressions and linear equations.

Keywords: algebraic expression, linear equation, secondary school mathematics

1. Introduction

Algebraic expressions and linear equations have been a vital part of secondary school mathematics curricula. Particular to Turkey mathematics school curriculum, the Algebra Standard for grades 7-8 states that students “use symbolic algebra to represent situations and to solve problems” (MEB, 2007). In high school mathematics curricula, the Algebra Standard for grades 9-12 suggests that students “understand the meaning of equivalent forms of expressions, equations” and that they “write equivalent forms of equations” (MEB, 2007). Expressions and equations have also been a significant part of the history of mathematics (Kieran, 1989); the Greek mathematician Diophantus was the first to use abbreviated forms for algebraic expressions, giving rise to “syncopated algebra” (Sfard, 1995). Al-Khwarizmi, a Persian mathematician wrote «al-Kitab al-mukhtasar fi hisab al-jabr wa'l-muqabala». Francois Viete, in 1591, wrote an algebra book which formally gave rise to symbolic algebra (Sfard, 1995).

The research shows that students should gain experience with modelling situations using expressions before they are introduced to the concept of equation. Tall and Thomas (1991) identified a main obstacle to making sense of algebraic expressions. For example, many students tend to interpret expressions such as $5+3x$ as $8x$. Kieran (1989) claims that students who “view the right-hand side of an equation as the answer and who prefer to solve equations by transposing,” lack an understanding of the balance between the right and left hand sides of the equation. Students also face difficulties when working with equivalent equations (Steinberg et al., 1991). The data showed that many students could not distinguish between expressions such as $7x$ and $7+x$. Hall reports that some students have difficulties combining “like” terms in expressions such as “ $4x+3y+3x$ ” which involve “unlike”

terms within the expression. This study attempts to address students' understanding of the differences between algebraic expressions and the concept of linear equation

2. Methodology

Specifically, the following questions are addressed in this study:

1. What difficulties do 8th grade students have with identifying differences between algebraic expressions and linear equations?
2. What sense do 8th grade students make of the various verbs such as 'simplify' and 'solve' and nouns such as 'solution', 'value', and 'variable' associated with algebraic expressions and linear equations?

Four eighth grade students participated in the study. All students received classroom instruction on simplifying algebraic expressions and solving linear equations prior to the study. These students were chosen because they represent a variety of secondary schools, had different teachers, used same curricula in their algebra classrooms, and they were different mathematical ability. The students were asked to provide written responses to the items on the instrument. In addition, they were asked to talk about their thinking and the processes they used to respond to the items.

Overall, the students worked with five types of tasks, organized under four activities:

- Task1: Sorting cards on which an algebraic expression or linear equation was written,
- Task2: Observing common characteristics of and identifying differences between algebraic expressions and linear equations,
- Task3: Combining like terms and simplifying expressions,
- Task4: Solving linear equations,
- Task5: Producing algebraic expressions and linear equations.

Activity 1: Sorting cards

Twelve index cards are provided. Sort the cards according to what you see as common among them. If a phrase is written on a card, sort according to what the phrase would result in if written mathematically.

- | | |
|--|---------------------------------------|
| 1) $5x - 5$ | 2) $b + 21 = 7$ |
| 3) add 2 to $2a$ | 4) $5 + t$ |
| 5) $m + 4 = 12$ | 6) y is 5 more than x |
| 7) $s + \textcircled{0} = \textcircled{0} \textcircled{0}$ | 8) $16 + \Delta = 125 + \Delta\Delta$ |
| 9) $2m + 1/4 n = 1/2$ | 10) $1/2a + 1/3b + 1/4c$ |
| 11) $3(4k - 5l) + 6m$ | 12) $m + n + r = a + b + c$ |

Activity 2: Characteristics of algebraic expressions and equations

Why did you sort the cards the way you did? What do you observe that the cards in each of the piles you sorted them into have in "common"? What do they have "different"?

Activity 3

- 1) Simplify $3a - 3 + 2a - 9$
- 2) Solve $3m - 4 = 5m + 7$

- 3) Simplify $a - 2 - 4b - 2a + 1 + 3b$
- 4) Solve $2x - 3 + 4n = 3x + 5 + 6n$
- 5) Combine like terms: $7k + 12 + 3k + 3(k + 14 - 4k)$
- 6) Solve $5p + 12 = 3p + 3(7p + 6 + 9p)$
- 7) Give an equation that has 4 as a solution
- 8) Give an expression such that when x is 2 the value of the expression is 0
- 9) Give an expression such that when x is 0 the value of the expression is 2

Activity 4

What is/are the “differences” between expressions and equations?

3. Findings

All four of the students “simplified” algebraic expressions and “solved” linear equations with one unknown given to them in symbolic form with ease, arriving at the correct result. When faced with the instruction simplify all students combined like terms. During the interview, all students mentioned that simplifying and combining like terms is one and the same thing. However, they all mentioned the term “simplify” in relation to algebraic expressions and none of them related the term to equations. When the students were faced with the instruction solve, four of them performed a “do the same thing to both sides procedure”. Two students followed the procedure “move the unknowns on one side and the numbers on the other”.

Table 1. The table shows the way that each student sorted the cards.

Intended Sorting		Student A		Student B		Student C		Student D	
1	2	1	2	1	3	1	2	1	2
3	5	3	5	2	6	3	5	3	5
4	6	4	7	4	7	4	7	4	7
10	7	6	8	5	8	6	8	6	8

11	8	10	9	11	12	10	9	10	9
	9	11	12			11	12	11	12
	12				9-10				

Student B said, he placed cards 9 and 10 on the same pile by themselves because “they were the only ones that contained fractions”. He then placed cards 1, 2, 4, 5, and 11 on the same pile because “they contained either one or in the case of card 11, two variables. So, they had a small number of variables.” As he indicated, he chose to place cards 3, 6, 7, 8, and 12 together because they “have more words or shapes like circles or they have many variables”. When Student A, Student C and Student D were asked about the “differences” in the two piles in which they sorted the cards, they all indicated that the cards on the right pile had an equal “sign” whereas those on the left did not. Also, these three students identified the cards on the right pile as “equations”. However, they could not remember the term “expressions” when asked “what name” they would give to the cards on the left pile.

Table2. Students were asked to produce expressions and linear equations in Activity 2 tasks 7-9 their responses were as follows

Student	Give an equation that has 4 as a solution	Give an expression such that when x is 2 the value of the expression is 0	Give an expression such that when x is 0 the value of the expression is 3
Student A	$4 + x = 4$	$x = 2$	$x + 2 = 2$
Student B	$2 + 2 = 4$	$-x = -2$	$x = 2$
Student C	$12 - x = 4$	$2 - x = 0$	$2x = 0$
Student D	$20 \div x = 4$	$-x + 2$	$x + 2$

The only student who made a distinction between expressions and equations in the tasks was Student D who provided correct algebraic expressions in tasks 8 and 9. During the interview, she corrected her response to task 7 to be $20 \div x = 4$. Student A did not distinguish between equation and expression in the above items.

4. Conclusion

In general, the data collected in this study has shown that students associate the term simplify with algebraic expressions and the term solve with equations. They may still not be able to identify the difference between the two and may find it very challenging to generate expressions or equations. Student confusion may not arise because of student misconceptions or difficulties with using mathematical concepts but perhaps because of the language they face.

Teachers should be extremely careful with interchangeably using mathematical terms in the classroom such as expression and equation. If they are not careful with language use then students might come to believe that the two concepts are actually the same and thus, not be able to distinguish between them. Teachers should use the term “expression” more frequently even after having finished instruction on expressions. Students should be reminded of the term expression while they receive classroom instruction on equations so that they acquire the correct mathematical vocabulary.

4th International Conference on New Horizons in Education

Opinions of Families with Pre-school Period Children toward Computer Games

Sengul Ilgar*, Nihat Topac

Istanbul University, Hasan Ali Yucel Education Faculty, Department of Primary Education Division of Preschool Education, Istanbul, Turkey

Abstract

Preschool education is the most critical period in child development. In today's world where technology is advancing rapidly and inevitably surrounding the people, its importance related to preschool period is undeniable. Numerous studies have revealed that children spend quite a lot of their time with computers, particularly computer games. The purpose of this study is to research general attitude and opinions of families with preschool kids on computer games. This is a qualitative research that examines the opinions of families with preschool kids toward computer games. Sample of the study are 11 fathers and mothers living in Istanbul with preschool kids. Semi-structured interview has been developed by researchers and used as a means of data collection. In interview analysis, descriptive analysis technique has been used that complies with qualitative data analysis. We have consulted to views of 2 expert academicians for reliability. Findings of the research reveal that parents find the time spent with computer games appropriate and do not experience crisis or problems in abandoning the game. The most commonly played game type was shoot the target games while brain teasers and line/drawing games were the least preferred types. We have observed that parents try to intervene by talking and banning and also in case of insistence they draw the child's attention somewhere else.

Keywords: preschool education, computer games, family

1. INTRODUCTION

Today's education aims to raise individuals who are able to use technology, catch up with technological innovations, have easy access to knowledge, classify, serve and share knowledge. Child's access to knowledge in preschool education is realized through games. Game is of great importance particularly in preschool child development.

Children learn things themselves by trying during games and get rid of the pressure from the adult and outer world. They develop personal and social skills they need, accelerate cognitive emotional development through game (Razon, 1997; Cheng, 2001). Teaching through game is quite important at this point.

Today's children spend most of their time in front of computers, with technological devices and playing computer games (Kafai, 2001). Using computer in preschool period may contribute to development of hand-eye coordination, consolidation of learning and development of decision-making skills. However, it must be used under adult guidance and limited to a short time (Oktay, 2002).

Game software may contribute to mental and affective development of students as they teach rules, create competitive setting and they are also entertaining (Akkoyunlu, 1998). Hitchcock and Noonan (2000) emphasized in their study that computer software is an important means of developing academic skills. Sahin and Yildirim (1999) have related the educative degree of an educational game to how well its software is structured. Educational games are divided into two groups. Real life simulation games enable the user to assume roles they are accustomed to in real life by giving scenarios directly related to real life. Academic games may teach exercise, practice, revision, problem solving strategies (Sahin & Yildirim, 1999).

It can be stated that educational computer games have been designed in consideration of the strong teaching potential of computer games developed with integration of game features into computer. Teaching from computer games or game-based learning may be modeled as below.

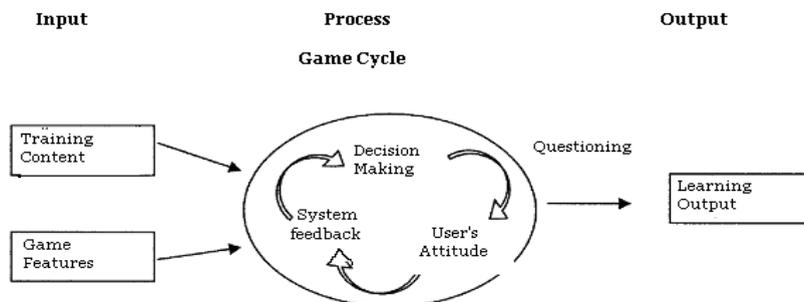

Figure 1. Game-based learning model (Garris, Ahlers and Driskell, 2002; Joanneum,

From a popular perspective, computer games seem to evoke mixed reactions. On one hand, many are troubled by the violent themes that constitute certain games, and some are concerned with the intensity of involvement and amount of time that youth devote to playing computer games and to being able to find and use information (Garris, Ahlers & Driskell, 2002).

Ricci et al.(1996) proposed that instruction that incorporated game features enhanced student motivation, which led to greater attention to training content and greater retention.

It is known that playing computer games with violent content causes aggressive behavior in children and youngsters (Kars, 2010). However, labeling computer games as good or bad is related to their content and time spared for playing them (George & Comerchi, 1996).

When studies on this topic are reviewed; in their research named “Effects of Rotational Play Feature on Electronic Games on Student Motivation: The Incredible Machine Case”, Inal, Sancar & Cagiltay (2005) examined the effects of single user and rotational play features on motivation of children. In the study covering 56 students between the age of 7 and 13, vast majority of the children stated that they liked more the single user part and found rotational play much more poorly designed in comparison to single user feature. Girl-girl competition among students is lower than boy-boy and boy-girl competition and girls are more inclined to cooperation, which may be helpful to trainers in group-forming during rotational games. The study also found out that younger learners need more explanation about how to use the game and more guidance during the game. In their study called “Science Teaching (Physics, Chemistry, Biology) Through Games”, Budak, Kanli, Koseoglu and Yagbasan (2006) stated that using various science games in learning science or consolidating previously learned subjects would make science learning easier and more entertaining. Garris, Ahlers and Driskell (2002)

revealed that students playing education content “Bottom Gun” developed their periscope using skill more than those students who did not play this game and received traditional education. Viadero (1999) carried out a study on 237 students in two primary schools in California, emphasizing the importance of spatial skills in learning. They concluded that piano lessons specially integrated with computer games might help students to understand mathematics. In their study named “The Effects of Feedback Strategies in Education Software on Learning Process of Children between 5-7”, Ozdener and Yildirim found out that success level of students who were trained through education software with feedback based on the literature knowledge was higher than the other group.

In today’s world where technology is advancing rapidly and inevitably surrounding people, its importance related to preschool education is undeniable. Computer games are one of the games preferred by children in this period. Parents are occasionally worried about these games.

The goal of this study is to examine the views of families with preschool children on computer games.

2. METHOD

This is a qualitative case study. Qualitative study is defined as a study where qualitative data collection methods such as interview and document analysis are used and a qualitative process is followed in order to reveal perceptions and events in a natural environment in a realistic and integrated manner (Yildirim & Simsek, 2005, 39).

2.1. Study Sample

The study was carried out with data obtained from 11 fathers-mothers with preschool children, specified with purposeful sampling.

The study sample comprises 11 fathers and mothers who live in Istanbul and have preschool children. Fathers and mothers were selected from the selected institutions on a voluntary basis. 2 of the 13 fathers and mothers who were asked whether their children played computer games answered the question negatively, so the study resumed with 11 fathers and mothers. Code names and several features of the sample parents are given in Table 1.

Table 1. Demographic Features of Parents in the Study

Code Name	Education	Age	Job
Sema	Bachelor’s Degree	46	Doctor
Nihal	Associate Degree	33	Tourism Professional
Dilek	Doctorate	36	Academic member
Beyza	Doctorate	40	Academic member
Seyhan	Doctorate	35	Research Assistant
Nesli	Bachelor’s Degree	33	Architect
Ahmet	Doctorate	38	Academic member

Ozge	Associate Degree	30	Tourism Professional
Mehmet	Doctorate	40	Academic Member
Osman	Bachelor's Degree	44	Doctor
Gul	Associate Degree	38	Nurse

The study sample comprises 3 fathers, 8 mothers. 3 have bachelor's degree, 3 associate and 5 have doctorate degree. 2 are doctors, 2 are tourism professionals, 1 is a nurse, 1 is an architect, 1 is a research assistant and 4 are academic members. 7 are between 30-39 years old while 4 are 40 or older.

2.2. Data Collection Instrument and Data Collection

The data were collected with half structured interview form comprising demographic information questions and open-ended questions designed by the researchers. The most frequently used qualitative method is interviewing. The most basic method used during the interviews was oral communication. The qualitative researchers using the interview method should have the training on features, preparation and realization process of this method. The most important facility of the half structured interview technique is that it provides more systematic and comparable information as the interview can be completed pursuant to the previously designed interview protocol (Yildirim & Simsek, 2005).

Before the interviews, 3 preschool institutions in Istanbul were specified in order to select the families to be interviewed. 11 volunteer fathers and mothers whose children played computer games were included in the interview. Three open-ended questions were asked to the families. The interviews were done face to face, one to one. Each interview took 40 minutes. The interviews were recorded on tape recorder and analyzed. Data were analyzed with descriptive analysis.

2.3. Data Analysis

Descriptive analysis method was used while analyzing the obtained data. The purpose of descriptive analysis is to transform raw data into a form that the reader is able to understand and use if necessary. In descriptive analysis, the data obtained is summarized and interpreted according to the previously specified themes. Direct quotations are frequently used in order to reflect the views of the persons interviewed or observed (Altinisik et al. 2001; Yildirim & Simsek, 2005). The factors that make descriptive research reliable are familiarity with research area, the chance to gather information through face to face interviews and observation, return to the field for confirmation of the collected information and gather additional information (Yildirim and Simsek, 2005). In this study, direct information was obtained from the participants and the data was evaluated. Views of the participating families are given in quotations.

3. FINDINGS

Families gave various responses to the questions that were asked in order to understand general attitude of the families with preschool children to computer games. After these responses were analyzed with descriptive analysis technique, similar responses of each question were transformed into an article, categorized and placed in a table. The number of occurrence of each category in the responses is written beside the sentences.

Table 2. Responses of the Families to the Question “How much time does your child spend on computer games? What are your opinions about the time he/she spends for computer games? (Does it make a crisis?)”

Time Children Spend on Computer Games / Related Questions	f
He plays maximum 1 hour. Time is enough. No problem occurs.	2
He plays too much if he finds the chance. We cannot control. He causes crisis.	1
Does not exceed 1 hour. This is too much. I have difficulty in convincing to stop.	2
Plays for about 2 hours. Leaves the game by himself. Time is appropriate. No crisis occurs.	2
Plays for 1 hour only at the weekends. It's too much. I have difficulty in convincing to stop.	1
Plays maximum for half an hour. Would rather watch the players. Time is appropriate. No crisis occurs.	2
Plays for 1 hour a week. Does not need playing. Time is appropriate. No crisis occurs.	1

As can be seen on Table 2, families gave various responses to the question “How much time does your child spend on computer games? What are your opinions about the time spent? (Does a crisis occur?)”, related to the time their children spent on computer games, whether it was appropriate and crisis occurred or not while leaving the game. 9 of the parents stated their children played computer games everyday while 2 said their children played only at the weekends. 7 parents thought the time their children spent for computer games was appropriate and sufficient while 4 parents stated that the time was excessive. Moreover, 7 parents who stated that the time spent was appropriate also said that they had no crisis or trouble in leaving the game while the 4 parents who stated that the time was excessive also added that they lived a crisis. Responses from some parents are as follows (code names are used instead of names).

Beyza: “30-35 minutes a day. Actually I think that it is too long. I sometimes intervene, which causes a crisis. He is satisfied after playing longer than 1 hour and he leaves by himself.”

Gul: “(...) He plays maximum 1 hour at the weekends. I could not cope with it on weekdays so I said only weekends. I brought a limit. Some crisis occur, he tries to persuade me to play longer when his game is not finished. I switch it off when he sometimes becomes obstinate.”

Ozge: “I let him play when I'm tired because I have a rest, too. I know it's not right but it happens. He plays for about half an hour. I think 1 hour is too long. I am in favour of communication. There he is alone while playing. He is not in communication with anyone, fixed and hypnotized. I concentrate when I play. (...) My child should not be left behind. He does not stop when he should, but I warn, which causes a crisis.”

Dilek: “Actually he can play in a controlled way. At the beginning we were telling him to stop when the minute hand came to 12. Now he knows and stops by himself. He does not exceed maximum 1 hour. I know that is enough. He tests us and forces the limits. His father warns him with the pretext of limited internet. He finds it insufficient because he is sometimes lost in games. He accepts when we are strict about the time so no crisis occurs.”

Mehmet: “I resisted for along time against bringing technology home. However, I realized that the child gets behind technology and I bought an Ipad. As he spends the whole day at school, I let him play for 1 hour at home, then he gets bored and I play real games with him. He does not play computer games as he spends time with me. He plays less as we spend more time together at weekends. We go out for a walk so that he does not get lost in games indoors. He plays for 1-2 hours a day, which I think is not long. Crisis occurred at the beginning, but not anymore.”

Table 3. Responses of the Families to the Question “What kind of computer games does your child frequently play? What is the content of the games?”

Type and Content of the Games Children Play	f
Target Shooting	6
War/Soldier/Strategy Games	5
Race Games	5
Clothing Games	4
Line/Painting Games	3
Brain Teasers	2

As can be seen on Table 3, families gave various responses to the question “What kind of computer games does your child frequently play? What is the content of the games?”, related to the kind and content of the computer games that the children played. All parents gave more than one response to this question. Target shooting games are the most frequently played game type, which is followed by strategic games with war and soldier content. Then comes the race games and clothing games. Brain teasers and line/painting games are the least preferred game types. Responses of some parents to this question are as follows:

Beyza: “He plays memory, pair finding, drawing, difference finding, and clothing games. He chooses the games himself. I or his sister helps. We don’t interfere in his selection. He does not choose games above his level.”

Nihal: “He plays car race, siege, Angry Birds. We don’t let him play warfare games, which he would play if we let him.”

Sema: “He likes puzzles and making 3D cities. He prefers clothing, king games, toy soldiers and mega power games.”

Seyhan: “As a rule, killing games are forbidden. For fight games, we check the type of the fight, whether it is sportive or harmful. If it is harmful with violent content, we warn the child not to play again. He rather plays tank games. He plays strategy and target shooting games.”

Dilek: “He prefers action games. He likes games with music, race and action probably because he is a boy. We have loaded the games. He chooses himself but we have the control.”

Table 4. Responses of the families to the question “Do you try to convince to stop playing a game that your child has chosen but you do not approve (for example warfare game)? If yes, what would you do?”

Do you Intervene in a Game that You do not Approve? How?	f
I do	
Talking/Forbidding if he insists	5
Diverging his attention somewhere else	4
I don't	
He prefers the games I play	1
I believe that what is forbidden looks more inviting	1

As seen on Table 4, families gave various responses to the question “Do you try to convince to stop playing a game that your child has chosen but you do not approve (for example warfare game)? If yes, what would you do?”, related to their intervention in the games played by their children. Some of the parents said they did not intervene while vast majority said they did. Intervention styles are talking, forbidding in case of insistence, diverging the child’s attention somewhere else. There is also a parent who did not intervene having the idea that what is forbidden looks more inviting and remarkable. Some of the responses to this question are as follows:

Osman: If he insists on playing a game, I choose with an appropriate content. He feels bad if it is something bad.”

Ahmet: I would begin by trying to explain and convince him to quit by offering options. I would buy a pet in order to direct his attention somewhere else. I would put forward alternatives.

Mehmet: “I would take him out or offer another game. If we train him to distinguish right from wrong, it will not be a trouble anymore and he will choose the right.”

Ozge: “We haven’t intervened in her selections up to now. She prefers the games that I play. That is probably because she is a girl. A boy would choose fight games.”

Dilek: “I don’t tell him not to play because I think that what is forbidden will look more attractive. I would explain why I don’t like the game.”

As can be seen, parents say that time spent on computer games is appropriate and they do not experience any problems or crisis in quitting the game. The most frequently preferred game type is target shooting games while brain teasers and line/drawing games are the least popular ones. Parents intervene by talking, forbidding in case of insistence, diverging the child’s attention somewhere else.

4. DISCUSSION AND SUGGESTIONS

The study examined the general attitude of families with preschool children on computer games, opinions of the families were taken about the time that children spend on computer games, type of the games they played and family intervention in the games.

Time spent on computer games by children of the families in the study are close to each other. Only 2 of the 11 children in the study play only at the weekends while the others play 1-2 hours everyday. Most of the families said that the time their children spend on computer games is reasonable while a little less than half said it was too much. However, the rate was much lower in Pack’s (1999) research. In his research on 3155 children aged 2-18

named “Kids and Media at the New Millennium: A Comprehensive National Analysis of Children’s Media Use”, Pack (1999) reported families saying that their children spent 70% of their time on computer games at home. 9% of those children played computer games for more than 1 hour. The study also reported that girls spent 8 minutes a day on computer games while boys spent 31 minutes.

The families also reported that they had trouble in time management but a little less than half stated that it resulted in a crisis. Most of the families stated that they had trouble in time management and occasionally had conflicts. It is known that conflicts in preschool period mostly end up in favor of the child as the age gets smaller. In such cases families may be trained to diverge the child’s attention somewhere else before or without going into any conflict with the child.

Target shooting games are the most frequently preferred game type. We can say that there is a hidden feeling of competition in target games. Target games are followed by war/soldier/strategic games. Race games are preferred equally with war/soldier/strategic games. We can also say that there is a hidden feeling of competition in those games. We may also consider that children try to reveal virtually the aggression potential they carry inside themselves. If this potential is not revealed in a controlled way, it may be misused by persons outside the family. Therefore, parents should be by their children while selecting and playing games, which would be of great importance as parents could make explanations about the negative perceptions that the game might evoke and guide their children. Besides, frequency of brain teasers is quite low. Awareness of families should be raised because perception, attention, decision-making and creativity skills of children can be developed easily and rapidly through computer games. Though some of the families in the study say that technology cannot be isolated from daily life, it is striking that they do not direct their children to brain teaser in game selection. Under such circumstances, computer cannot go beyond being a means of entertainment.

It is seen that parents intervene when their children play or want to play a game that they do not approve of. There are mainly two intervention types. More than half of the intervening families say that they try to convince by explaining. They deprive the child of the game when their explanation fails. They are usually inclined not to accept the deprivation or banning. They give a fight to win the child. Families should be consistent and determined in such cases. Some of the intervening families said that they tried to diverge the child’s attention to another game or somewhere else. This is one of the effective intervention methods. It would be appropriate to make the children forget and pull them to another setting without having a conflict. However, two parents said that they did not intervene in the type of the game. One of them said the child played the same games as the parent, which is a good example to how important being a model is. Families may be instructed that being a model is one of the most effective methods of making the child acquire a behavior. Akcay and Ozcebe’s (2012) study examining the computer game habits of preschool children and their families found out similar findings to those of this study. Akcay and Ozcebe (2012) found out that 78.1% of the families generally and always restricted their child’s playing computer games while 61% generally restricted their child’s playing computer games with violent content. Families reported that 48.8% of the children played computer games with violent content 1-2/3-4 times a week. The frequency of a child’s playing computer games increases as the frequency of the family’s playing increases.

The other non-intervening parent said that forbidding would solve nothing and on the contrary make the action more attractive. We can think that the child would understand his/her own mistake and correct it. The parent should not stay indifferent to this process but guide the child without making him/her aware of it. According to Tugluk (2011), the parents can stop being a forbidding authority in their children’s computer use and instead direct their children to educative games, enable them to learn and have fun simultaneously. They may be helpful in active learning process of their children by buying useful computer programs.

4th International Conference on New Horizons in Education

Optimizing professional insertion mentoring activities - an practical model to train beginner teachers -

Mihaela Gabriela Neacșu*

University of Pitești, Tg.din Vale Street, Pitești, 110040, Romania

Abstract

Mentoring as guidance, counseling and accompanying practice supposes trust and mutual respect between the partners of the mentoring relationship, which, in time, favors the professional and personal development of the beginner. The mentor, as a manager of mentoring activities, manages, over the duration of the probationary stage, the learning processes, the relation building processes with an interpersonal nature and the processes for the social and professional integration of the beginner. The research highlights particular aspects of the professional insertion mentoring in the Romanian educational system and submits to analysis certain internship mentoring intervention strategies by reference to the needs of the beginner teacher and the context of exercising didactical behaviors. The occasions created by investigation and reflection on existing professional practices generated a practical-action model to improve the quality of training beginner teachers. The quality of such processes depends on the mentor's abilities, the adopted training strategy and the professional intervention techniques used in training beginner teachers.

Keywords: beginner teacher, mentor, internship mentoring, didactical career

E-mail address: mihaela.neacsu@upit.ro

1. Introduction

In an important European document (Rethinking Education, 2012) it was stressed the importance of defining the teachers trainer's role (the mentor) taking into consideration criteria based on competences. It was specified further the fact that *"along with the measures of ensuring quality, this should represent the bases for projecting again that systems of enrolling in order to attract and make candidates trusty for the teaching process"*. [2]

It is about the mentorship programs of professional insertion or integration meant to offer personal support and counseling for beginners in the teaching career. There mentorship programs are mandatory in 15 European states, including Romania. The professional insertion mentorship organized in schools in Romania for beginner teachers represent an actual problem. Those who decide the educational policies introduced recently in legislation (2011) the methodological frame for the organization and development of internship mentorship activities and the insertion mentor's profile. The internship mentor represents the teacher with experience from the learning institution where the intern activates, especially trained in order to be a mentor and who survey the intern's professional development in order for him to practice a teaching career at quality standards. The mentor as manager of the mentorship activities leads during the practical internship processes of learning, relational processes with interpersonal character and the processes of social and professional integration for the debutante. The internship mentor sets a professional connection with the intern and collaborates with all the factors implied in his assistance. Achieving the function of mentor teacher for the professional insertion of interns I to be made by passing a specific contest which consists of two practical tests. The mentor has the ability to demonstrate in this contest the level of personal competences that he reached according to the ideal profile of the mentor, which will recommend him for the future mentor activity. The mentorship is conceived as *"an interactive process, which takes place between the mentor and another person (pupil, student, teacher), of guidance/support in learning, education, initial professional training and/or professional development, being based on the premise of interactive implication of both parts, assuming the obligation that each party has according to their status."* [12] The mentorship activity consists of correlating 3 main processes: *"assistance/guidance given to the assisted person by stimulating reflection towards his own practices, facilitating the conceptualization process personal experiences by the assisted person, of the process of using and disseminating of some examples of good practice, self-development strategies and encouraging practices based on active learning, learning through games, through discovering, using cooperative learning, mutual learning."* [12] The quality of these processes depends on the mentor's abilities, on the training activity that he adopted, and of the professional intervention techniques used in training young teachers.

The educational mentorship is a complex process through which the mentor offers professional and personal support to his disciple, helps him to develop his self-confidence, to become independent, autonomous and mature. The mentorship relation implies a professional, conscientious and creative relationship based on confidence and mutual respect. Barbara R. Frey and Ruth B. Noller (1983) catch three important aspects of the mentorship relation:

- The mentor completes this mission in the same time with other responsibilities;
- The mentor serves as *"knowledge channel"*;
- The mentor is a permanent source of guidance until the disciple, *"flies away"*, has an independent personality.

The mentoring life cycle has been described (Hay, 1995) as comprising four definable stages which can be defined as follows: *"initiation, orientation or courtship stage, getting established, adolescence, dependency, nurturing or honeymoon stage, maturing, developing independence or autonomy stage, ending, termination or divorce."*[9]

Hargreaves and Fullan (2000) consider that teachers' training has to be based on professional standards who represent one of the mechanisms that are able to really support teaching in a professional way, taking a double role in its validation. On one hand, they represent the modality to demonstrate to society that the teaching profession has enough mechanisms to control quality, that action at the level of access, and of exercising an efficient practice, and, on the other hand, the standards will function as orienting parameters for the professional activity development, defining the efficient practice in terms of desired results. Moreover, they sustain the identification of the way in which one can draw the lines of development and evolution in teaching career.

2. Methodology

The purpose of the study consists in generating a practical model to optimize professional insertion mentoring activities by referring the training of beginner teachers to a specific set of quality standards and by valorizing the new psycho-pedagogical orientations regarding learning in a community of practice, experiential learning, transformative learning, work integrated learning, self-directed learning, cognitive apprenticeship.

Objectives:

- a. to analyze the perceptions of the beginner teachers and of the internship mentors participating in the study on the existing mentoring practices;
- b. to establish certain criteria to analyze the behaviors, training strategies and intervention techniques adopted by internship mentors;
- c. to shape and analyze a practical model of improving the professional insertion mentoring program focused on quality standards and performance indicators.

In performing the action research, both qualitative and quantitative research methods were used. The research methodology reunites the analysis of documents, the focus group, the participative observation, the study of probation mentoring activity products (the beginner's portfolio, the reflexive journal, the individualized training plan, the progress sheet, the professional dialogue sheet, the self-assessment sheet) and the questionnaire-based investigation (for 25 beginner teachers). The research targeted the occurrence of significant improvement changes in performing professional insertion mentoring activities and was made in the October-March 2013 period.

3. Results and Findings

At the focus group participated 10 mentor teachers from Pitesti, with a rich experience in the educational mentorship activity. (appendix A) The group has duties to complete as identifying some analyzing criteria of the internship mentor's activity and setting the defining quality standards for the mentor's activity.(table 1) The data obtained by using the focus-group method can represent the base of some observation charts of behaviors (for mentors and beginner teachers) in the mentorship process.

Table 1- Quality Standards for the Professional Insertion Mentoring Activities

Quality standards	Performance indicators
1.Planning the program for the mentorship for beginner teachers	<ul style="list-style-type: none"> - There is the yearly action plan of the internship mentor; - The interns are consulted on the internship program; - The specific objectives of the internship program are formulated clearly and concise together with the the beginner teacher; - The specific objectives of the mentorship program are correlated to the result actions and indicators; - There is a graphic of the activities planned within the mentorship program; - There is the yearly calendar of the mentorship teacher of the respective program; - The set of competences that is to be completed in the mentorship program is analyzed together with the beginner teacher; - The specific evaluation criteria and forms for the respective period are announced.
2. The management of the efficient communication between the mentor and the beginner teacher	<ul style="list-style-type: none"> - The mentor analyzes together with the intern the obligation that he will have, according to the job prescription; - The mentor selects and communicates to the intern relevant legislative, didactic and methodological and curricular professional information; - The mentor ensures a constructive fed-back; - There is a chart for professional dialogue; - The mentor uses diverse and efficient methods in order to communicate with the beginner teacher; - There is a feet-back chart on the mentor teacher's activity that is to be filled in by the beginner teacher; - The mentor creates and maintains an atmosphere favorable to a good collaboration with the beginner teacher; - The mentor indicates the communication and relation barriers with the beginner teacher, and uses methods of passing over them on the bases of assertive communication; - The mentor adapts communication to real situations; - The mentor respects the beginner teacher's right to his own opinion; - The mentor puts value on the correct reception of the message; - The mentor formulates questions that are relevant in order to simulate personal reflections on teaching practices/some relevant learning experiences in order to improve them; - The mentor reformulates some sentences/questions in order to make himself better understood and/or to put in agreement positions that are apparently opposed; - The mentor has an emphatic behavior and emotional support in his relation to the the beginner teacher.
3. Facilitating and monitoring the professional insertion of the beginner teacher	<ul style="list-style-type: none"> - The mentor facilities the intern's access to the resources that the school has in order to sustain his professional activity and insertion in the organizing culture of the respective learning institution; - There is a chart for monitoring the beginner teacher's insertion; - The mentors pays permanent attention to the intern's curricular and extracurricular activity and does together with the intern activities from both categories; - Makes the planning for each semester and the entire year together with the beginner teacher
4. The planning, making and analysis of the observation lessons/activities	<ul style="list-style-type: none"> - There is the graphic for the observation lessons at which he intern participates; - There is the evidence chart of the observed lessons/activities; - There are the evaluation charts at which the mentor took part; - There are evaluation charts for the extracurricular activities; - There are analyzing charts for the observed activities.
5.The psycho-pedagogical counseling of the beginner teacher	<ul style="list-style-type: none"> - The mentor offers lesson plans for different types of lessons and/or activities outside school; - The mentor projects together with the beginner teacher at least one didactic incursion; - The intern is sustained in making the school documents; - There are charts to analyze the lessons taught individually/in team with the intern; - The mentor assist the beginner teacher in making his professional portfolio; - The mentor offers the beginner teacher support and understanding in order for the intern to be more confident in himself.
6. Evaluation the intern's didactic performance and professional behavior	<ul style="list-style-type: none"> - There is the beginner teacher's (auto) evaluation chart based on competences; - There is the evaluation chart from the part of the intern's colleagues; - There is an evaluation chart made by students; - There is the final report of the intern's teacher activity;

	<ul style="list-style-type: none"> - There is an objective characterization of the intern and of the competence level that he reached and that recommends us to subscribe to the definitive degree exam; - There is the recommendation to subscribe to the definitive degree exam in the learning system.
7. The mentor's auto-evaluation and evaluation	<ul style="list-style-type: none"> - There is the (auto) evaluation chart of the mentor's yearly activity; - The yearly (auto) evaluation chart of the mentor is analyzed by the administrative council in the respective school; - There is an yearly evaluation chart for the mentor made by the mentorship inspector.

To the question: "*Which were the main difficulties that you encountered as debutante teachers in your first year of teaching?*", the interviewed mentors answered:

- *The lack of a mentor that should support me and coach me in my didactic activity;*
- *My colleagues' resistance, who didn't took me into consideration me when I took the initiative on the reason that I was a debutante and didn't have experience;*
- *The understanding of the parents' attitude towards school, the educational process with all the difficulties of the teaching act, the evaluation results...*
- *It was difficult to handle the relation with parents, because I had a class with many students and with multiple discipline problems;*
- *Difficulties in class management and correct time management;*
- *Lack of experience in filling school documents;*
- *The daily distance to school because I walked more 2 km;*
- *Preparing an open lesson at a pedagogical meeting where my specialty colleagues took part.*

To the question: "*Was there someone who supported your successful integration in the first years of teaching? Shortly describe what this person did for you and in what way he/she influenced your teaching career!*", the interviewed mentors answered:

- *My colleagues helped me only if I asked them, they didn't ask me whether I manage teaching or not;*
- *colleague of mine explained to me who I should fill in the school documents, and another one offered me material for one of the school celebrations; otherwise I managed myself;*
- *In my school I haven't received professional aid, maybe just some verbal encouragements;*
- *I made use of pedagogical books of a primary teacher lady who retired.....;*
- *My mother, a Romanian language teacher, was my methodological and psychological support...;*
- *Nobody supported me in my fist years as a beginner teacher. I can say I stole some work craft from where I could, enlisting to training classes, going to pedagogical meetings and asking the more experiences colleagues.....*

To the question: "*What life lessons have you received from your mentor?*", the interviewed mentors answered:

- *To always say what I think, to have the courage to express my ideas even if sometime they are not liked by the others...;*
- *To give arguments in order to sustain my point of view;*
- *To be responsible for my ideas and deeds;*
- *To read extensively, to research, to work.....;*
- *To love children and to be a true friend for them;*
- *To really love this job and love children!;*
- *Every child is unique and important;*
- *Every child has something to offer...;*
- *Punctuality, honesty, correctness and professional objectivity;*

To the question: "*What will you tell a beginner teacher at your first meeting?*", the interviewed mentors answered:

- *I would tell him some positive/funny/ emotional experiences experienced by me with children, in my first years of activity...;*

- *I would congratulate him for choosing this profession and welcome him;*
- *I would encourage him, explaining him that the teacher profession has to be learned, and experience is gained in time through work and commitment.*

To the question: “*How will you explain the beginner teacher that he/she made some mistakes that can appear during teaching without offending/making him shift off this profession?*”, the interviewed mentors answered:

- *I would kindly explain what the mistake was, how we can fix it;*
- *I would start from a personal example, I would confess I had also made mistakes at the beginning, that they are inherent at every career beginning, in every field of activity and that experience will be gained teaching;*
- *I would correct the mistake by giving examples of good practice.*

To the question: “*Think of 3 pieces of advice that you consider the most important and which you will offer as tips to a novice in the teaching profession!*”, the interviewed mentors answered:

- *To “steal” profession from the colleagues, from the more experienced ones, or even the younger ones;*
- *To meditate over each activity and to acknowledge to himself: what did he like the most, what didn't, what he did right, what he could have done better...;*
- *Observe the child/students not as a being that has to be mastered/controlled, but as a being that has to be understood;*
- *Read all the time. Don't let the lack of knowledge make you commit errors in your teaching activity that you may regret later, but which you cannot remediate;*
- *Indifferently how hard, overwhelming, exhausting your profession may become, don't give up! Be a hero!;*
- *To be calm, to inspire trust and correctness, to create an efficient communication based on truth.*

In order to survey the beginner teachers' perceptions connected to their expectations on the mentorship internship and to draw a conclusion whether there is a significant correlation between their answers and those of the mentors, the *Beginner teacher questionnaire* was applied (appendix B).

To the question: “*On what psycho-pedagogical and methodological aspects would you like to concentrate the mentor's activities?*”, the most beginner teachers (64%) consider that in the mentorship activity the core has to be on exemplifying and applying the teaching methods and class management.

To the question: “*What aspects do you think will raise you the most problems in your teaching activity?*”, most beginner teachers (52%) consider as problems in their professional beginning: projecting the didactic activity, making teaching contents more accessible, differentiated education and evaluation.

To the question: “*What role do you appreciate the most at your mentor?*”, the most debutants (44%) answered that they appreciate the most the mentor's role model (44%), together with mentor as a resource (24%), and assessor (8%).

4. Conclusions

We consider that, by the way in which implementing the professional insertion program of mentorship was made in Romania (professional training at work place/ in school, monitoring the professional insertion by using quality instruments, mutual assistances, offering good practice, professional dialogues, self-evaluation etc.) an important step was made in increasing the young teachers' quality of training at their profession beginning. Between the limits of Romanian legislation concerning the training of beginner teachers through mentorship activities, some changes can be made, that will correct some errors:

- Making the access chart for worthwhile mentor teachers more flexible by introducing in the respective chart some quality criteria concerning: the mentor's didactic performance proved in different contexts and

acknowledged by students, their parents and the teachers community, special results with students, profs of the mentor's implication in school activities, local community life, etc;

- The proof of attending at least one mentorship program and presenting the extra value of this training;
- Experience in mentorship activities during the last 5 years;
- Giving up to some criteria that are less relevant for the professional insertion mentor: experience in leading, guidance and control jobs, educational management articles, coordinating/participating to international projects.

The aspects observed by mentor teachers and beginner teachers that took part in the study gives us the right to appreciate that there is a need for a change in the initial training for young teachers, in the sense of increasing self-knowledge for future teachers, and even more sustaining the professional implication attitude, preoccupation for personal and professional development. A major role in this sense is held by trainers from universities and mentors in schools. The models offered by them, their didactic styles, the attitudes and values they transmit, their didactic competences manifested, are sources of inspiration for future teachers, to create a harmony of theory and standard quality practice.

The research highlights particular aspects of the professional insertion mentoring in the Romanian educational system and submits to analysis certain internship mentoring intervention strategies by reference to the needs of the beginner teacher and the context of exercising didactical behaviors. The occasions created by investigation and reflection on existing professional practices generated a practical-action model to improve the quality of training beginner teachers.

Appendix A.

Interview Guide

1. Which were the main difficulties that you encountered as beginner teachers in your first year of teaching?
2. Was there someone who supported your successful integration in the first years of teaching? Shortly describe what this person did for you and in what way he/she influenced your teaching career!
3. What life lessons have you received from your mentor?
4. What does it mean in your opinion a mentor who is trained to coach, give advice, and guide the young debutante in this profession?
5. What will you tell an intern at your first meeting?
6. How will you explain the intern that he/she made some mistakes that can appear during teaching without offending/making him shift off this profession?
7. Think of 3 pieces of advice/ tricks that you consider the most important and which you will offer as *tips* to a novice in the teaching profession!
8. What does it mean in your opinion a successful mentorship?
9. What quality standards are necessary for an efficient mentorship program?
10. What performance indicators can you associate to the suggested quality standards?

Appendix B.

Questionnaire

1. Do you think it is good to have a mentor? Give a reason!
2. What do you want to realize together with your mentor?
3. On what aspects would you like to concentrate the internship mentorship activities?
4. What aspects do you think will raise you most problems in your teaching activity?

5. The mentor offered me support in	1	2	3	4	5
5.1. The mentorship program deployment					
5.2. Making of school documents					
5.3. The school culture and specific					
5.4. The characteristics of the class					

5.5. The teachers' community	
5.6. The communication relations between teachers-students in school	
5.7. Making of lesson plans	
5.8. Team teaching	
5.9 personalized education	
5.10. In anticipating and overcoming some difficulties/approaching some crises situations	
6. I learned many teaching techniques by observing my mentor's performance	
7. I was encouraged to apply modern teaching methods and to put into practice personal ideas	
8. I was helped to identify solutions in order to overcome some teaching difficulties	
9. I received permanent feedback from my mentor	
10. I was stimulated by the way in which I was assessed	
11. I was helped to use correct and objectively the evaluation tools	
12. I was helped to identify my strong points as a teacher	
13. I was given moments to reflect on my teaching performance	

(Likert scale: 1-strongly disagree, 2-disagree, 3-neither agree nor disagree, 4-agree, 5-strongly agree)

14. What does it mean for you to be a teacher?
15. What kind of teacher will you be?
16. What do you appreciate the most at your mentor?

4th International Conference on New Horizons in Education

Orchestrating an adaptive intelligent tutoring system: towards integrating the user profile for learning improvement

Reyes Juárez-Ramírez*, Raúl Navarro-Almanza, Yail Gomez-Tagle, Guillermo Licea, Carlos Huertas, German Quinto

{reyesjua, rnavarro, ygomez, glicea, chuertas, german.quinto}@uabc.edu.mx

Universidad Autónoma de Baja California, Facultad de Ciencias Químicas e Ingeniería, Calzada Universidad 14418, Parque Industrial Internacional Tijuana, Baja California, C.P. 22390, México.

Abstract

An intelligent tutoring system aims to provide immediate and customized instruction and feedback to learners. In this context, existing tutoring systems have limitations in the areas of dialogue, feedback and emotion-motivation, which are important elements in the learning process. These aspects are related with the learner abilities, capacities, and motivations. To overcome these limitations, we propose to model the user characteristics that are involved in the learning process and in the human-machine interaction. In this paper we present a proposal to consider an integral user profile in order to gain effectiveness and to achieve more adaptability to the learner.

Keywords: intelligent, adaptive, tutoring system, integral user profile, software engineering.

1. Introduction

Traditional instructional methods teach learners presenting facts and concepts followed by tests (Ong & Ramachandran, 2003). These methods are used for exposing learners to large amounts of information and testing their recall. However, they often impart "passive knowledge" that learners can recall but may not apply correctly when needed. With the proliferation of information technologies, nowadays, those methods have been obsolescent. Using technology to assist teaching was a solution. Teaching tutoring systems that act as personalized tutors became a popular media in past decades. By today, there are many environments for learning, varying from open online environments and Internet searching engines to desktop tools. Based on this, we have the following question: Is a personalized tutoring system an effective tool for improving learning? Individual tutoring is perhaps the first instructional method; it dates back at least to Socrates and the Socratic method (Koedinger & Corbett, 2006). In addition, one-to-one tutoring by expert human tutors has been shown to be much more effective than typical one-to-many classroom instruction (Bloom, 1984). Furthermore, computers are a familiar sight in classrooms (and outside) in the twenty-first century, and technology has been used to streamline many educational tasks, so that, we can continue improving the usefulness of computer-based tutoring systems.

Since three decades ago, researchers demonstrated that students who receive one-on-one instruction perform two standard deviations better than students in traditional classrooms (Ong & Ramachandran, 2003). However, in most cases, it is too much expensive to dedicate one instructor for each student. Then, the challenge is how to take the subject matter expertise and the teaching skills of the best instructors or mentors and encode them in a

* Reyes Juárez-Ramírez. Tel.: +52-664-662-2790; fax: +52-664-662-2790.

E-mail address: reyesjua@uabc.edu.mx

software system to provide the benefits of intelligent, one-on-one instruction cost-effectively systems (Ong & Ramachandran, 2003). In order to achieve this objective, from two decades ago many efforts have been made in developing intelligent tutoring systems (ITS). Other types of implemented systems are: computer assisted instruction (CAI) (Hall, Hughes & Filbert, 2000; AlSultan, Lim, MatJafri & Abdullah, 2006; Child, 1995; Fazelian, Saadatmand & Rad Saadat Gholi, 2005), cognitive tools (Beaumie & Reeves, 2007), adaptive intelligent tutoring systems (AITS) (Phobun & Vicheanpanya, 2010).

An ITS is defined as a computer system that aims to provide immediate and customized instruction or feedback to learners (Psootka & Mutter, 1988), usually without intervention from a human teacher. This context encompasses any computer program that contains some intelligence and can be used in learning (Psootka & Mutter, 1988). The main goal of ITSs is enabling learning in a meaningful and effective manner by using a variety of computing technologies (Ong & Ramachandran, 2003). However, in most cases, it is much too expensive to dedicate one instructor for each student.

Cognitive tools are technologies that learners interact and think with in knowledge construction, designed to bring expertise to the performance as part of the joint learning system (Beaumie & Reeves, 2007). Cognitive tools are generalizable computer tools that are intended to engage and facilitate cognitive processing. Cognitive tools refer to learning with technology as opposed to learning through technology.

CAI is a self-learning technique, usually offline/online, involving interaction of the student with programmed instructional materials (Hall, Hughes & Filbert, 2000; AlSultan, Lim, MatJafri & Abdullah, 2006; Child, 1995); a computer is used to present the instructional material and monitor the learning that takes place. CAI programs use tutorials, drill and practice, simulation, and problem solving approaches to present topics, and they test the student's understanding. CAI uses a combination of text, graphics, sound and video in enhancing the learning process (Fazelian, Saadatmand & Rad Saadat Gholi, 2005). In the form of a tutorial system, activity includes both the presentation of information and its extension into different forms of work, including drill and practice, games and simulation.

Adaptive Instructional Systems (AIS) emphasize that the effectiveness of instructional systems can be improved by incorporating algorithms that adapt instruction to individual capacities and differences (Ong & Ramachandran, 2005). These systems pretend to include other user attributes, such as cognitive styles, personality types, mental and emotional state, student experiences, and learning style. Most of the AIS models specify the data and algorithms required to assess (or estimate) these student attributes and apply these estimations to make better instructional decisions. Over AISs there is one more level of specialized systems such as AITS, which are systems that reach for adapting learning environments to student behavior. AITSs allow knowledge to be stored in such a way that is not only independent of the knowledge domain, but also supports the storage of transfer knowledge relationships and prerequisite knowledge relationships (Phobun & Vicheanpanya, 2010).

Even though this diversity of systems, recent research efforts are oriented to develop ITS to be applied in online education to monitor, track, record behaviors, and to perform formative assessment and feedback loop to students to foster a professional and reflective approach (Paviotti, Rossi & Zarka, 2012).

One of the most important characteristics of e-learning systems is that of being personalized, in order to fit the needs of a variety of students with different backgrounds and skills (Paviotti, Rossi & Zarka, 2012). Previous researches such as (Paviotti, Rossi & Zarka, 2012) proposed to consider aspects such as: learning style of the students, "personal predispositions" (memory, understanding, and content associations), psychological aspects, and affective states. The last two ones are focused on the types of emotions involved in the learning process.

Almost all the past researches propose a basic architecture for a tutoring system, which consists of the following elements: domain model, instructor model, learner model, expert model, and user interface. In those proposals, for the learner model there is not a complete user profile including all the human characteristics that are involved in the learning process. Several past works agreed that the user interface module is an important element that adjusts the learning environment to the user necessities. Even though this agreement, there is not a precise description about how they adapt the learning interface to the user characteristics.

In this paper we present a proposal to consider an integral user profile that includes the following user characteristics: cognitive, experience, psychological, demographic, sensory, affective, motivation, and physic. This proposal contributes to the orchestration of an adaptive intelligent tutoring system.

This paper is organized as follows. Section 2 describes some of the more relevant problems in the context of tutoring systems, and also presents the major trends. Section 3 exposes some related works. Sections 4 and 5 present our proposal for orchestrating an adaptive intelligent tutoring system. Finally, sections 6 presents the conclusions and future work.

2. Main problems, challenges and trends in the context of tutoring systems

Until today several systems have been implemented having significant results. Previous research reveals that tutoring system implementations commonly have been oriented on one type of tutoring system; there are not much evidences of implementations combining ITS, CAI, and AITS. In order to take advantage from them and to avoid their disappointments, we analyzed the main problems that are present in this context.

2.1. Expensive research for building tutoring systems

The research phase is often expensive; it requires the cooperation and input of subject matter experts, the cooperation and support of individuals across both organizations and organizational levels (Murray, 1999). A high portion of that cost is a result of content component building (Nkambou, Mizoguchi & Bourdeau, 2010), not only for the work of creating learning material, but also for the multidisciplinary required for that building. The time spent for developing the ITS is another expensive factor due to a big amount of human resources required for the system construction.

2.2. Limitations of the pedagogy of immediate feedback

The pedagogy of tutoring system currently in use is criticized; some aspects such as the immediate feedback and hint sequences that are built in to make the system "intelligent" present limitations. This pedagogy is criticized for its failure to develop deep learning in students. In some systems, when students are given control over the ability to receive hints, the learning response created is negative. "If students fail to reflect on the tutoring system's feedback or hints, and instead increase guessing until positive feedback is garnered, the student is, in effect, learning to do the right thing for the wrong reasons" (Koedinger & Aleven, 2007). In general terms, most of the tutoring systems are unable to detect shallow learning and therefore, the learning for some users is not optimal.

2.3. Lack of intrinsic motivation

Intelligent tutoring systems have been criticized for being too "instructivist" and removing intrinsic motivation, social learning contexts, and context realism from learning (Jonassen & Reeves, 1996). These

systems commonly fail in using attractive and persuasive scenarios to take students to appropriate the domain language. In such situations, if the student is not learning the domain language it becomes more difficult to gain a deeper understanding, to work collaboratively in groups, and to transfer the domain language.

2.4. *Lack of focus in learning content*

Several systems have intended to be effective and useful, but they lead in improving the usability of the system, for example, some cognitive tools (e.g. simulations) can have the effect that learner learns the tool and not something that he can transfer (Ong & Ramachandran, 2003). This is well known as the *video game effect*, that is, learner learns to operate the system and their logic, but the system does not support the learnability of educational contents.

2.5. *Lack of evaluation standards*

There are various evaluation techniques presented in the literature, such as proof of correctness, additive experimental design, diagnosis accuracy, feedback/instruction quality, sensitive analysis, expert inspection, pilot testing, formative evaluations, and summative evaluations (Iqbal, Oppermann, Patel & Kinshuk, 1999; Siemer & Angelides, 1998; Mark & Greer, 1993). Even though the usefulness of these evaluation techniques, there are no guiding principles for the selection of an appropriate evaluation method to be used in a particular context (Iqbal, Oppermann, Patel & Kinshuk, 1999; Siemer & Angelides, 1998).

For instance, there are not precise recommendations for when to use each technique, that is, if it is better to apply them during the design phase, during the implementation phase, or after the completion of a tutoring system (Mark & Greer, 1993). In general, the great challenge introduced by the lack of evaluation standards resulted in neglecting the evaluation stage in several existing ITS' (Iqbal, Oppermann, Patel & Kinshuk, 1999; Siemer & Angelides, 1998; Mark & Greer, 1993).

2.6. *The necessity of inclusion of Dialogue*

This capacity aims with attempting to simulate natural conversations (Graessner, Kurt VanLehn, Jordan & Harter, 2001). This is based on the fact that human tutors have the ability to understand a person's tone and inflection within a dialogue and interpret this to provide continual feedback through an ongoing dialogue, including being able to understand tone, inflection, body language, and facial expressions and then to respond to these (Graesser, Chipman, Haynes & Olney, 2005).

2.7. *The necessity of inclusion of Affective issues*

This concerns with the possibility of interpreting the affective process of an individual; that is, being able to interpret and adapt to the different emotional states of the learner (D'Mello & Graessner, 2012; Sarrafzadeh, Alexander, Dadgostar, Fan & Bigdeli, 2008). This is based on the idea that affective processes that learners go through also play an important role (D'Mello, Olney, Williams & Hays, 2012). It is necessary to read an individual's expressions and other signs of affect in an attempt to find and tutor to the optimal affective state for learning.

3. Related works

We pretend to integrate the usability approach in the tutoring system design. Based on this, in this section we present some related works in two main areas: adaptive user interface design, and adaptive tutoring systems.

Several efforts have been made in order to support the design of adaptive user interfaces. Two of the most relevant proposals are described here. In (Weinschenk, 2011), a set of 100 affirmations are presented, which describe the way of how humans perceive, read, put attention, memorize, and think, what thinks motivate them, how decide, how socially they act, errors committed, etc. Also, an explanation is provided about the impact these aspects have over the user interface design. In addition, a set of recommendations is presented about what to do and what to avoid for user interface design.

In the other hand, in (Johnson, 2010), an explanation is presented about the sensory and cognitive limitations humans have, and how these limitations impact the user interface design.

In (Schiaffino, Garcia & Amandi, 2008) an intelligent agent that provides personalized assistance to e-learning students is presented. This agent observes a student's behavior while he/she is taking online courses and automatically builds the student's profile. This profile comprises the student's *learning style* and information about the student's performance, such as *exercises done*, *topics studied*, and *exam results*. The student's learning style is automatically detected from the student's actions in an e-learning system using Bayesian networks. Based on this, the agent proactively assists the student by suggesting him/her personalized courses of action that will help him/her during the learning process.

Phobun & Vicheanpanya (2010) presented a proposal for combining ITS and Adaptive Hypermedia systems (AH) into an Adaptive Intelligent Tutoring System (AITS) for e-learning systems. This approach pretends to take advantages from ITSs and the capabilities of AHs. In this case, it is considered that an AH is better suited for the instruction of concepts whereas ITS generally assists in the use of these concepts to solve problems. This proposal considers two main elements of the user profile: *current knowledge* and *learning style*.

Sansoni & Giannandrea (2012) presented a proposal for the user profile in a tutoring system. They suggested that it contains pieces of information about the basic characteristics and habits of the user. Discovering these individual peculiarities is vital to provide users with a personalized service. The user profile stores learning activities and interaction history. It is created through storing both static information (as the previous course followed by the student), and dynamic information (as the learning activities that the student is doing).

Analyzing works such as (Schiaffino, Garcia & Amandi, 2008), (Sansoni & Giannandrea, 2012) and (Phobun & Vicheanpanya, 2010) we have found that there is a disconnection between leaning focus developments and user interface design approaches. Even though tutoring systems are software systems, commonly learning-oriented researches only consider aspects from the learning theory, but not consider user interface design principles.

4. Orchestrating the Adaptive Intelligent Tutoring System

ITSs incorporate a built-in expert system. Based on this idea we propose to consider various intelligent modules. In order to monitor the performance of the learner and to personalize instruction on the basis of adaptation to learners' learning style, current knowledge level, and appropriate teaching strategies (Phobun & Vicheanpanya, 2010), in this section we describe how we are orchestrating our AITS.

For orchestrating the user profile we use a Human-Computer Interaction (HCI) point of view due to we have previous works in this context (Mejía, Juárez-Ramírez, Inzunza, & Valenzuela, 2012; Mejía, Juárez-Ramírez, Inzunza, & Valenzuela, 2013; Mejía & Juárez-Ramírez, 2013); we believe that HCI makes a better consideration

of the user analysis for system design. Based on this, we propose in consider an integral user profile that includes user aspects such as: cognitive, experience, psychological, demographic, sensory, affective, motivation, and physic. Considering this integral user profile will help us to have a more useful and usable tutoring system.

4.1. Orchestrating the AITS modules

IEEE Std. 1471-2000 (Hilliard, 2000) defines software architecture as *the fundamental organization of a system; architecture is integrated for components, relations between them and the context where components will be implemented, and the principles that conduct the architecture design and evolution*. The traditional ITS model contains four components (Freeman, 2000): the *domain model*, the *learner model*, the *teaching (instructional) model*, and a *learning environment (user interface)*. We are considering other related models for integrating the AITS architecture (Phobun & Vicheanpanya, 2010): *expert model*, *tutor model*. Figure 1 shows our proposed architecture.

ITS projects can vary tremendously according to the relative level of intelligence of the components (Freeman, 2000). Each model can involve a level of intelligence in order to deals with its work inside the whole system. Based on this, we focus this description to where artificial intelligence is needed in each model and modules. Our architecture adapted from previous proposals.

Domain model. Represents the subject matter –expertise- and provides the AITS with knowledge of what it's teaching (Ong & Ramachandran, 2003). In the best scenario, it should be able to solve the problems the tutoring module submits to the students (Freeman, 2000). This module is very related with the expert model. *Artificial intelligence* would be needed for: (1) Generating solutions to complex problems, (2) generating novel problems, so that students can always have new problems to practice on.

Learner model. This model represents the student's knowledge, skills, and other attributes that affect how the student should be taught (Ong & Ramachandran, 2003). This model lets the AITS know who it's teaching. It reflects what the machine can infer about the student's cognitive state (Freeman, 2000). *Artificial intelligence* would be needed for: (1) evaluating each learner's performance to determine his or her knowledge, perceptual abilities, and reasoning skills (Ong & Ramachandran, 2003), (2) determining appropriate and inappropriate actions carried out by the learner, (3) predicting what the learner does or doesn't understand based on sequences of actions and states associated with concepts to learn.

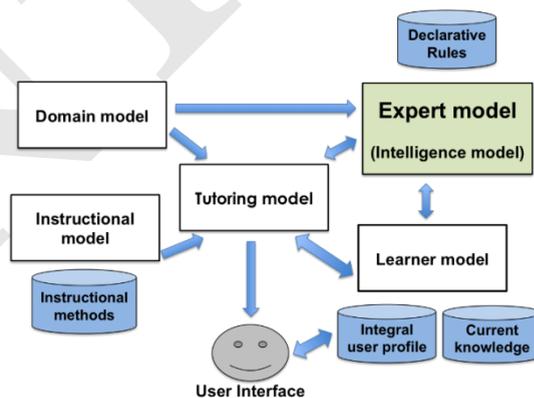

Fig. 1. Main architecture of the AITS

Instructional model. This model encodes instructional methods that are appropriate for the target domain and the learner and enables the AITS to know how to teach (Ong & Ramachandran, 2003). It contains knowledge for making decisions about instructional tactics. It relies on the information for diagnostic processes of the learner model for making decisions about what, when and how to present information to a learner. *Artificial intelligence* would be needed for: (1) cataloguing the expertise level (knowledge possession) of learners, (2) determining the level of complexity of the learning materials to be presented to the learner based on his/her expertise level, (3) deciding when to increase the complexity level of learning material for a learner, (4) choosing topics and examples that are relevant for the learner.

Tutor model. This model controls the interaction with the learner, based on its teaching knowledge and comparisons between the student model and the domain knowledge (Freeman, 2000). Based on its knowledge of a person's skill strengths and weaknesses, participant expertise levels, and student learning styles, this model selects the most appropriate instructional intervention. Also provides feedback, explanations, and coaching as the participant performs the simulated procedures. It might even pose questions, using Socratic teaching methods, to encourage students to reflect upon their actions and reasoning. *Artificial intelligence* would be needed for: (1) making decisions about what learning material and how to present this information to the learner.

Expert model. This module is a representation of a domain expert's subject matter knowledge (declarative knowledge) and problem-solving ability (procedural knowledge) (Ong & Ramachandran, 2003). It combines and applies rules to solve the problems. Also, it assesses each learner's understanding by comparing the software's reasoning with theirs, and demonstrates the software's solutions to the participant's (Ong & Ramachandran, 2003). *Artificial intelligence* would be needed for: (1) inferring the learner's needs to practice and learn at their own pace, (2) making decisions about what, when and how to present information to a learner.

User interface model: This model is important as a communication medium and learning environment that can support learning tasks. It can also act as an external representation of the expert model and instructional model. *Artificial intelligence* would be needed for: (1) inferring motivation and affective conditions to present to the learner based on their actions and achieves, (2) adapting the user interface characteristics to the user profile.

4.2. A proposal for an integral user profile

In the learning process there are two main parts, the student and the teacher. From the student point of view, there four characteristics to consider: *prior knowledge*, *learning style*, *intelligence*, and *motivation* (Huitt, 2003). Also, in the student side, during the learning process there are three main elements to consider: *content overlap*, *involvement*, and *success*. As a result of the learning process the student has achievement –*learning*. As the student is the main part of the learning process, in this section we describe a user-centered perspective, which helps giving to the tutorial system a software system orientation whose main objective is the student learning.

From the HCI point of view, user interface designers have considered simplicity and easy for learning (Biswas 2012; Biswas & Robinson, 2013). Other aspects of the user should be considered. User modeling has as objective the representation of preferences, abilities and knowledge possessed by the user (Biswas & Robinson, 2013; Tatjana & Alexander, 1997) in order to achieve usable and useful interfaces. The term “usable” is concerned with usability, while the term “useful” is concerned with usefulness. Relating these concepts, we can say that usefulness involves utility and usability. Utility concerns whether the system design provides the features user needs. Usability concerns with how easy and pleasant these features are to use.

Usability is often associated with the functionalities of a system. In the context of tutoring systems, those functionalities are related with presenting learning materials to the students, tests application, feedback to the students, and so on. From this point of view, “useful” concerns with *understanding what the learners who will be*

using the software want to achieve —what their goals are and how they go about achieving them; in this case, learning new knowledge and master new abilities in an easy way. This implies getting a better understanding of the learners and what they want to achieve, also understanding their motivations —what encourage them, what they like and don't like about what they do, and more.

Based on these ideas, for user modeling, it is necessary to consider the majority of human characteristics involved in the interaction with a machine or a software system. A human factor is a user characteristic that has relevance in the interaction between the user and the machine, a system or a product (Zudilova-Seinstra, 2007). Table 1 shows a set of factors to consider for the user modeling. These groups of factors have been integrated from the proposals made in (Stuart, Card & Newell, 1983; Cañas, Gámez & Salmerón, 2001; Quiroga, Crosby & Iding, 2004; Zudilova-Seinstra, 2007; Johnson, 2010; Weinschenk, 2011).

We are planning to consider the majority of these aspects for our AITS implementation. A first proposal for implementing the “adaption” in our AITS is taking into account the following aspects: cognitive (learning style), motivation (attitudes), affective (emotions), experience (technological abilities), demographic (scholarly, gender), physic (motion abilities), sensory (all sense), psychological (motivation, self-confidence).

Table 1. Factors for the integral user profile.

Factor group	Description	Examples of factors/attributes
Cognitive	Concerns with how humans process information; it is related with the mind and its processes.	Perception, memory, attention, concentration, decision making, learning capacity, learning style.
Motivation	Motivation engages the learner to use the system; it influences directly how the learner perceives and interprets the system.	Attitudes, necessities, expectances.
Affective	Concerns with the affective processes of an individual; that is, expressing the different emotional states of the learner.	Emotions: curiosity, satisfaction, awe; hopefulness; confusion, disappointment; frustration, discard, misconception (Shen, Wang & Shen, 2009; Kort, Reilly & Picard, 2001); Hao, 2003)
Experience	Concerns with the context of the learner, and is related with the learner previous experience with the system's domain, and using alike systems.	Technological abilities, knowledge over the system.
Demographic	Helps to put learner into a context in personal aspects; does not have a direct impact on the user interface, but it defines important aspects for learning.	Age, gender, scholarly, culture.
Physic (motion)	Aspects concern with human motion system, muscles and physical movements.	Motion abilities, movement control, and coordination.
Sensory	Concerns with such aspects related with the five senses of humans, which contribute to communication process.	Visual (eye-gate), auditory (ear-gate), hand-on (touch and physical movement). (Shams & Seitz, 2008)
Psychological	Concerns with the function of the human body, the mechanics, bioelectrical, and biochemical.	Motivation, self-efficacy, self-esteem, self-confidence. (Rahman, Yasin, Amir & Embi, 2011).

4.3. Summarizing aspects for building the adaptive intelligent tutoring system

Considering the nature and functions of each model from the tutoring system architecture and the description of the user factors, we established a connection between them as we can see in Table 2. In advance, the learner model would take into account all the user characteristics. The same case is for the tutor and user interface models.

Table 2. Determining the adaption – mapping the tutoring system models with the user characteristics

Factor group	Domain model	Learner model	Instructional model	Tutor model	Expert model	User interface model
Cognitive	√	√	√	√	√	√
Motivation		√	√	√	√	√
Affective		√	√	√	√	√
Experience	√	√	√	√	√	√
Demographic		√	√	√	√	√
Physic (motion)		√		√		√
Sensory	√	√	√	√	√	√
Psychological	√	√	√	√	√	√

The adaption is focused mainly in two components, the learning material and the user interface. For the learning materials, first we are proposing to present student learning materials respecting the complexity of contents depending on the previous knowledge and current student performance. Aspects such as demographic and experience are related with this factor. In the case of user interface, aspects such as motivation, affective, psychological, sensory and physic will contribute to adapt the user interface in terms of: visual effects, auditory effects, and animation.

4.4. Defining the complexity of learning materials

In order to determine the complexity level of the learning materials to be presented to the learner, by the moment, we are considering the following factors: *reading times*, *reading time*, *number of exercises done*, *test score*, and *test time*. We have proposed these factors derived from a survey applied to undergraduate students. Based on their experience, they considered that these factors could determine the complexity level for the learning materials. The *reading times* factor represents the number of times that a learning material (of a specific theme) has been read. The *reading time* means the time spent for reading this material. The *number of exercises done* means how many exercises the learned have done for a specific theme and learning material. The *test time* means the time spent in answering a test. The *test score* represents a score in a specific test for a learning material.

Combining these factors we can determine the level of complexity of the learning material (see Figure 2). We are considering three complexity levels: basic, intermediate, and advanced.

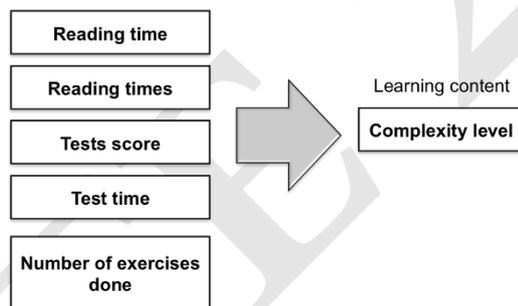

Fig. 2. Factors to define the complexity level of learning materials

It is important to emphasize that the number of factors would not be limited to this set; another variables can be considered taking into account the user characteristics contained in the integral user profile.

4.5. Learning material generation

As a first proposal, we are planning to generate learning materials considering three complexity levels and three learning styles (see Figure 3). We have the following combinations of learning materials: Basic level – Visual style, Basic level – Auditory style, Basic level – Kinesthetic style; Intermediate level – Visual style, Intermediate level – Auditory style, Intermediate level – Kinesthetic style; Advanced level – Visual style, Advanced level – Auditory style, Advanced level – Kinesthetic style.

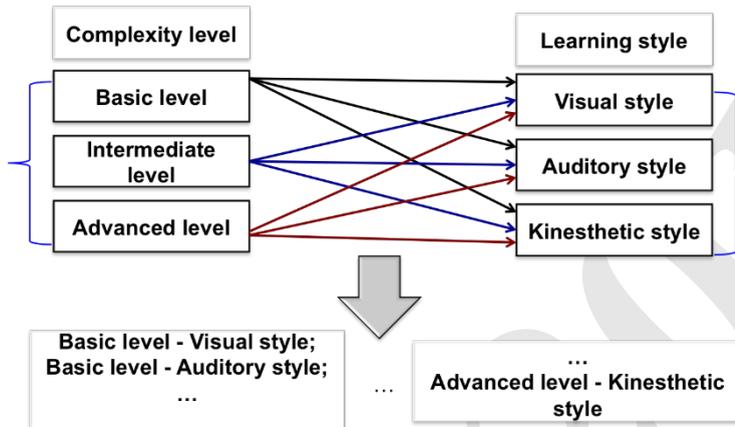

Fig. 3. Generating learning materials

By the moment, this classification helps us to present a complexity level to each student based on his/her performance.

We have implemented a set of learning materials for teaching object oriented programming. We implemented two formats for learning materials: textual explanations, and videos. We have probed the usefulness of these materials having significant opinions from students about the capacities of these materials for teaching this topic.

5. Orchestrating the intelligence of the Tutor Model

Considering that some factors have different ranges of values, for instance, *test score*; a fuzzy method has been selected for modeling and implementing the intelligence for the tutoring module. We propose to use a Mamdani method. This system has as numeric values as input; values are processed and after that a fuzzy output is generated. Bellow we describe the factors and data to be the input for the Mamdani algorithm.

In order to detect the learning style, we have considered a tool that consists in a questionnaire based on specific questions that emphasize aspects of the visual, auditory and kinesthetic styles. This tool is included in our prototype called TIPOO (in Spanish “Tutorial Inteligente para la Enseñanza de la Programación Orientada a Objetos”). The results from this tool will be stored in the learner profile inside TIPOO. Also, we have considered a timer module to measure the time spent in reading, in this way, the time spent in reading a topic will be stored in the learner profile. We have designed a test tool, which automatically calculates the score for each test. We propose the following score intervals: *low* (0-59), *acceptable* (60-79), and *excellent* (80-100). In addition, we have considered a timer for measuring the time spent in answering a test. For the test time we have define ranges

of values, having these intervals: *low*, *acceptable*, and *excellent*. For reading time we also have ranges of values, but they are mapped to the following intervals: *low*, *intermediate*, and *fast*.

In Table 3 we present a partial set of fuzzy system rules for determining the complexity level (see the fourth column), in this case we only show the rules for the kinesthetic learning style. In the same way we have proposed rules for visual and auditory learning styles, but they are not showed here.

Table 3. Fuzzy system rules – Kinesthetic learning style

Test score	Reading time	Test time	Complexity level	Learning style
Low	Low	Low	Basic	Kinesthetic
Low	Low	Acceptable	Basic	Kinesthetic
Low	Low	Excellent	Basic	Kinesthetic
Low	Intermediate	Low	Basic	Kinesthetic
Low	Intermediate	Acceptable	Basic	Kinesthetic
Low	Intermediate	Excellent	Basic	Kinesthetic
Low	Fast	Low	Basic	Kinesthetic
Low	Fast	Acceptable	Basic	Kinesthetic
Low	Fast	Excellent	Basic	Kinesthetic
Acceptable	Low	Low	Intermediate	Kinesthetic
Acceptable	Low	Acceptable	Intermediate	Kinesthetic
Acceptable	Low	Excellent	Intermediate	Kinesthetic
Acceptable	Intermediate	Low	Intermediate	Kinesthetic
Acceptable	Intermediate	Acceptable	Intermediate	Kinesthetic
Acceptable	Intermediate	Excellent	Intermediate	Kinesthetic
Acceptable	Fast	Low	Intermediate	Kinesthetic
Acceptable	Fast	Acceptable	Intermediate	Kinesthetic
Acceptable	Fast	Excellent	Intermediate	Kinesthetic
Excellent	Low	Low	Advanced	Kinesthetic
Excellent	Low	Acceptable	Advanced	Kinesthetic
Excellent	Low	Excellent	Advanced	Kinesthetic
Excellent	Intermediate	Low	Advanced	Kinesthetic
Excellent	Intermediate	Acceptable	Advanced	Kinesthetic
Excellent	Intermediate	Excellent	Advanced	Kinesthetic
Excellent	Fast	Low	Advanced	Kinesthetic

Excellent	Fast	Acceptable	Advanced	Kinesthetic
Excellent	Fast	Excellent	Advanced	Kinesthetic

Table 3 represents only a first proposal to manage the complexity level of learning materials and the learning style, but actually the user profile and the learning process involve a broad set of factors, some of them can have precise values, but others don't have exact values and states. Based on this, we would have to decide what type of uncertainty techniques we need to use for managing that level of knowledge about the user profile and the learning progress. In (Kasabov, 1996; Konar, 2000; Netnevitsky, 2011) uncertainty reasoning principles and techniques are presented that should be considered in order to select the appropriate techniques.

In (Netnevitsky, 2011) is stated that *uncertainty* is the lack of exact knowledge that would enable us to reach a perfectly reliable conclusion. In this context, *approximate reasoning* is a process of interpretation of knowledge in a presence of uncertainty in a form of vague and contradictory knowledge, incomplete past data, uncertain new facts, not clear goals, etc. (Kasabov, 1996). In (Konar, 2000) is stated that in the presence of forms of inexactness of data and knowledge, the following methodologies are suggested: (1) *probabilistic techniques*, (2) *certainty factor-based reasoning*, and (3) *fuzzy techniques*. As is stated in (Kasabov, 1996), different representation schemes influence the type of approximate reasoning techniques that can be used. Examples of representation schemes are: simple fuzzy rules, weighted production rules, and generalized fuzzy production rules.

6. Conclusions and future work

In this paper we have presented a general view of how to orchestrate an adaptive intelligent tutoring system, respecting the architecture of traditional tutoring systems, but emphasizing the inclusion of an integral user profile, which considers the majority of the human user characteristics: cognitive, emotion, affective, sensory, demographic, experience, physic, and psychological. This integral user profile facilitates the implementation of the intelligent modules and the user interface in order to have a more adaptable tutoring system.

We have introduced a new perspective for the user profile, which includes all the user characteristics that take part in the learning process. This perspective differs from previous research because they don't precise a specific set of characteristics and attributes of the user.

Even though by the moment we developed a prototype, we are working on the construction of a complete system, implementing the intelligence for each model as intelligent components in the AITS architecture.

Our future work is divided in different topics, but they are strong related as we can see in the following description:

Tutor-ability model. Taking advantage from our expertise in measuring learnability in software systems and also in videogame systems, we are defining a set of factors and properties for integrating a tutor-ability model. In educational contexts, students like to feel that they are making progress; they like to feel that they are learning and mastering new knowledge and skills. Based on this, in terms of teaching, we can define tutor-ability as *the capacity of an ITS for facilitating learning and mastering new knowledge and skills*. Towards integrating a set of attributes for defining tutor-ability, we have adopted some factors and properties from the playability model exposed in (González, Padilla & Gutiérrez, 2009). We considered that the factors presented by the playability model proposal are very related with the type of tutoring systems we are looking for because it is a good challenge to adapt learning materials to games features, such as immersion, motivation, emotion, and so on.

Tutor-ability metrics. Taking advantage from our expertise in software metrics, we are integrating a set of metrics to assess the capacity of ITS to assist learning process and students progress.

Natural language processing. In order to attend the necessity of integrating dialogue and feedback capacities, we are considering including the capacity of using text-based questions from the learner to the system. This capacity will be implemented adopting our past proposal (Huertas, Juárez-Ramírez, Gomez-Ruelas & Plata,

2011; Huertas & Juarez-Ramirez, 2012) for the treatment of structured texts, but extending this capacity to non-structured texts in order to make more flexible the interaction between the learner and the system. In addition, following this approach we are planning to integrate speech-based dialogue.

Parental influence on students' mathematics achievement: the comparative study of Turkey and best performer countries in timss 2011

Serpil Kilic^{a*}, Öyküm Esra Askin^b^a*Yıldız Technical University, Faculty of Arts and Sciences 34220, "Istanbul", Turkey*^b*Yıldız Technical University, Faculty of Arts and Sciences 34220, "Istanbul", Turkey*

Abstract

This paper assessed the impact of students' background and parents' attitude towards their children on mathematics achievement across four countries which were participated to Trends in International Mathematics and Science Study (TIMSS) 2011. Since Republic of Korea, Singapore and Chinese Taipei were ranked as the first three countries in terms of the achievement in mathematics scores, they were selected for the comparison with Turkey. Multilevel logistic regression model was used to estimate coefficients and to model differences in mathematics achievement within and between schools for each country. Gender, student-parent relationship, possessions of computer, room and internet were taken as student level variables, while school composition by student economical background, discipline and safety of school climate were taken as school level variables. According to results, owning a desk was the most effective factor on achievement of students for both Turkey and Republic of Korea, at the student level. Furthermore, at school level, the most effective factor on achievement was found the school composition by student economical background for all countries.

Keywords: mathematics achievement, TIMSS 2011, multilevel modeling, student-parent relationship

1. INTRODUCTION

Turkish educational system has modern, secular, democratic and co-education characteristics. Educational reforms in Turkey have been developing slowly. These reforms are included changes in structural and curriculum program. After having negotiations with European Union in 2004, Turkey has applied various reforms in curriculum program for accomplishing educational targets of European Union. Turkey should develop some strategic plans to increase the performance of education system and these plans should contain not only national but also international strategies. Besides national assessment studies were done in educational field, it was a need of educational indicators to locate at the international level. Turkey was involved in some projects such as Programme for International Student Assessment (PISA), Trends in International Mathematics and Science Study (TIMSS) and Progress in International Reading Literacy Study (PIRLS) to improve the educational level of other participating countries.

International assessment studies reflect many comparative surveys among countries pertaining to educational achievement. These assessments are concerned with the study of mathematics, reading and science. Mathematics is one of the fundamental lessons that used in everyday life and associated with other lessons, that's why we

* Corresponding author. Tel.: +90 212 383 44 24; fax: +90 212 383 44 20.

E-mail address: serpilkilic5@gmail.com

focused on mathematics in this study. Mathematics has become increasingly important and has been taken up at the highest level in educational field.

In this study, we compared the effects of students' background and parents' attitude towards their children on mathematics success across four countries; Republic of Korea, Singapore, Chinese Taipei and Turkey. It was shown considerable variation in the countries by using explanatory variables.

For this purpose, the research questions can be designed as follows:

- 1) How the variability in the mathematics achievement of eighth grade students is distributed within and between schools for each country?
- 2) Are the student and school factors influencing mathematics achievement in all countries?
- 3) To increase the mathematics success of Turkish eighth grades, what changes should be implemented?

2. Data and Method

2.1. Data

We use the Trends in International Mathematics and Science Study (TIMSS) which is an international assessment of student achievement in mathematics and science. The study conducted by the International Association for the Evaluation of Educational Achievement (IEA) in 1995, 1999, 2003, 2007 and 2011. The target population in TIMSS 2011 was fourth and eighth grades, teachers and school administrators. This data comprises for 63 countries and 14 benchmarking participants. The main purpose of TIMSS is to measure and improve teaching and learning abilities in mathematics and science. Furthermore, the internationally comparable results provided by TIMSS allow countries to determine how well eighth grades are prepared for life.

2.2. Sample

The sample for this study was restricted to four countries - Republic of Korea, Singapore, Chinese Taipei and Turkey - which participated in TIMSS 2011. This restriction was implemented to make comparative research for countries with a high level of success and Turkey.

According to the findings from TIMSS 2011, Republic of Korea (613), Singapore (611) and Chinese Taipei (609) were the top-performing countries at eighth grade students, respectively. The scores in parenthesis show the mean math score of students in these countries. Mathematics success of Turkey (452) was below the average success (500) of TIMSS 2011.

The sample design is structured for two-level system; students as level-1 and schools as level-2. The study involves 6077 eighth grades nested within 218 Turkish secondary schools, 4789 eighth graders nested within 139 Korean secondary schools, 5544 eighth graders nested within 155 Singaporean secondary schools and 4737 eighth graders nested within 143 Chinese secondary schools after deletion of missing data.

2.3. Variables

Mathematics Achievement (outcome): The mathematics assessment for TIMSS 2011 was designed along two dimensions: content (number, algebra, geometry, data and chance) and cognitive skills (knowing, applying and reasoning) (TIMSS, 2011). Students were taken as “unsuccessful” if their mathematics score was below the average mathematics score of each country; otherwise they were taken as “successful”.

Student level variables (predictors): Gender (G), the possession of computer (C), desk (D) and internet (I), the frequency of the student’s relationship with the family about school were obtained from the students’ questionnaires. Four items, to measure parents’ interest about their children’s schoolwork, were included in analysis. These items were described as follows:

- (P1) My parents ask me what I am learning in school
- (P2) I talk about my schoolwork with my parents
- (P3) My parents make sure that I set aside time for my homework
- (P4) My parents check if I do my homework

School level variables (predictors): School composition by student economic background (SES) and discipline-safety (DS) were derived from the school principal’s questionnaire. They were used to explain school level variance in mathematics achievement.

2.4. Method

Multilevel models applied to clustered or longitudinal data, repeated measures with observational units at one level nested within units at other levels in social and educational sciences. The samples are taken from high level units firstly and then from the sub-units (Heck and Thomas, 2000). Multilevel models are also known as hierarchical linear models or random coefficient models.

Multilevel logistic models do not require any assumptions, such as linearity, normality, independence of residual terms and homogeneity of error variance. We consider multilevel logistic models as special case of multilevel model for binary outcomes with a Binomial sampling model and logit link function (Raudenbush and Bryk, 2002). Since students are nested within schools for each country, we constructed hierarchical structure and used R software for the implementation.

Level 1: Student Level

The model we estimated was

$$Y_{ij} = \beta_{0j} + \beta_{1j}(G) + \beta_{2j}(C) + \beta_{3j}(D) + \beta_{4j}(I) + \beta_{5j}(P1) + \beta_{6j}(P2) + \beta_{7j}(P3) + \beta_{8j}(P4) + e_{ij} \quad (1)$$

where β_{0j} is the average outcome in school j , e_{ij} is the error term for student i in school j .

Level 2: School Level

The level 2 model is then

$$\beta_{0j} = \gamma_{10} + \gamma_{11}(DS) + \gamma_{12}(SES) + u_{0j} \quad (2)$$

where γ_{10} is the average intercept in level two unit j . u_{0j} is the error term for school j (Hox, 2002).

3. Findings and Results

Republic of Korea, Singapore, and Chinese Taipei were top performer countries in TIMSS 2011 study. Thus, the similarities and differences in students’ achievement across countries were tried to explain by using a two-level model. For this study, the students’ achievement in mathematics, students’ and school principals’

questionnaires were used. Since data had a hierarchical structure: observational units at one level were nested within units at other levels, multilevel models were preferred.

The percentage of variables for each country was shown in Table 1.

Table 1. Percentage of variables

			Turkey	Republic of Korea	Singapore	Chinese Taipei
Dependent Variable	Mathematics success	Below country average	51%	48%	48%	44%
		Above or equal country average	49%	52%	52%	56%
Level 1 Variables	Gender	Male	50%	47%	51%	52%
		Female	50%	53%	49%	48%
	Computer	Yes	59%	99%	97%	97%
		No	41%	1%	3%	3%
	Study Desk	Yes	66%	96%	89%	88%
		No	34%	4%	11%	12%
	Internet	Yes	46%	97%	96%	93%
		No	54%	3%	4%	7%
Level 1 Variables	My parents ask me what I am learning in school	Every day or almost every day*	54%	20%	24%	27%
		Once or twice a week	28%	40%	38%	32%
		Once or twice a month	9%	23%	20%	21%
		Never or almost never	9%	16%	18%	21%
	I talk about my schoolwork with my parents	Every day or almost every day*	51%	19%	22%	20%
		Once or twice a week	30%	36%	33%	28%
		Once or twice a month	10%	28%	22%	25%
		Never or almost never	9%	17%	23%	28%
	My parents make sure that I set aside time for my homework	Every day or almost every day*	61%	8%	41%	36%
		Once or twice a week	23%	18%	29%	21%
		Once or twice a month	7%	22%	14%	15%
		Never or almost never	8%	52%	16%	28%
My parents check if I do my homework	Every day or almost every day*	32%	15%	19%	26%	
	Once or twice a week	29%	22%	23%	17%	
	Once or twice a month	12%	21%	16%	14%	
	Never or almost never	27%	43%	41%	43%	
Level 2 Variables	Discipline and Safety	No problem	24%	36%	50%	64%
		Fever problem	49%	52%	50%	35%

	Lots of problem	26%	11%	0%	1%
School Composition by Student Economical Background	Disadvantages	61%	29%	13%	13%
	Neither Affluent nor disadvantages	25%	51%	61%	68%
	Affluent	14%	20%	26%	19%

* Reference category

As it can be seen in Table 1, there was no significant difference within country in terms of the percentage of mathematics success. While the rates of computer, internet and study desk possession in top performer countries were between 88% and 99%, they were between 46% and 66% in Turkey. We put emphasize on students' own study place and instruments of information technology since the proportions of not having these variables are much lower in Turkey compared to other countries. In addition, Turkish parents were interested about their children's schoolwork every day or almost every day. In general, most of Turkish students felt unsafe at school and had lower socioeconomic families than other countries.

Based on TIMSS 2011 dataset, the following research hypotheses were tested through the use of multilevel logistic regression model:

1. Male students outperform female students in mathematics achievement.
2. The possession of computer was a factor that increase students' mathematics achievement.
3. The possession of internet was a factor that increase students' mathematics achievement.
4. The possession of study desk was a factor that increase students' mathematics achievement.
5. The higher rate of parents interest in students' schoolwork, the higher their score in mathematics.
6. Students who feel safe in school were more successful in mathematics.
7. Students from higher socioeconomic status families achieved a higher score in mathematics than others.

Table 2 presented the results of multilevel logistic regression analysis for each country.

Gender difference had a statistically significant effect on mathematics success in all countries, except Chinese Taipei. It was shown that boys outperformed girls in Turkey, Republic of Korea and Singapore. Besides, the largest difference between two genders was in favor of girls in Turkey. Boys were about 1.32 ($e^{0.2781}$), 1.27 ($e^{0.2386}$) and 1.18 ($e^{0.1680}$) times greater than girls in mathematics success in Turkey, Republic of Korea and Singapore, respectively. Also, it was stated that gender variable was a positive influence on students' mathematics achievement in the literature (Ayalon and Livneh, 2013; Else-Quest, Hyde and Linn, 2010). In fact, this study was consistent with previous studies.

Although computer possession of students in Republic of Korea had the highest percentage among all countries, it had a negative impact (2.25 times lower) on mathematics achievement unlike the other countries. Furthermore, the possession of internet had a significantly positive effect (about 4.5 times higher than non-internet users) on mathematics achievement in Republic of Korea. These results were shown that students from Republic of Korea use internet for schoolwork, but they do not use their computer just for internet. They probably use it for playing games, listening music etc. Although the possession of computer has a positive impact on mathematics success in all countries, except Republic of Korea, the possession of internet had not statistically significant impact on mathematics achievement in Chinese Taipei.

Study desk was one of the most important factor that affecting mathematics achievement for all countries. Students who have an own study desk were about 1.7, 2.3, 2.1 and 1.3 times greater than others in mathematics achievement in Turkey, Republic of Korea, Singapore and Chinese Taipei, respectively. Consequently, the most important student background factors were found to be the possession of computer in Singapore and Chinese Taipei, in Turkey it was study desk, in Republic of Korea it was internet.

Parents attitudes towards children about schoolwork were taken into consideration in this study. It was composed of four attributes: to ask what he/she learnt at school, to talk about schoolwork, to make sure that he/she set aside time for homework and to check if he/she did his/her homework. As it was seen that parents behaviour separated into two basic attributes which were about schoolwork and homework.

In Turkey, most of the parents were asked their children what they learnt in school, but it was not an important role in mathematics achievement. However, students whose parents talk about schoolwork everyday or almost everyday, were more successful than others. In other countries, asking what children learn and talking about schoolwork had statistically significant effect on mathematics achievement. In Republic of Korea and Chinese Taipei, students whose parents ask what they learn at school everyday, were more successful than other students. On the other hand, the parents frequently asked what they learn at school has a negative effect on the mathematics achievement of students in Singapore.

Parents attitudes towards children's schoolwork and homework were other issues in mathematics achievement. Children behaviour was different from country by country in these issues. For example, the frequency of making sure that children set aside time for their homework was not important factor for achievement in Republic of Korea and Chinese Taipei, but it was important for students from Turkey and Singapore. Another issue was to check their students if homework was done. Turkish and Singaporean students whose parents check if they did their homework everyday, had lower score in mathematics than other students. However, in Republic of Korea and Chinese Taipei, students whose parents did not frequently check if they did their homework, were more successful than other students.

Mathematics scores were also associated with school climate. There was evidence for a negative effect between achievement and school safety (Thomson, Hillman and Wernert, 2012). Moreover, students who feel safe at school from Turkey and Singapore were more successful than others. In this study, discipline and safety of school and school composition by student economical background were tested whether they had a statistically significant effect on mathematics achievement. For all countries, students from higher socioeconomic status families achieved a higher score in mathematics than others (Kılıç, Çene and Demir, 2013).

The intraclass correlation coefficient is (ICC) an indicator of between-group heterogeneity or within-group homogeneity. It represents the proportion of group-level variance in total variance. The estimated ICC can be used to evaluate between group heterogeneity in multilevel logistic regression models. This coefficient is similar to Pearson correlation which is used to measure the association of two variables.

The variability in mathematics achievement by eighth graders was modelled as a function of student- and school-level factors in four countries. In Turkey dataset, we can see that the school level variance estimate was 0,642 and for the logistic regression model, the student level variance component was $\pi^2/3=3,289$. The intraclass correlation coefficient was $0,642/0,642+3,289=0,1633$. This percentage of the variability in mathematics achievement was accounted for by the school-level differences and remaining variation was at the student level. It showed a moderately large between-school heterogeneity or within-school homogeneity and the variance of the school level was statistically significant. Thus the multilevel model should be applied to this data (Wang, Xie and Fisher, 2011). The school-level variability of total variability was about 37,79%, 1,89% and 14,25% in Singapore, Republic of Korea and Chinese Taipei, respectively.

4. Conclusions

Our results show that this study may open a new angle in the investigation of gender inequality, students' background and parents attitudes toward children in mathematics achievement. Moreover, it was revealed that there were some factors affect mathematics achievement in a negative way such as internet and computer use, socio economic and cultural status in Turkey. Also it was showed that similiar factors affected students' achievement for all countries, so Turkey should create better strategies which were used to increase the performance of education system. There should be more studies for future comparative study on students' background and parents' attitude towards their children in mathematics achievement.

Abstract

This paper displays a panorama of diverse parenting education models used internationally. The paper reviews these parenting education models by using a general analysis framework: 'Intentions Mediations Tools Effects' (IMTE) designed by Sellenet & Weil-Barais (2008). This framework, which we describe in detail in our paper, has allowed us to make comparative analysis of the parenting education models we present here. We conclude the paper with a synopsis of different aspects of each parenting education model in relation to the analysis framework we have used. In this final section, we also discuss the normativity issue in educational programs in general.

Keywords: children, parenting education, educational programs, intervention models, parents

1. Parenting education: A recent development which has an ancient history

It has been widely accepted that the family milieu plays a significant role in children's development (see the synthesis offered by Pourtois & Desmet, 1989; Montandon & Sapru, 2002). In psychology, the ecological theories of development (e.g. Bronfenbrenner, 1986) have placed emphasis on the role played by the microsystem which is composed of persons who take care of the child, as well as the interaction of this microsystem with other systems in which it is situated. It has been demonstrated that the way in which parents exercise their roles has an impact on the child's development and his/her school success (Tazouti, Flieller & Vrignaud, 2005 ; Dearing et al., 2006 ; Lahaye, Pourtois & Desmet, 2007 ; Spoth, Randall & Shin, 2008).

A great deal of research has attempted to identify characteristics of different intervention methods and approaches used by parents that induce favorable child development not only at physical, but also at cognitive, emotional and social levels (e.g. Barocas et al. 1991; Steinberg et al., 1992; Martin, Ryan, & Brooks-Gunn, 2007). The idea of training parents explicitly by using '*best practices*' emerged in the United States in the 1970s. These parenting practices were based on scientific observation and stressed that certain types of parenting practices were more favorable for child development. The concepts of parenting and parenting education took shape in this particular context during a period when behaviorism reigned supreme. This theoretical framework, which employed stimulation and reinforcement methods through which children were used as subjects, was severely criticized and called into question. It was during this period that the term "program" referring to parenting education practices came into use.

Although initially parenting education programs concerned mainly 'at risk' families, today the interest in parenting education programs is widespread on a global scale (Pourtois & Desmet, 1997). This growing interest

is related to the bewilderment that today's human societies are experiencing, and it is the consequence of the internationalization of communication and technological developments. In the face of emerging and evolving situations, families often feel helpless and their immediate environments do not always offer models to provide them with satisfactory answers. Moreover, internationalization asserts some values that are perceived as righteous (e.g. gender equality, respect for the child etc.) and societies adapt to reconcile new ways of thinking. At present, parenting education programs seem to be the remedy to these individual or societal changes and demands. Today, as well as answering some common needs concerning all families, parenting education programs aim to respond to the specific needs of disabled children, intellectually-gifted children, children with behavioral disorders, and children with specific diseases, without excluding the needs of families with abusive, deficient or pathogenic parents.

A range of terms is used to refer to this field of social practices which aim to optimize conditions for the healthy development of children through the involvement and interventions of parents. In France, Pourtois (1984) and Terrisse (1997) introduced the term 'Parenting Education' (*Fr. Education Parental*). Durning (1995), alternatively, suggested the term 'Parenting Training' (*Fr. Formation Parental*). We opted for the term 'Parenting Awareness' (*Fr. Sensibilization Parental*) considering parenting support practices as a means of raising awareness in parents rather than educating them in something they are capable of doing on their own using their own personal skills and resources (Ailincai & Weil-Barais, 2006).

The disparities in terminology are in fact due to diverse intentions (objectives) such as: a) to help parents to fulfill their educational potential by developing a sense of competence and by making best use of the resources in their environment (Terrisse, 1997); b) to increase awareness of parents by improving their ability to understand; c) to help parents acquire know-how skills; d) to anticipate consequences of parental behavior (Durning, 1995) and so forth. These terms also refer to quite different conceptualizations. Indeed this field of practice is situated in the tension between training and self-development that requires an active involvement of participants in their development and does not only refer to the actions exercised by trainers/educators.

The situation concerning parenting education in France is particular. Unlike the North American context, French universities have scarcely invested in practices in social sciences, thus research in this area is not well-established. In addition, the notion of the parenting education 'program', which is widespread in English-speaking countries, is not well received in France. The concept of 'parenting education program' is often associated with the idea of deficiency in parenting skills and normative ideas in educational practices. In France, parenting education exists in rather singular forms as part of association activities such as the *École des Parents et des Éducateurs* and the *Maison Verte* (Mozère, 2000).

Initially, the assessment of the impact of parenting education programs was rather holistic. Today, assessment procedures are replaced by studies that aim to identify factors influencing the effectiveness of such programs, both in terms of intervention practices and the people involved (Cunningham et al., 2000; Sanders & Woolley, 2005; St.Pierre, Ricciuti & Rimdzius, 2005; Webster-Stratton, 2005; Hindman et al., 2008; Mendez, 2010). Today the emphasis is more on the question of identifying factors influencing the quality of these programs. It should be noted that, in addition to technical factors (e.g. duration and frequency of interventions, intervention tools/techniques used etc.), factors inherent in human relations such as mediation are now taken into account (Gross et al., 2003; Pourtois & Desmet, 2004).

2. Description of the IMTE general analysis framework

In this paper, we present an overview of various parenting education models. All of these models, either training or education ones, are viewed under the label "parenting education". Our overview is based on a general analysis framework developed by Sellenet and Weil-Barais (2008) which is called 'Intentions Mediations Tools

Effects' (henceforth IMTE). IMTE is used to describe educational intervention systems by looking into the intentions, the mediation types and tools used and, finally, the effects the interventions have produced (Sellenet & Weil-Barais, 2008).

2.1. Intentions

The initial intentions of parenting education program designers are manifold: to inform (e.g. about child development, intra-family conflicts, family assistance, etc.); to prevent problems (e.g. bedwetting, eating disorders, aggression, learning disabilities etc.); to prevent risk behavior (e.g. addiction and drug abuse); to help parents cope with difficulties (e.g. especially in the case of atypical children); to support parents in parental duties; to improve family relationships or to modify parenting behavior (e.g. especially in the case of abusive parents).

For the last decade, 'change' in parenting education has constituted the key element. The issue of 'change' was addressed in particular during the sessions of the International Association of Training and Research in Family Education (IATRFE) (2005). This issue, which appeared to be resistance to change on the part of parents, prompted researchers to wonder about the real needs of parents and the type of support they might need (Pourtois & Desmet, 1997).

2.2. Mediation

Mediation refers to the strategies and human resources deployed to achieve intentions. The concept of mediation used in parenting education presumes that consideration be given to parents (e.g. their views, intentions, expectations, interests, values etc.). That is to say, there is a preliminary negotiation of the objectives and the means to achieve them, which was not intended in the programs inspired by behaviorism. In fact, mediation is a suitable concept to describe an intervention method which grants a central place to the participants (to the actors) and bases its interventions on the quality of interactions.

The parenting education models that we have consulted use many different forms of mediation such as: home visits by trained professionals during which parents are invited to explain and discuss their problems in order to find a solution; meetings with more experienced parents; discussion sessions between parents in the presence of a facilitator; role plays; educational games and so forth.

Besides these presential types of mediation, there are also mediation forms at a distance such as call services, television series on parenting and so forth. Since the arrival of the Internet, innovative forms of mediation have also been developed (e.g. online chats, discussion forums, training platforms etc.). Through these tools, parents have developed different forms of mediation initiated by, and used, among parents themselves. The creation of these parent-initiated forms of mediation suggests that parenting education is eluding the influence of institutions.

2.3. Tools

Tools relate to materials and material means that are used in training. Today, there are diverse forms of tools that continue to increase with the onset of the Information and Communication Technologies in Education (ICTE). In addition to traditional written materials (e.g. informational texts, tip sheets or exercises, case reports with their resolutions etc.), drawings, comic strips and films featuring different situations are also used as tools. CD-ROMs have also been developed with hyperlinks allowing users to move back and forth between consultation of explicit situations with pictures, explanations or advice.

2.4. Effects

The effects refer to the outcome obtained from the parenting education intervention. In general, the effects of parenting education interventions are assessed in relation to the original intentions, although there is not necessarily a one to one relationship between the two. For example, facilitators generally expect to see from the effects a change in parents' experiences and their ability to act in an appropriate way. What questions the levers of change, however, is that evaluations suggest that parents can learn without changing their behavior.

In general, the specification of the expected effects at the planning stage is at the heart of the evaluation process of parenting education interventions. Identifying indicators of these effects is essential, however not to the extent of influencing the practices themselves, which is always a risk in education. Indeed, the best way to obtain something is not always to require it, since demanding it could provoke resistance from the participants who might feel deprived of their free will, or even feel their personal identity and culture is being attacked (e.g. especially in the case of parents with different cultural backgrounds).

3. Characterizations of some parenting education models

The parenting education models we present here differ from one another depending on: a) the type of parent commitment (i.e. voluntary, incentive, imposition); b) the child's age (i.e. perinatal period, infancy, childhood, adolescence) and c) the child's particularities (i.e. typical children or children with sensory or mental disabilities, gifted children, etc.). We believe that using an analysis framework to present parenting education models would be enlightening, since relevant literature does not provide us with an explicit description of standards that could be used in analyzing such programs.

As we noted in the introduction, parenting education models are numerous. In our presentation, we have made a review of research studies retaining only the studies that: a) are the most cited and most known to French scholars; b) have worked at a relatively large scale and have undergone external evaluation; and c) respect cultural diversity in so far as possible. These selection criteria have excluded programs that are under construction and without validation. We also excluded practices that have not been the object of research. In this paper, we have presented the parenting education models in chronological order in order to facilitate the identification of their evolution.

3.1. Parent Management Training Oregon Model - PMTO

The Parent Management Training Oregon (PMTO) model was introduced by Gerald Patterson and his colleagues at the Oregon Social Learning Center (OSLC) (Patterson, Cobb & Ray, 1973; Patterson, 1976, 2005). The PMTO model has been supported by more than thirty years of research on families with children and adolescents with severe conduct problems. The model uses clinical approaches and aims to prevent behavioral problems in children by enhancing knowledge, skills and confidence of parents.

Patterson and his colleagues identified five key parenting skills that have a positive impact on improving children's conduct problems:

- Encouragement: parents teach children new behaviors through the use of praise and incentives (not punishment);
- Limit setting: parents respond to the child's negative behavior by setting limits without having recourse to physical interventions;
- Monitoring and supervision: parents check the impact of their intervention on their child's behavior (at home and outside the home);
- Family problem solving: parents ensure that decisions are taken collectively, within the family;
- Positive parent involvement: parents give their children positive attention, genuine interest and caring.

The PMTO program interventions are aimed at helping parents with children between 3 to 18 years of age to build skills through the use of diverse activities (e.g. problem solving, role play, discussion activities etc.) (see Table 1). This model is based on the idea that parents present reference models for their children. Therefore the interventions in this model are designed to teach parents positive attitudes and behavior (e.g. not to smoke, to respond calmly, to observe before acting, not to hit etc.) that children are likely to imitate. The emphasis is put on the importance of the educational contract that regulates parent-child relationships. The solution proposed to problems assumes the consideration of such a contract, therefore helping its improvement. This program and the ideas underlying it were sources of inspiration for other major programs.

Table 1. Analysis of PMTO using IMTE

		Intentions	Mediation	Tools	Effects

http://www.oslc.org					

3.2. Positive Parenting Program (Triple P)

The Positive Parenting Program (Triple P) was developed in Australia by Matt Sanders 25 years ago. The model has since been implemented in a dozen countries around the world and is now recognized internationally. This parenting skills learning program is designed to: 1) help parents learn effective management strategies to deal with diverse problems concerning the development and behavior of their children from early childhood to adolescence; 2) help parents learn new ways of interacting with their children and expressing their thoughts and feelings; 3) promote positive interactive routines that help children learn and help reduce parental stress.

The approach consists of improving parents' knowledge and skills so that they are able to better address the needs of their children and increase their confidence in their parenting skills. The intervention method used in this model draws on behavioral techniques. The approach is both explicit and practical enabling the effective management of problems encountered with children.

The Triple P model assumes that differing needs of parents necessitate different methods of assistance with varying degrees of intensity (Sanders et al, 2000). The program is based on a multi-level framework, which incorporates five levels of intervention of increasing strength (see Table 2). The interventions are implemented in a progressive intensity depending on the nature of the problem addressed. Thus, depending on the level, intervention strategies can range from provision of information (e.g. via tip sheets, videos and media-based parenting information etc.), to targeted interventions conducted by professionals who already have contact with families (e.g. public health nurses, childcare personnel, practitioners and home visitors). Interventions can also

vary from a simple information session (e.g. a briefing) to participation in a community program. The highest level of intervention provides intensive parent training which includes problem-solving activities and discussions related to particular difficulties encountered within the family (e.g. parental conflict, depression, violence, stress, etc.). Families can enter the Triple P system at any level. Upon completion of a particular level, they are not required to move on to a subsequent level.

Triple P draws upon diverse theories such as social learning, cognitive-behavioral theory and theories of development. The model also draws upon research conducted on risk and protective factors associated with the development of behavioral problems in children. According to the proponents of this program, parents' ability to use the techniques taught at the onset of problems in children would guarantee the effectiveness of the program which has indeed been demonstrated through twenty-five years of research and evaluation (Sanders, 2003; Sanders, Markie-Dadds & Turner, 2003; Matsumoto, Sofronoff & Sanders, 2010). In France, the *Parasole* association offers training for parents and professionals using Triple P.

Table 2. Analysis of Triple P using IMTE

	Intentions	Mediation	Tools	Effects
Positive Parenting Program, Sanders, 1980, Australia www.triplep.net	Level 1: Informing parents about resources available to help them in their role as parents; encouraging parents to participate in prevention of developmental disorders of the child and to join a training program	Instrumented mediation (e.g. information campaigns on parenting, radio broadcasts etc.) and human mediation (e.g. telephone conversations etc.)	Television, print, electronic mailing, telephoning	Program membership
	Level 2: Preparing parents to cope with daily problems (e.g. eating problems, toilet training, bedtime problems etc.)	Human mediation [e.g. group seminars; individual consultations (20 minutes) by phone or face to face with a clinician etc.].	tip sheets, videos, leaflets	Improvement of parenting skills (e.g. solving everyday problems etc.)
	Level 3: Preparing parents to deal with specific problems (e.g. anger, rivalry among children etc.)	Human mediation (e.g. consultation with practitioners, telephone counseling, monitoring the evolution of the family etc.)	tip sheets, videos	Improvement of parenting skills (e.g. solving specific problems etc.)
	Level 4: Preparing parents to deal with behavioral problems (e.g. aggression, rejection etc.)	Human mediation (e.g. individual and collective - observation and reflection on parenting, written self-assessment etc.)	Videos, written documents	Improvement of parenting skills and maintenance of parental motivation
	Level 5: Supporting families whose children have behavioral problems caused by dysfunctional family situation (e.g. parental depression, parental stress and parental conflict etc.)	Face-to-face human mediation (e.g. therapeutic interaction, analysis of progress, discussions etc)	Written documents	Improvement of the ability to manage mood swings and stress; obtaining spouse support (e.g. for parents at risk of abusing their children)

3.3. *The Incredible Years: Parents and Children Training Series*

The Incredible Years is a comprehensive program developed by Carolyn Webster-Stratton (1981) for parents and teachers. The program has been translated into several languages and used in different countries (e.g. Korea, New Zealand, Great Britain and Norway). It aims to develop and strengthen parenting skills so that parents are able to understand their children and deal with their conduct problems (from birth to adolescence). Interventions are guided by a conception of development that emphasizes the important role of risk and protective factors related to people and their environment in a systemic perspective.

The training of parents consists of a series of interventions that focus on strengthening parenting skills (e.g. monitoring, positive discipline, confidence etc.). Real life situations are used to help parents acquire socially-acceptable parenting behavior (e.g. setting limits verbally rather than spanking etc.).

The program consists of sub-groups which are organized according to the age of children: infants and toddlers (0-3 years), early childhood/preschool (3-6 years), school age (6-12 years), advanced parent program and parenting training focusing on children's education (4-12 years) (see Table 3).

According to the research conducted by the Webster-Stratton research team, young children with high rates of aggressive behavior are at greater risk of conduct problems such as dropout, delinquency, substance abuse and violence. This is why the main goal of parenting training is to prevent and reduce the frequency of aggressive behavior and opposition. By way of example, we indicate some short-term goals regarding parenting skills:

- Improve the quality of care provided to children;
- Reduce physical and verbal violence towards children;
- Improve communicative and emotion management skills of parents ;
- Increase family involvement in educational networks;
- Help parents and teachers work together to improve educational settings;
- Increase parents' involvement in their children's education;
- Reinforce appropriate behaviors and social skills through games (e.g. taking turns, sharing, supporting, complimenting, etc.).
- Teach strategies of self-control;
- Increase the capacity to recognize, monitor and communicate emotions;
- Stimulate academic achievement, reading and interest in school;
- Reduce inappropriate behavior (e.g. expressions of contempt, aggressive behavior, peer rejection, bullying, stealing, lying, etc.)
- Increase self-esteem and self-confidence.

Each series in the program includes a variety of tools such as a huge handbook containing an assortment of situations that provide parents with examples and advice with the help of videos showing parenting skills that are favorable for child development, tip sheets and discussion materials, stickers, refrigerator notes mentioning things not to forget, posters with the program structure and target skills.

Parents involved in the Incredible Years programs are grouped according to the age level of their children and take part in group-work activities which help parents exchange ideas and participate in discussions in the presence of an expert. The expert ensures that parents are attentive to the know-how necessary for the proper development of their child (e.g. providing the child with physical, tactile and visual stimulation). The development of parents' know-how skills is guaranteed by exercises and activities of increasing complexity. The progress in the program depends on the successful completion of these activities and a particular emphasis is

given to the observation of the children's behavior. The aspects related to sociability as well as self-control are valued from the perspective of social welfare and personal development.

Table 3. Analysis of The Incredible Years using IMTE

	Intentions	Mediation	Tools	Effects
Incredible Years, Webster-Stratton, 1981, USA http://www.incredibleyears.com	Basic Training: Babies and very young children (0-3 years). Getting to know your baby ; understanding how to help babies feel loved and secure ; understanding how to encourage baby's development	Human mediation both collective (e.g. group work, brainstorming, debates etc.) and individual (e.g. home visits)	Books, DVDs, conversation card games, manuals, posters, tip cards, stickers etc.	Positive change in the quality of relationships between parent - child and children with their peers.
	Basic Training: Early childhood (3-6 years)			
	Establishing rules and promoting accountability; learning to manage misbehavior; helping children learn to calm and self-control etc.	Instrumented mediation (e.g. DVDs, conversation card games, manuals, posters, tip cards, stickers etc.).		
	Basic training: School age (6-12yrs). Using praise incentives effectively; Introducing rules and routines and promoting responsibilities			
	Advanced Training: (4-12 years). Improving interpersonal and problem solving skills; managing anger; giving and getting help			

3.4. *Helping the Noncompliant Child - HNC*

Helping the Noncompliant Child - HNC is a program designed and developed in 1993 by Robert McMahon and Rex Forehand (2003) in the United States (see Table 4). The program concerns parents and their 3-8 year old children with non-compliance and/or conduct problems. The long-term objectives of the program are to prevent juvenile delinquency problems resulting from adaptation problems at school. The short-term and intermediary objectives are to: 1) help parents modify their parenting styles in order to break out of coercive parenting styles and adopt practices based on negotiation (e.g. prosocial interaction); 2) improve parenting skills; 3) increase children's prosocial behaviors and reduce conduct problem.

Each program is composed of about ten sessions. Sessions are conducted with individual families. Both parents and children participate in these 60 to 90-minute weekly sessions in the presence of an expert or two who are educated in psychology. The presence of experts allows the effective implementation of role-play activities (e.g. one expert plays the parent's role, while the other expert the child's). Through these sessions, at the beginning, the know-how parenting skills are explicitly taught from demonstrations and role plays and later by using direct practice in real situations with the child at home.

The evaluation criteria for the short-term objectives of the program concern assessment of know-how practices within the family milieu. The evaluation criteria for intermediary and long-term objectives (with the help of longitudinal studies which can last between 2 months to 14 years after the intervention ends) concern the assessment of the transfer and the use of the mother's acquired parenting skills with her other children, the child's self-esteem, school learning, and parent-child relations. Using these abovementioned indicators, different aspects of the concerned person's development are assessed.

Table 4. Analysis of HNC using IMTE

	Intentions	Mediation	Tools	Effects
Helping the Noncompliant Child), McMahon & Forehand, 1981, USA	Establishing positive prosocial interactive styles ; Improving parenting skills	Human mediation (e.g. parent-child interaction mediated by one or two facilitators, games, monitoring progress etc.)	Video cassette, trainer's manual, books for parents	Decreased conduct disorders in children; Parents' improved perception of their children

3.5. Parenting Wisely

Parenting Wisely is a self-administered parenting education program. Computer based activities (e.g. DVDs, CDs, CD-ROMs and online applications) are used interactively to train parents. Donald A. Gordon (1979, 1998) originally designed and used the program in the United States (see Table 5). The Parenting Wisely program concerns mainly socially deprived and at risk families who have children from 9 to 18 years of age. Most of these families do not ask for any mental health therapy or parenting education programs to treat their children's conduct problems. A version of the program also offers parenting education for parents with young children (from the ages of 3 to 9).

This program was translated into French, adapted and distributed in Quebec and in France (both the manual and CD-ROM) under the name '*Etre Parent Aujourd'hui*' (Eng. Parenting Today) (Gordon, Terrisse & Pithon, 2003). The program offers parenting training on parent-child interactions with the solutions to problems with the help of an interactive CD/DVD with comprehensive critiques and explanations. The information included in the CD/DVD aims to help parents understand the advantages and disadvantages of permissive and authoritarian parenting styles. The message is to find the balance between the two parenting styles. The program draws on 'constructivist' theories and aims to help parents learn about the skills to develop in their children. The CD focuses on three general components that are postulated to help develop parenting skills:

- 'Knowledge' on the psychological development of children and the adolescents;
- 'Know-how' skills on how to act and solve problems in specific situations, due in part to this knowledge, but also out of habit. The skills learned are: how to assign responsibilities at home to each member of the family; how to effectively implement discipline avoiding repeated shouts and threats; how to develop educational contracts (from preadolescence) through which the child learns to express, negotiate and defend his interests while agreeing to the 'fact rules' designed with all members of the family;
- 'Being-skills' such as 'acceptance' of children, understanding and 'active listening' to the other.

Each component of parenting skills is illustrated using short video extracts of films that serve as examples. Basic definitions are given in a glossary. Parents and teachers are provided with hyperlinks to have quick access to different sections. Practical training exercises are also provided to assess the acquisition and application of these skills.

The theoretical viewpoints that influenced the creation of this parenting training CD are as follows: Social learning theories (Patterson, 1986; Mahoney and Patterson, 1992; Bandura, 1997); cognitive-behavioral theories developed by Beck (1976), Alexander and Parsons (1973); and current systemic that emphasizes the importance of relationships within and outside the family (Minuchin, 1974).

Studies conducted in the United States on the effects of this program have shown that the parents were satisfied that their knowledge of basic educational principles had improved. Furthermore, they maintained that they had more control on their parenting skills and could implement these skills in problematic family situations.

	Intentions	Mediation	Tools	Effects
Parenting Wisely, Gordon, 1998, USA	Improving knowledge, know-how skills and know how to be of parents and children (e.g. attitudes and ability to adapt new situations etc.)	Human mediation (e.g. interviews, role-playing, coaching etc.) and instrumented mediation (e.g. problem solving, performing exercises using tools etc.)	CD-ROMs, films, questionnaires	Improvement of parenting skills, mental state of the mothers, and intra-family relations (e.g. reduced conflicts and domestic violence), and child behavior (e.g. reduced criminal acts)

3.6. Krousar

The Krousar parenting education program was designed and developed in Cambodia by the E & D team (Child and Child Development) and the association Krousar Yoeng (created in 2002). The project was set up at the request of the Cambodian Government following a preliminary investigation into the "practices, beliefs, and values concerning parenting of young children in Cambodia". Parenting education was a new theme in a country that had experienced a destructive dictatorship. The preliminary investigations revealed that Cambodian parents suffered greatly from a lack of healthy parenting models that they could identify themselves with. In Cambodia, most adults between 25 and 35 years of age witnessed the destruction of their own family during the years of the Pol Pot regime. Therefore, they had difficulties in fulfilling the healthy parenting roles that are primordial in their children's education. In addition, the economic difficulties families were facing contributed to the weakening of the family milieu.

TV, as mass media, was selected as the main means to raise awareness in parenting skills (see Table 6). For this purpose, a television series entitled Krousar (meaning family), which depicted the parent-child relationship in a contemporary Cambodian family setting, was produced. Trained facilitators, through the distribution of the videotapes of the Krousar TV series and the use of role-playing, family debates and so forth, implemented parenting education in all Cambodian villages. The E&D project (2004) noted that television was a perfect tool which could reach a broad audience. It was also a perfect tool for transmission of norms and model behaviors and addressing various concerns without shocking parents in Cambodia. The topics covered took parents' beliefs and values into account concerning child rearing. The following are examples of some of the topics covered:

- parent-child relationships, parenting roles and attitudes;
- development and needs of the child (health care and hygiene, early intervention, early childhood developmental needs) and nutrition;
- behavioral control, discipline, parent-child communication;
- importance of play and everyday learning.

The "Krousar" series mobilized families around a common interest, the well-being of their children, and enabled exchanges and discussions in distant villages and between other communities in Cambodia. With the project entitled "Parenting and mothering support in rural areas of Cambodia," group sessions, along with more individualized support through home visits, were implemented. These individualized support activities were sometimes in the form of role-plays, card games and/or toy-making workshops. The project involved 106 facilitators and 847 families and continued in 2004 with rebroadcasting of the "Krousar" television series. In this phase, new activities and discussions between facilitators and families were introduced.

Krousar, 2002, Cambodia	Promoting physical, psychological and moral development of children in Cambodia	Human mediation (e.g. discussion, role play, home visits) and instrumented mediation (e.g. watching movies)	Television series, games	Creation of a dynamic community around children, improvement of school success of young children and parenting skills of mothers

3.7. Parenting Awareness Model (PAM)

PAM is an intensive one-session intervention which was designed to sensitize ordinary volunteer parents in the context of doctoral research carried out by Rodica Ailincăi (2005). The initial model was implemented and evaluated in the context of a science museum, *Cité des Sciences et de l'Industrie (CSI)*, in Paris.

Overall, this model is designed for parents who supervise their young children in the discovery of knowledge. It aims to help parents assess their supervision practices and let these evolve according to the needs of the child. Initially, PAM intended to sensitize parents towards the use of most favorable behavior in the discovery of scientific knowledge in a science museum (PAM--science museum setting/science learning). Subsequently, the model was used in French Guiana. In French Guiana, the model was adapted to a home setting where parents helped their children do their homework (PAM--home setting/school content knowledge). Currently, PAM is used in French Polynesia to sensitize parents to support their children in learning the Tahitian language (PAM—Home setting/language learning).

What characterizes PAM is its effectiveness and strong impact on initiating behavior-change in parents in a very short period of time (an hour approximately). This one-hour session consists of moments of watching some short films of one-to-two minutes each (between two and five short films), followed by a panel discussion for about 50 minutes.

The discussions are organized by a facilitator and focus on parenting supervision practices viewed in films, which contrast greatly in terms of the parenting intervention styles used. The films were inspired by the actual parenting practices of the parents involved in these sessions (who were observed prior to the parenting education sessions) and the films were produced by using professional actors/actresses.

The educational challenge is to make parents aware of their own behavior with their children and to make them observe the influence their behaviors have on the actions of their children. In order to help parents identify the most effective intervention style based on the objective they have, discussions are oriented towards the analysis of non-verbal actions and verbal reactions of the children. This intervention model is based on the interactionist theory (Vygotsky, 1985; Bruner, 1983), cognitive-behavioral theory (Beck, 1976), eco-systemic theory (Bronfenbrenner, 1979) and social learning theory (Bandura, 1980).

Table 7. Analysis of PAM using IMTE

	Intentions	Mediation	Tools	Effects
General characteristics	Modifying the forms of supervision	Discussion between parents organized by a facilitator Duration: 1 h Group size: 5-10 people	Films with typical interaction sequences	Improved awareness of the importance of parental supervision and the relationship between the parent's behavior and the child's reaction; Decreased directive approach; Improved quality of exchanges (joint attention); Diversification of activities
Specific characteristics	Context - science museum setting /science learning (for children aged 3 to 5 years) - home setting/school content knowledge - home setting/language learning	<u>Principles of the discussion</u> Relationship between parenting and the child's behavior; Non-normativity; Sharing the floor; <u>Procedure:</u> watching a movie to initiate the debate; discussion between parents, mediated by a facilitator; <u>Role of the debate facilitator:</u> differentiation, identification and assessment of the discussion; not allowed to give any opinion or advice; managing turn-taking between the participants	Scenarios designed from existing interactive styles, contrasting (favorable/unfavorable) Duration: 3'20" Characters: actors	EVALUATION of expected effects Comparison of parent-child interactions before and after participation in the discussion session using the following criteria: - Content of dialogic exchanges - Interactive style of parents - Structure of exchanges - Objectives of tasks - Level of distancing
Preliminary studies	Study of 'spontaneous' parent supervision in a science museum exhibition context	Non	Evaluation of films (three contrasting groups)	Identification of interactive styles Development and evaluation of films in terms of their clarity

Different evaluations of PAM have illustrated that the behaviors of the participant parents had a marked evolution and that they adopted more individualized parenting styles after attending the PAM sessions. One of the strengths of PAM is the total absence of normativity in the parenting intervention sessions, which in other contexts proved to have been faced with resistance from parents. The other positive aspect of PAM is the presence of the parents' actual parenting behaviors in the films which helped the parents to identify themselves. The panel discussions helped the parents discover the most favorable parenting intervention style without feeling that they were being judged (even if the parenting behavior they observed in the film was identical to theirs).

4. Summary and discussion

The aim of this article was to present some parenting education models by using a general analysis framework (the IMTE model – Intentions, Mediation, Tools, Effects - Sellenet & Weil-Barais, 2008) in order to identify the general characteristics of each of these models and differentiate between their similarities and differences.

We note that in these models the intentions, although very different, are usually quite well defined. The theoretical foundations used in these models are diverse. They can be pragmatic such as in the 'Helping the

Noncompliant Child' model which is based on the analysis of the relationship between parents' parenting styles and the aggressive behavior in children. Parenting education models may also be based on ideological and moral grounds such as respect for others, equality, democracy and so forth. They can also have foundations in which they integrate cognitive and epistemological dimension as in PAM.

All (of the aforementioned) parenting intervention models more or less include a mediation instrument, although its nature and the specific methods of intervention are not always explained explicitly. The specification of the expected effects in operational terms is what is most lacking in the program descriptions of the aforementioned parenting education models. However, this specification is essential to evaluate the methods of intervention.

In recent debates in parenting education, the question of the normativity of mediation tools has often been at the center of criticism. During the presentations about PAM, in different congress, researchers were often questioned about the model's normativity (as if norms must necessarily be absent from any form of training). In PAM, the mediation is non-normative. The paradoxical aspect of PAM is that the intentions can be at times normative and non-normative. They can be normative in the sense that the parenting education interventions target parenting supervision skills required in the specific area of knowledge (e.g. science teaching, language teaching etc). They can also be non-normative because the parents have the flexibility to adapt their parenting supervision according to the needs of their children (e.g. parents need to have an analytic point of view to differentiate between different supervision styles and choose the one that they think is the best in their case). In fact, there is no education without norms and standards. From our point of view, the debate would be more explicit if all educators accept that there are norms to follow because education would not be possible without the sharing of norms and standards. Standards differ from one domain/context to another and we believe that such standards should be taken into account. The educational competence of any parent, like any other educator, should be naturally linked to related fields of knowledge and practices. Whatever the field (e.g. sanitary health, nutrition, social relations, reading, science, etc.) there are social and scientific norms. It seems to us that it is the ability of parents to share these norms with their children which lies at the heart of parenting education.

Generally, in the case of education, the key concern is the strategies and tools provided for the individuals so that they can take ownership of the standards. In a totalitarian system, they are imposed and it is recognized that individuals challenge these norms. Democratic systems offer an approach that we have adopted: conflicting information, debate and ultimately singular choices by individuals. From our perspective, it is important that parents volunteer to participate in such parenting education programs and they progress regarding the personal intentions they set for themselves such as to be 'good teachers' so that their children can succeed in society. We believe that it is possible to help parents interact with their children in a favourable way in order to prevent parents from inventing their own methods of parenting which could not always be adapted to their children's needs. In the cases when the parents' methods do not succeed, there is a risk that they withdraw from the relationship with their child.

In our opinion, the aim of parenting education should not be to minimize the creative potential of the parents; on the contrary, it should aim to help them use it better. It should be recognized that today both parents and educators are facing new situations (e.g. change of status and social roles, change in family structures, access to new types of media, etc.), and that society has a role to play in helping parents to educate their children. This comes down to the assumption that education is not a natural process and that it requires specific competence to be incorporated by educators. The informal nature of parenting education does not exclude the need for the acquisition of specific skills. However, there has not yet been research evidence to show a direct correlation between parents' involvement in their children's education and the academic achievement of children (Fan & Chen, 2001).

4th International Conference on New Horizons in Education

Peace project from transdisciplinary dimension

Gabriel Mendoza^{a*}, Blanca Valenzuela^b, Manuela Guillén^c^aUniversity of Sonora, Faculty of Social Sciences, "Hermosillo, Sonora 83177", México^bUniversity of Sonora, Faculty of Social Sciences, "Hermosillo, Sonora 83177", México^cUniversity of Sonora, Faculty of Social Sciences, "Hermosillo, Sonora 83177", México

Abstract

This study deals with the guidelines and events arising from transdisciplinary research proposal confined to a project set within a framework of innovation and change, creator and generator of Peace, from the multiple disciplines considered are noted, the ongoing contributions to field of knowledge and learning in general. Various projects from each of their perspectives have been providing new data that allow us to reflect and bring different contexts and actors, new schemes impregnated for greater understanding and respect. The preliminary initiative arises from the participation of research in the field of intervention. Phase allowed us to refocus research targets at a greater range, originating well, new springs and streams to develop. Well considering the subsequent interaction that would be from the perspective of university academic setting, where it presents the findings and scopes made, as well as, the subsequent stages exhibited from the expansion that the same project of peace contemplates.

Keywords: Peace, transdisciplinary, education, innovation, change.

1. INTRODUCTION

Based on the international stage to approach gradually more immediate contexts, the issue of peace, has been the cornerstone in the development of societies, even though the subject has been treated in a cross, have been in the last decades in that attention to this topic has gained increasing relevance, considering also the posthumous periods of fighting, in which expected so the argument becomes a strong presence.

For authors like Monclús and Saban (1999), based on the recognition that peace is the highest priority for societies and the human race itself. Arguing, the need awareness about planning in general education from the perspective of the search and deepening peace (Monclús, 2008).

* Corresponding author. Tel.: 0152 6621895453.

E-mail address: ingabwetrust@hotmail.com

Delgado (1998) argued that peace to be sustained on principles contained in the universal declarations of Human Rights, which represents the achievement recognition as well reaffirming humanity, and legitimizing their inherent rights as individuals, are shown as a crucial area in the various social structures that make up the community, where it is part of the relationship that lead each of its components such as the education sector, which far from being an isolated organism, is where should consider conducting constants for intervention actions in their environment.

Unesco also from (1997) exposed that to throughout life is necessary to establish a culture of peace and education for citizenship and democracy building and Restated educational content, so that is routed to the promotion of peace based on justice, tolerance, dialogue and negotiation.

Morin Meanwhile, in (2001), said that the peace education is related to the mutual recognition of the human and cultural diversity inherent in all that is human, which in turn can shape an integrated universal culture collectively with aspirations to solve the various challenges from the platform of justice.

So that the spectrum of action, in both conformation and accuracy for that a peace project acquires a greater clarity would be from the transdisciplinary appreciation.

In this perspective, peace education should not be limited only to the academic or institutional scheme, but rather in a broader sense in which society could converge person and the constant global development.

1.1 Conceptions of peace in the global context.

As part of the primary initiatives could highlight the global institutional conformation of the United Nations specialized agency for education Scientific and Cultural Organization (UNESCO) created at the end of the second world war, as a relevant assimilation and prevention, from the experiential scheme that left the previous interactions of misunderstanding. Emerging well, the promotion of new proposals or alternatives that would meet the differences or events that are eventually present between the nations that made up the overall framework. Thus exposing the strategies and general guidelines which in turn should have the possibility to permeate the bylaws and that made up the various societies, surrendering to the creation of a culture of peace promoter.

In its 28th General Conference, dated in the year 95, UNESCO. It proposes four aspects that would shape the so-called projects aimed at promoting peace from transdisciplinary understanding, which would be comprised of: Education for peace, human rights, democracy, international understanding and tolerance, human rights promotion and of democracy cultural pluralism and intercultural dialogue; prevention and peace building after disengagement.

Conceptions taken from previous resolutions in both assimilation and conceptual redefinition and clarifications statutes and function of the body acting as such, which since 1989 schematized as a definition of peace and respect for life as the most precious of humanity. Referring to the male and female principles of freedom, justice, equality and solidarity (UNESCO, 1989).

Provided so since its formation as an entity of reference in the promotion and fair driving timely action in both social development, for the premises that basic fundamentals unveiled its institutions, would settle in the understanding and recognition of the influence of information in the educational context as assimilation parameters assumed human activity, its attitudinal perspective and presence when self respect and tolerance are in understanding and respect for individual differences among peoples and nations. The powers that emerge from the appreciation in both distinctions, are assumed as fundamental characteristics typical of the species in the course of his historical participation in its various expressions. So that promote understanding and cooperation at the global level would be conforming actors positioned as the principal axes.

Also, the concept of no boundary in terms of promotion and expansion of conforming elements are reflected in the positions, which are based on the permanent educational perspective, as well as his stance of inclusivity and constant reaffirmation, as Mayor in (1996), noted as a critical social work, and distant from the whole structure rigid and inflexible, to the various societies that constitute the global stage, in addition to its ongoing educational design would be for everyone.

1.2 Understanding the concept of Peace.

Based on the concept of education as a process by which human beings are going understanding in communication with other humans (Lopez, 2006). The concept of peace education in addition to its broad heritage (Jares, 1992). This in turn has given his own assimilation pattern of the different historical contexts, socio-cultural, which although has been redesigned according to the specific circumstances of the adjacent epochs, its definition has been taken up in the search transformation of attitudes and actions to establish harmonious relationships based on respect and recognition of human rights, freedom and dignity of each person. Which in turn is intentional and creative consciousness, able to restructure responsibilities that promote human relationships.

In an understanding for peace, begins with being a fundamental aspect of human development and their relationships, as a promoter of affection, respect, and empathy. Based on the rediscovery of the existence of parallel realities, while social systems as a conforming entities in a search and creative proposals accurate and reflective of interaction. From a conceptualization of intentionality that permeates the acquisition and assimilation of harmonic coexistence with specific objectives processing and construction collective and individual awareness, aimed at achieving purposes such as: recognition, development, respect for the rights, freedom, and maintaining coexistence schemes. Purposes which in turn are reflected in previous universal human

rights declarations, stressing an special emphasis on education provision as a way to understand affordable, as seen explicitly stated in the article itself 26 of the universal declaration on human rights, whose guiding principles state:

That education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms shall promote understanding, tolerance and friendship among all nations and all racial or religious groups, and shall further development of the activities of United Nations peacekeeping. (United Nations, 2010).

Everyone has the right to receive an education in peace and human rights, based on any educational system, which achieves help generate social processes based on trust, solidarity and mutual respect, facilitating peaceful solutions to various challenges that contribute alternately to rethink the human relations themselves.

This premise suggests peace education aimed at learning to live together and with others to develop an understanding of others and the perception of interdependence respecting the values of pluralism, mutual understanding and peace (Delors, 1996).

To achieve this platform requires the development of personal skills, the exercise of solidarization, empowerment, hope, autonomy, human love and freedom.

1.3 Significance of education for peace

This will understand the education for peace, as an educational process, ongoing and, according Jares (1992), is based on two concepts, one that would be the positive conception of peace, and other creative perspective of the challenges to be addressed; thus marking as guiding principles the following substrates:

Educating for peace would be a specific way values education. And this in itself carries implicitly the provision of securities, while its relevant coding. Understanding well that peace education presupposes adherence and value proposition to encourage this direction be and live peacefully, attending also the patterns whose statutes would be acting in different directions, which could be appraised from the perspective of creative resolution.

From and action would be the initial conception of the educational aspect of peace, citing attitudinal consistency that can present who participates in the formation and calls to the understanding of these aspects, its applicability and awareness of the general frameworks of peace. Such a comprehensive assimilation possible design would be supported by the active exemplification who would be a promoter.

In this sense, and just to be a concept of permanent application, schemes ordinary celebration and symbolic reference, would be a primal approach, but not a process of complementary, that is, that when posed the peace argument as an institutionalized precept, would be taking only a baseline scheme, which achieves the objectives draftsmen, would handle the shared participation of the participating teams, so that the Education for Peace would be understood as a continuous and permanent application.

Mainstreaming, as a dimension of peace education, we see from a proposal to integrate academic content in different social structures forming exercise their role in global collective understanding that training from the transdisciplinary perspective, the approach that takes in their educational proposals conceptualizations of peace as sensitizers participation bodies, would have greater possibility of extracurricular presence, as indicated Sacristan in (2001) refer to such content that should permeate all methodological and educational activity. Also Villarasa in (1990), warned that more than programs focused rather on the approach established guidelines from this approach could act peace, and from the various disciplines and at all levels and degrees.

As application contexts transdisciplinary understandings and their relationship to the context of global peace, would the reality in which we find ourselves and the distinct and diverse societies that exist on the planet, where the new proposals and underpin challenges to a comprehensive intervention and care, beyond dogmas or starring guidelines, which obstruct one timely and effective progress towards new and unprecedented situations.

Those who would agree with this understanding. Also allow greater insight into the realities manifest in the many existing fields, which in turn in the global from a transdisciplinary vision, the possibilities of action would show more prominence.

Conclusions

In this sense, the transformation object born into the exercise of introspection that is derived from a conscious conceptualization of peace, is aimed at creating an awareness of individual responsibility to the rest of the people who make the different contexts and for the individual, the reconfiguring attitudes, and reaffirm that are in keeping with the dignity proper to be, same that are geared to their independent development, full and grounded in their rights. In this way the peace education would not be exclusively focused on the transmission of knowledge, but in the full impact, which is reflected in the overall understanding multiple perspectives that make the individual, from their perspective of reality and the world surrounding and their own way of life perception and attitude.

In an internal transformation that extends beyond the individual aspect, reaching to the community, from a position of recognition and reconciliation, on an understanding of harmonious and peaceful coexistence, which permeates in its manifestation and life application schemes that build peace a cooperative manner, emotional and caring.

Also presented the approaches of understanding, that arise from the conception of the human being as a being able to modify and transform from their initial presence, his own self-concept, and outlook on life and reality, subsequently, achieving scope of transformation, so shared, besides being part of more complex clusters, and serve as an element of great potential, to encourage such changes, aimed at positive change, and from the very social structures that comprise the collective existence.

Arguments that the emblems outline and propose describing the main statements do this project, from conceptualization to transdisciplinary decoding are achieved, the statutes conforming to a development that has accompanied social participation processes in its different representations as well as multiple territories.

Appearing so that the development of this proposal raises the core axes of research that suggests the joint participation of many academic disciplines. Taking as a first stage involving the university context, from which findings allow us put forward the results oriented to the transdisciplinary integration as strong and coherent argument capable of giving and propose schemes and peaceful interaction in different global contexts structured, in and from peace.

Abstract

The goal of knowledge society is to meet the requirements of global learning needs. The passing from élite to mass education call for innovative solutions and consequently provides educational opportunities to diverse spectrum of students. Higher education institutions have to develop strategic preferences to ensure that the service meets students' needs and expectations. Education institutions should deliver knowledge in a way that enhance teaching and help students to develop to their full potential. In today's competitive environment the service quality is becoming increasingly important. While examining education service quality, many researchers focus on students' experiences, their perceptions of quality and satisfaction.

The aim of the paper is to examine different aspects of quality service impacting students' satisfaction. The results of the empirical analysis indicate that there is a positive correlation between pedagogical approach and technical support on students' satisfaction. The findings provide insights into students' preferences that are closely related to their perceptions of different dimensions of quality which can serve as framework for action plans for quality improvement.

Keywords: higher education; service quality; students' satisfaction.

1. INTRODUCTION

In contemporary competitive environment, educational service quality is considered to be an important factor to attract and retain students. Students seek quality of teaching during their academic development process helping them to gain the full potential to successfully compete in the labour market. Students' satisfaction can be enhanced by high quality performance. Therefore education institutions have become student focused where students' perception of quality influence students' satisfaction and loyalty (Helgesen & Nettet, 2007; Angel, Heffernana, 2008). The literature on service quality in general treats students as active participants of the service delivery therefore perceived quality of the service depends on the extent to which expectations are met (Angel Heffernana, 2008). In this context, students have to perform their participatory role effectively, so desired result can be attained (Telford & Masson, 2005).

The aim of this paper is to examine the perceptions of undergraduate students with regard to the pedagogical and administrative perceived service quality that have the impact on students' satisfaction. The current study focuses on students' perception of quality while measuring quality perception of students of vocational college in Slovenia. The paper consists of introductory part followed by the chapter that deals with the service quality measurement scales within educational context. The core part presents empirical findings. The paper ends with concluding thoughts and proposition for future research agenda.

2. Perceived service quality

Customers' value is something that is perceived by customers and the value that is commonly accepted characteristic. Perceived value is customers' consideration of the utility of a product based on perceptions of what is received for the money paid (Zeithmal, 1988) as well as perceived preference for product attributes and performance in achieving the customer's goals (Woodruff, 1997). Providing superior service quality is considered to be very important strategic direction through which sustainable competitive advantage can be attained. Similarly, since educational service quality scales originate from marketing scales, service quality is the fundamental aspect of educational excellence.

2.1. Educational service quality

The students' perceived value is estimated by focusing on student's learning and education experience and students being co-creators of value. There is a need to focus on student learning which is viewed as "the heart of quality" (Law, 2010). The professors' performance in the class is the most important indicator in the students' development therefore is a significant feature of enhancing students' satisfaction.

Students absorb information differently and learn better when they absorb information in a way that suits their personal learning preferences. Students can be classified according to their particular preferences that define how they perceive and process information (Villaverde, Godoy and Amandi, 2006). The way a learner assimilates information depends on which side of her/his brain predominates (Jacobson, 2001) as it is presented in the table below.

According to experiential learning theory the best learning results can be attained by establishment of different teaching styles that correspond to different students personal learning preferences. Students absorb information differently and learn better when they absorb information in a way that suits their personal preferences (Penger, Tekavčič, Dimovski, 2008). Learning techniques should meet students' needs regarding course design, teaching methods and didactical approach (Rovai and Barnum, 2003; Liao and Wang, 2008).

Table 1. Differences between the two brain functions

Left mode	Right mode
Verbal (using words to describe, define)	Nonverbal (awareness of things, but minimal connection with words)
Rational (concluding based on facts and reason)	Non-rational (not requiring a basis of reasons or facts, willingness to suspend judgement)
Analytic (comprehending step-by-step and part-by-part)	Synthetic (putting things together forming the whole)
Logical (conclusions based on logic)	Intuitive (making leaps of insight, based on incomplete patterns, feelings)
Abstract (taking out a small bit of information and using it to represent the whole)	Analogical (understanding metaphoric relationships and seeing similarities between things)
Temporal (keeping track of time)	Non-temporal (without sense of time)
Linear (thinking in terms of linked ideas, one following another and often leading to a convergent conclusion)	Holistic (seeing whole things all at once and often leading to divergent conclusion).
Symbolic (using symbols to stand for something)	Concrete (relating to things as they are at the present moment).
Digital (using numbers)	Spatial (seeing where things are in relation to other things and how parts go together)

Source: Jacobson, 2001

A holistic theory that identifies learning style differences and experiential learning as a process of constructing knowledge and creating tension among experiencing, reflecting, thinking and acting has been developed (Kolb and Kolb, 2005). By considering the elements of experiential learning theory and the concept of change in learning processes, professors can guide students to improve learning through student centred model of teaching that focuses on supporting students to attain deeper understanding (Butler and Reddy, 2010). To match students' learning style preferences there is a need of a variety of teaching methods and learning strategies and in this way the attention, motivation and confidence in learning can be aroused and consequently students' satisfaction is gained (Liao and Wang, 2008). By knowing and implying diverse learning styles professors can help students retain information, increase self awareness, achieve higher level of thinking, higher level of understanding, and critical thinking, moving beyond memorizing to more meaningful learning, synthesising, analysing, applying knowledge and consequently contributing to their success (Jacobson, 2001).

3. Conceptual model of students' satisfaction

In the literature, a particular approach that is prominent is referred to as a stakeholder approach where various stakeholders' perception of quality is being assessed (Watty, 2005). Most commonly researchers focus is on students that value relative advantage gained while studying (Lagrosen, Sayed-Hashemi & Leitner, 2004). It is asserted that among different stakeholders students' perception of quality is the most relevant (McCuddy, Pirnar & Gingerich, 2008; Yeo, 2008, Gallifa & Batallé, 2010; Reid, 2010, Tsinidou, Georgiannis, Fitsilis, 2010). It is important to develop deeper relationship with the students and gain their feedback (Reid, 2010). Most of the studies while researching education service quality examined students' experiences and their perceptions of quality and satisfaction (Standifird, Pons & Moshavi, 2008; Arambewela & Hall, 2009; Oijako et al, 2011; Teo & Soutar, 2012).

The most frequently used scale for measuring service quality is SERVQUAL. It was developed by Parasuraman in 1988 and was initially used to measure customer perception of service quality in retail and service sector. Definitions of quality measurement were further discussed by Teo and Soutar (2012) and they

developed alternative model to SERVQUAL that is based on Grönroos two-dimensional model measuring service quality proposing technical and functional service quality aspects. Current study is build upon their two-dimensional approach while examining mediated effect of both constructs (“pedagogical aspects” and “technical support”) on “students’ satisfaction” through “word of mouth” as presented in Figure 1.

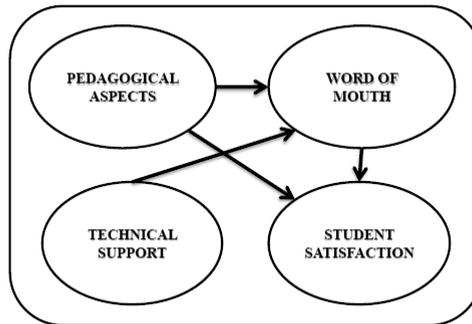

Fig. 1. Student oriented model

»Pedagogical aspects« is a latent variable that expresses the academic staff pedagogical approach that significantly impacts students’ quality perception. Many researchers confirmed “pedagogical aspects” to have the strongest impact on students’ perceptions of quality (Rojas-Méndez et al, 2009).

Also »technical support« is being conceptualized as a latent variable that pertain administrative staff supporting students solving their problems and fulfilling their requirements. While examining service quality regarding technical support we focused on administrative staff being always respectful, delivering prompt service to students, always responding to students’ requests and helping students to solve their problems.

Service quality is generally accepted as the driver of satisfaction and the ultimate outcome is the word of mouth (Pettersson & Spreng, 1997; Cronin, Brady & Hult, 2000; Lam et al, 2004). Word of mouth is person to person communication about product, organization or service that occurs between a sender and a receiver having great influence on customer’s choice (Teo & Soutar, 2012). The quality of service becomes an important factor influencing students’ decision regarding the institution they wish to study at (Bayraktaroglu & Atrek, 2010) therefore students’ satisfaction assessment has become central when setting strategic goals. Students who perceive education quality as very high are more likely to demonstrate more favourable behavioural intentions (Sheu, 2010). Similarly, Arambewela and Hall (2009) emphasise the importance for attaining students’ satisfaction and consequently desired outcome such as “word of mouth”, retention and loyalty. »Word of mouth« is a latent variable that, placed within the student oriented model, indicates students speaking in favour to the education institution.

Students are the most important stakeholders and the goal is to achieve their satisfaction (Wang, 2003). Some researchers argue that students’ satisfaction is an antecedent of service quality (Parasuraman, Berry & Zeithaml, 1988) while others believe that it is service quality that leads to students’ satisfaction (Helgesen & Nettet, 2007; Rojas-Méndez et al, 2009; Sheu, 2010). The current research takes the latter view, that service quality is a precursor of satisfaction, which was confirmed by several authors (Cronin, Brady & Hult, 2000).

4. Research method

In this study qualitative research method was used to test the proposed research model. A survey instrument was prepared to collect the data from students about their perception of service quality. Before the main survey

was performed, a pilot study was applied on students enrolled in vocational college and measured the construct validity of the proposed research model.

The survey comprised of two parts. Firstly, there are demographic questions and the second part consists of 16 five-point Likert-type scale questions aiming to assess four constructs of the proposed research model. A sample consists of 43 males and 65 females. The mean age of the respondents is 24.5 years. These questions are anchored from 1 to 5 where 1 indicates strong disagreement and five indicates strong agreement. The data was gathered by deliverance of questionnaires to 108 students of tertiary vocational school in Slovenia. The questionnaire was delivered personally to avoid non-responses. The respondents were guaranteed confidentiality.

The study aimed to propose an adoption model from students' perception of service quality and the scale to examine the relations among their variables according to corresponding hypothesized impacts. The model comprised four dimensions, namely "pedagogical aspects", "technical support", "students' satisfaction" and "word of mouth". As developed by previous researchers, the first path depicts the impact of "pedagogical aspects" on the "students' satisfaction". The second path is directed from "pedagogical aspects" towards »word of mouth«. The third path indicates the impact of "technical support" on "students' satisfaction" and the last path is directed from "student satisfaction" to »word of mouth".

The variables under examination, namely »pedagogical aspects«, »technical support«, »students' satisfaction« and »word of mouth« are hypothetical constructs, or latent variables, rather than directly measured variables. Therefore, the model was proposed, which consists of a measurement model that takes measurement error into account and a structural equation model which allows estimation of causal relationships among the latent variables involved (Jöreskog and Sörbom, 2001). Software package LISREL 8.8 student version was used to compute the estimation and measure the model fit. In order to compute estimates for factor loadings the variance of each factor on indicator was fixed at 1.0. All relationships were positive. The reliability of the measurement model is critical issue for the application of structural equation modelling. Attention is focused on absolute fit indexes such as standardized root mean square residual (SRMR) and goodness-of-fit index (GFI), relative fit indexes such as comparative-fit index (CFI), normed fit index (NFI), and parsimonious fit indexes such as parsimony normed fit index (PNFI), and parsimony goodness-of-fit index (PGFI). Fit is good since RMSEA is 0,043 (<0,05), SRMR is 0,04 (<0,09), GFI is 0,94 (>0,09), AGFI is 0,88 (>0,09), NNFI is 0,99 (>0,09), NFI is 0,97 (>0,09), CFI is 0,99 (>0,09). The fit indicators report separately for the structural equation model and the measurement model suggesting that the model fits the data well.

5. Conclusion

In the highly competitive education market, it is essential to carefully develop strategic preferences in a way to ensure that the service meets students' needs and expectations. Students' satisfaction is a source of competitive advantage with outcomes such as positive word of mouth communication, student retention and loyalty. The study confirmed the "pedagogical aspects" to be the most important factor in achieving service quality with the role of the teaching staff attaining students' satisfaction along with the considerable importance of "technical support". There is a need to find creative and innovative solutions and provide educational opportunities to diverse population of students. The final goal of higher education institution is to provide meta-cognitive support to students. Knowing about learning styles, professors can improve teaching process and enable students' to perform better and more easily master the learning tasks. The goal of higher education institution in knowledge society is to meet the requirement of global learning needs and enable individuals to develop to their full potential and thereof achieve students' satisfaction. Both aspects, the academic and administrative efficiency of the institution are extremely important. Higher education institutions have to open up and view the student as a whole person and meet students' expectations. However, students' achievements are significantly predisposed by educational activities and teaching approach.

The proposed model shows the possible solutions to continuous development. Further research may consider even wider dimensions for various educational level contexts. It might focus on examination of students' perception of quality within different study fields to gain deeper understanding of quality dimension. Examining service quality perception of other stakeholder groups like employers, government and general public would contribute to broadening the way of quality enhancement.

^bThe John Paul II Catholic University of Lublin, The Off-Campus Faculty of Social Sciences, Ofiar Katynia 6a, 37-450 Stalowa Wola, Poland

Abstract

The article shows what is perfection, especially at the university, in the opinion of students of the Catholic University of Lublin in Poland. The students pointed to several aspects of perfection - ontological, moral and aesthetic. Excellence at the university was described by four basic categories: fulfillment of obligations (both by students and teachers), the good atmosphere (of whole academic community), adequate conditions (material, organizational and didactic), as well as the reputation of the university and the achievement of its mission. Item is part of studies on education in higher school, carried out by the authors since 2008.

Keywords: education; university; students; perfection

1. Introduction

This article aims to answer the question what is perfection at the university, in the opinion of students of the John Paul II Catholic University of Lublin. First we answer the question what is perfection. The term is most often explained in philosophy and pedagogy – in this context, we define it in this article. We rely on classical concept of perfection, according to Zofia Zdybicka and Karol Wojtyła, as well as on the pedagogical approach taken by Janusz Tarnowski. The main part of the paper is to present a written students' works about the excellence, especially in the context of higher education and their interpretation in the light of the presented concept of perfection. The research material was obtained in 2012, from two groups of students of pedagogy at the Catholic University of Lublin (a total of fifty-one people). The article also refers to research on the culture of higher school and university education, which were conducted by the authors of this article in 2008 and 2010, among the students and teachers of three higher schools.

2. Understanding of excellence in classical philosophy and pedagogy – the selected approaches

Zofia Zdybicka, a known Polish philosopher, dealing with metaphysics, ethics, and philosophy of God and religion, creating on the basis of classical Thomistic philosophy, describes excellence in three areas: ontic, moral, and aesthetic. So it is a recognition of excellence as a being, an act or a values. Excellence of being (ontic) can take two forms: hierarchically higher being (relative to lower being) and the actualisation of ontic potentiality (the act). The highest perfection is the highest being – the absolute – in the ontic aspect – it is "pure act, act of existence, the existence itself" (Zdybicka, 1985: 146). Perfection is a feature of absolut what inheres in it in full

* Corresponding author. Tel.: +48 660 799 593; fax: +48 15 842 49 51.

E-mail address: justyna.truskolaska@kul.pl

swing, but it inheres in the other beings only in an analogous manner. Perfection of being is revealed in the act or action directed at goal - the value of good.

Therefore, the ontic aspect of perfection is closely connected with the moral aspect. Moral perfection is the realization of value – in Aristotle, excellence is the realization of potentiality of being consistent with the nature of being (*optimum potentiae*). According to Immanuel Kant perfection is the realization of moral obligation, in accordance with the principle "proceed so that your actions could be a model for others" (Zdybicka, 1985: 147). The Christian perfection is imitation of God, thanks to love for Him and by His grace (Woroniecki, 1984).

By Zdybicka (1985: 147) perfection can also be aesthetic value "one of the three objective factors of beauty (*integritas*) as a feature of a finished, coherent whole."

Karol Wojtyła discusses in detail the concepts of excellence on ancient philosophy (Plato, Aristotle), medieval philosophy (St. Augustine, St. Thomas) and contemporary philosophy (Immanuel Kant and Max Scheler) in work "Wykłady Lubelskie" (Wojtyła, 1986: 99, 104-5, 107, 122-3, 198-9).

Janusz Tarnowski describes perfection from the perspective of personalistic and existential pedagogy (Sliwerski, 2010: 69). His point of view is very close to Wojtyła's approach. Tarnowski believes that perfection, and properly striving for it, is necessary in education, and it relates primarily to educators and teachers. The man - both teacher and pupil - should exceed himself in every moment of his life and "the measure of his development is infinity" (Tarnowski, 1992: 143). A teacher, that starts upbringing from himself, can become an authority and a role model for pupils. The children start to imitate the teacher and they are inspired by personal dialogue with him or her. These pupils try to be more perfect and take responsibility for themselves and their development, but it is a gradual and lengthy process. Even though the education is based on the authority of the teacher, it can not be based on the authoritarian relationship. This understanding of excellence in upbringing is particularly important at the university, where we are dealing with young people who want to have personal role models, but they are also able to think critically about their university and their teachers.

3. Methodology of the research

The present study is a continuation of the research conducted by the authors in 2008 and 2010 among students and teachers of university and higher schools. Studies in 2008 and 2010 were related to the culture of the university and to education at the university and at the higher school. The aim of the present study was to answer the question: what is perfection, especially at the university, in the opinion of students of the Catholic University of Lublin. Statements of 51 students of pedagogy (II and IV year full-time) were collected to answer the research question. The statements were written completely arbitrary and had two parts. They provided the answer to the question, "What is your opinion on perfection, and especially what is perfection at the university?" The statements were collected in November 2012. The collected comments were categorized. Then the categories were grouped into four types: "honest fulfilling the obligations", "atmosphere at the university and meeting the needs", "material, organizational and didactical conditions" and "mission and reputation of the university." Subsequently the responses were counted. The result of calculations and conclusions arising from them are presented in next section.

4. Results of the research

Before we get to discuss in detail the results of research on students' opinions about the perfection at the university, we will answer the initial, basic question – how do students specify the concept of perfection. This was the first part of their expressions. The students often stated that perfection is: "an ideal pattern", "something

above the norm", "ideality", "being perfect", "being the best", "excellence", "precision in execution", "aiming for the objective", "the realization of a value". At the same time, many respondents marked that nothing was perfect, and a perfect man did not exist, but almost all people strived for perfection. Although perfection could be understood variously by different people. Interviewees repeatedly emphasized that there were different sides of perfection such as: the perfection of behavior, professional excellence (professionalism), aesthetic perfection (excellent work of art, the perfection of appearance – beauty, fashion clothes).

Voices about the negative side of perfection also appeared in several pronouncements. The young people said that a "excellent" person could be cocky and could treat patronizing the others. Students emphasized that the pursuit of excellence can be done at the expense of other people, and even at the expense of your own health. Thus, the students probably wanted to draw attention to the negative (social and health) consequences of perfectionism. The abovementioned statements testify to the fact that the respondents perceive the category of excellence: 1. in ontological sens, as a being ("model", "ideal") or as an act ("realisation of himself", "aim to something", "achievement of an aim"), 2. in ethical sens ("good behaviour", "be a better man"), as well as 3. in aesthetic aspect (realization the value of beauty).

Perfection at the university was understood differently by respondents, but we can clearly identify certain categories of expression – at the same time – the categories of understanding. The first one, called conventionally "good fulfilling the duties", is presented in Table 1.

Table 1. Perfection at the university as good fulfilling the duties

Symbol	Description	Number of choices
1.	Good fulfilling the duties	in total: 91
1.1.	by lecturers - skillful transfer of knowledge, a high level of education, improving teaching methods	18
1.2.	by students – conscientious fulfillment of obligations, such as preparation for classes and exams	21
1.3.	motivating to work, developing the students' interests, putting the requirements	15
1.4.	individual attention of lecturer to students	1
1.5.	execution of work in accordance with his or her conscience	5
1.6.	gaining knowledge necessary for living and working	10
1.7.	good, planned teaching and learning	7
1.8.	improvement and self-realization	14

Table 1. collects students' statements directly related to the first category: "good fulfilling the duties". The respondents understand it in particular as: good performing the duties by students (21 responses), as well as by lecturers (18 responses), which includes, among others: skillful transfer of knowledge, a high level of teaching, improving of teaching methods, professionalism and individual treatment of students. Developing students' interest, motivating to work, putting high demands are farther elements of perfection at the university (in the aspects of performance of duties) – according to the respondents (15 responses). Both sides of the educational process (lecturers and students) should still improve the work at the university (14 responses), they should all the time acquire the knowledge necessary for living and working (10 indications, primarily relating to youth),

properly plan the teaching and learning (7 indications) and conscientiously perform their duties (5 voices). This attitude of students and teachers is – in the opinion of the respondents – the same as the striving for perfection. However, they also pointed to another important element in improving the university, which is the right atmosphere. It is shown in Table 2.

Table 2. Perfection at the university, as an appropriate atmosphere and meeting needs

Symbol	Description	Number of choices
2.	Atmosphere and meeting needs	in total: 79
2.1.	good atmosphere - good interpersonal relationships	17
2.2.	respect for others, honesty	8
2.3.	caring for the welfare of students and staff	10
2.4.	justice, fairness	2
2.5.	openness	6
2.6.	understanding the needs and difficult situations	10
2.7.	helping people from outside the university e.g. as volunteer	6
2.8.	support for students	8
2.9.	organizing free time in collaboration with the local community	1
2.10.	students' help for the university e.g. the organization of conferences	4
2.11.	good communication between staff and students	7

Table 2. shows the components of the right atmosphere at the university, which is an essential component of university perfection. The proper atmosphere – by students – includes: good interpersonal relationships (17 responses), caring for the welfare of staff and students (10 responses), understanding the difficult situations of students, such as the need of paid work and the need of raising children (10 responses). Respondents also pointed out the need for mutual respect and integrity in the academic community (8 responses) appropriate assistance to students (8 answers), especially those in difficult situations. However, tested youth also saw need of helping people by students (a total of 10 responses), both within the university (e.g. by organization conferences, in scientific circles) and outside the university (e.g. within volunteering). The respondents note that efficient communication (7 responses), openness of university (6 responses) and justice (2 answers) were also the elements of perfection at the university. Only one person pointed out the importance of organizing leisure activities e.g. by students together with local authorities.

The next category of students' statements which has been singled out by the authors, is "material, organizational and personnel conditions." Table 3. presents a number of choices particular components of this category.

Table 3. Perfection at the university as material, organizational and personnel conditions

Symbol	Description	Number of choices
3.	Material, organizational and personnel conditions	in total: 42
3.1.	the material conditions - dormitory, classrooms	14
3.2.	early information about changes	3
3.3.	efficient handling matters - good organization	4
3.4.	clearly defined rules of study and exams	3
3.5.	good library	1
3.6.	providing qualified staff	13
3.7.	good organization of classes	4

As can be seen above (Table 3.), the students attach the greatest importance to ensuring good material conditions (14 responses), including: neat dormitories, nice classrooms and modern, properly equipped buildings. However, the qualified staff is in second place (13 responses). Less people found that the effective handling matters (4 answers) and the good organization of the course (4 answers) are important. Only three people recognize that the part of perfect functioning of the university were also clearly defined rules of study (including passing exams), and timely information about changes (e.g. in the class schedule). Only one person draws attention to the fact that students should have access to a good library.

The respondents found that reputation of the university and fulfilling its mission is the last component of university perfection (Table 4.).

Table 4. Perfection at the university as realization of its mission and as taking care about the reputation of the university

Symbol	Description	Number of choices
4.	Mission and reputation of the university	in total: 8
4.1.	realization of university mission	1
4.2.	taking care about university reputation	4
4.3.	patriotism	1
4.4.	high place in the ranking	2

Table 4. indicates that only eight people pay attention in their statements on the need of taking care about reputation of the university (4 subjects), obtaining high place in rankings (2 subjects), accomplishment of university mission (one person), and patriotism as the value of academic community (one person).

The last, summary table shows how many choices were given to each of four categories described above.

Table 5. Categories which are synonymous with perfection at the university - in the opinion of students – summary

No.	Description	Number of choices	
		N	%
1.	Good fulfilling the duties	91	41
2.	Atmosphere and meeting needs	79	36
3.	Material, organizational and personnel conditions	42	19
4.	Mission and reputation of the university	8	4

The most important to achieve perfection at the university seems to be honest (consistent with a conscience) performing the duties – students describe it in different places as much as 91 times (41% of responses). Students describe the atmosphere at the university and meeting the needs of members of the community as the second major category – they indicate it 79 times (36% of responses). Less important in the development of university perfection seem to be material and organizational conditions – together with personnel conditions – they received 42 indications (19%). The latter can be also attributed to the first category – proper performance of duties, because the good staff is the honestly working staff. In this situation, the first category got even more number of choices. And – as we can see above – shaping the reputation of the university and fulfilling its mission were mentioned only 8 times (4% of responses), they seem to be the least important to students.

5. Comparative analysis of the research results on culture and education in higher school (2008-2010) and the research results on perfection at the university (2012)

In 2008 and 2010 the authors of this article conducted surveys on culture and education in higher school in three Polish higher schools (Łuka, Truskolaska, 2009; Łuka, Truskolaska, 2011). The first part of the study (2008) refers to the opinion of students (208 respondents), while the statements of lecturers (71 respondents) were analyzed in the second part of the study (2010). The results from both parts of the study clearly show teachers as a very important group shaping the culture of higher education, in the opinion of students and lecturers. The majority opinion points to the fact that the important role of the academic teacher is not only 'practicing' science at a high level, but also: setting a good example for students, carrying out good teaching, implementation of educational mission of the university. The research described in this article, and carried out in 2012, supports this view, pointing to the need of good fulfilling duties by the academic staff (see Table 1.).

Those who shape the culture of the university – according to the opinions from 2008 and 2010 – are all staff and students. The current research on perfection at the university, also emphasizes the important role of good performance of their duties by the students. They understand it as: solid preparation for classes and examinations, acquiring the knowledge necessary for life and work, as well as the assistance provided by students at the university and help people outside the university.

The subjects in 2008 and 2010 indicate that one of the most important elements of a culture of the school is implementation of the value in everyday life through behavior in relation to other members of the academic community. Similarly, students by formulating their opinions on the excellence at the university in 2012, emphasize the need of a positive attitude of students to teachers and vice versa, as well as the need to meet their needs and helping each other.

The students in the study in 2008 indicate that teachers contributed to the deepening of knowledge, but subjects also underline lecturers' contribution to shaping friendly atmosphere on campus through e.g. fairness, openness, and good communication. The research conducted in 2012 also shows the important role of building a positive climate and the proper interpersonal relations in creating perfection at the university. Students emphasized – like their colleagues four years earlier – that a good atmosphere, proper communication and perception of the individual needs of students is important in shaping perfection at the university. It seems that the statements of students from 2008 and 2012 and the statements of lecturers from 2010 confirm each other - the interviewed show similar aspects of culture of higher education, and the striving for perfection at the university.

6. Conclusions

It was found, in the second section of this article, that perfection in philosophy is often understood as a goal-oriented action, and the good is the goal of the action. Our research shows that the students similarly understand the term of perfection. At the same time, the subjects – who contribute to create academic community – point to the need to strive for excellence at the university. They point to four key elements that allow for development of perfection: the conscientious fulfillment of obligations, appropriate atmosphere, suitable conditions for studying (material, organizational and personnel) and taking care about reputation of the university. The students emphasize necessity of engaging both students and lecturers in good job at the university. The opinions expressed in the study are congruent with the approach of Father Janusz Tarnowski – described in the first part of the article. Tarnowski emphasizes the need of continuous improvement of educators and teachers. Their examples attract youth, they become personal model for young people, who also want to be better and better.

These results are consistent with the research results from 2008 and 2010, carried out by the authors. They indicate what areas are most important in shaping the culture of higher education and striving for excellence at the university – in the opinion of our students and lecturers. Thus, it seems that the results of our study have not only theoretical, but also practical connotation.

Physical and mental training: jet lag and fast cognitive-emotional recovery

S. Di Stefano^{a*}, S. Nicolosi^a, R. Schembri^a, F. Sgrò^a, M. Lipoma^a

^a *Kore University of Enna, Enna, Italy*

Abstract

Several studies have underlined that the rapid long-haul transmeridian flights cause a circadian dyschronism, entailing physical upsets and psychological consequences (Winget et al. 1984). This research was aimed to evaluate the impact of time zone transitions on self-perception of mood, concentration, and time reactions, in a sample of 21 fencers, participating in the 2011 World Fencing Championships. Two self-report instruments were administered: the Profile of Mood States and a questionnaire assessing travel, sleep habits, and sleep-wake cycle in the first week after the arrival. Results of the mixed-method analysis and possible educational intervention on athletes' psychophysical recovery were discussed.

Keywords: Jet-lag; circadian dyschronism; mood alteration; cognitive-emotional recovery; physical and mental training.

1. INTRODUCTION

Since the diffusion of the modern sports, the number of élite athletes, with their staff, undertaking long-distance flights has continued to increase. For many athletes, this leads to a condition defined jet-lag.

The Jet lag Syndrome is a circadian rhythm disorder caused by a displacement between internal and external clock. It is the result of a temporary desynchronization of circadian rhythms by psychophysiological functions (such as attention, memory, and concentration) and performance abilities. Jet lag is characterized by a general psychological and physical discomfort associated with a typical fatigue accompanying long trips (Waterhouse, Reilly, Atkinson, & Edward, 2007).

The disorder is transient and disappear after a few days, with the realignment of the rhythms. The jet-lag produces a number of undesirable effects including disturbed sleep, loss of concentration, decreased efficiency, and depressed mood. These effects result from an individual's inability to adjust quickly the circadian clock to the requests of the new time zone. Generally, the duration and intensity of the jet lag symptoms is proportional to the number of time zones crossed, even if it depends on the traveler's characteristics (Winget, 1984).

Jet lag also depends on the direction of travel. Many studies (Comperatore, Lieberman, Kirby, Adams, and Crowley, 1996; Petrie, Conaglen, Thompson, and Chamberlain, 1989; Waterhouse, Reilly, Atkinson, 1997) showed that the eastward travel is often more difficult than westward travel, because the subject is forced to a

E-mail address: stefania.distefano@unikore.it

shortened day and this made it harder to support the adaptation to the new time zone. However, Relly and Waterhouse (2005) showed that elite athletes were affected by jet lag, regardless of the direction of travel.

It also has often been assumed that jet-lag can affect the psycho-physical wellness of the athletes and can cause detrimental effects on their performance in training and competition. In their study, Relly et al. (2009) involved the British Olympic Team, after a flight from the United Kingdom to Florida. Athletes reported symptoms, such as a decreased strength in the legs and a slower reaction time, which lasted for five days after the travel. Pirritano, Cei, Lucidi, and Violani (1997) showed that about 80% of the Italian elite athletes involved in their study was affected by the jet lag in the days following the transoceanic flights. 65% believed that jet lag does not directly affect the performance in the competition, but 31% suspected that the performance could be negatively affected.

Studies on the relationship between jet-lag and athletic performance have focused on the physiological adaptation of the athletes. Only few studies have also investigated psychological variables and results are not definitive.

Bullock, Marti, Ross, Rosemond, and Marino (2007) analyzed the impact of the long-haul flights to the east (from Australia to Canada) on the diurnal variations in cortisol, the psychological sensations, and daily measurements of physical performance in a sample of skeleton athletes. Five elite Australian skeleton athletes undertook the flight compared with seven athletes who did not travel. In both groups were recorded the amount of cortisol after 60 and 120 minutes of waking, the psychological sensations were assessed with a questionnaire on the jet-lag, and maximal 30 m sprints were performed once a day between 09:30 and 11:00 h local time. A distinct phase change in salivary cortisol rhythmicity were registered and the athletes perceiving themselves as “jet lagged”, but minimal disturbances in their physical performance were seen in the group of elite skeleton athletes after long haul eastward travel.

Waterhouse et al. (2002) conducted a study with 39 British athletes traveling to Australia, in order to investigate the relationship between the jet lag symptoms and adjustment time to the new time zone.

Each athlete was asked to evaluate the jet-lag, five times a day (at 8:00, 12:00, 16:00, 20:00, and 24:00 h) and fill out a questionnaire on the Jet Lag. The results showed a relationship between jet-lag and both physical and psychological symptoms, such as the alteration of sleep, daytime fatigue and loss of concentration, but there was no correlations between jet lag and other physical consequences, such as loss of appetite and gastrointestinal problems.

Several meta-analytical studies have confirmed the impact of sleep deprivation on psychomotor performance (Reilly and Edwards, 2007). The effect on performance depends on the period without sleep and the decreases in speed were greater than decrements in accuracy (Koslowsky and Babkoff, 1992). Pilcher and Huffcutt (1996) analysed 143 study coefficients and suggested that mood is more affected by sleep deprivation than cognitive tasks, which were more sensitive than motor tasks. Reilly and Edwards (2007) noted that “sports skills frequently incorporate decision-making as well as physical components, errors in either of which are reflected in performance outcomes. Any deterioration in mood is also likely to affect performance where maximum effort and determination are required of the participant” (Reilly and Edwards, 2007, p.276).

2. Method

2.1. Purpose

The general purpose of this study was to evaluate the psychological recovery in a sample of near-élite fencers.

The initial hypothesis was to verify a direct correlation between crossed time zones and perception of mood, concentration, and time reactions.

We also analyzed the relationship between sleep-wake cycle changes and psychophysical problems reported by the athletes in the week after their arrival in Italy.

2.2. Participants

This study involved 21 male fencers, from 21 to 38 years old ($M = 25,80$; $sd. = 4,58$), from different countries, participating in the World Championships, held in Catania from the 8th to the 16th of October, 2011.

2.3. Instruments

Two self-report instruments were administered:

- the Profile of Mood States (POMS)
- a questionnaire assessing travel, sleep habits, and sleep-wake cycle in the first week after the arrival in Italy.

Subjects were asked to answer about demographic information, flight, and sleep habits; as far as the first week after the travel, they asked to indicate their total sleep time, night-time awakenings, day-time rests, bedtime and awakening time. Furthermore, a last section of the questionnaire contained items related to the jet-lag symptoms and other psychophysiological complaints (concentration and mood problems, gastrointestinal problems, fatigue, slow reflexes, physical weakness, insomnia, sleep disturbances) .

2.4. Procedures

All of the subjects were informed about the purposes and instruments of the study and then were asked to give an informed consent.

Participants were assessed over a 7-day period for 5-10 minutes each day.

On Day 1, participants were asked to complete the self-report questionnaires. Every morning, each athlete was asked to report information about the previous night's sleep (total sleep time, night awakenings, bedtime and awakening time). On Day 7, each athlete completed the last section of the questionnaire about the psychophysiological problems.

3. Results

The descriptive analysis highlighted that eastward travelling athletes slept fewer hours during the first two nights after the travel than usual. Within the group of westward travelling athletes, only two subjects had problems in sleep duration.

These frequencies also reflected in the descriptive analysis of nocturnal awakenings during the first week after the arrival in Italy.

As expected, the disturbances reported by the athletes include a general physical weakness and other physical problems. Compared to the Psycho-physical problems Checklist, westward travelling athletes reported more physical troubles than mood problems. Eastward travelling athletes reported both physical and psychological disorders.

3.1. Correlations

Pearson's correlations showed a positive significant correlation between the physical strength recovery time and number of physical bothers ($p < 0.05$), tiredness ($p < 0.05$), and also the subscales tension ($p < 0.01$), depression ($p < 0.01$), and hostility ($p < 0.01$) of the POMS .

Furthermore, there was a significant positive correlation between concentration problems perceived and recovery times of concentration and mood (Table 1). There was no significant correlation between the number of hours of the flight and the number of time zones crossed.

Table 1. Correlations between Flight (n. of hours), Time zones, Recovery time, Psycho-physical problems, and Profile of Mood State Questionnaire (POMS)

	N. of hours of the flight	N. of Time zones (a)	Recovery time of physical strength (b)	Recovery time of concentration (b)	Recovery time of mood (b)
<i>Psycho-physical problems Checklist:</i>					
Physical bothers	0,332	0,005	0,548*	0,469	0,374
Problems in Concentration	-0,095	-0,282	0,159	0,579*	0,684**

(b) in days

3.2. Comparisons

Comparison between groups were made using the Student t test and one-way ANOVA.

Participants were divided according to the median of time zones crossed (until 4 time zones, more than 4 time zones). Then, comparisons between these groups showed only a significant difference in the Vigour subscale of the POMS ($p=0,03$). Athletes travelling more than four time zones have significantly higher average than athletes traveling four time zones or less (Table 2).

Comparison between groups were made using the Student t test and one-way ANOVA.

Participants were divided into two groups, according to the median of time zones crossed (until three time zones and more than three time zones). Then, comparisons between these groups showed only a significant difference in the Vigour subscale of the POMS ($p=0,03$). Athletes travelling more than three time zones have significantly higher average than athletes traveling three time zones or less (Table 2).

Table 2. Comparisons between athletes grouped according to the median of the time zones crossed

Profile of Mood State Questionnaire (POMS)	Until 3 time zones		More than 3 time zones		t	p
	(n=11)		(n=9)			
	Mean	SD	Mean	SD		
Tension	7,00	4,38	9,78	6,32	-1,159	ns
Depression	4,40	5,10	10,11	8,43	-1,808	ns
Anger	4,45	3,17	10,78	7,17	-2,455	0,03
Vigour	12,00	3,71	14,00	5,50	-,968	ns
Fatigue	6,64	6,53	8,33	5,96	-,601	ns
Confusion	5,20	3,39	7,89	2,76	-1,881	ns

Comparison between athletes, grouped according to travel direction (to the west, the east, and within the same time zone), showed that in the Vigour subscale of the POMS ($p = 0.03$), athletes traveling westward have significantly higher average than athletes traveling eastward, and than athletes remaining within the same time zone (Table 3).

Table 3. Comparisons between athletes, grouped according to travel direction

Profile of Mood State Questionnaire (POMS)	Eastward (n=11)		Westward (n=5)		Northward or Southward (n=4)		F	p
	Mean	SD	Mean	SD	Mean	SD		
	Tension	8,55	5,663	7,60	5,079	8,25		
Depression	6,70	8,731	9,20	5,541	5,50	6,191	0,293	ns
Anger	7,00	6,403	9,20	7,120	5,75	4,787	0,357	ns
Vigour	11,45	1,753	17,40	6,877	11,25	3,862	4,339	0,03
Fatigue	7,45	6,758	7,80	7,430	6,75	3,862	0,030	ns
Confusion	7,20	2,936	6,20	3,271	5,00	4,619	0,622	ns

Finally, comparisons between groups, divided according to the number of hours of flight, there were no statistically significant results in perceived mood states.

4. Discussion and conclusions

Past research on jet lag and athletic performance focused more on physiological variables than psychological dimensions. Findings of this study show that there are differences among athletes related to the number of time zones crossed and travel direction, concerning a subscale of the Profile of Mood State, the vigor. Perceived tension, hostility, and depression are significantly related to strength and physical fatigue recovery times, but there are no significant correlations among these variables and the number of hours of the flight and time zones crossed.

The self-perception of the mood could be caused by jet lag, as suggested by the psychological and physical disorders related. However, both the perception of mood and jet lag symptoms could be due to different causes, for example the perceived tension for the competition.

Nevertheless, the evidence suggests that a non-pharmacological intervention might be effective in managing the jet lag symptoms and perceived mood state.

From a research perspective, more research is needed in order to define a causal model with psychological variables related to performance in competition.

A limitation of this research concerns the assessment instruments. The different nationalities of athletes has limited the use of standardized psychometric tests, especially for the assessing of cognitive tasks. Further

research could assess the athletes in attentional, perceptual and mnestic tasks, comparing the results with their state of mood profile and response patterns in motor tests.

The tests should be administered in two stages, before and after the travel, in order to establish the baseline scores and check for the pre-post differences.

Finally, further investigation should consider the perceived precompetition anxiety, in order to analyze the relationship between this variable and perceived psychological and physical symptoms.

Previous research analysed the pharmacologic approaches and their effects on travellers, aircrew, and athletes (Relly, Waterhouse & Edwards, 2005). The pharmacologic treatments include the use of zolpidem and specific GABA agonists, antidepressants, and melatonin (Leger, Metlaine, Chudat, 2005). Other studies investigated the effects of the exposure to bright light in order to facilitate the resynchronization of the sleep-wake cycle (Czeisler, Richardson, Moore-Ede, and Wetzman, 1981; Manfredini, Manfredini, Fersini, and Conconi, 1998; Postolache and Dan Oren, 2005). Furthermore, athletes could benefit from nonpharmacologic techniques for promoting sleep onset. Several studies investigated these simple and self-administered techniques, including sleep hygiene, inverted posture, stimulus control, breathing techniques, motor and cognitive relaxation, and cognitive behavioral therapy (Hauri, 1982; Cole, 2005; Leger, Metlaine, Chudat, 2005; Reilly, Waterhouse, and Edwards, 2005).

From an applied perspective, it could be useful to combine a psychoeducational intervention with motor and cognitive relaxation techniques and mental training.

The intervention should begin in the flight preceding period to allow an optimal management of the athlete's psico-physical recovery.

Mental training should be provided in conjunction with the physical and technical training and it should include relaxation techniques as well as pre-competition mental preparation strategies.

Relaxation techniques, such as autogenic training (Schultz, 1932) or the progressive relaxation (Jacobson, 1938), could be used to encourage an awareness process of muscle tension during the rest periods and work sessions, managing the stressful situation.

Finally, the mental imagery, ideomotor training, and breathing relaxation techniques could facilitate a positive emotional and cognitive involvement of the athlete.

A psychoeducational intervention on the long-distance travel effects could help the athletes in managing the psychological consequences of the jet lag.

Acknowledgements

We would like to thank the International Fencing Federation, Italian Fencing Federation, Managers, Administrators, and Trainers of the National Teams involved, for giving us the permission to carry out this study. We also thank all of the athletes for their participation and cooperation.

4th International Conference on New Horizons in Education

Possible uses of newton's laws of motion in commodity price theory and the training of expert appraisers at universities

Jiří Pospíšil*

*Czech Technical University in Prague, Faculty of Civil Engineering, Department of Special Geodesy,
Thákurova 7, 166 29 Prague 6, Czech Republic*

Abstract

Newton's equations of motion are discussed with respect to their use in the theory of pricing commodities and for training expert appraisers at universities. Newton's equations of motion describing the movement of bodies at non-relativistic speed with constant mass over time are analyzed in three dimensional space. Also analyzed are motion equations describing the movement of bodies at non-relativistic speed with changing mass over time. The last part of the paper deals with equations of motion for describing the development of instantaneous relative depreciation and instantaneous relative commodity prices over time.

Keywords: Acceleration, jerk, law of inertia, law of force, law of interaction, momentum, market value, relative depreciation, relative price.

2. Introduction

In 1687 Newton published his work “Philosophiae naturalis principia mathematica” where he introduced three principles or laws of motion:

1. Corpus omne perserverare in statu quo quiescendi vel movendi uniformiter in directum, nisi quatenus a viribus impressis cogitur statum illum mutare (Newton, 1687).
Motte’s translation into English: Law 1. Every body continues in its state of rest, or of uniform motion in a right line, unless it is compelled to change that state by forces impressed upon it (Newton, 1952, 1960).
2. Mutationem motus proportionalem esse vi motrici impressae et fieri secundum lineam rectam qua vis illa imprimitur (Newton, 1687).
Motte’s translation into English: Law 2. The change of motion is proportional to the motive force impressed; and is made in the direction of the right line in which that force is impressed (Newton, 1952, 1960).
3. Actioni contrariam semper et aequalem esse reactionem: sive corporum duorum actiones in se mutuo semper esse aequales et in partes contrarias dirigi (Newton, 1687).
Motte’s translation into English: Law 3. To every action there is always opposed an equal reaction: or, the mutual actions of two bodies upon each other are always equal, and directed to contrary parts (Newton, 1952, 1960).

Newton’s laws of motions are currently interpreted as follows (Yavorsky & Detlaf, 1972):

1. Newton’s first law of motion (the law of inertia) states: Every material point persists in the state of rest or uniform motion in a straight line until the actions of other bodies compel it to change that state.
This law is called the law of inertia, and the motion of a particle, free of external action, is called inertial motion.
2. Newton’s second law of motion (the law of force) may be stated as follows: The first time derivative of the momentum of a particle is equal to the force acting on it.

Thus

$$\frac{d\vec{p}}{dt} = \vec{F} \text{ or } \frac{d}{dt}(m\vec{v}) = \vec{F} \quad (1)$$

The vector $\vec{F} \cdot dt$ is called an impulse of force \vec{F} acting over time dt .

In Newton’s formulation, the 2nd law is also applicable to the mechanics of bodies having variable mass, thus in relativistic mechanics.

Newton’s second law of motion can also be stated in the form: an elementary change in the momentum of a particle is equal to the elementary impulse of the force acting on it, i.e.

$$d(m\vec{v}) = \vec{F}dt. \quad (2)$$

However, since $m = \text{const}$, the acceleration vector \vec{a} is determined by the equation

$$\vec{a} = \frac{d\vec{v}}{dt} = \frac{\vec{F}}{m}. \quad (3)$$

3. Newton’s third law of motion (law of interaction): The action of two particles on each other are equal in magnitude and opposite in sense.

Thus

$$\vec{F}_{12} = -\vec{F}_{21}, \quad (4)$$

where \vec{F}_{12} is the force acting on the first particle exerted by the second particle, and \vec{F}_{21} is the force acting on the second particle exerted by the first particle.

According to (3) force \vec{F} is directly proportional to the product of the mass m and acceleration \vec{a}

$$\vec{F} = \text{const} \cdot m\vec{a}. \quad (5)$$

By selecting suitable units, it is possible to make the constant of proportionality, *const.*, equal to one.

The relationship which describes possible movement of a body in space is called an equation of motion. We understand a body to be a body or particle or possibly a set of particles. Space is understood to be the forces and fields of force acting upon the body and the mechanical relationships which limit its motion. By solving the equation of motion we obtain the position of the body at any given moment. In classical mechanics the solution describes the trajectory of the body. In quantum mechanics it is the result of a time-varying wave function (Karjakin, Bystrov & Kirejev, 1972).

In their most general form, equations of motion are typically differential equations of the second order, where we take the derivation of time. The solution is a vector function describing the position of the body in relation to time $\vec{r} = \vec{r}(t)$, which is an expression of the trajectory of the end point of the vector radius (Kohlmann, 1960). If $m = \text{const}$, the basic dynamics equation takes the form

$$\vec{F} = m\vec{a} = m \frac{d\vec{v}}{dt} = m \frac{d^2\vec{r}}{dt^2}, \quad (6)$$

resultant force \vec{F} and acceleration \vec{a} of the rigid body are vectors in the same direction. We call this a motion equation. For force we substitute the functions of time, position or velocity, i.e. in general $\vec{F} = \vec{F}(\vec{r}, \vec{v}, t)$.

3. Equations of motion at constant mass

3.1. Equations of motion at zero force

If $\vec{F} = \vec{0}$, then we can express the equation of motion using the first law of motion, for $\vec{F} = \vec{0}$ then $\vec{a} = \vec{0}$ and the equation of motion has the form

$$\vec{a} = \frac{d^2\vec{r}}{dt^2} = \vec{0}. \quad (7)$$

Since acceleration is zero, the velocity must be constant, thus $\vec{v} = \vec{v}_0$, which satisfies the first law of motion.

The initial velocity \vec{v}_0 does not change without the action of force during motion.

3.2. Equations of motion at constant force

If $\vec{F} = \text{const}$ and is in the same direction as the motion, i.e. $\vec{F} \uparrow \uparrow \vec{v}$ and thus $\vec{a} \uparrow \uparrow \vec{v}$, all vectors are parallel and we need not consider the vector character of quantities. We may then write

$$F = \frac{d^2s}{dt^2}, \quad (8)$$

where $s = s(t)$ is the path at time t . The solution of differential equation (8) is

$$s = s_0 + v_0 t + \frac{1}{2} \frac{F}{m} t^2, \quad (9)$$

where $\frac{F}{m} = a$ and is independent of time, thus the body must continually accelerate, s_0 is the initial position and v_0 is the initial velocity.

If $\vec{F} = \text{const}$ is not in the direction of motion, the motion equation can be expressed in the form

$$\frac{d^2 \vec{r}}{dt^2} = \frac{\vec{F}}{m}, \quad (10)$$

and the acceleration vector \vec{a} has a different direction than the velocity vector \vec{v} . The body will move in a general curvilinear motion.

3.3. Equation of motion for harmonic oscillation

Let the force acting on the body be directly proportional to the distance (deviation) from the equilibrium position and moving to this position (harmonic oscillator). The equation of motion then has the form

$$-ky = m \frac{d^2 \bar{y}}{dt^2}, \quad (11)$$

where $y = y(t)$ is the deviation from the equilibrium position and m is the mass of the body. Solving equation (11) yields the function

$$y = y_{\max} \sin(\omega t + \phi_0), \quad (12)$$

where $\omega = \sqrt{k/m}$ is the angular velocity. The body must move in a harmonic (sinusoidal) motion. y_{\max} is the maximum deviation and ϕ_0 the initial phase of the motion.

3.4. Equations of motion for curvilinear motion

For curvilinear motion, the acceleration vector \vec{a} is never in the same direction as the tangent of the trajectory, but it can be broken down into two mutually perpendicular components \vec{a}_n and \vec{a}_τ . Thus

$$\vec{a} = \vec{a}_n + \vec{a}_\tau. \quad (13)$$

Component \vec{a}_n , directed along the principal normal to the path, is called the normal acceleration. Component \vec{a}_τ , directed along the tangent to the path, is called the tangential acceleration. Their magnitudes are

$$a_n = \frac{v^2}{R} \quad \text{and} \quad a_\tau = \frac{dv}{dt} \quad (14)$$

and thus

$$a = \sqrt{a_n^2 + a_\tau^2} = \sqrt{\left(\frac{v^2}{R}\right)^2 + v^2}, \quad (15)$$

where v is velocity and R the radius of curvature of the path. The normal acceleration \bar{a}_n is always directed toward the center of the curvature of the path.

Of we break down the acting force \bar{F} into a normal component \bar{F}_n and tangential component \bar{F}_τ to the trajectory of movement, we obtain the following equations of motion in scalar form

$$F_n = ma_n = m \frac{v^2}{R} \quad (16)$$

$$F_\tau = ma_\tau = m \frac{dv}{dt}, \quad (17)$$

where v is the immediate velocity and R is the radius of the curvature of the trajectory. The normal component \bar{F}_n changes direction of velocity and is directed towards the center of the curvature of the path, which is why we call it centripetal force. The tangential component \bar{F}_τ changes the speed of the body. Given a constant speed of the body, tangential force $F_\tau = 0$. Only centripetal force acts on a rigid body.

4. Equations of motion with constant mass in different spaces

Let velocity v of the body movement be indirectly proportional to the traveled path s . Then

$$\frac{ds}{dt} = \frac{k}{s}, \quad (18)$$

where k is the proportionality coefficient. Solving this differential equation yields

$$s = \sqrt{2\sqrt{kt+C}} \quad (19)$$

$$v = \frac{ds}{dt} = \frac{k}{\sqrt{2\sqrt{kt+C}}}. \quad (20)$$

Given initial conditions $t=0$, $s(0)=s_0$, $v(0)=v_0$ then

$$s(0) = \sqrt{2C} = s_0, \quad (21)$$

from which

$$C = \frac{s_0^2}{2}, \quad (22)$$

$$v(0) = \frac{ds(0)}{dt} = \frac{k}{\sqrt{2\sqrt{C}}}, \quad (23)$$

then

$$k = v_0 \sqrt{2\sqrt{C}} = v_0 s_0. \quad (24)$$

Thus the motion is described by the equation

$$s = \sqrt{2\sqrt{v_0 s_0 t + s_0^2/2}} \quad (25)$$

$$v = \frac{v_0 s_0}{\sqrt{2} \sqrt{v_0 s_0 t + s_0^2 / 2}}. \quad (26)$$

Let the acceleration of a body which has initial velocity v_0 be directly proportional to force F and indirectly proportional to body mass m , then the equation of motion is

$$F = b - kv, \quad (27)$$

where v is velocity, and b and k are constants. We must find force F at time t , if at initial time where $t=0$ we have

$$F = F_0 = b - kv_0. \quad (28)$$

For acceleration we can write

$$a = \frac{dv}{dt} = \frac{F}{m}. \quad (29)$$

Thus

$$\frac{dv}{dt} = \frac{b - kv}{m} \quad (30)$$

Solving this differential equation yields

$$t = -\frac{m}{k} \ln(b - kv) + C. \quad (31)$$

Initial conditions: for $t=0$ then $v = v_0$ hence

$$0 = -\frac{m}{k} \ln(b - kv_0) + C, \quad (32)$$

then

$$C = \frac{m}{k} \ln(b - kv_0). \quad (33)$$

Thus

$$t = \frac{m}{k} \ln \frac{b - kv_0}{b - kv} = \frac{m}{k} \ln \frac{F_0}{F}.$$

For force F we obtain the equation

$$F = F_0 e^{-\frac{kt}{m}}. \quad (34)$$

Let force F , acting on the body, depend on the velocity v in motion while overcoming resistance in space, which is proportional to velocity, thus

$$F = -kv, \quad (35)$$

where k is the proportionality coefficient. Based on Newton's laws

$$F = m \frac{dv}{dt}, \quad (36)$$

thus

$$m \frac{dv}{dt} = -kv \quad (37)$$

Solving gives the relationship for velocity

$$v = e^{-\frac{k}{m}t + C_1} = e^{C_1} e^{-\frac{k}{m}t} = C e^{-\frac{k}{m}t} .$$

Assuming that the following initial conditions are met, i.e. at $t = 0$, $v(0) = v_0$, then we obtain the equation

$$v_0 = C e^{-\frac{k}{m} \cdot 0} \quad \text{i.e. } C = v_0 . \quad (38)$$

Then

$$v = v_0 e^{-\frac{k}{m}t} . \quad (39)$$

5. Equations of motion of a rigid body (body) with variable mass

In nature and technical practice, we encounter the movement of a body with variable mass. This is the case for rockets, balloons, falling drops and ice crystals.

The differential equation of translatory motion of a rigid body whose mass m is dependent on time is of the form

$$\frac{d(m\vec{v})}{dt} = \vec{F} + \vec{u} \frac{dm}{dt} , \quad (40)$$

where \vec{F} is the resultant of all forces acting on the body and \vec{u} is the velocity of the added mass before being joined to the body (if $\frac{dm}{dt} > 0$), or that of detracted mass after being separated from the body (if $\frac{dm}{dt} < 0$).

From equation (18) we obtain the following (if we do not consider the dependence of m on speed)

$$m \frac{d\vec{v}}{dt} = \vec{F} + (\vec{u} - \vec{v}) \frac{dm}{dt} , \quad (41)$$

which is fundamentally Meshchersky's equation, which in 1897 was published by I. V. Meshchersky in his book "Dynamics of a Point of Variable Mass" (Meshchersky, 1897, 1904).

6. Equations of motion in econophysics

The gradual incorporation of the methods of theoretical physics into economics during the 20th century has led to econophysics becoming part of basic theoretical research in economics (Zeithamer, 2012a).

Equation (37) can be rearranged to

$$\frac{dv}{dt} = -\frac{k}{m}v = -Av . \quad (42)$$

The first time derivation of velocity is, as we know from the above, the acceleration of motion in the given space. If we want to determine the rate of change of this acceleration, we take the second time derivative of velocity

$$\frac{da}{dt} = \frac{d^2v}{dt^2} = -A \frac{dv}{dt} = j . \quad (43)$$

The expression on the left side of equation (43) denotes j , or “jerk”, in units of $\frac{m}{s^3}$.

If the market value of a commodity is quantitatively determined only by the market price n of the commodity, we can now make the general assumption that the instantaneous acceleration of the reduction of the market value is directly proportional to the instantaneous rate of reduction of the market value (Zeithamer, 2010). Then the deterministic differential equation of price which expresses this model is

$$\frac{d^2n}{dt^2} = -A \frac{dn}{dt}, \quad (44)$$

where $A > 0$ is the proportionality constant, and a negative sign is used to indicate that n , the market value, is a decreasing function of time. The initial conditions now are that over time $t = 0$ the market value is $n(0) = n_0$ and $\frac{dn}{dt}(0) = r_0$.

By directly comparing equations (43) and (44) we get analogous equations of motion for commodity price n and velocity of the body in a previously defined environment. The instantaneous commodity relative depreciation RD is defined by a non-linear deterministic differential equation of the form

$$\frac{d^2RD}{dt^2}(t) = B \frac{dRD}{dt}(t) - A \frac{dRD}{dt}(t)RD(t), \quad (45)$$

Where $A > 0, B > 0$ are constants of proportionality and t is time, $t \in \langle t_0, t_e \rangle$ (Zeithamer, 2012b). If we express equation (45) in accordance with analogous equations (43) and (44) above, we get an equation of motion expressed through the quantity of “jerk” in the form

$$j = (A \cdot RD(t) - B)^2 \frac{dRD}{dt}(t) - A \left(\frac{dRD}{dt}(t) \right)^2, \quad (46)$$

where $\frac{dRD}{dt}(t)$ corresponds to the velocity v of motion of the rigid body.

A more detailed approach to modeling the process of falling prices with acceleration can be found in the following works (Zeithamer 2010, 2011a, 2011b, 2012b).

7. Conclusion

This contribution was inspired by the works of Ing. Tomáš Zeithamer, Ph.D. (Zeithamer 2010, 2011a, 2011b, 2012a, 2012b), who has been systematically examining synergetics and econophysics since 1986. The main objective of this work was to verify methods of deriving equations of motion for commodity pricing in economic theory based upon the work of T. Zeithamer in comparison to the equations of motion of classical mechanics based on Newton’s laws of motion. A secondary objective of this work was to outline the possible future development and use of equations derived from classical Newtonian mechanics in theoretical economics. From the analysis of equations of motion for the motion of a rigid body with constant mass and variable mass, it is shown that the method for deriving equations of motion for the immediate price of a commodity as well as the immediate relative depreciation of the commodity and immediate relative price of the commodity proposed by

T. Zeithamer is in accordance with the conclusions drawn by classical mechanics and is a new and promising direction for basic economic and physical research. This method constitutes the basis of a new system for training and preparing expert appraisers for their work, founded upon the causal mechanisms of changes in the market value of commodities.

Abstract

Linear and nonlinear deterministic motion equations are used to describe the degressive, progressive and progressive/degressive development of socio-physical system states over time. A homogenous linear differential equation of the second order with constant coefficients is derived to describe the degressive as well as progressive development of the instantaneous relative depreciation of a commodity and the instantaneous relative price of a commodity over time in a model of market structure with perfect competition. A homogenous nonlinear differential equation of the second order is derived to describe the progressive/degressive development of the instantaneous relative depreciation of a commodity over time in a model of market structure with perfect competition. An analogous approach is used to describe the development of instantaneous relative commodity price.

Keywords: Depreciation; differential equation; econophysics; equation of motion; training appraisers.

Introduction

The systematic use of methods of theoretical and mathematical physics in basic and applied research in the development of the states of economic systems can be relatively reliably traced to the end of the first half of the 19th century and especially the Cambridge and Lausanne Schools of Economics (Zeithamer, 2012a).

Economic phenomena and processes at that time were described and analyzed using analogies between the evolution of physical systems and the evolution of economic systems. Biographical research has shown that one of the reasons for the successful application of theoretical physics in economics is that many economists had initially studied physical and mathematical sciences, or fields related to the physical or mathematical sciences* (Zeithamer, 2012a).

The gradual spread of methods taken from theoretical and mathematical physics to economics during the 19th and especially the 20th century eventually led to the beginning of basic theoretical research, which in the 21st century consists of the systematically targeted application of theoretical, mathematical and statistical physics to economics (Mantegna & Stanley, 2000; Drozen, 2003, 2008; McCauley, 2004; Chakrabarti, Chakraborti & Chatterjee, 2006; Voit, 2010; Zeithamer, 2010, 2012b). A part of this basic theoretical research in economics has become known as econophysics. Great confidence in the power of mathematical statistics, which is justified in measuring techniques (Eadie, Drijard, James, Roos, & Sadoulet, 1971; James, 2010; Štroner & Pospisil, 2011), is somewhat weakened by works which, based on detailed knowledge of statistical methods and their use in physics itself, come to the conclusion that it is not possible using statistics alone to determine the causal mechanisms that explain observed phenomena in economics (Roehner, 2002, 2007; Chakrabarti, Chakraborti & Chatterjee, 2006; Voit, 2010; Abergel, Bouchaud, Foucault, Lehalle, & Rosenbaum, 2012; Abergel, Chakrabarti, Chakraborti, & Ghosh, 2013).

We encounter similar conclusions regarding the state of knowledge in a number of related multi-disciplinary and interdisciplinary scientific fields. For example, let us consider research into the relationship between the Sun and the Earth, where several works demonstrate the need to establish causal mechanisms for phenomena independent of the methods of mathematical statistics: 1) Physics of the Sun-Earth Relations (Akasofu & Chapman, 1972; Gonzales & Burch, 2011); 2) Helio meteorology of the Earth's Atmosphere (Pérez-Peraza & Libin, 2012); 3) Biophysics of the Sun - Earth relations (Sulman 1982a, 1982b; Kiefer, 2005).

Finding causal mechanisms which explain observed socio-physical phenomena on a gravitational, electromagnetic or nuclear level is a very difficult, long and costly task. The same applies to the behavior of experts in commodity price theory, thoroughly based on the knowledge of basic physical force interactions. The theoretical constructions presented in this work are intended to facilitate solving both tasks mentioned in future modern commodity price theory. Specifically, there are linear and non-linear elementary kinematic equations, which do not explain the phenomena observed in the socio-physical system with interactions of force, but merely describe the developing state of the socio-physical system. While not easy to solve, these kinematic equations lead to quantifiable mechanisms which explain observed developments in the state of the socio-physical system using analytical dynamics, i.e. force interactions. The analytical dynamics of socio-physical

* Giovanni Battista Antonelli (17. 9. 1858 – 12. 5. 1944) began his early studies at the Technical Institute of Leghorn and then continued to study at the University of Pisa where, in 1882, he received a doctorate in mathematics and in 1884 became a professor of mathematics. After this, he completed his engineering studies at the Polytechnic School in Milan, where he was awarded the title of civil engineer (Antonelli, 1998). William Stanley Jevons (1. 9. 1835 – 13. 8. 1882) studied chemistry and botany at University College School at London, where he obtained also knowledge of the physical sciences and logic (Mosselmans, 2012). Alfred Marshall (26. 7. 1842 – 13. 7. 1924) studied mathematics and physics at Cambridge University, where he also taught mathematics (Zemánek, 2006). Vilfredo Pareto (15. 7. 1848 – 19. 8. 1923) studied at the Polytechnic Institute of Turin, where he wrote his dissertation on the theory of elasticity „Principi fondamentali della teoria della elasticità de corpi solidi in 1869 (Pareto, 1869). Marie Esprit Léon Walras (16. 12. 1834 – 5. 1. 1910) studied mine engineering at École de Mines in Paris, where he acquired knowledge not only of mathematics and general physics, but also the statics and the dynamics of mine constructions (Jaffé, 1965).

systems is not the subject of this work, however, it is one of the subjects of basic and applied economic and physical research being conducted by the author of this article.

2. Linear motion equation of commodity state without inflexion

The late nineteenth century is a period in which there was a synthesis of the partial knowledge of economic laws formulated by the previous generation of economists, and increased attempts to describe these laws using the language of physics and mathematics, comprising both the mathematical and physical meaning of the differential of variable quantities; the foundations of “econophysics in the broader sense” were laid and expanded (Zeithamer, 2012a).

The first half of the twentieth century witnessed a deepening integration of economics, mathematics, and physics. At the Czech School of Economics during this time, no reliable sources have yet been found indicating such an interdisciplinary approach or related original work. At the end of the twentieth century however, we do find an economist at the Czech School of Economics whose work represents econophysics in the broader sense. This economist is František Drožen (born 30. 5. 1949), who was inspired by the work of German engineer August Wöhler (22. 6. 1819 – 21.3.1914)[†]. František Drožen constructed an analogy between the process of fatigue crack growth in axles and the process of price reduction for goods. This approach to modeling the process of falling prices for goods can be found in its final form in several of Drožen’s works (Drožen, 2003, 2008).

In this work it is assumed, as in Drožen’s works (Drožen, 2003, 2008), that the market value of a commodity is quantifiably determined only by the market price n of the commodity.

We now make the generalizing assumption that the instantaneous acceleration of reduction of the market value is directly proportional to the instantaneous rate of reduction of the market value (Zeithamer 2010). Then the deterministic differential equation of price which expresses this model is

$$\frac{d^2 n(t)}{dt^2} = -A \frac{dn(t)}{dt} , \quad (1)$$

[†] From 1855 – 1871 August Wöhler examined the causes of fatigue cracks in the wheel shafts of railway cars and the dependence of the number of cyclic loads until axle fracture at stress amplitude. The graphic depiction of Wöhler’s findings in the form of Wöhler curves is still used today in the investigation of metal fatigue in various constructions (Wöhler, 1855, 1870; Timoshenko, 1983; Schutz, 1996).

where $A > 0$ is the proportionality constant, and a negative sign is used to indicate that n , the market value of goods, i.e., a price, is decreasing and the acceleration of reduction of the market value decreases over time. The initial conditions now are that over time $t=0$ the market value is $n(0) = n_0$ and $\frac{dn}{dt}(0) = r_0 < 0$. A more detailed approach to modeling the process of falling prices with acceleration can be found in the following works (Zeithamer 2010, 2011a, 2011b, 2012b).

3. Linear motion equation of commodity relative depreciation

In a convergent sequence of market structures[‡] with perfect competition, the instantaneous commodity relative depreciation RD is defined by the magnitudes of instantaneous commodity relative depreciation according to the relationship (Drozen, 2008; Zeithamer, 2011b)

$$RD(t) = \frac{w(t) - w(t_0)}{w(t_0)}, \quad (2)$$

where $w(t_0) = w_0$ is the magnitude of instantaneous commodity depreciation at the initial time t_0 and $w(t)$ is the magnitude of instantaneous commodity depreciation at time $t (t \geq t_0)$. In addition to instantaneous commodity relative depreciation RD , the instantaneous commodity relative price RP is also defined under the condition of perfect competition by the magnitudes $RP(t)$ at time t according to the relationship (Drozen, 2008; Zeithamer, 2011b).

$$RP(t) = \frac{p(t_0) - p(t)}{p(t_0)}, \quad (3)$$

[‡] In the model of a market structure with perfect competition we assume the following conditions are met: a) in each market there are a large number of buyers and sellers, none of which are strong enough to influence the price or output of a sector; b) all goods are homogeneous; c) there is free entry to and exit from all markets; d) all manufacturers and consumers have perfect information about prices and quantities traded on the market; e) companies attempt to maximize profit and consumers attempt to maximize utility; f) companies have free access to information about technologies (Goodwin, Nelson, Ackerman & Weisskopf, 2009; Nicholson & Snyder, 2008).

where $p(t_0) = p_0$ is the magnitude of instantaneous commodity price p at the initial time t_0 of monitoring the instantaneous commodity price on a select model market and $p(t)$ is the magnitude of instantaneous commodity price at time $t \geq t_0$.

Instantaneous commodity depreciation w is a real composite function of time, i.e. $w(t) = w(p(t))$, where $w(p)$ is the continuous decreasing real function of instantaneous commodity price p and instantaneous commodity price p is a continuous decreasing real function of time t . If we monitor the development of instantaneous commodity depreciation at time interval $\langle t_0, t_e \rangle$, then for the first derivation of functions $w(p)$ and $p(t)$ it holds that $\frac{dw}{dp}(p) < 0$ for $p \in \langle p(t_e), p(t_0) \rangle$ and $\frac{dp}{dt}(t) < 0$ for $t \in \langle t_0, t_e \rangle$. It directly follows from these relationships

that for the interval $\langle t_0, t_e \rangle$, $\frac{dw}{dt}(t) = \frac{dw}{dp}(p(t)) \cdot \frac{dp}{dt}(t) > 0$. This means that instantaneous commodity depreciation w is a continuous increasing real function of time t , which corresponds to trends for common commodities over time. Then, instantaneous commodity relative depreciation RD is also a continuous real function at interval $\langle t_0, t_e \rangle$ and $\frac{dRD}{dt}(t) > 0$ for every time $t \in \langle t_0, t_e \rangle$.

Let us assume that the magnitude of instantaneous commodity relative depreciation RD over time t increases with acceleration and the acceleration of instantaneous commodity relative depreciation increases in direct proportion to the instantaneous speed of change of instantaneous commodity relative depreciation at time t . The motion equation of instantaneous commodity relative depreciation is thus (Zeithamer, 2011b)

$$\frac{d^2 RD}{dt^2}(t) = B \frac{dRD}{dt}(t), \quad (4)$$

where B is the constant of proportionality, $B > 0$. In addition, let initial conditions be met where $RD(t_0) = RD_0 > 0$, $\frac{dRD}{dt}(t_0) = v_0 > 0$, so that the solution of differential equation (4) at interval $\langle t_0, t_e \rangle$ is then

$$RD(t) = RD_0 - \frac{v_0}{B} + \frac{v_0}{B} e^{B(t-t_0)}. \quad (5)$$

From here it directly follows that instantaneous commodity relative depreciation RD is a purely convex function at interval $\langle t_0, t_e \rangle$. This means that the increase in instantaneous commodity relative depreciation at interval $\langle t_0, t_e \rangle$ is progressive.

Let us assume that instantaneous commodity relative depreciation RD increases with acceleration at time t again and the acceleration of instantaneous commodity relative depreciation increases in direct proportion to the speed of change of relative depreciation at time t while the constant of proportionality is negative. The motion equation of instantaneous commodity relative depreciation is then (Zeithamer, 2011a; Zeithamer, 2011b)

$$\frac{d^2 RD}{dt^2}(t) = -B \frac{dRD}{dt}(t), \quad (6)$$

where $(-B)$ is the constant of proportionality, $B > 0$. In addition, let initial conditions be met

where $RD(t_0) = RD_0 > 0$, $\frac{dRD}{dt}(t_0) = v_0 > 0$, so that the solution of the differential equation (6) at interval $\langle t_0, t_e \rangle$ is then

$$RD(t) = RD_0 + \frac{v_0}{B} - \frac{v_0}{B} e^{-B(t-t_0)} \quad (7)$$

From here it directly follows that instantaneous commodity relative depreciation RD is a purely concave function at interval $\langle t_0, t_e \rangle$. This means that the increase in instantaneous commodity relative depreciation at interval $\langle t_0, t_e \rangle$ is degressive. The progressive increase of instantaneous commodity relative depreciation is characteristic, for example, of certain types of food goods, while degressive increase of relative depreciation may be seen in certain commodities in the automotive industry.

3. Non-linear motion equation of commodity state with inflexion

In this section of our work we again presume the following conditions to be met: (1) the commodity is on one of the markets of the model of market structure with perfect competition at initial time t_0 ; (2) at time t_0 the commodity is found in its initial state, which is uniquely determined by the magnitude of instantaneous commodity depreciation $w(t_0) = w_0$.

Let the acceleration of $\frac{d^2RD}{dt^2}$ of the instantaneous commodity relative depreciation be the sum of two components, i.e.

$$\frac{d^2RD}{dt^2} = \left(\frac{d^2RD}{dt^2} \right)_1 + \left(\frac{d^2RD}{dt^2} \right)_2 \quad (8)$$

The first component of acceleration is a consequence of physical and chemical processes, which cause the first component of the instantaneous acceleration to increase in direct proportion to the magnitudes of rate of change of the instantaneous commodity relative depreciation, i.e.

$$\left(\frac{d^2RD}{dt^2}(t) \right)_1 = B \frac{dRD}{dt}(t), \quad (9)$$

where B is the proportionality constant, $B > 0$ and $t \in \langle t_0, t_e \rangle$. The second component of acceleration results from physical and chemical processes (also including socio-psychological processes in physio-chemical approximation), which cause the second component of the instantaneous acceleration to be directly proportional to the product of the magnitude of rate of change of the instantaneous commodity relative depreciation $\frac{dRD}{dt}(t)$ and the magnitude of instantaneous commodity relative depreciation $RD(t)$, while the proportionality constant is negative, thus

$$\left(\frac{d^2 RD}{dt^2}(t) \right)_2 = -A \frac{dRD}{dt}(t) RD(t) \quad (10)$$

where $(-A)$ is the proportionality constant, $A > 0$, $t \in \langle t_0, t_e \rangle$.

By substituting relations (9) and (10) into equation (8), we obtain the following motion equation for the acceleration of instantaneous commodity relative depreciation (Zeithamer, 2012 b)

$$\frac{d^2 RD}{dt^2}(t) = B \frac{dRD}{dt}(t) - A \frac{dRD}{dt}(t) RD(t) \quad (11)$$

where $A > 0$, $B > 0$, $t \in \langle t_0, t_e \rangle$.

One of the subsets of the set of solutions for motion equation (10) is given by

$$RD(t) = \frac{y_2 + y_1 e^{\sqrt{D}(t+C_2)}}{1 + e^{\sqrt{D}(t+C_2)}} \quad (12)$$

where for constants D, y_1, y_2, C_2 it follows that $D = B^2 + 2AC_1$, $y_1 = \frac{B + \sqrt{D}}{A}$, $y_2 = \frac{B - \sqrt{D}}{A}$,

$0 < |y_2| < y_1, y_2 < 0$, $-\frac{B^2}{2A} < C_1 < 0$, $C_2 = \frac{1}{\sqrt{D}} \ln \left(\left| \frac{y_2}{y_1} \right| \right) - t_p$. At time $|t_p|$ the value of instantaneous commodity relative depreciation is zero. The given subset of the solutions of motion equation (10) shows the progressive – degressive increase of instantaneous commodity relative depreciation with an inflexion point at time $t = -C_2$ and a limit at $\lim_{t \rightarrow +\infty} RD(t) = y_1$.

4. Conclusion

Assuming that the market value of the commodity at time t is fully determined exclusively by the value of the instantaneous commodity price $p(t)$, methodological procedures taken from theoretical physics were used to construct motion equations for instantaneous commodity relative depreciation RD . Motion equations (4) and (6) for the progressive and degressive increase of instantaneous commodity relative depreciation are linear differential equations of the second order with constant coefficients assuming market structures with perfect competition. Motion equation (11) of instantaneous commodity relative depreciation for the progressive/degressive growth of depreciation is a non-linear differential equation of the second order with

constant coefficients. Motion equation (11) was also derived for instantaneous commodity relative depreciation on a market with perfect competition. In the solutions set for motion equation (11), there is the subset of solutions which model progressive/degressive growth of the magnitudes of instantaneous commodity relative depreciation with a single inflexion point.

Abstract

Although design thinking becomes increasingly attractive for business management, it has not yet been sufficiently recognized and discussed in the context of entrepreneurship and especially not in the context of entrepreneurship education. The objective of this contribution is to conceptually analyze the potentials of EDT as being a rather new method for entrepreneurship education in universities. The results of our work show that the characteristics of EDT can enhance entrepreneurship education. In addition we reveal that EDT offers beneficial guidelines for the design of entrepreneurship education programs.

Keywords: Design thinking, entrepreneurial thinking, Entrepreneurial Design Thinking®, entrepreneurship education, teams.

1. Introduction

Although design thinking becomes increasingly attractive for business management, it has not yet been sufficiently recognized and discussed in the context of entrepreneurship and especially not in the context of entrepreneurship education. Still, there seems to be a gap between the design focus on creativity and invention on the one side and the entrepreneurial innovation focus on the other side (Cruickshank, 2010).

According to Romme (2003), design can be understood as an ideal-typical mode of engaging in scientific research and as an alternative to a natural sciences- and a humanities-based mode. Especially, design science involves inquiry into systems that do not yet exist. It is based on contributing to the so-called 'relevance gap' between theory and practice by finding out about if systems will work (epistemological notion of pragmatism), and it draws on 'design causality' in order to produce scientific knowledge, which is actionable and also open to validation (Van Aken & Romme, 2009; Van Aken, 2004; Romme, 2003). Against this background, design thinking is the basic methodology in order to 'build up' ideas as the outcome of creative processes. According to Simon (1969, 55), this process has seven stages (define, research, ideate, prototype, choose, implement and learn) which can occur simultaneously and can be passed through repeatedly. Similar stage models have been developed by institutions like the Hasso Plattner Institute of Design at Stanford University (dschool.stanford.edu)

in Stanford, USA, or most recently the School of Entrepreneurial Design Thinking® – The ED-School (www.ed-school.com) at the University of Koblenz-Landau in Koblenz, Germany.

In the following, we intend to overcome the gap between creativity and entrepreneurial innovation by introducing the concept of Entrepreneurial Design Thinking® (EDT). Based on the body of knowledge concerning design science, design thinking and entrepreneurship, we define EDT as a team-diversity-based approach for treating user-centered problems as entrepreneurial opportunities within an iterative process supported by the use of creativity fostering tools and environments.

The objective of this contribution is to conceptually analyze the potentials of EDT as being a rather new method for entrepreneurship education in universities. The results of our work show that the characteristics of EDT can enhance entrepreneurship education. In addition we reveal that EDT offers beneficial guidelines for the design of entrepreneurship education programs.

The research design of this contribution is mainly conceptual however we also implicitly integrate our first experiences with workshops that we conducted in EDT classes at the University of Koblenz-Landau. In the following, we will discuss different models of design thinking and conceptually develop an understanding for the characteristics of EDT. Afterwards we will formulate a model of EDT, introduce its main characteristics and discuss the implications of this model for entrepreneurship education.

2. Theoretical Background

2.1. Design and Design Theory

The concept of design has a long tradition in organization theory as well as in management science, not least by virtue of the seminal work of Simon (1969). Thus it is not surprising that the field of design management evolved very successfully over the last decades in both disciplines (Cooper & Junginger, 2008). In very general terms, design is about the creation of meaning and describes both the results (systems, artifacts et cetera) and the development processes, which lead to the respective outputs (Kazmierczak, 2003). Design management conceptually links the potential benefits of creative design resources with business-oriented management decisions and the potential advantages of the use of management know-how with design processes and related outcomes (Best, 2006). Besides its business orientation, design management's contributions as a research discipline are rooted in what is called design research and design science.

In his work Owen (1998) identified that design always consists of two phases: (1) an analytical phase consisting of searching an understanding and (2) a synthetic phase consisting of experimentation an invention (Figure 1).

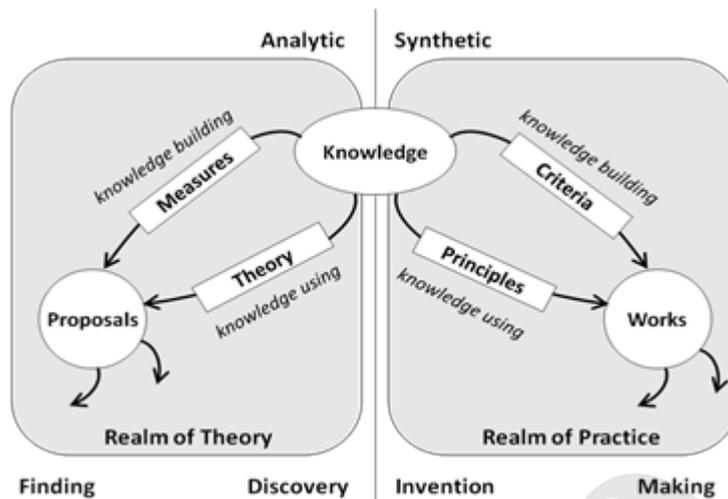

Figure 1: Owen's model of knowledge generation in design theory (Owen, 1998)

Owen (1998) sees those phases in a framework that can describe the process of knowledge development through design. He suggests that the design process has both analytic and synthetic elements, and that it operates in both the theoretical and practical realms. In the analytic phases of design, one focuses on finding and discovering, while in the synthetic phases of design, one focuses on invention and making. Movement between the theoretical and practical realms happens as participants in the process draw insights from what they have learned in the world of practice, convert it to abstract ideas or theories, and then translate those theories back into the realm of practice in the form of artifacts or institutions. He proposes that this is the elementary innovation process that fits all fields, although tools and techniques might differ in each field.

2.2. Design Thinking Theory

The range of understanding of design thinking is broad and diverse across several disciplines. These definitions cover generic descriptions like “approaching managerial problems as designers approach design problems” (Dunne & Martin, 2006, 512) to narrow definitions of design thinking as “a distinctive process of mind which manifests itself in shape, configuration or composition of pattern or color containing performance (functionality), image (aesthetics, look, feel) and style (a manner of doing things, especially in a fashionable way) to produce a product, process, service, user experience, or an organic change” (Ilipinar et al., 2008, 6). As an effort to define design thinking by delimitation, Liedka (2004) compares science and design and infers that science uncovers actual conditions while design envisions options. Romme (2003) compares design with science and with humanities as different research paradigms and connects the disciplines with the proposal of a design-science interface, and arranges a circular design within. Furthermore, the independence and membership of design thinking to disciplines throughout different sciences and arts is being discussed (Johansson & Woodilla, 2009). Buchanan (1992) even formulates a ‘doctrine of placements’, describing design thinking as the systematic pattern of conceptual repositioning designs (including symbols, material objects, activities, organizations or complex systems).

2.3. *The Entrepreneurship-Design-Thinking Nexus*

Entrepreneurship and design thinking seem to be two disciplines, which are divided and thematically far away from each other. O'Grady (2008) even reveals a 'culture clash' between social sciences and design when he compares the different cultures of management and design students. Although there are interfaces between those disciplines, like in organizational design, there has always been the limitation of comparability due to different attitudes towards research: while design majoritarian excludes prediction as a *modus operandi* and embraces intuition and experiments, social sciences (including entrepreneurship) rely on prediction as their source of knowledge (Dunnbar & Starbuck, 2006). Even while design thinking is promoted as one of five future entrepreneurial minds (Duening, 2010) it is limited to the fields of 'organizing' and 'operating'.

Despite this fundamental difference in researching approaches and allocations, design thinking and entrepreneurship seem to be a promising combination as a teaching approach in entrepreneurship education. Especially in the area of scientific entrepreneurship, design thinking can help to build sustainable concepts that are no more just technology-driven but also consider real-live-problems as impulses for development. In order to identify the possible benefits from this combination, we first need to unveil the nexus of entrepreneurship and design thinking. In literature, we can find examples that discuss similarities between those two disciplines. Following we will discuss the notion of entrepreneurs as designers (actors), the similarity in environmental condition, the similarity in the requirement of character and the role of creativity as a tool.

Similarity of actors: Boland et al. (2008) for example describe entrepreneurs as designing managers. In a similar approach, Sarasvathy et al. (2008) indicate that entrepreneurs and designers have similarities by unveiling the entrepreneurs' attributes as designers. In their work they point out that entrepreneurs are designers on two levels. First they design entrepreneurial artifacts, which can be new organizations, markets or institutions. Second their artifacts design their own environment. Furthermore in design thinking (Dunne & Martin, 2006) as well as in entrepreneurship (Foo et al., 2005) the advantages of multidisciplinary teams are discussed. Both disciplines consider team-based approaches as central elements.

Similarity of environment: Furthermore entrepreneurs deal with uncertainty that makes it impossible to calculate probabilities for future consequences (Sarasvathy, 2004; Sarasvathy et al., 2008). This environmental condition is also identified in the context of design with the notion of 'wicked problems' that designers face (Buchanan, 1992). In both disciplines uncertainty is a major force that drives behavior.

Similarity in character: In entrepreneurship as well as in design thinking there is a distinct need for empathy. Entrepreneurs use empathy in order to gauge the appropriateness of novel ideas (Chiles et al., 2010). It helps entrepreneurs to understand the problems (prospect) customers have. Designers use empathy in the same manner when they imagine the world from a user perspective, (Brown, 2008) and understand (prospect) users' problems (Dunne & Martin, 2006). This attribute allows for entrepreneurs and designers to address explicit or latent needs. Especially the identification of latent needs enables the creation of new markets.

Similarity in creativity as a tool: Creativity is like empathy an important element in both disciplines. In design thinking creativity is the core of discussion in all works (Ping-Yong Lee, 2008). Li (2002) describes design as being the synthesis of creativity as the ability to imagine new thing and innovation as the ability to bring those new things together. In entrepreneurship creativity is required in order to identify opportunities that lead to new ventures (Ko & Butler, 2007). Matthews (2010) argues that creativity is the intersection between entrepreneurship and design. She first analyzes entrepreneurship, design and creativity as independent processes and concludes that creativity is the main similarity between entrepreneurship and design.

As the following figure summarizing highlights, design thinking and entrepreneurship have similarities in actors, environmental conditions, character and tools.

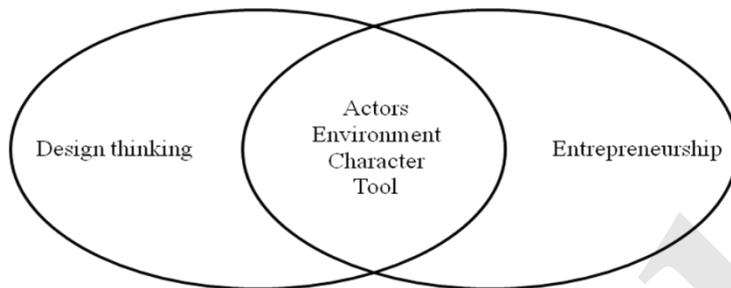

Figure 2: The entrepreneurship-design-thinking nexus

3. The essence of design thinking

Design thinking was gradually derived from classical design domain into various disciplines (Lindberg et al., 2010). Different applications of design thinking accompany different process models and therefore we find variety of understandings of what design thinking is ought to be. For the formulation of Entrepreneurial Design Thinking® (EDT) as a teaching method for entrepreneurship education, a solid definition of design thinking and its process is needed. A review of different models of design thinking and their interpretation will help to postulate a generic definition of design thinking and its process for the ‘entrepreneurial purpose’. Doing this, we will be able to understand the basic principles of design thinking that sum up into a general understanding of design thinking. Therefore selected articles concerning ‘design thinking’ will be analyzed on two levels - design thinking comprehension and process model.

3.1. Design Thinking: A Literature Review

In an article published through Harvard Business Review, Brown (2008) introduces design thinking and expresses his comprehension by concentrating on the executers’ characteristics of the design thinking process: the ‘Design Thinker’. In his understanding a ‘Design Thinker’ has to provide empathy towards people he works with, apply integrative thinking, exhibit optimism, advocate experimentalism and embrace collaboration. Design thinking is described as “...a discipline that uses the designer’s sensibility and methods to match people’s needs with what is technological feasible and what a viable business strategy can convert into customer value and market opportunity” (Brown, 2008, 2).

He declares the design thinking process as a system of three phases (inspiration, ideation and implementation), while he emphasizes the circular mode of the spaces and the possibility to loop backwards if needed (Figure 3). In Brown’s concept, inspiration as the beginning of the design thinking process represents the recognition and understanding of a problem and opportunity. Subsequently in the space of ideation several ideas are generated,

which provide possible solutions to the problem. The following space of implementation employs the idea execution and the learning from the process so far.

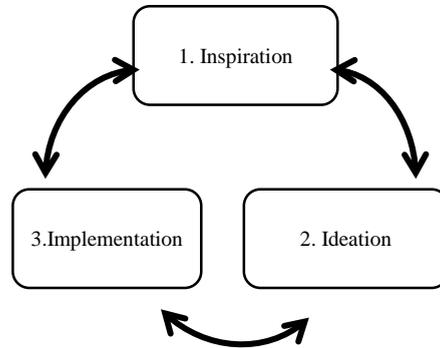

Figure 3: Design thinking spaces (Brown, 2008)

Clark & Smith (2008) describe design thinking more as a tool that helps business executives to adopt design instincts and methods. They see design thinking as a universal problem-solving method that can be implied in every profession. In their understanding design thinking enhances three types of intelligence that are necessary for innovation: (1) emotional intelligence as the ability to work with empathy, (2) integral intelligence for being able to bring different ideas together and keeping the big idea in mind while working on details and (3) experimental intelligence as an experience learning method. The formulated design thinking process exhibits five steps (Figure 4), beginning at understanding the problem, continuing by understanding the customer through observation, conceptualizing a solution and validating it. The last step is the implementation of the solution. Between validation and observation of the customer there can be iterating loops.

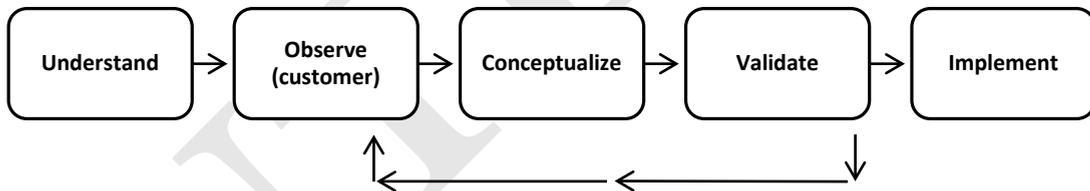

Figure 4: The experience design method at IBM (Clark & Smith, 2008)

On an article written by Dunne & Martin (2006), design thinking is described as the mental process that designers use. Furthermore a certain attitude of curiosity, as well as a design attitude is needed, meaning the designers perception of problems' constraints. Furthermore they formulate the request for integrative thinking, which provides a holistic view by identifying important relationships and extending the notion on salient aspects. Iterative and collaborative work is recognized as essential for design thinking. Both kinds of work emphasize the role of constraints as triggers for creative solutions and the benefits of collaboration with diverse team members. Regarding the process of design thinking the authors formulate 'The Cycle of Design Thinking' (Figure 5), which consists of four elements: generalize, generate ideas, predict consequences and test. This process model also exhibits a circular buildup, which benefits the work with difficult problems.

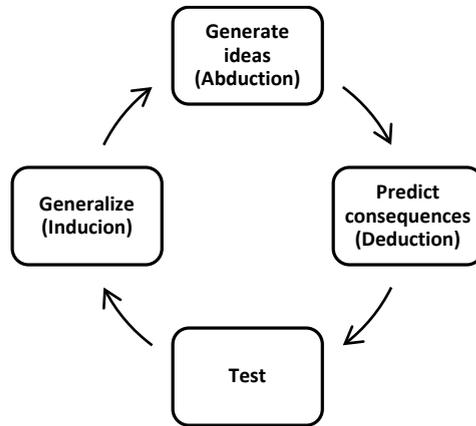

Figure 5: The Cycle of Design Thinking (Dunne & Martin, 2006)

Lindberg et al. (2010) introduce the design thinking process according to the approach of the Stanford d.school. They introduce their approach as a didactic process model that is used for design education (Figure 5). The main task of the model is to balance flexibility as well as sequentiality. Therefore the model is arranged in a linear manner but considers forward and backward linkages. In the phases of understand and observe the analysis of problems is essentially important for the following process of problem solution and is neglected in a lot of approaches. Within this approach great value is set upon this phase of the problem solution and big space within the process is acknowledged to it. Thereby especially empathy, the ability to put oneself in the situation of other people and to ‘change the perspective’ is emphasized. In the following phase of point of view gathered data is organized and insights are defined. In the phases of ideate and prototype creative solutions are ascertained and corresponding prototypes are produced. Especially brainstorming and modeling characterize these phases. In the last phase of test the prototypes are implemented and tested in real application. Corresponding modifications are made if there is any demand on correction.

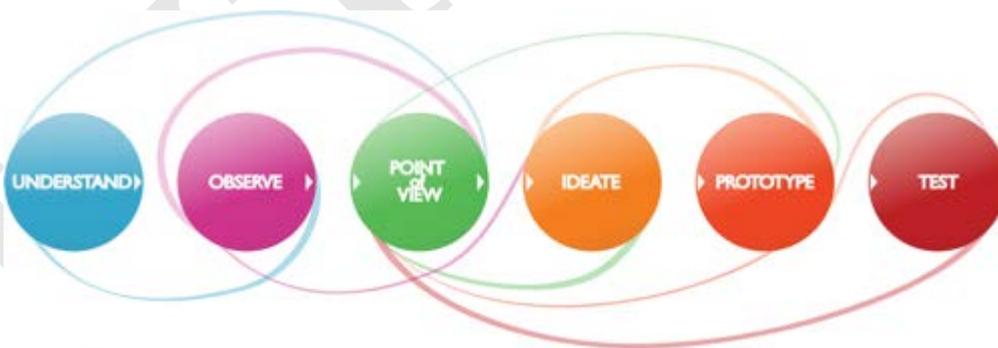

Figure 6: The Design Thinking Process at Stanford's d.school (Plattner et al., 2009)

3.2. A Generic Design Thinking Process

Regarding the literature review we can identify certain characteristics that are mentioned throughout all the design thinking concepts. In the following we will describe those characteristics. Furthermore we will develop a design thinking process that considers the above introduced processes.

Iterative, stepwise process: Although the models discussed above provide different processes, all of them exhibit an iterating buildup of some sort, from several looping steps (Clark & Smith, 2008; Stanford, 2009) up to complete circular structures (Dunne & Martin, 2006). The concept of process is the central promoted element in design thinking. As shown above every finding in the literature exhibits a process consisting of several phases as the key element of design thinking. The understanding of process is essential for making design thinking teachable as well as tractable (Chan, 2008). Furthermore, a process in design thinking assures that problems are treated until they reach the status of solutions or solution suggestions. Thus, the design thinking process can be regarded as the fundament of design thinking. In literature, the distinct term ‘procedural design thinking’ (Chan, 2006) emphasizes the importance of a ‘process aspect’ in design thinking. The iterative, stepwise process is due to the ‘wicked’ problems, design thinkers have to face (Buchanan, 1992). These problems are ill-formulated and characterized by provide confusing information and exhibit complex interdependencies. Therefore a linear technique would not be suited to address problems of wicked nature (Rylander, 2008; Buchanan, 1992). These problems are considered design thinkers’ challenges (Dunne & Martin, 2006). Apart from the amount and matter of the process steps, the tendency of implementing iteration is very clear. In addition, every design thinking process requires input (design problem) and produces output (solution or solution suggestions). The specification of input and output is depending on the particular scientific appliance of design thinking (e.g. management education). Furthermore the process of design thinking has to imply diverse elements, like activities, participants or guidelines. In summary we can formulate the standard that every design thinking process has to include iteration and stepwise processing in its structure.

Multidisciplinarity: The involvement of multidisciplinary teams in design thinking is promoted trough most of the literature (e.g. Dunne & Martin, 2006; Brown, 2008; Miosala & Toikka, 2008; Chan, 2008; Ungaretti et al., 2009). The source for this finding is the multidisciplinary affordance of the former introduced ‘wicked’ problems. Designers have to face challenges that arouse questions in several disciplines and therefore have to import knowledge from different sciences - they “are accustomed to forming ad-hoc teams and collaborating for a specific purpose” (Dunne & Martin 2006, 518). Hence design thinking has to enable and demand multidisciplinary teamwork. Multidisciplinary teamwork as an element of design thinking becomes recognized by phrasing the term ‘collaborative design thinking’ (Chan, 2008), giving this element an own space in design thinking theory.

The generic design thinking process is the result of our literature analysis (Figure 7). In the first phase of comprehension the main goal is to gain an understanding of a problem or problem situation. By observing behavior, simulating problem situations and interviewing customer orientation enables problem understanding. In the following phase of consideration ideas are developed based on the deeply understood problem. Techniques like brainstorming and creativity-fostering tools like playful environments support the development of ideas. Afterwards, the phase of creation is guided by prototyping of solutions. The design thinking process winds up in the phase of check, when a solution is brought to field-experiments and confrontation with prospect users. In each phase there can be one or more steps back to former phases in order to deepen or restart work if necessary.

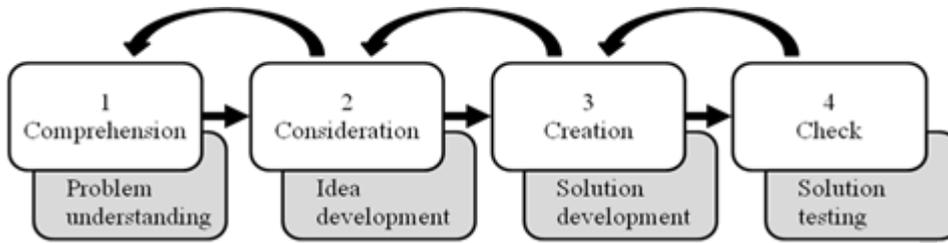

Figure 7: The generic design thinking process

4. The importance of Entrepreneurial Thinking

It is recognized that entrepreneurial thinking is not something someone is born with, but that it can be acquired (Krueger, 2003, 133; Gartner, 1988, 63; Minniti & Bygrave, 2001, 7). An entrepreneur learns through factual knowledge, experience and the interpretation of experience (Davenport et al., 1998, 43). This learning process is non-linear and continuous. The ability to identify a business opportunity depends on an entrepreneurs acquired knowledge (Hayek, 1945, 521f.; Gricnik., 2006, 1312) and ability to understand the problems of his customers (Shane, 2000, 452). Even more: the acquired knowledge enables an entrepreneur to interpret a situation as an opportunity (Shane, 2000, 452). Entrepreneurial thinkers exhibit a higher rate of alertness for opportunities (Kirzner, 1978, 35ff. & 65ff.; Kirzner 1997, 71f.) and intuition than other people (Allison et al., 2000, 32). Entrepreneurial learning builds on experience as the main source for knowledge as entrepreneurs reflect on their own actions (Dalley & Hamilton, 2000, 55). New experiences are combined with existing knowledge in order to expand it (Minniti & Bygrave, 2001, 5ff.). This is very similar to Owen's (1998) model of knowledge generation in design. Unexpected events cause a higher learning effect as they break routines (Jarvis, 1987, 167f.). The importance of experience is proven in a study conducted by Delmar & Shane (2006, 240), where they proofed that new ventures were more successful if they were founded by more experienced entrepreneurs. Opportunity identification is an essential entrepreneurial characteristic that is valuable for new venture creation. In entrepreneurship education we need students to learn how to create question instead of finding answers (Krueger, 2007, 132). This quality helps entrepreneurial student to understand and interpret problem situations as entrepreneurial opportunities. Considering the design thinking process, opportunity identification should be the first step, before students try to understand a problem – they should find it first.

According to Shane & Venkataraman (2000) entrepreneurs (1) discover, (2) evaluate and (3) exploit opportunities. So far, we discussed the concept of discovering (opportunity identification) and evaluating (design thinking). The last step refers to the exploitation of entrepreneurial opportunities. In the context of entrepreneurship education we understand the creation of a business model and writing of a business plan as the beginning of opportunity exploitation. Regarding the opportunity identification and design thinking process we can summarize, that students have found a problem, interpreted it as an opportunity and created and tested creative solutions. The entrepreneurial component of opportunity exploitation should now be introduced towards the end of the creative phases and lead to the creation of a business model based on the developed problem solution.

5. Introducing Entrepreneurial Design Thinking®

5.1. Characteristics of Entrepreneurial Design Thinking®

In the following the characteristics of EDT will be introduced and discussed.

Process: By discussing entrepreneurial thinking we identified entrepreneurial alertness as the main trigger in order to find and interpret opportunities. Entrepreneurial alertness as a main characteristic of entrepreneurial thinking is a precondition. Therefore it needs to be the first step in EDT. Only if a student is capable to identify a problem situation of a customer as an opportunity the student can consider this as a starting point for problem-solving. The exploitation of an entrepreneurial opportunity was introduced as the last phase of a combination of design thinking and entrepreneurship. Entrepreneurial thinking puts design thinking in brackets (Figure 8) and results in a concept for EDT as the combination of entrepreneurial thinking and design thinking.

Figure 8: Concept of Entrepreneurial Design Thinking®

The first phase in EDT is the identification of an opportunity which we label 'consciousness'. This marks the starting point for the next steps of comprehension, consideration, creation and check. The phase of opportunity exploitation is labeled 'carry out' and aims towards the development of business models and writing of business plans. The understanding of the design management process is essential for making design thinking teachable as well as tractable - this attempt is derived from researchers' effort to understand 'how one designs' (Chan, 2008). Furthermore, a process in design thinking assures that problems are treated until they reach the status of solutions or solution suggestions. Entrepreneurs face problems that are difficult to estimate, offer little information and intransparent links. As we already discussed design thinking and entrepreneurship literature acknowledges this circumstance (Buchanan, 1992; Sarasvathy et al., 2008; Sarasvathy, 2004). Iterative procedures account for this problem situation: students can revisit former work steps with new information and redesign their solution. The iterative structure of EDT allows for setbacks and therefore fosters experimenting.

Put together, we can describe EDT as an entrepreneurship education approach for treating user-centered problems as entrepreneurial opportunities within an iterative process of solution creation and exploitation.

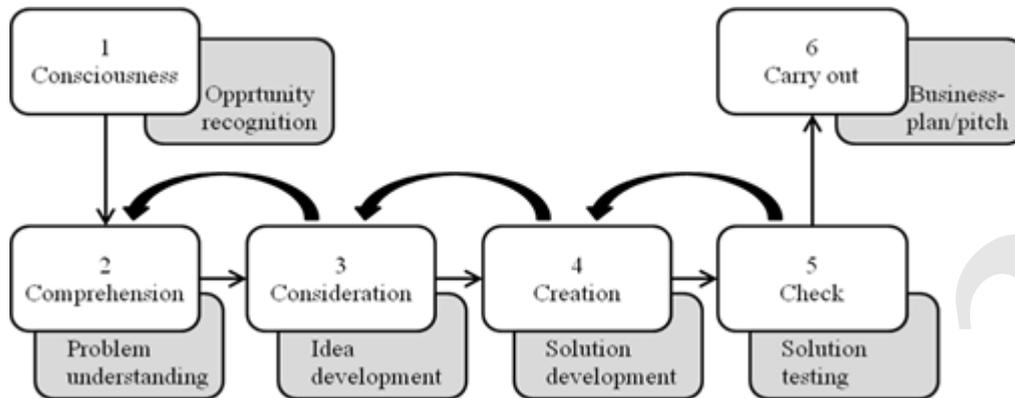

Figure 9: Process of Entrepreneurial Design Thinking®

5.2. An Entrepreneurship Education Approach

The purpose of entrepreneurship education is to impart entrepreneurship knowledge in students' minds. In order to successfully teach entrepreneurship it is necessary for students to actually experience entrepreneurship (Young, 1997). The concepts of experimenting and experience-based learning are important for entrepreneurship education, as they enhance learning success (Kourilsky & Carlson, 1997). Therefore educators should try to account for experimenting and experience-based learning by using EDT as a framework for entrepreneurship courses.

The students work on different complex projects, whereas the intensity and the continuity increase over the course of time. First of all introductory projects are elaborated for teambuilding and becoming familiar to the methods. Afterwards the groups work on enhanced projects, whereas the teams rotate and thereby every group frequently gets new team members. At last every team works on a great final project that deals with the solution of a real problem that the team observed before and prepares a possible foundation of a business model. The activities of the students are aiming to an entrepreneurial execution of creative problem solutions. Thus, the participants get an education in creative teamwork processes as well as in entrepreneurship subjects. The latter subjects include a variety of topics for example business models, marketing and distribution or investment and financing. On the basis of this knowledge the participants are enabled to independently evaluate their ideas and to write a business plan. Thereby the members get entrepreneurial competences, which are not only important for their self-employment but also for an employment (intrapreneurship).

During the course, the students should be accompanied by several advisers, who do not actively influence the process but give feedback and suggestions to indirectly instruct the participants. Ideally multiple advisers with different specializations are available to holistically accompany the students.

6. Implications for Entrepreneurship Education Research and Practice

EDT, as it was conceptually argued, is a very helpful methodology especially for entrepreneurship education. It may supplement the entrepreneurship research agenda on the levels of diverse teams, user-centricity, opportunities and processing. Further research needs to discuss these potentials on a broader empirical basis as well as in other contexts, like corporate or social entrepreneurship. Especially, our hypothesis is that EDT will increase the likelihood of successful start-ups from university origins. This also needs to be proved, empirically with respective rigor.

EDT definitely offers an alternative scenario in order to impart entrepreneurial competences. It is the atmosphere and using building bricks and plasticize which makes this learning process playful. Also, it includes the possibility of self-evaluation of the measures provided during the EDT workshops because it is dynamic and flexible in itself.

Sound teams are the basis for successful start-ups. Most often, potential team members use well established contacts in order to build a team accrue from stable friendship-based relationships (Francis & Sandberg, 2000) or family connections. Without questioning the positive effects of trust-based close relationships, we like to recommend a more open perspective also here because we see a huge gap between what is used as contacts and what could be used. EDT not only opens-up the perspective for other disciplines and related problem-solving perspectives but also for potentially completely new team members.

4th International Conference on New Horizons in Education

Power law distribution of student's achievement in stem: indication of ability or failure

Ivica Luketin*, Ivica Boljat

Split University, Faculty of Natural Sciences and Mathematics 21000, Split, Croatia

Abstract

Analyses of results on recent state matura examination in Croatia suggest power law distribution in physics similar to corresponding examination on Advancing physics in G. Britain. Same distribution has been observed in some other STEM subjects (e.g. informatics and mathematics) in Croatian matura examination. Interpreting results through the lens of Gauss distribution (traditionally prevailing in educational community) lead to wrong conclusions. Grounded on heuristic argument that nature of school knowledge differ, we justify choice of power law distribution as more appropriate for analyzing STEM subjects, not questioning suitability of Gauss distribution for analyzing achievement in humanities and arts.

Keywords: state examination, distribution, power law, nature of knowledge

1. Introduction

State matura examination in Croatia begun in 2010. Students successfully passed the 4nd class of gymnasium or vocational schools (in average at age of 19) are eligible to undergo matura examination. The purpose of matura is evaluation of student's school achievements. In spite of, according critics (Bezinović, 2010), numerous drawbacks (inclination to facts testing, does not evaluate application of knowledge in everyday life, does not examine critical thinking, does not assess ability for hypotheses making, reduces teaching on preparation for exams instead of developing student's high cognitive competences and creativity), matura, from its inclusion, also serves as university entrance exam. It was questioned matura exam as appropriate instrument of university success prediction. Some universities departments (arts, medicine, law, physical) add some domain specific entrance examination. It is expected that matura in future be shaped more as certification of high student's school achievements.

In the shadow of controversies concerning the purpose of matura state examination, which attract public attention, we accept challenge (Bezinović, 2010) of discussion on metric characteristics of exam tests. While Bezinović (2010) blames absence of predefined (expected) metric characteristics in exam preparation, we claim that authors of matura exam implicitly expected Gauss distribution of results. It is obvious if one see post tests analyses, made by same educational agency responsible for matura exam realization. Our position is that Gauss distribution is appropriate for analyzing achievement in humanities and arts, but leads to wrong conclusions applied on exam data concerning STEM subjects (especially physics and informatics). We propose power law distribution (Newman, 2006) as superb to Gauss in analyzing results in physics and informatics. Similar distribution of data on A-level physics examination (Advancing physics) in G. Britain is described (A-level results, 2012). Finally, we pose heuristic argument that difference in empirical data for STEM versus humanities

* Ivica Luketin, tel. +385 998 352 098.

E-mail address: luketin@pmfst.hr

school subjects on matura examination may stem from somewhat different nature of corresponding school knowledge.

2. High school curriculum and knowledge assessment

High school curriculum in Croatia is composed of mainly two parts: STEM (mathematics, informatics, physics, chemistry, biology and technology in some vocational schools) and humanities (mother languages, classic and foreign languages, history, arts, philosophy and religious) subjects. Some social (sociology, economy, geography) subjects, physical training and promoting citizenship and health form rest of curriculum but with minor impact on student's school success. Obligatory subjects on matura examination are mother language (Croatian at the most), mathematics and one foreign language (English at the most). Students can choose elective subjects too.

Exam questions are based on the learning outcomes. Besides multiple choice questions, some tasks are open ended or in essay form to access high cognitive competences and creativity.

3. Results of 2012 Croatia matura exam in physics, informatics and languages

3.1. Croatian and English language as typical instances of humanities subjects

Results of examination on Croatian language (in gymnasium and vocational schools) are shown in Fig.1.

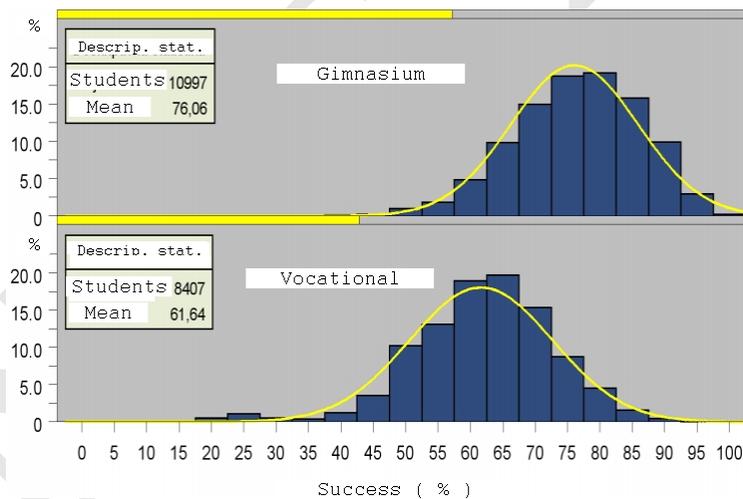

Fig.1. Distribution of percent success on Croatian language

Similar results, shown in Fig.2, are obtained for foreign language (at the most English).

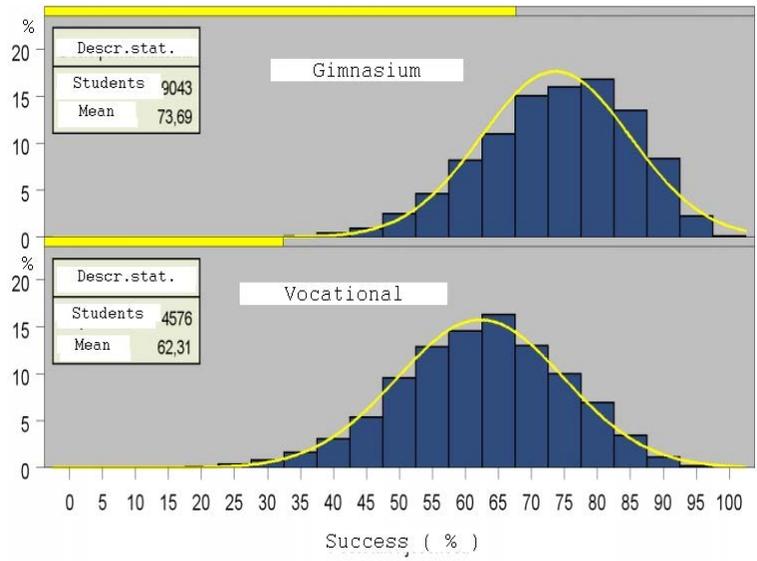

Fig.2. Distribution of percent success on English language

3.2. Physics and informatics as representatives of STEM subjects

Results of examination on physics (in gymnasium and vocational schools) are shown in Fig.3.

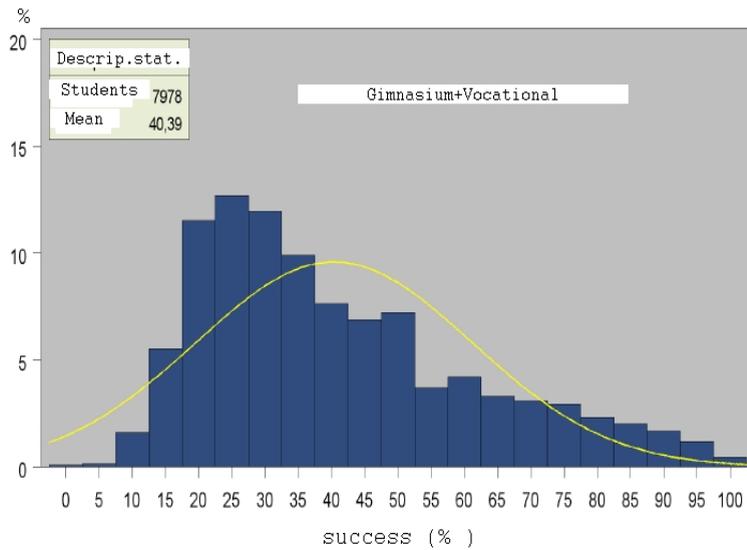

Fig.3. Distribution of percent success on physics

Results of examination on informatics (in gymnasium and vocational schools) are shown in Fig.4.

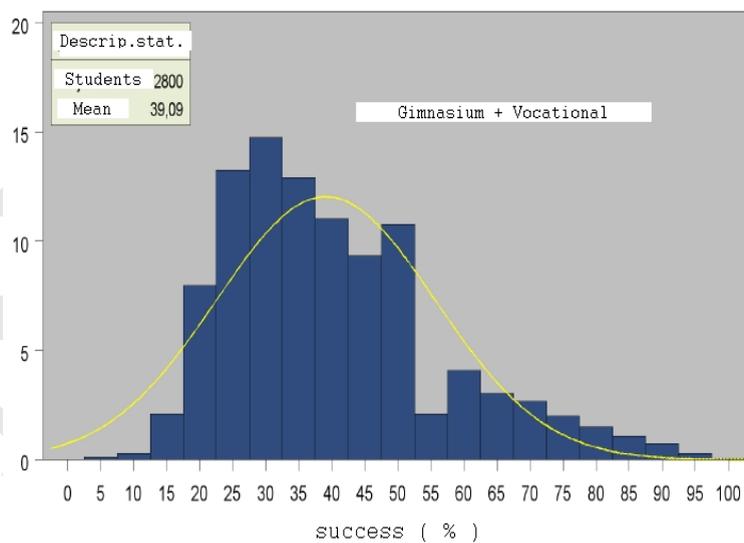

Fig.4. Distribution of percent success on informatics

On each graph on horizontal axe is shown percentage of successfully solved tasks, while on vertical axe is shown percentage of students who had corresponding success. E.g. closer examination of upper figure reveals that 15 % of students (i.e. 420) successfully solved 30 % tasks (multiple choice questions and open ended tasks) which qualified them for mark two because examination agency considered success of 25 % as lower limit to pass exam on informatics.

4. Analyses of results

4.1. Results on humanities exams are well approximated with Gauss distribution

Results of exams on four school subjects (Ispiti državne mature 2011/2012, 2012) shown on previous graphs has been analysed by state examination agency responsible for matura exam realisation. We agree with treating data on languages exams as belonging to Gauss distribution. It is obvious from the graphs (Fig.1 and Fig.2) that exam data for languages are very well approximated with bell-shaped Gauss distribution. Majority of students (60 %) is grouped in middle bin with mark good (3). The rest of them are distributed in class with mark enough (2) or with mark very good (4) or excellent (5). A certain degree of skewness to the right show an over dominance of reproduction type questions which is characteristic of school subjects inclined to transfer of cultural heritage. Also, the mean on Croatian language for gymnasium population is greater (76 %) than for vocational schools (62 %), what is expected when knowing higher primary school grades of students entering gymnasium.

4.2. Results on STEM (physics and informatics) are to be approximate with power law distribution

Key point of our work is that we disagree with treating exam data on physics and informatics as appropriate to be described by Gauss distribution. Visual inspection of graphs (Fig.3. and Fig.4.) is enough to reject attempt of psychometric experts to push empirical data under the bell of theoretically imposed Gauss distribution (green curve on figures). Quantitative analyses is not necessary to accept need for another distribution, better approximating data. We propose power law distribution. Quantitative proving of appropriateness of that distribution and advantages over possible choice of some exponential distribution will not be undertaken in this work (Clauset, 2009). For the first approximation it will suffice visual inspection.

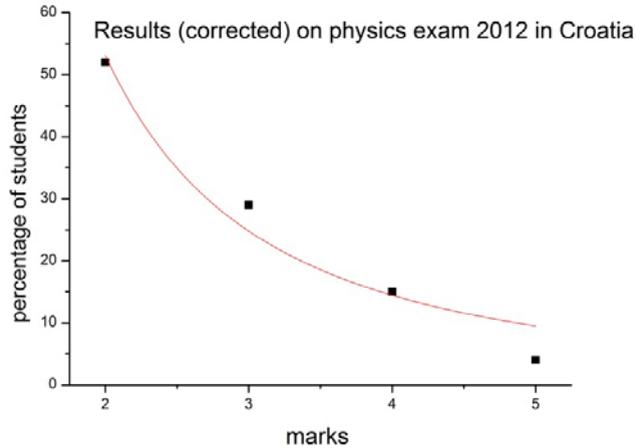

Fig.5. Power law distribution of percent success on physics

Here we have to emphasize that values on the graph are not crude data from physics exam in Croatia 2012. We made one important correction. Mark one (1) is missing on upper graph. Really, about 20 % students on that exam did not pass exam because they earned less than lower limit of 22 % successfully solved questions. We claim that these students had not been allowed to approach the matura exam. They have positively finished 4th class as result of constantly lowering of threshold in Croatian school system. Result on matura exam clearly indicates that they had not acquired competences in course of four year learning of physics. Same conclusion is concerning informatics result too.

5. Comparison with results of advancing physics exam in G. Britain

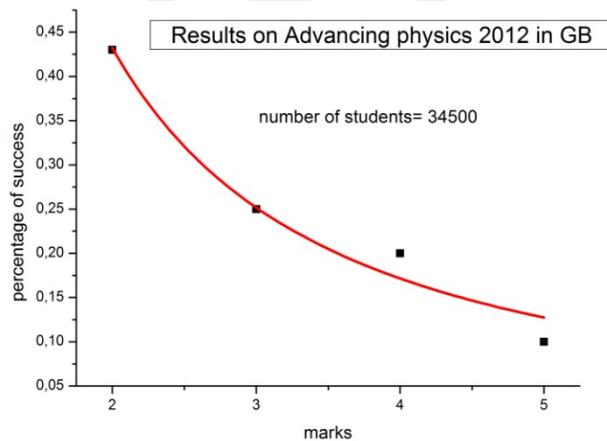

Fig.5. Power law distribution of percent success on physics

It is very suggestive to compare results of Croatian matura exam on physics with similar state examination on Advancing physics curriculum in Great Britain. That curriculum has similar coverage of themes, use of

mathematics and cognitive load expectation (problem solving) but is realised more compactly, in two year. To be consistent with marking schemas as used in Croatia and other continental Europe we transformed British marking schema so that level of success A* is mapped to mark excellent (5), level A to mark very well (4), level B to mark good (3), levels C,D and E are mapped to single mark enough (2). Several percents of students which had not passed exam are neglected, being inside statistical error. It is obvious good fitting of data to power law distribution whose mathematical expression has form:

$$y = x^a$$

a is parameter $\approx -2,5$

Empirical data partially depart from theoretical distribution in range of level A, where has more than expected students. We guess that reason is very competitive British high school system and more than expected fraction of, STEM inclined students, capable to study science and engineering faculties.

6. Does different nature of school subject's knowledge cause different exam data?

What's matter interpreting results of all school subjects as susceptible to Gauss distribution? First obvious impression is success in humanities and failure in STEM subjects. School authority in Croatia, parents and media proclaimed that schools made good jobs in humanities subjects while teacher of STEM subjects did not. We disagree with this interpretation insisting that results of STEM subjects are not to be expected to behave according to law of Gauss distribution, but, instead, to power law distribution.

Power law distribution is appropriate when describing phenomena in which huge events happen to occur extremely rare, smaller events occur often but very small events occur quite often. Examples of such events are numerous:

- distribution of earthquakes (huge earthquakes are extremely rare, small are very often)
- number of injuries in wars (very rare there are a lot of injuries in war, usually there are only several),
- number of cities with certain population (there is little cities with population like New York, but a lot of cities with small population),
- number of islands with area larger than certain (little islands with great area, almost infinity islands with very small area)
- etc

Applied on school knowledge based on mathematical reasoning (STEM subjects), heuristics is next:

- not too much students are ready to face unknown situation and solve problems using mathematical reasoning, majority of them are conform dealing with only familiar tasks. If so, rare students can earn excellent mark on exam, and the most of them are satisfied with just passing exam. Fast changing nature of informatics and sciences, process of constant construction and deconstruction of meaning fare from

equilibrium is not acceptable to majority, satisfied only with using new technology. But for development and solving complex problems our civilization is faced, involvement of talented students which outperformed on exams is crucial. Science has nature of constant development and improvement, so keen to talented minority ready for experimenting. Schools and teachers providing power law distribution of student's success on STEM subjects work good job.

What about majority passing good on humanities exams?

- they are of utmost importance, because only well educated majority of citizenship can be guaranty of preserving values and cultural heritage of our civilisation. Creativity is key word in education (Robinson, 2006), but one can not expected that the biggest part of recent cultural artefacts will resist the judgement of future. The Bible, Mozart or Picasso have to be transfered to next generation. One do not expect better music than composed by Mozart, maybe only different.

To conclude, school education is balance between preserving and change, we need all values, but have to be aware of them when measure educational outcomes.

Pre-service science teachers' concerns about chemistry laboratory (case of Muğla University-Turkey)

Şendil Can^{a*}*^aMuğla University, Faculty of Education 48000, "Muğla", Turkey*

Abstract

The purpose of the present study is to investigate whether there will be some changes in pre-service teachers' concerns about chemistry laboratories as a result of the activities to be performed within the framework of the course of General Chemistry Laboratory I. The present study was carried out on 101 first-year students attending the department of science teacher education within the program of elementary education at the Faculty of Education of Muğla Sıtkı Koçman University in the fall term of 2011-2012 academic year and these students were taking the course of General Chemistry Laboratory I. Within the study, "The Scale of Concern about Chemistry Laboratories" developed by Bowen and translated into Turkish by Azizioğlu and Uzuntiryaki was used to collect data (Azizioğlu and Uzuntiryaki, 2006; Bowen, 1999). The data collected from the administration of the scale as pre-test and post-test revealed that the activities done in the laboratory resulted in reductions in concern level of the pre-service teachers.

Keywords: Chemistry laboratory, scale of concern, science, pre-service teacher, general chemistry

1. INTRODUCTION

One of the most important features of natural sciences differentiating it from other sciences is their focus on experiment and observation. The attitudes and behaviours of individuals learning by experimenting, observing, researching and discussing against events will be different from those educated through classical methods (Taşkın Ekici et al., 2002). Laboratory settings constitute the main element of the activities performed by students to learn scientific issues, develop their scientific research conducting skills and their perception of science, and generate various learning environments. Moreover, these are settings which are suitable for students to conduct cooperative works to research scientific issues (Hofstein and Lunetta, 2003). In laboratory works, students are encouraged to participate in scientific activities ranging from learning through experience and discovery, asking questions, suggesting solutions, making predictions, organizing the data to explaining through examples. Such activities help students gain some insights into how actual scientists carry out their works. Based on this fact, laboratory works can be used to enhance the attitudes towards science, scientific attitudes, scientific research methods, conceptual understanding and technical skills (Hofstein and Lunetta, 1982; Chiappetta and Koballa, 2002:150). Many science instructors point out the importance and significant affects of laboratory works in terms of enhancing students' science achievement and attitudes towards science (Hofstein et al., 2005; Renner, Abraham and Birnie, 1985; Renner, 1986; Roth, 1994; Shymansky and Kyle, 1988; Okebukola, 1986). Aydoğdu (1991) conducted a study entitled "Importance of Laboratory in Chemistry Teaching, Laboratory Techniques and

E-mail address: csendil@mu.edu.tr

Applications". Demirci (1993) stated that the greatest achievement in science education can be obtained through experimental method based learning.

On the other hand, it is known that there are some factors directly affecting laboratory applications of students. Though it is known that there are cognitive, affective and experimental dimensions of learning, the research shows that learning is restricted to its cognitive dimension in general (Driscoll, 1994; Durit, 1991; Mintzes, Wandersse and Novak, 1998). However, it should be noted that besides cognitive features affecting learning, social and affective features, positive and negative attitudes, students' needs, interest, expectations and orientations should be taken into consideration. Among the negative feelings, concern has an important place (Laukenmaan et al., 2003). This is a feeling adversely affecting science learning, it can be defined as a kind of fear of science. Czerniak and Chiarelott (1984) proved that high level of concern about science results in low science achievement and draw the attention to concern about science as one of the factors affecting science achievement. Concern about chemistry is defined in different ways by many different researchers. Breslow (1993) defined it as a fear of chemical substances. Eddy (2000) analyzed the concern about chemistry under three headings; concern about learning chemistry, concern about evaluation of chemistry and concern about chemical substances.

Anılan, Görgülü and Balbağ (2009) investigated whether there are significant correlations between students' concern about chemistry laboratory and gender, field of study, general academic achievement and opinions about the course of chemistry. The study was conducted with the participation of 94 students from the departments of Elementary School Mathematics Teaching and Science Teaching. All of the students were taking chemistry course. It was found that the pre-service teachers were experiencing some conflicts in relation to use of laboratory equipments and chemical substances, they felt comfortable while working with their peers, they did not have any concern about collecting data and use of laboratory time. For some items, significant differences based on gender were found between the pre-service teachers' concerns about chemistry laboratory and these differences favour female students. For some items, significant differences based on field of study were found in the opinions of students about their concerns about chemistry laboratory and these differences favour the department of mathematics teaching. For some items, significant differences based on whether the students attend day time or night time classes were found in relation to the students' concerns about chemistry laboratories and these differences favour night-time students.

In the literature, the studies mostly focus on the determination of students' attitudes towards laboratory applications or the problems experienced in laboratory applications (Ayas et al., 2002; Cronholm et al., 2000; Nuhoğlu et al., 2004, Yeşilyurt, 2006). As there is a lack of research looking at students' concerns about laboratories and applications in chemistry laboratories can be influential on students' attitudes towards laboratories and their achievement and their concerns, this study is believed to be a contribution to the existing literature. In this respect, the purpose of the present study is to investigate whether there will be any changes in the students' level of concern about chemistry laboratory as a result of the applications to be performed within the framework of the course of General Chemistry Laboratory I.

For this purpose, responses to the following sub-problems were sought:

1. What are the pre-test and post-test percentage distributions of the students' opinions elicited through the administration of "The Scale of Concern about Chemistry Laboratories"?
2. Is there a statistically significant difference between the "The Scale of Concern about Chemistry Laboratories" pre-test and post-test scores?

2. METHOD

The present study employing experimental method was conducted on 101 first-year students attending the department of science teacher education within the program of elementary education at the Faculty of Education of Muğla Sıtkı Koçman University in the fall term of 2011-2012 academic year and these students were taking the course of General Chemistry Laboratory I.

2.1. Data collection instruments

As data collection instruments, "The Scale of Concern about Chemistry Laboratories" developed by Bowen and translated into Turkish by Azizioğlu and Uzuntiryaki was used (Azizioğlu ve Uzuntiryaki, 2006; Bowen, 1999). At the beginning of the term, before starting the course of General Chemistry Laboratory I, "The Scale of Concern about Chemistry Laboratories" was administered as a pre-test. Throughout the term, the experiments required within the content of the course were performed and at the end of the term, "The Scale of Concern about Chemistry Laboratories" was administered once more as a post-test. The scale includes 20 statements designed in the form of 5-point Likert type. The participants responded to each item on a scale ranging from "Strongly Agree", "Agree", "Undecided", "Disagree" to "Strongly Disagree". In the scale, there are 15 items supporting concerns (negative) and 5 items not supporting concerns (positive). The scoring of the positive items is as follows: Strongly Agree=5, Agree=4, Undecided=3, Disagree=2 and Strongly Disagree=1 and it is in the reverse order for negative items. The Cronbach-alpha reliability coefficient of the scale was found to be .85 for pre-test and .92 for post-test.

2.2. Data analysis

In the analysis of the data, SPSS 14 program package was employed. Pre-test and post-test percentage distributions of the opinions elicited with the administration of "The Scale of Concern about Chemistry Laboratories" were analyzed through descriptive statistics. Dependent samples t-test was conducted to investigate whether there is a statistically significant difference between the pre-test scores and post-test scores.

3. FINDINGS

3.1. Pre-test and post-test percentage distributions of the opinions elicited through "The Scale of Concern about Chemistry Laboratories"

The pre-test and post-test percentage distributions of the pre-service teachers' opinions elicited through "The Scale of Concern about Chemistry Laboratories" were determined by using descriptive statistics and the results are presented in Table 1.

The options of "Strongly Agree" and "Agree" in the scale were considered to be Positive (Agree) and the options of "Strongly Disagree" and "Disagree" were considered to be negative (Disagree) and the option of "Undecided" was considered to be undecided. It is seen in Table 1 that in relation to negative items, that is, the items supporting the concerns (1, 3, 4, 5, 6, 7, 8, 10, 12, 13, 14, 15, 16, 17, 19), the most popular option adopted by the pre-service teachers is "disagree"; on the other hand, in relation to positive items; that is, items not supporting the concerns (2, 9, 11, 18, 20) again the most popular option is "agree". The percentages of post-test administered to the pre-service teachers both agreeing and disagreeing after the completion of the laboratory

experiments performed within the framework of the course of General Chemistry Laboratory I greatly increased when compared to the percentages obtained as a result of the pre-test. The explanation of this finding for each item is given below:

- Item:** “While using chemical substances in the laboratory, I feel restless” is disagreed by 45% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 75% of the participants.

Table 1. Pre-test and post-test percentage distributions of the students’ opinions elicited through “The Scale of Concern about Chemistry Laboratories”

Items	Pre-test (%)			Post-test (%)		
	Positive(Agree)	Undecided	Negative(Disagree)	Positive(Agree)	Undecided	Negative(Disagree)
1	34	18	49	23	3	75
2*	58	21	22	83	6	12
3	42	23	36	17	14	70
4	14	8	79	18	8	75
5	27	22	52	16	12	73
6	23	20	57	18	11	72
7	20	14	67	10	12	79
8	31	8	52	15	8	78
9*	75	14	12	77	8	16
10	18	22	61	15	18	68
11*	55	20	26	70	16	15
12	25	23	53	10	9	82
13	35	22	44	11	9	81
14	10	18	73	16	10	75
15	26	28	47	20	12	69
16	21	18	62	6	10	85
17	26	21	54	15	9	77
18*	43	28	30	81	9	11
19	10	13	78	13	9	79
20*	46	31	24	70	14	17

Negative items: 1=Strongly agree 2=Agree 3=Undecided 4=Disagree 5=Strongly disagree

***Positive items:** 1= Strongly disagree 2=Disagree 3=Undecided 4=Agree 5=Strongly agree

- 2. Item:** “I feel at ease while using the equipments in the chemistry laboratory” is agreed by 58% of the pre-service teachers according to pre-test results; yet, the same item is agreed by 83% of the participants.
- 3. Item:** “While getting ready for the laboratory, I feel worried about not being able to record the data to be obtained” is agreed by 42% and disagreed by 29% of the pre-service teachers according to pre-test results; yet, the same item is agreed by 17% and disagreed by 70% of the participants.
- 4. Item:** “I feel tense while working with other students in the chemistry laboratory” is disagreed by 79% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 75% of the participants.
- 5. Item:** “I feel worried about whether there is enough time to complete the work in the laboratory” is disagreed by 52% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 73% of the participants.
- 6. Item:** “While getting ready for the chemistry laboratory, I feel worried about the chemical substances I will use” is disagreed by 57% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 72% of the participants.
- 7. Item:** “While working in the chemistry laboratory, I feel tense while performing the tasks required by the laboratory” is disagreed by 68% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 79% of the participants.
- 8. Item:** “I feel tense while recording the data in the laboratory” is disagreed by 52% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 78% of the participants.
- 9. Item:** “I feel at ease while working with other students in the Laboratory” is agreed by 75% of the pre-service teachers according to pre-test results; yet, the same item is agreed by 77% of the participants.
- 10. Item:** “While working in the laboratory, I feel worried about how long the experiment will last” is disagreed by 61% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 68% of the participants.
- 11. Item:** “I feel comfortable in the presence of chemical substances around in the laboratory” is agreed by 55% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 70% of the participants.
- 12. Item:** “I feel tense while conducting a laboratory work” is disagreed by 53% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 82% of the participants.
- 13. Item:** “While working in the laboratory, recording the data I will need makes me tense” is disagreed by 44% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 81% of the participants.
- 14. Item:** “I feel worried while working in the laboratory with other students” is disagreed by 58% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 75% of the participants.
- 15. Item:** “While I am preparing for the laboratory, I feel worried about the time given to conduct the experiment” is disagreed by 47% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 69% of the participants.

16. Item: “While I am working in the laboratory, I feel tense as I am close to chemical substances” is disagreed by 62% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 85% of the participants.

17. Item: “I feel worried while using laboratory equipments” is disagreed by 54% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 77% of the participants.

18. Item: “While working in the chemistry laboratory, I feel relaxed about recording the data required” is agreed by 43% of the pre-service teachers according to pre-test results; yet, the same item is agreed by 81% of the participants.

19. Item: “While preparing for the chemistry laboratory, I feel worried about the fact that I will work with other students” is disagreed by 78% of the pre-service teachers according to pre-test results; yet, the same item is disagreed by 79% of the participants.

20. Item: “I feel relaxed about the time given to complete the laboratory” is agreed by 46% of the pre-service teachers according to pre-test results; yet, the same item is agreed by 70% of the participants.

3.2. Findings concerning the pre-service teachers’ pre-test and post-test scores from “The Scale of Concern about Chemistry Laboratory”

Independent samples t-test was employed to investigate whether there is a significant difference between the pre-service teachers’ pre-test scores and post-test scores and the results are presented in Table 2.

Table 2. t-test results concerning the pre-service teachers’ pre-test and post-test scores of the Scale of Concern about Chemistry Laboratory

Tests	N	\bar{X}	S	sd	t	p
Pre-test	101	68.85	11.87	100	-3.83	.000
Post-test	101	75.31	11.83			

In table 2, it is seen that there is a statistically significant difference between the pre-service teachers’ pre-test and post-test scores [$t_{(100)} = - 3.83$, $p < .05$]. Before conducting the experiments within the framework of the present study, the mean pre-test score was found to be $\bar{X} = 68.85$, yet, after conducting the experiments in the chemistry laboratory, the mean post-test score of the students was found to be $\bar{X} = 75.31$. This shows that the

experiments conducted in the laboratory within the course of General Chemistry Laboratory I resulted in reduction in the concern level of the students.

4. DISCUSSION

In the present study looking at whether there will be reduction in the pre-service teachers' concern level about the chemistry laboratory as a result of the experiments to be conducted within the course of General Chemistry Laboratory I, it was found that the majority of the pre-service teachers responded to the items supporting concern; that is, negative items by disagreeing and the majority of the pre-service teachers responded to the items not supporting concern; that is, positive items by agreeing. Moreover, the percentages of the pre-service teachers agreeing or disagreeing increased significantly after they completed the experiments during the term. Each item is discussed individually below:

The post-test percentage of the pre-service teachers disagreeing with the first item "While using chemical substances in the laboratory, I feel restless" is higher than their pre-test percentage. The reason for the increase in the post-test percentage can be the increase in the percentage of the pre-service teachers who do not feel restless while using chemical substances.

The post-test percentage of the pre-service teachers agreeing with the second item "I feel at ease while using the equipments in the chemistry laboratory" is higher than their pre-test percentage. The increase seen in the post-test percentage after the experiments were completed may indicate that the pre-service teachers' ease of using laboratory equipments has increased as a result of conducting the experiments in the laboratory.

While the pre-test percentage of the pre-service teachers agreeing with the third item "While getting ready for the laboratory, I feel worried about not being able to record the data to be obtained" decreased in the post-test (as the item is negative, the decrease in the percentage of those agreeing indicates that the concern has decreased; the pre-test percentage of the pre-service teachers disagreeing increased. The increase seen in the post-test percentage of the pre-service teachers disagreeing with this item indicates that the percentage of those not worrying about recording the data after the experiments within the study were completed increased.

Though little, the percentage of the pre-service teachers responding to the fourth item "I feel tense while working with other students in the chemistry laboratory" by disagreeing decreased. This may be because of the affective characteristics coming to the forth as a result of working in groups in the laboratory.

The post-test percentage of the pre-service teachers disagreeing with the fifth item "I feel worried about whether there is enough time to complete the work in the laboratory" is higher than their pre-test percentage. The reason behind the increase seen after the experiments were completed in post-test score indicates that the pre-service teachers do not worry any more about the inadequacy of the time to complete the tasks in the laboratory.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the sixth item "While getting ready for the chemistry laboratory, I feel worried about the chemical substances I will use". This indicates that the concern level of the pre-service teachers about using chemical substances in the laboratory decreased after they completed the laboratory works during the study and this finding is in compliance with the finding obtained for the first item "While using chemical substances in the laboratory, I feel restless" and both of the items clearly show that the laboratory works performed during the study resulted decrease in the concern level of pre-service teachers about using chemical substances.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the seventh item "While working in the chemistry laboratory, I feel tense while performing the tasks required by the

laboratory” This increase seen in the post-test percentage may be because after completing the laboratory works performed during the present study led the participants to think that doing laboratory works do not make them tense.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the eighth item “I feel tense while recording the data in the laboratory”. The laboratory works performed during the present study may have resulted in a decrease in the level of concern felt while recording the data.

It is seen that there is an increase in the percentage of the pre-service teachers agreeing with the ninth item “I feel at ease while working with other students in the Laboratory”. Though little, the increase seen in the post-test percentage of the pre-service teachers indicates that the laboratory works performed during the study resulted in heightened sense of comfort in working with their peers.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the tenth item “While working in the laboratory, I feel worried about how long the experiment will last” This increase observed following the completion of the laboratory works performed during the present study may indicate that through practice, the self-confidence of the students increased.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the eleventh item “I feel comfortable in the presence of chemical substances around in the laboratory” and this indicates that as a result of the laboratory works completed during the present study, the pre-service teachers started to feel comfortable with chemical substances in the laboratory. Moreover, this finding is in good compliance with the finding obtained for the sixth item “While getting ready for the chemistry laboratory, I feel worried about the chemical substances I will use”.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the twelfth item “I feel tense while conducting a laboratory work”. This shows that the experiences gained from the laboratory works completed during the present study led the pre-service teacher to feel less tense about conducting laboratory works. This finding also supports the finding obtained for the seventh item “While working in the chemistry laboratory, I feel tense while performing the tasks required by the laboratory”. The parallelism seen between the findings obtained for different items of the scale indicates that the participants carefully read the questionnaire items.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the thirteenth item “While working in the laboratory, recording the data I will need makes me tense”. And this shows that after the completing the laboratory works during the present study, the pre-service teachers’ self-efficacy perception in terms of data recording increased. Moreover, this finding supports the finding obtained for the eighth item “I feel tense while recording the data in the laboratory”.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the fourteenth item “I feel worried while working in the laboratory with other students”. And this may indicate that as a result of the group work experiences gained during the completion of the laboratory works in the present study, the pre-service teachers started to feel more comfortable with working with other students. Moreover, this finding is supported by the findings obtained for the fourth and ninth items. And here affective characteristics of the students are more influential, the difference found between the pre-test and post-test is small.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the fifteenth item “While I am preparing for the laboratory, I feel worried about the time given to conduct the experiment”. As a result of the experiments conducted during the term, the pre-service teachers may have understood how much

time is needed for a given laboratory task. This findings is also supported by the findings obtained for item 5 “I feel worried about whether there is enough time to complete the work in the laboratory” and item 10 ““While working in the laboratory, I feel worried about how long the experiment will last””.

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the sixteenth item ““While I am working in the laboratory, I feel tense as I am close to chemical substances””. This increase seen in the post-test percentage shows that after the completion of the laboratory experiments, the pre-service teachers started to feel more comfortable with the presence of chemical substances close to themselves. This finding is supported by the finding obtained with the eleventh item “I feel comfortable in the presence of chemical substances around in the laboratory”

It is seen that there is an increase in the percentage of the pre-service teachers disagreeing with the seventeenth item “I feel worried while using laboratory equipments””. This may be because of the fact that after completing laboratory works during the term, the pre-service teachers may have developed their experimental skills, which resulted in an increase in the level of comfort felt with the equipments. Moreover, this finding is supported by the finding obtained for the second item ““I feel at ease while using the equipments in the chemistry laboratory””

It is seen that there is an increase in the percentage of the pre-service teachers agreeing with the eighteenth item “While working in the chemistry laboratory, I feel relaxed about recording the data required””. This increase observed after the completion of the laboratory works during the term indicates that the pre-service teachers’ perception of self-efficacy for recording the data increased. This finding is supported by the finding of eight item “I feel tense while recording the data in the laboratory” and the finding obtained for the thirteenth item “I feel tense while recording the data in the laboratory””.

It is seen that there is a small increase in the percentage of the pre-service teachers disagreeing with the nineteenth item “While preparing for the chemistry laboratory, I feel worried about the fact that I will work with other students””. The reason for this increase to be small is that pre-service teachers’ affective characteristics are of great importance for the responses given to this item. While conducting the experiments within the laboratory within the term, the pre-service teachers found some opportunities to work with their peers and as a result of these cooperative working experiences, the pre-service teachers may have started to feel more comfortable about working with their peers. This finding is supported by the findings obtained for the fourth item “I feel tense while working with other students in the chemistry laboratory” and for the ninth item ““I feel at ease while working with other students in the Laboratory””.

It is seen that there is an increase in the percentage of the pre-service teachers agreeing with the twentieth item “I feel relaxed about the time given to complete the laboratory””. This increase observed in the post-test may be because the pre-service teachers may have developed their time-management strategies and may have got rid of their concerns about the time given for the experiment as a result of the laboratory works performed during the term. This finding is supported by the findings of item 5 “I feel worried about whether there is enough time to complete the work in the laboratory”, item 10 “While working in the laboratory, I feel worried about how long the experiment will last” and item 15 “While I am preparing for the laboratory, I feel worried about the time given to conduct the experiment””.

A significant difference was found between the pre-service teachers’ pre-test scores and post-test scores obtained from the scale of concern because the mean score obtained for the post-test is higher than pre-test mean score. The pre-service teachers’ good level of preparedness and the strategies and methods used by the instructor may have affected this result. The research shows that laboratory applications may be influential on reducing the concern of students. Erötken (2010) conducted a study called “Evaluation of the Effects of Chemistry Laboratory

Applications on Student Concern” and when they compared the pre-test and post-test results, they found that there was a reduction in the concern level of the students as a result of the applications performed during the study. Toprak and Çelikler (2011) conducted a study called “The Effects of the Use of 3E and 5E Learning Cycles in the General Chemistry Laboratory on Student’s Level of Concern” and they compared the pre-test and post-test results and they found that there is a considerable reduction in the students’ level of concern about the General Chemistry Laboratory. Anılan, Görgülü and Balbağ (2009) revealed that the pre-service teachers feel comfortable while working with other pre-service teachers, they do not feel concerned about collecting data and they do not feel worried about the use of time.

5. RESULTS AND SUGGESTIONS

The findings of the present study can be summarized as follows:

- The majority of the teachers selected the option of “disagree” for negative items and the option of “agree” for positive items.
- The experiments conducted within the framework of the course of General Chemistry Laboratory I resulted in reduction in Science pre-service teachers’ concerns about the chemistry laboratory.

It is emphasized that when pre-service teachers recognize that experimental process is an integral part of natural sciences and get informed about the functioning of this process, the level of concern they can experience may drop.

4th International Conference on New Horizons in Education

Pricing Decisions in Educational Institutions: An Activity Based Approach

Ali Coskun^{a*}, Metin Yılmaz^b^a*Fatih University, 34500 Istanbul, Turkey.*^b*Dumlupınar University, 43100 Kutahya, Turkey.*

Abstract

The number of private high schools is significantly growing due to recent increase in the demand for private schools. Therefore, it has been crucial for the administration of private schools to be able to gain competitive advantage and to make strategic decisions including pricing decisions. Private schools have to determine appropriate annual fees in an intensely competitive environment in order to attract new students or not to lose current students. Many factors such as customer demand, attitudes of competing educational institutions, public image of the school, political environment, legal regulations, country's economic conditions and other factors are effective in pricing decisions. An educational institution determines the education fee using either market based or cost based approaches. In this study we will focus on cost-plus pricing approach. A private school may determine the fee by adding a sufficient profit margin on the cost of resources consumed to provide educational services in cost plus pricing approach. Therefore in this approach accurately calculating the cost of services is significantly important. Activity based costing (ABC) method is a new approach in allocating indirect costs to cost objects and determining the unit costs by producing the most accurate data needed by the administrators and as an alternative to traditional costing methods. In this study we will implement the activity based costing method in a private school and determine the annual fees using activity based approach. In the study, we provide application of strategic pricing decisions in an example of a Turkish private high school.

Keywords: School; Cost Accounting; Pricing; Activity based costing

1. Introduction

The intense competition in private education sector in Turkey forces private high schools to seek ways to provide high quality service with the lowest cost. The main goal of management is to increase to invest in resources in most efficient ways and to reduce the costs. School administrators and owners need to have more detailed and more correct cost information to manage the cost better. The allocation of the cost to services has a critical importance in decision making process of the administrators of schools. Important decisions such as resource allocations, investment decisions, adding or dropping new units, and finally pricing decisions are all based on cost of the services. In order to make right decisions and to achieve the strategic goals of the schools, schools administrations must use the modern techniques in cost allocation. It has been crucially significant for administrators of schools to reach the most accurate cost data in the most proper way. Activity based costing approach provides useful cost information for the administrators in their decisions.

In this study, we will provide some implications of activity based pricing for private school in Turkey. In this purpose first we will discuss about the costing and pricing concepts, then we implement the activity based costing

method in a private school and finally we investigate how to determine the annual fees using activity based approach. In the study, we provide application of strategic pricing decisions in an example of a Turkish private high school.

2. Pricing Decisions

Pricing is one of the most powerful tools a manager can use to transform unprofitable customers into profitable ones (Atkinson, Kaplan, Matsumura & Young, 2012: 250). Pricing services provided by an educational institution is the process of determining the value of sales that the costumers are willing to pay. Price of services determines the amount of profits after setting the costs of services. Pricing in short run and long run may differ in some aspects. Long run pricing decisions is a strategic decision designed to build long-run relationships with customers based on stable and predictable prices. Long-run pricing can be set to satisfy the desired rate of return while the short run pricing is decided under the current conditions which most items are irrelevant in short run (Horngren, Datar & Rajan, 2012: 456-457).

In general, managers determine prices considering factors such as customers, market, rivals, costs, timing, legal and political factors, and image related issues (Hilton, Milton, & Selto, 2008: 533). These factors influencing the pricing decision are also affecting the private schools. Education fees may be affected by some factors such as the city where the school established, other private schools in the same region, general economic conditions, school image, expectations of the parents, service coverage, costs such as personnel costs, utility expenses, marketing expenses, depreciation costs of assets, financial costs, etc.

In a free market, the price is the main factor to determine the effects of competition. The price is also important in determining the amount of demand and profitability margins. Even if a school is owned by a person or a foundation, the organization must make a profit to survive. Businesses require a rate of return to meet the cost of the serviced provided. Under normal circumstances, executives determines highest price for a sufficient profit margin after the costs, but in a competitive environment they do not have that power in their hands.

Two basic approaches of pricing are the market based pricing and cost based pricing (Horngren, Datar & Rajan, 2012: 459-460). In the market based pricing, prices are determined on the customers' expectations and the competitors' reactions. Based on market based prices, managers must control the cost of services in order to achieve the target return on investment. Educational institutions require high amount of capital investments, so to recover these investment managers must adequately place the schools' position in the market and offer a reasonable price to compete with the similar institutions. In the cost based approach, first the organization accumulates cost of services and determines the cost to recoup the costs and to achieve the target return on investments.

In market based pricing the school first determines the target price (annual fee). Target annual fee is estimated price for the educational services that the potential customers (parents) are willing to pay. After determining the target fee the executives drive a target cost by subtracting target profit from the target fee. Target cost covers all costs including variable and fixed costs (Horngren, Datar & Rajan, 2012: 461-462). Target costing may help managers to reduce the costs of services. Target costing emphasizes on planning and design stage and encompassing the entire life of the product. In order to achieve target cost making the necessary cost improvements through value engineering methods is the most difficult part of this business process (Coskun, 2003).

In cost based pricing approach, also called cost-plus pricing, managers determine the prospective selling price by adding a markup component to the cost of services. Cost-plus pricing can be used in the markets where the institution can set the prices of the services (Atkinson, Kaplan, Matsumura & Young, 2012: 87). Managers do not have to use a rigid markup component it may vary depending on the behavior of rivals and customers (Horngren, Datar & Rajan, 2012: 467). Based cost in cost plus pricing approach may be full cost, cost of services, or only variable costs.

Activity based pricing is a method uses the cost assigned to services by using the activity based costing approach. Activity based pricing establishes base pricing options for the institution to provide customers for any special services they requested (Atkinson, Kaplan, Matsumura & Young, 2012: 250). In the following part we will explain the activity based costing to make the activity based pricing more understandable.

3. Activity Based Costing in Educational Institutions

Allocation of cost in service type businesses sometimes become more complicated than manufacturing or merchandising businesses. Since their output is not a physical one, service businesses more carefully define the cost objects and allocate cost in a proper way. Activity based costing (ABC) approach is a new method of cost allocation that assigns indirect costs to services using the activities. Using the ABC method unit cost of students in an educational institution can be computed more accurately compared to the traditional cost allocation approaches (Yilmaz and Coskun, 2012: 280).

ABC method provides data on cost factors, activities, resources, performance measurement, customer profitability, distribution chains, merchandisers, brands, and on other fields that directly affect the profitability of an enterprise. ABC method relies on processes, activities, and then products, services, and customers for resource costing so that the costing can be calculated more reliably (Cooper & Kaplan, 1988; Eker, 2002; Kaplan & Atkinson, 1998).

ABC methods consists of two phases: the first one is to accumulate total cost of the each activity and computing the cost of activity cost pools, and to deliver these accumulated costs to cost objects such as educational services through appropriate cost allocation base (Morse, Davis & Hartgraves, 2003: 185; Hilton, 1997: 196-197).

Originally designed to be used for business and manufacturing enterprises that produce goods used by the service-producing businesses because of the benefits of activity-based costing method was introduced by seeing the wide acceptance (Cooper and Kaplan, 1991: 372).

4. Allocation of Costs through the Usage of Activity Based Costing in Educational Institutions

In this part of the study we will summarize an implementation of activity based costing in a high school in Ankara, Turkey.

Firstly the activities in the school are defined. There are 16 activities: Activity-1 New student enrollment, Activity-2 Former student enrollment, Activity-3 Teachers Training, Activity-4 Students Orientation, Activity-5 Educational Activities, Activity-6 Olympic Studies, Activity-7 Summer School, Activity-8 Students' Clubs, Activity-9 Parent-Teacher Meetings, Activity-10 Certification Programs for Students, Activity-11 Health Care Services, Activity-12 Cooking and Transportation Services, Activity-13 Students Counsels, Activity-14 Administration, Accounting, Information, Cleaning, Transportation and Security Services, Activity-15 Graduation, Activity -16 Maintenance.

Secondly, indirect costs are assigned to each activity cost pool. In the annual budget of the school total cost accumulated as 4,745,250 TL, including materials and supplies expenses, salary expenses, subcontractor expenses, education expenses, outsourcing utilities and services, several expenses, taxes and other fees, depreciation and amortization. Budgeted cost of the period of the study is summarized in Table 1.

Table 1. Budget for Cost of Services

Cost of Services	Amounts of Expense (in TL)
1- Materials and Supplies Expenses	12,673
2- Salary Expenses	2,530,854
3- Subcontractor Expenses	1,359,089
4- Other Education Expenses	393,454
5- Outsourcing Utilities And Services	319,496
6- Several Expenses	35,298
7- Taxes And Other Fees	2,865
8- Depreciation And Amortization	91,521
TOTAL EXPENSES	4,745,250

Later, in the third stage, cost allocation base for each activity cost pool is determined. List of cost allocation bases for the activity cost pools is given in Table 2. Cost allocation bases carefully selected based on cause and effect relationship in order to reflect the actual consumption of the resources used by the cost objects during the period.

Table 2. Education Activity Centers and Cost Drivers

Education Activity Centers	Cost Drivers
Activity -1 New student enrollment	The number of new student enrolled
Activity -2 Former student enrollment	The number of former student enrolled
Activity-3 Teachers Training	The number of teachers
Activity -4 Students Orientation	The number of 9th graders
Activity -5 Educational Activities	The number of students in total
Activity -6 Olympic Studies	The number of Olympic Studies participants
Activity -7 Summer School	The number of summer school attendees
Activity -8 Students' Clubs	The number of Students' club participants
Activity -9 Parent-Teacher Meetings	The number of Parent-Teacher meetings
Activity -10 Certification Programs for Students	The number of certification program attendees
Activity -11 Health Care Services	The number of students in total
Activity -12 Catering and Transportation Services	The number of students in total
Activity -13 Students Counsels	The number of counseling activities for each grade
Activity -14 Administration, Accounting, Information, Cleaning, Transportation and Security Services	The number of Staff x Time *
Activity -15 Graduation	The number of graduates
Activity -16 Maintenance	Used Space x Time *

* This activity expenses II. distributed to other activities of the educational institution distributions.

In the fourth stage of the cost allocation, among the activities, Activity-16 Maintenance and Activity-14 Administration, Accounting, Information, Cleaning, Transportation and Security Services are defined as "secondary" activities. Before allocating the activity cost to cost objects, cost of these secondary activities allocated to other 14 activities.

In the fifth stage, costs of the 14 primary activities are allocated to cost objects. In this stage total cost of the activities accumulated from first level and second level allocation are allocated. Allocation completed by using the cost allocation rates. Cost allocation rates are calculated by dividing the total cost of each activity to the total quantity of the cost allocation base of the activity. For example cost allocation rate for the activity 1- New student

enrollment is 235.01 TL per new enrolled student. Grades in high school are selected as the cost object in allocation. There are four grades in the high school: 9th grade, 10th grade, 11th grade and 12th grade. For each grade, allocated cost of each activity is accumulated. Finally the unit cost of students is computed by dividing the total cost of the grades to the total number of students in each grade. Allocation of activity costs to cost objects and calculating the unit cost of students are summarized in Table 3. Cost per unit student of 9th grade, 10th grade, 11th grade and 12th grade are 7,956 TL, 8,410 TL, 8,255 TL and 7,788 TL respectively.

If the school do not implement activity based costing, unit cost may be calculated just dividing total cost of the school to the total number of students regardless of which grade the student is. This is traditional cost allocation approach and it ignores the differences in resource consumption differences between the grades. In that case unit cost of the student would be 8,112 TL per student in all grades. Unit cost is calculated by dividing the total cost of 4,745,250 TL to the total number of students of 585.

Comparison of traditional costing system and the activity based costing is given in Table 4. As it's seen in the table in traditional costing 9th grade and 12th grade students are overcosted, while 10th grade and 11th grade students are undercosted comparing the activity based costing.

5. Implementation of Activity Based Pricing

The school can implement activity based pricing using the activity based cost allocation information. Assume that the school targeted a 10% markup on activity based cost of a student. While the annual fee for each student would be 8,923 TL/student in traditional approach, the annual fees of the grades will vary in activity based approach. The annual fees in 9th grade, 10th grade, 11th grade and 12th grade would be 8,751 TL/student, 9,251 TL/student, 9,080 TL/student, and 8,556 TL/student respectively. The comparison of cost plus pricing in two approaches is given in Table 5.

Markup percentage is varied on the amount of investment to the school, cost of capital, alternative investment opportunities, etc. So that the markup in this case may be higher or lower than 10% depending on the factors mentioned.

School administration may adopt the activity based annual fee to each grade or they may slightly change depending on the behavior of the competitors and customers.

In all circumstances, the management aware about the profitability of the students in each grade by getting accurate cost information from ABC approach. The administration may make further decisions using these cost information. They may determine how much discount they can make in some cases. For example if the annual fee is set up as equally for each grade, management may apply discount to 9th and 12th grades, but do not apply any discount to 10th and 11th grades as a requirement.

It should be in consideration that there are still many factors affects the pricing such as customer demand, attitudes of competing educational institutions, public image of the school, political environment, legal regulations, country's economic conditions and other factors.

Table 3. Allocating Costs using ABC

Activity Centers	Cost Allocation Rates	9 th Grade Costs		10 th Grade Costs		11 th Grade Costs		12 th Grade Costs	
		Allocation Key Criteria x Rate	Activity Costs	Allocation Key Criteria x Rate	Activity Costs	Allocation Key Criteria x Rate	Activity Costs	Allocation Key Criteria x Rate	Activity Costs
Activity -1 New student enrollment	235.01 TL/ New student	180 x 235.01	42,302 TL	45 x 235.01	10,575 TL	20 x 235.01	4,700 TL	10 x 235.01	2,350 TL
Activity -2 Former student enrollment	163.50 TL/ Former student	-	-	115 x 163.50	18,802 TL	110 x 163.50	17,985 TL	105 x 163.50	17,167 TL
Activity-3 Teachers Training	2,344.87 TL/ teachers	15 x 2,344.87	35,173 TL	19 x 2,344.87	44,552 TL	13 x 2,344.87	30,483 TL	12 x 2,344.87	28,138 TL
Activity -4 Students Orientation	433.49 TL/ 9 th grader	180 x 433.49	78,028 TL	-	-	-	-	-	-
Activity -5 Educational Activities	4,101.33 TL/ student	180 x 4,101.33	738,343 TL	160 x 4,101.33	656,305 TL	130 x 4,101.33	533,248 TL	115 x 4,101.33	471,719 TL
Activity -6 Olympic Studies	5,154.66 TL/ Olympic Studies attendee	-	-	20 x 5,154.66	103,093 TL	10 x 5,154.66	51,546 TL	-	-
Activity -7 Summer School	323.15 TL/ summer school attendee	-	-	-	-	130x 323.15	42,009 TL	115 x 323.15	37,162 TL
Activity -8 Students' Clubs	271.16 TL/ Students' club attendee	85 x 271.16	23,049 TL	160 x 271.16	43,386 TL	90 x 271.16	24,404 TL	-	-
Activity -9 Parent-Teacher Meetings	4,060.33 TL/ Parent-Teacher meeting	6 x 4,060.33	24,362 TL	8 x 4,060.33	32,482 TL	8 x 4,060.33	32,482 TL	4 x 4,060.33	16,241 TL
Activity -10 Certification Programs for Students	140.60 TL/ certification program attendee	180 x 140.60	25,308 TL	160 x 140.60	22,496 TL	-	-	-	-
Activity -11 Health Care Services	79.23 TL/ student	180 x 79.23	14,261 TL	160 x 79.23	12,676 TL	130 x 79.23	10,299 TL	115 x 79.23	9,111 TL
Activity -12 Catering and Transportation Services	2,306.58 TL/ student	180 x 2,306.58	415,184 TL	160 x 2,306.58	369,052 TL	130 x 2,306.58	299,855 TL	115 x 2,306.58	265,256 TL
Activity -13 Students Counsels	200.77 TL/ student	180 x 200.77	36,138 TL	160 x 200.77	32,123 TL	130 x 200.77	26,100 TL	115 x 200.77	23,088 TL
Activity -15 Graduation	210.59 TL/ student	-	-	-	-	-	-	115x 210.59	24,217 TL
Total cost		1,432,148 TL		1,345,542 TL		1,073,111 TL		894,449 TL	
Unit Cost Per Student		1,432,148 TL /180=		1,345,542 TL /160=		1,073,111 TL /130=		894,449 TL /115=	
Total Cost/The number of students in the grade)		7,956 TL		8,410 TL		8,255 TL		7,778 TL	

Table 4. Unit Costs using ABC and Traditional Costing

	Cost Objects			
	9th Grade Costs	10th Grade Costs	11th Grade Costs	12th Grade Costs
Traditional Costing Method	8.112 TL/student	8.112 TL/student	8.112 TL/student	8.112 TL/student
Activity Based Costing Method	7.956 TL/student	8.410 TL/student	8.255 TL/student	7.778 TL/student
The difference between two approaches	156 TL/student	(298) TL/student	(143) TL/ student	334 TL/student

Table 5. Pricing using ABC and Traditional Costing

	Cost Objects			
	9th Grade Costs	10th Grade Costs	11th Grade Costs	12th Grade Costs
Fee per student using traditional costing method (The fees applied in all grades in high school are the same: traditional cost + 10% markup)	8.923 TL/student	8.923 TL/student	8.923 TL/student	8.923 TL/student
Activity based fee per student (activity based cost + 10% markup)	8.751 TL/student	9.251 TL/student	9.080 TL/student	8.556 TL/student
The difference between two approaches	172 TL/student	(328) TL/ student	(157) TL/student	367 TL/student

Conclusion

In this study we implemented the activity based costing method in a private school in Turkey and determined the annual fees using activity based approach. We found out that there are differences among the grades of the high school in terms of resource consumption. So that we refer different fees could be applied to different grade students. Even the fix annual fee is set in all grades, activity based approach help the managers to calculate the profitability of each student. Activity based data also provide support in other kind of decisions such as resource allocations, investment decisions, adding or dropping new units, and finally pricing decisions are all based on cost of the services. We found out if the schools evaluate their cost more precisely by implementing the activity based approach, there would be beneficial for the schools.

Abstract

The purpose of study is to investigated the validity and reliability of the Turkish version of the Problem Solving Scale (PSS; Willoughby-Herb & Neisworth, 1983). The sample of the study consists of 280 preschool students. Confirmatory factor analysis showed that the three-dimensional model fitted well: RMSEA= .071, CFI= .99, IFI= .99, RFI= .99, SRMR= .044. The internal consistency reliability coefficients of the scale were .96. Also the corrected item-total correlations ranged from .61 to .78. These results demonstrate that this scale is a valid and reliable instrument.

Keywords: Problem solving, Validity, Reliability.

1.Introduction

During the pre-school period, which is one of the most important phases of human life, children go through a multi-dimensional and rapid process. Pre-school period covers the early childhood period between the ages of 0 to 6. This period is the one that the child learns the fastest and also the brain completes the two third of its development during this time. This period encompasses not only intellectual development but also character development (Garton & Gringart, 2005; Swanson & Beebe-Frankenberger, 2004). In this process children get fast and permanent acquisition in accordance with high order thinking. In this context, the pre-school education process which addresses the most important period of children's development has to have some attributions which can develop children's following abilities and capacities: self-awareness, social skills, awareness of his surrounding culture and other cultures, communication skills, perception and kinetic abilities, analytical thinking, problem solving abilities, creativeness (Genç ve Senemoğlu, 1999; Mussen, Conger & Kogan, 1963).

Problem is defined, as a situation, which exceeds the current capacities and resources of the individual (Güven, 2001). According to Bingham (1998), a problem has three crucial properties. Firstly, a person must have an aim in his mind, secondly there must be obstacle while he tries to attain his objectives, and for the last one is that, the person must feel distress. When the relevant literature is analysed it can be observed that, there are different kinds of steps for solving problem (Erdoğan, 2000; Shapiro, 1998). But for Gelbal (1991), problem solving consists of consecutive phases being aware of problem definition of

* Corresponding author.

Email address:

problem finding different ways for the solution and by implementing existing of solution strategies like elimination of problem is emphasized (Serin, Serin & Saygılı, 2010).

The child cannot learn problem solving skills systematically by him easily. For this by creating some surroundings to children for solving problems by themselves, creating some opportunities and planning some activities which are used for sustaining effective problem solving skills can be helpful (Kişisel & Yıldırım, 1983; Passolunghi & Siegel, 2001; Pajares & Kranzler, 1995). In this study, PSS was adapted into Turkish and its psychometric properties were examined with a sample consisting of Turkish preschool students.

2. Research Method

2.1. Participants

The participants of the research were 280 preschool students who were studying in Sakarya region during the academic year 2012-2013. They were selected by means of convenience sampling method. 180 were female and 100 were male. The age range of the sample varied between 4 and 6 years.

2.2.Measures

Problem Solving Scale. This scale which was improved by Willoughby-Herb and Neisworth (1983) consists of 25 items and sub-scale (For example, the child recognizes the main figures which the relationship between the play and object, is wanted.). The scale which consists of 25 items, 5-point Likert type from Totally Disagree to Totally Agree, (Problem Solving Scale -PSS-TR). Confirmatory factor analysis (CFA) was carried out for structure validity. Reliability of scale was examined with internal consistency and item analysis was examined with corrected item total correlation.

2.3.Procedure and Data Analysis

In the process of adaptation PSS into Turkish, the scale was translated into Turkish by 6 academics who have proficiency in English and then Turkish forms were back translated into English, and the coherence between Turkish and English forms were examined. After these, necessary corrections were made in terms of meaning and grammar and measurement properties. Turkish form was created and then was analysed by 5 academics who work in the Field of Psychological Counselling and Guidance and Assessment and Evaluation in Education, and some changes were made by taking their suggestions. Reliability of PSS was examined. For the construct validity CFA was used. Corrected item total correlations, was calculated. For reliability and validity analyses, SPSS 17.0 and Lisrel 8.54 (Jöreskog & Sorbom, 1996) programmes were used.

3.Results

3.1. Item analysis and reliability

At the end of the analysis, scale's factor of Corrected Item Total Correlation was line up between .34 and .80 understood. These diagnoses are shown in Table 1.

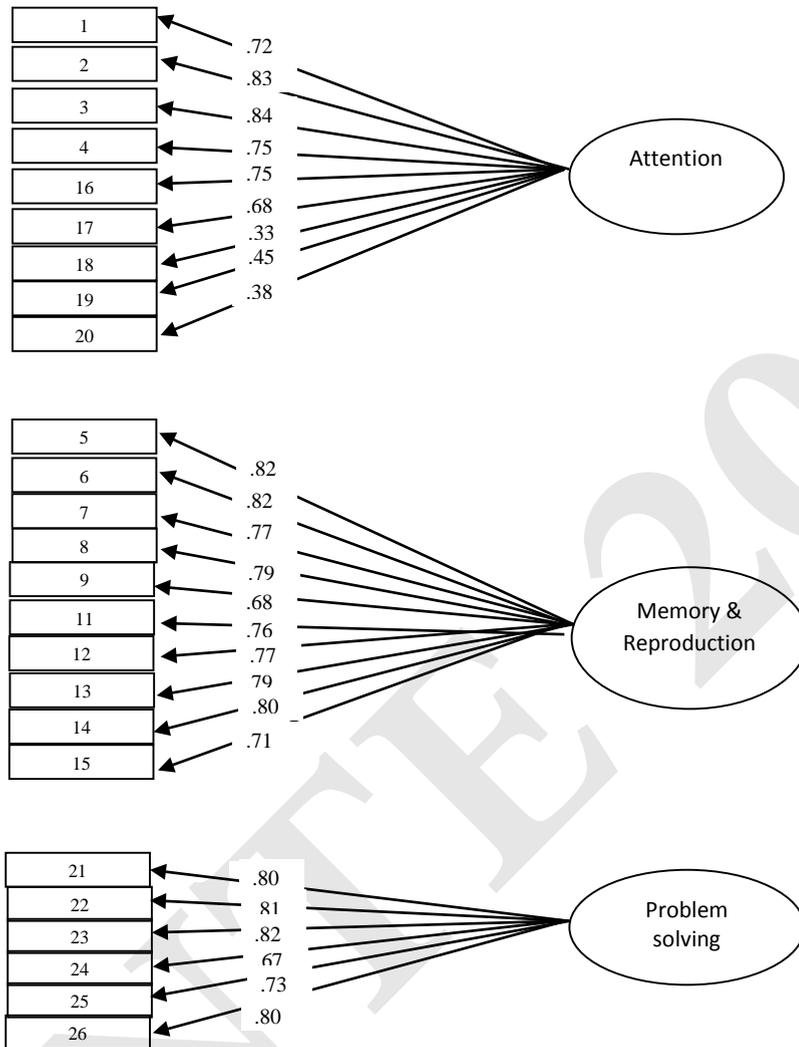

Table 1: *Item analysis results*

Item N.	<i>rjx</i>	Item N.	<i>rjx</i>	Item N.	<i>rjx</i>	Item N.	<i>rjx</i>
1	.68	9	.65	17	.80	25	.73
2	.77	10	.69	18	.80		
3	.79	11	.72	19	.75		
4	.73	12	.75	20	.76		
5	.78	13	.76	21	.76		
6	.77	14	.67	22	.77		
7	.73	15	.65	23	.61		
8	.74	16	.76	24	.67		

The internal consistency reliability coefficient of the scale was .96.

3.2. Confirmatory factor analysis

In this study, CFA was made to analyse the structural validity. In the study, it was found that rate of the chi square value was (6959,515) 1.88 regarding the three-factor model. Confirmatory factor analysis

showed that the three-dimensional model fitted well: $\chi^2=406.05$, $sd=203$, $p=.000$, $RMSEA=.071$, $RFI=.97$, $NFI=.98$, $NNFI=.98$, $CFI=.99$, $IFI=.99$, $RFI=.97$, $SRMR=.044$. The CFA results and factor loads in respect of the problem solving scale are presented Figure 1.

4. Discussion

In this research, PSS was adapted into Turkish and psychometric properties were examined with a sample consisting of Turkish students studying in preschool. In this study, the Turkish adaptation of PSS's was improved Willoughby-Herb and Neisworth, (1983) and searching reliability and validity of Turkish form was aimed. Groups which are leading reliability and validity of study, in terms of numbers, are enough in every respect of statistically analysis's. (Tabachnick and Fidell, 2001). PSS's form validity was searched with CFA. It shows that, PSS's Turkish form's reliability factor is high, and the original

form which is near to reliability is in sufficient level. For the assessment and evaluation instruments which are used in the studies, reliability level is considered as .70, measurements which were gained from PSS's Turkish form can be said, are reliable. When considered that it distinguishes the individuals really well in terms of measured features (Özdamar, 2004), in commenting the total substance correlation parameter, it is seen that the parameters of total substance correlation for substances .30 or higher are on a high level.

As far as the findings of PSS's studies on the validity and reliability of the form of Turkish language are concerned, it could be considered that the scale is ready to be used. However, as the validity and reliability studies are conducted on preschool students, it seems essential that the scale be conducted on different groups in terms of validity and reliability. The results of the examples studied on preschool students present that the scale has considerable level of validity and reliability.

Abstract

This study investigated the validity and reliability of the Portuguese version of the Problem Solving Scale (PSS; Willoughby-Herb and Neisworth, 1983) in the kindergartens of *Agrupamento de Escolas da Sequeira*. There were analysed 79 preschool students belonging to this school. The results obtained show that the adaptation of the PSSPT scale is a valid and reliable instrument to use in a future study.

Keywords: Mathematics Education; Problem Solving, validity, reliability

1. Introduction

Everyone understands that Education has changed across last decades, nowadays, no matter what level, age or gender students are, the work of a teacher is very hard concerning education process. Society progress is entering in the classrooms, either through new technologies, as computers, or even using old tools like board games, and is transforming preschools and schools in small experiences fields. Like Almeida (2012) said, *learning as well as playing follow us throughout life. Understood as a process, solving problems is also transversal to everyday duties*. So it's very important to pay attention to young children in kindergarten because, *the junior school years have been identified as a crucial period in the course of development of students' ATM (Attitudes Towards Mathematics), meaning that teachers have both, opportunity and responsibility, to promote their students' positive attitudes and high achievement* (Nicolaidou, M. and Philippou, G., 2003). So problem solving is an important issue in several disciplines across sciences all over the world, more particularly if we focus in Mathematics this aspect is even more important due to his connection with our daily life. International studies like PISA 2012 defined problem solving as, *relates to individuals working alone on resolving problem situations where a method of solution is not immediately obvious*, this is very important not only for the future of our students but also for society in general. The following scheme, Figure 1, is an overview of factors and processes for collaborative problem solving in PISA 2015, shows the importance for future of problem solving.

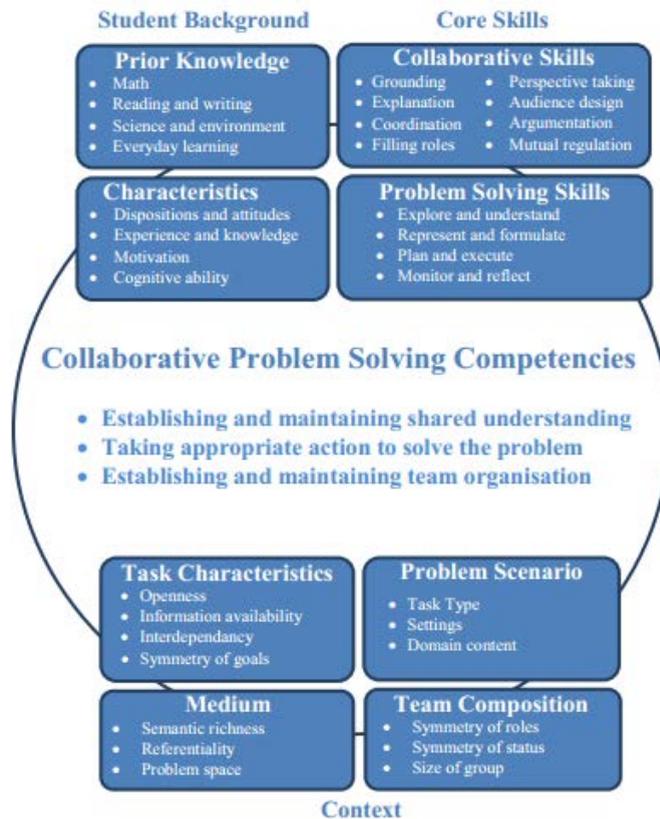

Figure 1: Overview of factors and processes for collaborative problem solving in PISA 2015

(<http://www.oecd.org/pisa/pisaproducts/Draft%20PISA%202015%20Collaborative%20Problem%20Solving%20Framework%20.pdf>)

We, as investigators and educators, should be interested in new process of transmitting knowledge facing students. There should be ways of measuring all this changes inside the classroom environment. So we pretend to test the validity and reliability of an adaptation of the Problem Solving Scale (PSS-Willoughby-Herb and Neisworth, 1983). This tool will be used with pupils in preschool facing a board game experiment. This is the initial part of a bigger project called LEGOMATKIND that will be done with support of the Danish company LEGO in Portugal and Turkey.

2. Research Method

In a brief review of literature there exist several scales to measure different kinds of problem solving skills. We start with the IPSS scale (The Independent-Interdependent Problem-Solving Scale) from Rubin, M., Watt, S. E., & Ramelli, M. (2012). The short version with 10 questions has a 7-point Likert-type response scale anchored *Strongly Agree* and *Strongly Disagree*. But we predicted that this will not serve our purposes due the ages of the population in study, so we decided later to use the PSS, which was improved by Willoughby-Herb and Neisworth (1983). From this we adapted and get a scale of 26 items, 5-point Likert type from *Totally Disagree* to *Totally Agree*, (Problem Solving Scale Portuguese-PSSPT). We expected to produce a scale divided into three factors, *Attention*, *Problem Solving* and *Memorization*. Later these scale turn to a 25 item scale. The adaptation and analyse of the PSSPT was done with 79 preschool students who were studying at *Agrupamento de Escolas da Sequeira*, (Guarda, Portugal), in 2012-2013. They were selected by means of convenience sampling. Following we have the characterization of the population in study.

The ages are from 3 until 5 years old, Table 1, from these we have 57% boys and 43% girls, Table 2.

Table 1: Ages of pupils from *Agrupamento de Escolas da Sequeira*

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 3,00	30	38,0	38,0	38,0
Valid 4,00	25	31,6	31,6	69,6
Valid 5,00	24	30,4	30,4	100,0
Total	79	100,0	100,0	

Concerning the gender of the population in study.

Table 2: Gender of pupils from *Agrupamento de Escolas da Sequeira*

	Frequency	Percent	Valid Percent	Cumulative Percent
Male	45	57,0	57,0	57,0
Valid Female	34	43,0	43,0	100,0
Total	79	100,0	100,0	

The knowledge of the pupils was not taken into account and the group were chosen randomly. The SPSS 20 was used to make the statistical analyses. It was done Exploratory Factor Analysis (EFA) for structure validity. Reliability of scale was examined with internal consistency and item analysis was examined with corrected item total correlation. Here are the results obtained for the PSSPT related to CITC, Table 3.

Table 3: Corrected Item-Total Correlation from *Agrupamento de Escolas da Sequeira*

P1	0,553	P14	0,732
P2	0,740	P15	0,790
P3	0,709	P16	0,875
P4	0,776	P17	0,821
P5	0,791	P18	0,811
P6	0,806	P19	0,776
P7	0,825	P20	0,854
P8	0,889	P21	0,789
P9	0,727	P22	0,897
P10	0,765	P23	0,820
P11	0,811	P24	0,854

P12	0,835	P25	0,892
P13	0,857		

The scale's factor of Corrected Item Total Correlation was line up between 0,324 and 0, 891. These diagnoses are shown in Table 4.

Table 4: Summary Item Statistics from *Agrupamento de Escolas da Sequeira*

	Mean	Minimum	Maximum	Range	Maximum / Minimum	Variance	N of Items
Inter-Item Correlations	0,653	0,324	0,891	0,568	2,753	0,012	25

The internal consistency reliability coefficient of the scale was 0.979 meaning that it's very good. In the study, EFA was made to analyse the structural validity, it was found the statistic Kaiser-Meyer-Olkin (KMO) 0,973 which means a very good factorial analysis. The value of chi square was (2476,666) with significance of 0,000 regarding the three-factor model another important indicator of the good EFA quality.

The internal consistency for the three factors is shown in the following Table 5.

Table 5: Corrected Item Total Correlation from *Agrupamento de Escolas da Sequeira*

Factor 1 - Memorization		Factor 2 - Attention		Factor 3 – Problem Solving	
Item	Corrected Item- Total Correlation	Item	Corrected Item- Total Correlation	Item	Corrected Item- Total Correlation
P5	0,802	P1	0,608	P20	0,876
P6	0,834	P2	0,783	P21	0,789
P7	0,860	P3	0,694	P22	0,879
P8	0,836	P4	0,739	P23	0,830
P9	0,758	P15	0,697	P24	0,903

P10	0,754	P16	0,853	P25	0,918
P11	0,817	P17	0,803		
P12	0,860	P18	0,792		
P13	0,816	P19	0,766		
P14	0,718				

In the last table we get CITC, this is the Pearson correlation coefficient of each item related to the others. We can observe high correlations between the data. The internal consistency of factor 1 – Memorization is 0,955, for factor 2- Attention we get 0,931 and the last factor 3- Problem Solving 0,957. This indicates very good consistency in each factor.

3. Conclusion

The PSSPT, adaptation of the original scale of PSS, found to be a very reliably tool in the future concerning our group of pupils in *Agrupamento de Escolas da Sequeira*. All the measures that were performed via SPSS 20 get us the positive feedback necessary to go for the next step of the project. When we were checking validity and reliability of PSSPT for the group of pupils in Guarda, Portugal, the same thing was done in Hendek, Turkey, by the colleagues from Sakarya University. They have tested the validity and reliability for the PSSTR-Problem Solving Scale Turkish (Kaya, Arslan, Tadeu & Demir, 2013 in press), with a translation of PSSPT. Both scales will be used in a future common project related to problem solving skills in kindergarten.

4th International Conference on New Horizons in Education

Procrastination, stress and coping among primary school teachers

Marcela Verešová*

Constantine the Philosopher University, Faculty of Education, Drážovská 4, 94974 Nitra, Slovakia

Abstract

In this paper we focus on finding the relationship between procrastination as personal feature manifested by behaviour, which is characterized by the postponement of activities and tasks to a later time, with the experienced stress (expressed by cognitive, emotional, social and physical dimension) and the preferred strategies of coping with stress (proactive coping, reflective coping, strategic planning, preventive coping, instrumental support seeking, emotional support seeking, avoidance coping). Based on professional resources, we assumed a considerable positive correlation between procrastination and experienced stress – cognitive, emotional, physical and social, positive relation between procrastination and avoidance coping and negative relation between procrastination and proactive coping by 194 primary school teachers from Slovakia (173 females, 21 males, mean age 38.6 years). To measure the research variables we used: General Procrastination Scale (Lay, 1986), Questionnaire for identification of stress level and burnout syndrome (Henning & Keller, 1996) and Proactive Coping Inventory (Greenglass et al., 1999). We confirmed our assumptions and we found a significant positive correlation between procrastination and stress (cognitive dimension $r=.512$, $p<0,001$, emotional dimension $r=.229$, $p=0,001$, social dimension $r=.331$, $p<0,001$) and avoidance coping ($r=.424$, $p<0,001$). We identify the negative significant correlation between procrastination and proactive coping ($r=-.422$, $p<0,001$), reflective coping ($r=-.244$, $p=0,001$), instrumental support seeking ($r=-.143$, $p<0,05$), emotional support seeking ($r=-.152$, $p<0,05$).

Keywords: procrastination, teacher's stress, proactive coping, reflective coping, strategic planning, preventive coping, instrumental support seeking, emotional support seeking, avoidance coping.

1. Introduction

The teacher's profession bestows quite demanding and psychologically diverse requirements on a person and it is possible to assert that especially in teacher's profession it is possible to meet unique significant stressors which can negatively influence the subjective content and well-being of teachers. Kyriacou & Sutcliffe (1977) used the term "teacher's stress", which they defines as a response of negative affect, usually accompanied by potentially harmful physiological changes, resulting from aspects of the teacher's job and mediated by the perception that job demands are a threat and by coping mechanisms used to reduce the threat. Kyriacou & Sutcliffe (1978) found four factors of teachers stress sources: pupil misbehaviour; poor working conditions; time pressures; poor school ethos. Křivohlavý (2001) determined these following stress sources: overload by the work quantity; time stress; excessively high responsibility; non-clarified competency; exhausting career effort; sleep deprivation; insufficient work possibilities on labour market; long-term tension; social conflicts. Chan et al. (2010) summarise from previous research and from their own research some significant stressors in teacher's profession: education reform policies, workload and time pressure, misbehavior of students and indiscipline, school management, working relationships, redundant teacher-related issues, school violence, continuing further

* Corresponding author. Tel.: +421 37 6408278 .
E-mail address: mveresova@ukf.sk

education, low salary and others. According to research by Blahutková, Vacková & Cacek (2002), the most significant teacher's stressor (research conducted on a sample of Czech teachers) is the time pressure. Only after it there are other described stressors – low pupils' discipline in class; incorrect relations and cooperation with other teachers; insufficient rest; insufficient time for professional development; lack of parents' interest in cooperation with teachers.

Our research goal was to find out if procrastination can be a significant correlate of teacher's stress. In the context of above stated significant stress sources (Kyriacou & Sutcliffe, 1978, Křivohlavý, 2001, Blahutková, Vacková, Cacek, 2002, Chan et al., 2010) we focus our attention especially on the stressor "time pressure", whereas we are convinced that insufficient time management, stress and procrastination of teachers are highly coherent. Nutall (2013) expressly relates procrastination and time management and offers recommendations for superior time management: keep a daily 'to-do' list listing what must be done today, what should be done today and what might be done today. This principle is a significant barrier and stress source for procrastinating people because time planning strictly negates their feature of postponing the duties or work.

Procrastination has been defined as the irrational tendency to delay tasks that should be completed. Trait procrastination is the predisposition to postpone that which is necessary to reach some goal (Lay, 1986). According to the concepts of cognitive behavioural therapy (CBT), the procrastinators postpone their tasks primarily because they doubt their ability to accomplish them and they are afraid of possible negative consequences in case of their failure (Ariely, 2008). According to Burka & Yuen (1983), procrastination is a personal feature of people with lower self-confidence, tendency to laziness and loss of self-control. Cognitive frame of procrastination, which is not sufficiently covered by even CBT, claims that procrastination is an irrational personal disorder which represents logical but ineffective behaviour (Ariely, 2008). Nuttall (2013) mentioned that people procrastinate for a variety of reasons: lack of time management skills; lack of experience of self-management; underestimating the task required; lack of interest in the task; aversion to discomfort: once you get used to putting things off, it's hard to break through the 'pain' barrier; anxiety about failing, about not being good enough, feeling overwhelmed; difficulty in concentrating because of personal problems.

Procrastination has positive associations with perceived stress, negative life events, and daily hassles (Flett, Blankstein, & Martin, 1995). Schraw, Wadkins & Olafson (2007, in Stead, Shanahan, Neufeld, 2010) emphasize the fact that experiencing stress resulting from procrastination. Melton & Briggs (1960) differentiate 3 types of stress: physiological stress (caused such extreme temperatures, lack of oxygen, etc.), psychological stress (intense sensory stimulation) and task induced stress (occasioned by marked changes in the task requirements). Especially the last stress type is probably significantly accompanied by a person's procrastination. From our point of view, interesting findings were introduced by the research of Tice & Baumeister (1997), where the authors point to the fact that academic stress of university students negatively correlates with the procrastination during the start of term but the stress cumulates later in exam period when the students procrastinators show significantly higher stress levels compared to non-procrastinating students.

Jennet et al. (2003, in Skaalvik & Skaalvik, 2010) states, that the majority of teachers copes with stress successfully. Nevertheless, long-time influence of stressors in connection with non-effective coping strategies can lead to burnout. Burnout is often described as the syndrome of emotional exhaustion, depersonalization and reduction of personal success (Maslach et al., 1996). Maslach et al. (1996) identified emotional exhaustion as the key aspect of burnout, while Pines and Aronson (1998) included physical exhaustion characterized by low energy and chronic exhaustion. Hennig & Keller (1996) describe four levels of experienced stress and teachers' burnout. The cognitive level incorporates a negative view of one's own abilities, loss of self-confidence, negative and even cynical relation to pupils or their parents, loss of interest towards one's own professional field, problems with concentration and escape from reality. Emotional level is characteristic by irritation and impulsive behaviour, nervousness and inner tension, emotional exhaustion, anxiety, feeling of helplessness and despair, loss of pleasure from work and the feeling of underestimation. Physical level covers a fast fatigue, increased tendency to illnesses, vegetative issues, headaches, sleep disorders, high blood pressure, muscle tension, vertigo and

nausea, appetite disorders. The fourth level is the social level, characteristic by decrease of educational engagement, limitation of social contact with colleagues and friends, problems in family and private life, neglect of one's hobbies.

Authors Hennig & Keller (1996) divide strategies for coping with stress to professional area, private relationships, life attitude and health. According to authors, there are three bases for stress prevention: 1) decrease of stress situations throughout the work day; 2) reduction of emotional excitement appearing together with stress and 3) change of way of dealing with stress situations, which the individual can't influence. In the context of above mentioned, an effective method for coping with stress load in teacher's profession can be considered the proactive coping. Proactive coping is oriented to achieving targets and includes future requirements, which can lead to self-development. (Greenglass, 2002, Šolcová, Lukavský & Greenglass, 2006). Swarzer et al. (1999) describes proactive individual as ingenious, responsible, scrupulous, who bears responsibility for his/her own results and applies the vision of success. Proactive coping includes target environment and persistent heading towards set goal. Proactive individual accumulates resources, he/she is able to mobilize all resources if necessary, he/she consecutively avoids the sources of exhaustion, owns highly developed social skills of how to mobilize resources.

Aim of our research is to analyse the coherences of experienced teacher's stress (in all areas – cognitive, emotional, physical and social), strategies of dealing with stress load (Proactive coping, Reflective coping, Strategic planning, Preventive coping, Instrumental support seeking, Emotional support seeking, Avoidance coping) and procrastination of primary school teachers. We assume a significant positive correlation between procrastination and experienced stress – in all areas – cognitive, emotional, physical and social. We also assumed positive correlation between procrastination and avoidance coping and negative relation between procrastination and proactive coping.

2. Methods

2.1. Measures

To identify the level of stress and burnout syndrome by teachers, we used Questionnaire for identification of stress level and burnout syndrome from Henning & Keller (1996). The questionnaire is dedicated to define the level of stress influence on central psycho-physical functions and how strong is the general inclination to stress and burnout syndrome. Henning and Keller (1996) specify four areas of reaction on stress: 1) Cognitive dimension (CD): negative picture of own abilities, loss of self-confidence, a negative up to cynic attitude towards pupils or their parents; loss of interest for happening in own occupation field; problems with concentration and escape from reality. 2) Emotional dimension (ED): Irritation and impulsive behaviour; nervousness; and internal tension; affective exhaustion; anxiety, feeling of helplessness; self-remorse, feeling of hopelessness; loss of joy from work and feeling of non-appreciation. 3) Physical dimension (PD): quick exhaustion; increased tendency to diseases; vegetative problems (heart, breathing, digestion); headaches, sleep disorders; high blood pressure; muscle tension (stiff neck, shoulders, back muscles pain); vertigo and nausea; appetite disorders. 4) Social dimension (SD): decrease of educational commitment; limitation of contacts with colleagues and friends; problems in family and personal life; neglecting own hobbies and indulgences. Every area is measured by 6 questions, while the respondent answers on a scale: always (4 points), often (3 points), sometimes (2 points), rarely (1 point) and never (0 points). Level of inclination to stress and burnout syndrome (SB) is moving from 0 to 96 points, the higher values indicating a higher level of experienced stress and burnout. The internal consistency for the present sample was: SB $\alpha = .59$; CD $\alpha = .68$; ED $\alpha = .62$; PD $\alpha = .85$; SD $\alpha = .66$.

To identify the strategies of coping with stress load, we used Proactive Coping Inventory (PCI) from authors Greenglass at al. (1999). PCI questionnaire consists from 7 scales: Proactive coping (PrC), Reflective coping (RC), Strategic planning (SP), Preventive coping (PvC), Instrumental support seeking (ISS), Emotional support

seeking (ESS), Avoidance coping (AC), it is created altogether from 55 statements to which the respondent gives answers on a scale: (1) not at all true, (2) barely true, (3) somewhat true, (4) completely true. Level of Proactive coping is moving from 14 to 56 points, Reflective coping from 11 to 44, Strategic planning from 4 to 16, Preventive coping from 10 to 40, Instrumental support seeking from 8 to 32, Emotional support seeking from 5 to 20, Avoidance coping from 3 to 12. The internal consistency for the present sample was: PrC $\alpha = .70$; RC $\alpha = .85$; SP $\alpha = .68$; PvC $\alpha = .75$; ISS $\alpha = .82$; ESS $\alpha = .61$; AC $\alpha = .81$.

To identify the procrastination of teachers we used General procrastination scale (Lay, 1986). The scale is composed of 20 items that measure trait procrastination on a variety of everyday activities. Items are scored on a 5-point Likert scale ranging from 1 (False of me) to 5 (True of me). The mean of all items yields a composite score, with higher values indicating a higher tendency to procrastinate. The internal consistency for the present sample was $\alpha = .85$.

2.2. Participants

The research sample was created from 194 primary school teachers from Slovak republic. From the total number, 89% were females (N=173) and 11% males (N=21). Average age of research sample was 38.6 years, age scope was 24 to 58 years. Average length of teaching practice was 17.6 years (minimum 5 years, maximum 37 years of teaching practice).

We didn't discover differences by teachers in observed variables (Procrastination, Stress and burnout level, Cognitive dimension of stress, Emotional dimension of stress, Physical dimension of stress, Social dimension of stress, Proactive coping, Reflective coping, Strategic planning, Preventive coping, Instrumental support seeking, Emotional support seeking, Avoidance coping) from the aspect of sex, or the duration of teaching practice.

3. Results

Descriptive indicators (Table 1) are the representation of gross score (minimum, maximum, average and standard deviation) in observed variables. In the area of stress experiencing and burnout by teachers, we discovered that in average are teachers in the light stress level. Most intensive reaction to stress is visible in teachers' physical symptoms, but average values also in this area show only mild level of stress experiencing. In the level of burnout (score over 73 points) appeared 4 teachers (females).

In the area of analysing the relation between procrastination of teachers and experiencing stress and burnout (Table 2) we discovered significant positive correlation ($r = .295$). Likewise we noticed significant positive correlation between procrastination of primary school teachers and three areas of reaction to stress - cognitive ($r = .512$), emotional ($r = .229$) and social ($r = .331$). We haven't noticed a significant correlation between procrastination and the physical area of experienced stress, although the direction of this correlation is positive.

Table 1 Descriptive Statistic of Variables

	Minimum	Maximum	Mean	Std. Deviation
Procrastination	24	92	54.78	14.88
Stress and burnout	1	77	27.95	12.83
Cognitive dimension of stress	1	17	7.03	2.30
Emotional dimension of stress	1	21	7,25	3,30
Physical dimension of stress	1	22	8.04	3.95
Social dimension of stress	1	19	5.62	3.28
Proactive coping	23	58	41.72	6.12
Reflective coping	15	42	33.65	6.09
Preventive coping	14	38	30.12	4.59
Strategic planning	6	16	11.42	2.52
Instrumental support seeking	9	32	24.21	4.09
Emotional support seeking	8	20	16.29	2.46
Avoidance coping	3	12	8.96	2.37

Table 2 Correlation Analysis of Procrastination and Levels of Teacher's Stress

N=194		1.	2	3.	4.	5.	6.
1. Procrastination	Pearson Correlation	1	.295**	.512**	.229**	.110	.331**

	Sig.(2-tailed)	.000	.000	.000	.000	.000	

In the area of analysis of relation between proactive coping and procrastination of teachers (Table 3), we observed highly significant negative correlation ($r = -.422$), which means that teachers which are proactive have low value of procrastination. Procrastination of primary school teachers significantly negative correlates with some other coping strategies: reflective coping ($r = -.244$); instrumental support seeking ($r = -.143$); emotional support seeking ($r = -.152$). In the area of analysis of relation between avoidance coping and procrastination of teachers we observed highly significant positive correlation ($r = .424$), which means that teachers which are procrastinators prefer avoidance coping as a coping strategy.

4. Discussion and Conclusion

Procrastination, a human feature mostly being linked with irrationality, connected with voluntary postponing or delay of intended activity course despite the presumption that the delay will not lead to increase of one's usefulness. In reality it means that a procrastinating person has a certain resolution to work on a set task but because of various reasons he starts to work on it much later than he planned or should. Procrastination is basically repeated voluntary decision making towards something that harms the person (Steel, 2007). Decision making process is connected with the intention to maximize a positive benefit (pleasure) and to minimize a negative benefit (pain) (Čerešník, 2012). In this sense, procrastination can be perceived as an occasional evading

of activity or task execution with the aim to avoid actual strain and effort necessary to achieve it. This leads to positional experiencing of irrational positive benefit. Lay (1986) states that it is natural, if an individual occasionally procrastinates, however excessive procrastination causes the feeling of guilt from unfinished task which should have been accomplished.

Procrastination affects every fourth to fifth person, at students is this number almost 40%. The occurrence of procrastination in the world (with the exception of USA) historically increases, while at individuals decreases with age (Díaz-Morales et al., 2008; Steel, 2007). Steel states that the reason of this phenomenon could be a life-long learning of effective self-regulation strategies. Ferrari (1994), Milgram & Tenne (2000) distinguish two main types of procrastination: behavioral and decision procrastination. The combination of these two types of procrastination is known in the literature as dysfunctional procrastination, which is defined as the chronic delay of tasks (Ferrari, 1994). Decision procrastination means to put off making a decision within some specific time frame (Orellana-Damacela et al., 2000) and it is based on postponing the decision based on fears, worries and inner confusion, which activate metacognitive solution of a problem, which at the same time leads to postponing of the decision (Milgram & Tenne, 2000). Behavioral procrastination is the tendency to delay the beginning and/or the completion of tasks (Orellana-Damacela et al., 2000).

In our research we focused on observation of the relation between primary school teachers' procrastination and the level of their experienced stress, as well as with the strategies of handling stress. We discovered that the experienced stress is highly related to primary school teachers' procrastination. A procrastinating teacher has a higher tendency to experience postponed tasks and duties than stressors, although according to existing findings of other authors (Tice & Baumeister, 1997), their experienced stress probably rises adequately to approaching deadline of the task. Research studies suggest that decisional procrastination represents a stable individual difference variable characterized by delays in making decisions, particularly under stressful circumstances (Ferrari & Dovidio, 1997). Our findings show that the most saturated area of experienced stress in relation to procrastination is the cognitive level of experienced stress. High correlation shows that either actual cognitive stress experiencing, accompanied by negative picture of own abilities, loss of self-confidence, negative attitude to pupils/parents, loss of interest about events from professional field, problems with concentration and escape from reality directly activates teacher's procrastination in the sense of decision procrastination, or the teacher normally behaves as a procrastinator, thinks and decides in the direction of postponing the tasks and duties, which cumulates his experiencing of stress in cognitive area and displays itself in above stated personal characteristic features.

Procrastination has been linked to several negative emotional states and outcomes and procrastinators perceived this behaviour as a problem they wanted to reduce (Orellana-Damacela et al., 2000, Steel, 2007). We discovered a significant correlation between teachers' procrastination and emotional manifestations of experienced stress. Teachers procrastinators express themselves by irritation and impulsive behaviour, nervousness and inner tension, emotional exhaustion, anxiety, feeling of helplessness and despair, loss of pleasure from work and the feeling of underestimation. We also discovered that teachers procrastinators significantly experience stress also in social level, they are characteristic by decrease of educational engagement, limitation of social contact with colleagues and friends, problems in family and private life, neglect of their hobbies.

Procrastination as a personal feature (Lay, 1996) has a positive relation to avoiding behaviour. According to our findings the teacher procrastinator voluntarily prefers avoiding behaviour as a strategy of coping with stress. Behavioural procrastination itself is related with the delay of accomplishment of bigger and smaller tasks. It means evasion and aberration from a given task in favour of other activities. We also discovered that teaches' procrastination is in negative relation to proactive behaviour which is considered to be an effective coping strategy. Proactive behaviour belongs to highly effective strategy of handling stress situations. It is a direct decrease of negative impacts, including depression and burnout syndrome, especially emotional exhaustion and cynicism, but also the feeling of anger. It is a positive strategy which is perceived as a support of individual's independent growth, his professional and life efficiency (Greenglass et al., 1999). According to our findings, with

the stressor in operation, procrastinating teachers don't prefer orientation on goals and future demands that could lead to self-development but they have the tendency to avoid it.

4th International Conference on New Horizons in Education

Professional development of early childhood mentor teachers in teaching math

Zeynep Alat^{a*}, Nuray Çalışkan Dedeoğlu^b

^a*Ondokuz Mayıs University, Faculty of Education, 5139, Samsun, Turkey*

^b*Sakarya University, Faculty of Education, 54300, Sakarya, Turkey*

Abstract

Importance of acquisition of early math skills and concepts on future school achievement has been widely acknowledged. Effective early math education takes place only when teachers are donated with necessary teaching competencies and attitudes toward math education. Those competencies are largely acquired during student teaching practices. Mentoring teachers by playing a role model for and supervising student teachers appear to be the most significant actors during this process. This study explores how early childhood mentor teachers define the effectiveness of their own pre- and inservice education in their professional development particularly in regard to math teaching skills and practices. Data was collected through semi-structured interviews with the preschool teachers working at the different preservice teacher placement sites. Results showed that the participants generally leaned on the collegial support and mentoring reflecting an almost total disregard for the teacher education courses they received during their undergraduate education. Student teaching received a mix of views whilst inservice trainings that are provided on a regular basis appeared to provide no teacher training on early math.

Keywords: early childhood; math; teachers; mentors; professional development.

1. Introduction

The accumulated empirical evidence regarding development of children's mathematical skills and understanding has disproved the notion that children in early years are too young to learn mathematics (Aubrey, 1993; Baroody, Lai, Li, & Baroody, 2009; Charlesworth & Lind, 1999; Davies & Walker, 2008; Flavell, Miller, & Miller, 1993; Ginsburgh & Seo, 1999; Griffin, 2004; Starkey, Klein, & Wakeley, 2004; Wynn, 1992). In fact, children's daily engagement with mathematical concepts and procedures in their natural environments helps them build varying levels of skills before any formal instruction (National Association for the Education of Young Children [NAEYC], 2010). This realization of the knowledge base that children bring to educational environments along with the research findings that linked successful early math experiences to future school achievement (Tsamir, Tirosh, & Levenson, 2011) has led to inclusion of math skills and concepts as an important part of early childhood standards in many countries including the U.S. and Turkey (Turkish Ministry of Education [MEB], 2006; NAEYC, 2010; National Council of Teachers of Mathematics [NCTM], 2000). Development of certain math skills and concepts even become a prerequisite for primary school entry.

Acquisition of expected early math skills and concepts largely depends on the quality of education provided by teachers (Borko, 2004; Garet et al., 2001). Indeed, teacher expertise explains almost half of the variance in

learning mathematics (Rhoton & Stile, 2002), which laminates the significance of teacher training and professional development. Teachers of young children need to have a strong background in domain specific knowledge, how mathematical skills and concepts are acquired by children, and effective pedagogies (Cullen, 1999; Darling-Hammond, 2000; Garet et al., 2001). Clearly, this means, teacher professional development is to be far from a simple provision of a training to bring out the natural instinct of an individual to teach, on the contrary, it is to be seen as a complex process in which many elements and factors come to play in interaction (Avalos, 2011; Borko, 2004; Kedzior, 2004). Such teacher related factors as job-commitment, willingness and openness to change, cooperative attitudes and practices as well as contextual factors including traditions, educational policies and reform movements, working conditions, school administration, student body, and professional development opportunities have an influence on the impact of teacher development initiatives. Success of a teacher-training program at one setting does not guarantee the same level of success at another.

The path to a career in teaching starts with formal college level courses, field experiences and student teaching and later embodies informal collegial support and interactions as well as formal and structured group trainings and postgraduate courses (Avalos, 2011). A similar path is followed by early childhood teachers in Turkey. First, they receive a nationwide well-structured coursework at a four-year college program that also includes a three-credit-course on early mathematics. Majority of the courses are a good blend of theory and practice hours. This standard coursework also gives teacher candidates opportunities to practice their teaching skills in real classroom environments as part of their three-semester-long student teaching placements. Mentor/cooperating teachers play an important role during this process by facilitating, guiding, and supervising student teachers in their struggle to put what they learned at school into practice whilst developing their teacher identity (Avalos, 2011). Upon hiring, all teachers receive a total of four weeks of inservice training each year throughout their career.

For the last two decades, an ambitious government initiative to provide all children access to early childhood education programs has been implemented in Turkey. The main components of this comprehensive initiative entail increasing the number of preschool and kindergarten programs, hiring a drastic number of new teachers, development of national standards and the curriculum, and revision and provision of both preservice and inservice teacher trainings. The success of this educational reform largely falls on the shoulders of teachers. Cooperating teachers are among the key participants in preparation of future teachers (Zeichner, 2002). With this understanding in mind, our study focused on early childhood mentor teachers' thoughts on effectiveness of their own professional development experiences in teaching mathematics. Additionally, we aimed to reveal the sources from which teachers drew their ways of teaching math to young children.

2. Method

2.1. Participants

The participants were recruited from public early childhood programs where student teachers are placed. A total of 17 teachers participated in the study. They were all cooperating teachers during the student teacher placements in that school year. All the participants had a four-year college degree in early childhood education. The range of teaching experiences of the participants varied from 4 to 28 years.

2.2. Data collection and analysis

Data collected through semi-structured interviews with the participants. During the interviews, the participants were asked questions about their preservice and inservice mathematics education trainings. All the interviews were tape-recorded and then transcribed.

Content analysis was carried out on data in order to reveal underlying themes. Pseudonyms replaced the real names of the participants in order to protect their identity.

3. Findings

3.1. Effectiveness of preservice education on teachers' practices

Preservice mathematics education preparation includes a mandatory course on early mathematics, pedagogy courses, and field experience and student teaching.

3.1.1. Effectiveness of Mathematics Education in Early Childhood course and other pedagogy courses

The participants in majority did not express positive views on this required course and were very critical of the way it was thought. Apparently, the course failed in reaching its goals because of such reasons expressed by the participants as lack of commitment and job-ethic of instructors, provision of inadequate opportunities for practice, failure to establish the link between theory and practice, and course content and aims not being followed by instructors. Defne, one of the participants, went on to narrate her experience as:

“All we did throughout the semester was making teaching materials. Nothing else. It was no different than the material development course. No mention of how to teach math. I learned nothing in that course that I can use now.”

For some of the participants, there was nothing to draw from that course to apply in their classrooms because of the instructors' failure to make connections between theory and practice. Banu remembered:

“I did not get anything at college that I could apply in my practice now. We just had to memorize a book called “instinctive mathematics” to get a passing grade. Nothing else.”

Selin, on the other hand, had to receive the course from an instructor who was not an expert on educational pedagogies. She explained:

“The course was all around pure mathematics. We were thought high level of mathematics, which absolutely does not have any place in our field. What we learned in that class had got nothing to do with teaching math to young children.”

3.1.2. Effectiveness of field experience and student teaching

For some of the participants, there was nothing to remember from their student teaching experience while for some others it was a limited opportunity to observe use of materials and play in teaching math. Some of the participants neither observed nor practiced any math activity during their field experience and student teaching. Ayse:

“We were on our own during our student teaching. The teacher was never in class. I learned nothing from her during my student teaching.”

For Esen, presence of the cooperating teacher in the classroom did not make much difference since she did not seem to have the necessary skills to teach math to young children. Esen:

“Even though the center I was placed in for my student teaching was equipped with nice materials and in good condition, inexperience of the classroom teacher was an impediment in my learning experience.”

Leyla experienced almost a blackout when it came to talking about her student teaching. Leyla:

“I don’t remember anything about those days. It is hard to tell if it was effective or not. I cannot tell if it is because there was nothing to remember. I just don’t remember.”

Those participants who found their student teaching somewhat effective were the ones who had a chance to observe and taught by their cooperating teachers how to use materials in teaching mathematics. Banu, for example, said, “I learned how to use materials like puzzles in math activities.” For Dilek, the experience was fruitful in teaching her how to incorporate different activities in teaching math. Dilek narrated, “She was a good resource to learn how to develop good and variety of math activities.”

3.2. Inservice trainings

Based on the participants’ accounts, it became clear that early mathematics was largely ignored at inservice trainings. Rather than providing domain specific knowledge and practice, inservice trainings were oriented towards an entire body of teachers from all backgrounds. Lecture based trainings were delivered in crowded rooms keeping the participants as passive listeners with no opportunity to take an active role or to cooperate with other teachers in their learning. Ayla was among the ones that scrutinized the effectiveness of those trainings:

“I don’t think it brings any benefit at all. They put hundreds of teachers in one room with an instructor who just lectures, pardon, just reads from the slides. No practice what so ever. It’s not the right way to provide education.”

Not impressed by the teaching styles of the trainers, Sakira also complained about ineffectiveness of the inservice trainings:

“They are just waste of time. I don’t know where they find those trainers. They cannot keep us engaged. And, subjects related to preschool education are never a part of the regular trainings.”

3.3. Collegial support

Inadequacy of their formal training led many participants to rely solely on their fellow teachers as a resource to learn from and receive support. In fact, for the majority of the participants, peer support appeared to be the only resource that was highly mentioned and drawn upon despite the fact that professional development experiences of those same colleagues were also not so promising. A firm statement by one of the participants, “I learned everything about teaching from my more experienced colleagues” was the epitome of the participants’ accounts. Considering the fact that the participants were employed at the same centers, were uninformed by the theory and received inadequate practical training in regard to teaching math, their professional support to each other was quite likely to be something “unproductive socialization,” as Tigchelaar and Korthagen (2004) would call, leading only to the continuum of a vicious cycle of poor teaching.

4. Conclusion/Recommendations

The study showed that preservice and inservice teacher training programs fail to provide effective training in early mathematics education leading teachers solely to rely on their colleagues for guidance in the process of their occupational socialization. However, their own lack of a strong background in teaching early math raised questions about the quality of guidance those mentoring teachers supplied. It is also alarming that all the participants in the study were the cooperating teachers who were supposed to be good role models for the student teachers placed in their classrooms. A vicious cycle of poorly trained teachers would continue, making the early childhood education initiative's ultimate goal to end educational and class disparities unlikely to achieve unless immediate measures are taken to intervene.

As part of the solution, first of all, measures should be taken to hold all participants playing a role in teacher education processes be accountable for fulfilling their job requirements. An accreditation system for college level teacher education programs could be developed in order to bring quality into preservice education. It is also essential that teacher candidates be given opportunities to gain experience in quality environments where best practices are preached and realized. Professional development trainings should also be restructured under the light of empirical evidence that describes in detail what makes a teacher training program work. A particular attention should be paid to provision and delivery of professional development opportunities for teaching mathematics to young children in order to help teachers develop a strong background in teaching mathematics and make connections between theory and practice.

Profile of multidisciplinary groups and collaborative styles in interdisciplinary research

Juan Carlos Villa Soto^{a*}, Norma Blazquez Graf^a, Haydeé García Bravo^a^a *Universidad Nacional Autónoma de México, Centro de Investigaciones Interdisciplinarias en Ciencias y Humanidades, 04360, D.F., México*

Abstract

The aim of this study was to identify the relationship between the profile of multidisciplinary groups formed to acquire integrative knowledge skills and their collaborative styles to develop interdisciplinary research projects. We analyze the experience of twelve multidisciplinary teams in professional update courses in interdisciplinary research. The results suggest that the combination of high heterogeneity in terms of disciplinary training and relative homogeneity in age and academic level of the team's members (concentrated in postgraduate studies in progress) was more appropriate to effective articulation of knowledge. We propose some criteria to configure ideal teams in similar educational programs.

Keywords: collaborative styles; integrative knowledge; interdisciplinary research; multidisciplinary groups; professional update courses.

1. Introduction

The aim of this study is to characterize collaborative styles in interdisciplinary research adopted by multidisciplinary groups in relation to their members' socio-academic profile, which together configure a group profile with a higher or lower heterogeneity. Team profile (regarding team size, members' academic level, sex, age, mono- or pluridisciplinary training, among other characteristics) is a key aspect in the dynamics of interdisciplinary research groups (Lee, 1997).

In an earlier study, we identified five collaborative styles associated with the socio-academic profile of six multidisciplinary groups pertaining to the Professional Update Diploma in Interdisciplinary Research (Diplomado de Actualización Profesional en Investigación Interdisciplinaria / DAPII in Spanish) at the Center for Interdisciplinary Research in Sciences and Humanities of the National Autonomous University of Mexico (Blazquez, García and Villa, 2012).

The way in which the task corresponding to the theoretical-practical module was performed -i.e., designing a proposal for an interdisciplinary research project- was the benchmark used to analyze collaborative style differentiation. It was observed that in some cases the way in which each group performed the task led to an identification of the task outcome with the academic program's objective (regarding the collective construction of the project) and, in any case, with the goal of obtaining the Diploma. The aforementioned occurred when the inherent tension in collaborative work in heterogeneous groups was dealt with in three different ways: a) when it was resolved through dialogue and agreements; b) when it was dissolved through condescendence; or c) when the tension was heightened due to a student's attempt to assume pre-eminence. These divergent strategies were associated to the way in which cognitive conflict was dealt with within the group dynamic. Although cognitive

E-mail address: visar@unam.mx

conflict—i.e., the possible incompatibility between students' prior conceptions and the new meanings emerging from teamwork—is intrinsic and necessary to interdisciplinary research (O'Donnell and Sharon, 2005), we considered that it was important to inquire whether some of the socio-academic profiles of the participants or the groups' degree of heterogeneity favored or hindered dealing with cognitive conflict with a certain degree of openness.

One of the distinctive features of interdisciplinary teamwork is its heterogeneous character (Klein, 2005). But, as far as its work dynamic is concerned, it is characterized by the fact that it combines highly intense interaction processes with vigorous discussions. Team members are thus obliged to think reflectively and adopt flexible stances regarding those held by unidisciplinary or multidisciplinary projects (Lyll and Meagher, 2007). Within the territory of organizational psychology, an interdisciplinary work canon is established that includes the relativization of the certainties of the individuals with a background in each discipline, the questioning of its paradigms and foundations or the possibility of considering other stances, even if they are not shared (see Martínez, 2013). Nonetheless, it is important to compare the interdisciplinary work experiences of a variety of groups following common methodological guidelines in order to thus identify the underpinnings of possible dialogue limitations or advantages and collaboration in this kind of project.

The aforementioned study highlights the importance of symmetry within multidisciplinary groups regarding their members' academic trajectories in order to reach authentic collaborative work. In any case, asymmetrical relationships elicit attitudes of insecurity and distrust and set up marginalization processes like those identified by Klein (2005) when analyzing psychological and social hindrances to teamwork.

The DAPII diploma, in its 2012 edition, not only allowed us to corroborate these first results in the study of collaborative styles, but mainly enabled us to delve more deeply into their characterization. A comparative analysis of collaborative styles, based on how the students reported their perception of teamwork, thus offered guidelines to analyze both the individual and group strategies that the students set up in order to deal with the tensions inherent to interdisciplinary research in the process of learning collaborative skills.

2. Method

This work is based on the analysis of the experience of six multidisciplinary groups from the 2011 DAPII diploma and six groups from the 2012 DAPII diploma at CEIICH-UNAM. These groups were constituted in agreement with the group members' choice regarding the thematic lines proposed by the Academic Committee. The themes in the 2011 DAPII diploma were: scientific culture (2 teams), citizen culture, new communication forms, environmental challenges and health issues. The themes chosen by the groups in the 2012 DAPII diploma were: education and the environment; citizen culture and public spaces; migration and rural development; education and social development, aging and education, as well as economic and social development.

In order to meet the teaching program's goal of developing student skills to conduct and assess interdisciplinary research, the groups formulated a proposal for an interdisciplinary research project based on the methodological criteria for differentiation and integration established by Rolando García to study complex systems (García, 2006). A questionnaire was designed to identify how students perceive teamwork. They were asked to evaluate their team's efficiency regarding: a) communication; b) cooperation; c) style for setting up agreements; and d) agreement compliance. They were also asked their opinion regarding their full understanding of the team's task to develop a proposal for a research project with an interdisciplinary approach and the team's commitment to implement it (see Appendix A).

The questionnaire had three sections: the first section was comprised of 20 statements related to the aforementioned themes which the students could agree with, disagree with or rate "more or less." The second section consisted of a teamwork evaluation rating each of these items from 0 to 10. This rating is called "assigned" rating. Two evaluations of each item were thus obtained from each student: the rating obtained from

the statements in the first section lacked nuance (ten points were allocated to each “yes” or “no” with a positive opinion, zero points to each “yes” or “no” with a negative opinion, and five points to each “more or less” answer). This rating, called “revealed” rating was confirmed, and in any case weighted with the assigned rating in the second section. The questionnaire’s third section consisted of open-ended questions regarding the issues identified in the groups’ teamwork as well as suggestions aimed at solutions.

3. Results

Figures 1(a) and (b) show the average rating assigned by each student to the six topics corresponding to collective work. It was observed that groups 3a and 5b presented the lowest ratings. The group members’ predominantly negative evaluation was confirmed by their revealed ratings (Figures 2(a) and (b)). A higher score (over 8 points) prevailed in both ratings among the rest of the teams. In each group, a certain correspondence between the ratings for group process and expectation fulfillment was observed (Figures 3(a) and (b)).

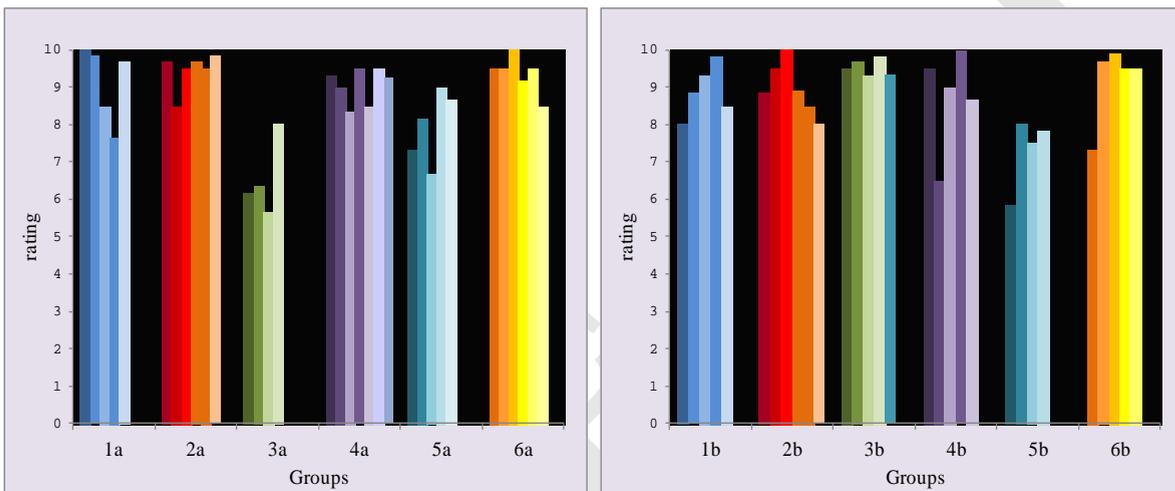

Fig. 1. (a) Group process assigned rating (2011 DAPII); (b) Group process assigned rating (2012 DAPII)

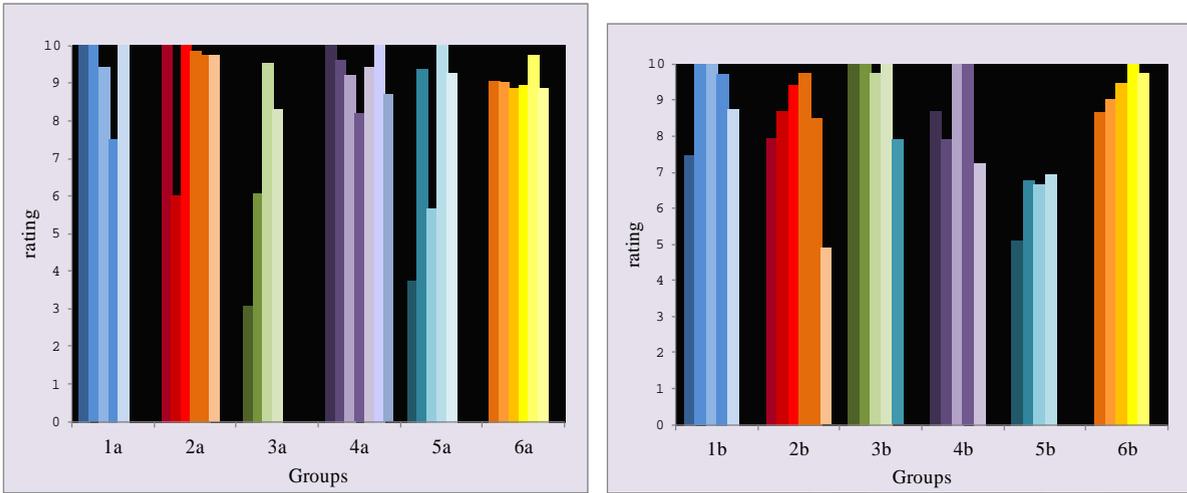

Fig. 2. (a) Group process revealed rating (2011 DAPII); (b) Group process revealed rating (2012 DAPII)

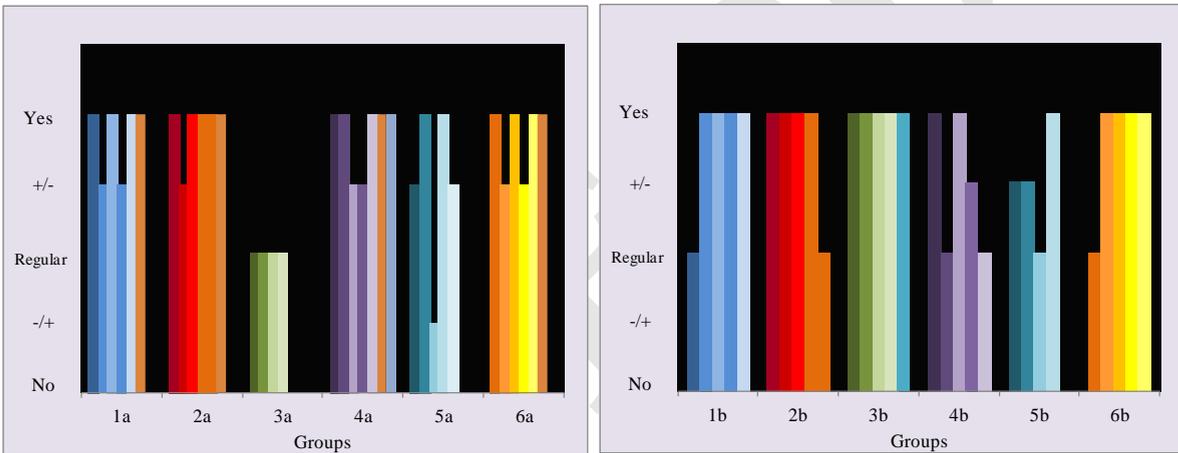

Fig. 3. (a) Expectation fulfillment (2011 DAPII); (b) Expectation fulfillment (2012 DAPII)

A comparative examination of group 3a (comprised of three women and one man) and group 5b (comprised of four women and one man), based on this first differentiation, showed that their socio-academic profile was different since the age range in group 3a was from 29 to 42, whereas the age range in group 5b was from 28 to 62. All students in group 5b had a pluridisciplinary academic background. As a whole, the group had studies in 11 different disciplines (Biology, Communication, Information Sciences and Techniques, Sociology, International Development Studies, International Studies, Visual Arts, Philosophy, Education and Teaching, Art History and Higher Education Management). Students in group 3a presented two cases of monodisciplinary academic background with studies in 7 different disciplines (Physics, Urbanism, Human Settlement Design, Regional Studies, Economics, Communication and Sociology). These groups did not have a similar academic profile since there was a more extreme polarization of academic degrees among the students in team 3a (two students with a BA degree and two with a PhD) than among students in team 5b (three individuals with MA studies -one of whom had graduated- and two individuals with PhD studies (one of whom had graduated). In

spite of this, both teams presented two individuals with a more extensive academic trajectory in terms of their teaching, research and even academic-administrative experience. This manifested as an asymmetrical relationship which was a decisive factor in the decision-making process and in the way in which cognitive conflict was dealt with. Students in group 3a reported problems in all topics regarding group process. Figures 4(a) and (b) show that these problems occurred to a larger extent in the areas of task understanding, communication and commitment. This translated into a lack of compliance with agreements. Two female students (with marked differences in research experience) expressed conceptual and methodological differences which were attributed to their different academic backgrounds (Economics and Sociology). In the final phase of the course, a less experienced female student self-marginalized (associated with health issues reported through medical certificates with a possible manifestation of stress). As a result of this split, two research project proposals were presented. One was signed and submitted by three members, whereas the other one was submitted by one member, but gave credit to the four students.

Students in group 5b also reported problems in all the topics regarding group process, particularly in communication and compliance with agreements (Figure 5(a) and (b)). In this group, there were differences in communication styles and in the understanding of teamwork dynamics among the female students with a higher academic background (a PhD student with All-But-Dissertation –ABD– status and a PhD graduate). The guidelines established by the female student with the most extensive academic trajectory who was also the most senior team member (age 62) prevailed. In this group, cognitive conflict was not attributed to the different academic backgrounds (Sociology and Philosophy). As in group 3a, a female student who had PhD studies with ABD status self-marginalized in the final phase of the course (also associated with health issues reported through medical certificates, and a possible manifestation of stress). In spite of this rupture, the research project proposal was presented by the group as a whole.

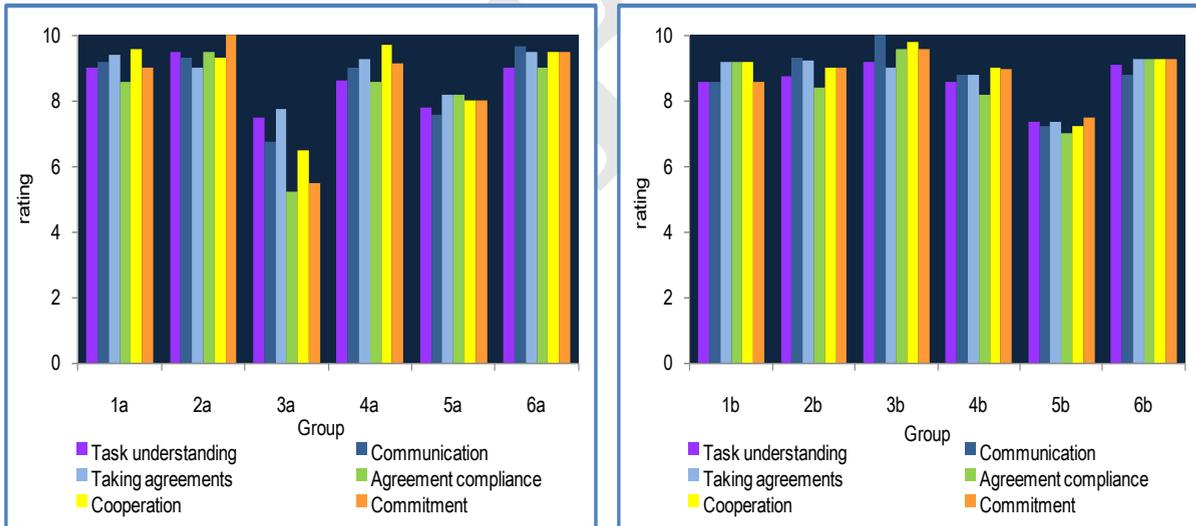

Fig. 4. (a) Teamwork assigned rating (2011 DAPII); (b) Teamwork assigned rating (2012 DAPII)

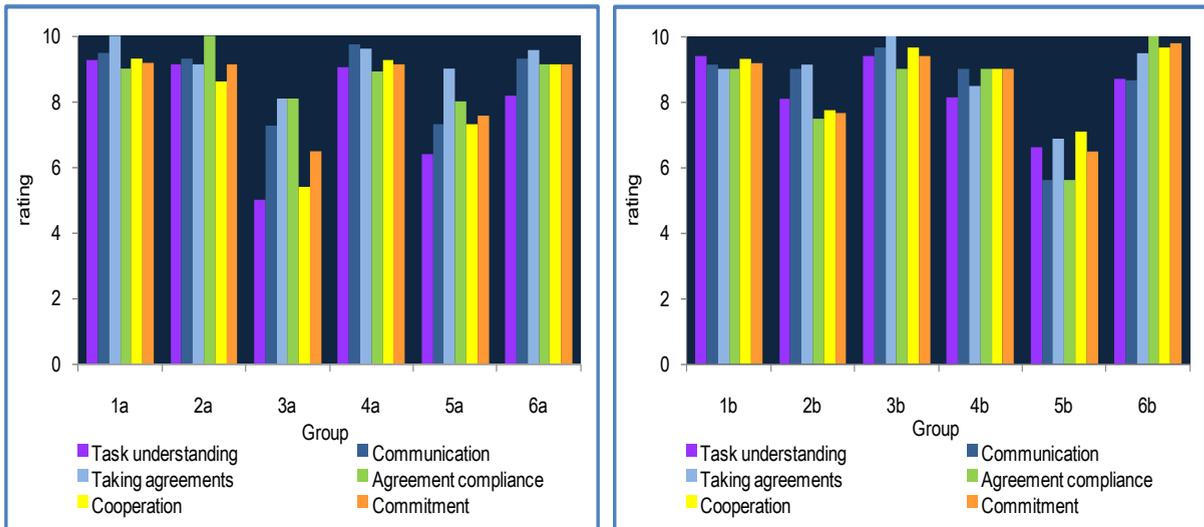

Fig.5. (a) Teamwork revealed rating (2011 DAPII); (b) Teamwork revealed rating (2012 DAPII).

Both group 3a and 5b avoided addressing the unresolved issues in the teamwork process in the project. In these groups, cognitive conflict took place in an asymmetrical relationship between team members. One showed contrasting academic trajectories and the other presented disagreement about leadership. This aggravated the conflict culminating in a rupture, which led to a collaborative style focused on task outcome and emphasis upon prestige. Although ratings above 8 prevailed among other teams that did not experience rifts, it was noted that in groups 1a, 2a, 5a, 1b, 2b, 3b, 4b and 6b at least one of its members gave a low rating, which was an assigned or revealed rating, or both. Upon ordering the groups based on the average assigned and revealed ratings of each of its members in all topics (Figure 6), it was observed that those that had a positive rating of all their members (4a and 6a) did not reach the series' highest score. A comparative analysis of the split groups, allows for an interpretation of the possible meaning of these disagreements and agreements.

Group 5a, comprised of four women and one man, with ages ranging from 44 to 61, had a relatively homogeneous socio-academic profile in terms of member ages (all were over 40) and academic level (two MAs with ABD status, one female student with an MA and two PhDs with ABD status). However, this group (comprised of four members with a pluridisciplinary academic background, one with monodisciplinary education, as a whole had studies in 8 different disciplines: Physical Education, Pedagogy, Anthropology, Medical Anthropology, Medicine, Public Administration, Biochemical Engineering and Microbiology) was characterized by its difficulty to listen and accept critical opinions from team colleagues. In this group, according to the revealed rating, three individuals considered the group's teamwork appropriate, whereas two estimated that it was deficient, particularly regarding compliance with agreements. This divergent vision can also be observed in expectation fulfillment, since two individuals reported that expectations had been fulfilled, another two considered that they had not been fully met and another answered that expectations had not been fulfilled at all.

In spite of cooperation issues, the group complied with the workshop's task with an outcome-oriented collaborative style.

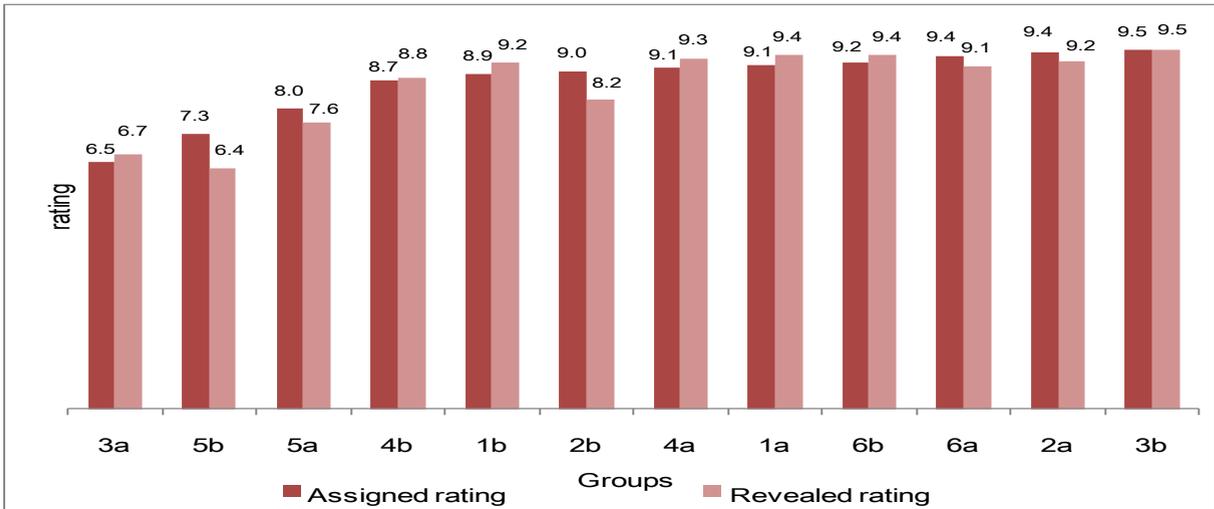

Fig. 6. Perception of collective work. Average ratings per group.

Group 4b (comprised of two women and three men aged 35 to 65, two MAs, two PhDs with ABD status and a female student with PhD) reported problems with task understanding and agreement compliance. Four students had a pluridisciplinary academic background and one reported having a monodisciplinary academic background. As a whole, the group had studies in 9 different disciplines (Social Anthropology, Teaching for Middle School and Higher Education, Latin American Literature, Romance Studies, Chemical Engineering, Pedagogy, History, Journalism and Communication). As opposed to groups 3a and 5b, in this team the member with the highest academic level was not the most senior team member. This could have influenced his failure to exercise leadership. In any case, this individual was able to contain the recurrent attempt of the second most senior team member (aged 50) with a high academic degree (PhD candidate) from defining the work guidelines. In spite of the dissatisfaction expressed in the evaluation by one of the younger female students and the student with the lowest academic level, this containment prevented the group from experiencing a rift.

The fact that age as a factor for leading group dynamics becomes diluted when it is not accompanied by a higher academic level than other group members was confirmed in group 1b comprised of three women and two men between the ages of 26 and 61 (one BA, one MA and three MAs with ABD status). The relative homogeneity of the remaining group members regarding age (from 26 to 35) and academic level promoted the integration of all the students with a collaborative style focused on dialogue and agreement compliance. The group nonetheless showed heterogeneity in relation to the members' academic backgrounds (three members had a pluridisciplinary academic background, two had a monodisciplinary background). The group as a whole had studies in 8 different disciplines: Industrial Engineering, Educational Planning, Physics, Sociology, Industrial Design, Social Work, Accounting and Fiscal Law). In this group, cognitive conflict was expressed more emphatically in the opinions of the female student with studies in Physics who rated group process with a lower

score since she felt uncomfortable with “ideological positions” and demanded greater precision in methodological issues.

A similar process was observed in group 2b in which although the most senior team member (aged 54) also held the highest academic level (PhD), the group experienced a more horizontal participation process in view of the group’s more pronounced homogeneity. The group was comprised of three women and three men between 30 and 54 (two MAs, three PhDs with ABD status and one PhD). The six team members had a pluridisciplinary academic background. As a whole, the group had studies in 13 different disciplines (Graphic Design, Art, Industrial Engineering, Sustainable Development, Biomedical Sciences, Sociology, Economics, International Economy, International Relations, Political Sciences, Geography and Urbanism). It is noteworthy that although this group reported disagreement regarding expectation compliance, as well as lower ratings (below 8 points) in cooperation, agreement compliance and commitment, it was able to present a project that reflected an intense process of dialogue, negotiation and collective construction of the proposal, which was embarked upon as a group task. This can in part be attributed to the fact that this group’s relative symmetry (both in age and academic level) was established on the basis of the students’ more consolidated academic background (most of whom had PhD studies).

Group 1a was comprised of two women and three men with ages ranging from 30 to 58. Although the age range is quite broad (28 years), a relative homogeneity was observed as far as academic background is concerned. All group members -as researchers- had postgraduate studies (three MAs with ABD status and two PhDs with ABD status). This favored their perception as peers. Although this group was also heterogeneous, since it had four students with a pluridisciplinary academic background and one with a monodisciplinary academic background, they all shared the fact that they came from social science programs. As a whole, the group had studies in 8 different disciplines: Psychology, Anthropology, International Relations, Pedagogy, Communication, Development Management, Political Sciences and Sociology. This allowed them to deal with cognitive conflict through a common epistemic commitment around Pierre Bourdieu’s theoretical framework with a task-focused collaborative style.

Groups 4a and 6a were the only groups in which all the members without exception assigned ratings higher than 8 to all items. These ratings, however, were not on average the highest of the series. Although group 4a, comprised of four women and three men with ages ranging from 27 to 45, had more members than any of the other teams, it had a more homogeneous profile in the students’ academic background, with a concentration in MA studies (one BA, three MAs with ABD status and three MAs). In this group, the students treated each other like peers, which enabled more open and direct communication, reinforced by intense use of a website. Like group 1a, this team was comprised of students with studies in social sciences and the humanities: five had a pluridisciplinary academic background and two had a monodisciplinary academic background. As a whole, the group had studies in 11 different disciplines (Psychology, Psychoanalysis, History, International Relations, Pedagogy, Communication, Graphic Communication, Visual Arts, Political Sciences, Sociology and Philosophy). Despite this affinity, group process ratings revealed the existence of disagreements, as well as two cases of expectations that were not fully met. These were received with “willingness to listen,” acceptance of criticism, “leaving the ego aside,” and focus on reaching workshop goals, which brought them closer to an effective exchange of knowledge.

Group 6a, comprised of four women and two men, with ages ranging from 27 to 62, had a similar profile to group 2b. Although this group had two members with a BA (one of whom was the most senior group member), it included a PhD and three PhDs with ABD status. This enabled horizontal participation. In this group, three people had a pluridisciplinary academic background, and the other three had a monodisciplinary background. As a whole, the group had studies in 8 different disciplines (Psychology, Geography, Graphic Design, Visual Arts, Architecture, Urban Design and the Environment, Chemistry and Political Sciences). Although in this group, discrepancy was noted in group process ratings since none of the different items received the same score, its members achieved greater cohesion by agreeing to reorient the task’s objective in such a way that instead of

designing a proposal for a research project, they presented an essay that nonetheless contained a reflection on the proposal's construction process as well as arguments to concentrate on the first phase of the proposal design regarding research question formulation. This group established an open dialogue and proposed that agreement compliance was proof of reciprocal trust. This team adopted a process-oriented collaborative style.

Groups 2a, 3b and 6b comprised a third block since they registered the highest average ratings in the series in spite of the fact that in all the cases at least one of the members gave a low rating which was either assigned, revealed or both. Group 6b, comprised of two women and three men with ages ranging from 24 to 53, presented a polarized profile in terms of their ages. Their academic background, however, was heterogeneous since the group was comprised by two BAs, two MAs with ABD status and one PhD; four group members had a pluridisciplinary academic background, and one had a monodisciplinary academic background (one of the individuals with a BA was studying two degrees simultaneously). As far as fields of study are concerned, the group comprised 10 different disciplines (Psychology, Educational Research, Biology, Basic Biomedical Research; Geography, Philosophy, Social Work, Political Sciences and Public Administration, Pedagogy and Latin American Studies). In spite of the high ratings group process received, one of the youngest individuals with a lower academic level gave a rating of 7.3, expressing dissatisfaction with expectation compliance. Likewise, a lower score was noted in task understanding. This group decided to dismiss addressing concrete issues and developed a theoretical project on the search for alternatives to the rationale of the neoliberal model, thus diffusing cognitive conflict.

Group 2a, comprised of three women and three men with ages ranging from 43 to 59, presented relative homogeneity not only in terms of team member ages (all above 40) but also in academic level, since the majority had a PhD degree (one MA, one PhD with ABD status and four PhDs). The group's heterogeneity was seen in the members' broad spectrum of academic backgrounds: with five members with a pluridisciplinary academic background, and one with a monodisciplinary academic background, as a whole, the group had studies in 11 different disciplines (Social Work, Anthropology, International Relations, Pedagogy, Philosophy, Philosophy of Science, Physics, Language and Literature, Communication, Political Sciences and Sociology). In spite of the group's relative socio-academic symmetry, there was one case of self-marginalization (accompanied by proof of participation in work commissions) by one of the group members with a PhD who systematically resisted the group's agreements, overvaluing his own ideas and appealing to the principle of authority. This group member gave low ratings to all the aspects regarding group process and considered that his expectations had not been fully met. Although agreement compliance was one of the items that received a higher evaluation, a lower score was given to the way in which agreements were established, which can be interpreted as a serious interest in fulfilling the workshop's achievement criterion, where all group members assumed a serious commitment, as was shown by the highest score given to this topic. This demonstrates a collaborative style focused on both results and prestige.

Group 3b, comprised of three women and two men, presented relative polarization regarding both age and academic trajectory since one of the group members, aged 65, had two PhDs, and another one, aged 59, had one PhD with ABD status, whereas another PhD with ABD status and two MAs with ABD status were aged 28, 29 and 23, respectively. This team chose the theme in which the person with the highest academic level was an expert. This group member assumed a persuasive leadership that allowed them to contain polemical stances in spite of the members' broad spectrum of academic backgrounds, all of whom had a pluridisciplinary academic background. As a whole, the group had studies in 13 different disciplines (Education, Hispanic Literature, Latin American Literature, Sociology, Social Sciences, Agricultural Education, Pedagogy, International Relations, Political and Social Studies, Social Anthropology, Latin American Studies, Medicine, Social Medicine and Epidemiology). The fact that the average revealed rating of one of the MA's with ABD status was 7.9 points shows that it is likely that concessions were made in this group regarding the course the task was to follow, without being fully convinced.

4. Conclusion

The study results confirm that the collaborative style in the multidisciplinary groups of the aforementioned teaching program on interdisciplinary research education is in part due to its members' socio-academic profile regarding age, academic background and academic level. In general, the groups with relative homogeneity in both member age and academic level, establish a peer relationship that allows group members to deal with cognitive conflict with a certain openness, free of inhibitions or resistance, and with a greater willingness to make intense negotiation efforts in order to fulfill a task through effective collective learning. The various teamwork experiences reveal that symmetrical relationships were also established with other profiles. Hierarchical features regarding age, academic level and/or professional trajectory were mitigated in view of the concentration of team members with relatively affinity in their socio-academic profiles. In any case, the lack of counterweights aggravated the tension triggered by cognitive conflict. This was a cause of ruptures. The evaluation tool applied in this study has been useful to characterize strategies followed by multidisciplinary groups in order to deal with cognitive conflict within the group dynamics on behalf of complying with the task of formulating a proposal for an interdisciplinary research project. The results of the group's self-evaluation of its teamwork led to identifying three forms of responding to the demand for intense discussion to articulate various visions germane to interdisciplinary research: 1) the lower ratings corresponded to the strategy of seeking certain preeminence in groups with a polarized socio-academic profile, which aggravated cognitive conflict leading to a rupture through self-marginalization; 2) the series' highest ratings revealed a strategy to reach agreements in which harmonious agreement is privileged, thus dissolving conflicts (this strategy was also followed by the groups with lower ratings, but did not lead to rupture); and 3) the intermediate but positive ratings coincided with the strategy of establishing an open dialogue with intense negotiations in order to reach agreements, thus seeking to overcome differences. According with the characterization in an earlier work (Blazquez, García and Villa, 2012), strategy 1 focuses on *the result* (obtaining the diploma) and *prestige*, (an interest in showing academic reliability at the cost of the group's learning); strategy 2 is also geared by *harmonious agreement* (an attempt to avoid conflict) and by *the objective* (task compliance). Strategy 3 focuses on *the process* that allows the proposal to be constructed collectively. As opposed to the first two strategies, strategy 3 is not established as a consequence of individual achievement. In the light of this new study, methodological guidelines regarding group dynamics may emerge so that regardless of the multidisciplinary groups' socio-academic profile, symmetrical relationships can be achieved between group members, emphasizing on the collective construction of the proposal. The latter justifies a revision of the achievement criteria of the academic process oriented to the acquisition of knowledge integration and collaboration skills. In view of the uncertainty of presenting an interdisciplinary research project dealing with cognitive conflict through intense knowledge exchange and arduous negotiations, it is necessary that the project be perceived as a pathway to reach group learning, rather than as an end in itself.

4th International Conference on New Horizons in Education

Progress in teaching pediatrics at Faculty of Medicine and Dentistry Palacky University Olomouc

Ludikova Barbora, Vladimír Mihál*

*Paediatric clinic, Faculty of medicine and Dentistry Palacky University Olomouc, I.P.Pavlova 6, Olomouc 775
20 Czech Republic*

Abstract

At Paediatric clinic – Faculty of Medicine and Dentistry Palacky University Olomouc many innovations in the education of future physicians were made in recent years. In this work, we follow up the achieved progresses and their contribution to additional use of graduates of the Faculty of Medicine. We managed to reach many changes in the study curriculum, in which is considerably more interconnected theoretical component with practical one. This fact is bringing more possibilities for students to work with patients themselves. In our work we try to educate students in terms of evidence based medicine and using e-learning education, multimedial virtual case studies and also trainers that faithfully simulate working with a real child patients.

Keywords: Paediatric, teaching, evidence based medicine, e-learning

1. INTRODUCTION

The Paediatric clinic of the University Hospital in Olomouc under the patronage of the Faculty of Medicine, Palacky University has been in the long run a respected clinical and educational department with long-lasting education of Czech as well as foreign students. Education in this department has been assessed very positively and some of our students become members of the clinic after graduation. Most students encounter the issue of caring for a sick child for the first time; therefore, this area must be addressed in an attractive and modern form, the significance of work with children must be emphasised and the students must be adequately motivated.

Thanks to new educational opportunities the teaching of paediatrics at the Faculty of Medicine, Palacky University, Olomouc has been improved and innovated. The new aspects of student education aim to establish closer links between theoretical and practical knowledge of the students.

The courses previously provided in our department were beneficial to students but were limited to a large extent by the theoretical level and did not allow sufficient development of students' skills and did not include work with patients.

Courses in paediatrics are carried out in four-week blocks. Students are divided into study groups of about twenty. This teaching block is a part of the fifth year of general medicine, i.e. after completion of most clinical subjects and after completion of all theoretical subjects.

E-mail address: author@institute.xxx

The courses are carried out on a theoretical as well as practical level. During the first three weeks of the training, students have two theoretical lectures during the day livened up by an interactive session and also take a three-hour practical bedside training, during which they take care of patients in bed under supervision of attending physicians. Students also undergo training in a general outpatient department and specialized outpatient departments. During the last week students take only bedside training. Each day, students independently take care of child patients, propose diagnostic procedures and treatment. All findings are consulted with the physicians in the department. The course also includes radiological seminars, during which interesting imaging results are presented.

2. EVIDENCE BASED MEDICINE

The first innovation is that students are involved in education in the form of evidence based medicine. In practice this approach means that each study group is divided into pairs and, in the initial days of the training, each pair is assigned a real patient to take care of. At first, students study any available patient materials. After that, subject to parental consent, they take medical history from the patient and his/her parents. The child is examined under supervision of an attending physician. After that students are assigned a clinical question, which is analysed using recent literary sources. To facilitate the analysis of clinical questions, during the initial lecture students are introduced with available medical search engines and their use. Clinical questions are addressed by students using the PICO format.

P – Patient

I – Intervention

C – Comparison

O – Outcome

Students are assisted by their lecturers and the librarian of the Library of the Faculty of Medicine, Palacky University, who advises on searching for literary sources. Students present their findings to all their colleagues under supervision of their lecturers in the form of casuistic reports at a small conference, which is part of the state exam. This type of teaching is very beneficial in terms of referring to possibilities that evidence based approaches bring in addressing complex and ambiguous medical cases.

3. MODEL CHILD PATIENT

Another innovation is the use of a SIM junior dummy serving as a model child patient on which students can train practical skills. During practical sessions, students use the dummy to insert peripheral venous cannulas and central venous catheters. The dummy also allows students to practice resuscitation and is provided with a screen displaying current parameters of basic vital functions, such as ECG curve, internal environment parameters, blood pressure, pulse, temperature and saturation. In almost real conditions, students can practice various medical situations including those requiring patient intubation and artificial lung ventilation. Students appreciate these training opportunities because there are no other ways to practice these situations throughout the course of their study although these are life-saving actions that every physician should be able to perform.

4. E-LEARNING

The course also includes a new multimedia platform, which allows student self-testing and care for a virtual patient who comes to the hospital and whose diagnosis must be made and therapy started. The multimedia platform is also provided with a theoretical level, which provides the results of self-testing, displays any mistakes and appropriate procedures, students are briefly advised on relevant theory and available literature.

There were many reasons to create such system and select suitable patients who would be useful for educational purposes of medical students.

The first reason was theoretical work with literature based on which the issues in question were addressed. This subsequently became an inspiration for further collection of data and information and further study of scientific literature and internet-based sources. The crucial part however was field work. Field-based data collection was an inseparable part of the process. We further continued with searching for and selecting suitable child patients hospitalized in our educational and therapeutic department. New findings were consulted with experts in relevant medical fields. Selected patients and the course of their treatment were then presented in the form of case studies and comprehensive lectures at various conferences nationwide. We must not omit presentations in special meetings aimed at the aspects of the project, whose main focus was the attitude to a sick child; however, the view of a sick child was not limited to medical aspects, very important appeared to be the suitability of including child patients into our project. A child patient had to be sufficiently 'easy to understand' and educative, we aimed to select patients with an 'added value', i.e. whether findings and information about the patient learned from medical records, outpatient cards, laboratory databases, radiological descriptions were sufficiently beneficial and useful in student education. All activities were based on a principle that the essence of a teaching material must be fulfilled. Therefore, selected case studies are provided with photo documentation and videos. These images and video files are implemented directly in the teaching material. We believe that by incorporating pictures and videos students are provided with a real picture of the course of an illness.

The next step was the development of the multimedia study platform, which was built on comprehensive and quality analyses, contents and source documents of individual case studies during the first key activity.

The development of the platform is performed by a specially designed and developed content management system. All findings, information and documents are continuously uploaded through the content management system, considerable attention is paid to updating.

Any prepared text is divided precisely according to the structure of the computer system.

The study platform consists of several parts.

The first – information part – is based exclusively on medical history. This part deals with medical history data and provides students with significant findings about the patient. Medical history data is divided into several parts reflecting the real examination approach of taking medical history of a real patient. The first section is current illness. The current illness section provides students with important data on patients' reasons for entering a hospital facility. The next section deals with personal patient medical history. Personal medical history includes information about the length and course of birth, information about past illness and, naturally, emphasis is put on the child's development. The next section of taking medical history is social medical history, which focuses on the child's standard of living. From the family medical history a physician learns about serious illness in the closest family; students find this information in the study platform. The next section of taking medical history is associated with medication – this is pharmacological medical history providing information about medication taken by the patient together with dosage. Allergy medical history provides students with information about the

patient's allergies. Epidemiological medical history informs about the patient's contact with infectious illness and journeys abroad. Gynaecological medical history provides information about maturation, menstruation, menstruation disorders and pregnancy.

The second information part of the study platform is the status somaticus. Here, students gain information about physical reports in child patients. For greater clarity and illustration, some typical reports are accompanied by pictures or videos. After studying information available from medical history data and physical reports, students should be able to make a picture of the source of the patient's difficulties and be able to prepare a differential diagnosis and decide on possible hospitalization of the patient and determine the urgency of the situation. This decision making process is dealt with by a different part of the programme, in which students decide on the selection of an appropriate therapeutic and diagnostic procedure in a specific patient case. Based on available information students indicate specific examinations required for diagnosis and treatment and assess the results of these examinations. In this part a large number of laboratory results, radiological analyses and other specialized examinations had to be uploaded to specific case studies in the multimedia platform to allow students an independent selection from a wide range of examinations divided into subgroups. The core task and aim of this section is to educate students, who should be able to indicate and decide on a specific examination. The programme offers possible diagnoses and treatment approaches, always giving reasons behind correct or incorrect selections. Based on available information, students select from 5 to 10 possible diagnoses. According to a specific diagnose, the therapeutic part offers 5 to 10 possible treatment approaches.

When testing is completed students are informed about the results of their case studies and provided with a commentary on mistakes and correct answers, a part of the commentary focuses on what should have been examined but was not. Finally, the system shows a theoretical part with a theoretical summary of the diagnosis with available literary sources.

Prior to uploading to the system, individual case studies were analysed because feedback provided by students using the programme is of vital importance. Feedback was used to improve individual case studies and remove or correct any deficiencies or unclear issues.

Currently the computer programme includes over 150 completed case studies from various paediatric areas: cardiology, intensive care medicine, allergology, surgery, neonatology, nephrology, endocrinology, gastroenterology, pulmonology, rheumatology and haematology.

The web pages of the multimedia platform are available at www.pedkaz.cz.

A positive result of our work is definitely the increasing interest of students in the education programme, even from other Faculties of Medicine in the Czech Republic and Slovakia.

The latest innovation at the Children's Clinic of the Faculty of Medicine, Palacky University is the electronic textbook, which has currently over forty chapters on various paediatric areas and is being further extended. The team of authors focuses on the most significant issues for students of medicine but also on topical knowledge and recent information, not always included in available Czech textbooks. The textbook is available at <http://nova.pediatric.upol.cz/web/flipviewerxpress.html>. Undoubtedly the greatest advantage of the publication is the possibility of online editing in case of new findings in the area.

5. CONCLUSION

The aim of the innovations is to link them together and develop a 'virtual paediatric hospital' concept that would gradually combine all available e-learning models and provide students with top quality education limited only by internet access. At the same time this will not be a mere learning text. These innovations brought also improvement into teaching itself. The academic teachers are more flexible and even their knowledge increases. According to students this view of education is very beneficial and they welcome these changes.

Abstract

The evolution of ICT promotes researchers in e-learning to integrate in the author system, the ability to design custom learning paths, tailored to the needs of users in e-learning platforms. The scenario of learning activities is one of techniques available to teachers, in order to customise and to adapt learning paths. The authors of educational scenarios can choose from several educational approaches, which change the learning environment.

Our case study is based on project-based learning, as a method of collaborative work of a group.

In this educational framework, a scenarisation of collaborative learning activities in the context of group work presents several challenges for researchers. The Modelling languages of learning scenarios such as EML (Educational modelling language) are criticized by their abstraction and their difficulty to be used by teachers.

To avoid these constraints, we propose in this paper a meta- model that will describe a modelling language.

The modelling language is used as an author tool, to formalise an activities scenario in online educational project. Our meta-modelling approach is based on the notion of process, and the implementation of the Framework of activity theory.

To illustrate our proposal, we have implemented the evaluation process, as instantiation of the proposed meta-model.

The assessment process during a project requires points of decision making. The decision is addressed through the hierarchical analysis method (AHP).

Keywords: project-based learning; activity theory, process, learning scenario, meta-model, assessment, AHP;

1. Introduction

The technological development has emerged new forms of group work, particularly in the field of distance education (e-learning). E-learning has seen many changes, and has improved teaching conditions, even with

* Corresponding author.

Email address:

temporal and spatial constraints. Most learning platforms are interested in management of educational content, rather than the process of distance education. This limitation is emphasised in a social constructivist pedagogy, which promotes group work and sharing of knowledge, like in a project-pedagogy.

This pedagogy is characterized by a social and collective nature (Louise), which promotes the negotiation, the critical of others, the group work, and the collaborative learning. All Those characteristics arouse a division of labour, and planning tasks, in agreement with the project actors, leading an affective investment and a motivation (Capra & Arpin, 2002). Therefore, the project is considered a collaborative learning process in terms of stages, and activities structured and unstructured, defined by the tutor.

The existing EML modelling languages (Koper, 2002) do not respond to the inherent characteristics of this current educational. The EML languages are criticized for complexity, abstraction, and generality, for a course designer. Hence, the idea is to model the learning process, using a language dedicated to the project approach.

Our proposal is based on the modelling of a learning process based on the UML meta-model.

The meta-model describes two different types of processes, the structured and unstructured in a work group (selmin Nurcan, 1998).

Furthermore, we introduce decision points in our meta-model to deal with the problem of decision-making individual and in group. Several methods treat the decision-making by group, whose AHP method (Saaty, 1980), which structures the evaluation criteria by a hierarchical analysis.

In collaborative writing, students perform tasks in the group, which generates traces of activities, constituting the evaluation criteria. The evaluation criteria concern the deliverables during a project, like a report written in collaboration with the group members.

In this article we will discuss, a state of art of collaborative modelling languages (LDL, CPM, etc...), their advantages and disadvantages. The following section will be devoted to the activity theory, which forms the theoretical basis of our work, by a projection in a teaching project. In the fourth section, we discuss our proposal of meta-modelling the processes, and definition of domain concepts.

In the fifth section, we will illustrate the evaluation process, as an instance of meta-model of processes in a project. Then in the sixth section, we will apply the method of group decision-making in an evaluation process.

The final section will highlight the work in progress, and our main perspectives in the context of project-based learning.

2. A Study of modelling languages

Several research studies have been conducted in the field of modeling languages of collaborative activities. In this section we introduce different modelling languages in a collaborative learning environment, and we discover their limits in teaching project. Among these languages, there are CPM (P. Laforcade & T. Nodenot & C. Sallaberry, 2005), LDL (Martel & Vignollet & Ferraris, & David ,2006) and PoEML (Manuel Caeiro Rodríguez,2007):

- CPM (cooperative Problem Based learning Meta-model): CPM is a modelling language which aim the designing of cooperative situations problem-based. The CPM is a UML profile that expresses the learning scenarios. However, the CPM is specific to learning through problem, thus it's not generic to other learning situations. Therefore, the CPM has a weak reusability (EL Kechai, 2008) Villiot-Leclercq, 2007). Further,

CPM is for instructional designers who have mastered the UML formalism, which makes it difficult to handle by teachers.

- LDL (Learning Design Language): used to model collaborative activities, and express collaborative scenarios. The LDL is based on a meta-model defined for CSCW (Computer supported cooperative work), and an infrastructure to take charge of the operational scenarios: LDI (Learning Design Infrastructure). This language is based on a particular organizational paradigm called participation model (Martel,1998) . However, the LDL is difficult to handle for scenario of a learning situation, due to the concepts of LDL that are not adapted to the project, in addition to the very specific level of decomposition of the project. Therefore, the concepts of LDL are generic in regard to a project-based learning.
- PoEML (Perspective oriented EML) : This language is an EML organized into several packages according to a meta-model, which separates the modelling of learning units, based on perspectives, and identified aspects. The perspectives are used, for group the elements of the meta-model in subset of models, each with a specific role in the modelling (S.Ouari,2006). During a project, the PoEML language is difficult to implement, due to the project structure which does not allow the decomposition, according to the aspects and perspectives. The project has a predefined structure, and a specific decomposition.

In sum, the languages listed are either dedicated to specific learning situations (CPM), either difficult to handle by teachers (LDL), or does not support the sequential activities of the project (PoEML).

Our goal is to define a modeling language dedicated to project-based learning, and also treats the decision making.

3. The activity theory

The activity theory incorporates the concepts of intention (the goal), mediation (artefacts), and development (activities). It has experienced three generations of research.

The first was based on the work of Vygotsky and his concept of mediation (Engeström, Y, 1987). From empirical observations, Leontiev (Leontiev, 1978) has structured activity as a set of conscious actions, which themselves consist of a set of operations.

The activity consists of a subject, and an object (in the sense of purpose, it can be physical or mental), which is managed through a process of transformation to get the result (the transformation process is the purpose of the activity). The activity is mediated by physical tools, or cognitive (symbols, language, gestures).

Engeström (Engeström, Y, 1999) has continued the development of the theory by introducing the notions of community (the environment in which the activity takes place), the rules (the constraints governing the exercise of the activity involve the social aspect) and the division of labor (Organization adopted by the community to perform the activity: the distribution of roles, the powers and the other organizational mechanisms).

In this perspective, we have applied the theory of the activity of the second generation to our pedagogical approach. As shown in Fig 1, the components of the Framework are:

- Subject: learner, group of learners.
- Artefacts of the project: educational resources (documents, courses, modules, etc.), technological tools (software, LMS platform, portfolio), cognitive tools (critical thinking, decision making, assessment), and social strategies (group work).
- Rules: meeting hours, planning of tasks, deadlines.
- Division of labour: distribution of roles (tutors, assessors, assessed), and distribution of tasks for each role. The tutor is responsible for assisting, guiding, and facilitating tasks to learners, while learners have the task execution as mission, communication, and information sharing.
- Learning objectives: mastery of language, writing etc...

• **Outcome:** In a project the outcome relates to the product of a task, or a step or to the entire project. The product can take the shape of a report, oral presentation, or even of an application.

The application of the theory of activity is adapted to the different granularities of the project. It can be applied to the entire project, then to a particular step, and finally to a defined activity.

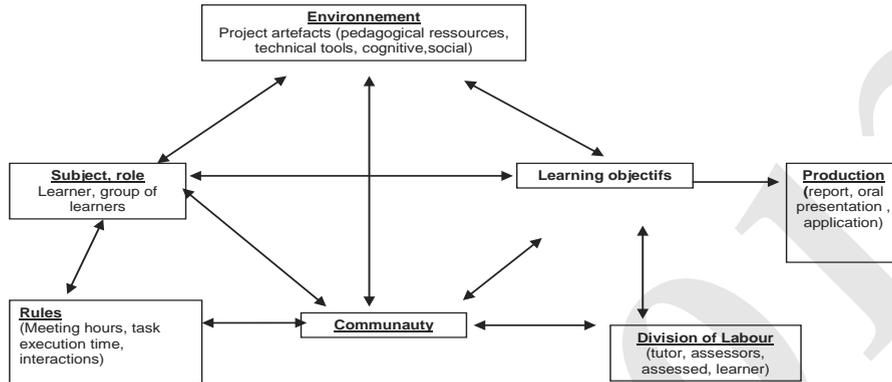

Fig. 1. Application of the 2nd generation of activity theory to a learning project

As shown in Figure 1, the tutor in accordance with the learners proceeds to the assigning roles and the division of tasks. The subject, plays role assigned by the tutor, and uses the project artefacts to carry out the learning objectives.

During the learning process, students perform tasks to achieve the goals, and they produce collaboratively reports and oral presentations. While the rules implemented concern the organization, such as the team formation, the meeting times, and the hours of collaborative work.

4. Meta-Model of learning in a pedagogical project

The working through project, is based on group cooperation, and been the subject of a field of research called computer-supported cooperative work (CSCW) (Grudin 1 Jonathan,1994).

The expansion of information technology and communications has shown up new modes of cooperation in professional and educational environment.

The keys of success in a work group, is dependent on the simplification and automation of the process, in order to ensure productivity and quality. In the context of the project, there are several modes of group work, synchronous or asynchronous, distributed or localized. The project group works on a common goal in a shared environment (Ellis, C.A. & Gibbs, S.J., 1994).

On one hand, the actors cooperate to carry out individual tasks in a time interval, and lead to an overall goal, on other hand, the other actors work together to achieve a common task in a shared environment.

There are two types of processes in project work (Mark de Boer & Simon Townsend ,2012): structured and unstructured processes.

The structured process or workflow (OVUM,1991) is a well-defined process, consisting of repetitive procedures performed via a set of predefined tasks, sequenced and coordinated between actors. Each task is implemented by actor with a corresponding role. The actor, who runs the task at a given time, is selected from this group.

The unstructured or ad hoc processes such as groupware (Ellis & Gibbs & Rein, 1991) are occasional processes, which supporting the unpredictable interactions of actors in a group project, during a collaborative work. The order and the exact time of performing tasks are not pre-established in the unstructured processes, and can be changed at runtime. Such processes are characterized by the sharing of information and knowledge.

As part of our research, we propose a meta-model of learning processes in a pedagogical project, in accordance with standards WFMC (consortium standard workflows).

The learning scenarios according to a learning situation, individual, cooperative, and collaborative, are an instance of the meta-model defined.

As shown in Fig.1, we define the package of our meta-model: organization, environment, interaction, subject, and objective.

4.1 The subject package

This package of discusses the organization of group in a project. We cite three main actors of project-based learning: teacher, tutor, and learner.

- Teacher: is the instructional designer of the activity of learning, and defines the specifications together with the learners.

- Learner: is part of a group of learners. The group members are distributed in space, and interact in different times, through project. The learner gains new knowledge and develops new skills.

- Tutor: its role is to follow the individual learning activities and group, to assist learners, and ensure the sharing of workspace. A tutor is qualified as controller, facilitator, and consultant.

- Role: A role is a concept that defines organizational intentions, shared by actors, according to the objectives. We define two types of roles: individual role, and group role which is composed of several individual roles. The individual role performs individual task, while collaborative task is performed by group role.

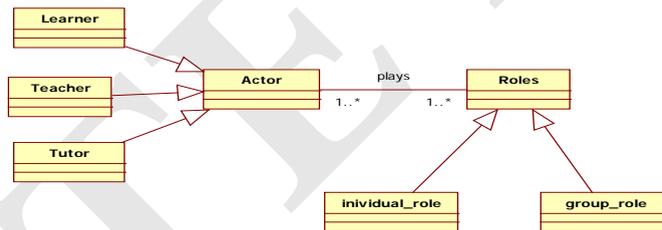

Fig 2. The organization package

4.2 The environnement package

This package handle the environmental aspect of the project, including artefacts, tools used in the project activity.

There are different kinds of resources such as:

- Tools: means the software, the platforms, and the software agents.
- Information: contents and exercises.
- Social: group work, collaborative work.
- Cognitive: critical thinking, decision making.

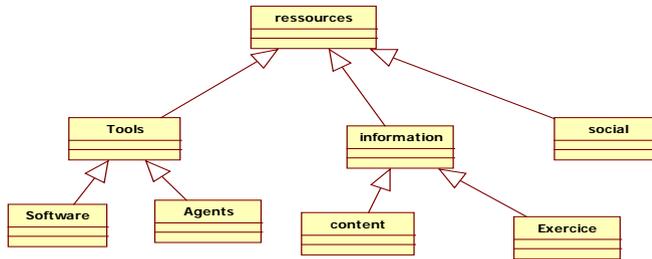

Fig 3. The environnement package

4.3 The control package

This control package concerns the flow control in a structured process. The collaborative interactions require the use of operators that control the flow, and operators in the tools.

The operators defined in package, have a sequential nature, parallel, and alternative. The sequential operator defines the steps, activities, and tasks sequentially in a structured process.

The operators and-join, and-split, are used to define a parallel flow (synchronization).

The Or-split and join-split, define alternative flows, depending on the parameters of conditions (deadline, the value of the response, etc...).

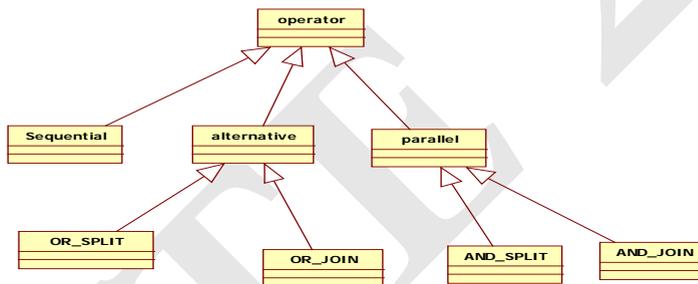

Fig 4. The interaction package

4.4 The functional package

This package describes the process of composition, in terms of types of processes, activities and tasks.

The process in a project has a disciplinary nature or transversal, in adequacy with the learning objectives.

The transversal processes are spread out throughout the life of the project, such as the evaluation process, communication, writing etc. Each step is composed of process, linked to decision points at runtime.

The decision is taken , during the runtime, by triggering an action in consequence of the learners interaction.

The role concept, takes an individual or collaborative decisions, in a step, at activity level and tasks. Processes are composed of sub-processes, structured and unstructured. Structured process consists of steps, ordered and coordinated.

So, the structured processes are modelled through workflows, defined by an ordered set of steps and activities, submitted for a flow control by the operators (sequential, parallel, alternative).

As an illustration, the planning of work prepared by the tutor is seen as a process, which can be decomposed into sub-processes.

While the unstructured processes, are executed in unpredictable ways by roles, using environmental resources (selmin. N,1998).

The main objective of unstructured process is the sharing of knowledge and information in a workgroup.

The part of the meta-model, which illustrates the functional package, is described below.

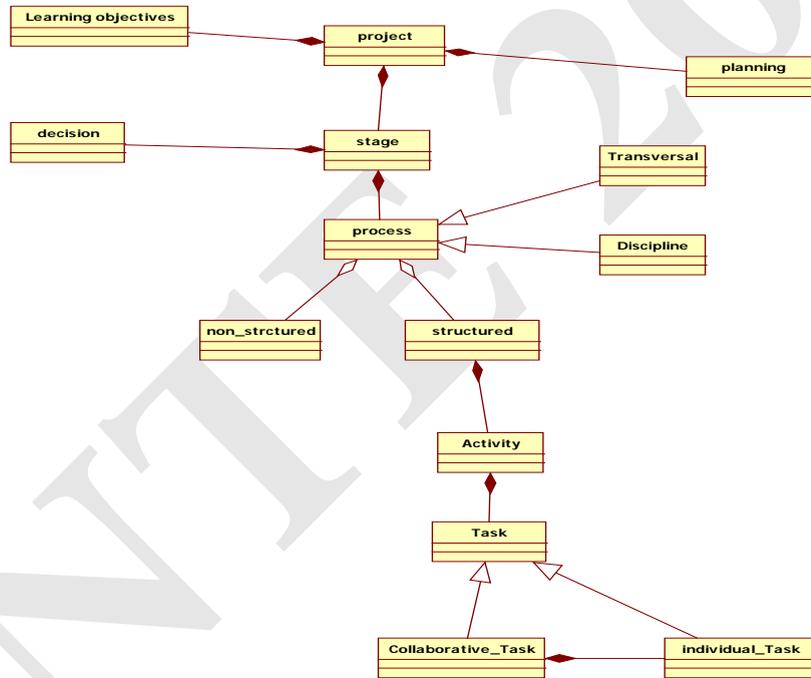

Fig 5. The functional package

4.5 The traceability package

The tracking package (Fig 6) provides indicators used to make decisions, and to produce feedback for learners.

The tutors manipulate indicators in order to regulate, assist and facilitate the learning process (Benjeloun & Faddouli & Khalidi & Bennani , 2012). The indicators can be from different levels in accordance with the

theory of activity (Leontiev,1978). Based on our analysis, we have indicators at the project level, composed of indicators at process level.

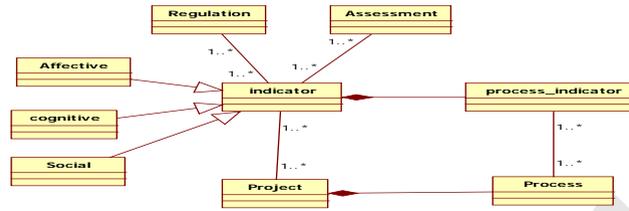

Fig 6. The traceability package

4.6 The meta-model of project-based learning language:

The aspect of meta-model is shown in fig.7, consisting of five packages, according to the theory of activity.

The organizational package describes the organization of project actors, and the roles played during runtime.

The functional package expresses the structure of the project, in stages and processes, which correspond to the levels of activity theory.

The interaction package corresponds to the control during a workflow in a structured activity.

The environment package illustrates the artefacts, and tools used in a project.

We added the traceability package to the meta-model, structured according to the hierarchy of three levels of activity theory.

5.1 The evaluation process in a pedagogical project

The evaluation process (Fig. 8) in the context of learning, has a transversal nature, spread throughout the project.

This process consists of two sub-processes of peer-assessment, and self-assessment.

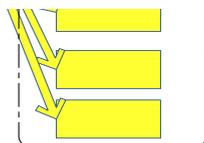

Fig.8 The assessment process in a project

- The self-assessment sub-process: The self-assessment in process consists in assessing the learners by them-selves. This sub-process is modelled by a workflow (Fig.9). At the beginning of the project, the tutor starts a prerequisite test of the group learners. The learner carries out the test individually, and then they send the test to the tutor. The tutor collects the results, and implements a learner profile, then stores these results in a learner model. This classification of learner profiles, allows a comparison of the test results, and the referential of learning. Then a self-assessment test is set up, as tool for learners during the project. These self-assessment tests cover all levels of granularity of the project (process, activity ...). Thus, in a stage of the project, the tutor assigns a cooperative activity to a group of learners. The cooperative activities are considered as a sub-process which composed of parallel individual activities. These activities form of tasks assigned to students. After completed the tasks, learners respond to a self-assessment test, which emphasises on the path of learning during the project. Following a comparison with the referential, implemented at the beginning of the project, the system takes a decision by the AHP method to guide the routing of the learning activities. The system guides the student towards an alternative activity, or moves to the next activity.

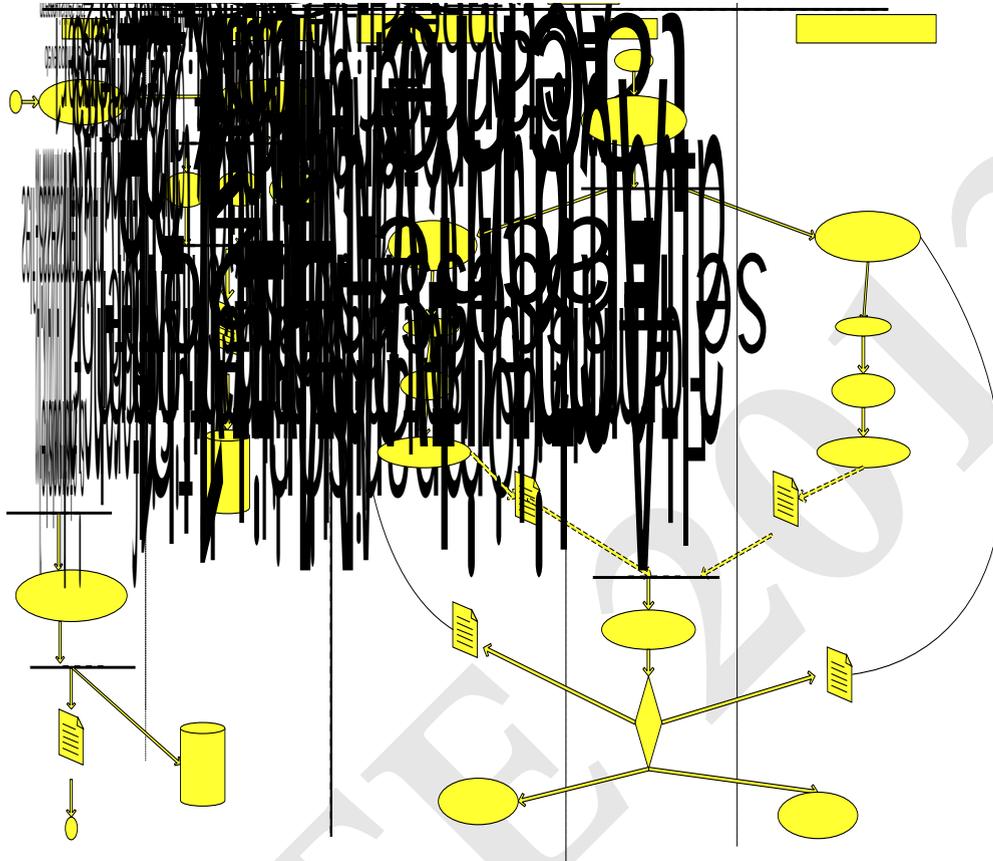

Fig 9. The self-assessment sub-process

- The peer-assessment sub-process: when learning by project, group members perform a cooperative task, and will be a subject of formative evaluation throughout a step, by a group of assessor which will continue the next step, such an operation is called inter-group assessment (Fig.10). The assessor group will be also assessed by another assessors group, which will continue the project. Members of the assessor group perform the assessment rubric of the assessed group, and then they assemble the results into a single form. This activity is done by mutual agreement between the members through a discussion and negotiation (unstructured process). The feedback will then be sent to the assessed group, for a review and necessary corrections. After receiving the feedback, a discussion (unstructured process) is initiated to measure the weaknesses of cooperative work and undertake the necessary corrections. The evaluation of cooperative work will be done by peers, who will evaluate the work of colleagues in an intra-group evaluation. In this case, each member will review the work of his colleagues, and will give his assessments in the rubric of intra-group evaluation. These appreciations will be used to review individual activities, by each group member. Each member takes a decision in function of the values assigned to the evaluation criteria in the peer evaluation form. The member of the group assessed, proceeds to a correction of its task, or sends his individual work to the group, after corrections. Consequently, the group performs a new

collaborative activity, and sends the outcome for a new inter-group reassessment. This step can be repeated as long as there are reviews from the assessor group. If the assessed group, is satisfied with his work, he takes a decision not to send the work for inter-group evaluation, but it will be submitted to the tutor assessment. At this level, the tutor will evaluate in turn, and assign a note at work. The final grade will be a combination evaluation between the tutor score, and the assessor group score. The decision in the case of inter-group evaluation or intra-group will be conducted by the AHP method.

Fig 10. The peer assessment sub-process

6. The decision-making process in the evaluation of a project

In this section, we present the process of decision making, during an assessment of a project.

When a decision is making, many interests are involved, which generates a set of criteria supported to achieve a goal. The process of decision-making is based on a set of methods (AHP, ELECTRE...). In our case we chose the AHP method (Saaty, 1980), for decision making. The AHP method is characterized by hierarchical analysis of evaluation criteria, such as indicators.

During a project, groups of students are asked to make choices in the evaluation process, either individually or in group.

6.1 The AHP process in the evaluation a pedagogical project:

The evaluation during project relates to several types of collaborative activities.

In our case study we will be limited to written reports. At each step i of the project, the group delivers a collaborative report written, for an evaluation by the group that will perform the step $i + 1$.

The assessment of the written report will be made through evaluation forms at the end of each stage of the project. Evaluation forms are of two types: form inter-group evaluation and intra-group.

When a group evaluates another, the assessor group fills the inter-group evaluation form, and responds to evaluation criteria of the group assessed. While the intra-group evaluation forms, are filled by members of the same group, who answers to the individual criteria of assessment.

When writing the report, learners use the transversal skills, (spelling, grammar, semantics etc ...), and discipline skills (related to the field of the project).so the collaborative writing is characterized by three aspects: the group's production, the writing process, and the individual and collective skills (Neomy storch, 2005).

Concerning the evaluation of the group's production, the written text is analyzed to measure the syntax, grammar, and semantics.

We define the writing process through three phases: planning, writing and review. During the planning phase, students read the instructions of the tutor generate new ideas and discuss the lexical and grammatical choices. Then learners pass to the writing phase to structure ideas, and interpret the tables and the graphs in format of written text. The contribution of learners during the writing phase generates new ideas (scaffolding) and builds a vocabulary, while co-constructing the written text.

The review phase is used to send feedback from learners to other, and to allow the structuring of ideas and the grammatical accuracy. In addition, the individual and collective skills are being tested during the collaborative writing, such as the attitude of the learners, and the level of the language used.

The three aspects of collaborative writing constitute the evaluation criteria of the written report. The form of inter-group evaluation includes assessment criteria of the group. The evaluation criteria are the indicators of the group listed in the Table 1.

According to Table 1, we note that there is a hierarchy of criteria, which will be organized by the AHP process, which will be detailed in the next section.

In Another strand, the intra-group assessment will be based on individual assessment criteria listed in Table 2.

In the same way, the evaluation criteria are structured according to the AHP process for intra group evaluation.

In next section, the forms of inter-group and intra-group evaluation, will be analyzed by the decision making process.

The group criteria	Process	Interpretation of tables and figures, that carry relevant information on the subject, in synthesized way.
		resources : learners are involved in the search for information by various means
		Structuring the essay: logical and organizing ideas
		Group members clarify the arguments, ideas, and conclusions.
		Checking references: cited in accordance with the Template Guide.
		The learners contribute to the development of the chosen concept, and to problem solving.
		Learners describe the theories, methodologies and procedures for implementation.
		Selection of resources related to the topic: resource quality, accessibility.
		Coherence of arguments
		Workload: distribution of workloads adequately between learners
	Written report	Spelling error
		Grammatical error
		Learners have achieved the objectives of the current stage of the project
		Learners contribute to the development of the chosen concept, and problem solving.
		Learners validate the results of the study project.
	skills	Group cohesion: the paragraphs are set homogeneously, and the links between the paragraphs are coherent and logical.
		attitude and team spirit
		Collective scaffolding: learners co-construct new knowledge and new ideas
		Quality of knowledge

Table 1. The group assessment criteria

Table 2. The assessment criteria of a learner

Individual criteria of a learner	Process	Look for resources: learners are engaged in seeking information in different ways.
		a learner fulfils a task adequately
		The learner contributes to the development of the chosen concept, and the problem solving.
		Learners describe the theories, methodologies and procedures implementation
		Selection of resources related to the topic: resource quality, accessibility.
		Time Management: perform the tasks within deadlines
	Product	Spelling error of the lexicon
		Grammatical error
		The vocabulary level employed by the learner.
		Quality of information and data clarified in the written text
	skills	assiduity and attendance at meetings
		Respect of deadlines
		Communication
		Reflexion: This criterion related to critical thinking, looking for consultancy, and explaining the ideas to the peers.
		Cooperation and contribution: number of messages sent, number of unread messages, number of received messages.

6.2 Decision making in inter-group assessment

A group is subject to a formative evaluation throughout a project stage (Fig. 10). The assessor group fills a form of inter-group evaluation, by answering the criteria of evaluation of assessed group. Following to the answers of assessor group, the assessed group (decision makers), will take a decision in group, either for to confirm the report or to return for a new assessment. The decision of the assessed group is based on AHP decision-making process detailed in Fig.11.

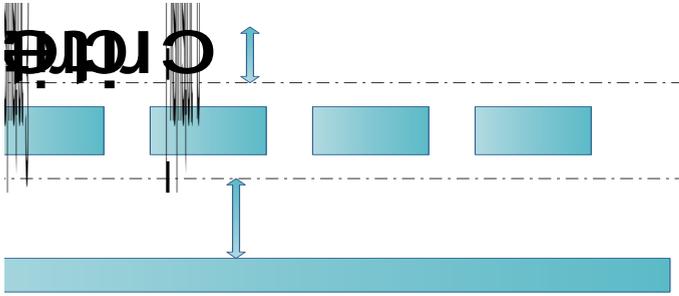

Fig. 11. Application of AHP decision making in inter-group assessment

Each member of the assessor group, fills the evaluation form by answering the inter-group evaluation criteria previously established (Table 3). Each assessed group member will receive the evaluation form.

Table 3. Evaluation form received by each member of the assessed group

criteria	criteria_1	criteria_2	criteria_3	criteria_4	criteria_n
évaluateur_1	Val11	Val12	Val13	Val14	Val15
évaluateur_2	Val21	Val22	Val23	Val24	Val25
évaluateur_3	Val31	Val32	Val33	Val34	Val35
évaluateur_4	Val41	Val42	Val43	Val44	Val45
évaluateur_n	Valn1	Valn2	Valn3	Valn4	Valn5

Each decision maker D_i (group member assessed), assigns values to the inter-group evaluation criteria, according to the importance attributed.

The values are used in the construction of comparison matrix, and are situated in the scale of Saaty (Saaty, 1980). Saaty's scale is a rating scale that includes values from 1 to 9.

Then we calculate the eigenvector starting from the comparison matrix of criteria (Table 4). This vector is composed of weight of the evaluation criteria.

Calculating the weight vector requires normalization of comparison matrix.

The elements are normalized by dividing by the sum of columns of the matrix of comparison (Table 5).

Table .4 comparison matrix of criteria

	criteria_1	criteria_2	criteria_3	criteria_4	criteria_n
criteria_1	1	a	b	c	d
criteria_2	1/a	1	e	f	g
criteria_3	1/b	1/c	1	h	i
criteria_4	1/c	1/f	1/h	1	j
criteria_n	1/d	1/g	1/i	1/j	1

Tab.5 The matrix of comparison normalised

	Criteria_1	Criteria_2	Criteria_3	Criteria_4	Criteria_n
Criteria_1	1	a	b	c	d
Criteria_2	1/a	1	e	f	g
Criteria_3	1/b	1/c	1	h	i
Criteria_4	1/c	1/f	1/h	1	j
Criteria_n	1/d	1/g	1/i	1/j	1
Sum of columns	$\sum Crtr_1$	$\sum Crtr_2$	$\sum Crtr_3$	$\sum Crtr_4$	$\sum Crtr_n$

The weight of criteria is determined by dividing the sum of a line by the number of criteria, see table 6 below.

Table.6 The eigenvector of the criteria

Criteria	VP_Ci
Criteria 1	$\sum Crtr_1 / n$
Criteria 2	$\sum Crtr_2 / n$
Criteria 3	$\sum Crtr_3 / n$
Criteria 4	$\sum Crtr_4 / n$
Criteria n	$\sum Crtr_n / n$

In the second step, the comparison matrixes of assessors are calculated with respect to each criteria.

Thus, for each criteria C_i , the decision maker assigns values to different alternatives of the assessors (criteria values). Then we establish a comparison matrix, of the different values assigned in the evaluation forms by the assessors, so the vector of priorities $[VP-C_i_assessor_j]$ is calculated (Table 7):

Table 7. The comparison matrix

Criteria C_i	assessor_1	assessor_2	assessor_3	assessor_4	assessor_5	$VP_C_i_assessor_j$
assessor_1	1	Vali1/Vali2	Vali1/Vali3	Vali1/Vali4	Vali1/Vali5	$VP_C_i_assessor_1$
assessor_2	Vali2/Val1	1	Vali2/Vali3	Vali2/Vali4	Vali2/Vali5	$VP_C_i_assessor_2$
assessor_3	Vali3/Val1	Vali3/Val2	1	Vali3/Vali4	Vali3/Valin	$VP_C_i_assessor_3$
assessor_4	Vali2/Val1	Vali4/Val2	Vali4/Val5	1	Vali4/Valn	$VP_C_i_assessor_4$
assessor_5	Valin/Val1	Valin/Val2	Valin/Val3	Valin/Val4	1	$VP_C_i_assessor_5$

In the third step, we synthesize for each decision maker D_i , by multiplying the eigenvector of criteria $[VP_C_i]$ in Table 8, by the matrix formed of the eigenvector of evaluators, relative to a criteria $[VP_C_i_assessor_i]$, using the following formula:

$$[W_assessor_j] = \sum_j \sum_i [VP_ci] \times [VP_ci_evalateur]$$

In general, for each decision maker, the eigenvector of the evaluators $[VP_assessor_j]$ is calculated, and classified in a rank.

Table.8 The eigenvector of evaluators for decision maker D_i

$$[VP_assessor]=[VP_assessor_1,VP_assessor_2,..,VP_assessor_n]$$

X

	criteria_1	criteria_2	criteria_3	criteria_n
assessor_1	$W_C1_assessor_1$	$W_C1_assessor_1$	$W_C1_assessor_1$	$W_C1_assessor_1$
assessor_2	$W_C1_assessor_2$	$W_C1_assessor_2$	$W_C1_assessor_2$	$W_C1_assessor_2$
assessor_3	$W_C1_assessor_3$	$W_C1_assessor_3$	$W_C1_assessor_3$	$W_C1_assessor_3$
assessor_n	$W_C1_assessor_n$	$W_C1_assessor_n$	$W_C3_assessor_n$	$W_Cn_assessor_n$

=

	W_assessor_j	Rang
assessor 1	W_assessor_1	R1
assessor 2	W_assessor_2	R2
assessor 3	W_assessor_3	R3
assessor 4	W_assessor_4	R4
assessor n	W_assessor_n	Rn

As a result, we have the eigenvector of the decision maker D_i (Table 8), represented by the synthesis vector $[W_{si}]$, which classifies different evaluators. The steps previously described will be repeated for each decision maker. We find the following final eigenvector (table 9):

Table.9 The final eigenvector

	Decider i		Decider i + 1		Decider i+2		Decider n	
	W _{si}	Rang	W _{s i+1}	Rang	W _{s i+2}	Rang	W _{s i+n}	Rang
assessor 1								
assessor 2								
assessor 3								
assessor 4								
assessor n								

As a result, we will calculate the final weight of the decision makers, by means of consistency indices.

For each decision maker D_i , the indices of consistency are calculated for comparison matrices, criteria / criteria, and for all matrices assessors / criteria C_i .

The coefficient of consistency is defined by $CR = CI / RI$, with consistency index CI . The consistency index is calculated by $(\text{mean coherence} - n) / n - 1$, with n is the number of parameters, and the consistency average is the average of coherences eigenvector of the weights of the matrix.

The average consistency is calculated by the multiplication of each column of the comparison matrix non-normalized by the weight of the associated criterion. We then assess the consistency, by dividing the sum of

lines by the weight of criteria of the line (Table 10). RI is the random index depending on the number of criteria, measured from random index table (Saaty, 1980).

Table .10 the final weight of the decision makers

	Decider_1	Decider_2	Decider_3	Decider_4	Décider_n
criteria/criteria					
assessor/criteria_C1					
assessor/criteria_C2					
assessor/criteria_C3					
assessor/criteria_Cn					
$\sum CR$					
$\frac{1}{\sum CR}$					
normalisation of CR					
Final weights of deciders (assessed)					
The normalization of CR is performed by dividing each $\frac{1}{\sum CR}$ the sum of the lines $\sum \left[\frac{1}{\sum CR} \right]$.					

After having calculated individually vectors for decision-makers by the AHP method, the final ranking of the evaluators is calculated by aggregating the vectors of priorities for each decision maker.

We note the two main modes of aggregation vectors priorities [(Forman, E. H. and K. Peniwati, 1998)].

The first is the aggregation of individual judgments (AIJ) calculated from the arithmetic mean. The second is the aggregation of individual priorities (AIP) calculated from the geometric mean.

The most common approach is the aggregation of individual priorities vectors (AIP), by the geometric mean of the various vectors of properties of decision-makers.

The formula for the geometric mean of the group is given as follows:

$$z_i^G = \prod_{k=1}^j [z_i(k)]^{a_k}$$

j : number of deciders (assessed).

$z_i(k)$: The priority of the alternative i for the decider k .

a_k : The final weight of the assessed (decider) k in the group G .

z_i^G : The priority value of the group aggregation.

In conclusion, for each evaluator, the final weight is calculated, also the classification of his assessment form (table.11).

Table .11 the final weight of the decider-makers

	assessor_1	assessor_2	assessor_3	assessor_4	assessor_n
Final weight					
Rank					

Thus, the assessed group makes a final decision, based on the decision of the high ranked evaluator (it means that, the highest ranked evaluation form, among the forms sent by the evaluators).

As a result, the group compares the values of selected evaluation forms, and the thresholds set at the beginning of the project of the various evaluation criteria, and stored in the referential. After this comparison the evaluated group, makes a decision for a new correction, or submission to a final rating by the tutor

6.3 Decision making in intra group evaluation (peer assessment)

In that case each student receives the intra-group evaluation form by the peers. As well, the student responds to criteria in the individual evaluation forms (Fig10) and sends to its peers in the group. The evaluation criteria in this case are individual evaluation criteria.

This is a particular case of inter-group evaluation, because the learner lonely decides (not in group) of the choice of the most appropriate form from his colleagues. The steps of this process are carried out in the same manner as discussed in inter-group evaluation, except that the assessed will take the individual decision.

The first step is to establish a comparison matrix of criteria. In the second step, the comparison matrices of evaluators in function of each criteria, are calculated. Thus, for each criterion C_i , the decision maker assigns values to different alternatives of evaluators.

For a given criteria C_i , we calculate the comparison matrix, and the corresponding vector of priorities (table 2), then the vector is verified by calculating the consistency index of coefficients. It follows by the calculation of the weight of each evaluator (Table 3) for evaluation criteria.

The resulting priority vector, gives different weights of evaluators, with their ranking position for each criterion. The classification provides us with the relevant assessment form, which allows the learner to choose either the correction of his activity, or the submission to the group to contribute to collaborative working.

6.4 Decision making in self-assessment

The self-assessment is carried out by the learner, which performs individual activity, then fills out a self-evaluation form (Fig. 9). Following values of responses to the evaluation criteria, the tutor compared with a reference value of criteria drawn up by the pre-test at the beginning of the project. Finally, the tutor takes the decision to move the learner to another activity, or continue its ordinary path.

6- Conclusion

This work has been established in a perspective to provide the authors with a modelling language based on the process in a pedagogical project. Our approach is based on modelling the processes of learning in a pedagogical project.

The second generation of the theory of activity has been a great theoretical support, by introducing the social component in project-based learning. The Framework of the theory, allows us to define the concepts of our meta-model, and the relationships between them.

In our meta-model, was introduced the concept of decision making, that is important in a collaborative work. We chose the AHP method for the individual decision and in group.

Our approach is illustrated by the evaluation process, which addresses the evaluation in inter-group, and intra-group. During this process, learners must take individual or group decisions, in order to make the necessary corrections in accordance with the evaluation criteria, or for validate the activity. The process of decision AHP helped us in the evaluation of the collaborative report.

However, the AHP method has limitations such as the choice of weights for the evaluation criteria, which affect the decision for the validation, or the correction of the work.

In perspective of this work, we will evaluate the process of decision making, by creating indicators of the decision performance. The indicators of the process inform the tutor of the pertinence of the decision.

In that purpose, we will use the process mining technique for the decision making.

Quality education in graduate mechatronics programs at Egypt-Japan University of Science And Technology

Ahmed Abo-Ismael*

Professor of Automatic Control

Provost of Egypt–Japan University of Science and Technology, E-JUST, Alexandria, Egypt

Abstract

This paper introduces the experience of “Egypt-Japan University of Science and Technology, *E-JUST*” in establishing research oriented-graduate engineering educational programs, founded on “Project Based Learning (PBL)”. PBL as a “*learning by doing*” methodology, is proved to be the most appropriate method of active learning, which is applied by merging theories with laboratory experimental work while satisfying the professional skills which match high demanded engineering workforce in industry and R&D centers. *E-JUST* applies Project-Based Learning (PBL) approach to promote active and deep learning by involving students in investigating real-world problems in a collaborative experimental environment. PBL is particularly an appropriate educational approach as it exposes students to practical learning by identifying the problem through “critical thinking” and proposing scenarios for competitive solution, and thus students become among the decision makers in future real professional environment. The innovative platform for education and research at *E-JUST* was established with a partnership of Japanese supporting universities to conduct an advanced education and research in the interdisciplinary graduate programs. The university has been pioneering new interdisciplinary fields for providing technologies required to create a sustainable society in Egypt, Africa, and Arab countries. The partnership with Japanese universities and the internship of Egyptian graduates in research laboratories of Japanese counter part universities makes *E-JUST* graduates enjoy international status in education and research.

Keywords: Project Based Learning; Problem Based Learning; Lab Based Learning

1. What Went Wrong in Engineering Education

Today’s engineering graduates need to have strong professional and teamwork skills, in which they mostly lack component design, systems design, analytical skills, and professional skills. They graduate with good knowledge of engineering sciences, but generally their learning outcome does not match the highly demanded practical skills neither in industry nor in R&D centers, due the following reasons:

E-Mail: aboismail@ejust.edu.eg

1. Lack of skilled faculties/instructors who acquire high practical/experimental skills, due to the limited number of professors who used to be professional leaders in their specialization.
2. Improper design of well-tailored course material supported by proper experimental equipment/ devices, and competitive real word physical projects.
3. Limited resources of hardware, equipment, instrumentation, virtual Labs and software facilities.
4. Reluctant passive education approach, which is entirely based on the traditional teaching methodology, rather than the active learning with the spirit of teamwork.
5. Lack of proper students' assessment system and students feedback in order to enhance the course material and learning process to satisfy the Intended Learning Outcomes "ILO's".
6. Assessment methods which are based on evaluating exam papers and answers sheets, are not suitable to measure the real skills of students, which may affect results thrust wordy.
7. Faculties/Instructors need professional training programs in specialized Institutions/advanced training centers before being involved in interdisciplinary engineering education courses.
8. Junior faculties and instructors generally miss the professional practical skills, and institutions must arrange well-oriented capacity building training programs.
9. Inadequate rules and policies of institutions to apply "Project-Based-Learning", "Problem-Based-Learning" and "Lab-Based -Learning" in all Engineering programs.

2. Engineering Education Enhancement:

Universities and higher institutions nowadays enhance engineering education to improve their graduates' professional skills and to increase the opportunities of the competitive market's need for demanded talented jobs. Higher institutes tackle various "active and interactive learning policies" to enhance students' Intended Learning Outcomes. Project – Based- Learning approach engages students in investigating physical problems in collaborative teamwork. Students collaborate with each other in planning their investigation activities, collecting and analyzing data, sharing ideas, drawing conclusions, and creating final products. These active investigations enable them to learn concepts, and apply information in creating their final products that are vital in constructing new knowledge.

What is important is what the students practice and create to build their innovative spirit as future industrial and researcher leaders. *"Learning takes place through the active behavior of the student, it is what he does that he learns, not what the instructor does"*, Tyler [1].

The general trend in engineering education in Egypt is the traditional way of learning, namely, the classes, the library and the self-study. However, there is a recent trend in many institutions to apply e-learning, but the trials are limited to few courses. The trend to advance teaching methods is spread nowadays. The TEMPUS grants and the national Higher Education Enhancement Projects Fund (HEEPF) are encouraging applying for financed

projects for enhancing learning methods. All engineering students have to work on real industrial problems in the final graduation projects, during the last year of their study. Most of these projects are assigned to small groups of students to practice the group working in design problems usually of impact on the regional industry or large establishments. Two or three faculties usually supervise each project.

The working groups define and analyze the real problem and design practical systems to solve the physical industrial problems, which enhance students' professional skills [2].

In 2006, the Egyptian Ministry of Higher Education started leading national projects for enhancing higher education programs (HEEPF). The Mechatronics Engineering group at Assiut University of Egypt implemented a national project: HEEPF Grant A-085-10-MOHE to enhance the quality of Mechatronics courses by applying PBL approach and using Multimedia Lab to transfer the process of passive teaching to active learning based on a cooperative team work and students assessment feedback [3-4-5]. Although PBL is the core approach for experimental learning environment, it faces some difficulties in real applications due to lack of experience, facilities, and some time teamwork spirit [6].

2.1 Project -Based Learning and Problem -Based Learning Impact on Education:

The two strategies have a multi- disciplinary orientation and both form pillars of active learning. There are some similarities and some differences:

- Both are open ended with regard to outcomes.
- Both rely on teamwork, in which student assessments are basic aspects and their feedback is a must to evaluate the Intended Learning Outcomes.
- Project tasks are closer to professional reality.
- Project - Based Learning work is more directed to the *application* of knowledge, whereas Problem-Based Learning is more directed to the *acquisition* of knowledge.
- Project-Based Learning is usually accompanied by applied interdisciplinary engineering courses (Advanced Mechanical Design, CAD/CAM, Advanced Mechatronics Systems, Robotics, Energy, Bio-Mechatronics, Environment, Manufacturing Processes, etc.).
- Management of time and resources by the students is very important in Project-Based learning.

3. Project-Based Learning Approach (PBL):

As early as 1900s, John Dewey, the father of progressive education supports “ *learning by doing*”; he promotes educational strategies that helped students to actively engage in learning topics relevant to their lives. Teaching is not a transformation of knowledge, but a construction of knowledge by the students' own activities and building on what they already understand. “*PBL is a comprehensive, deep learning approach to elaborate motivated learning that engages students in the investigation of real environment*”, Biggs & Tang 2007[7].

3.1 PBL Strategy:

The general strategy of PBL approach, Fig.1, is defined by the following corner stones:

1. It involves the solution of a physical problem, with open-end solution, through problem identification, modelling and simulation, system design, experimental system integration, testing and analysis, and submitting final product and /report.
2. It involves the initiative by group of students, and necessitates a variety of educational activities.
3. It usually results in an end product (e.g., report, program, model, component, experimental measurements and analysis).
4. It often goes on for a considerable period of time; one semester.
5. Instructors are facilitators who assume advisory roles instead of authoritarian.

To make PBL effective, instructors play important roles in motivating students and creating a laboratory-working environment for students learning. Collaboration among the students, instructors, and others in the community is important so that knowledge can be shared and distributed among the members. In addition, students' progress needs to be observed so that problems can be detected early.

Constructive alignment is an approach to design a curriculum that optimizes the conditions for quality learning. On the other hand, '*alignment*' means that what the instructor does is to provide a learning environment that supports the learning activities, which are appropriate to achieve the desired learning outcome. "*What is important is what the students does*".

It is expected that students will gain significant qualities from this PBL style course, in particular:

1. Students begin their long road on their discovery of how to be a lifelong learner and how to approach problems and challenges involved in practical field, and how to meet challenges at a personal level.
2. The ability to work as a collaborative team to plan, manage, design, and implement their project.
3. A grasp of ethical and professional standards that are required in all personal interactions and in dealing with any data that they collect.
4. Enhancing student's ability to draw plans and diagrams and communicates with a client using effective figures and charts for professional communication.

Fig.1 PBL Strategy

4. E-JUST as a Role Model for Higher Education in Egypt:

The mission of *E-JUST* is to become a role model for graduate education and research institutions in Egypt by fostering the Japanese educational standards, policies, and systems. In this regard, *E-JUST* has established links of collaboration between Egyptian and Japanese academic institutions, while enjoying a status of international recognition by providing research oriented education, founded on “Laboratory Based Learning,” Project Based Learning”, and ” Problem Based learning”.

The Faculty of Engineering and Applied Sciences in “Egypt-Japan University of Science and Technology“ in its first phase constitute three engineering schools. The innovative platform for education and research at *E-JUST* was established with a partnership of Japanese supporting universities to conduct an advanced education and research in the interdisciplinary graduate programs. The university has been pioneering new interdisciplinary fields for providing technologies required to create a sustainable society in Egypt, Africa, and Arab countries.

The partnership with Japanese universities and the internship of Egyptian graduates in research laboratories of Japanese counter part universities makes *E-JUST* graduates enjoy international status in education and research.

The university in the soft opening stage 2010 – 2013 started with three engineering schools, namely:

1. School of Electronics, Communications and Computer Engineering.
2. School of Innovative Design Engineering.
3. School of Energy, Environment, and Chemicals and Petrochemicals Engineering.

The university (*E-JUST*) in this stage, grants the Master of Science (M.Sc.) and Doctor of Philosophy (Ph.D.) degrees for B.Sc. Engineering or equivalent graduates in the following interdisciplinary specializations:

1. Electronics and Communications Engineering
2. Computer Science and Engineering
3. Mechatronics and Robotics Engineering
4. Industrial Engineering and Systems Management
5. Materials Science and Engineering
6. Energy Resources Engineering
7. Environmental Engineering
8. Chemicals and Petrochemicals Engineering

5. Mechatronics and Robotics Engineering Department (MTR) at *E-JUST* - Case Study:

The Mechatronics and robotics engineering discipline is a synergistic integration of precision machinery, electronics, sensors and actuators, and information technology to design innovative and smart products in Bioengineering, Space technology, automotive and Industrial systems. Mechatronics system can be represented by the overlapped intersection of the three fields, as shown in Fig.2.

The research priorities of the graduate programs are in the areas of Bio-Mechatronics, Autonomous Robots, Intelligent Mechatronics Systems, and Micro -Electro-Mechanical Systems (MEMS) for industrial, automotive, and bio-medical applications.

The vision of Mechatronics and Robotics department is to stand among the best Mechatronics departments in the region through establishing the state of the art research and education environment for excellent research impact, outstanding graduates and quality of community service. The Mechatronics research Labs are demonstrated by Fig.3.

E-JUST applies Project-Based Learning (PBL) approach to promote active and deep learning by involving students in investigating real-world problems in a collaborative environment. PBL is particularly appropriate as it exposes students to practical learning by identifying the problem through “critical thinking” and proposing scenarios for competitive solution, and thus its students become among the decision makers in the future of real professional environment.

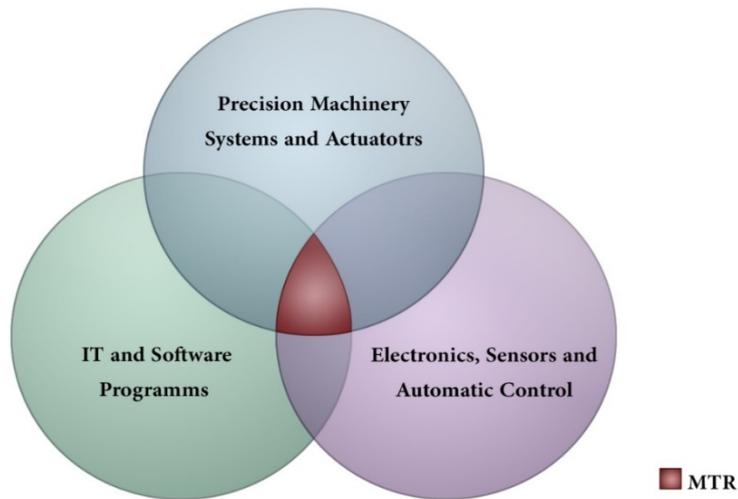

Fig. 2 Mechatronics Discipline

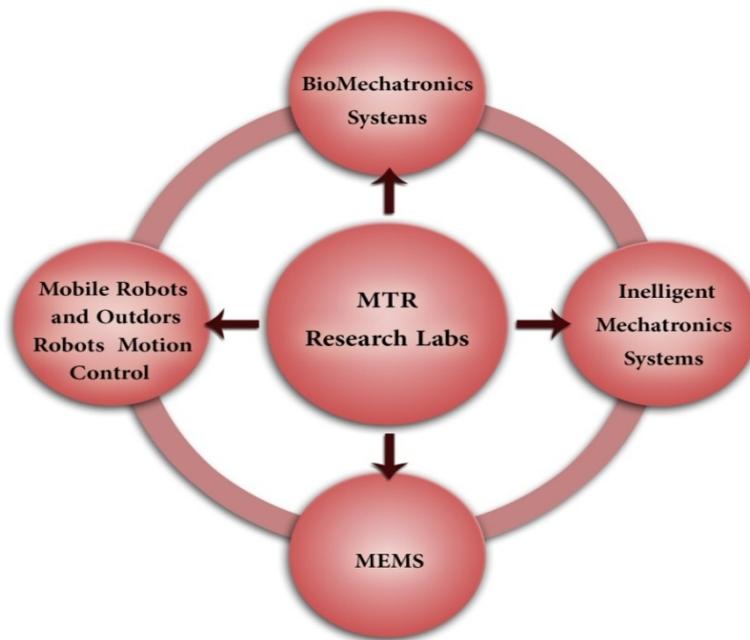

Fig.3 Mechatronics and Robotics Research Labs

5.1 Mechatronics and Robotics Graduate Programs (MTR):

The M.Sc. program includes 3-credit hours for Project-Based Learning Lab work to improve professional skills of students, while the Ph.D. program includes 6- credit hours for advanced research seminar course work to

develop students' research skills. The graduate courses of Mechatronics and Robotics programs are shown in Table-1. Graduate education in *E-JUST* is research oriented, where graduate courses are designed to match the main research tracks. The graduate students from the early beginning are given the opportunity to select freely their research tracks and consequently research Laboratories through active participations in weekly Lab seminars, where students are advised by their academic advisors to give seminars in recent advanced research topics related to their research Laboratories. Egyptian and Japanese faculties are sharing in the education process and in supervising students' M.Sc. and Ph.D. thesis

Table-1 Mechatronics and Robotics Graduate Courses

5.2 Project - Based – Learning (PBL) in E-JUST Graduate Courses:

PBL has the potential to enhance deep learning, as students have to acquire and apply concepts and principles in solving practical problems. It also promotes critical thinking, as they have to formulate plans and evaluate solutions. In addition, PBL moves students from passive learning to active learning, and helps to improve communication, collaborative skills, and professional's skills that are important in their working life later.

In Project-Based Learning laboratories at *E-JUST*, students works in small groups with a team of instructors who are advisers and consultants. Projects are undertaken throughout the length of the course along a period of one semester. The projects are usually combined with different active learning methods within the same course. The

interdisciplinary courses in *E-JUST* graduate Programs are implemented by applying “project--Based – Learning” approach, merged with “Problem –Based Learning” and “Lab Based Learning” approaches.

E-JUST interdisciplinary programs include an obligatory M.Sc. PBL course: e.g. MTR 701 Project-Based-Learning in Mechatronics. *E-JUST* applies Project-Based Learning (PBL) methodology as core experimental courses for Master of Science (M.Sc.) students in all interdisciplinary graduate programs, with the intensive use of real laboratory models. Fig.4 illustrates the PBL structure.

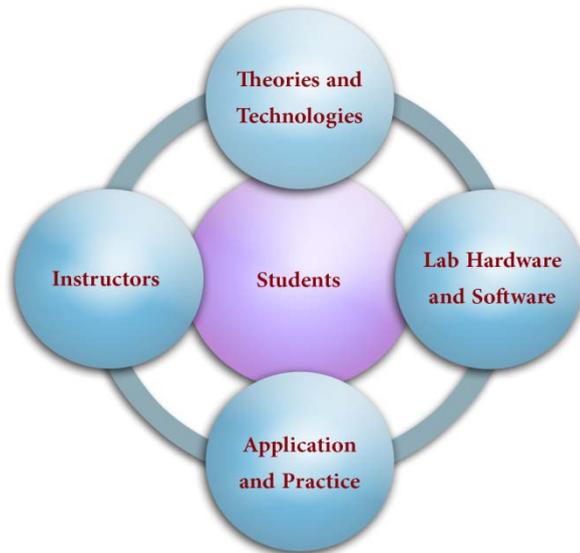

Fig. 4 PBL Structure

E-JUST and Waseda University’s specialized faculties started from the early beginning of 2009-2010 to hold workshops to develop the experimental course materials and equipment required to implement the PBL experimental course on Mechatronics. This necessitates designing the experiments, selecting the software, and designing laboratory catalogue and laboratory equipment early in 2010. The laboratory is well equipped with: Hardware (motors, encoders, sensors, smart actuators, robots, humanoid robots, photo Cells, PCs, Microcontrollers, Microprocessors, digital oscilloscopes, power supplies, electronic cards...etc.) and Software (MATLAB, Simulink, C++, Lab View, Solid Work, etc.) with extension to real-time applications, keeping the balance between theory and practical problems. Assessment of students’ activities is illustrated in Table-2.

Table-2 Assessment of Students' Activities in PBL Experimental Course- MTR 701

Type	Percentage	Grading criteria
Project final evaluation	30%	The student should complete the laboratory based learning project and give a Presentation and submit his project.
Middle term evaluation	30%	The student should to be able to explain one of the practices done during the course and/or modify it accordingly to new specifications.
Homework, Lab tutorials, Paper study, and Attendance	30%	Homework checking and active participation in the Lab. The student should attend at least 80% of the course work. The student should participate to the tutorial sessions with the lab engineer/technician.
Team work Cooperation	10%	The student will receive a grade related to the work autonomy and group cooperation.

Fig. 5 Work team in PBL Lab with Presence of Instructor (MTR 701)

The PBL learning approach in Mechatronics graduate education programs in *E-JUST* transferred classical passive teaching to active/interactive learning with excellence in high quality education. Fig.5 highlight samples of students' activities in PBL lab.

The above laboratory practices represents an experimental learning approach, which is an integrated learning methodology combining Project Based Learning, Problem Based Learning, and Lab Based Learning which results in a real final product. Fig.6 highlights this integrated active learning style.

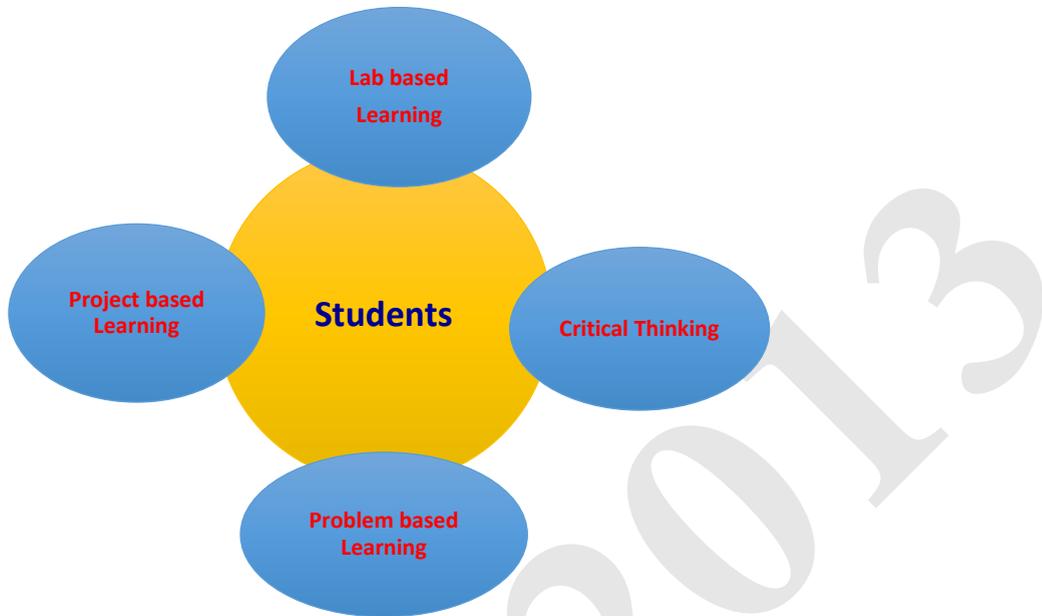

Fig. 6 Experimental Learning Environment

6. Conclusions and Recommendations:

- a. Project Based Learning (PBL) is a learning approach that has a significant potential to transform teaching from a passive educational process to an active learning environment, where students are actively engaged in laboratorial experimental work, resulting in deeper learning and gained significant skills and professional outcomes. PBL is an active learning approach that merges engineering sciences theories with technologies through collaborative experimental learning environment in order to achieve final industrial products.
- b. The experimental Learning approach, which is an integrated laboratory learning methodology, is recommended as a competitive engineering learning approach.
- c. Competitive assigned projects based on physical problems are more proper to build the students' professionals skills and construct their abilities in design, analysis, and management.
- d. Necessity of adequate strong rules and policies of institutions to apply Project-Based-Learning, Problem-Based-Learning, and Lab-Based-Learning methodologies in all Engineering programs.
- e. Availability of resources, to provide hardware components and software packages is a must.
- f. Adequate capacity building professional training programs is essential for new faculties.
- g. Involvement of industry experts in allocating real industrial problems for competitive projects is necessary.
- h. Training of students in industry and professional establishments must be compulsory in all engineering institutions.
- i. Institutions are recommended to unify main curriculum courses in specialized programs, to encourage internalizations of higher education in the near future and to enable credit transfer and students' mobility, making the best use of the most successful practices.

Acknowledgment:

The strong commitment of Prof. Ahmed Khairy “*E-JUST* President” for applying PBL in *E-JUST* is highly appreciated. The author appreciates the great contribution of Waseda University professors led by Prof. Hiroshi Yamakawa, who supports the Mechatronics and Robotics Department at *E-JUST* and shares in establishing the PBL MTR-Lab. The contribution of the pioneer Mechatronics group of *E-JUST*, namely Dr. Mohamed Abdelatif, Dr. Ahmed Ramadan Dr. Salvatore Sessa and Dr. Ahmed Fath Elbab are highly acknowledged.

4th International Conference on New Horizons in Education

Raising interest in the study of science and technology at the Technical University of Liberec

Markéta Dubová¹, Miloš Hernych^{2*}

1,2) *Technical University of Liberec, Institute for Nanomaterials, Advanced Technologies and Innovation
Studentská 2, 461 17 Liberec, Czech Republic*

Abstract

This article focuses on the authors' practical knowledge of working with children, students of secondary schools and colleges in encouraging them to study science and technology at the Technical University of Liberec. The authors have gained their experience during several years of implementing an incentive programme called "Children's University", which simulates the desire for higher education predominantly through interesting leisure activities for children, young people and their parents. In addition to mock university examinations the Children's University offers many different leisure activities. The main objective of the Children's University is to catch talented individuals early and awaken their interest in university studies of technical and scientific disciplines in order to better direct their future professional orientation towards sectors with high added value, which the labour market has a long-term interest in.

Keywords: technical and natural sciences, Children's University, Scientific Incubator, incentive programme

1. Introduction

In recent years we have witnessed a continual decline of the interest of high school graduates in studying science and technology at universities in the Czech Republic. A significant decrease was also seen at the Technical University of Liberec (TUL), which decided to actively resolve this unfavourable situation. Over the last four years an integrated communication and outreach platform has been established at TUL composed of both staff and students of TUL and external collaborators who help to actively seek talented children, and to develop and maintain their interest in technical and scientific fields in order to increase the number of talented researchers in these fields. Key activities, focused on developing a system to search and subsequently educate talented young people from elementary, secondary and vocational schools over the long-term, are performed under the title "Children's University". The aim of this article is to introduce the reader to the experiences and success with the implementation of this progressive project. The second chapter will describe the activities and principles of the Children's University, it will also mention some statistical data and finally the reader will learn about the follow-up programme entitled "Scientific incubator".

2. Children's University and its basic principles

As mentioned above, Children's University is the name of the programme at the Technical University of Liberec focused on long-term and systematic work with promising students of primary, secondary and vocational

* Corresponding author. Tel.: +420 5353288

E-mail address: milos.hernych@tul.cz

schools to awaken and maintain their interest in the study of science and technology. The basic principles of the Children's University are based on the principle of "3C", formed from the initial letters of the words

1. Capture
2. Captivate
3. Connect

Ad 1) This is the first phase of searching for talent. The aim is to reach the largest possible number of potential candidates for activities at TUL. Short informative media events are held with the intent to capture the interest of the participants - children, high school students, their parents, and current students of TUL, get them interested in the results of scientific work at the Technical University of Liberec and attract them to a particular event, described further in sections 2 and 3. Various events are selected where a larger number of people can be assumed i.e. festivals, open-street events, and also short-term leases of space in shopping centres. Furthermore, promotional events led by young researchers from TUL are held in primary and secondary school classrooms by replacing the regular class. These events have already taken place at primary schools in the towns of Doubí, Stráž nad Nisou, Mnichovo Hradiště, Mladá Boleslav and Sokolov, and secondary schools in Česká Lípa, Liberec, Mnichovo Hradiště and České Budějovice.

Ad 2) The first phase is directly followed by activities that aim to bring children and the general public to TUL where they are shown specific instruments, laboratories and procedures and the results of scientific work. For the public from further afield the school and its activities are presented in the form of lectures and seminars. The events can be divided into two categories. In the first are activities for a large number of participants. Examples of such events include:

- **“Open University”** is an event that takes place at the beginning of the academic year and combines elements of fun, learning and getting to know each other. It includes an open-air music festival, performances by school choirs and musical groups, theatre groups, thematic games and competitions for all ages and visits to laboratories and classrooms. In 2012, the event attracted around 2,500 visitors from the students and teachers of TUL, and the public from Liberec and its surroundings.
- **“Walk for science and technology”** is an activity aimed at families with children. Participants follow maps of the university laboratories, where in addition to expert interpretation fun tasks are prepared for all ages.
- **Science cafes** are a new format of outreach events for the general public. They are lecture events for the public focused on the latest results of research and development not only from the Technical University of Liberec, where a team of scientists from TUL describe in laymen's terms such issues as bionics, the impact of electromagnetic radiation on humans or to explore the benefits and application of nanomaterials and nanosurfaces in industry. The science cafes are a two-hour event, the atmosphere corresponds with their name, i.e. a pleasant chat about current issues of science and research over a cup of coffee.

The second category of activities includes “intimate” events or groups of related events where the public, especially children, high school and college students, will try specific aspects of scientific work. The events are often linked with practical demonstrations and visits to laboratories either in TUL or in industrial practice. Specific examples of the activities include:

- **“Saturdays with technology”** are intended primarily for pupils of the 8th and 9th grade who are unsure about what field to choose for further study. Participants can try soldering electronic circuits,

fundamentals of design using a PC, programming or basic video and photo editing, work with vector graphics and much more. Children discover what they are interested in which will help them to decide which secondary school to apply for in their further study.

- **“PřiTUL se!”** is a set of weekly events for primary school children, which take place during the school holidays (autumn, winter, spring, Easter). Children can sign up for a course programming robots, make rings on a lathe, learn to solder, build model airplanes and boats, try out different traditional and non-traditional textile technologies, and participate in interesting chemical experiments in the laboratory etc.

In addition to the above activities other events take place throughout the year such as an algorithm development course in the Karel language for the smallest children, a series of seminars programming CNC machines for high school students, computer graphics for the age group 12-17, and a series of non-traditional textile technology courses for adults, etc.

Ad 3) If the above activities attract children and high school students and galvanize their interest in technical and scientific fields so much that they start thinking about future careers in these areas, they can try a “dry-run” of a university education and participate in the **Children’s University for one full school year**. During their “studies” students will go through all of the steps of a university education including recruitment, matriculation and the subsequent study obligations of a university student. Children “study” subjects through games which focus on engineering - fundamentals of engineering, machining and assembly, automotive design, electrical engineering, robotics, microelectronics and natural sciences - chemistry, physics, fluid mechanics, microbiology and remedial technologies. The Children’s University also offers an opportunity to “study” fields such as material engineering and applied chemistry. Upon successful completion of the lectures, seminars, semester projects and thesis defence children who obtain the required number of credits attend a graduation ceremony, where they are addressed by the Rector who awards them with a Children’s University diploma. This year was the third annual Children’s University which was successfully completed by nearly 200 children, as well as in previous years it generated a great deal of interest among both children and their parents, who play a very important role in deciding on the further studies of their children.

The Children’s University and other events for children and young people between 2009 and 2012 were completed by a total of 2,606 primary school pupils, 654 girls and 1,952 boys, and 266 secondary school students, 58 girls and 208 boys.

In addition to activities aimed at primary school children events are also organized primarily directed at high school and university students. Examples are:

- **“T Day”** – During “T Day” individuals and teams have the opportunity to present their unconventional and original idea or thought to an expert committee. A team from TUL then provides financial and material support to the most interesting topics as well as the possibility to use the instrumentation of the TUL laboratories.
- **Cyber robot** – a creative competition especially for high school teams that participate with their home-made robots.
- **Mentoring programme** is an opportunity for applicants from high schools to try one week of university study in their chosen programme under the supervision of a TUL student. Similarly, university students have the opportunity to try scientific work shadowed by a selected doctoral student or TUL researcher.

3. Further principles of the Children’s University

Several years of experience working with talented children and students have given the Children’s University team of implementers the chance to verify the following rules:

- Voluntariness – events are intended only for those candidates who register voluntarily.
- “Edutainment” - Participants are actively involved in all activities so that they “get a feel” of the theory and participate in the experiments and production of prototypes, graphic editing of photography, technical aids or develop their own computer program, etc.
- Involvement of parents and grandparents – Parents play a crucial role in the future direction of their children’s study, therefore the implementers of the Children’s University regularly invite parents as well as their children to their events.
- “The sooner, the better” - it is necessary to catch the interest of children in technical and natural sciences with development related to these disciplines from early childhood where children exhibit an immediate interest.
- Patience and durability – the implementers of the Children’s University realize that a technical education is a long and enduring journey, the results of which will take effect only after years of effort. Some results of the Children’s University are already reflected with up to twice as many applications at the Secondary School of Mechanical and Electrical Engineering in Liberec, which was once part of the Children’s University project team.
- Promotion of “good example” - The best advertising is a good reference which spreads itself among people. The implementers have verified in particular the promotion of “good example”, where information about events is spread directly by the participants to their friends and acquaintances. (Hernych, 2012; Kretschmerová, 2012)

4. Science Incubator

The Science Incubator is a follow-up programme to the Children’s University. It is aimed at students of Bachelor’s and Master’s degree programmes at the Technical University of Liberec. The aim of the Science Incubator is to catch talented young scientists in time and keep them for research work at TUL. The Science Incubator offers a variety of activities:

- **Open days for students in the laboratory** take place together with the **exchange of themes with offers to participate in activities within R&D teams.** Young scientists can become a junior scientist in scientific research projects or obtain a current diploma or thesis themes.
- **All-day courses and seminars** - Implemented Scientific hatchery together with researchers TUL students represent the results of their research in order to engage talented young scientists in their research teams.

- **Excursions for students to interesting sites linked to research activities** - Students can visit interesting places and companies where they work with the research results. In the past excursions include a nuclear power plant, Škoda Auto, Josef UEF and other interesting places.
- **Use of Science Incubator equipment for the realization of their own ideas** – the Science Incubator has the financial resources to purchase new laboratory equipment or for their development at TUL. On the already mentioned “T day”, if the committee is interested in their ideas, students can obtain financial support and the opportunity to use new laboratory equipment at TUL.
- **Student workshop or “MOCK EXAM”** – the Student workshop is intended for TUL students who are preparing for their final exam and defence of their Bachelor’s or Master’s thesis. Under the guidance of a mentor they prepare a mock defence of their thesis and presentation in front of several people. The mentor is ready to advise the student and correct his/her verbal communication and reasoning.

5. Investigation of interest in the study of science and technology among students of primary and secondary schools and grammar schools

To determine the interest in activities offered by the Children’s University the implementers of the project in 2011 conducted a survey at primary and secondary schools. In total, 132 children and primary and secondary school and college students were interviewed, 92 boys and 40 girls. Most pupils were from grade 6 to 9 (73 children), as well as students of secondary schools (33). Sixteen were primary school pupils from grade 1 to 5, and five respondents were grade 5 to 8 grammar schools and secondary vocational school or college students. The results of this survey are listed below:

Table 1.

Attend	No.	%
Primary school grade 1-5	16	12%
Primary school grade 6.-9	73	55%
Multi-year grammar school (1 st to 4 th)	33	25%
Multi-year grammar school (5 th to 8 th)	5	4%
Four year grammar school	0	0%
secondary vocational school / college	5	4%

Respondents were asked brief questions on whether they were interested in technology or not, only one replied that they were not interested in technology. If the respondents expressed an interest in technology or natural sciences the survey continued. When asked for a specific field of technology or science disciplines respondents expressed interest in the following areas (in this case it is necessary to note that respondents could choose more than one):

Table 2.

Interest	No.	%
Robotics	68	52%
Electrical engineering	55	42%
Mechanical engineering	42	32%
Automobiles	28	21%
Microbiology	29	22%
Ecology	19	14%
Nanomaterials	33	25%
Chemistry	38	29%
Computers	92	70%
None of the above	0	0%

Most children and students were interested in computers (92), robotics (68) and electrical engineering (55), followed by mechanical engineering (42), chemistry (38) and nanomaterials (33). Less interest was expressed in microbiology (29) and automobiles (28). The lowest interest was in ecology (19). All of these disciplines can be studied at the Technical University of Liberec; hence the implementers were able to verify the sense of the activities of the Children's University at TUL. Another question was whether the respondent wanted to study in at university:

Table 3.

Would you study at university?	No.	%
No – not interested	0	0%
No – I don't feel like it	0	0%
No – there's no point	0	0%
Yes - I like to learn new things	51	39%
Yes - it is necessary for my future	38	29%
Yes - It will ensure me a better life	28	21%
Not sure	15	11%

In total 117 children and students responded that they want to study at university. Only 15 respondents said that they did not know. Most children and students (51) responded that they want to study at university because

they like to learn new things, 38 respondents said that it is necessary for their future and 28 respondents said that their study will ensure them a better life.

The next question was whether the respondent wanted to try a “dry-run” of a university, to which 131 respondents answered positively. Ninety children and students said they would like try a “dry-run” of a university with their current classmates and another 41 children or students would like to go to school with university students and see what happens there. Only one respondent said that they are not interested in this activity.

Another question asked whether the respondent would be interested in the work of a scientist.

Table 4.

Would you be interested in the work of a scientist?	No.	%
Yes – it is a well paid job	5	4%
Yes – it must be interesting and fun	85	64%
Yes – it has social prestige	1	1%
No – it is a badly paid job	5	4%
No – it is boring	0	0%
No – I could not handle it	1	1%
I don't know, I'm not interested in it	5	4%
I don't know, I'd like to try it	30	23%

A total of 64% of students and children responded that they would be interested in the work of scientists because it must be interesting and fun, 23% did not know but would like to try it and another 4% of children and students did not know because they are not interested. Four percent of respondents answered negatively because the work is poorly paid. It is interesting that the same number of respondents said that they would be interested in the work of scientists because in their opinion it is well paid, and 1% would be interested in the work because it has social prestige. Only 1% of respondents answered negatively with the feeling that they could not handle this work. Thus, 76% of children and students positively responded with various reasons.

The survey also examined whether the respondent wanted to try the work of a scientist - see Tab. 5

Table 5.

Would you like to try the work of a scientist?	No.	%
Yes – I'd like to work on a prescribed task	39	30%
Yes - I'd like to see what scientists do all day	15	11%
Yes – I'd like to try to invent something in the laboratory	78	59%
No	0	0%

All of the respondents answered yes, while 59% of respondents mentioned that they would like to try to invent something in the laboratory as the reason for their interest, 30% of children and students would like to work on a prescribed task. Only 11% explained that they would like to see what a scientist does all day.

The survey indicated to the implementers of the Children's that children and high school students have an increased interest in studying science and technology and thus also the leisure activities of the Children's University.

6. Conclusion

To capture and maintain the interest of children and young people in technology and science fields is a "long haul" which is already producing results. This experience has been verified in practice over the past four years by the implementers of the Children's University and the Science Incubators. Activities of both projects have captivated thousands of children, students and their parents and we can say that the interest in technical and scientific fields at Liberec schools has begun to increase. Evidence of increased interest can be found both in the results of the survey mentioned in the Section 5 and also double the number of applications to study at the Central School of Mechanical and Electrical Engineering in Liberec. Hopefully, the efforts made by the implementers of the Children's University and Science Incubator will reflect in future in an increased interest in studying at the Technical University of Liberec, which will be able to offer highly qualified specialists to industrial enterprises based on their demand.

4th International Conference on New Horizons in Education

Random effects in the entrance examinations

Jindrich Klufa*

University of Economics, W. Churchill Sq.4, 13067 Prague, Czech Republic

Abstract

In this paper we shall study a risk of acceptance students with lower performance levels when the multiple choice question tests are applied for entrance examinations. We shall use the entrance examinations at the Faculty of International Relations at University of Economics in Prague. In this case a model of binomial distribution can be used to answer the following questions (under assumption of random choice of answers): what is probability that number of right answers exceeds given number, what is expected number of right answers, etc. The results obtained in the analysis may be used for considerations about how well the results in test can discriminate between students with high level of abilities and students with lower performance levels.

Keywords: Entrance examinations, binomial distribution, multiple choice question tests, probability.

1. Introduction

Multiple choice question tests are widely used in testing knowledge of students. One of the advantages of such type of test is that the results can be evaluated quite easily even for large number of students. On the other hand, a student can obtain certain number of points in the test purely by guessing the right answers and this fact affects reliability of the test and should be considered in interpretation of test scores. This problem is addressed in education research – see Zhao (2005), Klufa (2012), Zhao (2006), Klufa (2013) and Premadasa (1993).

An analysis of a multiple choice question test from probability point of view is provided in this paper. This test is for example used for entrance examinations at University of Economics – see Klufa (2011). Note that standard (no multiple choice questions) tests are used for checking knowledge of students in mathematics courses at University of Economics – for analysis of such test see (Kaspříková, 2011), but regarding entrance examination, multiple choice questions are preferred so that the results of tests can be obtained quickly and there is clearly no impact of any subjective factor in evaluation.

Entrance examinations at the Faculty of International Relations at University of Economics in Prague include mathematics, English and other language. Test in mathematics has 8 questions for 6 points and 4 questions for 13 points (100 points total). Each question has 5 answers. Test in English or other language has 40 questions for 2,5 points (100 points total). Each question has 4 answers. Questions are independent (one answer is correct), wrong answer is not penalized. We provide an answer to the following questions (under assumption of random choice of answers): what is probability that number of right answers exceeds given number, what is expected number of right answers, what is standard deviation, and finally what is a risk of success of students with lower performance levels.

2. Methods

Multiple choice question tests (the test has n questions, each question has m answers) are applied for the entrance examinations at the Faculty of International Relations. Therefore a model of binomial distribution can be used for the entrance examinations. From probability point of view a multiple choice question test means:

Let us consider n independent random trials having two possible outcomes, say “success” (right answer) and “failure” (wrong answer) with probabilities p and $(1-p)$ respectively. Probability of correctly answered question p (under assumption that each of m answers in particular question has the same probability and just one answer is correct) is $p=1/m$.

Let us denote X as number of successes (right answers) that occur in n independent random trials. X is random variable distributed according to the binomial law with parameters n and p . Probability that number of successes is k ($k=0, 1, 2, \dots, n$) is (see e.g. Marek (2012))

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k} \quad (1)$$

The expected value and the standard deviation of random variable X distributed according to the binomial law with parameters n and p is

$$E(X) = np, \quad \sigma(X) = \sqrt{D(X)} = \sqrt{np(1-p)} \quad (2)$$

where $D(X)$ is dispersion of random variable X .

The distribution function of random variable X distributed according to the binomial law with parameters n and p is

$$F(x) = 0, x < 0, \quad F(x) = \sum_{k=0}^{[x]} \binom{n}{k} p^k (1-p)^{n-k}, x \geq 0 \quad (3)$$

where $[x]$ is integer part of x .

3. Entrance examinations in mathematics and English

Entrance examinations at the Faculty of International Relations at University of Economics in Prague include mathematics, English and other language.

Entrance examinations in mathematics have 8 questions for 6 points and 4 questions for 13 points (100 points total). Questions are independent. Each question has 5 answers (one answer is correct), wrong answer is not penalized. Under assumption that each answer has the same probability, probability that a particular question is correctly answered is $p=1/5$.

Entrance examinations in English (or other language) have 40 questions for 2,5 points (100 points total). Questions are independent. Each question has 4 answers (one answer is correct), wrong answer is not penalized. Under assumption that each answer has the same probability, probability that a particular question is correctly answered is $p=1/4$.

Let us denote

Y_1 = number of points in test in English, Y_2 = number of points in test in mathematics.

Example 1. Under assumption of random choice of answers we shall find probability that number of points in test in mathematics is 25.

Let us denote

T_1 = number of right answers in the first 8 issues

T_2 = number of right answers in following 4 issues

Random variables T_1, T_2 are independent, therefore we have (see e.g. Feller (1970))

$$P(Y_2=25) = P[(T_1=2) \cap (T_2=1)] = P(T_1=2) P(T_2=1)$$

Random variable T_1 has binomial distribution with parameters $n=8$ and $p=0,2$. Random variable T_2 has binomial distribution with parameters $n=4$ and $p=0,2$. According to (1) we obtain

$$P(Y_2 = 25) = \binom{8}{2} 0,2^2 0,8^6 \binom{4}{1} 0,2^1 0,8^3 = 0,120259.$$

Analogously, we can calculate the probability $P(Y_2=k)$ for other $k=0, 6, 12, 13, \dots, 94, 100$ (see Table 1 and Figure 1). For this calculation we used software Mathematica (Statistics 'DiscreteDistributions') – see Wolfram (1991).

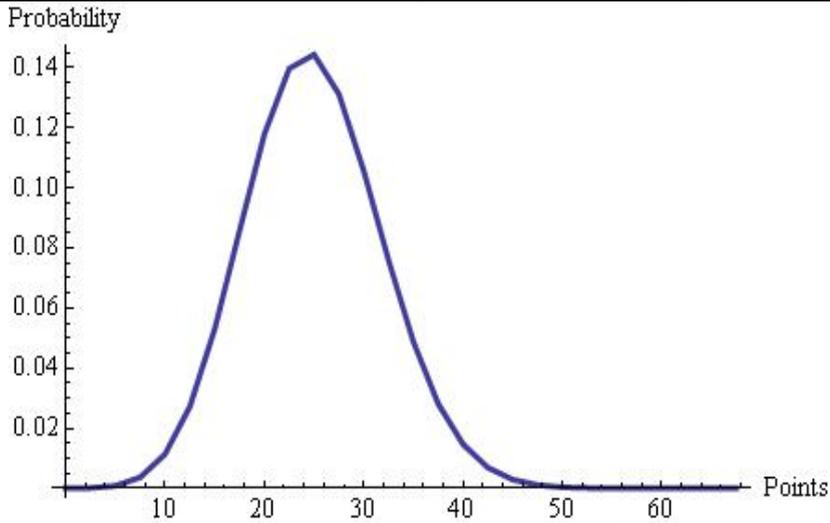

Fig. 2 Distribution of number of points in test in English

Example 2. Under assumption of random choice of answers we shall find probability that number of points in test in mathematics is

- (a) 30 and more,
- (b) 40 and more,
- (c) 50 and more.

(a) Using notation from example 1 we have (see e.g. Rao (1973))

$$\begin{aligned}
 P(Y_2 \geq 30) &= 1 - P(Y_2 < 30) = \\
 &= 1 - [P(Y_2=0) \& \acute{c} (Y_2=6) \& \acute{c} (Y_2=12) \& \acute{c} (Y_2=13) \& \acute{c} (Y_2=18) \& \acute{c} (Y_2=19) \& \acute{c} (Y_2=24) \& \acute{c} (Y_2=25) \& \acute{c} (Y_2=26)] = \\
 &= 1 - [P(Y_2=0)+P(Y_2=6)+P(Y_2=12)+P(Y_2=13)+P(Y_2=18)+P(Y_2=19)+P(Y_2=24)+ \\
 &\quad +P(Y_2=25)+P(Y_2=26)]
 \end{aligned}$$

Finally from Tab.1 we obtain

$$P(Y_2 \geq 30) = 1 - 0,757524 = 0,242476.$$

Under assumption of random choice of answers almost a quarter of students get the test score 30 or more points.

(b) Analogously, we obtain

$$\begin{aligned}
 P(Y_2 \geq 40) &= 1 - P(Y_2 < 40) = \\
 &= 1 - [P(Y_2=0) + P(Y_2=6) + P(Y_2=12) + P(Y_2=13) + P(Y_2=18) + P(Y_2=19) + P(Y_2=24) + \\
 &+ P(Y_2=25) + P(Y_2=26) + P(Y_2=30) + P(Y_2=31) + P(Y_2=32) + P(Y_2=36) + P(Y_2=37) + P(Y_2=38) + P(Y_2=39)]
 \end{aligned}$$

Finally from Tab.1

$$P(Y_2 \geq 40) = 1 - 0,941604 = 0,058396.$$

Under assumption of random choice of answers approximately 5,8% of students get the test score 40 or more points.

(c) Finally

$$P(Y_2 \geq 50) = 1 - 0,977006 = 0,022994.$$

Under assumption of random choice of answers approximately 2,3% of students get the test score 50 or more points.

Remark 2. Similarly we can calculate probability that number of points in test in English is 30 and more (40 and more, 50 and more). We have

$$P(Y_1 \geq 30) = 0,284855, \quad P(Y_1 \geq 40) = 0,026244, \quad P(Y_1 \geq 50) = 0,000571.$$

Example 3. Under assumption of random choice of answers we shall find expected number of points in the test in mathematics.

Using notation from example 1 we have

$$Y_2 = 6 T_1 + 13 T_2$$

Therefore - see e.g. Feller (1970)

$$E(Y_2) = E(6T_1 + 13T_2) = 6 E(T_1) + 13 E(T_2)$$

According to (2) we obtain ($E(T_1) = 8 \cdot 0,2 = 1,6$, $E(T_2) = 4 \cdot 0,2 = 0,8$)

$$E(Y_2) = 6 \cdot 1,6 + 13 \cdot 0,8 = 20.$$

Expected number of points in the test in mathematics is 20.

Remark 3. Similarly we can find expected number of points in the test in English. We have

$$E(Y_1) = 25.$$

4. Conclusion

Entrance examinations at the Faculty of International Relations at University of Economics in Prague include mathematics, English and other language. Probability that number of points from test in mathematics is 50 and more is 0,022994 (see Example 2). Analogously, we can calculate this probability for test in English or other

language. We obtain 0,000571 (see Remark 2). That means (the tests are independent: $0,022994 \times 0,000571 \times 0,000571 = 0,00000001$) that approximately one student from one hundred million (under assumption of random choice of answers and using 50 points as a cut-off value for successful completion in each test) successfully makes the entrance examinations at the Faculty of International Relations at University of Economics by pure guessing the answers.

Multiple choice question tests are optimal for entrance examinations at University of Economics. These tests are objective (there is clearly no impact of any subjective factor in evaluation). Moreover, results can be evaluated quite easily for large number of students. From results of this paper follows that risk of acceptance students with lower performance levels is negligible.

4th International Conference on New Horizons in Education

Reading intervention in second-grade children with poor reading abilities

Susanne Schwab^a, Susanne Seifert^{a*} and Barbara Gasteiger-Klicpera^a^aKarl-Franzens-University of Graz, Merangasse 70/2, 8010 Graz

Abstract

The purpose of the present study is to evaluate a newly developed teaching program that fosters the reading abilities of eleven second grade poor readers. This study is part of the intervention study *Improving Language And Reading Skills (LARS) in children with German as a first or second language*. The present study uses a controlled pre-posttest design. The intervention was applied as individual and small group courses (never more than three children) for children with very poor reading skills who were supported three times a week for nearly five months. Project team members worked with these children on the syllabic principle, decoding and reading skills with small texts and thematically adjusted vocabulary material. The children's reading and language abilities were obtained before and after the intervention period. The results indicate that there are some remarkable learning achievements regarding reading fluency and also slight to moderate gains in reading comprehension in most of the children, whereas the language skills did not improve much.

Keywords: reading intervention; evaluation; case study; reading fluency

1 Introduction

At the end of primary school, many students do not have the skills and abilities to understand age-appropriate texts (see also Bos, Lankes, Prenzel, Schwippert, Walther & Valtin, 2003). In German-speaking countries, about ten percent of students show insufficient reading performance (Hornberg, Valtin, Potthoff, Schwippert & Schulz-Zander, 2007). With regard to Austria, actually 16% of nine- to ten-year-old students belong to the at-risk group in reading literacy (e.g. Suchán, Wallner-Paschon, Stöttinger & Bergmüller, 2007). Until the end of compulsory education one out of four 15-year-old students (about 28%) fails the international standards concerning reading competence (OECD, 2010; Gasteiger-Klicpera, Oswald, Schwab & Ederer, 2011; Schwantner & Schreiner, 2010). For children with German as a second language (GaS), achieving the expected levels of reading proficiency in school is even harder, mainly because they often show deficient skills in the German language (Pochert, 2001). Poor linguistic proficiency in German is listed as one central reason for the close interrelation between reading abilities and socioeconomic and ethnic background, as well as one of the most important predictors for later school failure in children with GaS or from underprivileged families (Esser, 2006). The close

* Corresponding author. Tel.: +43 316 380 2539.

E-mail address: susanne.seifert@uni-graz.at

interdependence between difficulties in acquisition of reading and writing with linguistic skills has been subject of many studies (Snowling & Hulme, 2005). On the one hand, it was shown that children with higher levels of oral proficiency and a wider range of vocabulary are able to read more easily than their less proficient peers, which applies to mono- and bilingual children (Bialystok, 2007). On the other hand, language difficulties place children at risk for literacy problems (e.g. Bishop & Snowling, 2004; Catts, Fey, Tomblin & Zhang, 2002; Lonigan, Burgess & Anthony, 2000) - reading comprehension, in particular, is closely linked to language abilities (Snowling & Hulme, 2005; Perfetti, Landi & Oakhill, 2005).

Generally, difficulties in reading emerge at an early stage and are very persistent (e.g. Klicpera & Gasteiger-Klicpera, 1993; Scarborough & Parker, 2003; Stanovich, 1986). They can be attributed to specific affected components of reading abilities: some children have difficulties in phonological recoding, whereas others command problems in reading comprehension (e.g. Caccamise & Snyder, 2005). Therefore, interventions have the greatest success when they identify at-risk-students as early as possible and provide individual learning support (e.g. Gasteiger-Klicpera & Fischer, 2008; Grimm et al., 2004; Helf & Cooke, 2011; Hurry & Silva, 2007; Leppänen, Niemi, Aunola & Nurmi, 2004; Swanson, 1999; Torgesen, 2005).

Basically, concerning the effects of reading-interventions, the choice of setting (single intervention, small group intervention, parenting instruction, school class), the intensity of the intervention (numbers of remedial lessons, etc.) and the type of target group (e.g. only children with difficulties in reading, children with German as second language) seem to be essential (see also Antoniou & Souvignier, 2007). In German-speaking countries, symptom-specific intervention programs with children with dyslexia were evidenced as more effective than function and phonological awareness training. Furthermore, the person in charge of the intervention (teacher, authors of the paper, etc.) affected the outcome. It could be shown that longer intervention periods (more than 20 weeks) with the teacher obtained the highest effects (Ise, Engel & Schulte-Körne, 2012).

Especially for the use in individual treatments, numerous programs concerning the acquisition of literacy have been initiated in German-speaking countries. (e.g. the syllable-based and phonetic gestures-supported “Kieler Leseaufbau” by Dummer-Smoch & Hackethal, 1986; the morpheme-based training “Morpheus” by Kargl & Purgstaller, 2010; differentiate training in reading for fifth-graders “Leseförderung in Kompetenzstufen” by Fischer, 2008; strategy-based training for third-graders “Leseprofi” by Munser-Kiefer & Kirschhock, 2009).

However, only few evaluations of theoretically sound and evidence-based intervention programs, which consider children with GaS in an adequate and sufficient way, have been completed (Gasteiger-Klicpera & Fischer, 2008).

2 Purpose and research questions

This article analyses the effects of a small group implementation of the intervention program LARS (see also Schwab & Oswald, 2011) that was designed to improve reading skills in children with German as a first or second language. In this pilot study, it was decided to treat the eleven poorest readers outside the class to ensure

individual support. An intensive, systematic reading intervention should enable students with low literal and/or linguistic skills in the German language to improve these skills in a notable way.

3 Method

The study is a multiple case study using baseline and post-intervention measures. At the beginning of November 2011 (test time 1), all children from six second grade classes of two primary schools were tested. Both schools exhibited a similar catchment area and related socioeconomic and cultural background of parents and children. The children in both schools were from families with similar low socio-economic status and approximately 70% were children with GaS.

After the assessment, eleven children with low percentile ranks ($PR < 5$) in the word reading subtest of the *SLRT II* (Moll & Landerl, 2010) were chosen to receive a small group intervention from January to May 2012. In June 2012 (test time 2), the reading and language achievement of these children was examined again.

3.1 Sample

Eleven children, chosen because of their diagnosed deficit in reading fluency (inclusion criteria: word-decoding of the *SLRT II*; Moll & Landerl, 2010; percentile ranks below 5) participated in the intervention (small group treatment with not more than three children per group). On average, they were 8.23 years old ($SD = 0.696$).

The following Table 1 gives an overview of the included children. Five of the children (DO, JA, MU, NA, NI) have special educational needs (SEN). DO is diagnosed with autism and the others with learning disability. AJ and KH were supposed to be assessed for SEN soon, due to their low academic achievement. For six of the eleven children (DA, DO, JA, JO, NA, NI) German was their mother language; the remaining five learned German as a second language (all of them with different first languages). Concerning the intellectual abilities, the children did not have comparable results in the *Cultural Fair Intelligence Test (CFT-1: Cattell, Weiß & Osterland, 1997)*. The intelligence (IQ, age-norm) of four of the children (AJ, KH, NA and NI) was below average, whereas the others were in the average range.

TABLE 1. Sample Characteristics in Alphabetical Order.

child	sex (m – masc., f – fem.)	age	school	SEN (special educational needs)	GAS (German as a second language)
AJ	m	8.83	1	no*	yes
DA	m	8.52	1	no	no
DO	m	7.67	1	yes	no
EL	f	7.58	2	no	yes
EM	f	7.48	1	no	yes
JA	f	8.72	2	yes	no
JO	m	7.42	1	no	no
KH	f	9.21	2	no*	yes
MU	m	7.21	2	yes	yes
NA	f	8.80	1	yes	no
NI	m	8.52	1	yes	no

*These children will be assessed for SEN soon due to their low academic achievement.

3.2 Instruments

The reading part of the *Salzburg reading and spelling test* (SLRT II: Moll & Landerl, 2010) was deployed to measure the acquisition of literal competencies. As an individual reading test, it proves reading fluency of words and non-words. It allows a separate assessment of phonological recoding and lexical reading. Based on the reached percentile ranks in the subtest *word reading*, the children were selected for treatment.

The reading comprehension was measured with the *reading comprehension test for first to sixth graders (ELFE 1-6)*: Lenhard & Schneider, 2006). This test identifies reading comprehension on the word-, sentence- and text-level. The children's active and passive vocabulary was compiled with the short form of the *vocabulary- and word finding-test for 6 to 10 year-olds (WWT 6-10)*: Glück, 2007). Their grammar knowledge was measured with the subtest of the *Potsdam-Illinois test for psycholinguistic abilities (P-ITPA)*: Esser, Wyschkon, Ballaschk & Hänsch, 2010). The children's mother language and the information about SEN were collected through teacher information, while intellectual abilities were tested with the *Cultural Fair Intelligence Test (CFT-1)*: Cattell, Weiß & Osterland, 1997).

3.3 Description of the intervention

The support was offered for five months on average three times a week for 50 minutes. An intervention time of 30 to 50 treatment hours was reached, depending on individual absences. The treatment decision was taken depending on the level of reading proficiency. The children were taken out of class and fostered in small groups with not more than three children in separate rooms. They were grouped according to their reading abilities, class membership, mutual sympathy and behavioral peculiarities. For instance, DO and NA, members of the same class, had a similar profile of reading disability. Therefore, these two, for instance, were supported together, because, as their reading performance was comparable, none of them had to wait for the other while performing reading tasks. The implementation of the intervention happened through trained project members, supervised by the project leaders. The reading intervention (see also Gasteiger-Klicpera & Fischer, 2008; Schwab & Oswald, 2011) is based on a specific diagnosis of the different components of reading abilities (phonological recoding, lexical reading and reading comprehension). The intervention also takes language competencies into account, as especially for weaker readers it is assumed, that vocabulary work can improve reading abilities (Souvignier & Antoniou, 2007).

Notably for weak readers, the possibility of a shared access to literature increases the opportunities for participation and can enhance the quality of life (Browder, Gibbs, Ahlgrim-Delzell et al., 2009). To offer the children these opportunities and to ensure the relevance of the texts and the contained vocabulary, the used texts were oriented towards the main subjects of class instruction.

The intervention hours were divided into vocabulary units and predominantly reading units. During vocabulary units, the children worked on hidden object pictures and picture cards showing appropriate, linguistically and thematically controlled vocabulary. The syllabic principle, used as a hint for visual segmentation of the words and therefore as a support for word reading, was conducted for each word and repeated various times. With the help of the supporting project member, the children had to write the word matching the picture on the backside of the card. These practiced words were taught to facilitate the following reading tasks, as they appeared in the texts the children had to read during the reading units.

Within these reading units, the children worked with the supporting project member, using texts and corresponding tasks adjusted to their ability-levels. After the compulsory reading of the text including adequate tasks the children had to solve, the pupils could sometimes choose which texts/books to read on their own in order to allow some space for self-determination.

3.4 Scoring and Analyses

This explorative multiple case study uses baseline and post-intervention measures obtained by standardized tests. Due to the small number of participating students, no statistical instruments were used for the data analysis. The differences of percentile ranks (reading skills, vocabulary) and raw scores (grammatical skills) of pre- and post-test abilities are used to determine changes in reading and linguistic skills in each child.

4 Results

Above all, it is worth mentioning that reading abilities of most of the children improved substantially after the intervention compared to the pretest abilities.

The results of the reading tests (*SLRT II* and *ELFE*) followed by the linguistic tests (*WWT* and subtest *grammar* of the *P-ITPA*) are presented. Children with GaS are marked in the tables and figures.

4.1 Reading abilities

In order to be included in this case study, it was essential for all of the children to have initial deficits in decoding, measured by the *word reading* subtest of the *SLRT II*. The mean score of the percentile ranks in the *word reading* subtest of the *SLRT II* was 2.63 (SD = 2.23). However, regarding the reading competencies at test time 1, the children did not only show impaired word reading but also impaired reading of non-words. The percentile ranks in the *non-word reading* subtest of the *SLRT II* were in the mean 7.29 (SD = 3.96).

At post-intervention measures, all children except one (NI) showed gains in these reading tests. They read more words (mean score of percentile ranks at posttest 17.04, SD = 11.57) and non-words (mean score of percentile ranks at posttest 28.92, SD = 17.39) fluently in one minute than they did at test time 1. The gains of AJ, DO, EM, KH and MU even resulted in average reading fluency (in both: word and non-word reading). At test time 2, EL, JA and NA showed non-word reading skills within the average range, whereas word reading achievement stayed below average. The gains of these three children can be described as moderate. Only three of the children, DA, JO and NI, still performed below average at test time 2. Table 2 shows the reached percentile ranks in the reading fluency test at pre- and posttest, whereas Figure 1 gives an overview of the individual changes in reading abilities tested with the *SLRT II* (decoding, reading fluency).

TABLE 2. Performance in the reading fluency test *SLRT II*, showing the pre- and posttest values. The children are grouped in children "with substantial gains", "with slight to moderate gains" and "with no gains to deterioration"; within the groups they are in alphabetic order. Performance below average range is marked with *.

child	pretest		posttest	
	word reading PR (SLRT II)	nonword reading PR (SLRT II)	word reading PR (SLRT II)	nonword reading PR (SLRT II)
AJ (GaS)	1-2*	3*	16-19	38-43
DO	4-5*	10-12*	20-23	32-35
EM (GaS)	1-2*	6*	16-19	57-59
KH (GaS)	1-2*	<2*	24-29	44-47
MU (GaS)	<1*	7*	39-41	38-43

EL (GaS)	1-2*	7*	4-8*	15-19
JA	1-2*	7*	4-8*	32-35
NA	3*	8*	4-8*	15-19
DA	1-2*	8*	1-3*	8-11*
JO	4-5*	10-12*	12-15*	8-11*
NI	<1*	<2*	1-3*	1-3*

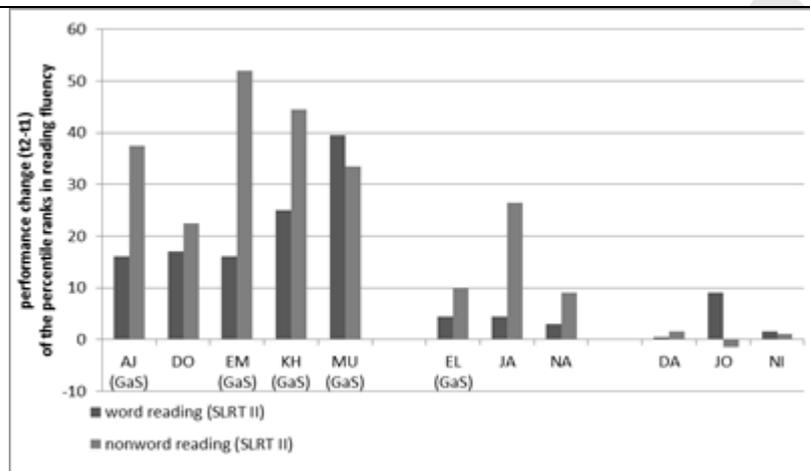

FIGURE 1. Performance gain or deterioration (t2-t1) in the reading fluency test *SLRT II* separated for the involved children. The children are grouped in children “with substantially gains”, “with slight to moderate gains” and “with no gains to deterioration”; within the groups they are in alphabetic order.

Besides reading fluency, also reading comprehension was impaired in all of the children at test time 1. In the reading comprehension test *ELFE*, the mean score was 4.46 (SD = 4.47) percentile ranks.

After the intervention, the reading comprehension improved in most of the children, but only in a moderate way (mean score of percentile ranks at posttest 7.93, SD = 13.05). Only one child, EL, showed substantial gains. The reading comprehension skills of all children, except those of EL, remained below average range after intervention. JA’s, JO’s and NI’s comprehension skills seem to have deteriorated. But regarding the raw scores, all of them managed to respond to some more items at test time 2 compared to test time 1.

The following Table 3 shows the reached percentile ranks in the reading comprehension test *ELFE* at pre- and posttest, whereas Figure 2 gives an overview of individual changes (performance gain or deterioration between the two measurement points) concerning reading comprehension.

TABLE 3. Performance in the reading comprehension test *ELFE* at the pre- and posttest measure. The children are grouped in children “with substantially gains”, “with slight to moderate gains” and “with no gains to deterioration”; within the groups they are in alphabetic order. Performance below average range is marked with *.

The children are grouped in children “with substantially gains”, “with slight to moderate gains” and “with no gains to deterioration”; within the groups they are in alphabetic order.

4.2 Language abilities

As the percentile ranks of the following tests can hardly be interpreted, raw scores of the vocabulary and grammar tests will be presented.

Referring to the results concerning linguistic skills, the majority of the children showed slight to moderate gains after the intervention. But the performance of nearly all children was below the average score before and after intervention.

As for the vocabulary skills, JO is the only one whose expressive and receptive vocabulary is in the average range at both test times. All the other children had expressive and receptive vocabulary-limitations before and after intervention.

Concerning the post-intervention measures, the majority of the children (except KH and NI) showed slight gains in expressive vocabulary, but only JO showed average achievements. Referring to the receptive vocabulary, AJ is the only child whose abilities improved substantially. Slight to moderate gains were shown in DA, EL, EM, JA, JO, KH and MU, whereas NA and NI showed constant results. DO’s performance slightly deteriorated.

The following Table 4 shows the reached raw scores in the vocabulary test *WWT* at pre- and posttest. Figure 3 gives an overview of the individual changes (performance gain or deterioration between the two measurement points) in vocabulary skills.

TABLE 4. Performance in the vocabulary test WWT at the pre- and posttest measure (maximal raw score = 40). The children are grouped in children “with substantially gains”, “with slight to moderate gains” and “with no gains to deterioration”; within the groups they are in alphabetic order. Performance below average range is marked with *.

child	pretest		posttest	
	expressive vocabulary raw scores (WWT)	receptive vocabulary raw scores (WWT)	expressive vocabulary raw scores (WWT)	receptive vocabulary raw scores (WWT)
AJ (GaS)	0*	1*	1*	22*
DA	10*	33*	17*	35*

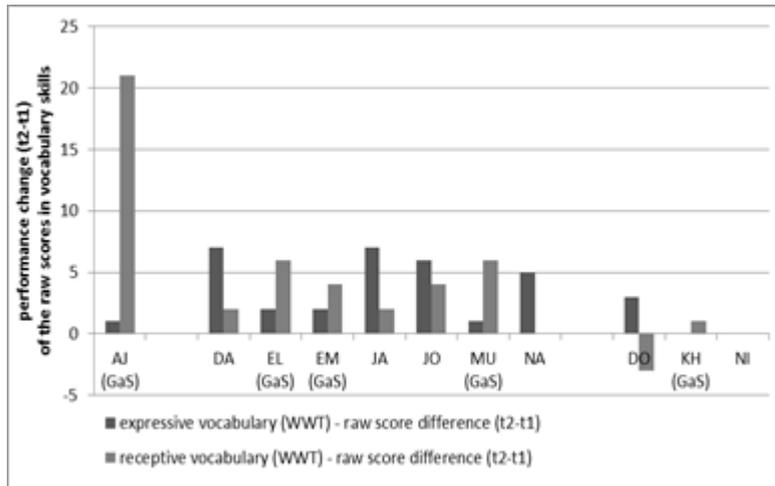

FIGURE 3. Performance gain or deterioration (t2-t1) in the vocabulary test *WWT* separated for the involved children. The children are grouped in children “with substantially gains”, “with slight to moderate gains” and “with no gains to deterioration”; within the groups they are in alphabetic order.

Just as in the vocabulary test, there can be seen a mixed picture concerning the results of the grammar subtest of the *P-ITPA*, too. Grammatical deficits at test time 1 could be found in all children except DA, JO and NI. Out of these three children only JO and NI could reach the average range at test time 2 though.

Three children (DO, EL and JA) showed substantial gains in grammar skills and four other children (AJ, EM, KH, MU) showed slight to moderate gains. NA’s skills remained constant. Another three of the children (DA, JO and NI) achieved smaller raw scores compared to test time 1.

Table 5 shows the reached raw scores of each child in the grammar subtest of the *P-ITPA* at pre- and posttest. Figure 4 gives an overview of the individual changes (performance gain or deterioration between the two measurement points) in grammatical skills.

TABLE 5. Performance in the grammar subtest of the *P-ITPA* at pre- and posttest. The children are grouped in children “with substantially gains”, “with slight to moderate gains” and “with no gains to deterioration”; within the groups they are in alphabetic order. Performance below average range is marked with *.

The children are grouped in children “with substantially gains”, “with slight to moderate gains” and “with no gains to deterioration”; within the groups they are in alphabetic order.

5 Discussion

This article examined the effects of a small group implementation of the intervention program LARS which was designed to improve reading skills in children with German as a first or second language. Eleven second graders, aged 7 to 9 and chosen due to their very poor reading skills, took part in this study.

Before and after the intervention period, reading and linguistic abilities were measured. Each of the nearly 50 intervention hours was divided into a short vocabulary unit and a reading unit. Following the intervention, all of the participants showed learning gains regarding reading fluency and most of them also in reading comprehension. Referring to reading abilities the study indicates that the treatment was effective for all of the participants. An increase could particularly be observed in the decoding abilities.

However, regarding language skills, no homogenous substantial effects were shown. These findings correspond largely with the results of the study, which analysed the intervention that was implemented at the same time in classroom settings (see also Schwab, Seifert & Gasteiger-Klicpera, in preparation). Within this classroom study, a systematically and differentiated language and reading enhancement created a possibility to further develop the literal competencies for children with difficult starting conditions, but not their language abilities.

An interesting result in the present study is that especially children with GaS benefited from the intervention, as they reached higher gains in reading competencies and gained more insight in the German grammar than children with German as a first language. The group of children with GaS reached substantially or at least slight to moderate gains, and all of them benefitted in reading and grammar. This advance in linguistic gains of the children with GaS complies with our findings concerning the class treatment, too (see also Schwab, Seifert & Gasteiger-Klicpera, in preparation). In general, the present finding shows that children with very poor reading performance (especially the ones who learn GaS) can benefit from a small group intervention that takes their initial learning level into account.

There are some limitations imposed to the interpretation of the effects. The first limitation concerns the choice and the size of the sample. The results apply to a very specific sample, thus they are not generalizable for average second grade children (the examined children belonged to classes with an obvious higher amount of children with GaS, since such a sample was selected for this study). Of course, the small size of the sample also restricts the possibility to generalize the effects.

Furthermore, since it was not possible to compare these findings to a control group with comparable poor reading skills receiving another type of reading treatment or getting no treatment at all, it is not possible to claim with certainty that the provided learning environment was more effective than the usually received classroom instruction. However, the recent meta-analysis by Ise, Engel and Schulte-Körne (2012) showed that symptom-specific and systematic reading interventions, such as the one proposed, are effective.

Even though some gains could be shown in the linguistic competencies, none of the children really profited remarkably. At posttest only one child (JO) reached the average range in the vocabulary and grammar test, but his linguistic skills at pretest had already been within average range. The absence of substantial language gains needs to be discussed, especially regarding the intervention's focus on vocabulary. Probably this finding has to be ascribed to the fact that the vocabulary contained special words with partly low frequency that happened not to be relevant in the children's linguistic daily routine. Moreover, the practiced vocabulary was excluded from the assessment. To avoid training effects, none of the words of the *WWT* or of the *P-ITPA* were used in the intervention. There was also no specific grammar work implemented in the intervention. Possibly, the language improvement is restricted to the involved, practiced vocabulary.

Due to the broad approach, the intervention exhibits restrictions. It is not possible to ascertain which specific part of the program (e.g. systematically vocabulary work, improvement of reading fluency, implementation of different strategies to improve reading comprehension) is primarily responsible for the children's progress. The success can be attributed to different intervention-strategies, which were addressed coincidentally. Multiple components of reading were supported to lead to positive effects (see e.g. Guthrie, Wigfield, Barbosa, Perencevich, Tobaada, Davis et al., 2004; Wigfield, Guthrie, Perencevich, Tobaada, Klauda, McCrae et al., 2008). Altogether it is presumed that the program's effectiveness is especially attributable to the differentiated material which had been adapted to the children's initial skills. This enables the children to work individually on their specific level and allows them to use their reading time more efficiently than in the other lessons.

Although the results of this study must be interpreted carefully, the current intervention program seems to constitute an effective reading intervention program, which can be used in single or small group settings, and can also easily be implemented into daily lessons (see also Schwab, Seifert & Gasteiger-Klicpera, in preparation). The recent debate about inclusion highlights the importance of individualization and differentiation within the classroom. For future work, it is therefore recommended to implement such programs in classroom settings in order to develop the literal competencies of all children and enable children with difficult starting conditions to take part in class instruction.

The positive findings of this study are encouraging. Within a follow-up study it could be proven if it is possible to maintain the gains.

Acknowledgements

We like to thank the city-education authority, the city hall and the cultural office of the city Graz which supported the current research project financially. We are also most grateful for the support of Petra Watko, Mike Trauntschnig and Tanja Obendrauf.

4th International Conference on New Horizons in Education

Reducing Language Obstacles to Students' Use of Historical Digital Libraries

Karel Kučera^{*a}, Martin Stluka^b^a*Czech National Corpus Institute, Charles University, náměstí Jana Palacha 2, Praha 1, 11638, Czech Republic*^b*Czech National Corpus Institute, Charles University, náměstí Jana Palacha 2, Praha 1, 11638, Czech Republic*

Abstract

Integration of digital libraries into school education has been explored for almost two decades now, with a primary focus on fully searchable contemporary materials helping to shift the emphasis in science classes from instruction and memorization to inquiry. The advent of digitization of historical texts created a possibility for a similar shift in history (and other) classes. However, to make historical texts fully searchable poses a major problem in languages with a long history of sound changes and spelling reforms. The paper describes solutions to be implemented in a current Czech historical digital library project both for educational and public use.

Keywords: historical digital libraries, information retrieval, historical texts, hyperlemma

1. INTRODUCTION

Seen in a historical perspective, digital libraries (DLs) – extensive collections of digitized texts, maps, images and other content – have been one of natural developments based on availability of wide-ranging, ever-growing quantities of digital data. Unlike the internet as a whole, most DLs are more specialized (primarily including factual materials which are, in a broad sense, scientific, cultural or educational) and aim at providing the users with advanced library-style organization of the data as well as with more sophisticated tools allowing information retrieval (IR) at different levels of generalization.

The use of digital libraries in education has been explored, assessed and experimented with for almost two decades now, with a particular focus on science classes where the modern multimedia materials and fully searchable science-oriented texts have been justifiably expected to help in shifting the emphasis from didactic instruction and memorization to inquiry and investigation. Even at a very early stage, it has been observed that “on-line resources play a key role in the inquiry process: the immediacy of finding relevant, multimedia resources make for a more engaging activity; we are seeing an intensity and involvement of the students that is too often missing in the more traditional didactic-style classrooms” (Soloway, 1996).

With the advent of digitization of historical printed materials, similar prospects arose for a similar shift of emphasis in history classes. Obviously, the accessibility of fully searchable historical texts such as newspapers, magazines, letters or diaries has the potential both to deepen students' general history awareness through inquiry of authentic documents reflecting everyday context of major historical events and to incite their interest in local history, and in other than history classes DLs may well spur students' concern about authentic period background

of and contemporaneous reactions to a variety of historical markers and changes ranging from inventions and discoveries to constitutions, groundbreaking rulings and laws to styles and works of art.

Understandably, the use of historical DLs both in history classes and elsewhere has its limitations, the most general one being the virtual nonexistence of factual texts in most languages just a few centuries back in time. However, even where old textual materials are available the building of a library including historical texts has to deal with a number of rather specific problems if it is intended to be more than just a collection of images of individual pages and aims at providing a state-of-the-art access to information in digitized historical documents through making full-text searching possible. Generally speaking, these are problems of two kinds, namely largely technological problems caused by the age of the medium (e.g. ageing and crumbling of paper, low quality of many old prints, obsolete typefaces etc., all of them hindering optical character recognition, OCR) and linguistic problems caused by the differences between the contemporary language and the language found in the documents, which are problems hindering information retrieval (IR) from the OCRed texts. Conceivably, both types of problems get the more complex the older are the digitized texts, with documents created more than half a millennium ago (before the advent of typography) remaining beyond the limits of contemporary OCR as much as most of perfunctory handwritten documents of today.

The focus of this short paper is on the latter set of problems, i.e. the problems ensuing from language differences between modern and historical texts.¹ In a work-in-progress manner, the paper presents solutions to two types of linguistic IR problems elaborated within the five-year project *Tools for Accessibility of Printed Texts from the 19th Century* coordinated by the National Library in Prague, the Czech Republic,² but in spite of this rather specific material basis, the authors believe that the presented solutions are essentially general in nature and can be applied in other digital libraries including historical documents.

The two types of linguistic IR problems addressed in the paper are

- problems caused by differences between the modern Czech language and 19th-century Czech in the area of vocabulary, spelling, phonology and morphology, and
- problems caused by coexistence of two or more spelling and/or phonological variants of words, in modern and/or historical Czech.

The two types of problems are similar in their effects, namely that the body of 19th-century-specific words and forms are not retrieved if a standard query is performed with existing IR software using modern Czech vocabulary, modern Czech spelling and modern inflected forms of words. However, from the point of view of IR, each of the two types of problems has its specific features, and calls for a specific solution. In the first case, the workable solution seems to be so-called hyperlemmatization, an extended concept of lemmatization; in the latter case, most problems can be removed by implementation of modified search procedures. The following two sections describe the two solutions in more detail.

¹ Problems of this kind remain virtually unaddressed even in such large-scale projects as Google Books, Hathi Trust Digital Library, Open Library, the University of Michigan Collection and others: in all of them special queries are needed to retrieve the singular and plural forms of a noun (e.g. *advancement* and *advancements*) or their historical spellings (*advancement*, *advancemente*, *advancements*, *advancementes*). (Test searches were performed at <http://books.google.cz/books>, <http://www.hathitrust.org>, <http://archive.org/details/texts>, <http://quod.lib.umich.edu/g/genpub?page=simple>.)

² The project is part of the of the *Applied Research and Development of National and Cultural Identity Programme (NAKI)* funded by the Czech Ministry of Education. For details see <http://www.isvav.cz/programmeDetail.do?rowId=DF> or <http://kramerius-info.nkp.cz/projekt-naki>.

2. LEMMATIZATION AND HYPERLEMMATIZATION

Lemmatization has been successfully used for decades in corpora of contemporary languages to group the inflected forms of a word under one lemma (the canonical or citation form, also used as a headword in dictionaries). Thus, for example, through lemmatization the English forms *speak*, *speaks*, *speaking*, *spoke* and *spoken* are all grouped under the lemma *speak* (although the present paper deals with problems connected with IR from historical Czech texts, English examples are used in the following, wherever possible, to make key points clearer). The linking of every word form in the text with its lemma then makes it possible to retrieve all the instances of all the inflected forms of a word by performing just one lemma query.

The newer concepts of hyperlemma and hyperlemmatization appeared about 5 years ago, when lemmatization of diachronic corpora (i.e. corpora designed to cover the entire history of a given language) started to be discussed (see Kučera, 2007). Understandably, the discussion centered on similar problems that have recently come to the foreground in connection with historical DLs (see, above all, *IMPACT 2011 Project Periodic Report*). In highly inflecting languages like Czech, in which some words may have had more than one hundred inflected forms in the past (moreover, with many of the forms existing in several phonological and/or spelling variants), it soon became obvious that information retrieval without some kind of historical lemmatization could hardly accommodate anyone whose queries are not limited to particular spelling or phonological variants of particular inflected forms used in a particular period in history. Also, it became evident, that the traditional strictly morphological concept of the lemma, limited to inflected forms of words, is a solution to only part of the problem.

Unlike the lemma, the hyperlemma (identical with the canonical contemporary form of the word) groups together not just the contemporary and past inflected forms of the word, but also its present and historical spelling and phonological variants. As a result, a single hyperlemma query (e.g. *speak*, to return to the example above) would retrieve not just the forms *speak*, *speaks*, *speaking*, *spoke*, *spoken* but also the historical inflected forms *speaketh*, *speakest* and their spelling variants such as *speeketh*, *speekest*.

Despite the fact that its concept originated in the domain of corpus linguistics, the hyperlemma may become even more important to historical digital libraries than to diachronic corpora. The main reason is that the typical user of a diachronic corpus is a linguist who is searching for linguistic information and can be expected to have a sufficient knowledge of the history of the orthography, sound changes and historical grammar of the language, so that her or his queries are mostly exact linguistic *known-item* queries. In other words, for him or her the hyperlemma may not be an absolute necessity; it is what makes some of the queries (those focused on words as lexical units, not just their particular form or forms) more efficient and less time-consuming.

On the other hand, typical users of a digital library are students and other interested persons searching for all kinds of information, whose motives range from unspecified curiosity to highly technical interests, but mostly are not based on a deeper knowledge of the history of the language. Their queries may be *fact* queries or *known-concept* queries, but typically are not *known-item* queries in the strict sense of the word, because such users most probably are not aware of the fact that the words representing the formal statements of their information needs (e.g. the search strings *emulation* or *speak*) used to be spelled differently (*aemulation*) or had archaic forms like

those quoted above (*speaketh* etc.). Thus, for typical users of historical DLs, the hyperlemma is what makes the searching of historical documents possible, not just more efficient. The statement may seem rather exaggerated in the context of languages like English (that is, highly analytical languages with limited morphology and highly traditional orthography), but is quite realistic in the context of languages like Czech (that is, highly inflecting languages with a long history of sound changes and spelling reforms). To illustrate the point: three deep-cutting spelling reforms were implemented in Czech during the 19th century, resulting in a fundamental change in the use of the high-frequency letters *g, j, w, y, ý*, the replacement of the digrams *au* and *ff* respectively with *ou* and *s*, an introduction of the letter *í* and re-introduction of the letter *v* into the Czech alphabet. Consequently, to search the 19th-century OCRred documents for any one of the thousands of words/forms including the letters affected by the reforms is virtually impossible without either a working knowledge of the reforms or hyperlemmatization. By way of another example: to search the 19th-century texts for words like *souvisící* ‘related’ would require the following six queries (*souvisící, sauvisící, sauwisjčj, sauwisjčj, sauwisýčý, sauwisýčý*), and even so the six queries would retrieve just one of the inflected forms of the word, not the majority of them (*souvisícího, souvisícímu, souvisícím, souvisících, souvisícími; sauvisícího, sauvisícímu...; sauwisjčjho, sauwisjčjmu... etc.*).

An essential prerequisite for hyperlemmatization is the existence of extensive lexica, each representing as complete a period-specific vocabulary as possible, with words expanded into complete paradigms, each form spelled in the period-specific orthography/orthographies and linked with the corresponding modern hyperlemma. So far few such lexica have been compiled, but a series of tests recently run on nine languages under the European IMPACT program has convincingly shown that “the deployment of historical lexica improves the state-of-the-art of both OCR and IR” (see *IMPACT 2011 Project Periodic Report*, 12).

In the Czech case, four historical lexica are being compiled to make hyperlemma queries possible in OCRred 19th-century texts, each lexicon covering one of the four periods (1800-1809, 1810-1843, 1844-1849, 1850-1900), the boundaries of which are primarily based on the introduction of spelling reforms in 1809, 1843 and 1849. However, it is becoming obvious that three more lexica will have to be compiled to cover the transitional periods between each pair of the reforms, i.e. the periods when both the pre-reform and post-reform spellings were used in printed documents.

The four lexica currently encompass more than 300,000 word forms each, but still are far from being representative. Existing experience shows that the compilation of a historical lexicon is a long-term undertaking which includes the following steps:

- compiling of a list of headwords found in historical dictionaries and wordforms found in an extensive sample of texts,
- assigning a modern lemma to each headword on the list,
- distributing the headwords into groups according to the way they inflect,
- using paradigm-specific utilities to expand the headwords into paradigms, with each form of the paradigm spelled in the period spelling and followed with the lemma,
- continual extending of the initial/core lexicon with proofread words and forms attested in newly OCRred texts,
- gradual discarding of the words and forms which remained unattested in OCRred texts and proved to be sources of noise in IR. (The unattested words are often unsuccessful coinages which were included in the period dictionaries obviously to show the potential of Czech, which in the early 19th century was still competing with German and struggling for recognition as a full-fledged cultural language.)

The last two of the above six steps characterize the present stage of development of the lexica for the digital library of 19th-century Czech texts.

3. HANDLING COEXISTING VARIANTS

In addition to the four period lexica under construction and three more lexica planned for the transitional periods between the spelling reforms, two more wordlists are being compiled in order to deal with problems caused by synonymy at its lowest level of phonological and spelling variants. Two problematic cases have been considered so far, namely (1) lemmata existing in two or more phonological and/or spelling variants, all of them more or less equally frequent (“balanced coexistence”), and (2) lemmata existing in two or more phonological and/or spelling variants, one of which is modern and the other archaic or extremely rare (“unbalanced coexistence”). From the point of view of students and other typical users of DLs, each of the two types of variants presents a slightly different problem in IR.

- In the first case of “balanced coexistence”, the typical user is most likely familiar with the variants of the lemma (e.g. the English *ax/axe*, *licence/license*, *omelette/omelet*, *whiskey/whisky disc/disk* etc.), but (s)he may not realize their existence at the moment of formulation of the query. In such a case the query would include just one of them and, consequently, part of the information in the documents would be lost. The same occurs if the user searches for an archaic word (s)he happens to know but has no knowledge of its variants (e.g. English *auncestry/auncestrie* ‘ancestry’ or the Czech *čiv/čiva* ‘nerve’). Therefore, a list of such balanced variants is being compiled to be used by the search program in the future to expand users’ queries. At the moment the general idea is that, by default, any time one of the coexisting balanced variants of the lemma is used in the query, all of its variants will be retrieved and the user will be explicitly notified about the extension of his/her query. However, he or she will be given the option to override the default and search for just one particular variant of the lemma, or to revert to string-matching queries.
- In the case of unbalanced coexistence of two or more variants of a lemma, the typical user will most likely be familiar with the modern/frequent variant only and will have no notion of the archaic or rare variants (e.g. the English *cruelty – crueltie/cruelly/cruelltie*, the Czech *francouzština – franština/frančina/frančtina* ‘the French language’ etc.). In this case, by default, all the variants will only be retrieved if the modern/more frequent variant is used in the query. On the other hand, if the query includes an archaic/rare variant, only this variant will be retrieved by default, the assumption being that the user has a deeper knowledge of the period language and has a reason to search for just that variant. As in the case of balanced variants, (s)he will have the option to override the default or to use a string-matching query instead.

The reasoning behind both of the modifications of the queries (and, in the end, also behind lemmatization) is that the typical user of a digital library is searching for factual information, not for specific forms of words of which he may not have any knowledge.

4. Conclusion

With a view to the presumed needs of students and other typical prospective users of a Czech historical digitized library, workable solutions to two types of problems have been designed and are currently elaborated to reduce language obstacles to information retrieval from OCRed 19th-century Czech prints. Although all of the proposed solutions make use of language-specific historical lexica and word lists, they are based on general principles applicable to analogous obstacles to information retrieval from historical texts digitized and OCRed in other languages. Moreover, the lexica and lists are definitely going to have other uses than those described above. In the foreseeable future, each of the 19th-century Czech lexica currently being compiled will include an extensive, highly representative record of spelling, phonological and grammatical period-specific forms, which can be used to generally enhance the performance of OCR. Also, the lists of synonymous variants will be ready

to be utilized in future historical ontologies to markedly extend the possibilities of known-fact retrieval from historical texts.

4th International Conference on New Horizons in Education

Reflections ecole and style issues of Turkish photography to photography education

Ozan Yavuz*

"Yildiz Technical University, Faculty of Arts and Design 34220, "Istanbul", Turkey

Abstract

Photography adopted very quickly from the second half of the 19th century in Ottoman Empire. However, it was settled as an institutionally in the context of a university or an art ecole from the late of 1970's. Throught the period until today, intermittents and the problematic progress of ecole and style concepts in the sense of both individual and institutional manners affected the photography education. The reasons of these intermittents are other crucial concepts should be examined in economic, political, cultural and artistic senses. Photography education institutions, which are established in this context, created their education programs within the framework of either modern western ecoles or current trends. This study examines the reflections of Turkish photography attitude to photography education, which is still immature or has not a particular ecole or style, for some related institutions.

Keywords: Turkish Photography, Ecole, Education, Institution

1. Introduction

The meeting of Turkey with the photography, or the formation then, the Ottoman Empire, was not very late. The photography entered the Ottoman lands with the photography house opened by Italian Carlo Naya in Beyoğlu in 1945, just after the invention of the photograph had been announced in Paris Science Academy on 18th of August, 1839 (Özandes, 2013). However, this introduction to the photography was only technical. In other words, photography did not come to Ottoman lands as a result of the cultural developments; neither of transferring the scientific and philosophical thought periods into the technique and nor of the interest of social classes (especially bourgeois class) towards art, science and philosophy. The photography was just a technical outcome. Of course any technique or photography technique can be learned, applied and advanced further by technical means in a short period of time. However, when the creation process of the technique is not understood or adopted, there will be an eclectic issue. That is to say, photography is only the formation of the image put into the frame with one button in seconds. This process is fast and easy. Thus, the process can be completed when the shooting technique and surface arrangement (composition) information are learned. Nevertheless, this kind of training and education will ignore the background. So, we can exemplify this background? The perfectionist art insight and usage of the Renaissance, the concept of orientation of using one's mind brought by the Enlightenment, the eligibility for application of the experimental methods, acceleration of scientific researches; maybe the most importantly, spreading the relation of art with cultural life towards all parts of society.

Photography has become an extent of the technology as the material response for the importance given towards art, science and philosophy. Thus, this deep-rooted past of the photography does prevent it from being a simply display generator. The fact that the basics of photography had been made in Europe like this helped it became an independent quality during its historical development process and reach a level that it could create various ecoles within. This, of course, was reflected in the photography education. In order to see if such a process formed itself in Turkey, one needs to see the historical development, efforts for identification and the place within the corporal structures.

2.A Historical Look at Turkish Photography

2.1. *Photography in the Last Years of Ottoman Empire and in the First Years of the Republic*

In Ottoman period, with the great importance given by Abdülhamit II towards the photograph, one can observe that the usage of photography was documental. In this sense, the photographs taken were gathered within a general frame such as the architecture of official and cultural institutions, social life and formal ceremonies. An important visual archive has been obtained by gathering the taken photographs within Yıldız Albümleri. The Ottoman Empire met the photography in a way which we can define as fast and efficient, through the photographers supported by the state and non-Muslim photography houses. However, this meeting occurred as family photographs, studio portraits and the documentation of the current status of the state. In other words, we can observe that there were no steps taken towards the institutionalizing of the photography training and no artistic developments.

The interest of Ottoman Empire in photography continued with the foundation of the Republic. The foundation of the Republic of Turkey was important by means of photography but the point of view resembled with the Ottoman Empire; the documentation of state continuum and foundation, the visual documentation of the Nation State during its settlement and development and the publication of these photographs accelerated the usage of photography. It was inevitable for the public to meet the photography in this period. The photography studios occupied by the minorities during the Ottoman Empire period helped 'local' photography studios get more and more common. Of course this occasion arose from the visual data need of the Republic. The photos that had to be taken for the official documents and new identity cards were the precursor of the fact that the public would meet the photography and then the orientation towards the family photographs (Ervin, 2006).

2.2. *First Signs of Institutionalization Operations*

We observe that the photography concept after the Ottoman period had got common via the Village Institutes (1940) before a corporate identity was formed. The objective here was to follow a ecole and formation with the 'Bauhaus Ecole' insight by making art functional. The education provided to be applied to daily practice were towards the technics of photography rather than creating an artistic identity or manner. Thus, in the light of the thoughts of John Dewey, the education that would be converted to practice with a pragmatist attitude would be more beneficial.

A different approach was followed in Community Centers. The photography education attitude in the Community Centers, founded in 1932, was towards focusing the artistic attitude rather than being a technical applier. In this sense, the following saying of Vedat Nedim Tör is about putting the artistic manner of the photography forward: "*To see our neighborhood better, to seek (the beauty) more and to know the realm better*"

(Tör,1940). In addition, Ankara Community Center stated in its Conditions for 2nd Photography Contest that photographs could be documental; however, the artistic ones would be taken into account more (Tör, 1940). Another aim of this saying served the objective to meet the art with the public (Ak, 2001). This objective tried to spread photography (and other practices) to the public, positively influencing the democratization process. In this process, *“In accordance with the populism principle, artists were sent to Anatolia in groups and they had the opportunity to observe the beauties of the realm between 1939 and 1944. Thus, ‘art’ insight began to form within the people through the painting”* (Ervin, 2006). The development of the photography was in line with this insight. It accompanied a romantic perspective towards Anatolia.

To sum up, the ‘artistic’ and ‘functional’ perspectives of Community Centers and Institutions in the early periods were interrupted by technical deficiencies and the fact that political and civil constitutions were not continuous. Likewise, the fact that Community Centers and Village Institutes were discontinued in 1951 and 1954, respectively, prevented the photography from seasoning as documental, experimental, artistic or functional.

2.3. From “A Look at Anatolia” to “Experimental Movement”

Economic and political straits during 1950s and later resulted with the photographers acting in line with ‘social realism’. The immigration to İstanbul and the life in Anatolia were reflected in the photographs. Photographers like Ara Güler and Fikret Otyam documented the social life in İstanbul and Anatolia. In this phase, these photos that reflected their impact in 1960s unfurled the current social status of the people rather than introducing the country. This process continued during 1970s. Following the changing political regime in 1989s, the change in the perspective towards Anatolia resulted with the photography to move into a different aspect. The sounds of experimental photography that rose helped coming up with more personal works in accordance with the critics towards the fact that social documental photos lacked style. Experimental photography, placed between the social documental and communal documental photography were subjected to critics by means of content. It’s known that these types of critics have been made by each movement or insight towards each other. The discussions there were about which method was better. However, the fact that the *“non-existent ecoles”* in Turkey tried to ignore each other rather than creating a ecole or identity during the development struggle of photography made it hard the way that the identity would be created or led it to disidentification. During the 1980s, the works sprouting under the name of ‘experimental photography’ did not make Turkish Photography a ecole. The material which had been out forward was the repetition of the method or area as personal or a group; not a ecole.

3. What the Polarized Kingdom Brought

The reflection of 1980s to the photography was not related only with the emergence of the experimental photography. A strange type of documental photography was being formed as well. During the romantic area until 1950s, we encountered it as a more orientalist version of the photographers seeking towards Anatolia. This perspective, dragging the Turkish photography insight towards an effort to achieve the ‘beautiful’ and towards a self-orientalist perspective; along with the photographers having this insight, setting and directing the photography trend after 1980 affected the corporate education in the same way mostly having been supported with photography contests. It came up as a type where the modern photography technology was being used to its last extent, having been defined by the classical compositions of the ‘documenting’ feature of the documental photography, the appeal of tour photography and the astonishment of the ‘moment photography’. A type depending on the image hunting, the beauty given by the singular photography of which was sublimed with contests, having no context and easily repeatable formulas and expressing opinion as these formulas are the mere correct thing. The source where this insight, defining itself to this extent, had been Anatolia, while in time, it turned out to be exotic places such as India, Morocco, Far East and South America.

“When the villagers with ox carts and donkeys were replaced with the tractors, The Song of Anatolia ended as well. Tractors were not interesting for the ones living in a city. Comprehensive reviews which had been done 50 years ago in the west were not brought up already. It sufficed only to lurk on the turning point. Have you seen any comments from the great social confusion in our cities? Anyone that grabs a camera heads towards the lower classes. Are there no topics at your houses, neighborhoods, work places? Just as you realize your surroundings or your country loses its appeal after 3-4 trips, you hit the road towards the countries that keep their local colors” (Beyhan, 1992).

The only positive aspect of 1980s can be observed to have been the reflection of economical movement to the photography. The fact that the availability of the technical material increased also increased the quality of the applications in the photography. This process, during which quantitative increase was observed but there was no qualitative end, strengthened the singular photography saying and made it open for personal consumption and getting pleasure.

“In the game of subjects (artist, politician, scientist, employer, etc.) and subjects (society, people, masses etc.) played in Turkey so far, instead of trying to find a way regardless of the cost to solve the object, which it has never tried to analyze and explain completely so far (exceptions don’t break the rule), the subjects gave up on this, got cross with the object, closed upon itself and initiate ways towards personal salvation or lost within the object, having ended its own qualifications (qualifications that have not settled, so to say)” (Çoşturoğlu, 1992).

Primarily the fact that the political and civil constitutions were not consistent, that the art could not be transferred to the society, thus there were no civil settlement other than the government can be counted among the main reasons causing this. Consequently, the consistency, of the scientific, artistic and the cultural changes of the communal and personal constitutions is significant. *“In the societies open to evolution and development, ‘parted life’ is a fact of the transition. If the ‘parted life’ period gets longer in a society closed for development and rationality, it turns into a permanent communal disease. The sight in Turkey advances towards a disease as well” (Çoşturoğlu, 1992).*

It is observed that, the identification of the photography is not only about solving the internal constitutional problems within. Firstly, the photography and its artistic aspect should be internalized and defined by the society and its users. We need to take the photography, thus art, beyond being merely a usage; to solve abstract and tangible problems; to be able to observe and reflect the localness and while doing these, we need to do it without kitsch and with going beyond the analogy.

4. Turkish Photography Institutionalizing (is it?)

The story of the photography reaching the corporate level in university scale in Turkey is very interesting and tragicomic:

“In 1978, when the Fine Arts Academy of the period summoned us and launched this institution, its reason was not the need for higher education in photography branch. A Japanese photographer named Namikawa was going to prepare a book about Topkapı Palace and he needed to abide by some rules in order to take photographs comfortably. “Let’s open a photography school for you and get aid from the Japanese corporations,” he suggested to the Tokyo Embassy of the time. This wish just ignited the fire. Later, Namikawa appeared only two times and disappeared, minding his own business. After some period of time, the expected Japanese aid was proven to be a dream but it was decided to go along with the foundation having made so much preliminary works. So, Photography Institution was founded. When the first one was founded, it led the way for the similar ones in other universities” (Kalfagil, 2013).

Naturally, such a start unearthed some problems. Of course, out of these problems...;

“...the photography education takes its share. The start of the photography education was not due to the accumulated needs of the market. The market needs interlude workers. This need could be fulfilled with

secondary level education; a photography business high-school. The functional photography production had experience to some extent within the course representing the Turkish photography abroad and amateur and professional organizations reached a level of activity” (Kalfagil, 2013).

The emerging educational model was a co-ed, in other words, a syllabus oriented to satisfy the needs of both the art and the market had been prepared. Of course, this occasion can be evaluated under another heading, for the sake of the institutionalizing of the photography. The problem was that the conformity of the photography education model with the local conditions was not questioned and a lesson plan oriented to the needed area was not prepared. Apart from these, the fact that the photography activities and trends were inconsistent, shallow and that they ignored each other from time to time affected the ground and future of these corporate constitutions.

As Sabit Kalfagil (Kalfagil, 2013) states, an education model which both would satisfy the needs of the market and would provide artistic education has been emphasized within up to now. For instance:

“The point of origin of the Photography Department is oriented to seek the opportunities to conduct an education in communication with the photography sector in our country. Consequently, a great care has been shown towards the creation of this bond since the foundation phase. It has been aimed that creative photography artists, equipped with technical, aesthetical and notional information, would be schooled” (Marmara Üniversitesi, 2013).

Generally this objective that has been set is an interim or decisive and a medium objective in order to ecote workers capable of producing art. Consequently, it is not surprising that a non-existing photography ecote or attitude puts such an education plan forward. But how will this insight be reflected to the photography education? The student generally:

“...continues their education in the remaining two or three years by choosing one of the working areas. These divisions bring forward not only divisions of workshops, but also administrative and hierarchic divisions based on one instructor, being conducted with ‘master-apprentice’ relationship” (Tunç, 2007).

Or, necessarily, it appears before us with an average profile, taking all the basic and specialty areas oriented to photography practice one by one. In this process, which mostly happens in an analogy relationship, the student is eager to get a diploma, rather than putting his/her artistic ability forward. What needs to be is not a repetition; it is a photography insight developing by building upon.

In some institutions where different models are tested with a contemporary approach, the education model is reshaped with the new model between disciplines:

“The model aims to save the photography and video from a position where only their concepts speak and to reproduce them in experimental ways in terms of their borders within the world order of 21st century, which changes quickly by means of education, economy, social and political aspects” (Yıldız Teknik Üniversitesi, 2013).

Contemporary practices and trends can be followed more easily with such approach. Furthermore, within the scope of the applied education plan, apart from the basic courses, the student can choose the specialty courses from the desired area. The department, started the education in the end of 90s, has been freer by using different disciplines within the photography application area due to its different structure. Consequently, it becomes difficult to observe the effects of the insight of mainstream photography, which I defined not as a ecote but a strange kind of the experimental photography.

However, over the past five years, it’s possible to observe that mainstream photography insight has been generally being left and the reflection of the contemporary photography practice to the education has increased. Of course, it’s desired that photography education should follow contemporary dynamics in this way. However, again, the same question will come before us: “Which photography attitude and as whom?”

In the light of all these, the thing I wanted to exemplify or explain is related to a description or qualification. Ecote can be defined as the trends generally out of the mainstream; having a sorter quality by means of science, art and intellect and also a special method or attitude; mostly eligible to be initiative. Being a ecote is related to

either putting a new attitude forward or representing the available one in an appropriate way, conforming to its origins.

In this sense, what do we mean by saying “There are no ecoles in Turkish Photography”? Actually we can exemplify this situation with various photography ecoles:

F/64: The trend led by Edward Weston ve Ansel Adams denies all the interventions in the photography, America, 1932,

Farm Security Administration (FSA): The social documental photography trend started in America during the Great Depression in 1929,

Dusseldorf Photography Ecole: It is mentioned with the photography typologies made by Bernd and Hilla Becher towards the industrial buildings in 1970s, foundation of which was laid by the New Objectivity. Another feature of this ecole is that it raised world famous photographers with specific attitudes such as Andreas Gursky, Thomas Ruff, and Candida Höfer. The marks the photography philosophies of Bechers can be observed within the productions. However, none of them are similar to each other, nor a reproduction of Bechers.

So, who will we think of when someone mentions Turkish Photography? I’m asking this both as an approach and aesthetical values: Is what we will encounter a reflection of the cultural features or the reflection of an attitude emerging after a cultural, scientific or political movement of the country to art? Are they sparks of the individual activities? Are they the adaptations of the existing towards the local? Is it repeating Ara Güler, burning with the nostalgia disease? Is it the blindness caused by the failure to notice the contemporary? And how will the reflections of these questions to the education, which have not been solved yet, be solved?

5. Conclusion

It appears that the photography works in Turkey caused the same tentativeness to continue within the education insight due to social and political instability and parties’ failure to share, produce and define the ‘art of photography’.

The important thing is not using an experimental a documental method or discussing and fighting over a method or a technique brought into non-defined or immature attitude, ecole and movement about which one is better. The problem is not the competency to produce photography in a contemporary way. The problem is to have the conscious of what to produce and how to produce it; identifying it. Thus, the source of the problem is a matter of “defining” and “implementing” this definition.

4th International Conference on New Horizons in Education

Reformulating Local Ceramic Stoneware as Replacement Material for Heat Sink Design

Samsiah Rahman^{*a}, Rusmadiyah Anwar^b, Oskar Hasdinor Hassan^c^{a,b,c}Universiti Teknologi MARA, Faculty of Art & Design, Department of Industrial Ceramics, 40450, Shah Alam, Malaysia

Abstract

Heat sink was a device that enhances heat dissipation from a hot surface, usually the case of a heat generating component, to a cooler ambient, usually air. Currently, heat sinks were made of aluminium alloy, brass, cooper and steel. At a moment, the heat sink lamp quiet high producing the thermal expansion inside and poor air flow across the heat sink lamp. In this work, the investigation on typical design of current heat sink lamp and its ergonomic will be conducted. The objectives of this research is to fundamentally determined the applicable of stoneware body composition as the most suitable for heat sink lamp compared to the present products in the market thus enhance its quality production and commercial values. The stoneware body formulation then modified into five different batches. It investigated by comparing the 100% of stoneware with formulated stoneware versus alumina by a ratio of 90/10, 70/30, 50/50 and 30/70, respectively. By investigating the stoneware in designed test bar mould, it shows an increasing result of body density and strength. However, the water absorption decreased due to the increasing temperature from 1250°C to 1300°C. As conclusion, the acceptable stoneware body formula to be replacing the conventional heat sink material is batch 3 which is 70/30. The advantages of using this formula are because of this composition less shrinkage, less porosity and more strength.

Keywords: Stoneware, Heatsink, Design, Firing.

1. Introduction

All semiconductor devices have some electrical resistance. This means that when power is switch on, the power transistors will dissipate power and work as heat energy. The heat must be removed from the device which is usually using the base junction for a bipolar transistor as fast as enough rates to prevent excessive temperature rise. If not, the devices will be damaged harm by the heat. The most common way to solve this is by using a heat sink. Heat sink is a passive component that cools a device by dissipating into surrounding air. Heat sink are using cod electronic component such as high power semiconductor device. In the present study, M.A. Ismail, M.Z. Abdullah, M.A. Mujeebu (2008) four different types of heat sink have been used i.e. Pentiums III and IV, AMD Athlon and Duron heat sinks; in order to analyze their performance. To be an efficient affect, a heat sink must be design perfectly which is the surface area of heat sink as big as possible to allow the air flow from the fan to travel easily through the heat sink and provide the best possible amount of air flow cross the het sink. The part of heat sink that is in contact the devices must be very good thermal transfer. But even though it is flat, there will

* Corresponding author.

Email address:

still be small air gaps in the contacts area and heat sink. Practical heat sinks for electronic devices must have a temperature higher than surroundings to transfer heat by convection, radiation and conduction. Ceramic materials present interesting properties such as a good hardness, high wear and corrosion and temperature resistance which makes them candidates for thermomechanical applications. However, these advantages are counteracted by the brittleness of the ceramics. Consequently, the presence of small defects such as pores can lead to a dramatic decrease in strength value. Therefore, according to M. Asmani, C. Kermel, A. Leriche, M. Ourak (2001) the use of ceramics as structural parts is conditioned by the development of non-destructive evaluation techniques such as ultrasonic methods which allow the porosity level.

2. Overview

In this work, the investigation on typical design of current heat sink lamp and its ergonomic will be conducted. At a moment, the heat sink lamp quiet high producing the thermal expansion inside and poor air flow across the heat sink lamp. An observation on the present heat sink lamp is to understanding what and why is the problem statement occurred. Once it is achievable, the heat sink lamp will be re-construct a new design by using advance stoneware composition as an important fundamental to replace inadequacy of the existing products. There will be some modification on the stoneware body formulation to further enhance its quality and commercial values. The objectives of this research is to fundamentally determined the applicable of stoneware body composition as the most suitable for heat sink lamp compared to the present products in the market thus enhance its quality production and commercial values. At the end of the research, it expected that with advance stoneware body as a main template for heat sink lamp will be produced and patented. The finding may also provide the better thermal resistance and durability of the heat sink lamp.

3. Methods

3.1. Experimental Procedures

This work presents a study on comparison of local ceramic body based on different firing profile. A physical test was used to determine the shrinkage, density, pores and strength between the different firing temperatures with five different ratio composition. Ceramic materials present interesting properties such as a good hardness, high wear and corrosion and temperature resistance which makes them candidates for thermo mechanical applications. This research will start with the body formula composition using difference type of advance Stoneware body. This body composition will make into different ratio each of them. According to Jorge Martín-Márquez, Jesús Ma. Rincón, Maximina Romero (2010) a porcelain stoneware composition was prepared by mixing 50% kaolinitic clay, 40% feldspar and 10% quartz. Stoneware is clay that when fired to maturity becomes a sturdy, chip resistant material suitable for using in cooking, baking, storing liquids, as serving dishes and to use in the garden. These pieces are meant to be used due to their durability. Slip casting technique were used in this study whereas new composition with different ratio of material casted using mould in solid rectangular shape with 15cm x 2cm x 1cm. All casted test bars dried into room temperature in two days time afterward transfer into dryer with temperature 110°C within 12 hours and it's become totally dry. After dried, every batch fired in two different temperatures which is 1250°C and 1300°C with the same firing profile. These methods have been used in reference citations as R.Anwar, H.R.Kamarun, V.V.Vermol and O.H.Hassan (2011)

Table 2: Stoneware / Alumina Composition

Batch	Stoneware (a)	Alumina (b)
100ST	100	0
90/10	90	10
70/30	70	30
50/50	50	50
30/70	30	70

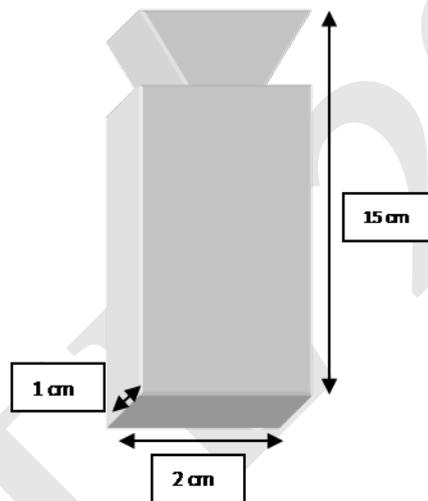

Figure 1 : Test Bar

Test bar

$$\begin{aligned}
 \text{Volume} &= H \times L \times W \\
 &= 15\text{cm} \times 2\text{cm} \times 1\text{cm} \\
 &= 30\text{ cm}^3
 \end{aligned}$$

$$\text{density} = (\text{weight}) / \text{volume}$$

$$2.0 = (\text{weight}) / (30\text{ cm}^3)$$

$$= 30 \text{ cm}^3 (2.0) \text{ g / cm}^3$$

$$= 60 \text{ g}$$

Based on test bar calculations that have been made, there is 2595.78g stoneware needed in total. Next, each material consists in stoneware need to be calculated.

Ball clay	$\frac{30\%}{100}$	x	2595.78g	= 778.74 g
Kaolin	$\frac{20\%}{100}$	x	2595.78g	= 519.16 g
Feldspar	$\frac{40\%}{100}$	x	2595.78g	= 1038.31 g
Quartz	$\frac{10\%}{100}$	x	2595.78g	= 259.58g

Alumina

$$= T1 + T2 + T3 + T4 + T5$$

$$= 0\text{g} + 8.07 + 25.92 + 46.8 + 71.19$$

$$= 151.98\text{g} \times 9 \text{ pieces}$$

$$= 1367.82 \text{ g}$$

3.2. Experimental Devices

The fired test bar then been measure by using the physical reflection method which is caliper (pulse echo method) that needs the use of to measure size shrinkage while scale to measure weight shrinkage. METTLE TOLEDO AG204 scales were used for water density test which accurate with four decimal result. Water absorptions and the apparent densities of the test bar measurement required the test bar being immersed into the water, as cited R.Anwar, H.R .Kamarun, V.V.Vermol and O.H. Hassan (2011) a tank with 100°C water being used.

4. Result and discussion

4.1. Size Shrinkage

As per shown in figure 2a, the complete casted test bar using slip casting process into solid rectangular without any defect. Each test bar has been measure the length from the time when it greenware, dried and after firing. Figure 2b shows that this experiment is measured by caliper to get the accurate measurement in length, depth and thick on each test bar. Table 2 shows the changes of test bar due to the length undertake some process

within two different firing temperatures which is 1250°C and 1300°C. At this stage, it is observed that high temperature can increase the shrinkage percentage due to the material. However, it shows that alumina sample consists with high alumina contain decrease the percentage of shrinkage. It is for the reason that, this research needs to control the size during production to produce the accurate size for heat sink.

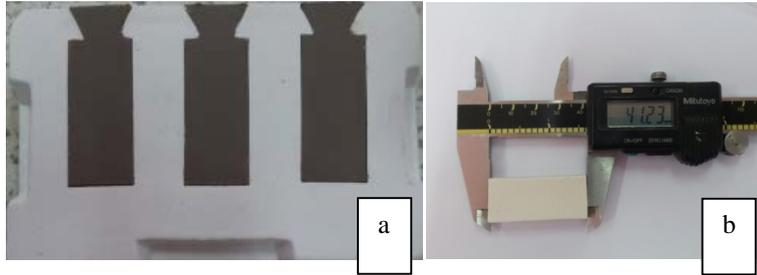

Figure 2a : Casted test bar

Figure 2b : Measuring length

Table 3 : Size shrinkage for 5 different batches.

ST Al ₂ O ₃	1250°C				1300°C			
	Wet	Dry	Fired	Reduce	Wet	Dry	Fired	Reduce
100ST	50.00	47.55	41.96	8.04	-	-	-	-
90/10	50.00	47.95	41.81	8.19	50.00	48.15	42.59	7.41
70/30	50.00	47.56	41.00	9.00	50.00	48.09	41.44	8.56
50/50	50.00	47.39	42.58	7.42	50.00	48.05	41.50	8.50
30/70	50.00	48.18	45.77	4.23	50.00	47.56	43.44	6.56

4.2. Weight Shrinkage

Table 3 shows the change of weight for each batch before and after firing. The more alumina content inside composition, it will reduce weight slightly.

Table 4 : Comparison for weight shrinkage

1250°C					1300°C			
Weight (g)					Weight (g)			
ST / Al ₂ O ₃	Wet	Dry	Fired	Reduce	Wet	Dry	Fired	Reduce
100ST	22.73	17.86	16.63	6.10	-	-	-	-
90/10	23.45	18.63	17.46	5.99	24.04	19.13	17.87	6.17
70/30	24.27	19.07	18.12	6.15	24.26	19.36	18.32	5.94
50/50	25.39	19.71	19.02	6.37	26.06	20.46	19.64	6.42
30/70	27.75	21.96	21.47	6.28	27.12	21.63	21.07	6.05

4.3. Water absorption

The water absorption (WA) of each specimen after involve the test specimens to constant mass (D), soak 4 hours in boil water 110°C and another 2 hours in tap water. After impregnation, the mass (M) at saturation was determined. Table 4 shows that comparison of water absorption between two different temperatures which batch 30/70 is the highest ratio for water absorption. These mean that this ratio is more porous than others. It also can be seen that the more alumina composition, the more porous it is. Compare with stoneware composition, it'll become dense after firing in high temperature. V.Melnick, S.A. Pianaro, S.Cava, S.M. Tebcherani (2010)

$$WA = \frac{M - D}{D} \times 100\%$$

Table 5 : Comparison of water absorption

1250°C				1300°C			
Weight (G)				Length (Mm)			
ST / Al ₂ O ₃	Fired	Soak	%	Fired	Soak	%	
100ST	8.17	8.2	0.003841	-	-	-	
90/10	8.26	8.29	1	7.50	7.54	1	
70/30	7.77	8.51	0.086522	6.60	6.615	0.002268	
50/50	10.13	10.84	0.065498	7.91	8.01	0.013109	
30/70	10.09	11.45	0.118777	8.40	9.09	0.076458	

4.4. Water density

To determine water density, fired specimens (W_{dry}) was examined by weighed the specimen. Fired specimens were immersed into water and record the saturated weight (W_s) and follow by the weight after immersed (W_{ss}).

$$\rho_{app} = \frac{W_{dry}}{W_{ss} - W_s} \times 1.00 \text{g/cm}^3$$

ρ_{bulk} was measure by weight after firing (M) and divided by volume after fired.

$$\rho_{bulk} = \frac{M}{V}$$

Once ρ_{app} and ρ_{bulk} is calculated, ratio of water density can be determined by calculate by following formula.

$$\rho_{ratio} = \frac{\rho_{bulk}}{\rho_{app}} \times 100$$

Figure 3 : Water Density test equipment

Table 6 : Comparison of water density

	1250°C						1300°C					
	Weight (g)		ρ_{app}	ρ_{bulk}	ρ_{ratio}	Dry	Weight (g)		ρ_{app}	ρ_{bulk}	ρ_{ratio}	
	(WS)	(WSS)					(WS)	(WSS)				
ST / Al ₂ O ₃ :Dry	Wf saturated	Wf Immersed	(g/cm ³)	(g/cm ³)	%		Wf saturated	Wf Immersed	(g/cm ³)	(g/cm ³)	%	
100ST	8.17	4.79	8.29	2.34	2.78	119.17	-	-	-	-	-	
90/10	8.26	4.99	8.35	2.46	2.84	115.34	9.13	5.41	9.24	2.39	1.96	82.01
70/30	7.77	4.98	7.87	2.69	3.12	116.05	11.67	7.50	11.72	2.76	1.57	56.78
50/50	10.14	6.62	10.82	2.41	2.50	103.80	9.70	6.33	9.80	2.79	2.02	72.45
30/70	10.09	6.87	11.39	2.24	2.75	122.99	12.47	8.52	13.45	2.53	1.69	66.90

4.5. MOR (Modulus of Rupture)

Table 6 gives the result of data evaluation for MOR test on different ratio composition and different types of body. Figure 2 prove that batch 70/30 is the strongest when fired in 1300°C compare with others, yet, in 1250°C temperature, it is also in average, not too high and not too fragile. For easy handling purpose while production, 100% stoneware are the best. As been shown, the more alumina contains in composition, it might be use after firing due to the hardness, and however it was very fragile at greenware stages so it is not suitable for production. So, in average from greenware to high temperature, batch 70/30 are suitable for production due to its character while greenware or after firing.

Table 7 : MOR result

MAX FORCE

ST Al2O3	Greenware	1250	1300
100ST	70.6514	2207.26	-
90/10	72.6700	2554.73	2468.12
70/30	49.8732	2624.19	4308.49
50/50	40.7577	2777.71	3231.89
30/70	44.4651	2760.83	3580.11

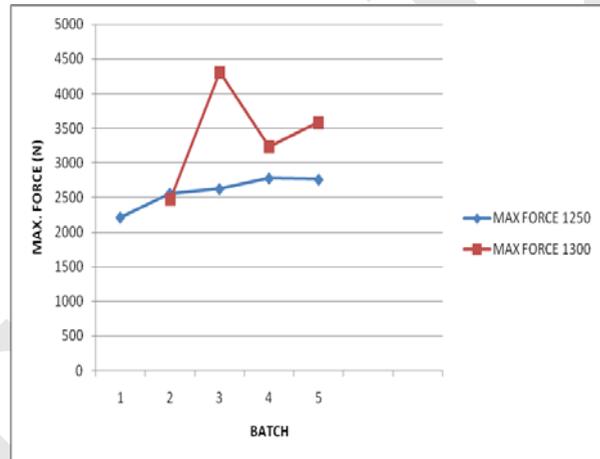

Figure 4 Comparison MOR for 1250°C and 1300°C

Figure 5 MOR test

5. Conclusion

Alumina mixture with stoneware body can create a new composition that suitable use for strengthen. However, on the other hand, if more alumina content in composition, it will become more porous. Batch 70/30 are the suitable mixture for heat sink design as the strength, shrinkage and it is easy for handling in production. As the result, alumina and stoneware depending on each others and only with the right combination can make it become suitable to use. However, batch 50/50 and 30/70 are good enough for strength and density nevertheless it was very difficult while casting process which is easily set, so it always need to stir before casting process, beside, it was very fragile while greenware stage and after casting processed, we have acquired result for the mixture which is there are many air trap as shown in figure 7.

Figure 6 Air trap in Test bar

Relationship between mathematical ability and achievement in mathematics among female secondary school students in Bayelsa State Nigeria

Odual Nabel Nizoloman *

*Department Of Teacher Education Faculty Of Education Niger Delta University Wilberforce Island,
Bayelsa State, Nigeria.*

Abstract

This study investigated the relationship between female senior secondary school students' mathematical ability and achievement level in mathematics in five (5) out of eight (8) local government areas in Bayelsa State Nigeria. This study adopted multi-stage sampling technique. Data were collected from a sample of 121 female students from rural and 141 female senior secondary school students from urban schools which were randomly selected using the simple random sampling method both at the Local Government, and at the school level. Two research questions and instruments were raised for the study. The instruments were Student Mathematical Ability Test (SMAT) with $r = 0.68$ and Mathematical Achievement Test (MAT) with $r = 0.68$ was established for the student Mathematics Achievement Test. Simple linear correlation was used to analysed the data collected at 0.05 alpha. Results showed that there was a positive significant relationship between mathematical ability and achievement in mathematics. Using multiple regression analysis showed that mathematical ability has a significant effect on achievement in mathematics with $B = 0.386$ and $P < 0.05$. Based on these findings, it was recommended that government should provide schools with facilities that will develop and sustain students' mathematical ability as it is a good predictor of students' achievement in mathematics.

Introduction

The vital role which mathematics plays in education is derived from the cultural, utilitarian and interdisciplinary values which the subject seeks to inculcate in the learner. Mathematics education is to a nation what protein is to a young human organism. It is a vital tool for the understanding and application of science and technology. The discipline plays the vital role of a precursor to the much needed technological and national development of Nigeria. Hassan (2002) opined that mathematics as a subject is now universally recognized and accepted as indispensable to self-reliance and sustainable development of any nation because of the perceived functional utility. Umuoyang (1998) warned that any nation seeking to develop a strong level of science and technology must pay attention to the teaching and learning of mathematics. He puts it as “*any nation that seriously desires technology must not relegate the teaching and learning as well as research into mathematics to the background*”.

In support of the above assertion, Eguawon (2002) is of the opinion that mathematics is a model for thinking, developing scientific situations, drawing conclusions as well as for solving problems. Mathematics trains the mind on attention and concentration which are bound to be useful for the student throughout life. He went further to stress that mathematics also promotes the habit of accuracy, logical, systematic and orderly arrangements. Because of the importance attached to the technological development, the Nigerian government has not only made mathematics a compulsory subject in the curriculum of the primary and secondary school levels of her educational system (Federal Republic of Nigeria, 2004) but also as a prerequisite to the study of science courses in her colleges, polytechnics and universities (JAMB Brochure 1992 – 2007).

Despite the relevance and usefulness of mathematics as a key in realizing any national development and aspiration, over the years, there has been a repeat of low level of achievement or poor performance and failure of students in mathematics at both junior and senior secondary school levels in both rural and urban schools.

Poor achievement in mathematics in Nigerian secondary schools has assumed an alarming proportion and caused a lot of concern for many years. The concern for this poor performance is not only limited to mathematics educators but also parents and other stakeholders. However, the reason for the poor performance of mathematics from year to year has been ascribed to inadequacies in one or all of these areas namely, the nature of the subject, the learners factor and the teachers factors. Korau (2006) opines several variables ranging from the learners themselves, teachers, textbooks, curricular and school environment to have been responsible for students' poor achievement in mathematics. The above argument informed Hornby (1985) to define achievement as the act of achieving or something done successfully especially with efforts or skills. According to research, achievement is the end product of learning experience, what students have gained as a result of what they have learnt.

Mathematics achievement deals primarily with the performance of students in their either teacher-made test or standardized achievement test administered by examining bodies. Looking at the academic achievement of students in mathematics across the country, the poor achievement becomes more striking. One wonders what then could be responsible for this poor performance despite its importance and recognition given by the society and various efforts made by the Federal Government and the Mathematical Association of Nigeria (MAN).

Various factors have been adduced for the poor performance of students in mathematics. Such factors as the interest of students in mathematics which according to Aremu (1998) have been related to the volume of work completed; anxiety (Odunuga, 2005); motivation (Broussard and Garrison, 2004, Tella, 2007); reasoning and numerical ability (Adeleke, 2007); problem solving skill (Onabanjo, 2007); mathematics phobia (Bature, 2006) and instructional strategy (Onabanjo, 2007).

The wide spread low performance of students in secondary school mathematics can also be ascribed largely to how instructions on mathematics is presented to the students. According to Ale (2001) the paucity or scantiness of relevant mathematics textbooks stands a basic factor which affects the teaching and learning of mathematics in Nigerian secondary schools. In the Nigerian context, poor achievement in mathematics in secondary schools has assumed alarming proportions and caused a lot of concern for many years. This poor performance is as a result of many factors which includes among others, self-concept, attitude, and mathematical ability.

Gender factor is very strong in learning and thus determines the interest and achievement and consequent career choice. It is interesting to note that while Jahun, and Momoh (2001) established that gender is significant in school mathematics achievement, other studies such as that of Aiyedum (2000) found no significant difference between males and females in school mathematics achievement.

Whereas Meyer and Koehler, (1990) cited in Badmus (2009); is of the argument that males are better at mathematics than females because of genetic reasons, some because of societal influence and some said it is due to mathematical anxiety level. Also in agreement are Onabanjo (2000); Ojo (2004) who independently found out that boys perform significantly better than girls in senior secondary school mathematics. This difference is often overstated and its cause is often highly debated. For Benbow (1990) lower performance trends of females in mathematics have been observed to influence the lower participation of females in science and mathematics related profession. Still on gender difference in achievement in mathematics some other researchers puts male and female discrepancy in mathematics achievement in favours of males performing better than their female counterparts to be as a result of the female belief towards mathematics.

Despite the importance of the girl-child education, there are still a number of cultural, social and economic barriers to girl-child education in Nigeria, that the cultural inhabitation is closely tied to religious affiliation and cultural practices. Nigerians are yet to accord the girl-child education the same level of importance as that of the boy-child.

1.1 Statement of problem

Observations and reports from examining bodies revealed that a high percentage of secondary school students failed mathematics examinations and the failure often generated much concern especially, to parents, teachers, students and other stakeholders in education business. In a situation where the student will be blamed for poor performance, emphasis is only placed on the students' cognitive or intellectual ability. Little or no attention is given to the fact that the student's mathematical ability can affect their achievement in mathematics. Based on the above assertion, this study intends to find out the relationship between mathematical ability and achievement in mathematics of female secondary school students.

1.2 Research questions

Based on the above problem, this study intends to provide answers to the following questions:

- * What is the relationship between the mathematical ability and achievement in mathematics of female senior secondary school students?
- * What is the relative effect of mathematical ability on achievement in mathematics of female senior secondary school students?

1.3 Significance of the study

This study is important to all stake-holders in education as it provides a better understanding on the relationship between students' variables in several ways. The results of the study will provide an empirical basis for development and improvement of students achievements in mathematics among which are:

- * The information obtained will unveil the effect of mathematical ability on the achievement in Mathematics of female secondary school students.
- * The results of this study will help provide a basis for curriculum planners to review and make necessary modifications or improvement in instructional methods and materials at the senior secondary school level.

2. Literature review

2.1 Gender and achievement

For full realization of this laudable objective of Mathematics education, subject mastery and demonstrated achievement should be evenly distributed across gender. Poverty, economic constraints, early marriage and teenage pregnancy, inadequate school infrastructure and cultural and religious misinterpretation are some of the main barriers preventing girls in Nigeria from going to school (UNICEF, 2007)

Alao, and Adeleke (2000) investigations showed that girls exhibit more fear for mathematics than boys in mathematics activities. Manger and Eikeland (2006) who worked on the effect of mathematics self-concept on girls' and boys' mathematical achievement, establish several results concerning gender and achievement. First, they found out that there was no significant effect of gender on overall mathematical achievement. Second, although the gender difference in achievement favoring boys increased with increasing task difficulty, no significant effects of gender were found in sub-samples of difficult tasks.

2.2 Mathematical ability and achievement

Mathematical ability is the capacity to use or manipulate numbers effectively in clerical administrative, scientific and other areas of application of numbers. It is the ability to understand and work with numbers with ideas related to numbers. Tremblay, Garner, and Heipel (2000) studying the impact of the sample variables, supported the hypothesis that mathematical ability contribute to the prediction of achievement in statistics as suggested by Harlow, Burkholder, and Morrow (2002). Similarly, Oyekanmi (2008) in his work on mathematical ability and gender as correlates of students' achievement found out that there is no significant interaction effect of gender and mathematical ability on students' achievement in physical geography. This implies that gender and numerical ability do not jointly differentiate students' achievement in practical and physical geography achievement test.

3. Research Methods

3.1 Research type

This study is a non-experimental survey. This is so because the variables studied are already there in the students and the researcher will not in any way attempt to manipulate the variables.

3.2 Variables in this study

The independent variable is Mathematical ability.

The dependent variable is Achievement in Mathematics

3.3 Target population

The focus and population of this study is made up of female students of Senior Secondary School year two in Bayelsa State both from rural and urban schools.

3.4 Sample

Thirty (30) out of the ninety eight (98) senior secondary schools in Bayelsa State were randomly selected. Ten (10) female students were randomly drawn from each of the thirty (30) selected schools to give a target population of three hundred (300) female students.

3.5 Sampling technique

This study adopted multi-stage sampling technique. Random sampling techniques were employed at the Local Government Area and at the school level.

3.6 Sampling at Local Government Level

As at the time of this study, Bayelsa state is made up of eight Local Government Areas. They are Brass, Ekeremo, Kolokuma/Opukuma, Nembe, Ogbia, Sagbama, Southern-Ijaw and Yenagoa Local Government Areas. Five out of the eight (8) Local Government Areas of Bayelsa State were randomly selected for this study given about 63% coverage of the entire Bayelsa State Senior Secondary Schools.

3.7 Sampling techniques at school level

A total of 30 senior secondary schools were randomly selected. This figure constitutes about 30% of the secondary schools in the sampled Local Government Areas. The sampled schools were made up of 60% urban schools and 40% rural schools.

4. Data collection

4.1 Instrumentation

This study was designed to examine the relationship between students' mathematical ability and achievement in mathematics. The two instruments for this study were partly developed and partly adopted by the researcher. These are:

- * Mathematical Achievement Test (**MAT**).
- * Student Mathematical Ability Test (**SMAT**)

4.2 Mathematics Achievement Test (MAT)

To measure the students' mathematics achievement, an Mathematics Achievement Test (MAT) developed by the researcher using a table of specification generated 30 items from a pool of already standardized test items was used. This is a multiple-choice objective test made up of four options A, B, C and D. The instrument was validated by experts for face and content validity after consulting a conventional Public Senior Secondary School Mathematics teacher. Each item has one correct option (the key) and three distracters. The correct option will attract 1 mark.

4.3 Students' Mathematical Ability Test (SMAT)

Mathematical Ability Test consists of twenty (20) items was used in this study to assess students' mathematical ability. The students were allowed twenty minutes to respond to the items. A student's correct response to an item was scored 1, while a students' wrong response was scored 0. There was no penalty for guessing. The reliability coefficient of 0.72 for the instrument was established by the researcher using the Kuder-Richardson reliability coefficient formula (RK20). The test is curriculum referenced. The SMAT was adopted from Barret & Williams (1997).

4.4 Validity of the instruments

For the purpose of this study, both the face and content validity of the instruments were ensured. The content validity of the instrument was enhanced by suggestions from research experts in questionnaire construction at the Institute of Education, University of Ibadan. Based on the suggestions and comments of these experts and colleagues, the necessary corrections were made. The data collected showed that the students did not have problems responding to the items in the questionnaire.

4.5 Reliability of the instruments

The reliability of the students' responses to the instruments was established. The split half reliability coefficient of the thirty test items was determined by using Kuder Richardson Formula K21 which gave a reliability estimate of 0.68. This establishes the internal constituency of the student Mathematics Achievement Test.

4.6 Data collection procedure

Well structured, closed and scaled questions determined from pilot study were administered on respondents through SMAT and MAT. The administration and collection of all the necessary information was done during normal class periods personally by the researcher and with the help of research assistants. The necessary data for this study were obtained from students of the selected schools in the selected local government areas. The researcher and the assistants directly used the instrument to collect the required data. In each of the selected schools visited, permission to administer the instrument to their students was obtained from the principal of the concerned school. 300 copies of the instrument were distributed to the selected students in the 30 schools and were retrieved, among which 38 (11.4%) badly filled ones were discarded. A total of 262 (88.6%) instruments fully responded to were utilized and data collection lasted for 28 working days.

5. Data analysis and results presentation.

5.1 Data Analysis

The scores for the items were encoded in SPSS software in order to analyze the data. The statistical procedures used to describe the variables include frequency counts and percentages. Variables linkages were performed on the data. All the research questions were tested at 0.05 significance level. The qualitative data collected were analyzed using descriptive statistics to explore respondent's views. T-tests, ANOVA, Correlation and Multiple Regression were used to determine associations between the independent variables and the dependent variable in answering the research questions.

5.2 Challenges

One of the limitation of the study was the missing values which affected the validity of the entire 300 questionnaire responded to by the students. One other challenge that was faced by the researcher during the study was associated with the insincerity of some students which was observed as some respondent either tick only one particular option or in an alphabetical order. They were however discarded. Selection and participation of students was a challenge in most schools. This problem was solved with the assistance of the Principal or a teacher in the school who helped the researcher addressed the students and sought the consent of those who wanted to participate in the exercises which were later selected at random. Finance was another big challenge. The study involved huge amount of money from cost of developing and producing the instruments to transportation logistic due to the terrain of Bayelsa State.

5.3 Results

The results are presented in line with the sequence of the research questions. An alpha level of .05 was used in statistical test.

Research Question One: What is the relationship between Mathematics Ability and Achievement in Mathematics of Female Senior Secondary School Students?

Table 1. Correlation for Mathematics Ability and Achievement in Mathematics of Female Senior Secondary School Students.

	Achievement	Mathematical Ability
Achievement	1.000	
Mathematical Ability	.393***	1.000

Note: ** P < .01; * P < .05

Table 1 presents the correlation among variables. The table shows that the correlation between female senior secondary school students' mathematical ability and achievement in mathematics is 0.393. And it is statistically significant at $P > 0.01$. This result implies that there is a positive relationship between mathematical ability mathematics and achievement in mathematics.

Research Question Two: What is relative effect of Mathematical Ability on Achievement in Mathematics of Female Senior Secondary School Students?

Table 2 Regression Coefficients Relative effect of Mathematical Ability on Achievement in Mathematics of Female Senior Secondary School Students.

Model	Unstructured Coefficients		Standard Coefficient	T	Sig
	B	Std. Error	Beta		
1	.425	.063	.386	6.740	.000

Results from table 2 shows that the predictor (mathematical ability) of female senior secondary school students on achievement in mathematics in Bayelsa State had a statistical significant effect on achievement with $\beta = 0.386$, $t(260) = 6.74$; $P > 0.05$. This is to say that mathematical ability is makes a significant contribution to achievement in mathematics.

5.4 Discussion

It is beneficial to note that the causes of students poor performance have not only been identified but that educators have been actively engaged in seeking clear understanding of the issues involved and in some cases proffer viable remedies. Yet the problem of poor performance in school works or in public examinations according to Salau (1995) seems to loom larger. He opined to the fact that the causes of student's under-achievement are perhaps less obscure than remedies. While in mathematics of which the results of this study tend to reveal, it may be true that high achievement in mathematics is a function of some inter-related factors, among which mathematical ability is; the impact of school factors and in particular overcrowding and dilapidating/unfurnished classrooms, can hardly be over-emphasized.

Research Question one: What is the relationship between Mathematics Ability and Achievement in Mathematics of Female Senior Secondary School Students?

The studies carried out by Naiz (1993); Simsek (1993) seemed to lend credence to the efficacy of mathematical ability groupings on learning outcomes. Despite the students demonstrating confidence in their abilities, the overall performance on the mathematics achievement test was quite poor, particularly considering the basic nature of the questions. The average score was about 50% and almost half the students achieved this or lower. This finding is in corroboration with WAEC, (2003) whose findings have also shown that poor performance of students in mathematics could be traced to their mathematical ability. The findings of this study also substantiate the results of the studies of Tremblay, Garner, and Heipel (2000) who studying the impact of the sample variables, supported the hypothesis that mathematical ability contributes to the prediction of achievement in statistics as suggested by Harlow, Burkholder, & Morrow, (2002). However, the students were seen to demonstrate a procedural knowledge of the ability to reason through the given mathematical situations, the ability to connect, employ and communicate an algorithmic process within the given problems with little ease. That is to say, the higher the mathematical ability of a student is, the higher his/her achievement in mathematics and the lower the mathematical ability of a student is, the lower his/her achievement in mathematics.

Research Question two: What is relative effect of Mathematical Ability on Achievement in Mathematics of Female Senior Secondary School Students?

The findings of this study from as shown in table 2 presents, the standardized and unstandardized regression coefficient and the corresponding T-values for each of the independent variables mathematical ability. The beta weight gives an indication of the relative contribution of the variable to the prediction of students' achievement in mathematics when all other variables are controlled. The beta weight associated with mathematical ability is significant at .05 level. From the values of the standardized regression weights associated with the independent variable in table 2 above, it indicates clearly that students' mathematical ability is a potential contributor to students' achievement in mathematics. This is in agreement with the findings of the results of the studies of Tremblay, Garner, and Heipel (2000) who studying the impact of the sample variables, supported the hypothesis that mathematical ability contributes to the prediction of achievement in statistics as suggested by Harlow, Burkholder, & Morrow, (2002).

5.5 Summary of Findings

In secondary schools, the role and place of their mathematical ability affecting student's achievement in mathematics cannot be over-emphasised. It is in light of this that the present study has been carried out to investigate likely relationship between students' mathematical ability and achievement in mathematics.

Two hundred and sixty two (262) female senior secondary school students out of which one hundred and twenty one (121) students from fifteen (15) schools in the rural areas and one hundred and forty one (141) students from fifteen (15) schools in urban areas selected from five (5) out of the eight (8) local government areas in Bayelsa State were used for this study. The independent variable was mathematical ability, while the dependent variable was achievement in mathematics. The data collected were analysed using statistical tools known as linear correlation and multiple regression in the computer statistical package for social science (SPSS).

The finding of this study based on the sample and data collected revealed:

- * That there is a positive and significant relationship between students' mathematical ability and achievement in mathematics.
- * That student's mathematical ability can predict achievement in mathematics.

5.6 Conclusion

This study highlights an important result that provides further information concerning the links between students' mathematical ability and achievement in mathematics. However, the results of this study also showed that mathematical ability is a strong predictor on students' achievement in mathematics.

5.7 Recommendation

The following recommendations are made.

- Students' confidence in their mathematical insights and abilities should be developed and maintained.
- Students should be made to have a feel of the enjoyment, curiosity, and perseverance when encountering new problems.
- Government should equip and provide social amenities in the rural schools so as to attract and sustain qualified staff.
- Teachers should make mathematics teaching interesting.
- Individual differences in students' ability, background and attitude should be taken into consideration by teachers and parents.
- Instructional materials should be designed and developed to aid mathematics teaching and learning.

Relationship between self-compassion and job satisfaction in white collar workers

Ramazan Abaci^{a*}, Devrim Arda^b^a*Istanbul Commerce University, Faculty of Art and Sciences, Üsküdar 34672, İstanbul, Turkey*^b*Maltepe University, Maltepe 34857, İstanbul, Turkey*

Abstract

The purpose of this study is to examine the relationship between self-compassion and job satisfaction and to observe whether job satisfaction scores vary in view of certain demographic variables. 300 white-collar workers from four different companies in İstanbul, operating in telecommunication, chemicals, security technologies and insurance sectors, participated in this study in 2011-2012. The study was conducted on a voluntary basis. In this study, Self-compassion Scale, Job Satisfaction Scale and Personal Information Sheet were used. SPSS 16.0 was used for data analysis. Results demonstrated moderate positive correlation between self-compassion and job satisfaction. The results also showed that job satisfaction scores vary by age, level of education and position but do not vary by gender, department, tenure, company's sector and capital structure.

Keywords: White-collar Workers, Self-compassion, Job Satisfaction

1. Introduction

Job satisfaction has a positive impact on productivity, presence and competitive performance, resulting in a decline in employee turnover rates and withdrawal behaviors. Job satisfaction has a positive impact on the employee's well-being and overall life satisfaction as well. As a result of recent interest in Eastern philosophy, some new concepts are shown to have a positive impact on an individual's overall well-being and life satisfaction. Self-compassion, defined by Kristin Neff, is one of these concepts (Neff, 2003b).

Self-compassion involves being discerning and gentle towards oneself in the face of hardship or perceived inadequacy and entails acknowledging that suffering, failure and inadequacies are part of the human condition. Neff proposed that self-compassion involves three main components: Self-kindness versus self-judgment, common humanity versus isolation and mindfulness versus over-identification (Akin and others, 2007).

Self-compassion has been found to be positively associated with psychological well-being, life satisfaction, happiness, optimism and positive affect. Positive relationship between these concepts and job satisfaction has already been shown. Other studies have shown that mindfulness is positively associated with job satisfaction (Hollis-Walker & Colosimo, 2010; Neely, Schallert, Mohammed, Roberts & Chen, 2009; Neff, 2004; Neff, 2011; Neff, Kirkpatrick & Rude, 2007; Neff & Vonk, 2009).

2. Purpose

The purpose of this research was to explore the relationship between self-compassion and job satisfaction. In this study we hypothesized that there will be a positive relationship between self-compassion and job satisfaction.

3. Method

3.1. Participants

This research involves 300 white collar workers (35% females, 65% males) working in telecommunication (25%), chemicals (25%), security technologies (25%) and insurance sectors (25%).in Istanbul. Instruments used for data collection in this study were Self-Compassion Scale (Neff, 2003), Job Satisfaction Scale (Brayfield & Rothe, 1951) and Demographics Questionnaire. Of the participants, 34 (11,3%) were graduated from high school, 234 (78%) were graduated from college, and 32 (10,7%) were graduated from post-graduate / doctorate. Their average age was 33.59 years (SD = 1.09) ranging from 21 to 50 years.

Table 1. Demographic Information

Capital Structure	Frequency	%
Foreign partnership	150	50
Foreign capital	150	50
Department		
Finance / Accounting / Legal / IT	65	21,7
Human Resources / Admin / Personnel Affairs	35	11,7
Sales / Marketing / Business Development	163	54,3
Production / Quality Control / Purchasing / Logistics / Planning / Product Development	37	12,3
Total Tenure		
1-10 years	176	58,7
11-20 years	86	28,7
21-30 years	38	12,7
Position		
Technician / Clerk	31	10,3
Assistant Specialist / Specialist / Senior Specialist	210	70
Supervisor / Assistant Manager / Manager / Director / Executive	59	19,7

3.2 Procedure

This research was conducted in 2011-2012. Participants received an email with a link to the online survey including the Self-Compassion Scale, Job Satisfaction Scale and Demographics Questionnaire. The survey page

included explanations about the purpose of the study. Responses to the survey were recorded anonymously and confidentiality was guaranteed for the participants. Participants had to respond to each question in order to complete the survey.

4. Findings

Table 2. Descriptive Statistics and Inter-correlations of the Variables

Variables	1	2
1.Self-compassion	1	.446
2.Job satisfaction	.446	1

Results showed a moderate positive relationship between self-compassion and job satisfaction in white collar workers. ($r=0,446$; $p<0,01$).

Table 3. White Collar Workers' Job Satisfaction Levels in Terms of Total Tenure

Source	Ss	df	MS	F	p
Between Groups	5,21	2	2,61	2,16	0,12
Within Groups	358,35	297	1,21		
Total	363,57	299			

According to the ANOVA results, there is no significant difference between white collar workers' job satisfaction levels in terms of total tenure ($F=2,16$; $p=0,12>0,05$).

Table 4. White Collar Workers' Job Satisfaction Levels in Terms of Position in the Company

Source	Ss	df	MS	F	p
Between Groups	12,729	2	6,365	5,388	0,005
Within Groups	350,837	297	1,181		
Total	363,57	299			

According to the ANOVA results, there are significant differences between white collar workers' job satisfaction levels in terms of position in the company ($F=5,388$; $p=0,005<0,05$). We used Post Hoc Tests to find which positions cause differences in job satisfaction levels.

Table 5. Post Hoc Test Results

Position I	Position J	Mean Difference (I-J)	Std. Error	p
Technician, Clerk	Assistant Specialist, Specialist, Senior Specialist	-0,002	0,2	1
	Supervisor, Manager, Director, Executive	-0,52	0,24	0,08
Assistant Specialist, Specialist, Senior Specialist	Technician, Clerk	0,002	0,21	1
	Supervisor, Manager, Director, Executive	-0,52*	0,16	0,004
Supervisor, Manager, Director, Executive	Technician, Clerk	0,52	0,24	0,08
	Assistant Specialist, Specialist, Senior Specialist	0,52*	0,16	0,004

* The mean difference is significant at the ,05 level.

According to the Tukey HSD test results; job satisfaction levels of Supervisor, Manager, Director and Executives significantly higher than job satisfaction levels of Assistant Specialist, Specialist, Senior Specialists (Mean Difference=0,52; p=0,004).

Table 6. White Collar Workers' Job Satisfaction Levels in Terms of Department

	46-50	-0,51	0,27	0,42
	21-25	0,4	0,26	0,64
	26-30	0,47	0,23	0,31
46-50	31-35	0,78*	0,24	0,02
	36-40	0,64	0,25	0,12
	41-45	0,51	0,27	0,42

* The mean difference is significant at the ,05 level.

According to the Tukey HSD test results; job satisfaction levels of workers at 46-50 age group significantly higher than job satisfaction levels of workers at 31-35 age groups (Mean Difference=0,78; p=0,02).

5. Discussion

Individuals with high self-compassion levels tend to feel less depression, anxiety and burnout, thus feel more satisfied with their life and are more prone to positive affect. They also tend to evaluate the circumstances with a more balanced and optimistic point of view. As a result, these individuals tend to have higher job satisfaction levels.

This is believed to be the first study in Turkey examining the relationship between self-compassion and job satisfaction. However, it is limited to white collar workers in four different sectors operating in Istanbul. Replication of this study in blue collar workers, other regions and government institutions can generate additional data. Variations in self-compassion levels according to demographics can also be explored.

Representations of concepts as a catalyst for change in teacher pedagogical content knowledge

Jennifer Way*, Janette Bobis, Judy Anderson, Lisa Cameron

University of Sydney, Sydney 2006, Australia

Abstract

Increased pressure to improve teaching quality has intensified the emphasis on the development of conceptual understanding in mathematics rather than reliance on procedural understanding. A particularly problematic content area is fractions. This article explores the shifts in pedagogical content knowledge for fractions in a group of 12 primary teachers during a professional learning project. Responses to a 'before and after' fractions task and reflective comments revealed the majority of teachers developed a more comprehensive understanding. We propose that emphasizing different representations of fractions for teaching, especially number lines and grids, has the potential to positively influence teachers' pedagogical content knowledge.

Teacher development; pedagogical content knowledge; fractions

1. Introduction and background literature

The early work of Shulman (1987), which explored the complexity of knowledge for teaching, has become a theoretical foundation for a large body of research into teacher knowledge and professional learning. Of Shulman's (1987) seven categories of teacher knowledge, it is *content knowledge* and *pedagogical content knowledge* that have received the most attention in research. Content knowledge is described as knowledge of a subject, in this case mathematics, and its organizing structures (Lowenberg Ball, Hoover, Thames & Phelps, 2008). Pedagogical content knowledge is the blending of content and pedagogy into an understanding of how particular topics or problems are organized, represented and adapted for learners (Schulman, 1987).

Many studies have focused on mathematical content knowledge of primary (elementary) teachers concerning weaknesses in their conceptual understanding and a reliance on procedural understanding (Hill & Ball, 2004; Ma, 1999). Although further research is needed into the relationship between the quality of a teacher's mathematical knowledge, effectiveness of instruction and student outcomes, there is already substantial evidence that causal link exist (Baumert & Kunter, 2010; Cobb & Jackson, 2011; Hill, Rowan & Ball, 2005). However, it is widely recognised that improving content knowledge alone is not sufficient for increasing the quality of teaching. A teacher must also develop pedagogical content knowledge to guide student understanding, through the skilful design of learning experiences, including the use of representations, explanations, examples, and by identifying and addressing student misconceptions (Ball, Lubienski & Mewborn, 2001; Baumert & Kunter, 2010).

A highly problematical area of mathematics for teachers is 'rational number', and in particular for primary teachers, the topic of fractions (Moseley, Okomoto & Ishida, 2007; Moss & Case, 1999; Lamon, 2007). A

Email address:

common research finding is that many primary teachers lack deep conceptual knowledge of fractions and rely on their knowledge of procedures, which is insufficient for teaching fraction concepts to their students (Baumert & Kunter, 2010; Forrester & Chinnappan, 2010). In the light of recent evidence that primary students' understanding of fractions and division is the key predictor of success in high school mathematics, the lack of fractions understanding by many teachers is alarming (Booth & Newton, 2012; Seigler, Duncan, Davis-Kean, Duckworth, Engel et al., 2012).

Charalambous (2010) that a strong mathematical knowledge for teaching allows teachers to use "representations to attach meaning to mathematical procedures" (p. 273). The implication is that teachers without conceptual understanding of fraction concepts and their representations will not be able to explain 'why' a procedure (like finding a common denominator before adding two fractions) works, or even why it is necessary. A comprehensive conceptual understanding of fractions involves knowledge of a range of constructs for fractions (such as part-whole, measure and division) and a corresponding range of representations (such as area models, discrete items and number lines), as these form the foundation of image-making before students can work abstractly with fractions as numbers (Clarke & Roche, 2009; Gould, 2006; Lamon, 2007).

Previous research has demonstrated that the teaching of fractions is typically limited to the part-whole construct as modelled by area diagrams such as shaded parts of circles (Clarke & Roche, 2009; Lamon, 2007). A commonly taught procedure for fractions is that of multiplying the numerator and the denominator by the same number to produce an equivalent fraction. Recent research points to the importance of developing an understanding of the multiplicative structure of equivalent fractions as a basis for deducing a mental strategy rather than simply being taught a procedure (Pearn, 2007; Wong & Evans, 2011). Facility with equivalent fractions is critical for operations with fractions and for proportional reasoning. Another recent direction highlights the importance of students working with number lines to express the magnitude of fractions because build on their existing conceptions of whole number (Moss & Case, 1999; Seigler, Fazio, Baily & Zhou, 2013). This representation connects with the construct of fractions as a measure, in which unit fractions a conceived as units of measure can be iterated along a length (number line) to show a cumulative distance from zero.

The review of literature suggests that to improve teachers' capacity to teach fractions, professional learning activities should:

- address both content knowledge and pedagogical content knowledge, including attention to common misconceptions,
- promote conceptual understanding rather than procedural understanding,
- explore the different constructs for fractions and associated models,
- include a focus on representations of fractions that support multiplicative thinking and proportional reasoning, and
- include the use of number lines to model the magnitude of fractions as numbers.

It is important to note that the items listed here integrate both content and pedagogy is reflective of the theoretical perspective of this study that the two become intertwined in the context of professional learning for practicing teachers, and are arguably of equal importance for improving student learning. This supported by other researchers (Darling-Hammond and Richardson, 2009; White, Mitchelmore, Branca & Maxon, 2004) and justifies the emphasis placed on *pedagogical content knowledge* in this study.

The aim of the present study is to explore changes in the *pedagogical content knowledge* (PCK) for fractions in a group of primary teachers involved in a professional learning project encompassing the foci listed above

2. Methodology

The exploratory study was guided by two specific research questions and drew on qualitative data from written sources provided by each teacher:

- What patterns in pedagogical content knowledge of fractions and content knowledge in a pedagogical context can be detected in the cohort of teachers?
- What is the nature of change in individual teacher's knowledge?

2.1. Context and participants

The broader context for this study is the *Empowering Teachers of Mathematics Project* which is a funded two-year project (2012-2013) involving two cohorts of middle-years teachers (late primary and early secondary) in the Sydney metropolitan area of Australia. The ETM project has the dual aims of developing teachers' knowledge and pedagogy in mathematics, and their understanding of the role of motivation and engagement of students in mathematics learning. The overall approach of the project embodies all of the principles identified by Darling-Hammond and Richardson (2009) from their review of effective professional development, specifically that it:

- Deepens teachers' knowledge of content and how to teach it to students.
- Helps teachers understand how students learn specific content.
- Provides opportunities for active, hands-on learning.
- Enables teachers to acquire new knowledge, apply it to proactive and reflect on the results with colleagues.
- Is part of a school reform effort that links curriculum, assessment, and standards to professional learning.
- Is collaborative and collegial.
- Is intensive and sustained over time. (p.49)

The teachers ranged from to teachers with over 20 years experience, and were from a cluster of six primary schools and two high schools. This particular study focuses on the 12 primary teachers from the 2012 cohort in their first 6-month cycle of the project that involved three whole-day meetings interspersed with periods of teaching experimentation. During each of the three days the teachers participated in workshops on fractions of one to two hours duration intended to increase their conceptual understanding and included the following activities:

- Information and practical activities dealing with the fraction constructs of part-whole, measure, division, operator and ratio – with 'teacher friendly' research articles supplied for further reference.
- Various ways to model fractions with particular emphasis on using arrays and grids to promote multiplicative thinking strategies for equivalent fractions, and using number lines to sequence and compare fractions.
- Patterning tasks and grid models to reveal the vertical and horizontal multiplicative structure of equivalent fractions.
- Scaffolded analysis of the fraction assessment results for their own students, and the cohort's results, with emphasis on common errors, misconceptions and the appropriateness of representations of fractions.
- Reflective discussions on their teaching experiments.

2.2. Data sources

Before commencing the project, the teachers individually completed an open-ended written task, as displayed in Figure 1. This task was repeated four months later (Referred to as Time 1 and Time 2). The task was designed to provide an indication of each teacher's content knowledge, but within a pedagogical context. This type of open-ended task has been previously used in research as a qualitative survey instrument and is favored as a means to minimize the stress associated with 'testing' teachers on their mathematical knowledge (Dole, Clarke, Wright, Hilton & Roche, 2008; Hill, Ball & Schilling, 2008; Watson, Beswick & Brown, 2006). A 'comparison of fractions task' was chosen because such tasks are mathematically rich in solution strategies, commonly used in middle-years classes and are known to cause difficulties for students (Clarke & Roche, 2009).also asked to write reflections at the conclusion of Cycle 1 and were invited to comment on what they had chosen to explore with their classes and what learning they had experienced themselves. It is important to note that the teachers were not compelled to utilize any of the material presented to them in the project workshops, but rather were encouraged to respond to the learning needs of their students using whatever approaches they thought might be most effective.

Student Task: Which fraction is larger $\frac{2}{3}$ or $\frac{5}{6}$? *Draw and write* something to explain your reasons.

Your task: Give three examples of student responses (correct or incorrect) to this task and comment on the likely thinking behind each response.

Fig. 1. Teacher task for Time 1 and Time 2

2.3. Analysis

Baker and Chick (2006) developed a *Framework for Analysing Pedagogical Content Knowledge* that deconstructs teacher pedagogical content knowledge into three categories (Clearly PCK, Content Knowledge in a Pedagogical Context and Pedagogical Knowledge in a Content Context) and 16 sub-categories, providing the basis for fine-grained analysis of data (See also Chick, Baker, Pham & Cheng, 2006). The framework recognises the important role of content knowledge, yet highlights the difficulty of separating it from pedagogy with practicing teachers. The framework was developed within a broader range of data sources than was available for this study, so for its specific application in this study some of the sub-categories were omitted due to a lack of relevant data. The modified framework appears in Table 1, where a brief explanation of each sub-category is provided.

The modified *Framework for Analysing Pedagogical Content Knowledge* was utilised as the basis of a *directed content analysis* approach (Hsieh & Shannon, 2005), which takes a deductive approach for detecting specified attributes in the data. The analysis process began by assigning a code to each sub-category in the framework. Each teacher's written response to the 'fraction comparison task' was carefully scrutinised independently by two members of the research team, and the codes used to tag segments detected in the text and diagrams that matched the descriptors. The two researchers then compared and debated every tagging until all discrepancies were resolved and all text segments were accounted for.

In addition to the coding process the researchers noted significant observations for each teacher's task responses, such as 'focus on equivalence', or 'incorrect diagram', and what type of representation they drew. This allowed the text segments, including diagrams, to be viewed in two ways - as qualitative examples of each sub-category from which additional information could be extracted, and as countable items to build frequency data. All of the data were recorded in a table to facilitate comparison of the data sets for 'before and after'.

The text gathered from the teachers' reflections on their teaching experiments and their own learning was not extensive and so was subjected to a basic open-ended content analysis process of reading and highlighting the key points, then classifying these into categories. This qualitative information was used to enrich the interpretation of task data by providing the teacher's own perspective of their learning, as well as some context for any changes detected between the before and after tasks.

Table 1. Analysis framework for pedagogical content knowledge (Adapted from Baker & Chick, 2006)

PCK Category	Evident when a teacher.....
Clearly pedagogical content knowledge	
Student Thinking	Discusses or addresses student ways of thinking about a concept, or recognises typical levels of understanding.
Student thinking – Misconceptions	Discusses or addresses student misconceptions about a concept.
Appropriate and Detailed Representations of Concepts	Describes or demonstrates ways to model or illustrate a concept (can include materials or diagrams).
Content Knowledge in a pedagogical context	
Deconstructing Content to Key Components	Identifies critical mathematical components within a concept that are fundamental for understanding and applying that concept.
Procedural Knowledge	Displays skills for solving mathematical problems (conceptual understanding need not be evident).
Methods of Solution	Demonstrates a method for solving a mathematical problem

3. Results and discussion

This section is organized into two main parts aligned to the two categories of the analysis framework, and combines the data from the three sources. As will be seen in the presentation of findings, the strongest themes to emerge were the changes in the teachers' use of representations of fractions and their increased attention to multiplicative relationships and structures.

3.1. Patterns in pedagogical content knowledge

3.1.1. Student Thinking

The Fraction Comparison Task required the teachers to provide three examples of student responses to the comparison-task and comment on the hypothetical students' thinking. It is natural therefore that most text segments related to student thinking (see Table 2 for frequencies).

In Time 1 many of the comments student thinking mentioned the use of equivalent fractions to solve the task, but multiplicative thinking was rarely mentioned. For example, "*The student can visualise the equivalence between thirds and sixths and present it to show her understanding*" (Teacher A, task T1), and "*Understanding of equivalence but not how to show pictorially*" (Teacher C, task T1)

In their reflections on their teaching experiments in the following months, all teachers mentioned working on equivalent fractions with their classes and some also covered improper fractions. Of the 12 teachers about half explicitly mentioned a focus on multiplicative thinking, most refer to arrays and grids to support their students' thinking about factors and multiples, particularly related to equivalent fractions. For example, "*We explored the multiplicative approach & children became aware of the value of knowing times tables and the importance of understanding them*" (Teacher O reflection); and, "*I also pushed 'multiplicative' thinking and using arrays to represent fractions. This has shown improved results already.*" (Teacher P reflection), and "*Using a multiplicative approach rather than an additive approach - this was valuable for children to represent fractions and understand relationships between Mixed/Improper fractions*" (Teacher J reflection).

Table 2. Frequency of each sub-category of Pedagogical Content Knowledge evident in Time 1 and Time 2 teacher responses

	Clearly Pedagogical Content Knowledge					
	Student Thinking		Student Thinking – Misconception		Appropriate & Detailed Representation of Concept	
	T1	T2	T1	T2	T1	T2
Totals	32	31	14	5	14	25

The teachers' exploration of multiplicative thinking with their real students was reflected in their suggested responses for hypothetical students in the Time 2 task, as illustrated in Figure 2. A third of the teachers explicitly identified multiplicative thinking in Time 2, whereas no mention at all had been made in Time 1.

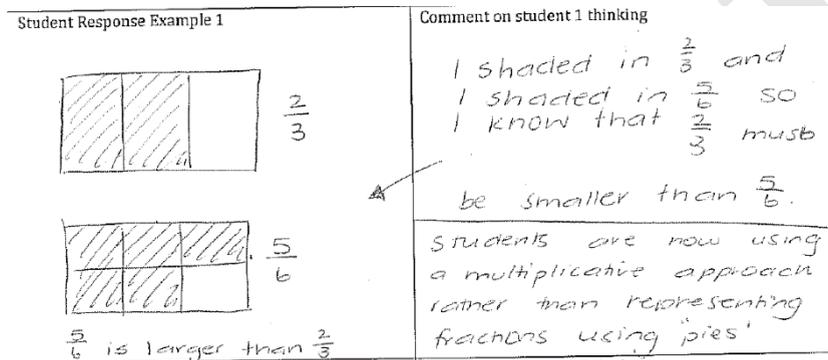

Fig. 2. Teacher response showing attention to multiplicative thinking (Teacher J task T2)

In their reflections, seven teachers wrote about developing conceptual understanding in their students rather than only procedural knowledge, indicating an awareness of its importance. The following example, referring to a procedure for making equivalent fractions, also demonstrates an awareness of the role of modeling the multiplicative relationships; “*I have also given a lesson on multiplicability using visuals. The students are able to multiply fractions using the standard method but they are beginning to understand why you get the answer rather than just presenting the answer*” (Teacher R reflection). Students’ use of meaningful representations to support the explanation of fraction equivalence is considered to be a sign of progress towards conceptual understanding (Wong & Evans, 2011)

Although not specifically asked to comment on student misconceptions, there were 14 instances in Time 1. Indeed, Teacher F offered only incorrect solutions and student misconceptions. Most student-misconception examples were given as the third and final response, perhaps suggesting that some teachers did not have a third correct solution approach to offer. This may help to explain the reduction in the number of student misconception comments to only five in Time 2, because the number and variety of correct solution methods increased. However, understanding common misconceptions that children have and knowing how to remedy them is an important part of teacher knowledge (Ball, Lubienski & Mewborn, 2001; Baumert & Kunter, 2010). The reduction in attention to student misconceptions in Time 2 perhaps points to a weakness in task design, which could have requested that one example illustrated a common misconception, thereby avoiding the loss of information about teacher knowledge of this aspect.

3.1.2. Representations

Although the task instructions said “draw and write”, less than half (14) the responses included an appropriate visual representation of the two fractions in Time 1 (Table 2). All but two representations were either an area model shown as circles or as rectangular strips, as illustrated in Figure 3. The remaining two representations were a two-by-three grid, and a set of discrete items depicting an incorrect solution. All of the diagrams illustrated the part-whole construct of fractions, although a few of the teachers who drew rectangular strips with some sections shaded specifically referred to length rather than area in the written comment, suggesting awareness of the ‘fractions a measure’ construct. However, the transition from perceiving a part of a rectangular strip as an area to focusing instead on its length can be problematic for students as they can hold contradictory images in their minds instead of reconciling the interpretations (Gould, 2011).

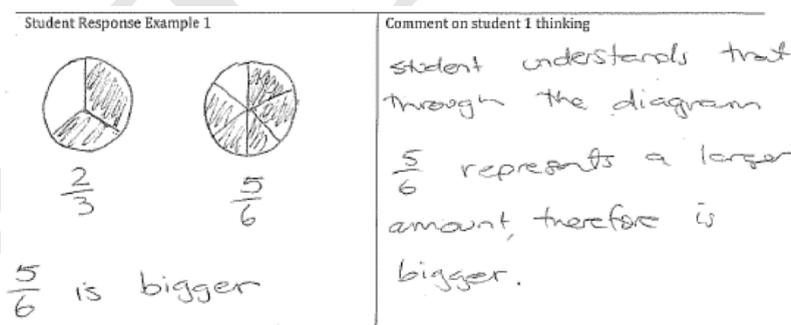

Fig. 3. Teacher response showing use of an area model to show part-whole fractions (Teacher H task T1)

The Time 2 responses presented an increase in both the number and variety of representations with a total 25 diagrams (Table 2). The most striking change was that ten teachers used a number line to illustrate the comparison (none were used). An example of such a response is shown in Figure 4. In their reflections about half the teachers spoke of using number lines with their classes “*to show students how fractions can be compared on*

a number line” (Teacher P reflection), and to sequence fractions, including fractions greater than one and mixed numerals. Most teachers also included an area diagram (mostly rectangular strips) and there were four instances of grids. The increased use of number lines is considered a positive shift, as this representation is more likely to connect constructively with students’ understandings of whole number (Pearn & Stephens, 2011)

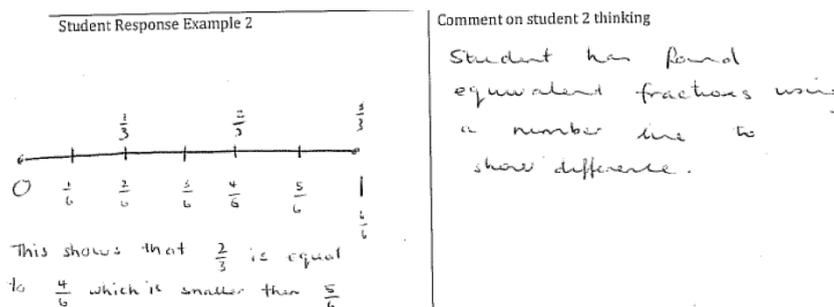

Fig. 4. Teacher response showing use of number line to compare fractions (Teacher C task T2)

In their reflections all 12 teachers wrote about deliberately using specific representations of fractions, such as folding paper to model fractions with odd denominators, fraction walls and grids to support their students better understanding fractions. The quotation illustrates one teacher’s growing understanding of the role of fraction representations for children’s understanding.

“I have realised how many forms fractions can take and how often things I have taught separately should, in fact, be taught as one. I have also learned how difficult fraction concepts are for children to comprehend and how important visualising/ making them is. I have begun working on different ways of expressing equivalent fractions visually with the children. I was surprised when some of the usually quick mathematicians had difficulty distinguishing thirds from halves and quarters”. (Teacher A reflection)

3.2. Patterns in content knowledge in a pedagogical context

3.2.1. Methods of solution

Most teachers three responses the majority examples of correct solutions. However, the repertoire of distinctly different solution methods was somewhat limited, with only a quarter (3) of the teachers showing three different correct approaches to solving the task. This doubled to six teachers in Time 2 (see Table 3). The similarity in the figures (Table 3) for the Methods of Solution and the Procedural Knowledge is not coincidental, as in this particular task it was natural for the teachers’ examples of solutions to illustrate a procedure for comparing the fractions. Note that the interpretation of ‘procedural knowledge’ was quite broad and not intended as necessarily indicative of the absence of conceptual knowledge. The increase in the range of solution methods was also closely associated with the increased range of representations used for the fractions.

Table 3. Frequency of each type Content Knowledge in a Pedagogical Context Time 1 and Time 2 teacher responses

	Content Knowledge in a Pedagogical Context					
	Deconstructing Content to Key Components		Procedural Knowledge		Methods of Solution	
	T1	T2	T1	T2	T1	T2
Totals	17	28	21	27	23	27

3.2.2. Deconstructing Content to Key Components

The number of key components identified by teachers within their comments about student thinking increased from 17 in Time 1 to 28 in Time 2 (Table 3). The most common aspect of content mentioned both times was 'equivalence of fractions' which is not surprising given the task of comparing fractions. However, 'equivalent fractions' is a high order concept that can be further deconstructed. The Time 2 responses contained more instances of the characteristics of equivalent fractions in this context, like 'multiples', 'same denominators', 'same size', 'same position on number line', 'multiplicative' relationship. Other content components included 'equal parts', 'meaning of the denominator' and 'same size wholes'. While these content components were clearly identifiable within the text, they were intertwined with the teachers' methods of solution, representational choices and explanations of student thinking.

Overall there were no discernable differences in the responses of early career teachers (C, J, P & Q) to their more experienced colleagues. There is some contention in the literature about the significance of experience in determining PCK, with some saying novice teachers (1-5 years) lack the skill to recognize and practice the connections between content and teaching strategies (for example, Wilson, Shulman & Richert, 1987). Others assert that disposition towards reflection on content knowledge is a more important factor (Hoz, Tomer & Tamir, 1990). However, most of this research involves secondary teachers rather primary teachers, so its direct relevance is uncertain.

4. Conclusions

This study focused on the impact of two particular aspects of fractions – the multiplicative structure of fractions and fractions as numbers with a magnitude. These aspects were communicated to a group of teachers via particular representations, namely; arrays and grids promote conceptual understanding of the multiplicative relationships in fractions and the number line to show fractions as numbers having value and a position on the line relative to other numbers. The teachers' responses to a task designed to assess some of their pedagogical content knowledge, and their reflections on their own teaching experiments, indicated that working with these foci led to changes in both their knowledge of fractions concepts and in their teaching practice.

The implications of these findings are heavily constrained by the study's limitation to one task and one set of reflections with one group of teachers. However the shifts in the teacher responses to the written task around the use of representations of fractions clearly suggest that attention to this aspect of fractions has the potential to enhance pedagogical content knowledge. This proposition is supported by the teachers' self-reported teaching experiments applying these approaches, which indicated some improvement in the conceptual understanding of their students.

The evidence warrant further investigation of the impact an expansion understanding various representations teacher pedagogical content knowledge. A second study will look for connections between changes in the teachers' responses to the comparison task and changes in their students' responses to related tasks from the fractions pre and post-test used in the larger ETM Project. Working with a second cohort of teachers will also

provide the opportunity to expand the data sources to include more than one written task, as well as collecting some rich data through teacher interviews and lesson observations.

The increased pressure from education authorities and governments to improve the quality of mathematics teaching and student learning creates the situation where the identification of high impact approaches in teacher development make research of this nature urgent.

Research Communiqué on the Use of Animated Cartoons in Teaching English to Children with Disorders and Disabilities

Werona Król*

Pedagogical University of Cracow, Podchorążych 2, Cracow 30-084, Poland

Abstract

The following paper focuses upon the issue of using animated cartoons in teaching English to young learners with Special Educational Needs. The research conducted in one of the Polish integrated primary schools aimed at examining the influence of video on children's vocabulary attainment. The present communiqué is concerned with general data evaluation and with a more in-depth analysis of particular cases of pupils with disorders and disabilities. As a final point, some pedagogical implications are drawn from the study.

Keywords: animated cartoons, video, children with disorders, children with disabilities, special educational needs, inclusion, integrated primary school, foreign language teaching, English as a foreign language, young learners

1. YOUNG LEARNERS OF ENGLISH IN THE VIDEO ENVIRONMENT

Broadly speaking, young learners feel at ease with video, but they may not recognize it as a teaching aid. Watching video in a domestic environment brings certain positive connotations of pleasure and entertainment. Thus, when presented with a video material in the classroom, children often expect to be entertained. Of course, learning and fun do not exclude each other, but learners have to be guided in advance in order to understand the instructional value of a film or a programme (Lonergan, 1992). Since children associate video with relaxation, the way they watch it may tend to be passive and uncritical, whereas the use of this medium for a pedagogic situation requires that they watch in a slightly different manner – actively, directing attention in a constructive way (Walker, 1999).

Understandably, the best medium appealing to children is a cartoon. Apart from those aimed at entertainment, some are used also in educational programmes. Perhaps the most prominent example of an educational television, although designed for native English speakers, is the American series *Sesame Street*. For more than 40 years, it has used puppets, animation, stories, etc. to amuse and instruct children around the world. In the article *Children's learning from television*, Fisch (2005) cites more than 35 international studies which all affirm the learning benefits from *Sesame Street*. For instance, one study “showed that high school students who had watched educational television – and *Sesame Street* in particular – as pre-schoolers had significantly higher grades in English, Mathematics, and Science in junior high or high school” (Anderson et al., 2001 in Fisch, 2005).

Although there is a great number of educational videos available, this does not necessarily mean that all are equally effective. What is then that causes some to be more powerful than others? According to Fisch (2005), we can identify some features that contribute to the effectiveness of video on children. First of all, a given video should engage young students through the use of appealing elements, such as mysteries or humorous situations and dialogues. Moreover, it should constitute an action-filled visual rather than a static, “talking” one. Obviously, the topic has to be age-appropriate, inherently interesting to children and relevant to their lives. As for the characters, they should be viewed by pupils as competent and intelligent, with whom they can identify. Clearly, the content of the storyline ought to be presented via clear and direct language, at a level of difficulty tailored to children’s knowledge of the world and cognitive development. Taking these factors into consideration, individual episodes should convey a small number of ideas, draw explicit connections among them and reinforce the concepts through repetitions. Also, children are to be encouraged through participation, e.g. by attempting to solve a problem before the on-screen characters do it. Naturally, the list of factors is not exhaustive, but may be useful for teachers while selecting appropriate material to integrate into the classroom practice.

According to brain research, younger school-aged children can focus in direct instruction for approximately 5-12 minutes (Jensen, 1998 in Schulz, 2006). No matter what type of video is chosen, after 10 minutes of passive viewing, a child’s focus on the subject matter begins to wane (Adams and Hamm, 2001 in Schulz, 2006). Because children are unable to stay concentrated on one thing for longer than a few minutes, a teacher needs to select media which can be divided into smaller but complete segments, accommodating the student’s attention spans.

2. SENSORY STIMULATION OF CHILDREN WITH SPECIAL EDUCATIONAL NEEDS

Multisensory presentation of lexis through the use of video may be both appealing to young learners and effective, unless it is introduced prematurely. Considering the cognitive development of children, elementary students are well apt for watching videos in order to learn from them. As presented in research, even students with various disabilities can benefit from video-assisted language learning and this fact should not be undervalued.

Just to mention one study, Xin and Rieth (2001) investigated the effects of using video technology as a tool for facilitating vocabulary acquisition of students with learning disabilities. Seventy-six, 4th, 5th and 6th - grade students were randomly assigned to either a video or a nonvideo instructional group. The video instruction group learned word meanings and concepts in videodisc based contexts, while in the nonvideo group teachers taught students word definitions. All students were administered pre, post, and follow-up tests two weeks after the completion of the intervention phase on word acquisition, generalization, and passage comprehension over the 30 target words taught. Findings indicate that students in the video instruction group had statistically higher word acquisition scores than those in the nonvideo instruction group. As can be deduced from this study, video provides sensory stimulation, depicts movement that can lead to the formation of mental images and exposes students to both auditory and visual cues. Unlike an abstract definition, video depicts a real situation and makes

otherwise difficult information seem relevant. Research indicates that students that are taught using video-assisted instruction outperform students that engage in traditional instruction in knowledge of word meanings.

Since today SEN (Special Educational Needs) students move to more inclusive environments, they are increasingly challenged with learning and retaining material from the general education curriculum. As far as EFL teachers are concerned, one challenge for them is to find appropriate methods that would help their exceptional pupils to learn and remember foreign vocabulary. This issue may be problematic because of the children's learning difficulties, but partially solved through the use of video.

3. STUDY ON THE USE OF ANIMATED CARTOONS IN TEACHING ENGLISH TO CHILDREN WITH DISORDERS AND DISABILITIES

The overall aim of the study conducted was to investigate how much vocabulary can children who attend inclusive classrooms learn from video-assisted lessons as well as to find out whether video-assisted teaching proves to be an effective and likeable vocabulary teaching support for both children without learning disabilities and those with SEN.

3.1. Research structure

The study was conducted in the Ludwika Wawrzyńska Integrated Primary School No.105 in Cracow in two inclusive second grade classrooms. It involved a total of 28 students: grade II "a" – 13 (5 with SEN), grade II "b" – 15 (5 with SEN), though none with hearing or visual impairments.

The construction of the research was mainly inspired by Szpotowicz's (2009) study on factors influencing young learners' vocabulary acquisition and by Sun and Dong's (2004) experiment on supporting children's English vocabulary learning in multimedia context. Three main research instruments were used: vocabulary recognition tests, vocabulary production tests and a small questionnaire investigating pupils' attitude towards video-aided EFL lessons. Understandably, before each and every test a vocabulary pre-test was done, which would look similar to the recognition vocabulary test. Additionally, one learning support method was used with both classes, namely a 5-min Target Warming-up (TW) session, which would take place before children viewed the videos.

3.2. *Teaching material*

A special learning material to facilitate vocabulary learning among children in inclusive classrooms was selected for the purpose of the study. Appropriate 10 minutes long segments from *Magic English*, a popular educational DVD programme designed for EFL teaching, were played to both classrooms, but during the projection sessions grade II “a” was not provided with any kind of support, whereas grade II “b” was supported by the teacher (in the case of nouns and adjectives those were flashcards in A4 format with pictures + repetitions, in the case of verbs – children imitated the actions and repeated the words).

3.3. *Research procedure*

The method used in the study was a quasi-experimental action research (Wallace, 2006) with a didactic perspective. It lasted six weeks and consisted of two parts. The first concentrated on the vocabulary attainment of students and the second on their attitude towards the video-aided instruction. A preliminary pilot study was conducted before the main one, in order to check the feasibility of the chosen tools and to improve the research design, but its results will not be discussed in the present communiqué.

In the recognition vocabulary test subjects were tested collectively. Each child was given a worksheet consisting of several pictures from the previously watched video. The worksheet included target vocabulary items (nouns, verbs, or adjectives) plus a distractor. During the test me as the researcher would read aloud the words and say what numbers they are. Pupils would mark the pictures with the appropriate numbers I called out and put on the blackboard in order to exclude the possibility of mistakes in students’ marking.

In the production vocabulary test students were interviewed individually. They were asked to name the objects presented on flashcards. I would note down and score the quality of pupils’ production in the following way: 3 points if the child recalled the word correctly, 2 points if the child recalled the word but mispronounced it, 1 point if the child remembered only a part of the word, 0 points if the child was not able to recall the word at all. Articles were not taken into account.

As already mentioned (3.1.), one learning support method was used with both classrooms, namely a 5-min Target Warming-up (TW) session, which would take place before the projection of the videos. In this session I would display each target word (printed on a flashcard – A4 format, font similar to the one used for captions), read

the word aloud and ask the class to repeat it several times. This session was used to familiarise young learners of English with each word's pronunciation. Children would then be asked to watch the video and guess the meanings of the target words. The following instruction was given: "You're going to watch an interesting cartoon in English. All the words we've just practised will appear in the video. Please watch it carefully and try to guess the meanings of these words."

Each video was projected twice with the use of a computer and an overhead projector. From the researcher's observations results that for the first time children concentrated more on the plot and simply enjoyed the characters' capers. Only during the second viewing, they started to grasp the meaning of the target words.

The reason for conducting the TW session was the assumption that young learners would behave more actively and intentionally and pay more attention to the English input when having clear goals set before watching the cartoon. Furthermore, it was expected that this method would improve children's pronunciation of the target words and their ability to infer the meanings of these words from the context.

What is most important, class II "a" had no support while watching the videos, whereas class II "b" was supported by the teacher during the projection sessions (in the case of nouns and adjectives those were flashcards with pictures + repetitions, in the case of verbs – children imitated the actions and repeated the words). No translation was given, so even children from class II "b" had to discern the meaning of the target words themselves.

The interview concerning students' attitude towards the video-assisted instruction was done after the whole project. To avoid young learners' untrue responses (e.g. given to please the researcher), it was not me who interviewed the subjects. Pupils were interviewed in Polish, their native language, and the person talking to them was the English teacher that normally conducted lessons in both classroom. In this part of the study, the Thurstone scale (DeVellis, 2003) was used, which required individual pupils to either agree or disagree with a few statements about the video-aided lessons they had experienced.

3.4. *General results*

Without going into detailed statistical calculations, percentile results will be presented in three categories: nouns, verbs and adjectives, respectively.

The non-supported class remembered and recognised passively 61 % of newly introduced nouns, of which they were able to actively recall 51 %. The supported class performed better in both tests: they recognised 89 % of the new vocabulary items, of which they recalled 66 %.

When it comes to verbs, the non-supported class remembered and recognised passively 42 % of the new vocabulary items, of which they were able to actively recall barely 29 %. On the contrary, the supported class performed much better in both tests: they recognised 98 % of the new vocabulary items, of which they recalled 71 %.

Last but not least, the non-supported class remembered and recognised passively 57 % of new adjectives, of which they were able to actively recall 88 %. The supported class performed better in both tests: they recognised 88 % of the new vocabulary items, of which they recalled 71 %.

3.5. *Performance of children with Special Educational Needs*

By and large, SEN students from the WS group performed better in comparison to SEN students from the NS group, no matter of the type of learning difficulty. In this respect, they did not differ from the rest of the class. Obviously, SEN children cannot be treated as a homogenous unit. Each and every child could actually be treated as a case study. However, when I compared individual children with SEN's scores to the class means it turned out that they did not deviate from the norm. Of course, there happened to be single incidences of performance below the mean, but more often than not SEN students achieved percentages even over the class average. This unavoidably leads to the conclusion that SEN children who attend mainstream schools can achieve comparable success to the rest of learners, provided their special educational needs are met by teachers.

Two most interesting cases from the pedagogical point of view – one from the NS and the other from the WS group - will be scrutinised in this section in order to demonstrate that children with SEN must not be taken for granted as worse learners.

Subject A from the NS group has been diagnosed as a child suffering from Attention Deficit Hyperactivity Disorder, which is neurobehavioral. ADHD is characterised by “an ongoing inability to concentrate or be ‘attentive’ in given situations, alongside a frequent higher than usual level of acting-out behaviour, presented as impulsivity, forgetfulness and a susceptibility to distraction” (Garner, 2009). Generally, a child suffering from ADHD is more prone to experience difficulties in organising its school work. ADHD is also associated with other serious SEN, such as oppositional defiance disorder (ODD), an indicator of angry outbursts, temper tantrums and antisocial behaviour. Sometimes ADHD can contribute to anxiety disorders or other mental-health issues. The prognosis for children with ADHD is mixed, although a diagnosis of this disorder means the likelihood of impairments in life functioning, with a small percentage of the ADHD population continuing to study beyond compulsory schooling (Garner, 2009).

However, when we look at the subject’s tests results we can ask ourselves a question: How is it possible that a child with ADHD performed so well in comparison to the whole NS group average? Indeed, the boy remembered 100 % of the new nouns, while the class mean equalled 61 %. He also remembered almost the double percentage of verbs – 83 % as opposed to the average 42 %. When it comes to adjectives, subject A’s score was the same as the mean = 57 %.

Table 1. Subject A’s test results.

TEST	Nouns	Class mean	Verbs	Class mean	Adjectives	Class mean
recognition	100 %	61 %	83 %	42 %	57 %	57 %
production	40 %	51 %	13 %	29 %	42 %	32 %

From my personal observation of the subject's behaviour during the video projection sessions, I may conclude that an ADHD child can gain a lot from an English lesson if s/he manages to stay concentrated. Without doubt, the biggest challenge for teachers is to make an ADHD student calm and attentive. In the course of six weeks I had the chance to observe subject A in different problematic situations, e.g. at the beginning of the lessons or during breaks, when he was fidgeting with whatever was at close hand, moving around and trying to disturb others. However, when a video started and he became interested in it, all the problems just faded away.

Subject B from the WS group has been diagnosed as a child suffering from Asperger syndrome (AS), which is a developmental disorder that falls within the autism spectrum. AS is characterised by difficulty in four main areas: social interaction, communication, imagination (e.g. imagining what others are thinking), sensory sensitivity (Winter, 2004). Lorna Wing (1983 in Winter, 2004) described the main clinical features of AS as: lack of empathy; naïve, inappropriate and one-sided interaction; little or no ability to form friendships; pedantic, repetitive speech; poor nonverbal communication; intense absorption in certain subjects; clumsy and ill-co-ordinated movements and odd postures. Children with AS can also be diagnosed with other SEN, e.g. ADHD or dysgraphia. On the other hand, AS children tend to be honest, creative and dedicated. Tony Attwood (in Winter, 2004), an English psychologist and an author of several books on Asperger Syndrome, described it as a different way of approaching life, one that is dominated by the pursuit of knowledge and truth.

As can be observed in the table below, the subject's scores are very high. He remembered and recalled 100 % of new nouns and verbs, while the WS group's means were 89 % and 88 %, respectively. Although during the projection sessions the child seemed not interested in the cartoons at all and showed no enthusiasm, in fact he caught the meaning of all new vocabulary and, what is even more striking, he was able to pronounce it correctly. When it comes to verbs, the boy scored below the class average in the recognition test – 86 % as compared to 98 %. Still, his result was quite high.

Table 2. Subject B's tests results.

TEST	Nouns	Class mean	Verbs	Class mean	Adjectives	Class mean
recognition	100 %	89 %	86 %	98 %	100 %	88 %
production	100 %	66 %	78 %	71 %	100 %	71 %

One can think that the subject should have performed flawlessly, considering the TPR support provided. I speculate that, contrary to common belief, TPR created chaos in the classroom and in this respect did not help the child with Asperger. Children were moving around, imitating the actions, while subject B remained seated, with his head lowered, and was about to cry. I was not able to persuade him to participate in the activity and simply resigned not to aggravate the situation. The class teacher later explained me that subject B was a very intelligent, but reserved child preferring individual work to group activities.

3.6. Young learners' attitude towards video-aided EFL lessons

The results of the oral questionnaire demonstrated subjects' positive attitude to the video-aided lessons they had experienced. Children had to take a stand (agree/disagree) on the following statements in their native language:

- 1) It is fun to use video during EFL classes.
- 2) Video helps me to remember new words.
- 3) At times I feel bored while watching video during EFL classes.
- 4) I prefer to learn new words from the coursebook rather than from a cartoon.
- 5) I would like to have video-aided classes in the future.

The overwhelming majority of young learners declared that it was fun to use video during EFL classes (100% of the WS group and 92% of the NS one). Interestingly, 100% of NS students affirmed that video helped them to

remember new words, although they performed significantly worse both in the recognition and production tests in comparison to the WS students, of whom 87 % believed that video aided them.

Nevertheless, one third (31%) of NS subjects admitted that at times felt bored while watching video during EFL classes and would prefer to learn new words from the coursebook rather than from a cartoon. A similar percentage (27%) of WS subjects had sometimes the sensation of boredom, but only one fifth of them (20%) would choose to learn vocabulary from a traditional coursebook. Tout ensemble, all NS and 93% of WS students would like to have video-assisted classes in the future.

4. Data evaluation and pedagogical implications

The findings from this study indicate that learning L2 vocabulary in a video-based context proves to be quite an effective technique for inclusive classrooms. However, since the difference between the two groups in terms of lexical gains was statistically significant, it can be argued that a learning support has to be provided by the teacher. Although the NS group managed to infer the meaning of and remember some new lexical items, their results were not as impressive as those of the WS class. Vocabulary learning under the NS conditions was incidental in nature, that is, even though children were given the instruction to pay attention to the words they were introduced to in the Target Warming-up session, they seemed not to be aware of the real purpose of the activity and, consequently, not engaged actively in inferring the new words' meanings. This may account for their worse performance on the recognition and production tests. Phonic acquisition might have also been impaired if learners had paid inadequate attention to the cartoon.

Moreover, the study might have provided yet another evidence to the generally shared assumption that both indirect and guided learning of vocabulary can be achieved by resorting to contextual clues. This calls for an important pedagogical implication for EFL teachers to use contextual materials such as video to assist students' vocabulary learning instead of explaining the words in an isolated manner.

Also, information gathered in the attitudinal interview is of crucial importance, since one of the researcher's attempts was to devise a vocabulary teaching technique that, apart from being effective, young learners would

simply like. As could be predicted, one third of students admitted that at times felt bored during the projection sessions, but still they generally enjoyed the video cartoons. No technique is perfect and none can please all students in 100%. Nonetheless, my aim was to respond to the majority of learners' needs in a heterogeneous inclusive classroom.

Based on many research articles studied and the present research conducted, video watching appears to have positive effects on children's vocabulary comprehension, to a lesser extent also on production. What is even more important, when it is accompanied by teacher support, it proves to be very effective in inclusive classrooms. All things considered, foreign language teachers should not become discouraged by students with SEN's educational ups and downs. All children can have better or worse days in their performance, but this definitely does not mean that they are unable to learn. Contrariwise, young learners should be constantly motivated and encouraged by teachers to release their potential, which is so often overlooked. However, due to the somewhat limited number of studies investigating specifically the effect of mode of instruction on vocabulary acquisition by children with Special Educational Needs, more research in this area is advisable.

4th International Conference on New Horizons in Education

Research on quality of life of workers in school counseling centers for the visually and hearing impaired in the Czech Republic

Prof. PaedDr. Libuše Ludíková, CSc. *, Mgr. Petra Tomalová

Faculty of Education, Palacký Univerzity, Institute of Special Education Studies, Žižkovo nám. 5, 771 40 Olomouc, Czech Republic
Faculty of Education, Palacký Univerzity, Institute of Special Education Studies, Žižkovo nám. 5, 771 40 Olomouc, Czech Republic

Abstract

The process of the integration of students with visual and hearing impairment within the intact students is unthinkable without the cooperation of the school guidance facilities . Counselors of these centers work closely not only with the students, their parents, teachers , but also with other cooperative institutions. In this paper we try to present, according to the research, how these counselors themselves are satisfied with their jobs . How they assess the job from different perspectives , and whether there are opportunities to improve the quality of their lives.

Keywords: quality of life ; counseling ; counselor ; students with special needs ; pupils with visual impairments ; hearing impaired pupil .

1. Introduction

After 1990 in the Czech Republic, the view of individuals with special needs within the society began to change and the process of their integration was commenced. In the area of school policy the most significant change took place in 2004 with the new Education Act No. 561/2004 Coll., which provides for equal access of individuals with special educational needs to education without any discrimination. The Act reflects the educational needs of an individual, ensures mutual esteem, respect, solidarity and dignity and overall personality development with an emphasis on cognitive, social, moral, ethical and spiritual values. Fulfilling these defined legal provisions should also lead to improved quality of life of individuals with special educational needs. During recent years, the term 'quality of life' has become widely discussed in the area of special education in the Czech Republic and there has been a lot of research dealing with the quality of life of individuals with special needs. On the other hand, there are no studies focussing on the quality of life of counsellors, who are in a daily and intensive contact with children and pupils with special needs, or with their families or school employees. Legal regulations applicable to employees in school counselling centres gradually increase their workload; however, the question that remains is whether the support of these employees increases as well. We believe that the effort aimed at assessing the quality of life of individuals with special needs should be correspondingly targeted at people in counselling professions, who largely contribute to the quality of life of individuals with special needs.

2. School counselling centres – special education centres

Professional counselling services rendered to children and pupils with special needs, their legal representatives and teachers present an integral part of educational systems in all developed countries (Hanák, 2008). In the Czech Republic school counselling centres are defined by Act No. 561/2004 Coll. and provide children, pupils,

* Corresponding author. Tel.: +420 585 635 301; E-mail address: libuse.ludikova@upol.cz

their legal representatives, schools and school facilities with information, diagnostic, counselling and methodological activities, ensure professional special-education and educational-psychological services, preventive educational care and help in the selection of appropriate education of children, pupils and students and their preparation for future professions. School counselling centres cooperate with social and legal child protection institutions and youth and family care institutions, health-care institutions and other authorities and institutions as required.

Special education centres (referred to as SECs) are school counselling centres defined by Decree No. 72/2005 Coll., which provide counselling services especially to children and pupils with special needs integrated in schools and school facilities. SECs are usually designated for a single type of impairment (hearing, visual, mental, etc.)

In our study we will address the issue of SECs only for children and pupils with sensory impairment, i.e. visual or hearing impairment.

The activities of SECs are performed on an outpatient basis in SEC centres and also by SEC employees visiting schools and school facilities or in families or institutions caring for pupils with special needs.

The work of SEC employees is based on a close cooperation with the family members of a child – according to the ‘Code of Ethics for SEC counsellors’ SEC employees should always explain to the parents the principle of each examination or professional intervention that the child undergoes, communicate the results of each examination, consultation or other services rendered to the child and last but not least consult with the parents the plans to support the child and optimize the child’s development including any alternative approaches.

With respect to the teachers of these children and pupils, SECs try to develop harmonic and cooperative working relations with school employees involved in the process of integration.

SECs also maintain significant cooperation with other institutions and organizations involved in their scope of activities.

SECs employ pedagogical staff consisting of a special pedagogue, psychologist and social worker.

2.1. Research

The following research was carried out in order to obtain basic information about the professional lives of special pedagogues in SECs focussing on children and pupils with visual and hearing impairment.

Data collection was performed by means of questionnaires consisting of 15 open-ended questions ‘satisfaction tables’ with scale assessment.

The first item focussed on the length of work experience in the respondents’ current job – i.e. SEC for children and pupils with visual or hearing impairment.

Table 1. : Length of work experience.

Length of work experience	
Work experience in the field up to 2 years	9
Work experience in the field up to 10 years	21
Work experience in the field up to 20 years	5

The results in Table 1 imply that the length of work experience varied among the respondents, the prevailing length of work experience was up to 10 years.

We further focussed on the assessment of the respondents' satisfaction with various factors of their professional life.

Table No. 2: Degree of job satisfaction.

Degree of job satisfaction	
Completely satisfied	14
Very satisfied	11
Fairly satisfied	10

The results show that the employees expressed satisfaction with their jobs.

Table No. 3: Change of job.

Change of job	
I am not thinking about changing my job	25
I am thinking about changing my job	10

This question was based around thinking about changing the current job (i.e. SEC). Over 70 % of respondents (25) do not consider changing their current position. Less than 29 % respondents sometimes think about changing their job. One respondent said that thinking about a job change was absolutely normal, particularly in a demanding work setting.

Table No. 4: Degree of satisfaction with career growth.

Degree of satisfaction with career growth	
Completely satisfied	4
Very satisfied	8
Fairly satisfied	16
Dissatisfied	4
Disappointed	3

The degree of satisfaction with career growth is evenly distributed around the mean value. Out of the total number of respondents, 45.71 % is fairly satisfied.

Table No. 5: Degree of satisfaction with availability of work-related materials.

Degree of satisfaction with availability of materials	
Completely satisfied	6
Very satisfied	19
Fairly satisfied	10

The degree of satisfaction with availability of work-related materials was in the positive half of the assessment scale for all respondents.

Table No. 6: Degree of satisfaction with meaningfulness of work.

Degree of satisfaction with meaningfulness of work	
Completely satisfied	21
Very satisfied	9
Fairly satisfied	5

None of the respondents was dissatisfied or disappointed, which we believe is a very important aspect in any job.

Table No. 7: Degree of satisfaction with work relationships.

	Completely satisfied	Very satisfied	Fairly satisfied
Degree of satisfaction with work relationships	9	22	4
I have support from my colleagues	9	20	1
I do not have support from my colleagues	0	2	3

The degree of satisfaction with work relationships was predominantly positive – 9 respondents were completely satisfied, 22 very satisfied and 4 fairly satisfied.

Table No. 8: Degree of satisfaction with family cooperation.

Degree of satisfaction with family cooperation	
Very satisfied	9
Fairly satisfied	26

The degree of satisfaction with family cooperation ranged between very satisfied (9 respondents) and fairly satisfied (26 respondents). None of the respondents was completely satisfied, dissatisfied or disappointed.

Table No. 9: Degree of satisfaction with cooperating institutions.

Degree of satisfaction with cooperating institutions	
Very satisfied	6
Fairly satisfied	29

Apart from families, SECs commonly cooperate with other entities, particularly schools and school facilities, SECs often cooperate with other special education centres and other organizations. Out of all respondents, 6 were very satisfied, 29 fairly satisfied.

Table No. 10: Degree of satisfaction with importance perceived by the public.

Degree of satisfaction with importance perceived by the public	
Completely satisfied	2
Very satisfied	6
Fairly satisfied	10
Dissatisfied	17

For the first time throughout the survey, the responses to this question showed significant dissatisfaction of the respondents.

Table No. 11: Degree of satisfaction with work schedule.

Degree of satisfaction with work schedule	
Completely satisfied	1
Very satisfied	9
Fairly satisfied	11
Dissatisfied	14

Similarly to the previous question, the responses indicated a higher degree of dissatisfaction.

Table No. 12: Physical and mental work demands.

	Mental demands	Physical demands
Yes	35	9
No	0	26

In the questionnaire survey we also focussed on physical and mental demands of work in SECs. The data indicates that the work is mentally demanding for 100 % of respondents. On the other hand, according to 74 % of respondents the work has low physical demands.

3. Conclusions

If we endeavour to increase the quality of life of impaired individuals (whether it be through integration, increasing the knowledge of parents or other professionals involved in child care, through a process of deinstitutionalization or a change in the perception of these individuals by the general public), we should also consider the conditions and motivation of SEC employees, who are an inseparable part of the process.

The aim of the research was to reflect on the knowledge about the professional lives of the employees of special education centres caring for children and pupils with visual and hearing impairment. The intention was not to assess the quality of professional lives of these employees. The main aim was to find out about the degree of professional satisfaction of these employees.

What are the conclusions? Possible areas to improve the quality of professional lives of counselling professionals reside primarily in deepening equal opportunities, harmonizing the interests of the employees and employers and improved conditions for self-realization of the employees. A significant aspect is also the meaningfulness of work and improved work and life conditions of the employees, who should be respected. At the same time attention should be given to their individual needs and decreased periods of adverse risk factors of the working environment.

A crucial part of increasing the quality of professional life is employee motivation and stimulation, primarily in terms of joint decision making about the length, arrangement and location of working hours, increased degree of work-related independence and support of professional growth, interests and other personal activities.

Responsive web design: a new type of design for web-based instructional content

Meltem Huri Baturay^{a*}, Murat Birtane^b

^a*Ipek University, Center of Distance Education, "Ankara", Turkey*

^b*Ipek University, Department of Information Technologies, "Ankara", Turkey*

Abstract

As the time passes by, more and more people surf through the Internet using mobile devices compared to a desktop computer. Recently, mobile device and computer screen designers have been trying to provide users with qualified web-browsing but this hasn't been able to afford adequately users' needs that are exposed to traditional website layouts. Therefore, there is a need to switch to Responsive Web Design which is capable of reshaping itself depending on various screen sizes and resolutions from largest screen sizes to smallest on mobile devices. Thus, the users will be exposed to the best experience with content visual display on the device or platform that they are viewing it on. This is more significant when users are studying on instructional web-sites and pages not to decrease their concentration, motivation and performance on their study since the responsive web design automatically change page layout, resize the images or crop them proportionally. In the paper, the authors will inform the audience on Responsive Web Design by indicating an educational web-site as a sample and discuss about its features.

Keywords: responsive web design, instructional content, web-based

1. INTRODUCTION

Whenever a user enters a website, the most prominent and fundamental thing he looks for is whether he can access all info he required as quickly as he can with minimum effort. This requires provision of the best experience for the user with minimum resizing and scrolling while navigating the site (Sharkie & Fisher, 2013). Mobile device and computer screen designers have been trying to provide users with qualified web-browsing but this hasn't been able to afford adequately users' needs that are exposed to traditional website layouts. Therefore, there is a need to switch to a new design which is capable of reshaping itself depending on various screen sizes and resolutions from largest screen sizes to smallest on mobile devices, see Fig 1. Thus, the users will be exposed to the best experience with content visual display on the device or platform that they are viewing it on.

Fig. 1. Mobile devices with various screen sizes and resolutions

The term “Responsive Web Design” was coined by Ethan Marcotte in 2010 on his “A book apart” website. Since then, many projects have been developed using his techniques (Rekhi, 2013). The term is often used to infer the same meaning as a number of other descriptions such as fluid design, elastic layout, rubber layout, liquid design, adaptive layout, cross-device design, and flexible design (Frain, 2012). RWD enables users the best practices while surfing on a website through a multi-device world such as smartphones, tablets, laptop besides desktops. It is time that the web site designs should allow user to respond to any devices like mobiles in portrait and landscape mode, tablets in portrait and landscape mode, laptops, desktops and monitors (Sharkie & Fisher, 2013). Rekhi (2013) states that the designers work is not huge in the development phase of a responsive web site which serves different screen resolutions since with the advent of CSS3 and its design techniques it is becoming easier and easier.

There are three key technical features a responsive web design holds:

- *Media queries and screen resolutions:* A designer should use HTML and CSS3 media queries so that the web site decides how to view the content depending on the screen of each device.
- *Fluid grid layouts:* Responsive web design works on multiple devices by using fluid proportion based grids. It allows the content to resize and rearrange as the percentage-based width of a webpage grid expands or contracts. Therefore, it targets the width of each user's web browser to determine how much space is available and how it should display the website.
- *Flexible images and media:* (through dynamic resizing): The responsive web design automatically changes page layout, resizes the images or crops them proportionally. Thus, there is no need to work on three separate designs for a designer. With the capability CSS3 script language, three dynamic screens are easily designed at one time. For a desktop screen, 1024 pixels width is kept; the same design is rendered on mobile devices (like Ipad) with 768 pixels width and the same design again rendered on smartphones (like Iphone, Galaxy etc.) with 320 Pixels width, see Fig 2.

Fig. 2. The blocks depicted for a desktop, an iPad and a smartphone in pixels

All these features should be implemented to have a responsive web design. De Graeve (2011) states that the key point is adapting to the user's needs and device capabilities. Besides, keeping a simple layout and HTML5 code as simple as possible is the first rule and every styling CSS3 and styling information should be removed.

1.1. Advantages of Responsive Web-Design

Some of the prominent advantages of responsive web-design are as follows:

- Broadcasts content on multi-devices at one-time by automatically resizing content to the screen by making it easily readable on every device.
- The content can be degraded if required. For instance we might have some images on a desktop version of our content which we do not want to present on the smartphone size version but the texts or vice versa; or a web page designed for access by smartphone might have fewer menu options than the one of a desktop.
- There is no need to zoom in or out since everything is readable and presented on any screen.
- Easy navigation with the provision of minimum of resizing, panning, and scrolling across a wide range of devices.
- The designer saves time and money by not maintaining a mobile friendly site. There is no need of it.

1.2. Limitations of Responsive Web-Design

Some of the limitations of responsive web-design are indicated below:

- Screen readers which translate web content into audio or Braille for handicapped might be confused by the systems.
- Unfortunately most mobile devices are not compatible with CSS3 media queries and not all browsers (i.e. Internet Explorer) support CSS3. With a Javascript Library Documents; however, this limitation can be eradicated.

- As RWD works on image resizing, the full image is downloaded on a user's device and then resized to fit the screen; sometimes it takes time and impacts performance of the website (Rekhi, 2013).

2. E-learning through Responsive Web Sites

Responsive Web Design offers ways to create a single site that responds dynamically to the devices viewing it. This is more significant when users are studying on instructional web-sites and pages as their concentration, motivation and performance on their study should not decrease while they are studying. While studying on an instructional web site, the audience should not waste their time for navigating, scrolling, paging. This not only effects their learning but also breaks their concentration. Besides, this might create huge "cognitive load" for the audience. Thus, with RWD, web-based instruction;

- is run on a more user-friendly learning environment for the learners,
- is more enjoyable, usable and readable through different mobile devices,
- is more effective since the learners' concentration are not broken and their motivation does not decrease with unnecessary navigation,
- HTML5 eradicates the problem of flash-based content which have often been preferred for the presentation of web-based instructional content.

The same standards and the approach behind Responsive Design are kept to run responsive e-learning. With the developments in HTML5, instructional designers can now develop a single e-learning module which will work on all devices.

3. The Design

The authors of the current study designed a web page depending on the principles of responsive web-design. The web site was in Turkish and about Distance Education.

Fig. 3. The same design on a desktop, laptop, iPad and a smartphone

As indicated in Fig 3, the same piece of information is easily accessed on the web site through different devices like a pc, laptop, iPad and a smartphone. All applications present the same content almost in the same format which enable users to access the same piece of information in the same place with the same type of navigation. This facilitates users' work and eradicates time loss while they are looking for the same information on different devices. As seen, this design is more user-friendly.

4. Conclusion

Responsive Web design is still in its early stages, new designs will be offered as more and more screen sizes and form factors arrive, the conversation will continue.

Web designers will continue to offer different opinions and recommend directions related to whether to build for mobile first, how to fit these decisions into the design process, whether to slice up the comps into all the different screen sizes, and so forth. And

HTML5 and CSS3 standards are great help to web designers to deal with these issues. Responsive web design meets the challenges with traditional designs and it's clear that new standards will continue to evolve to handle the changing world of devices and browsers.

4th International Conference on New Horizons in Education

Retaining mature knowledge workers: the quest for human capital investments

Mojca Kogovsek^{a*}, Metka Kogovsek^b^aUniversity of Ljubljana, Faculty of Economics, 1000, "Ljubljana", Slovenia^bUniversity of Ljubljana, Faculty of Economics, 1000, "Ljubljana", Slovenia

Abstract

Knowledge society requires constant professional development since the growth no longer lies in improving efficiency but rather on workforce capabilities. Individual level of human capital in particular has become the key quality of labour upon which future economic growth is built upon. However workforce is aging in all developed countries and subsequently workforce aging will continue for decades. The skill shortages are predicted especially regarding knowledge-intensive occupations that raise question about competitiveness of organisations therefore mature knowledge workers do play an important role in workforce.

The purpose of the paper is to provide a discussion on integrative approach toward professional development of mature knowledge workers within the wider organizations' strategic plans to achieving competitive edge over those that ignore the demographic trends. The accumulation of human capital does not end with schools but is rather a constant process of professional development, a lever to augmentation and adaption of existing knowledge of an individual. Organizations that apply professional development of all the workers regardless of age will be able to rely upon human capital potential that can adequately adapt to internal and external business demands. Based on literature retrieval, the most important dimensions of professional development of mature knowledge workers are identified and the professional development framework proposed.

Keywords: mature knowledge workers, professional development, retention.

1. INTRODUCTION

All developed countries face the phenomena of workforce aging and it is predicted to continue for decades (Callan & Greenhaus, 2010; Voelpel & Streb, 2010). It will gradually result in skills shortage that is likely to become the central issue on the company level (Koc-Menard, 2009; Midtsundstad, 2011). Due to confrontation with skill shortages there is a need to develop skills and competences of existing workforce including mature-aged employees since they are forming increasing proportion of it (Smith, Smith & Smith, 2010). Knowledge-based economy focuses on human capital as the key source of economic growth (Cheng & Ho, 2001, Bernardin, 2003) and the challenge is mainly on knowledge workers. By constant professional development of mature knowledge workers knowledge is updated and companies are able to rely upon their potentials (Bangali, 2004, Jalette & Villeneuve, 2002). Although not always acknowledged adequately (Peterson and Spiker, 2005), mature knowledge workers are valuable sources of experiences and knowledge (Callahan, Kiker & Cross, 2003). In rapidly changing knowledge environment there is an absolute need to offer quality training programs to maintain

* Corresponding author. Tel.: +386 41 623 259.

E-mail address: mojca.kogovsek2@guest.arnes.si

workers' employability. The emphasis of training is common to advanced economies, because organisations can overcome competition issues only if workforce attains high levels of knowledge and skill and accordingly Brooke (1995) argues about the most important organizations' assets: "Few companies appear to have developed comprehensive strategies to overcome these skill shortages and even companies investing more on training tend to focus on the short term need for technical skills, rather than the longer term development of employees. In the long run, organizations are made or broken not by markets or capital patents or equipment, but by people."

Organizations' valuable assets in knowledge-based environment are more in employees than in machinery (Mellander, 2001). The rise of knowledge work has emerged in labour markets in all developed countries. Therefore there is a growing importance of knowledge as an economic resource that reflects technological development. There is shrinkage of jobs in the manufacturing in comparison to professional and service occupations that involve working with knowledge or people. In new economies business success no longer lies on improving efficiency, but rather on human capabilities (Pyöriä, 2005; Loretto & White, 2006) and human capital is generally worth five to ten times more than physical capital (Gill, 2009). Therefore human capital investment should have been set according to the increased value of knowledge. Rapid technological advancement brings opportunities to prolong working life since work is done by reduction of physical demand (Smith, Smith & Smith, 2010).

Even though a vast literature that in theory generally supports age management exists (for example Rocco, Stein & Lee, 2003; Brooke & Taylor, 2005; Leibold & Voelpel, 2006; and many others) research on professional development of mature knowledge workers is lacking (Picchio & van Ours, 2013). This study attempts to bridge the gap by offering the comprehensive discussion on personal and organizational determinants of professional development. The structure of this paper is divided into three sections. After reviewing the problems of workforce aging and skills shortage, the second chapter deals with the need for professional development strategies supporting professional development while the final chapter ends with concluding thoughts.

1.1. A mature knowledge worker definition

Knowledge worker is a worker that possesses problem solving skills and is able to produce knowledge that requires high level of intellectual capital (Mitchell & Meacham, 2011) whereas mature individual cannot be limped within a particular chronological age group since individuals differ considerably. Therefore age can just serve as a proxy (Kanfer and Ackerman, 2004). Ennis-Cole and Allen (1998) emphasise the importance of the adequate conceptualization of age that is based on maturation and is build upon personal and professional experiences. There are different threshold age categories, but most frequently researchers conceptualise individuals aged 50 and older as mature because it is the age when participation rate in labour market starts to decline (OECD, 2005).

1.2. The need to retain mature knowledge workers

Although Europe lost 5.5 million jobs due to economic and financial crises since 2008, according to the forecasts 83 million vacant working places are predicted in European labour market by 2020 mainly due to 75 million individuals retiring and only 8 million vacant working places due to job demand expansion. The raise is forecasted especially in knowledge-intensive occupations (Lettmayr & Nehis, 2012) therefore the future is uncertain regarding availability of skilled workers especially in knowledge-intensive occupations while human capital reserves are predicted within the group of mature workers aged 65 and over (Pillay, Kelly & Tones, 2010; Lettmayr & Nehis, 2012).

2. Strategies supporting professional development of mature knowledge workers

Mature knowledge workers should have been regarded not as short-term costs but rather long-term investments particularly in respect of training (Brooke, 1995) since they are greatly interested for training, readily embrace organizational changes are more focused at work, more reliable and loyal to the employer (Smith, Smith & Smith, 2010). Updating mature workers' skills is found to be more cost-effective than hiring a non-experienced worker (Ennis-Cole & Allen, 1998). Companies are advised to invest in training mature employees since their commitment to learning is stronger and try to contribute to organisation's mission. Mature knowledge workers' continuous education and training is being proved to be beneficial since the organisations report increased motivation, retention and reduced absenteeism (Newton, et al., 2005).

2.1. The need for professional development

Aging of the workforce is an issue for the organizations therefore for their best interest understanding of mature employees' career goals and other factors of work engagement are needed for designing strategies to retain mature employees (Tones, Pillay, & Kelly, 2011). There is no reason to believe that elderly individuals are incapable learners although in 19th and 20th century, gerontology literature reported cognitive decline with ageing whereas recent studies contradict those conclusions. Many researchers have proved that significant declines in cognition often manifest when people are in their 60s to 70s (Schaie, 1996; Craik & Salthouse, 2000; Staudinger & Lindenberger, 2003; Smith Smith & Smith, 2010). Mature individuals may suffer a slight decline in some areas of cognitive abilities but only those of aged 80 or more. However, they develop compensatory mechanisms for any sort of decline

The importance of learning constantly increases in contemporary working environment with continuous changes in working life exacerbated by technological development and an increasingly global economy and will continue to impact general competence requirements (Billet, 2010). Human resource departments provide learning opportunities that help employees to be ready for competition within a global economy since employees who acquire a wider range of skills become the organizations' valuable assets. The positive consequence of learning is that workers can much quicker adapt to internal and external business demands and at the same time preserve productivity under any conditions (Abrams, & Berge, 2010). Contemporary assumptions are built on cognitive abilities of employees (Ballot, Fakhfakh & Taymaz, 2001) that are intangible assets appearing in a form of training stock which was proved to be a significant input of production function. In emerging knowledge society learning as well as other features of work considerably altered. Individual level of human capital in particular has become the key quality of labour upon which future economic growth is built upon (Pyöriä, 2005). High-skilled occupations that deal with knowledge or people are growing while routine-intensive and less abstract jobs are eroding that require development of transferable skills (Bosch & ter Weel, 2013). Knowledge work requires extensive formal education and constant on-job training (Pyöriä, 2005). Therefore in contemporary work setting employer usually pays for transferable skills regardless the assumptions of theory of training

because of the growing importance of knowledge as an economic resource that reflects technological development (Pyöriä, 2005; Loretto & White, 2006).

Through professional development programs, human capital is upgraded, skill obsolescence avoided, performance improved and consequently employability increased that means that mature individuals less likely to be pushed outside the labour market. Nevertheless, non-voluntary separation from work means violation of human rights and further exclusion from labour means loss of financial independence and dignity (Bangali, 2004).

2.2. Professional development and mature knowledge workers' retention

By the means of training, employability is strengthened and as such it is considered a very powerful human resource strategy (Picchio & van Ours, 2013). It has been proven that among other conditions, continuous learning help improve attachment of mature knowledge workers to labour market (Bangali, 2004; Fourage & Schils, 2008; Bohlinger & van Loo, 2010). Individual employability comprises of the abilities of individual under the consideration of his/her labour market ability to manage his/her own career, continuous learning. It emerges in forms of initial employment, employment maintenance and ability to get new employment when required (Bangali, 2004). From the employees' prospective employability is defined as an appropriate set of skills whereas from employers' perspective employability is understood to be a set of skills offered by a job applicant that can add value to business (Patrickson & Ranzijn, 2003). Thus, lifelong learning of mature knowledge workers must address today's issues and challenges with appropriate new learning tools that are flexible, adaptable, and easily updated (Maurer, 2001). Lifelong learning enhances individual development and employability which pertains obtaining and remaining in paid employment (Žnidaršič, 2008).

Almost half of knowledge resides in the brains of the employees organizations are severely affected by the knowledge loss through the process of retiring therefore another thing that has to be considered is knowledge transfer through which knowledge is retained within the workplace. Knowledge is mostly transferred through mentoring while guidance is offered but there are also other ways like usage of document repositories, classroom learning, through leaning communities where knowledge is shared between older and younger colleagues, there are also multi-media courses, audio/video interviewing. Reverse mentoring contains two-way learning where younger workers assist mature workers regarding specific fields and vice versa but it requires attitude of openness (Stevens, 2010).

In growth-oriented organizations optimal knowledge management can be gained within multi-generational work teams where knowledge can be shared and finally successfully deployed where learning, innovations and continuous training are viewed as strategic measures (Stevens, 2010).

2.3. Holistic approach towards professional development strategies

Knowledge and competences are developed through the process of education and training and is transferred and strengthened through social interactions. When organizing learning activities, characteristics of adult learners have to be taken into account. The dimensions that needs to be examined to gain optimal implementation of different learning measures are those that ensure enhancement of learning motivation, several management supporting measures, learning styles implementation that match learners personal learning preferences, choosing appropriate learning strategies and learning forms. Lowe (2002) emphasises the necessity to firmly establish organizational learning where new approaches regarding mature knowledge workers' professional development, work organization, job design, organizational culture and business strategy needed to be redefined. Rapid transformation of knowledge and technology bring about the need to leverage skills through continuous active training within and outside working environment.

Table 1. Strategies supporting professional development of mature knowledge workers

Strategy	Specific suggestion	Reference(s)
Management support	Non-discriminatory approach	Burke & Ng, 2006
	Fostering the developmental paths	Maurer & Lippstreu, 2008
	Recognition	Knafer & Ackerman, 2004; Griffin, 2011
	Organizational culture where learning is highly valued	Lowe, 2002; Rocco, Stein & Lee, 2003; Bohlinger & van Loo, 2010
Learning motivation enhancement	Offering career development from training	Bertolino, Truxillo & Fraccaroli, 2011
	Creation of climate of mutual respect and appreciation	Issac, Wilfred & Pitt, 2001
	Linking acquired knowledge with previous experience	Cole, 2012; Smith, Smith & Smith, 2010
Learning styles implementation	Shaping an individual approach to learning	Kolb & Kolb, 2005; Graff, 2012
Pedagogic approaches	Systematic approach to training that pertain identifying and analyzing the training need, specifying training objectives, establishment of training design, choosing training program	Brooke, 1995; Bertolino, Truxillo & Fraccaroli, 2011
	Choosing appropriate learning form	Bohlinger & van Loo, 2010
	Curriculum on practice-based experience with educational intervention	Bertolino, Truxillo & Fraccaroli, 2011

Based on expectancy theory, training motivation is conceptualized in terms of tendency to engage in training and development activities. Intrinsic motivation can be enhanced through offer of career development from training in the coming years (Bertolino, Truxillo & Fraccaroli, 2011). Additionally emotions of intrinsic motivation can be enhanced through in learning and training opportunities within a climate of mutual respect and appreciation when employees met or even exceed employers' expectations (Issac, Wilfred & Pitt, 2001). Adults are independent individuals who mostly like to be involved in learning, most of them being internally motivated learners with wealth of experience, therefore links between acquired knowledge with previous experience are highly recommended. They mainly prefer goal-oriented training that has immediate effect at their workplaces (Cole, 2012).

Management support is offered through several important dimensions that contribute to optimization of human capital accumulation. It starts from the very basic requirement of non-discriminatory approach towards workers regardless of age with the access to training for all and further with the creation of positive learning climate (McCracken, Brown & O' Kane, 2012). Providing equal opportunities is recommended to create win-win situation since older employees remain motivated to contribute in terms of high quality performance (Kluge and Krings, 2008). Employees need credible information about the development paths that management fosters through learning (Maurer & Lippstreu, 2008) and through recognition and learning evaluation (Griffin, 2011). To firmly establish organizational learning, approaches regarding human resource development, work organization, job design, organizational culture and business strategy need to be redefined. Human resource managers are advised to shape organizational culture that appreciates mature individuals as valuable workers (Rocco, Stein & Lee, 2003). In knowledge economy all employees are able to contribute and develop their skills therefore policy

priorities for promotion of continuous learning demand organizational culture that highly values learning (Lowe, 2002).

Learning styles implementation that match learners personal learning preferences are founded in experiential learning theory (Kolb & Kolb, 2005; Graff, 2012) since most adults use a blend of four learning styles which shape an individual approach to learning (activists, reflectors, theorists and pragmatists). By knowing the learning style of an individual learner and adopting it accordingly, newly acquired knowledge can be maximized. Technology based approaches offer opportunities to accommodate individual learning style preferences, so individuals can learn by reading materials, by watching videos or by hearing lectures on-line (Rahim & Finch, 2011). When learning at work, experiences develop during the process and provide a foundation for reflection and comparison to previously encountered knowledge (Gray, 2004) therefore it is considered to be an important way of competence development related to job itself and is a bridge between formal education and practical competences (Gray, 2004; Fourage & Schils, 2008). Although work experience is found to be of great importance, it is still not sufficient therefore to achieve optimal results, education and experience need to be linked (Paloniemi, 2006).

Decision about learning strategies is rather complex. Different subjects and knowledge domains response to different learning aims and therefore it would appear likely that learners have preferences for different pedagogic approaches in particular learning contexts (Ong, Lai & Wang, 2004). Deciding about learning strategy has to be conducted systematically through integration of formal and informal workplace learning where learner is viewed as knowledge-seeker. Adequate organizational practices in treatment of human resources are being emphasized regarding establishment of systematic approach to training that pertain identifying and analyzing the training need, specifying training objectives, establishment of training design, choosing training program and finally evaluating training achievements that follows with rewarding procedures (Brooke, 1995). To accommodate the diverse training needs different curriculum models are proposed through which learning that suits the specific needs of individuals and meet learning target are offered. The wholly practice-based model is designed to accommodate different options of on-job-training where knowledge is developed in self directed learning through access to more experienced employees. On the other hand, education-based learning based on specially required programs that offer development of specific personal and professional competences. However, the mix of two in terms of curriculum on practice-based experience with educational intervention is being proposed (Bertolino, Truxillo & Fraccaroli, 2011). Several studies have found increasing variability on learning paths. While aging individuals develop different skills at different points in life, and simultaneously become more and more different. Therefore a life-course perspective on human resource development should be differentiated across domains of expertise, individual biographies and age groups (Lahn, 2002). Mature individuals cannot be all limped into the same category but rather be paid attention to regarding facilitation of their special needs (Ennis-Cole & Allen, 1998). Differences in learning preferences between individuals become greater with ageing and are based on personality differences, class differences and educational differences therefore mature learners have to receive even greater consideration in the delivery of training programs (Maurer, 2001).

When preparing training plan, three main forms of learning are differentiated as formal learning that takes place in education institutions and when completed individual receives recognized diplomas and qualifications. Than non-formal learning appears as on-job training and other forms within the human resource development measures within organizations that does not lead to receiving recognized certificates. And finally informal learning that occurs in everyday life and is not recognized and sometimes even not intentional but nevertheless contributes to upgrading of knowledge and skills (Bohlinger & van Loo, 2010).

3. Conclusion

The workforce ageing raises question about competitiveness of companies globally due to labour and skill shortages, especially regarding knowledge-intensive occupations. Because of demographic impacts on social life

as well as the problem that it creates impacting state budgets, mature individuals are being treated in a new fashion as valuable human resource and labour market reserves and as such organizations' policies need to facility their participation in lifelong learning to foster their employability (Bohlinger & van Loo, 2010). Many mature individuals will now have to extended their working lives therefore there is a need to maintain their employability longer than previous generations of workers. In emerging knowledge societies companies are increasingly reliant upon knowledge workers to secure their economic and social development. When implementing training programs, human resource departments enhance developments of workforce in terms of flexibility and growth and at the same time prepare companies for emergencies, recessions, and the increased competition.

The conclusion goes to necessity of adoption of new requirements regarding learning and working life, building inclusive and learning supportive workplaces. Human resource departments that offer training opportunities are those that enable workers to become capable, productive, and lifelong learning workers. Knowledge workers need strong support regarding lifelong learning due to rapidly changing technologies and global environment. The key issue regarding whether a worker is capable of prolonging working life is the maintenance of individual workability which is the prerequisite in pursuance of prolonging working life. Continuous training of mature workers is one of the most important agents of prolonging working life because up-to date knowledge and skills are, above adequate health status, key factor of workability. Adequate levels of investment in lifelong learning results in mental fitness. Maintenance of workability of an individual worker means of taking health preservation actions and constant engagement in lifelong learning.

Knowledge workers' workability model offers holistic approach to human capital development as a transition to successful combating challenges of current difficult situations of economic decline and where success no longer lies in improving efficiency but rather on human capabilities. Success can be attained when learning is implemented according to specific requirements regarding management support, establishing appropriate learning strategies, deciding to conduct the form of learning according to learning content and above all because knowledge workers are strongly motivated motivation to participate in learning.

4th International Conference on New Horizons in Education

Satisfaction with Education

Marek Botek^{a*}

^aInstitute of Chemical Technology, Prague, Faculty of Chemical Engineering, Department of Economics and Management of Chemical and Food Industry, Technická 5, 166 28 Prague, the Czech republic

Abstract

Many studies confirm a collection of students satisfaction measurement. It represents the first level of Kirkpatrick model. This level is the basic one and used in a lot of companies, but some gaps and problems are discussed. The aim of the article is to show problematic aspects of student satisfaction measurement at Institute of Chemical Technology Prague. These aspects should be taken into account if the measurement is used as a source for changes or teachers evaluation. The article shows that received data are not representative and offers other methods to evaluation of education.

Keywords: Students Satisfaction; Quality of Education; Student Feedback; Kirkpatrick Model

1. Introduction

Satisfaction with education is the first level in the Kirkpatrick model of education evaluation. Grider, Capps and Toombs (In Bates, 2004) found that most of organizations are historically focused only for collecting reactions measures. Other levels are learning, behavior, and results. Philips (1996) added the fifth level – return of investment (ROI). Also other authors tried to modify and add the original Kirkpatrick model (e.g. Cannon-Bowers, 1995; Cascio, 1999). The model has also received a certain amount of criticism (e.g. Alliger & Janak, 1989; Tannenbaum & Woods, 1992; Sitzmann et al., 2008; Giangreco, Carugati & Sebastiano, 2010). Against these polemics it is used in a lot of business and non-commercial institutions include universities using particularly students satisfaction measurement.

Satisfaction with teaching seems to be very important factor in university evaluation, but it is hard to satisfy all stakeholders (students, sponsors, employers, society, etc). Universities as a nonprofit organizations, can not be focused for obtain profit. Choudhury (2012) offers more questions to define university goals and priorities. Only after the finding of stakeholders and goals, it is possible to define quality of higher education sector. Parasuraman et al. (1988) defined five dimensional model of service quality consist of tangibles, reliability, responsiveness, assurance and empathy, which is possible to use for higher education evaluation. Berk (2006) thinks that no objective method for measuring teaching performance exists.

This article is focused to show failings and problems of satisfaction measurement based on the analysis of students' evaluation at Institute of Chemical Technology, Prague (ICT). It discusses other possible tools to quality evaluation of teaching.

The paper begins with literature review regarding to students evaluation and satisfaction. Next, the design of study is described and findings are discussed. At the end article offers other possible tools to evaluate teaching and possible ways for future research.

2. Literature review

Schools and universities are traditionally focused on evaluation of students. In accordance with Kirkpatrick model there is the second level - learning. Because they usually prepare wide range graduates, they examine knowledge without considering their job related application. But universities use the first level of Kirkpatrick model, too. They often consider students as customers of higher education (Cremonini, Westerheijden & Enders, 2008; Sinclaire, 2011; Taylor et al., 2008), and therefore collect students feedback. Loveland (In Haan, 2010) claimed there have been during the past seventy years over 2 000 studies in student evaluation teaching. Nair, Bennett and Mertova (2010) found that many universities around the world collect student feedback, but they do not use it for institutional changes.

There are many definitions of student satisfaction (see O'Leary & Quilan, 2007; Moore, 2009 and there is clear that students satisfaction is influenced by many factors (Griggs, Blackburn & Smith, 2012). Choudhury (2012) assumes four dimensions (teaching, facilities, attitude and convenience), Maceli, Fogliasso and Baack (2011) confirmed gender influence, Marsh (2000) discussed the impact of the grade which students expect to receive. Maceli, Fogliasso and Baack (2011) claim that students expect teachers to possess superior communication skills and the ability to artfully engage students in the learning process, Abduh, Maritz and Rushworth (2012) were focused on satisfaction in terms of learning and teaching resources, teaching methods and achievement of expected outcomes.

Other researchers have analyzed satisfaction in comparison traditional, textbook based and non-traditional internet based education (DeBerg & Chapman, 2012; Peacock, Watts & Foreman, 2013; Sinclaire, 2011) or surveyed factors for choice of university (Sojkin, Bartowiak & Skuza, 2012).

Improved student involvement and satisfaction can lead to improved learning. Student perceptions are important parameters of the social and psychological aspects of the learning environments (Fraser, 1998; Huam, Amram & Lee, 2011; Ramsden, 2005).

3. Research design

Evaluation of student satisfaction at ICT Prague is realized since 2004. Previously it was pen-paper modification, since 2006/2007 it is computerized. Students can from 10th week of semester (semester consist of 14 weeks) evaluate each subject (lecturer) they enrolled. The evaluation consists of 8 items of satisfaction evaluated on five-point Likert scale (1 is the best, 5 is the worst).

Data were collected under winter semester 2012/2013. There were evaluated 247 lectures, 158 exercises, 7 different seminars and 18 laboratories, it is 430 items. Because a lot of subjects consist of lecture and exercise, there were 330 evaluated subjects. Some subjects are taught in more teaching groups (e.g. Mathematics I in 7 per lectures and 20 per exercises; Chemical Calculations in 30) and some students forgot to fulfill teacher's name therefore in winter semester 2013/2013 were collected 1 114 items. The example is in Table 1. Subject Enterprise Economics consist of lecture (lecturer M.B.) and exercise (for groups because of number of students – lecturers J.D., J.F, D.S., J.S.). Because some students forgot fulfill the name, this subject is divided into 7 items.

Table 1. Evaluation of Enterprise Economics

	Quantity	Item 1	Item 2	Item 3	Item 4	Item 5	Item 6	Item 7	Item 8
Enterprise Economics [M.B, lecture]	21/135	1,57:0,68	1,24:0,54	2,00:0,89	0,00:0,00	2,86:0,96	2,00:0,63	0,00:0,00	2,24:0,83
Enterprise Economics [J.D., exercise]	11/135	1,45:0,93	1,00:0,00	0,00:0,00	0,00:0,00	0,00:0,00	1,64:0,81	0,00:0,00	0,00:0,00
Enterprise Economics [J.F., exercise]	2/135	1,00:0,00	1,00:0,00	0,00:0,00	0,00:0,00	0,00:0,00	1,50:0,71	0,00:0,00	0,00:0,00
Enterprise Economics [D.S., exercise]	4/135	1,25:0,50	1,25:0,50	0,00:0,00	0,00:0,00	0,00:0,00	1,50:0,58	0,00:0,00	0,00:0,00
Enterprise Economics [J.S., exercise]	3/135	1,67:0,58	1,67:0,58	0,00:0,00	0,00:0,00	0,00:0,00	1,67:0,58	0,00:0,00	0,00:0,00
Enterprise Economics [?, exercise]	6/135	1,33:0,52	1,33:0,52	0,00:0,00	0,00:0,00	0,00:0,00	1,67:0,52	0,00:0,00	0,00:0,00
Enterprise Economics [?, lecture]	8/135	1,75:0,46	1,63:1,06	2,13:0,83	0,00:0,00	2,88:1,13	2,13:0,64	0,00:0,00	1,88:0,83

4. Findings

The main disadvantages of current evaluation of students satisfaction is the minimum information value or representativeness. In the evaluation are only total numbers of respondents (students). It is enough if there is only one teacher per group. It does not problem if one teacher leads more groups (e.g. exercises). Instead two evaluations of e.g. 2 groups (18 and 23 members) he receives one evaluation of one group (41 members).

Example presented in Table 1 shows two problems. The first is very low number of feedback and the second is impossibility to find the size of taught groups. 135 is total of enrolled students. These students have only one lecturer but they can choose one of four groups per exercises. The size of these groups is possible to find in other section of Informational system but students can change the group during the semester and evaluate all four teachers. Enterprise Economics is quite small subject, e.g. Mathematics had 1 450 and Chemical Calculations 1 295 enrolled students.

The problem with small number of respondents will be shown in example of Faculty of chemical Engineering, one of four Faculties at ICT Prague. In the winter semester 2012/2013 there was taught 141 subjects in this

Faculty in 350 groups. In this number are not included laboratories, seminars and semestral projects, because of changing too much lecturers here and impossibility to find how many teachers student should evaluate. Table 2 shows the numbers of enrolled students in all departments (signed by numbers 401-407) of the Faculty.

Table 2. Enrolled students at Faculty of Chemical Engineering

	401	402	403	404	405	406	407	total
Nr. of subjects:	30	22	20	16	16	12	25	141
Nr. of groups	56	67	50	55	35	23	64	350
Nr. of enrolled students								
-5	6	25	8	6	3	9	27	x
-10	15	12	11	9	12	1	10	x
-20	20	15	21	7	6	5	11	x
-50	13	11	8	15	9	5	10	x
-100	1	2	1	6	4	3	6	x
-150	1	1	-	5	1	-	-	x
-200	-	-	1	2	-	-	-	x
201+	-	1	-	5	-	-	-	x

Table 3 shows the numbers of received feedback in the semester.

Table 3. Nr. of feedbacks at Faculty of Chemical Engineering

	401	402	403	404	405	406	407
Nr. of students who provided feedback	Nr. of evaluated groups						
1	19	8	13	13	15	12	12
-5	26	26	12	10	11	12	5
-10	7	3	5	11	1	1	11
-20	-	1	2	3	1	1	4
-50	-	2	-	9	1	-	2
50+	-	-	-	-	-	-	-

If we compare these Tables we can see e.g. that at the department 402 was taught 15 groups (11+2+1+1) with more than 20 enrolled students but only in 2 cases evaluated the same group more than 20 students. It is obvious that majority of evaluation comes from 1 up to 5 respondents. Vice versa there was no evaluation of more than 50 members group although there were 6 groups at the Faculty with more than 200 enrolled students.

5. Conclusions and Recommendations

There are two problems in students satisfaction measurement at ICT Prague. The first one is impossibility to determine number of students who should provide feedback. This problem is possible to solve in modification of data collection system. The bigger problem is low returnability of feedbacks. The compulsory feedback is not suitable way. It tends to give average evaluation for all subjects and teachers, very often give feedback students they did not attend the lecture, too. Much better way has chosen the University Centre for Higher Education Quality (CHEQ) (Nair, Bennet & Mertova, 2010), where the rate of responses increases from 33.4 in 2005 to 51.9 in 2008. They use the results to prepare Strategic Policy for Quality Improvement in Teaching and Learning and students belief that staff will act on their feedback.

To use the satisfaction measurement as a source for changes, it is important to select good questions. Interest of subject is for example not good one, because of different natural interest of different subjects (e.g. Soft skills versus Accounting). Vice versa students are able to evaluate e.g. preparedness of teacher or student outcomes.

Indirect method to find student satisfaction is attendance, naturally only in case of voluntary attendance. It is influenced by a lot of factors – e.g. time, day in the week, year of study, another duties, etc. – but influence of teacher is important. Problem can be if there are used quizzes to increase performance (Botek, 2013), because than voluntary attendance is a bit changed to obligatory.

Another indirect method can be analyses of students performance/grades. It is possible particularly for subjects with high number of enrolled students with more lecturers if we can compare these lecturers. If students from some group are significantly better in final test, it is probably because their lecturer. It is important to use same tests and evaluate them in accordance with same way.

Future studies should be focused on comparing student satisfaction, attendance and performance to verify if these indirect methods are usable.

Save animals - use yourself: teaching cardiovascular pathophysiology without lab animals.

Peter Scheer^{a,b*}, Jana Hložková^a, Ivana Uhríková^a, Jaroslav Doubek^a

^a University of Veterinary and Pharmaceutical Sciences Brno, Palackého tř. 1/3, 612 42 Brno, Czech Republic

^b St. Anna's Faculty Hospital - ICRC Brno, Pekařská 53, 61200 Brno, Czech Republic

Abstract

Historically was education of physiology and pathophysiology associated with demonstration of organism's function or basic pathological process on lab animals. This was partly due to the fact that many functions were able to be recorded only invasively i.e. encroaching on investigated object's integrity. But educational trends have significantly changed in last two decades. All of the students, legislation and pressure of non-governmental organizations led to minimizing of using lab animals in lessons of many Faculties of Medicine and Faculties of Veterinary Medicine. Didactic films were used in first phase and animated multimedia presentations prevail recently. Teaching of biomedical subjects without using living organism is possible but students aren't acquiring any new skills by passive monitoring of virtual information. Students also don't have a chance to perceive organism's reaction in other than by sight or audition. This way of teaching lacks emotions that accompany every doctor-patient contact. It is not associated with its stress and tactile and odor perceptions are also missing.

Keywords: teaching pathophysiology; 3R concept; didactic experiment; cardiovascular physiology

1. Introduction

The Department of Physiology, Faculty of Veterinary Medicine provides education of physiology and pathophysiology both in Czech and in English language. We have prepared interactive multi-media manuals for practical works (Matalová et al. 2008, Matalová et al. 2010a, Matalová et al. 2010b, Doubek et al. 2012). After previous working experiences with laboratory animals and following period of virtual teaching which persists and has our support we have decided to 'go back to roots' and restore demonstration experiments. In accordance with 3R concept in experimental medicine we prefer non-invasive methods done on students, what reduce amount of used laboratory animals. Using humans as testing subjects in didactic experiment brings simultaneously valuable information about feelings and impressions which cannot be told by laboratory animals. Testing subjects also experience many examination methods and gain personal opinion whether some methods called as 'non-invasive' are truly non-invasive.

* Corresponding author. Tel.: +420541562303; fax: +0-000-000-0000 .

E-mail address: scheerp@vfu.cz

The most non-invasive examination methods are from cardiovascular physiology, pulmonary physiology and pathophysiology and of course neurology. Neurology is classically demonstrated on people. Therefore we took the liberty of presenting a few protocols from cardiovascular physiology, pulmonary physiology and pathophysiology where we use volunteers of students instead of animals.

2. Influence of oxygen and carbon dioxide to controlling the breath cycle and the type of breathing

Oxygen and carbon dioxide are two main blood gases which fundamentally influence breathing rate, breathing depth and minute tidal volume. Change of concentration in inhaling air and thus in blood manifest itself in breathing parameters described above.

2.1. Tools

Two respiration monitor belts, oxygen sensor and carbon dioxide sensor + 4 channel digital data logger (Vernier) for scanning breathing curves, concentration of oxygen and carbon dioxide in inhaling air, respirator mask, breathing tube, breathing box, fingers pulse oximeter (Nonin) , wireless Blue Tooth ECG, digital tonometer.

2.2. Perform the tasks

Respiration monitor belts are placed on proband's chest (5-6 intercostal space) and abdominal (belly button) area. Pulse oximeter, ECG electrodes and pressure cuff are placed as usual. Proband lies comfortably on bed and breathes calmly approximately 1 minute. In zero time ECG recording starts as well as data logger recording, detecting SpO₂ value and blood pressure. Mucosa colour and colour of limb's skin without pressure cuff is inspected. Skin temperature is measured by non-contact thermometer and modified CRT is performed. The same set of parameters is recorded in second and third minute. Then respiration mask with breathing tube is put on proband's head (enlargement of dead space) and after one minute recording of all data is done. Next, breathing tube is connected to breathing box with minimum ventilation and reverse inhalation is performed which leads to **hypercapnia and hypoxia** (after 3 mins identical parameters are recorded). Then proband breathes for 3 minutes only with breathing tube and detached breathing box and parameters described above are measured in minute interval. In next step reverse inhalation is performed again, but with the box supplied with 100% oxygen in a volume of 3l/min. Situation induce clean **hypercapnia without hypoxia**. Finally, restitution of normal breathing without box is done. In last phase the box is supplied with **100% oxygen** in a volume of 10 l/min and 3 min period is recorded again.

During this experiment proband tells its subjective impressions from individual experiment's phases and try to express its feelings and impressions regard to perception's polarity (pleasant – unpleasant – indifferent) and quality (itching, tingling, sensation of skin, pain...).

All gained data are written to protocols and converted to curves. Breathing curves are printed and attached to protocol. Next students' tasks are to assess changes, interpret them and compare recorded results with theory of breathing regulation they studied.

3. Demonstration of cardiopulmonary reflexes

Inhalation and exhalation are connected with oscillation tone of vagal nerve. This oscillation influence respiratory centre and cardiac activity. It leads to change of heart rate and blood pressure.

3.1. Tools

Fingers pulse oximeter (Nonin), wireless Blue Tooth ECG, digital tonometer.

3.2. Perform the tasks

Pulse oximeter, ECG electrodes and pressure cuff are placed on proband. Proband lies comfortably on the bed and breathes calmly approx. 1 min. In zero time ECG recording is started as well as detection of SpO₂ value and blood pressure. Then proband makes **deep inhale and holds breath** as long as possible. Each ½ minute (in exception of blood pressure measuring which is made once in a minute) measurements are performed. After that, proband breathes normally for three minutes followed by **maximal inhale again but tries to exhale against closed rima glottidis**. Recordings are performed each ½ min, for maximally 2 mins totally (in exception of blood pressure, which is measured once in a min). Then proband is allowed to breathe normally for three mins and every min recording of all described parameters is performed. Then proband makes **maximal exhale and remains in exhalation** as long as possible. Recordings are done each ½ min, for maximally 2 mins totally (in exception of blood pressure, which is measured once in a min). Proband is allowed to breathe normally again for three mins and every min recording of all described parameters is performed. Then wet towel tempered at fridge's temperature is put on proband's face and data are measured in usual cycle.

During this experiment proband tells its subjective impressions from individual experiment's phases and try to express its feelings and impressions regard to perception's polarity (pleasant – unpleasant – indifferent) and quality (heart beating, dizziness, narrowing of visual field, suffocation feeling and need to breathe).

All gained data are written to protocols and converted to curves. ECG curves are printed and attached to protocol. Next students' tasks are to assess changes, interpret them and compare recorded results with theory of breathing regulation they studied.

4. Demonstration of local disorders of blood and lymph circulation

Local disorders of blood circulation and lymph are base of many external disease manifestations and are part of basic pathological process as inflammation. This includes arterial and venous hyperaemia, ischemia and oedema. Embolism and thrombosis cannot be demonstrated without proband damaging.

4.1. Tools

2x fingers pulse oximeter (Nonin), mercury tonometer, stethoscope, non-contact thermometer, thread, timer, hand-held dynamometer connected to data logger (Vernier).

4.2. Perform the tasks

Proband sits comfortably on a chair next to table and blood pressure is measured and pulse wave is evaluated on both limbs. Dominant limb is used in this experiment (right-hander right limb, left-hander left limb). Pulse oximeter is put on the limb and forearm circumference is measured using thread on the place which is marked by highlighter (standardization of measurement). Dermal "CRT" and skin temperature is measured on hand palmar side on metacarpal pad under the thumb and power of squeeze for 5 seconds is measured. Identical values are measured in contralateral limb. **Ischemia model** – tonometer cuff is inflated 30 mmHg higher than the proband's systolic blood pressure. Successful ischemia is expressed by pulse and oximeter signal disappearance on ischemic limb. Parameters described above are recorded in each minute for 10 mins. Proband tells its feeling of ischemic limb part i.e. distally from cuff. After cuff removal **post-ischemic arterial hyperaemia** is noticed and after 30 seconds of reperfusion all parameters are measured again. Then proband raise its hand and exsanguination at the place of previous post-ischemic hyperaemia and **myoparalytic hyperaemia** at the skin which was under the cuff can be seen.

Normal blood flow is restored for 10 mins and then modified capillary test of fragility as an ideal model of venous hyperemia is preformed: after measurement of all parameters cuff is inflated for 80 mmHg. This value guarantees arterial blood supply to the limb we see on measuring pulse oximeter and palpable pulse as well but prevents outflow of venous blood. Data described above are recorded in each minute for 10 mins.

During this experiment proband tells its subjective impressions from individual experiment's phases and try to express its feelings and impressions regard to perception's polarity (pleasant – unpleasant – indifferent) and quality (heart beating, dizziness, narrowing of visual field, suffocation feeling and need to breathe).

All gained data are written to protocols and converted to curves. Breathing curves are printed and attached to protocol. Next students' tasks are to assess changes, interpret them and compare recorded results with theory of disorders of blood circulation and lymph they studied.

5. Conclusion

Nowadays when is generally accepted teaching in multimedia visualization form, is needed in biomedical subjects to deepen contact of students with living organisms already in preclinical subjects. Advantage of modern era is wide availability of non-invasive diagnostic method which allows seeing many functioning parameters without proband alteration. Facts are in graphically acceptable (digital) form which is demonstrative, easily interpretable and with ability to be electronically archived.

4th International Conference on New Horizons in Education

Scale of teachers' beliefs on the effect of the use of mobile devices on students

Yelkin Diker Coşkun^a, Gonca Kizilkaya Cumaoglu^{a*}^a*Yeditepe University, Faculty of Education, Istanbul, 34755, Turkey*

Abstract

The aim of this study was to develop a scale to determine beliefs of teachers about students' mobile device usage. Development process is composed of literature review, writing down the items, obtaining expert views, applying scale forms (N=130) and validity and reliability studies. As a result of factor analysis which is carried out within validity study of scale, it was determined that the scale is composed of 2 dimensions; academic development and social development. The scale which included 28 items in pilot application was reduced to 16 items as a result of analyses. Reliability coefficient of the whole scale is (∞) .91, reliability coefficient of academic development is .85, reliability coefficient of social development was calculated as .81.

Keywords: mobile devices, teacher beliefs, academic development, social development

1. INTRODUCTION

As the mobile technologies become widespread, mobile devices which can execute many functions of the desktop computers have become indispensable for the new generation and students started to carry these technologies to the school environment. The usage of mobile devices eases the daily lives of the human life in many ways and makes them more effective in accessing information. Mobil device usage and human behaviors interact in the sense of social, emotional and personality characteristics (Butt, Phillips, 2008; Hong, Chiu, Huang, 2012; Turner, Love, Howel, 2008).

Durin (2009) defines today's children as I-Children due to their interactive, independent and interpersonal characteristics. Moreover, he also stated that this new generation is easily adapted and manipulated to every kind of new technology and screen-based design. Children who we are educating today and will educate in the future are digital native and also their education needs, skills and interests differ compared to us. When the wider picture is considered, we confront a student community who are fully equipped in digital sense and whose education needs changed and transformed. Then what is the belief of teachers who fulfill education requirement of this community about the way students are influenced from mobile device usage? This question is the starting point of this study. Both observations and beliefs which include emotions and thoughts of teachers about this issue would give information about influence level of students. Moreover positive results of mobile learning

* Corresponding author. Tel.: +90 532 514 77 01; fax: +90 216 578 16 60.

E-mail address: gonca.kizilkaya@yeditepe.edu.tr

which is supported by researches (Çavuş, Uzunboylu, 2009; Hwang, Wu, Ke, 2011; Marcos, Hilera, Barchino, Jiménez, Martínez, Gutiérrez, Gutiérrez, Otón, 2010; Sandberg, Maris, Geus, 2011) would give idea about students' integration to mobile devices and their including mobile devices into learning-teaching processes.

It is not difficult to think that a variable which influences us socially would also influence academic development and learning in education and teaching environments. In fact, in a study in which the effect of mobile computing devices in K-8 classes on motivation and learning of students was analyzed (Swan, Hooft, Kratoski, 2005) teachers stated that in this way participation of students into learning activities have increased. According to the results of same study, students used these devices most commonly for note taking and journal writing. Apart from this, teachers draw attention to the fact that students who need special education benefit from mobile devices about writing skill. Therefore, it can be said that students who have different education requirements make use of mobile devices in various ways.

Therefore determining the usage purposes and levels of these devices by the students and examination of their effect to their academic and social features will be directive in regulation of student based and technology friendly learning environments. Determining the teacher opinions about the effect of mobile devices on educational and social features of students is important in terms of emphasizing the perceptions of teachers regarding the relation of technology and education. Teachers have the opportunity to closely monitor and evaluate the behaviors of students using the mobile devices in the education environment. The beliefs of teachers towards mobile devices in working environment, their thoughts regarding the result of mobile device usage of students, will be directive regarding usage of mobile devices with the aim of learning. Therefore it is important to present which way the mobile devices used by the students and the educational and social behavior changes they cause, are interpreted by the teachers. Consequently, the purpose of this study is to develop a scale to measure teachers beliefs regarding to usage of mobile devices of students.

2. METHOD

2.1. Participants

Study group of scale development process is composed of 132 teachers who work at different branches of government (2) and private elementary schools (3) in Istanbul in 2012-2013 academic year. 2 forms which were not answered appropriately were excluded as a result of study and the study was carried out with the answers of 130 (81 females, 49 males) teachers. Demographic information about study group was summarized in Table 1.

Table 1. Demographic information about study group

	Professional Experience					Total
	1-5 year	6-10 year	11-20 year	21-30 year	Over 31-40 year	
Woman	35	22	14	8	2	81
Man	16	12	15	9	1	49
Total	51	34	29	13	3	130

2.2. Scale Development Process

First of all a literature review was done in the process of scale development (Chen, Katz, 2009; Ching, Shuler, Lewis, Levine, 2009; Cheon, Lee, Croocs, Song, 2012; Druin, 2009; Hoadley, 2009; Sung, Mayer, 2012; Uzunboylu, Özdamli, 2011; Yang, 2012). In this review, basically possible effects of mobile devices in school environment and learning, their roles and effects in learning-teaching process, use of mobile device at schools were analyzed. Semi-structured interview was carried out with 2 teachers about use of mobile devices in school environment and their effects to students. In the interviews it was concluded that beliefs of teachers about mobile devices should be stated and scale composed of 28 items was formed accordingly. For the face validity and scope validity of scale, views of one education technologist and 2 experts from psychological counseling and guidance. According to these views, necessary regulations were made on items. The scale was applied on 132 teachers who serve at private and state elementary schools in different districts of Istanbul and data were analyzed with SPSS 16.0 statistics program.

Items of scale are in 5-grade likert type. Consensus about ideas of items were arranged in the levels of “Strongly Agree”, “Agree”, “Neutral”, “Disagree”, “Strongly Disagree”. These levels were scored as Strongly Agree=5, Agree=4, Neutral=3, Disagree=2, Strongly Disagree=1. Total score of scale was formed as the sum of answers over these scores. Greatness level of total score is interpreted as that teachers have positive belief about mobile device usage of students. Regarding the contrary, low scores can be interpreted as that the belief has negative trend. There are positive and negative items in the scale. During scoring of scale, items which include negative view was regarded as inverse items and coded inversely. For example answer of “Strongly Agree” given for a negative item is calculated as 1 point, “Strongly Disagree” answer is calculated as 5 points.

3. FINDINGS

3.1. Findings Concerning the Validity of the Scale

Exploratory factor analysis was carried out in order to determine structure validity on data obtained from 130 teachers. The method to be used varies according to the assumptions and aims of researcher in explanatory factor analysis. For this aim, Principal Components Analysis which helps to explain variables through “representation”, “summarization” and “addition” concept was used (Şencan, 2005).

Before analysis, Kaiser-Meyer-Olkin (KMO) coefficient and Barlett Test were used in order to determine whether data are suitable for factor analysis or not. KMO being higher than .60 means that data are suitable for factor analysis (Büyüköztürk, 2005). In this study KMO was found to be .85. This result shows that data are quite suitable for factor analysis.

Table 2. Results of KMO and Bartlett Tests

Kaiser-Meyer-Olkin Sampling Adequacy Measure	0,85
Bartlett's Test Results	
X ²	1711,953
Degree of Freedom	378
p	0,00

For the factor analysis of scale within the scope of construct validity, explanatory factor analysis was done by using Varimaks rotation and Principal Components Analysis. As a result of factor analysis, it was found that 16 items of scale have two sub-dimensions whose eigenvalue is bigger than 0,30. Eigenvalue graphics of the scale supports this finding. Total variance explained for the scale by these factors is 36,948%. This situation shows that the scale is composed of items which generally measure similar characteristics..

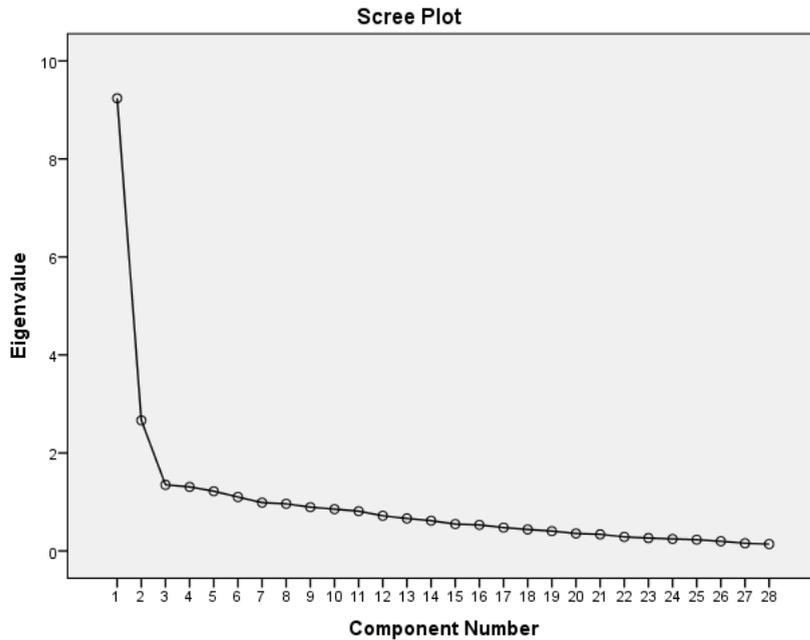

Figure 1. Eigenvalues Graphic

In Figure 5, it is seen that there is a sudden decrease after the first factor. This situation shows that scale may have a general factor. Following the other factor coming next, eigenvalue of factors included within graphic have similar values. Therefore these dimensions which are not explained theoretically were disregarded. While the items to be included within scale, items which have .40 and above factor load.

As a result of factor analysis, it is understood that items are grouped under two sub-dimensions which qualify beliefs of teachers about the effect of mobile devices on development of students. The first factor explains “academic development” (11 items) dimension, the second factor explains “social development” (5 items) dimension. As it is seen in Table 3, factor load of 18 items in the scale is higher than .40. Factor load of academic development dimension of scale varies between .75 and .40. Only factor load of 28th item of the scale concerning critical thinking was calculated as .045 however in spite of this it was not excluded from the scale as a result of common view of researchers. In the literature there also views that thinking skills and critical thinking can be supported with mobile learning (Çavuş, Uzunboylu, 2009; Naismith, 2004). Moreover it was thought that it would be beneficial to learn beliefs of teachers today where the education of thinking skills has gained importance. Considering in this sense, it was concluded that the item about critical thinking skill is an important item and should be included in the scale. Explained variance of this dimension of scale is 19,665%. Factor load of social development dimension of scale varies between .73 and .41. Explained variance of this dimension is 17,283%.

Table 3. Results of the Factor Analysis of the Scale

Item No	Item	Factor loadings after rotation	
		F 1	F 2
25	Frequency of using mobile device is the reason for inability of students in answering open-ended questions.	,75	
18	I observe that students who have the habit of using mobile devices at an earlier age compared to their peers are more impatient.	,70	
26	Mobile device usage creates motivation problems for learning among students.	,65	
13	Mobile device usage prevents self-confidence development.	,60	
17	I think that students who frequently use mobile device suffer from depression much more compared to those who do not use frequently.	,58	
20	Intensive use of mobile devices would result in memory problems among students.	,57	
19	Mobile devices influence studying habits of students negatively.	,54	
15	Mobile devices cause sleeping disorder among students.	,50	
14	I think intensive mobile device usage would cause attention deficit among students.	,49	
27	Mobile device usage decreased academic achievement of students.	,45	
28	Mobil device usage improves critical thinking skills of students.	,045	
6	I think mobile devices isolate students.		,73
10	I think mobile devices cause problems in communication of children with their families.		,69

3.2. Findings of Reliability of the Scale

Cronbach alpha (α) internal consistency level was calculated in order to determine reliability of the scale. Reliability (α) was found to be .89 for the first form of scale which is composed of 28 items. Cronbach alpha

internal consistency level (α) was found to be .91 for the final form of scale which is composed of 16 items. Internal consistency coefficient of academic development sub-dimension is .855, internal consistency coefficient of social development sub-dimension is .815. This result shows that the final scale has high reliability.

Another study which was carried out about reliability of scale is calculation of correlation coefficient between item score and scale score. At the end of this study, it was determined how each item effects scale reliability and items whose item-total correlation is below $r=.30$ were excluded from the scale. As it is seen in Table 4, correlation between scale items and total scale varies between .74 and .41. However, 28th item whose Item-Scale correlation is below .30 was excluded from the scale due to reasons mentioned within the scope of construct validity study.

Table 4. Teachers beliefs scale item total Correlations

Item No	Item-Scale r	Item No	Item-Scale r
25	,41	6	,69
18	,64	10	,74
26	,67	1	,61
13	,56	12	,59
17	,51	16	,47
20	,70		
19	,69		
15	,53		
14	,63		
27	,54		
28	,23		

* $p < .05$

In this study, minimum score to be obtained from general average of scale is (16x1) 16 and maximum score is (16x5) 80.

Table 5. Descriptive statistics of scale total

	N	Min.	Max.	\bar{X}	Ss
Total Scale	130	16	80	36,43	10,37
Factor 1:					
Academic development	130	11	55	25,35	7,21
Factor 2:					
Social development	130	5	25	11,07	3,98

When the scores obtained from the scale of teachers' beliefs is analysed, it was seen that the lowest score was (16) and the highest score was (80) and the average of scale is (\bar{X} =36,43). Although it is not the direct subject of scale development issue, when descriptive statistics obtained from scale was analysed, it was observed according to the average score of teachers (\bar{X} =36,43) that they believe mobile device usage of students have negative effect on their academic and social development. When the averages are analysed according to sub-dimensions of scale it is observed that teachers believe mobile device use have negative effect on students for both dimensions (academic development (\bar{X} =25,35), social development (\bar{X} =11,07)).

4. CONCLUSION

In this study, a scale was developed a scale to determine teachers' beliefs about mobile device usage of students. There are 16 items in the scale which was developed in 5-graded Likert type. Exploratory factor analysis was carried out within the scope of validity study of scale. There are 2 sub-dimensions of scale as a result of factor analysis. These are academic development and social development. Items whose factor load is below .40 were excluded from the scale and the scale which was composed of 28 items in the beginning was completed with 16 items finally. In the studies of factor analysis, conditions of items' factor load are above .30 and explained total variance being 40% at least is regarded sufficient in the sense of social sciences (Klein, 1994). It can be said that this scale is a valid and reliable instrument in measuring beliefs of teachers about students' mobile device usage.

Presenting thoughts and beliefs of teachers about the effect of mobile devices on students would shed light upon necessary regulations concerning education. Therefore results to be obtained from mentioned scale would contribute to determination of observed effects of mobile devices on students. Moreover, it would also contribute to teachers' arranging mobile activities which would enrich learning-teaching process. In fact; Liu, Wang, Liang, Chan, Ko, Yang (2003), stated that mobile learning devices can solve the dilemma in traditional and computer classrooms and allow students to participate in both physical and virtual learning activities. In fact, using skills, attitude and belief levels of teachers about mobile technologies should be determined in order to arrange mentioned activities in a way that would increase quality of education and it must be supported with necessary in-service education studies.

Abstract

The purpose of the current study is to determine the effects of physical and environmental conditions of schools, and the features of the class and teacher in the application process of Science and Technology curriculum of schools from different socioeconomic status (SES). The participants of the study composed of 2 schools with high SES, 2 with middle SES, and 2 with low SES, which were chosen via stratified sampling from Sakarya province central district elementary education schools that have low to middle, and high SES, and the directors and Science and Technology course instructors of that chosen schools. Qualitative data was acquired via the observations that were done in schools and classes, and from the interviews that were done with school directors and teachers. Acquired data was analyzed and following items were found: (1) In schools with high SES, having convenient opportunities provides advantages for the application of the science and technology curriculum. However, sometimes, courses are taught teacher centered because of crowded classes and time problems. (2) In schools with middle SES, science course is taught teacher centered because of the lack of laboratory, material insufficiency, and seating order in classes. (3) In schools with low SES, science course is taught teacher centered because of infrastructure insufficiency, high-class size, being not able to use laboratory, and material insufficiency.

Keywords: science education, school, class, teacher, input evaluation.

1. INTRODUCTION

In order to apply science and technology curriculum that aims to raise students with science and technology literacy as it is foreseen, it is necessary to transfer the curriculum to the classroom environment. The adequacy of environmental conditions that affect teaching- learning process gains importance in the curriculum in which the activities and experiments are dominant. If we think that the environmental factors that are considered as input affect the application process of the curriculum and the reaching level of students to the gains, the actualization level of the curriculum will be different in schools with different SES.

Moreover, it is important how teachers, responsible to apply the curriculum, evaluate the conditions of schools that they work.

"The application of the curriculum is successful if all conditions are improved especially the teacher factor. The development of curriculum depends on the development of expert, teacher, students, parent, course books, materials, and environmental factors" (Varış, 1988: 27). In order to apply curriculum realistically, it is necessary to consider the time and environment that is assigned to education, and the features of the education environment when the teaching- learning process is organized (Fidan, 1997). In an effective education environment, the learning level of the students and the reaching level of the school to its aims can change in relation to the

*This study is the part of unpublished doctoral dissertation of Zeynep DEMİRTAŞ (2012).

resources the school have, the quality of the relationships in the school, the management understanding, and the in- class activity characteristics of the teacher (Celep, 2008). In addition, physical variables in the classroom that is in teacher's charge should be arranged in a way that is motivating, informative, and interesting for students (Aydm, 2010). Similarly, learning environment should be arranged in a way that it should be provided multi-directional interaction between students- teacher, and student- student (Sönmez, 2007: 168).

The classroom size, one of the physical variables in the class, is an important factor that has an influence on the teaching style of the instructor. In crowded classrooms, teachers prefer traditional way of teaching, while in classrooms with small class size, they prefer teaching style, which depends on the active participation of the students (Aydm, 2010; Başar, 2001). Classrooms with small class size make active learning easier. The attention of students increases so does the opportunity to attend classroom activities (Başar, 2001).

Besides, the seating order in the classroom is important because it affects the student- student, and students-teacher interaction, and the education either positively or negatively. For seating order, there are two approaches as teacher centered, and student centered. In teacher-centered approach, students sit down one after another, and the course materials are arranged according to teacher. In such a classroom environment, the way of interaction is between teacher and students. On the other hand, in student centered seating order, either individually or as a group, seating order is preferred depending on the topic, and in both styles students can see each other easily. In those classroom settings, the student- teacher interaction is supplied as well as student- student interaction. Furthermore, seating order, either individually or as a group, which is arranged according to the aims of the topic, increases student success (Aydm, 2010). Students should feel independent, and arrange their experiences according to their abilities in classroom environment, more precisely in learning environment. Therefore, the classroom environment should be organized in accordance with student expectation (Celep, 2008). In addition, seating order that affects the interaction between students negatively, or makes student participation difficult should be avoided (Akbaşı, 2011). "Having fixed desks, and sitting down either in doubles or in threes prevent students from performing group activities. Thus, learning approach that depends on cooperation cannot be applied because of the physical conditions of schools" (Brooks and Brooks, 1993: 7).

According to Dönmez (2008), in most of the schools, classrooms are very crowded, desks are not suitable for developmental features of students, and students sit down in threes on those double desks, teachers do not have any other option except for traditional seating order for teaching, desks continue till teacher table, classrooms are not enough in calefaction, airing, and lightening. Therefore, all these negative features prevent qualified teaching. Moreover, physical obstacles like desks, tables, cabinets, distance, and student create psychological problems between students and the teacher, so that change the communication and the interaction (Barker, 1982, Aktaran: Başar, 2001: 25).

In science and technology curriculum, the teaching- learning process, learning environment, teaching strategies, and learning experiences are determined in accordance with the principles of the constructivist approach. In constructivist approach, the main purpose is to provide meaningful and permanent learning. In order to achieve this, education activities should be configured in a way that enables students' participation to learning experience, and it should be arranged in a way that improves students' higher order thinking abilities (Çakıcı, 2008). Similarly, Tyler (1950) indicated that learning is achieved with the active participation of the student, and student learns what s/he does instead of what teacher does (Aktaran: Bloom, 1979: 20). In classrooms in which the constructivist approach is applied, students are aware of the fact that they are responsible to configure information instead of being passive information receiver, and they are active participants of the learning process (Savery and Duffy, 1995). Furthermore, in science and technology course, in order to provide students' active participation, and to succeed learning style of experiencing- doing with activities and experiments, it should be provided group works in laboratories while arranging learning environment (MEB, 2006).

In order to achieve the main purpose of science and technology curriculum, science and technology literacy, it is necessary to reflect the foreseen factors to learning environments. Therefore, it is important to determine physical conditions that are considered as input, and to identify their impacts on the application process of the curriculum in terms of compensating shortcomings before the application. Hence, in the present study, the physical conditions of schools and classrooms, technological equipments, and classroom environments are

investigated as an input. Having enough equipments in science and technology classrooms, for science and technology education is fundamental to actualize the curriculum that depends on practice. Therefore, it is inevitable to experience application differences in teaching- learning process of the same curriculum, if we think that different schools with different levels of SES show differences in terms of physical conditions. It is important to determine the effects of those differences on the application process of the curriculum in order to provide schools with necessary infrastructure support.

2. METHOD

In the current study, the case study method was used as a qualitative research method. Six schools were chosen via stratified sampling from Sakarya province central district elementary schools. Two of the schools have high SES, two of them have middle SES, and two of them have low SES. Physical conditions of the schools that make up the sample were observed, and detailed information was taken by interviewing school directors. The science and technology course that was taught in either classes or laboratories was observed (average 50 class hours). The observations were noted by the experimenter in order to investigate the positive and negative effects of schools, class, and teacher in teaching science and technology course. Besides, the opinions of science and technology teachers were taken about the appropriateness of teaching- learning environment, and positive and negative aspects of the application of science and technology curriculum. Schools with high SES were coded as H1, and H2, schools with middle SES were coded as M1, and M2, and schools with low SES were coded as L1, and L2. Moreover, teachers that were interviewed were coded as T1, T2, ...T6. Data, which was acquired via observations and interviews was analyzed, and interpreted.

3. FINDINGS

The findings that were derived from school, and class observations and interviews with school directors and teachers in order to determine physical and environmental conditions of schools from different SES, and to determine the features of classes and teachers were presented below.

3.1. Features about H1 School, H1 class and T2 teacher:

H1 School, which is in the center of Sakarya province, began to education service in 1972 as a primary school. In 1998, the Ministry of Education did a change in National Education Fundamental Law, and the school began to give service as an elementary school. School building has 2460 m² closed area. The school is triplex and each storey is 820 m². Moreover, it has 24 classrooms, a conference hall up to 300 people, a science and technology laboratory, an information technology classroom with 38 computers, and 3 printers, a technical work workshop, a photocopy room, a canteen, department of preschool education, a room for the manager, a room for the assistant manager, and a room for teachers. As a school employee, there are a manager, 3 assistant managers, a counselor, 8 kindergarten teachers, 30 class masters, 26 in- field- teachers, and 2 servants. Besides, there are 249 students in kindergarten, 220 students in the first grade, 287 students in the second grade, 333 students in the third grade, 288

students in the fourth grade, 300 in the fifth grade, 267 in the sixth grade, 331 in the seventh grade, 316 in the eighth grade, and total of 2591 students. There are six sections for each class level. In the school, morning and afternoon education system is used. H1school is more crowded than other schools because it is preferred mostly by parents. Furthermore, with the help of its opportunities, the school can be characterized as well equipped. In terms of success in placement test, known as SBS in Turkey, in 2008, 210 students from H1 schools took the point more than 400 that brought a good reputation to the school. In addition, the sport is very important in H1school so that students have championship in the province in different kinds of sports branches.

T2 teacher who is one of the four science and technology instructors at H1 school, was graduated from science and technology teacher ship of faculty of education, and has been performing teaching for 10 years in general, and for 6 years in H1 school.

The class in which the observation took place is in the second storey in H1school. It is a crowded class with 52 students, 28 of them are female, and 24 of them are male. The movement area of students is restricted because the classroom has a 45 m² closed area. Moreover, there are three students in each desk. The teacher table, the blackboard, and front desks are interbedded, and very close to each other. The Figure 4-1 shows the classroom arrangement.

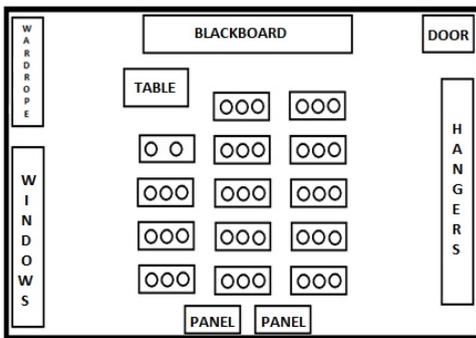

Figure 4-1. The observed classroom in H1 school

As it is seen in Figure 4-1, in classroom arrangement in H1school, students sit down one after another and with this arrangement the interaction between students cannot be provided. However, it was observed that T2 teacher wants students to put desk together in break times for group works. By combining two desks, six -people groups are created. Students in groups sit down opposing in combining desks. With the help of this arrangement, the interaction between students is supplied. The T2 teacher explains the work that each student performs so that the activity is done collectively. The products that students create, are represented in class pin boards. Besides, it was observed that T2 teacher takes the photos of products of students that are represented in class pin boards and hangs them on to the pin boards at each storey. In the class activities, the accessible materials are used so that the teacher wants students to bring those materials. For the activities that are done with laboratory materials, students go to the science and technology laboratory. The activities in laboratory are performed by the teacher due to crowdedness of the class and students follow those activities while standing. Furthermore, for unperformed activities, students watch them on the internet with the help of Vitamin program in information technology classroom. It was observed that T2 teacher has some problems while trying to perform activities and to manage students due to crowdedness of the class. Nevertheless, T2 teacher considers coping with those difficulties as a duty of the teacher and tries to minimize them. T2 teacher indicated his/ her opinion during the interview as

follows: *“Of course I experience some troubles but we are teachers and our duty is to minimize those troubles, everything depends on us. If there is a disadvantage, we should turn it to an advantage. I think we should not give up without applying it just because it has a disadvantage.”*

3.2. Features about H2 school, H2 class, and T5 teacher:

H2 school, located in the centre of Sakarya, was started to give education service in 2000-2001 academic year, it was established on the 1700 m² land, and it has 6040 m² closed area as a building. School building is triplex and each storey is 1800 m². There are 32 classrooms, a conference room up to 220 people, a science and technology laboratory, an information technology classroom with 24 computers and a printer, a visual arts workshop, two technology design workshops, a classroom for music, separate canteens for 1 to 5th grades and 6 to 8th grades, a library including approximately 6500 books, a cafeteria up to 300 people, a room for parent meetings, a room for the director, a room for the assistant director, and a room for teachers. All classrooms have projector, and continuous internet connectivity. Besides, there are a manager, 3 manager assistants, a counselor, 3 kindergarten teachers, 20 class masters, 20 in- field- teachers, a library employee, a secretary, and 5 servants in H2 school. In addition, H2 school covers 80 students in kindergarten, 172 students in the first grade, 176 students in the second grade, 175 in the 3rd grade, 173 in the 4th grade, 176 in the 5th grade, 180 in the 6th grade, 182 in the 7th grade, and 185 in the 8th grade, and total of 1499 students. Each grade has four sections. H2 school gives service full day (between 09:00 and 15:00), and it is well- equipped. Moreover, H2 school organizes social activities for both students and parents regularly. Furthermore, H2 school gives importance to the sports activities, and students have many championships in the province and in the region in different branches of sports. In addition to the sports, H2 school encourages students to attend chess tournaments, and students have championship in this area also. In terms of success in placement exam, SBS, as compared to other schools, there are more students in H2 school who earn a right to go to the science high schools.

T5 teacher who is one of the two science and technology teachers in H2 school, was graduated from science and technology teacher ship of the faculty of education and has been doing teacher ship for 14 years. Moreover, T5 has been doing teacher ship in H2 school for 4 years. T5 teacher thinks the conditions of the H2 school are very available for his/ her course. During the interview, s/he reported his/ her idea about preparing the appropriate learning environment like this: *“I have an advantage because there is a laboratory in the school, in addition to projector and computer. I can provide students with visuality by using them...”*

T5 teacher teaches his/ her lessons mostly at science and technology classroom that is described as science and technology laboratory. The classroom in which the observations took place is in the second floor of H2 school. It is a crowded class with 45 students. 19 of the students are female, and 26 of them are male. The movement area of students is not so restricted because the classroom has 52 m² closed area. Furthermore, students sit down side by side in a U shape. Figure 4-2 represents the arrangement of the classroom.

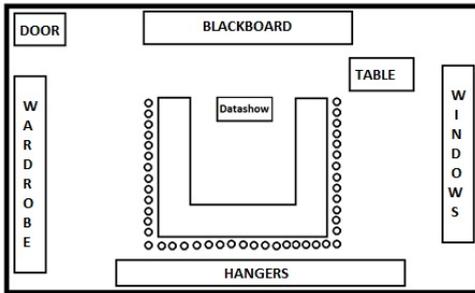

Figure 4-2. Science and technology classroom in H2 school in which the observations took place.

As it can be seen in Figure 4-2, students sit down in a U shape so that the interaction between them can be supplied easily. In the cabinets that are placed in the classroom, there are activity and experiment materials. T5 teacher makes 5- 6 student- groups for activities, and half of the students sit down inside of the U shape table, and other half sit down outside of the U shape table, which makes students sit down face to face. Thus, this increases the interaction between group members. T5 teacher wants students to bring some materials that do not exist in the laboratory for some activities. Moreover, it was observed that T5 teacher makes students do activities that do not take too much time as a group, and s/he does other activities that take too much time by himself/ herself. T5 teacher indicated this situation during the interviews as follows: *“I want students to bring materials for some activities, and we do them in classroom. However, this can be few in number. We can do short term activities in class because we experience a chaos due to the crowdedness of the class. I give some activities as assignment. For some activities, I do them and students follow me.”* T5 teacher uses the computer and the projector in classroom frequently, and also s/he makes students watch the topics on the internet with the help of Vitamin program. Besides, T5 teacher takes students to their usual classroom in order to solve some questions about the topics. In this class, the desks are arranged one after another.

3.3. Features about M1 school, M1 classroom, and T3 teacher:

In 1969, M1 school began to give education service with 5 classrooms. In 2005, it was re-built, and in 2006-2007 academic year it started to give service again with three storeys and 16 classrooms. M1 school is in county town in Sakarya, it was built on 4406 m² land, and it has 2148 m²-closed area as a building. M1 school is triplex and each storey has 716 m²-closed area, and the school garden has 3690 m² area. In addition to 16 classrooms, there are a science and technology laboratory, an information technology classroom with 26 computers and a printer, a projection room, a canteen, a guidance service room, an archive room, a bookshelf, the manager room, the manager assistant room, and a room for teachers. Moreover, for disabled students, there is an elevator, and a toilet. Besides, the M1 school gives education service with a manager, 2 manager assistants, 2 kindergarten teachers, 10 class masters, 5 in- field- teachers, and a servant. There are 31 students in kindergarten, 118 in the first grade, 84 in the second grade, 76 in the third grade, 83 in the fourth grade, 76 in the fifth grade, 64 in the sixth grade, 48 in the seventh grade, and 63 in the eighth grade, total of 643 students. There are two sections for each grade in M1 school. The fixed classroom setting is used in the school that is each course has separate classroom. Moreover, 13 classrooms out of 16, have projector and internet connection. M1 school gives

education service full day (from 09:00 to 15:00). The school organizes folk dancing activities, and chess training. In chess, school earned a degree in top three.

T3 teacher is the only science and technology teacher in M1 school. S/he was graduated from science and technology teacher ship of the faculty of education. S/he has been doing teacher ship for 5 years in M1 school, and for 6 years in general.

The classroom in which observation took place in M1 school, is called as science and technology classroom. The classroom is in the second storey of the school, and it has approximately 38 m² closed area. There are 32 students in the class, 17 of them are female, and 15 of them are male. The movement area of students in the class is not restricted. Students sit down side by side in a U shape. Figure 4-3 shows the arrangement of the classroom.

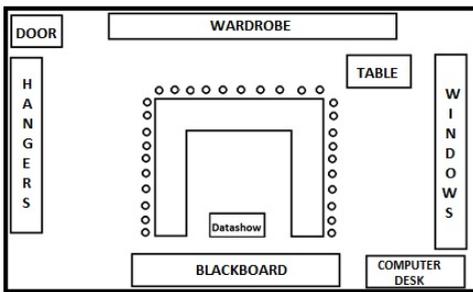

Figure 4-3. The observed science and technology classroom in M1 school

As Figure 4-3 demonstrates, seating order in M1 class is as a U shape so that students can see each other easily. Although the classroom is a science and technology class, the materials in the cabinets are not enough in number and in diversity. T3 teacher wants students to bring materials, and s/he brings also. During the observation, T3 teacher did some activities by himself/ herself. S/he asked some questions to students, and encouraged them to raise their opinions while s/he was doing activities. Generally, s/he gave activities, not done in class, as assignments to students. Moreover, it was observed that T3 teacher made students watch unperformed activities on the internet with the help of Vitamin program. Furthermore, relying on observations, T3 teacher provided each student to take part in teaching- learning process because the class is not so crowded.

3.4. Features about M2 school, M2 classroom, and T6 teacher:

M2 school started to give education service in 1973, and it continued to give that service with its new block that was established in 1996 with 3000 m² closed area, and 24 classrooms. The school was established on 6600 m² land, and it has 3900 m² closed area. Moreover, there are 30 classrooms, 2 kindergarten classrooms, a science and technology laboratory, a technology design work shop, a visual arts work shop, an information technology classroom, a manager room, 2 manager assistant rooms, a counselor room, a room for teachers, a library, a sports hall, a parent meeting room, a canteen, an archive, and a servant room in M2 school. Moreover, it gives service with a manager, 2 manager assistants, a counselor, 2 kindergarten teachers, 15 class masters, 18 in-

field- teachers, and 3 servants. Furthermore, there are 32 students in kindergarten, 73 students in the first grade, 80 in the second grade, 82 in the third grade, 67 in the fourth grade, 72 in the fifth grade, 63 in the sixth grade, 66 in the seventh grade, 102 in the eighth grade, and total of 637 students. There are 2 sections in the kindergarten, and three sections for each grade. There are a projector and internet connection in every classroom. The school gives education service full day (from 09:00 to 15:00).

T6 teacher is the only science and technology teacher of the M2 school. T6 teacher was graduated from science and technology teacher ship of the faculty of education and T6 has been working for 7 years in M2 school, total of 8 years in teacher ship.

The classroom that observation took place is called science and technology class in the school. It has approximately 32 m²-closed area. There are 26 students, 14 of them are male, and 12 of them are female. The movement area of students is not restricted due to small class size. Students sit down in doubles on desks in the class. In seating arrangement, desks are one after another that makes interaction between students weaker. Figure 4-4 shows classroom arrangement.

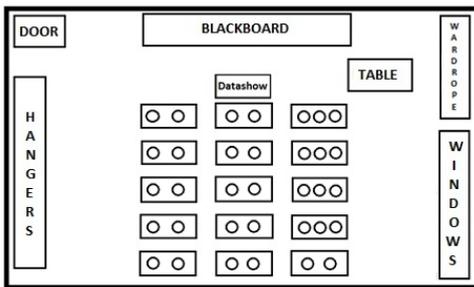

Figure 4-4. The observed science and technology classroom in M2 school

M2 classroom, science and technology class, has a normal classroom arrangement on basement as seen in Figure 4-4. In the cabinet, there are some little glass tubes, and beakers as materials. During the interview T6 teacher reported this situation as follows: "I cannot do most of the activities because we do not have a laboratory and necessary materials. We try to do something with daily materials in our houses, but it is not applied as much as it is needed." During the observation, T6 teacher did an activity with students in the class, and wanted students to bring materials for that. It was observed that T6 teacher made students watch unperformed activities on the internet with the help of Vitamin program by using the projector and the computer in the classroom. T6 teacher teaches lessons by asking questions to students frequently, and wanting them to report the situations that they confront in daily life. By doing this, T6 teacher encourages students to participate. Moreover, T6 knows every student's names in the class due to small class size, and encourages everyone to share their opinions.

3.5. Features about L1 school, L1 classroom, and T1 teacher:

The L1 school that is in Sakarya central district was established in 1957. The courses started to be taught in prefabs due to the damage in school building in 1999 Adapazarı earthquake. Later, additional building was established next to the prefab. The additional building is duplex and has 1097 m² closed area. The prefab is

single-layered and has 816 m²-closed area. The school has 1500 m² garden. The courses are taught in prefab and in additional building. The additional building has 10 classrooms, a science and technology laboratory, a technology design workshop, an information technology classroom with 17 computers and a printer, a library, a manager assistant room. The prefab has 15 classrooms, 2 kindergarten classrooms, a manager room, a manager assistant room, a counselor room, and a room for teachers. The school canteen is on the garden. There are a manager, 2 manager assistants, 2 kindergarten teachers, 17 class masters, 17 in-field teachers, and 2 servants in L1 school. Moreover, there are 40 students in the kindergarten, 93 in the first grade, 97 in the second grade, 90 in the third grade, 119 in the fourth grade, 107 in the fifth grade, 102 in the sixth grade, 74 in the seventh grade, 88 in the eighth grade, total of 814 students. The morning and afternoon education system is used in L1 school.

The T1 teacher is one of the two science and technology teachers in L1 school. T1 teacher was graduated from science and technology teacher ship of the faculty of education, and has been doing teacher ship for 12 years. T1 teacher has been working in L1 school for a year.

The observed classroom in L1 school is in prefab, and it has approximately 30 m²-closed area. The class size is 32, 17 male students and 15 female students. Students sit down in doubles in their desks.

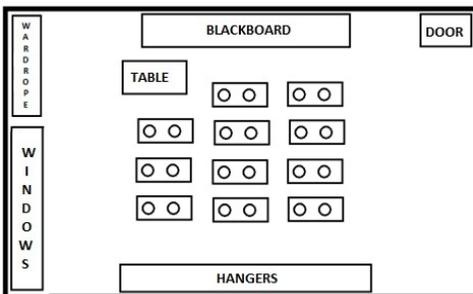

Figure 4-5. The observed classroom in L1 school

As seen in Figure 4-5, student desks are arranged one after another. There is too much noise from the outside during the lessons because the classroom is prefab, the windows are large, and they see the school garden directly. T1 teacher indicated his/ her opinion about this condition during the interview as a disadvantage of the application process of the curriculum. "... *there is too much noise from outside because the school is prefab...*" It was observed that during the observation T1 teacher did not do any activity. Teacher teaches lessons by making one volunteer student read the topic from the course book, and making other students follow it from their books. Sometimes, T1 asks questions to students and chooses only 1- 2 students who raise hands. In some classes, T1 showed some posters about the topic to students. In the observation, T1 took students to the informatics classroom in a course hour, but the lesson could not be taught there because it was not available. T1 indicated this situation like this "... *the conditions of the school is not good, there is no material in the laboratory. The informatics classroom is not available. One-hour visuals per week are not enough for students. School has lots of financial problems...*" It was observed that T1 teacher experienced some problems related to class management. T1 tried to prevent these problems by giving minus point to students who were talking within themselves.

3.6. Features about L2 school, L2 classroom, and T4 teacher:

The L2 school that is in the central district of Sakarya province was established before the proclamation of the Republic of Turkey. In 1957, the school building was demolished with the earthquake, it was given a label as dangerous, and a modern building was established. In 1960, the school began to give education service. The additional building, next to the school, and having 6 classrooms, started to be constructed in 1985, and in September 1987 it was opened to education service. The school is triplex with a total closed area of 735 m². The school garden is 1300 m². There are 13 classrooms, 2 kindergarten classrooms, a science and technology laboratory, a technology design workshop, an information technology classroom with 19 computers and a printer, a manager room, a manager assistant room, a guidance room, a teacher room, a library, and a canteen in the L2 school. Moreover, the school gives education service with a manager, 2 assistant managers, 2 kindergarten teachers, 15 class masters, 19 in- field- teachers, and 2 servants. Furthermore, there are 31 students in the kindergarten, 57 in the first grade, 53 in the second grade, 78 in the third grade, 68 in the fourth grade, 99 in the fifth grade, 98 in the sixth grade, 93 in the seventh grade, 121 in the eighth grade, total of 698 students. There are three sections for each grade. In L2 school, morning and afternoon education system is used. The school is in the 24th order in the province according to the placement test (SBS) points.

T4 teacher is one of the two science and technology teachers in the L2 school. T4 was graduated from chemistry department of the faculty of arts and science, and T4 has been working for 7 years in L2 school, and for 16 years in general.

The observed classroom in L2 school is approximately 35 m² and has 42- student class size. 24 of the students are male, and 18 of them are female. Students sit down in doubles or in threes on their desks. The movement area of students is restricted because the class is crowded. Figure 4-6 shows the class arrangement.

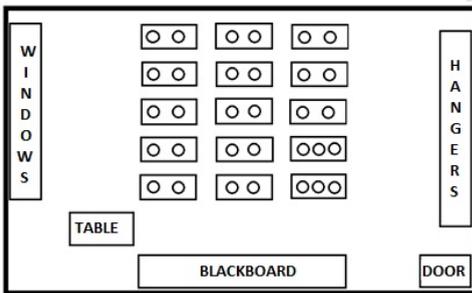

Figure 4-6. The observed classroom in L2 school.

As Figure 4-6 illustrated that student desks are arranged one after another. It was observed that the interaction between students is restricted because of the desk arrangement, and lack of group work. Moreover, T4 did not apply any activity during the lessons. T4 taught lessons mostly in a traditional way and sometimes made students attend the lesson by asking questions. T4 indicated his/ her opinions about the conditions of the school, and the class size as follows: “... I cannot apply the curriculum because our classes are too crowded. Our laboratory is not available. The conditions of our school are not sufficient...”

4. RESULTS AND DISCUSSION

In the current study, the effect of inputs in relation to the features of the school, the classroom, and the teacher on the application of science and technology curriculum was investigated. It was found that schools with high SES had better school and classroom environments, and more advantages than schools with middle SES, and schools with low SES; similarly, schools with middle SES had better school and classroom environments, and more advantages than schools with low SES.

Studies show that in terms of the arrangement of physical environment that affects classroom environment either positively or negatively, the careless, inattentive, and incomplete arrangements of the followings affect the class environment negatively: designing the classroom plan, preparing the materials that will be used in teaching-learning process, arranging seating order of the students, arranging the visuals as pin boards on which student exhibit their activities (Çakmak, 2005). In addition, for student centered education, a functional classroom environment in which students' active participation is supplied, is foreseen. However, in most schools with traditional classroom environment, teachers are asked for student centered teaching (Saritaş, 2005). It can be indicated that science and technology teacher in H1 school provides students with group work by arranging student desks, uses science and technology laboratory functionally in the teaching-learning process, and encourages students to do new activities by hanging their activities to pin boards even though the classroom in H1 school has traditional seating order, and high class size. In H2 classroom, whose class size is high, the seating order of students is in a U shape so that multi-directional communication and interaction between students can be supplied. When the communication in the classroom is multi-directional (between students and the teacher as well as within students), it will be useful in terms of supplying information flow, determining problems, and interest and abilities of students, bringing students in positive behavior (Helvacıoğlu, 2011). In M1 classroom students sit down in a U shape. Moreover, due to small class size, the interaction, and communication are provided easily. This is in line with researches that in classrooms with small class size, students have more opportunities to attend activities (Başar, 2001). In M2 classroom, the class size is small but student sit down in a traditional way. It was observed that in M1 and M2 schools, lack of laboratory and inadequacy of materials prevents the application of activities in the curriculum. Nevertheless, in both schools, unperformed activities are watched to students with the help of the projector, computer, and the internet connection in the classrooms. Research supports the importance of physical environment in the class that supporting physical environment in class with technological materials makes students be motivated, increases learning, and provides new information with persistency (Başar, 2001). For example, in H2 school, science and technology teacher has an advantage in terms of technological equipment in the classroom. Teacher in H2 school makes students watch unperformed activities with the help of technological equipment in the class. On the other hand, in L1 and L2 classrooms, high-class size, traditional seating orders, lack of laboratory and materials, lack of technological equipment make the application of science and technology curriculum impossible as it is supposed to be. This is in line with the study of Erdoğan (2007), which found that teachers indicated that high-class size affects the application of teaching methods and techniques as well as new evaluation methods negatively, because of this problem, they could not arrange their classrooms appropriately to the group work, and they left the seating order in a traditional way.

Shedding light on the findings of the current study, in order to prepare an effective and fruitful teaching-learning environment, and to provide necessary educational materials, the inadequacies of schools and classrooms should be determined, and necessary resources to compensate those inadequacies should be created.

4th International Conference on New Horizons in Education

School and Parents' Cooperation on Formation of Value Orientation of a Child

Eva Frýdková

University of SS. Cyril and Methodius, Faculty of Arts, Department of Pedagogy, Nám. J. Herdu 2, 917 01 Trnava, Slovakia

Abstract

The family and the school belong to the institutions that – to the greatest extent – affect the formation of the value orientation and shaping the child's personality. The child could create a desired value system only with difficulties without the continuing education of the family and school. Educational treatment can be more successful the more each of the partners fulfils its own roles in the system of educational delegation of the authority and labour sharing. Because of the importance of creating a desired value system of children as our future generations, our paper is focused on the cooperation of the family and the school in shaping the value orientation of children.

Keywords: family; school; cooperation; value orientation

1. Introduction

Family and school are institutions participating greatly in forming of child's value orientation and its character development. Without these two elements, formation of value orientation would be almost impossible. School complements primary family education. Family is the most important element in child's education and is greatly affected by consequences of education itself. Considering this immense responsibility, the collaboration between family and school has to be strengthened. Parents should be an active part of education and should be constantly interested in a "school life" – child's work and teacher's work, as well as positive changes connected to school's development.

1.1. Family and School: their complementary roles in value orientated education

Family is the first environment with an educational function, securing care and child's ability to function as a part of society accepting its values. Family is the first to deal with value orientated education. Children learn not only during the process of education, but also by observing and imitating everyday behaviour of their parents. Another important role of a family is transmission of ideology, culture and beliefs. Family education is important mainly in the early years of a child, as some responsibility has been delegated to formal institutions, school principally.

Considering social changes, society relies more and more on school to control development of child's personality and its ability to function as a part of a group. However, school cannot solve all social problems, neither can it substitute family education. Family is the first and the most important environment in which values

are being formed. Children need love, attention and role models in order to evolve into independent and responsible individuals.

Primarily, school provides a service to a family and, thus, cannot act separately. School's cooperation with family is based on natural demand rather than a "good will" of teachers. (Rabušicová, 1999, s. 22). Therefore, during the formation of value orientation of a child, school cannot work without parents' cooperation.

Parents are primarily responsible for their children's education and they have to carry out their tasks responsibly. On these, school education is based. Communication between teachers and parents and exchanging of both information and advices is necessary for value orientation forming.

Mutual cooperation between school and family requires coordination of educational tasks of both elements. The main aim of this cooperative education is development of child's personality. This task has to be carried out cooperatively. Accepting mutual responsibilities is only making sense if each of the elements is able to accept his own competence responsibly. Educational process is more sufficient if each of the elements is efficient in its very own task, and values of elements are in accordance. Not only parents are helping teachers, but also teachers are helping parents. The way schools need support from families, families need support from schools. However, neither schools nor families have exclusive position when dealing with social and moral changes. Both family and media are important parts of educational process.

When forming value orientation, there are some issues to be addressed:

- Discrepancy of family values, school values and values presented by media. It is impossible to ignore other elements influencing forming of value orientation. Thus, it is necessary to educate children and young adults co-ordinately and in cooperation.
- Transmission of educational function from family to school. Some of the values have been redefined while shifted from family to school, therefore; there are more challenges to be faced connected to the content of these values.
- Value oriented education is a responsibility of whole educational community, results of formal education are not sufficient.
- Moral crisis in society, disappearance of traditional values and appearance of value alteration accompanied by educational system crisis. In such system, terms education, nurture and schooling are easily interchangeable.
- Family values crisis and loss of teacher's status (Cobos Pino, 2009).

Values as a content are acquired easily and school is not the only place for forming value orientation. Value orientation should be formed not only during the process of formal education, but also through imitation of real-life role models in family, school and outside school.

Realization of value oriented education is a collaborative task; family, as well as children and young adults collaborate with school and other educational institutions. However, it is not only school and family responsible for forming of value orientation of children and young adults. Forming of active and cooperative citizens is responsibility of all elements with educational nature. Task of all these elements is to create collective and complementary goals to improve society.

"Value oriented education deals with "social project" spread through time with numerous social participants" (Cobos Pino, 2009, s.3). It is a process both cognitive and affective which helps individual with his social integration. It deals with moral dimension of a character while forming autonomy to create such principles and

norms that will guide him and help him to think and act. Without cooperation between family, school and society, conflict of values appears.

Important part of value orientation forming process is school's responsiveness to thoughts and ideas, as well as parents, and flexibility of school management. Responsiveness is followed by school's social status change and, according to some authors, should be cultural, sporting and social centre of community in a specific region. As for the relationship between school and parents, collaboration has to be strengthened, with emphasis on equality, cooperative decision making, partnership and competence sharing. Considering value orientation forming of children and young adults, it is necessary for family and school to agree on common values and their realization. This is influenced by position and priorities of both such institutions.

1.2. Family and School Cooperation

Family and school cannot work separately. Both are part of social processes, cultural patterns, and political and legal systems. Their roles in the process of value orientation forming and cultural transmission are irreplaceable. Family and school strengthen value orientation, attitudes and decision making of teenagers as follows:

- Family is principal educative element. Family is the only environment influencing child from its birth and is able to create efficient conditions for development of child's personality.
- There has to be a partnership based on cooperation between school and family. This partnership enables child's development in both school and personal life. Moreover, parents have to be part of professional counselling and training.
- Value oriented education is a component of school program. Both classroom and school climate may influence forming of child's education and values.
- Teachers serve as role models for both children and young adults, preparing for this responsible task during their studies.
- Besides educational responsibilities, school is responsible for culture of teaching subjects, such as religious education and ethics (Gugel, 2012).

The main goal of a cooperation between school and family is balance between influences of both elements and prevention of any conflicts. Cooperation should be achieved throughout various activities leading to an improvement of communication and awareness. Each one of teacher's strategies has to be planned and beneficial for both parties.

It is required that parents, when choosing a school, are aware of values transformed in this school (Barniol, 2003, In. Lorca, 2005.). Emphasis on parent's involvement in a child's school life represents school's acceptance as the most important element in education.

Parents have a right to be a part of school's politics to get an assistance from school. The best way how to achieve this is by being a part of Parents' Council, where its members are making decisions dealing with child's education; values; pedagogical principles dealing with school life; ways of cooperation between family and school; and aims influencing this cooperation. "Fathers and mothers are participants and protagonists of educational process of a child. Thus, it is not only their right, but also duty to inform, judge, make decisions, and supervise this process" (Guerra Santos, 2003, s.137).

As far as rights go, parents are usually interested in child's behaviour at school rather than in learning objectives; methods used in teaching process; or assessment. Parents' exclusive concern in grades usually leads to difficulties in cooperation. Legally speaking, parents have every right to know all the information connected to both their child and school. However, they use this right rarely.

Most researches dealing with mutual cooperation of family and school are focused on parents' involvement in school life and its impact on child's results rather than on importance of parents' involvements at home, even though it represents a significant part of value orientation formation.

Family relationships, activities family are doing together, family's way of life – all of these have an impact on behaviour of a child and can increase efficiency of teacher's role in process of value orientation forming. School should encourage parents to provide positive home curriculum because of the importance of basic elements and patterns of family life for cooperation of school and family.

The process of value orientation formation can be influenced, by both school and family, as follows: enforcement of such norms that are important for society and are part of it, as well as specific experiences based on conflicts (Giesecke, 2005, s. 181).

Good cooperation when forming values includes:

- Good communication – communication is a necessary part of family-school relationship and is important for further cooperation.
- Sharing and respecting of roles – family and school can share roles and tasks quite clearly. In child's upbringing, both institutions are engaged, however; it is not possible for teachers to role as mother or father, and for parents to “teach” teachers how to do their job.
- Cooperation based on specific agreements – good cooperation is not only pleasant, calm and hearty agreement. The most important elements are child's results rooted in such cooperation, and benefits that meetings of parents and school bring to a child. This cooperation reaches compromises, concrete and recognizable, that can be evaluated when considered as decisive criterion of a relationship between family and school (In. Programa Nacional de Convivencia Escolar, 2007).

In Practice, there are always programs and initiatives provided by school that support and develop cooperation between family and school. If a teacher wants to create cooperation-friendly environment in order to help students to achieve good results, it is important to realize such cooperation may not be occasional, one-way with a small amount of mutual objectives, but long term with a mutual objective (Frýdková, 2010). In such environment, parent is not just an observer of the educational process, but also helpful participant in child's education.

In context of this issue, it is important to consider options of cooperation when forming value orientation of children and young adults. Should school ensure forming of desirable value orientation, the emphasis cannot be only on tasks that student has to carry out, but also their meaning, significance and objective. Trough these tasks

students deal with various scenarios that, depending on their theme, lead them to an acquisition of some values applied in future life.

Active cooperation between family and school is necessary when considering development of a child's personality. This is done through forms, and their intensity; exchangeability; and focus are dependent on teacher and school management. Influences of school and family environments on a student are in balance, complementing each other. Their cooperation is the key element not only for student's success at school, but also for his education. Degree of their connection is dependent on mutual attitudes, procedures and interactions.

Mutual relationship with shared responsibilities is crucial for cooperation between school and family. The main purpose of its development is to help children being successful in both school and personal life. Specific parents' activities provided by a school are proof that such relationship is working well. Variability of these activities may be time consuming for both school and teachers, but this can be partially solved by engaging parents. These activities are chosen and directed by a school depending on its resources (personal, financial) and school's conception.

When transmitting values, relationship with a family is crucial. Therefore, it is important to think about activities that will be done with parents (timing, methods, equipment, transmission of information, etc.). Participation of parents has to be planned ahead and managed well to prevent any barriers.

Family plays the key role in learning and accepting of values and it is important to keep in mind that children learn these by imitating and relating to an adult. First experiences with values are gained in family environment and value system is formed by everyday interactions and activities. That's why the communication and cooperation between family and school is so important and is a frequent subject of researches.

Some of the results of such researches abroad has shown that cooperation between family and school transforms. School is open to parents, environment and creative projects, and creates space for not only parents' active cooperation, but also their education and development of family education. Changes in both value systems and society are projected into family life and education. In the past, values were more stable, passed down from generation to generation. Today, values transform and change constantly. The consequence of an absence of more stable values is parents' confusion when educating their children.

Formation of value awareness of a child in its first years is determined mainly by family life and role models, parents predominantly. Later, education is influenced by school life of a child: environment, interaction between peers, and cooperation between family and school. Family becomes part of a school community and both child's success at school and shaping of value consciousness are formed by mutual cooperation between school and family, as well as family's participation in educational process.

1.3. Methods of family and school cooperation at shaping the value orientation

There exist a number of variants and forms of cooperation which are used for family involvement into the school performance, as well as the means of communication and collaboration with parents, teachers and pupils that also provide possibilities for real cooperation of family and school in shaping the attitudes and values of children and youth.

Basically, there are three main lines how can parents work with the school:

- through the school council, through their representatives, and voting bound with important aspects of upbringing and education of their children;
- through Slovak board of parents' associations, through its active members;
- through the teacher and various forms of communication and cooperation.

Family plays an important role in acquiring the values, so we must not forget that children acquire them mainly through their imitation and identification with the adults. The first experience with the values a child obtains in the family environment, where the value system shapes everyday interactions and activities. Therefore, the communication and cooperation between home and school is important, and it becomes the subject of various studies.

Traditional methods and forms of cooperation, which can be classified through Parent Association, consulting meetings, open classes, writing references, or parent visits at the school environment belong to the most frequently used forms. In terms of education levels, these forms are only used for information purposes, because they do not provide sufficient space for active cooperation of parents, teachers and pupils in shaping the values of children and youth, but it does not mean that these forms are not justified in the moral education of pupils. Lack of space for families and school cooperation in value orientation creation can be filled out by innovative methods and forms of cooperation which are mainly used abroad, but in terms of our schools they can also find their importance and application. These forms are largely informal in nature, but provide many opportunities for mutual transmission and creating real situations where children have the opportunity to emulate their parents and teachers as the role models to receive the applicable values in life.

The collective cooperation of families and schools is a good choice for the beginning of the school year as a *"welcome meeting of the school board and parents bound with the information market"*. The afternoon meeting of parents with children, for example, in the park, can be the opportunity to meet up with friends and meet new families. The information market provides good opportunity to gain important information from school officials, but also get useful advice from parents of students from higher grades: what is proved and what services can be used, etc. (Lauermann, 2010).

"Guide for Parents" which parents receive after the new school year opening (after taking their child to school is also appropriate, open and very specific and real invitation of parents to become the co-partners. The guide begins with the Director's foreword, which explains the importance of the document and directly calls for parents' involvement in the school events. The guide enables parents to tap into the learning process at school and raise the aims and values of the school. The last page provides specific space for parent signature or the signature of the child which confirms that the manual was thoroughly studied and all the requirements, rules and principles needed for successful operation of the school are understood. The guide can also familiarize parents with the educational philosophy of the school and its educational and training objectives. Next part of the manual can contain rules and regulations, including how to deal with critical issues, as well as the rules for telephone communication with the school. The most important part of the document provides clearly elaborated description of the educational program at various levels of the school, including the teaching methods, evaluation criteria and rules for homework specification and its processing.

School magazines, newsletters, calendars, school web site create an inseparable part of partnership with families and school.

Discussion forum on the school *website* is an integral part of the school information system. Parents, teachers and school management have the possibility to participate in the non-anonymous discussion and react to recent

school events . The interactive communication of pupils with teachers and school management change parents position from passive recipient of information to the real school partner.

Lectures, discussions and conferences for parents. In some countries are held conferences for parents, which involve parents and teachers and their primary aim is to provide recommendations and advice to those parents who are interested in various topics related to the education of their children. Themes of conferences are set according to the parents' interest. The topics are not only provided by relevant professionals (psychologists, special educators, pediatricians, etc.), but also by experienced teachers and parents.

Parents can be initiated to cooperation also by using the form of "**Book Fair**", which takes place once a year, for example, before Christmas. In the school premises after several days offered different genres of literary production. Parents, who collect books from book catalogues, ensure their ordering, preparing the selling premises, posters and also books selling and answering questions about the books. Proceeds from sales is used for the school needs. This form of cooperation is also trying to point out, that reading is not only a source of knowledge, but also the source of joy and value by itself. It is not only an exhibition of books in school premises because there are other programs, such as meetings with authors and illustrators of children's books. Under this form are also offered other opportunities to shape the value orientation in partnership with families and schools. Each teacher can mention his or her favourite book from childhood that children can read along with their parents. Through that children come to know the older literature, and parents can find their favourite titles. The similar focus has also informal class competition in "**Reading records**". Children record in the chart titles of books they read with their brief assessment. Parents acknowledge number of read books via their signature. .At the end of the month will be declared the class winner who gets diploma and a book as a reward (Tydlitátová, 2001a).

In addition to own reading also applies aloud reading. The book can be in the class read by teachers, parents, older siblings and other representatives of the school community. Great importance belongs to aloud book reading by grandparents or retired people. This form of learning and communication with someone older at school is mutually beneficial, because some grandparents or retired have the opportunity to gain the impetus for themselves for example their children f learn make them familiar with computer using.

The same emphasis is given also to the speaking ability in front of people ("speaking skills"). Children defend and explain their projects on "**Science Fair**" in front of their classmates, but also in front of their teachers and parents. Each child personally chooses the topic – subject of science, which he or she enjoys and has knowledge about and process it separately, for a few weeks he or she keep a diary where he or she writes the results of experiments, observations, collected pictures, graphs, and finally everything evaluates and displays. Topics are provided by school, websites, specialized magazines, or parents who are not excluded from similar actions.

A special room is purposefully made for parents, children and the public, which is opened throughout the day or during limited hours and can be used as a library, providing relevant public education for parents and literature for children. In this room can work a few parents as volunteers, is the natural centre for working with a book. The library can be implemented in the educational process through reading out books on various topics bound with teaching, and these topics also lead to discussions. The room creates a space for collaboration with parents, it can be reserved for parents who can have the opportunity to read aloud for children, talk with children about the books, try to introduce and offer the favourite authors of their childhood, familiarize with books published in the year they were born, they or their children develop a list of favourite family titles. More reading is associated with an effort to limit the use of television and computers for computer games. Each family can receive a rich list of activities that can be done when the TV is turned off. School alerts parents to the library

websites or libraries in the area, recommending titles and children's reading. It does not matter which means are used for parents and children to share the joy of reading, it is important to provide the child with reading experience as a valuable and joyous activity (Tydlitátová, 2001b).

Room for parents can be also used as a *"tea room"* in which parents, teachers, school management can discuss, inform each other and consult on various issues related to children - pupils. The purpose of the meeting is the mutual recognition and elimination of prejudices of parents and teachers, so that in a situation when they express their dissatisfaction they are able to avoid misunderstandings and conflicts, and work together to find the effective solutions (Lauer mann, 2010).

Another informal meeting helping to shape many social and spiritual values is *"selling homemade cakes and pastries"*. Each cake baked by parents together with their child, gets a price tag. When the school exhibits a large inscription *"Today's sale of cakes and pastries"*, mothers stand at the tables and lavishly offer cakes. On the same day may be also the sale of T-shirts with the school logo, which can be designed and drawn by parents together with children (Tydlitátová, 2001b).

Values such as tolerance, solidarity, cooperation, empathy, etc. can be communicated during the *"International Fair"*. It can be the opportunity of one Saturday, in the school year, when can be paid attention to all the nations represented in the school. In addition to the traditional point of the program, which are laid tables full of national specialties, there is also a possibility to give a lesson of the national dance for children and adults, set the children's theatre, and so on. Our schools are commonly not having a large representation of students and families of other cultures, therefore it is possible to modify the form and prepare presentation of different regions in Slovakia or different cultures. In addition to performance of the country or region and national or traditional meals, may be also presented the most important monuments, the way of clothing, language or dialects, scripts or values of the culture.

Parents can also help as assistants to teach certain subjects, accompany children for trips, play them the piano and sing with them, sew theatrical costumes for children, etc. They can bake gingerbread house together with the children before Christmas, they can talk about their jobs or they can read aloud some stories the primary school.

"Book of reports" or *"Home Projects"* play important a part in the process of formation of value orientation and have impact on pupils' school results and success. Certain topic can be processed in many forms. Children read books, draw pictures, go on field trips, the topic can be brought in a playful way, for example by biscuits baking. At the end the topic is processed separately. In first grade a child can find something on the topic together with the help of parents, in the second and the next classes is the common nature more complicated. Topics may have different ideas: the biography of a famous person, processing and the realization of a short video ads. Gradually become more common compilation of several sources, studying in the library and using the internet. The final work is normally read and sometimes defended in a group of classmates (Tydlitátová, 2001b).

Apart from the already mentioned *"Book of reports"*, children are led to keep their *"School Diary"* - a few sentences, the first are of descriptive origin, but soon they are replaced by their own ones. They keep and as a routine write notes about observations from school, about reading their stories, writing poems and stories. Own stylization is a means that allow and find something interesting to say, encouraged them to send letters to parents, grandparents and friends, keep a diary, write about the trip. Regular habit of writing skills utilization is a valuable asset for the life, where can participate teachers, parents and other family members.

Education is not only a value by itself, but it also shapes the future life of the pupil. One month of the school year is dedicated to the usefulness of different occupations during the "*Month of career education*". Parents from diverse professions come to the class and talk about their work, why is their profession interesting, beneficial and what was necessary to learn during the preparation for the profession.

Recent trends in education constantly emphasize the importance of pupils involvement in the self-assessment process. Involving pupils in the assessment processes causes a partial shift in communication between a teacher and a pupil. It creates more space for communication related to the result and development of a learning experience. For the more complex development of comprehensive and self-evaluation is used the "*Evaluation Book*" (Kratochvílová, 2013). The Evaluation Book is working mostly with verbal evaluation, which provides information on the so-called social qualification of a learner, his or her ability to cooperate, the efforts, diligence, creativity, perseverance. The rating system implies strong involvement of students in the evaluation process at regular intervals. It uses a continuous, regular weekly student self-evaluation, which is supplemented by monthly complex review. This process is completed by semi-annual summative self-assessment and subsequent final evaluation at the end of the school year. Evaluation is systematically and purposefully linking teacher's evaluation to student's self-evaluation. Parents can enter this assessment process via their active participation in the evaluation and student self-evaluation, which is done on a weekly. Comprehensive evaluation concept is based on the work of the objectives and their systematic evaluation. In addition the result is also focused on the learning process and progress, interested pupil's survival, behaviour, desire and effort.

We have introduced several innovative forms of cooperation of teachers, parents and pupils, applicable in shaping the value orientation of the pupil. We realized that these forms may cause scepticism in practice and their application in our country have to overcome several barriers from the side of schools as well as the families. Optimum, efficiency, as well as its utilization is desirable for empirical examination. Innovative forms can change the attitude of parents to the school and the teacher, but also their mutual communication and cooperation. This transformation process is one of the most challenging. Foreign schools, as well as the innovative concepts applied in some of our schools have revised the implementation of cooperation with the school and the pupil's family and they are more aware of the pupil's needs but also of the parents' needs.

1.4. Conclusion

Despite of efforts of educational institutions in engaging parents, some of the barriers and prejudices still persist. These prevent formation of meaningful relationships between parents and teachers that would be based on mutual trust, respect and exchange of information. It is thus more difficult to create such relationship for teachers and to cooperate with parents on forming of character, moral consciousness and value orientation of a child. It is assumed that despite teacher's or school's effort it is complicated, sometimes even impossible, to achieve desirable cooperation. It is important to realize that the most important people influencing education are teachers, parents and child itself. Each of these elements is important. If one of them is weakened, there is a risk that the desirable result won't be achieved. Objectives of family and school have complementary function and they usually overlap. However, it is family that is primarily responsible for child's education. It is important to understand and accept this responsibility and demand an improvement of cooperation between family and school.

4th International Conference on New Horizons in Education

School culture as part of Marketing-orientated approach

Blandína Šramová*

Comenius University in Bratislava, Faculty of Education, Račianska 59, 813 34 Bratislava, Slovak Republic

Abstract

One of the possibilities of how to flexibly adapt to changes within the developing society, that strongly influences the school environment, is to apply marketing approaches comprising a complex system of inter-related factors focused upon the school and the school environment – all with the purpose to create a positive image. This paper presents findings related to perception of the school culture by pupils, teachers, employees and parents. Key-factors, that shape attitudes towards schools, cover particularly satisfaction of pupils, employees and parents, mutual communication, evaluation process which asserts effective risk prevention efforts and fosters positive school climate. The Creating an Environment for Emotional and Social Well-Being (WHO) survey, unfinished sentences, semi-structured interview and focus groups were applied as research methods. Gathered results show the following strengths: positive approach of pupils to teachers, providing a friendly, rewarding and supportive atmosphere, the prevalence of the formal-collegial school management model. Among main weaknesses findings state: sexual harassment of pupils (especially girls), feeling safe, applying a duties-based school model as well as on one-way communication of schools with parents. It has been proved that improving the competence abilities of a school lies in utilizing social marketing (education results are of benefit for its graduates as well as for the whole society) and in improving the positive school atmosphere.

Keywords: school culture; marketing communication; school marketing, school atmosphere

1. Introduction

Currently we are facing an increasing number of schools where beside public and state schools there are also church and private ones. Due to this fact it is necessary that schools consider measurements regarded to their survival and transformation – resulting from constant changes within the developing society. Additionally such shifts have impact over the whole educational environment too, and if wishing to improve the competitive abilities, schools have to react adequately.

Mentioned changes are mostly related to demographic structure, different family life-style, rising diversity, political and legislative impacts and technological development. Schools therefore must adjust to changes in accordance with the developing society, new technologies, political and economic decisions (see Džupina, 2011). One of the possibilities is to apply marketing approaches within the school environment i.e. utilizing marketing activities aimed at schools and the school environment with the purpose to improve the general school image. This approach consists of a complex sequence mutually linked areas. These comprise modern and effective methods used within the teaching process in order to achieve quality within the education programme.

Furthermore marketing approach includes the use of an open communication as within internal level (fostering positive school climate) as within the external one (having good public relations). According to Andreánska, Cabanová (2012) positive school climate increases pupils' academic performance. Actually a successful marketing approach within the education environment is based on fulfilling needs, wishes and expectations of participants on both levels. According to Světlík (2006, p.25) the traditional paradigm on one hand stresses the needs of a teacher and school, whereas on the other hand the marketing approach emphasizes mainly the pupil as well as applies marketing-mixture methods, segmentation and a marketing oriented school structure. When having a look upon subjects being either primary or secondary participants of the education process (equally benefiting from the educational results) we have to state that schools provide benefits to everybody - children gain education, parents have a feeling of satisfaction that they are putting maximum efforts for the future of their child, employees enjoy working in an attractive environment with the opportunity to reach their own goals, wide public and stakeholders contribute to cultivation of the future generations and have an indirect influence over the improvement of the society and finally employees knowing that schools are preparing competent graduates.

However being aware of the needs and wishes of all involved participants is not enough to achieve the marketing oriented approach, it is also needed that a school has technical, legislative and personal capacities to be able to fulfill all needs that will be compared on a higher level to other competing schools. Representatives of the school management have to bear in their mind that only communication materials presenting the school either through attractive websites, newspaper advertisements or leaflets cannot fulfill the criteria for a positive school image when on the contrary there is a stressful atmosphere among employees, passive pupils and indifferent parents (Šramová, 2011).

Some authors assume that the best marketing approach to be applied at schools is the integrated one. (Lockhart, 2005). This approach has already been successfully used within the private sector especially in the area of improving the competence abilities that concern also public and state schools (Lockhart, 2005). A customer-oriented school institution emphasizes not only open communication with its customers, but also with the wide public. Both the education programme and human resources that the school disposes with are undergoing certain evaluation process all with the purpose to improve the effectiveness and the quality of the services (i.e. education) and to take into account the rapidly changing society. This type of management system therefore follows trends of the whole society, labor market and flexibly reacts to these issues. Either we speak of an integrated marketing (based on inter-relation of single elements and mixed-marketing), or a relation-based marketing (based on good relationships with parents, pupils, employees, graduates, other schools, wide public, state government, private sector etc.) the main goal is always the same – to improve the quality of the education process, to use finances in an effective way, to apply successful internal and external communication, to create a positive school image within minds of the wide public. Regarding utilization of the marketing approach at schools we can also speak of a so called social marketing (Kotler et al., 2007), which means that the school, on the contrary to other competing ones, fulfills needs, interests and wishes of its target groups in a better and more effective way, places priorities upon satisfaction and ensures a long-term well-being.

Of course utilizing marketing approaches without having detailed knowledge of the whole school system is impossible also because education process within educational institutions does not follow exclusively commercial principles. According to the research carried out by the University of California in Los Angeles in 2005 (Bauerlein, 2008) it has been shown that not only the popular culture, but also approaches of a school to its students as to consumers lead to neglecting the school by its students. The McDonaldisation (Ritzer, 1996) appears more often also within the school systems, where more crucial is effectivisation, quantification, predictability and monitoring instead of underlining humanity (Šramová, 2011).

Quantitative indicators are first of all measurable and create an illusion of being objective, in opposite to the qualitative indicators which tell us more about satisfaction of pupils, their ability to solve problems, about natural curiousness, eagerness for knowledge, pleasure of learning and results. Unfortunately focusing at quantitative indicators, such as evaluating the education process, the role of a teacher (see in Sokolová, 2010), operation services, the time-tables and not creating stimuli and appraising teachers, occurs at present-day schools very frequently. It is obvious that satisfied employees are not only loyal to the company they are working at, but are also more prosocial oriented that fosters the positive school climate. What is more the school climate is afterwards reflected within mutual relations of a pupil and teacher, teacher and parent, motivation of a pupil towards learning. Furthermore trust, respect, open-mindedness and tolerance are qualities that dominate at school with a positive climate. The quality of the management as well as of the employees (especially the pedagogical staff getting into primary contact with pupils and parents) form an important part of an internal school environment. The school culture made by rules, norms and in some cases by the code of ethics and mutual relationships has a strong influence over work of pupils, the school results and on its climate. The actual organization structure is always reflected within the school culture. Handy (1993) defines the following four types of a school culture that we can face also within the education process: 1. power culture, with a centralized power, 2. role culture, with defined roles and associated duties of an every employee, 3. task culture, focusing upon projects and tasks utilizing creativity and professionalism, 4. person culture, with an individual at the center of attention and with the whole organization adjusted to the person. According to Bush (2003) management models occurring within the school contexts could be divided into six groups: 1. formal model, emphasizes managerial system i.e. authority and influence are concentrated within formal positions held by individuals within the organizational hierarchy, 2. collegial-based model, stressing discussions resulting in consensus, 3. political model, based on a premise that power and influence within institutions is divided, 4. subjective model, aiming at needs and interests of an individual (and not at the interests of the whole institution), 5. ambiguity model, characterized by uncertainty and unpredictability, 6. cultural model, asserting non-formal aspects on the expense of formal elements.

A school utilizing marketing approach focuses, within its education process, upon the most effective ways of pursuing pupils' needs and wishes including all other clients as well. This approach is applied on the vertical and the horizontal level, what means that the vision of a marketing-oriented school is fulfilled by means of all participants of the education process. All employees (the door-keeper, the cleaner, the director, the secretary, the teachers) are forming the image of a school by their mutual relations and approach to pupils that influence attitudes of pupils towards school. Recently there have been few researches carried out that prove negative attitudes of Slovak pupils towards their school, what is actually rather alarming. Moreover negative attitudes towards school and school attendance is reflected within attitudes towards studying, fulfilling tasks and into establishing rather negative mutual relationships. One of the main tasks of any school is to cultivate the school climate that afterwards fosters positive approach towards the school itself and towards tasks of pupils and teachers as well. Creating opportunities for either life-long learning or burn-out prevention programs for teachers might only partially determine attitudes to schools. However improving teachers' competences and attempts to provide a high quality education are important to achieve pupils' progress and to shape a positive school image are very important but by far not the only ways. There are several factors that influence pupils', parents' and all other clients' satisfaction. Among these are also ways of communication with all persons involved, the design of processes of evaluation in order to eliminate risk phenomena such as bullying, harassment, avoiding school attendance, experimenting with drugs etc.

In accordance with the above mentioned facts the purpose of this research was to explore perception of the school climate within chosen schools by all people involved i.e. – pupils, the school personnel and parents.

2. Methods

2.1. Participants

The participants consisted of parents (N=15), school personnel (pedagogical, non-pedagogical and managing staff) (N=30), and pupils of lower (N=110) and higher classes (N=153) at two primary schools in Slovakia.

2.2. Measures

To meet the set goals a combined methodological approach had been applied comprising quantitative and qualitative procedures.

One of the used methods was a survey *Creating an Environment for Emotional and Social Well-Being*. (WHO material adjusted to the conditions in Slovakia) . This survey is targeting pupils and school personnel and it monitors the following seven areas of a school quality: 1. connecting school and home life, 2. not tolerating bullying and harassment, 3. providing a friendly, rewarding and supportive atmosphere, 3. assuring a friendly, rewarding and empowering atmosphere, 4. Forbidding physical punishment and violence, 5. Valuing the development of creative activities, 6. Supporting cooperation and active learning, 7. Promoting equal opportunities and participation.

Unfinished sentences, designed for pupils attending lower classes, were related to school environment, relationships within the classroom and the whole school.

A *semi-structured interview* has been carried out with selected pupils (N=10), and parents (N=15) in order to explore the school culture, image, relations with class-mates, teachers and other school personnel.

A *focus group* has been realized including pedagogical and non-pedagogical staff. More specifically there were three groups including - N=8, N=10, N=12. In this case the main goal was to explore perception of the school quality, culture and the school climate.

3. Results

During data analysis we were concentrating upon interpreting the attitude of specific groups – lower classes, higher classes, the school personnel and parents - towards school, perceiving atmosphere and the school climate.

Pupils within lower classes referred more to technical description of the school. They expressed a very positive relationship with the teacher and moreover they accentuated the thrust of a teacher teaching them. High emphasis was put upon moral qualities of a peer; atmosphere within the classroom was seen as emotionally and socially very favorable.

Pupils at higher classes defined the most positive things related to:

- The school regularly organizes events during which publicly appraises various successes and achievements of its students (85.1%).
- The school has a policy of prohibiting physical punishment (74.0%).
- All pupils are aware of the school rules (77.7%).
- Pupils (mainly female) face sexual harassment (3.7%).

The finding related to the percentage of pupils facing sexual harassment was rather alarming and required a more deep analysis. During interviews it has been found out that this concerns various forms of haptic communication carried out by means of touching intimate parts of a body by persons of an another sex, as well as satirizing the other.

Among weaknesses pupils of higher classes listed the following issues:

- The discipline is kept in a good manner (37%).
- Pupils feel safe (44.0%).
- It is allowed to express dissatisfaction with inadequate or abusing behavior (33.3%).
- The school has a public program me related to the non-tolerance of bullying and to consequences related to such behavior (37.0%).

In this area it is evident that pupils notice lack of discipline-keeping, safety, limited possibilities to talk to the school personnel about inadequate behaviors towards them and lower awareness about examples of solving bullying at school.

According to the school personnel the following quality indicators (assessed using the WHO survey) were underlined:

- connecting school and home life (85.30%)
- not tolerating bullying and harassment (80%)
- promoting equal opportunities and participation (79.4%)
- providing a friendly, rewarding and supportive atmosphere (79.4%)
- forbidding physical punishment and violence (77.4%)
- valuing the development of creative activities (77.4%)
- supporting cooperation and active learning (71.50%)

The school personnel considered the school culture as task culture, the most typical features of which is orientation at tasks and projects. Moreover a formal and collegial-based school management model, where authority and influence are concentrated within formal positions – however when solving particular situations there is a shift towards a college-based model including discussions with the purpose to achieve consensus.

Pupils and parents perceived the formal model that emphasizes authoritative approach, as the most prevalent within task-oriented school management models. Furthermore the ambiguity model and in predictableness of the management has been perceived by this sample. On the other hand simultaneously analysis has shown the perception of a collegial-based model too. According to parents the communication with the school management is rather hierarchic, lacking feedback and clear determining of responsibility, unwillingness to solve conflicts, overestimation of material safety.

In the area of assessing the communication of the school with parents the following three levels have been identified (from the perspectives of involved parents):

- One-way communication carried out by the school towards parents – parent is only a recipient without a possibility for a feedback. Above mentioned approach was according to the parent's perspectives the most dominating one.
- One-way communication carried out by parents towards schools – the school is only a recipient without a possibility for a feedback.
- Both-ways communication where the school and parents are feedback oriented, the consequence of which is either elimination or avoidance of appearing conflicts and stimulating parent's participation at the school life. Moreover such type of communication results in loyalty of parents and pupils and in improving the school image.

Results show that this communication model was the least represented one within the school culture and management models.

Other analysis resulting from focus groups discussions was mostly aimed at perceiving the relationships marketing applied within involved schools. The following issues have proven to belong among the positive ones:

- contacts with local authorities
- contacts with managing bodies
- contacts with career organizations
- contacts with non-profit organizations.

Within weaknesses teachers listed the following issues:

- relationships with pupils, parents, graduates
- interpersonal relationships within the micro-environment
- relationships with other schools
- contacts with sponsors
- contacts with to media representatives
- relations to the public.

Nevertheless several studies are pointing out the choice and importance of the propagation and presentation tools as a factor affecting attitudes towards school activities, what has been proved as insufficient within engaged schools (Jurášková, 2011, Soukalová, 2011).

4. Conclusion

In order to be able to compare certain schools and to assess the school quality the utilization of unified criteria, used to evaluate social and emotional wellbeing within EU countries, should be mandatory. Moreover either teachers or the management and the state government could after evaluate specific issues of interest for a certain period and to compare gained findings not only from the perspective of one school but even from the perspective of a region, state and the EU. Above mentioned factors should have an effect upon improving competition abilities of given schools. However it is also crucial to build a positive atmosphere and not an atmosphere full of stress, uncertainty or fears.

The following important feature is to create marketing orientated schools, to spread social marketing, which means that results of the education process are for the benefit of the graduates and the whole society as well. The school should be aware of the fact that its positive image belongs among key-factors influencing

interest of parents in its activities. Moreover a symbiosis of elements creating the school image is important i.e. localization of the school, cleanness, equipment, high-quality study programme, good public relations and empowering a healthy and positive school climate.

4th International Conference on New Horizons in Education

School organizational climate and violence in the school: case study of two Brazilian schools

Adam, J.M.^{a*};Salles, L.M.^b^{a,b} *Universidade Estadual paulista. Avenida 24 A, 1515, Rio Claro, 13506-900, Brasil*

Abstract

The issue of organizational climate has been pointed out by various researchers both from Brazil as well as other countries as an important component in the analysis of situations of school violence. In this perspective, this study presents and analyzes data from a research carried out in two schools in the interior of the State of São Paulo, Brazil. The main focus of the research is the organizational climate of the school and the conflicts ensuing from the interactions, exploring these mainly from the point of view of the teachers.

The climate is understood in this study as being the collective and shared view that the teachers have of the school where they work. It is a set of norms, values and feelings perceived by all the components of the school organization and that can be indicators of the way in which these act in the school.

We can come to the conclusion that the vision of the climate presented by the teachers of the two schools studied presents different natures of conflicts. The largest conflict observed refers to the relationship with the family of the students, who are responsible for the uncivil behavior, aggressions and violence occurring in the school, as well as for the lack of interest of the students in learning. Another problem pointed out refers to the relationship between the teachers themselves and the difficulty in carrying out collective work.

Key words: school violence; schools climate: schools relationship.

Introduction

The issue of organizational climate has been brought up by various researchers, both Brazilian and from other countries (Gonçalves e Spósito, 2002; Guimarães,1994; Spósito, 2001; Revilla Castro, 2002; Blaya and Debarbieux 2002) as an important component in the analysis of situations of school violence. It is from this perspective that the current study presents and analyzes data of a research carried out in two schools in the interior of the state of São Paulo/Brazil. The main focus of the study is the organizational climate of the school and the conflicts emerging from the interactions, exploring mainly the point of view of the teachers.

The option to highlight the teachers' perspectives in the study is due to the fact that in a previous study we noticed that further to the conflicts between students, the conflicts between teachers and students are evermore present in the day-to-day school reality and contribute to a deteriorated school organizational climate. The quote below exemplifies well this situation, as far as the relationship between youths and adults in the classroom situation, where teachers and students are the main interlocutors:

E-mail address: joyce@rc.unesp.br

The perception of the existing tensions between students or between the former and the adult world has affected the climate of the school establishments, especially the action of teachers, who begin to feel under permanent threat, be it real or imaginary. Fear of the student leads the teacher frequently to demand safety, particularly from the police in the school units, compromising the quality of the educational interaction. (Spósito, 2001, pg. 100)

According to Revilla Castro (2002), some authors have worked with the relation of school violence and the organizational climate, broaching issues such as: the size of the schools (Alexander e Curtis, 1995); the interactions among the different groups (Debarbieux, 1997 Astor, Meyer e Behre, 1999); and the disciplinary issues (Baker, 1996). In France, Debarbieux has worked with the concept of incivility, defined as the insults, rudeness, shoves, interpellations, humiliations, as one of the factors that can unleash situations of violence in school, as well as the trivialization of violence. Baker highlights that the excess of discipline can worsen the situation of violence in school. Astor, Meyer and Behre demonstrate in research carried out by them that the violence in school occurs mainly in ownerless spaces, such as refectories or canteens, in the corridors, the patio, etc.

We also recall that the issue of school violence is also seen by some authors, like Charlot (2002) under different aspects. Charlot characterizes school violence as: violence in the school; violence to the school and violence of the school. This differentiation is important as it leads us to reflect on the different processes of production of school violence and therefore the different ways to broach it.

This author argues that the distinction is important in the sense that if the school is in great measure impotent with respect to the violence in school, that is to say, that the violence is a reflection of the world outside, it is not so with respect to its action in face of violence of the school and to the school.

The violence of the school is related principally to the interactions that are processed inside it, the perceptions of the different players in interaction and the violence to the school if related mainly to the interactions of the school with the external community and the family. As far as this last consideration, Debarbieux (2001) focuses mainly on the action of the adults in the school institution, not depending only on the actions of the school itself, but in the relations that it also establishes with the community.

The studies of the action strategies implanted focus mainly on the adult players, employees of the national education system, teachers, administrators, or students. There is no other way here to keep the neighborhood and its inhabitants away, and doesn't this position over estimate the role of the school and the teachers? If certain establishments are more or less efficient than others, isn't this also due to the mobilization and demobilization of the inhabitants of the neighborhood in which they are located? The study (criticism) of "community" action programs in other countries and the development of the partnership between school and family would be a form of thinking and following the educational mutation in course in the dualized liberal democracies, rendering in turn, the same social and sociological dignity to the various players of the education system (pg.185)

Taking as a starting point these considerations, the research on organizational climate in the school was carried out, giving the core prominence to the relationship between teachers and students, as well as the relationship of these players the school institution.

Seeking a more encompassing definition of climate, this can be found in Stewart (1994), quoted by Silva and Martin Bris (2003):

The climate is the total environment of an educational center determined by all those physical factors, structural, personal, functional, and cultural elements of the institution that, integrated interactively in a specific dynamic process render a

peculiar style or tone to the institution, in turn, conditioning the different educational products (pg. 25)

The different dimensions in which the organizational climate can be studied encompass as much those of the structural nature, as well as those dimension of interactive and inter-personal nature. Those of a structural nature relate to such aspects as: size of the institution, financial sources, geographical and economic location, etc. The dimensions of an interactive and interpersonal nature, relate to aspects such as: administration methods, nature of the motivational forces, nature of the communication processes, decision making models, manner of definition of the objectives and organizational norms and control processes, among others.

All the above mentioned parameters are relevant, but the parameters related to the nature of the communication processes were more highlighted in our study, as we consider that these relate more closely to the situations of violence in school.

In this manner, this study had the core objective of analyzing the organizational climate in the schools participating of the research, taking as categories the aspects related mainly to the dimensions of interactive nature and the perceptions of the school teachers.

The Study of the Climate: Methodology and Research techniques used

The climate is understood in this study as the collective and shared vision that the teachers have of the school in which they work. It is a set of norms, values and feelings perceived by all the components of the school organization and that can be indicators of the manner in which these act inside the school.

In a study about the relationship between school violence and the organizational climate, comparing France and Spain, Catherine Blaya; Eric Debarbieux, Rosário del Rey Alamillo; Rosário Ortega Ruiz (1996, p. 299), used the following indicators to study the school climate: the perception of the students of the school's general atmosphere; the perception of the behaviors and acts of violence; the perception of the school's surroundings; the perception of the relationship: between students; students and teachers; students and the school; the perception of learning; the perception of the tension between students and teachers.

Brunet (1992) using the studies carried out by Likert in the 1960s as a reference, points out five fundamental factors in the investigation of the climate: establishment of objectives; power relations; communication; control process; decision making process.

Based on the Works of Brunet (1992), Martin (1996), Falcão (1985) Carvalho (1992) and Blaya & Debarbieux (2002, 2006) and Debarbieux (1996), the climate of the schools involved in the research was studied by means of a analysis model that takes into consideration the following categories:

- a) Vision of the physical environment of the school, the school surroundings;
- b) Relationship between teachers and the administration, general aspects and main conflicts;
- c) Relationship with the students and parents main[†] conflicts and feeling of insecurity.

As a research technique, a quali-quantitative questionnaire and a group dynamics that dealt with the day to day conflicts of the two schools studied were utilized. In **school 1**, 12 teachers answered the questionnaire and 25

participated in the group dynamics. In **school 2**, 26 teachers answered the questionnaire and 14 participated in the group dynamics.

School 1

The school is located in a middle class residential neighborhood, with a few commercial sites. A large part of the local community has their children enrolled in private schools. Therefore only 5% of the students live in the neighborhoods near the school, being that the other 95% come from far away neighborhoods and use public school transport as means of locomotion. Very few of them go to school by bicycle.

The students come from various neighborhoods, for example: Bom Sucesso, Novo Wenzel, Jardim Centenário, Jardim Santa Eliza. All of these are considered peripheral neighborhoods. The school is also attended by students who live in the rural zone of the municipality. The school works in three shifts (morning, noon and night) and has a total of 1118 students from the 5th to 8th grades, Middle school and EJA.

Vision of the physical environment and the school organization

All the teachers who took part of the dynamics and who answered the questionnaire consider the school to be well organized and clean. The words used to characterize the school were: excellent, clean, serious, organized; nice looking and well preserved school.

School 1 is a school that does not undergo outside aggressions and has a reasonably well organized and ample physical space, though it is not taken care of well enough. While the research team was there, the school was undergoing refurbishing, which would make it “tidier”, but it is noticeable that the resources are not sufficient to maintain the school’s physical structure. Even so, the teachers present an optimistic and positive vision in relation to the physical aspects, and important component in the discussion of climate.

In this perspective, there are research and studies relating to the conformity of the physical school space, which as already analyzed by some researchers in Brazil (Guimarães, 1994; Cardoso, 2002; Dayrell, 1996; Gonçalves, 1996) not only produces impact on the social relations establishes inside it, but also established links with a certain ideological perspective about education. Quality education also passes through the quality of the structure in which the educational process is occurring and contributes to the value given to the professional and to the student, contributing to a climate that is more propitious to learning and to interpersonal relationships.

The criticism referred to the number of students per classroom, in average 45 to 50, to the lack of resources for the school and the lack of autonomy.

One of the teachers made a comment about the mobility of the students in the school space, which is not directly related to the physical structure of the school, but to the manner in which it is organized:

The student has to be inside the classroom all the time. The student does not have the liberty to circulate in the school area and this makes him want to cheat the system.

Relationship between teachers, general aspects and main conflicts

We noticed certain incongruence between the data on the questionnaire and with that presented on the group dynamics performed. In the questionnaire, the twelve teachers who answered referred to the relationship

among their colleagues with the terms: *good relationship, pleasant, smooth, friendly and trustful, excellent*, as can be seen in the table below:

However, in the group dynamics, statements comes out that contradict these characteristics given by the teachers as answers to the questionnaire, presenting a vision that brings up difficulties in the collective work, and tensions, as the below statements demonstrate:

- *A divided school. While one side fights to improve, the other keeps its arms folded (tug of war).*
- *Teachers without motivation, disunited, and anguished.*
- *Group work is still faulty, there is a big gap related to acting collectively.*
- *The team does not use the same vocabulary.*
- *Highly intense tensions*
- *Individualism, a lot of complaints and little action.*

The exchange of experiences and ideas among the teachers, a question on the questionnaire with the core objective of analyzing the collective work and decisions in the school, had positive answers from almost all of the teachers, however, in the dynamics, there were manifestations that contradicted these answers, as we will see further on.

The difficulty of collective work came up with much emphasis in the answers given to the questions worked on in the group dynamics, when we could observe a certain tension among the teachers, as well as in the debates. The division in “cliques” was demonstrated, there having even occurred a situation where one of the teachers refused to share his text with a colleague.

The answers given with respect to the question of which would be the ideal school, also corroborates with this analysis, as far as it showed up in a good number of the answers that point out that the ideal school would be that one where a collective work existed, which led us to conclude that this was not present, or there was little of it. The answers given were:

- *All are united in one ideal.*
- *Plan of united action.*
- *Where the whole school team: administration, teachers, students and employees unite to reach school success.*
- *United... everyone running in the same direction in favor of one sole objective. Involved, firm, pioneering, without fear of innovation*
- *A democratic school that seeks to promote the union among the teachers.*

Relationship with students and parents, main conflicts and feelings of insecurity

The relationship with the parents and students in the school 1, followed the standard of other schools already researched, in other words, it demonstrated great conflict among teachers and students and school – parents.

The question on the questionnaire that asked if the teachers had already suffered any type of aggression, received 8 positive answers and 4 negatives, which means that 66.7% of them suffered some type of aggression. There was no tale of any physical aggression on teachers by the students, but only verbal aggression, or, as many affirmed, “lack of respect”.

In the issues worked on in the group dynamics, a large part of the answers relating to conflicts in the school, referred to the students, these conflicts being of different natures, as observed in the answers that we will discuss further on.

Despite the conflict with the students expressed in the questionnaires answered by the teachers, we could observe a positive view of the climate in this aspect. The words that referred to the students were: the best possible; very difficult; very good; respect; fondness; some problems, many students have no limits; good; very good; I try to talk to the students.

However the statement of one of the teachers synthesizes many of the feeling described by a good part of the teachers at the school: *The school is excellent, what spoils the school are the students who do not respect the administration or the teachers.*

The terms “lack of commitment” and “disinterest” in studying were the words most utilized, both in the questionnaire and in the group dynamics, to characterize the school’s students. The following answers demonstrate this vision:

- *The big conflict today is the between students and teachers, the student does not want to learn, the teacher gets more frustrated every day, feels discontent and this causes constant conflict.*
- *Unmotivated students with socio-economic problems*
- *The school serves a clientele from far away neighborhoods, that’s why they show no attachment to the school.*
- *Students uncommitted to studying*
- *Lack of respect among the students who fight and use bad language.*
- *The school rules are not obeyed*
- *The teacher insists that the student learn the contents and they don’t want to, do the contradictions start there*
- *Some students (undisciplined) are frowned upon and sometimes even looked upon as bandits.*

These words illustrate one of the main points of conflict between teachers and students that directly influence the school atmosphere, as they point to constant tension that originates in the assumption that the students are not interested in what the school has to offer and that they resist learning in all ways, although they give value to knowledge for their lives, as we will see by the questionnaires answered by the students.

Despite the conflict expressed by the teachers, these do not demonstrate that they feel the school as an insecure place. Of the 12 answers to the question about if the teachers feel safe in the school, 8 indicated that there was good and respectful coexistence and one says that students sometimes “say adolescent things”. The answers given, copied below, illustrate this fact:

- I never felt threatened.
- Sometimes the students say adolescent things.
- Climate of total respect.
- Atmosphere of mutual respect.

- I have a good coexistence with the students.
- I respect the students and they respect me.

In this way, we can come to the conclusion that inside the school as well as in its surroundings, the teachers did not show any feelings of real threat.

The other point of constant conflict in the school is the teachers' vision of the students' families in the relation of parents to the school. One marked characteristic in the school's statements are the constant demands and attribution of guilt to the families regarding the problems that the schools face with students.

In the questionnaire question of whether there is the participation of the parents in the school, 9 of them answered that there is not, only two confirmed that there was participation and that the relationship with the parents is "good" ... They stated that there was little participation or that they only participate when they are called. One has to note that there are statements that the parents are only called in when there is a need to talk about the child's conduct, so that they take some action.

- Only when there is a need to talk to the parents about their children's' behavior.
- The parents are called and informed so that they can take action.
- Pleasant
- Objective is to solve problems
- The same reaction of the parents to the administration and the teachers.
- I don't know

In the group dynamics the absence of the parents in the school life of the student was very much emphasized as one of the big problems that the school faces, as shown by the following statements:

- *The students are unmotivated mainly by the absence of the Family and by the educational system itself, as there are no demands made for learning;*
- *The school serves a clientele from distant neighborhoods, which is a complicating factor. It is difficult for the parents to accompany*
- Lack of commitment by the parents with the student's school life.*

Summarizing the analysis of the data obtained in school 1, we come to the conclusion that the vision presented by the teachers about the climate in the school presented conflicts of different natures. The biggest conflict observed refers to the relationship with the students' families who are considered responsible for rude behavior, aggressions and violence occurring in the school, as well as for the lack of interest of the students for knowledge. Another problem pointed out refers to the relationship among teachers and the difficulty of collective work.

5. The concrete difficulty of the school's location, geographically distant from the families, in our view is not the major problem. The main issue that we found in the question of school-family is the desire of the school to have students with a different social reality. Although in the question about the impression of these about the work with children in problematic socio-economic conditions, the answer was that they didn't mind, the concrete fact is that they constantly place the socio-economic condition of the students as one of the causes of a behavior of lack of interest in learning. The school considers that it is the family that should promote the

shaping of ethical and moral concepts and of standards of behavior adequate to the social context, which enters into shock with the concrete reality of the majority of the students of public schools and the values of an individualistic society with huge social and economic inequality.

The feeling of insecurity and the physical space of the school was one of the issues little brought up by the teachers, leading one to conclude that there is a feeling that they feel secure and that the physical space of the school is pleasant.

In this manner, we come to the conclusion that the organizational climate in school 1 as presented by the teachers is positive except for the question of the conflicts with the students due to their lack of interest in studying that causes indiscipline, aggressiveness and violent attitudes. We highlight in this perspective the blaming of the families for this context, which contributes to a negative climate in reference to the relationship of the school with the families.

SCHOOL 2

The school is located in a densely populated peripheral region with low socio-economic indexes. In this region, popular standard housing and residential complexes created in the decades of the 80s and 90s by the state. It serves approximately 800 students from the 5th to 8th grades in the Middle School, distributed between the morning period and the afternoon. The majority of the students live in neighborhoods near the school.

In the neighborhood where the School is located there is a lot of degradation to the environment caused by the clandestine disposal of solid waste (domestic, industrial and even hospital) and the existence of large areas of rubbish and the launching of raw sewage into the waterways, situation which is commonly seen in the city outskirts of developing countries.

The violence rates are high and they characterize one of the most violent regions in the city. The daily routine of the population is linked to police actions in combatting crime and drug traffic. The local population knows where the drug points are and know how to distinguish the drug pushers and the hoodlums who circulate the neighborhood. However, as in all the regions of heavy violence, there is no open talk about the problem, because of the fear and the need of social coexistence imposes the law of silence. Unfortunately this seems to be the reality of this population.

Vision of the physical environment of the school and its surroundings

School 2 presents a badly compromised physical structure, with badly cared for, dark environments, full of graffiti and with metal bars everywhere.

The school's image corroborates with the teachers' statements about the school's physical space, demonstrating how much this factor is a result of the climate present in the school.

The physical structure of the school shows up a constant situation of invasion by students and youths from the community who come in to speak to the students, "look at the girls", play ball, etc. Despite this, we could verify, by the semi-open questionnaires answered by the teachers, that they don't feel threatened. 18 teachers answered that they don't feel threatened and 6 answered that they do. The invasions are considered as an important point of conflict, however they do not necessarily constitute a threat to the property and physical structure of the school.

Reinforcing what was already discussed in school 1 with respect to the physical space, it not only impacts the social relations established in its interior, but it also established links with a certain ideological perspective about education. Quality education also is given through the quality of the structure in which the educational process occurs and contributes to the valorization of the professional and of the student, contributing

to a more propitious climate for learning and for interpersonal relations, something which certainly is not happening in school 2.

Relationship between teachers: general aspects and main conflicts

The data about the relationship between teachers demonstrated that there is a “good” relationship between teachers, although a certain amount of criticism appears in the statements. Ten answers state that the relationship is good and relatively good and 06 answers state them as a bad. The other answers were neutral, characterizing them as “professional”, “reciprocal” or without an answer.

The answers to the question posed in the group dynamics carried out and that related to the characterization of a bad relationship were:

“ The relationship is not very good, because there are teacher who do not carry out their roles as they should”.

“ The teachers are very individualistic and divided

“I do not get involved with my colleagues because of previous problems (gossip, intrigue, etc.).”

“There is a lack of unity”

“Lack of communication among the work group”

“I feel the administration is negligent and part of the teachers don’t even talk to the others”.

“There is not always articulation between people in the work”.

We could notice by these answers that there is a climate of little integration between the teachers. However, in the answers given to the other question in the questionnaire about whether there was an exchange of experiences and ideas among teachers about the general and pedagogical issues in the school, the great majority answered yes, and only 3 answered that this exchange did not exist, as can be seen by the table below. In this manner, the data appear to be contradictory with respect to the positive climate among the teachers.

Table 1. relationship -teacher-teacher

Bad
Reciprocal
Relatively good- 3 answers
Good- 5 answers
Very good
There are distinct groups of older and newer teachers. The older teachers isolate the newer ones

The relationship is not very good as there are teachers who do not carry out the role they should
They are very individualistic, divided
A few lack communication
There is a lack of unity

With respect to the relationship with the administration, a few criticisms were put forth by some teachers, although the majority of the answers state that there is a good relationship with the administration. The criticisms were in the vein of negligence by the administration with respect to the school as far as its physical as well as pedagogical aspects go, as can be seen in the table below:

Table 2. Climate –Relationship-Administration-Teachers

Distant
Some have respect, others don't
Reciprocal
Lack of collaboration and communication
Good
Communication difficulties
Good, however require more connection and dialogue
The Director is very humane
The teachers have the liberty of exchanging ideas
They are present and give us support.
I have hardly any contact with the administration
There is respect and support
Open to dialogue, but absent
Medium, the administration should have a stronger pulse and demand more from the teachers and employees
Harmonious and respectful
There is conflict between the teachers' vision and the school administration

Relationship with the students and parents, main conflicts and feelings of insecurity

The teacher –student relationship in school 2 demonstrated itself to be very similar to school 1, because the same points were highlighted: undisciplined, disinterested, aggressive, etc. Notwithstanding these points showing up, the relationship with the students according to the majority was considered to be good, as demonstrated in the table below, which shows the answers to the questionnaire:

Table 3. teacher-student relationship

Very good
Who respects is respected
Partial involvement
Good- 5 answers
Despite the large wave of violence, I was never disrespected, Always coexisting in harmony
I don't have any problems. Some are sweet, others are the opposite
Good, the students aren't saints, but our relationship is very cool.
Reasonable, undisciplined students, with no interest in the subject matter
Good, there being only the ordinary problems of lack of discipline in isolated cases
Reasonable
The teacher student relationship is respectful with Exchange of ideas, despite the fact that some students are undisciplined
I can communicate well with them, but I perceive that there are professors that are very distant and place a barrier in this relationship

The answers given to the questions arising in the group dynamics presented a very negative view of the students, although, as we can see on the above table, a condition of good relations between teachers and students. We highlight below some of the statements made by some of the teachers attesting to the above:

“Socially unstable students, functionally illiterate and the worst category, the socially aggressive, already leaning towards criminality.”

“I consider that the majority of my students have no commitment to the school activities, they are lax, they don't like studying and they like the school environment even less”

“Students without any future prospects, without limits demotivated”

“The students are revolted and aggressive maybe by the lack of attention from their parents”

“Badly educated students, they don't respect the employees, teachers or colleagues”

We can come to the conclusion that the climate present in the teacher-student relationship is a mixture of resignation and at the same time condescension as they consider that the lack of discipline, rudeness and incivilities are the consequence of the students' social and family situation.

The relationship with the parents also demonstrated a similar condition to that of school 1, with respect to the blaming the families for the type of behavior of the students in the school, evidencing a tense climate and a mixture of fatalism with respect to the concrete situation of the students' life and their behavior in the school. The picture that we reproduce below shows the vision of the teachers with the parents:

Table 4 .Relationship Teachers-Parents

Difficult
Partial absence
When the parents com it is good
God- 5 answers
Inexistent
Unfortunately the parents of the children who have no problems always appear
When I ask the parents to come for a talk, I was always answered.
They are called in when there are problems and for the bimonthly meetings
There are very few parents that seek out the teachers to find out about their children
There is no relationship, they only appear when they are called to solve discipline problems
When I relate, it is good

The great majority talk about the absence of the parents and, as we can observe, how they come when they are called and only to solve problems. During the group dynamics carried out, there was much questioning about the family's responsibility with respect to the students' attitudes. We noticed, however, that the answers written in the questionnaire and the questions in the group dynamics, very little was talked about by the teachers concerning the conflicts with the students' parents and families, contrary to what happened in school 1.

We cannot come to the conclusion that the climate between the school and the parents is positive or negative, what we can conclude is that there is an absence of the parents in the school and this deserves to be studied better.

The issue of insecurity seems to be one of the biggest problem points for the school, constantly pointed out by the teachers. The invasion of the school by elements not part of it was pointed out by the majority of the teachers, as can be seen by the following statements when asked what would be the main conflicts in the school:

“Insecurity of the building, invasion of strangers to the school”

“Invasion of individuals with bad intentions”

“Invasion by students who study in different periods”

“Insecurity, aggressions and disrespect”

“Invasions by people from the community, lack of discipline of the students, physical and verbal aggression among students, lack of direction.”

Synthesizing the different variables that compose the climate and that were studied, we can come to the conclusion that the climate in school 2 is a climate of significant tension, motivated mainly by the difficulty in the relationship with the families and with the community and a certain dose of difficulty of articulation between teachers –teachers and teachers administration.

4th International Conference on New Horizons in Education

Science and geography teachers' conceptions regarding problem-based learning related concepts

Sofia Morgado* & Laurinda Leite

University of Minho, Campus de Gualtar, Braga, Portugal

Abstract

Teaching for Problem-Based Learning (PBL) requires big changes in teachers' usual roles. As teachers' conceptions may exert an influence on their own teaching practices, putting into practice a new and demanding teaching approach like PBL may be facilitated by teacher education. This paper presents an analysis of the evolution of 33 Science and Geography teachers' conceptions regarding PBL related concepts due to an in-service course. Results indicate that most teachers overcame their conceptions of problem and started to acknowledge the idea that using problems as a starting point for learning new ideas (as required by PBL) makes sense.

Keywords: Type your keywords here, separated by semicolons ;

1. Theoretical framework

There are several conceptions of Problem-Based Learning (PBL), being some more student-centred and other more teacher-centred (Barrows, 1986; Hmelo-Silver, 2004). This paper assumes a conception of PBL as is a student centred teaching approach that takes problems as starting points for new learning (Lambros 2004). Thus, a problem is a task that requires an answer or a solution (Jonassen, 2004). However, it must be stressed that a problem may have no solution, or it may have one or more solutions. In any case, the problem solver should not be able to anticipate the answer nor the appropriate strategy to get it. Although problems can be used at different phases of a teaching sequence (Leite & Esteves, 2005), PBL requires them to be used at the beginning of the learning sequence, as starting point for new learning. When this is the case, problems can be brought by the students or by the teacher or they can emerge from a scenario (Lambros, 2004) prepared or selected by the teacher in such a way that it elicits questions that have to do with the concepts that teachers are supposed to teach.

Solving a problem requires efforts from the problem solver. Hence, school science problems should be or at least seem real (Azer, 2008; Jonassen, 2004; Lambros, 2004) so that students feel it is worthwhile solving it. Besides, this would promote integration of knowledge (Jonassen, 2004) which is a competence relevant from an everyday point of view. In fact, real problems are multidisciplinary in nature and they require the integrated use of knowledge and skill from several different areas of expertise. If school science problems have this characteristic, then students would both feel more prone to find out a solution for them and develop competences that are relevant for solving problems later on in their private and professional lives (Azer, 2008; Hmelo-Silver, 2004; Savin-Baden & Major, 2004). Besides, if a social constructivist perspective of learning is acknowledged, then students should work in small groups to solve the problems. This would also be important for their future life as professionals have been more and more asked to work cooperatively.

Characteristics of problems and problem-solving that were mentioned so far show that differ significantly from

* Corresponding author. Tel.: +351 253 604 274; fax: +351 253 601 201

E-mail address: softiamorgado@ie.uminho.pt

exercises, as the latter require rote use of conceptual knowledge and mathematical expressions, have a single solution as well as an only solving strategy (Jonassen, 2004). Although they may enable training some skills that are relevant for solving problems, if exercises are one of the most frequent type of task students are asked to perform (Fortus, Krajcik, Dershimer, Marx, & Mamlok-Naaman, 2005), then they will prevent students from developing competences that are nowadays acknowledged as key components of science education for citizenship.

Teaching for PBL requires big changes in teachers' usual roles. As a matter of fact, instead of being a "knowledge teller" (Leite & Esteves, 2012), teachers have to be knowledge building facilitators and student guides (Azer, 2008; Hmelo-Silver, 2004; Lambros, 2004). However, assuming these new apparent passive roles may make teachers feel uncomfortable; they may feel that they are not doing their job appropriately (Savin-Baden & Major, 2004; Goodnough & Cashion, 2006). Besides, research has shown that teachers do not hold clear conceptions of exercise and problem, as they use the word problem when they are referring to exercises (Freitas, Jiménez & Mellado, 2004) or they do not distinguish exercise from a problem (Sousa & Fávero, 2003; Freitas, Jiménez & Mellado, 2004). As there is some evidence that teachers' conceptions may exert an influence on their own teaching practices (Van Driel & Abell, 2010), putting into practice a new and demanding teaching approach like PBL may be facilitated by teacher education. Thus, this paper aims at analysing how Science and Geography teachers' conceptions regarding Problem-Based Learning related concepts evolve, due to an in-service course.

2. Research Methodology

Participants in the study are 33 Science (27) and Geography (six) in-service teachers, teaching in secondary schools located in the north and centre of Portugal, who volunteered to attend an in-service course on PBL. As it is usual in Portugal, even in science, most of the subjects (28) are female. The majority (26) are graduates (only) and had been in the teaching profession for more than 16 years. This means that they are well established as teachers and therefore they are an appropriate sample to studying teachers' conceptions. However, they may be more motivated towards the issue than their counterparts were.

The course, focusing on "Teaching Science and Geography through PBL", with 25 hours face-to-face work, was recognized by the Portuguese Ministry of Education as an in-service teacher education course qualifying for teacher progression in the career. The course was organized so that teachers could: reflect upon the role of problems and exercises in Science and Geography teaching; characterize Science and Geography teaching oriented towards PBL; develop teaching materials relevant for PBL; develop instruments for students' assessment. Two editions of the course were run by one of the authors of this paper together with a third colleague. Participants' final learning assessment was based on an essay individually done.

Data were collected, before and after the course, by means of a questionnaire. Open questions focusing on the concepts of exercise, problem and problem based learning were included. Data were content analysed based on *a posteriori* defined sets of categories.

3. Results and discussion

Participants in the study were questioned about the relationship between problem and exercise, before and after the course. All of them mentioned that exercise and problem are different. When teachers explained why they are different, several correct ideas were mentioned. However, a few of them did not give an explanation for that, neither before nor after the course. In addition, before the course, teachers tend to mentioned the most common characteristics (A and E) while the most unusual ones were omitted (C) or were mentioned by only one teacher (D). After the course, the percentages of teachers mentioning ideas B and C are higher than they were before. This means that some teachers gained some awareness of two distinctive characteristics of problems, one related to the obstacle it offers to the problem solver and another one related to the possible numbers of solutions.

However, none of these ideas was shown by the majority of teachers that participated in the study.

Table 1. Evolution of teachers' ideas about the relationship between exercise and problem (%)

Problem (P) <i>versus</i> Exercise (E)	Before	After
A - A Problem is cognitively more broad and demanding than an Exercise	30,3	24,2
B - A Problem presents an obstacle to the problem solver; an Exercise does not	18,2	42,4
C - A Problem may have no solution or one or more solutions; an Exercise has one only solution	0,0	24,2
D - A Problem may have several solving strategies; an Exercise has only one	3,0	9,0
E - A Problem serves new knowledge learning and application; an Exercise serves training purposes	37,4	39,4
G - Do not know / No answer	12,1	9,1

All the participants in the study were also asked about what they think that PBL is. Before the course, one third either did not answer or stated that did not know what it is (F). This percentage (the highest one before the course) was reduced to a half after the course, which is an unexpected result as teachers had just finished the course where this concept was focused and materials were prepared.

Table 2. Evolution of teachers' ideas about PBL (%)

Characteristics of a PBL approach	Before	After
A - The problem is the starting point for learning	27,3	39,4
B - Students are at the centre of the teaching and the learning processes	24,2	69,7
C - Students are responsible for their own learning	0,0	60,6
D - The teacher is a learning facilitator	6,1	30,3
E - PBL develops conceptual and procedural knowledge	9,1	15,2
F - Do not know / No answer	33,3	15,2

Before the course no teacher mentioned that "Students are responsible for their own learning" (C), but the percentage on this category increased a lot after the course (60,6%). Other categories in which the number of teachers increased a lot from before to after the course are B (24,2% → 69,7%) and D (6,1% → 30,3%). This increase may mean that participants in the course understood the role and responsibility of the students in a PBL approach and that a few of them also became aware of teachers' role as a learning facilitator. However, taken together, these results suggest that it is easier for teachers to accept the change in students' role than in their own role, and therefore they are consistent with literature reviewed in the first section of this paper. In addition they may suggest that they focused more attention in people roles than in problems role as percentage in category A increased about 10% only. This may also mean that most of them resisted to the idea that problems on a theme or concept can be used before teaching them.

4. Concluding remarks

Results suggest that teachers' conceptions evolved due to the in-service course they attended. However, evolution is not too consistent with regard to the diverse categories used for the purpose of data analysis, being those representing less innovative ideas and/or those that put into question their 'comfortable' authoritative status the less mentioned. Although these results could be anticipated, they may have implications for implementing PBL oriented Science and Geography teaching. An implication of this is that teachers need support from teacher

educators if they are going to put PBL into practice. It should include helping teachers in preparing teaching materials, namely problems and scenarios, and accompanying them when they are working with their students, in order to make sure that they just guide students in their problem-solving tasks, without telling them the problem answers. In fact, this support would help teachers not only to use PBL appropriately but also to develop their pedagogical content knowledge, namely with regard to teaching Science and Geography through PBL.

Acknowledgements

This research was carried out within the scope of the Research Project “Science Education for Citizenship Through Problem-Based Learning” (PTDC/CPE-CED/108197/2008), funded by FCT within the scope of the Thematic Operational Program Competitiveness Factors (COMPETE) of the European Union Community Support Framework III co-funded by the European Regional Development Fund (ERDF/FEDER).

Abstract

The paper introduces the results of research in the field of information and communication technologies in a specific group of students with mild intellectual disabilities. The main objective was to compare the behaviour of students with mild intellectual disabilities, who attend secondary practical schools and students of secondary mainstream schools, in the use of the Internet, in particular with the rules of its safe use.

Keywords: information and communication technologies; internet safety; mild intellectual disabilities

1. Introduction

In recent years, information and communication technologies have become a normal part of our society; hence security in the Internet environment is gaining interest. In connection with the expansion of Internet use, mobile technology and especially the popular social networking sites, bullying or cyber-bullying via the Internet and other potentially dangerous activities have become more common. Therefore, one of the important current objectives of our schools is to teach children how to use the Internet safely (Maněnová, Skutil, 2010; Maněnová, Skutil, Zikl, 2010).

In our research, we focused on one specific group of children - children with mild intellectual disabilities. These children commonly use all the possibilities of the Internet, but due to the characteristics of their disadvantages, they represent a group at greater risk due to a lower ability to forecast the consequences of their behaviour, the worse the ability to analyse a situation, a higher degree of suggestibility, etc. (Beirne-Smith, Patton, Kim, 2006). It is therefore important in schools for pupils to be prepared for the fact that the Internet is not only a good helper and counsellor, but it is also full of pitfalls that need to be guarded against.

The theme of safety when using the internet is included in the curricula for both regular schools and schools that educate children with mild intellectual disabilities. The Framework Educational Programme for Basic Education (hereinafter as FEP BE), and FEP BE – a supplement specifying education of pupils with mild intellectual disabilities, do not contain explicit competences in the field of security when using the Internet, but both documents include exactly the same subject matter generally determined: "principles of safety and

* Corresponding author. Tel.: +420 493 331 386.

E-mail address: pavel.zikl@uhk.cz

prevention of health risks associated with long-term use of information technology". Teaching children with mild intellectual disabilities effective and safe use of information technology is obviously more challenging than in the general population, so therefore more time is allocated for the educational area of "Information and Communication Technologies" in the curriculum for children with mild intellectual disabilities.

2. Research objectives and methodology

The main objective of this research was to compare the behaviour of pupils with mild intellectual disabilities who attend practical secondary schools and pupils of secondary mainstream schools, during the use of the Internet, in particular the rules of its safe use. We wanted to determine whether there are differences in awareness between the two groups of pupils about the safe use of the Internet, how they comply with the principles on the Internet and how they protect their personal data. For additional information regarding the two groups of children, we also investigated whether they have a computer with internet access and how many hours they spend using it.

The research sample consisted of 71 pupils of practical secondary schools and 211 pupils of mainstream secondary schools. The age distribution is given in Table 1.

Table 1. Age of the respondents

	mean	Standard deviation	min	max	mode	median
pupils with Mild Intellectual Disability (MID)	14,3	1,08	13	17	14	14
intact pupils	12,9	1,27	11	16	13	13

The higher age of students with mild intellectual disabilities is given by their later onset in primary school because of school attendance delays and frequent repetition of year for this group of pupils. This makes the average age of students in the practical primary school a little higher than in mainstream schools in the same grade.

The data were collected using a questionnaire of our own design in mainstream primary schools and practical primary schools.

3. The research results

The first part of the results presents a comparison of the possibilities to access a computer and the time spent on the PC during a day. We started from the hypothesis:

H01: Students with mild intellectual disabilities will have equal access to the computer as the intact population.

H02: Students with mild intellectual disabilities spend the same time during a day at the computer, as the intact population.

Based on the tests, the first hypothesis wasn't accepted ($\chi^2 = 15.6$; probability = 0.008). We can say that there is a difference in the options for accessing computer between the groups (the results are presented in Figure 1). We assumed the same approach, because in the Czech Republic 85% of households with children under 16 years have a computer and 80% have internet connection (Czech Statistical Office, 2010). It probably

reflected the worse social situation of families of children with mild intellectual disabilities and a partial influence also lies in the lack of ability of the parents to work with information technologies.

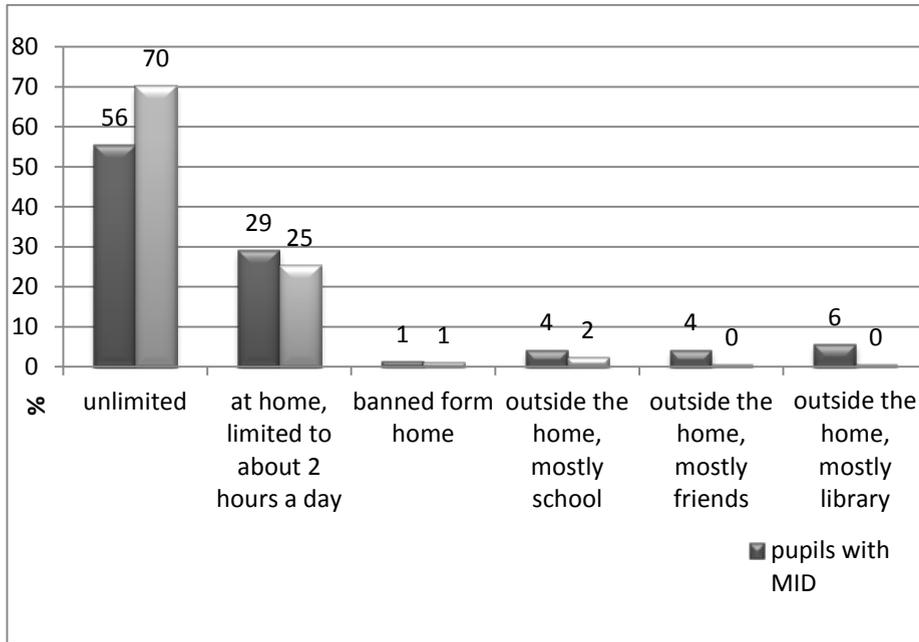

Fig. 1. Access to a computer

The second hypothesis was accepted, the average time spent on computer doesn't differ significantly in the groups of children (according to Figure 2). We used Student's t-test whereas the data didn't clearly show a normal distribution, the non-parametric Mann-Whitney test was also used. The test criteria value was T value = -0.3724, probability = 0.710118. The test criteria value Z of value approximation with correction = 0.7303, probability = 0.465197.

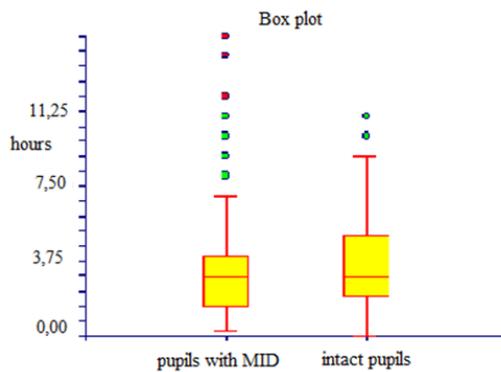

Fig. 2. Number of hours spent on a computer

The next section of the paper publishes some results of the research that focus on Internet safety.

We wanted to find out how the two groups of children handle a password (passwords) that they use on the web. In this issue, we proceeded from the general rules of Internet safety, and we assessed whether students keep their passwords confidential. The responses were positive, because both groups most commonly chose to keep the password secret, a pupil doesn't disclose it to anyone and they sometimes change it. The second most common option was keeping their password a secret, but without change (detailed results in Figure 3). Between the two groups there is no significant statistical difference (chi-square = 1.27, degrees of freedom = 2, probability = 0.529).

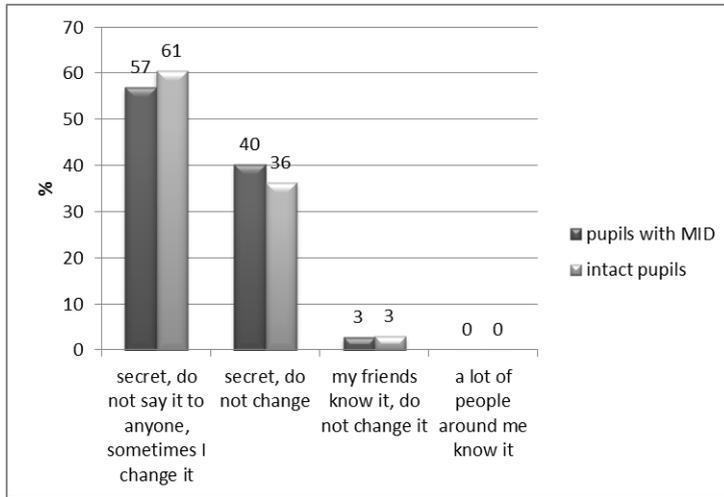

Fig. 3. Dealing with password

In the next part of the research, we focused on how children approach protecting their personal data. First, we were interested in what information they publish about themselves on their web profiles and whether they send some of the data to other people. It turned out that the majority of children from both groups do not send their details (address, phone) over the web to anyone, although it is a bit alarming that about one quarter of children normally and very often send information via a website and basically do not protect it in any way (Figure 4). There was statistically no significant difference between the groups on this issue (chi-square = 2.45, degrees of freedom = 2, probability = 0.294).

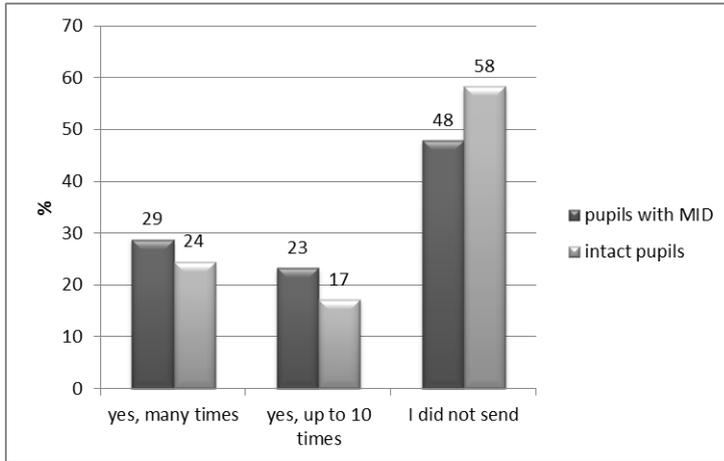

Fig. 4. Provision of personal data

Figure 5 presents what true information children publish on Internet profiles about themselves. Neither here is any significant difference between the two groups of children, although a slight tendency to publish more personal data is apparent in children with mild intellectual disabilities.

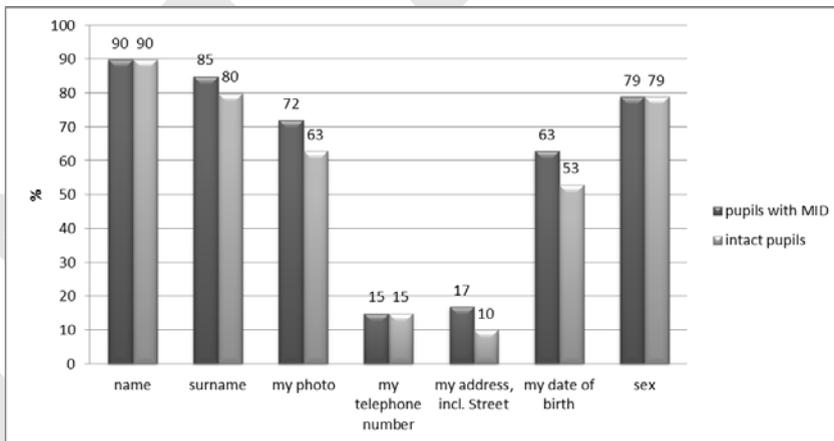

Fig. 5. What true data do they report on the Internet?

Furthermore, we focused on the issue of meeting with a person that are only known to them via the internet. Here, the difference between the two groups of children appeared, but was not statistically significant (P value

0.0935). 75% (pupils with MID) or 62% (intact pupils) clearly reject the possibility of a meeting with a person known only through the Internet. The answer to this question was open and the other respondents (25% and 38%) responded that under certain circumstances, they would meet with a person known only via the internet. The most common condition for meetings for pupils with MID was to know the person otherwise than through the Internet. Smaller percentage also represented the opportunity to meet with an unknown girl, which some pupils with MID does not perceive as dangerous and sometimes also meeting with an unknown person in the presence of another friend. Intact students also reported knowing a person via video and other forms of communication as a possible condition for meeting.

4. Conclusion

It is gratifying that in the field of security on the web, there is not only compliance in curricula for children from both surveyed groups, but in fact do not differ too much, as confirmed by our research. We noticed a slightly higher incidence of risky behaviour in children with MID (e.g. in disclosure of personal data), but not statistically significant.

Overall, however, we feel that practical primary school students do not significantly lag behind mainstream primary school pupils and the vast majority of students with mild intellectual disabilities are no different working on the Internet and in compliance with the principles of safe use from their peers in mainstream schools.

4th International Conference on New Horizons in Education

Self-regulation of adolescents. Gender specifications.

Michal Čerešník ^{A*}

^a *Constantine the Philosopher University in Nitra, Faculty of Education, Department of Pedagogy and School Psychology,
Dražovská 4, 949 01 Nitra, Slovakia*

Abstract

In our paper, we focused on the gender specifications of adolescents' self-regulation. Our attention was concerned on research in which we worked with two research methods: Scale of Masculinity and Femininity and SPARO. Our research was realised on the sample of 150 participants who were adolescents – students of the secondary schools and university. We hypothesized that there the differences exist in self-regulation of the adolescents in the relation with their gender role. We can support the hypothesis we designated despite of that we did not found the differences among the gender types in all variables.

Keywords: gender; masculinity; femininity; androgyny; indifference; self-regulation; SMF; SPARO

1. Self-regulation

The issue of self-regulation in relation to volition processes is as old as the history of explicitly defined psychology. We already encounter these terms in works of James, Wundt or Freud. Even though this term has already a long existence, only in 20th century we come in Psychology to the idea that self-regulation processes and their analysis should be the subject of scientific analysis and heading of this science. (e.g. Karoly, 1993).

Brichcín (1999) states that we use many terms to identify self-regulation and these terms have content links created between them. We use terms such as self-guidance, self-management, self-control, volition, will, etc. This means that in this particular area still exists uncertainty when it comes to terminology.

Carver and Scheier (1998) state, that the term self-regulation is generally related to human efforts to change their own thoughts, feelings and behaviour towards higher aims. If we therefore speak about self-regulation, the centre of our attention is a human as an active entity and a being which can decide independently. At the same time, it actively adapts to life conditions and does not stay in the position of helpless observer of events (Baumeister, 2005).

Cameron and Leventhal (2003) identified two basic features of self-regulation. The first one is related to dynamic motivation system of setting goals, the selection and application of strategies to achieve these goals, the process for evaluation and revision of goals and strategies. The second feature is related to the management of emotional answers which the authors see as crucial elements of one's motivational system. These two features could be called cognitive-motivational and emotional-motivational.

However, if we return to the definition of self-regulation (e.g. already mentioned Carver & Scheier, 1998, or Zeidner, Boakaerts & Pintrich, 2000) and understand it as a systematic process which involves conscious effort to influence thoughts, feelings and behaviour to achieve goals in the context of change of environment, then we can identify another feature of self-regulation. We could call it mobilizing. It would be related to the personal variable, which we call in Psychology high frustration tolerance.

There are various self-regulation theories, defining structural components and self-regulation processes. To the most widely known belongs the theory of Bandura (1977), Carver and Scheier (1981), Locke and Latham (1984), Kanfer and Ackerman (1989), Frese and Zapf (1994), Zeidner, Boakaerts and Pintrich (2000), Zimmerman (2000). They vary in emphasis they put on regulation processes and regulation evaluations (Sitzmann & Ely, 2011). They differ in planning processes, monitoring, metacognition, attention, learning, time management, structuration of environment, help seeking, emotional control and evaluation in the form of self-evaluation attributes and self-efficiency. We can however also identify common features. All theories have a common fixation to goals, persistence and effort. This means that they work with such attributes as setting standard, or formulation of expectation (e.g. I want to pass the next exam with an A), allocation of resources in spite of boredom or mistakes (e.g. this textbook is boring but I will persist and learn it), time duration of activity (e.g. time spent by learning boring content).

In Slovak conditions were also created theories[†] where the main interest lies in the problem of self-regulation. These are the theories of Komárik (2007, 2009), Kováč (2007) or Mikšík (2004).

Komárik (2007, 2009) within his theory understands the human as a system consisting of six self-regulation systems, which are cells, viscera (inner organs), movement, reproduction system (family), culture and personality. These systems are considered as hierarchically (or more exactly transcendently) arranged. Lower systems represent potential and capacities for higher systems. Higher systems are the regulators of lower systems. They change their structure so that it complies with their needs. Komárik (2006) speaks about conception in which there is place for outer (family, culture) and inner sources of self-control, or self-regulation (cells, viscera, movement, personality). The highest control system is the personality. Author doesn't reject outer sources of self-control and he claims that overcoming individuality and creating over-individual communities is natural to

[†] In Slovak condition, there were also realized the researches within this problem. At our university, the best known are the researches of Verešová (2000), Verešová (2007a, 2007b) which were also the impulses to recall the interest of this problem.

humans and brings with it advantages, which are decrease of costs (increase of efficiency) and expanding possibilities.

Kováč (2003, 2007) defines regulation as maintain and modification of stability of a certain system based on feedback with the influence of regulators. He understands psychical regulation or psychical self-reflection of oneself and the world as a process whose functions are following:

- it enables the organism to better adapt to the surroundings (compared to genetically programmed behaviour for survival) – *assimilation*,
- it enables the organism to create more favourable conditions for life (compared to changing environment) – *adaptation*,
- to change the system in which the psychic reality works, that is to change itself – *auto-regulation*.

The most specific approach to self-regulation can be found at Mikšík (2004). His concept of structural and content system of self-regulation is presented in chapter 3.

2. Gender differences in self-regulation

Gender differences in self-regulation were researched in many researches. We pick from them some important results. Meece, Glienke and Burg (2006) in their researches indirectly point to the fact that boys / men have higher cognitive flexibility which shows in higher interest and higher success in science and mathematics. Pintrish and Zusho (2007) have shown that girls / women compared to boys / men have lower self-evaluation when evaluating own scientific abilities, which shows in lower interest and distorted image of oneself. Pajares and Valiante (2001) confirmed that boys / men and girls / women differ in motivation beliefs and in regulation of learning. Velayutham, Alridge and Fraser (2012) have proven that defining the goal, value of task and self-efficacy are important precursors of self-regulation and specifically bound to gender, or sex. Differences between boys / men and girls / women in self-enhancement were confirmed by the researches by Beyer (2002), Baumaister (1989) and Kurman (2004).

All these results lead us to the formulation of hypothesis about gender differences in self-regulation (end of chapter 3). This assumption is tested in a group of adolescents which are in this time sensitive to questions of identity, whose inherent part are also gender expectations and their fulfillment.

3. Method

The sample consisted of 150 participants whose average age was 18.03. They were the students of the secondary schools and students of the university. The structure of research sample according to gender types is inscribed in Table 1.

Table 1. Structure of the research sample according to sex and gender

			masculinity	femininity	androgyny	indifference	total
sex	women	N	6	35	38	11	90
		%	4.00%	23.30%	25.30%	7.30%	60.00%
	men	N	23	4	26	7	60
		%	15.30%	2.70%	17.30%	4.70%	40.00%
total		N	29	39	64	18	150
		%	19.30%	26.00%	42.70%	12.00%	100.00%

The process of the gender types creation is described in chapter 5. Despite of the women's dominance in the research group, we found that the largest gender type is group of androgynous adolescents and that the clear and expected gender types (feminine women and masculine men) had the count 58 (35 women and 23 men) what is approximately 39% of the research sample

We used the following research methods (in alphabetical order):

Scale of Masculinity and Femininity (SMF)

author: Kusá

The questionnaire consists of 45 items which are distributed into three scale: masculinity, femininity and social desirableness. The items regularly alternate. The participants use the 6-point scale to judge the items. We used only the scale of masculinity and femininity in our analysis.

SPARO

author: Mikšík

This personality inventory consists of 300 items. The task of the participants is to express their agreement or disagreement with these items.

The basis for creating the SPARO method was the IHAVEZ method (the author is also Mikšík, editor's note), which was developed as a diagnostic tool of personal variables, on which depends the quality of interactive behaviour of an individual in acute life situations, the nature and dynamics of individual's coping with situation variables in effect. By researching the items and scales of IHAVEZ questionnaire, four basic mutually independent factors were extracted, which could be perceived as internally specific structured complex of cognitive, emotional, regulatory and adjusting components which connect into individual profile of psychological personality variability, as an integrated complex of inherent and adopted strategies of dynamic coping with various variants of situation complexes, readiness to certain ways and forms of interactions with life reality.

Mikšík (2009) states that SPARO serves to diagnose the structure and dynamics of basal auto-regulation and integration of inner and outer personality activities, personality's psychical toughness. The author understands the basal psychical integration of personality as an integrated complex of inherent and adopted strategies, which help the individual to cope with various variants of situation complexes. According to the author, this means subjectively characteristic quality of readiness to certain form or ways of interactions with the environment. From this integration depends, which circumstances, life conditions, contexts or aspirations are optimal for human and for which of them he is not enough psychically disposed.

Mikšík (2004) defines following most general integrity indicators:

- PS = general psychical spontaneity, excitability, (inner) activation, behaviourally expressed as a tendency to incline towards dynamic interactions, related to intensive psychical activation, or as high situation excitability (arousal);
- MD = motoric (interactive, outer) dynamics and reactivity. By high values it is expressed in looking for changes in smaller regulatory barriers and high emotional and adjustable rigidity: by negative values, it is expressed by the tendency (situation and also active) calmness by high emotional excitability, regulation to adjustability.

These two given indicators then reflect in a specific way into key, mutually independent components of psychical interactive variability of a personality, which are:

- CV = cognitive variability, is a component related to cognitive functions. A pronounced variability is characteristic by the tendency to change, high quantity, dynamics and variability of impulses by their complex recourse and processing. Invariability on the other hand is characterized in individual being more stable when interacting with the environment, also being cognitively poorer, so he has lower cognitive capacity for dynamic recourse and processing of situation variables.

- EV = emotional variability, which is related to experiencing interactions with the environment and situation changes and records dynamics of emotions and its influence in the cognitive and behavioural area. Positive pole is represented by high excitability, the tendency to experience situation tension and euphoria. Negative pole expresses emotional stability, decreased emotions.
- RV = regulation variability, which is related to regulatory or controlling functions of the behavioural modality, auto-regulation quality, resolution and activity control. High variability means low self-control, low consideration of possible consequences of interaction activities, decreased self-regulation of behaviour. For invariability is typical systematic affiliation of future possible effects into decision making process, into activity, behaviour system activity (we speak about anticipation regulation of behavior and activity).
- AV = adjusting variability, where by higher adjusting variability is typical dynamics of actuation of situation variables and also adjusting activities. By invariability we speak about adjusting rigidity, when a person show tendency to inertly stick to own approaches, activities, behaviour schemes (tendency not to adjust oneself, but adjust to oneself).

Mikšík (2004) institutes also other personal attributes, which serve to better view the individual specifically basal auto-regulation of a personality. These attributes are then integrated in the questionnaire into more general dimensions. These dimensions are (we define them together with brief characteristic of high score of individual scales):

Dimension N - normality attributes:

- scale of egocentrism and suspicion (ES): high score shows the tendency to hypochondria and chasing delusion;
- scale of psychical instability/stability (LS): high score shows emotional stability and prudence, psychical balance;
- scale of extremity (EX): high score shows deviation from population norm;

Dimension S – optimal level of stimulation:

- scale sensory impression (SI): high score shows searching intensive various sensual experience, dynamic forms and contents;
- scale intensity of inner psychic processes (IP): high score shows looking for intensive emotional experience for the pleasure itself;
- scale movement disconcertion (MD): high score shows the tendency to rivalry, danger and adventure;
- scale of dynamic interaction with the environment (DI): high score shows the interest in change, unexpected, unusual, the tendency to new things and to overcome boredom;
- scale of social disinhibition (SDh): high score shows damping, momentum and in extreme cases even asocial behaviour;
- scale of stimulation level (SL): score shows which dynamics in outer environment suits a person and which is considered to be a burden;

Dimension Ri – individual tendency to take risks:

- scale of aspirations (AS): high score shows a high aspiration level, setting high goals and prevailing success experience;
- scale of anticipation (AT): high score shows enormous tendency of evading activities, connected with danger of failure and losses;
- scale of tendency to rely on luck (TL): high score shows the tendency of risky decisions, in which is assumed little hope of success, or loss;
- scale social exhibitionism (SE): high score shows the tendency to show off, be admired for something that the person can do compared to others;
- scale of tendency to risk (TR): score shows individual specific tendency of a person to take risks;

Dimension I – effective personality integration:

- scale of anxiety (AN): high score shows the tendency to experience anticipation anxiety;
- scale of emotionalism (EM): high score shows high intensity of experience, high situation sensitivity, speed and dynamics of this experiences;
- scale capacity of understanding (CU): high score shows the tendency to behave rationally even in acute situations;
- scale of resistivity to disturbing impulses (RD): high score shows high resistivity to unfavourable conditions and will qualities;
- scale of personality integration (PI): score shows individual profile of relation between rational, experience and will qualities;

Dimension Re – interpersonal relations:

- scale of cut-off and contact (CC): high score shows easy relations creation, in extreme cases even extravagance and promiscuity;
- scale of benevolence and tolerance (BT): high score shows good intentions, respecting the rights of others, trust, in extreme cases even indulgence of socially disproportionate behaviour;
- scale of conformity (CN): high score shows symptoms of extreme submission to collectivism;
- scale of tendency to independence (TI): high score shows the preference of personal freedom, need to rely on oneself alone, don't care about the others and to be independent;

Dimension C – correction, regulation of interactions:

- scale rigidity versus flexibility (RF): high score shows social adaptation, suggestiveness, compliance;
- scale frivolity versus responsibility (FR): high score shows self-control, concentration, organization, perspective;
- scale abandonment versus endurance (AE): high score shows the tendency to caution, conservatism, modesty;
- scale frustration versus meaningfulness (FM): high score shows a person with fundamental and clearly defined approach to regulation of own activities;
- scale correcting versus impulsiveness (CI): high score shows uncontrolled, impulsive behaviour;

Dimension A – self-achievement:

- scale suppression versus high confidence (SC): high score shows the confidence of oneself, handling the situation and effective behaviour;
- scale distressfulness versus sanguineness (DS): high score shows optimism, life enthusiasm, tranquillity, satisfaction;
- scale experience versus reaction approach (ER): high score shows orientation to active feedback, acts;
- scale furtiveness versus enforcement (FE): high score shows emphasis of own importance, ambition, personal prestige;
- scale feminine versus masculine type of reaction (FeM): high score shows manifested masculinity.

We hypothesize that there exist differences in self-regulation of the adolescents in the relation to their gender role.

4. Results

Before we came to the statistical analysis, we had to divide the research task into gender types. We proceeded analogically, the same way as by our previous research (Čerešník, 2006), meaning we set a central value of masculinity and femininity. We therefore utilized the formula:

$$(\max M - \min M)/2 + \min M, \text{ resp. } (\max F - \min F)/2 + \min F,$$

where $\max M$, or $\max F$ represents maximum potentially measured value and $\min M$, or $\min F$ represent minimum potentially measured value in masculinity or femininity scale (using SMF). In both cases the minimum scale value is 15 points and maximum value is 90 points. Therefore the central value is 52.5. If we take that masculinity and femininity are the variables present in every personality and that they are orthogonally ordered (Čerešník, 2006) and they intersect in the central value 52.5, then we can get four gender types with the combination of high and low values of masculinity and femininity:

- high masculinity – low femininity = masculine type,
- low masculinity – high femininity = feminine type,
- high masculinity – high femininity = androgyny type,
- low masculinity – low femininity = indifferent type.

We worked with these types also during statistical analysis. We assumed that sex and gender role can't always be in concordance, that means that a female for example don't have to be always feminine or gender-defined in terms of femininity or masculinity dominance (our research sample distribution based on gender and sex points this out).

To test our hypothesis we used Statistical Program for Social Science 16.0. We used Kruskal-Wallis test to test differences among research groups. As a critical statistical value which indicates the statistical significance, we appointed the standard value of $p \leq 0.05$.

The results are presented in Table 2. All significant differences are emphasized by Bold.

legend to Table 2.: N = count; AM = average mean; SD = standard deviation; H = value of Kruskal-Wallis test; df = degrees of freedom, p = significance; abbreviations of the components, factors and dimension of SPARO are defined in chapter 3.

We found the difference among gender types in:

Components:

- emotional variability (EV) (H = 19.295; $p < 0.001$), the highest score was identified in femininity (AM = 11.87), the lowest score was identified in masculinity (AM = 7.62);

Factors:

- motoric dynamics (MD) (H = 15.325; $p = 0.002$), the highest score was identified in masculinity (AM = 7.62), the lowest score was identified in femininity (AM = 4.95);

Dimension of normality attributes

- psychic lability / stability (LS) (H = 19.066; $p < 0.001$), the highest score was identified in masculinity (AM = 10.66), the lowest score was identified in indifference (AM = 6.94);

Dimension of optimal stimulation level

- motoric disconcertion (MD) (H = 11.026; $p = 0.012$), the highest score was identified in masculinity (AM = 11.17), the lowest score was identified in femininity (AM = 8.33);
- dynamics interactions with the environment (DI), (H = 8.452; $p = 0.038$) the highest score was identified in masculinity (AM = 10.34), the lowest score was identified in femininity (AM = 8.21);
- social disinhibition (SDh) (H = 13.459; $p = 0.004$), the highest score was identified in masculinity (AM = 11.41), the lowest score was identified in indifference (AM = 7.67);

Dimension of effective personality integration

- anxiety (AN) (H = 12.380; $p = 0.006$), the highest score was identified in femininity (AM = 12.31), the lowest score was identified in masculinity (AM = 8.79);
- capacity of understanding (CU) (H = 24.162; $p < 0.001$), the highest score was identified in masculinity (AM = 11.93), the lowest score was identified in indifference (AM = 7.72);
- resistivity to disturbing impulses (RD) (H = 10.035; $p = 0.018$), the highest score was identified in androgyny (AM = 12.83), the lowest score was identified in indifference (AM = 9.67);
- personality integration (PI) (H = 19.016; $p < 0.001$), the highest score was identified in masculinity (AM = 12.55), the lowest score was identified in indifference (AM = 8.78);

Dimension of interpersonal relations

- cut-off and contact (CC) (H = 9.994; $p = 0.019$), the highest score was identified in masculinity (AM = 10.00), the lowest score was identified in femininity (AM = 7.26);
- conformity (CN) (H = 8.658; $p = 0.034$), the highest score was identified in femininity (AM = 11.54), the lowest score was identified in masculinity (AM = 9.41);

Dimension of correction

- abandonment versus endurance (AE) (H = 8.399; $p = 0.034$), the highest score was identified in indifference (AM = 11.00), the lowest score was identified in masculinity (AM = 8.52);

Dimension of self-achievement

- suppression versus high confidence (SC) ($H = 15.317$; $p = 0.002$), the highest score was identified in masculinity ($AM = 12.97$), the lowest score was identified in indifference ($AM = 9.72$);
- distressfulness versus sanguineness (DS) ($H = 20.609$; $p < 0.001$), the highest score was identified in masculinity ($AM = 9.07$), the lowest score was identified in indifference ($AM = 6.06$);
- experience versus reaction (ER) ($H = 11.692$; $p = 0.009$), the highest score was identified in masculinity ($AM = 10.28$), the lowest score was identified in femininity ($AM = 7.69$);
- feminine versus masculine interaction (FeM) ($H = 19.257$; $p < 0.001$), the highest score was identified in masculinity ($AM = 11.17$), the lowest score was identified in indifference ($AM = 7.33$);

We allege that we can support the hypothesis we designated despite of that we did not found the differences among the gender types in all variables.

5. Discussion

Based on gained findings, we created profiles of gender types. As a type with the lowest number of describing characteristics we identified androgyny type (high score of masculinity and also femininity), which in our research sample has high score in scale of resistivity to disturbing impulses (RD). This means that androgyny people are distinguished by developed will attributes, high level of self-control and regulation of own behaviour.

A very specific type is also indifferent type (low score of masculinity and also femininity) where we recorded high score only in the scale abandonment versus endurance (AE). This shows the tendency to carefulness, conservatism, modesty. On the contrary, we recorded low score in various scales (chapter 4). Therefore we assume that indifferent type is distinguished by (1) emotional balance, choiceness, which is however lost in critical situations and it is substituted by irrational ways of reactions and loss of self-control, (2) respect of social norms, (3) low integration of personality connected with low self-confidence and doubting own value, pessimism, even depressive experiencing. A surprising finding is low score in scale of feminine and masculine reactions (FeM) where indifferent types achieve lower score than feminine types.

Feminine type (low masculinity and high femininity score) is distinguished by emotional excitability, tendency to experiencing tension, anxiety and adaptation to pressure of social environment, with the goal to prevent potential conflicts and misunderstandings. Emotional experiences represent real and also potential challenges to anticipations of impacts and consequences, without the need of rational evaluation of the situation. This type is also characteristic by the tendency to search for calm, stable and known environment (as a compensation of high emotions) in which there is no danger and necessity of fulfilling high expectations (aspirations, needs, interests), where the relationships are stable and the stereotype represents security. Establishing and keeping contacts is more directed towards satisfaction in rigidity and stable behaviour patterns than towards longing for new and exciting.

Masculine type (high score of masculinity and low score of femininity) is a type with the highest number of characteristics (with regards to highest or lowest achieved score). It is identified by emotional stability without fluctuations and exaggerated expressions, without anxiety experiencing (not even in critical situations), low focus on expectations of environment and focus on oneself. This type is specific by its readiness to act, actively decide and solve created situations. It looks for changes, it has no barriers, and it fights against boredom and steadiness. These characteristic features show also when establishing new relationships and can also show themselves in exhibition, extravagance, even promiscuity. Conventions are not regulators of their behaviour. Their personality is integrated. People of this type are perceived as self-confident, they trust their powers and abilities to deal with different life situations. They are optimistic, full of energy, tranquillity and satisfaction.

The results of our research are in accordance with actual knowledge of specifications of behaviour regulations. Gender stereotypes last, even though the social pressure for production of gender-specific behaviour (slightly) decreases.

We identified all four types with various self-regulatory profiles. Androgyny type is specific by high behaviour regulation. Low number of most typical features can be caused by close relation with masculine and feminine type (and similar score). Indifferent type is specific by indefiniteness, uncertainty, which has shown itself also in self-regulatory profile. Feminine type is characteristic by emotionality and emphasis on stability. Masculine type is specific by rationality, focus on self and tendency to change.

Self-regulation based learning strategies and self-efficacy perceptions as predictors of male and female students' mathematics achievement

Sertel Altun^{a*}, Münire Erden^b,

^a Yıldız Technical University, Faculty of Education "Istanbul", Turkey

^b Yıldız Technical University, Faculty of Education "Istanbul", Turkey

Abstract

This study aimed to determine whether mathematics achievement can be explained in terms of self regulation based learning strategies (metacognitive self regulation, regulation of time and study environment, effort management, help seeking) and self efficacy perceptions, and whether these differ between the two genders. The sample consisted of 473 (144 girls and 329 boys) freshmen at Yıldız Technical University who were attending the course "Mathematics I". "Motivated Strategies for Learning Questionnaire" developed by Pintrich et al. and students' examination results were used to collect data for the correlational study. The findings indicated that metacognitive self-regulation, regulation of time and study environment, help seeking, and self-efficacy perceptions were significant factors in explaining mathematics achievement while effort regulation was not. Further, it was concluded that there was a difference between the two genders as to the use and benefits of these strategies.

Keywords: Self regulation based learning strategies, self efficacy perception, gender and mathematics achievement.

1. Introduction

The need for regulating one's own learning has emerged due to the value placed on education and it has underlined self-regulated learning. Research into the issue has shown that low-achieving students have a poor perception of their self-efficacy (Schunk, 1991; Zimmerman, Bandura and Martinez-Pons, 1992; Pajares and Kranzler, 1995; Pajares, 1996; Bandura, 1997; Chye, Walker and Smith, 1997; Andrew and Vialle, 1998; Lopez, 1998; Pajares and Graham, 1999) and that they use fewer learning strategies (Paterson, 1996; Zimmerman and Risemberg, 1997; Songg Youn, 2001; Mc Whaw and Abhami, 2001; Vandergricht, 2002; Chularut and De Backer, 2004).

Today, the impact of self-regulation on academic achievement in various disciplines has become a popular research area. Mathematics is one such discipline. Malpass, O'neil, Harold and Hocevar (1999) found in a study conducted on students good at mathematics that there was a strong relationship between mathematics achievement and self-regulation, goal management and perceptions of self-efficacy. This study aims to identify how the mathematics achievement of university students is affected by self regulation skills (metacognitive self-

regulation, regulation of time and study environment, effort management, help seeking strategies) and self-efficacy perceptions.

1.1. Self-Regulated Learning

An important concept in socio-cognitive learning theory, self-regulation relates to the use of processes such as thinking, taking action, behaving and engaging in purposeful activities (Zimmerman, 1989). According to a different definition, self-regulation is a process whereby students actively manage their cognition, motivation and behavior after passing through certain self-regulatory processes (Hofer, Yu and Pintrich 1998). Elsewhere, self-regulation has been defined as the process of setting realistic goals, strategizing to achieve these goals, implementing the strategies, and self evaluating oneself (Bandura, 1994; Zimmerman and Risemberg 1997).

Based on these definitions, it can be stated that self-regulated learning entails the regulation of an individual's self-produced emotions, thoughts and behaviors with the aim of achieving an aim.

1.2. Metacognitive Self-Regulation

The concept of metacognition was first defined by Brown (1975) and Flavell (1976). They defined it as the knowledge of individuals about their own cognitive processes and the strategies they use to control these processes (In. Flavell, 1987; Baird and White, 1996). Metacognition involves knowledge about cognition and how individuals use this knowledge to regulate their cognition (Hofer, Yu and Pintrich 1998; Schraw, 2001). Research studies have shown that there is a strong relationship between the use of metacognitive strategies and academic achievement (Carr and Jessup 1997; Maqsud, 1997; Desoete, 2001).

1.3. Time and Study Environment

The regulation of time and study environment helps students pursue their academic studies productively (Zimmerman, 1998). Time management strategy entails the processes of planning, implementing the plan and self evaluation with the aim of using time effectively. Previous studies have shown that students who use time management strategy efficiently have better academic achievement (Zimmerman, Greenberg and Weinstein 1994; Britton and Tessor, 1991).

The regulation of study environment strategy involves the regulation of a student's study environment in a way that will help the achievement of aims. Zimmerman and Martinez-Pons (1989b) found in a study that students with self-regulation skills arranged their physical environment according to their own needs and their academic achievement was high.

1.4. Effort Regulation

Effort regulation strategy entails the use of an individual's effort for achievement effectively. In other words, effort regulation is the ability to deal with failure and building resiliency to setbacks (Chen, 2002). Using effort regulation strategy enables students to focus their attention on the task at hand, and control their effort to do the task by ignoring outside stimulants. Pintrich et. al. (1991) define individuals with effort regulation strategy as those who can perform tasks as they have planned. Research shows that effort regulation was a strong predictor of academic achievement (Doljonac, 1994).

1.5. Help Seeking

This strategy involves the efforts of individuals to secure assistance from others. Help seeking is considered to be an important element of social learning. Students who study in a self-regulated learning environment can choose people who can assist them when necessary and receive the help needed. This help provider may be a peer or a teacher (Hofer et.al., 1998). Previous research has shown that success-oriented and active students who adopted specialization attitude sought help when needed (Ames and Lau, 1982; Karabenich and Knapp, 1991 in Chen, 2002).

1.6. *Self-Efficacy Perception*

Self-efficacy perception has an important role in the development of students' self-regulation skills. Self-efficacy is people's beliefs about their capabilities to perform a task successfully (Pajares, 2002a).

A must for achievement, self-regulation is affected by self-efficacy (Zimmerman et.al., 1992). Students with self-regulation primarily need a high level of self-efficacy (Schunk and Ertmer, 2000). Research has shown that students with high levels of self-efficacy perception use effective self-regulation strategies and display high levels of academic achievement (Pajares, 2002b; Malpass, Neil and Hocevar 1999; Zimmerman and Bandura, 1994; Schunk and Swartz, 1993; Marsh, 1990; Pintrich and De Groot 1990; Zimmerman and Martinez-Ponsb, 1990; Helmke, 1989; Schunk, 1989).

1.7. *Gender*

Gender roles emerge according to the culture of societies and it is important to understand their effects on individuals' learning-related skills. Relevant studies have shown that motivational factors based on self-regulation and strategy use both differ according to gender (Zimmerman and Martinez-Pons, 1990; Qutami and Abu-Jaber, 1997; Wolters and Pintrich, 1998; Peklaj and Pecjak, 2002; Ader, 2004). As gender perceptions are different in each society, the present study also aims to identify whether the effects of self-regulation strategies and self-efficacy perceptions on the achievement of Turkish students varies between the two genders.

1.8. *Current Study*

The aim of the current study is to examine with respect to gender the mathematics achievement prediction of self-regulation based learning strategies (metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking) and self-efficacy perception scores.

The study has been conducted on university students because, as seen from a general cognitive skills aspect, they have more advanced self-regulation strategies and beliefs about learning when compared to lower level students (Pintrich and De Groot 1990; Wigfield, Eccles and Pintrich, 1996 cited in Zimmerman, 1998).

The self-regulation skills of students depend on the subject that they are studying. This study aims to explain student achievement in the course Mathematics I attended by freshmen engineering and architecture students. This specific course was chosen as it is a prerequisite for engineering programs and mathematics achievement is generally low in Turkey (Pisa study). Additionally, gender was also taken as a variable as individuals' learning skills may be affected by gender roles which change according to a society's cultural makeup.

2. **Method**

2.1. *Subjects*

The study group of comprises a total of 472 first-year university students attending Electrical and Electronics Engineering, Mechanical Engineering, Civil Engineering, Chemical Engineering, Metallurgical Engineering, and Architecture Departments. A total of 30,4% of these students were female while the remaining 69,6% were male.

2.2. *Research Instrument*

Motivated Strategies for Learning Questionnaire (MSLQ):

In order to determine the students' self-regulation based learning strategies (metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking) and self-efficacy perception scores, the relevant dimensions of the MSLQ developed by Pintrich, Smith, Garcia and Mc Keachie (1991) for use with university students was employed. Designed as a 7-point likert scale, it was used in the course Mathematics I.

Language adaptation equivalency, validity and reliability studies were undertaken prior to the use of the scale. As a result, the Cronbach Alpha reliability coefficients for metacognitive self-regulation was 0.85, for time and study environment regulation was 0.77, for effort regulation was 0.88, for help seeking was 0.76, and for self-efficacy was 0.89.

2.3 Mathematics Achievement

Mathematics achievement was calculated by adding 60% of students' mean scores on the first and second mid-term examination results with 40% of their final examination grades in the course Mathematics I.

2.4. Procedure

The students were given scales to identify their “demographic information, self-regulation based learning strategies, and self-efficacy perceptions” simultaneously. They had 30 minutes to complete the scales. Additionally, their end-of-term grades were obtained from the instructors offering the course Mathematics I.

2.5. Statistical Techniques

“Multiple Regression Analysis” was used in order to identify the mathematics achievement prediction of self-regulation based learning strategies and self-efficacy perception scores with respect to gender. The 13.00 SPSS package program was used for the analyses.

3. Results

The effects of metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking and self-efficacy perception on mathematics achievement: Multiple regression analysis was used to determine to what extent metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking and self-efficacy perception predict mathematics achievement.

Prior to the regression analysis, Pearson correlation analysis was conducted to identify the relationship between the independent and dependent variables. Results of the analysis are given in Table 1.

Table 1: Correlation Analysis Results between Dependent And Independent Variables

<i>Variables</i>	<i>N</i>	<i>r</i>	<i>p</i>
<i>Metacognitive self-regulation & mathematics achievement</i>	472	.54	.01
<i>Regulation of time and study environment & mathematics achievement</i>	472	.46	.01
<i>Effort management & mathematics achievement</i>	472	.43	.01
<i>Help seeking & mathematics achievement</i>	472	.25	.01
<i>Self-efficacy & mathematics achievement</i>	472	.44	.01

As shown in Table 1, there is positive and meaningful correlation ($p < .01$) between metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking and self-efficacy perception scores and mathematics achievement scores. Table 2 presents the multiple regression analysis results relating to the prediction of mathematics achievement by self-regulation based learning strategies and self-efficacy perceptions.

Table 2: Multiple Regression Analysis on Independent Variables and Dependent Variable

Variables	Unstandardized Coefficients		Standardized Coefficients	
	B	SH	β	T
Intercept	-14.10	4.2		-3.31**
Metacognitive self-regulation	.42	.08	.246	4.77**
Regulation of time and study environment	.37	.10	.182	3.72**
Effort management	.26	.17	.075	1.53
Help seeking	.30	.15	.077	1.93*
Self-efficacy	.58	.08	.284	7.15**
R= 0.62 R²= 0.39 F=59.4** *p<.05 **p<.0				

As can be seen from Table 2, the regression analysis results show that self-regulation based learning strategies and self-efficacy perception scores are meaningful predictors of mathematics success. The independent variables of metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking and self-efficacy perception account for 39% of the variance on the dependent variable of mathematics achievement. When the parameters about the regression model in Table 2 are considered, it can be seen that the relative importance ranking of predictive variables on mathematics achievement scores according to the standardized regression coefficient (β) is; self-efficacy perception, metacognitive self-regulation, time and study environment regulation, help-seeking and effort regulation. It was concluded that, among the independent variables, metacognitive self-regulation ($t=4.77$, $p<.01$), time and study environment regulation ($t=3.72$, $p<.01$), help-seeking ($t=1.93$, $p<.01$), self-efficacy perception ($t=7.15$, $p<.01$) were meaningful predictors of mathematics achievement, while effort regulation was not.

The effects of metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking and self-efficacy perception on mathematics achievement with respect to gender: Multiple regression analysis was used to determine to what extent metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking and self-efficacy perception predict mathematics achievement with respect to gender.

Mathematics achievement scores of girls and boys, correlation coefficients between self-regulation based learning strategies and self-efficacy perception scores, and the levels of meaningfulness are given in Table 3.

Table 3: Correlation Analysis Results of Girls and Boys between their Self-Regulation Based Learning Strategies and Self-Efficacy Perception Scores and their Mathematics Achievement Scores

Variables	N	Girls		Boys	
		(mathematics achievement)		(mathematics achievement)	
		r	p*	r	p*
Metacognitive self-regulation	143+329	.36	.01	.59	.01
Regulation of time and study environment	143+329	.39	.01	.46	.01
Effort management	143+329	.22	.01	.20	.01
Help seeking	143+329	.21	.01	.65	.01
Self-efficacy					

As seen from Table 3, positive and meaningful correlations were found between mathematics achievement scores for girls and metacognitive self-regulation, time and study environment regulation, effort regulation, help seeking and self-efficacy perceptions. Parallel to this finding, positive meaningful correlations were also found between

boys' mathematics achievement scores and metacognitive self-regulation, time and study environment regulation, effort regulation; help seeking and self-efficacy perceptions.

Table 4: Multiple Regression Analysis on Independent Variables and Dependent Variable according to Gender

Gender	Variables	Unstandardized Coefficients		Standardized Coefficients			
		B	SH	β	T		
Girls	Intercept	11.33	8.82	1.28			
	Metacognitive	8.09E-02	.11	.05	.45		
	self-regulation	.21	.23	.10	.93		
	Regulation of time and study environment	.96	.40	.26	2.39**		
	Effort management	.44	.28	.12	.01		
	Help seeking	.25	.15	.13	1.69		
	Self-efficacy						
	Intercept	-24.03	3.34	-5.53**			
	Metacognitive	.46	.09	.26	4.92**		
	self-regulation	.38	.09	.19	3.98**		
Boys	Regulation of time and study environment	-6E-02	.16	-.02	-.40		
	Effort management	1.75E-02	.17	.00	.10		
	Help seeking	.97	.09	.46	10.60**		
	Self-efficacy						
$R_g = .48$		$R^2_g = .23$	$F_g = 8.26^{**}$	$R_b = .73$	$R^2_b = .54$	$F_b = 76.77^{**}$	$**P < .01$

Table 4 presents the multiple regression analysis results related to girls' and boys' mathematics achievement scores. The table shows that self-regulation based learning strategies and self-efficacy perception scores are meaningful predictors of mathematics achievement for both genders ($F_{girls} = 8,26$, $p < .01$; $F_{boys} = 76,77$, $p < .01$). In girls, self-regulation based learning strategies and self-efficacy perceptions account for 23% of the variance on mathematics achievement. In boys, the same value is much higher: %54. According to the standardized regression coefficients (β) given in the table, the relative importance ranking of predictors on mathematics achievement scores is as follows in girls: effort regulation, self-efficacy, time and study environment regulation, metacognitive self-regulation, and help seeking. In boys, the relative importance ranking is as follows: self-efficacy perceptions, metacognitive self-regulation, time and study environment regulation, help seeking and effort regulation. While effort regulation ($t = 2.39$, $p < .01$) is a meaningful predictor on its own for girls, metacognitive self-regulation ($t = 4.92$, $p < .01$); time and study environment regulation ($t = 3.98$, $p < .01$) and self-efficacy perceptions ($t = 10.6$, $p < .01$) are meaningful predictors of mathematics achievement in boys.

In brief, metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking strategies and self-efficacy perception scores were found to have different effects on explaining mathematics achievement with respect to gender. More precisely, metacognitive self-regulation, time and study environment regulation strategies and self-efficacy perceptions were found to have a statistically meaningful effect on

predicting mathematics achievement in boys, whereas effort regulation alone was found to be a meaningful predictor of mathematics achievement in girls.

4. Discussion

At the end of the analyses, a positive relationship was found between the self-regulation based learning strategies and self-efficacy perceptions of university students and their mathematics achievement. The regression analysis showed that all self-regulation learning strategies – except effort regulation – and self-efficacy perceptions have a meaningful effect on explaining the variance in mathematics achievement.

The analyses have shown that self-efficacy perceptions have the biggest role in predicting mathematics achievement. Self-efficacy is the belief of an individual in their own capacity to organize and successfully perform those activities necessary to perform at a certain level (Bandura, 1986:391). Believing in one's achievement is the precondition to being successful in a course. Students with high self-efficacy perceptions more readily adapt to school life and therefore display better achievement (Schunk, 1981). When students believe that they will be successful in a course, they have more confidence that they will be able to regulate their learning, set higher goals for that course, and identify and implement strong strategies to reach their aims.

Studies in the literature have similar findings to that of the present study (Norwich, 1987; Pintrich and De Groot, 1990; Zimmerman and Martinez Pons, 1990; Seegers and Boekaerts, 1993; Pajares and Kranzler, 1995; Fortier et.al., 1995; Chye et.al., 1997; Lopez, 1998; Andrew and Vialle, 1998; Pajares and Graham, 1999; Ader, 2004). Studies undertaken in the areas of foreign language education and social sciences have likewise found a positive relationship between academic achievement and self-efficacy perceptions (Helmke, 1989; Schunk, 1989; Marsh, 1990; Schunk and Swartz, 1993; Malpass, 1999).

It has been found that metacognitive self-regulation strategy takes second place after self-efficacy in the prediction of mathematics achievement. Metacognition is knowing about one's own knowledge, controlling it during the process, and regulating is as necessary. The contents of a mathematics course have a pre-requisite relationship to one another, which means that it is difficult to learn a new subject without mastering the previous ones. As students with metacognitive skills are more aware of their lacks, they make an effort to master old subjects before starting a new one, thus achieving better ultimately.

Findings from studies in the literature about the prediction of mathematics achievement are also in line with those of the present study (Maqsd, 1997; Boekaerts, 1997; Carr and Jessup, 1997; Demir-Gülşen, 2000; Everson and Tobias, 2001, Desoete, 2001). The experimental studies conducted by Volet (1991) and Kramarski and Zeicher (2001) both concluded that the achievement of groups that received metacognitive support in mathematics classes was statistically meaningfully better than those who did not receive such support. These researchers also stated that individuals may improve their metacognitive skills. To achieve this, the learning environment needs to value student participation, provide feedback to students about their development, and allow them to evaluate themselves.

Time and study environment regulation emerged as the third predictor of mathematics achievement. In other words, it was found that students who used their time and study environment effectively achieved more in the mathematics class. This strategy involves planning one's time so as to meet goals, following this plan, and regulating the environment. Likewise, Zimmerman and Martinez Pons (1988) and Paterson (1996) reached similar results too. The findings of the present study support the literature as well.

In the prediction of mathematics achievement, help-seeking emerged as the least important variable. Help-seeking not only has an important place in social constructive theory, but also in self-regulation. Research shows that students who knew when and who to consult for help achieved better than those who did not (Paterson 1996;

Newman 1994). Our findings also support the idea that the use of help-seeking affects mathematics achievement positively.

The current study has shown that effort regulation does not have a meaningful effect on student mathematics achievement. Effort regulation entails taking precautions against failure (Chen, 2002). In a study about the relationship between effort regulation and academic achievement, Paterson (1996) concluded that the former has a positive effect on achievement when taught in academic settings. This result may have been caused by the descriptive nature of the study and the norm based assessment used at the university where the study took place.

The findings of the present study showed that metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking strategies and self-efficacy perception scores were different in the two genders. In explaining boys' mathematics achievement, metacognitive self-regulation, time and study environment regulation and self-efficacy perceptions had a positive and meaningful effect, whereas in explaining girls' mathematics achievement, effort regulation alone caused a similar effect. Similar findings can be found in other studies cited in the literature. To illustrate, Wolters and Pintrich (1998) and Ader (2004) found lower self-efficacy perceptions among girls in mathematics classes than boys. Similar findings were reached for different courses by Qutami and Abu-Jaber (1997). They showed that girls had lower self-efficacy perceptions than boys in computer classes. However, there are also studies in the literature that show otherwise. For instance, Peklaj and Pecjak, (2002) found that girls had higher metacognitive self-regulation skills than boys in mathematics class. The literature also hosts studies which concluded that self-efficacy perceptions and self-regulation based learning strategies did not vary according to gender. Pajares and Graham (1999), Miller (2000), and Lee and Browman (2001) supported this through their studies. Such different results in the literature may be due to the different outlooks on girls in different cultures. For instance, boys are generally thought to be better inclined to mathematics in Turkey, which may have led them to believe that they are sufficient in mathematics class. The reason why effort regulation was found to be effective in predicting girls' mathematics achievement may have been because they believe they are making more of an effort to be successful. In the Turkish society, where boys are generally encouraged by their families to pursue a higher education, girls more often need to prove to their families that they are successful in order to continue their education.

To sum up, the present study has shown that self-regulation based learning strategies (metacognitive self-regulation, time and study environment regulation, effort regulation, help-seeking) and self-efficacy perceptions have a positive effect on Turkish university students' mathematics achievement. Among all variables, the most effective one changes between the two genders. While the self-regulation based learning strategies of metacognitive self-regulation, time and study environment regulation and self-efficacy perceptions are important in explaining boys' mathematics achievement, effort regulation alone is important in explaining girls' mathematics achievement. This difference may have been caused by culture. In Turkey where boys are perceived to be more valuable to their families (Kağıtçıbaşı, 1981), the mental capacities of boys are supported and admired by their parents. Such an attitude from their parents may be encouraging boys' self-efficacy. On the other hand, girls, whose mental capacities are not equally rewarded by their parents or teachers, may be reaching success with their own effort.

New studies may be conducted by providing a self-regulation based learning environment and measuring the extent to which these environments contribute to the development of girls' and boys' self-regulation skills. Additionally, comprehensive studies are needed about the cross-cultural variables affecting self-regulation skills so that teachers can take more effective measures for enhanced learning.

4th International Conference on New Horizons in Education

Self-transformation process in wellness and health education

Milada Krejčí*

College of PE and Sport PALESTRA in Prague, "Prague", Czech Republic

Abstract

In a modern wellness research it is relevant to analyse how human health associates with physiological changes generated through the action of autonomous nervous system. Mental activity in the form of our perceptions (including proprioception), emotions, cognitive ability (predictions, anticipation, imaginations and needs), cognitive transcriptions in dreams, and mental activity during communication (inner – out), etc., can causing in imbalance in organism. Stress state in fact is also a state of autonomic imbalance, does not matter, if sympathetic or parasympathetic activity is increased because resulting is the same reality - in many different kinds of disorders. Diseases as arthritis, a back pain, cardiovascular disease, type 2 diabetes mellitus, digestive disorders, hypertension, hypotension, spondylitis, etc. are originated in harmless of human organism. Postmodern living period is so called "Period of Stress" and therefore health education and education strategies to resilience building for good health keeping are crucial. The ultimate aim of education is a positive behavioural modification, defined as the Self - Transformation. In the research study is presented the model of Self – Transformation process like a system of complementary attributes of wellness according the wellness definition of WHO in 2000. To understand better Self is a great help for healing process. In this study we try to show it and define on the research base. The study aims to map the current situation of stress and resilience within the educational sector, recognizing the increased level of stress that many educators are experiencing in their daily work.

Keywords: health education, wellness, resilience building, personality coherent development

1. INTRODUCTION

The definition of wellness (according WHO) presents wellness as: “an optimal state of health of individuals and groups. There are two focal concerns: the realization of the fullest potential of an individual physically, psychologically, socially, spiritually and economically, and the fulfillment of one’s role in the family, community, place of worship, workplace and other settings” (WHO, 2000). Wellness is defined as the principle by which individuals and groups of people learn to behave in a manner conducive to the promotion, maintenance, or restoration of health. Deductively we can found out that wellness begins with human motivation/interests they may have in the improving their living conditions. The educational aim of wellness is to develop in social life a sense of responsibility for health - as individuals, as members of families and as society members. Only through this education it can be changed the paradox situation in the health care, which is nonstop increasing in advanced countries. The **increase in the cost of health care** has bad economic impacts in these countries. The origin lies in unfit life style, which depends on “unfit” mental activities like for example in ignorance, in indolence, in a lack of interest, in negligence about personal health. Quality of life develops in depending of individual wants or needs. Individual wants or needs are unique and correspond much with social and spiritual level. It follows that only right intentional education to health and wellness can guide to individual health and especially to the health society. From this point is very important complementation of all education attributes in wellness for a continual building of resilience in main tree education domains, see Fig. 1. Only interactive and integrative education linked “hand in hand” in the three domains can support wellness, health and quality of life in society globally.

Fig. 1 Coherent cooperation of 3 phenomena of education to wellness

This task is solved intensively especially in last two decades globally in word with the priority of support and protection of mental health. Why? Mental health promotes learning, working and participation in society. The level of mental health and well-being in the population is a key resource for the success of knowledge-based society and economy. However mental disorders are on the rise in the EU and in the whole world globally. According statistic review from 2008 – 2012 almost 50 million citizens in EU (about 11% of the population) are estimated to experience mental disorders, with women and men developing and exhibiting different symptoms. Depression is already the most prevalent health problem in many EU-Member States. Suicide remains a major cause of death. In the EU, there are about 58,000 suicides per year of which 75% are committed by men. Eight Member States are amongst the fifteen countries with the highest male suicide rates in the world. The mental health and well-being of citizens and groups, including all age groups, different genders, ethnic origins and socio-economic groups, needs to be promoted based on targeted educational interventions that take into account and are sensitive to the diversity of the European population.

From a political point of view was 20 years ago favored a need to improve the knowledge base and research determinants and implications of health education and the possibilities for effective interventions in education area, e.g. in school education. School education on national political base is relatively easy alterable and easily controllable. Czech government has issued such a resolution about health education in 2002 (as a condition to be accepted in EU), in the Western European countries about 10-15 years ago. The teacher was transferred into a role of prevention agent and society and often also parents uncritically expected of teachers full responsibility for health education and wellness promotion. Such unreal expectation without inclusion of families and society systematically in this process led to increasing of burn out in teachers very soon. Delisio (2001), Dunham (2002), Rudow (1999) wrote and warned about stress in teaching, about stress and burnout in the teaching profession, about rapid increasing of autoimmune diseases of teachers. It was found out that without special training in health and education strategies to resilience building, teachers are not able to fulfill the role of health promoters successfully and without own health risks. On the other hand it is clear, that teacher has great role in pupil's behavior intuitively (imitation, identification as strong factors in education), what influence daily on pupils. Therefore it is of great importance that teacher is in very good physical and psychic condition, has a lot of knowledge about healthy lifestyle, etc. for health society and quality of life. Teaching profession itself carries a high burden. Teachers present professionals who are exposed to the influence of daily stress in many elements of teaching process. Teachers, which can learn how to be more effective in the management of their own stress levels safe own health and health of pupils, prevented of occupational diseases. To improve educator's resilience to stress, to master strategies to control stress and to develop satisfactory in education (of both – teachers and pupils) and in this way to promote wellness in school environment generally, we realized the down described international research project. The study presents an initiative which main aim is to develop a tool to combat the consequences of the increased pressure that is on educators and the education system as a whole. A consortium of 8 organisations and 2 silent partners, which represent in total 9 countries, was working intensively to achieve this goal within the 2 years duration of the project (November 2010 – October 2012).

2. AIMS

The main goal lied to recognize and analyze needs of teacher's work related stress in the education area and to develop and evaluate useful content with an international perspective to fight educators' and education institution's stress through effective intervention strategies. The second goal was to evaluate psychosocial hazards at a national level (conditions in the work environment that cause stress, burnout, etc.) and work engagement (factors that contribute to resilience) considering perspectives of teachers.

3. METHODOLOGY

3.1 Subjects

In total 459 educators (153 males, 306 females in age interval 30-60) from Belgium (BE), Czech Republic (CZ), Greece (GR), Latvia(LV), Netherlands (NL), Portugal (PT), Slovenia (SI), Switzerland (CH), United Kingdom (UK) Almost half of them were educators working in secondary schools, followed by primary and post-secondary institutions. The majority of the cases were referred either with educators with more than 20 years of

service (31, 7%) or with educators with 1 or 5 years of work (21, 95%) and with educators of 15 – 20 years of educational practice (17, 07%) and 5 - 10 years (14, 63%).

3.2 Instruments

- A. The short version of the Copenhagen Psychosocial Questionnaire (Short COPSOQ II) and Utrecht Work Engagement Scale (UWES) were complemented with two additional socio-demographic variables (nature of the institution and years working in the educational system) to generate the questionnaire distributed to educators translated in mother languages.
- B. The statistical analysis - descriptive statistics, Pearson correlations, Linear regression. For the statistical procedure were created several models supported by the different variables identified during the correlation analysis. The linear regression models analysis must be done by the result obtained in the R Square (should be higher than 0, 5), the significance of the ANOVA (should be equal to 0,000) and also the significance of the coefficients for each variable (less than 0, 1).

3.3 Procedures

The needs analysis for the STRESSLESS project – Improving Educators' Resilience to Stress (www.spi.pt/stressless), was conducted in all the partners' countries and included three general groups identified on the basis of previous research findings: countries with stress levels higher than the European average (e.g. Greece, Latvia, Slovenia, and Switzerland), countries with stress levels lower than the European average (e.g. Belgium, Czech Republic, United Kingdom and, the Netherlands) and countries with stress levels equal to the European average (Portugal). The reference data for this division were the results presented in the European Risk Observatory Report (European Communities, 2009) and ETUCE teacher surveys (2007).

An online version of the questionnaire was available online in order to facilitate the data collection from educators that were invited to participate in the study. The software SPSS (version 17) was used to analyse teacher's needs on the base of the data from the questionnaire.

4. RESULTS AND DISSCUSSION

4.1 General Results

The results were analyzed regarding to the 4 selected indicators, e. g. Work engagement, Work life conflict, Burnout, Stress. These 4 major variables to analyze the consortium defined during the research. Other variables were included in each country when relevant differences were found.

Work engagement:

The statistical analysis showed no significance (R Square = 0,189 for an ANOVA of 0,000), but presented strong consistence regarding the relation of work engagement and quantitative demands, tempo, emotional demands, meaning of work, role clarity and burnout.

On the base of Pearson correlation process, negative correlations (meaning that the increasing of one variable is accompanied by the decreasing of the other) were observed between work engagement, quantitative demands and tempo. Positive correlations (meaning that the increasing of one variable is accompanied by the increasing of the other) were observed between work engagement and emotional demands, meaning of work, predictability, role clarity, leadership, social support, trust, justice, burnout and stress.

From descriptive statistic of the 9 countries data it is evident that in the indicator of "Work engagement" (range 0/6) CZ, UK, SI, PT presented higher results and CH, NL and BE lower results.

Work life conflict:

The statistical analysis showed significance (R Square of 0,529, ANOVA =0,000) and presented a strong relation with quantitative demands, tempo, emotional demands, development, burnout and stress. Positive correlations were found between work life conflict, quantitative demands, tempo, emotional demands, development, meaning of work, burnout and stress.

Negative correlations were found with predictability, rewards, social support, job satisfaction and self-rated health. The indicator of "Work life conflict" concluded that PT presented higher levels (75% of the responses were between 4 and 6 points) and was followed by LV. GR, CZ and UK showed the lower scores.

Burnout

The model created showed significance (R Square of 0,650, ANOVA =0,000) and presented a strong relation with work engagement, emotional demands, work life balance, self-rated health and stress. Positive correlations were observed between burnout, work engagement, tempo, emotional demands, meaning of work, work life conflict and stress.

Negative correlations were found with predictability, rewards, job satisfaction, justice and self-rated health. In the case of "Burnout" indicator (range 0/8) PT was the country with higher levels, followed by LV, SI, CZ and UK. GR, BE and NL were the countries with lower levels of burn-out syndrome.

Stress

The model created showed significance (R Square of 0,598, ANOVA =0,000) and presented a strong relation with quantitative demands, tempo, emotional demands, work life conflict and burnout. Positive correlations were observed between stress, work engagement, quantitative demands, tempo, emotional demands, work life balance and burnout.

Negative correlations were found with predictability, rewards, role clarity, leadership, social support, job satisfaction, justice and self-rated health. The "Stress" indicator (range 0/8) demonstrated that PT was the country with higher levels, followed by CH, SI and BE. In the opposite UK, CZ and NL were the countries with lower levels of stress score.

Very high results compared with the ones found in the original study for all the variables but especially for the bullying cases.

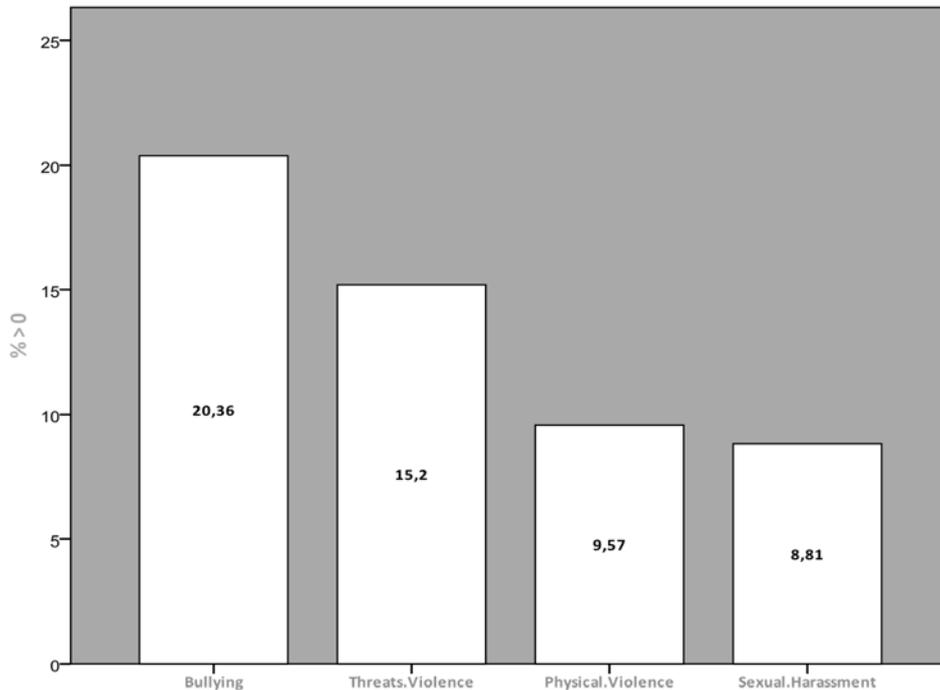

Fig. 2 Level of bullying in sum of percentage (N=459)

Descriptive statistics of Czech participants showed that the majority variables in study[†] were higher in components of “Burnout”, “Meaning of work”, “Emotional demands” and “Stress” comparing with the original study results. The results were equal in components of Work engagement and Work family conflict and lower in the component Quantitative demands comparing with the original study results.

- **Work and well-being:** higher global levels of work engagement, mainly linked with dedication (sense of significance, sense of enthusiasm and proud, sense of challenge and inspiration). Vigour (linked with high levels of energy and resilience, motivation for investing efforts and persistence to difficulties) presented also general high levels. Nevertheless, this was the indicator less valued by the respondents.
- **Psychosocial factors at work:** higher levels regarding meaning of work and role clarity (the work is meaningful and important and clear objectives exist, helping educators to know exactly what is expected). Stress and burnout (feeling worn out, emotionally exhausted, irritable and stressed) integrated

[†] During the research, the consortium defined 4 major variables to analyse: Work Engagement, Work Family Conflict, Burnout and Stress. Other variables were included in each country when relevant differences were found.

the lower scores of the group, together with the quantitative demands (having enough time for the task and getting behind with the work).

- **Other variables:** the majority of the educators are satisfied with their jobs, considered that their health was very good during the 4 last weeks and assumed that the work has in some way a negative effect on their private life).

Offensive Behavior: Similar results compared with the ones found in the original study for the bullying cases (2, 5%). The variables with significant differences regarding the original study were analyzed through a statistical procedure of correlation. The results were the following:

- **Work engagement:** Positive correlations were found between work engagement and predictability, rewards, job satisfaction, self-rated health. Negative correlations were found with quantitative demands.
- **Work family conflict:** Positive correlations were observed between work family conflict and quantitative demands, emotional demands, burnout and stress. Negative correlations were observed with job satisfaction and trust.
- **Burnout:** Positive correlations were observed between burnout and quantitative demands, emotional demands, work family conflict, and stress. Negative correlations were observed with role clarity, leaderships, social support, justice and self-rated health.
- **Stress:** Positive correlations were found between stress and quantitative demands, emotional demands, work family conflict, and burnout. Negative correlations were found with influence at work, role clarity, leadership, social support, justice and self-rated health.
- **Quantitative demands:** Positive correlations were observed between quantitative demands and work family conflict, burnout and stress. Negative correlations were found with work engagement, predictability, rewards, social support, job satisfaction and justice.
- **Emotional demands:** Positive correlations were observed between emotional demands and work family conflict, burnout and stress. Negative correlations were found with job satisfaction.
- **Meaning of work:** A negative correlation was found with stress.

Linear Regression:

- **Work engagement:** R Square=0,431 (not relevant).
- **Work family conflict:** R Square=0,489 (not relevant but with significance for quantitative demands).
- **Burnout:** R Square=0,624 (ANOVA 0,000) with relevant significance for self-rated health and stress.
- **Stress:** R Square=0,720 (ANOVA 0,000) with relevant significance for role clarity and burnout.
- **Quantitative demands:** R Square=0,578 (ANOVA 0,001) with relevant significance for work family conflict
- **Emotional demands:** R Square=0,304 (not relevant).

- **Meaning of work:** No model was created since only a negative correlation with stress was found.

Clarifications:

- It was found an important relation between Stress and Burnout with relevant significance for role clarity and self-rated health.
- It was also found an interesting relation between Quantitative demands and the Work Family Conflict. These and the up mentioned relevant variables are in context with a high feminization in Czech education system and with high divorcing. For women is not easy and often not possible to joint quantitative demand in their job with traditional women roles. Still in Czech society is hard rooted the model, when men are not helping generally to women.
- Therefore the quantitative demands were observed like a strong stress factor with in correlation of tempo, work life balance and burnout. Negative correlations were found with predictability, rewards, role clarity, leadership, social support, job satisfaction, justice and self-rated health.

The research in international cooperation exemplifies that only daily compensation of professional effort and mastering of the effective compensation techniques can keep teacher healthy and stress less. On the base of presented results of the STRESSLESS project analyse and on the base of research results in the EU PROJECT Aim 3 -16 PACZion “**Passau-České Budějovice union for support of teachers’ health**“ the continuum of Self transformation we defined. In the continuum main principles of health protection and support are contained, e.g. Relaxation - Adequate movement regime – Nourishment – Preventive medical care – Professional salutogeneses. The continuum is ordered in the circle to express better the continuity and a possibility to repeat health support paradigm in coherent cycles. On analyze of individual specifics it is possible to start the intervention, for example, from nourishment, or movement and proceeded father with components in the circle line. In psyche it decides about the whole health change, does not matter in which dimension of organism (e.g. overweight reduction).

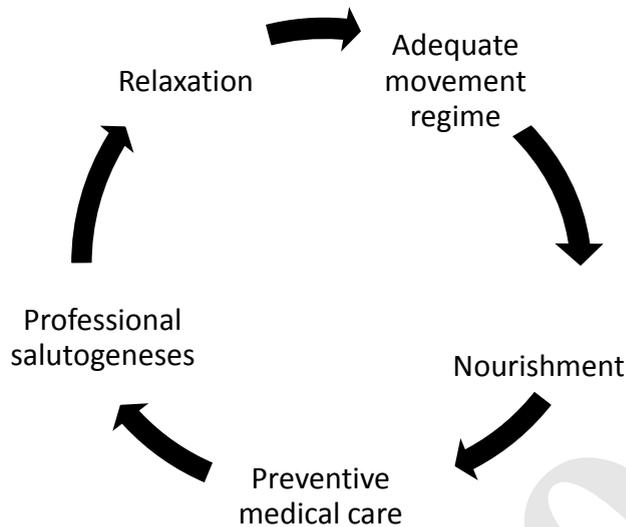

Fig.3 Continuum of Selftransformation in the sense of Health support and Resilience Building (Krejčí, 2010)

We found out that to start by Relaxation is benefited from the view of active life style and health support of teachers, because of their psychic state is key point in area of individual health support and health development. To influence effectively the psyche is most easy just during the relaxation and breathing. It is possible to use many techniques, which all have benefits in self-regulation and self-control development. Relaxation in psychic state can be easy transfer in motoric area, if the principle of adequate movement activity is respected. The process of motoric learning and motoric engram creation, the relaxation plays very positive role.

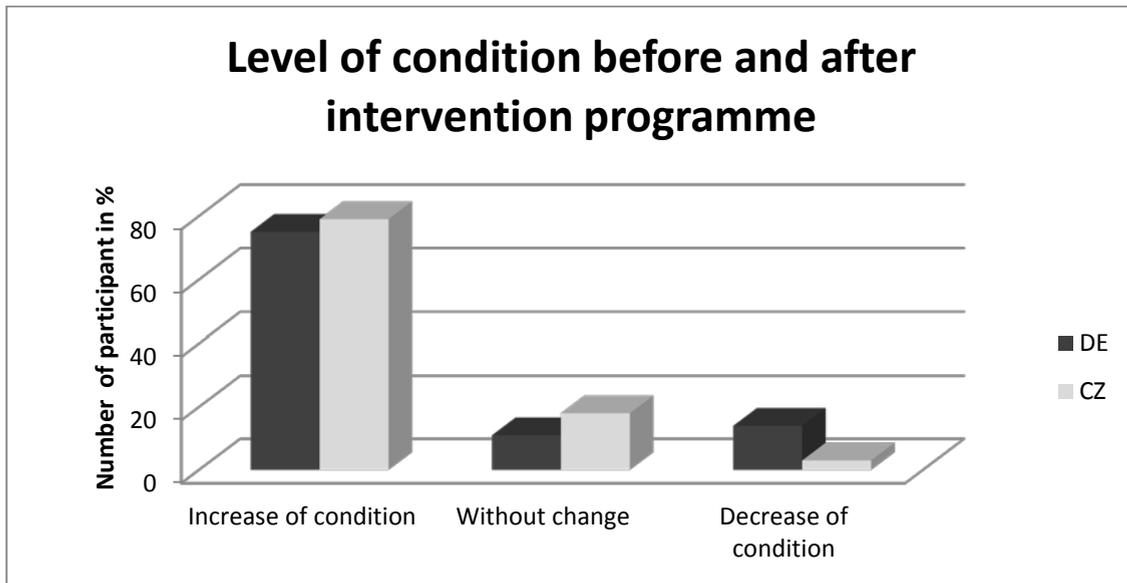

Fig. 4 Level of condition before and after intervention programme (Seibert, N.-Krejčí, M., 2012)

In the state of relaxation and well-being teachers learn easier to motor skills which are a base for the individual adequate movement regime. Mastering of the relaxation leads to homeostasis optimization and positive influences in circadian rhythm.

The next element of the Continuum is the nourishment. Health supported food should be fresh prepared with important portion of raw food (e. g. fruit, nuts, vegetable, milk, müsli, etc). Just in fresh and in raw food are enzymes, which are accelerants of biochemical reactions in human organism (bones construction, muscles, haematogenesis). Ready-to-cook foods, heated food, old food, food with chemic additives influence negatively on organism and health, provoke tiredness. According the results of monitored teachers was found out that they neglect health nourishment and that they have not the health nourishment like a need or attitude. Often mistake of them was a poor breakfast and too opulent dinners. Also hurry during eating time, dis-concentration (calling, reading, TV). Preventive medical care and Professional salutogeneses are the rest parts of the Continuum of Self transformation in the sense of Health support and Health development. Preventive medical care in Czech Republic is based on European tradition of healing and presents self very high of treatment. So it is very wise and advisable to prosper from the possibilities of prevention check-up and care according the individual needs. It is necessary to remark that WHO declares that preventive medical care can positively influence the human health only from 15 -20%. The biggest part can be positively influenced during the active life style including the adequate movement regime. From the view of the Professional salutogeneses for teachers is very important to analyze working milieu, working regime and according that consider carefully risk factors in context of individual health and health of others. On the base of this analyse is possible to implement in life style the salutors, which compensate health risk of the teachers profession – for example voice calmness in teacher's profession, etc.

Body intervention and mental health education strategies

The continuum of Self-transformation in the sense of health support and health development proceeds in coherent cycles (we recommend 3month's cycles), when in the first cycle a basic education is realized and after in other cycle(s) is deepened education in sense of independence of the clients on educators. The aim is the complete individual autonomy, when the learner is able to:

- use relaxation and breathing techniques for tiredness compensation and stress management

- plan and realize an adequate movement regime
- know the benefits of health nourishment and to solve drinking regime and overweight management
- be resistant to false advertising
- know overweight and obesity health risks including health risks of hypo kinesis
- analyze health risks joint to the occupation and to compensate it with adequate salutors

Special situation was for intervention process in overweight or obese participants. In nowadays the movement insufficiency (hypo kinesis) can be observed in adults as in child age as well. Its psychic symptoms (so called “hypo kinetic syndrome”) are impulsivity, irritation, lack of self-control, discomposure and aggressiveness. The movement insufficiency (hypo kinesis) is also one of the main reason of increasing trend of overweight and obesity in teachers. Health complications of the overweight and obesity are numerous and influence negatively on the quality of professional and personal life.

On the base of 2 phases adequate movement regime, induced changes in self-control and in self-esteem, in first through the intervention yoga training program for teachers with overweight, leaded in daily home practicing (3 months), and after through the coherent adequate movement activities (2 weekends, one week course). Physical condition presents a key base to competent teachers work. To define terms of adequate movement regime and adequate movement activity generally was an important postulate and premise in our research.

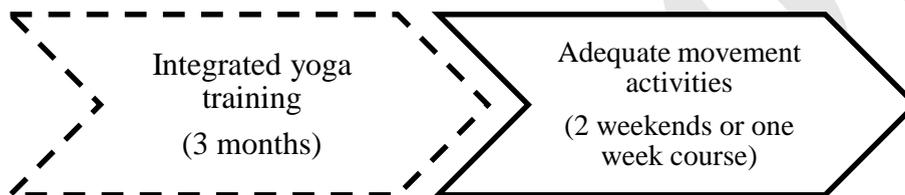

Fig. 5 Scheme of algorithm of 2phases adequate movement regime

Adequate means to be adequate to the age, to the personal skills, to the individual needs etc. The base is created on the well-being, joy, play and creativity. That means to move and in the same time experience well-being and joy. To move and play we can alone or with a partner. Different movement activities, adequate to the individual skills, inclinations and interests and suitable implemented in daily life, create the adequate movement regime. Its basic characteristics and principles are defined (in the line according the importance and the consequence) in the next points:

- **Coping** - in the sense of individual managing and mastering of movement. What for one is easy, for the second is difficult. The main role are playing: condition, age, health situation, impairments, etc. Coping is the base of progress in motor learning.
- **Spontaneity** – in the sense of freedom, facility, pleasure during the movement activity, eventually to experience „flow“ effect. The spontaneity is the preposition for the saturation benefit.
- **Saturation** – in the sense of satisfaction, self-realization, self-determination during the movement activity and after it. The person has tendency to return to the movement activity again and again.
- **Repeatability** – in the sense of wish to return to the movement activity and to develop the performance as possible. Only in this step is real to begin with regular training with variable training load. The person accepts discomfort and even a pain.
- **Training** – in the sense of the variable dosage of the intensity according to the health situation, age, condition, body structure, sex, etc. During the training process can be developed a positive dependency on the movement activity. An obstacle can be availability of the movement activity every day.
- **Availability** – in the sense of regular, daily application of movement activity. It depends of nature conditions, time factors, solvency, laws, etc. Here usually begins combination of daily activity with season, temporal movement activities (for example yoga + alpine skiing + biking). Adequate movement regime is created.

- **Safeness** – in the sense of the accident prevention, rescue during the movement activity realization. To keep principles of safeness. Only safe movement activity is adequate to the person. Again an important role plays: health situation, age, condition, body structure, sex, availability of equipment, etc.

On the base of adequate movement regime is possible to develop individual motoric skills. All, what is learned should be used by teacher in normal daily life and active life style according individual specifics and needs. It is very important if adequate movement regime concludes outdoor activities. Adequate movement activity connected with outdoor has a strong effect on resilience in physical, mental, social and spiritual context in teacher's health.

CONCLUSIONS

In last 20 years the stress involved in a career in teaching has increased considerably. Anxiety, depression, long-term psychical burden, relationship difficulties and even physical illness are just some of the symptoms. The teachers work deals with the effect of undesirable stress on human organism and follow the responses in immunity system. The goal is to provide a survey on this interaction and to alert to the burnout syndrome as manifestation of weakening of the organism at all its levels. The knowledge on the causes, symptoms and prevention of burnout syndrome is focused on the personality of the teacher whose profession is included among the most endangered ones. To the existing pressures of discipline problems are appended poor working conditions and low pay in some countries of EU (Krejčí 2010). Kornatovská (2011) presented in her paper research results of Krejčí, M. et al. (2010) which documented following findings in monitored teachers:

- sickness absence (in many cases long-term),
- sleep problems,
- low motivation,
- low productivity,
- lack of engagement,
- lack of co-ordination,
- poor interpersonal relationships,
- poor student feedback

To develop strategies to control stress should help schools to reduce pressures on their staff by the development of satisfactory in quality of life. Quality of life is the product of the interplay among social, health, economic and environmental conditions which affect human and social development. It can be said that quality of life reflects the difference, the gap, between the hopes and expectations of a person and their present experience.

It seems very necessary to organize workshops for self-preventing from most common diseases of teachers in Czech Republic. It is very important to realize health education programs – including coherent information and practical skills of areas: relaxation, nutrition, adequate movement regime, health care system, professional salutogenesis - for all pre-graduate and post-graduate educationalists in universities and faculties which prepare teachers and educators (Krejčí, 2010). Also regular medical screenings of educationalists should be connected with feedback about healthy life style. The health education should be presented in lifelong learning programs and obligated for all teachers and educationalists. It would be very fruitful to develop instruments and strategies of stress control and stress testing for teachers and heads. It can help to reduce pressures on staff by the development of satisfactory whole-school policies and teachers to be more effective in the management of their own stress levels.

The easier way of education to wellness is to start according the concrete local conditions. No general receipt exists, but it is possible to have inspiration of several successful interventional projects from last decade under ESF support. One of them will be present in this research study. In this context is human health not only a medical category, but it is the category with a wide human context. Physical, mental, social and moral determine of the health need a coordinated approaching to the whole problematic. The base is a respect of personal uniqueness and understanding of comparative facts. Scientific research in the area of wellness should open for people experiences and methods in prevention, protection and development of health and quality of life. educators assumed that work had an important negative effect on their private life. Assuming the results from the correlations, different “models” were created using the linear regression procedure. These models included each one of the dependent variables (Work Engagement, Work Family Conflict, Burnout, Stress, Tempo and Emotional Demands) and all the independent variables that demonstrated positive or negative correlations. Only for some of these dependent variables were found relevant models that can explain the results obtained. In adequate movement regime is the base of perfect teacher’s professional performance connected with resilience to burnout in teachers and their health support generally. Therefore very good results bring non-competitive activities as to absolve a bike trip, to descent the river, walking tour with a dog, paragliding, snowboarding etc., when one does not compare skills and force with others, but more to excel, to realize self. If the adequate movement regime is practiced with friends, colleagues from the teacher profession is upgraded in unforgotten experiences fixed friendships and relations in staff. On the base of found results we recommend to implement mental health support and training of mental hygiene techniques in school education in context with presented program and paradigm of Continuum of Self transformation in the sense of Health support and Health development. Special attention in education process should be gave to optimizing and explanation to sleep habits and circadian rhythm. With mental health support use adequate movement regime and promote movement skills and self – esteem and self – confidence during individual providing of physical activities. Adequate movement regime creates a part of a paradigm - “Continuum of Self transformation in the sense of Health support and Resilience building.

Significance of Japanese tea ceremony values with ceramic art interpretation

Adibah Ali ^{*a}, Rusmadiyah Anwar^b, Oskar Hasdinor Hassan^c, Ham Rabeah Kamarun^d

^{a,b,c,d}Universiti Teknologi MARA, Faculty of Art & Design, Department of Industrial Ceramics, 40450, Shah Alam, Malaysia

Abstract

Japanese Tea Ceremony represents harmony, respect, purity and tranquillity which we must embrace in order to achieve the main purpose of the tea ceremony. This event is unique as every process from the tea equipment preparation until the tea is drunk has a distinctive technique. Therefore the positive values are applied to the whole process of the ceremony without not only focusing on the tea as the end product which is essential to present a good value to perfect the ceremony in order to convey it to the guests. Statement of problem is in Malaysia, people value ceramic aesthetically but not the interpretation of it or the values they put in that made the artwork how it is. It is because the artist does not feel the importance of moral values to be the message of their artwork and mostly focuses on the artworks physical. The objective is to instil positive values in ceramic artwork and make it mean something. The values do not have to be labelled specifically for example for nature extinction, political or religious but so long that there are good values to be conversed to people. This is for it not to become just a beautiful artwork but also as a reminder of how important moral values are in the world today as it is being taken for granted each day. This study is based on observation of the ceremony itself. A case study from real life of Japanese culture derived through the comparison with stated in any publication. The summary of this approaches indicate a concept of an art hidden behind these ceremonies. The outcome is an artwork that can be a reminder for us in this grasping world on how important it is to preserve moral values which is the core to live a harmonious live. The Japanese tea ceremony gives a positive impact and teaches good characteristics that need to be instilled in everyone such as manners, beauty, simplicity, respect, appreciation, discipline, humbleness and kindness. The Japanese tea ceremony is a part of Japanese culture that has been kept for a long time and it's proven that the discipline came from this culture. These literature study then be applied as philosophical method in proposing an artwork based on cultural elements.

Keywords: Japanese Tea Ceremony, artwork, culture, moral values.

1. INTRODUCTION

The Japanese Tea ceremony is more than just tea drinking and some say that it is similar as learning steps to a complicated elegant dance as stated by Kalman (1947). It is a very special event for the Japanese and has been an important tradition for their culture where they wear *kimono* which is their traditional attire and attend the tea ceremony to drink green tea in Japanese tea bowl while relaxing and admiring the beauty of the ceremony also leaving all their life problems as they enter the tea room. A tea room is decorated in a very simple manner which it is mainly just the tea ceremony equipment and a few decorations such as Japanese calligraphy, painting as shown in Fig.1. (a) or *ikebana* which is known as flower arrangement as shown in Fig.1. (b).

Email address:

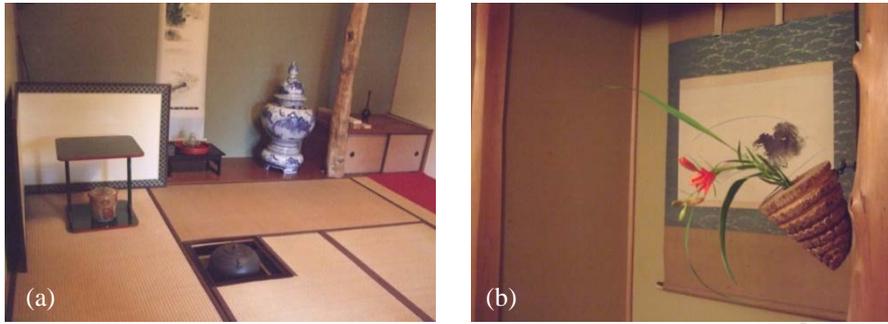

Fig. 1. (a) View of a Japanese Tea Room; (b) Tea Room Decoration

There are a few types of tea ceremony significance for certain event as stated by Tanaka (2000). It represents how precise and important this ceremony is towards the Japanese. Every tea ceremony symbolizes a unique event of green tea stories of all seasons and how it relates to the Japanese society daily lives. There are some to celebrate the first usage of the portable brazier in the New Year of tea and honoring the last remains of the year's supply of tea and to see out the warm months before winter sets in October until the beginning of a new season of tea, the seal of the jar with new tea plucked in spring is broken and the new, fresh tea is used for the first time as stated by Tanaka (2000). There are two types of tea to be mixed which is *koicha* which means thick tea and *usucha* which means thin tea depending on each ceremony.

The Japanese tea ceremony represents harmony, respect, purity and tranquility which we must hold on to in order to achieve the main purpose of the tea ceremony as mentioned by Tanaka (2000). This event is very special because of the fact that every process which from tea equipment preparation process until the tea is drunk has a unique technique. It even has a specific place, techniques, equipments, utensils and garments that are used specially for this event. Everything related to it represents beauty and softness suitable with its high level in the Japanese culture.

As mentioned by Mayuzumi (2006) the tea ceremony guides to thinking, knowing, and writing differently that separates from the main forms of knowledge in academic analysis. As mentioned by Harrison (2011) the practice of tea from an ignorant stranger's position, appears to have many rules, politics and different views. Therefore, it relates to our problem of this research due to the different views and interpretation of values of how differently the perspective people have. Only several feel the importance of embracing the best possible outcome that they can achieve from the spiritual aspect of their art work.

In this research, the researcher determined the importance of moral values to be instilled in the process of producing an artwork parallel with the meaning behind the pieces produced to be conversed to the public as a positive reminder which have the potential to give an enormous impact in the future.

2. METHODOLOGY

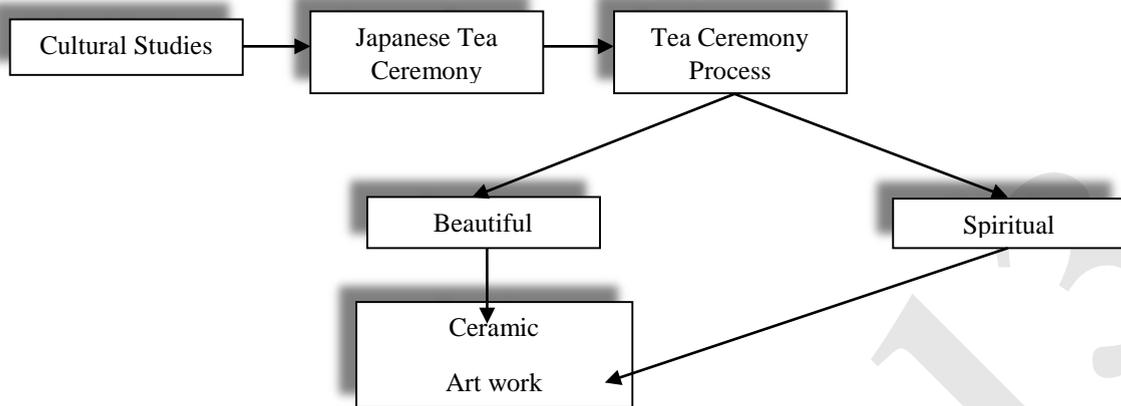

Fig. 2. Relation of Cultural Values Application with Ceramic Art work

Researcher focuses first on ethnographies and provided detailed descriptions and interpretations of the social life event as it happens. The researcher's study was also based on observation in everyday settings usually over a considerable period of time. This is because the focus is to investigate the Japanese Tea Ceremony as a culture that offers elegant tradition of preparing the tea and positive energy and moral values to the society that is capable to be applied to ceramic art work as the medium. Above at Fig. 2 is shown the relation between the traditions of Japanese Tea Ceremony with the application of both beauty as well as moral values to the ceramic art work. The data collected from Japan was acquired with assistance of several friends and supervisors whom assisted with the observation as well as participation in the Japanese Tea Ceremony. The researcher had the opportunity to attend three formal tea ceremony which was hosted by Mrs. Hamajima, Mrs. Fukushima and Mrs. Fumiko.

One of the three ceremonies the researcher was brought by Mr. Tomimoto and Mrs. Keiko the researcher's supervisor and wife, to Mrs. Hamajima's house which is located at Obu. Another was with Mrs. Fumiko's house at Tokoname who is a Japanese Tea Ceremony teacher which is a family member of Mr. Senko Yamamoto, one of Japan's Ceramic Artist the researcher have met. Lastly the researcher observed the ceremony at Ms. Fukushima's place situated at Tokoname once more where she also teaches Japanese Tea Ceremony. The researcher's last observation was taken by Mrs. Kazuko the researcher's landlord. The researcher observed the three tea ceremonies within two weeks time.

Secondary Data was information collected regarding the Japanese Tea Ceremony which is from books and journals. The researcher relied more on books which have information most about its origins, process, utensils and equipments and ethics.

3. RESULTS AND DISCUSSION

There is a message behind every movement made in the Japanese tea ceremony which the researcher hopes to convey to other society thus that they will gain knowledge and understand about the value that is not essential to other society but is important to the Japanese culture. The ceremony leaves a deep impression on oneself who truly engages in the experience and as mentioned by Kondo (1985) through the process is a sequence that expresses emotions and feelings and creates a distilled form and experience hence helping to increase understanding the reasons on the cultures preservations which is something to be instilled in every individual because it is a basis for good moral and personality.

According to Anderson (1991) the Japanese Tea Ceremony is starting to be recognized internationally with the assistance of the Tea Master's whom encouraged them by simulating the trend. Tea ceremony is a very well mannered event but an enjoyable one which those two collaborations is balanced and therefore a good tea ceremony is achieved. Tea ceremony is also a way of the society to get together and enjoy a period of time of positive energy coming out of each other and life issues excluded by just enjoying the beauty of the moment.

The event itself is an intriguing event where making tea becomes art work where many beautiful movements were involved in perfecting the ceremony. This traditional practice takes years of commitment and discipline to master due to the many different steps to be imbued and remembered which signifies meaning of discipline and the moral values that they teach.

The Japanese Tea Ceremony has been practiced by the Japanese society all these years for very good rationale. It gives a positive impact to the society spiritually to motivate discipline and an improved way of thinking that must be continued by the younger generations. Consequently, they will understand every significant of the ceremony has numerous advantages.

The researcher has noticed that the ceremony was full of manner, calm and peace as well as elegantly beautiful. The host for the tea ceremony wears Japanese traditional attire such as the *yukata* or *kimono* preparing the water and tea utensils for the start of tea making as shown in Fig. 3 (a). The host sits in a particular posture with bended knees with straight back as shown in Fig. 3 (b) Muromoto (2013) appropriate with the tea making utensils which is located directly on the floor covered with *tatami* mat.

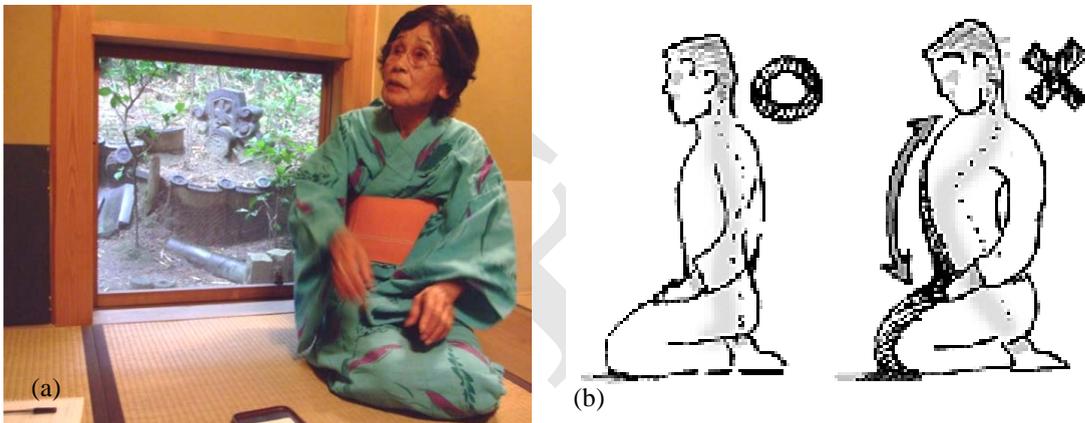

Fig. 3. Mrs. Hamajima in a *Yukata* by the Entrance Door of the Tea Room;
(b) Sitting Posture based on Japanese Culture (Muromoto 2013)

However before that, there are certain processes that are unique and significant related to the tea ceremony. For the host, they are to enter the tea room from the other side of the tea room, technically from inside beginning with a kneeling position holding a water jar. The guests wash their hands at a pond located at the traditional Japanese rock garden which there are special technique required and enters the front door of the tea room by crawling through a small door. Washing the hands is a symbol of purity which it is to clean ourselves before we enter a spiritual ceremony and maintain the value that represents the ceremony.

Then the host prepares the tea gracefully following every movement and technique that makes tea making beautiful like an art. The guests kneel facing the host while waiting as well as observing the host prepare the tea. They are served with extremely sweet desserts that are very famous in Japan. It is a part of the tradition which is to eat sweets before drinking the green tea.

Making the tea also stresses in cleaning and caring for the tea utensils. Every item is wiped with a silk cloth usually red in color symbolizing the importance of all the special handcrafted and unique tea utensils. Just to show the valuable tea utensils are at Japan. The most special utensil is the tea bowl, tea container and the tea spoon which is all appreciated and admired after tea has been drunk, symbolizing that it is essential to appreciate things that are around us, appreciate the simplicity and notice the smallest details that make them special.

Usually, the most expensive tea bowls are the simplest in color and surface design. The famous tea bowls are black *raku* tea bowl which have been used since ancient times. A visit to the Japanese Art Museum was where many *raku* tea bowls were exhibited together showing its value. These also show as well as represent the lifestyle of the Japanese which are progressive but at the same time simple. Simplicity is a way to make their life easier in the most possible way but Japan is one of the leading countries in the world.

After tea has been prepared, the host serves the tea to the guests' one at a time. The front of the tea bowl will be served facing the guests which symbolizes humbleness and respect of the hosts to their guests. That is a good characteristic to be instilled in everyone and should be practiced in our daily lives. Other than that, the ceremony shows an appreciation of art where making tea is beautiful and every item that was used is unique.

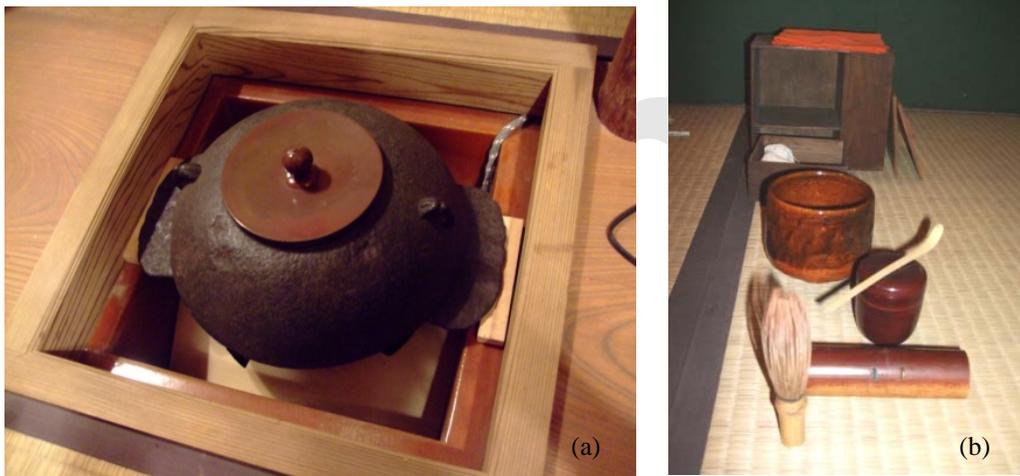

Fig. 4. (a) Water brazier ; (b) Tea Ceremony Utensils

Choosing the tea utensils as shown in Fig. 4 (a), (b), mixing and matching them together requires skill and therefore, it demonstrates the importance to maintain the beauty of the ceremony inside and out. Making the tea, the host needs to be pure and clean at heart. This symbolizes that it is important to be beautiful inside and not only physically beautiful.

The guests also need to play a role in the tea ceremony besides only to drink the tea. They have responsibility to bring some item such as paper tissue, small knife and paper fan which are all to be kept in a small purse. All the items are to be used for eating the dessert which the knife is needed to cut and pick the dessert and the paper tissue as the serviette. This act provides more guest participation in the ceremony and be prepared for it as well as teaches them to be disciplined and well manner. After drinking the tea, the front part of the tea bowl was turned facing the host and drink the tea with three sips, slurping and then turning it back to its former position.

Then the guests then admired the tea utensils and appreciate the craftsmanship shown by the artist through his art. The tea ceremony was ended with a thank you speech between the host and guests mainly on the topic of gratitude for the invitation and participation between the two parties.

4. CONCLUSION

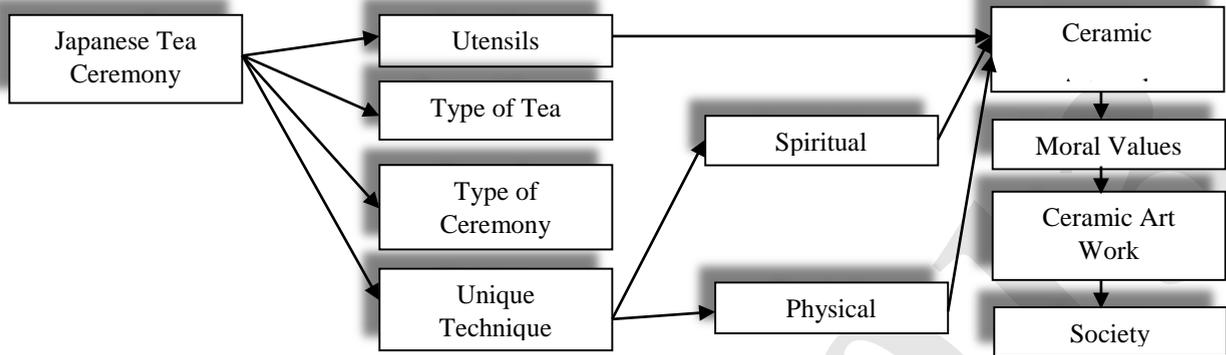

Fig.5. Ideation Process of Research

Fig. 5 illustrates the researcher's ideation process from Japanese Tea Ceremony until it is deliberated to the society. There are a few aspects related to this research topic however the researcher's focus is its tea making technique. It starts with understanding the Japanese Tea Ceremony, a delicate ceremony which not many people appreciate the uniqueness due to its' irrelevant movements and techniques that are important during the ceremony. For an example, pouring water from the hot water pot to the tea cup can be poured normally but for the Japanese Tea Ceremony, they have a special way of pouring the water elegantly and beautiful.

There is also awareness about discipline through the techniques of making tea which there are so many that they need to be carefully done in order to achieve tea making beautiful. There are messages hidden behind the ceremony which are cleanliness, respect and harmony which is practiced two ways, by the host as well as the guests.

The researcher have also acquired out about the kinds of tea ceremony that exists and the different tea utensils that they used according to the seasons. Each tea utensils are special in its' own way and are usually chosen for its uniqueness and they are always handmade because they will be admired at the end of the ceremony. This is a significant value to be instilled in everyone which in this context, to appreciate the craftsmanship of the Japanese traditional skills in making tea ceremony utensils as well as the craftsmen. This is what the researcher is hoping from other society especially the Malaysian ceramic artist which is to improve on that aspect. The researcher strongly believes that from the starting of a pure process filled with good values at heart will produce a meaningful art work that will interpret and appreciated by viewers.

All in all, this research has changed the researcher's point of view about Japanese Tea Ceremony and understanding further on how spiritual values can be translated through art of the tea into ceramic art work and furthermore the society. Everything the researcher has learned relates in daily life and will be applied to improve the researcher's personality and mentality which hopefully can benefit others as well.

5. RECCOMENDATION

This research has deliberated knowledge in understanding the values hidden behind an important cultural event which in this case is the Japanese Tea Ceremony, importance for preserving our culture alive no matter which country we are from and to learn it because there are benefits and reasons why it is still being practiced

until this day. Therefore the researcher recommends the society to learn more in this particular culture for they are inspirational and have an enormous possibility help make us a better person in our daily lives once the understanding is achieved. Other than that, they will be shaping us for a better future as well as to be thought to the newer generations so that they will be inspired from it as well. For that, practicing it might help us instilled the benefits that are hidden all this while and lets us transformed the messages behind the produced art work which some are for us to be disciplined, aware, respectful and so many more positive values that are important that can be shared.

Acknowledgement

We would like to acknowledge the generous participation of the interaction designers in the research. This study was conducted in Form Giving Design Research Lab established by Research Management Institute, Universiti Teknologi MARA (UiTM). This issue has finalized in collaboration with the contributing authors, and with support UiTM for the financial support under Research Excellent Fund Scheme. In addition, two anonymous reviewers provided insightful and of an earlier abstract of this paper.

4th International Conference on New Horizons in Education

Simplexity, teaching and movement

Stefania Milite^a, Rosalba Barbato^a, Nicolina Pastena^b, Filippo Gomez Paloma^{*b}

^a Faculty of Education Sciences – University of Salerno (Italy)

^b Department of Human, Philosophical and Education Sciences – University of Salerno (Italy)

Abstract

Alain Berthoz, contrasts with the complexity term, the word "simplexity" indicating a property of living beings, which over time have learned to develop increasingly sophisticated solutions to process an increasing number of information. The simplexity is what gives meaning to simplification, since the simplex solutions are guided by an intention, a purpose, a function. This theory can become an instructional scaffolding that supports both the student, and the teacher in the teaching-learning process. The simplexity has to be ascribed therefore, between those which constitute innovations in education.

Educational Technologies simplex solutions show an operative strategy towards new forms of implementation, able to conjugate effectively with the current views of teaching, giving the body a central role in learning.

Currently, the school excludes the component body underestimating the role of the body in motion as a main device through which, creating experiences, we develop learning and produce knowledge.

From the studies conducted, it is clear, as today the body represents a machine of knowledge, so the abstraction and generalizations can produce useful learning only if they have been built from the experience of the world body. To this end, in our project we have tried to combine the learning of mathematics with the bodily component, all referring to the principles of simplexity.

Our goal is to give life to a teaching able to activate a plurality of interactions and stimulate various body mechanisms from which derive the processes of signification and meaning attribution.

1. Introduction

A. Berthoz, opposed to the term complexity the word "simplexity," which is not a mere synonym of simplicity, as in the English-speaking world since the 50's, but a property of living beings, which over time have learned to develop increasingly sophisticated solutions to process an increasing number of information.

The simplexity like the complexity is not simple to understand, and therefore even to illustrate. To fully understand it, it seems correct, in this context, to consider the reasons that pushed A. Berthoz to seek a new strategy to deal with life and the world. It all starts here: the complexity.

1.1 The complexity

The last decades of 20th century witnessed an epic revolution in scientific thought, a revolution which in some ways is not fully completed yet, but it has opened the way to an irreversible path in the history of science. About this revolution there has been talked of chaos, non-linearity, holism, disasters and more, but the concept that best embodies and expresses the character of the new line of thought is complexity. In a short time we had to accept a series of changes in the traditional view of nature that, despite the variety of application areas explored are based on two fundamental principles: the effects are not proportional to their causes, and the whole is more

* Corresponding author. Tel.: +39089963441; fax: +390898803.

E-mail address: fgomezpaloma@gmail.com

than the sum of the parts. These principles were present in science even earlier, but were considered as non-essential characteristics of nature, contingencies which with appropriate approximations could be eliminated without affecting the deep understanding of the phenomena. Instead, the development of the new science has shown how nature, from the level of elementary constituents to the one of more structured biological systems to the human social and economic network, is intrinsically and irreducibly complex.

Niklas Luhmann introduces additional elements in the complexity characterization, he says that an event is complex if it consists of so many elements that they can be put in relation to each other only selectively.

The greater is the amount and variety of relationships between elements of a system, the greater is its complexity. The main goal of complexity theory is to understand the behaviour of complex systems. Complex systems are systems whose behaviour can not be understood from the behaviour of the individual elements that make them up because they interact, the interaction among the individual elements determines the overall behaviour of the systems and provides them with the properties that can be completely extraneous to the single elements. The autopoietic concept is important when talking about the complexity, Maturana and Varela defined autopoietic unity as a unit that is capable of self-generating through a network of reactions that take place within a confined space.

This speech leads to another image representing the life as a system that follows a cyclical logic, an organized system, which generates a network of reactions, for example a metabolic one, but, generally, any network of reactions, which in turn generates molecular compounds, then re-assembled in the same system and so on, in a cyclical logic where there is no beginning and no end.

1.2 The complexity of 'human being

We talk about complexity and movement not only to emphasize how complex is at a neuronal and muscle level the possibility of performing the simplest of movements, but also because the movement allows us to build actions that face complexity. So thanks to the movement we express ourselves, and through it we explore the world around us, a complex world, in fact, that could not be tackled without a previous experience, deriving from body exploration.

Today we live according to the principles of disjunction, reduction and abstraction, which together form what Morin calls the "paradigm of simplification." To formulate this principle, which is fundamental for the West, it was Descartes who divided the thinking subject (*res cogitans*) from the body (*res extensa*). This principle has allowed us to analyze the world as something distinct and distant, so that science, philosophy and other disciplines did enormous progress. We have had the consequences of this way of conceiving reality, only since the twentieth century. This conception brings science to be completely separated from philosophy and this entails, without a doubt, the inability of science to reflect on itself. The only way, according to Morin, to solve this problem has been another simplification, and more precisely the reduction of the complex to simple. This means discover that behind the apparent complexity of the phenomena, there is nothing but a perfect order, simplified, if we can say so by mathematical formulas and equations. With the introduction of complexity science the world has ceased to be linear and Cartesian dualism has been replaced by a dense network of interconnections that made it difficult to distinguish the individual parts from the whole.

!1.1 Complexity VS Simplicity?

This collection of fascinating thesis - often enclosed in the expression "order from disorder" - has stimulated Alain Berthoz, to lay the foundations of a new theory, which based on the same principles of complexity tries to go further. According to the author the excessive propensity to complexity, expressed by contemporary societies, has been the main cause of the simultaneous increasing of methods aimed at simplifying complex situations, which, paradoxically, have produced a further increase in complexity. To make computers easily usable by

anyone, very complex programs have been developed, so that "the more the use of computers is simple, the more the software will be heavy." The conclusion reached is that Berthoz "simplify comes at a price." Simplify for our brain has a price, but it is a necessity, since it cannot store the excessive bombardment of information that every day, indeed every millisecond, it is exposed.

Very often people make the mistake of confusing the word simplicity with that of simplicity and yet they are two concepts differ materially because simplicity means the absence of complexity, while the simplicity is deeply linked to the complexity.

2. The Simplicity

The simplicity is a property of living beings, is a set of solutions found by the latter so that, despite the complexity of natural processes, the brain can prepare the deed and anticipate consequences, identifying faster solutions, more effective and stylish, this in relational processes allows to predict the reactions of others.

The simplicity is therefore a decipherable complexity because it is based on a rich combination of simple rules.

More over it is important to emphasize that each organism has its own rules of simplification, these vary from individual to individual also according to its own Umwelt, namely the relationship that the subject has with the environment of belonging, and its relationship in it.

As stated by Uri Alon observing the biological phenomena of living beings genetic make one a words we can use to defined them is surely be "complex". As each protein is similar to spaghetti tangled and held together by atomic bonds. Yet these relations are simpler than you might think, as starting from a limited and small number of basic schemes. The fact that the basic patterns are limited and the like, gives a striking example of what is the simplicity from the genetic point of view and biological. Indeed identical or similar patterns are used in all living beings to minimize the energy and increase the speed of processing of the information.

There are properties of living organisms that constitute fundamental tools for a better definition of the simplicity concept:

Separation of duties: the dimension of time is a matter of separation of functions, there are indeed some molecular entities who work more quickly, whereas others operate more slowly, what to facilitate the distinction of the different tasks. This separation of functions is also visible in motor control and perception, where there are tonics, slow and steady systems and rapid and transient systems, both systems cooperate.

Differentiation: namely modularity, differentiate tasks within a company or organization allows a greater efficiency.

The rapidity: it is based on anticipating and predicting the consequences of an action. This is seen for example in the human being implementing motor action anticipating the danger of an obstacle that would result in the fall, the motor action is in fact active in 100 milliseconds. This property can also be found in some of decisions taken, that sometimes occur in a fraction of a second. One way to make quick and easy a solution to a problem is called "diversion simplicity" which takes up the mathematical model of Thom, or focus on special features, bifurcations and critical elements of a problem and simplify everything else. To put it in a Cartesian way: decompose the problem into a series of easier sub-problems broken down into modules and then recomposing.

Reliability: this property does not link well to the concept of complexity, especially if the person in question is the human being with its different facets to the molecular and cognitive level. To increase the reliability of these processes, we make use of tools such as: the redundancy, the use of paradoxical noise, cooperation between inhibition and excitation, the use of coupled oscillators.

The flexibility and adaptation to climate change: is the ability of an organism to act in different ways to solve a problem depending on its type and know how to deal with new situations. An example may be in teaching what the teacher arises in explaining the decimal numbers to a class, the easiest and fastest way would seemingly be to implement a lecture, but the risk is that the class is not able to internalize the concept. The solution semplessa

instead is to create a new method of teaching, for example based on the embodied cognition, that even if requires more time ensures a greater stimulus for students and as a result an internalization of the concept, ensuring that the teacher has a solid foundations on which to build more complex concepts.

The memory: the memory of a past experience is vital to deal with the present and to predict the consequences of future action. The division of different areas in the memory refers to the mechanism of modularity.

The generalization is especially crucial in the movement, it allows us to move in space and is at the origin of human thought.

2.1 Simplexity and movement

Our body and the organization of infinitesimal connections it has with our brain are explanatory of what we mean by simplexity. The movements we continuously make with our body, from the simplest to the most complex, are faithfully subject to the simplex laws.

Berthoz in his book "The sense of movement" describes the laws simplifying the movement.

To delineate them he invites us to describe an elliptical path with a finger, pointing out how the speed varies along the orbit: where the curve is reduced you progress faster, hence the tangential velocity. A very important law is the basis of this phenomenon: the power law $1/3$, which binds the tangential velocity to the radius of curvature. The origin of this law is simple as it leads to reduce the energy to a minimum and consequently also the jerk, that is the speed of variation of the acceleration of a movement. There is also a very close relationship between the velocity along the trajectory, the curvature, and the twist, the speed is determined by the degree of twisting of the body segment under examination. Many authors argue this law is also the basis for the perception of movement.

Every movement of our body is the result of the combination of basic motor patterns, defined primitives of motor actions, they belong to a wide range of movements inborn or acquired during childhood. The combination of primitive motors makes possible movements such as walking, grasping, postural control, avoidance. These synergies are limited, but they can also be acquired through training, also thanks to mirror neurons we simulate the easier movement as much as we perceive them as family. On this basis it is possible to recreate the movements against nature if you practice with intensive practice, because our brain is able to reorganize their functional connections.

2.2 The gesture

Continuing to outline the movements of our body that respond to the principles of simplexity, we can neglect the significance of the gesture.

To the Greeks and Latins the gesture, or the *actio* must express the movements of the soul according to four registers:

- the physiognomy (*vultus*);
- the voice (*sonus*);
- the gesture or movement (*gestus*);
- the gait (*incessus*).

The gesture is more than the simple and the complex, because he embodies the simplexity.

It's simplex because it allows our brain, in a concise and straightforward to grasp a reality, an intention, a thought, a complex social relationship.

According Berthoz we can distinguish three broad categories of action:

- The gesture can also be a form of simplified coding, as it can be for example a military salute, the codes of the army or even the gestures that performs a traffic cop at an intersection;
- Finally the gesture can also be a sign of an emotion, intention and thus have a more abstract sense.

The fact that we communicate through the gesture implies the other in his own body. According to the philosopher and psychologist Theodule Ribot emotion is first of all "e-motion" then leaves from movement. The gesture represents the very essence of simplicity of living organisms.

The simplicity assumes that the brain has information, not just the word, to give a sense of the gestures. Information can not only come from the outside world, but there must be some link between the nature of the information and the laws of operation and interpretation of our brain. So we need to learn the meaning of gestures that relate to human relationships, social norms or religious symbols.

Verbal language is undoubtedly essential part of communication between human beings, in fact, has allowed a rich repertoire of trade, it undoubtedly belongs to simplicity as it allows to simulate reality by replacing a series of signs and symbols.

However, the verbal language is not the only way that men have to communicate, non-verbal communication, which has been long underestimated in itself has got a lot of communicative potential. Men, like animals, have in fact a form of non-verbal communication based on the body, on movement and gesture.

The repertoire of gestures is very vast and is always accompanied by attitudes or postures, gestures are not only the expression of the body but the whole person.

Why do we define the gesture simplex? The gesture is a manifestation of simplicity because it is an immediate summary of the complex reality, it contains the essence of what it is to act and not just the action, reflecting both the intention and the context. It also takes into account the psycho-physical characteristics of the person who does it, it can also be an anticipation of future action. Finally, we have an immediate perception, as in the act there 's evidence.

Doing complex and specific gestures is not always easy, but with practice you can hone all the gestures, make them faster and gain a very personal form. The initial hesitations, the need for multiple points of reference are replaced by security, the mastery of gesture and elastic adaptability. The gesture becomes unique and no more fragmented, it needs very few points of reference, so the movements are concatenated as the notes in a melody.

3. The simplicity, movement and teaching

Currently, most of the technologies used in schools excludes the component body underestimating the role of the body in motion as a "main device through which, realizing experiences, we develop learning and producing knowledge" (Rivoltella, P., 2012) - "and refusing to" look the corporeality teaching as a real situated practice and consider the results of teaching as the final product of a complex non-linear "explainable" (Sibilio, M., 2011).

A scientific reflection on the body as a "machine of knowledge" (Varela, 1990), thanks to that "the abstraction and generalizations can produce useful learning only if they have been build from the experience of the world body" (Rivoltella, 2012), would favour a necessary diversion of educational research towards strategies to exploit technologies able to reproduce and amplify in the digital environment, many of the mechanisms that the body puts in place to deal with the complexity of the Umwelt in which inter-acts (Berthoz, 2011 p .14). In fact, the opportunity to activate a plurality of interactions able to stimulate various bodily mechanisms from which origin the processes of signification and attribution of meaning, can help to enrich the boundaries of experiencing in education, widening the opportunities to decipher the complexity the process of teaching-learning "More generally we can say that the complexity of the world can be easily overcome if our brain processes some consistency between the components of the real" (Berthoz, 2011 p.55).

In this sense, the teaching techniques simplex "showed an operational strategy to a specific perspective of" ergonomics teaching": the deviation from simplistic strategies for selecting technology, towards new forms of implementation are able to conjugate effectively with current pedagogical visions, returning to the body a central role in the relationship technology/learning and recognizing the action the ability to make possible, and at the same time, "exercise", a projective-cognitive function; "projective the brain is able to evoke a complete scene to interpret the world as it has been perceived and experienced in a given time in the past "(Berthoz, 2011 p.58).

The movements are not a pure mechanism, a means to achieve something, motor actions play an important role in the formation of the mind, affect learning and are the basis of language. Movements, motor patterns and physical relationship with reality develop the mental logic and opens up the thought. Generally when we think of mind we focus more on the perception and ideas but not on the move yet even the latter has a fundamental role in the mental representations. Very often it is believed that the action starts from a sensory perception which is follows a cognitive processing which then gives to life motor act. But you can also find a pattern not so linear, but cyclical, the body that interacts and changes the surrounding environment, the perception of consequences and the influence it has on the successive movements. So thinking is simply to decide which move to make then, from this point of view the movement is not the means to meet the demands of the mind, but is the mind is to meet the demands of the action.

This way of looking at reality may seem somewhat paradoxical because motor functions are often considered low-level, subordinate to that which is pure thought.

As mentioned previously, however, the body is closely related to areas of the cortex responsible of real or imaginary movements, in other words the same area of the brain comes into operation when we imagine a movement or when this is planned.

According to some neurophysiologists as William Calvin the evolution of some motor behaviours, such as the ability to construct and manipulate the objects, has meant affirm a logic motor based on the structuring of a concatenated sequence of steps: as the motor cortex and the pre-motor have developed a sequential capacity inducing an area, that of Broca that controls the drive of the language, to generate the sequences of syllables that lead to the word.

There is a close interplay between motility and thought, from the point of view of the natural history of man, from the ontogenetic point of view, and from the point of view of functioning of the mind, in fact now focus on a problem and consequently to think leads to a tension of the muscles of the neck.

3.1 *A new perspective on teaching and educational*

The profound changes that have altered over the years the society in its social, economic, cultural and professional in fact have also transformed the educational systems and training. The advent of new communication and information technologies have created new possibilities for each person to have access to information, to knowledge, involving a change in the skills required to understand and act in the current social, national and international contest and to carry out their functions. The change of the society brings as a consequence the transformation of the demand for education and training.

It is then proposed a not self-referential school, but open to society, the processes of change that can improve its educational effectiveness in terms of outcomes of training. A school that expresses its offering educational curriculum and taking into account a possible coalition between body, mind, and language by taking a playful approach. This new perspective takes into account especially the new concept of simplicity discovered by A. Berthoz, as today to cope with the increasing complexity it is necessary that not only the individual human being implements simplex solutions, but also the school to embrace this concept to enhance and facilitate their students learning.

The work comes to life from the theories of authors such as P. Dennison "movement is the door of 'learning', McLuhan" there is no learning without fun and there is no fun without learning ", A. Damasio "research has convinced me that emotion is an integrated part of learning.", A. Einstein "means learning experience, anything else is just information."

It has been questioned whether in fact to meet the needs of the application you can find a simple solution that will stimulate students and will be therefore not only effective, but also innovative, in specific case for learning the English language. The solution that fully reflects the simplex principles has been in our opinion the possible coalition between body, mind, and language.

The project seeks to undertake a practical study, and not just in theoretical level, that having "the purpose of identifying the body both didactically accessible resources for the promotion of knowledge, and the physiological properties responsible for the 'adaptation' of the body to 'environment and turn them into principles of simplifying it a didactic act." The idea was born from the need to promote innovative methodologies in the school for the learning of a foreign language. With this new strategy is expected teaching to be based on full immersion of student in the language as a foreign mother tongue, like the mother of the rest, is a dynamic character, so it must be learned not as a simple idea to leave in a dark drawer of mind, but to be in constant use, to express needs, to solve situations. And this is the reason why it was decided to associate it to learning body, to emphasize and amplify that the participatory nature of this new teaching, which no longer provides a linear learning, but a cyclical one, where future experiences are to reinforce old ones automatically .

Thus we find a simple solution to the problem of lack of stimulation in the school, and now due to excessive static lectures, in order to improve the performances and skills of each student, in this case in the English language.

4. Conclusion

"Tell me and forget. Maybe show me and maybe I will remember. Involve me and then I will understand!"

The maximum of Confucius holds the value of the hypothetical research, because through our experience it could be shown that a coalition between body, mind, and language is possible becomes necessary as a new frontier for teaching that breaks the mould with the classical tradition of lectures and with aseptic mnemonic learning. The combination of these three elements might be understood to be the winner for the school of the future. A school that lays the foundation on the body, on the motion, on a new way of learning, a school in the name of a new goal, simplicity.

Situation assessment of students of food engineering department: the sample of Namık Kemal University

Emine Yılmaz^a, Ismail Yılmaz^{*b}^aNamık Kemal University, Faculty of Agriculture, department of Agriculture Economy 59030, Tekirdağ, Turkey^bNamık Kemal University, Faculty of Agriculture, department of Food Engineering 59030, Tekirdağ, Turkey

Abstract

The aim of this study was to investigate the opinions of the students of food engineering department about their department, their expectations from the job. A survey study was conducted with the students (totally 174 students) of Food Engineering Department in Namık Kemal University Agricultural Faculty in order to find answers for such questions as the following: What do our students think about the efficiency of education they take in order to be a food engineer with a foundation that is appropriate for this definition? What are their expectations from departments regarding education? According to the survey results, these points were observed that most of the students of the department chose food engineering department consciously, and that 46 % of our department's students put our university in the first five ranks in the preference list of universities; moreover, they agreed on the following issues: laboratory conditions do not satisfy the students, and they should be better; the number of the students accessed to the department is excessive. By and large, it was observed that although the students hold a view about employment potential of their jobs, they are reluctant to work in their own jobs. They also demand that the courses should be supported with current issues. They reported that the present practices about the food control are insufficient.

Keywords: survey, food engineering department, students, education

1. Introduction

A food engineer is someone who plans for foodstuff to be processed, protected and stored up in accordance with the standards without losing its nutritional value, conducting its practice and developing new systems. He makes research in respect to protecting foodstuff for a long time without losing their qualities, making use of stuff more productively, utilizing wastes, turning them into new products or reducing them to minimal levels (Yılmaz, 2005).

In line with the researches he makes, he prepares projects regarding forming new products and developing more affordable production techniques and conducts these. By removing possible problems that can emerge in the course of production, he supplies continuity of functionality. As a producer, he chooses the most convenient methods that can compete with other producers, does studies regarding producing the best product with the least cost. He supervises and exerting quality control of the production in all the phases from production until it reaches the consumer (Yılmaz, 2005; Demirci, 2010).

Namık Kemal University Agricultural Faculty Food Engineering Department was founded in 1982. While continuing its education as affiliated to Trakya University, it was affiliated to Namık Kemal University with the foundation of this university. In the department, there are three laboratories and totally 18 academic staff, particularly 14 lecturers and 4 research assistants (Anonymous 2012). The answers for the questions regarding the opinions of the students of food engineering department about their department, their expectations from the job, activities they fulfill with the aim of carrying out what they learn in their social life or improving themselves were looked for

2. Material and method

This research is a study aiming at receiving opinions of the students of Namık Kemal University Agricultural Faculty Food Engineering Department regarding their satisfaction level of their department by means of surveys. The survey was conducted with 174 students by interviewing them face to face. The survey data were itemized in the computer with Microsoft Word and Excel Package Software and organized in the form of tables. The comments of tables were carried out with arithmetic average and % calculations.

3. Results

In Namık Kemal University Agricultural Faculty, the total number of the students is 1495. 643 (%43) of these students are female while 852 (57%) are male. The number of the students of Faculty's Food Engineering Department is 284, and 201 (71%) of them are female while 83 (29%) are male. According to the survey made face to face with 174 students out of Food Engineering Department students, 125 (72%) are female while 49 (28%) are male. When the total number of students is considered, it can be seen that the number of female students are more than male ones. As for the age of the participants, 87 (50%) are 20 and under 20 whereas the others (50%) are over 20. The distribution of the students according to high schools they graduated from is as the following: there are 86 students (49%) from Anadolu High School, 81 (47%) from general high school, 1 student from science high school and 6 students from other vocational high school.

They were asked in which number their preference for the department was when they gained the right to enter the department, and it was determined that 80 students (46%) wrote their preference between 1-5 in the list, 43 (25%) between 6-10, 51 (29%) wrote 10 and over in the preference list. When the students' preference is considered, it can be said that they succeeded in accessing the department in line with their eagerness. Similar results were reported by Seviktekin, Nargileçekenler and Çetin (2012). In respect to the previous question, when they were asked whether or not they chose food engineering department consciously, 149 students (86%) said "yes" while 25 (14%) said "no". When they were asked what their opinion about the number of students accessing to the department in which they study, 62 students (36%) found the number sufficient, 106 (61%) stated that the number is too high whereas 6 students (3%) said that they had no idea on this subject. 63 students are enrolled in Namık Kemal University Agricultural Faculty Food Engineering Department every year. When 3 students with the quota of undergraduate transfer and 3 students with vertical transfer are added to this number, it reaches 69. This number poses as a problem in dividing students into groups in applied courses. The replies given to the survey confirm this problem. When the students were asked if they contact with the lecturers outside the courses, 61% (106) of the participants reported that they can contact and negotiate their questions and problems while 39% expressed that they cannot contact.

The participants (78%) claim that they cannot use the laboratories when they want. The rest of the students (22%) state that they use the laboratories when they want and that they do not encounter with any problem in that. The fact that those particularly thinking in that way and students who make an explanation are in the last class and

they often prepare dissertations under the control of the assistants support this idea. It was determined that 30% of the students want to work in production after graduation, 24% want to work in laboratories, 20% in research development department, 19% in quality control and 9% in business and marketing department.

When the students were asked if they wanted to produce a new product, in which technology it would be, 35% of them reported that it would be in dairy products, and 30% stated that it would be in aroma-additives. It is followed by the fact that 11% thought that it would be in cereals, and in meat products for 9%.

It was found out that when they graduate, the proportion of those that do not want to work in another area other than food engineering is 56% while that of those wanting to work in another area is 44%.

It was also revealed that while doing the shopping, 122 students look at production and last consumption date, 88 students look at the brand, 79 students at the content, 78 students at the price, 60 students at additives, 54 students at nutrition and calorific value, 39 students at if there is a discount, and 38 students look at package. They expressed that they choose selectively because of the subjects they study in the courses. In this question, they chose more than one option.

When they were asked how they follow developments in food industry as food engineering students, most of them (154 students) say that they use the Internet. 27 students follow various food magazines, 30 students follow conferences, 14 students use scientific articles, and 13 students follow fairs. 7 students say that they do not follow anything. The students chose more than one option in this question.

When the students were asked whether they improve themselves outside the university, 122 replied "yes", and as for how they improve themselves, 59 students improve themselves with certificate programs, 53 students with attending the courses, 40 students with attending conferences, 21 students with following fairs, 23 students with other things. In this question too, they chose more than one preference.

In order to determine the opinions of the students about the education of the department where they study, the questions asked and their replies are seen in Table 1.

Table 1: The students' opinions about the department in which they study (%)

	Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
I find our department's education quality sufficient	6	41	31	16	6
I think that it is true that food engineering department is within the scope of agricultural faculty	14	29	24	18	15
I think that the content of the courses is suitable	9	50	25	12	4
I demand that the courses should be supported with current issues	63	32	4	-	1

The courses are supported with current issues	4	28	38	24	6
I think that the questions in the exams are in parallel with the courses	10	44	26	11	9
I find the resources used for the courses sufficient	4	33	29	27	7
I find the lecturers' teaching sufficient	5	34	36	17	8
I think that the course duration is used effectively	10	49	25	11	5
I think that the variety and number of the courses taken in a term are sufficient	13	48	14	13	12
I find the laboratories that we use sufficient	2	10	25	28	35
I hold a view about the occupation potential of food engineering	18	56	17	8	1
I apply what I have learnt in the place where I live	12	35	27	19	7
I think that supervising the food products in our country is sufficient	2	7	27	30	34
I think that food engineers take part in supervisions sufficiently	4	9	25	30	32
I think that education that we take is sufficient for our career and competence	3	18	36	26	17

4. Conclusion

According to the results of the surveys made with the students of Namık Kemal University Food Engineering Department, it was observed that most of the students in the department choose food engineering department consciously, and also that 46% of the them wrote our university in the first 5 preferences in the preference order; moreover, they agree on the points that laboratory conditions do not satisfy them and that the number of the students accessed to the department is excessive. Although the students generally hold a view about their occupation potential, it was observed that they are not eager to do their jobs. In addition to all these results, the students prefer the Internet as popular in order to improve themselves in the food area, and they expect the courses to be supported with current issues.

4th International Conference on New Horizons in Education

Social Network in Education: a Mathematical pilot test.

Pedro Tadeu^{*a}, Joana Lucas^b

^aUDI-Research Unit for Inland Development IPG-Polytechnic of Guarda, Av. Dr. Francisco Sá Carneiro n°50, 5300-559 Guarda, Portugal

^bPorto, Portugal

Abstract

Nowadays the use of ICT technologies, and more specifically computers, is increasingly fast in all activities. Connected to the increase use of new technologies is also the use of social networks. New forms of connection spread among the internet, occupying an empty space of the web and also significant time of youngsters, becoming a daily routine for all of them. The network communication triggered a considerable advance in social behaviour, and originated several social networks. Examples are Facebook, Twitter, Hi5, Orkut and others, some of these increased rapidly and remain nowadays, other succumbed to the natural evolution. Following Marteleto (2001), these networks are characterized as being social structures composed of persons or organizations, connected by one or more types of relationships that share common goals and values.

Over the past few decades the Education began to look for new technologies as a tool to be used in order to improve the teaching process. We are now faced with another major challenge, the evolution and exponential growth of social networks around the web.

New questions arise:

- Social networks may be one more step on the staircase of using new technologies in teaching and learning process?
- Do these can be useful tools to achieve the proposed objectives, as well the creation of rich moments of learning?

In this article we intend to expose, through our experience of using a social network, in the specific case Facebook, what can be done within the framework of a subject at university level. We analyse what we call the Hybrid Model Guide (HMG) of a subject. This hybrid model makes the connection between the contents of a subject and how they can complement and associate with the creation of open or closed group within Facebook.

Keywords: Mathematics Education; Social Network

1. Introduction

It is our understanding that education must be aware of changes in terms of what nowadays is defined as being the Web 2.0. As Patrício and Gonçalves (2010) say, the Web 2.0 tools, like social networks, provide many opportunities for creating a learning environment effective, efficient and engaging. Innovation, collaboration, interaction, sharing, pro-activity, participation, critical thinking and reflective, are some of the advantages of using Web 2.0 in educational settings.

Email address:

Other important thing is the integration of social networks with tablets and cell phones as it is say in Educause (2007), the ability to browse the site or upload photos from a phone and communicate with the site through text messages - moves the notion of social networking away from computers and into the realm of an “always on” application. This is an important step forward to the possibility of being in touch with education everywhere. So clearly, there are several aspects that we need to discuss considering the use of social networks, in our case, Facebook, some positive and others not. After we consider these aspects in a practical case, we will give our personal opinion regarding the use of a social network in education, however the reader may draw his own conclusions from this exposure and use as he like the framework develop by the authors.

2. Proportional Evolution: Education and Society

The last few years have been really significant in terms of technological evolution of our society.

The teaching-learning process was, over time, mutating, evolving, adapting, and always considering the changes occurred in contemporary society. Teaching, generally, reflects the society, but, in a particular way, the teaching process presents the individuals *modus operandi* that live in this society and the available resources.

Teaching in any room whatever the content, Mathematics, Languages or even Sciences, it is not a process that should always follow the same guidelines or be a part of structural or contents changes, given the important changes observed in recent years in this regard. The emergence of computers and other more recent technological tools, as smartphones and tablets, pave the way for a world so vast and diverse, presenting fruitful possibilities of acquiring information and other situations that belong to a dimension more futile, regarding the veracity of the subject observed. One of the major implications of the rapid development of these instruments was the enlargement of the normal context of what is a classroom. Defining classroom could be more difficult than before, because this is not the only place educator must have as exclusive to teaching-learning process: nowadays, it should be given the chance to the students to have access also at home, or anywhere, to direct support by the educator and even by their own colleagues.

Aware of this trend, educators were adapting. Initially, somewhat slow, just using the computer for smaller jobs; more recently, the exploration of internet connections and, as a consequence, the use of resources obtained through this means. As such, in this vast ocean of knowledge accumulated, it becomes essential to understand the possible choices for a better understanding, so that subsequently we can better understand what to do and how to do it.

Introducing the specific area of mathematics, there are many available software, author or freeware, however, the vast majority have closed structures. Other possibilities such as dynamic geometry software, intend primarily for

the specific area of geometry, either in 2 or 3 dimensions, presenting itself, therefore, as a tool with a single objective, i.e., reductive. Nowadays, saying that it is possible to teach differently in a math class is complicated and does not truly define “differently”, because there are few changes from a normal process of teaching. Besides these factors, there is another, probably the most important: the interaction of the student with this kind of technology and software. Students are not always motivated to work with these tools, making this a key aspect for the presentation of new technologies in the context of the teaching-learning process. The motivation, essential, whether in a traditional classroom exposure of content, either in a class that makes use of the technological elements, it is imperative factor for success.

In recent years, there has been an enormous increasing in the use of social networks by learners of all ages and not only. Numerous sites on the Internet were presented, and some succumbed to the same speed that appeared while others resist and continue to reinvent themselves to the rhythm of society and its demands.

Given these innovations, the need arises: teachers have to question themselves as educators of future active citizens about what kind of changes can, and should, be done in the teaching-learning process, inside and outside the classroom (physical), so that it can quickly integrate the web technology in which society is intertwined:

- What will be the primary concern of the use of social networks in the teaching process?
- It makes sense to use this in the context of formal classroom and beyond?
- When can social networks be used in the process of teaching?
- How can it be used?
- What are the advantages and disadvantages that can be identified before and after using it?

Regardless of the resources or tools used in the teaching-learning process, since the sheet of paper up to the latest technologies, the teacher should focus primarily on the student. That is a teacher main function: to be the link between student and knowledge, keeping the students interested and awakening them to the importance of knowledge.

If we consider the process of teaching as a scheme, we can say that the teacher should seek the point equidistant between himself, students and knowledge. (cf. Figure 1).

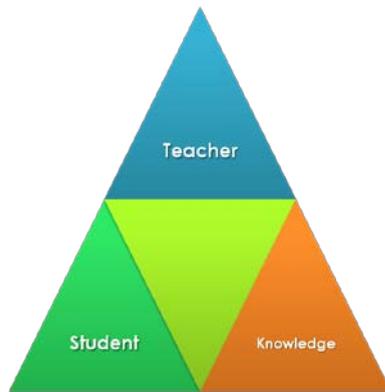

Figure 1 – Teaching Process

Of course this demand is not static and is always dependent on the society's ebb and flow in the search of progress. Educators should therefore incorporate in this scheme new tools and processes that society offers.

But sometimes changes to the normal processes of teaching and learning, which are already rooted and embedded within the educational community, are difficult to realize and fully fit. Tools such as social networks can bring something new in the process of teaching and learning, not only in terms of knowledge transfer, but as a motivational tool for the student.
