The motivation for teaching and learning these days is a daunting task for the teacher. He is required to fight a battle with panoply of distractions constantly entering the environment of the classroom. This way, the observation of the group or student in particular presents itself as a fundamental initial step in the activity of the educator. The interests of the group of learners can be combined with the motivation process and therefore important to the process of teaching and learning. Having as a starting point a particular interest, as the taste for a particular content or use a known and appealing way, that is part of its range of entertainment activities daily, such as social networks, to address or consolidate new concepts, will make the student feel more integrated and predisposed to participate in the activities that are proposed.

In this way, and relying on recent studies in Portugal (WIP, 2010) and that can easily serve as a guide for other countries, we find that a large number of students use and interact with social networks.

According to the study, 63% of the Portuguese population between 15 and 34 use the internet. Thus, in any of social networking sites analysed users with quantitatively higher expression are the youngest and, conversely, the number of users is more restricted in the older age group. It is possible to say that in sites like MySpace (51% of

users in this age group) and Twitter (50%), half of the users are under the age of 25 years. The Hi5 and Facebook have less than half of users under the age of 25 years, but still a strong representation of this age group (45.8% and 42.3%, respectively). Orkut is the social network with greater presence, in relative terms, of subjects aged 25 or more. In this network, there is closeness between the numerical ranking of 15 to 24 years (37.5%) and the next phase - 25 to 34 (31.3%), as it is possible to see in the table below (cf. Table 1).

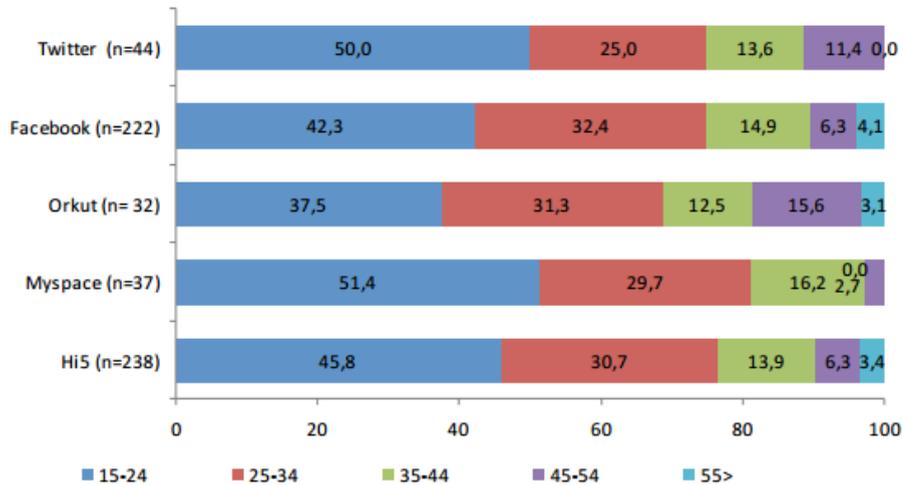

Table 1 – Social Networks in which people have created profile (WIP, 2010)

Analysing these data, given the increasingly high use of social networks by students, it seemed pertinent to authors to present a model that could be consistent with this reality: the use of social network integrated in the model of teaching and curricular structure of a subject.

Thus emerged what the authors called Hybrid Model Guide (HMG), in an attempt to present another possible bridge between the student and the knowledge.

3. Defining HMG

The main idea was to motivate students through virtual networks available on the internet where they are already fully integrated, having with it a constant daily connection. In this way, the authors recommend the use of tools that are part of the normal daily tasks of students but with disparate features of what is already known and

currently used in educational. The fact that the vast majority of students has smartphones and computers with internet connection makes the student a constant element of the virtual world that surrounds and absorbs us.

The HMG is a model that seeks, as already noted, the link between the student and the knowledge in a more natural way, as demanded by the contemporary society. It consists in the access to information/knowledge through social networks, widely used tool by students of different age groups.

Before clarifying the *modus operandi* of this model, it is important to define what usually we call as a social network.

A social network is a social structure consisting of individuals or organizations, connected by one or more types of relationships, which share common values and goals. One of the key features in the definition of networks is their openness and porosity, allowing horizontal and non-hierarchical relationships among participants. For being a social connection, the fundamental connection between people occurs through identity. The boundaries of networks are not boundaries of separation but boundaries of identity. It is not a physical limit, but a limit of expectations, trust and loyalty, which is permanently maintained and renegotiated by the communications network. Online social networks can operate at different levels, for example, social networks, which are the most important for this study. (consulted in http://pt.wikipedia.org/wiki/Rede_social, October, 15th, 16h58m).

This way, the authors defend the use of a social network which presents itself as a transversal way of learning (cf. Figure 2).

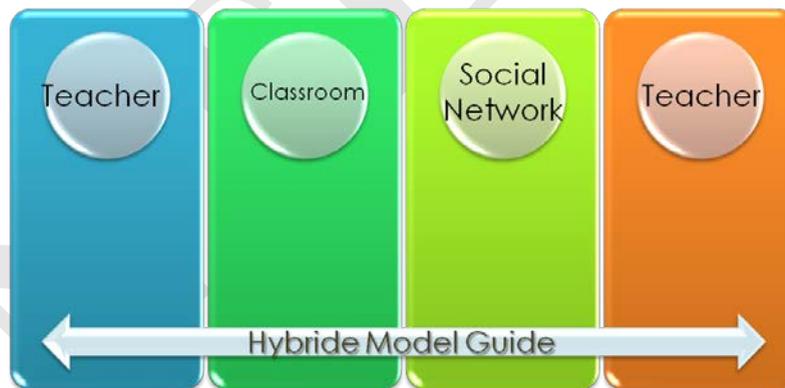

Figure 2 – Hybrid Model Guide

This figure clarifies HMG and its essential elements: the teacher, the classroom, the social network and the student. None of this elements can be put aside of this methodology, or else it would not make sense.

The teacher continues as a fundamental and indispensable element in the process. It stills belong to him mediating role. The classes, represented here by "classroom", ensure to the process its socializing dimension and explain the feature "hybrid" of this model, i.e., it is not presented as a reductive entity, focusing only on lessons in the classroom but extending them through new processes and means, in this case, the social networks. The social networks, interest focus of the students show up as an asset on the teacher-student relationship, being one more common point between the two, in which the student feels particularly comfortable.

The normal discipline curriculum is defined through subjects and areas divided separately. Each one of them will provide the student specific objectives and competences. So our idea was to use a social network (Facebook) during a semester in a discipline, defining goals along the subjects. Every week the teacher gives some practical exercises and other type of information in a close group created for the effect. This kind of work was not considered by the students as homework in the normal way. So most of them usually give answers and comment to the questions that were putted in the area without afraid of being wrong or somehow giving an answer that were not so correct. One interesting part of this, since the group it's all the time open for answers and questions at any hour during the day and night, was that when the teacher goes to check regularly what is going on, some students already give their own idea about the answer of their colleagues. Sometimes trying to correct, or explaining why they think it's wrong, stating their opinion. Other times giving examples that deny the colleagues affirmations. In mathematics, for example, this kind of thinking it's very important, the counterexample. Using a social network could also create situations that teacher uses to explain some concepts. The classroom it's supple by the outside effects and vice-versa, so the regular use of a social network during the semester could prolong the classroom space. Off course the role of the teacher it's still very important, checking the answers and acting as a coordinator of all the process. As we said before, the teachers still have a great importance in the overall process. His knowledge is still the most important part of all situations that are created during the use of the social network.

The evaluation of this situations its easy configure, the teacher that follows the works done in the close group can evaluate the efforts that students do along the semester. Also the written evaluation shows to the teacher, that the sharing in the social network could give deepness to some concepts. The evolution of conversations and discussing about videos, files or just affirmations are also proof of students' involvement in their own knowledge.

4. Characterization of study case

The authors applied this model to the curricular guidelines of a subject of higher education course in Portugal. This case study aimed at examining the relationships that are created during this interaction, later to be able to lay the roots for something deeper and that could be perceived as an international network of knowledge with the backdrop of the use of social networks.

The studied group was composed by 34 students. 85.3% of them were female, percentage corresponding to 29 individuals, and 14.7%, 5 elements, were male. All of them had computer and 94.1% (32), had internet connection.

From the 34 students, 50%, 17 individuals, considered to be knowledgeable regarding the use of computers. As relates to the use of social network study, 15 elements, 4.1%, it is able to develop a good use of this tool. Yet, 2 elements don't believe in their social network abilities, classifying their ability with "bad". Still, 7 people believe they have a good performance and 1 element claims to be excellent.

This small group of students were using for an entirely semester a social network, Facebook, apart from the normal classes. The teacher were giving information and coordinating the answers from the group users, validating thoughts and interacting with them. We should say that not all the students were regular users, considering regular as a person who interacts every day minimum, but from the study, and ending of semester with the curricular evaluation, we feel that part of the results are due to the used of the social network.

The situation that we lived brought us visions of what could be another interesting teach and learning process, with the use of a social network.

5. HMG: Advantages and Disadvantages

One of the advantages that authors found in the use of HMG model, instead of the current models that are based on static and, especially, by placing documents in virtual platforms created as repositories documentary, is the ease of use by students. The fact that the online connection online is so high, becomes the content sharing something natural, effective and accessible anywhere and anytime. The high percentages of students who use these social networks are perfectly familiar with the various systems of the different networks. For the few who do not have frequent user experience, these software turn out to be intuitive to use, being not necessary profound explanations.

Another great advantage is, as previously mentioned, the motivational factor: the realization of a job or even clarify questions about content through any social network may arouse greater interest in the student's own task performance.

Speaking about students with special academic situations, this methodology can constitute a great support in their academic courses. Working students with schedules incompatible with academic time, students with chronic illnesses requiring successive fault or even if they are unable to attend classes, can have in this methodology an added advantage, since, more easily, are aware of the contents worked as well as subsequent analysis which can be done using the network established for the purpose. As such, HMG may contribute to the personal achievement of the individual, allowing him to be aware of what is being presented in the study of a subject and generally extend the analyses and discussions that take place in environment room, both in space and in time.

Regarding the disadvantages that might be pointed to this type of methodology refers to the fact that socialization can be affected. However, the authors cannot but remember that this is a hybrid model, not totally dismissing the classroom, continuing to assign to them the intrinsic importance, being truly indispensable to the development of each ones personality, as well as the integration of teach element in the group. Furthermore, the promotion of group work with this method is an essential issue and must often be stimulated, this being a practical easily performed. The Educator is an essential link in HMG process.

Another possible disadvantage it would be the so called "danger" of publication personal data on Internet and the consequences that this action might entail. Actually, this did not constitute "danger", since many of the groups created within these social groups can be closed. The working group used in this experimental study was "closed", i.e., only previously selected people are allowed to be part of these groups and, as such, only these people had access to the information available in there.

In this way, it can be inferred that the use of social networks in the process of teaching proved itself a privileged tool in school-social context, being the biggest reason for such success that this tool be intrinsically linked to the daily lives of our students, as well as their personal interests, constituting therefore as a motivational element. Therefore, teaching-learning and social networking, instead of constituting dichotomous poles, present themselves as elements of an educational continuum, in which both dimensions may, according to the intentions of actors want to achieve the same goals.

6. Conclusion

The Internet is part of students' lives and even themselves have already set up their space in this vast environment. Thus, they drive at the speed of technologic evolution to more flexible, interactive and timeless lifestyles making use of social networks for participation, sharing and reporting information. So, these are dimensions that are based on the pursuit of knowledge, of information, so the pedagogical perspective should be extended, allowing students an active participation in the teaching-learning process and a role as co-producers of

the contents, presenting itself as a participatory, social and supportive process, regarding the interests, goals and needs of individual students (McLoughlin et al., 2007).

Being the social networks an emerging technological tool with positive results in the social field, it is assumed that its efficacy is greater when social networks start to be used actively in the educational field.

Our study case show us that the line between the use of new technologies and the teaching process it's very small and could be diminish with the use of social networks.

Being connect everywhere, at every hour, at every minute, it's a normal situation for the students of the future, our students!

We should always look for the best learning process, adapted to the class that we have in the present moment. For that, we need to be always aware of the large possibilities to drive the learning through different ways.

Which will be the ultimate process, which will be the optimum way to do it? There isn't a final answer, only the will to do it as a conscientious transmitter of knowledge. Everyone should try to seek options, test it and analyse the effects. Social networks are getting an extreme importance in our daily life, all across the world, are we capable to deal with this?

Getting to the end of this article we answer to some of the beginning questions, others not. So we left with another series of interrogations, meaning that investigation it's not always finish.

Investigating lead us to more investigation, the path is not always done, especially in the field of education.

Social studies teacher candidates' views on the community service practices course

Berna Kaya *

Sakarya University, Faculty of Education Social Studies Education

Abstract

This study aimed to determine the views of social studies teacher candidates that were enrolled at the Faculty of Education at Sakarya University on the Community Service Practices (CSP) course. The study benefited from qualitative research methodology and the participants were selected using purposive sampling. The data collected through semi-structured interview forms were analyzed through descriptive analysis method. The results of the study indicated that Social Sciences teacher candidates were not well informed about the aim of the course. Half of the teacher candidates believed that the aim of the course was not completely realized. The most common issues faced during the practices were stated to be obtaining permission to visit the institutions and the institutions' attitudes towards the students. The teacher candidates learning how institutions function and what they do not know about real life are willing to transfer these experiences to their students. In order for the course to be conducted efficiently, the teacher candidates request that the necessary permission to visit institutions be obtained by their universities, that they can visit different institutions, and that a financial source be provided for this course.

Introduction

The CSP course helps students use their social problem solving skills using their academic knowledge. In our country, the foundation of this course is based on the method of environmental analysis that Cavit Binbaşı developed in the 1950s. According to this method, students analyze the environment to determine problems. Moreover, they contact the authorities to solve these problems. Thus, students become active to solve problems (Coşkun, 2009). When we consider the development of the course in the United States, it is seen that CSP activities are included at all levels of education, from kindergartens to universities. However, it is observed that there is not a precise definition of the course in this country (Avaroğulları, 2009).

The CSP course, limited to a single semester and conducted outside the classroom in practice, has been offered as a compulsory course in all programs of faculties of education since the beginning of 2006-2007 academic year. Teacher candidates must reserve at least one day a week in order to perform the activities as specified by CSP. It is aimed through this course to lead teacher candidates to adopt behaviors sensitive to social developments through helping them become entrepreneurs in other institutions and enterprises (Coşkun, 2009). Moreover, through this course, teacher candidates are expected to develop projects that will provide solutions to the current problems of the society. Within the scope of the course, teacher candidates are encouraged to take part in scientific activities such as panels, conferences, congresses, and symposiums and act as organizers in these activities. Teacher candidates gain experience with this course that will help them socialize with the society (Sönmez, 2009). The CSP course is included in the school curricula in order to reinforce students' participation in democratic and social activities. Students learn through active participation in this course (Ohn & Wade, 2009). Efforts should be made to develop students' civil responsibility and morality of social responsibility in the countries ruled by democracy. The CSP course including social sensitivity contributes to individuals' engagement in activities as informed citizens. The activities of this course are built on strengthening individuals' bonds with the society (Coşkun, 2009). The activities done throughout the course aim to develop teacher candidates' awareness of social responsibility by supporting the skills of social responsibility and awareness, cooperation, solidarity, effective communication, and self-evaluation (Sönmez, 2009). CSP practices should be group-oriented, and students must provide concrete and visible products. This course should be built on social issues perceived by students to be important in real-life and students should be encouraged to gain experience in these issue. When mutual learning and communication between the school and the community are allowed, CSP provides a mutual positive development of relations (Keith, 1997). This indicates that the activities done in this course are intended to lead students to form a coherent and comprehensive change.

This study determined Social Studies teacher candidates' views on the CSP course. In this study conducted through using qualitative research methodology, the participants were selected using purposive sampling and the data collected through semi-structured interview forms were analyzed through descriptive analysis method.

METHODOLOGY

Research Design

Qualitative research method was applied in the study to determine Social Studies teacher candidates' views on the CSP course thoroughly. In qualitative research, through the qualitative data collection methods such as observation, interviews, and document analysis, perceptions and events are handled in a natural environment as a holistic and realistic way (Yıldırım & Şimşek, 2005).

Participants

The participants of the study included Social Studies teacher candidates enrolled at Sakarya University. Purposive sampling was used to determine the participants. In this vein, the participants were selected from the

Social Studies teacher candidates that took the CSP course. The participants included equal numbers of female and male Social Studies teacher candidates. In accordance with the research ethics, the participants' real identities were kept strictly secret and the participants were given a nickname, ranging from Participant 1 to Participant 10.

Table 1: The demographic information of the participants

Pseudonym	Gender	Year	Training
Participant1	Man	21	Social Studies Teacher
Participant 2	Man	21	Social Studies Teacher
Participant 3	Man	23	Social Studies Teacher
Participant 4	Man	20	Social Studies Teacher
Participant 5	Man	21	Social Studies Teacher
Participant 6	Girl	20	Social Studies Teacher
Participant7	Girl	22	Social Studies Teacher
Participant8	Girl	25	Social Studies Teacher
Participant 9	Girl	22	Social Studies Teacher
Participant 10	Girl	20	Social Studies Teacher

Data collection and Analysis

The data were collected through the semi-structured interviews conducted in May in 2013. Through these interviews, it was aimed to obtain in-depth information from the teacher candidates. Expert views were obtained during the preparation of interview forms. The questions that were prepared in line with the aim of the study and used in the semi-structured interviews are as follows:

- 1- What are the Social Studies teacher candidates' perceptions about the aim of the CSP course?
- 2- What are the Social Studies teacher candidates' views on the problems faced in the CSP course?
- 3- What are the suggestions as put forward by the Social Studies teacher candidates in order to better conduct the course?
- 4- What are the Social Studies teacher candidates' views on the contribution of the CSP course to their profession?
- 5- What are the Social Studies teacher candidates' views on the contribution of the CSP course to their personal developments?

FINDINGS

The Social Studies Teacher Candidates' Views on the Aim of the CSP Course

The majority of the participants provided limited statements regarding the aim of the CSP course. They stated that the aim of the course was to know about institutions, to enable them to serve the community, and to write

reports on the institutions that were visited. The perceptions as provided by some of the participants are as follows.

Participant 1 provided the statement that "*Seeing how people are and act accordingly when they are in a difficult situation*". Participant 2, Participant 3, and Participant 9 provided similar statements and stated that the aim of the course was to obtain information on how some institutions functioned. Participant 8, pointing out that the aim of the course was to raise social awareness through knowing about institutions, said that "*To increase our sensitivity to the society. We have seen many things*". This participant provided a more comprehensive view regarding the aim of the study compared to other participants. Similarly, Participant 5, with the statement "*To observe the service provided by the institutions on behalf of the society. To present what we have seen as a report to our lecturer*", reported that the aim of the course was to observe the institutions and to write reports based on these observations. The teacher candidate, Participant 1, saying that "*To help other people and to enable us to gain experience*", explained that the aim of the course was to help people and talked about a practical activity. Participant 4, thinking in a similar way with participant 1, pointed out that the aim of the course was to serve the community. Similarly, Participant 7 also claimed that individuals would be useful for the community through this course, saying that "*To be useful for the community, in other words, lead people that are not productive by themselves like us (...) to this direction*". Participant 6 said that they participated in various activities without being informed about the aim of the course. Regarding the issue, Participant 6 expressed that "*The aim of the course, as far as I understand, is to do something for the people around us*", which indicates that there is some uncertainty. Participant 10, on the other hand, added some meaning to the course beyond the institutions, saying "*To help people see what they do not want to see*", which is quite different from what other teacher candidates say.

Half of the participants are of the opinion that the aim of the course is realized. However, Participant 2, Participant 3, Participant 7, Participant 8, and Participant 9 think that the aim of the course is partially realized. Regarding this, Participant 2, through the statement, "*We only took photos. Some just take some photos in front of the door and then come back.*" indicated that the aim of the course just became a formal procedure, rather than knowing about the institutions or serving the community. Participant 3, pointed out this situation with the following statement, "*When we visited the institutions, there was not any communication in person. We could not get answers to our questions, for instance.*" Participant 7 expressed that some of the lecturers were just interested in whether the students visited the institutions while grading and said that "I think it is wrong to grade just have us look a few photos. In this regard, the aim seems not to be realized". Participant 8 expressed how some institutions were indifferent to them saying that "*When we went to the nursing home, we did not meet any employee. Furthermore, we were ignored.*" Participant 9 stated that it was necessary to have follow-up courses to realize the aim of the course, saying that "*If we had been offered more similar courses, the aim of the course could have been realized.*"

The Social Studies teacher candidates' views on the problems faced in the CSP course?

The Social Studies teacher candidates were asked about the problems that they faced in the CSP course. In line with the responses obtained, the most common problems faced by the teacher candidates in this course, as indicated in Table 1, are found to be due to the deficiencies in the procedure and the institutions' attitudes towards the students.

Table 2: The Problems that the Social Studies Teacher Candidates Faced in the CSP Course

The problems faced	Participants
Not being allowed to take photos	Participant 2, Participant 3,
Financial problems	Participant 2, Participant 7,
The problems related to the institutions' attitudes towards the students	Participant 3, Participant 4, Participant 5, Participant 9
The difficulties caused by the procedure (getting necessary permission)	Participant 6, Participant 1, Participant 8, Participant 10
The problems caused by group harmony	Participant 10
Shortage of time	Participant 7

Some of the teacher candidates expressed the problems that they faced in the CSP course as follows. Participant 2 explained that the problem faced in the CSP course was due to both the institutions and the financial means, saying that *"We were expected to take photos as a requirement of the course." However, we were not allowed to do this. The child protection agency was too far away. We spent a great amount of money. Students need to be supported finally.*" Similarly, Participant 7 complained about the financial difficulties, expressing that *"There were difficult times in terms of financial means. We had problems as we did not have time.*" Participant 5 pointed out the problem of the institutions' attitudes towards the students, saying that *"In child protection agency, particularly, in the rehabilitation center, the parents did not want us to observe their children."*

The Suggestions as Put Forward by the Social Studies Teacher Candidates in Order to Better Conduct the Course

The Social Studies teacher candidates were asked what they could suggest to improve the CSP course. As can be seen in Table 3, the teacher candidates suggested that there should be visits to various institutions to improve the CSP course. The visits to different institutions such as kindergartens and governor's building are stated to be included in the list of activities. Moreover, the teacher candidates request that the necessary permission to visit the institutions be taken by the university in advance not to face any problems.

Table 3: The Suggestions as Put Forward by the Social Studies Teacher Candidates in Order to Better Conduct the Course

Suggestions	Participants
Lecturers and Teacher candidates should visit the institutions together	Participant 1
Financial support should be provided for the course	Participant 2, Participant 7, Participant 3
Institutions should be informed about the CSP course	Participant 3
There should be visits to various institutions	Participant 4, Participant 5, Participant 10
The university should obtain the necessary permission	Participant 6, Participant 4, Participant 8
Activities that will provide solutions should be organized	Participant 9

Some of the suggestions put forward by the Social Studies teacher candidates to improve the CSP course are provided as follows: Participant 7 suggested that the activities should not be based on financial means saying that *"It would be good to have some financial means. However, if not, the activities should not be based much on financial means."* Similarly, Participant 3 pointed out the financial problem, expressing that *"We visited the institutions through our own efforts. We had some problems."* Participant 9, on the other hand, suggested that activities should be *"planned so that they provide solutions to the problems and efforts are necessary to do so."*

The Contribution of the Social Studies Teacher Candidates' Experience through the CSP Course to Their Professional Lives

The Social Studies teacher candidates were asked how they would benefit from the experience that they gained through the CSP course. As indicated in Table 4, a great majority of the teacher candidates, particularly female teacher candidates, want to visit the institutions together with their students so that they also benefit from the experience that they have gained through this course. Some of the teacher candidates, thinking that their students would be those that stay in the Child Protection Agency or the Rehabilitation Center, stated that they would be more sensitive to their students.

Table 4: The Social Studies Teacher Candidates' Views on the Use of Experience that They Gained Through the CSP Course in Their Professional Live

Using the Experience Gained through the Course in Professional Life	Participants
Not Being Biased Towards the Students	Participant 1, Participant 6, Participant 9
Transferring how institutions function to students	Participant 2, Participant 5,
Visiting institutions together with students	Participant 3, Participant 4, Participant 7, Participant 8, Participant 10

Of the teacher candidates, Participant 1 argued that this course would lead teachers not to be biased towards their students, saying that *"I will not judge my students immediately, for instance. Perhaps, they do not have any parents."* Participant 5, on the other hand, stated that s/he would lead his/her students through the knowledge acquired in this course, saying that *"I can at least lead my students when they need advice. We did not have time."* Participant 8 noted that s/he would like to do the activities of this course with his/her own students, expressing that *"I can do similar activities with my students. A visit to a nursing home, visiting the elderly on special occasions, during feasts, for instance."*

The Contribution of the Experience Gained by the Social Studies teacher candidates through the CSP Course to Their Personal Lives

The Social Studies teacher candidates were asked how the experience that they gained through the CSP course was reflected in their personal lives. The teacher candidates that visited institutions such as child protection agencies and nursing homes for the first time in their lives stated that they would like to visit these institutions regularly expressing that they were affected by what was experienced in these institutions. As can be seen in Table 5, some of the teacher candidates believed that the course proved to be useful to them as they had the opportunity to visit the institutions whose names they had already known but about whose internal structures they did not have any ideas.

Table 5: The Social Studies Teacher Candidates' Views on the Contribution of the CSP Course to Their Personal Lives

Using the Experience Gained through the Course in Personal Life	Participants
Have respect for the elderly	Participant 1, Participant 3,
Being beneficial to the community	Participant 1, Participant 6,
Knowing about organizations previously unknown	Participant 2, Participant 4, Participant 5, Participant 8
Visiting institutions regularly such as Nursing Homes and Child Protection Agencies	Participant 3, Participant 6, Participant 7, Participant 8, Participant 10
Not being biased towards people	Participant 4
Learning the facts of life	Participant 9
Ensuring socialization	Participant 1, Participant 10,

Some of the teacher candidates' views are as follows: Participant 3 expressed that *"I think they need love. I think that I will visit them at regular intervals."* Participant 6 also stated that s/he would like to visit the people in these institutions in the rest of his/her life, saying that *"When I went there, Child Protection Agency, I was deeply affected. It was the same while I was in the nursing home. I will absolutely visit these places later. I think so."* Expressing a different view, Participant 10 stated that the course provided him/her with the opportunity to socialize with other people, saying that *"I have absolutely socialized with other people. I have been here for two years and have not engaged in any social activity"*. Similarly, Participant 1 pointed out the contribution of the course to his/her socialization, saying that *"I am not that much social. We had the opportunity to socialize with the community."*

Findings and Results

The great majority of the teacher candidates stated that the aim of the CSP course was to know about the institutions and obtain information on how these institutions functioned. However, in the study conducted by Keleş and Aydın (2011) in order to determine Science Education teacher candidates' views on the CSP course, the teacher candidates stated that the aim of the course was to identify problems, to find solutions to these problems, and to be responsible citizens. In the current study, the Social Studies teacher candidates' participation in the CSP course was limited to visiting the institutions that serve the community. The teacher candidates obtained information about the institutions that they visited. However, it was observed that the individuals did not participate in the voluntary activities in the institutions such as Child Protection Agency and Nursing Home. This indicates that the activities are conducted fast and superficially. In order to conduct this course effectively, teacher candidates are required to make necessary efforts to find solutions to social problems. It is seen that the most common problems that teacher candidates faced during the practices are the problems caused by the institutions' attitudes towards the students and the financial means. It is seen that the similar results were obtained in the study conducted by Uğurlu and Kral (2011). The teacher candidates state that the CSP course is

beneficial to them in terms of professional and personal life. Similarly, in the study conducted by Erkan, Uludağ, and Burçak (2012), the most commonly agreed item as expressed by the teacher candidates related to the CSP course was determined to be the view that this course would contribute to their professional lives. The teacher candidates stated that they would not be biased towards their students in their professional life through this course which they were enrolled at saying that the experiences they gained would be useful to them. Acquiring information about how institutions function and having the opportunity to closely observe the facts of live, the teacher candidates would like to make these visits a routine part of their lives. This indicates that that the course has been useful to the teacher candidates.

Abstract

Living conditions has changed as a result of historical, socio-economic, political, and technological developments. To control this conditions, to protect and to empower the isolated people are aims of social work which identifies itself with the principles of human rights and social justice. Social work is an applied science was a volunteer and charitable activity later showed a development path as being a profession and a science discipline in the last century. It's educational organization has an important role in the path which is from voluntary social work activities to professionalism and being a science discipline. Social work education has important developments in Turkey since 1961, the year of initial education. One of these developments is distance education applications. In this study, distance education applications in the field of social work in Turkey will be discussed.

Keywords: education, social work education, distance education

1. INTRODUCTION

The internal dynamics (the establishment of the Ministry of Family and Social Policies) as well as the effect of external dynamics (the EU membership process) have emerged in the absence of adequate social worker in Turkey, and especially since 2009 have experienced a boom in the number of social work departments in universities. However, distance education has become a model used in social work with the request of many reasons such as the raising many social workers and the lack of trained social work academics. These developments strongly criticized by schools and leading academics in the area, based on the application of the social work profession has been suggested that the argument taught in distance. Despite this, with the reason of absence of adequate social worker, social work department within the Atatürk University Faculty of Open Education has been established at the undergraduate level in 2011. This program's coordinators have not any social work degree and they see social work as a volunteer, religious and charitable activity. In this study, recently started to be implemented in Turkey, distance social work education programs will be discussed.

Distance Education in Social Work

Technological improvements in all areas of human life (education, health, social services, etc.) in line with the changing needs of the diversified services offered. Technological advances in society, changes in economic indicators and in line with population growth, the provision of educational services has become a necessity

* Corresponding author.

Email address:

searching for a more efficient and effective ways. Because of these reasons, educational services that offered have taken a variety of applications. One of these applications is distance education. Thach and Murphy (1995), also claim that distance learning is spreading because of ‘advances in the technology, emphasis on cost-savings, and changing demographics.’ Peters (1998) suggests that persons participated distance education programs for several reasons:

1. They were denied the opportunity to attend regular schools to acquire the desired qualification,
2. They were poor and socially disadvantaged,
3. They were in ill health (due to the effects of industrialized labour),
4. They were incarcerated,
5. They lived in sparsely settled areas, too far from the university or other educational institution.

These changes in the field of education are reflected to the social work and the case of distance education has been one of the ways used in the teaching of social work. According to the Council on Social Work Education (CSWE), the accrediting body for social work programs, “social work education options have been expanded to offer a multiplicity of educational program designs, some of which qualify as alternative programs” (1994:111). In this context distance education has become applied and an accredited type of education in social work.

In Turkey, from 1961 until 2002, the only institution of formal education in social work was in Hacettepe University and then the second institution began social work education in Başkent University, 2002. In 2006, there was a large increase in the number of social work departments in different universities. This increase continues today. Today, there are 25 active, 35 passive and a total of close to 60 social work departments in Turkey. Only the Social Work Department in Atatürk University Faculty of Open Education has distance education at undergraduate level (4 years). The admission of students in the 2011-2012 academic years has started with 2.000 students.

Formal education, which is embedded in a four-year undergraduate social work education is maintained with both theory and practice aspects from a generalist social work perspective. The first two years of undergraduate education; such as sociology, psychology, philosophy, economics and law, basic social science courses are given and the last two years are directly related to social work theory and practice courses. Classroom environment is usually implemented in the framework of theory lessons on various activities (role play, group work, etc.) is performed. Although it varies from department to department, the practices are usually carried out in the form of block practises in the last year.

In this context, if we look at the ongoing social work degree program through distance education, basic social science courses is given to the first year like formal education. The second and third years of education, education paradigm is different. While formal social work schools have generalist approach this school has

method focused approach. Course materials are offered to students in a written format (Atatürk University, 2013). Students which in this system cannot carry out many practices which are carrying out in class environment in formal schools.

Discussion and Conclusion

Two pieces of social work education which are theory and practice are inseparable. On the other hand social work which has an eclectic knowledge base benefits from many branches of science. This base, enable holistic view to the social problems but on the other hand creates a compelling effect in education process.

In this context, bachelor degree first of all begins related social sciences lessons and then this education continues with the lessons about Fundamentals and problem areas of social work. Also studies related to practice are made in the theoretical side of education and integrity between theory and practice are tried to make by practice field under supervision process in the 7th and 8th semesters.

In order to good practice in the last year students should learn knowledge, skills and values of the science of social work. Student participation in practices that given in undergraduate education courses it is preparing students to practices area, also block applications that made in the next process, providing opportunity to students to use knowledge and skills they was learned in the process. Further, providing to the emergence of the connection between theory and practice in this process, this process allows to students learning roles and responsibilities of social workers.

The practice aspect of social work education at least as important as the theoretical aspect. Academic supervisors' (at the school) and advisors' (in the social work settings) knowledge and skill levels effect quality of the practice in the practice process as students' knowledge and skill levels.

Social work training process is much more complex than many other social sciences. Social work's eclectic based complex structure also exists in the social work practise settings. Social workers use lots of approaches belongs to different disciplines in their interventions and work together with many professional staff. Therefore the quality of professional practice, first of all directly related to the quality of education received.

Social workers expected to find solutions for complex problems of individuals should have multi-dimensional tasks. In 2011, within the framework of the Bologna process compliance capabilities that are based on the study commissioned by the YÖK (Council of Higher Education) indicated that social workers should use these tasks such to be able to import thoughts and solution suggestions about problems both written and orally, to listen thoughts, requests and expectations of agencies and organisations, to share thoughts with everyone who are related in the process of problem solving, to communicate in an effective way in an intercultural level (YÖK, 2011:5).

On the other hand by Australian Association of Social Workers (AASW) the purposes of social work are separated into six categories:

1. Upholding people's interests and rights
2. Working with individuals, groups and communities in the pursuit and achievement of equitable access to social, economic and political resources
3. Providing assistance to improve the well-being of clients. Clients are individuals, families, groups, communities, organizations and societies, especially those who are neglected, vulnerable, disadvantaged or have exceptional needs
4. Raising awareness of structural inequities
5. Promoting policies and practices that achieve a fair allocation of social resources
6. Acting to bring about social change to reduce social barriers, inequality and injustice. (AASW, 2010:5). When we look at these objectives, we see the objectives for the benefit of people which are formed as basically working with other people and the human units.

Social workers are expected to have some basic skills to understand the structure in which the client, and to produce appropriate solutions to the problems.

While working with clients, the appropriate behaviours of social worker can increase the functionality of intervention, can help to maximize the contribution of the client to the process and the client who feels that he/she is understood can be easier to get out of the negative situation.

During the theoretical social work training the student to acquire the appropriate skills should be in social interaction and the training staff - student relationship should be established. Otherwise, the only theoretical knowledge of social work causes serious problems during the practice phase. On the other hand in the distance education process, student practices after theoretical courses that do not seem to be able to solve these problems.

From another perspective, the 2000 students admitted to the school each year to carry out a healthy student practice, functional analysis of institutions and organizations should be done in each province, as well as the staff and structural conditions, as well as the potential client groups' situation must be taken into account. Otherwise, the student practices after the theoretical undergraduate education are already not enough will not be very meaningful.

Parallel to the increasing number of social workers in Turkey should increase employment opportunities. Otherwise the sad results may occur. Looking at the last period, the number of social worker assigned to government institutions are decreasing and the scores increase. With the addition of 2000 more people in this

process will become very difficult to find work. If not taken precautions as soon as possible, unemployed university graduates will participate in one of the new ones.

After this distance social work education program number of social workers will increase but quantity of social workers issue is main concern and the quality issue is most noticeable. Social workers have a key role in clients' lives. For this reason these problems can effect client groups directly and the quality of the services offered can be reduced dramatically. On the other hand, in practice many ethical problems are likely to occur.

To get rid of these problems this program should stopped or by using the highest level of technological capabilities based on the interaction (online interactive) educational model should be adopted for some courses. Some of the courses must be taken on campus. Because social work is an applied science and cannot teach only via electronic books and tests.

In addition, in the evaluation process of social work education is often based on the creative student presentations, case studies and questions of interpretation. In evaluation total performance is measured. The test method used in distance education is not appropriate to the content of education in social work. In this process, evaluation and presentation format of lessons is not enough to be a social worker. To make qualified of this process, studies should be started as soon as possible and effort should be made to maintain the social work education completely via formal education.

Finally, distance education in social work is suitable for the philosophy of social work. Because of the principle of starting from where the client, the fact that education is a right for everyone, and is directly linked to the provision of access to education for disadvantaged individuals (Abels, 2005). However, social work education requires; a rich communication behind student- student and student- faculty member, theoretical education with practical applications in classroom environment, students receive a healthy supervision, development of social interaction skills are thought-provoking topics for distance social work education.

Social work profession to be learned exactly with the process of distance education in Turkey in social service agencies, depending on the quality of the professional activities will be reduced. With the quality of education, quality of service in the field of social services is directly related to each other. Increasing number of social workers will not increase the professional quality. Arrangements should be made very serious about social work bachelor's degree in particular.

Special educational needs and evaluation

Giovanni Arduini^a *, Diletta Chiusaroli

^a *Univerisità di Cassino e del Lazio Meridionale - Cassino - FR - Italy*

Abstract

The Italian school is dealing with the matter of the evaluation of Special Educational Needs (SED). Since there are no legislative references that indicate which procedures to follow, it is left to the teachers' discretion. Recent ministerial documents, though, suggest to refer to the existing normative on Specific Learning Disturbances, in particular to prepare the PDP, and to use the necessary tools to reach the estimated requisites for the SED.

One of the main problems is still that of evaluation. Despite all the debates, even when evaluation is not used in a selective function it is not correctly used in an educational perspective, as a mean to teach, to improve the learning processes more than to penalize the results.

In the following work, we aim at indicating some evaluating tools and approaches useful in the delicate assessment activity of teachers, mostly intended in its educational value.

Keywords: evaluation, special educational needs, disabilities, ;

1. Introduction

The term "Special Educational Needs" came into widespread use in Italy after the enactment of the Ministerial Directive of 27 December 2012 "Instruments of intervention for pupils with Special Educational Needs and territorial organization for educational inclusion." The Directive itself gives a synthetic outline of the meaning, since the area of educational disadvantage is much broader than the one expressly referred to the presence of a deficit. In each class there are students who submit a request for special attention for a variety of reasons: social and cultural disadvantage, specific learning disabilities and / or developmental disorders, specific difficulties arising from the lack of knowledge of the Italian language and culture because they belong to different cultures.

The use of the Acronym SED therefore indicates a large groups of pupils for whom the principle of personalization of teaching, in accordance with Law 53/2003, must be applied with particular emphasis in terms of features, intensiveness and duration of changes. The ministerial directive is an important document because it gives a clear outline of the inclusive strategy of the Italian school. According to this document, in fact, the area of the educational disadvantage is much wider than that the one explicitly referred to the presence of a deficit.

The ministerial directive is a response to what is becoming increasingly clear: that is the steadily increasing number of pupils who submit a request for special attention. This paper concludes and completes the speech that was started in 1992 with the Framework Law 104 and continued with the L. 53/2003, L. 170/2010 and subsequent amendments for children with learning difficulties. In dealing with the speech on the discomfort and difficulty,

* Corresponding author. Tel.: +39 0776 2993421

E-mail address: g.arduini@unicas.it

the Directive moves the focus from the certification procedures to analyze the needs of each student and permanently extends the right to all those in need - and therefore the duty of all teachers – of customization of their educational project. The area of specific learning disabilities is extended to different problems such as: the deficit of language, non-verbal skills, motor coordination, attention and hyperactivity, intellectual functioning to the limit and the socio-economic disadvantage, linguistic, culture.

The attention that, in recent years, is placed to the SEN has the purpose of trying to remove all those obstacles present in learning pathways: this is made possible through the important activities of observation and careful reading of the signs of discomfort, dialogue with the family and the offer of adequate and personalized responses, all in order to promote the full inclusion of all students and their educational success.

The ministerial directive states that pupils are identified with special educational needs after the examination of the clinical documentation submitted by the families and on the basis of psycho-pedagogical and didactic considerations. Individual class councils can make decisions to enable them to use compensatory and dispensatory measures under the provisions already in place for pupils with specific learning disorders.

A very delicate and complex case is when teachers take the decision to communicate to parents that their child has a learning disability, suggesting a systematic evaluation of academic skills. Delicacy and complexity arise from the risk of hinting to the parents that their child is in a psychopathological condition. In some cases it is already known, but in most cases it is totally unexpected.

These considerations also arise from the fact that the term "developmental disorders" refers to the SEN and deficit of language, non-verbal skills, motor coordination, attention and hyperactivity (ADHD). Pupils with reduced intellectual potential, indicated generally by the expressions of cognitive / intellectual borderline or with "mixed specific developmental disorder", require special consideration.

Even if these particular issues are not covered by Law 104, the n.170/2010 on SEN represents a turning point in this direction as it gives a different interpretation to the concept of "educational care", suggesting the principle of personalization of courses set out in L. 53/03, with care of the pupils by regular teachers.

We should, therefore, identify those at risk of difficulties with tools and methods specific for each order of school; we need to upgrade and increase their specific requirements of learning or academic skills not related to those expected for each age and level of schooling. In this perspective it is possible to avoid focusing exclusively on the formal aspects of medical nature-based certifications and to develop customized programs. In any case, the focus is moved towards the educational level and the process of inclusion becomes relevant to the whole educational staff.

The latter directive, in fact, seen in a new light the inclusion model because it is directed not only to the students with certified disabilities, but also to those with conduct or attention disorders, those with language delays or with an IQ just above the limit.

2. Learning Environments

Pupils with Special Educational Needs live in a particular situation, which hinders their learning and development: this negative situation can be on different levels: organic, biological, or family, social, environmental, contextual, or combinations of these.

These situations, thanks to the work of other mediating factors of a personal nature and / or contextual nature, cause directly or indirectly obstacles or delays in learning processes. These difficulties can be global and pervasive as autism or more specific such as in dyslexia, sectoral as in language disorders and psychological disorders as mild or severe, temporary or permanent anxiety.

A very important aspect is the educational alliance with the family, marked by mutual agreement, with participation in the development of the IEP and PDP that are signed by the family for sharing, not just for acknowledgment.

An important role can be played by the family who is called to follow homework taking care of the child to perform the tasks, supporting the activities of study, accompanying him in the research and discovery of its modes and ways of learning, trying, along with him and the teachers, personalized and effective paths.

To implement effective learning environments in terms of teaching, but even more significant from the socio-relational point of view is important that teachers operate with unitary purpose and, simultaneously, cure attitudes and approaches that contribute to a positive construction of the student identity with SEN, through the creation of a positive environment in class, encouraging dialogue in all activities with their classmates in the class, stimulating and supporting intrinsic motivation.

It is also necessary that teachers act to build "learning environments" in which the student with SEN, feeling welcomed and heard to develop self-esteem and confidence in their abilities, to adopt positive attribution styles.

The teacher in his educational action should take into account an important prerequisite and that is what "works" for the pupil with SEN, it is equally effective for others, so in reorganizing its educational intervention he must necessarily activate and implement strategies useful for enhancing the strengths, as intuition, visual and creative thinking, and minimize those weaknesses as misspellings, memory deficits, executive sluggishness, fatigue, lack of autonomy in reading etc.

So the intervention of the teacher in order to facilitate learning could use primarily the visual and auditory canal. For the first you can take advantage of graphics such as diagrams, maps, pictures, movies and colors, in these cases a whiteboard is very useful, while for the hearing field you can resort to audio books, recordings, speech synthesis, digital textbooks. The teacher can also take some measures to increase working time for homework, exercises, tests, etc.. or reduce workload or even divide into several parts the verification procedures that should be predominantly oral.

Among the measures that could be adopted by the teacher, we suggest to begin the activity with a summary of the previous lesson, involving everyone with flash "warm up" questions or using visual and graphic brainstorming for orientate in information, creating a map of the lesson to be followed during activity. Or, also, varying actions and contents, developing the different abilities, so that everyone can find his own space, and encouraging motivation. Sometimes it might be useful to stop and make a synthesis of content; resume and repeat in different ways the most important concepts or frequently check if pupils follow or if the issue is clear. Another trick that the teacher can adopt is to prefer cooperative learning strategies such as provide recorded material to listen to the lesson or working in pairs, in which the cognitive abilities of the pupil with SEN can be expressed in interaction with their peers, that act as mediators.

Exclusive frontal lessons should then be avoided, as well as long explanations, copying from the blackboard, tests and corrections in italics or small fonts, highlighting the mistakes, separating classes and organizing them for level. Interactive lessons, reflections and sharing between the students should be privileged, as well as providing the photocopied material, not punishing mistakes but trying to locate only the cognitive processes and the underlying reasoning, and giving rewards.

3. Learning styles

Teachers should start from the knowledge of the mode of operation of the student with SEN to try to contain and overcome the difficulties, and to focus on their potential. To facilitate an individualized teaching that considers learning styles. In students with SEN, in fact, the disorder unconsciously affects learning style preferences, "forcing them to switch to other styles, that become favorites." The concept of "multiple intelligences" (Gardner, 2005): intelligence is a factor composed of different cognitive modes, which allows you to deal with and understanding of the reality. They vary from person to person, based also on cultural and environmental factors to promote effective learning. The teacher must know their learning styles and preferences,

as they affect his teaching method, and he should help students to explore the different learning and cognitive styles for a shared construction of knowledge.

Learning styles are characteristic cognitive, affective and physiological behaviors that function as relatively stable indicators of how learners perceive the learning environment, interact with it and respond to it (Keefe, 1979).

Stewart and Felicetti (1992) define learning styles as those educational conditions in which a student is more likely to learn. So learning styles do not affect the content of learning, but rather, on how he prefers to learn.

Teachers, therefore, should diversify teaching proposals, experimenting with different strategies, training the different access channels according to the way of learning of their pupils, using concept maps, engaging students to an oral exposure with visual support from the maps during interrogations, teaching the students multiple modes for each required task such as taking notes, studying a text, using bullet points, etc.. Furthermore, proposing multiple ways to gather information suggesting, for example, the use of different colors or graphics for different content categorization of the written text.

4. Learning assessment

For the evaluation of pupils with special educational needs, it can be said that there is no single criterion or tool, it is necessary, however, to adopt measures taking into account the characteristics of these students, such as, for example, evaluating more content, avoiding to consider spelling mistakes, bearing in mind that the student with SEN needs a longer time to complete homework. A teacher may assign less homework and keep in touch with the family in order to avoid stressful situations, not allowing them to carry other extracurricular activities.

Educational activities may be concentrated in class, in order to allow, for example, more time to organize thoughts and to complete the job. As already mentioned, the teacher should strive to identify strengths favoring those activities in which the student is good and supporting them.

Teachers should pay attention to the type and level of tests, for which it is appropriate to ensure that they have understood correctly.

As far as the objectives of the educational program, there are no exceptions for SEN except in cases where there are also disabilities. However, learning for the pupil with SEN is a great effort and is necessary, therefore, to ensure maximum freedom and flexibility to learning styles. The teacher in setting objectives must be sure that they are practical and realistic, and also check the adequacy of teaching materials such as reading with reference to the lexicon, the syntactic structure and the graphic impact. Very useful could be the use of a compensatory educational software, such as voice synthesis, digital books: many textbooks have a digital version, audiobooks, reading books on CD, digital dictionaries, specific software.

For the evaluation a very important document is the personalized learning plan. The school guarantees and explicit, towards pupils and students with SEN, educational interventions individualized and customized through the preparation of a personalized learning plan and also indicates compensatory and dispensatory measures, the customized forms of evaluation and assessment.

The document is drawn up by the class council or team of teachers and is agreed with the family, the privileged ally, which must actively participate in the educational project of the school.

5. Indicators for evaluation

For the definition of a correct approach to the assessment we may refer to a major report of the 'European Agency for Development in Special Needs Education in 2009, Development of a set of indicators - for inclusive education in Europe.

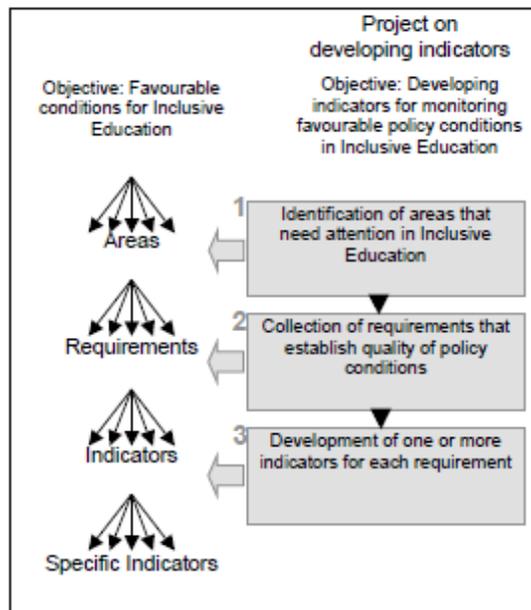

Fig. 1 - Development of indicators

The report identifies several areas within which there are the requirements and the corresponding indicators. For the assessment system of individual disabilities, the identification of the educational needs are considered important, as well as the systems of evaluation of teaching and supporting inclusion.

The assessment procedures should not be discriminatory. The original identification of the discomfort of the students should be conducted with a holistic approach and be based on the principle that teaching and learning are a common tool in the fight against discrimination. Finally, even the rules for the identification of disability should promote and encourage the educational experiences of each student.

Abstract

An individual goes on his/her development and education process started in family environment in educational institutions. The primary school age that forms the basis of achievements in the future should include arrangements based on equality of opportunity and access to education. The aim of this study is to examine in a comparative manner the school starting age of students with special requirements in Turkey and European Union countries and educational model applied, supports provided to students and classroom teachers, and the variables relating to other personnel. This study is a descriptive study aiming at determining the existing circumstances. In most of the EU countries integration, inclusion and separate training model for children with special requirements are applied together and as a whole in the primary school age. In addition, in the countries in which the integration and inclusion implementations are applied densely families are provided with family trainings, health, financial and transportation supports together with support to academic skills for school teachers, and guidance and training service for families in terms of behavioural management.

Keywords: elementary education, special education, elementary school, elementary institutions

1. INTRODUCTION

An individual goes on his/her development and education process started in family environment in educational institutions. The primary school age that forms the basis of achievements in the future should include arrangements based on equality of opportunity and access to education. Quality of training provided in this age in which an individual is getting accustomed to real life in terms of both social and emotional aspects differs for educational personnel and students. It is an obligation according to the law to support development of children with different developmental properties together with their peers; implementations relating to which may vary from country to country according to their educational policies (Sucuoğlu, 2006). All educational arrangements being carried out under certain program or not do have an influence of lives of individuals (Çelenk, Tertemiz and Kalaycı, 2000, 1). These arrangements vary depending on the development levels of countries and their economic, cultural, social and political status. Since the level at which individual requirements are met may be affected by the development level of society, quality of educational environments which take into account the individual requirements should be assessed according to the principle of equality of opportunity.

In our country, for the school year 2012-2013, each child who turns his/her 66th month (born on or before 31 March 2007) as of 30 September 2012 shall start primary school. Registrations for primary school are carried out

* Corresponding author. Tel.: +90 382 288 2263.

E-mail address: nilaykayhan@gmail.com

automatically by use of the address-based database through e-school system. Primary school session is a process in which children's physical, emotional, social and mental developments are supported in an educational environment which is suitable for the children's individual properties and development levels. Since basic habits and mental skills quickly develop and take a shape in preschool and primary school age, integration programs that provide opportunity to each individual to receive training together with his/her peers and that are based on individual differences and equality of opportunity should be promoted and supported. Children who attended integration implementations in the preschool and primary school age showing more educational attainment in the future require arrangements for individual requirements to be taken in terms of health and accomplishments of next generations (Eripek, 1999; Jenkins, Speltz and Odon, 1989; Sucuoğlu, 1996). On the other hand, support provided to children and their families is an determining and essential item which bears the characteristics of primary education. Examination of cooperation-based services provided would have an influence on determination of quality benchmarks for primary education as well as enabling taking root and improvement of models based on the principle of equality of opportunity (Marcon, 1999; Pretis, 2009). Quality of education provided in preschool and primary school age forms the basis of social skills and academic accomplishments of children; which reveals the importance of support provided to children with several incapacibilities in terms of their social, mental, emotional and language development like their peers (Epstein and Sheldon, 2006; Marcon, 1999; Miedel and Reynolds, 1999; Pretis, 2009). Children with special requirements and showing different development process in comparison with their peers who receive education and training together with other students with normal development process have a chance to learn how to assist each other by being aware of their strengths and weaknesses (Batu and Kırcaali-iftar, 2005). Since the quality of support services are affected from the level of support provided to personnel in charge and families, and other implementations in addition to individual properties of students, the aim of this study is to assess existing regulations and arrangements in effect in our country and those in European Union countries used for students with special requirements who receive educational services at primary school level.

2. Method

The purpose of this study is to compare and analyze the elementary institutions that the students with special needs attend, the education model being implemented, education starting age, personnel number of the institutions and support services provided to the family. The study is a descriptive and aims to identify and define the present conditions. The data used in this study about the variables of EU countries and Turkey is obtained from Agencies of the European Union, European Agency for Development in Special Needs Education, Eurydice- Network on Education Systems and Policies in Europe, Eurybase-Descriptions of National Systems and Policies. The findings were retrieved by analyzing the countries' National Educational System Descriptions and the results were organized and interpreted with the use of tables.

3. Results

3.1. Elementary school education system and special education in Turkey

Eight-year compulsory education system has been in force since 1997 in Turkey. Educational services that had been carried out under the responsibility of two different bodies, general directorate of preschool education and

general directorate of primary school, until 2012 was assembled under the same roof of General Directorate of Basic Education in 2012. In our country, the age at which children compulsorily start school is 5 years and 6 months and it is essential that individuals with special requirements attend both preschool and primary school education together with their peers. Arrangements and measures to be taken for students with special requirements are of the responsibility of the General Directorate of Special Education and Guidance Services of the Ministry of National Education.

3.2 Elementary institutions, educational model and education enrollment age of students with special needs in Turkey and EU countries.

The findings regarding the elementary education institutions, educational model and education enrollment age of students with special needs in Turkey and EU countries are presented in Table 1.

Table 1. Elementary education institutions, educational model and education enrollment age of students with special needs in Turkey and EU countries.

Countries	Educational Institutions	Education Models	Start Age
Austria	<i>mainstream classes, classes with support teachers, co-operation classes</i>	mainstreaming	6
Belgium	mainstream classes, separate classes.	mainstreaming/separate	6
Cyprus	fully inclusive, special classes in mainstream school, segregated special school	mainstreaming/separate	4.8
Czech Rep.	fully inclusive, special classes in mainstream school, segregated special school		6
Denmark	fully inclusive, special classes in mainstream school, segregated special school	mainstreaming/separate	6
Finland	fully inclusive, special classes in mainstream school, segregated special school	mainstreaming/separate	7
France	fully inclusive, special classes in mainstream school, segregated special school	mainstreaming separate	6
Germany	fully inclusive, segregated special school	mainstreaming/separate	6
Greece	inclusion support units, segregated special school	mainstreaming/separate	5
Hungary	fully inclusive, segregated special school	mainstreaming/separate	5
Iceland	fully inclusive, special classes in mainstream school, segregated special school	mainstreaming/separate	6

Italy	fully inclusive, regular classes	mainstreaming	6
Lithuania	fully inclusive, special classes in mainstream school, segregated special school	mainstreaming/separate	7
	<i>mainstream classes, special education class special education schools</i>	mainstreaming/separate	4
Malta	fully inclusive, special classes in mainstream school, segregated special school	mainstreaming/separate	5
Netherland	mainstream classes, <i>special education class special education schools</i>	mainstreaming/separate	5
Norway	mainstream classes, <i>special education class special education schools</i>	mainstreaming/separate	6
Poland	mainstream classes, <i>special education class special education schools</i>	mainstreaming/separate	5
Portugal	mainstream classes, <i>special education class special education schools</i>	mainstreaming/separate	6
Slovenia	mainstream classes, <i>special education class special education schools</i>	mainstreaming/separate	6
Spain	mainstream classes, <i>special education class special education schools</i>	mainstreaming/separate	6
Sweden	mainstream classes, <i>special education class special education schools</i>	mainstreaming/separate	7
Turkey	<i>mainstream classes, special education class special education schools</i>	mainstreaming/separate	5.6

As shown in Table-1, the compulsory age at which children shall start primary school in European Union members states and in Turkey is between 5 and 7. In some countries this age interval may be delayed for one year for students with special requirements such as Sweden, Portugal and Poland. On the other hand, in Southern Cyprus, Holland, Italy, Luxemburg and Greece these children start receiving education in early stages together with their peers after relevant diagnosis. Educational system adopted by Turkey and EU member states for students with special requirements for the primary school age is the collective education-based inclusion and integration model. Individual differences and type/degree of handicap are taken into consideration for those with special requirements who are attending appropriate schools according to relevant educational model under the countries' educational policies. Inclusive educational model and supporting educational services are all rendered under general educational environments in Austria and Italy while in Turkey and many of the EU countries (such as Belgium, Czech Republic, France, Ireland, Spain, Iceland, Malta, Hungary, Poland, Portugal, and Slovenia) inclusion classes are provided at special classrooms in general schools or at special schools.

3.3. The personnel in elementary school institutions where students with special needs attend

The information regarding the personnel to provide service to students with special needs in Turkey and EU member countries is presented in Table-2.

Table 2. The personnel working in elementary school education institutions in Turkey and EU countries

In Table-2 information on personnel in charge of education and training of students with special requirements who are attending to primary schools. Personnel working at primary schools of Turkey and those of European Union member states share similarity in respect of training field while there are differences between them in terms of other field, in particular for speaking therapists, family care experts, physiotherapists, social work experts. In primary schools of Turkey the main responsibility is of student advisors, psychological advisors, classroom teachers, special training teachers while in many European Union member states (such as Austria, Belgium, Cyprus, Czech Republic, Denmark, Finland, Germany, Hungary, Portugal, Poland, Malta, and Luxemburg) relevant teams are composed of experts higher in number. In many European Union member states (Czech Republic, France, Hungary, Slovenia, Finland, Lithuania, Holland, Spain, Sweden) family counsellors, health experts, special pedagogists, physiotherapists, language-speaking therapists, sign language experts, aesthetic arts experts, information-technology experts, sports and music experts meet students with special requirements and their parents on certain days of a given week. Nevertheless, for the inclusive education model adopted by Turkey and EU states share similarity in terms of cooperation with special training teachers, classroom teachers, student counsellors and psychological experts.

3.4. The information about the support provided to families with children who need special education in Turkey and EU countries is presented in Table 3.

Table 3. Individuals with special needs and support provided to their families in Turkey and EU countries.

Countries	Counselling	Education	Financial	Family Education	Health	Public Travelling,	Transport, food	Teaching Material	Subsidised housing, electricity, telephone,	fuel, Special Support (Language, art)
Austria	√	√	√	√	√	√		√	√	√
Belgium		√	√	√	√			√		√
Cyprus	√	√	√	√	√	√		√		√
Czech Rep.	√	√	√	√	√	√		√		√
Denmark	√	√	√	√		√		√		

Finland	√	√	√	√	√	√	√	
France		√	√	√	√	√		
Germany	√	√	√	√				√
Greece	√	√	√	√	√	√	√	
Hungary	√	√	√	√	√	√	√	√
Ireland	√	√	√	√			√	√
Lithuania	√	√	√	√	√	√	√	√
Luxembourg	√	√	√	√	√	√	√	√
Malta	√	√	√	√				√
Netherlands	√	√		√			√	√
Norway	√	√	√	√	√		√

Spain	√	√	√	√	√		√	√
Sweden	√	√	-	√		√	√	√
Turkey	√	√	√	√	√	√		

As shown in Table-3 it should be noted that students with special requirements and their families benefit more from counseling and training services rendered. In most of the EU member states (Cyprus, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Luxemburg and Malta) it is a priority that migrant families and minorities and their children are enabled to get use of social benefits and bilingual children at their childhood and primary school age are considered individuals with special requirements. For these children at this age who receive language support, team studies are preferred in health and training environments concerning their special requirements. Regarding the primary school age, it should be noted that both in Turkey and EU member states educational policies are based on taking measures necessary to enable these children to benefit from equal opportunities like their peers with the understanding that health, education and counseling services should form an entire system.

4. Discussion and recommendations

In most of the EU member states inclusion, integration and separate education models are applied together for children with special requirements who are at the primary school age. Compulsory age to start school in Belgium, Czech Republic, Denmark, Austria, Poland and Portugal is 6 while it is 4-4,5 in Luxemburg and Southern Cyprus and 5 in United Kingdom and Hungary. In these countries individuals with special requirements start school at the same age as their peers. On the other hand, as of the preschool age both the individual himself and his family and classroom teacher receive supporting services. In European Union member states in which compulsory age to

start school varies between 4 and 6, employment of personnel who render services at different levels of education also differs depending on the needs and requirements of the said individuals. Special education supports in several countries such as Hungary, Lithuania, Luxemburg and Holland cover also the migrant and poor children and their families who suffer from social, cultural problems and language-related deprivations. However, it should be noted that in our country the level of supporting services rendered is not sufficient due to expert personnel working at the field of special training and education who are insufficient in number. In countries where concentrated inclusion and integration are applied families are provided with family trainings, health, financial, and transportation support while classroom teachers are provided with sufficient level of academic knowledge and skills and behavioural management (Czech Republic, Iceland). For children in Turkey who are diagnosed to have special requirements and in need of special training, it is required by laws that these children receive primary school education. On the other hand, there exist several problems in schooling and educational policies.

The 8-year compulsory education system adopted in 1997 in our country was amended to be for 12 years (4+4+4) with the amendment of 2012 by the Ministry of National Education. It is stated that individuals who turned 5 in the academic year 2012-2013 shall start the compulsory education while there are still several problems relating to how students with special requirements who are under inclusion studies will be regulated and arranged and what supporting services will be provided to students and their classroom teachers. Insufficient number of personnel specialized in the field of special training should be corrected through trainings and employment and on-the-job trainings for classroom teachers should be addressed.

In conclusion, education and training activities should be based on properties of the said individuals as a whole with relevant personnel, program and other arrangements. Considering that the training process that starts within the family and that goes on in preschool and primary school ages, quality of these arrangements for students can be expressed as an indicator of social development.

Strategy and methodology of ethical education in Slovak Republic

Petra Fridrichova*

Cesta na amfiteater St 1, Banska Bystrica 974 01, Slovakia

Abstract

Ethical Education is a compulsorily optional subject in primary and secondary schools. The Ethical Education (EE) objective is the education of a personality with one's own identity, with interiorized ethical standards, with mature moral judgement and therefore with the behaviour determined by one's own beliefs; with a positive attitude to himself/herself and other people and that is why he/she is able to cooperate and to initiate cooperation. EE is thus subject oriented to: personal development (self-understanding, positive self-esteem), social development (knowing other people, their positive judging, group work ability and willingness, empathy, assertivity), moral development (understanding and acceptance of general ethical standards and principles, acting in compliance with ethical standards and one's own beliefs). In the paper we describe strategy of teaching of Ethical education. The basis of this strategy is Cognitive and Emotional sensitization, Reflexion of value, Practices in class and Transfer to workaday conditions. The second aspect of this paper is analyses of methods of ethical education. We describe and analyse two unconventional methods of Ethical education: Drama structuring and The Theatre Forum. Ethical education itself is not a recipe to solve any problems in our society, but it contributes to the education of good people who are aware of the necessity to respect social norms and are able to assume responsibility for their own behaviour in any situation at present and in the future.

Key words: Ethical Education; Strategy of Ethical education; Methodology of Ethical education; Drama structuring; Theatre Forum.

1. Introduction

Changes in society in Slovakia after 1989 created the need for changes in the school system. A typical manifestation of transformation phenomena education in Slovakia is a change of ideology (based becomes humanistic education) and resulting novel characteristics of school: thaw in relations teacher - pupil, penetration of new methods which are based on experience waiver from memorizing a transition to creative exploring the world and so on. In the context of these changes in Slovakia as an experimental subject appeared ethical education. Its foundation was training for sociability, a concept created by R. R. Olivar Autonomia Univerzity in Barcelona. R. R. Olivar, along with Slovak author of Ethical education L. Lencz (and later J. Krizova) introduced the teacher subject; teachers need to be translated to a change in fair shape. The teacher through Ethical education became "partners" to their pupils, although he was the one who determined the rules, but on the other hand, it was also an element of class to first talk about themselves, their feelings, analyse the situation, to which he got so approaching children and young people.

Today, Ethical education is taught as a compulsory optional subject in primary and in secondary education. Its content consists of 10 primary Olivar, 1992) and 6 application topics. The goal is to educate personality with its own identity, capable of independent decision-making, expressing their own opinions, but respecting the freedom

E-mail address: petra.fridrichova@umb.sk

and the needs of other people. It is a comprehensive program with specific teaching strategies and methodologies. The following sections of the text, we would like to describe the strategy of Ethical education and analyse selected methods of ethics in relation to the objectives of the subject.

2. The Strategy of Ethical Education

Methodology of Ethical education recommends for effective implementation and compliance with the attainment of the object of four basic steps that constitute the acquisition of desirable attitudes:

- A. Cognitive and emotional sensitization
- B. Value reflection
- C. Practice during lessons
- D. Transfer to everyday life

While the first two phases (sensitization and value reflection) provide input to the problem - generating interest and gradual impersonation issues, the last two are practical and personally trained socially desirable behaviour (more about the strategy in Fridrichova – Hajnalova, 2012).

Cognitive and emotional sensitization is the starting phase ethics class. Her role takes place at two levels: emotional attunement pupil on, call up the first phase of personal involvement - preoccupation and cognitive (intellectual) preparing to deal with issues. The basis of cognitive and emotional sensitization is called "Irritation" - a stimulus of very interested in learning. Suggestions in Ethical Education provide important basis of success of the course: personal commitment pupil. It is therefore necessary to ensure the introduction of a teaching unit "retraction" of the pupil to the topic, motivated him to further learning, to an awareness of others and to self-knowledge. Sensitization depends on the good success of the entire teaching units, if a student is personally committed (do not feel that the topic is inherently affects him and for him is important), working formally and not fulfilling the objectives hours. After well projected sensitization pupil experiencing different emotions: joy, sadness, anger, happiness, fright and the like and thinking of their own previous actions in similar life situations, considering the consequences of different decisions and so on. Invoking emotions ensures activation of thinking creates a good basis for reflection on the value and pursues the objective of teaching units.

The purpose of the value of reflection is to point to a desirable value. Value reflection through clearly defined question leads students to reflect on the importance of values for herself or himself, for good coexistence in the classroom, establishing and maintaining friendships, for good family relations and so on. We note (in accordance with the perception of the value of reflection by L. Lencz) that link cognitive and emotional sensitization with reflection of values (i.e. experiential teaching methods with cognitive approaches to teaching) provides a sound basis to enable the teacher to ethics classes avoid theorizing without links with everyday life (only cognitive approach). The result follows the projected hours of ethical education (sensitization linked to the quality reflection of values) should be outlet into concrete actions in the daily management of the pupil.

Difficulty reflection of the value rises with the development socio-moral thinking, and thus is directly linked with the development of personality. The importance of the value of reflection on ethics lessons we see only in the networking experience (emotions) with cognitive topics, but also in fulfilling socio-affective standards, respectively targeting the attention of students to specific values. In primary education would Ethical education through value-reflection have adequate methods to develop sensitivity to the creation, maintenance and development of friendship (as basic social skills). In lower secondary education (based on an analysis of Ethical education in the national curriculum) would have reflection of values towards the development of responsibility for their own decisions and actions (development of responsible attitude to themselves and to others). In upper secondary education is a fundamental requirement of teaching ethics moral development (humanity), which is responsible for developing proper relationships of man in private, at work, in public life, and so on. Ethical

education should value through reflection aimed at developing core values in different stages of education has become an important subject for the development of socially desirable, but especially ethical behaviour.

While cognitive and emotional sensitization prepares the student on, working with his particular experience or experience created directly in the classroom, classroom training is the part of an hour in which the pupil (safe) environment class develops self-discovery and learning about others, but mostly trying to practice and a desirable behaviour. Training in the classroom draws on previous experience and student incentives (cognitive and emotional sensitization), reflection of their own experience in the sense precautions for desirable behaviour and actions in the context of the target values of ethics (and society) and creates the basis for the transfer - application practicing behaviour in everyday life. The essence of training consists of classroom practice and of holding new or modified model of behaviour in different situational contexts. Part of classroom training is continuous reflection, it is necessary for a student to talk about what survives while experimenting with your own behaviour, act in different situations, for self-knowledge and knowing others in their neighbourhood, while valuing himself, his good qualities, knowledge of own weaknesses, receiving criticism and praise, but also the perception of a gradual awareness of the value of other people, formulating constructive criticism and positive expression of other pricing in your area. The pupil needs to confront their own feelings with feelings of others in the group as a reflection of the teacher.

Practicing in normal conditions or transfer interconnects ethical education to real life. Ethical education are often accused her/his "detachment" from life. Is for two main reasons:

- The objectives of Ethical education system are demanding socially desirable values, attitudes and demands for human behaviour in different life situations;
- Socially desirable behaviour in the context of the declared value is realized only in community safety class and after learning the declared values, attitudes, behaviour away from the student (pupil) is not required.

Just another reason why Ethical education becomes the object of criticism, is the answer to the question, why has this subject as the basic strategy of teaching and training in normal conditions. Transfer to normal life is not possible unless the student is satisfied itself of values in everyday situations. On the other hand, it is necessary to confront the desired behaviour, values and life companies. It is expected that the student gradually begins to perceive the advantage of behaviour and decision-making in the context of how it is presented to Ethical educations classes, as enforced values ultimately improve the view of the self (confidence in himself), developing greater awareness of other (search for the good in others people, learning about different responses to different stimuli), promote good relations (openness of communication, self-enforcement, but also acceptance of those around them, help and support) and ultimately benefit the environment in which the child / young person lives.

The presenting cycle training is a system that is based on experience, its reflection and gradually improves their own behaviour, decisions and actions in the context of socially desirable values. In order cycle was presented successful work is needed thought Teacher, which also includes appropriate use of methods and forms of teaching. The following chapters focus on the most common and the most appropriate method, which fills the content and performance standards and are appropriate tools for activating students' achievement in teaching Ethical education.

3. Drama structuring as an unconventional method in Ethical education

Aims and Idea of Ethical Education is not simple. Pupils come to school with specific patterns of behaviour which are typical for their family life or for their peer life with friends.

The question therefore is how and what the students work, the methods and procedures applied in education to be willing and able to respond appropriately later in different situations. Methodology ethics recommended for effective implementation and the attainment of subject compliance strategy. Several methods of drama education conative assist in meeting performance standards and full and content standards of ethics. The drama structuring

is a specific type of drama project used in educational process. It integrates and varies the various methods that are based on role-plays and others activities (discussions, art or music activities). The exploration of situations from various points of view and aspects represent an important integral part of drama structuring. Drama structuring can be based on literary work of art or on a topical issue (e.g. bullying, child abuse, unseen and neglected children, sibling adoption, eating disorders, and others).

As we have already mentioned, it is important to emotionally engage pupils in the topic at the beginning of Ethical education. Therefore, not only cognitive, but also emotional sensitization, the importance of which is multiplied with age, must be included in the initial stages of training courses. Cognitive sensitization allows pupils to become familiar with key terms (the gathering of information about topics, the discovering of what pupils know, or do not know, their opinions of topics, and so on.), but emotional sensitization represents the base for personal tuning and arousing interest in what is going to happen. We consider personal involvement to be a common denominator of successful implementation of drama structuring, the fulfilling of Ethical education aims.

Successful implementation of drama structuring during Ethical education lessons focused on the prevention of undesirable behaviour depends on interest, on the involvement of pupils as well as on whether the problem intrigues them or not. In this context, it should be mentioned that the taxonomy of affective goals according to Krathwohl is based on the willingness to perceive a stimulus, to purposively pay attention to it, to gradually respond to it and to find satisfaction in the trained behaviour. We believe that in terms of Ethical education lessons with implementation of experiential learning, the presented taxonomy of personal involvement constitutes a good departure point for the determination of educational requirements during the stage of emotional sensitization. Teachers as implementers of drama structuring create pedagogical situations that not only absorb pupils in their work and capture their attention, but also motivate them to look for their own solutions, develop a sense of responsibility (a better understanding of the consequences of behaviour in various social contexts) and gradually pupils find out that there is a connection between a problem and themselves, which results in characterization during this stage; i.e. the pupil begins to consider the value or problem in question as an element that is his/her integral part.

The basis of cognitive and emotional sensitization is a so-called dramatic situation representing drama structuring itself. Teachers present a problem in a dramatic context, e.g.: parents are informed that their child is in hospital in coma caused by drug abuse lasting for many years or a minor who is at home alone opens the door to strangers and becomes a victim of burglary or a fifteen-years-old pupil suffers from eating disorder or teachers are informed about an attempted suicide of a pupil because of long-term bullying, etc. During the stage of problem presentation, cognitive sensitization occurs, because pupils consider the problem, they try to remember any examples from their lives, they think about the term or the problem that was presented. The degree of personal involvement depends on how the problem is presented. Morgan and Saxton (2001, p. 40) mention four components that are necessary for drama implementation: participation (physical), monitoring (verified by means of eye contact), listening (verified according to adequate verbal responses) and reactions (non-verbal responses). Morgan and Saxton mention that it is the task of the teacher to arise curiosity (emotional sensitisation).

Role-plays are also very important for emotional and cognitive sensitisation. However, they require a higher degree of personal involvement, i.e. participation and captivation. In terms of Krathwohl taxonomy, pupils who are willing to engage in role-play show willingness to react to a particular impulse, because they identify themselves with the role and the social environment they enter during playing. The performance itself cannot be understood as a theatre performance, but as a social role, i.e. pupils present a mode of social behaviour that in terms of the taxonomy of affective goals represents an assessment of value. The same principle is apparent during role-plays in the situation when pupils play "for themselves" (a so called simulation), or the pupil performs a familiar situation in the role of someone else. In terms of meeting socio-affective objectives, it is necessary to monitor whether pupils are ready to play a role or a situation, i.e. whether a value is assessed. It seems to be appropriate if pupils in primary education first monitor their own behaviour in model situations, and then they

gradually start to practice role-plays. This level is really important if drama structuring is implemented, because teachers can see whether the majority of class is interested in a specific fictive situation or not.

If pupils empathize with the characters and their actions, and their involvement is apparent, then it is possible to continue with the phase of internalization. In line with The Krathwohls taxonomy, pupils should be able to classify and sort out values and attitudes according to the role they play. Captivation represents a peak of drama structuring, i.e. the strongest emotions are generated, what is of most importance to Ethical education teacher in relation to a relevant value reflection.

Value reflection is closely related to the interpretation and evaluation phase, where students have room for survival analysis from multiple angles. The importance of the value of reflection on Ethical education classes is indisputable - because without it disappearing meaning and significance realized. The role of reflection is of value not only to determine whether students understand the issue, but it is also necessary to consider the consequences of decisions made while playing the role or situation.

Result of quality of the value of reflection and excited prior personal commitment, the willingness of the student to reflect on the values, the importance of which for a happy and responsible life outlined the teacher. Even though the structured drama is quite challenging method and its application to the teacher requires a high degree of creativity, ability to organize work and maintain attention and tension in the participants, providing students experience a comprehensive look at the issues examined. Objectives of Ethical education is a complex set of abilities, skills and knowledge and their achievement is a lifelong development. However, we believe that ethics teacher can give a student more than to be able to watch their behaviour and the situation in which he finds himself, comprehensive and knew seek alternative solutions.

4. The Forum Theatre – Specific method of Ethical education

The second method, which is recommended to achieve goals of Ethical education, is the Forum Theatre. Its founder is Augusto Boal, theatre roots are in Brazil and preceded him so simulated dramaturgy. The essence of Forum Theatre is finding as many solutions to one problem, debate and argument. The object of the game may be drugs, aggression, bullying, exclusion of an individual or group bullying at work, infidelity and the like. Theatre Forum takes place in several parts and its base is a short story with an open end. The first part is a performance problem, viewers get to know the "aggressor", victim, find out where the problem actually. Created collision is not intended to address, but to a negative conclusion. After the show - played the situation enters the scene called. Joker plays the role of facilitator observer and attendant between audience and actors. Together with the audience he identifies the main source of the problem - the aggressor and the victim. In the third stage, the game starts playing again, and viewers have a chance to intervene to stop the game at any time and replace one of the actors, but not replace the aggressor - the source of the problem to be solved. The game is played repeatedly until the audience exhausted all ideas to resolve the situation. After each played and completed the situation is re-name the problem, analyses, and discusses the advantages and disadvantages of the proposed solutions. As we mentioned earlier, the true essence of Forum Theatre is one finding the right solution, but finding all the possible solutions (whether they are more or less likely) to analyze their influence on the conduct aggressor.

The Forum Theatre is for students to Ethical education lessons appropriate means of training desired behaviour. Its realization may take even one more lesson. The first play, when the students acquainted with the problem, a cognitive and emotional sensitization. Teacher in position during the discussion Joker realizes the value reflection, resulting in the identification of the problem, pointing out the inappropriateness of the behaviour aggressor, the implications of this case in relation to the victim, the reaction temperature, but also the responsibility of each person. The third phase - searching for solutions - is basically pointing out how it can do, but the sacrifice itself to change the behaviour of the aggressor in the event of his own actions. At this stage there is an awareness of their own responsibility, the impact of their actions on the environment. Comprehensively it

can be stated that The Forum Theatre is inherently close to reality and helps students find a connection between a normal life and school.

In terms of achieving the objectives of ethics may The Forum Theatre is a suitable means to conduct training, which is a child or young people learn how to defend against negative environmental influences. Also learn how to recognize inappropriate behaviour, will see its share of the solution of the adverse situation, but especially be seen and gradually aware of the responsibility of everyone in problematic situations. Forum Theatre can be considered successful if students produce proposals for further troubleshooting and gradually passing from the stage of aggressive interventions in defence of victims to assertive actions that disarm the aggressor. Then the teacher can see that pupils are adopting non-violent patterns of behaviour, and thus they realize what are the standards of what is good and what is bad in the proceedings of the individual and what the consequences may have their aggressive intervention to solve the problem. Achieving this goal requires the teacher patience, precision in demanding respect for rules and standards, continuous analysis of negative and positive events in the classroom and reinforcing appropriate behaviour of students.

5. Conclusion

Ethical education is a subject focused on personnel (knowledge of himself, himself a positive evaluation, design your own self-development), social (knowledge and learning about others, a positive evaluation of others, the ability and willingness to work in a group, empathy, assertiveness, reasoning ability and acceptance of other views, etc.) and moral development (knowledge and adoption of general ethical standards and principles, act in accordance with ethical standards and self-belief). By applying specific teaching strategies based on the reflection of my own experience and applying the appropriate techniques can gradually achieve individual goals of Ethical education and participate in education and personalities respecting standards of good companies, but especially the fundamental ethical principles.

Strategy focused schools: an implementation of the balanced scorecard in provision of educational services

Harun Yüksel^{a*}, Ali Coşkun^b^a*Fatih University, 34500 Istanbul, Turkey.*^b*Fatih University, 34500 Istanbul, Turkey.*

Abstract

The main mission of the educational institutions is to provide benefit and create the social values for the society. In order to ensure educational institutions to deliver their main mission, they should measure whether they have achieved their strategic objectives or not. While most of the main objectives of the businesses are financial such as maximizing the profits, however educational institutions' prior performance objectives are not financial ones. Therefore, the performance management of the high schools as an educational institution should be based on nonfinancial performance perspectives. By bringing a comprehensive system to performance measurement, the balanced scorecard (BSC) may help educational institutions to motivate and evaluate the organizational performance. The BSC may be a suitable model to be used in public and non-profit organizations by defining the links between leading inputs, processes, and outcomes and focusing on the importance of managing these components to achieve the organization's strategic priorities. While the implementation of the balanced scorecard (BSC) in the different sectors is frequently seen in the literature, very few researches has been conducted concerning the application of the BSC in the education sector. In this study we will develop a BSC model for the high school in Turkey. First we will review the administrative structures, functions and the operations and the current performance measurement systems of the high schools. Later in the study we develop the perspectives of the school balanced scorecard and we define strategic objectives, performance measures relating to these objectives, performance targets for each measure and initiatives. In the study, we suggest that if high schools use the balanced scorecard as a strategic performance management system it may help them to be strategy focused and may better serve their missions.

Keywords: School; Performance Management; Provision of Educational Services; The Balanced scorecard

1. Introduction

Education is a vital fact that increases knowledge which is an essential feature that enhances the qualifications of people and therefore it plays a critical role in shaping the future of the nations. It is well known that education is an important factor at accelerating economic, cultural and social development in a country. As competition in educational services has become more intense, many educational institutions invested in education in order to achieve their goals. In order to ensure educational institutions to deliver their main mission, they should measure whether they have achieved their strategic objectives or not.

Education has been related with the process of instructing young people in ways which form the mind and character necessary to become good citizens and employable workers to increase the development of a country. Nowadays, education has become a life-long process, increasingly connected to schooling, human and economic development, and productivity by enhancing personal and national welfare. During the past 50 years, development of educational services has contributed to a fundamental conversion of OECD countries, including Turkey (Owings, Kaplan and Pirim, 2012). As a developing country, Turkey accepts education as a crucial component in constructing its economy to world class levels.

The purpose of this study is to increase understanding of how the BSC is used in educational institutions. This paper is organized in the following manner. First we will review the purpose of educational services as privat and governmental sector. Then strategic planning in education is presented. Later in the study we develop the perspectives of the school balanced scorecard and we define strategic objectives, performance measures relating to these objectives, performance targets for each measure and initiatives.

2. Educational Services

The purpose of education is to improve the welfare of the individual and the society by promoting civilized, progressive, competent and efficient development of the individual and the society in a given country. Nowadays in developed countries, the priority of educational services is one of the main features that determine level of development. Besides education provides special benefits to people, it also creates positive externalities to the society that increases the social development of a country. The developments in all fields of life increase the importance of education. Thus concentration of many efforts in the provision of this service by government and private sector become prominent.

There are different perspectives on the outcomes of the education process. One view states that education increases the skills of individuals and thus contributes all kind of development. This perspective perceives investment in people as capital investments. The greater is the investment of human capital, the greater is the productivity. Another view is about the socialization role of education. It teaches people how to perform well in public, work and home. In this perspective, there is a positive relation between education period and social skills of individuals. These social abilities make people more valuable in the life. Another function of education is to identify the abilities of different individuals. Those who attend to school longer than the others get higher wage and are observed to be more productive. This is not because the schools have increased their productivity, but rather because the schools have identified those individual who are the most productive, or who have the necessary ability or skill. This view indicates schooling as separating the very able and highly motivated from the less ones (Stiglitz, 1999).

3. Strategic Planning in Education

Public and private educational institutions are experiencing challenges such as increased competition, emerging technology, scarcity of resources or inefficient resource allocation. Because of globalization trend and knowledge-based era all these challenges become more important. The increasing volatility of the environment has forced institutions to adapt to ever changing external circumstances (Machado and Taylor, 2010). The literature strongly recommends strategic planning as the key to superior performance. According to the mission and vision of the educational institutions managers should apply administrative and managerial strategies to achieve the institutions' goals.

Planning is a way of looking toward the future and deciding what the organization will do in the future. Strategic planning is a disciplined effort to produce decisions and actions that guide and shape what the organization is, what it does, and why it does it (Bryson, 1995).

Pfeiffer *et al.* (1986) defined strategic planning as, “the process by which members of an organization envision its future and develop the necessary procedures and operations to achieve that future.” Another definition in the literature that is often used to explain what strategic planning is made by Barry (1997) and he states that it is “*what* an organization intends to achieve and, secondly, *how* leadership within an organization will direct or utilize its resources to achieve its ends”.

Figure 1 shows the process of in an uncomplicated view. Bryson (2004) provides a simple structure for the strategic planning process by defining the ABC’s of strategic planning. According to Bryson, A is where you are, B is where you want to be and C is how you get there. The vision, mission, and goals of the organization help it move from A to B. Strategy formulation connects A to C and strategy implementation connects B to C.

Fig. 1. ABC's of Strategic Planning

Source: Bryson, J.M. (2004). Strategic planning for public and nonprofit organizations: a guide to strengthening and sustaining organizational achievement (3rd ed.). San Francisco: JosseyBass, p.11.

In short, strategic planning indicates the path managers will take to achieve the mission and the vision of their institution. Strategic actions will guide managers to achieve their institutions' goals by providing strategic

direction, allocating and concentrating their resources –human, financial, and material-, establishing shared values, coping with uncertainty and indicating success and failure. As a result of this process, institutions will have a clearer idea of what it is, what it does, and what challenges it faces. Following strategic plans will also help the institutions to get enhanced performance and responsiveness to its environment.

It can be thought that strategic planning process is an issue of business sector because for many years business and education have been regarded as two separate areas that act completely different. But there are considerable common points between the activities of a school and the activities of any other organization.

As far as the similarities are concerned, the main task of both business and education is to make a profit. One could argue that their profit is different, but what matters is that in one way or another they both seek to achieve something. Their resources are always limited, since there is a scarcity and they are constantly trying to obtain more for themselves. In contrast, their needs are usually unlimited and they are trying to satisfy as many as possible (Tsiakkiros & Pashiardia, 2002).

The concept strategy is used widely for over 10-15 years in the education system and educational institutions and especially with implementing number of actions related to planning more efficiently. There is also a wide use of the word strategy together with planning in the literature. According to the literature if the planning is not strategic, it is not accepted as a plan. Strategic planning's advantages is seen as a path for schools that transmit them to the future (Ensari, 2005).

School managers should take more initiatives in order to fit to the rapidly changing environmental circumstances. Strategic planning helps to cope with this problem by presenting a functional model. In this way managers can be more effective and make their schools adaptive to the changing environment (Erdoğan, 2000).

4. Education and Performance Measurement

Performance management is a means of auditing and managing the organizations' overall activity. Organizations are encouraged to raise their levels of performance, and manage their staff and customers more tightly to achieve better outputs and outcomes. The transformation of industrial era into the information age has improved the importance of educational services. This change has placed education in a central position in the development of countries. In the sight of globalization, managers need to cope with changing environments and technology. In order to compete with the others all institutions have to provide these services successfully, the managers of the educational institutions carefully design the activities and processes, organize and implement the planned activities, and conduct the supervision and controls on the operations. The most important activity of control functions of the management is the performance measurement and management, which are among the main tasks of the managers. Managers may set up a performance management system for the entire institution as a systematic system or just for a specific activity or for a business unit. In some cases performance measurement can be done just for a specific purpose.

Performance measurement results of an activity to determine the extent to achieve observance. The performance measurement is not only a data collection process but rather it is a process to improve effectiveness and efficiency of operations. The performance measurement is an important process for decision-makers in any type of organization. However, it is not sufficient just to measure the performance of the activities. Managers should also make the decisions based on performance results and implement corrective actions according to the results (Coşkun and Şenyiğit, 2010).

Performance indicators should be rigorous chosen. According to Markless and Streatfield (2001) good performance indicators should be:

- Relevant to accepted organizational goals.
- Informative (giving warning signs, identifying achievements etc.).
- Able to be changed.

- Reliable.
- Valid
- Accessible/understandable.
- Acceptable (seen to be fair; checkable).
- Not corruptible.
- Cost-effective.

The use of indicators of performance as a way of managing and improving performance in education is now so widespread across schools, colleges and universities that it is difficult to imagine educational life without them. Educational institutions operate in both the private sector and the public sector. The main objective of the educational institutions in the private sector is to increase profitability and the value of the institution, or to ensure the continuity of business as determined in accordance with the basic aim is scheduled. Managers of educational institutions in the public sector aim to achieve the goals and objectives determined by the law and improve the general education level of the society. Therefore, in the performance management of the public educational institutions, non-financial factors such as satisfaction of the customer (student) and other stakeholders and service quality are more important than the financial objectives. However, the financial aspect of business continuity is also important in the evaluation of the performance of public enterprises (Coskun, 2009).

Performance measurement systems in educational institutions can be either based on financial or nonfinancial performance. Financial statements analysis, standard costing and budget analysis are the examples of financial performance measurement. Managers of the educational institutions can also implement nonfinancial approaches of the performance measurement such as measuring the service quality, productivity, efficiency and effectiveness, and customer satisfaction. As a contemporary approach in performance measurement and management, the balanced scorecard (BSC) provides a comprehensive set of financial and nonfinancial performance measures for the organizations to be strategy focused. Reliance only on financial performance measures may not show future competitive advantage as financial indicators are outcome measures (Chia et al., 2009). Without measuring results, there is no way of knowing whether the business is being managed satisfactorily, nor is it possible to hold managers accountable for the business. Moreover, it is not easy to determine what kind of successes should be rewarded. Even though so far there have been numerous tools developed for the purpose of performance measurement; the BSC differs by putting the organization's vision and strategy into a framework effectively and communicating the strategic intent efficiently.

5. Concept of the Balanced Scorecard

The Balanced Scorecard is a management tool that was developed by Kaplan and Norton in the 1990s (Kaplan and Norton, 1992; 1993; 1996a; 1996b; 2000, 2001). Kaplan and Norton recognized the need for businesses to have a more "balanced" approach of assessing company performance than the traditional method of looking strictly at financial data (Davis, 2005).

Kaplan and Norton (1996a) list the following uses of the BSC:

- To clarify and update strategy
- To communicate strategy in the company
- To align unit and individual goals to strategy
- To link objectives to long term targets and budgets
- To conduct performance reviews to improve strategy

Since the new economy has new concepts such as process orientation, continuous improvement, competence and knowledge, customer focus, and operational efficiency, it *generates* challenges for measurement of data (Gumbus et al., 2003). While financial data is important, in large part, it only gives an indication of historical company performance. The BSC combines financial data along with non-financial performance criteria, such as product quality and customer service, in a way that allows businesses to not only track their performance, but also to align business activities in such a way that they support the organization's stated missions and goals (Davis, 2005). The BSC system has flexible structure. It is important to take into account the specific needs of the institution and the industry in which it competes when creating the BSC (Olson and Slater, 2002).

Mainly there are four stages of the BSC design and implementation for most type of organizations (Kaplan and Norton, 1996a): Translating the vision, communicating and linking, business planning, and feedback and learning.

The BSC provides superior financial performance when compared to a traditional performance measurement system (Albright and Davis, 2004). In contrast to the financial based measurement systems, the BSC reinforces the organization's focus on future success by setting objectives and measuring performance from different perspectives. 'Balance' is expected to be assured by short and long-term financial and nonfinancial and leading indicators, concerning four perspectives (Ahn, 2001). These balanced perspectives in the Kaplan and Norton's first BSC are the financial perspective, customer perspective, internal business processes perspective, and learning and growth perspective (Kaplan and Norton, 1992). The BSC retains the financial measurement, but it focuses on a more general and integrated set of measurements that link customer, internal business processes, employee learning and growth, and financial performance to long-term financial success.

These four perspectives are defined as (Griffith et al., 2002):

- Financial Perspective – performance and resource management (related to investors' interests)
- Internal Business Processes Perspective – cost, quality, efficiency and other characteristics of goods or services (related to internal processes)
- Customer Perspective – measures of satisfaction, market share and competitive position (related to customers' needs)
- Learning and Growth Perspective – ability to respond to changes in technology, customer attitudes and economic environment (related to constant improvement concerning employee qualification and information management)

For each perspective of the BSC, strategic objectives, performance measures relating to these objectives, performance targets for each measure and initiatives are defined. Performance measures in a scorecard should be linked to each other and to the long term vision and strategy, following a cause and effect relationship (Coskun and Bayyurt, 2008). This cause and effect relationship clearly explained in the BSC strategy maps. A BSC strategy map is a generic architecture for describing the strategy and shows the cause and effect relationship between the perspectives (Kaplan and Norton, 2001).

The BSC assists companies in overcoming two important issues: effective organizational performance measurement and implementing strategy (Niven, 2002). The first issue is an effective performance measurement: "If you cannot measure it, you cannot manage it". Traditionally, the performance measurement system for

business has been financial. A key problem with looking at financial or accounting-based measures alone is that it gives only one particular perspective. In fact, it may even lead to poor decision-making. For example, if the cost per customer is one of the main performance measures managers may try to cut costs without taking care of customer satisfaction and this may result dissatisfied customers because of the lower quality products and services. Implementing a strategy successfully is another important issue facing organizations. A strategy is a set of hypotheses about cause and effect. The measurement system makes the relationships (hypotheses) among objectives in the various perspectives explicit so that they can be managed and validated (Niven, 2002).

The BSC is not merely a collection of financial and non-financial measurements. The BSC should be the translation of the business unit's strategy into a linked set of measures that define both the long-term strategic purposes, as well as the mechanisms for achieving those purposes (Kaplan and Norton, 2000). In the nature of implementing strategies, the organization may have some barriers. There are four barriers to strategy implementation that exist for most companies: a vision barrier, a people barrier, a resource barrier, and a management barrier. The managers can remove these barriers by implementing the BSC (Niven, 2002).

There are also some requirements for an effective and efficient implementation of the BSC (Mearns and Havold, 2003):

- The organization has to know where it would like to go and how it will get there.
- The organization must understand that the scorecard is a long-term exercise. It is a tool for implementing business strategy.
- Management must have the maturity to use the results of the scorecard for continual improvement and not look for faults in the measures if they see something they do not like.
- The BSC must reach down the organizational structure and back up again. It is a tool for departments as well as senior management, and the scorecards throughout the organization must be linked together.
- Parameters must be objective and the data gathering process should be transparent to people using the information or being measured.
- It is unrealistic and de-motivating to measure people on things they cannot control.

6. Balanced Scorecard for Educational Institutions

The BSC is not only better in monitoring and evaluating performance of an educational institution but also in improving the performance to its best level. For instance, by tracking value delivery and paying incentives to staff based on how much value an organization delivers to customers, rather than the amount or value received from customers, educational institutions can motivate and redirect staff to look for better ways to improve value of service. This can serve as counter to the possibility of staff motivation to promote short-term importance on the revenue received from clients. Also by effectively tracking improvement made by students, families and community, BSC can give internal stakeholders such as teaching staff and employees a renewed pride in what they do (MacStravic, 1999).

The original BSC of the Kaplan and Norton (1996a) has financial, customer, internal process, and learning and growth perspectives, but educational institutions may modify these four perspectives in their scorecards or add some other perspectives. We slightly changed the original scorecard and used four perspectives in the Balanced Scorecard for Educational Services: stakeholders, internal processes, learning and growth, and financial sustainability perspectives

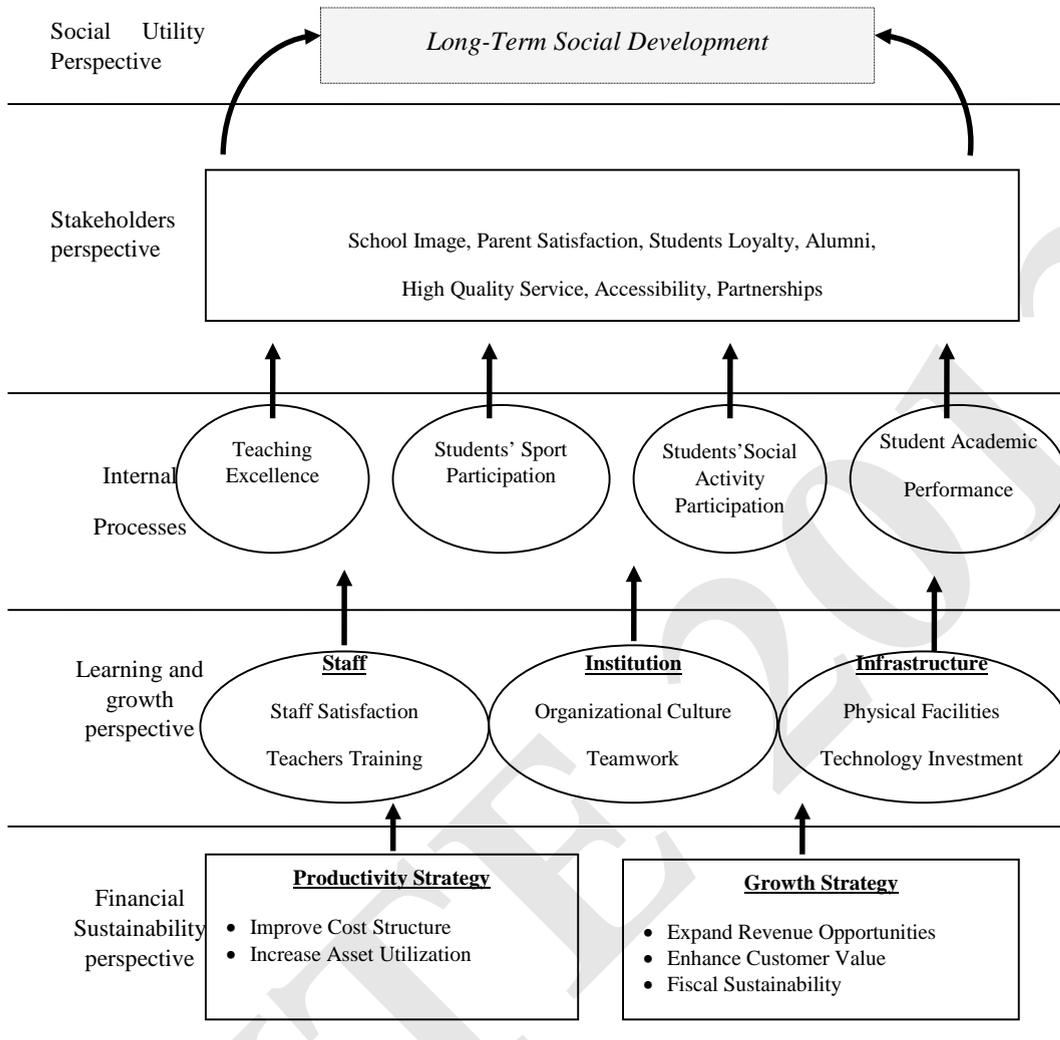

Fig. 2: Strategy Maps for Educational Services

In each perspective of the balanced scorecard for educational services there are related strategic objectives and certain number of performance measures to evaluate the achievement to these objectives. Performance targets for each performance measure are determined and achieved results are gathered end of each period. Depending on characteristics of the institutions and the strategic objectives performance measures may differ.

We developed a Balanced Scorecard for Educational Services in Table 1. Later we defined the strategic objectives in each perspective. Finally we determined the performance measures to evaluate the achievement of each strategic objective. There are three strategic objectives in financial sustainability perspective of the balanced scorecard for educational services: improve cost structure, increase asset utilization expand revenue opportunities. Four performance measures can be used to evaluate these strategic objectives: Saving in cost of service, efficient use of facilities and resources, level of student enrollment fund raising from stakeholders. In the second perspective, learning and growth perspective; improve staff satisfaction, Technology implementation and Knowledge enhancement are the three strategic objectives which are measured at the balanced scorecard for educational services. Internal processes perspective is listed with improving the student academic performance,

to achieve improvement in teaching excellence, increase students participation to sport activities and increase in students participation to social activities are the four strategic objectives. Educational institutions can achieve these targets by measuring exam results of students, budget spent on staff development, number of students attending the sport activities, number of social activities as performance indicators. Finally, in stakeholders perspective of the balanced scorecard for educational services we determine objectives based on three different aspects. Students, parents and other related institutions. These objectives can be measured by reputation ratio,, external rankings, alumni evaluation graduation job offerings, university acceptance rate, school leaving rates, quality assessments, joint projects and activities.

Table 1. Balanced Scorecard for Educational Services

	Strategic Objectives	Performance Measures
Stakeholders perspective	Promote school image	Reputation ratio,, external rankings, alumni evaluation
	Parent satisfaction	Graduation job offerings, university acceptance rate
	Students loyalty	School leaving rates
	Increase quality of service	Quality assessments
	Encourage partnership with related institutions	Joint projects and activities
Internal processes perspective	Improve the student academic performance	Exam results of students
	To achieve improvement in teaching excellence	Budget spent on staff development
	Increase students participation to sport activities	Number of students attending the sport activities
	Increase students participation to social activities	Number of social activities
Learning and growth perspective	Improve staff satisfaction	Satisfaction surveys
	Technology implementation	Number of courses using new technology
	Knowledge enhancement	Number of seminars attended
Financial Sustainability Perspective	Improve Cost Structure	Saving in cost of service
	Increase Asset Utilization	Efficient use of facilities and resources
	Expand Revenue Opportunities	Level of student enrollment Fund raising from stakeholders

Conclusion

The main purpose of performance measurement and management in educational institutions is to increase accountability, handle with changing environmental and compete with the other institutions. As competition in educational services has become more intense, many educational institutions invested in education in order to achieve their goals. In order to ensure educational institutions to deliver their main mission, they should measure whether they have achieved their strategic objectives or not. In line with this purpose, many aspects were explored about the BSC in literature and it can be claimed that there are much to be discovered about it. Although the BSC has been implemented in developed countries for many years, especially in business sector, it has not until recently brought relevant sectors' attention on BSC theory and BSC has rarely been applied especially in educational institutions in Turkey. Therefore, this study verifies that BSC is a performance management system and a strategic management tool to achieve institutions goals. In this study we state that, by emphasizing missions and visions in educational institutions, schools can learn from business and pay more attention to educational costs and benefits in implementing performance management.

Student academic support as predictor of academic locus of control in Turkish university students

Serhat Arslan *, Mehmet Çardak, Recep Uysal

**Sakarya University Faculty of Education, Sakarya, Turkey*

Abstract

The purpose of this study is to examine the relationships between academic locus of control and student academic support. The sample of study consists of 477 university students who were enrolled in different programs at Sakarya University, in Turkey. In this study, Academic Locus of Control Scale and Student Academic Support Scale were used. The relationships between student academic support and academic locus of control were examined using correlation analysis and multiple regression analysis. According to results internal academic locus of control was predicted positively by dimensions of student academic support. Further, external academic locus of control was predicted negatively by dimensions of student academic support. Results were discussed in the light of literature.

Keywords: Academic locus of control, Student academic support, Multiple regression analysis

1.Introduction

As a personality factor, the locus of control concept comes from Rotter's (1966) social learning theory, represents individual's beliefs of his/her ability to execute control over their environment and related to interaction of individual and environment (Yates, 2009). Locus of control (LOC) can be accepted as a personality trait that has a powerful cognitive focus and it is the result of anticipation about expected outcomes of events in a person's life (Lefcourt, 1991). LOC refers individual's perceptions that they have in the amount of control over their lives (Rotter, 1966), set of beliefs about personal behaviors and the relationship of that behaviors to how one is awarded or punished (Morris, 1979; Chak & Leung, 2004).

LOC can be defined as the degree to which a person believes that control of reinforcement is under internal versus external control (Rotter, 1966; O'Brien, 1986). Accordingly, LOC shows a distribution on dimensions of internal (strong personal control and influenced by inside forces) and external locus of control (weak personal control and influenced by outside forces) (Akin, 2010). Rotter (1966, p.618) propounded that individuals who have internal locus of control (ILOC) believe that "reinforcements are contingent upon their own behavior, capacities, or attributes". Otherwise individuals who have external locus of control (ELOC) "reinforcements are not under their personal control but rather are under the control of powerful others, luck, chance, fate, etc." Individuals with high ILOC believe that they can control their own fate, see the outcomes are results of own behavior; they are confident and careful in attempting to control their external environments; they can have a direct influence on the events in their

* Corresponding author. Serhat ARSLAN
E-mail address: serhatarslan@sakarya.edu.tr.

lives, accept responsibility for their events (Burger, 1992; Davis & Davis, 1972; Esterhuysen & Stanz, 2004). On the other hand, individuals with high ELOC believe that consequences are not related to their actions and are result from some factors out of individual's control like luck or intervention by others, more determined by external forces rather than by themselves and they have little things to do to influence outcomes; they blame their environment for failures and see the events as unpredictable (Esterhuysen & Stanz, 2004; Iskender & Akin, 2010; Rotter, 1966; Phares, Wilson, & Klyver, 1971).

Previous studies indicated that there is a positive association between LOC and academic achievement (Dağ, 1991) so the way a student accounts for personal achievements or failures in school (Cetinkalp, 2010) which refers academic locus of control (ALOC) is important. Studies on LOC and academic achievement indicated that individuals with ILOC have a higher academic achievement than the ones with ELOC; ILOC has been found to be a significant predictor of academic achievement and achievement motivation (Brown, Fulkerson, Furr, Ware & Voight, 1984; Eachus & Cassidy, 1997; Findley & Cooper, 1983; Weiner & Kukla, 1970). Otherwise Aremu, Pales and Johnson (2009), found that individuals with the ELOC have more tendency for dropout. Students who have more ILOC tendencies perceive that their academic success depends on their own effort and pay more attention to knowledge and learning in order to reach their target (Burger, 2006). In addition, Akin (2010) showed that learning-avoidance and performance approach/ avoidance goals were predicted positively by the ELOC and the ILOC predicted learning-approach/avoidance goals in a positively and performance-approach/avoidance goals negatively.

Student Academic Support

Peer leadership has been becoming quite important in the current education system. It is traditionally defined as academic support, and courses for the purpose of one-to-one studying or preparation for exams (Keup & Mullins, 2010). These skill-based approaches are quite inadequate to meet the changing requirements of students (Clark-Unite, 2007). Peer education support is very important for the students especially in terms of academic skill development, professional developments, development of personal efficacy feeling as well as skill development for communication and establishing bilateral relationships (Smuts, 1996). Maxwell (2001) defines academic peer support as "socializing the education" in his study. Social support perceived socially by the individual consists of people who helped, has been helping and will help the individual. Peer academic support includes the assistance interaction of students to each other academically (Kenny & Rice, 1995; Lafreniere & Ledgerwood, 1997; Shaver & Buhrmester, 1985). Lack of social support for the student causes the student to look for academic support from other students. However, there is little information on the process how academic student support and peer support occur (Chen, 2005; DeBerard, Spielmans, & Julka, 2004; Tinto, 1997, 2005). Peer academic support includes the solution of academic problems faced by students (e.g., answering of questions about papers, studying together, sharing studying habits, helping with academic difficulties) and academic encouragement (support for reducing exam stress, academically motivating for courses) (Mazer & Thompson, 2011; Thompson, 2008; Thompson & Mazer, 2009). Informal peer support in undergraduate level has an importance place in terms of academic support system and academic efficacies of students (Braithwaite, Bride, & Schrodt, 2003; Jones, 2008; Kong, 2009; Mortenson, 2006). Thompson (2008) stated that methods of communication with each other and academic peer support effect are quite important for the academic successes of students. Academic peer support is effective on formation of new academic expectations and on the academic support system interiorized by the individual (Alfaro, Umana, & Bamaca, 2006; DeBerard et al., 2004; Kenny & Rice, 1995; Lafreniere & Ledgerwood, 1997; Thompson, 2008; Tinto, 2005). In this context, informal academic peer support has a quite important place in academic success of students (Giddan, 1988; Mpofu, 2003; Penn-Edwards & Donnison, 2011). Tinto (1997) concluded that social and academic success levels of students increase as their academic and social communication methods increase. Peer academic support is important for the education programs to achieve their aims. In addition, peer support has a positive effect on new learning gains of the students.

McKeachie, Pintrich, Lin and Smith (1986) emphasizes that "the answer of best teaching method is education aims, student, content and teacher... but another answer as an alternative is academic peer support". Many researchers studied on the effect of social support on academic success (De Berard, Spielman, & Julka, 2004; Forman, 1988; Kloomok & Cosden, 1994; Malecki & Demaray, 2002). It was concluded that social academic support is related with cognitive, emotional and behavioral factors on the students and in addition academic peer support has a positive effect on students with difficulty to learn and low academic success (Rothman & Cosden, 1995; Wenz-Gross & Siperstein, 1997). In studies on university students, it was found that peer support has an effect on primary degree academic success (Elliott, 2007; Mazer & Thompson, 2011; Thompson, 2008; Thompson & Mazer, 2009). These supportive interactions among university students have a developing effect on social support and peer relations. In addition, developing peer supportive relations is important for making up for the traditionally lost values. Study of Thompson (2008) which examined the academic support process thoroughly in terms of students is quite important since it presented the factors which affect academic support processes of university students.

Despite these findings, as far as our knowledge, no study has investigated the relationships between academic locus of control and student academic support. Thus, the aim of the present study is to examine the relationships between academic locus of control and student academic support. Based on the studies of student academic support (Cutrano, et al., 1994; Rueger, Malecki, & Demaray, 2010; Sacco & Yanover, 2006; Vieno, Santinello, Pastore, & Perkins, 2007; Satici, Uysal & Akin, 2013; Williams, 1995; Yıldırım, 2006) and academic locus of control (Akin, 2010; Arslan & Akin, in press; İskender & Akin, 2010; Çetinkalp, 2010; Eachus & Cassidy, 1997; Findley & Cooper, 1983; Hans, 2000; Mearns, 2006; Weiner & Kukla, 1970) with psychological constructs we hypothesized that student academic support would be associated positively with internal academic locus of control and negatively with external academic locus of control

2. Research Method

In this part are given such information as the research method used in the research, the universe and sample of the research, the development and implementation of measuring tools, collection of data and analysis of the collected data.

2.1. Participants

Participants of the study were 477 university students (277 were female and 200 were male) enrolled in various undergraduate programs at Sakarya University Faculty of Education, Turkey. Their ages ranged from 18 to 25 years and the mean age of the participants was 21.6 years.

2.2. Measures

Student Academic Support Scale (SASS). SASS developed by Mazer and Thompson (2011) consists of 15 items (e.g., Explained how to solve a specific problem) including sub-dimensions of information support, respect support, motivation support and relieving support has a 5-point Likert type grading (1 Never - 5 Always). Development studies of the original scale were conducted on 253 individuals. Fit index values of four-dimension model in confirmatory factor analysis applied for structure validity of the scale is found as follows: $\chi^2= 83.17$, $p<.01$, RMSEA=.067, NNFI=.98, CFI=.99, SRMR= .03. Internal consistency reliability coefficient is .94 for information support sub-dimension, .78 for respect support sub-dimension, .81 for motivation support sub-dimension and .84 for relieving support sub-dimension. Under criterion-related validity, a positive relationship was found with "Inventory of Social Support Behaviors" ($r=.75$, $p<.01$) and "Perceived Social Support Scale" ($r=.44$, $p<.01$).

The Academic Locus of Control Scale (ALOCS); Akin, 2007). The ALOCS is a 17-item self-report scale using a 5-point Likert scale (1 = strongly disagree to 5 = strongly agree). This scale has two sub-scales: external academic locus of control (11 items) and internal academic locus of control (6 items). The

Cronbach a internal consistency coefficients were .95 for external academic locus of control and .94 for internal academic locus of control. Test–retest reliability was assessed by readministering the scale to 148 undergraduate students in 3 weeks time. The Pearson correlation coefficients were .93 and .97 for two sub-scales, respectively.

2.3.Procedure and Data Analysis

Convenience sampling was used in the selection of participants. Convenience sampling is a non-probability sampling technique in which participants are selected because of their convenient accessibility and proximity to the researcher. For this reason, the results of this study did not make inferences from the population which led to a decrease in external validity. Students voluntarily participated in research, completion of the scales was anonymous and there was a guarantee of confidentiality. The scales were administered to the students in groups in the classrooms. The measures were counterbalanced in administration. Prior to administration of scales, all participants were told about purposes of the study. In this research, Pearson correlation coefficient and multiple regression analysis were utilized to determine the relationships between dimensions of academic locus of control and academic student support.

3.Results

3.1.Descriptive Data and Inter-correlations

Table 1 shows the means, standard deviations, inter-correlations, and internal consistency coefficients of the variables used. Preliminary correlation analysis showed that informational support ($r=.44$, $p<.01$), esteem support ($r=.45$, $p<.01$), motivational support ($r=.40$, $p<.01$) and venting support ($r=.50$, $p<.01$) related positively to internal ALOC. In contrary, while informational support ($r=-.43$, $p<.01$), esteem support ($r=-.42$, $p<.01$), motivational support ($r=-.34$, $p<.01$), and venting support ($r=-.43$, $p<.01$) were found negatively associated with external ALOC.

Table 1 *Descriptive statistics and inter-correlations of the variables*

Variables	Informational S.	Esteem S.	Motivational S.	Venting S.	Internal ALOC	External ALOC
Informational S.	—					
Esteem S.	.67**	—				
Motivational S.	.42**	.60**	—			
Venting S.	.34**	.50**	.89**	—		
Internal ALOC	.44**	.45**	.40**	.50**	—	
External ALOC	-.43**	-.42**	-.34**	-.43**	-.82**	—

** $p < .01$

3.2.Multiple Regression Analysis

Before applying regression, assumptions of multiple regression were checked. The data were examined for normality by the Kolmogorov-Smirnov test. The Kolmogorov-Smirnov test indicated normality of distributions of test scores for all tests in the current study. Outliers are cases that have data values that are very different from the data values for the majority of cases in the data set. Outliers were investigated using Mahalanobis distance. A case is outlier if the probability associated with its D^2 is .001 or less. Based on this criterion, five data were labeled as outliers and they were deleted. Multi-collinearity was

checked by the variance inflation factors (VIF). All the VIF values were less than 10 (Tabachnick & Fidell, 2007), which indicated that there was no multi-collinearity.

Two stepwise multiple regression analysis have applied to determine which dimensions of student academic support were the best predictors of internal and external academic locus of control. Table 2 showed the results of multiple regression analysis where the independent variables were dimensions of student academic support and the dependent variable was internal ALOC.

Table 2. *Summary of Stepwise Multiple Regression Analysis for Variable Predicting Internal ALOC*

Variables	<i>B</i>	<i>SE_B</i>	β	<i>t</i>	<i>p</i>	<i>R</i> ²
Step 1						
Informational support	1.59	.149	.44	10.675	.00	.19
Step 2						
Informational support	.919	.194	.254	4.730	.00	.24
Esteem support	1.99	.381	.281	5.225	.00	
Step 3						
Informational support	.895	.192	.247	4.666	.00	.26
Esteem support	1.22	.427	.172	2.861	.04	
Motivational support	.568	.150	.188	3.793	.00	
Step 4						
Informational support	.934	.175	.258	5.331	.00	.38
Esteem support	1.421	.390	.200	3.641	.00	
Motivational support	-1.586	.260	-.525	-6.105	.00	
Venting support	1.817	.186	.777	9.750	.00	

**p* < .01

Informational support entered the equation first, accounting for 19% of the variance in predicting Internal ALOC. Esteem support entered on the second step accounting for an additional 5% variance. Motivational support entered on the third step accounting for an additional 2% variance. The last regression models informational support, esteem support, motivational support and venting support as predictors of Internal ALOC and accounted for 38% of the variance in Internal ALOC. The standardized beta coefficients indicated the relative influence of the variables in last model with informational support, esteem support, motivational support and venting support all significantly influencing Internal ALOC and informational support was strongest predictor of Internal ALOC.

Table 3 showed the results of multiple regression analysis where the independent variables were dimensions of student academic support and the dependent variable was external ALOC.

Table 3. *Summary of Stepwise Multiple Regression Analysis for Variable Predicting External ALOC*

Variables	<i>B</i>	<i>SE_B</i>	β	<i>t</i>	<i>p</i>	<i>R</i> ²
Step 1						
Informational support	-1.03	.099	-.434	10.463	.00	.19
Step 2						
Informational support	-.655	.130	-.275	-5.052	.00	.22
Esteem support	-1.118	.254	-.239	-4.399	.00	
Step 3						
Informational support	-.645	.129	-.270	4.994	.00	.23
Esteem support	-.801	.287	-.171	-2.785	.00	
Motivational support	-.234	.101	-.118	-2.324	.02	
Step 4						
Informational support	-.667	.121	-.280	-5.497	.00	.32
Esteem support	-.914	.270	-.196	3.379	.00	
Motivational support	.988	.180	.496	5.485	.00	
Venting support	-1.031	.129	-.669	-7.981	.00	

**p* < .01

Informational support entered the equation first, accounting for 19% of the variance in predicting External ALOC. Esteem support entered on the second step accounting for an additional 3% variance. Motivational support entered on the third step accounting for an additional 1% variance. The last regression models informational support, esteem support, motivational support and venting support as predictors of External ALOC and accounted for 32% of the variance in External ALOC. The standardized beta coefficients indicated the relative influence of the variables in last model with informational support, esteem support, motivational support and venting support all significantly influencing Internal ALOC and informational support was strongest predictor of External ALOC.

4. Conclusion

The aim of this study was to investigate the relationship between student academic support and academic locus of control. It was supposed that student academic support would be associated positively with internal academic locus of control and negatively with external academic locus of control. The results of correlation and regression analysis confirm these hypotheses and the importance of student academic support, especially student academic support from peers for better understanding of academic locus of control.

In addition, some details of the results should be further addressed. Firstly, the positive correlation between the student academic support and the internal academic locus of control is in line with existing studies on student academic support and the internal academic locus of control (Akin, 2010; Iskender &

Akın, 2010; Arslan et al., 2012; Arslan & Akın, in press; Lefcourt, Rod, & Saleh, 1984; Satici, Uysal & Akın, 2013). The findings demonstrate that students would be eager to select other students for academic support rather than teachers. Students would choose peer support because of access, availability, and shared context. Social-support research indicated that both within and outside the academic performance has been described as a key feature of the social support process (Thompson, 2008; Thompson & Mazer, 2009; Vaux, 1985). Noteworthy finding of the study, the perceived student academic support predicts internal locus of control in a greater extent than the teachers' support. Previous studies shows that (Ghaith, 2002; Johnson & Johnson, 1994; Rueger, Malecki, & Demaray, 2010; Vieno, Santinello, Pastore, & Perkins, 2007; Satici, Uysal & Akın, 2013; Yildirim, 2006) perceived student academic support is related positively to adaptive variables in terms of education. Student academic support is one of the most important aspects of classroom climate that may influence students' academic achievement (Ghaith, 2002; Malecki & Elliott, 1999). In addition, students tend to give significant importance action-facilitating academic support from their friends throughout their university life (Demaray & Malecki, 2003; Thompson & Mazer, 2009).

Secondly, the negative correlation between the perceived student academic support and the external academic locus of control supports the hypothesis of the study and demonstrates that people who experience weaker perceived student academic support would tend to be external ALOC. Students with an external locus of control will need more support and guidance from the instructor and peers (Bargezar, 2011; Satici, Uysal & Akın). Also this finding is coherent to that of Sarason et al., (1983) who, found that college students with low perceived social support and an external locus of control performed on an unsolvable problem inadequately.

This study has a number of limitations. First of all, the sample presented here consists of university students. For that reason, it is questionable whether the findings can be generalized to gender and different age groups. Secondly, this research was limited by the use of self-report scales and wasn't used a qualitative measure of student academic support and academic locus of control. Lastly, as correlational statistics were applied, no definitive affirmation about causality could be made. Consequently, despite of the limitations this study provides crucial knowledge about the predictors of academic locus of control and academic student support. The variables which are shown that in this study exactly reported for the motivational process that triggers student's academic performance.

Student perceptions on the development of speaking skills: A course evaluation in the preparatory class

Orhan Kocaman ^{*a}, Levent Balcıođlu^b^a*Sakarya University, Faculty of Education, Turkey*^b*Istanbul Şehir University, School of Languages, Turkey*

Abstract

This study aimed to evaluate the student perceptions and perspectives on their progress in the speaking skills course at the Preparatory school of English Language Teaching program in the Faculty of Education at Sakarya University. In this study, the CIPP model developed by Stufflebeam was taken as a basis of evaluation to measure the perceptions of the preparatory students towards the effectiveness of the course. As is known, the CIPP model consists of four core concepts: context, input, process, and product evaluation. In this study, the stage of process was evaluated by means of a four part questionnaire consisting of 66 items and 5 open ended questions. The main objective of the evaluation at this stage was to find out defects in the procedural design or its implementation in process to come up with tangible suggestions for the refinement and improvement of the program. The evaluation of the course revealed several significant results in that more pair work and group work are favored by the students. Student-centered classes are preferred by the majority of the students. More peer correction is regarded as a helpful activity that might also serve to constitute a friendly atmosphere in a class. Students' perceptions clearly indicated that the most frequently used type of instructional method was student presentations. From the open ended question section, it is obvious that students do not prefer lecture type classes. They prefer interactive, entertaining and cooperative tasks in their learning process.

Key words: Evaluation, Process, Implementation, CIPP Model, Perception.

1. Introduction

Recently, the demand for English teachers has grown in Turkish education system since learning English language has gained importance in finding a decent job, being able to follow scientific journals written in English and keeping up with new technologies. Therefore, if one wants to remain updated in the world of science, s/he cannot do without a proper understanding of English. This need is, to a certain extent, met through preparatory schools, which give students an academic year of English education. Preparatory schools enable students to have a proficient knowledge of English so that they can follow their courses in their departments effectively. Because of this crucial mission attributed to preparatory schools, it is essential that the preparatory school programs should be evaluated so as to be aware of their strengths and weaknesses.

Scriven (2003) states that evaluation is not just the process of determining facts about things, but it is expected to come up with a particular type of conclusion using evaluative terminology such as bad, good, better, worse, well, ill, elegant, poor and so forth to indicate the significance, value, worth or merit of an object.

According to Worthen (1990), evaluation is merely determining the value of something, which can be applied to programs of any size in educational settings. Language education practitioners have recently begun to realize the benefits of broader notions of evaluation as a means of informing program development, and focusing on program processes (Alderson & Beretta, 1992; Kiely & Rea-Dickins, 2005; Lynch, 1996). Evaluation can take two forms depending on the objectives. If the aim is to improve the program, it is typically called formative evaluation, and if the aim is to decide on the fate of the program, then it is called summative evaluation (Worthen 1990).

In order to gain a full understanding of the evaluation process the term 'evaluation' needs to be defined clearly.

Evaluation has a great number of definitions in the field. Lynch (1996), for example, defines evaluation as the systematic attempt to gather information in order to make judgments or decisions. As such, both qualitative and quantitative forms can be used to evaluate information, and different methods such as observation or the administration of pen-and-paper tests can be used to gather data. As for program evaluation, Lynch states that it not only provides insiders with valuable information on how the current work can be improved but also offers accountability to outside stakeholders (Lynch (1996).

Stufflebeam, Madaus and Kellaghan (2002) conceptualize the evaluation as neither a once-off nor a static activity. Brown (1995), in his explication of a systematic approach to language program development, points out that evaluation is the heart that connects and gives blood to all the other program elements.

Similarly, Richards (2001) defines evaluation as a systematic collection and analysis of all relevant information necessary to promote the improvement of the program and to assess its effectiveness within the context of the particular institutions involved.

Dickins and Germaine (1992) claim that there is a common belief that evaluation means the same as testing, and evaluation is done while students are being tested. However, testing is only one component of the evaluation process. They further state that evaluation is an indispensable part of teaching and learning. Evaluation should never be underestimated as a standardized and prepackaged process. However, planning evaluation could be a standardized, prepackaged process, and the steps involved in conducting an evaluation could clearly be identified (Ogle, 2002).

Scheerens, Glas and Thomas (2005) define educational evaluation as judging the value of educational objects on the basis of systematic information gathering in order to support decision making and learning. In line with the other practitioners and writers Scheerens, Glas and Thomas (2005) define educational evaluation as judging the value of educational objects on the basis of systematic information gathering in order to support decision making and learning.

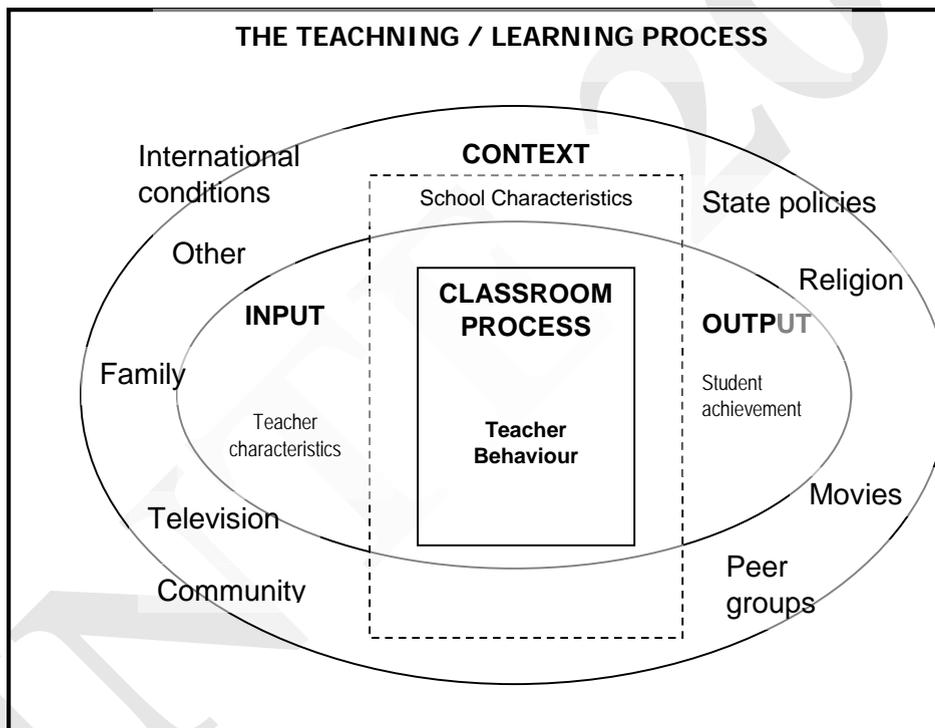

Stufflebeam (2002) describes the CIPP Model as adaptable and widely applicable to evaluate materials, personnel, students, programs, and projects in a range of disciplines and most important purpose of this evaluation is not to prove, but to improve.

The CIPP model's central components are context, input, process, and product evaluation. The objectives, methods and the relation of decision making functions of the components are given in Table 1.1

(Huitt, 2003). Table 1.2 illustrates Huitt's (2003) model of instructional process which identifies the major categories of variables that are related to school achievement.

Although the table 1 depicts the important features of the CIPP model, the components of the model might be summarized as follow: Context evaluation assesses needs, problems, and opportunities as bases for defining goals and priorities and judging the significance of outcomes. Input evaluation assesses alternative approaches to meeting needs as a means of planning programs and allocating resources. Process evaluation assesses the implementation of plans to guide activities and later to help explain outcomes. Product evaluation identifies intended and unintended outcomes both to help keep the process on track and determine effectiveness (Stufflebeam, 2002).

Table 1. A transactional model of the teaching/learning process (Huitt, 2003)

Inside the classroom there are a number of elements such as teachers, students, classroom environment and knowledge which are constantly interacting with each other (Huitt, 2003). Institutions can make use of information obtained through CIPP evaluations to solve institutional problems and meet accountability requirements. By disseminating evaluation reports, institutions can help stakeholders to participate in decision making process.

Table 2. Four types of evaluation in CIPP model.

	Context Evaluation	Input Evaluation	Process Evaluation	Product Evaluation
Objective	To define the institutional context, to identify the target population and assess their needs, to identify opportunities for addressing the needs, to diagnose problems underlying the needs and to judge whether the proposed objectives are sufficiently responsive to the assessed needs	To identify and assess system capabilities, alternative program strategies, procedural designs for implementing the strategies, budgets and schedules	To identify or predict in process defects in the procedural design or its implementation, to provide information for the preprogrammed decisions and to record and judge procedural events and activities	To collect descriptions judgments of outcomes and to relate them to objectives and to context, input and process information and to interpret their worth and merit
Method	By using such methods as system analysis, survey, document review, hearings, interviews, diagnostic tests and the Delphi techniques.	By inventorying and analyzing available human and material resources, solution strategies and procedural designs for relevance, feasibility, and economy	By monitoring the activity's potential procedural barriers and remaining alert to unanticipated ones, by obtaining specified information for programmed decision	By defining operationally and measuring outcome criteria, by collecting judgments of outcomes from stakeholders and by performing both qualitative and quantitative analyses.
Relation to decision making in the change process	For deciding upon the setting to be served, the goals associated with meeting needs or using opportunities, and the objectives associated with solving problems	For selecting sources of support, solution strategies and procedural designs	For implementing and refining the program design and procedure	For deciding to continue, terminate, modify or refocus a change activity and to present a clear record of effects(intended and unintended, positive and negative)

From *Evaluation Models Viewpoints on Educational and Human Services Evaluation Second Edition*. In Kellaghan, T., Madaus, G. F., Stufflebeam, D.L (Eds.) Dordrecht: Kluwer Academic Publishers. 2002 p.302.

Process evaluation includes three strategies. The first is to detect or predict deficiencies in the procedural design or its implementation stage, the second is to provide information for decisions and the third is to maintain a record of procedures as they take place. This stage, which includes the three strategies, occurs during the implementation stage of the curriculum development. It is a piloting process conducted to refine the program before district- wide implementation. From such evaluation, project decision makers obtain

information they need to anticipate and overcome procedural difficulties and to make decisions (Ornstein and Hunkins, 1988).

The focus of *process evaluation* is the implementation of a program or a strategy. The main purpose is to provide feedback about modification if the implementation proves inadequate. In process evaluation, formative assessment serves to the purpose to a great extent. Formative assessment tools, in their non-evaluative nature, are quizzes or assignments which are employed to provide timely, specific and corrective feedback to the learners and instructors (Cizek, 2009).

Production or progress evaluations are conducted to determine whether a program meets its goals. Implementation evaluations are conducted to determine whether a program is being conducted as planned (Ogle, 2002).

In paralel with the definitions above, Alkin (2011) also states that formative evaluation is conducted during the implementation and utilised to provide information to see how things are going. It might also provide the information whether the goals of the program are achievable or not.

2. Program Description

2.1 Evaluation Setting:

The evaluation took place in the Preparatory school of English Language Teaching (ELT) program, Sakarya University. The ELT program started education with 45 students in the fall term of 2010-2011 academic year..

2.2 Participants:

30 students who failed a language proficiency test enrolled in the preparatory school comprised the sample of the study. The evaluation process took 4 weeks in the middle of the term The participants were authorized to study in the department of English Teaching by the Turkish Higher Education Council according to their scores on the University Entrance Examination. Characteristics of participants were analysed by means of descriptive statistics and given in the following tables.

Table 3. Gender

	Frequency	Percent
Male	5	16,7
Female	25	83,3
Total	30	100,0

Table 4. Age

	Frequency	Percent
18 and under	17	56,7
19-24	13	43,3
Total	30	100,0

Table 5. Type of high school

	Frequency	Percent
General high school, Vocational high school	14	46,7
Super/ Anatolian Anatolian teacher / science/ Anatolian technique high school,	16	53,3
Total	30	100,0

Table 6. English course

	Frequency	Percent
Yes	14	46,7
No	16	53,3
Total	30	100,0

2.3 Evaluation Questions

This evaluation study sought answers to the following questions:

- 1) What are the students' perceptions of the speaking class?
- 2) What needs to be done to improve the quality of speaking class?
- 3) Is there a correlation between the success and student perceptions?

2.4 Evaluation Design

Following an initial meeting with the course instructor, it was agreed that a formative evaluation was needed to learn how the classes were 'going' in order to make necessary amendments in classroom procedures.

The result of the evaluation would be used both during the rest of the semester and during the next one, when he would be teaching the same class.

To measure students' perceptions of the speaking class, a questionnaire that included 66 items was adapted from Erozan (2005). The questionnaire was composed of four parts. The first part (items 1-4) gathered information about students' gender, age, high school type, and previous experience with English. The other parts were Likert-type scales. The second part (5-26) had twenty-one 5-point Likert scale questions to measure students' perceptions of the teaching-learning process. The third part (27-44) had nineteen 4-point Likert scale questions about their perceptions of the frequency of classroom activities and methods. The last part (45-66) had twenty-two 3-point Likert scale questions about how frequent the activities should be. In Part 2, the scale ranged from 'I strongly disagree' to 'I strongly agree,' in Part 3, from 'Never' to 'More than I want'; in Part 4, from 'Never' to 'Often'. In addition, an open-ended questionnaire with five items was given at the end of the questionnaire as the fifth part so that the students could elaborate on their answers to the items in the questionnaire

The data obtained from the closed items in the questionnaires were analyzed by using descriptive statistics from SPSS 15.0, through presenting the frequency counts of the responses for each item in the questionnaire. The internal consistency coefficient (Cronbach alpha) calculated for the reliability study was found to be $\alpha=0.80$. It was agreed before the administration of the questionnaire that a cut-off point of 60% was validated for decisions about all items. Cut-off score was chosen as 60 arbitrarily because the department, the instructor and the students were new. For example, if more than 60% of the students believed that the class was interesting, it would mean that the students perceived the class positively. To gain insight for the success rate of the students, six in-term scores obtained from all speaking exams were taken into consideration. The correlation between success rate and teaching-learning process was analyzed by means of Pearson Correlation test.

Open-ended items in the questionnaire were analyzed by listing all raw data (all the individual responses) under each item, and then grouping the similar responses, identifying common themes, and counting frequencies. In this part, since the interpretation of the students' opinions was essential to provide deeper insight into the research questions, qualitative method was resorted for open ended questions. Students' answers in the open ended questions were valuable for the evaluator to be able to observe whether there was a consistency between their responses in the closed ended questionnaire and its open ended counterpart. As Patton (1990) claims, qualitative methods are used to investigate 'What actually happens to people in the program? What they say about what happens to them?' (p.420).

3. Results

3.1 Statistical results-Descriptive Statistics

Students' responses in the 2nd part of the questionnaire showed that students generally had positive perceptions of the items. More than 60% of them agreed or strongly agreed on all the items except 7, 15, 20, 22, and 25.

Table 7. Items related to the student perceptions of teaching and learning process

Item No	Items		Strongly Disagree	Disagree	No Idea	Agree	Strongly Agree
8	A variety of activities is used in the course.	f		2	7	11	10
		%		6.7	23.3	36.7	33.3
9	The teacher teaches in an interesting way.	f		1	9	13	7
		%		3.3	30.0	43.3	23.3
10	It is easy to follow the teacher.	f		3	6	20	1
		%		10.0	20.0	66.7	3.3
16	The teacher pays equal attention to all students in the class.	f	1	3	6	14	6
		%	3.3	10.0	20.0	46.7	20.0
21	The lessons are taught in an interesting way.	f			10	17	3
		%			33.3	56.7	10.0

Table 7 indicates that although the items 8, 9, 10, 16, 21 were agreed on 70% or so, 30% of the students remained neutral, disagreed or strongly disagreed. From these responses, it seems that about 30% of the students either had difficulty in following the classes or found the classes tedious.

Table 8. Items related to the student perceptions of teaching and learning process

Item No	Items		Strongly Disagree	Disagree	No Idea	Agree	Strongly Agree
7	The students have cooperative relationships with each other.	f		2	14	10	4
		%		6.7	46.7	33.3	13.3
15	The teacher uses the board effectively.	f	1	4	8	15	2
		%	3.3	13.3	26.7	50.0	6.7
20	I use only English in class.	f	1	6	12	10	1
		%	3.3	20.0	40.0	33.3	3.3
22	Other students help me to learn in this course.	f	2	3	8	12	5
		%	6.7	10.0	26.7	40.0	16.7

25	The students give sufficient feedback on each other's performance.	f	6	4	14	3
		%	20.0	13.3	46.7	10.0

As indicated in Table 8, the items 7, 15, 20, 22, and 25 revealed that almost 50% of the students did not exchange ideas and collaborative work could not be utilized among them. The item results indicated that the students failed to engage in pair work and group discussions and could not establish class spirit.

Table 9. Items related to the student perceptions of teaching and learning process

Item No	Items		Strongly Disagree	Disagree	No Idea	Agree	Strongly Agree
5	There is an efficient use of time in class.	f			6	20	4
		%			20.0	66.7	13.3
6	There is a good student-teacher interaction in the course.	f				23	7
		%				76.7	23.3
11	The teacher's instructions about what we should do are clear.	f		1	8	14	7
		%		3.3	26.7	46.7	23.3
12	The teaching methodology of the teacher is effective in our learning.	f			5	16	9
		%			16.7	53.3	30.0
13	The teacher encourages us to participate in the lessons.	f				19	11
		%				63.3	36.7
14	The teacher uses audio-visual aids (OHP, video, CD player, etc.) effectively in the lessons.	f		1	2	12	15
		%		3.3	6.7	40.0	50.0
17	The teacher's correction our mistakes facilitates our learning.	f	1	1	2	15	11
		%	3.3	3.3	6.7	50.0	36.7
18	I prefer to work individually in class.	f	10	9	5	5	1
		%	33.3	30.0	16.7	16.7	3.3
19	I prefer to work with (a) partner(s) in class.	f		1	5	13	11
		%		3.3	16.7	43.3	36.7
23	The teacher helps me to learn in this course.	f			4	16	10
		%			13.3	53.3	33.3
24	The teacher gives sufficient feedback on our performance.	f		1	9	16	4
		%		3.3	30.0	53.3	13.3

As presented in Table 9, 100% of the students agreed on items 6 and 13, by indicating that they had interactive classes and their teacher motivated them for participation. The items 5, 11, 12, 14, 17, 18, 19, 23, 24 were related to the *instructor performance* and showed that 80% or more of the students were satisfied with their instructor in terms of the methods, techniques and corrective feedback.

Table 10. Items related to the frequency of activities.

Item No	Items	None	Not enough	The right amount	More than I wanted
26	Teacher lecture	f	1	24	5
		%	3.3	80.0	16.7
27	Silent individual work	f	1	24	2
		%	3.3	80.0	6.7
28	Student presentations	f	1	23	6
		%	3.3	76.7	20
29	Pair work	f		25	5
		%		83.3	16.7
30	Group work	f		24	6
		%		80	20
31	Discussions	f	9	18	3
		%	30	60	10
34	Projects	f	4	22	4
		%	13.3	73.3	13.3
35	Video sessions	f	5	20	5
		%	16.7	66.7	16.7
36	CD sessions	f	1	22	7
		%	3.3	73.3	23.3
37	Homework/Assignment	f	2	24	4
		%	6.7	80	13.3
40	Reading aloud (by students)	f	5	24	1
		%	16.7	80	3.3
41	Reading aloud (by the teacher)	f	1	24	2
		%	3.3	80.0	6.7

As presented in Table 10, Students' responses in the third part of the questionnaire showed that students generally had positive perceptions on the items. Of 19 items consisting the whole third part of the questionnaire, 12 items were found sufficient enough or more than sufficient. Pair work and group work seem to be the most frequently used activities with the percentage of 100% followed by teacher lectures and student presentations with the percentage of %96.

Table 11. Items related to the frequency of activities.

Item No	Items		None	Not enough	The right amount	More than I wanted
32	Games	f	6	16	8	
		%	20	53.3	26.7	
33	Role plays	f	10	12	5	1
		%	33.3	40	16.7	3.3
38	Peer correction	f	4	13	13	
		%	13.3	43.3	43.3	
39	Self correction	f	1	13	15	1
		%	3.3	43.3	50	3.3
42	Songs	f	3	21	6	
		%	10.0	70	20	
43	Peer evaluation/feedback	f	5	16	9	
		%	16.7	53.3	30.0	
44	Self evaluation	f	6	12	12	
		%	20	40	40	

As indicated in Table 11, the activities in the items 32, 33, 38, 39, 42, 43 and 44 were considered to be used insufficiently or were not used at all. Activities such as role plays with the percentage of %20 , songs with the percentage of %20, games with the percentage of %27 seem to be least used activities followed by peer feedback with the percentage of %30, self evaluation with the percentage of %40, Peer correction with the percentage of %43 and Self correction with the percentage of %53.

Table 12. Items related to the students' preferences of activities

Item No	Items	Never	Sometimes	Frequently
45	Teacher lectures	f	11	19
		%	36.7	63.3
47	Pair work	f	4	26
		%	13.3	86.7
48	Group work	f	8	22
		%	26.7	73.3
52	Video sessions	f	11	18
		%	36.7	63.3
53	Tape sessions	f	6	24
		%	20	80
56	Computer-aided activities	f	7	23
		%	23.3	76.7
59	Teacher correction	f	6	24
		%	20	80
64	Questioning (by the teacher)	f	9	21
		%	30	70

As indicated in Table 12, the activities in the items 45, 47, 48, 52, 53, 56, 59 and 64 were the most preferred activities. The findings of the fourth part of the questionnaire revealed that the participants mostly preferred pair work with the percentage of 86.7%, CD sessions with the percentage of 80% and teacher correction with the percentage of 80% in their Speaking Skills course. Second most wanted activities to be utilized during the courses are listed as computer aided activities with the percentage of 76.7%, group work with the percentage of 73.3% and questioning by the teacher with the percentage of 70%. Though not favored by the participants mostly, teacher lectures with the percentage of 63.3% and video sessions with the percentage of 63.3% could be categorized as moderately wanted activities. When the statistics were taken into consideration, it could be said that the participants stated a firm opinion on the need of pair work activities, teacher correction and the use of multimedia sources in classes.

Table 13. Items related to the students' preferences of activities

Item No	Items		Never	Sometimes	Frequently
46	Individual work	f	7	19	4
		%	23.3	63.3	13.3
49	Role-plays	f	11	14	5
		%	36.7	46.7	16.7
65	Translation	f	7	13	10
		%	23.3	43.3	33.3

As indicated in Table 13 the activities in the items 46, 49 and 65 were not preferred by the participants. Only 16.7 % of the participant wanted to use role play frequently, 33% of the participants preferred translation and 13% preferred individual work during Speaking Skills courses.

3.2 Inferential Statistics

Table 14. T-test results between the age of students and teaching-learning process in Speaking Skills course.

	Age	N	Mean	Std. Deviation	Degree of freedom	t	p
Process	18 and under	17	79,24	6,778	28	,002	,999
	19-24	13	79,23	7,791			

Table 14 shows that there is no significant difference between the age of students and teaching-learning process in Speaking Skills course ($t_{28}=0,002$; $p>0,05$).

Table 15. T-test results between the type of high school and teaching-learning process in Speaking Skills course.

	Type of High School	N	Mean	Std. Deviation	Degree of freedom	t	p
Process	A	14	80,86	5,736	28	8,027	,248
	B	16	77,81	8,027			

A: General High School, Vocational High School,

B: Super/ Anatolian / Anatolian Teacher / Science/ Anatolian Technique High School.

Table 15 reveals that there is no significant difference between the type of high school and teaching-learning process in Speaking Skills course ($t_{28}=8,027$; $p>0,05$).

Table 16. T-test results between previous experience of English course and teaching-learning process in Speaking Skills course.

	English Course	N	Mean	Std. Deviation	Degree of freedom	t	p
Process	Yes	14	80,50	6,925	28	,911	,370
	No	16	78,13	7,293			

Table 16 indicates that there is no significant difference between previous English course experience and teaching-learning process in Speaking Skills course ($t_{28}= 0,911$; $p>0,05$).

Table 17. Correlation between teaching-learning process and students' success rate

		Success	Process
Success	Pearson Correlation	1	,347
	Sig. (2-tailed)		,060
	N	30	30
Process	Pearson Correlation	,347	1
	Sig. (2-tailed)	,060	
	N	30	30

Table 17 signifies that there is a moderate correlation between teaching-learning process and students' success rate in Speaking Skills course ($p<0,05$). As is clearly known, several factors affect students' success in the process of education and Table 5.2.4 illustrates that students' perceptions on the teaching-learning process in Speaking Skills course have an impact on their success rate up to 12% (Determination coefficient, $r^2= 0,12$).

4. Open-ended Questions

Despite the fact that dialogues and conversations are considered to be the most evident and most frequently used speaking activities in language classrooms, a teacher has always a chance of selecting activities from a variety of tasks (Florez, 1999). Brown (1994) lists the possible in-class activities and tasks in six categories as imitative, intensive, transactional, responsive, interpersonal and extensive.

In light of these categories, the students' ideas about the most useful activities related to both receptive and productive skills were analyzed in the open ended question part. 22 students stated that they should somehow interact with others in the class, be it in group discussions or dialogs. Some believed that they could relate stories or other information to the speaking context. A third of the students underscored the importance of input, half of whom preferred watching movies. They think that watching subtitled films once a week may help them to acquire correct pronunciation, a wide range of vocabulary and improve their listening abilities.

Others mentioned reading, listening to authentic conversations, and memorizing prefabricated chunks may be also worthy to improve their listening abilities.

The theme of input emerged even more conspicuously in students' responses to how the instructor could help them most (12 instances). In addition to the being provided with input from the sources mentioned, two students wanted the instructor to 'give them information about speaking,' and one suggested memorizing vocabulary. The students also craved for motivation (7 instances), both in the form of encouragement and coercion from the instructor. Moreover, four students asked for whole class speaking activities such as discussions and individual speaking activities such as retelling stories and giving presentations.

The students believed that teaching learning process should include more group work, corrective feedback, and English practice. As a confirmation of students' demand for more discussions and dialogues, seven of the students believed that they should work in groups. However, in doing so, they wanted to be obliged to speak in English, a result that confirms the questionnaire's finding that they spoke in their L1 during the class hour (11 instances). Also, the students wanted corrective feedback from the instructor (7 instances).

The students' answer to question one – other possible activities and their preferred frequency – generally confirmed the above mentioned issues. They wanted to watch more films (8 instances), engage in dialogs (1 instance), prepare presentations (1 instance), be placed under pressure and encouraged to talk (1 instance), or listen more (1 instance). A different suggestion over the activities in the questionnaire was imitation (4 instances). One student suggested imitating local accents; another, songs. Still another asked for memorizing roles in a theatrical production and staging it.

5. Conclusions and Recommendations

The evaluation of the course revealed several significant results in that more pair work and group work is favored by the students. Student-centered classes are not preferred by the majority of the students. More peer correction is regarded as a helpful activity that might also serve to constitute a friendly atmosphere in class, which most students complained about. Students' perceptions clearly indicated that the most frequently used type of instructional method was students' presentations. From open ended question section, it is obvious that student do not prefer lecture type classes. They prefer interactive, entertaining and cooperative tasks in their learning process. As for the recommendation for the future studies, the study can be

reinforced by means of classroom observations, teacher interviews, learner diaries and recordings which will obviously give more reliable and generalisable results.

6. Limitations

The main limitation of this study was that the sample size was not big enough to have more generalizable results. Therefore, it is assumed that the relation between the student perceptions and success rates may reveal different results in a more comprehensive study.

Another limitation was that some of the responses students gave in open ended question part fell short of providing a clear 'picture'. Hence, these responses needed further elaboration.

For example, five students mentioned that they wanted 'activities' in class, without giving any more information. The evaluator and the instructor came to believe that an activity could be engaging students in more production-oriented tasks or providing them with a variety of tasks. Although all the students believed that the teacher tried to motivate them, seven of the students stated that they needed more encouragement and inducement. The last limitation which is worth mentioning was concerned with data collection instruments. Classroom observations, teacher interviews, learner diaries and recordings could not be done which could have given more detailed insights in the study.

Abstract

Tracking and observing graduates is a study field which has not been studied enough to meet the expectations in Turkey. Any type of data gathered are considered to be very significant in terms of both reorganization of educational content and providing solidarity between alumni. Tracking graduates is also thought to be useful in monitoring employment policies. The focus of this study is on the employment rates of graduates of Printing and Publishing Technologies program at two different universities, one of which is a state and the other is a foundation university. Evaluation has been made through Graduate Monitoring Surveys. Research techniques such as descriptive statistics, and the average percent has been used to analyze the data.

Keywords: Vocational Schools, Printing, Publishing, Graduates

1. INTRODUCTION

Vocational Schools in the Turkish educational system have been founded in order to provide communication between employees and management and to contribute to a continuous flow of the production cycle (Balci, 1996). Besides, the objective of existence of Vocational Schools has been divided into two main branches. The first is to provide employments of graduates in accordance with the demands of relevant sectors. The second is to prepare students to the license level of education after their graduation. These two axes has become important for the education system in vocational schools as well as employment.. Vocational schools conduct educational activities of the students while they track their graduates' employment rates. However it is an issue which has been neglected to a great extend in Turkey (Kavak,1992). Research on the subject is very few in Turkey. However there are some researches made by Arabacıoğlu and his colleagues in the field of Computer Programming. (Arabacıoğlu et al, 2011). A more extensive research on the graduate tracking is the Graduates Survey of Ankara University Faculty of Educational Sciences, which was conducted for three times (Taymaz, H. ve arkadaşları, 1995). Another graduate follow-up study was carried out by the Bakıoğlu and friends. The survey conducted by Bakıoğlu and his friends is about the experiences of the graduate tracking system. It also focuses on the attitudes towards career planning, volunteerism, communication, commitment to the school and the expectations of university graduates (Bakıoğlu, A. and Friends 2011).

Turkey Vocational Qualifications Authority (VQA), founded in 2006, sets the qualification needed within the framework of professional-level ranking of Level 5 which is briefly defined as the knowledge, skills and competence in a particular field's dimensions of expertise, being able to use their own initiative in case of unforeseen circumstances (www.myk.gov.tr). Printing and Publishing Technologies programs, which make up the main structure this research, have been founded to meet the needs in pre-press, printing, post-print production and management activities in the sector. (Karasar, 1981). The program was named "Printing Program" when first established in 1980. (Abike, 2003), which later took the name of "Printing and Publishing Technologies Program" with the Human Resources Development through Vocational Education Project (İKMEP).

2. Purpose

The aim of this study is to find answers to the following questions:

- What is the employment status of graduates of the program?
- Which the printing and publishing industries and jobs do the graduates work?
- What are the attitudes of graduates towards the training received in the program?
- What are the thoughts about the adequacy of training they have received?

3. Methodology

In this section includes research design, sampling, data collection, and resolution.

3.1. Research Methodology

The research has been carried out in a survey form. It was aimed to determine the employment status of Printing and Publishing Technologies Programme graduates. In this context, the researchers developed a questionnaire with 14 questions to get feedback from graduates.

3.2. Population and Sapmle

Participants of the survey are Printing and Publishing Technologies Programme graduates (2009-2012). In total there are 170 graduates, 40 of whom are from Yildiz Technical University and 130 of whom are from İstanbul Arel Üniversitesi. All graduates were reached via e-mail and social networking sites. Survey was conducted among the 85% of the İstanbul Arel University Graduates and 26% percent of the Yildiz Technical University graduates. Therefore 65% of the graduates took part in the survey with 111 questionnaire.

3.3. Data Collection and Analysis

The data used in the scope of research has been collected through questionnaires. The development of the survey has been carried out in two stages. The first stage includes the literature review and the review of the questionnaires used in such studies. The second stage includes preparation of a new questionnaire with the help of experts. Questionnaire includes three parts and fourteen questions regarding personal information, employment and opinions related to training received. The survey gathers data using statistical programs analyzed in the context of the frequency percentages.

4. Findings

This section includes the results obtained through questionnaires. Genders of the respondents were also determined in Table 1.

Table 1. Genders of the Respondents

		Gender		Total
		Female	Male	
University	Foundational	45	40	85
	State	21	5	26
	Total	66	45	111

85 out of 111 respondents are the graduates of a foundation university while 26 of them are from a state university. 66 of the respondents are female and 45 of them are male graduates of the related programme. Therefore it is possible to say that the survey has been preferred more by the female graduates.

4.1. Employment Findings

The participants are asked the question “Do you work in any field now?” The was asked “Yes” and “no” and all the participant graduates gave their answers. The data collected through the question is indicated in Table 2.

Tablo 2.The state of the graduates' employment in any area

University			Yes	No	Total	
Foundational	Gender	Female	Count	33	12	45
			%	73,3%	26,7%	100,0%
		Male	Count	29	11	40
			%	72,5%	27,5%	100,0%
	Total	Count	62	23	85	
		%	72,9%	27,1%	100,0%	
State	Gender	Female	Count	16	5	21
			%	76,2%	23,8%	100,0%
		Male	Count	5	0	5
			%	100,0%	,0%	100,0%
	Total	Count	21	5	26	
		%	80,8%	19,2%	100,0%	

76, 85% of the repondents stated that there were employed in an area while 23,15% are unemployed. 74,75% of those employed graduates are females and 86,25% is males.73,3% of employed foundation university graduates are females and 72,5 is males. 76,2 of the repondents who are employed graduates of state universitty are composed of females.All of the male graduates of state universities participating the survey are unemployed. The rate of the graduates of foundation universities who answered "No" is 27,2% while this rate is 19,2% in state universities. The graduates who answered "No" are asked fort he reasons why they do not work in any field. The data collected is shown in Table 3.

Table 3. The Reason Why the Graduates do not Work in Any Field.

University			Unemployed	Studies	Health	Military Service	Giving Birth	Total	
Foundational	Gender	Female	Sayı	3	6	1	0	1	11
		%	27,3%	54,5%	9,1%	,0%	9,1%	100,0%	
	Male	Sayı	2	7	0	1	0	10	
		%	20,0%	70,0%	,0%	10,0%	,0%	100,0%	
	Total	Sayı	5	13	1	1	1	21	
		%	23,8%	61,9%	4,8%	4,8%	4,8%	100,0%	
State	Gender	Female	Sayı	2	1		2	5	
		%	40,0%	20,0%		40,0%	100,0%		
	Total	Sayı	2	1		2	5		
		%	40,0%	20,0%		40,0%	100,0%		

31.9% of those who answered 'no' are unemployed, 40,95% is maintaining their studies, 22,4% is not working giving, 4,8% because of health and 4,8% is working because of their military service issues. When the difference between Foundational and State Universities are surveyed, it is indicated that 61.9% Foundational University graduates maintain their studies, 23.8% are unemployed, and 4.8% of them are not employed in an area because of their military service, health and giving birth issues. Whereas 40% State University graduates are unemployed, 20% maintain their studies, and 40% of them are not employed in an area because of giving birth. When the survey is analysed depending on gender, %33.65 of females are unemployed, %37,25 maintain their studies and %24,55 are not employed because of giving birth.

The graduate participants of the survey are asked the question "Are you working in an area dealing with your university studies?" The answers of the question are in "Yes" and "No" type, and they are indicated in Table 4.

Table 4. Graduates' state of working in an area dealing with their university studies

University			Yes	No	Total
Foundational	Gender	Female			
		Count	16	29	45
		%	35,6%	64,4%	100,0%
		Male			
	Count	15	25	40	
	%	37,5%	62,5%	100,0%	
	Total				
	Count	31	54	85	
%	36,5%	63,5%	100,0%		
State	Gender	Female			
		Count	13	8	21
		%	61,9%	38,1%	100,0%
		Male			
	Count	3	2	5	
	%	60,0%	40,0%	100,0%	
	Total				
	Count	16	10	26	
%	61,5%	38,5%	100,0%		

When the graduates' state of working in an area dealing with their university studies is analysed; it is observed that 51% of graduates are not employed in their studied areas in total. The rate of those employed in their studied area is 49% in total. 51,30% of those are not employed in their studied areas are females and 48,70% are composed of males. When their employment states are observed under school basis, 63,5% of Foundational University graduates work in their related areas while 36,5% of them do not. 61,5% of State University graduates work in their related areas while 38,5% of them do not.

In the survey, graduates were asked the question "What is your reason to work in an area that you did not study at university?" The question has four optional answers; "I searched for a position in my sector but could not find it", "I realized that the sector I studied does not fit me", "I am maintaining my studies" and "Other". The answers given by the graduates are indicated in Table 5.

Table 5. The Reason Why Graduates Work in A Different Area Rather Than Working in the Sector They Studied at University

University			I searched for a position in my sector but could not find it	I realised that the sector I studied does not fit me	I am maintaining my studies	Other	Total	
Foundational	Gender	Female	Count	15	7	6	2	30
			%	50,00%	23,00%	20,00%	7,00%	100,00%
	Male	Count	11	5	7	1	24	
		%	46,00%	21,00%	29,00%	4,00%	100,00%	
	Total	Count	26	12	13	3	54	
		%	48,00%	22,00%	24,50%	5,50%	100,00%	
State	Gender	Female	Count	5	1	1	2	9
			%	56,00%	11,00%	11,00%	22,00%	100,00%
	Male	Count	0	2	0	0	2	
		%	0,00%	100,00%	0,00%	0,00%	100,00%	
	Total	Count	5	3	1	2	11	
		%	46,00%	27,00%	9,00%	18,00%	100,00%	

When the table is analysed 47% of the participants stated that they searched for a position in their related sector but could not find one. The general average rate of those stated that their related sector did not fit them is 25,5%. The rate of those who maintain their further education but do not work is 16,75% in average. When the rates are analysed depending on Foundational Universities, 48% of foundational university graduates stated that they could not fit into a position in their related sector. 22% of foundational university graduate participants stated that the sector they studied does not fit them, 24,5% stated that they are still maintaining their studies in a further education foundation. When the survey is analysed in gender depending on their state of not working in their related sector 53% of women stated that they searched for a position in their related sector but could not find it. While 17% of females stated that the related sector is inappropriate for them, 15,5% stated that they are maintaining their studies in a further education foundation. 23% of males stated that they searched for a position in their related area but could not find it whereas 0,1% stated that their related sector is inappropriate for them. The rate of the male graduates who are maintaining their studies in a further education foundation is 14,5%. The graduates in the "Other" segment stated that they are not employed because of giving birth.

Under this survey, it is aimed to determine the sector branches where the graduates are occupied. In this content graduates are asked in what branches they are occupied by giving them an alternative list of 20 business branches. In the process, assuming that some may work in more than one area, graduates are asked to mark more than one option. Depending on the graduates' answers, the evaluation is done over 11 options by eliminating 9. The business branches and their ranges in the sector are indicated in Table 6.

Table 6. Business Branches Where Graduates are Occupied in the Sector

Fields	Count	University		%
		State	Foundational	
Graphic Design	62	19	43	30
Planing	24	12	12	11
Postpress (Folding, Cutting, Saddlestitching, Binding)	23	4	19	11
Sales/Marketing	17	6	11	8
Customer Representative	16	5	11	8
Assembly+Plate	16	8	8	8
Film-CTP	12	8	4	5
Sheetfed Offset	11	4	7	5
Costing	8	5	3	4
Quality Control	8	3	5	4
Other (Web, Flexo, Photogravure, Silk-Screened Printig, Product management)	13	5	8	6
			Total	100

When business branches of the sector where graduates are occupied are analysed, it is seen that Graphic Design is the most occupied business branch with a 30% rate. Planning and Prostpress have 11%, Sales and Marketing has 8%, Customer Representative and Assembly anda plate are listed in a row. Business branches with 5% share are Film-CTP and Sheetfed Offset fields. The rate of graduates working in Costing, Quality Control branches is 4%. Under “Other” option, it is seen that the graduates are occupied in Web Offset Printing, Flexo Printing, Photogravure Printing, Silk-Screened Printing and Product Management branches.

4.2. Viewpoints About the Education Taken

On the scope of the research graduates are asked the question “Is the education taken in Vocational School of Higher Education adequate for you in your work life?” As answers, “Inadequate”, “Partly adequate” and “Adequate” are given. The result data of the question is indicated in Table 7.

Table 7. The Level of Adequateness of the Graduates' Education Taken in Vocational School of Higher Education in Work life

University			Inadequate	Partly adequate	Adequate	Total		
Foundational	Gender	Female	Count	5	8	4	17	
			%	30,0%	45,0%	25,0%	100,0%	
		Male	Count	3	5	6	14	
			%	23,5%	35,3%	41,2%	100,0%	
	Total	Count	8	13	10	31		
		%	27,0%	40,5%	32,4%	100,0%		
	State	Gender	Female	Count	2	10	1	13
				%	14,3%	78,6%	7,1%	100,0%
Male			Count	0	3	0	3	
			%	,0%	100,0%	,0%	100,0%	
Total		Count	2	14	1	16		
		%	11,8%	82,4%	5,9%	100,0%		

On the scope of the research when the answers the graduates gave are analysed, 19,4% stated that the education taken in the Vocational School of Higher Education is inadequate in work life. Depending on the table, 61,45% of the graduates stated "partly adequate" while 19,5% stated "adequate". When the difference between the adequateness level of education in work life between Foundational and State Universities is analysed, 27% of foundational university graduates stated "inadequate", 40% of them stated "partly adequate", 32,4% stated that it is "adequate". 11,8% of State University graduates stated that it is "inadequate", 82,4% stated "partly adequate", 5,9% stated that it is "adequate". These results indicate that graduates of Foundational Universities state that education is adequate more than those in State Universities. When the answers are analysed in terms of gender, 22,15% females state that it is "adequate", 61,8% state "partly adequate", and 16,05% state "adequate" while 11,75% of males state that it is "inadequate", 67,65% state that it is "partly adequate" and 20,06% state "adequate". Depending on the data, a great range of graduates express their opinions as the education taken in Vocational Schools of Higher Education is adequate in their work life.

5. Conclusion and Proposals

As a result of the research the following findings were determined.

Graduates take part in work life regardless of their educational backgrounds. The data collected indicates that graduates do not face any problems in finding jobs whether they are graduated from Foundational or State Universities. It is observed that the graduates who are not employed in an area are mainly maintaining their studies in further education foundations such as bachelor's degree.

When the employment of the graduates in their related sectors are analysed, it is clearly seen that the rates had a sharp decrease. Depending on the topic, graduates indicated that the most important reason why they do not work in their related areas is that they cannot find any positions. With reference to the findings of this research it is considered that it is a need to meet the participation of all sides at once and analyse the reasons of unemployment together and create an action plan depending on the results. In this way the effort and time spent may be used in a more appropriate way and more beneficial results may be acquired. Another result of the finding emerged in this research is that the rate of the graduates thinking their related sector is inappropriate for them are high. Thence, the necessity and obligation of a research on the reasons why their related sector is inappropriate for them has emerged. The reasons must be analysed apartly and be presented.

The findings indicate that graduates are mostly employed in Graphic Design field. Other fields are planning, marketing, customer service, and after printing. The education given and the content of the courses must be reorganised with reference to their efficiency and productivity in their fields.

It is seen that the adequateness level of education taken in Vocational School of Higher Education is under the level expected. It is proposed that professionals from both public institutions and education area must come together and revise course programs and analyse the course programs at the end of each year.

The research done is aimed to present the general frame of the graduates of Publishing and Printing Technologies Program of Vocational School of Higher Education. For this reason, it is concluded as a scientific study must be carried out on every single finding emerged on the scope of this research.

Synchronous Interaction in Online Learning Environments with Adobe Connect Pro

Emel Dikbaş Torun*

Pamukkale University, Faculty of Communication, 20200, Denizli, Turkey

Abstract

Universities now have the potential of Web 2.0 technologies to facilitate learning opportunities to support, communicate and interact with learners of all ages from all over the world. This study focuses on the use of an online collaboration and virtual classroom system, Adobe Connect Pro, in an undergraduate distance learning programme of an international university. Virtual classroom's 74 students of the online Web Programming course including the content of .NET programming with Visual Studio 2012 participated in the study. Course's perceived teaching and learning quality, interaction, instructor's support, live tutorials, technical issues and challenges are reported as the key dimensions of the synchronous e-learning environments.

Keywords: Interaction; Synchronous Learning; Virtual Classroom; Adobe Connect

1. Introduction

During the last decade the use of computer and internet increasingly changed many concepts in our lives. The internet has also changed the way we communicate and transformed our learning. The rapid growth and integration of internet-based learning technologies has emerged the phenomenon known as e-learning.

E-learning requires a set of applications and processes such as computer-based learning, web-based learning, virtual classrooms and online collaboration. The evolution of e-learning continues with the e-learning 2.0 as the consequence of online innovations.

Generally, e-learning can be defined as an open and distributed dynamic learning environment allowing instructors and learners interact with well-designed web based technology tools in order to share and reuse course materials at any time from any place. In a professionally designed system, e-learning can provide accessible, relevant and high quality learning opportunities so that every learner can achieve his/her own personalized learning. Content delivery can be synchronous (all participants are logged on at the same time and communicate directly, e.g. Virtual classrooms, video conferencing, two-direction live satellite broadcasts) or asynchronous (participants cannot communicate without time delay, e.g. CD-ROM, self-paced courses, videotaped classes, email, discussion groups) (Gallaher, 2002).

Synchronous e-learning tools such as video conferencing (e. g. Skype), web-based seminar (e. g. Elluminate, Wimba, Blackboard Collaborate, iVisit and Adobe Connect), chat rooms and instant messaging are used to enrich

E-mail address: edikbas@gmail.com

the e-learning environments by facilitating online participation. Implementing a synchronous learning platform in an online course may improve students' participation and motivation (Hudson et al., 2012). Synchronous e-learning environments are described as virtual classrooms or digital version of classroom meetings (Almpanis et al., 2011).

Asynchronous technologies such as Blackboard, Moodle, Web 2.0 tools and learning management systems (LMS) give students the ability to communicate with their teachers and peers together with a full-time open access to content including course materials, lecture notes, tutorials, messages and recordings. However the lack of interaction or real-time learning experience in an e-learning environment can lead to a low level of participation. Contemporary e-learning technologies can offer solutions (Stewart et al., 2011) to various problems such as attracting students and providing support.

On the other hand, the new generation teachers who use technology effectively in their classrooms now play the role of mentor, coach (Volman, 2005) and facilitator (e-moderator) (Salmon, 2004) by using online technologies rather than being a transmitter of knowledge or using ICT in their classrooms. Teachers also try to adapt new technologies and educational changes into their teaching environments in order to enhance the quality of education (Ham & Davey, 2005). Teachers need to be able to give emotional and social support, observe learners' performance, provide encouragement and immediate feedback in order that students develop their own knowledge and learn at their own paces (Entonado & Diaz, 2006).

E-learning can also play a critical role in training the new generation learners of all ages from all over the world. E-learning provides collaboration and networked communities for learners to work and conduct research together or to share problems, innovations, and various course materials. E-learning can also transform the traditional paradigm of teaching and learning. Considering the value of e-learning in enhancing the skills of learners, it is possible to generate the successful and skilled students who can easily transform the information into their own knowledge.

The present study contributes to the related literature in this field of research by investigating the learners' perspective of an e-learning course which is processed in an international university's online learning platform. It is important to understand the dynamics of an e-learning environment in order to provide better e-learning opportunities for distance learners who search for effective learning. The investigation addressed the following research question:

- What are the learners' perspectives on the effectiveness, usability and the challenges of an e-learning environment?
- What implications does this study provide to improve the virtual classrooms for e-learning?

2. Research Method and Data Collection

2.1. Participants

This study was conducted over a 13-week semester during the first half of 2013 with the participation of 74 students aged between 18-44 from a distance education course of an international virtual university. Participants were undergraduates in the final year of a four-year management information systems degree. Approximately half of the participants work part time or full time during the day. Table 1 shows the characteristics of the participants.

Table 1. Characteristics of participants

	Category	Number
Gender	Female	18
	Male	56
	Total	74
Age	18-30	25
	30-40	40
	40+	9
Job	Part time	17
	Full Time	48
	None	9

2.2. Virtual Classroom with Adobe Connect Pro

A web-based, centrally-hosted platform; Adobe Connect Pro web conferencing tool which students enrolled the e-learning system's virtual classroom was used in this study. The subject being taught was Web Programming II course which is a 4th year undergraduate course module for Management Information Systems. The module ran over 13 weeks and required minimum 45 minutes of synchronous session study per week during weekdays.

Figure 1 illustrates a typical virtual classroom layout, with the video/audio, instructor, attendee list and shared whiteboard window panes. The panes such as text-based chat, polling, timeline, application and file sharing were also revealed.

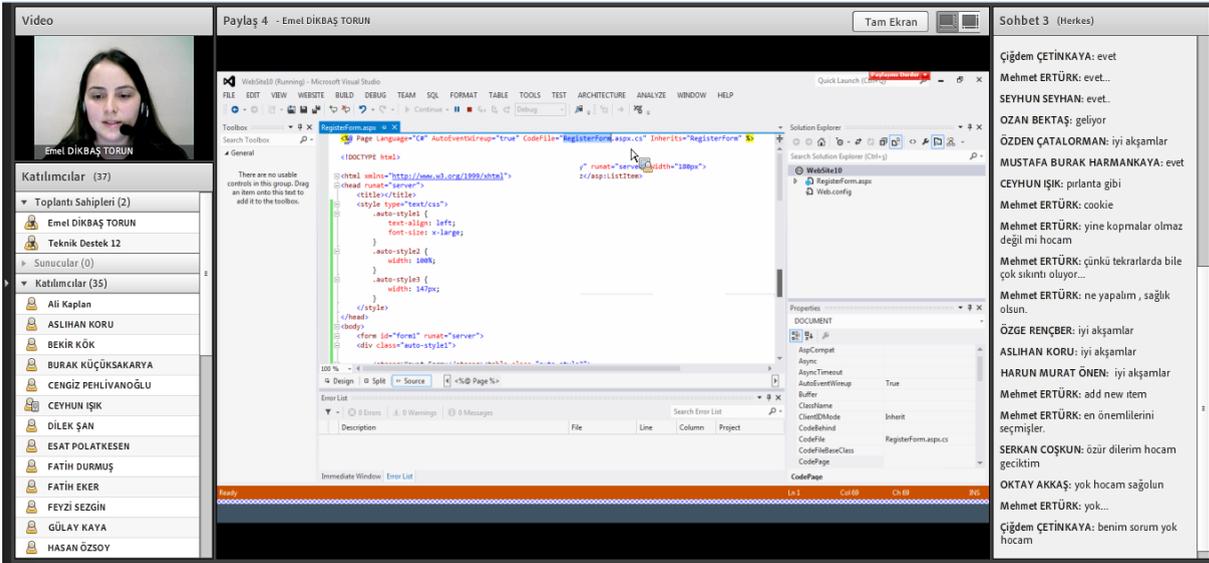

Figure 4: Screenshot of an Adobe Connect interface, showing (from left to right) camera and voice, attendee list, screen share- file share and chat panels. The instructor has taught web programming and code development synchronously with Visual Studio 2012 .NET platform.

The instructor constructed a theory-practice teaching process for this course that students had the ability to learn code writing in Web Programming II online class with live tutorials in Visual Studio .NET 2012 platform.

The first 15-20 minutes of the webinar include theoretical presentation of the course content based on the curriculum and the rest was live tutorials for coding practice with Visual Studio .NET 2012 platform. Web Programming II class consisted of the chapters such as Visual Basic .NET, Asp .NET, SQL and ADO .NET. These topics, by their nature, are not usually suitable for simple PowerPoint presentation type of webinars and have to be taught and supported by a live tutorial so that synchronous learning and communication would be more attractive for the students.

The course content based on the curriculum was available in the LMS 24/7 for the students and instructors which were programmed as interactive Flash educational softwares by the content experts and consultants. The flow of the synchronous session presentations and the tutorials of the chapter for each webinar were constructed purposefully by the instructor in order to reach the teaching and learning process goals at the end of the semester.

2.3. Data Collection

A questionnaire including 5-point Likert scale, multiple choice and short response sections was developed and administered by the researcher at the end of the semester by using the online survey (see figure 2) option of Google Drive™. The questionnaire's Likert Type section was partly adopted from Falloon (2011), translated

into Turkish and evaluated. Expert reviews were taken into consideration during scale development process. The short response section of the questionnaire was developed by the researcher and transcribed. A mixed methods approach (qualitative for participants' short responses and quantitative for analysis of 5 point Likert Type questionnaire data) research design was adopted.

3. Results

This study focused on the students' perceived learning outcome, their experience and preferences related to the use of the virtual classroom and synchronous e-learning environment. Due to questionnaire section types, results were analysed quantitative/qualitatively and a large volume of data has been examined. In the questionnaire's Likert Type section results (see Table 2), a slight majority of the students (88 %) agreed or strongly agreed that virtual classrooms of e-learning improved their learning and it was nice to be a part of a virtual learning community.

Similarly, 66 students (88%) of the total 74, indicated that they had new skills in the virtual classroom during learning online. 63 students (85%) evaluated e-learning and learning in a virtual classroom as beneficial, and the same percent of the students' reported that the instructor's shared information and course materials helped them to learn. However, 23 students (32%) were neutral in ease of self expression during online sessions of the virtual classroom. On the other hand students' perception of learner isolation was critic. 26 students (35%) reported that they sometimes experienced isolation, while 36 (49%) students disagreed and 12 students (16%) were neutral about learner isolation.

Table 8: Likert type section statements and number of the responses

Statement	Number of Responses					
	1	2	3	4	5	N
The use of virtual classroom in e-learning improved my learning		5	3	33	33	74
The virtual classroom had a positive effect on my relationship with others in the e-learning environment	2	9	30	21	12	74
It was easy to interact with the instructor			2	36	36	74
It was nice to be a part of a virtual learning community		3	6	35	30	74
Sometimes I experienced learner isolation during virtual sessions	9	27	12	20	6	74
Virtual classroom had a positive effect on my studies			2	51	21	74
Virtual classroom would be used more frequently in e-learning			8	39	27	74
It was easy to express myself during virtual sessions		3	23	27	21	74
I had new skills in the virtual classroom during learning online	2	3	3	39	27	74
E-learning and learning in a virtual classroom is beneficial for students			11	27	36	74
The instructor shared us the information and course materials that helped me to learn			11	27	36	74

The results of the responses for multiple choice section reported students' perspectives on virtual classroom session time, the technical features and challenges of the environment, live tutorials that the instructor presented and the time limit of the live tutorials. All of the students (32: very beneficial, 42: beneficial, 0 neutral or non-beneficial) clearly indicated that the live tutorials were undoubtedly beneficial for their own learning processes in the virtual classroom. 16 students reported that the technical background of the virtual classroom system was inadequate and needs to be developed. Some of the students criticized the time limit of the live tutorials and the synchronous virtual classroom sessions. From students' perspective, in a virtual classroom environment the live presentation and tutorials need to be used more frequently and longer, therefore they reported that the total time (45 minutes) of the virtual classroom session was inconvenient.

The short response section of the questionnaire focused on the students' implication and critics about the e-learning and virtual classroom sessions. Due to the large volume of qualitative data some of the main transcription topics are reported in this section.

From some of the students' perspective in this course, online learning and virtual universities are the most beneficial dimensions of the e-learning in providing a degree chance for the students with difficulties and disabilities.

Students also reported that synchronous environments would be much more effective on students' learning processes, collaboration and communication as well as the instructor's teaching and communication processes when supported with asynchronous environments via LMS such as recorded virtual classroom sessions. Students indicated that the video archive of the live sessions guided and supported them too much. The students also reported those uploaded content as very useful and helpful to study. The instructor's information messages days before the next session, including the session and tutorial topics led to a kind of self-awareness at the students' side. Students' short answers concluded that instructor's informing posts remind them of the self-awareness about the course and guide them to an increased level of online presence.

The most challenging issues reported by the students were about the network connection and technical problems. In this study, as stated before, the instructor carried out the practice sessions on code development in Visual Studio .NET 2012 platform. While connecting to the platform the Adobe Connect System cancels the session for a while and this cancellation results as the loss of the internet connection. This is a big disadvantage for engagement, synchronous learning, social presence and attentional processes waiting for to be addressed in terms of quality of the connection.

4. Conclusion

In this study, findings indicated that perceived teaching and learning quality, time, live tutorials instead of slide presentations, collaboration, learning outcomes and technical issues are the valued dimensions of synchronous e-learning in a virtual classroom setting.

Virtual classroom tools as Adobe Connect are widely available for use in e-learning. However, there is a need for more research and practice on how effectively incorporate these tools in maximizing the learning outcomes. This paper has presented students' experiences and perspectives on the use of virtual classrooms of synchronous e-learning. Further, the lessons learned from this study may then be used as a basis for implementing virtual e-learning system and settings. However, more research is needed to combine different scenarios of virtual synchronous e-learning environments and guide the students to enhance their own learning outcomes. Further

research may also provide new implications for future development of virtual classrooms of synchronous e-learning.

Teacher's subjective definition of family

Jana Marie Havigerová^{a*}, Jiří Haviger, Zuzana Truhlářová^aUniversity of Hradec Králové, Institute of Social Work, 50003, Hradec Králové, Czech Republic

Abstract

The research purpose is to gain information about how the teachers understand the term family. The aim of this contribution is to document the main ideas underlying the teacher's subjective definition of term family. The research was attended by 45 students of a combined form of pre-primary and primary education studies (age: 20 to 52). There were appeared 95 different terms used for a definition of the family that have been aggregated into 7 categories: social roles (including kinship relations and ancestry), emotions, responsibilities (including child welfare), being together, economics (housekeeping), leisure and care. Some students were able to include in the definition families without or with adopted children, extended family (such as grandmothers and grandfathers) or some non-traditional forms of family life – these definitions have occurred only rarely. Within the framework of teaching (there is a theme *Child and the family* in the curriculum) we reveal some blind spots in understanding of family and we try to enrich student's concepts of family towards huge comprehension, a better orientation at the problematic and more open treatment of the subject for pupils. Teachers should be therefore able to explain the problematic in an acceptable, sensitive and, if possible, positive way.

Keywords: family, implicate theory, primary and preprimary education

1. Introduction

If you ask anyone whether he/she knows what a family is, he/she would look in a surprise towards such a strange question. For sure Family is the state basis, a basic social unit (William James Durant even says that family is a *nucleus of civilization*), where a child is born to, where the child is further socialized into wider society. The answer for this simple question is not easy to answer. The society is changing and its basic unit, the family also. Well, it's time where the need of ingrained content should be redefined (Corbett, 2004).

1.1. Family

The term *family* comes from Latin *familia* - household (including servants as well as kin of the householder), from *famulus* – servant. It was first known use of the term in the 15th century in Middle English *familie*.

It can be traced in the dictionaries (Merriam Webster, n.d.) mostly 8 types of definitions of family:

1. a group of individuals living under one roof and usually under one head : household,
2. a group of persons of common ancestry: clan or a people or group of peoples regarded as deriving from a common stock: race,
3. a group of people united by certain convictions or a common affiliation: fellowship, the staff of a high official (as the President),
4. a group of things related by common characteristics: as a closely related series of elements or chemical compounds, a group of soils with similar chemical and physical properties (as texture, pH, and mineral content) that comprise a category ranking above the series and below the subgroup in soil classification, a group of related languages descended from a single ancestral language,
5. the basic unit in society traditionally consisting of two parents rearing their children; also : any of various social units differing from but regarded as equivalent to the traditional family (a single-parent family), spouse and children (want to spend more time with my family),
6. a group of related plants or animals forming a category ranking above a genus and below an order and usually comprising several to many genera, in livestock breeding: the descendants or line of a particular individual especially of some outstanding female or an identifiable strain within a breed,
7. a set of curves or surfaces whose equations differ only in parameters ,
8. a unit of a crime syndicate (as the Mafia) operating within a geographical area.

Synonyms for term family can be blood, clan, folks, house, kin, kindred, kinfolk (or kinfolks), kinsfolk, line, lineage, people, race, stock, tribe.

The scientific theory of family is usually based on basic definition that the nuclear family is a universal institution for nurturing children. Three features of family follow from this instruction developed the world famous Bronislaw Malinowski (Skalnik, 2006):

- family is a bounded social unit,
- families have shared place,
- family members have emotional ties.

Family can also be consider as institutionalized social formation of at least three persons, among whom there are parental, family or marital ties (Stašová, 2001).

Some authors further claim that it is a unit whose primary function is not to give birth to children but to socialize them. Parsons (In Parsons, & Bales, 1956) attributes to unit further characteristics:

- family is a solidary group stratified by ascribed statuses such as age and gender,
- family is a cooperative unit; families shared the principle of division of labour.

Becker (1993) adds that:

- family has collective goals.

Family members' interests that differ from their family ones might be viewed as 'deviant'. This is undoubtedly true in families' interests that differ from their society ones might be viewed as abnormal, strange or deviant.

Some authors point out on many other aspects such as an isolated family, lesbian/gay family, biological/blood family, peaceful and nurturing family versus male domination or domestic violence, patriarchy/matriarchy and so on (Tae, 2009).

1.2. Implicit theories

The notion of implicit theory comes from Latin *implico* (to weave) and means: inclusive, contained but also failed directly or understanding itself. Implicit (also subjective, naive) theory is designation of laical theoretical concepts, so concepts which are made by common people inadvertently and unconsciously about the life and the world all around (sometimes in this context also labelled as knowledge and conviction - beliefs, personal construct, mental representation or mental folk or naïve models, further see Sedláková, 2000).

It can be defined as relatively stable sets of imaginations, definitions and knowledge connected with specific phenomena (e.g. normalities, learning, life origin etc.) (Groeben, Scheel, 2001). Rosch and Lakoff (Lakoff, 1987) understand as set of types or categories purely descriptive character (e.g. we can on a request to describe a normal family or to list several typical examples of problematic families). These unconscious mind contents reflect towards inner reality (e.g. let us answer the question what is my own family, what type of family I want or is my family normal?) and the behaviour and acting in the outside world (e.g. I could have lived in this family or something does not add up here, they look strange to me). Although people tend to have a clear imagination about a prototype they are usually not able to justify and mark the boarder for the notion (e.g. they are able to mark certain cohabitation as a family without being able to justify it etc.). In the area of implicit theories it is common while explanation the cause and effect is confused and many other similar "symptoms" (Furnham, 1988). Therefore it is different from scientific studies which always have well thought and certified system of statements interpreting following phenomenon.

The establishment of implicit theories is presumed by analogical development of attitudes: either by the way of unwitting acceptance of social surrounding (including media contents) and/or on the base of evaluating own experience (Sternberg, 1985).

The general purpose of existence of implicit theory is the interpretation of individual and social facts, works as a tool for explanation and prediction of human behaviour.

To penetrate into the interior of implicit theories is possible by linguistic utterances. Research is developed since such characteristics. We have recorded wide range of methods for obtaining data for this study of implicit theories. (Benveniste, Lecouteur, & Hepworth, 1999, Cameron, 2002, Howarth C., Foster, J, & Dorrer N., 2004). It is possible to use any of listed methods or their combinations for study of implicit theories. As far as we are concerned that it is possible to use any method. But however any method used the emphasis must be placed on understanding and verification of gained model of implicit theory by the informant him/herself.

2. Method

2.1. Purpose of study

Research questions for this paper are three:

1. Which categories are used by teachers to explain the concept of family?
2. How many categories are used by teachers to explain the concept of the family?
3. Where are the blind spots in the teacher's implicit theories of family?

2.2. Participants

This part of research was conducted in 45 students of part-time master study of pre-primary and primary education. It is a study when working and therefore all the respondents are working in education at the same time.

Forty-four women and one man participated in the research which is a reflection of a typical state of Czech education which is mainly in the field of pre-primary and primary education highly over-feminized.

The research group in terms of marital status is described in table 1

Table 9: Research sample - marital status: Frequencies (N=45)

<i>Marital Status</i>	<i>Frequency</i>	<i>Percent</i>	<i>Cumulative Percent</i>
1 single	16	35,6	35,6
2 married	25	55,6	91,1
3 divorced	4	8,9	100,0
<i>Total</i>	<i>45</i>	<i>100,0</i>	

Table 2 describes a research group in terms of a number of children.

Table 10: Research sample - number of children: Frequencies (N=45)

<i>Number Of Children</i>	<i>Frequency</i>	<i>Percent</i>	<i>Cumulative Percent</i>
0	18	40,0	40,0
1	5	11,1	51,1
2	17	37,8	88,9
3	3	6,7	95,6
4	2	4,4	100,0
<i>Total</i>	<i>45</i>	<i>100,0</i>	

Table 3 describes a distribution of research sample in terms of variable age.

Table 11: Research sample - age: Descriptive statistics (N=45)

	<i>Minimum</i>	<i>Maximum</i>	<i>Mean</i>	<i>Std. Deviation</i>
Age	20	52	34,24	9,333

2.3. Method

The contribution presents partial results of a wider research project. The proceeded data have been gained by the method of free explanation. The instruction for students of combined pedagogical study was: *Imagine that*

you met someone who had not heard anything about the term family (child, stranger, UFO, Mr No...). Explain to Mr No, what is the meaning of family term.

2.4. Procedure

The students of education are asked in several psychological disciplines to work with different themes and methods. In the course of social psychology there is address issue of family. At the start of the lesson the students are confronted with their implicit theories of family. Firstly, they are asked to imagine that they met someone who had not heard anything about the term family (child, stranger, UFO, Mr No...), the instruction is: Explain to Mr No, what is the meaning of family term. They subsequently explain what is similar and what is different in term of: marriage, cohabitation, bloodline, wider relationships. In the course of Research methods the teachers fill the method of repertory grid, where are the feedbacks for choice of elements selected by both introduced poles of behavioural, emotional and cognitive elements of posture and the most frequent stereotypes (e.g. Family where we would like to live, Typical Czech family). In the course of Czech language the students generates adjectives for description and family evaluation. This contribution refers about results gained by the first mentioned method.

2.5. Data processing

The obtained answers of the teachers were transcribed into PC and processed in two phases.

The first phase was based on the procedures of qualitative methodology. The data was pre-processed using the creation of clusters (trsy) described by Miovský (2006): reduction of the first order (omission of the unimportant, rhetorical padding etc.) and segmentation of statements to units of meaning. Each unit of meaning corresponded either to a word or phrase (e.g. Love, they love each other). Each unit was assigned a label in the form of a noun (i.e. the label of the units which were not nouns was created with substantivization, e.g. they love each other = love, they return to each other = return). The labels were categorized based on the methods of similarity, overlap, contrast and comparison (i.e. the labels protection and support were put into the category care as the contents of both fall under the phenomenon of being together, another example: the labels loneliness and togetherness were both put into the category being together, since they refer to the two sides of the same phenomenon). The categorization was done by two independent observers according to the following rules: 1. the categories are independent of each other, 2. the categories describe phenomena on the same level of generality, 3. the maximum number of categories is 15. Note: We are aware of the fact that despite our effort to make independent categories their character can be fuzzy (in mathematic terms, they undoubtedly correlate to some extent). We consider this to be a natural consequence of the categories' relation to the phenomenon of family, therefore we believe our work with them as independent to be justified. The final number of categories was 7, they are described in more detail in the section Results.

The second phase was based on the procedures of qualitative methodology: the authentic answer of each respondent was coded using the system 0-1, i.e. each answer was assigned a code based on which of the 7 categories it mentioned. The system of coding was continuously verified and validated comparing the generalized terms to the original transcriptions (e.g. some categories were re-named to depict the content of the terms in them as precisely as possible). The data was further processed using the standard mathematic and statistical procedures.

3. Results

Question 1: Which categories are used to explain the concept of family?

Categorization enabled to identify 7 categories of units of meaning, which the teachers used to describe the term family (examples of the labels of some units are given in brackets)

- social roles – partnership, marriage, mum, dad, two men/women raising children, children, grandma, grandpa, relations, generation, lineage, children without family, children from children’s homes etc.,
- emotions – feelings, good feeling, love, happiness, well-being, security, trust, intimacy, sadness (result of loneliness), emotional needs etc.,
- responsibilities (including child welfare) – authority, duties, education, organization, rules, work, contribution,
- being together – being together, cooperation, coexistence, sharing, belonging together, community, togetherness, unity, loneliness, reclusiveness etc.,
- economics (housekeeping) – housing, house, place (where one feels good), household, management, home, background, material security,
- leisure – hobbies, free time spending time together,
- care – protection, care, support, help, concern, refuge, reliability (relying on one another.)

Table 12: Categories of terms used for definition of family: Frequencies (N=45)

<i>Category</i>	<i>Frequency</i>	<i>Per cent</i>	<i>Cumulative Per cent</i>
Social roles	30	20,41	20,41
Emotions	31	21,09	41,50
Responsibilities	10	6,80	48,30
Being together	32	21,77	70,07
Economics	19	12,93	82,99
Leisure	6	4,08	87,07
Care	19	12,93	100,00
<i>Total</i>	<i>147</i>	<i>100,00</i>	

Table 4 shows that the units which were used most to define the term family belong to the categories of *being together*, *emotions* and *social roles*, each representing approximately one third of the used units. Roughly one tenth is represented by *care*, one tenth by *economics* and the categories *responsibilities* and *care* constitute one twentieth each.

Question 2: How many categories are used by teachers to explain the concept of the family?

A new variable giving the total of the used categories was introduced and descriptive statistical measures were computed. The results are presented in Table 5.

Table 13: Number of categories used: Descriptive statistics (N=45)

	<i>Minimum</i>	<i>Maximum</i>	<i>Mean</i>	<i>Mode</i>
Number of categories used	1	6	3,2667	4

Figure 1 shows the numbers of teachers (y axis: frequencies) who used a given number of categories (x axis: number of categories). It makes evident that most teachers used 3 to 4 categories.

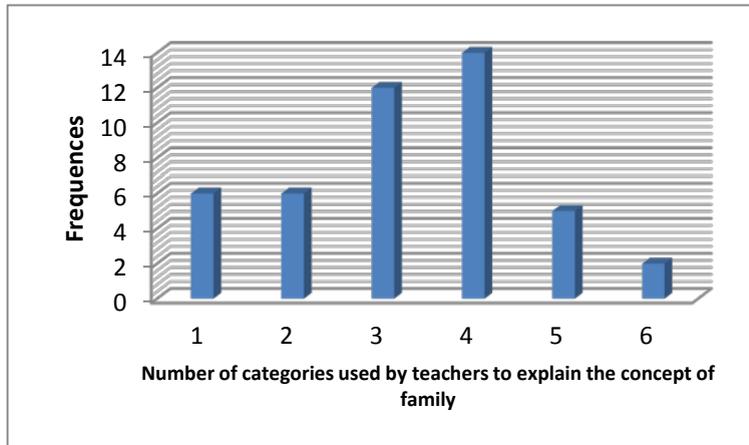

Fig. 1. Number of categories used by teachers: Descriptive statistics (N=45)

Question 3: Where are the blind spots in the teacher's implicit theories of family?

This question will be answered by method of comparing subjective theories with the objective scientific theories in the discussion part of this paper.

4. Discussion

In order to reveal the implicit theories of family in primary and pre-primary education teachers we used the method of free explanation. The teachers were asked to explain the term family to someone who does not know it yet. The explanations were segmented into units of meaning, which were assigned a label formed by substantivization (all word classes were converted into nouns). 95 labels were identified in the 45 explanations. As this number is too high, the labels were categorized. **The explanations of the term family given by primary and pre-primary education teachers were based on the following seven key categories** (descending order according to frequency): *being together*, *emotions*, *social roles*, *care*, *economics (housekeeping)*, *responsibilities (including child welfare)*, and *leisure*.

The first sight makes evident the similarity of subjective concept of the term family (connotation) with the objective definitions (referent). The eight definition of family included in Merriam Webster dictionary (n.d.) and quoted in the theoretical chapter of this paper (introduction) contain units of meaning which could be put into the same categories: *being together* (common, series), *emotions*, *social roles* (unit, group, individuals, persons, parents, descendants, clan, related common ancestry, livestock, stock, line, race, genus), *care*, *economics* (living under one roof, household, operating within a geographical area), *responsibilities* (one head, rearing their children), *leisure* (spending time).

Some labels which did not occur in the subjective theories of the teachers include: people united by certain convictions (conviction), common affiliation, similar properties, line of a particular individual especially of some outstanding female or an identifiable strain within a breed, a set of st differ only in parameters, and any of various social units differing from but regarded as equivalent to the traditional family (a single-parent family), spouse and children. These definitions/labels represent categories which seem to represent the blind spots in the subjective theories of the teachers and which could point to potential hidden problems (e.g. if the questions of race, multicultural or bilingual families and emigration (or other question connected with the missing categories) arise during the discussion of the topic Child and family at school). Hornáčková (2011) says in this context that teacher must be able to apply activating educational methods, situational, staging methods, including group work and cooperative forms of striking the problem solving tasks and situations, using the methods of experimentation and creative drama in its diverse forms. It is all about emotional intelligence (Hornáčková, 2011, 83).

On the other hand, we may state that the **explicit definition of the term given in dictionaries do not enough reflect the socio-emotional element of the term** – family means a coexistence of people who spend their time together, feel good and safe together and if they lose their background, they experience sadness and discomfort.

Cox (2009), for instance claims that family fulfils all six functions that are necessary for the maintenance of society:

1. socialization for children to become participating members of the society,
2. individual goals harmonized with the values of society,
3. supplying for intimacy and emotional gratification and dealing with emotional crises and maintaining the sense of purpose,
4. distribution of goods and services,
5. provision for solving conflicts and maintaining order,
6. replacements for dying members.

This agreement of views is something to be found in contemporary literature as well as in sources which could be considered older. Ruth Nanda Ashen's book from 1946, for instance, comments on the "greater weight" of husband-wife relationship (1949: 78) or economic considerations (1949: 421).

Current theories and knowledge also stress the increasing influence of family on leisure and recreation (Wilson, 2001), which appeared as an independent category in our research.

5. Conclusion

In order to reveal the implicit theories of family in primary and pre-primary education teachers we used the method of free explanation. The teachers were asked to explain the term family to someone who does not know it yet. The explanations were segmented into units of meaning, which were assigned a label formed by substantivization (all word classes were converted into nouns). 95 labels were identified in the 45 explanations, they were merged into seven categories: *being together*, *emotions* and *social roles*, each representing approximately 1/3 of the used units; roughly 1/10 is represented by *care* and *economics* and the categories *responsibilities* and *care* constitute 1/20 each. Most teachers used 3 to 4 categories. The teacher's definition of family including all categories could be: **family is a social unit consisting usually of mom, dad and who love each other, parents are caring for children and raise them, parents provide care and support to their children and each other, relationship is based on reciprocity, the coexistence takes place in the household, home and in free time.**

Some labels which did not occur in the subjective theories of the teachers include: people united by certain convictions (conviction), common affiliation, similar properties, and any of various social units differing from but regarded as equivalent to the traditional family (a single-parent family), spouse and children. These

definitions/labels represent categories which seem to represent the blind spots in the subjective theories of the teachers and which could point to potential hidden problems (e.g. if the questions of race, multicultural or bilingual families and emigration (or other question connected with the missing categories) arise during the discussion of the topic Child and family at school).

Current explicit theories and knowledge also stress the increasing influence of family on leisure and recreation, which appeared as an independent category in our research. On the other hand, we may state that the explicit definition of the term given in dictionaries do not enough reflect the socio-emotional element of the term – family means a coexistence of people who spend their time together, feel good and safe together and if they lose their background, they experience sadness and discomfort - which is the moment that our teachers perceive very sensitively.

Abstract

Recent years in science education, especially in teaching science subjects that are generally thought to be difficult, the importance of out-of-school learning environments that bring formal education and informal education together under the same roof in order for the students to achieve their own learning, started to increase. This situation requires teachers to be aware of those environments, how and when those environments can be used, in which aims and objectives of teaching and learning process those environments can be used, and the effect of activities conducted in those environments to students affective, cognitive and kinesthetic features. Therefore, in this study the aim was to investigate science and technology teachers' perceptions regarding the effect of usage of out-of-school learning environments in science and technology courses to students' academic achievement and their anxiety towards science. In this study descriptive qualitative research was used. The data of the study were obtained in 2011-2012 academic year, through semi-structured interviews conducted with 36 science and technology teachers who work in Gölcük town which is a district of Kocaeli Province. Almost all teachers highlighted positive effects of using out-of-school learning environments during the teaching and learning process' on the students' academic success and anxiety levels towards science by presenting a variety of reasons. On the other hand, the remaining teachers indicated that out-of-school learning environments affect the students' skills and qualities apart from academic achievement and anxiety towards science.

Keywords: Out-of-School Learning Environments, Teachers' Opinions, Science and Technology Teaching, Informal Education, Academic Achievement and Anxiety towards Science.

1. INTRODUCTION

Informal education which means lifelong learning is a process that begins with the birth of the individual and continues until the end of their life (Eshach, 2007). With the fact that informal education lasts lifelong, any place or environment the human being reaches is named as an informal learning environment. Mass communication tools such as television, radio, newspaper, magazine, internet and social spheres such as botanical gardens, family meetings, zoos, shopping malls, books, cyber museums, factories, stores, aquariums, libraries, houses, science centers and nature centers (caves, lakes, rivers, coasts etc.) are shown as learning environments that provide substantial resources while learning (Hannu, 1993; Howe and Disinger, 1998; Hill, Hannafin and Domizi, 2005). When such environments are used within a plan and schedule in order to make acquisition possible, they are called out-of-school learning environments (Hannu, 1993). Science, which brings the phenomena and events in

* Corresponding author.

life into our attention and is the daily life itself, is a discipline that often takes place in this kind of environments. In spite of this, science which often helps the individual to get to know both thyself and the world around them lifelong is perceived as a course that is just in the school curriculum and the fact that it involves many practical applications while the issues are mainly abstract makes it seem like a discipline the students are having a hard time understanding from time to time. However the goal with science education is to enable individuals to interpret the natural events along with the nature itself, help them become literate in science and get them to use their five senses to create solutions for problems (Türkmen, 2010). In order to achieve this goal, the education activities in the schools are performed mainly with scientific symbols and with a fair amount of ties to the events, phenomena, objects in daily life while distant from the real world. In spite of this, with the out-of-school learning environments' usage in a framework of plans and schedule, the individual will succeed on performing a complete and meaningful learning while forming close relations with the notion and objects that are in the science classes (Ramey-Gassert, 1997). At this point, the usage of informal learning environments such as zoos, museums and science centers is attracting more attention from the science teachers day by day (Smith, McLaughlin and Tunnicliffe, 1998). There are researches in the literature which emphasize that the informal learning environments used along with the formal education offer authentic experiences to the students, make it possible to interact with real objects, keep their curiosity and attention alive (Pedretti, 1997; Meredith, Fortner and Mullins, 1997), help the individuals understand the notions of science and take responsibility in their subsequent learning (Olson, Cox-Petersen and McComas, 2001). In addition, there are also studies in the literature which show that the out-of-school learning environments benefit the students in regards of success, motivation, attitude, problem solving skills, and their interest in science (Bozdoğan and Yalçın, 2006; Ramey-Gassert, 1997; Braund and Reiss, 2006; Paris, Yambor and Packard, 1998; Falk and Adelman, 2003; Yavuz and Balkan Kıyıcı, 2012).

Although out-of-school learning environments are often used in science teaching in the developed countries, they are still not being used at the desired levels in Turkey. There are not many studies in the literature that present the effects of the usage of out-of-school learning environments in science teaching on the cognitive and affective skills of the students. Due to the rising importance of these learning environments that are in the education activities, teachers are obliged to be aware of the effects of the out-of-school learning environments on various skills of the students. In this regard, it is vital to elicit the opinions of the teachers who are the executives of these activities, on the matter. Therefore the goal of this study is to research the opinions of the science and technology teachers regarding the effects of the usage of out-of-school learning environments on students' academic achievement and anxiety towards science.

2. METHOD

This research which aims to elicit the opinions of the science and technology teachers regarding the effects of the usage of out-of-school learning environments in the science and technology courses on students' academic achievement and anxiety towards science has been based on the descriptive qualitative research approach.

2.1. Study Group

The study group of the research consists of 36 science and technology teachers who work in Gölcük town which is a district of Kocaeli Province in the 2011-2012 academic years. Some of the descriptive features of the teachers were presented in Table 1.

Table 1. The features of the teachers who are in the study group.

Features		Frequency	Rate	Total
Gender	Female	25	69.44	100
	Male	11	30.55	
Profession	Science and Technology Teacher	33	91.67	100
	Chemistry Teacher	1	2.78	
	Art-Science, Biology	2	5.55	
Worked for	1-5 years	18	50.00	100
	6-10 years	10	27.78	
	11-15 years	5	13.89	
	16-30 years	3	8.33	
Teaching in the classes of	6th,7th and 8th grade	35	97.22	100
	8th grade	1	0.97	

2.2. Data Collecting Tools

In this study, in order to research the opinions of the science and technology teachers regarding the effects of the usage of out-of-school learning environments on students' academic achievement and anxiety towards science, semi structured interviews were used. During the preparation of the semi structured interview form for the research, the literature has been surveyed, the relevant questions have been formed and the experts' opinions have been taken (3 Science Educators). Upon the completion of the required adjustments, in order to identify the opinions of the science and technology teachers regarding the effects of the usage of out-of-school learning environments on students' academic achievement and anxiety towards science, interview forms were created and applied in one session.

2.3. Data Analysis

Content analysis was performed in the process of analyzing the interview records which were transcribed in the scope of the research. The collected data was coded by two researchers independent of each other. Themes were created upon achieving a consensus. The collected data was made meaningful with content analysis by putting them under the topics of code and theme depending on certain relations and similarities (Yıldırım and Şimşek, 2011). The opinions of the teachers which were collected in the study are given in italic within quotation marks and symbolized as T1, T2, T3 ...T36.

3. RESULTS

The findings of the interviews with the teachers are presented in this part.

The first stage question directed to the teachers during the interviews in the scope of the research is specified as "Do you think that using out-of-school learning environments affects the academic achievement of the student? How?" When the answers of the teachers given to this question are examined, it is seen that while

94.44% of them state that out-of-school learning environments affect the academic achievement of the student, 5.56% of them emphasize that this kind of environments does not affect the academic achievement of the student.

Table 2. The Opinions of the Teachers Regarding the Effects of the Usage of Out-of-School Learning Environments on the Academic Achievement of the Student

Data Source	Theme	Code	Teachers	Frequency Rate (f)	Percent age (%)	Overall Percentag e (%)

Total			67	100	100			

When the opinions regarding the effects of using the out-of-school learning environments on the academic achievement of the student in Table 2 are examined, it is seen that 37.32% of them fall into the theme of learning. While 31.36% of the statements are about the support of out-of-school learning environments, 16.42% of them emphasize the improvement of skills and 8.96% state the contributions. The rest which is 5.97% includes the affective domain.

It is spotted that the teachers who stated that out-of-school learning environments do not affect the academic achievement indicate that this kind of environments affect different notions (i.e. general knowledge, point of view) rather than academic achievement.

Some direct quotations from the interviews with teachers:

“It affects. At least the student’s motivation towards the course increases. ...the student likes science and shows interest regardless of choice because there are trips. Increases the rate of achievement.” (T8)

“...Yes it will increase their chance of success because they implement what they have learned in the courses, in regards of feeling curiosity for the things they couldn’t understand.. We can consolidate with the questions they will ask, there might be a contribution like this.” (T16)

“It will affect. It will provide long term knowledge, there won’t be memorizing.” (T18)

The second stage question directed to the teachers during the interviews in the scope of the research is specified as “Do you think that using out-of-school learning environments affects the student’s anxiety towards science? How?” When the answers of the teachers given to this question are examined, it is seen that while 91.67% of them state that out-of-school learning environments affect the student’s anxiety towards science, 8.33% of them emphasize that using this kind of environments does not affect the student’s anxiety towards science.

Table 3. The Opinions of the Teachers Regarding the Effects of the Usage of Out-of-School Learning Environments on the Student's Anxiety Towards Science

Data Source	Theme	Code	Teachers	Frequency Rate (f)	Percentage (%)	Overall Percentage %
The Usage of Out-of-School Learning Environments Affecting the Anxiety of the Student Towards Science	Supporting	Learning Entertainment	With T3, T4	2	3.39	47.44
		Understanding Science	T7, T16, T28, T32	4	6.78	
		Converting Knowledge to Concrete Knowledge	Abstract T18	1	1.69	
		Recovering Memorization	from T1, T18	2	3.39	
		Allowing Connection With Life	to Form Daily T2, T7, T9, T15, T16, T17, T20, T21, T22, T23, T26, T27, T30	13	22.03	
		Simplifying the Course	T18, T20, T22, T31, T34	5	8.47	
		Understanding That Science isn't Difficult	T27	1	1.69	
	Affective Domain	Interest Towards Science Increases	T6, T16, T21	3	5.08	35.58
		Adopts Positive Attitude Towards Science	T5	1	1.69	
		Fear Towards Science Will Decrease	T1, T17	2	3.39	
		Attachment for the Course Will Increase	T7, T19, T28, T33, T35, T36	6	10.17	
		Course Will Become Amusing	T2, T3, T13, T28, T31, T36	6	10.17	
		Will Taste the Feeling of Success	T7, T25	2	3.39	
		Provides Comfort	T28	1	1.69	
	Effect	Increasing Imagination	T29	1	1.69	16.93
Increasing Creativity		T29	1	1.69		
Facilitate to Remember		T13	1	1.69		
Increasing Motivation		T3, T4	2	3.39		
Provoke Curiosity		T5, T24	2	3.39		
Preventing Prejudice Towards the Course		T11, T12, T32	3	5.08		
Total			59	100	100	

When the opinions regarding the effects of using the out-of-school learning environments on the anxiety of the student towards science in Table 3 are examined, it is seen that 47.4% of the statements are about the fact that the usage of out-of-school learning environments is supportive, while 35.58% talk about the affective domain and 16.93% have listed the effects.

It is spotted that the teachers who stated that the usage of out-of-school learning environments do not affect the anxiety of the students towards science indicate that this kind of environments affect different notions (i.e. curiosity, listening attentively) rather than the anxiety towards science.

Some direct quotations from the interviews with teachers:

“...it will increase the interest; the child will see what kind of a world science is. ...the child will think that it’s related to everything in life and see that everything in our life depends on science, that everything has a scientific explanation, that will increase the interest and when the interest is increased the chance of success and willingness will increase as well, and the level of anxiety will drop accordingly.” (T21)

“Just the same the anxiety goes away as well. ...Curiosity is also developed by the students, anxiety goes away and right after that the rate of success increases.” (T24)

“Of course they will understand that it’s not as difficult as they think because science is usually thought of as difficult. They will understand that it’s not like that and it’s from the life itself.” (T27)

4. DISCUSSION AND CONCLUSION

The aim of this research was to elicit the opinions of the science and technology teachers regarding the effects of the usage of out-of-school environments in the science and technology courses on students’ academic achievement and anxiety towards science. In this direction, when the opinions of the teachers regarding the effects of the usage of out-of-school learning environments on the students’ academic achievement and level of anxiety towards science are examined, it is seen that almost all of the teachers emphasize the fact that with the use of out-of-school learning environments the rate of academic achievement of the students will change positively. There are many studies in the literature which state that the out-of-school learning environments have a positive effect on the academic achievement of the students (Ayres and Melears, 1998; Ramey-Gassert, 1997; Rennie, 1994; Yavuz ve Balkan Kılıcı, 2012). The causes of this effect can be listed as follows: provides information rich environments for learning, by using out-of-school learning environments to support the education activities that are carried out in formal education reinforces previous learning and improves the science process skills of the students (Ramey-Gassert, 1997; Pedretti, 1997; Melber and Abraham, 1999; Randler, Kummer and Wilhelm, 2012). In spite of this, a limited number of teachers stated that the activities which are performed in the out-of-school learning environments are important in terms of the individuals’ self improvement while emphasizing that the general knowledge and the point of view of the students might be affected rather than their academic achievement. The reason for this is the fact that they perceive the purpose of the visits to this kind of environments as sightseeing and entertainment, therefore not being able to associate many living beings, events and objects they may see or have seen with the science and technology course.

Almost all of the teachers in the research emphasized that with the use of out-of-school learning environments the level of anxiety of the students towards science will decrease. The reasons behind this effect are explained with the fact that it supports the science and technology course and affects the affective skills of the student. In this scope, the teachers have noted that the activities that are carried out in the out-of-school learning environments will cause the level of anxiety to decrease by showing that the science and technology course is not as difficult as the students perceive it to be and that this course can be performed in an out-of-school learning environment as an interesting and entertaining course. Dohn (2011) states that one of the reasons the activities conducted in a zoo attract the attention of the students is the novelty and diversity in the environment while the students have also indicated that they have moved away from the boring education in the classroom. This situation may also affect the opinions of the students towards the course. Nevertheless, some teachers have explained that although they state that the course will be carried out as more interesting and entertaining in these environments, this will not affect the level of anxiety of the students towards science simply due to the fact that the courses are already being conducted in an entertaining way and it affects different features of the students. In a parallel to most of the opinions of the teachers, there are studies in the literature which express that various affective features are affected positively in the out-of-school learning environments (Bozdoğan and Yalçın, 2006; Ramey-Gassert, 1997; Braund and Reiss, 2006; Paris, Yambor and Packard, 1998; Falk and Adelman, 2003).

As a the result of the research, it is stated and supported with the teachers' opinions that with the use of out-of-school learning environments in the education activities, the academic achievement and anxiety of the students towards science will be affected positively, and these results have contributed to the literature about the out-of-school learning environments in science education in Turkey. In addition to this study the change in various cognitive and affective skills of the students with the implementations carried out in different out-of-school learning environments can be researched.

Abstract

This paper is a situational research aiming at determining teachers' perceptions with regard to Modules Used in Vocational and Technical Education. The data were collected from 12 teachers via semi-structured interview method. Context analysis is applied for the data. According to the data, teachers have positive ideas in some main points with regard to the modules, but they stated that there were very important problems in the process of their application. There are two main reasons for these problems. First, modules were not prepared by specialist and they were very far from real business life. Teachers' perceptions towards modules are not different from each other in three different institutions.

Keywords: SVET, Vocational Education, Modular Education, Module

1. INTRODUCTION

In our age in which technology and industry show a rapid development, it is a fact that this change has significantly affected education functionally and structurally. It is a natural consequence of the initiatives of the use of technology, modernization and industrialization of societies. From this perspective, it can be said that the rapid development of technology and industry has closely influenced particularly technical and vocational education.

The project of strengthening the system of vocational education and training in Turkey (SVET) which is supported by the European Commission and aims to strengthen the vocational education and training system accordance with the principles of the socio-economic needs and lifelong learning has been implemented in stages at all vocational and technical education institutions starting from the academic year 2005-2006. With the realization of the SVET project, modules which aim to provide vocational qualifications have been developed to be used as teaching material (MEB, 2006).

E-mail address: nuyangor@balikesir.edu.tr

The module consists of teaching experiences having a beginning and an end, based on individual teaching, demonstrating integrity in itself, coordinated within a systematic framework and follows a specific order. Knowledge and skills are provided for at least one qualification through each module (Doğan, 1997;MEB, 2006).

It is essential that the introduction part that contains general introductory information of a module should include an assessment method that will demonstrate to what extent objectives were achieved by behavioural objectives, materials and learning activities to be realized. (Akgül, 2004; Kaykı, 2008; Gömleksiz, 1999; Özkan, 2005).

The sections of modules prepared under SVET are in teacher's guide book; table of contents, descriptions, introduction, learning activities (purpose, research, information issues, applications), assessment and evaluation (objective tests, practical tests, practice evaluation), the module evaluation (objective tests, performance tests and evaluation), answer keys, recommended resources are expressed in the form of references (MEB, 2006).

Description part is on the top of the module. This section is important in terms of its functions such as introduction of the module, the guidance of the users and providing motivation. The aim of description part is to draw attention to the subject by giving general information about the module, information on how students should work by emphasizing the significance of the module, and points related to the module (Akgül, 2004; Akgül, 1999). In the description part of modules prepared under SVET; there are general information (code, area, branch / occupation, name of the module), module description, duration, prerequisite learning, proficiency, purpose of the module, education and training environments and equipments, and information on the assessment and evaluation (MEB, 2011).

In introduction, there are explanations for students and these explanations aim to motivate students for module. Introduction should provide information on the importance of module in field- profession and the use of gains in professional skills and on everyday life (Altın, 2003).

The Part of learning activities should include the activities organized to achieve the goals set out at the beginning of the module and equipments to be utilized (Gömleksiz, 1999). In this section, information and applications must be presented in a clear, understandable way. Text portions should be supported by pictures, charts and graphs, and pictures, charts and graphics should be referred to in narrative parts. Information The information given on the information should consist of information that will support the application activities (Akgül, 2004; Altın, 2003). The part of learning activities of the modules prepared under SVET contains purpose, research, the contents of learning activities and the application part.

In the part of assessment and evaluation, there are assessment and evaluation tools by which students evaluate themselves at the end of each activity to take necessary measures by determining the attainment levels to the objectives of learning activities during the process of learning and teaching. The evaluation tools in question are objective and applied tests according to the characteristics of behaviour to be measured (Altın, 2003). Techniques can be employed such as tests including self- evaluation, teacher evaluation observation forms, student evaluation report, multiple choices, true-false, matching, completion question types. The individual's own self-assessment, teacher observation forms to be followed by the assessment of the students will be taken during the event, the assessment reports, multiple choice, true-false, matching, such techniques can be applied to complete the evaluation tests of question types (MEB, 2006; Akgül, 2004).

In addition to the features described above, it is considered beneficial to include a visually striking designed cover page and information on module (name, year of publication, location, etc.) as well as a small survey for the views of students about module (Akgül, 2004). Moreover, a module should have the feature of compliance with the objectives, accuracy, precision and reliability in knowledge, attractiveness, technical competence, promoting,

effectiveness, compliance with student, usability, usability individually and in a group, compliance with cognitive, affective and psychomotor behaviours (Nazlı, 2010).

As the modular system is economical, cover broad masses socially, meet individual requirements; respond to regional differences, and is applicable by local authorities and all parties, it makes modular teaching approach indispensable for vocational training and practical training courses. Although modules are materials based on individual training, teachers play an active role during practices. Teachers play an active role in the preparation of the modules, the determination of periods, the planning of activities inside and outside the classroom, the implementation and evaluation of activities. That teachers help students especially during the use of modules increases the success (Taşpınar, 1997).

The aim of this study is to determine teachers' views towards modules used as education-teaching material in vocational- technique education. In accordance with general purpose, answers were sought to the following questions:

1. What are the views of teachers towards the modules used in technical and vocational education?
2. What are the problems teachers encounter on the implementation of the modules used in vocational and technical education?
3. What are the recommendations of teachers for the modules used in technical and vocational education?

2. METHOD

2.1. Model of the study

In this study, case study, one of qualitative research methods, was used. The key feature of the case study was to survey one or a few case in depth. That is, factors of a situation (environment, individuals, events, processes, etc.) are studied by holistic approach and focus on how they affect the related case and how they are affected by related case (Yıldırım and Şimşek, 2006).

2.2. Working Group

The research was carried out with the participation of a total of 12 teachers working at 3 vocational and technical High School in the academic year 2012-2013 in the district of Bursa Province Mustafakemalpaşa, There were 8 male and 4 female participants. The participants were from different fields on a voluntary basis.

Table-1. Distribution of respondents according to schools

Type of School	Participant Code	Number of participants
Technical and Industrial Vocational High School	EML-(1,2,3,4)	4
Technical and Vocational High school of Girls	KML-(1,2,3,4)	4
Trade School	TCL -(1,2,3,4)	4
TOTAL		12

2.3. Development of Data Collection Instrument and Data Collection

Semi-structured interview technique was used in this study as a method of data collection. As semi-structured interview technique allows data collection by open-ended questions rather than closed-ended questions, it shows the quality of a flexible guide during the interview and provides focus on the subject and help take in-depth knowledge about the participants (Rietbergen-McCracken and Narayan-Parker, 1998).

In the preparation of Interview forms, the opinions of teachers were consulted and literature related to the subject was surveyed. The draft interview form reviewed by members of the faculty in the field of educational sciences was finalized in line with comments and suggestions. The interview form consists of 10 open-ended questions. During the interview, participants were asked probing questions as needed. Face-to-face interviews with participants were recorded by audio recording device with the approval of the participants. After the interviews, the recorded data was converted to text.

2.4. Validity and Reliability

The themes in the content analysis made to increase the internal validity of the study were tried to be as broad enough to include the related concepts. All of the findings were directly presented without comment to improve the internal reliability of the data and the other researchers were involved in the process of analysis of data. To enhance the external reliability and external validity of the study, research process and those made in this process were tried to be explained in detail. In this regard, the model of the research, the data collection process, analysis and interpretation of data were described in detail. Also, the raw data obtained and codes are stored for others to review.

2.5. Analysis and interpretation of data

The data obtained were subjected to content analysis. The main objective in content analysis is to achieve the concepts and relationships to explain the collected data. Data are defined through the content analysis; facts that may be stored in data are brought out. The main process in content analysis is to bring together data similar to each other within the framework of specific concepts and themes and interpret them by organizing in a way that readers can understand (Yıldırım and Şimşek, 2008).

In this study, in the process of data analysis, these steps were followed: 1 - Data Coding: interview data were examined and the general framework of coding list was established. 2 - Finding themes: it was decided which codes can provide a combination in order that they could make a convenience in data classification and finding themes. Thus, codes were brought together and meaningful relationships between them were established. 3 - Regulation of codes and themes: The codes and themes were arranged. Data united under the same code or theme were associated with sub-problems the theme. 4 - The identification and interpretation of the findings: Descriptions for themes to each sub-problem theme were made and findings were interpreted with the support of direct quotations.

3. FINDINGS

3.1. Findings related to the views of teachers towards modules used in vocational and technical education

When the overall assessment of the participants on explanations part in the module was examined, it can be seen that they are of the opinion that the explanations are clear, functional, necessary and sufficient.

"... a language that both the student and the teacher can easily understand. In terms of language, I do not see a problem for the usability of the words ... "(TCL-1)

While some of the participants are of the opinion that time for the module is sufficient, while other participants say that time is much more for some modules and insufficient for some.

"... Some of our modules are adequate, but there is much time in some of our modules. The number of modules is not adequate but there is too much time while in others there is less time... "(CML-1)

All of the teachers are of the opinion that the objectives in the part of explanations are suitable, clear, understandable for developmental feature of students and special objectives are consistent with general objectives.

"... Yes, clear and understandable. So they are applicable. Short and descriptive sentences are already used. I think it can be carried out when we have a lecture or make the orientation of the course in accordance with the sentences and explanations... "(EML-2)

It is seen that teachers are of the opinion that recommended environment and hardware are consistent with the objectives and applicable when the views of the participant teachers towards educational environments and equipments in the part of explanations are studied.

"... I think they are prepared in a way that they overlap with each other already. There is not a shortage. But somewhere, for example, we always tell the same, if there is something, if there is im-possibility or lack of material, we can't realize any of them from the beginning already... "(EML-3)

Vast majority of participants are of the opinion that the part of introduction is clear, understandable qualified enough to guide students and appropriate for their levels.

"... The part of introduction is necessary in terms of providing the necessary start-up information on the subject as in the part of explanation. In general, language in modules is understandable...a language that students read without having any difficulty or getting bored so I do not see any problem ... "(CML-3)

The teachers in the study group are of the opinion that preliminary research proposed in teaching-learning activities in module are appropriate to the level of students as well as cost and time, and in a consistent with objectives and can be performed.

"... when I look through the explanation here, I consider and observe that our students can easily do and it is prepared in a way that it won't pose any financial burden on our students. There is no problem in understanding. It is easily understood. It is suitable for high school students..."(EML-1)

On the other hand, as an analysis of views towards the content of the teaching-learning activities, the content is coherent with objectives, according to the level of students, clear and understandable and is considered to be scientifically accurate and up to date.

"... It is good as a language. I mean, there are no very complex sentences. I think coherence at level of students is normal. It is fine, so I can not say anything negative ... "(EML-5)

As an analysis of views towards the proposed practices in teaching-learning activities, participants agree with the opinion that they are coherent with objectives, appropriate for student level, and cost-effective, sufficient in terms of time and functional.

"... It is well-chosen. It is really nicely prepared as they are more and more challenging applications such as on-stage level; for example, the applications at the end of the module, and in the subject. It is suitable for student level. Students are not imposed to severe stress as it goes from simple to hard..."(TCL-4)

The vast majority of participants agree with the opinion that the proposed evaluation and assessment tools in module are easily applicable and sufficient in scope.

"... It is easy. Sometimes we encounter questions that contrast with each other. For example, here is a question, answer of which is given as a question in the other. I think that the evaluation should not be this way. I take advantage of all ... "(CML-3)

3.2. Findings related to the problems teachers encounter on the implementation of the modules used in vocational and technical education.

As an analysis of participants' views towards the implementation of the part of explanation in module, it is seen that they agree on the idea that explanations are not used by students, do not guide students, insufficient and hard to follow up.

"... We read the descriptions at first, but I do not think many students consider it much ..." (TCL-1)

"... Students have had the habit to skip the explanation part and directly start from the introduction part..."(EML-3)

"... Students do not look too much here, but it is written in an understandable language and it can guide students and teachers ..." (CML-2)

Some of the participants state that there is insufficient time for module in the implementation of it. In addition, participants express that periods of extra-curricular proposed in module cannot be used and followed up.

"... In every classroom I am in different. Part. . In one part, I am a week ahead. In another, I am one week back. Some modules differ according to the students of the class and according to their ability. In some of the courses, the given period of time can be inadequate for that module..."(TCL-1)

"... We have practical courses, but after dealing with a subject, I do not think we can make it applicable outside. On the other hand, we cannot follow the work outside. ... "(EML-3)

Teachers state the problems concerning the objectives of the implementation process as the lack of the level of students' readiness, time and the learning environment. Moreover, the objectives are far away from work life.

"... Of course, we have a problem with the period of time and the problem of time arises. For example, the button buttonhole camera should be used by everyone. There is a shortfall of equipments in these matters. That is the Low level of the student. General problem of vocational high schools is the lack of interest. That is the decrease in the level and the reluctance of the student ... "(CML-1)

When the views of participants towards educational environments and equipments on the problems of the implementation of module are examined, it is seen that they agree with the opinion that there are insufficiency in terms of equipment and disconnection from work life.

"... We can deal with 80% of the subjects, but we cannot deal with 20% of subjects due to lack of equipment. There are also subjects remaining in a level of information. That is, if you can tell the module through full equipment, you can teach the students and allow them apply it. However, students experience completely different machines and measurements at workplace. For example, you have them weighed 5 g and you teach them in this way..."(CML-2)

The vast majority of teachers emphasize the problems on the introduction part in the process of implementation as not using the part of introduction and not being able to draw interest.

"... We want to start our subject in an anxiety to finish the modules as soon as possible, and do not refer to this section. In addition, even when it is in plaintext, it is not attractive.... "(CML-4)

"... Students do not take into account much more. So any students has not returned saying that he or she read the introduction.... "(EML-2)

It is seen that teachers in the study group differently express the problems involved in the process of the realization of preliminary studies in teaching-learning activities in module. Among these, inability to draw the attention of student, the low realization rate, high cost, lack of environmental opportunities and time, disconnection of work life and difficulty in following come forward.

"... The time is not enough. Environmental facilities are insufficient. We live in the district. It is not a very well-equipped place. So, for example, sometimes we can not find a pen that we look for ... "(CML-4)

"... But as a result of this learning activity, students themselves obviously cannot make the assessment of the application of this work..." (EML-1)

It is seen that teachers' views are diversifying on the problems in the process of implementation of the content of teaching-learning activities. The main problems in this area are scientific error, not being up to date, poor quality in printing, unnecessary detail, not being original, and misspellings, being comorbid and inadequacy visually.

"... In general, except for the period, the part in the modules, are processed disconnected from each other. For example, what have we dealt with in computerized accounting module? We have dealt with current accounts. After this subject, so many subjects have been dealt. . For example; accounting receipts. When passing to another part, as if we had never dealt with the accounting receipts, we start from the very beginning and the subject is told to the student.... "(TCL-4)

"... There is not a very specific content... "(CML-2)

When the findings concerning the problems in the process of the realization of the practices in learning-teaching activities are examined, it is seen that participants' views are diversifying and state that there is lack of environment, equipment and time, superficiality, and the high cost.

"... If there is the impossibility in question, if there is the impossibility of workshop, this is biggest problem in terms of the material. Another can not be a nuisance anyway ... "(EML-3)

"... There are not enough subjects for applications, I mean in the modules. Just a few simple application examples are given. There is no sample in the applications but the titles of the topics. These sources will be made, these processes will be made. Is there anything else? There is nothing else. Which application will be made is not available in the module... "(EML-4)

The vast majority of participants agree with the opinion that there are certain problems such as lack of environment in evaluation and assessment practices, and inability to make a self-assessment and performance evaluation.

"... but some of the modules do not cover all learning activities in assessment and evaluation questions..... Let alone the evaluation of learning ... It is unfortunately we do not have a student profile ... (EML-1)

3.3. The recommendations of teachers concerning modules used at Vocational and technical education

When the recommendations of participants concerning the part of explanations are generally examined, it is seen that they agree on the opinion that the explanations should be clearly written by experts.

"... I want it to be prepared by the instructors at the university. So there can be a little more informative and consolidating explanations. One explanation may be the result of research ... "(EML-4)

On the duration of the module, Participants recommend that class hours should be increased, and the duration of the module should be arranged in accordance with the school-industry cooperation.

"... I think the solution here is to survey and increase the class hours so that they can get to know their profession environment. Of course, it is necessary that school and the profession should be compatible with the environment ..." (EML-5)

The participating teachers are of the opinion that the views of teachers towards the explanations should be taken and teachers should inform the students about the purposes of the modules.

"... Teachers should give the students the habit of reading. . Also, by taking the views of teachers, the part of explanation should be conformed to the level of students... "(TCL-4)

When the participants' recommendations towards educational environment and equipments are examined, it is seen that they agree with the opinion that the school environments should be developed in terms of equipment, the visual materials should be used, and the environment should be in compatible with the business life.

"... That the teacher use materials more (TV, VCD, computer, etc.) allow the students have an optimistic atmosphere to the profession, and they become more interested in ..." (TCL-1)

"... Graduates from different universities must come together. Only teachers would not be enough. I think academics should be a participant..."(CML-4)

On the recommendations of the part of introduction, the vast majority of teachers are of the opinion that this part should be supported by pictures and visuals, be prepared by experts, be made in the future and should include significant elements.

"... People who have been trained in this field may perform this work. Perhaps, it would be much better. What can arouse students' attention? So, especially coloured images provide much benefit, I mean, there is much difference between a Coloured book and colourless black and white book ..." (EML-3)

On the preliminary studies in the teaching-learning activities, teachers state that they should include more sample applications and be adapted to the business life.

"... I believe that in preparing the module, it would be better to have a sample of them on the page (EML-4)

"... especially on regional basis, there are a lot of activities to be carried out, of course, there is a union in education. This is not something easy to ..." (TCL-3)

When the recommendations regarding the content of the teaching-learning activities is analyzed, it is seen that certain recommendations are expressed as follows: it should be updated, be adapted scientifically, have an increased print quality, be purified from detail information, written by experienced teachers and experts, be supported by remarkable elements.

"... When the module was first introduced, it was very feasible. However, our profession is very dynamic. Therefore, the content should be revised and renewed. We encounter very deep-rooted and very basic errors. So the content of the modules should scientifically be examined again ..." (EML-1)

On the applications concerning teaching-learning activities, participants agree with the opinion that there should be implementation activities taking the expectations of work life into account, implementation activities should be enriched and be detailed, and they should be prepared by experienced teachers and experts.

"... It is essential that applications are needed to be chosen in accordance with today's technology and innovations. Those who prepared this module should visit the enterprises to see the current practices. And they should put these applications into the modules by obtaining information about them ..." (EML-4)

On the evaluation and assessment tools, the vast majority of participants recommend that teachers should establish question banks, suitable environment should be provided for evaluation process, and the examples for different types of questions should be included in the module.

"... Teachers can make up evaluation - assessment questions through the modules and introduce sample test. These tests are submitted to the centre. The commissions to be created in the centre can prepare the assessment tests for the following year and question banks can be made available to all teachers ..." (EML-1)

4. CONCLUSIONS AND RECOMMENDATIONS

In this study carried out to determine the views of teachers towards modules used as educational material in vocational and technical education, the following conclusions were reached:

On the part of explanation of modules used in vocational and technique education, teachers state that modules are clear, functional, necessary and sufficient. On the other hand, they also state the problem that the part of explanation is not used by student, do not guide students and is too hard to follow. So they recommend that the part of explanations should be clearly written by experts to solve out these problems. While teachers disagree on the evaluation of the time allocated for the modules, while they agree on the problems that there is insufficient time, extra-curricular periods cannot be used, and they are hard to follow. In order to solve the problems mentioned above, they suggest that, modules in the course bourses should be increased and period on modules should be regulated in cooperation with school-industry. While goal statements in the part of explanations are appropriate for developmental characteristics of students, clear, understandable and consistent with the general objectives, there are problems related to lack of students' readiness levels and environment and disconnection from business life. In order to solve these problems, teachers propose that their views are to be taken in writing module and students are to be informed about aims of the module. The conclusion, in a study conducted by Seçilmiş and Ünlüönen (2011), in which teachers who participated in the survey agree with the opinion that overall aims and objectives were clearly stated and clear and understandable, show consistency with this study. As the environment and the equipments in the module are evaluated by teachers as consistent with the objectives and applicable, lack of schools in terms of equipment and disconnection from business life are designated as the main problems at this point. About the solution, it is proposed that school environments in terms of equipments be developed, visual materials be used, and the environment should be compatible with business life. Also, in a study conducted by Gök (2011), similar conclusions regarding equipment deficiency at school environments were achieved, teachers who participated in the survey agreed with the opinion that the existing equipment of schools are not sufficient for the implementation of modules. Similar results were also introduced in a study conducted by Adigüzel and Berk (2009), participants in this study emphasized the inadequacy of the existing equipments in vocational and technical education institutions and stated the need of additional equipments for implementation of modular education programs effectively.

The part of introduction of modules was interpreted by teachers as clear, understandable and in a way to guide students in accordance with the level of the students. As the issues relating to this section are disuse and inability to attract interest, recommendations should be prepared by experts, used in the future and include remarkable elements.

As Preliminary research proposed in learning activities on the module is evaluated as suitable for the student level, appropriate in terms of cost and time, consistent with objectives and achievable; inability to draw attention, the low realization rate, high cost, lack of time and environmental opportunities, disconnection from business life, work life, difficulty in follow-up are stated as problems. In order to solve these problems, teachers list their recommendations as follows: more sample applications should include and be adapted to work life. Teachers stated that the content of learning activities were compatible with the objectives, suitable for the student level, clear and understandable, scientifically accurate and up to date. On the other hand, certain problems are indicated such as the presence of the scientific error, not being up to date, poor quality in printing, unnecessary detail, not being original, spelling errors, being comorbid and insufficiency visually. Recommendations to overcome these problems are listed as follows: Updating of content, optimizing scientifically, improving the quality of printing, purification from detailed knowledge, written by experienced teachers and experts, supporting by attractive elements. These results achieved significantly show consistency with the results achieved in a study

conducted by Seçilmiş and Ünlüönen (2011). About the applications proposed in learning activities, teachers are of the opinion that they are compatible with the objectives, suitable in terms of the student level, and cost-effective, adequate in terms of time, and functional. However, they state the problems such as lack of environment, equipment and time and superficiality and high cost. Recommendations on these issues are expressed in this way: the implementation of activities should be enriched in a way to meet the expectations of business life and be detailed, prepared by experienced teachers and experts. In a study conducted by Dursun (2008), it was found out that the participating teachers are neutral about the providing opportunity to practice of SVET project in enterprises to students and the increase school-industry relationships. Also, in a study conducted by Gök (2011), conclusions that support these findings were achieved, and it was found that participants disagreed on the opinion that experts took part in the writing of the modules. Similar results were also achieved in a study conducted by Ünlüönen and Seçilmiş (2011), and it was determined that the most significant difficulty is that people who wrote the modules do not have knowledge and experience in this regard.

Assessment and evaluation tools proposed in Modules are considered by teachers as easily applicable, and adequate in terms of content. On the other hand, lack of environment, self-assessment and failure of performance evaluation are stated as problems. Teachers list their recommendations regarding assessment and evaluation tools; question banks should be established, a suitable environment should be provided to evaluation process, examples for different types of questions should be included in the module. Similar conclusions about the lack of assessment and evaluation tools were achieved in a study conducted by Seçilmiş and Ünlüönen (2011).

As an analysis of research in related literature on the assessment of the modules, it is seen that participants are of negative views on modules in general (Ergin, 2008; İşoğlu, 2010). It can be said that there is a significant consistency between the results obtained in studies in related literature and the results obtained in this study.

When the findings of the study are analyzed in general, although modules, prepared to be used as teaching material at vocational and technical education institutions, are evaluated by teachers as positive with certain aspects as draft, it was discovered that there were significant problems in the implementation process. It was determined that the two main sources of these problems were that modules are disconnected from business life, and not written by experts. In addition, based on the findings of this study, it can be said that the views towards recommendations for modules and the problems encountered in the process of implementation of modules, on the evaluation of modules do not differ significantly in terms of teachers institution, and there is a similarity between the views of teachers who work in different three institutions.

Developed recommendations on the basis of the results achieved are listed below;

1. Modules are to be written by expert individuals,
3. Modules are to be improved in a qualified way to prepare students for their lives of future business,
4. Modules are to be prepared to support students' lifelong learning,
5. The content of the modules are to be clear, understandable and scientifically updated,
6. The expectations of the industry are to be taken into account in the preparation of modules,
7. School environments are to be supported by applicable equipments effectively,
8. Modules are to be supported with visual elements,
9. Revisions are to be made by taking feedbacks about the proposed time and subjects for modules.

Teacher-coaches' perspective on the validity and acceptability of commercial laboratory testing and analysis of high school science investigatory projects

Richard R. Jugar*

Science and Mathematics Education Department, University of San Carlos, Cebu City 6000, Philippines

Abstract

This paper attempts to determine the teacher-coaches' perspective concerning the validity and acceptability of commercial laboratory testing among high school students in conducting their investigatory projects (IP). Considering the conduct of IP as an inquiry-based learning of the scientific method, *validity* in this context refers to the alignment of the practice to the goals and aims of having the students do an IP, whereas *acceptability* refers to the personal judgment of the teacher whether the said practice is appropriate or not. The study initiates with a review and discussion of the nature of IP as practiced in the Philippine setting vis-à-vis with relevant literature on inquiry-based teaching and learning. The empirical aspect of the study is the participation of 47 practicing high school science teachers who are, or have had an experience in teaching and coaching the conduct of an IP. Data collection involves the use of survey as well as grouped and individual interviews. Results indicate that while majority of the respondents consider the practice as invalid, majority of the same pool of respondents also consider the practice as acceptable. Lack of laboratory instruments and materials was pointed out as the inherent determining factor in the consideration of the validity and the acceptability of the practice. The implications to assessment specifically on judging the merits of the students' IP output are also discussed.

Keywords: Investigatory Project; Inquiry-Based; Scientific Method; Experiment; Science Investigation

1. Introduction

1.1. The Philippine High Schools Science Curriculum

The Philippines is currently changing the landscape of its main educational highway as evidenced by the current transition from K+10 to K+12. The current secondary education science curriculum in the Philippines as prescribed by the Department of Education (DepEd) is disciplined-based. First year high school students take general science, which is a combination of astronomy, earth science, biology, chemistry, and physics. Second, third and fourth year high school students take biology, chemistry and physics respectively. Each science subject is a combination of both lecture and laboratory encounters that are usually integrative in nature- that is, the same teacher is handling both laboratory and lecture classes. In order to increase interest in science of high school students, almost all secondary schools require their students to conduct an investigatory project. Investigatory projects or IP's are science investigation projects where students undergo the research process utilizing the scientific method. The design is generally experimental and students are free to choose the specific discipline with which they are to conduct their research. The length of conducting an IP generally varies in different schools. Some schools follow a spiral format where students submit their IP's by parts (4 years), other schools

* Corresponding author.

Email address:

opt to require the students to conduct the IP on the last year of high school (4th year), while still others require one IP per year level. The conduct of an investigatory project is not a requirement of the Department of Education. However, DepEd conducts a yearly event in the form of a science and technology fair showcasing the best IP's of all secondary schools in the country. Such event is actually a contest to select the best investigatory project from the district level (basic aggregate of schools), the regional level (several districts), and in the national level (DepEd Memorandum 73, 2009).

1.2. Investigatory project as an inquiry-based assessment

Inquiry-based teaching and learning is one of the approaches in science education. The National Research Council (2000) proposed five standards that capture the characteristic of an inquiry-based approach to teaching and learning with respect to the learner: (a) engaged by scientifically oriented questions, (b) give priority to evidence, which allows them to develop and evaluate explanations that address scientifically oriented questions (c) formulate explanations from evidence to address scientifically oriented questions, (d) evaluate their explanations in light of alternate explanations, particularly those reflecting scientific understanding, and (e) communicate and justify their proposed explanations. These standards when used to examine the nature of the conduct of an investigatory project among high school students generally condone the nature of IP as an inquiry-based activity. Further, the fact that IP's are one of the considerations for the assignment of grade, and are considered one of the major requirements in science make IP's as a form of assessment. In effect, an investigatory project in this context would be an inquiry-based assessment. In line with this reasoning, the dynamics that govern the conduct of the IP should be interpreted in light of the assumptions and underlying principles of the inquiry-based teaching and learning.

Using inquiry-based learning as the framework for the conduct of an IP, the objectives of such an activity can be coincided with that of inquiry-based teaching as offered by Schwab (1962) where "instruction by inquiry promotes student understanding of the nature of science". By extension, the conduct of an IP has the primary goal of allowing the students to undergo the process of conducting an investigation using the scientific method thereby gaining a considerable understanding of the nature of obtaining solutions to problems or answers to questions in a systematic and scientific way.

Simply having this broad idea concerning the objectives of the conduct of an investigatory project poses a dilemma specifically concerning the skills that the students ought to develop during the course of doing the IP, in this case, the testing and analysis of their data. The non-existence of a non-standardized target or competencies for the students who are required to conduct investigatory projects has repercussion on the method and the extent to which the conduct of an IP is taught and evaluated. Consequently, such repercussions will affect the grade that the student gets. It is in this light that a national document explicitly specifying the goals and limitations for the conduct of IP's among high school students is necessary. As of the moment, the guideline that is being followed is in the form of excerpts taken from the International Science and Engineering Fair International Rules and Guidelines (2013), which do not exactly suit the context with which the IP's are conducted in the Philippines.

2. Methodology

The study was conducted among practicing high school science teachers who are, or have had an experience teaching IP as the respondents. A total of 47 science teachers served as the respondents of the study. Of the 47 respondents, 9 were male and 38 were female; 37 have a bachelor's degree, 7 have acquired graduate units while 3 are graduate degrees holders (MA). Out of the 37 with a bachelor's degree, 28 had a bachelor's degree in secondary education (BSEd) while the other 9 have a bachelor's degree in the pure sciences. Out of the 9 non-

BSEd degree holders, 7 were with a bachelor's degree in the sciences: 1 in physics, 2 in chemistry and 4 in Biology; and the other 2 in chemical engineering. The teaching experience of the respondents ranged from 1 to 18 years.

The method used in gathering relevant data was mainly data mining and survey using a 2-item, researcher-made differential semantic scales concerning the validity and acceptability of the practice. Prior to answering the survey, the respondents were personally briefed of the operational definition of the terms *validity* and *acceptability* as used in the context of the study. The respondents were also interviewed personally, through email exchanges, and electronic chats. The responses during the interview were thematically analyzed and the prevalent themes of their responses were presented and discussed.

3. Results and Discussion

3.1 Validity and Acceptability of Practice

The following tables (1 and 2) present the result of the teacher-coaches' response using the 5-level differential semantic scaled questions with 1 as very invalid or very unacceptable and 5 as very valid or very acceptable:

Table 1. Teacher-coaches' response on the validity of practice

Scale	Very Invalid (1)	Invalid (2)	Undecided (3)	Valid (4)	Very Valid (5)
Number of Respondents	24	9	6	5	3
Percent Respondents	51%	19%	13%	11%	6%

Table 2. Teacher-coaches' response on the acceptability of practice

Scale	Very Unacceptable (1)	Unacceptable (2)	Undecided (3)	Acceptable (4)	Very Acceptable (5)
Number of Respondents	24	9	6	5	3
Percent Respondents	51%	19%	13%	11%	6%

As can be observed, majority of the teacher respondents consider the practice as invalid with a combined percentage of 70%. Of this 70%, 51% indicated the practice to be very invalid. This implies that with the teacher respondents' perspective, the conduct of an investigatory project necessitates the students to undergo each and every process associated with doing an IP, from problem conceptualization until the final presentation of the results. Moreover, this choice also provides a picture, albeit not very clear, on the perceived goals of conducting an IP despite the lack of a national framework. Upon probing through interviews, most of the respondents who consider the practice as invalid believe that testing and analysis is an integral part of conducting an investigatory project by the students themselves, and that the inability of the student to conduct such practices on their own is equivalent to non-acquisition of the skill to do so. On the other end, some of the respondents consider the practice as valid. There were two dominant justifications as to why they consider the practice as valid: (a) the utilization of commercial laboratories is part of the students' prerogative and 'method' in acquiring the desired results, and (b) the value of 'practicality' considering the inability of the school to provide the necessary equipment for the conduct of such testing and analysis.

With regard to the acceptability of practice, a shift can be observed in the teacher respondents' choice. While majority considers the practice as invalid, the number of respondents who consider the practice as very unacceptable dramatically decreased. Further, the number of respondents who were relatively ambivalent also increased as indicated by the number of respondents who answered 3, from 13% on the issue of validity to 28% when it comes to acceptability. Considering the figures in the table, it was observed that a number of respondents who indicated the practice as very invalid and invalid shifted to ambivalence while those who were ambivalent as regards to validity shifted to acceptable and very acceptable. As expected, those respondents who considered the practice as very unacceptable came from the same set of respondents who considered the practice as very invalid. During the interview, the shift in the teacher respondents' response was largely due to their personal claims on the objective of the activity, which is the conduct of an investigative research following the scientific method, and the inherent financial and instrumental demand of the practice.

3.2 Implications to assessment

Since the investigatory project is used as an inquiry-based assessment, it follows that the conduct of the IP is supposed to follow sound practices of both formative and summative aspects of assessments concerning inquiry-based teaching and learning. Further, since assessment is largely based on the objective of the activity, it is likewise important that the teacher be guided as to what scientific skills are being targeted with respect to the different steps involved in conducting an IP. The lack of a national framework that would have enabled the teacher-coaches to have a uniform understanding of the objectives of conducting an investigatory project is seen to be one of the major factors why a number of ambiguities such as these exist. To cite an example, consider the exchange in the following interview segment between the researcher and one of the teacher-respondents:

Interviewer: Are your students free to choose the topic or problem that they will investigate?

Teacher: Yes. They are free to conceptualize the problem although I have to guide them since they tend to formulate out-of-this-world problems most of the time.

Interviewer: What do you mean out-of-this-world problems?

Teacher: Well... silly problems like the effect of drinking 8 glasses of milk in a day and some other problems that are not really answerable in a way.

In this exchange, it is apparent that the teacher has an idea as to what is feasible to be considered as a science investigatory project with respect to the students' capacity to do a scientific investigation, albeit in a very personal way. If a framework exists defining the limits or extent of research problems that the students can use in the conduct of their IP, such framework will essentially have to contain conditions stipulating whether to only allow problems that are doable within the boundary of the school's environment and resources, or beyond. Having this framework will give a resolution on the validity and the subsequent acceptability of the practice being focused in this study.

Another implication to assessment is the formative aspect of the conduct of the IP. While the teacher might be aware of the summative aspect of the IP as a graded output, the formative assessment aspect has to be stressed to be of equal importance. Bell and Cowie (2001) categorized formative assessment into two types: formal and informal. Formal formative assessments are those assessments that are planned and whose main purpose is to obtain learning information from the whole class whereas informal formative assessments are unplanned and are used in obtaining information about student learning whenever possible. Example of informal formative assessment is the dynamics of simple classroom interaction or 'hallway conversation' between teacher-coach and the student. As of this writing, there was no literature available concerning the role of formative assessment in the conduct of IP especially in the Philippine context. The role of formative assessment has been proven to be essential especially in improving student performance. Moreover, formative assessment as used in inquiry-based teaching and learning usually focus on the epistemic rather than on the conceptual feature of the scientific inquiry (Ruiz-Primo and Furtak, 2006). This means that the integration of formative assessment will actually reinforce student learning of the conduct of an IP as a 'process' rather than as an 'output'. This reinforcement is consistent with the literature of Bodzin and Beerer (2003) concerning the claim of inquiry-based teaching and learning advocates that the practice does "provide learners with the opportunity to learn scientific practices by actually engaging in them."

Finally, the results of this study indicate the need to come up with a sound rubric that is anchored in an encompassing framework that depicts the interplay of the concepts and processes in conducting an IP. As of the moment, the lack of a defining framework concerning the use of IP as a teaching-learning process and as an assessment scheme significantly affects the way IP's are assessed. The consequent evaluation of the IP output is therefore relatively invalid since the resulting rating will be subject to the teacher-coaches personal interpretations as well as to inter-rater threats to reliability.

4. Conclusion

The conduct of investigatory projects in the Philippines is more of an inquiry-based assessment scheme. It was noted that the practice of students having their IP data tested and/or analyzed through commercial laboratories is deemed by majority of the teacher-coaches respondents as invalid but acceptable. Based on individual and group interviews, the most prevalent factor that determines the acceptability of the practice is the lack of materials and laboratory instruments available for student use. Also, the lack of a national framework specifying the scientific skills and target competencies of students in the conduct of the IP is also a factor that contributes to the inconsistencies in both practice and evaluation of the conduct of IP's. Moreover, the conduct of IP as an inquiry-based assessment scheme in Philippine classrooms necessitates the utilization of both formative and summative aspects of assessments. Finally, the inclusion of the identified gaps in formulating a rubric to better assess and evaluate the quality of IP outputs is likewise proposed.

Teacher candidates' use of facebook for educational purposes

Emre Çam^{a*}, Aytekin Işman^b

^a *Gaziosmanpaşa University, Niğsar Technical Sciences Vocational School 60100, "Tokat", Turkey*

^b *Sakarya University, Faculty of Education 54300, "Sakarya", Turkey*

Abstract

In this study, the views of teacher candidates over the use of Facebook for their educational purposes (communication, cooperation, sharing sources and materials) have been analyzed in terms of gender and class variables. The research has been conducted with teacher candidates of Sakarya University College of Education. The sample of the research consists of a total of 1494 people 877 of which are females and 617 of which are males. A set of data has been formed depending on the answers of the teacher candidates to the Educational Use of Facebook scale. The data collected through the polls has been analyzed with the help of frequency and percentage, t-test, ANOVA and the techniques. With the ANOVA analysis, considerable differences have been found in the answers of the teacher candidates according to the class variable.

Keywords: education, facebook, communication,

1. INTRODUCTION

Nowadays, the interaction on the social network sites is primarily based on the friendship, relationship, interests and activities. However, this is not the only function of the social network sites. These networks are not only comprised of family and friends but also of teachers, school staff, neighbors, and the connections among the society. Social networks provide the users with such facilities as creating information, and sharing and making contacts (Kwon and Wen, 2010).

According to Jones and others (2010), social network has nothing to do with the technology or computer systems. It is a purpose which gives the teachers and learners the opportunity to share their experiences and the things that they learn. As well as enabling the workers in an institution to be in contact with their colleagues social network sites also help them make new contacts and cooperate with their colleagues in similar institutions (Ploderer, Howard and Thomas, 2010).

As the social network users are mainly the young and students, and provide them with rich contents, social networks are considered to be used for academic purposes. Users of all ages using the Facebook and its playing an important role in their lives has generated great interest among some academicians (Selwyn, 2007). A number of researchers have wondered the the effect of this virtual world on the users. These researchers have agreed upon the idea that social networks really have considerable effects and social networks should be used in the area of education (Joly, 2007). Grant (2008) stated that the use of social networks in the learning environment would foster a better communication between the teachers and the learners and thanks to social networks teachers could get to know their learners closely.

Social networks develop communication skills, participation and social connectivity and moreover, it fosters learning with the peer support and cooperation. Social networks are among the most popular applications of the

* Corresponding author. Tel.: +90 356 252 16 16; fax: +90 356 527 24 52.

E-mail address: emrecam@gmail.com

internet—which today rapidly advances on the way to being one of the most important means of communication (Cam and Isbulan, 2012).

Academicians also make use of the social network sites. Social network sites are used more easily than other instructional systems due to their flexible and developable content. Students and researchers form groups appropriate for the content and for the easy use of social networks and thus sharing what they have with each other. This provides both the teacher and the learner with ease in terms of communication, interaction and feedback (Gülbahar, Kalelioğlu and Madran, 2010)

Facebook is the most popularly used and preferred site off all the social networks. The most significant feature of Facebook distinguishing it from the others is its applications. There exists applications on Facebook that are created by the system itself and the users. This feature of Facebook causes the users to spend more time on the site (Kobak and Biçer, 2008). As Facebook is mostly used by the young and the students and also to reduce the effect of waste of time on Facebook, a number of researchers tend to conduct their sessions on Facebook. According to Munoz and Towner (2009) Facebook can be integrated into the lessons in various ways.

There are many researches on the use of social networks in the process of learning and teaching. When looked at the researches on the use of social networks for academic purposes, it is understood that most of these researches are based on the popular social sharing site Facebook.

With the research carried on 909 students, Selwyn (2007) searched their courses and their ideas on their education by searching usage purposes of Facebook, its effect on undergraduate education and the students' walls on Facebook profiles. Throughout the research, he asserted that Facebook helps the students to come over the role complexities that they encounter especially in their academic works against the instructors and academic chats.

With their research, Munoz and Towner (2009) stated that pictures, videos, messages, homework and applications appropriate for the students' topics handled at the courses could be used for educational purposes on Facebook. Furthermore, they asserted that students could share their presentations, homework, and other products by integrating the web-based courses, videos, and Google Documents into Facebook.

As a result of another research carried out by Martin (2009), students used the social networks at most for socialization and entertainment and at least for occupational purposes, and also Facebook was the most popularly used social network and LinkedIN was the least popular social network. Keleş and Demirel (2011) looked into this application process in terms of the interaction between each other, instructors and the content of the course by working on a sample for the academic use of Facebook with the undergraduate students. Another study, Mazman and Usluel (2009) developed a model to suggest the use of social networks for educational purposes.

2. RESEARCH METHOD

The purpose of this study is to determine Educational Use of Facebook of teacher candidates who are enrolled in Sakarya University, College of Education. In a descriptive method, the aim is to describe systematically the facts and characteristics of a given population or area of interest, factually and accurately. According to Karasar (1999), descriptive method is the research method that explains existing circumstances with fidelity, i.e. it seeks for the answer to the questions of “What is was?” and “What it is?”

2.1. Participants

The participants of the research consists of a total of 1494 people 877 of which are females, 677 of which are males and 497 of them are freshman, 305 of them are sophomore, 336 of them are junior, 356 of them are senior students. Distributions of teacher candidates who took part in the research according to their genders were as follows: %58.7 of females and %41.3 of males. The demographic characteristics of the participants are given Table 1.

Table 1. Data About the Sampling

Variables	N	%
Gender	877	58,7
Female	877	58,7
Male	617	41,3
Classes		
Freshman	497	33,3
Sophomore	305	20,4
Junior	336	22,5
Senior	356	23,8
Total	1494	100

2.2. Data Classification and Analysis

In the research, to identify teacher candidates' demographic characteristics, frequencies and percentages were calculated. T- test and ANOVA were used to examine differences among groups in terms of independent variables. For statistical analysis, SPSS 19 Statistical Data Analysis Program was used.

2.3. Instrument

Facebook Academic Use Scale which was used within the research was developed by Mazman(2009) in the scope of Master Degree Thesis. According to Mazman (2009) Academic use of Facebook was handled under three factors as “communication”, ”cooperation” and “sources and material sharing”. A scale consisting of 11 items was developed to identify the usage purpose of Facebook within these three factors. The items in the scale were 10 points likert type and the responses were prepared like that:1=“Completely disagree”, and 10=“Completely agree”. To identify the validity of the scale developed within the research, expert opinion method and to identify the reliability,item-total correlations and Cronbach-Alpha reliability coefficient methods were used. For the validity of the scale, each one of expert in his own field, 7 experts were interviewed, and the

scales were formed for eventual use according to the feedback received on the appropriacy of the items to meet the purposes of the scale.

According to the Educational Use of Facebook Scale reliability analysis results, internal consistency reliability of the 11 items measured via Cronbach Alpha was .92. The internal consistency coefficients of the scale with three subfactors were as follows; communication (.85), cooperation (.88) and sources and material sharing (.86).

3. FINDINGS

This study examines Educational Use of Facebook of teacher candidates who study in college of education. t-Test and ANOVA were used to examine differences among groups in terms of independent variables.

3.1. Gender Differences

According to Educational Use of Facebook scale with three factors, the t-test was applied to the basis of the factors. In this part, it is aimed to investigate that the difference between educational use of Facebook according to gender. The gender differences are given Table 2.

Table 2. Gender Differences on Factors Basis

Factors	Gender	N	\bar{x}	S	sd	T	P
Communication	Female	877	40,06	12,70	1492	,302	,762
	Male	617	39,87	11,57			
Cooperation	Female	877	20,07	7,12	1492	1,403	,161
	Male	617	20,20	6,34			
Sources and Material Sharing	Female	12,94	5,21	7,12	1492	1,492	,301
	Male	13,21	4,53	6,34			

As a result of the t-Test applied, there is not a significant difference between males and females related to the answers given to the Educational Use of Facebook scale.

3.2. Class Differences

As a result of the ANOVA that was applied to see whether there is a significant difference among between teacher candidates' classes related to the answers given to the Educational Use of Facebook Scale. In this part, class differences are analyzed according to factors.

Table 3. ANOVA for Differences between Classes on Communication

Factor	Class	N	\bar{X}	SD	Source Variance of	Sum Squares of	Df	F	p
Communication	Freshman	497	39,40	12,06	Between Groups	4512,76	3	11,00	,000
	Sophomore	305	37,23	13,67					
	Junior	336	42,19	10,01	Within Groups	305477,93	1490		
	Senior	356	41,06	12,64					

As shown in Table 3, significant differences were found between type of classes in their Facebook usage for educational communicational purposes ($F_{(3, 1490)} = 11.00$; $p < .05$). In order to find out among which group this difference results from, Bonferroni analysis in ANOVA was applied. According to ANOVA results firstly, juniors ($\bar{x} = 42,19$) are significantly different from freshmen ($\bar{x} = 39,40$) and sophomores ($\bar{x} = 37,23$). Secondly, seniors ($\bar{x} = 41,06$) are significantly different from sophomores ($\bar{x} = 37,23$). It was understood that the teacher candidates who are juniors more significantly use Facebook for educational communicational purposes than freshman and sophomores. Besides, seniors are more significantly use Facebook for educational communicational purposes than sophomores.

Table 4. ANOVA for Differences between Classes on Cooperation

Factor	Class	N	\bar{X}	SD	Source Variance of	Sum Squares of	Df	F	p
Cooperation	Freshman	497	20,18	6,92	Between Groups	1530,82	3	11,21	,000
	Sophomore	305	18,92	7,59					
	Junior	336	21,86	5,49	Within Groups	67822,67	1490		
	Senior	356	21,00	6,79					

As shown in Table 4, significant differences were found between type of classes in their Facebook usage for educational cooperational purposes ($F_{(3, 1490)} = 11.21$; $p < .05$). In order to find out among which group this difference results from, Bonferroni analysis in ANOVA was applied. According to ANOVA results firstly, juniors ($\bar{x} = 21,86$) are significantly different from freshmen ($\bar{x} = 20,18$) and sophomores ($\bar{x} = 18,92$). Secondly, seniors ($\bar{x} = 21,00$) are significantly different from sophomores ($\bar{x} = 18,92$). It was understood that the teacher candidates who are juniors more significantly use Facebook for educational cooperational purposes than freshman and sophomores. Besides, seniors are more significantly use Facebook for educational cooperational purposes than sophomores.

Table 5. ANOVA for Differences between Classes on Sources and Material Sharing

Factor	Class	N	\bar{x}	SD	Source of Variance	Sum of Squares	Df	F	p
Sources and Material Sharing	Freshman	497	12,46	4,96	Between Groups	1234,42	3	17,38	,000
	Sophomore	305	12,06	5,36					
	Junior	336	14,53	3,90	Within Groups	35266,85	1490		
	Senior	356	13,33	5,08					

As shown in Table 5, significant differences were found between type of classes in their Facebook usage for educational sources and material sharing purposes ($F_{(3, 1490)} = 17.38$; $p < .05$). In order to find out among which group this difference results from, Bonferroni analysis in ANOVA was applied. According to ANOVA results firstly, juniors ($\bar{x} = 14,53$) are significantly different from freshmen ($\bar{x} = 12,46$), sophomores ($\bar{x} = 12,06$) and seniors ($\bar{x} = 13,33$). Secondly, seniors ($\bar{x} = 13,33$) are significantly different from sophomores ($\bar{x} = 12,06$). It was understood that the teacher candidates who are juniors more significantly use Facebook for educational sources and material sharing purposes than freshmen, sophomores and seniors. Besides, seniors are more significantly use Facebook for educational sources and material sharing purposes than sophomores.

4. CONCLUSION

The fact that social networks provide the users with rich content, and the users of social networks are mainly the young and the students revealed that social networks could be used for educational purposes. Facebook is the most widely used one among other social networks. The most significant feature of Facebook most widely used and preferred social network and distinguishing it from the others is its applications. There are applications created by the users and the system on Facebook. This feature of Facebook causes the users to spend more time on the site. The purpose of this study is to identify how Facebook could be used educationally other than its known uses.

According to factors, it was found that there are significantly difference between classes. Juniors are more significantly use Facebook for educational communicational, educational cooperational and educational sources and material sharing purposes than freshmen, sophomores and seniors. However, seniors are more significantly use Facebook for educational communicational, educational cooperational and educational sources and material sharing purposes than sophomores.

In this study, juniors teacher candidates are most significantly use Facebook as educational than freshmen, sophomores and seniors that they use Facebook for fosters communication among to peers, fosters communication between teachers and students, conductional classroom discussions, transmission of course materials and sources, announcements about school, class and courses, forming academic groups considering the common needs, sharing information on the courses or other educational studies, carrying out group works, access to rich sources and materials for learning, providing rich multimedia (video, animation, sound...) during learning.

Abstract

This study focused on the future trainers' attitude in respect of gender, sex and sexual orientation. Contrary to previous research studies, which associate to a greater knowledge a better attitude, our results shown that prejudices are still present even for graduate students. Therefore, it urges a reflection on a new teaching paradigm able to provide a plural gender identity vision. Training processes must be more than a mere intellectual education: a reflection on professional future.

Keywords: teaching, learning, sexual prejudice, sexual orientation, university

According to public opinion, the evolution of the medical view on sexual orientation has not proven useful in the review of opinions on homosexuality. Homosexuals, victims of sexual prejudice, are in fact forced to fight against false beliefs, mistrusts and consequently for the vindication of their rights (example: Stonewall Riots (NY), June 1969).

The distorted and stereotypical picture that emerges from shared representations, in spite of the progress of the research, encourages us in fact to anchor the homosexual to the figure of a sick man: in other words to that of a different man because it barely connects with male-female and man-woman dichotomies.

1. Sexual Prejudice

Prejudice, usually associated with a negative connotation, represents a type of ongoing attitude which is able to resist change due to a lack of sensitivity towards a reasonable argument, despite evidence of the subject's irrationality. One characteristic, which can be attributed not only to the origin of prejudice, seen in the automatic elaboration of information that escapes individual control, but also in affective and cognitive aspects of their attitudes:

1. Cognitive component: information and beliefs towards a subject

* Corresponding author. Tel.: +39-091-23897716; fax: +39-091-6513825.
E-mail address: maria.garro@unipa.it

2. Affective component: emotional reaction towards the subject
3. Behavioural component: approaching or distancing actions towards/away from the subject.

Specifically for this research, attention has been focused on sexual prejudice towards sexual orientation, in general on the LGBT Community (Lesbian, Gay, Bisexual and Transgender) and in particular on Gays and Lesbians. It is based on the attitudes which create intergroup tension as they are expressed through appreciation or judgement of a social group (in-group vs out-group), whose members are perceived as similar in virtues, in belonging to a specific group, and worthy of contempt or hostility (Herek, 2000). A different response, in other words, than what is manifested by heterosexuals who have the possibility to interact with friends or family belonging to the LGBT Community; in these cases, in fact, one feels inclined to focus primarily on the personality traits of single individuals instead of the exaltation of the similarities of homosexual subjects (Tajfel, 1959). The minority group, in the absence of interaction, is therefore perceived and perceives itself as inferior, a subordinate segment to the broad social framework of belonging, with poorly considered characteristics displayed by the surrounding environment (Altman, 1982). It is a disadvantaged situation for its protagonists, not only in psychological terms but also social terms, as it implies discrimination and aggressive behaviour (Meyer, 2003).

The use of the term sexual prejudice is, in Herek's opinion (2000), favourable to that of Homophobia, an expression that has crystallised social opinion towards sexual orientation since the end of the sixties; in other words, when it was coined by heterosexual psychologist, Weinberg (1972).

The rigidity of the concept of homophobia is, in the Author's opinion, identifiable in its own content. Although that does not help us to understand it in its entirety, the aversion towards Gays and Lesbians, as it seems to be associated with anxiety and an irrational aversion towards homosexuality, is likened to a similar fear to that of infection and to the terror of being in a closed space with homosexual people.

The difference between the terms sexual prejudice and homophobia is therefore clear: the first is descriptive and makes reference to extensive, traditional research of social psychology related to attitudes, and highlights the dynamics which animate antigay behaviour, whilst homophobia does not define the origins, the dynamics and the motivation of antigay attitudes (Herek, 2000). The appeal of the concept of homophobia, in fact, can be useful when highlighting poor tolerance in general and repulsion against homosexuality, of homosexual people and the actions connected with them. Poor acceptance is shown in physical violence, in murder or in the instigation of suicide (gay bashing). Previous research has demonstrated, in fact, that the increased number of suicide attempts, especially in youngsters, represents a positively correlated link to sexual discrimination (Haas et al., 2010).

Studies dedicated to such a theme have been able to identify possible motivations behind such attitudes when assuming controllability of the cause of homosexuality (etiology), or if it is less connected to the development and learning or more to lifestyle and individual choice. It has been demonstrated, in fact, that members of the majority group only express their positive judgement during assignments, attributing biological or genetical sources that, due to their nature, are uncontrollable (Haslam, & Levy, 2006; Haider-Markel & Joslyn, 2008), and they express the opposing, negative opinions only if the cause is defined as controllable (individual choice). In this sense, the attribution of controllability/uncontrollability and situational and dispositional factors become strong indicators for the possibility, recognised by Gays and Lesbians, to take advantage of social support (Heider, 1944, 1958; Weiner, Perry & Magnusson, 1988).

Attitudes, sexual prejudice and homophobia ultimately seem to be well expressed by the multidimensional concept of Homonegativity. This, in fact, refers to both the aversion and to the anxiety of homophobia, as well as to the range of attitudes towards homosexuality (Hudson & Ricketts, 1980), also including the cultural components and the social roots of intolerance (Lingiardi, 2007). Specifically associated with a type of cognitive strategy, dictated by the need to defend oneself against a threat of disorder and by the will to maintain a socially

unchangeable framework, homonegativity seems capable of flourishing within a framework in which homosexuality is unspoken and considered an etiquette which refers to the concept of disease and sin (Ibidem).

The aggressive behaviour is, in this sense, comprehensible and results in intentional characteristics (to cause deliberate harm to others) and in expectation (that such an act provokes negative consequences in those who suffer) (Garro & Ruggieri, 2012; Ruggieri, 2009; Ruggieri & Boca, 2013).

2. Future Trainer and Teaching Paradigm

Prejudices return to the simplification of information, a useful strategy for the immediate formation of opinions and for the choice of a determined behaviour (Rosenberg & Hovland, 1960; Fazio, 1986). For this reason, the study of behaviours on sexual orientation in university students is important – for those enrolled onto training courses for Support Workers – and also for reflection on their own professional futures. Kozloski (2010) states that the level of cultural background is related to levels of sexual prejudice; in this sense, only if teaching programmes are not based on heterosexual paradigms is it possible to promote the knowledge and the development of relationships with LGBT people.

3. The Research

The objective of this study, therefore, focuses on the attitudes of university students regardless of gender, sex and sexual orientation. The hypothesis is that high levels of training may be related to a better attitude towards homosexuals and towards the possible promotion of civil rights for Gays and Lesbians.

3.1 Participants

603 Sicilian university students (Italy) – of which 43 (7,13%) male and 560 (92,87%) female – enrolled onto degree courses at the branch of education for a period of three years ($n = 396$), and for a two-year masters degree ($n = 207$), between the ages of 18 & 27 years old ($M = 21,18$; $DS = 2,41$). Of these students, 598 declare to be *exclusively heterosexual*, 4 *mainly heterosexual* and, lastly, 1 *mainly homosexual*.

3.2 Procedure

The administration of research tools took place during class hours in line with the teaching calendar, and in accordance with a collective administration that ensures full anonymity to all individuals involved.

3.3 Instruments

Self report questionnaires which focus on the collection of attitudes and are capable of determining their direction (favourable vs unfavourable) and their level (the intensity of the assessment).

Questionnaire on the attitudes of university students^a allows, through the use of a Likert 5 point scale (1= “strongly disagree”; 5 = “strongly agree”), us to see students’ attitudes towards:

- Arguments regarding sex and gender (9 items);
- Gays (GS: Attitudes Scale towards Gays – 16 items);
- Lesbians (LS: attitude scale towards Lesbians – 16 items).

Italian Scale for the Measurement of Homonegativity (Scala Italiana di Misura dell’Omonegatività - SIMO – Lingiardi, Falanga & D’Augelli, 2005), to multiple responses (Likert 5 point scale). This is composed of 56 items, of which 28 investigate the attitudes towards Gays and another 28 towards Lesbians.

3.4 Data Management and Analysis

Data has been collected in specific databases and subsequently processed using electronic spreadsheets and the statistical processing package SPSS.20 for Macintosh. Frequency distributions and descriptive statistics were inputted to examine the distribution of the data.

3.5 Results

The present contribution analyses and examines the attitudes amongst the LGBT community, with a focus on the LG component.

The data analysis of the items considered most significant for the purposes of this contribution, estimated by both tools, demonstrates that 58,08% do not know anyone who could be defined as gay, lesbian or bisexual (don’t know = 16,72%); a statement that refers to the invisibility of homosexuals that can produce harmful effects, especially for the development of relationships between peers (Dessel, Woodford & Warren, 2011). And still the tendency is noticeable to consider the pathological dimension of homosexuality as items F, G & H highlight the absence of knowledge of civil rights (couple, same sex parents, work...) (Item B, C, D, E, I) (Table 1).

^a Worthen, M., Lingiardi, V. & Caristo, C. in press

Table 1. Frequencies (%) of responses related to judgements expressed in regards to male homosexuality

(scale: attitudes vs gay – GS)

Item	Disagree	Do not know	Agree
A. Effeminate men make me uncomfortable	24,63%	16,34%	59,03%
B. If I find that a teacher is gay would remove my child from his class	29,46%	26,54%	44%
C. i would not vote for a candidate openly declared gay	34,76%	23,45%	41,79%
D. The marriage between men should be legal	67,32%	12,34%	20,34%
E. Gays cannot be good parents	11,48%	15,18%	73,34%
F. Male homosexuality is a psychological disorder	39,78%	18,76%	41,46%
G. Gays should undertake treatment to change their sexual orientation	38,23%	16,78%	44,99%
H. Psycian and psychologist should find a cure for male homosexuality	36,23%	23,78%	39,99%
I. Male homosexuality is a threat to the family as a social institution and value	21,05%	16,72%	62,23%

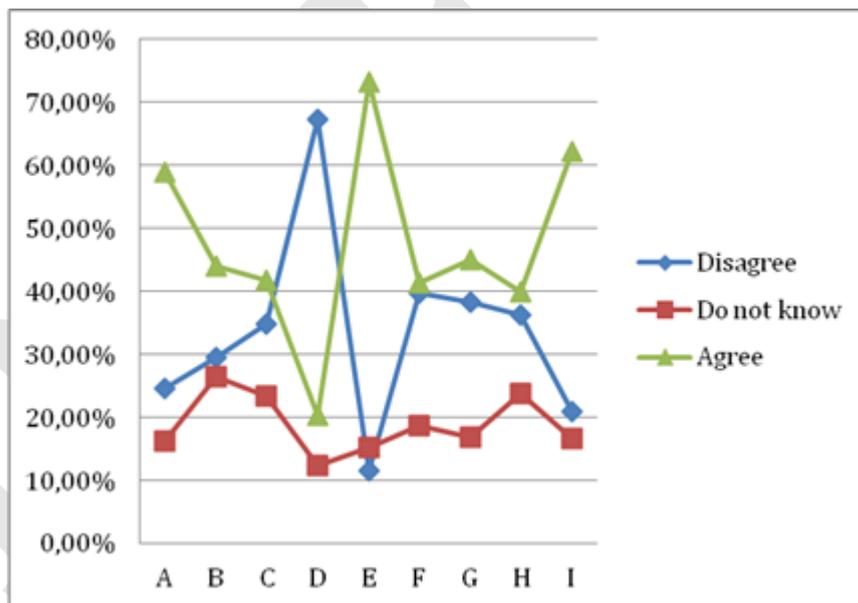

Figure 1. Complex responses – Scale GS

In relation to GS, participants, therefore, amount to an average score of 45,57 in a range that has 16 as an inferior limit (this number represents the total not accepting of gays) and a maximum limit of 80 (that instead represents the maximum score of acceptance).

The currently reported data does not differ from that relating to female homosexuality, summarised below (Table 2 & Figure 2)

Table 2. Frequencies (%) of responses related to judgements expressed in regards to female homosexuality (scale: attitudes vs lesbians – LS)

Item	Disagree	Do not know	Agree
A. Masculine women make me uncomfortable	32,34%	17,89%	49,77%
B. If I find that a teacher is a lesbian I would remove my child from her class	32,92%	23,45%	43,63%
C. I would not vote for a candidate openly declared lesbian	37,75%	12,76%	49,49%
D. Lesbian marriage have to be legal	71,23%	8,23%	20,54%
E. Lesbians cannot be good parents	23,45%	16,67%	59,88%
F. female homosexuality is a psychological disorder	35,67%	23,12%	41,21%
G. lesbians should undertake treatment to change their sexual orientation	43,67%	14,78%	41,55%
H. Psysician and psychologist should find a cure for female homosexuality	41,60%	15,82%	42,58%
I. Female homosexuality is a threat to the family as a social institution and value	28,83%	19,85%	51,32%

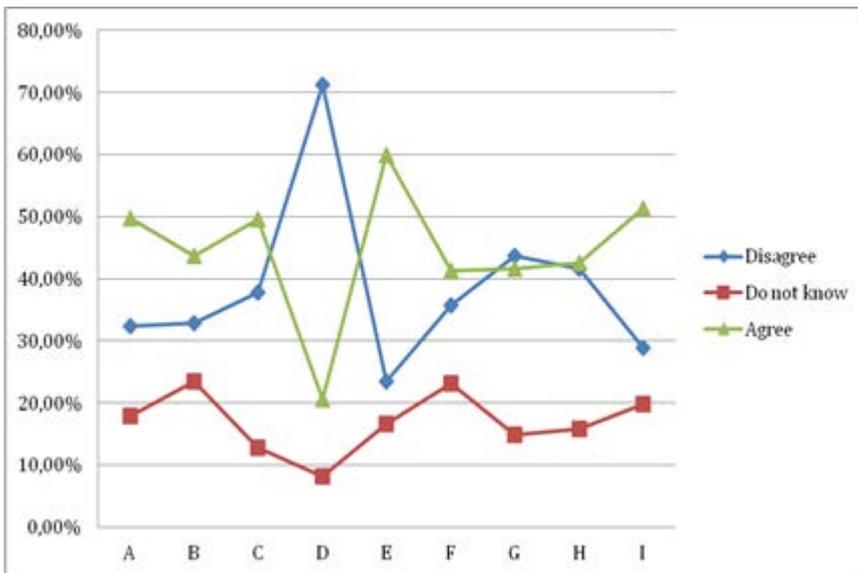

Figure 2 Total responses – LS Scale

Compared to LS, in fact, participants settle for a mean score of 44,29 in a range that, as stated above, has a lower limit of 16 (total non-acceptance of Gays), and a higher limit of 80 (maximum score of acceptance).

In both sections (GS and LS), the transition from Bachelor Degrees to teacher’s courses does not seem to have influenced the quality of the opinion towards homosexuality. The average scores, in fact, do not undergo significant changes, despite a higher level of education (figure 3).

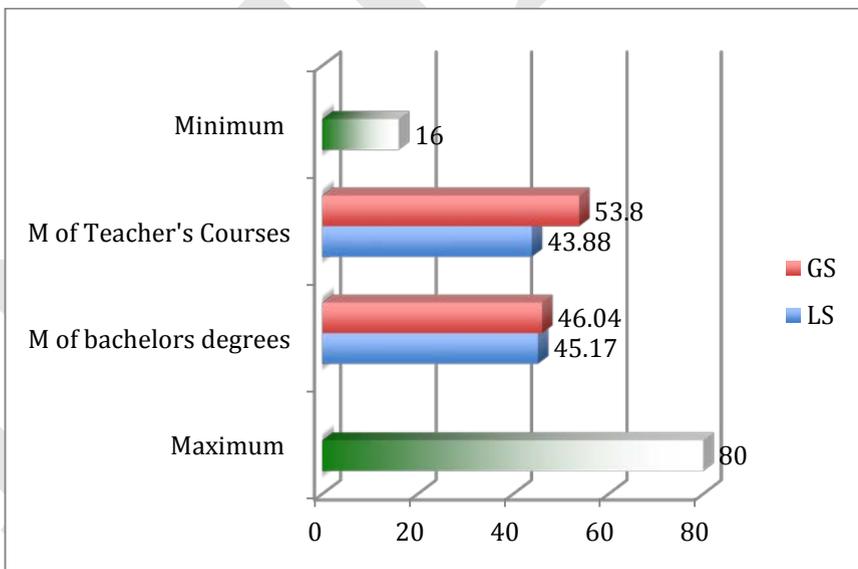

Figure 3: Total responses - Scale LS and GS - Bachelor Degrees and Teacher's Courses

Some of the data, for example Items D, E and I on both scales, also encourage reflection on the levels of prejudice which appear to be related to traditional, sexual roles and to sexual conservatism. These results can appear unpredictable if attention is aimed at the sex of a group of participants, which is female dominated. Previous research, in fact, has demonstrated that women, both adolescents and adults, generally demonstrate low levels of prejudice towards homosexuality, unlike men who, on the contrary, tend to not only have a strong interest towards the distinction of gender differences, but also a tendency to maintain a clear and coherent gender identity (Baker & Fishbein, 1998). It has not been possible, unfortunately, to compare the responses in relation to the participants' sex due to the low number of males enrolled onto the training courses covered by the survey. In fact, in the Italian, academic world there is a female dominance in Humanities courses and psycho-pedagogical courses (Mebane, 2008).

Finally particular attention is given to the percentage of 'do not know' responses (about 25%), provided by both means: a figure which seems to suggest a difficulty expressed by students in assuming a position relative to the thematic focus of attention, avoidance or indifference.

In conclusion, the tables shown represent a stimulus for reflection, since the results are unquestionable entities; in fact, contrary to the design hypothesis, the opinion on homosexuality has not been subjected to changes with the progression of training. The participants of the survey probably think they do not really know any homosexual people, by not assuming an invisibility of these. It is likely that, instead, they are protagonists who are unaware of friendly and informal interactions with members of the out-group, and so they do not find it necessary to review their own beliefs and observe errors of categorisation (Cook, 1984; Herek & Capitano, 1996). The outcome of the survey, again, could be attributed to the quality of the content of the training offered to the students, presumably unarticulated and poor models for training of future social workers (educators, trainers and teachers). The individuals involved in the survey, in fact, will have a profession mainly based on listening to and interacting with others, and whose foundations should find a place for acceptance, not prejudice, of the challenges expressed by the user. The study of attitudes, in this sense, can facilitate the comprehension of the relationship strategies adopted in connection with interpersonal interaction and the corresponding behavioural response. To create a beneficial relationship means, in fact, to change social representations, to revisit their own prejudices and, yet, to sacrifice opinion by going beyond dichotomies before the everlasting movement of research and of change (Morin, 2001).

Through extensive gender training, it is not only necessary for Social Workers to reflect on the ways in which the human being represents reality, but also for those who deal with education in particular to reflect on the processes of categorisation, prejudices and on the possibility of changing these.

It is a journey of lifelong learning, thus being capable of guaranteeing a suitable acquisition of knowledge and valuable lessons, without avoiding confrontation with certain social issues that can appear more challenging than others.

4. Discussion and Concluding Remarks

The current survey, which is by no means exhaustive, will further explore the preoccupation of the students, equally distributed by sex and by another Italian region (Puglia). It is also a good opportunity to analyse the content of educational programmes offered in advanced training at other universities of the peninsula.

The quality and the level of instruction represent, in fact, indicators for the increase of social tolerance. In this sense, the requirement emerges for future professionals of beneficial relationships, to acquire new competencies and high healthcare training to guarantee social support of ample respite to social minority groups, subjects of discrimination and stigmatisation. Job training is also necessary with youngsters belonging to different nationalities, present in high proportion in educational institutions of a society more and more multi ethnic like the present, because it should make the understanding of different cultures possible towards homosexuality. One objective, the latter, that in other countries has been achieved through group meetings that have focused on the heteronormative culture and on the invisibility of sexual orientation. Students sought to create a more welcoming world for LGB people by learning about the views of others and then promoting understanding and acceptance through teaching others about sexual minorities (Dessel, Woodford & Warren, 2011). The training of social workers should, therefore, focus its attention on the acquisition of valid competencies for the integration of different sexual identities, on the creation of a real respect for equal opportunities and on counteracting the discomfort caused by the prejudices against homosexuality. The way in which they coordinate issues with social norms, with understanding sexuality and human well-being is in fact connected to the attitudes and opinions on homosexuality (Heinze & Horn, 2009). Training processes should further extend into education and reflect our professional futures. Internal wrestling with how gender and orientation have been shaped and re-shaped in our own lives, remains to be discussed further (Marshall 2006).

Teaching approach for autism students : a case in Malaysia

Habsah Omar, Zaharah Hussin, Saedah Siraj*

*Polytechnic of Ungku Omar
Faculty of Education University of Malaya*

Abstract

Children with Autism are isolated in their own nature, not because they are visually or hearing impaired but because of the difficulty of understanding what is happening around them. Pupils' background of Autism disorders as expressed in terms of delayed language development, communication, social interaction and behavior have created problems for teachers when implementing the teaching and learning process in the classroom. This paper presents the findings of a case study conducted in Malaysia to identify teaching approaches applied by the teachers during the process of teaching pupils with Autism. This study was carried out by interviews with two teachers who teach Autism students in Special Education classes and a teacher who teaches Autism students in an Inclusive classroom. All respondents were selected based on criteria of already having more than five years teaching experience and a history of outstanding teacher awards over their service. Verbatim interview data are further supported by the observation data and document analysis. This study has demonstrated impressive results in which teachers are always trying to reach out and attract the attention of students with autism to focus on the classroom teaching by using the elements of love and profound concern. The study also found that patience was apparent in the teachers and exhibited at a high level on a continuous basis during teaching sessions; this was seen to alter some Autism students' negative behavior to a more positive behavior.

INTRODUCTION

This article is a summary of the findings of a study conducted in Malaysia on teaching approaches for Autism students. Teaching for Autism children in Malaysia has provided a challenge for the teachers to implement instructional approaches that are appropriate to the needs of students. Children with Autism present a series of unique problems that create confusion for all parties involved because of the discrepancy in the understanding of their behavior compared to normal children (Fong Chew Hoon, 2003). Children with Autism are said to have problems caused by differences in social skills, communication, interpersonal relationships and behavior compared with normal children.

Additionally, Norfishah Mat Rabi (2009) also states that students with Autism disorders have problems of language development and communication, social interaction and behavior. These caused problems for teachers in implementing the teaching and learning for them. Every autism child is also said to have different characteristics. Therefore, teaching special education for students with learning disabilities such as autism requires a teacher who is knowledgeable about special needs students, always ready with rigorous lesson plans and adapting their teaching in accordance with the achievement of individual pupils (Rosidah Jemain, 2006).

Ab. Halim Tamuri and Nik Mohd Rahimi Nik Yusof (2010) state that the effectiveness of teaching and learning in schools depends on the capacity and role of the teacher in the classroom. This statement is also supported by Md. Isa Bin Hassan (1993) who pointed to the failure or the success of an educational system depends on the approach or teaching and learning methods used. If the approach and methods are used well, then, the whole education system will run smoothly and successfully. According to al-Syaibani Omar Mohammed al-Toumy (1991), Abdullah Ishak (1989) and Mohd. Azam Mahat (2009), improved methods and approaches are important to help students to acquire knowledge, skills, attitude and behavior change, and to instill the desired values.

OBJECTIVES OF THE STUDY

This study tried to Identify teaching approaches used by teachers when implementing the teaching process to pupils with Autism.

PARTICIPANTS

This study focused on the methods of teaching to three autism students in an inclusive classroom at secondary school, a student in special education class at secondary school and a student in special class at a primary school. The main participants of this study are three teachers who teach Islamic education in those classes. All teachers selected for this study had several criteria such as having more than five years of teaching experience in Islamic

education subject, had been awarded as an excellent teacher over their service, had at least a Bachelor's degree, willing to cooperate and to give commitment to this study and voluntarily agreed to be participants.

RESEARCH METHODOLOGY

This study is a qualitative research case study conducted through semi structured interviews, observations and documents analysis. The interviews were conducted on two Islamic Education teachers in special education classes and a teacher of Islamic education in an inclusive classroom. To support the data, observation in the teaching and learning process was implemented. The document analysis, field notes and diaries were also used to strengthen the findings.

DISCUSSION

The study found that the approach of loving and caring was implemented by the respondents. This was stated by a respondent named Norli, who said ...

"... I try to educate my students with love and affection. I am confident that with love, they will grow up to be an outstanding generation, creative, and confident. They will see the world in a positive way, stepping with confidence, find happiness in life, intelligent face.. trials in the best way ... " (Norli, 2012)

This finding is supported by the view of Ahmad Zawawi (1990) which states that Islam emphasizes compassion in education. Based on interviews and observations, researchers have identified that teachers need to express affection for autism students through five key elements of love, that is, intercommunion, touch, praise, gift giving, and nurture a deep concern for all the problems and needs of students with autism.

Intercommunion

Intercommunion approach or friendly interaction that is often shown by participants was shaking hands, holding students' hand when they go to the toilet and canteen, rub students' back when they sulk, hold their hands for writing, rub students' shoulders, joked pinch, swipe the head, touching foreheads and cheeks to track student body temperature during fever, wipe the tears, wipe the mucus of the nose, tidy students' shirt and pants, and clean up leftover food in the mouth. This finding is also seen to coincide with the views of Zuri and Aznan Mohd Che Ahmad (2011), which state that teachers should always care for and love their students. This finding is also supported by Abdul Ghani Abdullah and Abd. Rahman Abd. Aziz (2009) who stated that the advice that contains polite words accompanied by gentle touch is very meaningful compared to advice without action.

Praise

The participants also had shown their attention and behavior through praises by using positive words and motivation encourage learning. Norli (Participant 1) often called her students ... 'handsome' ... This was to motivate her students to keep taking care of their hygiene. Fatimah often used a word ... 'clever'... as a compliment when a student successfully completed the task earlier than other students. To Fatimah (Participant 2), she often followed by using persuading skills. Similarly, Mr. Adri (Participant 3) always praised his autism students.

Appreciation and Gift Giving

The approach of appreciation and gift giving as practiced by the three respondents in the study are intended to persuade and attract the attention of students in the process of teaching and learning, to entertain their heart, to strengthen the relationship, as on the basis of sympathy and as appreciation for their success. The gift giving in this study also refers to a form of feeding in the school cafeteria, daily spending money for their students' needs, such as for school shoes, pens and notebooks. The participants also gave greeting cards and congratulated their students during the birthday party by giving away colored pencils, candy, chocolate and crackers and key chains. This approach used by teachers are stated as follows: "..... I also held a birthday celebration and gave some gifts to students. I feel happy seeing my autism students having fun".

Care and Concern

Participants also showed their love and care for the students through their concern for them. They gave their attention, concern, met the needs of pupils, acting as a protector, and emotional control to soothe the hearts of students. These were expressed by Norli as in the following passage: "*He's an orphan. If he's not healthy, I really would visit him at the hostel. Bought his favorite food to amuse his heart ...*" (Norli, 2012)

The findings of this study indicated that teachers not only carry out their duties of teaching, but also had shown the capacity to love very deeply. The respondents had shown affection not only when delivering lessons in the classroom, but they had shown concern to take care of the students' welfare outside the classrooms. They had been willing to lend their money for daily expenses and the purchase of essential items for the students' schooling.

Teachers caring, compassionate and being gentle toward the students should be emphasized in the teaching of students with autism. Teaching can be done well if the teacher has the patience, sincere feelings of deep affection for children. No matter how great a single approach used in a lesson, it will not guarantee the success in educating if it was implemented without sincere affection from a teacher to his students. In addition, teachers should avoid from the action of insulting their autistic student in front of other students. Teachers' anger will not bring any benefit to students but will lead to boredom in teaching, creating confusion, resentment, and even emotional stress to children with autism. Researchers concluded that the nature of love, compassion and sincerity are very important implanted in the soul of every teacher involved in teaching and learning, particularly involving students with special needs. Based on these findings, the researchers have developed a teaching approach model for autism students known as the Caring Approach in Teaching Autism Students, as illustrated in Figure 1.

Teaching specialized terminology at Mendel University in Brno – creating interactive multimedia cd

Jitka Sýkorová*

Jitka Sýkorová, Mendel University in Brno, Zemedelská 1, 613 00 Brno, Czech Republik

Abstract

In 2012, Mendel University in Brno was awarded prestigious international certificates ECTS Label by the European Commission. The ECTS Label confirms that all degree study programs at Mendel University as well as subject outcomes (exams and credits) follow the European credit system; therefore they are also recognized abroad. The ECTS Label provides a transparency and quality guarantee within international student mobility and recognizes the study undertaken abroad. The Diploma Supplement label meets strict European criteria and it is issued to every graduate of bachelor's, master's and doctoral study programs; it follows principles of European university education internationalism in compliance with Bologna Declaration. The preparatory period before granting certificates called for reviewing foreign languages curricula, i.e., the English and German languages, and creating new ones. Another step consisted in evaluating foreign languages methodology and finally, new study materials are being prepared at the Faculty of Forestry and Wood Technology, Mendel University in Brno; they are focused on interactive teaching specialized terminology.

Keywords: certificates, MENDELU project, specialized terminology

1. INTRODUCTION

Preparation of the ECTS Label certificate resulted in reviewing and restructuring existing syllabi for teaching the English and German languages at the Faculty of Forestry and Wood Technology, Mendel University in Brno. Referring to and considering many year's pedagogical and methodological experience, we came to the conclusion that the level of general language knowledge is a crucial criterion: required knowledge should be B2 and higher. We also considered personal experience resulting from long-term foreign language teaching, translating and interpreting and decided to apply a grammar-based approach in contrast to the direct method used in textbooks published abroad.

Students from Central Europe having passed the secondary school leaving examination in the native language are grammar literate; using this knowledge, they are able to learn a foreign language if contrastive linguistics approach is applied, therefore the contrastive linguistics methods can easily be used while teaching English and German languages. Our experience shows that students are able to make a correct hierarchy of grammatical structures, they can discover their consistency, establish further grammar material and create a good foundation for mastering other foreign languages; they know grammar terminology and categories unambiguously when

* Corresponding author.
Email address:

grammar-based method is used. However, the conventional grammar-based method has to be complemented with the listening skill comprehension, reading comprehension and writing using the latest textbooks written by professional native speakers; we are offered other teaching varieties while combining these two sources because Czech textbooks and “foreign” textbooks apply different methodologies.

2. PREPARING MULTIMEDIA INTERACTIVE CD

An interactive multimedia CD came out after two-year work with specialized literature in the field of agriculture, horticulture, forestry; in addition, there was another publication covering intercultural studies and grammar summary. Currently, we are working on a new product, an interactive multimedia CD; we cooperate with experts so that specialized tailored software could be developed.

The CD should be a good learning support as well as an e-learning product and it is designed for full-time undergraduate students, combined study programs and the academic staff. Numerous PhD students participate in the courses because they need to improve their language knowledge before taking the doctoral examination. The aim consists in reinforcing the foreign language competence courses trainees in order to enhance their chances and competitiveness at the domestic and foreign labour market; students should be able to summarize, discuss, explain and present technical issues and research results in conferences, internships, lectures and publish in foreign journals and proceedings. Doctoral students are particularly focused on the academic skills, i.e., writing, reading, and speaking because there is still the biggest discrepancy between theoretical and practical knowledge.

3. CONTENT AND METHODOLOGY OF MULTIMEDIA CD PROCESSING

Since the curricula overlap in some fields of study, the content will be interdisciplinary focused. The educational CD creation made us create new teaching materials using the latest modern design. We apply long-term teaching experience and knowledge acquired while working with technical texts starting from simple to highly advanced specialized vocabulary and terminology. Every chapter requires careful selection and quality processing quality of source texts. What are high-quality texts? Current topic, compressed specialized lexis supplied with graphs, photos, etc. We intend to select 40 texts in English and 40 in German. Every chapter will contain the introductory text followed by series of variable exercises. The experience shows that every lesson should be arranged using the same frame: the introductory text, then practicing vocabulary derived from the source text, grammar presented and derived from this text and practiced exclusively using specialized terminology from the introductory text. The 40-chapter set will be bonused: there will be added specificities of specialized texts, common phrases, abbreviations, acronyms, numerals, etc.

The structure of every chapter/lesson must be the same: too many new and different exercises are confusing for learners and they have problems to handle and manage the material thoroughly. Methodology selection is a crucial key stone, therefore the most efficient types of exercises are chosen, the existing software is modified and new one is being gradually developed: the attention is paid to lexis, practicing vocabulary, grammar, developing

all four skills; exercises cover listening comprehension because the experience shows that even good students are able to manage grammar, phrases, express present ideas verbally (oral, written), however listening with understanding case the most serious troubles. The developed software must offer self-students combining various methods and training different skills: two skills must always be involved, e.g. listening/writing, speaking/writing, etc. Attention is paid to grammar correctness, form and culture of expressing and presenting ideas, practical exercises are targeted at academic reading and writing specificities.

4. COLLABORATION WITH OTHER PROFESSIONAL INSTITUTES AND INSTITUTIONS

Interdisciplinarity requires consulting specialists and exchange of experience within Mendel University, universities abroad and practical verification at partner institutions. Teaching the academic staff also enables further contacts and sources of knowledge and latest published materials from conferences. The staff members enhance and improve the language knowledge as well as language presentation skills and competence to teach specialized subjects in a foreign language: presentation skills are beyond the scope of a multimedia CD. Learning helps them to conduct subjects in English, arrange seminars, prepare and carry out presentation in a typical English-Saxon style; communicative methods dominate in these courses method. Presentations of the trainees are evaluated by other participants, therefore arguing and discussions are practiced as well.

5. DISCUSSION

Having finished the first third of the project, it becomes more and more obvious that every teaching and learning process, regardless whether general language or specialized, must consistently monitor vocabulary and lexicology. Students acquire the latest terminology while reading original literature sources written by native speakers; the aim consists in supplementing specialized dictionaries, which lack neologisms or expressions just difficult to translate. Available specialized dictionaries just repeat and reprint the same terminology, which is hardly ever complemented with the latest terminology of the field: neologisms are exceptional or they miss completely. The final training goal should be skills focused on resumes, abstracts, conclusions, conference papers, etc. It is also necessary to practice listening comprehension; this skill is elaborated least of all and calls for more enthusiasm and effort.

6. CONCLUSION

In the course of the project activities, students and teachers will acquire new experience while using specialized vocabulary. The results will be verified by samples of students; questionnaires, interviews and investigation will help to modify, adapt, precise, target and improve the effectiveness of newly elaborated specialized language teaching methodology.

renee-pascale.laberge@polymtl.ca*

Abstract

The École Polytechnique de Montréal has integrated an approach of teamwork in its twelve engineering programs, in the bachelor's degree program since 2005. Students must take a compulsory 45 hour course on teamwork and are then accompanied with team coaching throughout the four years program, in all the engineering integration projects. These integration projects are generally ones in which, over a session, the students work in teams to conceive an engineering project. Within the framework of these projects (1 per year), a group communication specialist meets every team for approximately 60 minutes. This process promotes the transfer of the accumulated knowledge acquired in the teamwork course to their projects and helps identify the group processes at play in their teamwork dynamics. The objective pursued by this conference is to present the innovative formula used by the École Polytechnique de Montréal and to demonstrate by clear examples how it allows the development of skills in teamwork in all the scientific disciplines.

1. Introduction

Private and public organizations are in full mutation. The growing complexities of the work environment are causing such great changes that it is difficult for someone to manage, elaborate solutions and to make decisions on their own. More and more, the working world is using collaborative-style management; multidisciplinary and interdisciplinary teams seem to be becoming the norm (Federman-Stein 2000). In Québec, as elsewhere in North America, the engineering world has transformed itself in recent years. Where once the engineer worked alone, there is now a team. The expectations of the engineering milieu in regards to work team competencies are becoming more demanding. That explains why certain engineering programs are looking to integrate group work training. The production of work in teams within courses has grown in popularity because it allows the integration of pedagogical approaches that correspond to the expectations of the workplace (Federman-Stein 2000). Therefore, it has become important to explore the conditions that will allow the integration of new competencies and pedagogical approaches in team work in engineering schools.

* Corresponding author.

Email address: renee-pascale.laberge@polymtl.ca

In 2003, the *École Polytechnique de Montréal* integrated, entirely and massively, in the course curriculum for the students of 12 of its undergraduate programs, some teaching methods linked to the needs of the job market. Among the objectives of its new *training project*, put in place since 2005, the will to reinforce the development of team work abilities is certainly considered to be a priority. Interpersonal abilities were identified as one of the necessary strengths of the specifications of the training project. Since 2006, 2 credits have been accorded for the integration of teamwork and interpersonal communications courses in the undergraduate programs, which demonstrates to students that these competencies are of the utmost importance in their training to become engineers.

A 45 hour mandatory course is the foundation of a team coaching over a 4 year period in every engineering integration project. A team of specialists in interpersonal communication and small groups are responsible for teaching the courses and the monitoring of the teams in their integration projects. This innovative and personal approach aims to motivate students to put into practice these skills and this approach can be applied to disciplines as varied as Design, Computer Science, Engineering, and even Ergonomics.

2. Teamwork Courses at the *École Polytechnique de Montréal*

Teamwork provides individuals with the opportunity to get to know themselves better, to use their leadership, to take on responsibilities in relation to others, to promote their ideas and points of view, to open up to others, to listen and question the ideas of others. Reaching these objectives necessitates, however, an openness and effort on the part of the students. Our experience has shown us that to simply ask a group of students to execute a task and produce a report does not guarantee that the group will reach their objectives. To develop this type of ability, the students have to learn to concentrate not only on the task to be accomplished, but also on themselves, on the interactions and the group dynamics taking place in their work groups. The development of introspection seems to be essential to provoking the change and the awakening of a level of consciousness that is necessary for collaboration (Young 2002). The students must learn to look at each other, to question themselves while identifying their strengths and weaknesses (individual and team) and to determine objectives for realistic, concrete changes to develop their abilities and eventually their competencies.

2.1 *An Experiential Approach Oriented towards Change*

A founding principle underlying the training is the idea that through experience comes knowledge. We can link this to the idea that comes from Confucius, "I hear and I forget. I see and I remember. I do and I understand." Each class begins with a practical activity that places the student in a difficult situation that necessitates the use of interpersonal skills and/or teamwork. The experience facilitates the emergence of certain phenomena that are then discussed as a group and colored with numerous examples drawn from the engineering milieu. We have established that the student, who has lived the situation, is able to grasp the depth and importance of the notions that they are taught. As a result, the concepts generally associated with human science are transferred through practice and are, generally, no longer considered as an abstract idea by the students. That is why the pedagogy of this type of training combines a practical dimension and a theoretical dimension. The learning objectives are at once both of a cognitive and behavioral nature, of the order of knowledge, of know-how and inter-personal skills.

This enunciation aims to allow students to learn cognitively and experientially from these phenomena and to develop their reading capacity and develop certain skills in action.

Therefore, the development of teamwork skills at Polytechnique de Montréal stems not from technical learning but through experience. This type of training implies a modification of attitudes, beliefs and personal values demanding a strong involvement from the students. As is the modern tendency in teaching, our methods are student-centered and require a great deal of involvement on their part (Assister 1995).

Kegan (1994) states that the complexities of today's world and the need's of the working world necessitate, beyond new skills, the attainment of a higher level of consciousness, that is to say, a change in the way we interpret and react to our world. Young (2002), for his part, affirms that “transformational” leadership, is strongly linked to the level of consciousness of management. It is they who are capable of considering a multitude of points of view, since they can take into consideration that various interpretations of the same event can be simultaneously valid. They adopt a systematic mentality, looking for interdependencies rather than the relationships of cause and effect and focus not only on results, but also on the process (Cook-Greuter 2001). While seeking the development of a higher level of consciousness and the skills that appear to flow there from, three principles are at the base of the team work training: 1) we learn in interaction, 2) we can improve our abilities while experimenting with new behaviors and asking our colleagues for feedback, 3) we develop our level of consciousness and our reflex to improve as we engage in a process of self and group analysis, as well as identifying and practicing our objectives of change. Hence, the courses affect the whole person, their way of knowing, doing and being and are part of a short, medium and long-term process.

2.2 Some Concepts Taught and their Objectives

Two important interdependent themes are touched upon in the 45 hour training through teamwork. Firstly, some concepts linked to interpersonal communication are presented: mental models (mental maps), perceptions, emotional and relational intelligence, listening, critical and constructive feedback and conflict management (Bohm and Nichol 1996, Cormier 2004, Caruso and Salovey 2004, Wind and Crook 2005, Weisinger 2006, Goleman 2009). We consider these skills to be the foundation of collaborative team behavior. Secondly, the concepts associated with the literature are addressed in small groups through team work: some models of small teams, the characteristics of a team, norms, roles, modes of interaction, facilitation, cohesion, power and leadership (Bormann 1975, Tuckman 1977, Arrow, McGrath and Berdahl 2000, Saint-Charles and Mongeau 2006, Landry 2007). These notions foster understanding of group dynamics, important elements that it is composed of, and its management.

2.2.1 Mental Models

For Wind and Cook (2005), mental models represent the way that we look at the world. This mental map helps us to orient our way of entering into communication, of understanding and seizing the world. A reflection on the influence of our mental models allows a transformation of our beliefs and assumptions that underlie our decisions

and our openness to the ideas of others. Since we forget that we function with mental models, the objective is to remind ourselves that we do not deal directly with reality. As the Talmud says, we do not live in the world as it is, but rather as we are. Take the example of a student who is not able to understand that his interpretation of a conflict situation in a team is nothing more than a hypothesis among many - that his understanding greatly relies on his mental models that stem from his past experiences, his values, his emotions, etc. - he risks being stuck in his position and closed to the resolution of the problem. Newburg and Waldman (2006) argue, as well, that if we are conscious that our mental model is nothing more than a hypothesis, a “guess”, then we can remain open to the opinions and points of view of others without feeling threatened or upset. They add that the development of a holistic and systemic vision, as well as links to be made between our mental models and our perceptions, allow the team members to reach the state necessary to be disposed to the development of a common intelligence. Thus, the members of the team are no longer in opposition to one and other, they perceive each other as allies and can make discoveries or make decisions that, individually, they would not be able to.

Like these authors, we believe that to make room for a real collaborative effort with others, it is necessary to approach it through the development of this awakening to the awareness that our manner of interpreting is simply one of many possible ways that are just as valid (Cook-Greuter 2001). The latter also promotes a greater sensitivity in the student in terms of the effect of their behavior on others and the effect that the behavior of others has on them. Furthermore, we think that the capacity to practice active listening, to develop emotional intelligence, to give and receive critical and constructive feedback, as well as resolving conflicts, depends largely on the awareness and the development of a holistic and systemic vision of the group.

2.2.2 Group Models

A model is a representation of the organization or the workings of something. This representation is generally proposed in the form of words and images. A road map, for example, will allow a driver to follow the main roads and find their way. It serves them, in a way, as a landmark, as a guide. Moreover, explaining the workings of the group demands the use of a representation of its principle elements and their function. The purpose of a group model, its usefulness, is to illustrate how a group is organized, and how its different elements interact with each other without, however, claiming to represent all of its complexity. Even if these models have their limits, they still facilitate a certain adaptation and intervention in the reality they represent. To establish a useful tool, we could say that a model, as a conceptual system, must meet a certain number of criteria. Firstly, it must organize the entirety of the data of the literature in a pertinent fashion. Next, its statements must be linked to our intersubjective experience of reality. Lastly, its hypotheses must be verifiable and modifiable (Saint-Charles and Mongeau 2006). We can add that “a good model is one that is capable of orienting the action” (Miles and Huberman 1994).

In the team work part of the course, we present 3 models of small groups capable of orienting the action: a 5 stage linear model (Tuckman 1977), a systemic model in 3 zones (Landry 2007) and a “constructivist” model of structures and functions (Saint-Charles and Mongeau 2006). Tuckman's model offers the first milestones for the understanding of the development of group dynamics. Figure 1 shows group development in 5 stages.

1- Forming	2- Storming	3- Norming	4- Performing	5- Adjourning
Courtesy, prudence, avoidance of serious confrontation, little definition of roles and dependence on the leader.	Tensions, confrontations, criticisms, defining of group objectives and the formation of cliques and struggles for power.	Defining of roles and duties, consolidation of the “rules of the game”, greater listening, cooperation, collaboration and involvement.	Confidence, interdependence, equilibrium of the group between its task and people-related goals, challenges and creativity. Many teams never reach this stage.	End of the task, disengagement, diverse climate, anxiety, deception or relief. The author reminds us of the importance of paying particular attention to ending the life of a group.

Figure 6 : Tuckman's Stages

The interesting thing about the Tuckman's model is that it allows a team to quickly situate itself in its development. It provides the team with the basic information to understand what is problematic in its current functioning and what can be done to improve it. For example, a newly formed team could, by identifying what characterizes stage 3 of the model, give itself the means to reach it more quickly. If, in the norming stage, the rules of the game are clear, cohesion is good and each member's role is clearly defined; it is the inverse for the forming stage, associated at the beginning of the life of the group. In fact, the latter is defined by a lack of clarity of the roles and the norms and a lack of cohesion that is displayed in the form of an exaggerated level of prudence in the members who fear to clearly state what they truly think. The team can decide, as a strategy of change, to discuss its norms and roles, so as to make them explicit for everyone in the group to improve its performance. It could decide to organize a lunch or even a group activity to improve the level of cohesion through getting to know each other better. Through these two actions alone, the team can give itself the means to pass through the stages and achieve greater efficiency. This first use of Tuckman's model by the students, sets the necessary foundation for the integration and understanding of the subsequent models (Saint-Charles and Mongeau 2006, Landry 2007), of greater complexity.

2.2.3 Proposed Actions for the Development of an Efficient Team Dynamic

A team can define itself according to certain characteristics: 1- small number of members: 3 to 20 (Landry 2007), 2- Face to face interactions, direct communications (Anzieu and Martin 1994, Saint-Charles and Mongeau 2006, Landry 2007), 3- pursuit of goals valorized by members, common objectives (Anzieu and Martin 1994, Saint-Charles and Mongeau 2006, Landry 2007), 4- development of an emotional life (Anzieu and Martin 1982, Mongeau and Saint-Charles 2006, Landry 2007), 5- appearance of norms and roles (Anzieu and Martin 1994, Mongeau and Saint-Charles 2006, Landry 2007) and 6- development of a structure of power (Mongeau and Saint-Charles 2006, Landry 2007). These characteristics and the models that stem from them help in the understanding of the elements at the heart of a group dynamic and its management. Thus, certain behaviors in a team setting are practiced within the framework of our training, in the courses themselves and through the follow up (or monitoring) in the engineering projects :

- agree on a common goal (the what) by clearly defining your tasks, your objectives and the way to attain them.
- develop good organization (the how) and regularly question yourself about it by conducting, among other things, a team feedback session at the end of each reunion on what went well and what needs to be improved.
- establish the working rules, explicit group norms.
- develop links between members, try to develop group cohesion (the climate); by giving, for example, individual and team feedback regularly.
- clearly define each person's role linked to a task and the organization of the task.
- verify the comprehension of the task by insuring that everyone understands what each person's job is by conducting a round table where each member presents the progress in their tasks and their understanding of what remains to be done.
- utilize each member's strengths, starting with the strengths identified by the individuals themselves, or still, by using tools such as group interaction methods (Saint-Charles and Mongeau 2006).

3. Monitoring of teams in integration projects

We believe that a 45 hour training course, centered on understanding and experimentation of interpersonal and team work communication phenomena and techniques is essential, but not enough to attain an adequate level of skills and competencies in the domain. This is why this basic training is a cornerstone of the organization and management of team work performed in integration projects, among others. The integration projects are projects of one session in which the students produce a team project in engineering. From the creation of a scale model of a bridge, to the production of a miniature robot, or even the design of an industrial product, the projects are as varied as the teams. A specialist in communications and team work conducts one visit per team for each integration project and allows the students to perfect their skills in this domain throughout the four years of their training. Figure 2 shows the monitoring of the teams offered in all Engineering programs at the École Polytechnique de Montréal.

Interventions are done in 3 or 4 integration projects per engineering program:	A specialist does:
Aerospatiale, Biomedical, Chemical, Civil, Electrical, Geological, Industrial, Computer, Software, Mechanical, Mining Engineering and Engineering Physics.	<ul style="list-style-type: none"> - One visit per team - 45 minutes to an hour of coaching per team - Personal interventions for teams in difficulty (conflict) - Tool available at the website: www.hpr.polymtl.ca

Figure 7 : monitoring of teams over 4 years

The monitoring is more than a simple managing of work processes and constitutes a central element of team work training. Group phenomena are “complex” because of the singular dynamic of each team; the interaction of

the individuals that compose the teams make each unique (Anzieu and Martin 1994, Saint-Charles and Mongeau 2006, Landry 2007). During monitoring, the team work specialist must adapt and put their knowledge of theory and practice of small groups at the service of the team. Together, they bring the complexity of the performance of the team up-to-date. Consequently, the specialist does not make any decisions for the group, does not take on the role played by the team members, but rather supports them and provides the necessary tools to make the best choices for good group performance. Once the monitoring is completed, the team has a more precise vision of their singular dynamic, which promotes understanding and accountability of the students faced with their common tasks and objectives of individual change to be put into practice.

3.1 General monitoring

Regular and varied monitoring are offered to the teams all through their studies. Two important types of monitoring are practiced: 1- “general” monitoring (the specialist acts as an instructor) and 2- “crisis management” type monitoring (the specialist acts as a mediator). The latter is offered when major problems arise in the group. “Generous” monitoring is offered to all teams during the integration projects. It promotes the transfer of learning of themes related to team work and the management of the group by team members. To do this, the specialist guides the group to reflect on its own dynamic so that they can assess their strengths as much as their weaknesses that need improvement. To achieve this, the specialist can use different strategies in order to probe the themes associated to each of the monitoring sessions. These strategies gradually touch upon three themes. Figure 3 presents the sequence of the themes covered during the monitoring sessions over the four year period.

1st year: Organization	2nd year: Emotions	3rd year: The General Dynamic of the Group	4th year: The General Dynamic of the Group
Time management, work planning, separation of tasks, physical and material organization, appearance and maintenance of norms related roles.	Cohesion, roles related to emotions, creation of sub-groups and their impact, effects on climate and common goals, emotional norms, listening in groups and resolution of problems.	Equilibrium of the three dimensions (organization, emotions, power/leadership), methods of interaction, roles and tasks, leadership, group culture and norms.	Equilibrium of the three dimensions (organization, emotions, power/leadership), methods of interaction, roles and tasks, leadership, group culture and norms.

<u>Objectives:</u> <i>understanding the direct effects of this organization on efficiency and productivity of the group.</i>	<u>Objectives:</u> <i>understanding the direct effects of good management of the climate on the efficiency of group performance.</i>	<u>Objectives:</u> <i>understanding the direct effects of an overview of the group dynamics and the application of concrete actions to affect change in the efficiency and performance of the group.</i>	<u>Objectives:</u> <i>understanding the direct effects of an overview of the group dynamics and the application of concrete actions to affect change in the efficiency and performance of the group.</i>
---	---	---	---

Figure 8 : three types of “generous” monitoring

The sequence of the monitoring sessions has been elaborated with the goal of understanding the major elements of team work, to avoid redundancies and promote the progression of learning. As well as putting the emphasis on these central elements associated with each of the monitoring sessions, the specialist promotes the practice of critical and constructive feedback within the framework of the meetings. Depending on the needs of the group, the specialist can insist on the use of feedback focused on individuals or on the team. The specialist promotes the development of a systemic and comprehensive vision of the group and insists on the taking into account of the effect of interactions between group members on the individuals and on the development of the team.

4. Conclusion

This article tried to explore what the parameters are, such as certain conditions, of the learning of collaborative work and of the development of skills for team work at the École Polytechnique de Montréal. Answering this kind of query involved identifying and clarifying how we treat, enlightened by a certain review of the literature, certain key concepts, approaches and team work methods in our practice. Our review of the literature has allowed us to note the abundance of research in this field and to detect a coherence, so as to construct our learning model and competency development. Of course, this training model is not definitive or exclusive, other concepts, methods and approaches could be possible. The possibility of using other ways, illustrates the complexity of the phenomenon that is the group, but especially the difficulties and interest that there are to attempt to find pedagogical methods for teaching and the development of competencies in this field, for our students. This is the challenge that we attempt to meet in laying the foundations of a pedagogical approach in team work for disciplines other than Human Science. Finally, we think that it would be useful to validate our efforts for skills development in our students through an in-depth study of their team work competencies, as perceived by the employer, either of the student in job placement or of the junior engineer starting their career. The study of the effects of this training, within the framework of a wider ranging research, could certainly promote a greater advance of knowledge and a better accompanying (framework, guidance) of our students in the study of team work.

Technology-enhanced learning scenarios based on digital ink & tablet PCs

José-V. Benlloch-Dualde*, Félix Buendía-García

Universitat Politècnica de València, DISCA-ETSINF, 46022 Valencia, Spain

Abstract

Numerous studies show that ICTs can bring about major changes in the classroom, thereby easing some of the problems associated with the traditional model of instruction. There is widespread consensus that digital-ink technologies (Tablet PCs) have great potential for encouraging interaction in the classroom and promoting a more dynamic learning environment. However, it seems convenient to support instructors who plan to incorporate these technologies, by conceptualizing their educational capabilities. To this end, this work addresses an approach based on the use of concept maps. During the three last years, several experiences were successfully implemented and tested in different Computing disciplines.

Keywords: digital ink, tablet PC, pen-based technology, conceptual maps, instructional design

1. INTRODUCTION

In relation to the teaching and learning models, a recently published report (Fundación Telefónica, 2011: pp. 47) states, “A trend toward a participatory and collaborative model has been noted, in which learning takes place as the student performs activities and acquires knowledge through interaction with the environment.” The report goes so far as to state, “It is anticipated, for example, that in the year 2015, 80% of university professors will be using new, ICT-supported didactic models in their classes.

In general, we could say that teaching strategies must move from the still widespread traditional lectures and concept-based teaching to student-centred and competency-based instruction. However, these changes may sometimes produce some issues related with students’ attitudes and motivation, instructor workload, logistic issues, or even reluctance to the changes. In this context, there are evidences that technology can drive major positive changes in the classroom, helping to face these problems. In particular, the flexibility of Tablet PCs and other digital-ink enabled devices have demonstrated their potential, at the college level, to achieve a wide range of educational goals as well as promoting a more participatory classroom environment (Sneller, 2007; Tront, 2007; Mckenzie & Franke, 2009).

Taking into account the complexity and explosive development of these technologies, it seems necessary to support instructors in their use by conceptualizing educational and technological possibilities. There are different tools to represent and organize these knowledge items and we have selected conceptual maps (Novak, 1998) as one of the more flexible and powerful techniques to graphically sustain this process. This work discusses on the use of conceptual maps as tools to model both the instructional domain and the technology domain in order to provide instructors with guidelines to design and develop engaging and interactive Tablet PC-based learning scenarios.

E-mail address: jbenlloc@disca.upv.es

The remainder of the article is organized as follows: section 2 introduces concept maps as a way to support instructors who plan to use these technologies to improve the classroom environment; section 3 describes the way the approach is been implemented and tested, and finally, section 4 draws some conclusions.

2. Supporting teachers to introduce digital-ink technology

This section describes our approach to support faculty who plan to use digital-ink technology to create more interactive and engaging classrooms. The first step in the proposed process is to develop a concept map representing the instructional model for the learning environment where the intervention is to be made. However, in order to facilitate the subsequent processing of the information contained in the maps, the different concepts of a rather generic instructional map were converted to questions, and a complete questionnaire was developed by listing these questions in the same hierarchical order as the concepts on the map from which they were taken. Then, the approach uses a concept map that was developed to give an overall concept of digital-ink technologies: their features and the types of devices that provide them, the operating systems that support them, the services they offer, and the associated software tools, among other aspects. The terminal elements of this map are related to the aspects of instruction that may be enhanced by them, as depicted in the Figure 1.

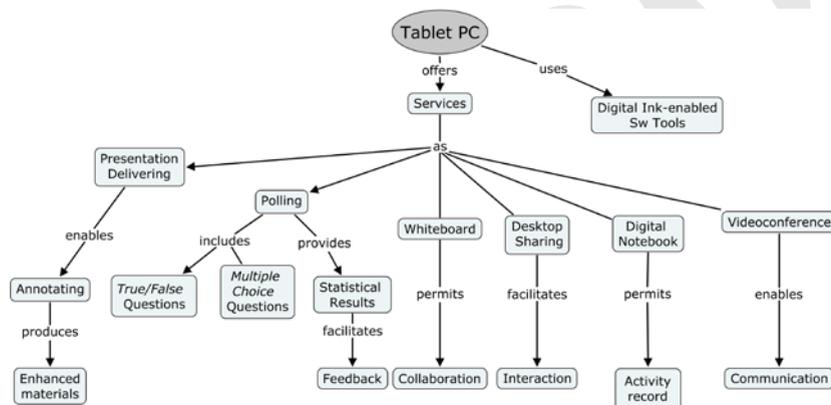

Fig. 1. Detail of the Tablet PC conceptual map concerning services.

Once the instructional and technological domains have been defined using the appropriate concept maps, the next step is to correlate them to each other. In other words, our proposal aims to infer information from the elements that make up the two concept maps (concepts and correlations) so as to give teachers some recommendations for using these technologies that have been adapted to their particular instructional approach, including specific examples of ink-enabled software tools.

3. Implementing and testing the approach

To validate the proposal described, a number of workshops were conducted during academic years 2010-2011, 2011-2012 and 2012-2013, in which teachers were given a presentation on the capabilities of digital-ink

technologies and, at the same time, experimented with tablet PCs and other digital ink devices in a classroom configured for this purpose. More than 100 engineering professors participated in these workshops.

Before attending the workshop, participants were invited to answer a pre-questionnaire in order to obtain each one's particular instructional model.

Figure 2 summarizes the responses obtained on the pre-questionnaire from those who attended the workshops held during the last three academic years. The percentages shown are for certain questions only, those where these technologies have shown superior capabilities. There is a remarkably high number of professors who use digital presentations in lecture-based classes (95%); who support their content presentation with graphic elements such as diagrams, figures, and schematics (84%); and who incorporate an element of student classroom evaluation (64%). Teachers also commonly assign activities that make use of graphic elements (69%) or open response exercises (70%).

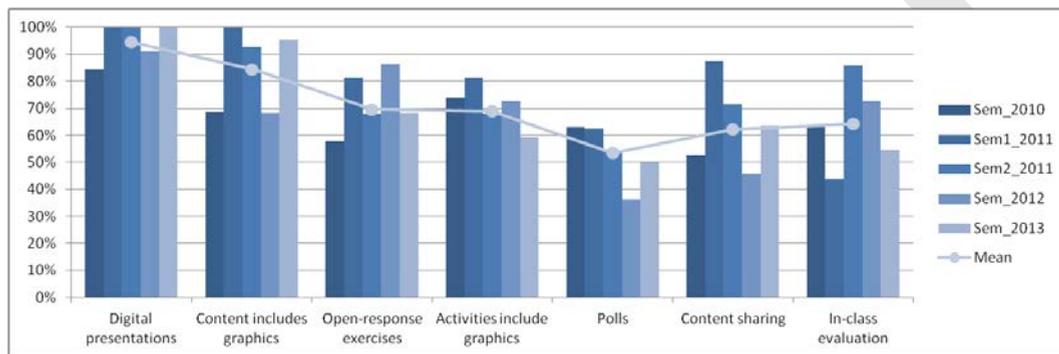

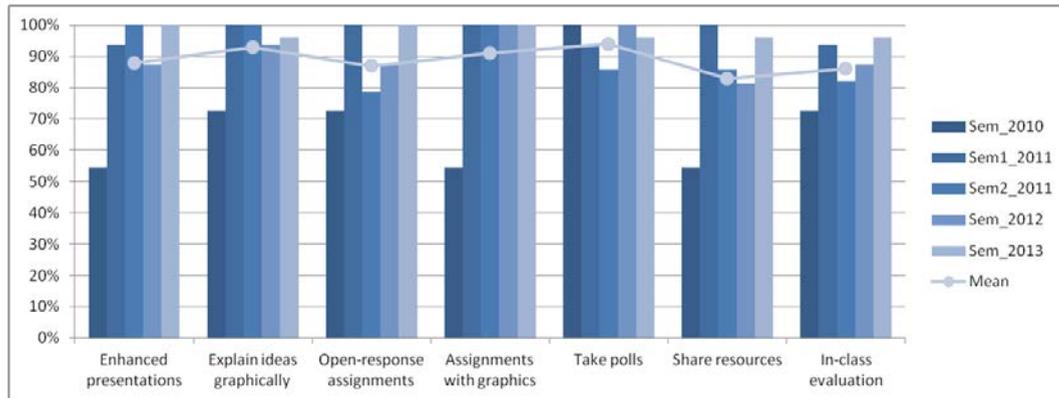

Fig. 2. Summary of Pre-Questionnaire Results.

Based on the instructional capabilities included on the aforementioned technological concept map and experiences with applying them in various disciplines, a list of good practices in using these technologies was drawn up. This list was used to produce a post-questionnaire on digital-ink technologies capabilities that was given to the workshop participants at the end of the workshop. In this way, and after experimenting with the technologies, they assessed the instructional capabilities of these devices in terms of suitability for their particular context.

Figure 3 summarizes the responses on the post-questionnaire. Firstly, it is important to point out the high percentage obtained (above 83%) for all the dimensions analyzed, what confirms, from the point of view of the workshop attendants, the potential for improving those aspects. The percentages are particularly high for the ease of taking polls (94%), presenting ideas graphically (93%), performing tasks requiring graphic elements (91%), and evaluating students on class participation (86%).

Fig. 3. Summary of Post-Questionnaire Results.

4. Conclusions

In this work we have presented an approach to support faculty who plan to use digital-ink technologies to create more interactive and engaging classroom environments. The proposal is based on the conceptualization of instructional and technology issues using concept maps to represent the corresponding knowledge. Starting from the learning requirements of a particular context and the educational potential of these technologies, instructors are provided with some guidelines that help them to properly develop new learning scenarios.

This approach has been applied in an educational technology-enhanced context based on digital ink technologies and several workshops have been developed. This approach implementation has enabled the detection of interesting connections between instructional and technological issues revealing the potential services provided by digital-ink technologies according to the proposed teaching guidelines.

Abstract

This paper uses a theoretical grounding in activity theory to analyze technology as an activity system for enhanced self-directed learning outside of the classroom. The analysis considers how technology serves as an activity system that mediates and shapes student learning to reveal the complexity of the relationships between the learner (the subject) and the learned (object) as well as between the learners and artifacts. The paper contributes to our understanding of the dynamics of technology. Technology is not a neutral tool; it becomes a generative force that shapes the self-directed and social nature of learners' knowing, doing and being and presents implications for educational practice.

Keywords: technology, activity theory, activity system, learning

1. Introduction

The prevalence of technological innovation has created the contemporary 'network society' (Castells, 1996) and 'network culture' (Taylor, 2001) in which we live. Educators must understand how students may use technology to create a 'learning network' (Koper, 2009) that facilitates and expands student engagement in learning beyond the classroom. Virtual learning networks (Giani, 2004) can serve as support mechanisms that transcend time and space to connect individuals on a social level. Contemporary learning can be a convivial, collective experience rather than a solitary, individual activity. In this context, technology is typically viewed as a material 'thing', such as a tool for information exchange and communication or a platform for establishing 'virtual communities of practice' (Hibbert & Rich, 2006). Little research has explored the dynamics of or the possible deeper relationship among technology, human activities and learning.

A theoretical framework is required to highlight and facilitate our understanding of the dynamics of technology and human learning. This paper employs activity theory to conceptualize technology as an activity system that actively shapes and mediates student self-development and professionalism beyond that which a neutral tool can achieve. The structure of this paper is as follows. First, this paper describes how technology has shaped and facilitated the tendency for self-direction in contemporary learning. Second, activity theory is introduced and

E-mail address: yahuisu@hotmail.com

used to illustrate the role of technology in mediating learner agency and development in actual practice. An example is provided to demonstrate how a group of university students in Taiwan have used Facebook to achieve their learning and professional development goals. We obtained consent from the participants and indicated that we would protect their privacy (e.g., names and photos) in our use of Facebook content to illustrate the dynamics of technology as an activity system. This section bridges general theory with a specific example of practice. Finally, we conclude with implications for educational practice.

2. Technology

Although technology is now ubiquitous, it is generally viewed as a neutral tool that assists learners in knowledge acquisition or as a platform external to learner agency. The question arises as to whether this technology-as-neutral perspective adequately captures the richness and complexity of the role of technology (Mlitwa, 2007). Technology partially serves as a generative force that shapes learner agency (Tan, Kim, & Yeo, 2010); learners use technology for self-development, self-determination and self-construction.

The technological revolution, which features information technology (computers) and communication technology (the media), suggests a change in ideas of knowledge and learning. Technology enables the expansion of a learner-centered learning space and therefore undermines educators' authority to speak truth and knowledge. Technology lessens 'the centrality of institutional education' (Usher, 2007, p. 221) and facilitates knowledge and learning shift 'from the millenary concept of centre to the concept of network' (Giani, 2004, p. 185). Educational institutions lose their exclusive role in producing knowledge because knowledge production can occur anywhere. Rather than hierarchically transferring knowledge, technology ontologically shapes the learning process as a networking system in which learning is essentially a process involving 'interactions with a greater variety of knowledge producers than in the past' (Mlitwa, 2007, p. 54). Learners use technology to directly access knowledge and to participate in the necessary self-direction and self-determination of their own learning construction. Hence, technology has facilitated the tendency toward self-direction in contemporary learning.

Technology facilitates learner agency, and there is an emerging need for a more applicable theory that accounts for the active role that technology can serve in shaping learner development. This paper proposes activity theory as the lens for understanding technology beyond the enabling of learner cognitive processes to include the mediation of learner action and to ensure lasting education (Mentkowski & Associates, 2000).

3. Activity theory with an example

Originating from Soviet psychology, activity theory has evolved through the contributions of many theorists, such as Vygotsky (1978), Leont'ev (1978) and Engeström (1987). Activity theory focuses on 'development and change' (Kaptelinin & Nardi, 2006, p. 226) and 'practice' (Nardi, 1996, p. 7) and serves as a useful framework for conceptualizing technology as a dynamic mechanism that conditions and enables development and change in learners and in the mechanism itself. Here, we bridge activity theory and practice with an example of a virtual (Facebook) community to illustrate the dynamics of technology as an activity system. Two years ago, the community was established by a group of students enrolled in a pre-service teacher education program. These students had the common goal of passing the national teacher certification exam and ultimately securing appropriate teacher posts in vocational secondary schools. One of the group founders realized that the university program focused on the intrinsic delivery of teacher knowledge via disciplines, with little connection to student career development. The students realized the need to self-direct their own learning using online technology as a learner-centered space to generate a learning force to meet their own needs and foster career development. The

community members primarily include current students and alumni. One of the authors was invited to join the community to maintain a connection with the students. This author is aware of the need to define her participation as an observer who seldom intervenes in the spontaneous learning activities in which current students and alumni participate. The community uses online technology as an activity system to provide opportunities for increasing student self-directed engagement and collaboration to meet various learning needs (e.g., passing exams and finding employment).

Activity theory indicates that online technology serves as an activity system in which 'the minimal meaningful context for understanding individual actions' is an activity (Kuutti, 1996, p. 28). For the sake of analysis, an activity can be analyzed in terms of the elements involving the subject, object, mediating artifacts (signs and tools), community, division of labor and rules (see Figure 1). However, the activity system itself is the fundamental totality that precedes individual elements; none of these elements can be independently distilled from the dynamics of activity. Based on activity theory, an activity begins with a purposeful subject(s); in activity, 'a live, that is, active relation of the subject to reality is realized' (Leont'ev, 1981, in Kaptelinin & Nardi, 2006, p. 55). The subject (the community member in this example) is not simply regarded as a passive, cognitive agent; rather, the subject is 'object-related' (Engeström, 1999) in the sense of always being involved with the objective of his or her concern. The subject in an activity, or an activity itself, cannot exist without an object. In fact, one author argues that '[a]n "objectless" activity is impossible' (Leont'ev, 1981, in Kaptelinin & Nardi, 2006, p. 55).

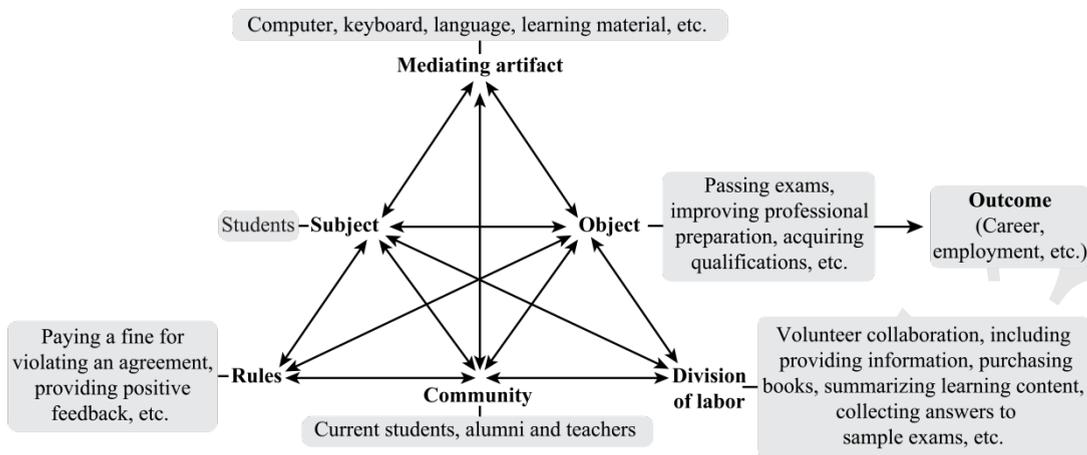

Fig.1. Application of activity analysis to a virtual community as an activity system

An object can be tangible (a material thing) or intangible (an ideal or a plan) (Barthelmeß & Anderson, 2002, p. 15). When the object meets the need of the subject, 'the object becomes a motive and directs the subject's activity' (Dakers, 2011, p. 24). Each subject within a system may have one or more motives (e.g., acquiring various professional certificates and licenses for career development, passing the national teacher certificate exam, finding employment or improving the profession). With this motive in mind, the subject transforms an object into a desired outcome, which motivates the dynamics of an activity.

For Engeström (1999, p. 20), '[h]uman activity is endlessly multifaceted, mobile, and rich in variations of content and form'. In this sense, activities are not undertaken once; rather, activities represent long term, continuous movement and formations (Kuutti, 1996). Activities are conducted during chains of actions, which are realized by a series of operations (Leont'ev, 1978). The level of operations in the example that is presented in this paper includes scrolling through and moving back and forth between website pages and paragraphs. These specific actions are *performed automatically, and the subject need not even think about these processes*. The level of actions in this example refers to the subject's conscious, object-related agency, such as deciding to open a learning file, reading and discussing with other subjects (other members), and providing feedback.

The processes of operations and actions evidence that the subject in the activity system does not have a direct relationship with the object (e.g., preparing for the national teacher certificate exam). The relationship is mediated by artifacts, including signs and tools. The artifacts in this example include both the physical tools (e.g., computer and keyboard) and mental tools (e.g., language and learning material) that are required for thinking and action to achieve the desired outcome. Such an artifact not only 'empowers the subject in the transformation process' but also 'also restricts the interaction to be from the perspective of that particular tool or instrument' (Kuutti, 1996, p. 27).

Technology as the activity system denotes the social collaborative context within which the dynamic, active relationships between the subjects and the object occur. Many subjects in the community are involved in an activity that is mediated by the community, division of labor and rules. According to Engeström (1993, p. 67), the community 'comprises multiple individuals and/or subgroups who share the same general object'. In the system,

'[t]he subject has been changed. It is no longer "me" as an individual' (Engeström, 1999, p. 31). The division of labor 'refers to both the horizontal division of tasks between the members of the community and to the vertical division of power and status'. The division of labor in the community in this example is loose, flexible and reliant on the willingness of students as volunteer participants. For instance, alumni may offer exam experience while current students voluntarily collect key points and learning material for participants who are actively preparing and studying for exams (see Figure 2). Finally, the rules refer 'to the explicit and implicit regulations, norms and conventions that constrain actions and interactions with the activity system'. The explicit regulations in the virtual community, for example, may include paying fines or increased writing practice as a penalty for violating an agreement, whereas the implicit norms may involve student expression of emotions (Roth, 2007) that contribute to sustaining long-term commitment to the activity process (see Figure 3).

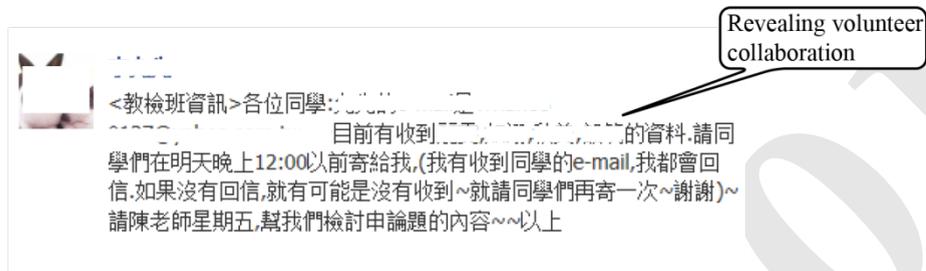

Fig. 2. An example of the division of labor in the virtual community

Fig. 3. An example of explicit and implicit rules in the virtual community

The community, the division of labor, the rules and the types of the tools that are used mediate and shape the ways in which the subjects engage in the activity and frame the subjects' knowing, doing and being. The result of subject discussions in the activity process may correct and reconstruct disciplined knowledge instruction (see Figure 4). The subject in the activity system is not viewed simply as a cognitive agent who is reduced to a brain or an internal 'psychic process' (Engeström, 1999). Rather, the subject 'has the capacity to regulate and coordinate his or her behavior' (Bannon, 1995, p. 206) with respect to the activity objective. Figure 5 shows the action that the participants planned to use in taking the exam. The community develops 'a positive emotional climate that embodies qualities of mutual trust, respect, caring, and concern' (McCombs, 1991, p. 123). A subject may express his or her emotional attachment to the community, prompting other subjects to 'express the same emotions, which then gives rise to a sense of solidarity' (Roth, 2007, p. 59). The subjects' sense of solidarity sustains their commitment to the system and encourages long-term learning (see Figure 6).

Fig. 4. An example of an activity system that frames the knowledge construction of the subjects

Fig. 5. An example of an activity system that frames the collective action of the subjects

Fig. 6. An example of an activity system that frames the identity and being of the subjects

4. Conclusions and implications

Using activity theory, this paper has introduced an alternative lens for viewing technology as an activity system that mediates and shapes learner activities. This paper analyses and illustrates the theory in a real context to explain the concept of technology as an activity system. Activity theory avoids underutilization of technology and presents technology as a practice rather than simply as a cognitive tool. Activity theory reveals the technological complexity and dynamics of technology as a live, complex system that enables active learner engagement in activities and authentic learner self-direction to achieve learning goals.

This activity theory analysis of technology presents a number of implications. First, although technology use may not replace conventional classroom lecturing and learning, it is a global primary educational access point and part of the human lifestyle. The integration of technology into educational design can supplement, add value to, enhance and expand the self-directed learning of students. Second, instructors or learning facilitators must realize how technology as an activity system can nurture and optimize students' understanding and actions and can holistically address student needs. Activity theory conceptualizes the student 'as a technologically empowered and socially contextualized subject' (Kaptelinin & Nardi, 2006, p. 199). Conceptualizing technology as an activity system creates a potential for 'learning between users of artefacts' (Bødker & Petersen, 2000, p. 66) and replaces the solitary educational experience. By acting as collaborators, communicators, problem solvers, knowledge integrators and creators, students are active, responsible agents rather than passive agents who receive knowledge (Arievitch, 2007). Third, this paper suggests that technology as an activity system should be incorporated into educational design. The activity theory perspective indicates that student motives must be considered during the development of educational technology for student educational engagement. Students who participate in such a technologically motivated and socially supportive context will develop a sense of mutual belonging and self-significance. Instructors or learning facilitators should consider this support system to maximize educational effectiveness while incorporating technology into educational use and design.

Abstract

This research examined the viability of using television commercials as supplementary material for teaching English as a second language and how advertising could make lessons culturally relevant, up-to-date and low cost. Connecting language and culture in the classroom can aid non- native speakers in understanding implied and literal meanings. Cultural concepts depicted in a selection from 2,000 television advertisements were measured. Then, relative merits of using TV commercials as teaching tools were evaluated on eight different language populations. Television advertisements were cited as an aid to English language education in speakers of Spanish, Serbian, Chinese, Japanese, Korean, Tagalog, Cebuano, and Chuukese.

Keywords: Advertising, Television Commercials, TV Ads, English as a Second Language, ESL, Culture, teaching material.

1. Introduction

The purpose of this study was to investigate the feasibility of using television advertising, specifically 30-second commercials, as teaching tools for teaching English as a second language (ESL). In addition to investigating commercials themselves, this study examined a model through which the adult educator can select appropriate commercial messages and a system for determining how to best use them.

2. The Cultural Imperative in Teaching English as a Second Language

ESL is taught in countries where English is the dominant language, such as the United States, Canada, and Great Britain. English for speakers of other languages (ESOL), a term that is interchangeable with ESL, focuses on teaching English to students whose native language is not English. English as a foreign language (EFL) is taught in countries where the dominant language is not English. Culture, for purposes of teaching ESL to adults, may be defined as the symbols of expression that individuals, groups, and societies use to make sense of daily life and to articulate their values (Campbell et al., 2006, p. 10). A culture's predominant language is essential in communicating and maintaining its collectively held values, and the mass media are further able to standardize these beliefs. Campbell et al. explain that when we listen to music, read a book, watch television,

or scan the Internet, we are not asking, “Is this art?” but are instead trying to identify or connect with something or someone. Advertising, AKA commercial speech, attempts to motivate people to action by appealing to their values and beliefs. The success or failure of these persuasive messages relies on an advertiser’s ability to make people feel connected with something or someone they value, which varies widely depending on their culture. For example, the Marlboro Man has depicted the American ideal of rugged individualism for decades, but in Japan, he was always riding on a white horse to indicate he was a “gentleman” (Roman & Mass, 1992, p. 121). Hundreds of thousands of adult learners in ESL and EFL classrooms would be well served to have guidance in navigating these cultural differences in meaning.

Teachers of adult students in ESL and EFL classes face a challenge. In an evolving and dynamic language world, they need to keep course work current and culturally relevant (Gardner Flores, 2007, p. 8). The idea that language and culture are bound is a common one (Furstenberg, Levet, English, & Maillet, 2001; Russell, 2000; Sapir, 1949; Greenberg, 1971; Hall, 1959). Not only does an understanding of a culture give the learner a reason to become fluent, it also addresses the fundamental question of meaning, i.e., why words and terms are used the way they are. The Whorfian hypothesis of linguistic relativity simply states that the structure of a culture’s language determines the behavior and habits of thinking in that culture (Littlejohn, 2002, p. 178). The concepts of culture and communication are so tightly woven that it led anthropologist Edward T. Hall to conclude, “Culture is communication and communication is culture” (Hall, 1976).

3. Advertising as a Messenger of Cultural

Saatchi & Saatchi, a global advertising agency network with 140 offices in 76 countries began running a series of advertisements that reflected their research on women’s attitudes toward the agency’s commercials for Kellogg’s Special K cereal. One ad featured a group of men seated in a bar. Worried about their weight, they “resolve” not to let their size define them. One says that he has to accept the fact that he has his mother’s thighs and another asks if his jeans made his “butt look big.” While this was a culture-laden, purposeful attempt to reach out to American women, one could not help but wonder what a non-English speaker would think of it. Is this an example of how American men talk to each other? Is this what they think is important? In the end, the targeted viewers, women, are asked why they obsess over these things when men do not. Sensible eating, of Special K cereal, is offered as a solution.

This type of multi-layered message is common in television advertising and this particular example was a joke on men and on advertising itself. It also pointed out a common obsession of American women and did it in a way that made it all seem laughable. The inside joke, as evident here, is a way to bond with the audience. The idea is that, if the sender and receiver of the message see the same irony, the receiver must think the same way on other things. As Hall explained it, this kind of messaging is “about you and me in a highly personal way” (Hall, 1969, p. 33). In the advertising profession, this translates to: I get the joke, I see the point, I understand the irony; therefore, I am part of an elite group; I am on your side. The intent being for the consumer to ultimately ask, “Where do I buy your product?”

Since culture is a social construct that involves our emotions and feelings (Martin & Nakayama, 2007), there are many types of subtleties present in television commercials that could easily be misunderstood by non-native speakers. We expect the content of culture to have clear parallels with the content of language, which is a kind of cultural system in itself (Goodenough, 1981, p. 67). So, in considering the content of culture, we must take account of an entire range of phenomena that enter the human experience and that are

the subject matter of learning. According to Goodenough, these phenomena are central to advertising disseminated through television commercials.

While advertising messages like Saatchi & Saatchi's Special K commercial are rich in examples of culture, and could be very useful as teaching tools for adult ESL or EFL students, the review of literature reveals advertising has been largely overlooked as a teaching tool.

Not only could television advertising serve as a window on culture, it could be used to teach syntax, phonology and morphology, as well as pronunciation, intonation, and emphasis. The repetitive nature of TV commercials, along with the aforementioned desire of the advertiser to make a meaningful "connection" with the viewer, serves to make commercials excellent resources for the ESL educator. Although we can study permanent cultural forms, such as novels or songs from various historical periods, culture is always changing (Campbell, Martin, and Fabos, 2006, p. 10). Culture may be defined as the symbols of expression that individuals, groups, and societies use to make sense of daily life ... when we watch television we are trying to identify or connect with something or someone. Culture, according to Campbell et al., delivers the values of a society through products, namely the mass media.

4. Discussion

The methodology for this research used elements from several different qualitative research systems. It was a twofold approach that first centered on the collection and treatment of the commercials sampled for later use in the study, and second, dealt with the creation and evaluation of a suite of teaching materials used by ESL teachers in the classroom and a system to measure the value of commercials in teaching the class.

This study investigated the following research questions:

1. What, if any, elements of culture do television commercial messages contain?
2. If television commercials do contain culture, can they be used to teach English to adults who are learning it as a second language?
3. Do participants report commercial messages used as a teaching tool to be an effective addition to their program?

5. Looking for Cultural Content in Television Advertising

This phase of the study relied on content analysis to examine television commercials. Berger (1998) stated that content analysis is useful in making inferences about people indirectly, and is helpful in determining any interesting changes that may have occurred over the years. Content analysis is also an unobtrusive means of studying media and therefore, advertising messages. There were two main characteristics that made this aspect of the study a qualitative content analysis rather than a quantitative analysis or cultural criticism:

1. The use of qualitative assessment in the coding process; connotative vs. denotative content categories (i.e., what constitutes *culture* to be counted and what are the observable characteristics that manifest that concept.)
2. The use of qualitative assessment, or inference, in the analysis of the findings (i.e., attempting to answer the broader “So what?” question). Construct validity (Frey, Botan, Friedman, & Kreps, 1992, p. 197) was attempted by developing content categories on the basis of other similar studies (Signorielli, 1989; Hall, 1959).

Central to the analysis was Hall’s (1959) *Map of Culture*, which he referred to as a by-product of his study of “culture as communication” (p. 171). This grid (Table 1) of 100 components of culture allowed raters in this study to put a numerical identifier on concepts they observed in the sample commercials. The volunteer raters, all of whom were adult college students majoring in communication, spent some time familiarizing themselves with the *Map*, and were then able to spot and identify many different cultural concepts in the a subset of 25 randomly selected commercials. These advertising messages were part of a collection of 2,000 randomly recorded over a month-long period.

The use of non-specialist observer/raters helped add a level of objectivity to the study. These individuals, with limited knowledge of anthropology or sociology, tended not to bring preconceived notions of culture to the study. Hall himself explained that the *Map of Culture* “satisfied a demand for specificity, concreteness and teach ability,” saying that he created it “to enlighten the non-specialist interested in cross-cultural work as to the nature of culture, and to stimulate students to further work” (p. 176).

Two separate groups of observer/raters examined cultural content information in the commercials and a selection of these was ultimately used to create the discussion guide for use by ESL instructors. These example commercials were edited onto a DVD as part of a suite of discussion materials used in the ESL classrooms. Information from the raters’ analyses was also used to create appropriate survey questions to survey the adult educators and students who used the classroom exercises.

These observer/raters investigated what, if any, elements of culture television commercial messages contain. The researcher hypothesized that they do. A group of volunteer raters, after watching each of 50 commercials presented, indicated that they do contain elements of American culture. Employing a grid of 100 different cultural elements yielded several that were more common, but most of the commercials viewed appeared to contain several different elements. While the raters were not always in complete agreement, there was enough consistency that the researcher could infer a high likelihood that, even when chosen at random, television commercials would have observable elements of culture.

6. Testing Television Commercials as a Teaching Tool

The second phase of the study included the creation of a suite of teaching materials for ESL classes. Each class received a DVD with 25 television commercials (12.5 minutes of video). The ESL students watched the video, paused after each 30-second spot, and engaged in a short discussion about the content. Once they had seen all the commercials, the teacher asked them to fill out a survey that was provided. After the lesson, students were asked to pay attention to some TV commercials at home and be ready to talk about one at the next class. Teachers themselves answered a separate evaluation survey and were give a follow-up interview about the class on a later date.

In an effort to assure the symbiosis between entertainment and education, the researcher screened for messages with consistently high production values (better filming, editing, acting and scenic work) by limiting the selection to randomly chosen nationally distributed commercials. It should be noted that, to serve as a discussion model for ESL classes on a week-by-week basis, it is also mandatory that messages repeat often enough that there is a high likelihood that student and instructor will see them. Materials created for use in the classroom included a discussion model with a pretest component, a video of the selected TV commercials, a Q&A format follow-up discussion guide, and a post-test measurement instrument.

The researcher conducted a pilot test of the lesson and observed the effectiveness of the lesson. All classes were later analyzed with teacher/student testing and ESL teachers involved in the test were surveyed on the feasibility of using television commercials as a teaching tool. Teachers were asked to address such issues as logistics, interest-level on the part individual students, content, and cultural relevance.

7. Conclusion

The two separate groups of observer/raters examined 50 television advertising messages and reported that cultural content was very evident. They noted that the “slice-of-life” style, in particular, infused cultural content into many of the commercials. While the sample of advertising messages used for this research were from American television, and in no way represented a full spectrum of culture from other English speaking countries, it did contain a number of concepts that teachers reported as useful in ESL teaching.

Ultimately, seven classes in Hawai‘i and Kansas were tested with the TV-commercial lesson. Native speakers of eight different languages and seven language families (Figure 1) returned similar results. Those results were that students and teachers reported generally positive attitudes toward the concept and said they had indeed learned about, in this case American culture, by watching and discussing the commercials (Figure 2) something.

Television commercials include visual content like body language, proxemics, gender and age relationships, as well as auditory content like tone, emphasis and volume. This makes television advertising particularly rich sources of information on these aspects of language.

Teachers reported using a variety of materials to supplement lessons (Figure 3) and did mention televised movies and books as useful. Unlike movies and books, television commercials are, by their very nature, current. A typical television commercial is seldom even available to the audience for more than a few months. Often the time in circulation is less. This short “shelf life” means that these advertising messages are on the cutting edge, from a cultural point of view. Words and phrases used in television commercials are likely to contain the latest jargon, not dated phrases that may have already become passé in the vernacular. Teachers who incorporate television commercials into their ESL or EFL curriculum will be helping their students pick up on the most recent evolution of culture and the words, phrases and gestures that frame it in that particular English speaking society.

The fact that television commercials repeat on a regular basis during the time they are available is another plus. As discussed earlier, students can see a message on television, discuss it in class the next day, and then see it again that night. It is an endless source of new material, but there is enough repetition of existing messages to reinforce teaching points.

A final reason to incorporate television commercials into the ESL classes is that it would present teachers with an opportunity to discuss issues like consumerism in society, body image and ageism. While these were not specifically tested for in this research, they did come up in class discussion during the study. Awareness of these influences would be particularly helpful to younger students.

This research helped show that television commercials could contribute positively to the teaching of English as a second language. Their ubiquitous presence, the emotional connections they make and their constantly changing content all work to make them a rich source of new material for educators. They offer a low-cost way to provide up-to-date, ever changing discussion aids. Considering that most ESL programs are “cash strapped” (Griffith & Hancock, 2006) and the learners themselves are often from low-income status, this could be a true benefit to the field.

8. Further Research

While this study demonstrated a value in using television advertising as an English language- teaching tool, further research could benefit the field. A control group and several treatment groups, provided with tests of cultural literacy, could produce additional validation that learning had, indeed, taken place. Since the learning outcomes in this study were self-reported, the researcher must take the respondents at their word that they actually added knowledge through the process. Also, since the experimental groups were all ESL classes on mainland USA or Hawaiian environments, a replicated study with EFL classes conducted in non-English speaking countries would add an extra layer of meaning to the results.

The views of special education teachers about mathematics instruction in special education

Tamer Aydemir*

Pamukkale University, Faculty of Education Faculty, Kınıklı Campus, 20020, Denizli, Turkey

Abstract

The purpose of this research to determine the special education teachers' views about mathematics and mathematics teaching methods using in special education. For this purpose, a semi-structured interview form was prepared to be able to interview with the special education teachers teaching mathematics. The participants of the study are four teachers who graduated and non-graduate from the field of mental retardation. The method used in the research is qualitative research approach. The research was designed as a case study in qualitative research methods. In this research, data obtained from interviews, document review and thinking aloud. Content analysis was used to analyze the data. The data are presented in comparison recommendations are given for the future. The result of the research was represented in comparison and provided practical suggestions for the future. And also the results will be pathfinder for a project that will apply to teacher in Denizli in Turkiye.

Main objective of the special education is to prepare the students for life and enable them to live in society independently. For this purpose, students in special need are thought self-maintenance, daily life skills, social and communication abilities. Besides these skills, it is required that students with intellectual disabilities must gain academic skills, too (Eripek, 1996). Among these academic skills, numeracy such as counting, using numbers, money concept, controlling the money, shopping, telling the time, recognizing the shapes, solving the problems requiring four operations are very important and prior condition for the individual to live independently. For this reason students with intellectual disabilities have to learn numeracy, adapt these mathematical skills to daily life and be the member of the society by solving problems like every other student.

Mathematics skills, while very important prior condition for the students with intellectual disabilities to proceed in academic life, daily life, vocational field, is the leading skill which students with intellectual disabilities have difficulty to understand (Kroesbergen & Van Luit, 2003; Perie et al., 2005). This problem is multiplied by the factors. These factors are especially about mathematics skills which requires cognitive skills, difficulties in literacy, not allowing enough time teaching concepts, not providing students with enough opportunities, mathematic in volute and low motivation of the students (Vaughn et al., 2003).

Along with all these reasons, Cawley (1978) shows the reason of not being able to gather mathematics skills for the students with intellectual disabilities that course materials are not prepared according to the needs of the students and concepts and skills are not presented in a systematic way. At the same time, especially in 1990's such an opinion gained importance that students in effective education can learn mathematical skills and concepts in a shorter time period and can use the things they learn in life. Together with this opinion, it is stated that difficulties in Maths don't stem from them but about preparing and presenting the course materials (Jones et al., 1997).

According to this, some facts make the students have difficulties to learn new concepts and skills in Maths. These can be stated as programmes aren't convenient for the needs of the students, teaching activities aren't according to the performance of the students, concepts and skills are presented without analysing, physical materials are not used, egzercises, practices and correcting aren't done (Gürsel, 2000).

Because of this the individuals with intellectual disability don't have enough ability to learn by themselves. In learning mathematical skills the most important factor is to teach effectively and efficiently.

Without doubt teachers are the most important element of effective and efficient education. Students with intellectual disability are usually unsuccessful to learn in traditional ways. Teachers are required to be sufficient for addressing their students (Flores ve diğerleri, 2010). Also National Council of Teachers of Mathematics (NCTM) and such associations has defined standarts that Maths teachers have to have. When looked at literature, there are some studies about knowledge of content, belief, attitude and proficiency for this standarts of teachers of special education in mathematics. According to the data gathered from these studies, speacial education teachers don't have enough knowledge in mathematical content, their anxiety level for teaching Maths is high and they don't see themselves sufficient in teaching Maths (Ball, 1990; Hinton, 2011, Lee, 2011, Flores and the others, 2010; Gerretson & McHatton, 2012; Floyd, 2006; Bursal & Paznokas, 2006). Also, it is stated that according to the standarts of National Council of Teachers of Mathematics these teachers are not adequate (Maccini & Gagnon, 2002; Floyd, 2006, Hinton, 2011) and they are unwilling to obey the reforms (Hofmeister, 1993; Rivera, 1997; Simon & Rivera, 2007).

Another point stated by researches is the relationship between teacher adequacy and student success (NMAP, 2008; Lee, 2011). The more teacher is equipped about the field, the more the students are academically successful. Even if there are many reasons for that, the most important one is that teacher having good content knowledge can plan well what and how to teach (Ball, 1990; Ma, 1999). It is thought that even the students

showing normal improvement have difficulties in mathematics skills. So students with intellectual disabilities need additional help. That's why teachers are expected to plan the educational content for fulfilling the needs of the students best and to present by choosing the best teaching method (Krosbergen & Van Luit, 2003). In this context it is important that mathematics is taught by efficient techniques which leads mathematics instruction to function (Tekin-İftar, Kurt & Acar, 2008).

Today many studies are publishing about teaching mathematics instruction to the students with intellectual disabilities and also effective, secure and systematic teaching methods are still being looked for. In these studies, in teaching Maths direct, staggered, through concrete to abstract, accurate and to the point teaching methods have become prominent.

However when it is looked at literature, it is seen that special education teachers don't prefer to use the practices proved to be effective and efficient (Lee, 2011). Also (Boardman et al., 2005) stated that teachers don't use systematic methods and choose more flexible ones. Besides this, Woodward & Montague (2002) and Miller & Mercer (1993) stated that teachers focus on proceeding rather than focusing on conceptual understanding among the students with intellectual disabilities.

Data from researches shows that teachers have problems during the process of teaching numeracy to the students with intellectual disabilities. Because of this special education teachers need more researches in teaching numeracy. Also especially in Turkey there is no study showing the results of appointing classroom teachers as special education teachers by giving classroom teachers certificate to fulfill teacher shortage. From this point of view, studies defining teaching the methods of numeracy are needed for the special education teachers who didn't study in special education.

The aim of this study is to state the perspectives of special education teachers for teaching numeracy. For this reason questions below are sought to be answered.

1. What are the views of the special education teachers about the importance of teaching Maths?
2. What are the views of the special education teachers about the attitude of family and student during the process of teaching Maths?
3. What are the views of the special education teachers about teaching methods based on science during the process of teaching Maths?
4. What are differences among views of the special education teachers about being graduate of special education?

2. Method

In this research, qualitative research approach is used as the method. The research is designed as a case study.

2.1. Participants

Four special education teacher have attended the research from a private school. Participants are volunteers. Two of them graduated of the special education and the other two graduated of primary school teacher working as special education teacher.

2.2. Data collection tools

In the research, for data collection semi-structured interview forms are used. Form is designed by pilot study and prepared by expert consultation. In the form there are 15 main questions and according to the answers sub-questions support the interview. Interviews are recorded by getting the necessary permits then put in order. In the research document examination and thinking aloud technique are used.

2.2. Data analysis

Data is analysed by using content analysis method according to the research questions.

3. Findings

Here data, obtained by answers to 15 questions their sub-questions, is classified and sub-divided according to aims of the study.

3.1. Views of the special education teachers for the importance of the Maths teaching

In the interview, teachers generally have given positive answers for the importance of the Maths teaching. They stated especially that numeracy is the prior condition of the Daily life skills and numeracy has to be used in everyday life. Some parts of the teachers' answers are like these:

“Kids have to express things and numbers everyday, when she goes to convenience store, they have to state the number of the things bought, when she gets on the minibüs or bus, they have to learn the number of it” (Teacher 1).

“When upper classes graduate, they take the exam for disabled officer. It is very important here” (T 1).

“It is something she can use in daily life. In a supermarket, all in all, to do something for her/his own, it is a valid reason which they already use. We say go buy something from the canteen and they can” (T 2).

“Numeracy is as important as self-care skill. However, gathering self-care is quite important (T 3).

“For example she has to know money, numbers, add-subtract, things which will be used in daily life. These are very important for mentally disabled. we have to teach these” (T 4).

3.2. Views of the special education teachers about the attitude of family during the process of teaching Maths

In the interviews it is stated that especially families having self-care skills have positive attitudes for numeracy education. But it is underlined that families' demands for numeracy education are less when compared to others. Some of the answers are like these:

“We have feedbacks from families especially when they use Math” (T 1).

“Families' demands for self-care skills and housework skills are prior” (T 2).

“Constantly they come and ask what can we do at home. (T 3)”

“The parent of the students with high IQ level gives more importance to Math instruction.” (T 4).

3.3. Views of the special education teachers about the attitude of student during the process of teaching maths

Teachers generally stated that students are in positive attitude for Maths and studying Maths is more preferred compared to literacy. Some parts of the answers are like these:

“Generally they are positive. For example in Maths there are 10 numbers, but in Turkish there are 29 letters so Maths is more fun” (T 1)

“They like practising it because it is not oral and no need for momorizing” (T 2)

“They love Maths very much” (T 3).

3.4. Views of the special education teachers about teaching methods

In the interview teachers were asked questions about practices which were proved to be effective and efficient by researches from literature and based on science. Firstly they are asked about their teaching methods and which method they use most.

According to this, graduates from special education have more awareness for evidence based methods, other teachers aren't graduates of special education don't have a view about these methods at first side. Also the most used teaching method is concretisation by using materials. And also a teacher stated that direct teaching is being used, other three participants emphasize on setting example method. Some parts of the answers are like these:

"We don't use a method mainly, I am using direct education. With these I am using simultaneous method most and also constant time delay procedure. I don't use the others much. (T 1)"

"I generally prefer using material"(T 2)"

"I am demonstrating first and then make them apply. Generally I am using concretization method" (T 3)

"I don't have such a special method. I am working with students face to face. First we are doing together by demonstrating. I am giving oral clues" (T 4)

To the questions as according to what they choose such methods, they stated that they choose the method according to skill's and student's features. Some parts of the answers are like these:

"Firstly we are looking for if they are available for concretization." (T 1)

"Student's readiness and how much they know is important" (T 2)

Also when teachers are asked for examples of the activities done through these methods, first teacher stated that addition process is done through direct teaching and simultaneous teaching, second teacher mentioned that setting an example by giving clue is used as prerequisite skills are important. Third teacher stated that subtraction process is done by using material, fourth teacher stated that to study a skill it is important to study prerequisite skills first. Teachers especially mentioned concretization activities and doing by demonstrating. Also their common point is to agree on the counting technique in addition. Also in this process giving clues is very important. Some of the answers are like these:

"In rhythmic counting when we do counting through direct teaching, we can draw pictures on the board, and we can count these pictures." (T 1)

"In addition firstly I mention quantity factors of course then I do it myself and then I ask. If the student is not able to do it, I give clue, then I ask again, if unsuccessful again, I help the student."(T 2)

"For example, in abstraction firstly, I do backwards counting. I do this by making them subtract. I put ten pencils then I do by making them subtract."(T 3)

"For example eight plus five, student can do it by drawing lines, for example it is five student draws five, it is three student draws threes. Then student can add by counting these."(T 4)

Also in the interview teachers are asked some questions about teaching methods which are from literature and proved to be effective and efficient (Direct teaching, accurate teaching, through concrete to abstract teaching, staggered teaching, to the point teaching). The teachers were asked whether they use these or not. According to these first teacher who is graduate of the special education answered the questions concerning direct teaching

and simultaneous education especially as yes. This teacher said that she only use the concretization part of through concrete to abstract teaching and doesn't know much about this technique. Teacher stated that because staggered teaching method requires preparation and it is long she is not able to use it. Also she mentioned that she never uses to the point teaching and she doesn't know this teaching method.

"I use direct teaching often" (T 1)

"I prefer simultaneous teaching." (T 1)

Again the second teacher who is graduate of the special education stated that she doesn't use direct teaching method and especially prefer simultaneous teaching method. This teacher doesn't prefer using staggered teaching method as the class is crowded. This teacher use through concrete to abstract teaching on for concretization, and doesn't know as a evidence based method, as for he to the point teaching this teacher doesn't know about it.

"I don't use direct teaching." (T 2)

"I am using as concretization but I don't use any evidence based methods. I do concretization by using materials." (T 2)

Third teacher who is graduate of special education stated that teacher doesn't know teaching methods fully. Teacher said that she can guess the teaching methods of direct teaching and through concrete to abstract teaching by their names .

"Direct teaching method? I don't know." (T 2)

"I don't know its stages much. I don't do it by plan also we don't have much time." (T 2)

Fourth teacher who isn't graduate of special education stated that she heard staggered teaching method only. When these methods were shortly mentioned, Interviewer stated that she uses some of them but they aren't based on evidence. As for staggered teaching method , teacher mentioned that she uses it but doesn't have detailed knowledge.

As for the direct teaching method: *"our practices can be included to that." (T 4)*

As for to the point teaching method : *"I got it, we use that but not consciously. But I am not using this method like this." (T 4)*

As for the staggered teaching method : *"Yes I use this method. At the end , when the student did , liberalize them." (T 4)*

4. Argument ve Result

In the study, in the light of the questions asked to the teachers, it is determined that special education teachers are positive as for the importance of the teaching Maths on the contrary to findings that are in literature. This positive opinion is expressed by especially by the students with mild intellectual disabilities and their families. These findings don't show consistency with the findings about special education teachers have the negative attitude about teaching Maths in literature (Ball, 1990; Hinton, 2011; Lee, 2011, Colman, Flores and the others, 2010; Gerretson & McHatton, 2012; Floyd, 2006; Bursal & Paznokas). Also teachers stated that it is very important to teach counting, four operations and money-shopping in numeracy which is one of the aims of the special education and this shows consistency with the principle of living independently in life.

In the study when we look at the teachers' views about teaching methods based on literature, the findings are quite important. According to this the graduate students from this field are generally aware of the evidence based applications in teaching Maths even if it is less. However, teachers who aren't graduates of special education don't have any view about the evidence based teaching methods, it is quite worrying. These mentioned findings seem to support the findings of the literature that special education teachers are unwilling to apply evidence based methods (Lee, 2011; Boardman et al., 2005; Maccini, Gagnon, & Calvin, 2002).

Another important point about applying the evidence based teaching methods is that teachers don't plan their methods, which they already use, systematically, more than that they do it extemporally when they go in the class. This situation can result in either unsuccessful education or have the risks of failure about continuance and generalization. Also another important point gathered from interviews teachers don't have a full command of the teaching method they use. In this situation we have some examples to prove this finding, as the examples of the staggered teaching methods, direct teaching and through concrete to abstract teaching are not fully used but only one stage of the teaching method is used. Modelling and doing together teaching methods are used but teacher didn't hear about direct teaching method. Another example is that teacher use the concretization teaching method however teacher hasn't heard about through concrete to abstract teaching and doesn't use it. In fact teaching methods are more effective when they are planned systematically before the lesson according to the needs of the students and applied stage by stage after the aim of every stage is provided, next is applied. These findings show consistency with the views of the literature about the application of the evidence based teaching methods. These views tell us that they are deficient. (Boardman et al., 2005; Lee, 2011; Maccini, Gagnon, & Calvin, 2002).

"Do you feel yourself qualified in teaching Maths?" is the most important question in the research intended to its aim. Participants commonly answered "No". Apart from this sub question is "would you like to attend an in-service course about teaching Maths?" and this question is answered as "Of course, Yes". This view shows consistency with the idea from the literature that teachers don't feel themselves enough about teaching Maths.

In the light of these findings more research should be done and according to the results of research, decisions should be taken about employing the not-graduate of special education and also this should be discussed. If that is necessary with the in-service courses containing Math instruction, teachers should be equipped more. Especially in the process of training the teacher, teacher candidate should be aimed to have more content and pedagogical content knowledge. Especially because teachers need special treatment to teach mathematics skills to the students with intellectual disabilities. Teachers who are not the graduates of special education should take the in-service course more seriously about teaching Maths, if that is necessary experts' help should be provided.

The Academic Tutoring at the University Level: development and promotion methodology trough project work

José Miguel Molina Jordá^{a,b*}^a*Departamento de Química Inorgánica, Facultad de Ciencias, Universidad de Alicante*^b*Instituto Universitario de Materiales de Alicante, Universidad de Alicante*

Abstract

Tutoring is a methodological element of utmost importance in the EHEA (European Higher Education Area) context. Academic tutoring at university-level must offer counselling and technical support to university students in the three following areas: academic, professional and personal. This contributes to the students' integral development through their university years. Nevertheless, its potential is very often overshadowed due to the general lack of awareness (here we must place responsibility on the teacher-student relationship) of its methodological function in the teaching proposal required by the EHEA, whose organizational model is focused on the acquisition of competencies. A Formative Assessment applied model in university subjects, in which the teacher becomes tutor of autonomous work groups and that proposes the use of well-organised academic tutoring sessions, is proposed on this contribution. The result, after introducing this model in the classroom, is very positive in several aspects, since it contributes to the development of instrumental, interpersonal and systematic competencies. Moreover, there is a very favourable improvement of the use of tutoring sessions as far as students are concerned, which will be of advantage to their teaching-learning process.

Keywords: tutoring; project work; formative assessment; portfolio; rubric.

1. Introduction

1.1. Question posed and contextualization of the problem

Tutoring is a methodological teaching tool with great potential within the new EHEA context. According to Ferrer (2003) 'tutoring is a training activity that has an impact on the holistic development of university students in their intellectual, academic, professional and personal dimension. In other terms, it can be said that it is the teacher-tutor activity aimed at favouring a permanent maturation process, through which university students manage to obtain and process correct information about themselves and their environment, within intentional proposals of reasoned decision making: to integrate the constellation of factors shaping their life-course; to fix their self-image through life-course experiences in general and tasks in particular, to display the precise abilities and attitudes in order to integrate work inside a global life project.'

As reflected above, tutoring is a more complex process than a 'doubt solving' activity as understood hitherto. The concept of tutoring is in itself an inclusive global process that it is not reduced to 'office hours'. According to Rufino Cano's words (2009): tutoring reappears adopting a clear, renewed goal stated in terms of unified criteria and more complex actions in an attempt to improve university teaching quality; to deeply

E-mail address: jmmj@ua.es

transform the procedures centred on students' learning, so as to provide them as complete a training as possible through their university experience; and, of course, to favour their entering the professional world from the platform of an organizational model of university counselling and formally institutional tutorial action. Therefore, it is understood as an institutionally standardized teaching activity and inherently linked and integrated in the teaching practice of all teachers and to the performance of their duties, as the closest level to students, from a multidimensional perspective.

In general terms, three great tutorial spheres or areas are defined (Rufino Cano (2009)):

- Vocational counselling (transition from college to university)
- Academic tutoring at the university level (teaching and research)
- Career mentoring and counselling (professional world)

These three tutorial areas must be enhanced to the extent possible. This paper expects to offer an alternative to favour academic tutoring through a new methodology based on group-work research projects.

1.2. Question posed and contextualization of the problem

Though a correct tutoring offer implies the development, put into practice and follow-up of an integral tutorial planning as well as a of a support plan for academic, professional and personal development of all students with no exceptions. It is also true that small actions of redirecting the teacher-student relationship may contribute to obtain better results on these plans. Thus, this paper expects to prove that, by means of a methodology based on the tutoring of research works carried out in work groups, it is possible to encourage students' awareness that in the future they must look at a teacher's role not in terms of a mere purveyor of knowledge, but in terms of a guide and a source for learning. With the methodology put into operation in this paper, it is concluded that students have shown an attitudinal change towards their relationship with the teacher, the use of the academic tutoring has been promoted and, most importantly, a noticeably dialogical, reflective relationship has been generated between the teacher-tutor and the students.

2. Methodology

2.1. Context and participants description

The tutoring methodology proposed here has been put into practice in two subjects of the Faculty of Science at the University of Alicante taught by the author of this paper. In particular, the participants have been students from the 'Introduction to Materials Science' subject, a third-year subject of the Chemistry Science Degree, and from the 'Solid-state Chemistry' subject of the Master's Degree in Nanoscience and Nanotechnology. Due to the excellent results obtained, it is intended to be used in future subjects of the Chemistry Degree and in subjects of the Master's Degree in Materials Science and the Master's Degree in Nanoscience and Nanotechnology. Both the development of the work and the conclusions derived from it are the result of working with students from different years during two consecutive academic years (2009-2010 and 2010-2011).

The students participating in this experience have been, therefore, undergraduate students in the middle of their academic maturation period and students who have already finished their curriculum. In both cases, the initial disposition has been the same and both groups have considered the exercise to be very positive for their training.

2.2. Materials

In general, no special materials are required. The following materials have been used for the development of the exercise proposed: i) for the classroom work: a projector and a traditional blackboard, besides the U layout of the tables for a better teacher-student approach; ii) for the work at home: a computer.

2.3. Instruments

The instruments used for the accomplishment of this project have been very much welcomed by the students, who had never had previous experience with them. These instruments are the following:

- **Learning agreement:** the learning agreement developed is a mutual contract between teacher and students in which the codes regulating the behaviors, interactions and relationship between both sides of the teaching-learning process are explicitly made known in writing. The contract version chosen has been a group contract (the contract is signed by a whole group and not only by one student); this way, a clear cooperative learning objective is set from the beginning and the use of individualist learning strategies is prevented. The objective of this agreement is to direct students' independent work or work at home promoting their autonomy and their learning to learn competency.
- **Portfolio:** the portfolio consists of a document in which all the output made by the student and the teacher is collected. It is through that output that competencies can be judged in the context of a discipline or an area of study. The group portfolio informs of the evolutionary process followed by the group, allowing the group itself and the teacher to see the achievements with regard to the learning objectives and to the assessment criteria previously established on the learning agreement. Therefore, it is 'a dynamic process through which teachers and/or students gather the data resulting from their work and professional and academic development respectively, organized by themselves on the basis of reflexion, discussion and consensus with other colleagues and the author-advisor of the process' (Lyons (2006)). The portfolio format used can be seen on the Annex.
- **Rubric:** This has been the instrument used for the assessment of the accomplishments achieved by the different groups (a group rubric has been used) and by the different students (an individual rubric has been used as well). Rubrics are measuring instruments, in which criteria and standards are established for levels through the layout of scales, and that allow determining the quality of the students' execution in specific tasks. The most important advantages of using this tool quoted in Frade (2009), Martínez-Rojas (2008), Capote and Sosa (2006) are, among others, the following: a) students assessment is more objective, since the measuring criteria are clear and known in advance; b) it clarifies the learning objectives and the means to achieve them; c) it provides students with feedback on their strengths and weaknesses on those areas they need to improve; d) it helps to maintain the achievements of the learning objective focused on the established standards of performance and on the students' work.

2.4. Procedures

An action strategy has been followed for the development of two very important aspects in the teaching-learning process within the context of Higher Education: a) group work; and b) project work. In order to develop these objectives, a plan of action of academic tutoring has been planned. In the aforementioned plan, judging by the results obtained, students have evaluated their academic and personal development very positively and have learnt to 'use' tutoring sessions as a methodological element of special importance in their path as protagonists of their own learning process. The procedure followed is now explained. The subjects in which this experience has

been put into practice have a common thematic content, which is the materials science and the solid state or condensed matter. All of them share a 'Characterization Techniques' thematic cluster in which they must develop the different techniques to obtain characterization information of the different solid materials presented throughout the academic year. The experience lies in proposing a tutorial action planning to guide students in the development of the aforesaid thematic cluster by means of research works. To this end, the first task has been to explain the activity to the students and to read them a proposal for a learning agreement, as well as to inform them of the monitoring of their work through a portfolio and of the existence of a rubric as an assessment element (not only with grading purposes) of their work throughout time. Reached a consensus, the class has been divided into work groups, as proposed by the students themselves, so that each group is composed of five members. Therefore, five research works have been proposed. Once known the groups and the research work proposals, each group must be assigned a research work. It is advisable that this task is done in a comfortable, dialogical climate in which all different groups can reach an agreement between them and with the teacher in order to reach a general consensus.

Research works entail face-to-face activities and activities to do at home. The idea is that students can develop a lesson of Characterization Techniques by means of group work and present the topic on the last session of a series of six sessions. The work at home will consist of developing the different aspects of the research work that have been established in the portfolio. This work will be guided by means of five tutoring sessions with all different groups in the classroom. Each student will play a different role in every session and will provide whatever required depending on the role play in each session. All five roles to be assumed by the students in their groups (coordinator, secretary, person in charge, assistant and spokesperson) are taken into account on the portfolio, in which it is depicted the rotation of roles for each students in the group (each students is identified with a number from 1 to 5). Thus, the student whose number is number 1 will play the role of coordinator on the first session, of secretary on the second session and so on. The role for each one is specified on the students' portfolio. So that the portfolio can be revised by the teacher on a regular basis and the members of the group can receive feedback of their work and progress, it was decided to use a digital format with free access for the teacher by using the Virtual Campus (a computer tool on the University of Alicante website that allows the exchange of information between teacher and students). Therefore, the portfolio will have notes both from the students and the teacher, thus becoming an actual work and assessment tool. There are sections of the portfolio to be filled in by the teacher, some others to be filled in by students and some others, as in the case of the assessment questionnaires that must be filled in by each group member.

After the five sessions of tutored work, on the sixth session each group must present their work, in a free format, in front of the teacher and the other groups for a maximum time of 25 minutes, so the main contents are summarized. Moreover, each group must explain both the members' and the group's progress. During this session the members of each group must undertake the role of speaker.

3. Results

Generally speaking, the experience has been very positive. Students have handed out the portfolios and have defended their works orally in conformity with the teaching-learning agreement previously signed. In the explanations of their progress, they have shown great optimism towards this activity.

The assessment questionnaires have provided by the students, as well as some of the teacher's records, are summarized in the graphics below. The graphics gather different opinions from students of all groups (regardless their subject or year) that have taken part in this activity.

- To the question 'Group work is...' (Attitudinal self-assessment), students have answered:

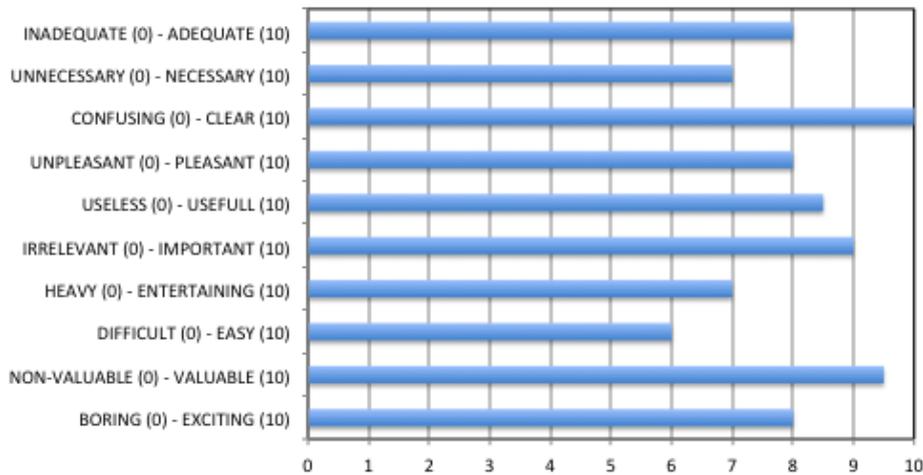

Fig. 1. Results of the students' attitudinal self-assessment questionnaire in response to the question 'Group work is...'

- To the question 'My behaviour while doing the research and on the oral presentation has been...' (behavioural self-assessment), students have answered:

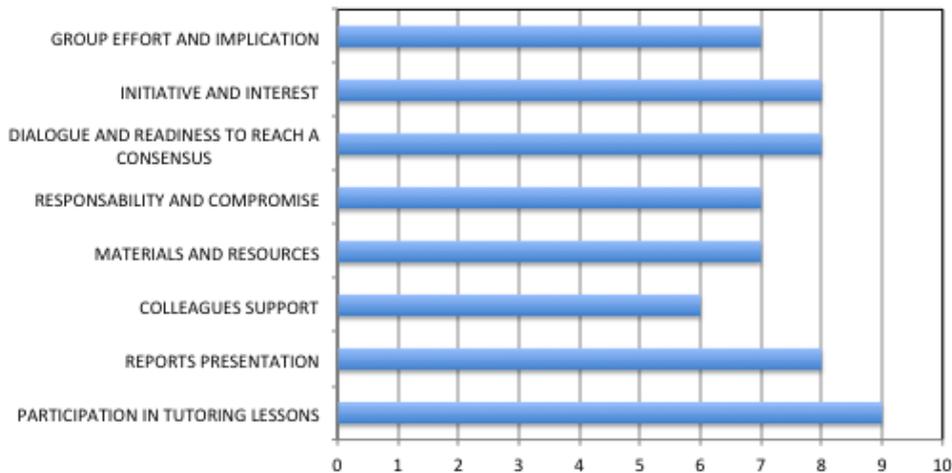

Fig. 2. Results of the students' behavioural self-assessment questionnaire in response to the question 'My behaviour while doing the research and on the oral presentation has been...'

- The record (number) of the 'extra' tutoring sessions (apart from the 6 suggested sessions for work development) gathered by the teacher are summarized below:

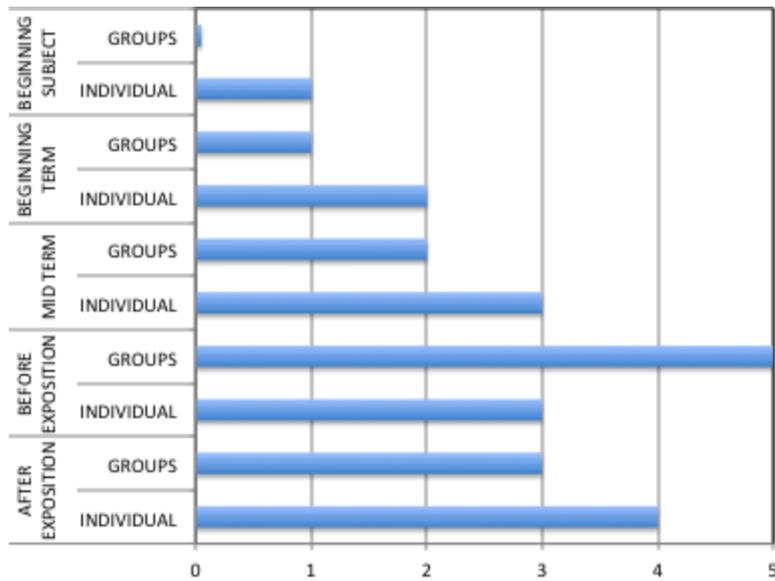

Fig. 3. Results registered by the teacher regarding the number of 'extra' tutoring sessions either in group or individually.

- The record (number) of the 'extra' tutoring sessions gathered by the teacher for the resolution of questions raised in relation to individual or group roles is summarized below:

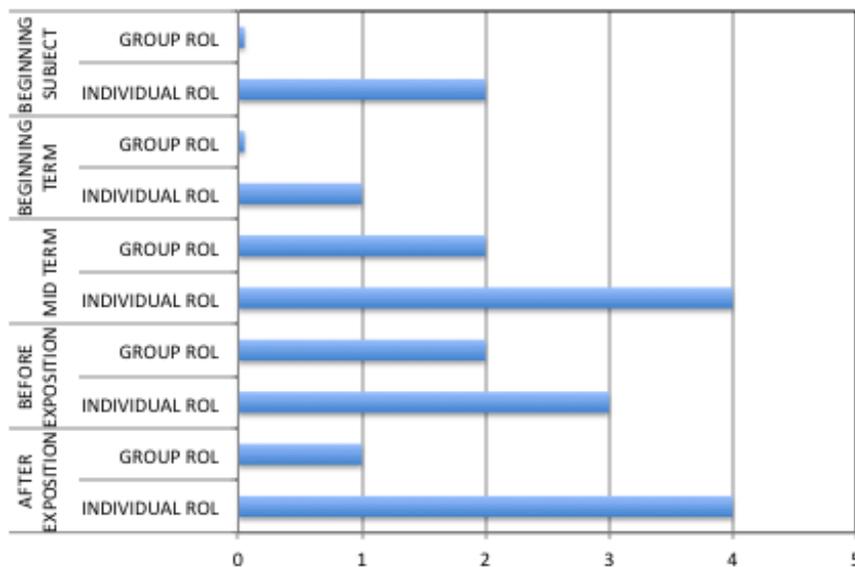

Figure 4. Results registered by the teacher regarding the number of 'extra' tutoring sessions for the resolution of questions raised in relation to both individual and group roles.

4. Conclusions

In general, a very positive evaluation from the students involved in this experience is observed. Students have considered that this activity is (in ranking order):

Clear / valuable / important / useful / adequate – pleasant – exciting / necessary – entertaining / easy

Consequently, students become aware that a difficult activity does not need to be unpleasant or little enjoyable, as well as that it can be very useful for their learning process. As for their behavioural self-assessment, students show full involvement in the group work and value their participation in the tutoring sessions as very important (both in the 6 established sessions and the extra sessions), recognizing them as an essential methodological element in their training by grading their implication in this activity with a 9 out of 10. In the same way, the graphics obtained show that students have used extra tutoring hours both for the preparation of the research work and after the oral presentation. This proves that during this activity students have become aware of the teacher's role as their learning guide and are prepared for the teacher to continue playing this role for the rest of their training (not only until the accomplishment of this activity). Likewise, the reading of the information obtained about the resolution of the questions raised in relation to individual or group roles is very positive. Even though individualized tutoring still prevails, the results obtained seem to conclude that students continue to work in groups even after having finished the activity, since the number of group tutoring sessions, which was non-existent at first, appears to be of some importance now. The membership of the extra tutoring sessions in group coincides entirely with that of the work groups formed for the accomplishment of the research works. It appears, therefore, that students have adopted cooperative studying models that have expanded to their general learning activity.

4th International Conference on New Horizons in Education

The analysis of music teachers' questionnaire survey on issues of developing harmonic hearing

Galina Zavadzka^{a*}, Jelena Davidova

^a*Daugavpils University, Faculty of Music and Art, "Daugavpils", Latvia*

^b*Daugavpils University, Faculty of Education and Management, "Daugavpils", Latvia*

Abstract

The developmental tendencies of the society determine the choice of a new pedagogical paradigm at all stages of higher education. In Latvia, the development of music teachers' harmonic hearing takes an important place in their study process. The investigation on the music teachers' opinion about issues of developing harmonic hearing can identify and reveal essential problems pertaining to music teachers' professional training.

Research aim: to study music teachers' opinion about the problems of developing harmonic hearing on the basis of the developed questionnaire.

Research methods: a survey, computer data processing by SPSS, data analysis.

The paper deals with the analysis of the conducted research on music teachers' opinion about children's compositions (Miller, 1999) and on music teachers' opinion about pupils' individual differences in music classes (Hewitt, 2005). The questionnaire on issues of developing harmonic hearing designed for music teachers is presented. To examine the current situation in the field of developing music teachers' harmonic hearing in Latvian educational institutions and abroad, a questionnaire survey among professional music teachers was conducted. The results obtained from the questionnaire survey will contribute to the development of strategy and methodology for developing music teachers' harmonic hearing at sol-fa classes.

Keywords: harmonic hearing, questionnaire, opinion.

1. INTRODUCTION

The developmental tendencies in the contemporary society determine the necessity to choose a new pedagogical paradigm in all stages of higher education. In Latvia, the development of music teachers' harmonic hearing occupies an important place in their training process, because a music teacher is often simultaneously also a conductor of a school choir, amateur choir or some other choir. The research on this issue, done in Latvia, and findings from it (Davidova & Marnauza, 2003; Marnauza, Kriumane, Gzibovskis, 2005; Znutins, 2009; etc.) testify to this fact and also allow us to broaden our perceptions about the tendencies in the development of Latvian music culture.

E-mail address: g.zavadzka@inbox.lv

The effectiveness of musical activity largely depends on the development level of musical hearing, first of all (Kazkayasi, Yetiser & Ozcelik, 2006). Harmonic hearing is a component of musical hearing. A consecutive and purposeful development of harmonic hearing is also an integral condition for polyphonic choral singing. The quality of intoning in a choir or in a vocal ensemble depends on the development level of harmonic hearing.

The problem concerning the development of harmonic hearing is one of the most essential issues in music pedagogy. In traditional investigations, harmonic hearing is viewed as one of the principal human musical abilities (Vigners, 1936; Teplov, 1947; Seashore, 1967; Petrushin, 1997; Hallam, Gross & Thaut, 2009).

Though thorough investigations in the field of the development of harmonic hearing have been carried out, it is vital to study the opinions and experience of teachers as well: a comprehensive research on teachers' opinions about the development of harmonic hearing may contribute to identifying and determining the problems existing in the sphere of professional training of music teachers, as well as to constructing a further pedagogical process and also to tackling practical tasks of training and educating prospective music teachers.

Research aim: to explore music teachers' opinions about the problems of the development of harmonic hearing, based on the designed questionnaire.

Research methods: questionnaire survey, data processing in SPSS program, data analysis.

2. METHODOLOGY OF THE RESEARCH

To prove the topicality of the research and explore music teachers' opinion about the current situation in the field of the development of harmonic hearing, teachers' questionnaire survey is conducted in professional education institutions of Latvia and abroad (Belarus, Lithuania, Estonia). A questionnaire survey is one of the most widely spread and effective methods for collecting primary sociological and statistic information. According to A. Pipere (Pipere, 2011), a questionnaire is one of the most widely spread and effective methods of collecting information, which helps to study either the current situation of the practice of pedagogical work or teachers' opinions relating to the problem under the research.

In this research, the advantage of a questionnaire survey as a method of pedagogical investigation is seen in the following:

- a questionnaire survey provides an insight about the situation in a contemporary music education, about the level and the need to develop music teachers' harmonic hearing;
- being anonymous (without psychological pressure), a questionnaire survey leads to more well-founded answers on respondents' part;
- a questionnaire survey helps to collect information from a sufficiently great number of music teachers;
- the structure of the offered questionnaire contributes to identifying and determining the problems existing in professional training of music teachers;
- structuring of questions enables us to make the analysis of different forms and methods of developing harmonic hearing, to evaluate their topicality and interrelations with other problems;
- the use of different type of questions – closed-ended questions, which contain a full list of answer choices, and semi-closed questions, which include a list of prepared questions, but also provide an opportunity to give one's own answers. The advantages of semi-closed questions are as follows: a) they make it possible to avoid misunderstanding the questions, b) they make it simple to fill in the questionnaire and process the obtained data;
- the data obtained from a questionnaire survey can be computer-processed;
- singling out essential and problem questions provides the opportunity to concentrate efforts and resources on dealing with the most vital problems.

3. THE PROCEDURE AND RESULTS OF THE RESEARCH

The conducted questionnaire survey was individual. R. Weiss (Weiss, 1994) and J. Creswell (Creswell, 1998) recommend researchers to conduct pilot interviews before the study begins in order to test their research questions. A pilot study allows the researchers to get a clearer idea of what they want to know and how they can best find it out without the expense and effort of a full-fledged study. They are used commonly to try out survey questions and to refine research hypotheses (Grossman, 2013).

A pilot study was carried out in 2011. In the first questionnaire survey, 60 music teachers from Latvia, Lithuania, Estonia and Belarus took part. R. Weiss (Weiss, 1994) states that choosing 60 respondents completely independently of each other will result in a statistically significant survey of most populations. The questionnaire contained seven questions and a table with forms of work for the development of harmonic hearing at music classes, which had to be assessed by five parameters of the Likert-Scale. First were the questions of sociological nature, pertaining to music teachers' age, education and work experience. They were followed by the specific ones, relating to the research theme – the development of harmonic hearing. The data received from the questionnaire survey were processed by computer SPSS program.

4. THE ANALYSIS OF THE RESULTS OBTAINED FROM THE FIRST STAGE OF A QUESTIONNAIRE SURVEY

The analysis of the received results showed that the average age of the respondents was 43.5 years, the youngest being 25 years old, the oldest – 63 years old (See Figure 1).

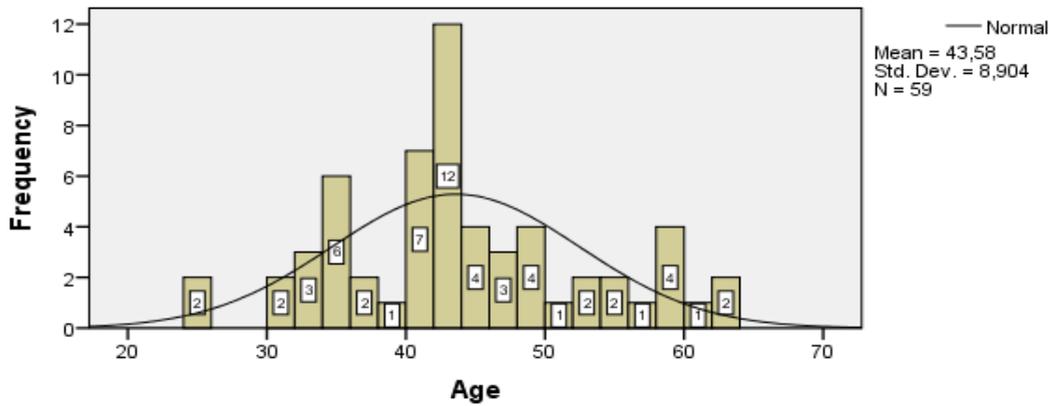

Fig. 1. Respondents' age

Length of respondents' pedagogical experience fluctuates between 1 and 44 years, the statistic mean being 20.5 years (See Figure 2).

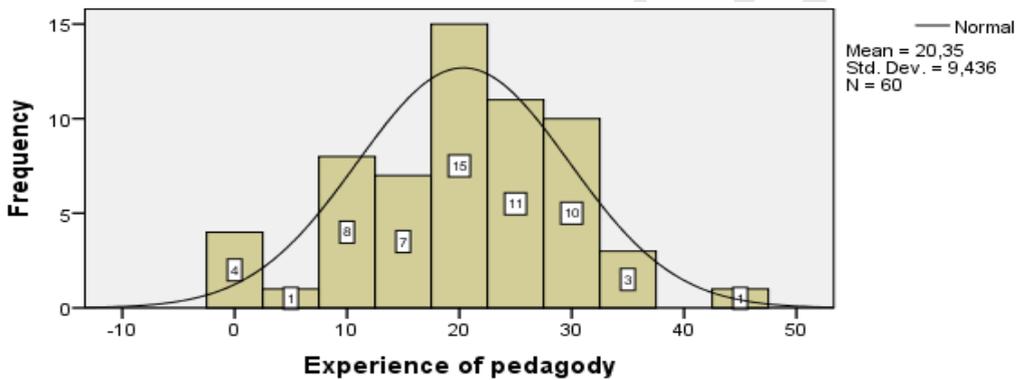

Fig. 2. Respondents' experience of pedagogy

A more detailed processing of statistic data is shown in Table 1

Table 1. Statistics of respondents' age and experience of pedagogy

	Age	Experience of pedagogy
Mean	43,58	20,69
Median	42,00	21,00
Mode	42	20
Std. Deviation	8,904	9,128
Range	38	43
Minimum	25	1
Maximum	63	44
Percentiles		
25	37,00	15,00
50	42,00	21,00
75	48,00	27,00

5 teachers –respondents had secondary special education, the rest – 55 respondents – higher education (See Table 2).

Table 2. Respondents' education

	Frequency	Percent
secondary special	5	8,3
music pedagogy	55	91,7

Teachers – respondents having a master's degree constituted 43.3%, those having a bachelor's degree – 56.7%

Table 3. Distribution of respondents by scientific degrees in percentage terms

	Frequency	Percent
No	34	56,7
Yes	26	43,3

The analysis of the survey data on the question *How much time in percentage terms was devoted to the development of harmonic hearing during your musical-pedagogical training?* Yielded the following results:

Table 4. Time (in percentage) allotted to the development of harmonic hearing in current practice

	Frequency	Percent
10%-20%	20	33,3
20%-40%	40	66,7

66.7% of respondents stated that 20% - 40% of their training time was allotted to the development of harmonic hearing, whereas 33.3% of respondents indicated 10% - 20%.

The answers to the question *How much time in terms of percentage do you think is expedient to allot to the development of harmonic hearing?* provided the results as follows: 31.7% of respondents indicated 10% - 20% of the total time of classes, but 68.3% of respondents – 20% - 40%.

Table 5. Time necessary for developing harmonic hearing

	Frequency	Percent
10%-20%	19	31,7
20%-40%	41	68,3

Practically all respondents recognized the importance for music teachers to develop harmonic hearing: answers of 59 respondents were positive, the answer of 1 respondent – negative.

Table 6. Importance of developing music teachers' harmonic hearing

	Frequency	Percent
No	1	1,7
Yes	59	98,3

The question *Which types of musical hearing, in your opinion, are important for the profession of music teacher?* was given a detailed cluster analysis. The respondents were offered either to choose three out of the given seven types of musical hearing which, in their opinion, were important for a teacher of music or to give their own answer variants. Table 7 shows the frequency dynamic of the choice of different types of musical hearing made by the respondents.

Table 7. Importance of developing music teachers' harmonic hearing

	Responses		Percent of Cases
	N	Percent	
Melodic	48	26,1%	81,4%
Harmonic	54	29,3%	91,5%
Timbral	7	3,8%	11,9%
Inner	24	13,0%	40,7%
Metrorhythmic	32	17,4%	54,2%
Vocal	10	5,4%	16,9%
Polyphonic	9	4,9%	15,3%
Total	184	100,0%	311,9%

The table shows that among all types of musical hearing harmonic hearing takes the leading position – 91.5%, next comes melodic hearing – 81.4%, and the third position is taken by metrorhythmic hearing – 40.7%. The least important, in respondents' opinion, is timbral hearing – 11.9%.

Table 8 shows the distribution of the choice of types of musical hearing, depending on respondents' scientific degree. Respondents – masters ranked melodic hearing as the first, while respondents, having a bachelor's degree – harmonic hearing. Metrorhythmic type of musical hearing again takes the third position among the priorities.

Table 8. Distribution of the choice of types of musical hearing depending on respondents' scientific degree

	Masters		Total
	No	Yes	
Melodic	26	22	48
Harmonic	31	23	54
Timbral	2	5	7
Inner	16	8	24
Metrorhythmic	20	12	32
Vocal	9	1	10

Polyphonic	1	8	9
Total	34	25	59

The cluster analysis allowed dividing all respondents into homogenous groups. The division made according to the respondents' choice produced two groups. The first group of respondents – 28 people (46.7%) is characterized by the fact that they do not choose inner hearing at all, harmonic hearing and melodic hearing – 100%, metrorhythmic – 75%, they do not choose timbral, inner and vocal types of hearing, polyphonic – 25%.

Clusters

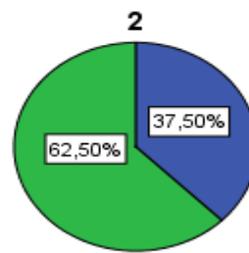

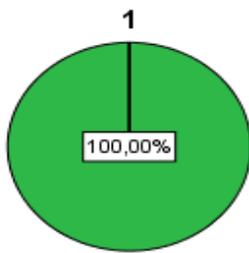

Input (Predictor) Importance

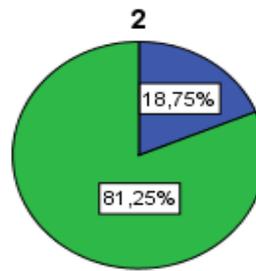

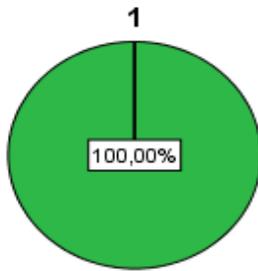

Cluster	2	1
Label		
Description		
Size	53.3% (32)	46.7% (28)
Inputs	Inner 1 (75.0%)	Inner 0 (100.0%)
	Melodic 1 (62.5%)	Melodic 1 (100.0%)
	Vocal 0 (68.8%)	Vocal 0 (100.0%)
	Metrorhythmic 0 (65.6%)	Metrorhythmic 1 (75.0%)
	Timbral 0 (78.1%)	Timbral 0 (100.0%)
	Harmonic 1 (81.2%)	Harmonic 1 (100.0%)
	Polyphonic 0 (93.8%)	Polyphonic 0 (75.0%)

Fig. 3. Division of respondents into homogenous groups

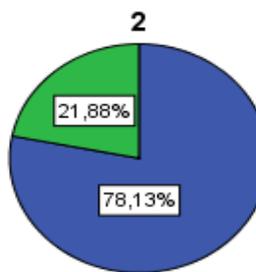

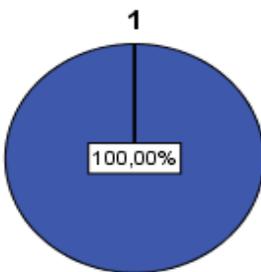

The second group – 32 people (53.3%) – is characterized by the fact that each respondent in this group chooses inner type of musical hearing; moreover, none of the other types of musical hearing reaches 100% importance. The color diagrams below clearly show the respondents' priorities in each group.

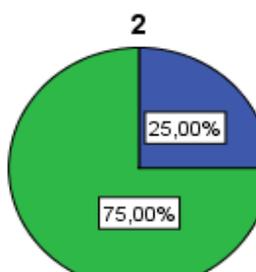

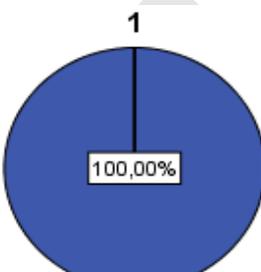

Melodic
■ 0
■ 1

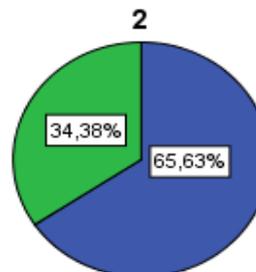

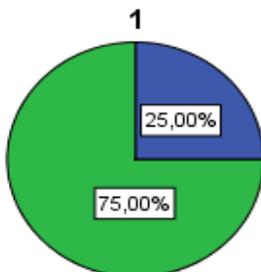

Harmonic
■ 0
■ 1

Timbral
■ 0
■ 1

Inner
■ 0
■ 1

Metrorhythmic
■ 0
■ 1

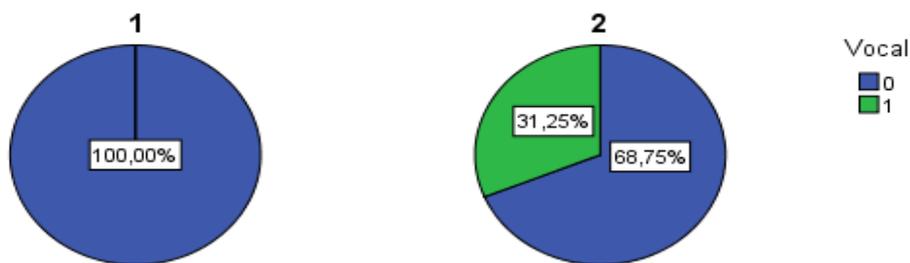

Fig. 4. Percentage of the choice of the types of musical hearing by homogenous groups of respondents (the first and the second)

The analysis of the first and the second cluster group was made in order to reveal the quantitative indicators of respondents' choice (See Table 9).

Table 9. Quantitative indicators of cluster groups

	ClusterGroup1		Total
	1	2	
Melodic	28	20	48
Harmonic	28	26	54
Timbral	0	7	7
Inner	0	24	24
Metrorhythmic	21	11	32
Vocal	0	10	10
Polyphonic	7	2	9
Total	28	31	59

On the basis of indicators given in Table 9, the Test Statistics was done in order to reveal the dependence of respondents' age and pedagogical experience on the choice of priorities given to types of musical hearing.

However, this test did not provide statistically significant results: inclusion of the respondents in different groups does not depend on preliminary given parameters.

The data collected from the questionnaire survey are not sufficient for a qualitative analysis of the choice made by the cluster groups. The analysis of the table, showing the forms of work for the development of harmonious hearing during music classes, assessed by applying the Likert-Scale, did not produce statistically significant results either. This can be attributed to the fact that the respondents had not been offered discussable questions which would involve alternative questions. This shortcoming initiated working out the next stage of the questionnaire survey – a pilot study, where the respondents will be given alternative answers to questions concerning the development of harmonious hearing and work forms at music classes.

5. CONCLUSIONS

1. The first stage of the conducted music teachers' questionnaire survey on issues of harmonic hearing resulted in identifying the current problems relating to music teachers' training:
 - Practically all the respondents recognized and marked the importance of developing music teachers' harmonic hearing (59 respondents out of 60);
 - 68.3% of respondents marked that 20% - 40% of music class time should be allotted to the development of harmonic hearing. However 33.3% of respondents indicated that in the current practice only 10% - 20% of time is devoted to the development of harmonic hearing.
 - The cluster analysis showed that harmonic type of musical hearing takes the leading position among other types of musical hearing offered for respondents' choice – 91.5%, and it is followed by metrorhythmic hearing – 40.7%. According to the choice made by the respondents, the least important is timbral hearing – 11.9%.
2. The cluster analysis of homogenous respondents' groups revealed some shortcomings in the conducted questionnaire survey, because the collected data turned out to be insufficient for a qualitative analysis. Problems also arose over the analysis of respondents' assessment of work forms for the development of harmonic hearing at music classes (Likert-Scale).
The analysis of the statistic data is the basic information for constructing a further stage of the research – pilot study, where for the respondents alternative answers to questions concerning the development of harmonic hearing and work forms at music classes will be given.

4th International Conference on New Horizons in Education

The analyzing of the computer science learning habits of the freshmen mechanical engineering students on the Obuda University in the last five years

Gabor Kiss*

Obuda University, Nepszínház u. 8, H-1081, Budapest, Hungary

Abstract

Aim of this research to analysing the learning habit of the freshmen undergraduate mechanical engineering students in the first semester and compare it in the last five years. The students have to pass two tests until the semester the first on the 6th-7th week the second on the 13th-14th week. Between the tests the students may to participate on the presentations. My personal experience shows the big part of the students until the presentation period do not have learned the teaching material week in week out just have visited the presentations or simple stayed at home. The situation is unfortunately same by other subject too at the university and the colleagues have same experience from other universities and colleges in Hungary. The learning habit of the undergraduate mechanical engineering students could be following and analysing if we can see the details of the downloading of the teaching materials. The Students may download the teaching material of basic Computer Science from an own developed web based system. The material is accessible in the system just after the presentation, on the same day the students have the opportunity to save read and learn it. They get username and password to log into this system, which logs the download saving usernames and the time of each file transfer. A huge mass of data makes possible a statistical audit and the analysing based on. The analysing of the data made possible to draw conclusions regarding the learning habits of undergraduate mechanical engineering students. I analysed the saved data of downloads in the last five years to see the changing of the learning habits of the students if is it recognisable. We can draw the inference on learning habits analyzing the distribution of downloads before the test. The prepared two chart show frequency of downloads depending on time. On the first chart we can see the frequency of downloads before the first test, on the next chart the frequency of downloads before the second test. We can see one-one peak on the charts it means most downloads took place the day before the first test and the second test. The overwhelming part of students wanted to learn the material only one day before the test. On the days of tests we can see a little bit lower number of downloads. The result of the analysing shows the students downloaded the teaching material on the day of test or the previous day. It means these students did not have enough time to read, understand and learn the teaching material before the test and these habits do not have changed in the last five years. The earlier analysing showed the situation is same in the first semester and the undergraduate mechanical engineering students did not recognise the advantage of the learning earlier before the test. I have found strong correlation between the days before the test and the number of downloads of teaching material. It needs a didactical method to motivate the students to download the teaching material earlier and read it to pass the tests in higher percentage because this learning habit has influence on the results of the successful exams too.

Keywords: learning; habit; undergraduate; student; computer; science; higher education

1. INTRODUCTION

E-mail address: kiss.gabor@bgk.uni-obuda.hu

Since 2007 have been downloading students the teaching material of basic Computer Science from an own developed web based system. The students got username and password to log into the system, which on the other hand saved who what and when has downloaded. It is mean, we have a huge mass of data to analyze.

Aim of this research to analysing the learning habit of the freshmen undergraduate mechanical engineering students in the first semester and compare it in the last five years. The students have to pass two tests until the semester the first on the 6th-7th week the second on the 13th-14th week. Between the tests the students may to participate on the presentations. My personal experience shows the big part of the students until the presentation period do not have learned the teaching material week in week out just have visited the presentations or simple stayed at home. The situation is unfortunately same by other subject too at the university and the colleagues have same experience from other universities and colleges in Hungary. The learning habit of the undergraduate mechanical engineering students could be following by analysing the data of downloading of the teaching materials. The material is accessible in the system just after the presentation, on the same day the students have the opportunity to save read and learn it. A huge mass of data makes possible a statistical audit and the analysing based on. The analysing of the data made possible to draw conclusions regarding the learning habits of undergraduate mechanical engineering students. I analysed the saved/logged data of downloads in the last five years to see the changing of the learning habits of the students if is it recognisable.

2. THE ANALYZING OF THE DISTRIBUTION OF DOWNLOADS

First of all we need to see how the human memory is working (Bloom, B.S.; Engelhart, M.D.; Furst, E.J.; Hill, W.H. and Krathwohl, D.R., 1956), the taxonomy of learning, teaching, assessing (Anderson, Krathwohl and Bloom, 2001) and the levels of learning to guide the students through the process of learning (Hoffmann, 2011). These researches shows the reason why student have to take part on the presentation and listening, after that read the learning material at home at same day or at least at the week of the presentation to deepen the knowledge and get better result on the exam.

I have some successful experiments and researches with the consequences the students could get a ~half-one mark better paper results we can see that ones in the following. I developed some programs to show how works different steganography and cryptography algorithms (Kiss G, 2010a), I used web conference system during the lessons (Kiss G, 2012a; Kiss G, 2012b) and my students used Computer laboratory to learn easier the Computer Architecture. These methods were enough to grow the successful exams and the students got better paper results but it was not enough to modify the learning habits of the students (Kiss G, 2010b). The big part of my freshmen students downloaded the learning material one day before the test (Kiss G, 2010c).

2.1. The student population using the system

In order to evaluate the data we have to know the number of students who have used the system to download the tutorials of basic Computer Science. You can see this in table 1. According to the table we can see I taught more than three hundred freshmen mechanical engineering students in the last five years.

Table 1. The number of freshmen students mechanical engineering students by years

Years	Students population
2008-2009 1 st semester	376
2009-2010 1 st semester	430
2010-2011 1 st semester	401
2011-2012 1 st semester	368
2012-2013 1 st semester	439

2.2. The frequency of downloads before the test

We can draw the inference on learning habits analyzing the distribution of downloads before the test. The next two chart show frequency of downloads depending on time. On the first chart we can see the frequency of downloads before the first test (chart 1), on the next chart the frequency of downloads before the second test (chart 2).

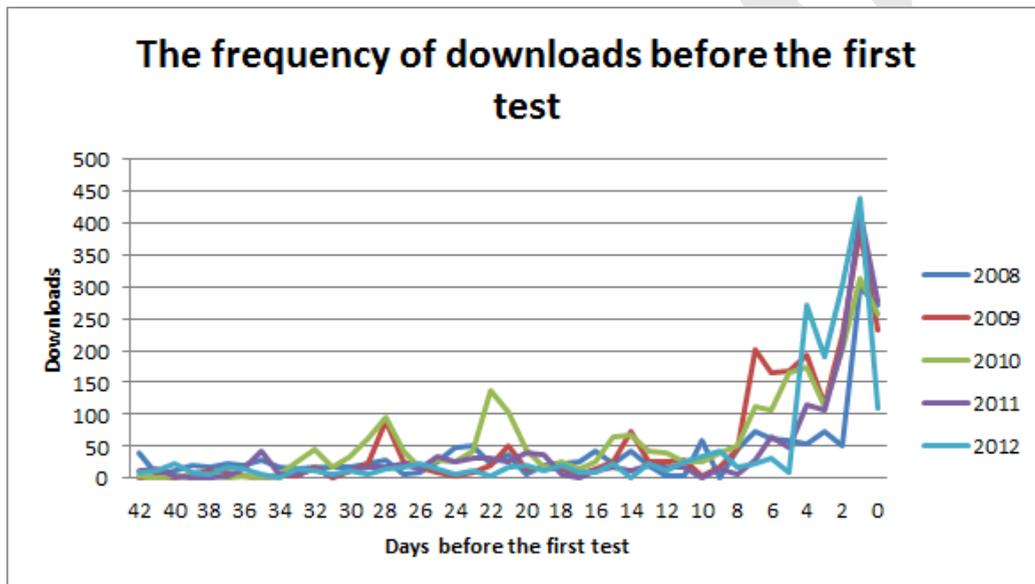

Chart 1. The frequency of downloads before the first test

You can see now that most downloads took place the day before the first test. You can see two peaks in the case of mechanical engineers in 2009 (the brown line), because one group of students have believed to write the one week earlier and downloaded the learning material 7 days earlier.

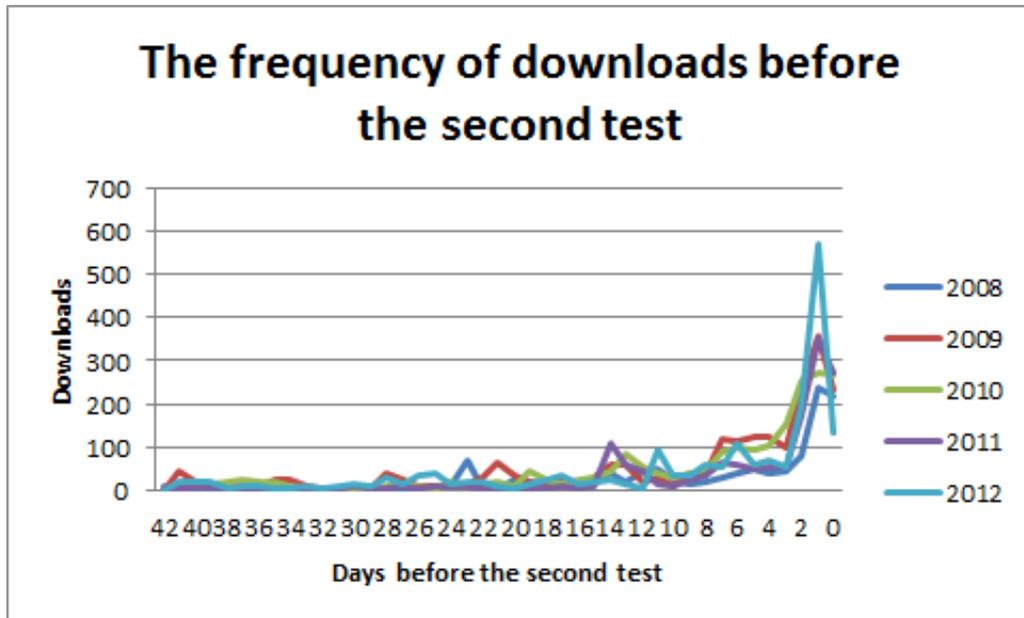

Chart. 2. The frequency of downloads before the second test

The next chart shows a similar situation: most downloads took place on the day before the test. It is important to notice the high number of downloads on the day of the test too. It means a big group of students does not learn the material just makes a copy in order to use it during the test.

If we spend more time looking at these charts, we can see the frequency of downloads before the test did not change in the last five years against the different didactical teaching methods (Kiss G, 2010a; Kiss G, 2012a; Kiss G, 2012b). These methods were good to get the students better results how downloaded the material in time before the test but the big part of the students can not pass the exam. They do not interesting for this subject and the download the learning material just one day before the test. If I want to change the learning habit of these students, I have to find another way to press the students to start to learn in time to pass exams in the first Semester.

2.3. The relationship between the distribution of download and the number of days before the test

We have seen earlier the highest number of downloads of the learning material was one day before the test and the second biggest one was on the day of the test in the last five year in the first semester. Now we have to calculate the correlation coefficient to see the measures of association.

Table 2. The correlation coefficient of download distribution and days before the test

Years	Correlation coefficient
2008-2009 1 st semester	-0,50
2009-2010 1 st semester	-0,68
2010-2011 1 st semester	-0,69
2011-2012 1 st semester	-0,54
2012-2013 1 st semester	-0,53

According to the table we can see the negative correlation between the distribution of downloads and the number of days before the test. It means if the number of days before the test are lower in this case the number of downloads are bigger. It is not surprising because the charts show same situation.

These correlation coefficient values show the measures of association, i.e. how strong the connection between distribution of downloads and the number of days before the test is. The calculated values mean there are middle strong negative correlation existing between the distribution of downloads of the learning material and the number of days before the test. We can see strong connection in the first semester in 2009 and 2010.

We can see the learning habit of freshmen student not changed in the last five years. The big part of students waited to download the learning material one day before the test or on the day of the test. This learning time is not enough to pass the test.

3. Conclusion

We could see after the analyzing of the distribution of downloads of the learning materials in the first semester in the last five years the learning habit of students not changed. We have found strong negative correlation between the distribution of downloads and the number of days before the test. It means the overwhelming part of students downloaded the teaching material on the day of test or the previous day they wait for the last moment before the test to download the learning material and learn it. They are not enough motivated to read the material at home week in week out and they can not pass the exams too. My colleagues have same experience at the university.

Future work

We have to try to motivate the students to learn the material week in week out to modify the learning habit. The students could be to write on every week a short test from the learning material of the previous presentation after that we can see how changed the learning habit of the students

Abstract

In the last twenty five years, digital tools has been with no doubt a support in teaching civil Engineering topics; in this work some of them are remarked, related with hydrology concepts and we emphasize the importance of having a balance given such topics based on the traditional education style so that the student achieves a deep learning of the concepts and a practical formation.

Keywords: digital tools; Civil engineering; traditional teaching.

1. INTRODUCTION

The traditional problem based learning in Civil Engineering curricula has been the most commonly applied in several countries; it is important to create a mixed methodology that includes both problem and project based learning and not only chalk and talk (Mills & Treagust, 2003). There are great expectations in the learning based on a web environment, such as those of Ebner & Holzinger (2002) which found an important increase in learning topics of structural concrete, although some problems in the coordination of the forum and chats to solve the students' doubts. Some efforts to improve the teaching learning process in hydrology by considering field and laboratory modules has been made in Chile by Vargas, Cartes & Dussaubat (2007), 86% of 41% students who answer a test, had reported such activities improved their team work in 94% and the 86% of the them considerer such activities increased their knowledge of the hydrology topics they developed. In the particular area of the hydrology the teacher needs to take into account the random nature in many of the involved variables, Is not possible to design an uniform system with validity in teaching hydrology in all countries because their local natural differences (UNESCO,1975).

The evolution of computers from the 1940's brought a huge development in helping tools to teach some topics of civil Engineering (Chapra & Canale, 2000). Particularly the hydrology topics currently are explained with more flexibility and faster software which allows to illustrate and show the concept with few words. But not all can be taught with programs and images; the practical experience of the teacher inside the classroom is very necessary to be displayed. In this document we present two examples where both the software and a traditional explanation are needed to explain complete a hydrological concept.

2. Cases study

2.1 The double Gumbel probability distribution function

In several regions of many countries maximum annual inflows historical data have a behavior similar to a double Gumbel distribution (González, 1970, Rossi, 1984):

$$(1) \quad F(x) = p (e^{-e^{-y_1}}) + (1 - p) e^{-e^{-y_2}}$$

Where

$$y_1 = \alpha_1(x - \beta_1)$$

$$y_2 = \alpha_2(x - \beta_2)$$

The double Gumbel distribution function is applied in the statistical study of annual maximum inflows that belong to two different populations, the first comes from the inflows incurred by rainfall related with dominant meteorological phenomena in the region under study and the second one is from inflows produced by cyclonic precipitation or rains of winter known as "Equipatas", normally larger than the first ones.

The parameters of that distribution can be obtained with an optimization problem, such as the minimum squares; the AX© software is a useful tool to get those parameters. Currently genetic algorithms, which become a novel evolutionary computing techniques since the middle eighties (Goldberg,1986) are applied to make easier the nonlinear optimization problem and the problem to find the five parameters of the double Gumbel distribution can be made by applying the likelihood method. Everything is possible with the properly tool.

The AX software only needs to have a txt data file which contains in one column the maximum annual inflow data. The interface is very friendly for the user and y very few steps results are obtained (See Figure 1). In the same case, if a student has the Matlab© toolbox with a genetic algorithm already set, almost only with a program with extension .m can be enough to give an objective function and the problem is easy solved (Figure 2) . The genetic algorithm will give the student a set of parameters and the double Gumbel can be drawn in a worksheet, Excel©, for example (Figure 4).

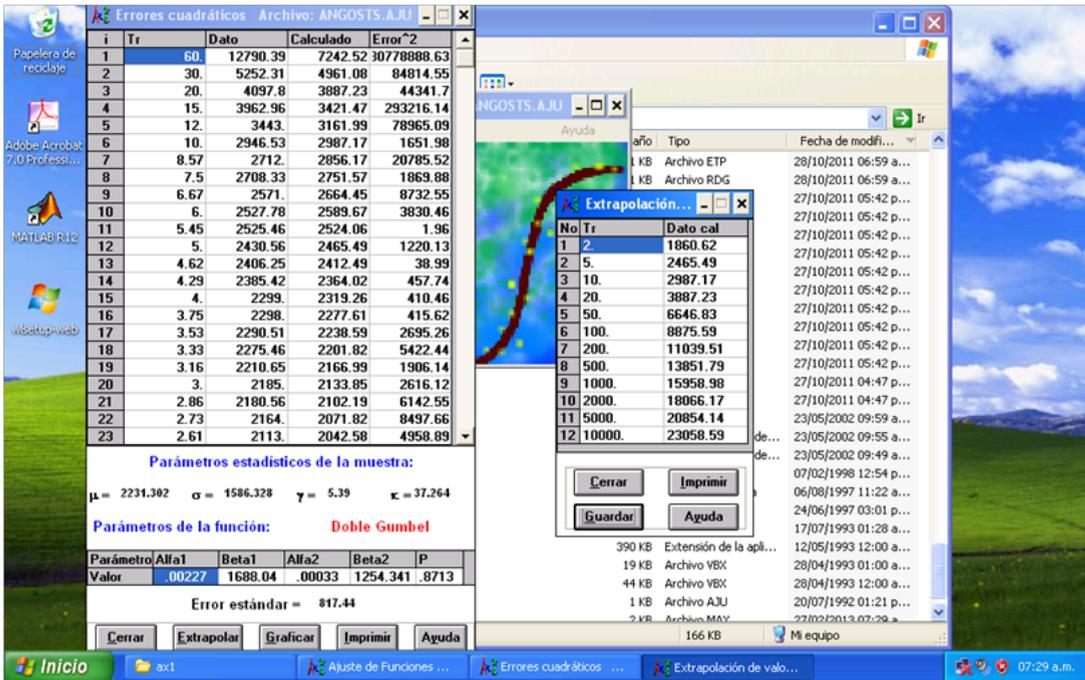

Figure 1. Frames of AX © software's results

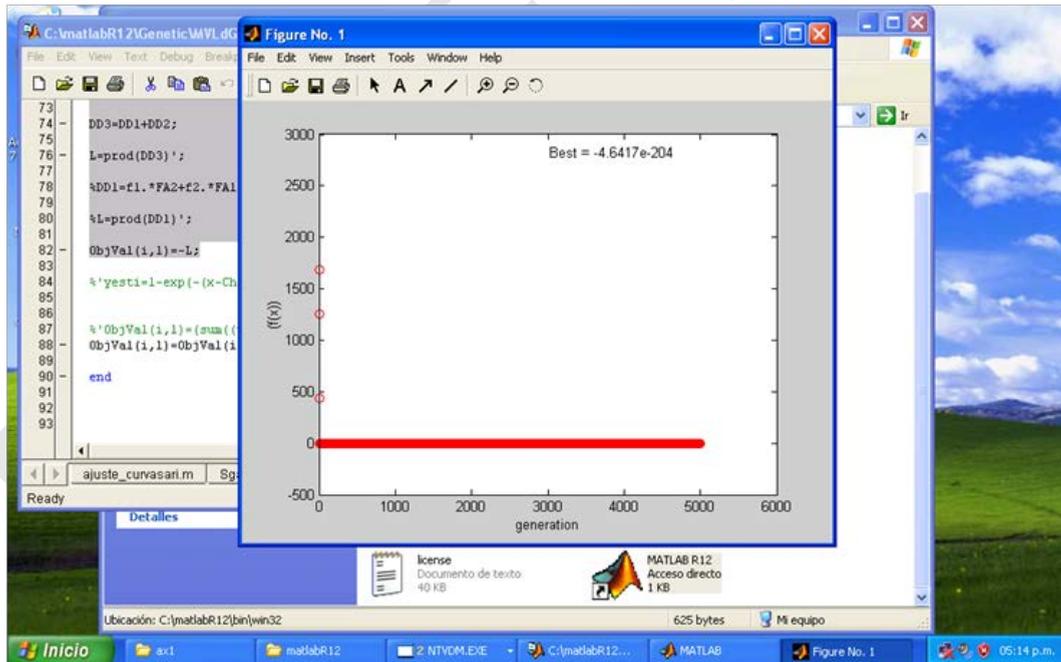

Figure 2. Frames of a genetic algorithm's results by applying Matlab©

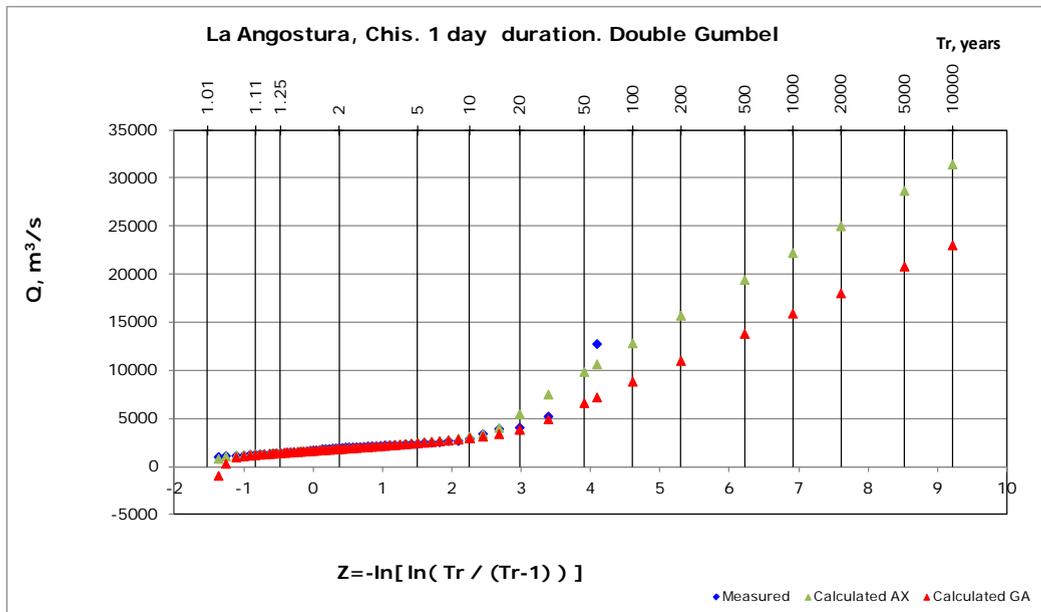

Figure 3. Comparison between double Gumbel distribution function obtained with two procedures. All points.

But how can we read or understand those results?, Will the software give the students all the information?. Only virtual forums on line can solve all doubts? , The teacher is unnecessary in the classroom?.

The answer is no, the student needs the practical experience from his teacher, it is very important to have a general talk about the topic, it is very important to show real examples where data had double Gumbel function as the best fitted distribution. The obtained data can be applied for the design or revision of a dam's spill without to analyzing anything, but that is not a good professional practice. The results must be visualized, a comparison between the historical data and the obtained data must be done before to take any further decision.

For example, the points in the tails of the historical distribution function normally tend to be apart from the theoretical curve; those points must be detailed analyzed because they can be really mistakes in the measurement or they are only extraordinary historical values. it is convenient to find out in local news, old climate reports, local people memories, if there were episodes of hurricanes or draughts in the dates from the unusual data in the tails. In Figure 4 we can see the changing in the results if the biggest point of the analyzed series is removed.

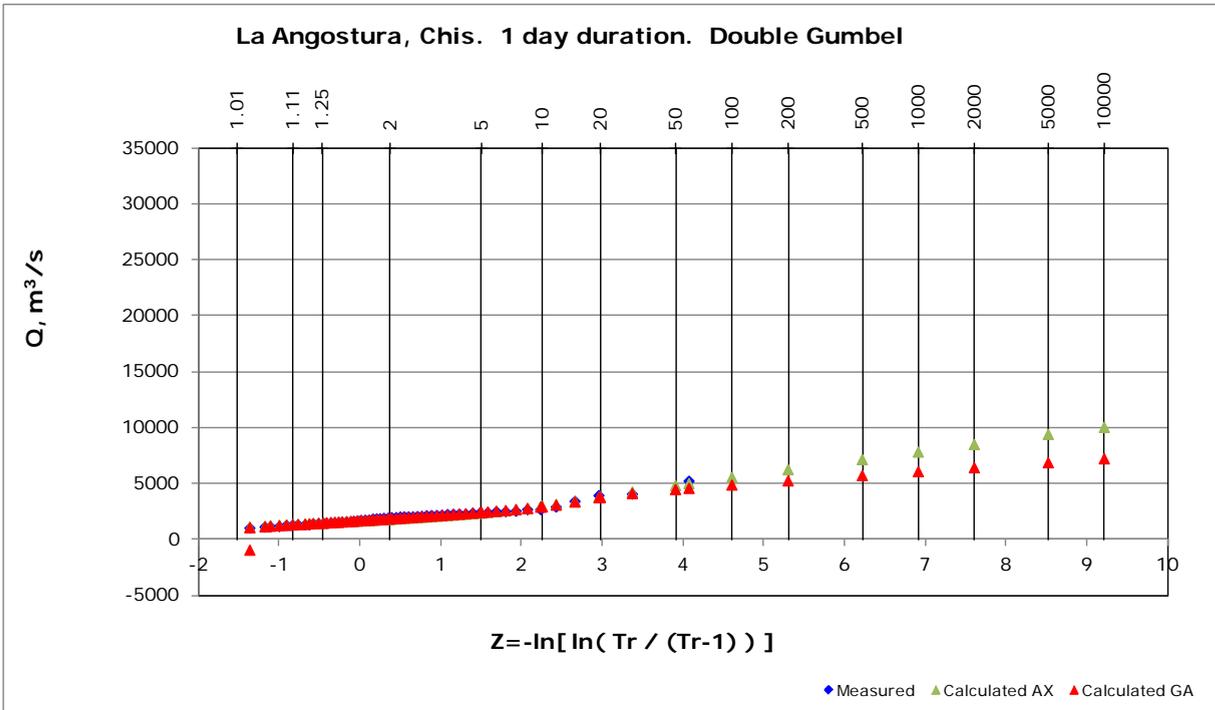

Figure 3. Comparison between double Gumbel distribution function obtained with two procedures. Biggest point removal

By comparison of Figure 3 and 4, the result changes dramatically. In this case a true extraordinary event happened and the results in Figure 3 were taken as the best.

2.2 Flood routing

The flood routing allows to the civil engineering to know information about a dam’s safety operation. When the results of the flood routing are taken directly from a software without any further analysis the decisions can be risky.

Here we present the case of the flood routing made for a student during his master’s thesis. The Chicoasen dam’s design avenue for a return period was routing with the results shown in Figure 4.

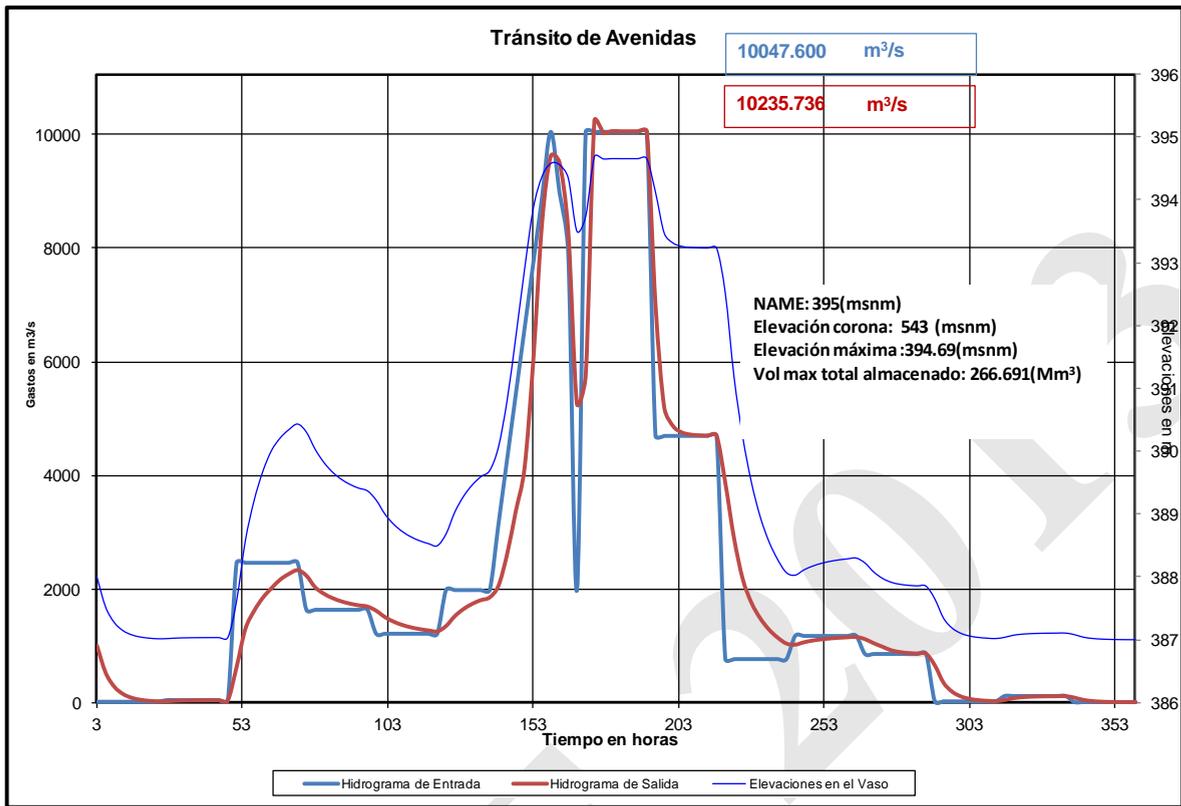

Figure 4. Flood routing with an unusual outflow hydrograph's shape

The professor suggested to the student to check both the inflow hydrograph and the oscillations generated in the outflow hydrograph. It was necessary to give a better shape to the inflow peak and to give a less time interval for calculations in order to avoid the oscillations. After the student made all these changes, the new flood routing was that shown in Figure 5, and this was better than the one in Figure 4. The inflow changes in more than 2000 m³/s and the outflow was according to the nature of a flood routing. The maximum elevation also was important in this new estimation because with the discharge rule there could be a risk hydrological for the dam because the surcharge pool elevation (SPE or NAME in Spanish) is overtopped in 10 cm.

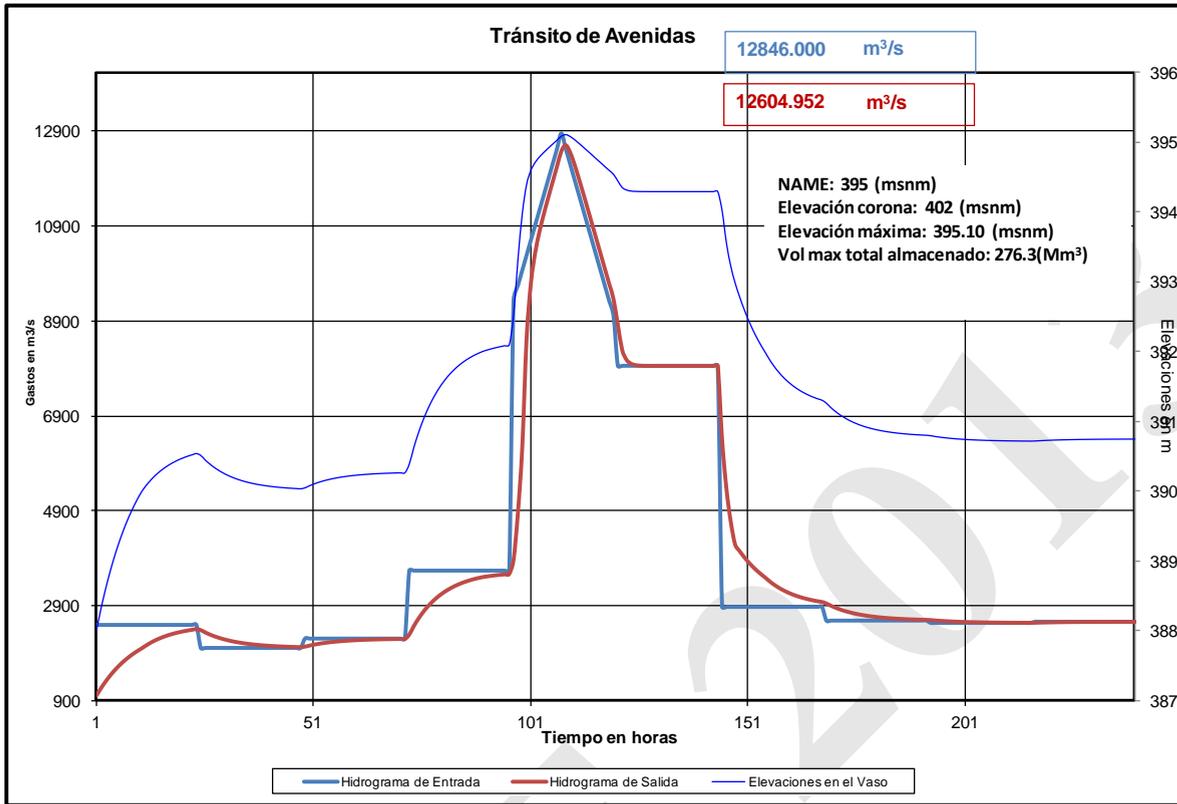

Figure 5. Flood routing recalculated after some modifications in the data

3. Conclusions

Several cases of study in Civil Engineering, in particular in hydrology, are solved with mathematical models and probability distribution functions. There are a lot of software which can lead to a numerical solution.

Students must to do a good balance between the results given by digital tools and the explanations they get in class by their teachers. A careful analysis must be done for every simulation they do, before to make any conclusion or before to give the reports of these results to a decision maker, because many civil engineering works are related with the safety of the population allocated near those works, so it is important to guarantee a properly hydrological and hydraulic function.

4th International Conference on New Horizons in Education

The causal impact of economic education on achievement of optimum outcomes

Helena Chytilova^{a,*}

^aUniversity of Economics, Faculty of Economics, Department of Economics, W.Churchill Sq., Prague, 148 00, Czech Republic

Abstract

It seems nowadays that economic education in vulnerable and complex environment provides helpful option, how to isolate and use information in the most effective way. However, various considerations emerge, among others Stigler (1970), if dissemination of economic knowledge to broader public is worth the cost. We pose a question, whether decision making of individuals is positively affected through incentives governed by a possession of economic education, followed by significant reduction of suboptimal behaviour. Hypothesis verified via the laboratory experiment enables to derive important implications related to better functioning of the economy, if educational effect will be proved.

Keywords: economic education; laboratory experiment; optimum outcomes

1. Introduction

Recently, many institutions started to encourage public with vast array of educatory programs with aim to enhance their economic knowledge and skills. Rising interest in economically educated public is not necessarily valued only because of its own sake, but often it is believed that it may result in better market outcomes. It seems that economic education may provide guidance for subjects in order to isolate and apply information in the most effective way, in contemporary vulnerable and complex environment. This is however associated with considerations, whether the causal impact between economic education and achievement of optimum outcomes is really present. Various studies are devoted to examination of this issue like Bernheim and Kotlikoff (2001), Carpena et al. (2011), Walstad and Larsen (1992), Harris (1999), Fetting, (1998) or Aghion (2009). Some of them find stronger, some of them weaker evidence in favour of economic education.

Diverse results achieved in these studies are closely related to the fact that it is not clear whether dissemination of economic knowledge to broader public is worth the cost, since the utility from its application might be exceeded by costs as emphasized by Stigler (1970). As a result the effect of economic education on outcomes may not be straightforward.

This study aims to follow the latest research and tries to examine whether economic education might play any role in achievement of optimum outcomes. We assume that individuals endowed by adequate economic knowledge may better cope with market conditions, which might contribute substantially to significant reduction of sub-optimal behaviour. If the effect of economic education on behaviour of individuals will be proved, there might be serious implications for various public policies in terms of efficiency of various educatory programs. Our hypothesis will be verified with help of the laboratory experiment. Subjects are setting prices on artificial

E-mail address: helena.chytilova@vse.cz

market with aim to maximize profits and have to cope with the sudden change in the level of prices in the middle of the experiment. The examination of educational effect is secured by two qualitatively different samples, which differ by the level of economic education achieved.

Results indicate that the role of economic education is not straightforward with regards to the ability of subjects to achieve optimum outcomes. First section describes basic facts related to significance of economic education with brief literature survey regarding the research related to exploration of potential effects of economic education. The second section consists of description of basic hypothesis and experimental design. Third section outlines results gained on the basis of experimental testing. The last section concludes.

2. The Case if any for Economic Education

If we adopt more general view on economic education, it is sometimes referred to as economic literacy. This might be understood as “the possession of basic understandings and skills needed by all individuals for intelligent management of their own business and financial affairs, and for responsible participation as citizens in the determination of public policy and the maintenance of the general welfare.” (Wentworth, 1976, p.4) Alfred Marshall saw economic literacy as “the study of mankind in the ordinary business of life” (Minehan, 2006, p.1), by which it is indirectly stated that individual’s success is hidden in his ability to apply basic economic concepts in the ordinary business of life, if proper support is provided. This includes the ability to make wise financial decisions, build wealth, and evaluate the policy decisions that face all individuals.

Whether the effect of economic education holds is substantially affected by the way how individuals acquire economic knowledge and how effectively they use it. According to Stigler (1970) each individual considers potential benefits and costs regarding economic education. Since economics discipline is considered as universal knowledge, used in numerous and highly diverse situations, it is definitely worth the cost. However, the condition regarding the cost is not fulfilled, since individuals after introductory course are not capable to apply basic economic concepts to the real situations, although they recognize it. According to Salemi (2005) economic knowledge in this sense may be rather formal. This suggests that the effect of education on economic outcomes might not be substantial as suggested. However, still Walstad and Rebeck (2002) find out in their research that small but significant difference (6-11%) exists between the economic knowledge of the public and those who have taken the first college economics course. Variety of reasons might be responsible for potential weak effect of economic education, for instance how education is provided, since frequently basic courses are subject to artificiality criticism (Salemi, 2005). In this sense it appears that economics might not be universal knowledge.

Additionally, attention should be also paid to how people gain economic knowledge and how their conceptual image about the economic world is created. Economic efficacy enters into the process of how economic knowledge is acquired. This concept is understood as the individual’s belief about the level of his power or control in order to influence basic economic processes in the economy. People might have different level of economic efficacy. If people have low level of economic efficacy, this means that they may not be necessarily interested in learning economics, since they consider it not as useful experience, (Wentworth, 1976). Costs of learning are at the expense of utility gained from economic knowledge. Thus a low sense of economic efficacy will correlate positively with disinterest in learning economics. This further supports Stigler’s argument regarding costs related to economic knowledge, which individual has to consider.

3. Experimental Design

3.1. Hypothesis

We assume that acquired economic education might reduce individual behaviour leading to suboptimal outcomes on markets. Hypothesis will be examined with help of the experiment, which was partly inspired by study of Fehr and Tyran (2001). Individuals are setting price with aim to maximize profit in artificial monopolistic competitive economy. Players with strong incentives, supported by financial reward, try to maximize their profit, defined as a function of their particular price and the average price level, which is determined by price set by other players. During the process of learning, subjects are assumed to select the profit-maximizing price, which should be consistent with the total general equilibrium of the economy, if other subjects choose the correct price maximizing their profits, as well.

Possibility to explore the effect of economic literacy is secured by setting two types of groups in the experiment, which can be compared. The first treatment is composed of well educated experimental group of subjects in their master's degree, who have advanced knowledge of microeconomics, macroeconomics, game theory and other related economic courses. This gives them solid backgrounds in economics and analytical skills, which enable them to apply basic economic concepts to various situations. This implies that the effect of economic education within this group should according to our assumption lead to better economic outcomes. The second treatment is in the role of control group, where students are in their first year of bachelor's degree, therefore having only minimum knowledge of basic economics. This according to the Salemi (2005) leads only to formal knowledge, which implies significantly lower ability to reach optimum outcomes. Therefore, the effect of economic education should be the least possible.

3.2. Experimental Design

Experiment is based on n-player pricing game with monopolistic competition. The game has 40 rounds plus one trial period, with a group size of $n=4$. 76 subjects participated in the experiment, which was conducted in the Laboratory of Experimental Economics, University of Economics, Prague. Experiment is divided into a pre-shock and a post-shock phase. Fully anticipated negative price shock is implemented during the game, which is common knowledge to participants.

In order to test the impact of economic education on economic outcomes, treatment groups differ with respect to economic education attained as mentioned above. Both groups received payoff functions, which provide them with information about their pricing strategy. Pay-offs of participants are expressed in real terms.

The real pay-off of subject i is given by:

$$\pi_i = \pi_i (P_i, P_{-i}, M) \quad i=1, \dots, n \quad (1)$$

where P_i stands for nominal price, P_{-i} is the average price of the other $n-1$ group members, and M is nominal shock variable. Subjects are informed about payoffs of other subjects in the group, since x and y types players are present in the real treatment. For more detailed specification of real payoffs and real payoff tables see Fehr, Tyran (2000). Major experimental parameters inspired by Fehr and Tyran (2001) are as follows. The money supply before the shock in each treatment was given by $M_0 = 42$, while in the post-shock phase it was given by $M_1 = M_0/3 = 14$. The average equilibrium price over all n group members in the pre-shock phase is given by $P_0^* = 18$,

whereas in the post-shock equilibrium $P_1^*=6$. The length of the pre-shock and the post-shock phase is $T=20$. Experimental subjects interact via computer terminals and have to select in each period an integer price P_i in interval from 1 to 30. They also have to form an expectation about average price of other $n-1$ players. Moreover, they have to indicate their confidence about their expectation, which was measured by choosing an integer on scale from 1 to 6, where 1 indicates that the subject is not at all confident, whereas 6 indicates that the subject is absolutely confident. This should indicate, whether well educated subjects were more comfortable when decision-making about the price was made.

It is assumed that well educated subjects will easily overcome the shock imposed in the middle of the experiment and their behaviour should be directed more frequently towards optimum outcomes. On the contrary, control group should face higher uncertainty owing to absence of economic knowledge, leading to more volatile and suboptimal behaviour. We also predict that well educated subjects will adjust their price in faster manner as opposed to low educated subjects, whose ability to adjust might be hindered.

4. Results

In order to investigate the effect of economic education, we opted for evaluation of the performance of both educational treatments in the real environment before and after the shock with respect to the pricing strategy and development of the average income, with regards to the size of average welfare loss (WL) and the total size of income achieved before and after the shock. Mainly the post-shock phase is important for our analysis, where the comparison between the RH Mgr and the RH Bc enables to isolate the difference in the performance, for which economic education might be responsible. Following Figure 1 shows the performance of both treatments with regards to the average price prevailed. Economy's equilibrium price, to which subjects should converge, is $P_0^*=18$ before the shock and $P_1^*=6$ after the shock.

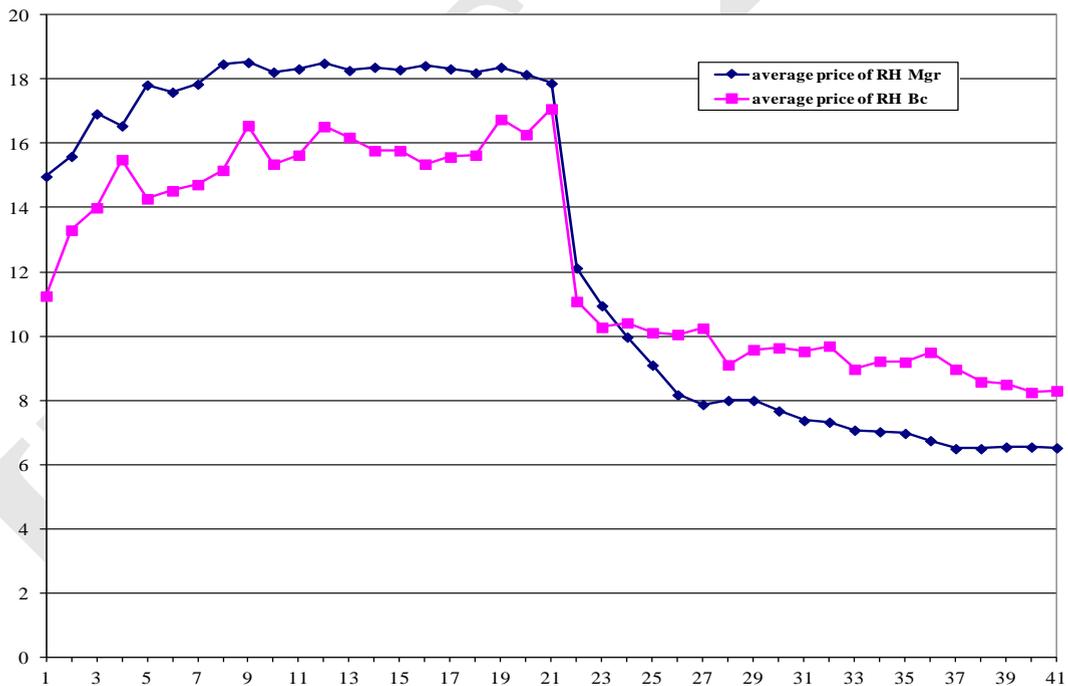

Fig. 1. Development of the average price across educational treatments

The development in the pre-shock phase clearly shows that RH Bc have mostly tendency to stay below the equilibrium price $P_0^*=18$, whereas the average price of RH Mgr is mostly around the optimum. This is evident mainly for the last periods before the announcement of the shock. The crucial for our investigation is behaviour of subjects after implementation of the shock. In the first post-shock period, reaction of both treatments is similar and the price is not reduced significantly for well-educated treatment as opposed to initial expectations. Notwithstanding, the following periods of the post-shock phase indicate that well educated treatment exhibit slightly better performance, since the adjustment of the average price to its optimum post-shock value is slightly faster. In contrast, low educated treatment seems to follow reluctant pricing path, mostly around 8 even at the end of the post-shock phase. Based on afore-mentioned development, it seems that there might be some role for economic education although weak one.

The character of pricing strategy was translated directly in the size of income earned, (See Figure 2). Although well-educated treatment did not maximize rewards for the whole pre-shock phase, tendency towards maximum rewards may be encountered in the second half of this phase. On the contrary, rewards for low-educated treatment are usually below the well-educated one. The size of rewards for this treatment reflects their reluctance to adjust after the shock. Development of income for both treatments directly after the shock is almost indistinguishable, which suggests that immediate response to the shock is in no way better for well educated treatment in the first post-shock period. However, subsequently the difference among treatments in terms of rewards is clearly visible. This again provides support for the potential existence of educational effect.

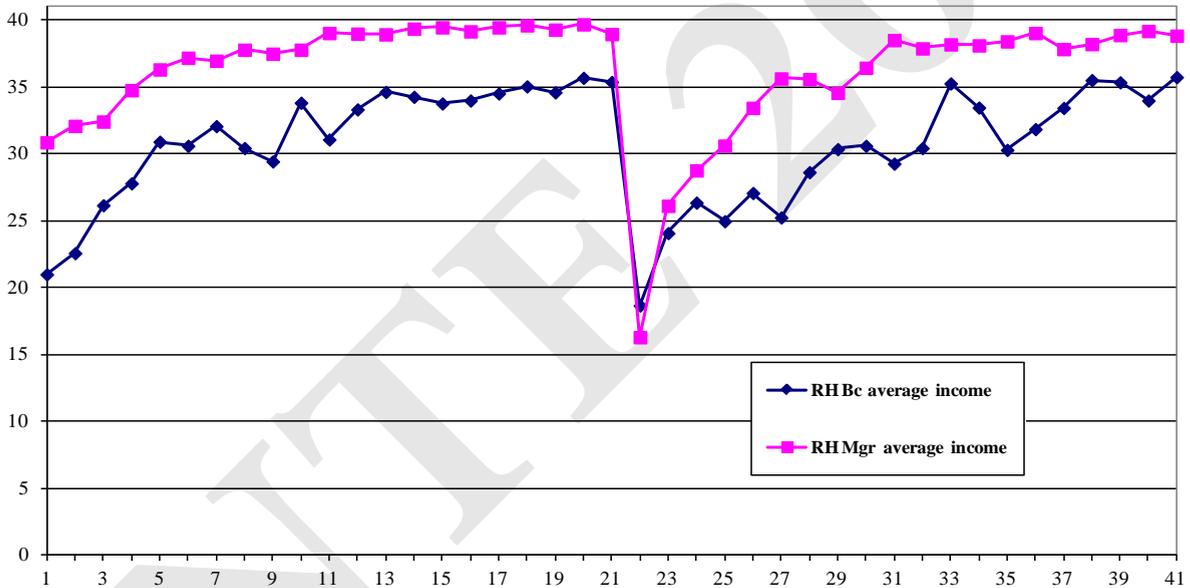

Fig. 2. Development of the average price across educational treatments

The performance of treatments was also assessed in terms of average welfare loss experienced by artificial market, based on price deviations of individuals from optimum outcomes. Development in Figure 3 documents that low-educated treatment experienced substantially higher welfare loss as opposed to well educated treatment. Consistent with previous results, the development in the first post-shock period shows that the size of welfare loss is almost comparable among treatments, which weakens our presumptions about educational effect.

However, in other periods of the pre-shock and post-shock phase, well educated treatment clearly dominates over low-educated in terms of lower average welfare loss. This suggests that decision-making about the price was directed more frequently towards optimum outcomes for well-educated treatment.

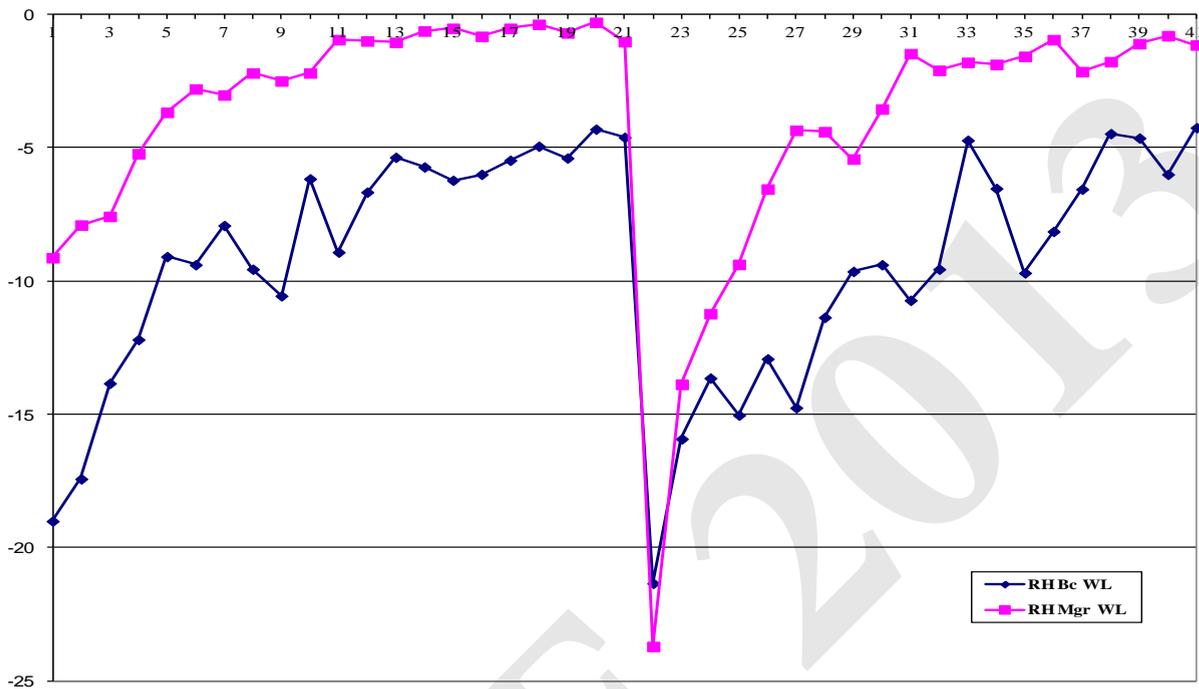

Fig. 3. Development of the average price across educational treatments

Table 1 summarizes the performance of both treatments in terms of income achieved in the pre-shock and post-shock phase and in terms of average welfare loss. If our educational hypothesis holds, it should be reflected in lower welfare loss achieved by well educated treatment.

Table 1. Income Development and Average Welfare Loss for the RH Mgr, NH Bc

Educational Treatments	RH Bc	RH Mgr
Pre-shock income	661.2778	785.875
Post-shock income	600,75	700.8
Total income	1262.028	1486.675
Welfare loss	-23.05%	-9.35%

If we compare the size of average welfare loss among treatments, welfare loss for RH Mgr is -23.05%, whereas for RH Bc is -9.35%. As a result, the difference in welfare loss about 15% speaks in favour of RH Mgr. This implies that well-educated treatment slightly eliminates tendency of subjects to move towards suboptimal outcomes. Still, the difference in the performance is not substantial in order to derive strong statements about educational effect. This is supported also by the total size of income gained, which is higher for well educated group, but not significantly. For both treatments reduction of income is present after implementation of the shock, which suggests that well-educated treatment was not able to cope with this change in the first period after the shock. However income for well-educated treatment is higher not only for the pre-shock, but also for the post-shock phase, which further supports partly our presumptions that individuals might be at least partly benefited due to the possession of economic knowledge.

5. Conclusion

Rising interest in economically educated public poses questions related to potential effects of economic education on achievement of optimum outcomes. We aimed to verify this educational hypothesis with help of the laboratory experiment. Results of our investigation are two-fold. Firstly, well educated subjects appeared to dominate mostly over low educated ones not only in more frequent selection of optimum prices and the size of rewards for the whole pre-shock and post-shock phase. The size of welfare loss speaks also in favor of well educated individuals, with the difference among treatments around 15%. Our second finding weakens our educational hypothesis. It appears that there is one exemption, when well educated subjects are indistinguishable in their performance with regards to low educated ones. Directly after the shock is imposed, individuals are not able to change their pricing strategy immediately and their performance is in the first moment comparable to the low educated individuals. Inability of well educated individuals to cope with the shock implies that the effect of economic education might not so straightforward as suggested. Additionally, the performance of well educated subjects is better but not distinctively in order to derive clear conclusions regarding educational effect. Our findings are similar to findings of Walstad and Rebeck (2002), which confirm that weak effect of economic education is the case. Possible explanation of the weak effect of economic education might lie in the fact that costs of economic education exceed benefits and economic knowledge is still rather formal even in case of well-educated individuals, which is in line with Stigler (1970) and Salemi (2005). Additionally, broader experimental sample could be desirable. Although our results are not strong enough in order to derive obvious implications, the presence of formal knowledge was weakened at least slightly by educational effect and well educated individuals exhibited better performance with regards to optimum outcomes. The existence of causal effect of economic education with respect to achievement of optimum outcomes raises several implications. It may contribute to better decision-making of individuals on markets with regards to financial matters and avoid possibility of suboptimal decisions. Further it may help to promote sustainable economic policies. However, further research on this issue is highly desirable in order to verify, whether educational effect really holds. This could support even further basic incentives of institutions to invest into economically educated public.

4th International Conference on New Horizons in Education

The classroom as an extension of our society: empowering students through technology in service learning to bridge the global digital divide

Rodica Neamtu*

Emmanuel College, 400 Fenway, Boston MA, 02115, USA

Abstract

The rapid development of our society created a number of social issues including the global digital divide which can be encountered on international, national and local levels. My papers discusses the role and importance of engaging students in discussing, understanding and contributing to the bridging of this gap using their information technology skills in a service learning experience to help people who don't have access to technology or the necessary computer skills to succeed in our society. Volunteering for 15 hours in centers like Julie's Family Planning, ABCD Parker Hill neighborhood center, Notre Dame Education Center, students experience firsthand the impact of the lack of technology skills and access to technology on various groups of people, and get a chance to help these people.

Students keep an online blog to record and reflect on the outcome, meaning and importance of their service learning activities, such as: teaching computer classes, designing curriculum, tutoring in computer skills, database entries and cleanup in offices computer upgrades. They share in their blogs the meaning and importance of engaging in service learning to solve social problems using their own technology education. This experience expands our classroom to engage and empower students to become active and responsible members of our society, while using their formal information technology education in a practical way.

Keywords: education, technology, social responsibility, engagement, social justice, global digital divide

1. Introduction

The rapid development of our society created a number of social issues including the global digital divide which can be encountered at international, national and local levels. My papers discusses the role and importance of engaging students in discussing, understanding and contributing to the bridging of this gap using their information technology skills in a service learning experience to help people who don't have access to technology or the necessary computer skills to succeed in our society. Volunteering for 15 hours in centers like Julie's Family Planning, ABCD Parker Hill Neighborhood Center, Notre Dame Education Center, students experience firsthand the impact of the lack of technological skills and access to technology on various groups of people, and get a chance to help these people.

Students keep an online blog to record and reflect on the outcome, meaning and importance of their service learning activities, such as: teaching computer classes, designing curriculum, tutoring in computer skills, data entries and maintenance and computer upgrades. They share in their blogs the meaning and importance of engaging in service learning to solve social problems using their own technological education. This experience expands our classroom to engage and empower students to become active and responsible members of our society, while using their formal information technology education in a practical way.

1.1 Background:

A few years ago, I was asked to teach a course called: Social Issues and Technology. The course was based on readings from Thomas Friedman's book: "The world is flat". The book is an eye-opener about the way the entire world has been transformed in the past ten years. Friedman defines ten "flatteners" and explains how they contributed to major changes in our global society. Predictably, information technology in its many facets shows up repeatedly among the flatteners of the world. A question begged: how can I best involve my students in understanding the depth of the transformation of our society as a result of the rapid development and implementation of technology?

In my experience, students in a liberal arts private institution are usually focused on a variety of fields, rarely on technology. They have very little understanding of the major role that technology has been playing for years now in redefining and reconfiguring the workforce and the global economy. I started designing this course around what I thought was the biggest challenge: showing my students the reality of a world impacted so dramatically by information technology.

The first few weeks were spent understanding what a flat world means and how it was created. During this time, students started to understand the role and impact that information technology has on our society. Learning about the global world and the process of outsourcing, students became aware of the new demands on the global workforce, the new challenges and opportunities.

One of the first social issues identified during the class discussions was the global digital divide. This is a concept that was approached and discussed in many different contexts by students, but mostly as a global issue. One of the particular aspects of the global digital divide, in my opinion, is that its globalism is anchored on its roots that are reaching deep in all societies, developed or not. When one says "global digital divide", most people think Africa, Middle East, or South America. Few people realize how far reaching inside our society this divide is.

One way to think of the global digital divide is as "the global disparities between developed and developing countries in regards to access to computing and information resources such as the Internet and the opportunities derived from such access". (Wikipedia) Unlike the traditional notion of the "digital divide" between social classes, the "global digital divide" is essentially a geographical one. The digital divide is "an economic inequality between groups, broadly construed, in terms of access to, use of, or knowledge of information and communication technologies. The divide inside countries (such as the digital divide in the United States) can refer to inequalities between individuals, households, businesses, and geographic areas at different socioeconomic and other demographic levels, while the Global digital divide designates countries as the units of analysis and examines the divide between developing and developed countries on an international scale". (Wikipedia)

I see this reality as one of the main social issues in the American society, and one that the younger generation needs to fully understand before they join the workforce.

1.2 Implementation:

It is my firm belief that the best way to understand a social issue and to be able to assess the impact that it has on the society is to immerse yourself in it. In order to do that, I decided to create my course as a service course, which means that as part of my class each student would have to volunteer a certain amount of time (15 hours per semester in this case) to use their technical skills to help people in need as an effort to understand and contribute to solving the problems caused by the digital divide.

The students performed service at three centers:

- ABCD Parker Hill Neighborhood Center
- Sisters of Notre Dame Education Center
- Julie's Family Planning

The service was planned and organized in such way that students would be able to provide assistance in these centers in various ways:

- In-class tutoring: all centers provided computer literacy classes to their clients at various levels. My students were able to help the instructors set up the computers with the proper software, help students learn how to use productivity and educational software.
- Computer setup and maintenance – all centers were very understaffed with IT personnel – the computers are in their vast majority outdated, infected with malware and adware, in great need of “cleaning” and defragmentation.
- One-on-one tutoring for people whose skills were so deficient that they could not even participate in a beginner level computer literacy class.
- Cyber-café help for people who had certain computer skills and were interested in learning skills that were not being taught at that time in the computer classes offered in the centers.
- Curriculum design and implementation –the students were asked participate in the assessment of classroom materials and update/improve them.
- Data entry – students were asked to help out a lot in the offices, as most of the staff was behind in inputting data in the various systems. Ultimately, not being able to input the data had a negative impact on being able to properly get and use the right resources to help their clients.
- Design, maintain and use spreadsheets and databases in the offices to help staff better keep track of clients and resources.
- Training staff in using the various programs and applications that the centers had available.

The students had the option to decide which center they wanted to work with, best match their computer skills with the needs of the centers and people they were working with. One of the most sought after skill was the combination of foreign languages speaking (Spanish in particular) and the ability to tutor people in computer literacy issues.

The students enrolled in my service learning course came from various backgrounds themselves and were at various levels of computer fluency:

- some of the students had a very thorough computer science education, as they were completing individualized majors or minors in information technology;
- other students were participating in this class as part of their sociology or global studies education, but had very little formal education with computers themselves;
- other students were just interested in the combination of social and technology aspects as they were heading out to start working, as seniors in college;

The bottom line is that no matter what level of computer education they were at, they were all astonished by the low-level of proficiency with information technology they encountered in these centers, both in regards to the clients of the centers, and their staff.

Before the service component of the course started (week 4 of the class), we arranged for visits to all centers and meetings with the centers managers so we better understand what kind of computer skills they needed. Lists of necessary tasks to be performed, staff and clients to work with, and schedules were compiled. The students had to sign up in advance for the hours and tasks they were going to perform and became responsible for their completion.

In order to prepare them for the experience in the centers, we approached the issue of the digital divide on many levels:

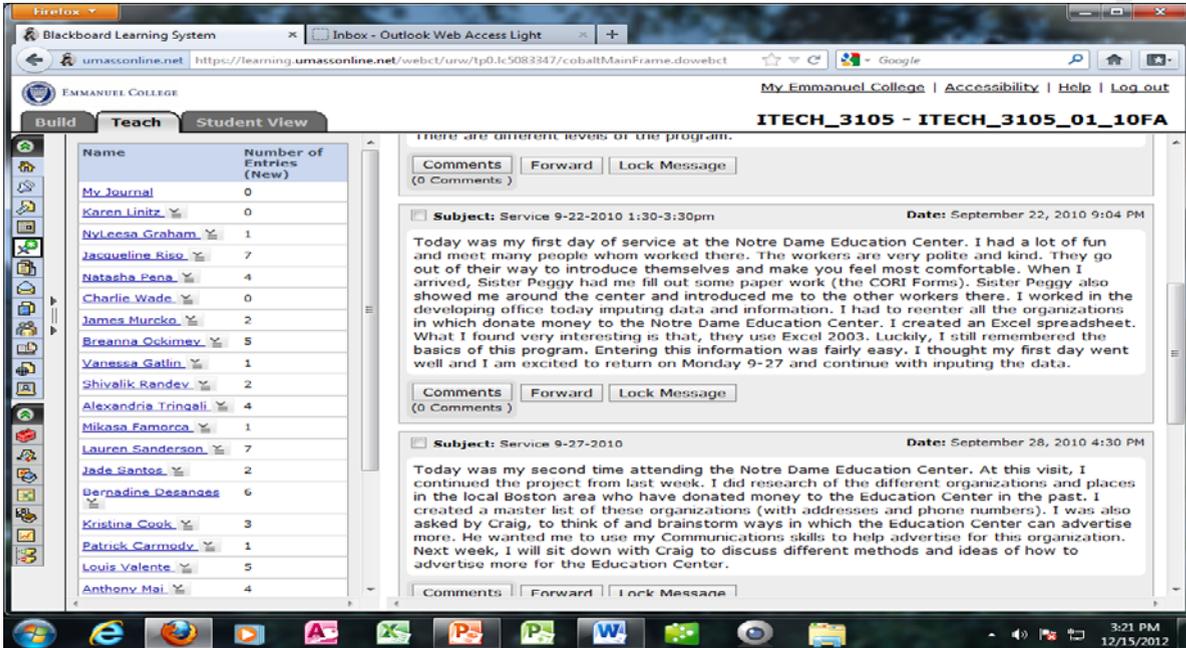

- We defined, discussed and analyzed the digital divide in a global and local context. We researched the many facets of the digital divide and became acquainted with the different projects and efforts made by individuals and organizations to bridge the digital divide.
- We compiled a list of the skills needed to perform the various tasks in the centers.
- During class time, IT skills were reviewed, updated or taught, as necessary.
- Each student created and maintained throughout the semester an individual blog to accomplish the following:
 - Keep track of all the tasks they had to perform and the activities they were engaged in;
 - Record their observations about the digital divide created by inadequate computer skills and the impact this had on people's lives and careers;
 - Describe how they solved the problems they faced or get the help of the class if their skills were not enough at the time to address the issue;
 - Reflect on the impact of technology on different groups of our society;
 - Reflect on their experience in the centers in general and the impact that this has on their education and future careers.
- The blogs were maintained on a weekly basis, and discussed as a group in class.

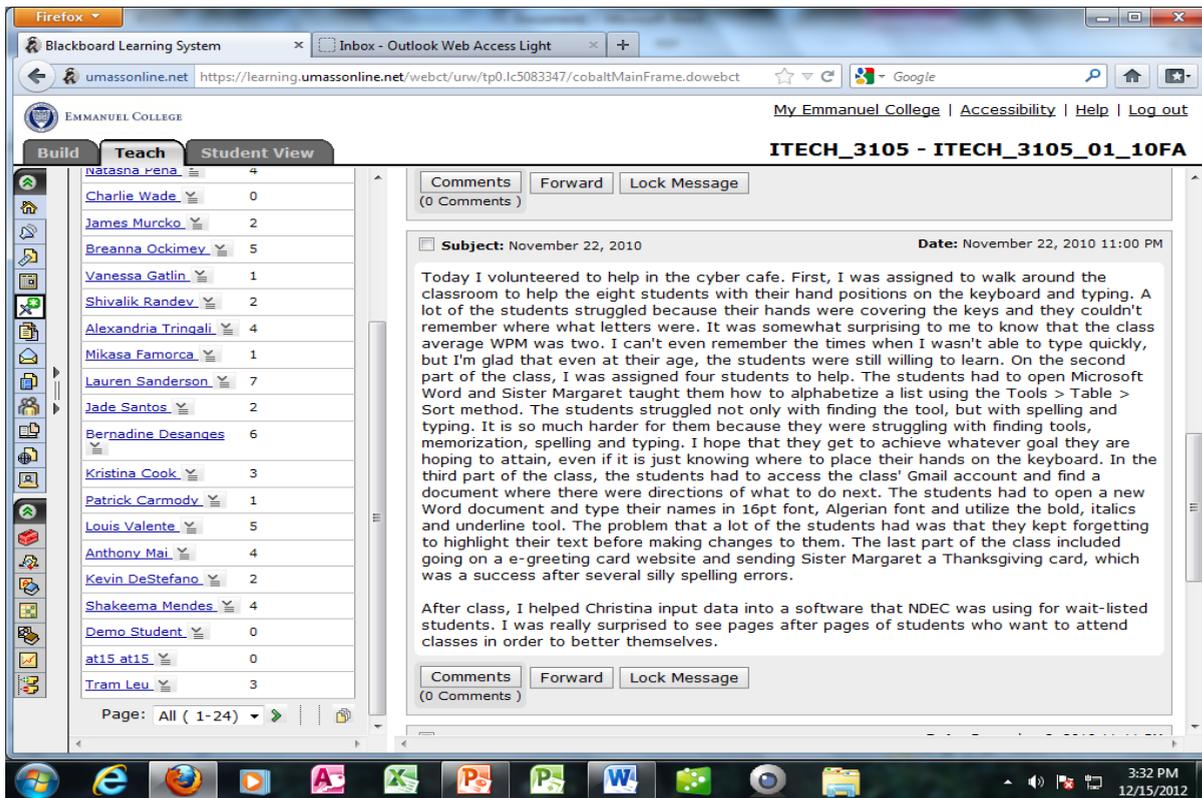

In the next section, I will try to give an appreciation of the kind of experiences students had and shared with me and with each other, by showcasing some of the entries in the online blogs.

1.3 Work showcase

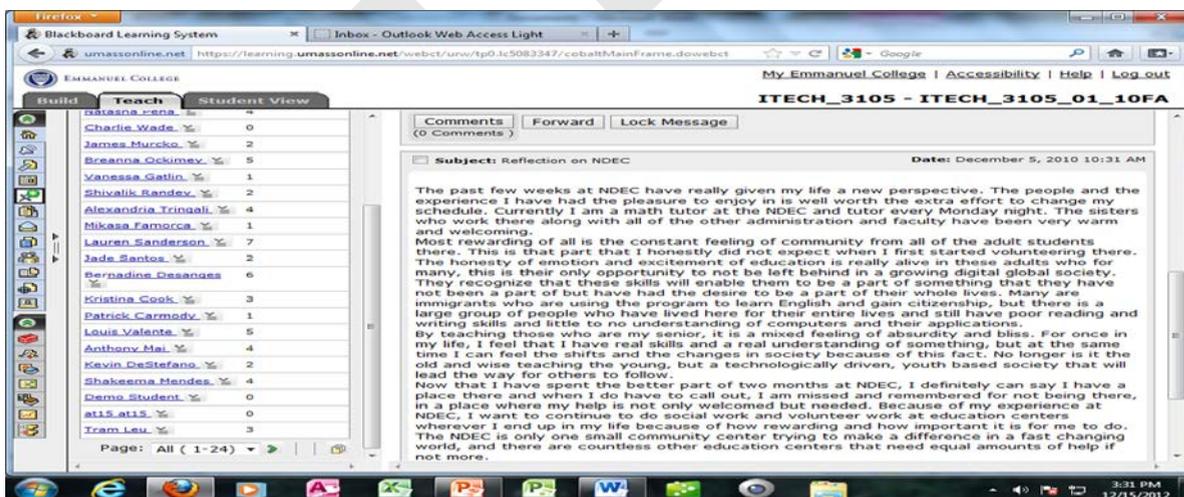

The blogs were created using Blackboard Vista, a course management software that has a component dedicated to online discussions and blogs. The students engaged both in online public discussions and in private blog entries, sharing their thoughts, their experiences, their struggles, asking each other for help when their own expertise with computers and technology was not enough to solve a problem, expressing their surprise and disbelief that this divide is present geographically within one mile of the school where they are enrolled and so close to some of the most affluent and technically advanced areas in the world: the metro Boston area.

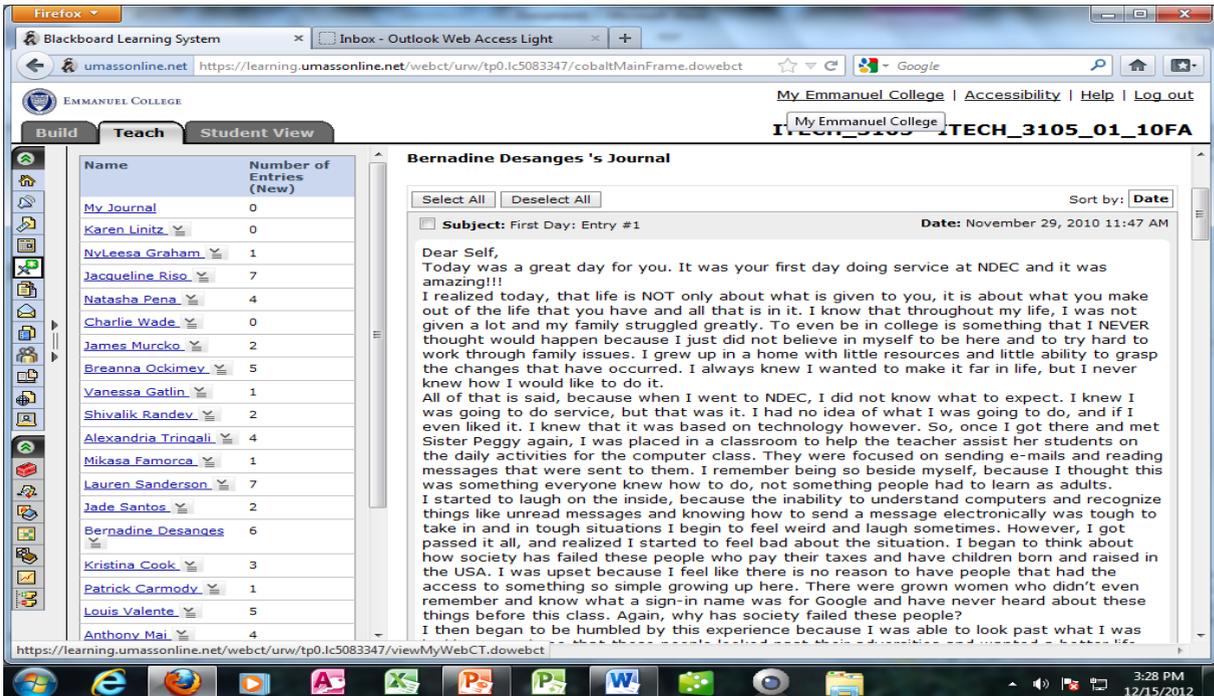

Here are a few “first entries” in private blogs, describing the initial encounters of my students with staff and clients of the centers:

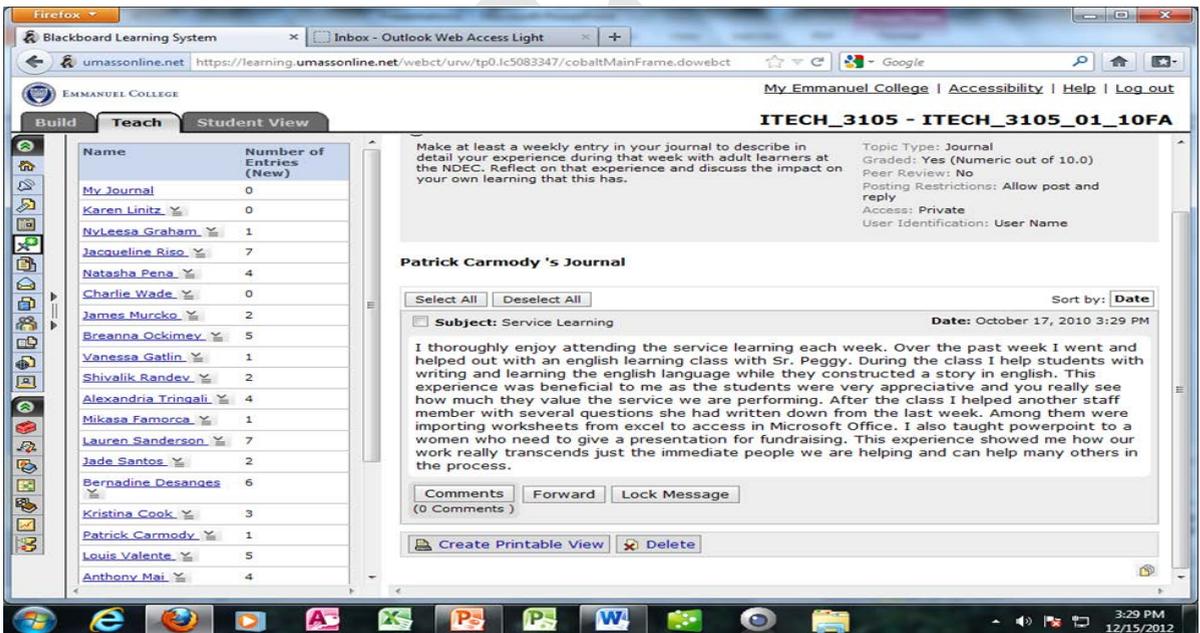

One of the most interesting aspects of this “experiment” was to watch the transformation of my students – the process of reflecting on their own social status, on their own education and future. Some of these students came from very privileged backgrounds, others didn’t. Here are two very different perspectives:

Some of the entries were purely “operational”, making sure that students keep track of the activities they perform and they understand what it takes to run a center like this and what kind of IT expertise is needed and often unavailable to workers in those offices:

address, city, state, zip, phone number, and email and learn how to utilize the correct capitalization and symbols necessary for formatting. I think most people were good with this except for some who forgot a capital here and there, and didn't realize how to enter onto the next line. I also found some mix up when you say "backspace" and "space" as well as "space" and "enter" so I have been trying to speak more slowly. There also was another student from BU in the class that was also helping, but just one gentleman that was new to the class.

After we completed the formatting, she had us show them how to copy and paste it on the page. And then we went to Google and showed them the Mass Gov site and the different resources that are available there. Like finding a job, or registering to vote. I think this was good because that one website had so much available to them from their own state. This was a good exercise to me too because I am not really familiar with the site because I am not a resident of Massachusetts, and have not really used the site.

Overall, I really liked the environment of the internet cafe because I felt like it was dictated more properly and clearly to the students and they were more engaged in the topics. However, you can tell that unlike the ESOL courses sometimes they may have less technical skills of being able to type properly or being able to use the mouse simultaneously, which you would think sometimes would be the other way around. Also, I thought it was crazy that this gentleman in the class, clearly educated I think he was wearing a college sweatshirt on, and had the mass accent, but just was there to develop computer skills. He actually brought in his laptop that he purchased, and said 'I just want to be able to use the thing' it was brand new, and he really did not even know how to turn it on. Therefore, even a person that could have the resources available to them might need the proper training to be able to use it. It definitely is feeling like a more rewarding process and it opens so much knowledge to them.

Today was our second day back to the ESOL 3 course at the NDEC Center. I really feel comfortable there now and Sister Peggy is great, it is nice to walk in and chat with her right before she starts class. Today's great because I was able to see what the students did this

My first service hours I completed were at ABCD about two weeks ago. When I arrived they informed me that due to legal issues they could not have me doing specific tasks. Instead they had me go through there picture files on a specific computer and move any I thought were bad quality or repeats into another folder. From there they would review them and delete to make more room on the computer. I did not post a journal afterwards because I did not feel there was much to my experience and that it did not impact me in my learning. After leaving ABCD, I was excited to start at NDEC, which I started this past week. I was excited because I wanted to get as much as I could from volunteering and I felt a bit useless just moving pictures into another folder.

When I arrived at NDEC with Amanda, they informed us that we would be helping out in their cyber café class for the afternoon. There were 5 students for that afternoon and the teacher had a small to do list for the day. The teacher then put Amanda on one side of the room and me on the other. That way we could help out both sides without having to go back and forth. I thought it was going to be a piece of cake being that the to do list seemed simple enough and I only had to help three students. This list consisted of opening a word document, change font, change size, underline, bold, copy and paste. But it ended up being much more difficult than I expected. The simplest things we take for granite like changing fonts, took these individuals almost two hours to complete. We talk in class about how people don't know how to do simple things like these on a computer but I don't think it sunk in completely till I went to this cyber café. It has definitely made me think much more about our class discussions and how the world is flat but still not completely. Yes we are all on an even playing field and people have easier access to these resources, like the computer class. But not everyone is able to perform as evenly as one would expect by generalizing the whole world as flat.

Overall, I enjoyed my experience working with the individuals at NDEC and I am excited to continue going to their cyber café and see how it changes week to week.

1.4 Conclusion

There were several goals to this class experiment:

- Understanding what the digital divide is and how it affects our society;
- Witnessing first-hand the impact of the digital divide on people's lives and careers;
- Taking an active role in understanding and helping with the social issues created by the digital divide;
- Gaining a deeper understanding of the society they live in and taking responsibility for contributing to the well-being of this society;
- Participating in a journey of self-discovery by reflecting onto the experience of meeting, working and helping people who are "victims" of the digital divide;
- Opening their minds to future engagement and work, to becoming responsible citizens.

In the end of the semester, we had several class discussions to evaluate the outcomes and importance of this service learning course. The overwhelming feeling was that students felt much more connected and engaged in this class than their other classes. They felt part of the society and part of the solution to social issues caused by the rapid implementation of technology. More than anything, they felt empowered by their computer education to help others and to understand other segments of our society.

Through this experiment, we extended our classroom out in the world, became integral part of the society, experienced first-hand social issues created by technology and put computer skills to good use to help people in need.

I received several notes expressing the gratitude of the people involved with the three centers. They all spoke very highly of the students who used their time to assist in the classrooms, office and cyber cafés.

Most importantly, many students received individual notes from the people they helped, clients of these centers, people whose lives were transformed by their newly acquired ability to use computers and technology to get jobs and interact with various governmental agencies. This gave my students a boost to realize how important anyone's work is for the benefit of the society and how rewarding could be to help others and see them succeed.

As a new generation joining the workforce in this global society, they have now not only a deeper understanding, but the ability to empathize and the desire to help bridge this digital divide that ultimately affects everyone.

Most important, we became a little community of people trying to help solve a big issue. Most of the students expressed their deep gratitude for being involved in a program like this, for having an opportunity to use their skills to help people in need, and for getting a chance to feel help like valuable members of the society. They continued to serve in these centers beyond the required 15 hours and long after the semester ended.

The comparison of methods used for oud education in Turkish music

Ferdi Koç*

University of Sakarya, State Conservatory, Department of Turkish Music, Esentepe Campus, Serdivan, Sakarya 54187, Turkey

Abstract

Compering of Oud Methods in Oud Instrument's Education of Turkish Music In Turkish music has both voice and instrumental basis, but specifications of instrumental basis has different significancies. In this regard, as being used an instrument of traditional Turkish Music, Oud is an important role in terms of performing. It is important that interplaying between Oud performances in Turkish music and other musical genres which is coming from centuries. People who wanted to know playing Oud with effects of different cultures and geographies made up new methodologies. Here, musical abilities such as ear training and finger techniques has primary role at instrumental performance. In additional, teacher and methods that are make of used are great effect on learning Oud performance. Nowadays, methods are being used for Oud education at institutes such as conservatories and music divisions. In 1910, first Oud method was written by Udi Hoca Ali Salahi Bey in the end of the Ottoman era. After that, method writing custom was spread. The custom are kept by Şerif Muhiddin Targan, Kadri Şençalar, Cinuçen Tanrıkorur, Mutlu Torun, Onur Akdoğu ve Gülçin Yahya Kaçar. In all of this methods; preferences of the writer' musical abilites, knowledge, performing specifications/choices can be seen. In this paper, how current Oud methods are useful and how methods increase performing specifications for students will be comparatively gone over.

Keywords: oud, oud education, oud method, turkish music, music instrument education

1. Introduction

Art of music has always been in the centre of mankind's wordly and other wordly life. In İslam geography it has played an important role from the ezan which is sang in the birth of mankind to the sala which is sang in death of a person. In performing music humanbeings used his voice first. Musicologists accepted human voice as the most perfect instrument. Later, mankind invented instruments.

In the world when compared to other types of music, Turkish music has a different place with the effects of its sound intervals, traditions and the geography in which it appeared. Turkish music depending on its rhythmic and the instruments used has attracted the greatest attention in eastern music category. So the importance of the voice and the instrument performace of Turkish music can't be denied. This has shown the importance of Turkish music education. Since the beginning of Turkish history, Turkish music has used modern music education

E-mail address: fkoc@sakarya.edu.tr

methods together with ‘meşk’ known as traditional music education. In voice and instrument education, traditional method includes listening and repeating while modern method includes listening, repeating, comparing, analyzing and more.

In this context in our article we are going to compare the oud education methods.

2. A Brief History of The Oud

The Arabic origin Oud takes its name from an agalloch tree called el-oud. Turks transformed the word ‘‘Oud’’ to ‘‘Ud’’ in accordance with their language structure. Westerners met this instrument during the Crusades between 11th and 13th centuries and they named it ‘‘lute in English’’ ‘‘luth in French’’ ‘‘laute in German’’ ‘‘liuto in Italian’’. Çinuçen Tanrıkorur stated that although it is an Arabic origin word that does not mean it is an Arabic instrument and he supported his idea with this statement: ‘‘Arabs saw this instrument for the first time in seventh century in Baghdad while turks were playing it who came from khorassan, the main body of the instrument was made of agalloch tree; that's why it was called el-oud, in illetarete period for the arabs who didnt know any other instruments than def and rebab this was an instrument similar to Turkish kopuz Turks had been using since huns.(Tanrıkorur, 2001:176).

In Turkish culture and history there can be found written resources about oud dating back to Uigur civilization. According to the Wang Yeri-Tü's records, a ruler of Uygur civilization, which is accepted as one of the most important resources of that time written in 981, kopuz and oud is an instrument which turks always used to carry with them wherever they went. In *Ravzatlü's- Safa* it is stated that in Horasan during the first immigration the instrumentalists playing ud had an important place in the society. And in the same work, it is explained that the name ‘‘ud’’ was used for the first time during by Muhammed İbn-Harezmi (Gazimihal, 1975: 29). In the Works of El-Kindi, Farabi and Harezmi which were written in 9th and 10th centuries, important information about ud is available. In the same works, how to accord and perform ud and its effect on people are mentioned. Besides, ud is used as a music theory's instrument.

In Selçuklu and Ottoman states Turk İslam musicologists started to write music edvar and risale making use of the resources of the works of ancient Greek musicologists such as Pythagoras, Aristotle and Euclid. In El-Kindi's music books, it is written that Oud belongs to Prophet Adam's 6th generation Lamech, its cord length must be 30 fingers' length (about 35 cm) and its width must be a third of its cord length, it is named as ‘‘Melikül-Alat’’ which means the king of instruments and it is used as a theory instrument (Turabi, 1996: 69-70). In the 10th century, Farabi gave information about how the Oud and kanun were invented and how to accord and perform them in his work of *Kitabül-Musical-Kebir* (Jebrini, 1995: 162-163). In 13th century Safiyuddin Urmevi in his work named *Kitabül-Edvar* studied Oud in three parts; accord styles, arrangement of cords and producing sounds and made use of Oud to talk about the music theory (Uygun, 1999: 214, 224). In the 11th century Ibn Sina explained Oud in his book *Eş-Shifa, Cevamül-musiki* part, 6th article, 2nd section. There can be found information about the structure of Oud and its music pitches calculation in this work (Turabi, 2004: 108, 117). In the 15th century in *Jamiül-Elhan* of Abdülkadir Meragi, analyzed Oud and Oud-like instruments (Oud-I Kadim, Oud-I Kamil, *Tuhfetül-Oud, Pipa and Shahrud*) in terms of structure and performance and he showed the oud plectrum using techniques and ‘‘Terjiat’’ (Sezikli, 2011: 235-252). In Fatih Sultan Mehmet's Palace, the information in *Nekavetül-Edvar* which was written by Udi Abdülaziz, The Son of Meragi are similar to those in his father, Meragi's work (Koç, 2010: 46, 50). From the end of 15th century to 19th, Oud's position in music was almost replaced by tanbur and ney (Tanrıkorur, 2001: 189). That's highly because Ottomans liked tanbur and ney and the effect of spread of ‘‘Mevlevilik’’.

At the end of 19th, Udi Violinist Şakir Pasha made the Oud gain the deserved the value and added it the 6th sore spot. Since this term, Cinuçen Tanrıkörur categorizes Oud instrumentalists into three; classic, fantasist-innovative and marketable style (Tanrıkörur, 2001:189). We can see all the performers from Nevres Bey up to Sherif İçli as the representatives of classical style. Performers of this style follow the way of Tanburi Cemil Bey. The latest representatives of this style have been Cahit Gözkan, Cinuçen Tanrıkörur, Osman Nuri Özpekeli, Necati Çelik and Samim Karaca. The representatives of fantasist-innovative style are Sherif Muhittin Targan, Yorgo Bacanos, Bayram Coşkun who is in search of different styles, Münir Nurettin Beken, Mehmet Emin Bitmez and Yurdal Tokcan. Oud performers of popular style are Selanikli Ahmet, Kadri Şençalar. Their performance is under the effect of arabesque music which is played in night-clubs. According to Cinuçen Tanrıkörur, the most successful Oud performer of the 20th century is Yorgo Bacanos (Tanrıkörur, 2001). The performance feature of Bacanos is that his right hand can get the sound of “anvil-hammer” sound from the cord and he can use the traditional performance and virtuosity skillfully.

3. Oud Methods

In Turkish Music; the need to write methods with high efficiency levels in order to grow good performers in Oud instrument is occupied after Turkish Music part has been departed from Darü'l-Elhan in 1924. For this reason there has been a breakdown in the system of meshk that adopts a line of conduct the style of transforming master to student and there has been deficiencies in Oud training. In 1974 with the establishment of Turkish Music Conservatory and the other conservatories; some Oud method and learning ways have began to be written. Turkish Music and Oud training between 1924-1974 have been by the help of personal effort and civil establishments. Oud methods which are published in Turkish music history are generally written to gain main technical performance skill. Any methods are written in order to advanced technical performance but, some records and writings that teachers wrote for their special students are used as methods. At this point oud performers can be seen unlucky up to western music instrumentalists but may be lucky up to the other Turkish music instrumentalists. Student who wants to take Oud training must have a very good music hearing because Oud is a pitchness instrument and he/she have to be patient, hard working and have to take lessons from a master who has already trained with traditional performance school. These are the desirable elements for Oud training and without these elements following a method may be thought as useless.

3.1. *Ali Salâhi Bey's Oud Method*

In Turkish music history the first pressed Oud method was written by Udî Ali Salahi Bey by name of “Learning of Oud Method Without Teacher” in 1910. This method was published again with the added studies by name “Oud Teacher with Bound Insert” in 1924. (Targan, 1995:1) In this method simply presentation of Oud, how to hold it, plectrum technic, open string and position studies have took place.

3.2. *Kadri Şençalar's Oud Method*

Kadri Şençalar, after telling the short Turkish music history; says that his main goal for writing Oud method is to teach the youngs in conservatories and radios who wants to learn Oud instrument and also educate them as experts on their instruments. While preparing this method Kadri Şençalar has profitted from notes of Sherif Muhittin Targan's students Cemil Beşir, Ali Salahi, Fahri Kopuz and Sadettin Arel. Method is consisted of three parts and in the 1st chapter the short history of Oud, 2nd chapter the effect of Oud in human being and legendary stories about Oud, information about production and in the 3rd chapter it has been mentioned about scales. Also in all of the three chapters 50 etudes are existed. In these etudes there are open string etudes, finger

etudes and maqamic etudes. At the end of the 3rd chapter Kadri Şençalar has given some of peşrev, saz semaisi, şarkı and taksim notes (Şençalar, 1978).

3.3. Şerif Muhittin Targan's Oud Method

This Oud method is published by Zeki Yılmaz by combining manuscript notes of Şerif Muhittin Targan. Method is consisted of the manuscript notes of Şerif Muhittin Targan between years of 1919-1956. It is composed of three chapters: In the 1st and 2nd chapter information about Oud training and etudes and in the 3rd chapter it has been placed to information about Targan's own style and compositions. In the first chapter it has been mentioned chord, positions, plectrum beats of Oud and etudes related to these units. In the third chapter, Targan, who is also a master violoncellist and has very well information about western music area, tries to teach his style –near to western music- with his own compositions. (Targan, 1995).

3.4. Cinuçen Tanrıkorur's Oud Method

This Oud method wasn't published but the students of Tanrıkorur has made copies for distribution of his own manuscripts. It consisted of 1 to 190th etudes. In 1 to 60th there are string etudes, 60th to 190 there are maqams and the other pitches which are hardly performed. Tanrıkorur has betrayed his own musical terms such as s: means that finger will be in stable finger position, k: shows that the pitch which is in different column must be hold without raising finger. The position numbers are shown with the roman numbers that are written at the beginning of the scale (Tanrıkorur, Unpublished Oud Method).

3.5. Mutlu Torun's Oud Method

Mutlu Torun has prepared this method while he was giving lessons in conservatory. He say that this method especially has been written to make cleanly the voices' pitches. This method consists of information of Oud's structure, tuning, string wiring, maintenance and etudes in three chapters. In the first chapter technics of plectrum, open string etudes and position etudes, main column etude, In the second chapter side columns, In the third chapter style, nuance, modulation and taksim (Torun, 1993).

3.6. Onur Akdoğu's Oud Method

Onur Akdoğu has written his method in the form two books. He wrote second book in memory of Şerif Muhittin Targan. The First Book includes six chapter, The Second Book includes eleven chapter and instrumental compositions. In. The first chapter of first book The history of Oud and the prior knowledge of oud are allocated. 2, 3, 4, 5 and 6th chapter include plectrum technics, position, maqamic and same sound etudes. In the second book, it has been showed the maqams's common and separated using according to 1, 2 3. and the other positions. It also has been described the position's using from 7th position till 12th position by means of etudes for virtuosity (Akdoğu, 1992).

3.7. Gülçin Yahya's Oud Method

In this method Yahya has been addressing to wide music community and aiming at training without the turkish music's style. The method consists of five chapters. it is allocated general informations, seat, holding of oud, concept of position and open string etudes related to oud in first chapter; the position's introduction, main columns, maqam knowledges and the etudes of first position in second chapter; second position, side columns and the using of first and second position together in third chapter; the various performance technics and

enrichments in fourth chapter; the application of performance technics that is trained on the Works in the fifth chapter. In addition to this method, Gülçin Yahya's the book called "Oud Etudes" covering all technics was published (Yahya, 2001).

4. The Comparison of Oud Methods

The comparison of methods which we have advertised above will be done by caring of many points. All of the writers which we have take in hand their methods are master on their instruments and oud performers who knows Turkish music both theoretically and practically. While comparing methods; it has been taken into consideration that the style and tradition of method writer, the technic of using plectrum, positions, and nuances, his virtuosity, agility and feasibility of his technic by students.

4.1. The Comparison of Methods in Terms of Holding and Using Technic of Plectrum

The purpose of holding plectrum in performance of Oud is to achieve clear and fine sound. The level of treble and lowness of sound, its nuances and impetus must be worked through with plectrum. When the methods have been compared according to holding plectrum and technic of usage, it has been understood from his own studies that Targan uses agility frequently and he uses plectrum softly and perfectly. His interest to western music is affective in this situation. Sometimes guitar style can be seen in his plectrum usage. He has used bottom-above plectrum expertly and showed it in his studies. Students which have difficulties using plectrum fastly must use the plectrum exercises in Targan method (Yıldız, 2005:39). In Şençalar, it has been heard hard usage of plectrum and this is seen in study performances. Plectrum exercises of Targan and Şençalar resemble to each other. In Oud plectrum we can hear the traditional plectrum technic and exercises in Tanrıkorur's method. In this performance style, classic ambience of Oud and the style that is near to Tanbur can be seen in study performances. Tanrıkorur has used plectrum above-bottom up to the notes and done the performances with tremolo (Yıldız, 2005:41). Torun, Yahya and Akdoğu's methods resemble to each other because of usage of plectrum technics and sameness of their working conditions.

4.2. The Comparison of Methods in Terms of Using Position

Oud's usage of position area is substantially wide. In this 3,5 octave instrument, from one double string there can be achieved sound with 19 positions. Clear and fine sounds are possible with first 7 positions. Targan's skill about using these 19 positions is admirable by musical environment. This is observed in his compositions such as "Running /Runner Children" and "Caprice". For this reason, Targan's position studies are fairly difficult according to other methods and persons whose perform Targan's position studies are admitted as command of oud positions completely. In Şençalar method, position studies are not complex as Targan's. Şençalar has found sufficient only 7 positions. (Yıldız, 2005:45) Tanrıkorur has written his studies and made usage of positions considering agility, style and traditional performance. In his method he used 7 position too and has showed the other positions as nuances. Yahya, Torun and Akdoğu's position studies resemble Tanrıkorur's technic. It has to be carefully about the usage of maqams as Hüzam, Saba which are performed hardly. The desirable sounds cannot be corresponded in every position. The persons that follow Tanrıkorur's method have written methods considering this. It is very important to use positions in Oud training. It is so hard to get an oud performance better which begins with a wrong position. Style and interpretations of performers may cause differences in usage of positions. On the way of student to be a good Oud performer, every performer creates his own position technic and he makes his own.

4.3. The Comparing Methods in Terms of Oud Style

When we compare the methods in terms of oud style, we see that Udi'(Oud performer)s style reflects to methods after main studies. It may be thought that studies in Targan's oud method are prepared about virtuosity after the main education. Although Targan is a very good performer, because of his western music education; his style is lack of traditionalism. This is so natural. His virtuosity is reflected to his method but spirit of maqams are thought to be as deficient. This method is not demanded for traditional oud performers because of Targan's style. Targan appropriated soloist performance, had'nt participated collective performance and avoided from performing traditional maqams as saba and hüzzam (Yıldız, 2005:42). In his studies he has mostly used his own compositions. Because of the reason Şençalar performed his instrument in places as casino ,his own style of identity is not clear. In Tanrıkorur's method soloist performance is came out but he has a traditional special style. The missed style which is near to tambur is seen in Tanrıkorur's method. Tanrıkorur is known with his resitals and he does not participate to collactive performances. He has used the traditional Ud style expertly in his method. However Torun has used his own style in his method other than Targan and Tanrıkorur. In consequence of Akdoğu is a good researcher other than being a good oud performer, his style is not clear in his method. But Yahya shows in her method that she follows the trace of Tanrıkorur.

5. Conclusion

In this research, oud methods have been analyzed and compared. As the method of Oud performer Hoca Ali Salahi Bey is quite simple we haven't been in need of comparing it with the others. Actually Oud methods are categorized in two groups. In the first category Targan, Şençalar and Akdoğu methods are close and similar. As for second category Tanrıkorur, Torun and Yahya methods are close and similar. When the studies compared, the western music effect on the first category and the traditional effects on the second category are highly seen. But the common feature of all methods is that in some parts they initially involve an introduction of Oud, a short story of it and the technique of plectrum then they give information about open string and position studies. One of the most important requirement of Oud training is having a musical ability inherently and the other is the work discipline. That is, the higher the capability the higher the contribution of the educator, the work discipline of the pupil, the school or the methods. Besides, together with the contribution of methods, for Oud student listening to skillful Oud performers will make a major contribution to his self-improvement.

Abstract

This article deals with various ways of formation of the students' professional motivation for a successful professional activity. Modern labour market requires a new concept of professional training of specialists, based on close cooperation with the education institutions as a response to more socially organised production and business.

The article carries out diagnostics of professional-cognitive interest of students of higher educational of Latvia. These results lead to major conclusion, that when a student is aware of a public use of his future profession and when he has all the needed skills and tools, he shows a profound interest and motivation for his field of study and is able to address potential physical and moral difficulties.

Key words: successful professional activity, professional motivation, and conditions of motivation forming, higher education.

1. Main text

INTRODUCTION

This article proves the necessity and deals with various ways of formation of the student's professional motivation for a successful professional activity.

The problem. Modern labor market requires a new concept of professional training of specialists, based on close cooperation with the education market as a response to more socially organised production and business.

* Tel.: (+371)26008383; fax: (+371) 67241591.

Nowadays, higher sense of responsibility and initiative to learn and use acquired knowledge in new contexts are key conditions for professional and career growth.

In the actual context of harsh competition at the labour market, high professional education is a fundamental part of the entire system of continuous professional education. Professional motivation of a student is an important factor for competitiveness. This problem is amplified in a context of systemic social crisis, as the lack of social protection and economic instability destroys the personal integrity.

Therefore, we consider the education, and especially lifelong learning to be a key factor in improving employment even in time of crisis. Rapid changes in economic environment affecting each economic sector need a constant update of skills, in addition to accumulation of knowledge[†].

The way students choose their university specialization might not be subject of mature reflection and might often be independent of the future profession they want to have.

Therefore, formation of professional motivation requires more supervision, management and intensification.

A critical analysis of conceptual approaches to motivation training identified the following requirements[‡]:

- a) the need to monitor the motivation of students
- b) identification of characteristics of motivated students
- c) the creation of conditions that would facilitate the transfer of external motivation into the

internal one. Implementation of these requirements is an important component to create a motivation mechanism during the professional training of future entrepreneurs. Educational Activity Motivation is a complex system that has both objective and subjective features.

The major features are these: independence, personal development, education, social interaction, and professional activity.

This means that any activity of the student includes a projection of the corresponding subsystems. Domination of each of these subsystems leads not only to a violation of the balance between them, but also to significant distortions in the future.

[‡] Hanson E. Marc, *Educational Administration and Organizational Behavior* /Boston, MA: Allyn & Bacon, - 2003. – 384 p.

At the same time, the study period is specific as the main (system-forming) factor (for objective reasons) is the professional formation. Therefore, professional development should provide synchronization, mutual indemnifications, complementarities of all other system components.

The aim of the article is a systemic-structural analysis of the conceptual bases of professional motivation formation and self-determination of students as a basis of competitiveness in the labour market.

To understand the formation of professional motivation, it is necessary to analyse the structure of motivation first. Academic work shows that motivation includes all kinds of motives, namely, needs, interests, goals and preferences. Motivation is the basis of any human behaviour improving the performance. Moreover, motivation puts motives of human behaviour in practice as well as it stimulates one's activities. Shortly, it is an internal, individual personal process behind all behaviour and choices of a person, that is, makes him behave in a particular situation in a certain way. Understanding the motivation process helps also much better understand the person himself and behaviour of others.

Motivation formation needs to consider the following conditions:

1. Social-economic system must be open to human potential and be able to develop it
2. People should be aware that they must faithfully and effectively carry out their work
3. Creative approach to work determines the efficiency of the organization

Motivation is a key factor in education where it influences the study results and achievements. Existing research shows that if students are aware of the usefulness of their professional training, they find themselves motivated to improve results of their achievements[§]. Realizing the real usefulness help students therefore deeper concentrate on their studies as well as increases the level of social activity and has an effective impact on motivation.

Professional motivation as a feature of individual character is a system of goals and needs that motivate student to acquire new knowledge and skills and form a conscious attitude to the profession^{**}.

Furthermore, professional motivation plays the role of compensatory factor. It is particularly visible on an example of a student whose abilities are insufficiently developed but he disposes of a strong professional motivation. This student can achieve more than a very capable student who lacks professional motivation.

[§] Lisovets, N.M. Professional motivation of students as a way of activating learning [electronic resource] / N.M. Lisovets. - Mode of access:<http://www.masters.donntu.edu.ua/2012/iem/temnenko/library/article5.htm>.

^{**} Pinska, O. Professional motivation as a means of improving the efficiency of learning activities students / O. Pinska // Problems of employment and vocational training. - 2009. - Issue 14. - P. 111-115.

Therefore, purposeful formation of professional motivation of students is one of the priority tasks of high school.

In order to determine the professional motivation formation, the case of Professional Higher Education in Latvia will be analyzed using diagnostics of professional-cognitive interest methods. Object of this article are students of first and fourth year of professional Bachelor degree^{††}.

The sample of first year and fourth year of Bachelor degree year students at university is not random. While during the first year, the professional motivation reflects the motives that lead the student continue in the Master Degree with respect to his future profession, in the last year, students start thinking about themselves as of subjects of future professional activity. This show to what extend the issue of professional motivation is important.

The main hypothesis stipulates that professional motivation of students is being formed during the whole duration of training, that is during the four years when a student is to learn the major disciplines of his field and get some practise. This process, influence of course also the vision of the future profession.

A complex of diagnostic methods used in the study consisted of methods aimed at identifying the components of professional motivation^{††}. Structural components of professional motivation are based on two criteria: professional orientation and value orientation. Professional orientation was studied using a modified questionnaire «Cards interests» from E.Rogov and a questionnaire on «Level of awareness about the future profession»^{§§}.

Diagnostics of Value orientation is based on Rokeach's «Value orientation»^{***}, and Sopov's «Morphological test values»^{†††}. The results of the study are presented in table 1.

On average, 44, 27% students in their first year of studies show enough of interest for the study field and that even the practical experience within that field. Corresponding to these criteria, the study field «Business Administration» shows the highest percentage rate (47,5%). We explain these figures by the fact that students of Business Administration have ambitions to create their own business.

^{††} The Latvian higher education system is part of the Bologna process, and, correspondingly, follows the so-called 3-cycle system, where the 1st cycle includes an academic (3 years) or professional (4 years) Bachelor degree, the 2nd cycle includes an academic or professional Master degree and the 3rd cycle includes the Doctoral degree.

^{††} Bodalev A. General psychodiagnostics. / A. Bodalev, V. Stolin. - St. Petersburg. Rech, 2000. – 438 p.

^{§§} Rogov E. Handbook of Psychology: a Textbook. Benefit: in 2 books. - Moscow: VLADOS, 1999. - 384 p.

^{†††} Morphological test values. /Ed. by V.F. Sopova's, N.V. Karpusina's. M:2007. - 284 p.

However, there is a significant decline in interest towards profession in the fourth year of study: if for the first year students we observed 40, 27%, for the fourth year students it is only 8,6%. This phenomenon can be explained by the fact that the idealized vision of future profession by first year students was confronted with the reality and rationalized by understanding the realities, risks and financing of a self-owned business.

Table 1. Results of research components of students of Latvian universities professional motivation of professional-cognitive interest (%)

№	INDICATORS	Study programs , study yars							
		Business Administration		Tourism Business		Manager Information systems		Average value	
		I	IV	I	IV	I	IV	I	IV
Professional orientation									
1.	Interest in the chosen specialty	47,5	9,4	43,2	9,8	42,15	11,4	44,27	10,20
2.	Interest in another areas	13,2	24,2	14,6	21,09	14,9	20,1	14,25	21,8
3.	Interest in entrepreneurial activity	20,1	26,8	17,1	22,9	16,42	26,32	17,87	25,34
4.	Lack of sustained interest	13,1	35,1	15,3	32,8	17,68	36,8	15,36	34,9
5.	Awareness of future profession	25,1	76,2	27,3	73,9	27,1	77,3	26,5	75,8
Value orientation									
1.	Importance of profession	21,9	35,6	22,2	35,2	22,8	36	22,3	35,6
2.	Education as a vital value	17,4	37,8	19,1	38,1	15,2	39,3	17,23	38,4
3.	Family life	16,1	17,1	16,7	16,4	15,6	17,2	16,13	16,9
4.	Importance of a creative activity	11,6	13,2	11,5	13,8	11,09	13,8	11,4	13,6
5.	Other priorities	24,3	4,8	26,3	3,9	29,5	4,8	26,7	4,5
6.	Pragmatic type	44,5	56,7	47,5	52,6	47,2	52,1	46,4	53,8
7.	Intermediate type (unspecified)	44,7	17,9	42,2	18,6	43,3	20,2	43,4	18,9
8.	Humanistic type	28,1	33,1	26,9	35,1	23,3	34,1	26,1	34,1

On average, only 17,87% of first year students and 25,34% of fourth year students have an interest in the activities in the field of entrepreneurship, tourism activities and information systems; 14,23 % (1st year students) and 21,8% (4th year students) expressed interest to other branches of knowledge; in 15,36% first years and 34,9% of the graduates-bachelors showed no steady interest to the profession. Students become more aware of their future profession in their final bachelor year (75,8%) compared to the first year of their studies where only 26, 5% are aware of it.

Concerning the value orientation, the morphological test of V.Sopova permits to distinguish two groups of values^{†††}. First group consists of humanistic individual values such as: self-development, spirit growth, social network capacities. The second group consists of the so-called pragmatic components: prestige, wealth, achievements and preservation of identity. This typology is tested on various spheres of life: professional life, training and education, family life, creativity. The obtained results have allowed identifying three main groups of students: pragmatic, humanistic and intermediate type.

The majority of students, namely 46, 4% of the first year students and 53, 8% of the fourth years belong to the pragmatic type. Only 18, 9% of fourth years belong to intermediate type and 26, 1% first year students belongs to a humanistic type of values. The changing value dynamic is a proof of an increasing consideration of various professional motives during the studies as the following number show:

Between the first and the fourth year of study, there is a substantial increase of pragmatic type (from 46, 4% up to 53,8%), decrease of intermediate type (from 43,4% to 18,9%) and an increase of humanistic type of values from 26,1% to 34, 1%.

Furthermore, thanks to the Rokeach's methods, it is therefore possible to identify a value hierarchy at different stage of study processes. The results are the following: 22,3% of first year students and 35, 6% students of the fourth year consider entrepreneurship as an essential quality. If for the first year students the second most important is to be interested in other fields too (26,7%), then for 38,4% of fourth year students it is the education. Family is considered as a life quality by only 16,13% of first year students and by 16,9% fourth year students. 11,4% 1st year students and 13, 6% fourth years consider creativity important. The fourth year students seem to loose interest in other study fields as it show the declining percentage 26, 7% to 4,5%).

The level of professional interest of the fourth year students shows that the longer a student study a specific professional discipline, the readier he is for creation of his own business. However, in the fourth year we observe a growing number of students, whose interest is not linked to their future profession.

At the same time, the preference of student for certain study fields becomes more pragmatic, with the greatest number of "pragmatists" (56,7%) to be find again at the Business Administration.

This phenomenon is probably linked to the fact that many students get specific work experience in the sphere of trade and services, security agencies, modelling etc. during their studies or they get a second diploma.

^{†††} Morphological test values. /Ed. by V.F. Sopova's, N.V. Karpusina's. M:2007. - 284 p.

The result of research based on qualification level of the future specialist in the field of entrepreneurship, tourism activities and information systems conditioned by the level of the formation of professionally-cognitive component, enabled us to identify low, medium and high levels (figure 1).

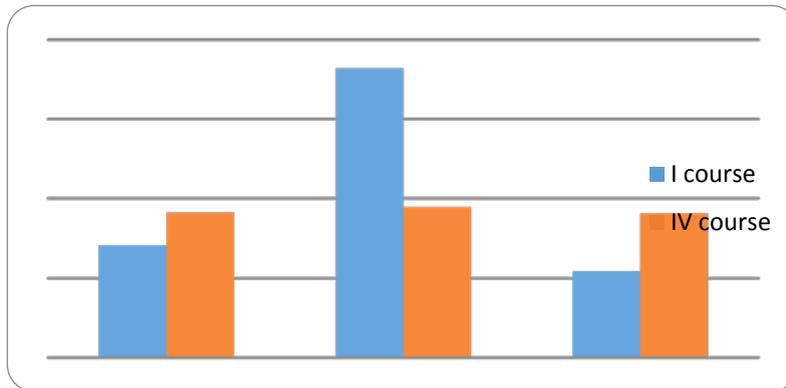

Fig. 1. Levels of formation of professional and educational interest of Latvian universities students (%)

Dynamics of changes in the formation of professional motivation observed on first and fourth year students suggests that in the number of the fourth year students who are at the initial level of the formation of professionally - cognitive interest increased by 8.3%. There is also 34.8% fewer students who belong to the middle level; and the number of students of the high level of professional-cognitive interest increased of 14.7%. During the monitoring of learning achievement, we observed that within the group of expelled students 76,9% showed an initial level of professionally cognitive interest and only 6,3% showed the high one.

These results lead to major conclusion, that when a student is aware of a public use of his future profession and when he has all the needed skills and tools, he shows a profound interest and motivation for his field of study and is able to address potential physical and moral difficulties. There are four main groups of motives: a) responsibility for the performance of professional duties and requirements; b) a desire to improve in the chosen direction; C) innovation at work and organization; d) general altruistic aspirations^{§§§}.

The process of development of self-professional suitability is controversial. The student is sometimes unable to correlate the known properties of the profession with their personal qualities (deficit of self-knowledge) or it is hard for him to choose a profession, which would suit his needs (the lack of professional information)^{****}.

For sustainable professional motivation of students, it is necessary to give students an opportunity to present their abilities and use them in education and professional contexts^{††††}. For this, it is necessary for student

^{§§§} Erohin, S.A. The concept of professional student motivation as a factor of competitiveness in the labor market / Erohin S.A., Nikitin, Y., Nikitina J.V // Jurisprudence. - 2011. - № 1. - P. 20-28

^{****} Podolak, L.G. Psychology High School / L.H.Podolyak, V.I.Yurchenko. - K.: Caravel, 2008. - 352 p.

to take in account: a detailed introduction to the future professional activities and its public importance, knowledge, skills and personal qualities required for such a profession, examples of successful professionals in their field, perspectives of the professional training, his own professional self-esteem. At the same time, the student in question must be able to continue his self-knowledge, self-education, self-improvement and maintain curiosity and "cognitive" psychological climate in the student's academic group ^{††††}. As a result, the students formed a lifetime perspective, identified himself with a successful professional model and can assume the role of fully responsible professional.

For the reasons mentioned above, it is necessary to change the educational process. As practice shows, the use of active methods in higher education is a necessary condition of training highly qualified specialists and produces positive results: formation and systematization of knowledge and skills through their involvement in active educational-cognitive activity, an educational information is transformed into personal knowledge of the students ^{§§§§}.

Conclusions and perspectives of further research:

1. High school should systematically promote the motivation of students to the professional activity by means of professional practice, facilitating positive use of professional experience.

2. There is a growing need practically oriented courses with the capabilities of students to choose as a discipline voluntarily and profile disciplines in accordance with the requirements of the practice, business and the requirements of the employers.

3. For the first year students, it is necessary to develop an educational optimization program of in order to help them in the process of adaptation to training in a higher educational institution, to expand their motivational sphere and to create a professional responsibility.

4. To develop students' high level of motivation for professional achievements is necessary: the organization of training with an appropriate level of difficulty, according to the requirements of the training course, as well as development opportunities for each student; personalization of the learning process.

5. Educational activity of universities should be directed at the formation and enrichment of motives of creative professional activity of the future specialists, the integration of their theoretical training and practical activities.

This study is a base for a further research on development of personality-professional potential of successful professional on the basis of formation of professional motivation of success.

Abstract

With the Declaration of the Republic of Turkey in 1923 the importance given to health affairs and medical education was increased. Until recently to declaration, Turkish people who have participated in the Tripoli, Balkan and First World War were threatened with so many diseases. Consequently, a work program was prepared by the Minister of Health, Refik Saydam, as one of the primary activities for the development of health services and for the rehabilitation of medical education as well.

Within the context of the tenth year anniversary of the new Republic in 1933, the University Reform was set as an objective for the realization of the training of future scientists. For this purpose, especially the German scientists, who have been invited to Turkey, played an important role with their significant contributions to university reform process and medical education as well.

With the aforementioned frame, this paper has two aims: primarily, to put forward the reasons behind the university and medical education reform process by applying the volunteer policy transfer concept; secondly, to determine the actors and/or transfer agents and their contributions in this reform and transfer process with an interdisciplinary approach.

Keywords: Medical Education; University Reform of 1933; Lecturer; German Scientists; Policy Transfer; Public Policy

INTRODUCTION

Especially since the beginning of the 20th Century, the nation-states have faced with problems which have affected almost all humanity while the governments were not able to find solutions by themselves (Sobacı, 2009). Because the encountered problems had similar and common properties and some

pioneering states have produced best learning practices related to the solution of those problems; others had the opportunity of examining the previous, usefull implementations and benefitting from them within a scale from “copying” or “emulation” to “lesson drawing” (Keser, 2012). Within this context, both in developed and developing countires, the decision makers have not only looked for the relevant answers related to the problems within the country but outside as well (Evans, 2004). In order to meet the requirements and to be able to satisfy the expectations of the public, the governments of nation-states have immediately started to look for the models which have proved success and tried to find out the best practices implemented in the other countries. Therefore, especially in most of the developed countries, stressing on the evidence based policy formulation, policy transfer has become a kind of rational choice (Pawson, 2002). Within this frame, the policy transfer analysis is defined as a policy developing theory, which is seeking the significance of the process or set of processes, used to develop organizations, policies and public services at one sector or governance level by using the knowledge of the organizations and/or policies in another sector or governance level (Evans, 2004).

The policy transfer studies, conducted in this context, have initially focused on “voluntary transfer” process, implemented by the rationalistic political actors, testing the potential usefulness of the policies, implemented in some systems into another system, but recently have shifted to “coercive transfer” and “emposition” topic (Dolowitz & Marsh, 1996). In due course the academic literature has focused on different forms of policy transfer. Band-wagoning, convergence, diffusion, emulation and harmonization, learning and lesson drawing are some of the samples of these forms. Without referring to its special form, policy transfer, emulation and lesson drawing refers to the process of using the know-how about the organizations, administrative systems or policies at any time or place, in developing the organizations, administrative systems or policies in another time or place.

By the help of aforementioned briefly conceptualized introduction, this study aims to examine the 1933 University Reform process in Turkey and the rehabilitation of medical education, particularly by focusing on the transfer activities conducted at Medical Faculty of Istanbul University as one of the milestones of revolutionary steps after the decleration of Republic in 1923, with an interdisciplinary approach, since the common dynamics of the process lies at the intersection of different sciences and disciplines such as “political science, public administration and medical history”. Hence, it is expected that this study will provide a significant contribution to the literature as a pioneering paper, which adapts the policy transfer approach of political science and public administration discipline to medical history research area.

The policy transfer analysits typically refer to three different types of policy transfer processes such as “voluntary transfer or lesson drawing”, “transfer by negotiation” and “direct coercive transfer”. The reform process of university and medical education in Turkey, which is the focal point of this study, will be examined within the voluntary transfer concept since there was no infusion, restraint, enforcement, emposition or coercive input from any other state, country or international organization.

In this respect, when the motivations at the background of policy transfer activities are studied, it can be stated that, the voluntary transfer or lesson drawing is a rational and action oriented approach to provide solutions for the public policy problems, which is developed related to one or several of the following reasons:

- (1) Common unsatisfaction related to the current policies due to the poor performance.
- (2) The implementation of a new public policy agenda due to a change in government, ministry or administration of a public organization.

- (3) A political strategy which aims to legitimize the recently achieved results.
- (4) The attempts of political leaders, aiming to improve the items of political agenda to neutralize the political opponents and to provide political allies.

After the above conceptual frame, the two aims of this study can be denoted as follows: First, to put forward the reasons behind the university and medical education reform process by applying the volunteer policy transfer concept; secondly, to determine the actors and/or transfer agents and their contributions in this reform and transfer process with an interdisciplinary approach. The alternative reasons related to the first aim were mentioned before. Related to the latter aim, which are namely the actors playing a significant role in the transfer process, the academicians indicate the following six categories in general (Dolowitz ve Marsh, 1996; Evans, 2004): “(1) Elected Officials, (2) Political Parties, (3) Bureaucrats / Public Servants, (4) Pressure / Interest Groups, (5) Policy Entrepreneurs / Experts, (6) International or Supra-national Organizations”.

The university reform process in Turkey can be examined within the policy transfer concept if the reasons behind and actors in the process are clearly determined. With an historical perspective it can be expressed that, the importance given to health service and medical education has significantly increased with the declaration of the republic in 1923. Both the improvement of public health services and medical education as well were two of the primary tasks, as part of a development program prepared by Refik Saydam, who was the Minister of Health, due to the threatening effect of numerous diseases that the Turkish people, being participated in Tripoli War, War in the Balcans, Ist World War and the Independence War, have faced with.

In this sense, one of the utmost important reforms achieved by Mustafa Kemal Atatürk was definitely the “University Reform of 1933” after the foundation of the new Republic. Atatürk, even in the years of the Independence War has planned the reforms to be conducted in training, education and culture areas. Within this context, the aim of University Reform, which was an important milestone in Turkish Cultural History, was to train and educate the scientists and capable officials to satisfy the requirements of the just founded Republic. The objective was set as to carry out the science level of the country to the contemporary civilization level. For that purpose, especially transferring the German scientists to Turkey and having their contribution to medical education, as implemented in other areas also had a major role. If these aims are examined in detail, it can be stated that the motivative reasons, lying behind the policy transfer process related to the Medical Education Reform in Turkey, were first “the common unsatisfaction of leaders, officials and the public, related to the policies implemented especially during the Balkan War and the Ist World War”, and secondly “new policy agenda aimed to be implemented in relation with the administrative system change” after the foundation of a new state and declaration of a new regym as republic.

After introducing the reasons behind the conducted policy transfer as above, it is required to examine the historical process related to the university and medical education reform, to be able to determine the actors playing a significant role in the transfer process.

2. THE HISTORICAL COURSE OF UNIVERSITY REFORM PROCESS

The modernization process of university level education during the Republic period has started with the abolishment of the Darülfünun (a kind of university and/or house of science during the Ottoman Empire period) and constitution of Istanbul University instead (Namal, 2012). Atatürk has preferred to manage the agenda within a “frame of culture program” as expected from the young Republic of Turkey (Aktar, 1994). To that end, during the preparation stage of University Reform Process, primarily Prof. Albert Malche, rector of Geneva University of Switzerland, was invited to Turkey and requested to prepare a report related to the matter. Malche, who had come to Turkey in 1932, prepared a report after his investigations and submitted to the authorized officials on 29th of May 1932 (Widmann, 1973; Terzioğlu, 1997).

The aforementioned report of Prof. Malche consisted of 5 chapters and 34 articles (Aktar, 1994). Prof. Malche stated in his report that, the practical implementations were insufficient, lectures were based on memorization and conference type transfer of encyclopedic information, the lecture methodology was out of date (Widmann, 1973; Kuruyazıcı, 1999; Namal & Karakök, 2011), the amount of scientific publishings written in Turkish was insufficient, the students were not able to understand the foreign scientific resources due to the lack of foreign language level they had, almost only the knowledge that the students had was made up of the lecture notes (Hirsch, 1998) and the salaries paid to the istructers were considerably poor (Widmann, 1973; Aktar, 1994). Furthermore, the medical library was also substantially needy even if it was located in a rather large hall although the law library was really superb. The mentioned report was completed as “the Darülfünun issue is the intellectual, moral and even future-proof matter of Turkey” (Hirsch, 1998).

Another fundamental topic stated in Malche report was about transferring sufficient instructors from European Universities to Istanbul University which would be founded shortly. For this reason, with Hitler’s coming into power in Germany, Prof. Malche tried to import his son in law, Prof. Dr. Philipp Schwartz, immigrated to Switzerland from Germany and other professors leaving from Germany. Consequently, as the representative of the “Notgemeinschaft Deutscher Wissenschaftler im Ausland (Emergency Assistance Organization for German Scientists)”, established in Zurich, Prof. Dr. Schwartz arrived to Istanbul on the 5th of July 1933. Upon arriving to Ankara on 6th of July 1933, he met with Dr. Reşit Galip who was the Minister of Education. After a mutual meeting a protocol was signed concerning the transfer of 30 professors from Germany also including the remuneration package to be implemented for them (Terzioğlu, 1997; Taşdemirci, 2005).

According to the respective protocol, the prospective scientists to be transferred would learn Turkish in a short while and would give their lectures in Turkish. Turkish associate professors would be trained in 5-10 years and they would take over the professorial chairs from the foreign scientists. However this projection was not realized since some of the German scientists could not be kept as much time as planned. Furthermore, Turkish associate professors, expected to take over the chairs, could not be gotten to stay at the university as full time instructors as well. Despite all these deficits, it can be stated that the development, efficiency and productivity of the University were better than the period of Darülfünun (Namal, 2012).

Referring back to the respective meeting between Schwartz and Galip, the negotiation went better than Schwartz has initially expected. Schwartz stated in his report sent to Zürich that: Nicht drei sondern dreissig (Not three but thirty). Following day (on the 7th of July 1933) Schwartz met with the Minister of Health, Refik Saydam and negotiated about the instructors those would constitute

the core staff of the Medical Faculty of Ankara University and then returned to Switzerland. Within the following time frame, Schwartz has contacted with professors in Frankfurt, Berlin, London and Paris and received their approval about coming to Turkey even from the professors as Kantarowicz, Dessauer and Kessler, those were under arrest in Germany (Terzioğlu, 1997).

After his above efforts in Europe, Schwartz returned to Turkey accompanied by Prof. Dr. Nissen on the 25th of July 1933 and met with Dr. Reşit Galip again. Dr. Reşit Galip accepted the instructor list proposed by Schwartz and Nissen and requested them to prepare a notion about the possible problems to be faced with during the relocation of Medical Faculty from Haydarpasha to Beyazit. As part of the related subsequent efforts, based on the recommendations of Schwartz, mathematician Richard Courant, physicist Max Born and James Franck, instructors of Göttingen University, arrived to Istanbul and after an investigation for a couple of weeks concerning the restructuring issue of Science Faculty, prepared a report on the matter and returned to their countries (Terzioğlu, 1997).

Upon completion of all these process, Prof. Dr. Schwartz also returned to Zürich. The German instructors to be transferred to Turkey signed their contracts in the presence of Turkish Ambassador Hüseyin Cemal and Prof. Malche. After the signature procedure, a group of 150 people consisted of the instructors, their assistants and families arrived to Istanbul in October 1933. After their arrival, the relocation of Medical Faculty from Haydarpasha to its new installations in the European side was completed and education was started on the 19th of November 1933. Between the years 1933-1945, 16 of those professors coming from Germany have fulfilled director positions in different institutes and clinics (Terzioğlu, 1997).

The Minister of National Education during the period, Dr. Reşit Galip stated that the academic staff of the newly constituted university would be provided from three different resources: First category was comprised of 73 previous professors of Darülfünun those would be transferred to the new university; second category would consist the young Turkish instructors, had been sent to European countries for education and expected to return as associate professors in a few years; finally the third category included the professors transferred from Germany (Widmann, 1973; Kuruyazıcı, 1999; Namal, 2012; Taşdemirci, 2005).

3. THE PROMINENT SCIENTISTS OF THE UNIVERSITY REFORM PROCESS AND THEIR CONTRIBUTIONS

The number of lecturers distributed to the faculties were not equal and/or balanced when the University was initially constituted. The number of Medical Faculty and Science Faculty associate staff was more than the members of Law Faculty and the Faculty of Arts (Widmann, 1973).

In spite of the unbalanced or insufficient number of faculty staff, the contributions of the foreign professors can not be underestimated. Two of the foreigner scientists employed in the Medical Faculty with the 1933 University reform, operator Rudolf Nissen (5 Sep.1896- 22 Jan.1981) and pathologist Schwartz (1894-1977) pioneered the dialogue execution activities with the Turkish Government within this context. Eventually, Nissen conducted the first “pneumonectomy” operation in the world in 1931 and became the director of the 1st Surgery Clinic of Istanbul University when he was only 37 years old. He has contributed to Turkish science history with the techniques originated by him, with the surgeons he has trained and with 62 published scientific

articles in Turkish (Namal, 2012). According to Schwartz, especially Prof. Nissen who has developed important surgery techniques, Prof. Wilhelm Gustav Liepmann (1878-1939) with his contributions in gynecology, and Prof. Joseph Igersheimer (1878-1965) with his efficacy in ophthalmology, played significant roles in determining the destiny of the University Reform Process in Turkey. The contributions of Liepmann to gynecology and other medical disciplines with his papers during the symposiums and conferences and two lecture books for the medical faculty students can also be stated among those milestones of the respective university reform process (Widmann, 1973).

Another important scientist Friedrich Dessauer (19 Jul. 1881-16 Feb. 1963), who came from Frankfurt University in 1934 has conducted the activities of Radiotherapy Institute. He had important contributions in the establishment of rontgen devices (Widmann, 1973).

At the Dentistry Faculty as part of the newly constituted Medical Faculty, Alfred Kantorowicz (18 Jun. 1880-6 Mar. 1962), who was detained when he was at Bonn University and then arrived to Turkey took part at the prothesis department and became the director responsible for the lectures following the year 1935 (Widmann, 1973). Upon his arrival the education period was extended from three years to four years, the number of practical lectures were increased, a suitable environment for experimental implementations was prepared and the research thesis were submitted for the first time by organizing scientific projects. Prof. Kantorowicz was not interested in the development of his colleagues only at the University, but also the ones in Istanbul and all around the country by organizing scientific course programs for them (Öncel, 2001).

Among those considerable contributors to the University Reform, one of the significant names was Richard Edler von Mises (19 Apr. 1883-14 Jul. 1953) who took part at the Faculty of Science. He was one of the prominent names of applied mathematics and a worldwide authority in probability calculus. According to Nissen he was the most experienced and the most respected among the foreigner professors. After instructing several years in Turkey, he accepted the invitation from Harvard University and moved to United States in 1939 (Widmann, 1973; Namal, 2012).

One of the new formations established during the university reform was Astronomy Institute. When the institute was first constituted by Erwin Finlay Freundlich (29 May. 1885-24 Jul. 1964) there was neither a single device nor an observation equipment and even worse there was no single literature in Turkish. All these handicaps were overcome by Freundlich in a short period with the significant support of the government. As a result the "Star Observation House" located in the University yard was completed with the efforts of Freundlich in a short time (Widmann, 1973).

Another scientist, Prof. Fritz Arndt (1885-1969) was employed in General Chemistry Institute. Due to the heavy work load of the institute, Prof. Hans Kroepelin, who had come from Braunschweig, took over some of Arndt's responsibilities particularly related to the lateral branch students (Widmann, 1973).

In regard to the Faculty of Arts, Leo Spitzer (1887-1960) was one of the foremost instructors. He played an active role in the institution of process of Foreign Languages School of Istanbul University in 1933 and fulfilled the directorate post (Namal, 2012).

One of the important milestones of Turkish reform process and university reform within this frame was of course conducted in the justice system. As part of this process, the jurists such as Ernst Hirsch (1902-1985) and Andreas Bertalan Schwartz (1886-1953) were assigned to the explanation of the Swedish Civil Code and Italian Criminal Law to Turkish public and to the academic society (Kuruyazıcı, 1999). Hirsch, who was born in 1902, came from Frankfurt to Istanbul in 1933. Hirsch, who has started to give his lectures in Ankara after 1943, exerted most of his scientific efforts for Turkey, the country which had enabled him to immigrate. “Ord. Prof. Dr. Ernst Hirsch’e Armağan (Presentation to Distinguished Prof. Dr. Ernst Hirsch)”, a publishing ascribed to Hirsch, refers to Hirsch as follows: “He has played a significant role in training the jurists of the country with his outstanding teaching abilities as well as his productive scientific studies”. He had essential contributions in the constitution process of Turkish Trade Law, Turkish Law of Royalty Rights and the Law of Autonomy (1946) (Namal, 2012). Besides these he provided crucial contribution in the legislation of “Atatürk Law” which enacts the preservation of the founder of the Turkish Republic and his monuments with some law sanctions (Pekin, 1998).

Related to the Economics and Financial sciences, Fritz Neumark (1900-1991) was assigned to transmit his knowledge (Kuruyazıcı, 1999). He has conducted his lectures in Turkish for Turkish students and published scientific publications in Turkish for them. His contributions to Turkish Tax Reform in 1950 can be cited as one of his significant efforts (Widmann, 1973).

Within the historical course examined so far, it can be determined that all the reform process was initiated and conducted with the own initiatives of the leaders ruling the country; thus actualized within the frame of voluntary policy transfer, during the Turkish University Reform process in general and medical education reform process in particular. Therefore, the actors playing a significant role in this transfer process can be cited primarily “starting from the founder of Turkish Republic and president of the time Atatürk, than Refik Saydam (the Minister of Health) and Reşit Galip (the Minister of National Education), and in addition to these leaders, corresponding public officials/elected officials, the government, bureaucrats/public servants”; secondly Prof. Albert Malche with a prominent role who was initially invited from Switzerland for an investigation on the University system and the notable German scientists following Malche’s efforts by participating in the reform process as policy transfer agents. Apart from these aforementioned actors, it is determined that other possible role players of policy transfer literature such as “Pressure / Interest Groups, Policy Entrepreneurs / Experts and International or Supra-national Organizations” have not played any significant role during the reform process.

4. UNIVERSITY REFORM’S CONTRIBUTIONS TO HIGHER EDUCATION

Yabancı bilim adamlarının, geri kalmış olan eğitim ve öğretim programları ile yöntemlerinin, çağın gereklerine uygun hale getirilmesinde önemli katkıları olmuştur. Derslerin ansiklopedik bilgi şeklinde değil de günlük konuşma şeklinde anlatılması, öğrenci ile karşılıklı soru cevap şeklinde interaktif bir eğitimin yapılmasının sağlanması, pratik uygulamalar ve seminer çalışmalarının eğitimde yerlerini almaları gibi konularda hizmetleri olmuştur (Namal, 2012).

During the university reform process one of the most problematic matters was about the lecture books both in quality and the quantity as well. With the admirable efforts of Turkish and foreign lecturers both faces as of quality and quantity of the problem was solved. During the early years of the reform period both the Turkish and foreign istructers tried to translate the lecture notes to

Turkish language. After the first three year stage they have concentrated on the scientific researches and publications. Among the respective foreign lecturers 80% have published at least one copyrighted book and 60% have published at least two. Concerning the instructors at the Medical Faculty, most of them have published a variable number of copyrighted books between 2-5 and some of them even more than that (Namal, 2012).

Another notable contribution of the foreign lecturers was performed on the development of the existing libraries and on the establishment of new ones at the emerging faculties or institutes. They have prepared a list of periodical journals being published in Europe and proposed them to be bought for the libraries. All these efforts have received affirmative feedback and support from Turkish government and various foreign publications written in German, English and French were brought to the libraries in a considerably short time. It is stated that some instructors such as Ernst Hirsch and his assistants have worked like a librarian public officer during the registration and classification stage (Namal, 2012).

As indicated by Prof. Dr. Philipp Schwartz, despite the insufficient amount of lecture materials and equipment, the classes were kept sustainable and he stated that: “we had provided our students to learn the basic principals of Physiology, Biochemistry, Histology, Microbiology and Pathology by implementing practical exercises; each of the students had the opportunity of conducting at least four autopsies before their exams. We educated and trained our assistants” (Widmann, 1973).

Ataturk also focused sensitively on the University reform process. During this reform period, “university conferences” open to public and “a university week in each city” implementations were activated. Respective foreign scientists also took part in these conferences in an active manner (Namal, 2012). Among those, the university conferences conducted by Prof. Winterstein have a considerable importance (Kahya, 2005).

The periodical scientific journals such as Journal of Law Faculty and Journal of Science Faculty (1935), Romanology Journal (1937), Journal of Medical Faculty (1938), Journal of the Faculty of Economics (1939) (Namal, 2005; Taşdemirci, 2005), Journal of Psychology and Pedagogy (1940) were also published with the contributions of foreign scientists (Namal, 2012).

Those scientists, most of them came from Germany, have also contributed to the process of changing the academic titles after the 19th of November 1933 as follows: the former title of “University Emin” was changed as “rector”, the former title of “Faculty Reis” was changed as “Dean”, the title of “profesör muavini” which means deputy professor was changed as “Doçent (associate professor)” (Taşdemirci, 2005).

Due to their successful scientific researches and contributions to Turkish University reform, Richard von Mises (Faculty of Science-Mathematics), Fritz Arndt (Faculty of Science-Chemistry), Curt Kosswig (Faculty of Science-Biology), Fritz Neumark (Faculty of Economics), Gustav Oelsner (Istanbul Technical University) were awarded with honor doctorate title (Widmann, 1973).

The contributions of the Turkish instructors, trained at the Gulhane Military Medical Academy, which is one of the pioneering institutions of post graduate medical education in Turkey, should also be indicated besides the German lecturers. Among those scientists, Tevfik Sağlam, Hulusi Behçet, Akil Muhtar Özden and Mazhar Osman were some of the significant instructors contributed

to Turkish higher education activities (Harmankaya, 2001). Within the university reform process, Distinguished (Ord.) Prof. Dr. Brigadier General Ali Tevfik Salim Sağlam (1882-1963) was elected as the Chair of Distinguished Professorship at the 2nd Internal Medical Diseases Clinic of Medical Faculty and as the Dean of Faculty; Distinguished (Ord.) Prof. Dr. Hulusi Behçet (1889-1948) as the Chair of Dermatology and Syph Diseases of the Medical Faculty and started to publish the dermatology journal named as “Dermatologic Diseases and Syph Clinic Arcives” (Ataç, 2001).

Thus far the study has focused on the contributions of the German scientists, but besides them, it is known that scientists coming from other countries of Europe have also participated to University Reform Process in Turkey, having been employed at the Medical Faculty of Istanbul University. Although the dominating number of German scientists was not sympathically accepted by French side, the answer sent to the France by the Ministry of Education was as follows: “The aim of the university is not to serve for German or French science, only to serve for the science”. This approach was welcomed by the German scientists. As a result, it was decided to have worldwide famous professors Sauerbruch and Albert Einstein as guest instructors at Istanbul University twice a year. As a result of all these efforts during the University Reform conducted by the contributions of Turkish, German and other European academicians, the education levels of Turkish Universities were promoted to the levels of leading European Universities (Terzioğlu, 1997).

During the aforementioned reform process, some of the scientists coming from Germany in 1933 were converted to Turkish citizenship and serve for the University until they die in Istanbul. For example Prof. Dr. E. Frank has refused the invitations he received from US universities due to his loyalty to Turkey. When the reason of his choice was asked, he replied as follows: “During the days in which I was under the painfull embarrassment of being dismissed from my own country, only Turkey welcomed me with open arms, this soil is my homeland since than and I can not deceive for the blessing presented to me” (Terzioğlu, 1997). Gerhard Kessler, another scientist served for the university reform in Turkey stated about his admission to Turkey as follows: “I will forever feel grateful to Turkish Nation, which has a noble chevalier spirit, because they have presented me such a possibility” (Namal & Karakök, 2011). Kessler has gone over the existing problems during various lectures, conferences, articles and interviews. He was personally studied on some significant problems such as the value matter of money, the introduction of “Ozel Idare”s (a kind of special local administrative body), cooperative/union systems in some sectors, pricing system, syndication and housing policies (Widmann, 1973).

CONCLUSION

In line with the above mentioned historical perspective, it can be stated that a breakthrough in Turkish higher education was achieved by the efforts of Ataturk, during the University Reform process. In realizing this reform, particularly the contributions of scientists comming from Germany can not be ignored. With the establishment of Istanbul University instead of its predecessor, named as Darülfünun which was a higher education institution of Otoman type, the significant scientists of the time, most of all were Germans, took part as instructors at the newly emerged Faculties of Medicine, Science, Arts, Law and Economics. The quantity and quality of the lecture books used in education and scientific publications have rapidly increased after the University Reform. The methodology and techniques used in education process were also changed significantly. Especially the active participation of the students to the learning process was achieved instead of memorizing

the encyclopedic information. Although the process was resulted with productive outcomes, some of the scientists have left Turkey upon receiving invitations from US by the time and some others returned to their own countries (Namal, 2012).

To sum up, the contributions of the foreign lecturers, came to Turkey during the University Reform can not be excluded related to the training and education activities. Atatürk, as being the foremost motivative actor behind this transfer process, summarized the improvements gained by the University reform as follows: “The scientific and executive autonomy was achieved for the universities. The academic career route was organized by law. Universities were given the opportunity to be administrated by supplementary budget system. Their budgets were improved to a level which can not be compared with the former status. Academic lecturers in every scientific branch were trained. The tools for research and development were increased” (Namal & Karakök, 2011).

In conclusion, as possibly conducted in many disciplines, the process related to the policy formulation and carrying out the reforms concerning the university education in general and medical education in particular, can be examined through a “public policy transfer perspective”. Related to the issue, the process activated in Turkey also presents a good case to be studied. When the process is examined through this approach, it can be stated that, the policy transfer process related to the university reform and medical education in Turkey was conducted with a voluntary policy transfer perspective as the details were explained above. The foremost reasons behind this transfer were “the unsatisfaction of the administrators and leaders of the time, related to the low performance of the former policies and organizations within their interest area, and looking for best learning practices”. Related to the second aim of the study, it is determined that, “the political officials formulating the state policies, the bureaucrats performing the public service according to the formulated policies and the foreign academicians transferred primarily from Germany and from other European countries for the purpose of transferring the best practices implemented outside the country” were the principal actors playing significant role as the transfer agents during this reform process.

4th International Conference on New Horizons in Education

The development of the coordination between 6-7 year-old pupils' vocal apparatus and musical hearing in the process of singing: Latvian music teacher's opinion

Oksana Sersnova^{a*}

^a *Daugavpils University, Faculty of Education and management, "Daugavpils", Latvia*

Abstract

The problem of the development of the coordination between 6-7 year-old children's vocal apparatus and musical hearing is topical, because before the age of 6, the vocal apparatus of children has not yet sufficiently developed and sounds are formed due to the vibrations of the edges of vocal cords.

The aim of the research was to find out whether in their pedagogical activity music teachers apply individual learning strategies for teaching children, whether such strategies are necessary for the work with children and which learning strategies are the most effective for the development of the coordination between the vocal apparatus and musical hearing in the process of singing. More than 50 music teachers working with 6-7 year-old children in kindergartens, music schools and general education schools participated in the questionnaire survey.

The research results provide information regarding the music teachers' understanding of the problems of the coordination between 6-7 year-old children's vocal apparatus and musical hearing and reveal their opinions concerning the possibilities to resolve these problems. On the basis of the questionnaire survey results, the recommendations for resolving the problems of the coordination between the vocal apparatus and musical hearing have been worked out.

Keywords: vocal apparatus, musical hearing, development of coordination, questionnaire survey, singing process.

1. INTRODUCTION

In the process of acquiring skills of singing, the central problem appears to be the development of the coordination between musical hearing and voice, because singing is a complicated process of sound forming and the coordination between hearing and voice or correlation between precise intoning and aural sense is important for this process.

Thurman and Welch (2000) have proved that at the age of 7, 30% of children cannot intone precisely, and less than 5% of them cannot do it even when they are 11 years old. The scholars point out that the age of 7 is a very essential period for vocal development. According to Menabeni (1987), at the age of 6, a permanent formation of vocal muscles is already starting to develop: consequently, we have to start developing the coordination between a child's vocal apparatus and musical hearing, because the age when the vocal muscles start developing is the most favorable time for teaching a child to sing precisely. The way the child has learnt to coordinate his voice

* Corresponding author. Tel.: +37129897156.

E-mail address: osivohina@mail.ru

will determine how he is going to sing in future, and to re-teach him to correctly coordinate his singing by ear will be very difficult.

Harris (2009) notes that it is not possible to develop one model of the development of the coordination between the vocal apparatus and musical hearing that would be suitable for all children, because each child develops individually. Naturally, there are certain physiological peculiarities that are common for all 6-7-year-old children, but it is vital to realize that in order to develop the coordination successfully we have to work individually with each child, because the development of coordination involves the activity of both musical hearing and vocal apparatus.

To prove the importance and topicality of individual learning strategy for 6-7-year-old children when developing the coordination between their vocal apparatus and musical hearing in the process of mastering singing, a questionnaire survey among Latvian music teachers has been conducted. 71 music teachers working with 6-7-year-old children in kindergartens, music schools and general education schools participated in the survey.

The research aim is to get and clarify the Latvian music teachers' opinions concerning the need for an individual learning strategy at developing the coordination between 6-7-year-old pupils' vocal apparatus and musical hearing in the process of singing.

2. METHOD AND PARTICIPANTS

To get the Latvian music teachers' opinion about the need for an individual learning strategy at developing the coordination between 6-7-year-old pupils' vocal apparatus and musical hearing in the process of singing a questionnaire survey method was applied.

The teachers meeting the formal requirements for music teachers' education and having music as their main speciality participated in this survey. 40 (56.3%) teachers had a bachelor's degree, 31 (43.7%) – a master's degree. The age of the respondents was within the limits of 25 – 75, the average age being – 46 years. Standard deviation of the average age is 10 years.

Table 14. Respondents age groups

Age group	Frequency	Percent	Cumulative Percent
25-35	12	16,9	16,9
36-45	21	29,6	46,5
46-55	26	36,6	83,1
56-75	12	16,9	100,0

Teachers' experience of pedagogical service fluctuates between 4 – 47 years, and more than a half of respondents are older than 24. The average length of pedagogical service experience working with 6-7-year-old children is from 18 to 45 years, and for more than a half of respondents it exceeds 15 years.

Table 15. Respondents experience of pedagogical service

Pedagogical service group	Frequency	Percent	Cumulative Percent
4-14	19	26,8	26,8
15-24	22	31,0	57,7
25-30	12	16,9	74,6
31-47	18	25,4	100,0

Latvian music teachers' survey consisted of four indicator groups where primary data were obtained by assessing respondents' answers according to Likert scale :

- indicators of cooperation (17);
- indicators of teaching (15);
- indicators of learning (25);
- indicators of lesson organization (8).

The secondary data were obtained by dimension reduction, making use of a factor analysis. The "Statistical Package for the Social Science (SPSS), version 19.0 for Windows, was used for data processing, statistic analysis and presentation of the research results.

In order to analyze the structure of factors in indicator groups of the survey, the research factor analysis was made, extracting the factors by the method of principal components and further application of Varimax rotation method (Extraction Method: Principal Component analysis; Rotation Method: Varmix with Kaiser Normalization). Varmix is an orthogonal rotation where the variables with great factor loading are minimized. The method is mostly used to simplify the interpretation of factors.

The criterion of sampling adequacy – (Kaiser-Meyer-Olkin Measure of Sampling Adequacy – KMO) – which in different question blocks of the survey fluctuates within the range of 0.634 (Indicators of lesson organization) to 0.813 (indicators of teaching) shows that the use of factor analysis is desirable.

3. THE RESULTS OBTAINED

The structure of factors of separate question blocks in the survey is represented in Table 3 – 7.

The tables show what percent of summary dispersion characterizes each of the extracted factors, and also the indicators having the greatest factor loading among the extracted factors. The aggregate indicators of the extracted factors are obtained by summing up the results of the respective indicators.

For further interpretation, standardization of factor assessments was done. Standardized assessments are normally distributed with the mean value 0 and dispersion which is equal to 1 (-N (0.1)). Standardized assessments were distributed according to the normal distribution law. Standardization of factor values allows classifying respondents within each of the factors depending on their indicators, which can be higher or lower than the mean value.

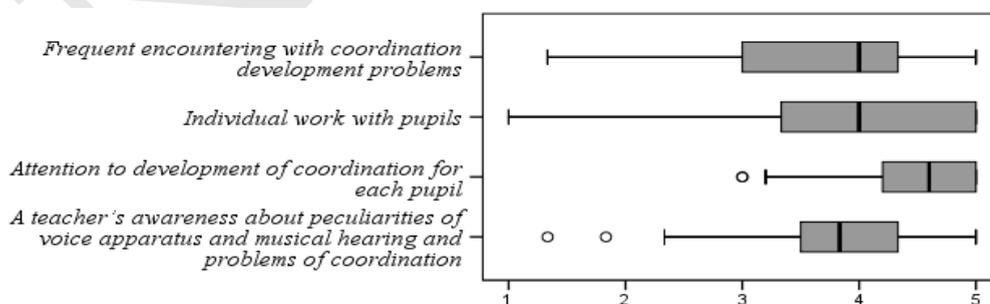

Fig. 1. Factors of Cooperation (Boxplot)

Factors *A teacher's awareness about peculiarities of vocal apparatus and musical hearing and problems of coordination* and *Frequent encountering with coordination development problems* are distributed according to the law of normality (Kolmagorov – Smirnov test shows the level of statistic significance Asymp. Sig. (2-tailed) >0.05). The distribution of factors *Attention to development of coordination for each pupil* and *Individual work with pupils* differs significantly from the normal distribution considerably differs from the normal distribution.

Numerical values of *Factors of Cooperation* vary within the range of 1 -5. The smallest variance of range changes is that of the factor *Attention to development of coordination for each pupil*, where all respondents' assessment is not lower than 3, but that of a half of respondents – higher than 4.6. The greatest variance ($\sigma = 0,930$) is that of the factor *Individual work with pupils*. Half of respondents assess it higher than 4, but 25% of respondents assess it by 5.

Assessments of *Factors of Cooperation*, based on Friedman Test, have statistically significant differences. The factor *Attention to development of coordination for each pupil* is assessed higher (Median=4,60), the factor - *A teacher's awareness about peculiarities of voice apparatus and musical hearing and problems of coordination* - lower (Median=3,83).

Table 20. Factors of Cooperation (Descriptive Statistics)

	A teacher's awareness about peculiarities of voice apparatus and musical hearing and problems of coordination	Attention to development of coordination for each pupil	Individual work with pupils	Frequent encountering with coordination development problems
Mean	3,80	4,44	4,00	3,75
Median	3,83	4,60	4,00	4,00
Mode	3,50	5,00	5,00	4,00
Std. Deviation	,749	,583	,930	,924
Range	3,67	2,00	4,00	3,67
Minimum	1,33	3,00	1,00	1,33
Maximum	5,00	5,00	5,00	5,00
Percentiles				
	25	3,50	4,20	3,33
	50	3,83	4,60	4,00
	75	4,33	5,00	4,33

Between factors *Attention to development of coordination for each pupil* and *Individual work with pupils* a medium strong linear correlation is observed ($r=0,524$). Between factors *A teacher's awareness about peculiarities of voice apparatus and musical hearing and problems of coordination* and *Attention to development of coordination for each pupil* as well as between factors *A teacher's awareness about peculiarities of voice apparatus and musical hearing and problems of coordination* and *Frequent encountering with coordination development problems* ($r=0,319$) there are significant but medium weak correlations.

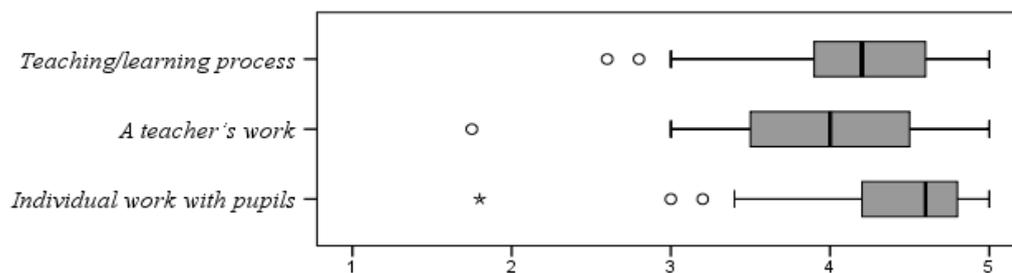

Fig. 2. Factors of Teaching (Boxplot)

The distribution of the factor *Individual work with pupils* differs significantly from the normal distribution, but the rest of the two from the group *Factors of Teaching* have normal distribution. Difference in assessments of all factors is statistically significant. The respondents assess the factor *Individual work with pupils* higher, but the factor - *A teacher's work* – lower; besides, half of the respondents assess this factor lower than 4.

Table 21. Factors of Teaching (Descriptive Statistics)

	Individual work with pupils	A teacher's work	Teaching/learning process
Mean	4,41	3,95	4,21
Median	4,60	4,00	4,20
Mode	4,60	4,00	4,20
Std. Deviation	0,557	0,594	0,550
Range	3,20	3,25	2,40
Minimum	1,80	1,75	2,60
Maximum	5,00	5,00	5,00
Percentiles			
25	4,20	3,50	3,80
50	4,60	4,00	4,20
75	4,80	4,50	4,60

A strong linear correlation is observed between all the factors of this group.

Table 22. Spirman correlation coefficient between Factors of Teaching

	Individual work with pupils	A teacher's work	Teaching/learning process
Individual work with pupils	1	0,608**	0,735**
A teacher's work	0,608**	1	0,628**
Teaching/learning process	0,735**	0,628**	1

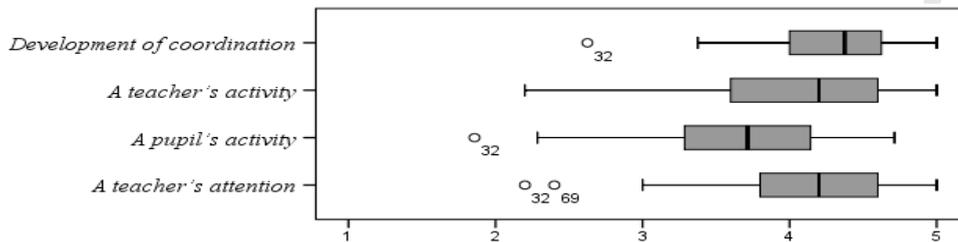

Fig. 3. Factors of Learning (Boxplot)

All *Factors of learning* have a normal distribution, which allows comparing the mean values of these factors by applying parametric methods. The dependent samples do not display significant differences between the factors *A teacher's attention* and *A teachers activity* according to the Students' criterion (Paired Samples Test, Sig. (2-tailed) = 0.106). The assessments of the latter factors have statistically significant differences. The respondents have assessed the factor *Development of coordination* higher, but the factor *A pupil's activity* – lower.

Table 10. Factors of Learning (Descriptive Statistics)

	A teacher's attention	A pupil's activity	A teacher's activity	Development of coordination
Mean	4,16	3,64	4,05	4,27
Median	4,20	3,71	4,20	4,37
Mode	4,40	3,86	3,80	4,13
Std. Deviation	0,574	0,590	0,629	0,455
Range	2,80	2,86	2,80	2,38
Minimum	2,20	1,86	2,20	2,63
Maximum	5,00	4,71	5,00	5,00
Percentiles				
25	3,80	3,28	3,60	4,00
50	4,20	3,71	4,20	4,37
75	4,60	4,14	4,60	4,62

All *Factors of Learning* correlate. A stronger correlation is observed between the factors *A teacher's attention* and *Development of coordination* ($r=0,766$). The correlation between *A pupil's activity* and *Development of coordination* is non-linear. If *A pupil's activity* increases to 4 grades, *Development of coordination* also increases, but a higher assessment of *A pupil's activity* does not show the correlation between these factors.

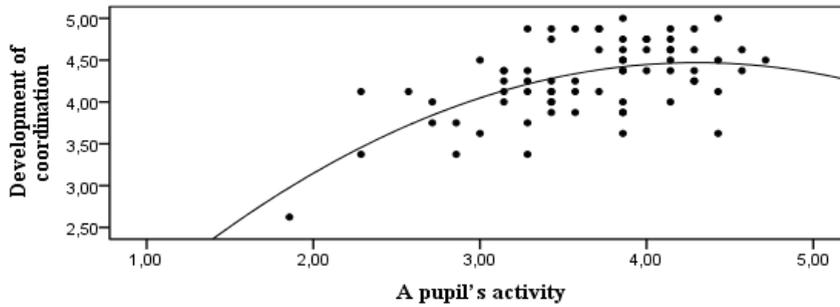

Fig. 4. Scatter diagram with squared regression in *A pupil's activity un Development of coordination* space

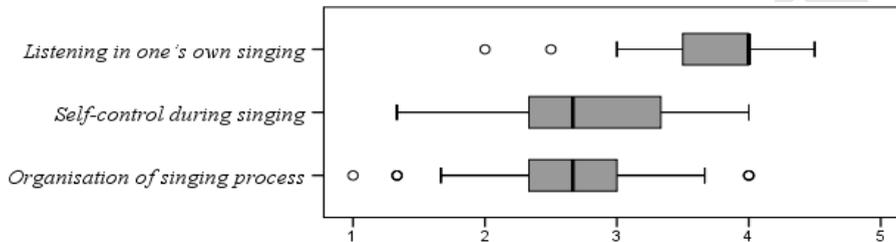

Fig. 5. Factors of Lesson Organization (Boxplot)

From *Factors of Lesson Organization* only *Self-control during singing* is distributed normally. The factor *Listening to one's own singing* has the smallest variance and the highest estimate. Significant correlations between the factors of this group are not observed.

Table 11. Factors of Lesson Organization (Descriptive Statistics)

	Organization of singing process	Self-control during singing	Listening in one's own singing
Mean	2,65	2,80	3,75
Median	2,66	2,66	4,00
Mode	2,67	3,00	4,00
Std. Deviation	0,699	0,665	0,429
Range	3,00	2,67	2,50
Minimum	1,00	1,33	2,00
Maximum	4,00	4,00	4,50
Percentiles			
25	2,33	2,33	3,50
50	2,66	2,66	4,00
75	3,00	3,33	4,00

By a two-stage cluster analysis the respondents were split into two homogenous clusters. The respondents of the first cluster (53.5% from the cluster) estimated all factors higher than the mean value given by the group. The respondents of the second cluster (46.5%) assessed all factors lower than the mean value given by the group. The average age of the respondents of the first cluster is 46.53 years. The average age of the respondents of the second cluster is 45.39 years. According to the t-test criterion, age differences are not statistically significant even

if the level of significance is 10% ($p = 0.648$). The significance level is the precision with which the hypothesis can be rejected.

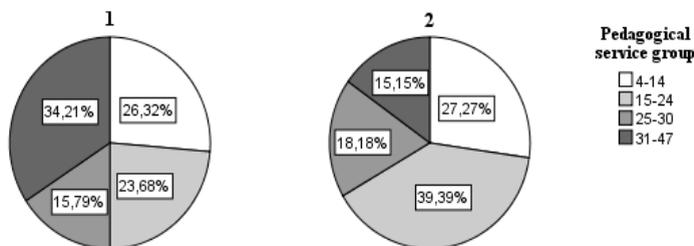

Fig. 6. Distribution of teachers into clusters by pedagogical service

The first cluster includes 34.2% of teachers whose pedagogical service is from 31 to 47 years long. The second cluster includes 39.4% of teachers whose pedagogical service is from 15 to 24 years, but according to Chi-Square test, these differences are not statistically significant ($p=0.261$)

The first cluster includes 42% of teachers with master’s degree, the second cluster includes 45.5% of teachers with master’s degree, but the differences are not statistically significant ($p = 0.482$).

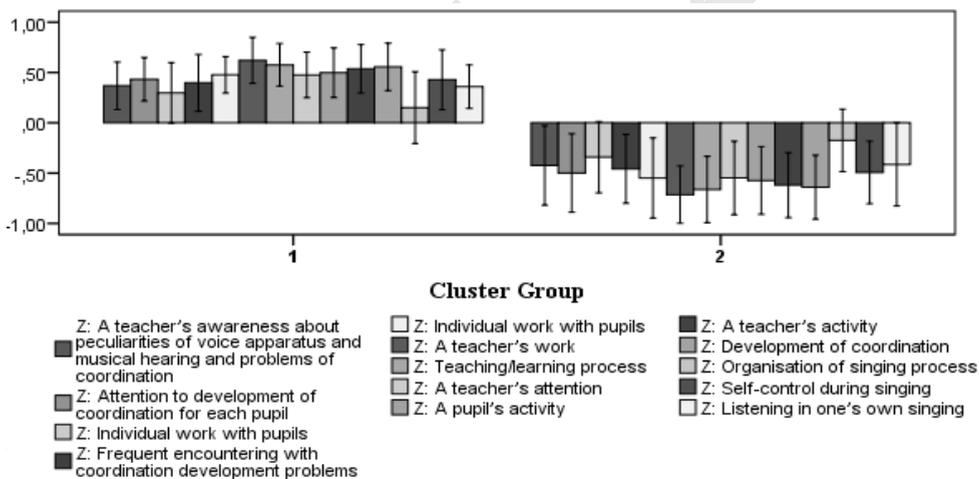

Fig. 7. The mean value of cluster factors for the respondents

The algorithms of classification trees allow for solving classification tasks and easy interpretation of the results obtained from the developed model. A classification tree intended to classify teachers into clusters was created by using such characterizations as: *Education, Age, Pedagogical service, Service as a music teacher (6-7)*.

3.1. Projection of the Classification Tree Analysis

To the first cluster are ascribed 77.8% of teachers whose length of pedagogical service working with 6-7 year-old children is more than 25.5 years and 45.3% of teachers having a shorter pedagogical service period. At splitting into clusters teachers with pedagogical service longer than 25.5 years, the next important criterion is education. All the respondents holding a master's degree are ascribed to the first cluster.

61.9% of teachers under 40.5 and the length of pedagogical service less than 25.5 years are included in the first cluster.

Teachers with a bachelor's degree under 40.5 and the length of pedagogical service less than 25.5 years may be ascribed to the first cluster with the probability of 84.6%.

The classification tree allows us to find out what percentage of respondents from the present sample group satisfies the requirements of the projection. The greatest part of the respondents – 46.1% of them - satisfies the requirements of the projection: 65.5% of teachers with pedagogical service more than 25.5 years and age more than 40.5 years are ascribed to the second cluster. Besides, on the basis on the development of the classification tree, a discriminant analysis of factor abilities can be made. The differentiating ability of the cluster is *Service as a music teacher (6-7)*.

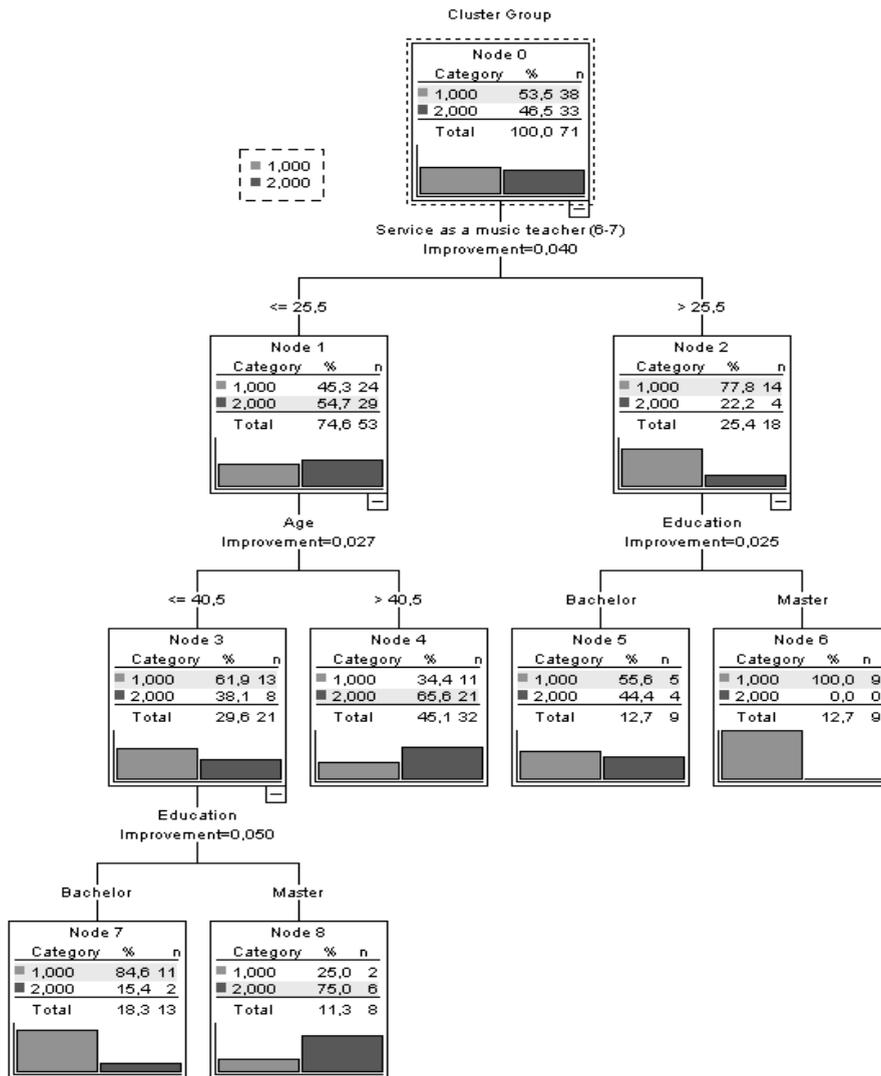

Fig. 8. Classification tree

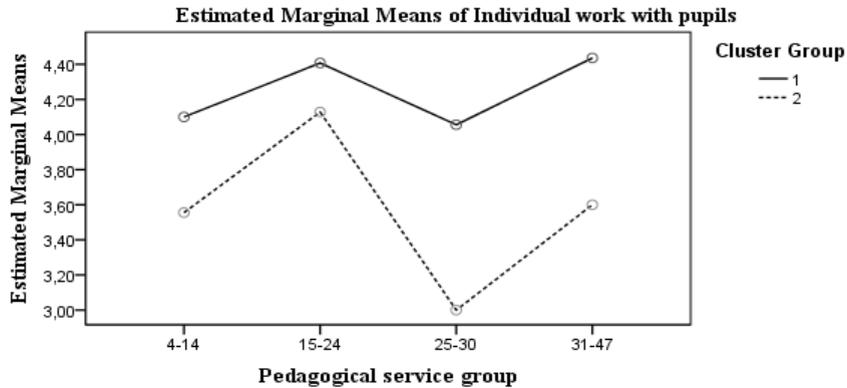

Fig. 9. The mean of the factors (Individual work with pupils) depending on the respondents' pedagogical service

At assessing the factor *Individual work with pupils* by two-factor dispersion analysis, we estimated whether the *Cluster Group* and *Pedagogical Service Group* variables effect the given factor, as well as mutual correlations between them. The variable *Cluster Group* effects the dependent variable *Individual work with pupils* (Tests of Between-Subjects-Effects, $p=0.03$). Statistically significant factorial correlation was not observed (Test of Between-Subjects-Effects, $p=0.612$). The factor *Individual work with pupils* was estimated comparatively high by teachers with pedagogical service from 31 to 47 years and ascribed to the first cluster, while teachers with pedagogical service from 25 to 30 years and ascribed to the second cluster estimated this factor quite low.

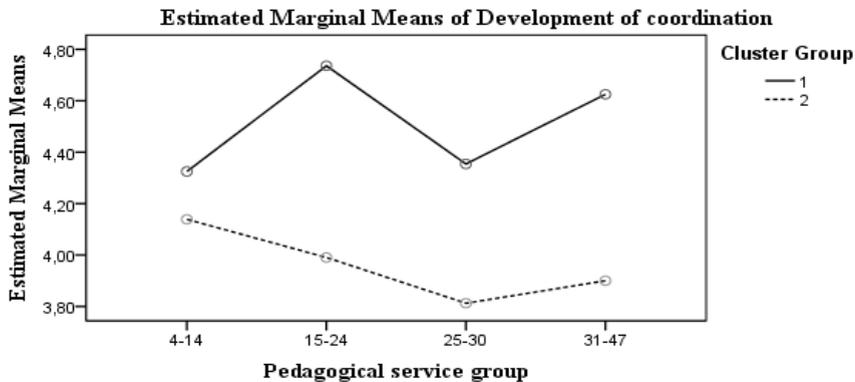

Fig. 10. Factorial means (Development of coordination) depending on respondents' pedagogical service

A two-factor dispersion analysis helped to define the mutual correlation between the factors *Cluster Group* and *Pedagogical Service* at estimating the factor *Development of coordination* (Tests of Between-Subjects-Effects, $p=0.053$). Despite the fact that the respondents of the first cluster estimate *Development of coordination* higher than the respondents of the second cluster, nonetheless the respondents of the first cluster with pedagogical service from 4 to 14 years estimate this factor lower, while the respondents of the second cluster belonging to the same group estimate this factor higher.

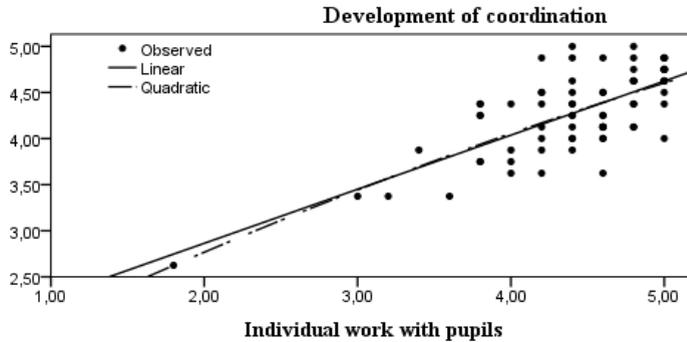

Fig. 11. Scatter diagram with a linear regression on the plane of *Individual work with pupils* and *Development of coordination*

A direct relationship between *Individual work with pupils* and *Development of coordination* is observed ($r=0.718$, $\text{sig.}<0.001$). The correlation coefficient is above 0.7, therefore the correlation is considered strong, and consequently *Individual work with pupils* and *Development of coordination* are mutually dependent. If one increases, the other increases as well.

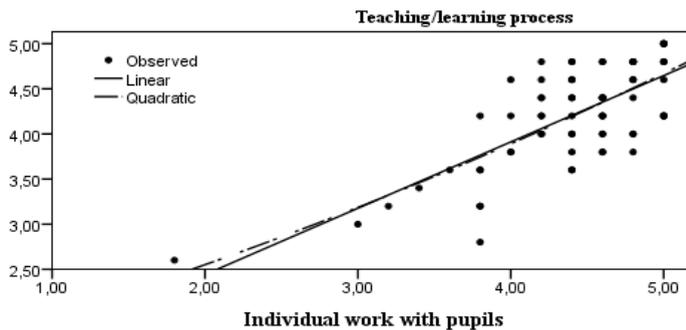

Fig. 12. Scatter diagram with a linear regression on the plane of *Individual work with pupils* and *Teaching/learning process*

A direct relationship between *Individual work with pupils* and *Teaching/learning process* is observed ($r=0.576$, $\text{sig.}<0.001$). The correlation coefficient is smaller than 0.7, but bigger than 0.4, thus the correlation is considered to be medium strong and, consequently, *Individual work with pupils* and *Teaching/learning process* are mutually dependent.

4. CONCLUSIONS

1. To a greater or lesser extent, all the respondents pay attention to the development of the coordination between the vocal apparatus and musical hearing of each pupil. Half of respondents give special attention to it. Not all teachers know the peculiarities of the vocal apparatus and musical hearing of each pupil and are able to deal with coordination problems.

2. The majority of teachers consider the individual work with pupils important for the development of the coordination between the vocal apparatus and musical hearing. The teachers of the first cluster with master's degree and pedagogical service from 31 to 47 years widely apply it in their pedagogical practice. Teachers with a master's degree and pedagogical service from 31 to 47 years pay more attention to the development of coordination between the vocal apparatus and musical hearing than the teachers with the length of pedagogical service from 25 to 30 years.

3. Teachers have admitted that individual work helps teachers to identify problems of the coordination between the vocal apparatus and musical hearing for each pupil and discover their causes. Consequently, an individual approach is the methodological basis of the development of the coordination between the vocal apparatus and musical hearing in the process of acquiring singing.

4th International Conference on New Horizons in Education

The door of universities that is open for all ages: Continuing education centres

Emine Yılmaz^a, Ismail Yılmaz^{*b}

^a*Namık Kemal University, Faculty of Agriculture, department of Agriculture Economy 59030, Tekirdağ, Turkey*

^b*Namık Kemal University, Faculty of Agriculture, department of Food Engineering 59030, Tekirdağ, Turkey*

Abstract

Continuing education centres that function as a bridge in order to develop the relationship more effectively between universities and cities where they exist appeal to all of Turkey's population. Educations supplied in the centres aiming at such a wide community are multifarious. When we look at the working areas of continuing education centres, the following ones can be counted; giving project services and consultancy to public and private sectors, international institutions and individuals in areas which they need, arranging educational programs, courses, seminars and conferences in the national and international standards, giving psychological counselling and guidance services and coordinating these activities, introducing every kind of legal publication regarding the conduct of services and opportunities of university in these areas. The most important requirement for Continuing Education Centres that overtake important missions for educating society to carry out this duty is to have educational halls and administrative buildings belonging to themselves, sufficient administrative staff. The notable problems that still exist for many Continuing Education Centres are inadequacy of buildings, lack of educational halls and buildings and limited number of administrative staff. In addition, Continuing Education Centres have a lot of problems as they are not regarded as academic units. Some of the problems encountered with can be counted such as the standardization and accreditation of education, cooperation with shareholders (such as MEB, business world), international relations and not being able to make use of the project opportunities of The European Union sufficiently, effectiveness in the national and international webs.

Keywords: Continuing education centres, courses, certificate, problems, seminars

1. INTRODUCTION

In information society, the most important factor that will enable countries to reach social, technological and economical standards that they aim at in the rush and interaction web in a cultural atmosphere where competition and quality understanding change depends on innovation and enabling discoveries to be permanent. Technological innovation has put forward the importance of education and learning in information age. With information technologies, educational technologies have changed wholly, and learning has required permanency. While advancing technology and permanent change cause information to be out of date, it necessitates learning to be permanent and life-long. Increasing of the importance of education and developing of new approaches require education to be questioned permanently and developed. This is essential for information society (Yılmaz, 2012).

The general aim of continuing education can be summarized as transforming society into an advanced information society through education, providing better job opportunities and developing social cohesion. One of the most important institutions assuming a task in information society is universities because universities are the

* Corresponding author. Tel.: +90 2822504001; fax: +90 2822509934.
E-mail address: iyilmaz@nku.edu.tr

main institutions that are responsible for production, spread and permanence of information which is the staple of information economy. Accordingly, continuing education centres are founded nearly in each university today. Continuing education centres founded appeal to the whole society with educations that they arrange. As learning is an activity continuing life long, courses opened within the scope of continuing education centres, certificate programs, summer schools, sport schools, child universities and language courses appeal to everybody. Also, higher-up courses can be given in a private area. Moreover, the basic tasks of universities are education, research and development and service for the society. Continuing education centres take on these three missions.

It is known that there are some problems in educational system in Turkey and that these affect the quality of continuing education centres directly.

2. The Problems of Continuing Education

The cutbacks carried out by the circulating capital management pose as a problem. Reducing the cutbacks by the circulating capital management on the incomes obtained from services given by continuing into the minimum will enable the incomes gained from educations given by the centres to be transferred to the trainers. Considering the fact that the target group of continuing education centres all of the Turkish population that is 76 millions and considering the examples in the European Union countries, it is necessary that it should be paved for continuing education centres to work more actively by implementing legal regulations immediately for enabling the conduct of all the life-long learning and general educational activities, which are conducted in different units at universities for the establishment of the staff of Vice Rectors that are responsible for continuing education, the standardization of educations and accreditation, as a single unit under continuing education centres.

In terms of continuity and institutionalization of activities, not regarding continuing education centres as an academic unit and not having permanent staff and managers of continuing education centres are serious problems. The developments in the activities in continuing education centres are closely related with the permanence of those working in these centres (Oğuz, Günay& Boz, 2012).

The most significant requirement for continuing education centres assuming important missions aimed at educating society to put into effects this charge is that they should have education halls and administrative buildings that belong to themselves and sufficient number of administrative staff. For many continuing education centres, insufficiency of buildings, lack of education halls and buildings, the limited numbers of administrative staff are still serious problems.

Considering working in the administration of continuing education centres that have a very heavy work load and giving education as academic performance will increase the motivation of those working in these charges and those assuming charges.

The non-standard educations, using different titles and denominations, not using a common language emerge as problems. Initiating actions aimed at standardisation without delaying is necessary. The council of Turkey continuing education centre can achieve accelerating information transfer and increasing the share of documents by taking a more active role.

There must be an independent institution that will assess the programs regarding the accreditation of continuing education centres. It is necessary that National Standardization of Continuing Education Centres and Recognisability should be enhanced. Developing Continuing Education Programs and Management, providing solidarity, Continuing Education's taking more active roles within the scope of Service Application For Society, the existing International Relations and developing EU Projects and increasing their number must be put into action (Gülşen, 2012).

Not being able to enhance the resources allotted to continuing education adequately and to use the existing resources effectively and conveniently are among the problems.

Proceeding of the quality differences in big city-small city education in continuing education institutions, equipment insufficiency in the course materials related to physical substructure insufficiency in continuing education institutions are also serious problems for the next generations.

Through the financial problem of continuing education centres that are located at universities because of the circulating capital system, the fact that the cost proposals of education service aimed at marketplace in some technical educations are higher than those in private sector education firms forces those who want to take education into different searches.

Insufficiency of communication, cooperation and vocational solidarity among trainers can be added to the problems. Insufficiency of professional manager and staff in continuing education institutions is among the basic problems.

3.Recommends

Trainers must be enabled to be also literate, practitioner and producer in computer, informatics and educational technologies. It is clear that it is necessary that the subject of "education of the trainer" should be in a privileged position within the strategic aims that will function as a hoist in renewing education. In an atmosphere in which learning is in the forefront instead of teaching, both educating permanently trainers in each rank of continuing education and reaching the systems that they can learn and surroundings by themselves must be enabled and encouraged. The creation and permanence of the most extensive opportunities that are possible aimed at becoming creative-innovative experts and talented individuals of information age of trainers that have strategic importance in renewing education beyond developing skill, ability and competence must be attentive to. It must be kept in mind that it is necessary for quality intellectual capital to exist and that it can be put into effect by innovative trainers' education. The candidate of continuing education must turn his direction to the future, be sensitive to changes and developments, and must take into account failures in educations where he will take part. In order to increase the quality of education, it is necessary that trainers should be raised well and that trainers' education should be spread in such a way that it will follow innovations.

The fact that education of information age is implemented as learning oriented, permanent, life-long and independent of any setting results from the radical revolution experienced in communication and information technologies. Therefore, our education system has to be united with technology-based equipment rapidly.

Being dominant over the technologies of the future firstly makes it necessary to have trained human power in those subjects. As well as institutes that will train human resources that will work in scientific and technological areas which prioritize society and that will be needed in research and development, continuing education centres must be enabled to put into action and supported particularly. In continuing education, a new enterprise that will make use of various resources and opportunities, including trainer opportunities, is essential to be made. In this context, our university must be put into effect and supported. By renewing science and technology policies, a new pursuit, a new world view, constructing innovative cultural policies and motivations, the subject must be approached in more comprehensive policies. Life-long learning must be sustainable.

It is necessary to provide structural alteration in continuing education, to develop human resources, to better research and development, to develop intellectual capital, to establish university-industry cooperation and to form innovative trainers. Achieving these practices is closely related to the social awareness.

Renewing learning of continuing education must be within the educational system that the power to renew itself.

The foundation of the society is learning individuals. From this perspective, continuing education that will be effective in creating learning individuals have a significant function and effectiveness because the presence of learning individuals in societies can be possible by means of continuing learning. In order to be successful in a permanently changing, renewing and developing global atmosphere, it is necessary for the personnel to be educated permanently.

4. Conclusion

The major capital of information age is educated people. It is necessary for our country which has the potential of young people to make an enterprise by making use of this potential. Our country's young population is more than most of the European countries. This young population is not a power by itself. Solely the young population that are educated well can make up a strong potential. For this reason, universities have an important role in the development of the society. The only resources of educated human power which can enable the country's development are "science", "technology" and "universities."

Universities contribute to society's education with continuing education centres that they found and that they give service with, and they supply with permanence in individual learning. In constructing an information society, people are given some attainments with continuing education. These can be counted as the following;

To increase occupational skills,

To have knowledge in occupation in depth,

To teach learning,

To create individuals who are open to sharing information and to prevent jealousy of information,

To create the culture of sharing information,

To teach how information can be reached,

To create individuals that are researchers and developers,

To create creative and innovative individuals,

To create flexible individuals that are open to change,

To create individuals who are open to working in a team (Atak&Atik, 2007). The significance of continuing education centres which serve to obtain these results will enhance day by day.

4th International Conference on New Horizons in Education

The effectiveness of problem-based learning supported with computer simulations on reasoning ability

Özlem Koray^{a*}, Abdullah Koray^b^a*Büilent Ecevit University, Ereğli Education Faculty, Department of Primary Education, Kdz.Ereğli,67300 Zonguldak, Turkey.*^b*Büilent Ecevit University, Ereğli Education Faculty, Department of Primary Education, Kdz.Ereğli, 67300 Zonguldak, Turkey.*

Abstract

The purpose of this study was to investigate the effectiveness of Problem Based Learning (PBL) supported by interactive computer simulations within the context of “Buoyant Force in liquids and gases” subject on reasoning ability. The study was conducted with a quantitative methodology via non-equivalent groups quasi-experimental design. The sample of 54 students enrolled in two eighth grade classes of a public middle school in Turkey was included in this study. One of these classes was randomly assigned as experimental group and instructed by means of PBL, whereas the other class was assigned as control group and instructed by means of traditionally designed instruction. In order to measure reasoning ability of the students, The Test of Logical Thinking was used as pre- and post- tests in both control and experimental groups. The results of independent t-test showed that the students in PBL classes had significantly higher mean scores on reasoning ability than the students of control group.

Keywords: PBL, Elementary Science Education, Buoyant Force in Fluids and Gases, Reasoning Ability.

1. Introduction

Continuous change occurring in today’s world has been forcing educational systems to change. The changes in educational systems have caused replacement of common approaches of education in which students are dependent on books and teachers, and want to get too much knowledge by rote learning, with modern approaches of education. In modern educational point of view, students must be heartened to go beyond the memorization of facts, to think critically and creatively, and to apply their knowledge to problem solving in new and unfamiliar contexts (Chin & Chia, 2006). To provide required changes in line with modern education approaches, constructivist theory has been providing a well-established guide. The constructivist theory accepts that students need to be exposed to learning experiences that enable them to construct their own knowledge and promote their thinking skills (as cited by Barak et al, 2007 from Cobb, 1994 and Driver, Asoko, Leach, Mortimer, & Scott, 1994).

Among methods based on constructivist approach, problem based learning has been providing an important opportunity to improve active learning and higher order thinking skills including critical thinking, creative thinking and problem solving (Kumar, 2010; Tan, 2007; Barak et al, 2007). Problem-based learning has been developed in the late 1960s at McMaster Medical School in Canada and pervaded since then throughout different parts of the world. PBL has also been integrated into other medical schools and health-related programs such as nursing, dentistry and therapy (Mierson, 1998, Scott et al., 1999, Solomon & Geddes, 2001). Furthermore, it has

* Corresponding author. Tel.: +90-372-323-3870 (110); fax: +90-372-323-8693.

E-mail address: ocankoray@gmail.com

been adopted by numerous disciplines including architecture, law, engineering, business, social work (Savery & Duffy, 1995), geography (Bradbeer & Livingstone, 1996), zoology (Harland, 2002), biology (Chin & Chia, 2004), chemistry (Yee, 2007) and science education (Gallagher et al., 1995, Dahlgren & Öberg, 2001, Kumar and Sherwood, 2007).

Problem-based learning is an instructional method characterized by use of problems as a context for pupils, working in small groups, to learn problem-solving skills and to enhance their knowledge (Albanese & Mitchell, 1993). Learning in this way is oriented and self-motivating and pupils learn while searching for solutions to problems. They are actively involved in process and learn in the context in which knowledge is to be used (Chin & Chia, 2004). Kolodner et al. (2003) also indicated that, in a PBL process, students learn by solving real-world problems and reflecting on their experiences because real-world problems are complicated, students work together in groups where they pool their expertise and experiences together and cope with complexities of issues that must be considered. In PBL, information that students collect about unit of study is learned for the purpose of solving a problem. Therefore, problems are introduced at the beginning of a unit of instruction. This order is different from traditional teaching methods which present problems only after students have learned the necessary body of knowledge. The “problem-first” approach in PBL ensures that students know why they are learning about what they are learning (Gallagher et al., 1995), hence rising intrinsic motivation for learning (Chin & Chia, 2004).

Literature indicated effectiveness of PBL on development of a range of skills comprising active participation in learning process, taking responsibility for their own learning, becoming better learners in terms of communication and group work skills, evaluating different resources and assessing validity of these resources (Bernstein, Tipping, Bercovitz, & Skinner 1995, Eng, 2000, Gibbon & Wall 2005, Lieux, 1996, Lo, 2004, Vernon, 1995). According to Peterson and Treagust (2001) PBL was defined to develop students’ knowledge bases in their profession, and their reasoning and problem-solving abilities related with the discipline. Additionally, PBL helped students improve their critical thinking, problem solving and time management skills and encouraged them to do research for more detailed information beyond what was presented in the classroom (Araz & Sungur, 2007). As a different perspective, McBroom and McBroom (2001) proposed that students who completed the PBL tasks experienced change in attitude toward PBL application with positive direction and an apparent gain in self-confidence. Similarly, Harland (2002) observed that students in PBL environment undertook both of roles of teacher and student and they contributed to increase in knowledge levels of peers and teachers. Yee (2007) wrote other important advantages of PBL as to provide easier understanding and use of knowledge, positive attitude toward learning, and positive relationship among students and to increase in higher order thinking skills.

In the studies showing the effectiveness of PBL, advantages of PBL were shown from different points of view and its effect on higher order thinking skills were shown to be positive. In the process of PBL, students are in need of use higher order thinking skills while they decide on which of strategies and techniques should be used, which solution ways can be used and how they incorporate selected solution into application plan (Bentley and Watts, 1989). Higher order thinking skills correspond to analysis, synthesis and evaluation stages of Bloom’s taxonomy of cognitive abilities. Indeed, learning experiences focusing on analysis, evaluation, and synthesis, develop skills in problem solving, inferring, estimating, predicting, generalising and creative thinking, question posing, decision making, critical and systemic thinking, which are all considered as higher order thinking skills (Dori et al, 2003, Barak et al., 2007). In addition to these, reasoning ability is another type of higher order thinking skills as a potential variable for PBL studies. Piagetian approach accepts reasoning ability as higher level cognitive ability and the most important indicator of cognitive development. Differently from other higher order thinking skills, reasoning ability is an important ingredient of inquiry process and informed decision making .

Prominence of inquiry and informed decision making have been indicated by different studies in science education literature (Abd-El-Khalick et al., 2004; Chin & Chia, 2006). Reasoning ability has also an important role in meaningfully construction of science concepts (Tan, 2007, Lawson et al., 2007). By taking into account importance and potential of reasoning ability for inquiry process, informed decision making and academic performances of students, this study focused effect of PBL as a context for inquiry process on reasoning ability as a dependent variable indicating higher order thinking skill.

As another point, majority of existent literature on PBL at the level of elementary education have not used facilitators such as computer simulations (Araz & Sungur, 2007). But, simulations have a great potential for PBL teaching process. According to Sahin (2006), instruction supported by computer simulations provides students the opportunity to observe a real world experience and interact with it. Especially, in science classrooms, simulation can play an important role in creating virtual experiments and inquiry. At the same time, simulations might contribute to conceptual change, provide open-ended experiences for students; provide tools for scientific inquiry and problem solving experiences. In line with these ideas, Araz and Sungur (2007) also recommended use of simulation to increase effectiveness of PBL and stated that computer simulations facilitate to learn concepts and processes of science by PBL.

Therefore, the purpose of this study is to investigate effectiveness of PBL application supported by interactive computer simulations on reasoning ability.

2. Method

The study was conducted with a quantitative methodology by using a non-equivalent groups quasi-experimental design. For purpose of the study, PBL applications were conducted in two intact classes of an elementary school in Zonguldak, Turkey.

2.1. Sample

The sample of this research consisted of 54 students (28-experimental group, 26-control group) enrolled in two eighth grade classes of a public middle school in Zonguldak, Turkey. The mean age of the students was 14 and majority of the students were from middle-class families in terms of socio-economical status. One of the classes was randomly assigned as experimental group and instructed by means of PBL, whereas the other class was assigned as the control group and instructed by means of common instructional approach. The applications made in both groups were done by teacher of the classes.

2.2. Instruments

In this study, in addition to personal information questionnaire, one instrument; The Test of Logical Thinking was utilized to collect data. The instrument was applied as pre and post-tests in both groups.

2.2.1. The Test of Logical Thinking (TOLT)

The Test of Logical Thinking (TOLT) developed by Roadranga, Yeany and Padilla (1982) and adapted by Korkmaz (2002) was used to measure formal reasoning ability of the students. The test included 18 multiple choice and three open ended items. Students respond to each item by selecting a response and also their reason for selecting that response. For an item to be scored correct, the student must give both the best answer and the best justification. TOLT measured 6 logical processes. These processes are conservation (1item), mass (1 item),

length (1 item), volume (1 item), proportional comparison (6 item), controlling the variables (4 item), consolidative comparison (3 item), probabilistic comparison (2 item) and relational comparison (2 item). According to the study of Korkmaz (2002), the test was found to be appropriate for students at 6th grade level and above. The time required for completion of the test was 45 minutes. The alpha reliability of the test was 0.77. In the scoring process, one point was given to each true answer and satisfactory reason for the first 18 items, and one point was given to each true answer for the other questions.

2.3 Treatment

A total of 54 eighth grade students enrolled in science courses at a middle school were involved in the study. The study was carried out during four weeks in 2009-2010 fall semester (total number of hours for unit =16 hours). The instruction period for each class was four 40-minute sessions per week.

Experimental group, in which PBL was applied, included heterogeneous groups of four or five individuals who varied in gender and academic achievement. To construct heterogeneous groups was thought to be effective in providing high level interaction among students (Watson & Marshall, 1995). After construction of the heterogeneous groups and pretesting, each of the groups in experimental group was asked to produce problem situations regarding to one of the titles about “buoyant force in liquids and gases and related factors” subject at the first stage of the study. Then, the groups constructed scenarios including at least three alternatives of problem sentences after they wrote problem questions. In the following stage, the groups chose one scenario from three alternatives by discussing about the aspects of the scenarios. After the selection of scenario, the groups determined three sub-problems about their scenarios. Then, members of the groups presented their prior knowledge about scenario and its sub-problems. In addition, the participants decided about what they needed to know further and they shared task about researching on the scenario and the sub-problems by using reliable knowledge resources.

In the second stage, the groups evaluated and synthesized knowledge they found in the different sources; internet, journals, and books etc. Moreover, the participants used interactive computer simulations and packet programs about the subject in school computer lab. Based on their knowledge, the groups suggested different solutions on each sub-problem by brainstorming. By the way of brainstorming, the groups recommended too many solution ways as possible as they have done. After finding solution ways, the groups decided about which solution ways were valid and reliable. For making decisions, the groups shared the task of reaching experts and finding additional resources.

In the third stage, the groups eliminated some of alternative solution ways by using expert opinion and knowledge from resources and explained the most appropriate solution way for each sub-problem by stating the rationale of the eliminations. Then, the groups wrote their solution ways for each sub-problem in the form of hypothesis. The reason for asking to write the solution ways in form of hypothesis was that students should design experiments to test these hypotheses. As such, the groups might also have taken the opportunity of presenting their solution ways in an order. For the following stage, each group also shared the task of finding required materials and tools regarding to their experiments.

In the fourth stage, the groups designed their experiments and tested the hypotheses in an order. First, the groups made trials on their experiments before presenting them. Second, they presented their experiments to

whole class. Therefore, the experiments were observed by the other groups of the same class. At the last stage, the instrument was applied as post-test.

During the process of applications made by the students, teacher observed all groups by visiting them and provided guidance when it was required. Teacher did not give any content knowledge in spite of the groups' demands for driving the groups to do more research by themselves. At the same time, teacher examined all of the works of the groups and provided feedback for lack parts. In some situations, teacher warned the groups for studying as a group rather than individual struggles and recalled importance of group performance. In addition, teacher facilitated the process of applications by providing support for the great problems which had a potential to interfere with the process of the study.

In the control group, traditional method was used during the study time. The learning environment was teacher-centered and lessons were taught by considering objectives of the units with lecture and question-answer techniques. The units were the same with those for experimental group. The students were asked to be prepared for the units before the lessons and question-answer technique was used as beginning activity to teach the unit. Pre-knowledge levels of them were determined and the studies on the unit were presented with lecture and question-answer approaches. After that activity, the students were asked to study on the subjects. The control group students experienced an instruction in which explanations and questions of the teacher were focus and knowledge-centered approach was conducted. In this process, the direction of communication between student and teacher was from teacher to students. Similarly to experimental group students, control group students took the instrument as pre-and post tests.

2.4. Data Analysis

In the study, two variables; one dependent and one independent, were investigated. For analyzing of the data, t tests for independent and paired samples were utilized for its appropriateness to compare two groups on dependent variable. For purpose of this study, four different statistical processes were conducted, so family-wise alpha level (.05) was adjusted by Benforroni approach. Therefore, throughout analyses, .0125 was used as alpha value in this study.

3. Results

To compare the students' pre and post test scores of reasoning, the TOLT was administered to both groups before and after the treatment. In order to examine the effectiveness of the PBL on students' reasoning abilities, the scores acquired in pre- and post-tests of the TOLT were analysed by t-tests.

As can be seen in Table 1, independent sample t-test analysis showed no statistically significant difference between the mean scores of the control and experimental groups with respect to their prior reasoning abilities on the TOLT ($M_{\text{cont}} = 3.53$; $SD_{\text{cont}} = 2.25$ and $M_{\text{exp}} = 4.46$; $SD_{\text{exp}} = 3.32$; $t_{(52)} = .233$; $p > .0125$). The magnitude of the difference in the means was small ($\eta^2 = .02$) This result demonstrated that the students' reasoning ability levels in both groups were similar to each other before the treatment.

When looked at the results after the treatment, independent sample t-test analysis revealed a statistically significant difference between the control and experimental groups' mean scores on the TOLT in favour of the experimental group ($M_{\text{cont}} = 3.75$; $SD_{\text{cont}} = 2.60$ and $M_{\text{exp}} = 6.00$; $SD_{\text{exp}} = 3.45$; $t_{(52)} = 2.71$; $p < .0125$). The magnitude of the differences in the means was medium ($\eta^2 = .12$). The students in the experimental group demonstrated more increase in reasoning ability than the control group students.

Table 1 Independent t-test results for groups' reasoning ability scores

Tests	Groups	<i>N</i>	<i>M</i>	<i>SD</i>	<i>df</i>	<i>t</i>	<i>p</i>	η^2
Pre-test	Control group	28	3.53	2.25	52	1.2	.233	0.02
	Experimental group	26	4.46	3.32				
Post-test	Control group	28	3.75	2.60	52	2.71	.009*	0.12
	Experimental group	26	6.00	3.45				

Paired sample t-test statistics showed a no statistically significant mean difference between pre- and post-test mean scores of control group ($M = 3.75$; $SD = 2.60$; $t_{(27)} = .62$; $p > .0125$, Eta squared=.01) while there was a statistically significant mean difference between pre- and post-test mean scores of experimental group ($M = 6.00$; $SD = 3.45$; $t_{(25)} = 2.79$; $p < .0125$, Eta squared=.24) with respect to reasoning ability on the TOLT (Table 2).

Table 2. Paired t-test results for groups' reasoning ability scores

Groups	Tests	<i>N</i>	<i>M</i>	<i>SD</i>	<i>df</i>	<i>t</i>	<i>p</i>	η^2

4. Discussion

This study compared effectiveness of PBL instruction supported by computer simulations and common instructional approach on elementary students' reasoning ability at the context of "Buoyant Force in liquids and gases" subject. The results of this study showed that the students in PBL group had higher reasoning ability than the students in comparison group after the treatment. The difference between groups can be explained by effectiveness of PBL process on reasoning ability components. The TOLT included items on proportional comparison, controlling variables, consolidative comparison, probabilistic comparison and relational comparison as components of reasoning ability. In parallel to the components of the test, PBL application might have provided the opportunity of using higher-order reasoning components in finding useful solution ways. In addition, the students might have taken the opportunity to use reasoning ability during the first two stages of PBL application in which the students gathered knowledge, commented on the knowledge and eventually synthesized what they have learned. Studies have also shown that by reflecting upon learning during PBL process, students are able to analyse and synthesize the contextual information, acquire further knowledge and assimilate it into their existing knowledge base (Nelson, Sadler, & Surtees, 2004). According to Lam (2009) many studies have found that students in PBL curricula are likely to transfer higher order thinking to new situations. The study carried out by Krynock and Robb (1996) showed that PBL does increase higher order thinking skills of eight grade students by requiring them to think about a problem critically and analyzing data to find the solution. Wong and Day (2009) have also found PBL to be effective on increasing higher-order thinking ability at the level of junior secondary school. These results are in line with result of this study on higher order thinking skills as correlates of reasoning ability.

In the world, what is important for people who need solve open-ended problems in collaboration for their life is to use knowledge effectively rather than to record simply knowledge into mind. With this idea in mind, requirement for PBL applications in learning contexts emerges due to focus of the approach on group processes, problem solving and real life situations. Every effort in dealing with ill-structured open-ended problems by studying in groups might lead to departure with maximum gains from learning environments. PBL applications

might provide much more benefits from use of knowledge for solution to gain of higher order thinking skills (e.g. reasoning ability, creative thinking, critical thinking etc.) and of collaborative study habits such as communication and interaction than traditional applications. PBL might be used more effectively in learning contexts. For instance; technologically equipped PBL contexts might be used to increase visuality of the subject. Again, if this way is accompanied by interactive experience, the students can focus on the problem more effectively and internalize the problem.

In this study, effectiveness of PBL on reasoning ability has been shown. In the effectiveness of the approach, incorporation of the computer simulation was thought to be contributor and facilitator. For the role of computer simulations, it can be said that abstract concepts and principles might be converted into more concrete subjects by the simulations. The same effect of the simulation might have been valid for the increase in reasoning ability. As stated by Sahin (2006), simulations can contribute to conceptual change, provide open-ended experiences for students; provide tools for scientific inquiry and problem solving experiences. In addition, Kumar and Sherwood (2007) have shown the effectiveness of problem based simulations on conceptual understandings of students. In another study of Kumar (2010), he stated that interactive video technology reached new heights in providing anchors for problem-based learning. During inquiry process supported with visualisation, development of reasoning ability is easier due to continuous use of reasoning ability in inquiry process.

The results of this study have importance in science education. First, the study has been providing empirical evidence for effectiveness of PBL supported with computer simulations at the level of elementary students. Second, the experimental nature of the study has been giving the opportunity of finding cause-effect relationship. As the other implication of this study, applications of the study have been providing a guide for science educators who want to design an instruction by using PBL approach to increase reasoning ability. The support of the computer simulations is another important aspect of this study, because the abstract concepts of physics have been converted into more concrete objects. Therefore, this study has been describing a way of incorporation of effective computer simulations into PBL instruction.

Although the study has an importance for application of PBL in science education environment, this study has some limitations regarding to internal and external validity. Number of the subjects and the topic studied are limitations of this study for generalizability aspect. In addition, quasi-experimental nature of the study with non-random assignment is another limitation to eliminate threat factor including pre-existent difference between participant characteristics of the groups.

Based on the results of this study, it can be suggested that more sample is needed to increase generalizability of the study. At the same time, the subject of "buoyant force in liquids and gases" has been focused in this study, so the method should be applied to other physics subjects to increase external validity of the study. As another suggestion, true experimental method should be used with random assignment in future studies to overcome internal validity threats.

Appendix D. Examples of Simulations

Screen 1.

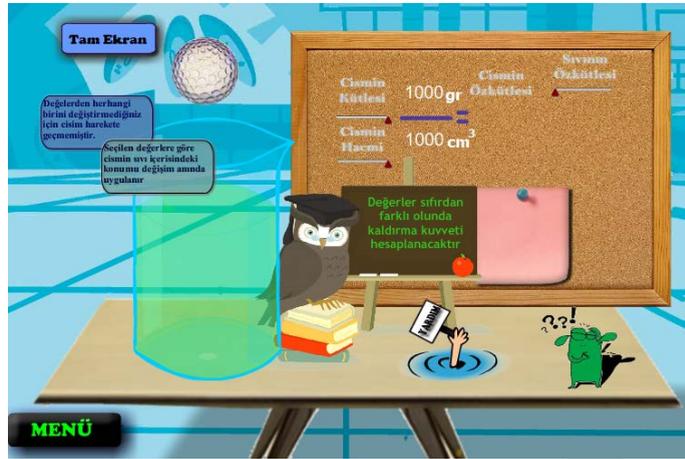

The student doesn't observe any changes until he interacts with the simulation. When the "release" button on the simulation is pressed, both objects tied to the two dynamometers are released. As one of the objects drops into the liquid in the beaker glass, the other remains in the same atmosphere (in the air). As buoyant force is applied to the object in the liquid, the value read on the dynamometer decreases considerably.

Screen 2.

The objects inside the glass globe and in the atmospheric environment which are tied to dynamometers are released when the "release" button is pushed. In addition, in order to empty the air in the glass globe, the amount of air inside the glass globe is adjusted by clicking the arrows near the cylinder. When the arrow which points to the right is clicked, the cylinder comes out and the air inside the globe is emptied. If it is emptied (on condition that the cylinder is already out) as the arrow which points to the left is clicked, the cylinder goes in and the globe is filled with air. The air in the globe can be checked via the gauge connected to the globe. If the user has emptied the

air inside the globe with the help of the cylinder, when released, the objects are balanced in a state in which the object inside the globe is lower. If the air inside the globe hasn't been emptied, both objects are balanced at the same level.

Screen 3.

In the section where the variables which buoyant force is dependent on except gravitational acceleration are analysed, the user can adjust the mass and volume of the object and the density of the liquid as desired. The density of the object is not displayed until the mass and volume of the object take a numeric value. The information as to how the user is going to change these variables is represented by the balloon which appears when the user puts the cursor on the names of sliders. Similarly, the value of the buoyant force appears on the screen when the density of the liquid is adjusted. The simulation doesn't make any calculations until the user defines values for all the variables. When all the variables on which buoyant force have been defined, the value of the buoyant force is presented by the simulation. When any change on the variables is made, the object immersed into the liquid is affected by these changes, and the location of the object is updated according to the interaction between, the density of the object and that of the liquid. This update process is animated in the animation and the object moves in a way close to real. Numeric values are provided on the panel about the immersed part of the object. To get information about the location of the object, the pointer is moved on the object, information about the location is provided in the speech balloon that appears on the screen. When the help icon on the table is clicked, a help screen about the simulation appears.

4th International Conference on New Horizons in Education

The Effectiveness of using Social Communications Networks in Mathematics Teachers Professional development

Hussein, Hisham Barakat*

Associate Professor of Mathematics Education, Curricula and Instructional Department, Teachers College, King Saud University, Riyadh, Saudi Arabia, Email: hbisher@hotmail.com , Website: <http://hishamh.net>

Abstract

The Study Aims to Determine the Effectiveness of using Social Communications Networks in Mathematics Teachers Professional development. The Main Research Questions was: What is The Effectiveness of using Social Communications Networks in Mathematics Teachers Professional development. And the sub Questions were: (1) what are the standards of sustainable mathematics teachers' Professional development? (2) What are the main features of a sustainable mathematics teachers' Professional development program?.. The Research Using the semi experimental methodology, the research group was (20) Elementary Mathematics Teachers.

The Result indicate the effectiveness of social networking in the for mathematics Teachers professional development program. And determine the Procedural Standards for mathematics Teachers Professional Development, Presented applied Vision for Mathematics Teachers Professional Development Program.

The result recommended that work on the development of intensive training to clarify the objectives and methods of use and activation of Social Networking in Professional Development, and give Attention to the provision of Computers and wireless internet access in schools, teacher training on using social networks, work to develop a strategy to activate these networks formally within the curriculum, and to encourage and support models and successful experiences in this field and published this deployment.

Keywords: Social communications networking, professional development, mathematics teachers

1. Introduction

The rapid development in all higher education institutions and technological resources made the ELearning Teaching has been recently stressed. Using Educational technology became a core and critical issue in education, In line with the fast advance seen in technology, the use of technological resources in education has play an important role in terms of drawing students' attention to the subjects studied in the classroom so that success increases and the knowledge is better internalized. (Can, Sendil, 2010). In addition, Teachers Have to know and use all new technological resources which facilitate the teaching and learning process, especially as using Social networks as means of Educations.

The great deal of cognitive and technological accelerating development in the world today which appears – especially- in the emergence of development of communication technologies, and the dominance of technology in general to all life situations, led to substantial exchanges in the methods of educational communication in both physical and human dimensions. That the technological, cultural, economical, and political challenges, so as the emergence of claims for quality and academic accreditation besides seeking precedence, imposed the necessity to

* Corresponding author. Hisham Hussein Tel +00966- 505514695; fax: +00966112088392 Ext 111
E-mail address: hbisher@hotmail.com

make radical changes in both the political , economical and the educational system in both the developed and developing world alike.

So the educational institutions are trying hard to cope with the variables of this age, shift towards electronic learning systems through activating the educational and information technology to reach the concept of positive learning which is based on cooperation among strategies of quality, access and lifelong learning using network based learning systems and application of the second generation of internet "Web 2.0" including the new techniques for digital reality that made a large changes in the classroom with the modern ways of communication between teacher and student , and among students themselves, so as with the potentials for knowledge management in academic learning environment.

Thus, every teacher in Arabic school should develop and modify his performance and build up himself professionally and cognitively, to comply with the information age, and to exceed challenges by having the knowledge and the ability to make it more, and upgrading his cognitive, cultural, technological and information experience. That can be achieved by depending on computer technology and internet that will make every teacher playing the roles of the "facilitator, guide, advisor and leader" to be able to fulfil his students needs.

That was the aim of the educational systems all over the world, by providing different opportunities to build up the teacher in an integration way to raise the level of the educational process, that the teacher consider one of the pillars of the educational system, so without a qualified, academic well trained teacher aware of his role well , any education system can't achieve its objectives. Besides the explosion of information and the world gets in to the information technology and telecommunication and the high-tech , it becomes a deep need to a developed teacher coping with his age, and to fulfil the students' needs and has the ability to deal with the technological tools to build and transfer information in different ways to meet the community needs and to be a producer for information through education directions and ongoing techniques and through the variables of the evolution of education and information technology.

So, the emergence of social communication networking sites on the Internet, is a natural result of the human needs to build a relationships and advanced and conversational interactions that rebuild relationships between individuals through the concept of individualism which is one of the requirements of using computer or we can say 'computer side effects. Because of that, These social networking has the strongest impact on the growth of the user's number of these networks, these users have the highest percentage of all interested users who use the applications of web 2.0. so each educational system should be aware of what are the modern technology applications in Web 2.0 and how to get use of it in the professional development to overcome gaps in the development of the educational system and its obstacles of time, low budgets, and the abstention of beneficiaries to get in professional development programs.

All of the above shows the extent of the use of social networking in teaching and learning and professional development, which reflects the importance of the current study as it discuss a none touched area by Arabic studies.

They are many studies refer that, the Using of Social networks (Facebook for Example) has Effectvnes in teaching and Training as: Chen· Y. C. (2008), Coyle· J. (2007), Craig Deed; Anthony Edwards(2010), Cristina Maria BĂLTAREȚU; Delia Cristina BALABAN(2010), Ellison, Nicole B., Steinfield, Charles, Lampe, Cliff (2007), Federica Oradini, Gunter Saunders.(2007) , Filiz Tiryakioglu ; Funda Erzurum (2011), Kevin P. Brady, Lori B. Holcomb, and Bethany V. Smith (2010), Klassen· J. D. (2005) Lockyer; J. Patterson (2008), Marianne Lenox & Maurice Coleman (2010), Mpine Makoe, Exploring the use of MXit(2010), Murphy· J· & Lebars· R. (2008), Naomi Kurata (2010), Ryan· R. B. (2007), Sacide Güzin Mazman; Yasemin Koçak Usluel(2009), Vasudha Kamat, Devika , Vildan Donmus (2010), Wolf M . Alison. (2010), Yih-Ruey JUANG (2010), YU-CHING CHEN (2008).

2. The Study

2.1. *The Problem of the study:*

The professional development system of Mathematics Teachers faces many defects which strictly the benefits of all development efforts, then this study try to involve the Social networks in mathematics Teachers professional development, which agree with studies of (Giraud, 1997; Keeler & Steinhorst, 1995; Rohrbeck, Ginsburg-Block, Fantuzzo & Miller, 2003).

The study main question is:

What is the effectiveness of Social networks in mathematics Teachers professional development?

The sub questions are:

- What is the reality of mathematics Teachers professional development?
- What are the professional needs of mathematics Teachers?
- What are the main features of Training programme based on Social networks for professional development of mathematics Teachers?
- What are the effectiveness of the suggested program in developing the teaching performance of mathematics teachers?

2.2. *The Limitations:*

- The Domain of Teaching skills of professional development domains.
- Elementary mathematics Teachers?

2.3. *The Tools:*

- Electronic Questionnaire directed to Elementary mathematics Teachers
- List of Professional development needs.
- Program for Elementary mathematics Teachers Professional development
- Performance Teaching Test

2.4. *The producers:*

- Building an Electronic Questionnaire directed to Elementary mathematics Teachers for exploring the reality of professional development.
- Building List of Professional development needs.
- Building The Training programme (defines the aims – the content - The Levels of the programme - The Time table - open the Facebook Page – trainers invitations)
- Pre-test
- Train the teachers
- Post-test

2.5. The Result:

The researchers found some result about the effectiveness of the suggested program in developing the teaching performance of mathematics teachers

are being displayed in the following tables:

Table (1) Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	Pre Post	-67.82500	6.39666	1.01140	-69.87075	-65.77925	-67.060	39	.000

Table (2) The descriptive statistical of pre-post

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Pre	20	64.9500	4.96806	1.11089	62.6249	67.2751	58.00	73.00
Post	20	73.7000	5.26258	1.17675	71.2370	76.1630	63.00	80.00
Total	40	69.3250	6.71923	1.06240	67.1761	71.4739	58.00	80.00

Table (3) F-test of pre-post test

	Sum of Squares	DF	Mean Square	F	Sig.
Between Groups	765.625	1	765.625	29.236	.000
Within Groups	995.150	38	26.188		
Total	1760.775	39			

From the last tables, there are an effectiveness of the Social networks in developing the teaching performance of mathematics teachers. This result agree with the result of many studies as: (Lenox & Coleman 2010) , Lockyer ; Patterson,2008, Wolf,2009. The result recommended that work on the development of intensive training to clarify the objectives and methods of use and activation of Social Networking in Professional Development, and give Attention to the provision of Computers and wireless internet access in schools, teacher training on using social networks, work to develop a strategy to activate these networks formally within the curriculum, and to encourage and support models and successful experiences in this field and published this deployment.

2.6. The suggestions:

- Involving the social networks in Teachers professional development
- Doing more studies about using WEB2 in Teachers professional development

The Author:

Hisham Barakat Hussein is an Associate Professor of mathematics Education In Teachers College - King Saud University, Riyadh, Saudi Arabia. He worked in the college as Part-time consultant for Quality and Accreditations In Quality Unit. Formerly He worked as Mathematics Teacher and Educational Researcher in Ministry of educations at Cairo, Egypt. He is a member in many professional and academic Associations in USA, Egypt and Saudi Arabia. He has published many Articles and books in Bothe Arabic and English, his research interest include E-Learning, Mathematics Education, Teacher Education, Professional Development, Quality and Accreditations and Authentic Assessment. Also He is Senior Certified Trainer in many Fields.

4th International Conference on New Horizons in Education

The effectiveness of music in grammar teaching on the motivation and success of the students at preparatory school at Uludağ University

Zehra Ezgi Kara^{a*}, Aynur Semerci Aksel^b

a Uludağ University, Faculty of Education 16059, "Bursa", Turkey

b Uludağ University, School of Foreign Languages 16369, "Bursa", Turkey

Abstract

The purpose of this study was to determine the effectiveness of music in grammar teaching to university students. The study was conducted with elementary level students at School of Foreign Languages at Uludağ University. Two participating groups each composed of 19 students were selected randomly. The control group was taught in traditional methods without any use of audio materials. The experimental group was taught the same grammatical structure with the help of selected songs and class activities including singing with musical instruments. The data were collected through a pre-test and a post-test which measured students' grammar competence. The test results of both groups were scored and compared. In order to evaluate motivation of the experimental group, a survey was conducted.

Keywords: Grammar Teaching, Motivation, Music

1. INTRODUCTION

Today, many researchers in the realm of English Language Teaching (ELT) have emphasized the contribution of utilizing various educational tools to enhance foreign language learning. Brown (2001) states that a variety of techniques in language classes will ensure that a maximum number of students will be reached. Thus, he suggests using visual and auditory techniques and instruments to support interaction among learners. Music is one of the most efficient instruments serving this purpose. According to Speckman (2004), music is a common instructional tool in second language classrooms. Since music is a pedagogical resource for language learning, songs have become an integral part of our language experience (Cruz-Cruz, 2005).

Sağlam and Kayaoğlu (2010) emphasize the importance of music in ELT context since they regard music as a potential device in order to promote language abilities. On the importance of using music in language teaching, Edwards (1997) points out as following:

Music can be used in a second language setting to lessen anxiety and lower the affective filter, promote self-esteem, increase motivation to learn a new

E-mail address: zehraezgikara@hotmail.com

language, address multiple intelligences, aid in memory retention and increase cultural awareness and appreciation.

Mizener (2008) states that singing and other musical activities provide an enjoyable means of practicing language skills. Jolly (1975) states that there is a close relationship between language and music since both entities have significant common elements and similarities. In her study on the effects of songs in foreign language learning, Jolly used songs in Japanese conversation courses for two semesters. At the end of the term, she asked her students to rate the songs according to their usefulness. Based on the empirical observations, she concludes that the songs served both psychological and educational needs of the learners.

McCarthy (1985) makes a good case for using music in language development. He maintains that skills in word recognition, comprehension, reading study, and literary appreciation are reinforced by singing songs. He further states that performing songs and rhymes provides practice in rhythm, form, dynamics, and mood concepts and skills common to language and music.

Mashayekh and Hashemi (2011) point out that the role of music in learning can be described in terms of enhancement of social harmony, motivation force, and tool for learning. They suggest that language teachers should familiarize themselves with the pedagogical applications of music in language classes and the effects of music on thought and behavior of the learners. These features of songs facilitate not only academic success of learners but also the atmosphere of the learning environment and learners' motivation. With regards to the effects of music on learners' motivation, Ur (1999) states that entertainment produces enjoyment, which in return adds motivation. She also proposes that appropriate grammar focusing techniques should be as lively and intrinsically motivating as possible. Brown (2001) underlies the importance of motivating activities which appeal to learners' interests and goals. He regards singing songs as a way to lower learners' inhibitions and to encourage them to use their right-brain processing.

Music and songs may help learners reduce their anxiety and stress when learning a foreign language. On the effect of music and melody to reduce stress and anxiety, Keskin (2011) emphasizes that activities which make use of songs have positive effects on students' language learning process. These activities also help them to be encouraged toward foreign language learning. According to Çakır (2006), audio-visual materials are a great help in stimulating and facilitating the learning of a foreign language. He points out that all audio visual materials have positive contributions to language learning as long as they are used at the right time, in the right place (as cited by Keskin, 2011).

According to Sariçoban (2000), utilizing songs in class environment not only amuses students but also helps them feel relaxed and get rid of their negative attitudes towards a foreign language learning. Sariçoban (2000) underlies the effects of songs in language classrooms by regarding them as one of the most enchanting and culturally rich resources to be used in language classrooms. He states that songs offer a change from routine

classroom activities. He also points that if selected properly and adopted carefully, a teacher should benefit from songs when teaching grammar. As for the teaching implications, he points out as following:

...the use of songs in language classrooms provides many advantages. They entertain and relax the learners while they are learning or practicing a structure, and they often eliminate the students' negative attitude towards learning. Through providing authenticity and context they make the grammar points more understandable and easy.

Abrate (1983) states that there are many benefits of utilizing popular songs such as holding attention and interest of students, introducing native and colloquial use of the language, presenting cultural phenomena and points of view, providing device and context for learning and creating an entertaining alternative to textbook study. Abrate also states that songs can be utilized to teach vocabulary and listening comprehension, grammar, and many other language skills. She suggests making use of various useful exercises serving this purpose.

Maria Luisa Cruz- Cruz (2005) conducted a study to determine the effectiveness of selected music and songs on teaching grammar and vocabulary. She concludes that music and songs can be an effective instructional supplement to teaching English grammar and vocabulary. She adds that the use of appropriate music can make learners feel energetic and motivated.

Smith (2003) states that music and language are closely related systems and beside the motivating effect or the change of pace they bring, serious issues affecting academic success can be addressed as well. Most of the research indicates that language processors in our brains also help us process harmony in musical relationships (Patel, 2008). According to Trollinger (2010), the study of language in relationship to music perception shows strong relationships between musical perception and processing with language. On the relation between music and language Trollinger points out as following:

Most imaging research about the brain and music involves studies of instrumentalists, instrumental training, and musical development that show a great amount of activity in Broca's area when processing musical melody, processing rhythm, and performing on an instrument. These findings have led many brain researches to conclude that instrumental musical training, musical perception and processing and language are strongly connected.

Moreover, Maess & Koelsch (2001) point that neurological research has shown that musical and lingual processes occur in the same section of brain, and there are significant similarities between musical and lingual syntax. Schön (2005) states that they found a strong overlap of the regions involved in language, music, and song processing. These findings support the hypothesis that the linguistic and melodic components of songs are

processed in interaction. Cruz- Cruz (2005) states that utilizing songs in teaching helps enhance integration and create a link between the right brain's processing of music and rhythm and the left brain's processing of verbal information. Considering these integration, the importance of using songs in language teaching can be regarded as a crucial factor to enhance learning.

2. METHODOLOGY

The present study was conducted with elementary level students at School of Foreign Languages, Uludag University in 2012-2013 academic year, spring term. Two groups each composed of nineteen students were selected randomly. One of the classes was selected as the experimental group while the other as the control group. All of the students are native speakers of Turkish.

At the beginning of the study, the grammar points to be studied were selected from the school curriculum. In order not to stay behind the pacing schedule, limited number of grammar subjects were selected. For the same reason again, the amount of time was restricted to ten days. The grammatical structures to be studied were *Present Simple*, *Present Continuous*, *Simple Past*, *Be: Future (will)* and *Past Tense (was, were)*.

As for the selection of the songs, three main criteria proposed by Abrate (1983) were applied. These criteria were the students' ability, the musical accompaniment, and the speed of the song. When determining the songs to be utilized for the study, the language and the speed of the songs, and students' level were all taken into consideration. In terms of grammar, the lyrics were easily comprehensible with the correct use of grammar in parallel with the grammar structures to be taught. The selected songs for the study were *Wonderful Tonight* by Eric Clapton, *The Way You Are* by Bruno Mars, *Lemon Tree* by Fool's Garden, *Killing me softly* by Fugees, *Bang Bang* by Nancy Sinatra, and *Oue Sera* by Jay Livingston, Ray Evans. With regards to musical aspect, songs with catchy and simple rhythm were selected. The songs had short utterances and motives with adequate repetitions. The definitions of the unknown verbs in the songs were given by the instructor.

In order to evaluate and compare the level of both groups, students were given a pre-test and a post-test. The pre-test consisted of 15 questions measuring the students' existing knowledge of grammar structures. Students were to answer 5 questions by filling-in-the blanks, and 10 questions from multiple choice section.

In both groups, grammar points were introduced in the same way. After greetings, taking attendance and lead-in activities, the grammar points were explained explicitly by the instructors and the students were asked to do the exercises in the course book. Following the exercises, the students created their own exercises and worked on the structure of the sentences. These steps were the same in both groups but the next step was different. In the experimental group, the students listened to English songs twice and did exercises including fill-in the blanks, correcting the errors and choosing the correct verbs. Each song activity lasted ten minutes. These activities were

done in eight lessons. In the last lesson, the songs were performed with the guitar played by two music teachers. The students participated to the lesson actively by singing.

On the last day of the study, both groups were given a post-test which included fifteen questions. The students were to answer five multiple-choice and ten fill-in-the blanks type of questions in the test. Following the post-test, the experimental group was also given a survey which evaluated their motivation. There were four questions in the survey which aimed to analyze the students' thoughts on the study.

2.1. STATISTICAL METHOD

The results of Box's M test that was applied to the data obtained from the study verified that variation covariance matrix was homogenous. The suitability of the data according to the normal distribution was controlled via Anderson Darling test. It was observed that the collected data met the pre-requisites of the parametric tests and repeated measurement ANOVA was applied.

In the study, repeated measurement ANOVA technique was applied to the values of the tests graded out of 100. In the trial, group factors have two levels namely teaching English with classical method and by means of music. Time factor has two levels namely as pre and post tests. Repeated measurements were realized at the levels of time factor.

3. RESULTS

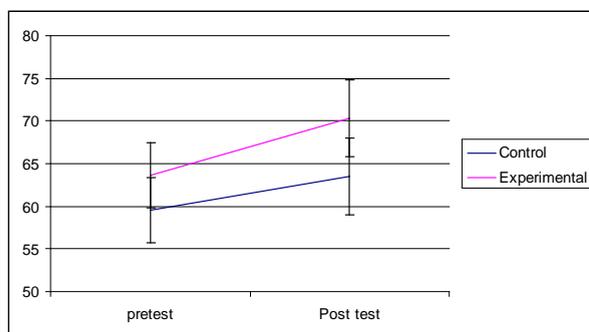

The results of the analysis of variance applied to the data have indicated that the group*time interaction and differences between the averages of group are not statistically significant. However, the differences between the averages of pre- and post-tests are statistically significant ($P < 0.05$).

Table 1. The level and sub-group averages of the factors applied in the study

	Pretest (mean±Std Error)	Post test (mean±Std Error)	Total (mean±Std Error)
Control (mean±Std Error)	59.58±3.84	63.47±4.51	61.53±3.82
Experimental (mean±Std Error)	63.63±3.84	70.37±4.51	67.00±3.82
TOTAL	61.61±2.72B	66.92±3.19A	

Analyzing Table 1, it is understood that the average value of the post test is 66.92, while the average value of the pre-test is 61.61, which points that the difference between these averages is not statistically significant. This difference is shown on the average values with Latin letters. It is also seen that the results of the post-tests are higher than that of the pre-tests. Although the average values are not regarded as statistically significant, the numeric size of the average values of the experimental group (67.00) is higher when compared to the average values of the control group (61.00).

Table 2. The level of success

The increase of the students' performance on the post-tests is shown in the graph in Table 2. The graph indicates that there has been an increase of four points in the control group, while seven points in the experimental group.

Table 3. Students' responses to the survey on the frequency of using songs in grammar lessons

	N	%
Some parts of every lesson	15	79
Once a week	4	21
Once a month	-	-
Never	-	-
Other	-	-

As shown in Table 3, the responses of the experimental group to the question of the survey on the frequency of using songs in grammar lessons have revealed that 79% of the students would like songs to be used in some

parts of every lesson, while 21% of them would like them to be utilized only once a week. This means that 100% of the students would like their grammar lessons assisted with song activities at least once a week.

Table 4. Students' responses to the survey on the use of songs as teaching materials

	N	%
Using songs in lessons increases my interest and sympathy towards the lessons.	12	63
I think songs should be utilized more often in grammar lessons.	11	58
Utilizing from songs make grammar lessons more enjoyable.	11	58
I find it useful to learn and practise grammar with songs.	10	53
I can memorize grammatical structures more easily with songs.	9	47
I can memorize vocabulary more easily with songs.	9	47
I do not find it useful to use songs in grammar lessons.	-	-
I get distracted when songs are used in lessons.	-	-

Table 4 shows the students' responses to the question of the survey on the use of songs as teaching materials. For this question, the students have chosen more than one option. Accordingly, 63% of the students have stated that using songs in lessons have increased their interest and sympathy towards the lessons. 58% of the students have stated that utilizing from songs in grammar lessons has made the lessons more enjoyable. 53% of the students have stated that they have found it useful to learn and practise grammar with songs. 47% of them have stated that they can memorize the grammatical structure and vocabulary more easily with songs.

The students are also asked to evaluate their level in grammar lessons. The results indicate that 16% of the students (N=3) have regarded themselves as excellent while 37% of them (N=7) as good, 37% of them (N=7) as average, and 10% as poor (N=2). Among the students, those who consider themselves as weak in terms of grammar have stated that they have found it useful to learn grammatical structures with the help of English songs.

As for the last part of the survey, the students have stated their own comments on using songs in grammar lessons. Some of the quotations of the students are as following:

"Song activities help us learn better. Since grammar is repetitive and monotonous, songs can make it more enjoyable. I think they should be utilized more."

“Grammar lessons require a lot of memorization, and thus, they are monotonous. Music and songs have made them more enjoyable. Moreover, it is useful to memorize grammatical points with the help of songs.”

“It is good to have diversities and variations in lessons. Memorizing lyrics makes it easier to learn grammar and new vocabulary.”

“I usually get bored in grammar lessons, but doing classroom activities with songs have made me enjoy the lesson. I think teachers should use songs in other lessons, too.”

This small-scale study was limited to ten days. If it had been extended, better results could have been gathered in terms of academic success of the students. As for the motivation of the students, expected results were obtained. The students' responses to the survey indicated that the songs and the activities related to them served both psychological and educational needs. Educationally, it is worth pointing out that the experimental group outperformed the control group in the post-test although the difference between the averages of the two groups is not statistically significant. In terms of motivation, most of the students stated that the songs created an enjoyable atmosphere and motivated them to learn a foreign language. This study needs more thorough research to analyze and evaluate the effects of songs on grammar teaching. More research could be carried out with songs to determine their effects on different aspects of language learning.

As language teachers, we should make use of audio-visual materials that will contribute to our students' success. Besides, we should seek ways to motivate our students as much as we can. Therefore, the benefits of songs should not be disregarded.

4th International Conference on New Horizons in Education

The effects of demonstration experiments on intellectually disabled learners' understanding the science of chemistry

Ümit Işık Erdoğan^a, Zühal Odabaşı^{b*}, Sinem Dinçol Özgür^a^aHacettepe University, Faculty of Education 06800, "Ankara", Turkey^bCanberk Special Education and Rehabilitation Centre,06540, "Ankara", Turkey

Abstract

This research examines the effects of demonstration experiment and worksheet practices on slightly intellectually disabled students' understanding the science of chemistry and the fields of application. The students with slight intellectual disabilities attending job learning schools in Ankara were included in the research. At the implementation stage of the research, a demonstration experiment was done in relation to matter and its properties, and worksheets prepared were administered to the students. For data collection purposes, video and audio recordings of in-class interviews in addition to observations and worksheets were used. Consequently, the data were analysed and evaluated.

Keywords: demonstration experiment, worksheet, in-class interviews, students with intellectual disability, chemistry

1. INTRODUCTION

In the definition made by American Association on Intellectual and Developmental Disabilities (AAIDD), the term intellectual disability was used instead of intellectual retardation, and such individuals were described as "individuals with remarkable restrictions in mental functions and in certain adaptive behaviors and who are observed to have such limitations before they are 18 years old" (AAMR, 2002)^{1†}. Although the classification of individuals with intellectual disabilities is usually made on the basis of intelligence quotient scores, they are also classified medically, pedagogically and according to the degree of help they need. Classification on the basis of intelligence quotient scores has been accepted by AAIDD for a long time. According to this approach, individuals who are influenced by intellectual disability are divided into four as individuals with slight, moderate, severe and profound disability. In this classification, 70-55 represent slight intellectual disability while 55/50-35 represent moderate level disability, 40/35-25 represent severe disability, and 25 and below represent profound (very serious) intellectual disability according to the intelligence quotient scores received from intelligence tests; in addition to that, 85% of individuals having intellectual disability are those with slight intellectual disability (Özokçu, 2010).

Most of the children with slight intellectual disability acquire the academic skills and job skills necessary for them to survive semi-dependently or independently by the time they are sixth graders, and they develop excellent social and communicative skills in adulthood, and they are no longer called incompetent when they

¹ American Association on Intellectual and Developmental Disabilities Mental Retardation - AAIDD, former name: American Association on Mental Retardation- AAMR

leave school (Heward, 1996). In the past, basic academic subjects such as literacy and arithmetics at the first stage of primary education and vocational education, job-labour at the second stage and in secondary education used to be emphasised as curricula for such children. Yet, at present, occupational education and the teaching of daily life skills are offered in the early years of primary school (Eripek, 2009). State and private schools are opened as special education vocational centres/schools for individuals who have completed primary education and who cannot continue general and occupational secondary education schools, needing special education, and who are under 23 years old to develop their basic life skills, to ensure their adjustment to society, to facilitate them to gain vocational knowledge and skills (MEB, 2012). Such students complete the primary and secondary education process with other students in the same schools. Generally speaking, mainstreaming– which may be defined as education of students with special needs together with their normal developing peers in the same schools (by preparing the grounds and offering support when necessary)- seems to be the most common and the most popular placement practice today in our country, as in developed countries.

Today, the education of students with special needs in general educational settings is on the increase. The fundamental thought underlying the placement of students with incompetence is to make sure that they receive education in the same settings with peers having no disabilities, as far as possible. Therefore, students with intellectual disabilities are placed in general education classes in many countries by taking the necessary precautions and making the preparations (Sucuoğlu, 2009). The basic aim of the curricula is to instil in individuals the social and daily life skills necessary for them to survive in the society independently. It is stressed that those students' learning objectives are similar to the normal peers' objectives, and that they are able to gain the skills in basic courses such as literacy, mathematics and science (Kaplan, 1996).

In recent years, when technology and science have been rapidly advancing, the importance attached to Science and Technology courses has been increasing; and the need for curricula to conform to the requirements of the modernity has become apparent (Saracaloğlu, Yenice & Özden, 2013). Thus, the curriculum for Science and Technology course in our country aims to “raise all the students- regardless of their individual differences- as science and technology literate people” (MEB, 2006). Scientific literacy was defined as the knowledge of what science is, in other words, as the knowledge of the nature of science (Lederman, 1998; McComas, Clough & Almazro, 2002; Shamos, 1995). The issue of how science should be taught, and the fact that the nature of science is a part of education have been discussed for years, and have been implemented through various programmes. Because science courses which are fused into the nature of science and effectively organised have considerable potential to provide students with skills to cope with problems they can encounter in real life (National Research Council (NRC), 1996, 2000). Individuals with special needs also receive education with their peers and they also have curiosity about the world. Besides, science courses, which are learnt through experiments, arouse students' natural motivation and make them willing to learn the science (Telli, Yıldırım, Şensoy & Yalçın, 2004). Chemistry, a major branch of science studies, which analyses the structure, properties, behavior and interactions of substances. Knowledge of chemistry has been used today in various fields from understanding the structure of living organisms to the solution of environmental problems (Kırbaşlar, Güneş, Avcı & Atalar, 2012). Thus, This research aims to examine the effects of demonstration experiment and worksheet practices with regard to “matter and its properties” on slightly intellectually disabled students' understanding the science of chemistry and the fields of application. The sub-problems of the research are:

1) What prior knowledge do the students with slight intellectual disability hold with regard to the science of chemistry and the fields of application?

2) What effects do demonstration experiments and worksheet practices have on slightly intellectually disabled students' understanding the science of chemistry and the fields of application?

2. METHOD

This research aims to question slightly intellectually disabled students' conception of chemistry and the science of chemistry. Therefore, the current situation was analysed with a qualitative horizon, without presenting any statistical data. Yıldırım and Şimşek (2011) define qualitative research as "the research in which the qualitative methods of data collection such as observations, interviews and document analysis are used, and in which a qualitative process is pursued so as to present the perceptions and events in a natural environment and in a holistic way".

2.1. Study Group

The research included a total of 10 students 5 of whom were female and 5 of whom were male with slight intellectual disabilities and who were attending the job learning schools in Ankara. They were in the 16-19 age range.

2.2. Data Collection Tools

2.2.1. Video and Audio Recordings of in-class Interviews: Face-to-face interviews or discussions enable researchers to interact with students and thus to question their configuration in details and to uncover it (Canpolat and Pınarbaşı, 2012). Therefore, video and audio recordings of in-class interviews were used in this research for the purposes of data collection, with prior permission from the parents.

2.2.2. Observations: This research employs unstructured field study, a type of observation. Such studies are conducted in the natural setting where the behaviour is actualized, and in most cases it is done through the method called "participant observation" in which the researcher takes part in the setting (Yıldırım & Şimşek, 2011). Participant observation was done by the researchers in this research. For the sake of detailing the data obtained via observations and of catching the elements unnoticed, the video recordings were also analysed.

2.2.3. Worksheets

2.2.3.1. Worksheet on "Matter and its Properties": In this worksheet, the students were asked to write the answers reached following the experiments to the questions "what colour?", "is it pulled by the magnet?", "does it dissolve in water?", "what colour is it when dissolved in water?" for "magnesium, salt, sand and copper (II) sulphate".

2.2.3.2. Worksheet of "Let's Separate Matters": The first stage of the two-stage worksheet was about the procedures of separating "the mixture of sand, wood, salt and water". With the demonstration experiment, the students were asked to write the separated and the remaining matters in each procedure. At the second stage, along with the demonstration experiment of separating "the mixture of oil and water" with separating funnel, they were asked to write in the picture of separating funnel in the worksheet what the liquids are at the bottom and at the top, and to write which liquid was in the beaker and which remained in the separating funnel.

2.3. The Application Process

During the applications made in a class hour, the students were first asked the questions: “have you heard of the science of chemistry before?” and “what does a person dealing with chemistry do?”, and thus identifying their prior knowledge of chemistry and attracting their attention to the demonstration experiment to be done afterwards were intended. Then the researcher gave examples from daily life (such as burning, cooking, etc), and thus wanted to help them understand the the place of chemistry in our life. Also with the two demonstration experiments containing the matters they encounter in daily life, the students were asked questions about the matters and offered explanations, and then they were asked to fill in the blanks in the worksheets handed out. The researcher also received help from the students during the experiment. While the researcher knowing the students closely (the one who works in a special education institution) did the experiment and made the explanations during the application, the other two researchers offered help with doing the experiment, did the observations and recorded the process with the video camera. In addition to that, two students whose writing skill had not sufficiently developed to write on their own were helped to write by repeating the spellings.

Having done the demonstration experiments and completed the worksheets, the students were asked the previously asked questions “have you heard of the science of chemistry before?” and “what does a person dealing with chemistry do?” again. Additionally, a discussion on the rules to obey while doing experiments in the lab was done. The students made some inferences by considering the researcher as a model.

2.4. Data Analysis

The answers given by the students to the questions in the worksheets, and the observation notes taken by the researchers were examined for data analysis. The video recordings of students’ in-class discussions were viewed, and their statements were analysed descriptively.

3. FINDINGS

In this part, the findings obtained through the descriptive analysis of the data concerning the research questions are described.

1) What prior knowledge do the students with slight intellectual disability hold with regard to the science of chemistry and the fields of application?

In the classroom discussion conducted, the students were firstly asked what a person dealing with chemistry does. Only a boy responded: “they do experiments” while the others approved of the answer and they remembered the concept ‘do an experiment’. Then no one answered the question “so what do they experiment about?”

2) What effects do demonstration experiments and worksheet practices have on slightly intellectually disabled students’ understanding the science of chemistry and the fields of application?

After the demonstration experiments had been done and the worksheets had been completed, the students were asked the previously asked questions “have you heard of the science of chemistry before?” and “what does a person dealing with chemistry do?” again. After the applications, the students responded to the questions as

“They work in labs”.

“They wear aprons while working in the lab”.

“They deal with matters from daily life”

“They do experiments with matters.”

In addition to

“Doing experiments.”

After the experiments, the students had a discussion on the rules to obey while doing experiments in the laboratory. By considering the researcher as the model, they made such inferences as:

“An apron should be worn in the lab.”

“Gloves should be used in the lab.”

“Glasses should be worn.”

“Materials should be clean when used.”

“One should be careful”.

On examining the worksheets, it was found that all the students had filled in the blanks correctly. Moreover, it was also found through the observations that they had curiosity about what to do while doing the experiments, that they were willing to help the researcher in doing the experiments, and that they said that they had never done such applications and they had not seen the materials used before.

4. CONCLUSIONS AND RECOMMENDATIONS

This research aimed to examine the effects of demonstration experiment and worksheet practices in relation to “Matter and its Properties” on slightly intellectually disabled students’ understanding the science of chemistry and the fields of application.

In line with the first sub-problem of the research, it was found that the students with slight intellectual disabilities had limited prior knowledge of the science of chemistry and the fields of application. When they heard the term “science of chemistry”, they only responded as “doing experiments”. The fact that they had prior knowledge of the concept of “doing experiments” could be attributed to the fact that they had received mainstreaming education and that they had taken the science course; and because they had received primary and secondary school education with their normal peers in the same schools. Education through mainstreaming is an educational application based on the principle that individuals with special educational needs receive their education (in combination with support services) with their peers with no disabilities in state as well as private institutions of pre-school, primary education, secondary education and informal education (MEB, 2012a).

In relation to the second sub-problem of the research, it was found that demonstration experiment and worksheet practices were influential in those students' understanding the science of chemistry and its fields of application. The students learnt that the science of chemistry dealt with various matters, experiments were done in this science, several materials were used while doing the experiments, and that various safety measures should be taken. Besides, it was observed that many of them were surprised while the experiments were being done, and it was remarkable that they said they had never seen such practices before. Science courses learnt through experiments arouse students' natural motivation and make them willing to learn science (Telli, Yıldırım, Şensoy & Yalçın, 2004). It is made sure in science courses that students gain knowledge about the natural world and thus they are presented learning experiences necessary for satisfying their innate curiosity (Carin, Bass and Contant, 2005). Literature review showed that research studies were available with students with intellectual disabilities using different methods of learning and teaching in the fields of mathematics, music, science and in the literacy skills (Sinoplu, 2009; Şahbaz, 2005; Jackson, 2005; Alston & Hampton, 2000; Demir, 2008; Güven, 2011; Frick, 1999; Armutçu-Arslan, 2008; Güler, 2008; Tokta, 2012). In research conducted by Jackson (2005), it was pointed out that the individualized teaching materials prepared by taking the students' handicaps into consideration were effective in handling those students' failure in science courses stemming from their disabilities. Demir(2008), in another study on the other hand, stated that the individualised teaching material which was presented through staged teaching method was effective in teaching the organs of digestive system to mentally retarded children. However, research studies concerning intellectually disabled students' understanding the science of chemistry and compatible with this current study have not been encountered in literature.

Peer-assisted therapy should be included in forming the effective learning environments for mainstreaming students; joint learning and study groups should be formed for science activities; unit boards should be designed; simple, clear, plain statements should be used in all presentations; adaptation work should be done to materials and aids for use with disabled students, interaction should be kept alive with families, homework should also be adapted for those students, and arrangements should be done to the texts in the course books (Güzel Özmen & Karakoç, 2010). According to the data of 2009-2010 academic year obtained from the Ministry of Education, 36599 of the 128.515 students with special education needs attend special education schools while 15712 attend the special education classes in normal schools, 76204 receive mainstreaming education; and 71142 of them receive this education in primary schools and 5062 in secondary schools. The above mentioned figures exhibit the prevalence of mainstreaming education; yet research on this issue makes it clear that teachers as well as other staff taking part or who will take part in this application are in need of knowledge (Diken, 2010). Alston and Hampton (2000), however, suggest that parents and teachers are the people most influential in disabled students' making career in science studies in the future. Lewis and Doorlag (1987) stress that every individual – with or without a disability- holds properties peculiar to themselves, and that their development should be evaluated in themselves and those students with special needs should be able to receive education in normal school settings. In brief, it is important for disabled students to receive the education that normal students receive in that they gain survival skills and direct their lives. Therefore, teachers graduating from faculties of education should both be raised with awareness and supply of mainstreaming education and disabled students, and teachers should be offered in-service training in gaining awareness of disabled students in their classes and in orientating them so that they are reintegrated into the society.

4th International Conference on New Horizons in Education

The effects of utilizing technology in classroom management

Lutfu Ilgar*

Istanbul University, Hasan Ali Yucel Faculty of Education, 34116, Istanbul, Turkey

Abstract

The purpose of this research is to determine the perspective of candidate teachers towards how educational technology affects classroom management, what its advantages and disadvantages are, what sort of classroom management challenges they may encounter, etc.

The majority of the candidate teachers involved in the research considers themselves as “good” or “very good” at using technology. It is seen that a great majority of the candidate teachers participating in the research support the use of technology for education, that the rate of those saying “I have sufficient information about how to use technology for education” is low (not as high as expected or it should be), that the rate of those thinking that the use of technology has a positive effect on classroom management is high, and that the rate of those considering the use of technology for education as a factor increasing teachers’ concerns is low. It is also seen that the rate of those who think that the use of technology must be very well known to achieve good classroom management is quite high. According to the findings of the research, the rate of the participants saying “The use of technology for education brings along the increase of undesired behaviors in the class” is low. A significant number of the participants chose to stay “neutral” to the statement “the use of technology for education provides an environment for the disruption of the lesson flow”. The number of those agreeing with the statement “the use of technology for education results in the increase of the number of students who are referred to disciplinary committee” is high. The number of the participants agreeing with the statement “The introduction of technology into classroom environment has caused changes in the nature of undesired student behaviors” was also found to be high.

Keywords: classroom management, educational technologies, the use of technology for education

1. INTRODUCTION

Technology has been developing rapidly in our age and it has influenced every aspect of our life as well as education and teaching. In our country, the use of technology for education is considered to be the means of catching up with developed countries by improving quality and a great deal of investment is made on this field.

Using technology to enable learning through the creation and communication of information is a time-honored tradition. More than 5,000 years ago, the invention of writing spurred the first information revolution, making it possible for one generation to accumulate information and communicate with the generations that followed it. When printing was invented about 500 years ago, the second information revolution began, marked by mass distribution of the printed word. Just 50 years ago, the invention of computers ushered in the third information revolution, making it possible to transform raw data into structured information, to transform that

Email address: lutfuilgar@hotmail.com

information into knowledge, and to transform knowledge into action using intelligent software agents and robots (Reddy and Goodman, 2002:3).

The developing process of technology has affected each part of our life includes daily life equipments-economy-education-entertainment-etc. Education which is the most important aspect of societies makes direct changes into people' life. Because of this, we cannot examine the improvements in education by ignoring the improvements in technology. They are bounded strictly.

Technology is a greater force in our lives than it was 10 years ago, and this force is likely to accelerate. The increase is partly driven by the inherent value of technology. It is also driven by a set of powerful economic and institutional processes. It is difficult to be exposed to any of today's media without also being exposed to technology. Across the many forms of formal and informal communications that affect our lives, there is a constant message about the benefits of technology (Goodman, 2002:290). As it is mentioned above, the force of technology has accelerated the educational improvements. When the historical process of technology is studied carefully, the benefits of using technology in education have become the most important step in education. The developing of electronic technology has been lasting since it started years ago. As Schwartz and Beichner (1999:7) stated, the world of electronic technology was developing at breakneck speed. Three areas of technology that directly affect education were developing rapidly: computers, multimedia, and the information infrastructure. For many years, the effects of these technologies on the classroom were marginal. However, in recent years, due to a combination of the developing information infrastructure and the development of standards-based curricula, the impact of technology is beginning to have a profound effect on schooling.

Every country's educational system has shaped by this profound effect. In order to see the effects and the process of these changes in education, the changes in educational materials in Turkey can be exemplified. According to Usun, (2004) In the 1930s, Turkish schools had teaching materials such as maps, laboratory equipments, and film strip projectors for instructional use. Until the 1940s, mostly printed instructional materials were used in schools. Between 1950 and 1970, schools had technologies such as audio cassettes and overhead projectors. Distance education was first introduced to students in Turkey in 1974. During the 1970s, several new teaching materials were provided for schools and introduced to teachers. In addition, some big universities started to offer graduate programs aimed at training professionals in the field of educational technology. Though some of these traditional technologies are still in use to prepare students, educational policy makers in Turkey believe that schools must give students the knowledge and the skills they will need in the future. Because of this, computers have gained more importance than any other educational technology.

In today's conception, educational technology can be defined as an abstract concept or as a field of practice. First, the definition of the concept: Educational technology is the study and ethical practice of facilitating learning and improving performance by creating, using, and managing appropriate technological processes and resources (Januszewski and Molenda, 2008:1).

The end purpose of educational technology is using, putting learners into contact with appropriate technological resources under conditions conducive to learning. Before using can take place, the resources must be selected and evaluated by an instructor and a plan must be made for utilization (Molenda, 2008:168).

According to Baker, (2001:78-79) what the technology is intended to do is :

1. Technology to meet existing requirements more efficiently
2. Technology may address learning goals that cannot be met in other ways
3. Adaptive approaches to the acquisition of knowledge and skills

Educational technology can claim to improve the performance of individual learners, of teachers and designers, and of organizations as a whole (Molenda and Pershing, 2008:76). As it can be seen, when the definition and the purpose of educational technology are studied, it is clear that teacher's role is the most important and the most critical one. Because of this, in this part it will be focused on the role of teacher in the using of educational technology.

Teachers employ a range of instructional strategies and resources to match the variety of student skills and to provide each student with several ways of exploring important ideas, skills, and concepts. They understand how to work as facilitators, coaches, models, evaluators, managers, and advocates. They know how to utilize various forms of play, different strategies for grouping students, and different types of media and materials (Callahan and Switzer, 2001:231). For that reason, as a teacher, following and using educational technology is inevitable.

As schools introduce new technologies, teachers must learn how to use and apply them. Since hardware and software are changing more rapidly than ever before, there will be no point at which teachers can say that they know everything necessary. New software and upgrades of older programs are released continuously, and frequently the new capabilities and features are of real importance to students and teachers. As schools become wired and acquire a range of equipment, teachers will have to be able to make good use of e-mail, Web browsers, databases, digital cameras, video cameras, digital video editors, and much more. Teachers must keep upgrading their skills, and expanding their awareness of new technologies (Tiene and Ingram, 2001:254). As it is stated above, being innovative, answering the modern life's necessities in schools and fulfilling the students' needs to use technology in each parts of their life are the most important responsibilities of teachers in modern education system. With the modern education system, teachers' role in classes has started to change. As it was stated by Mendicino, Razzaq and Heffernan (2009) with recent advances in educational technology, teachers now have a multitude of tools to assist and enhance student learning and motivation. New intelligent tutoring systems that guide students through math problems much the same way human tutors do have been successful in helping students learn math in the classroom. Some systems attempt to imitate a human tutor by reproducing the interactive dialogue patterns and strategies that were likely to be used by a human tutor, whereas others provide immediate feedback by highlighting each step attempted in either red or green to indicate a right or wrong answer. They may also provide hint sequences to students asking for help.

It is clear that the rate of success in modern education system is related to integration technology into classroom. This encumbers teachers another outstanding responsibility. According to Hofer and Swan (2008-2009) technology integration is a very personal and situated undertaking for teachers. According to Overbaugh and Lu, (2008) in response to the need to train teachers to effectively integrate technology into elementary and secondary education, a teacher professional development program funded by a federal grant provided a selection of instructional technology integration courses to K-12 teachers.

The integration of information and communication technologies can help revitalize teachers and students. This can help to improve and develop the quality of education by providing curricular support in difficult subject areas. To achieve these objectives, teachers need to be involved in collaborative projects and development of intervention change strategies, which would include teaching partnerships with ICT as a tool. Teachers' attitudes are major predictors of the use of new technologies in instructional settings. Teachers' attitudes toward ICT shape not only their own ICT experiences, but also the experiences of the students they teach (Gulbahar and Guven, 2008).

The teacher's role as a principal gate- way to knowledge for the learner has been in progressive decline. Far more information than school students need is now being rapidly made accessible through ICT, much of it in a form that is attractive and easily assimilated. Thus, the role of the teacher changes to helping students to find / access what they need, to evaluate its source, relevance, and quality. Beyond these skills and capacities, the challenge for teachers will be in enabling students to construct and apply knowledge in ways that are accurate and valuable (Bentley and Hargreaves, 2003:346-347).

Classroom management is the orchestration of classroom life: planning curriculum, organizing procedures and resources, arranging the environment to maximize efficiency, monitoring student progress, anticipating potential problems (Lemlech, 1988:3). To manage a classroom means accepting differences in class and advancing them and also making a harmony of different sounds in such a way that an orchestra conductor does; that is, making it possible to reach these aims.

Technology playing a very efficient role in today's world naturally affects education, too. As science and technology is the most evident feature of modern society, it is apparently necessary to bring education a scientific and technological attribute. Therefore, it is more compulsory than ever to utilize technological resources and facility in teaching-learning process. Resolving the issues in our education system is only possible with education technology that provides us with a wide benefit from technological possibilities (Keser, 1995). In today's world, as a result of rapid development and change in technology, the structure of society changes rapidly, too; and in accordance with this, there comes out some differences in educational purposes, methods and teachers' roles (Cetin and Cetin, 2000).

Using teaching technologies effectively in school and class environment and conveniently for educational purposes contributes to enriching teaching aims. A teacher can increase the interest in a class using different materials and teaching techniques. Regarding this, multi-media and internet systems that have been generated as appropriate to educational purposes get more and more widespread in schools (Yalcinkaya, 2005: 92). To make lessons more effective and consistent, a teacher needs to support a class with various materials and also create a positive atmosphere (Cafoglu, 1992) Teachers being able to use technology easily and productively affects students in a positive way; it sets an example as to being able to use technology (Ozer, 1997). The more sense organs are included in learning, the better we learn and the more slowly we forget (Ozdemir, Yalin, and Sezgin, 2004:179). When materials are chosen properly, they make teaching techniques faster and easier and more individual (Yalcinkaya, 2005:92).

According to Carroll (2001:5) in networked schools and classrooms, students can acquire knowledge on a schedule determined by their own learning needs. Networked learning communities will replace our producer driven model of education with a "consumer driven" model in which learners play a very active role in shaping the content, process and pace of their education. Net-worked computers give educators and students their first real opportunity to tailor educational experiences to specific learning needs.

One compelling way teachers can support such possibilities is to have students use computer technologies as tools to generate, share, and argue about ideas. Consider, for example, a student-run newspaper. Word processors and desktop publishing tools support students' writing. Spelling checkers help the presentation. Spreadsheets can help students to manage the financial aspects of running the newspaper, and databases to organize and access relevant information. Thus, students learn not only how to use a wide range of computer applications but that, as students, they control computer technology and are responsible for the consequences of their computer-mediated action: namely, for their published ideas (Kahn and Friedman, 1998:167).

Many of us expect that using technology wisely and effectively in education can lead, over time, to a real revolution in how teachers teach and students learn. It will not happen quickly or easily, but it could happen. It will not happen if we simply use technology to continue our old ways of teaching. We all need to learn new ways to teach that take advantage of what the various technologies do best. Learning how to use new instructional strategies is likely to be a more challenging task than learning the technology itself (Tiene and Ingram, 2001:257). By the help of these determinations, principles of class management must be regarded as a new field in technological education and it must be improved according to the needs of new networked classes and the students members of technological world.

As Simon stated (2002:63), design of technology must follow, not precede, the task analysis. It is wholly inefficient and ineffective to begin with a favorite technology-whether it be television films, computer displays of virtual reality, World Wide Webs, or any other-and then seek out possible applications to educational tasks. That is like buying twelve dozen hammers, then searching for nails to pound. Instead, we must first discover which nails need pounding, and then what hammers can drive them home effectively. Technology must be the servant, not the master.

2. AIMS AND SIGNIFICANCE

2.1. Aims

The aims of this research is to determine the perspective of candidate teachers towards how educational technology affects classroom management, what its advantages and disadvantages are, what sort of classroom management challenges they may encounter, etc. In accordance with this basic objective, this study attempts to seek solutions for the following questions:

- 1- How do candidate teachers assess themselves regarding using technology?
- 2- To what extent can they keep up with new technology?
- 3- What are the ways that they follow to learn to use technology?
- 4- Which technological components do they use? At what level do they use them?
- 5- To what extent do they support the utilization of technology for education?
- 6- What are their opinions about whether the use of technology for education is a factor that incurs concerns or not?
- 7- What do they think of the idea that good classroom management requires a very good command of technology?
- 8- What are their opinions about the way the utilization of technology for education influences classroom management?

2.2 Significance

When the literature is reviewed, it can be seen that there are not many studies aiming to determine the opinions of candidate teachers regarding the influence of the use of technology on classroom management. The findings to be obtained at the end of this research are expected to contribute to education and educational practices in various aspects. The identification of prospective teachers' self-evaluation regarding the use of technology, the technological components they utilize, the level at which they utilize these components as well as their views on how educational technology influences classroom management is considered to be important in the sense that it may provide the authorities with ideas on what to do at a teacher training institution in order to overcome the deficiencies that candidate teachers might have during undergraduate education. Additionally, the responsibilities of teacher training institutions for developing the education will be emphasized in this study. The data obtained through the research will also pave the way for more realistic and consistent judgments regarding classroom management and the use of technology in education.

3. METHOD

3.1. Research Model

The research is in scanning model. The answers provided by candidate teachers in personal information form and in the questionnaire aiming to determine the views on how the use of technology affects classroom management were analyzed and the outcomes were discussed in the light of the findings.

3.2. Population and Sample

The population of this research consists of the students of Primary School Teaching, Social Sciences Teaching and Science Teaching departments of faculties of education. The sample of the research is formed by 336 students who are studying at Primary School Teaching, Social Sciences Teaching and Science Teaching departments of Hasan Ali Yucel Faculty of Education at Istanbul University. A personal information form and a questionnaire form were given to the students constituting the sample in the second term of 2013-2013 academic year. The data obtained from 336 students, who filled the personal information form and the questionnaire completely, was taken into consideration.

3.3. Data Collection Tools

The personal information form and the questionnaire form prepared by the researcher were used in this study. The questionnaire consists of items aiming to determine the views of candidate teachers on the influence of the use of technology in education on classroom management. The questionnaire form has 12 items, each of which requires the selection of one of the following options: agree – neutral –disagree.

The personal information form was used to gather information about students' gender, the programs and the grades at which they are studying, their self-assessment regarding the use of technology, whether they follow new technologies, how they have learned to use technology, the technological components they use (computer, overhead projector, computer and projector device, video/TV (projecting onto a big screen), audio recording devices, smart board, educational tablets) and at what level they use these components.

3.4. Procedure

The data collection tools were applied at the beginning of the second term of 2013-2013 academic year. Before the application of the data collection tools, general info about personal information form and the questionnaire was given to the students. After the personal information forms and the questionnaires filled by the students were checked, those which were deficient or improper were eliminated and excluded from the evaluation process. The data obtained was analyzed in parallel with the objectives of this research.

Frequency and percentage values were used for the answers given by the candidate teachers involved in the research for the items on the personal information form and the questionnaire. The findings obtained were presented in table forms.

4. FINDINGS AND INTERPRETATION

Table 1. The Numbers and the Percentages Regarding the Genders, Programs and Grades of the Candidate Teachers Participating in the Research

		f	%
Gender	Female	228	67,9
	Male	108	32,1
	Total	336	100,0
Program	Primary School Teaching	100	29,8
	Social Sciences Teaching	121	36,0
	Science Teaching	115	34,2
	Total	336	100,0
Grade	2nd grade	111	33,0
	3rd grade	122	36,3
	4th grade	103	30,7
	Total	336	100,0

As it is seen in Table 1, 67,9% of the candidate teachers participating in the research is female, while 32,1% is male. Primary School Teaching and Secondary School Teaching professions in Turkey are mostly preferred by women.

Table 2. The Numbers and the Percentages of the Answers Given by the Participants to the Questions “How Would You Evaluate Yourself in Terms of Utilizing Technology?”, “Can You Follow Newly-Developed Technologies?” and “Please Mark the Way or Ways That Helped You Learn to Use Technology”.

		f	%
How would you evaluate yourself in terms of utilizing technology?	Very good	45	13,4
	Good	157	46,7
	Average	124	36,9
	Weak	10	3,0
	Total	336	100,0
Can you follow newly-developed technologies?	Yes	112	33,3
	Partially	212	63,1
	No	12	3,6
	Total	336	100,0
Please mark the way or ways that helped you learn to use technology	Through the lessons I have studied at university	55	16,4
	By attending a course	14	4,2
	On my own	267	79,5
	Total	336	100,0

When Table 2 is analyzed, it is seen that only 3% of the candidate teachers participating in the research consider themselves to be “weak” at using technology, that 63,1% of the participants can partially follow newly-developed technologies, that 79,5% of the participants answered the question “please mark the way or ways that helped you learn to use technology” by choosing “on my own” option, whereas 16,4% chose the option “through the lessons I have studied at university”. All these results indicate that the members of the newer generation of teaching (candidate teachers) consider themselves to be good at using technology. Today, almost everyone, individuals from all socio-economic layers, meet and start to use technology at an early age. 63,1% of the participants answered the question “Can you follow newly-developed technologies?” by choosing the option “partially”. Today, technology is developing at a stunning speed; it is almost impossible to keep up with technological developments. The item “please mark the way or ways that helped you learn to use technology” was marked by 79,5 % of the participants with the option “on my own”, while 16,4% of the participants stated that they learned to use it through the lessons they studies at university. This result suggests that Teaching Technologies and Material Design class, which is a 3-credit compulsory class given at faculties of education, affects the process of learning how to use technology only insignificantly.

Table 3. The Numbers and the Percentages of the Answers Given by the Participants to the Question “Which Technological Components Do You Use and at What Level Do You Use Them?”

	Very good		Good		Average		Weak		Total	
	f	%	f	%	f	%	f	%	f	%
Computer	60	17,9	208	61,9	60	17,9	8	2,4	336	100,0
Overhead projector	22	6,5	76	22,6	119	35,4	119	35,4	336	100,0
Computer & projector	45	13,4	148	44,0	109	32,4	34	10,1	336	100,0
Video/TV	70	20,8	151	44,9	87	25,9	28	8,3	336	100,0
Audio recording tools	70	20,8	157	46,7	86	25,6	23	6,8	336	100,0
Smart board	17	5,1	89	26,5	107	31,8	123	36,6	336	100,0
Educational Tablets	29	8,6	97	28,9	114	33,9	96	28,6	336	100,0

When Table 3 is analyzed, as for the technological means used by the candidate teachers involved in the research and their levels of using those means, it is seen that the majority (61,9%) of the participants can use the computer “well”, whereas the rate of those who consider themselves to be “weak” at using the computer is 2%. The majority (35,4%) regards themselves to be “weak” at using the overhead projector. It is seen that 10,1% of the participants consider themselves to be “weak” at using the computer and the projector together. 44,9% of the participants regard themselves as “good” at using Video/TV (projecting onto a big screen). 46,7% of the participants regard themselves as “good” at using audio recording tools. 36,6% of the participants consider themselves to be “weak” at using smart boards, which have become commonly used at Turkish schools in recent years. Similarly, 28,6% of the participants regard themselves as “weak” at using an educational tablet, another

means of technology introduced to Turkish educational institutions as well as our daily lives lately. Particularly, the high number of participants who consider themselves to be inefficient in using smart boards and educational tablets indicates that Educational Technologies and Material Design classes lack the emphasis on the use of these modern educational technologies. This result suggests that prospective teachers will most probably have difficulties when they meet smart boards and educational tablets.

Table 4. The Number and the Percentages of the Answers Provided to the Questions in the Questionnaire About the Influence of the Use of Technology on Classroom Management

Items	Agree		Neutral		Disagree	
	f	%	f	%	f	%
1- I support the use of technology for education.	312	92,9	21	6,3	3	0,9
2- I have sufficient information about how to use technology for education.	175	52,1	120	35,7	41	12,2
3- I think that educational technology has a positive effect on classroom management.	276	82,1	46	13,7	14	4,2
4- The use of technology in education is a factor that increases teachers' concerns.	59	17,6	116	34,5	161	47,9
5- To achieve good classroom management, a teacher must know how to use technology very well.	295	87,8	34	10,1	7	2,1
6- The use of technology for education affects teacher-student communication positively.	262	78,0	60	17,9	14	4,2
7- The use of technology for education affects the communication among students positively.	234	69,6	87	25,9	15	4,5
8- The use of technology for education affects the classroom atmosphere positively.	251	74,7	67	19,9	18	5,4
9- The use of technology for education brings along the increase of undesired behaviors in the class.	48	14,3	122	36,3	166	49,4
10- The use of technology for education provides an environment for the disruption of the lesson flow.	85	25,3	120	35,7	131	39,0
11- The use of technology for education results in the increase of the number of students who are referred to disciplinary committee.	76	22,6	130	38,7	130	38,7
12- The introduction of technology into classroom environment has caused changes in the nature of undesired student behaviors.	145	43,2	143	42,6	48	14,3

When Table 4 is analyzed, it is seen that the majority of candidate teachers (92,9%) involved in the research support the use of technology for education, that the rate of those saying "I have sufficient information about how to use technology for education" is low (not as high as expected or it should be) (52,1%), The rate of those who think the use of technology has a positive effect on classroom management is high (82,1%), and that

the rate of those who consider technology as a factor that increases teachers' concerns is low (17,6%). It is also seen that the rate of those saying "to achieve good classroom management, a teacher must know how to use technology very well" is quite high (87,8%). In addition, the rate of those saying "The use of technology for education affects teacher-student communication positively" is high (78,0%), similar to the rate of those saying "The use of technology for education affects the communication among students positively" (69,6%). The rate of those thinking that "the use of technology for education affects the classroom atmosphere positively" is 74,7%.

The rate of the participants saying "The use of technology for education brings along the increase of undesired behaviors in the class" is low (14,3%). 35,7% of the participants chose "neutral" option for the statement "the use of technology for education provides an environment for the disruption of the lesson flow". The rates of those choosing "neutral" and "disagree" options for the statement "the use of technology for education results in the increase of the number of students who are referred to disciplinary committee" were found to be the same (38,7%), whereas the rate of those agreeing with this statement is 22,6%. The rate of those who disagree with the statement "the introduction of technology into classroom environment has caused changes in the nature of undesired student behaviors" is 43,2%.

When the number and the percentages of the answers provided to the questions in the questionnaire aiming at determining the influence of the use of technology on classroom management were analyzed, it is pleasing to see that the number of those who are in favor of using technology for education is quite high. The use of technology is inevitable in education, just like it is in daily life. However, the low rate of those saying "I have sufficient information about how to use technology for education", which is 52,1%, is a worrying fact. The high rate of those thinking that the use of technology for education affects classroom management positively can be considered as a remarkable sign for the use of technology to achieve good classroom management. Similarly, the low rate of those considering the use of technology for education as a factor that increases concerns shows that teachers do not suffer from technophobia. It is quite pleasing to see the high rate of the participants saying that a teacher must know how to use technology very well to achieve good classroom management. This result demonstrates that the awareness levels of candidate teachers regarding the effects of utilizing technology in classroom management are high. Besides, the high rates of those who think that the use of technology for education affects teacher-student communication positively and that the use of technology for education affects the communication among students positively also promote the use of technology as a factor to support the establishment of a good communication in the classroom. Likewise, the high rate of those thinking that the use of technology for education affects the classroom atmosphere positively shows that candidate teachers establish a meaningful link between the use of technology and classroom management.

According to the findings of this research, it is seen that the rate of candidate teachers saying that the use of technology for education brings along the increase of undesired behaviors in the class is low. This result indicates that the number of undesired behaviors will decrease when a good command over technology is achieved. The fact that the rate of those agreeing with the statement "the introduction of technology into classroom environment has caused changes in the nature of undesired student behaviors" is high demonstrates candidate teachers' need to learn how to successfully manage a class when educational technologies are used, rather than conventional classroom management skills.

5. CONCLUSION AND SUGGESTIONS

As a phenomenon of today, like people with different professions, teachers are also urged and even obliged to use technology. Turkish educational system necessitates technology for quality and a significant amount of financial sources is spared for technology. The majority of the candidate teachers involved in the research considers themselves as “good” or “very good” at using technology. The majority of the candidate teachers can only partially follow the newly-developed technologies. Most of the participants stated that they learned to use technology “on their own”. Only a minority of them stated that they learnt it “through the lessons they studied at university”. As for the technological means used by the candidate teachers involved in the research and their levels of using those means; it has been found that they are “good” at using the computer, and that the number of those who consider themselves to be weak at using smart boards and educational tablets is high. It is seen that a great majority of the candidate teachers participating in the research support the use of technology for education, that the rate of those saying “I have sufficient information about how to use technology for education” is low (not as high as expected or it should be), that the rate of those thinking that the use of technology has a positive effect on classroom management is high, and that the rate of those considering the use of technology for education as a factor increasing teachers’ concerns is low. It is also seen that the rate of those who think that the use of technology must be very well known to achieve good classroom management is quite high. In addition, the rate of those saying that the use of technology for education affects teacher-student communication positively is high, similar to the rate of those saying that the use of technology for education affects the communication among students positively. The rate of the participants thinking that the use of technology for education has a positive effect on classroom atmosphere was found to be significantly high.

According to the findings of the research, the rate of the participants saying “The use of technology for education brings along the increase of undesired behaviors in the class” is low. A significant number of the participants chose to stay “neutral” to the statement “the use of technology for education provides an environment for the disruption of the lesson flow”. The number of those agreeing with the statement “the use of technology for education results in the increase of the number of students who are referred to disciplinary committee” is high. The number of the participants agreeing with the statement “The introduction of technology into classroom environment has caused changes in the nature of undesired student behaviors” was also found to be high. Based on the findings of this research, it is possible to suggest the following:

- To help candidate teachers follow newly-developed technologies, faculties or universities can procure these technologies and share them through renting, lending, etc.
- The use of modern educational technologies (particularly the use of smart boards, interactive boards and educational tablets) should be emphasized in educational technologies and material design classes. A candidate teacher should be graduated only after mastering the use of these technologies.
- In classroom management classes as well as educational technologies and material design classes, the focus should be on how to successfully manage a class when educational technologies are used, rather than conventional classroom management skills.
- The classes should be mostly practical rather than theoretical.

4th International Conference on New Horizons in Education

The Effect of Harmonic Accompaniment on Primary Two Children's Developmental Music Aptitude

Jinky Jane C. Simeon*

School of Arts Studies, Universiti Malaysia Sabah, Jalan UMS, Kota Kinabalu, 88400, Malaysia

Abstract

Studies on children's musical development have received increased attention than previously. The present study aims to investigate the effect on the use of bamboo xylophone as harmonic accompaniment on primary two children's music development. The study was focused on the following specific problems (1) Is there a difference with an additional harmonic accompaniment in the development of tonal aptitude in primary two children? (2) Is there a difference with an additional harmonic accompaniment in the development of rhythm aptitude in primary two children? Four classes ($n=80$) from two public schools in the city of Kota Kinabalu were randomly assigned to two different groups: a control ($n=40$) and an experimental group ($n=40$). Both groups of children sat for a pre-test and post-test on Gordon's Intermediate Measures of Music Audiation tonal subtest (IMMAT) and rhythm subtest (IMMAR). The results indicated no significant difference in the music aptitude test between the groups ($p > .05$). However, the mean gain score percentage of children in the experimental group increased more than that of the control group. The results suggest that a future study should include longitudinal data, larger sample size, different types of musical instruments and children's interest in learning music.

Keywords: Children's musical development; harmonic accompaniment; bamboo xylophone; tonal aptitude; rhythm aptitude

1. Introduction

The nature of children's music aptitude development has received increased attention than previously in the United States, Korea, Taiwan, and other countries (Flohr, 1981; Guilbault, 2002; Lee, 2010; Levinowitz, 1989; Moore, 1984; Rho, 2004; Rutkowski, 1996). Music aptitude is the potential to achieve in music. Most people misunderstand aptitude and achievement. Music achievement is intellectual, a measure of what someone has learned in music (Gordon, 2007: 46). According to Gordon (2003: 13), a well-known music psychologist states, "music aptitude is a measure of children's potential to learn music; it represents inner possibilities". It may be another factor affect children singing accuracy. With appropriate music environment and music instruction, a child with high music aptitude should perform better in singing accuracy than those children with low aptitude.

Research relate on tonal aptitude and singing achievement showed different results. In Atterbury and Silcox (1993) study, results showed no significant difference between the middle and low aptitude students in their singing ability. However, a significant was found between students who had high aptitude and those with middle and low aptitudes. Hornbach and Taggart (2005) found that no meaningful relationships between singing achievement and scores on the Primary Measures of Music Audiation (PMMA) tonal aptitude subtest. They

* Corresponding author. Tel.: +6088-320000, Ext: 2741; fax: +6088-320344.

E-mail address: jinkysoo@ums.edu.my

suggested that if singing is taught, ones' singing achievement can perform better. In contrast, Jaffurs (2000) concluded that singing achievement is related to tonal aptitude. In Rutkowski (1996) study found that a small relationship exists between use of singing voice and developmental tonal aptitude.

The Flohr Study (1981) examined the influence of short-term music instruction on young children's development of music aptitude. The results indicated that short-term music instruction has a positive effect on the musical development of young children. It seems important to know the extent of children's ability and their aptitude levels.

Previous research findings into the effectiveness of accompaniment have indicated different results in children's singing achievement. Petzold (1966) indicated that children experienced improved singing by using chords I, IV, and V accompaniment. Hale's (1977) study reported that the children sang better if they were using a three-step sequence after a year of music instruction that included both a melodic and harmonic piano accompaniment. Sterling's (1984) results indicated that children in grades 1, 3, 5, and 7 sang better with melodic replication and traditional tonal accompaniment than with chromatic and dissonant accompaniment. Gouzouasis (1987) reported that singing achievement seems to be influenced by the type of accompaniment. Simeon et al (2011) described with the combination of voice with bamboo xylophone as harmonic accompaniment effectively develops children's singing voices and their sense of tonality (Simeon et al., 2011).

In contrast, after a year of study, Atterbury and Silcox (1993) failed to find statistically significant differences in kindergarten children's singing accuracy when comparing those who received music instruction with and without piano accompaniment. Pelphey's (1998) findings indicated that no significant differences existed between groups who received music instruction *a cappella*, with piano or guitar accompaniment, or with compact disc recordings. Guilbaut's (2004) findings indicated that the use of root melody accompaniment did not help singing achievement in kindergarten and first grade children. However, she found that the experimental group children achieved better than those in the control group with regard to tonal improvisation.

It is important to know the extent of children's music development. The researchers continue to seek appropriate teaching strategies for improving it. In the elementary music classroom, musical instruments usually include percussion instruments, keyboard, piano and recorder for accompanying musical activities. However, there is lack of research on the importance of these instruments in music development. In addition, there are no studies about whether playing a bamboo xylophone as accompaniment facilitates musical development. In light of the scarcity of research, this study was designed to investigate the effects of bamboo xylophone as harmonic accompaniment on the developmental music aptitude of primary two children to gather information on the extent of children's potential in music. It may be important to examine whether the type of music instruction (song instruction with accompaniment versus song instruction without accompaniment) is an important factor in children music development. This study may also provide more insight into the development of music aptitude.

2. Method

2.1. Participants

This experimental research study was carried out over a period of 12 weeks of instruction. Four intact classes of 80 children ($n = 80$) were randomly selected from two public schools in the city of Kota Kinabalu, Sabah. One class from each school was assigned as a control group, while the other class was assigned as an experimental group. This study consisted of three stages: pre-test, music instruction, and post-test.

2.2. Design and Procedure

Following permission from the Ministry of Education, State Department of Education, the school, and the teachers, the children in the classes were randomly placed in either a control group to receive music instruction without bamboo xylophone accompaniment or in an experimental group with the bamboo xylophone as accompaniment for their music instruction. The respondents were all age 8, as this is within the developmental age of music aptitude.

Prior to the 12-week instruction period, children from the control and experimental groups sat for the Gordon's IMMA pre-test. The tonal and rhythm subtest was administered one week before the instruction period, using Gordon's (1982) IMMA test manual.

Both groups of children who participated in this study received music instruction for one hour per week during their regular music class schedule. All the music instruction and lesson plans in this study were based on the New Primary School Curriculum (KBSR) and were developed by the researcher, based on music learning theory and integrated music educational teaching methods. All class materials and instruments were provided by the researcher and the university. The music classroom activities for both groups' children included vocal warming-up exercises, singing, movement and playing percussion instruments.

Music instruction and lesson plans for both control and experimental groups were the same, except that the experimental group children received music instruction with bamboo xylophone as accompaniment, while the control group children did not receive music instruction with bamboo xylophone. Table 1 presents the differences in song instructions between the groups.

Table 1. Differences in song instructions between groups

Control Group	Experimental Group
Song was sung by researcher	Song was sung and played by researcher
Children echoed phrase by phrase	Children echoed phrase by phrase
Children sang <i>a cappella</i>	Children sang and played with harmonic accompaniment

During the 12 weeks of instruction, the researcher provided the music instruction to both the control and experimental groups. There was a need to have the same music instructor or teacher for all the music instruction, and to use the same music lesson plans to ensure a standard music approach to guide the children of primary two in playing the bamboo xylophone accompaniment.

After 12 weeks of instruction, the IMMAT and IMMAR subtests were re-administered to all the children as a post-test. The difference between the pre-test and post-test scores on the IMMAT and IMMAR tests served as the dependent measure for music development.

Results

3.1. Tonal Aptitude

The differences between the pre-test and post-test percentages of increased, decreased, and unchanged IMMAT scores are presented in Table 2. The IMMAT mean scores of both control and experimental groups improved between the pre-test and the post-test. Thirty-five students, or 87.5% of the control group students, improved their IMMAT scores; four students, or 10%, kept the same scores, and only one student, or 2.5%, had a lower IMMAT score. Nevertheless, the experimental group achieved slightly better improvement than the control group on IMMAT scores. Thirty-seven children, or 92.5%, of the experimental group children improved their IMMAT scores, 2 children, or 5%, kept the same scores, and only one child, or 2.5%, had a lower IMMAT score.

Table 1. Differences in song instructions between groups

Control Group	Experimental Group
Song was sung by researcher	Song was sung and played by researcher
Children echoed phrase by phrase	Children echoed phrase by phrase
Children sang <i>a cappella</i>	Children sang and played with harmonic accompaniment

Table 2. Comparison of IMMAT percentage changes by group

Type of Change	Control Group		Experimental Group	
	<i>n</i>	(%)	<i>n</i>	(%)
Increased	35	87.5	37	92.5
No Change	4	10	2	5
Decreased	1	2.5	1	2.5
Total	40	100	40	100

The difference between pre-test and post-test scores for the control and experimental groups is presented in Table 3. Children in the experimental group showed a significantly better mean score than the control group on the IMMA tonal subtest. The mean pre-test score for the experimental group increased from 31.725 ($SD = 2.46$) to 34.425 ($SD = 1.63$) for the post-test. The control group mean pre-test score was 32.5 ($SD = 2.38$) and increased to 34.625 ($SD = 1.78$) for the post-test. The mean gain score for the control group was 2.125 ($SD = 1.56$) while the mean gain score for the experimental group was 2.675 ($SD = 1.87$).

Table 3. Differences between pre-test and post-test means of the control and experimental groups in tonal aptitude

Test	Control Group (n = 40)			Experimental Group (n = 40)		
	Pre-Test	Post-Test	Mean	Pre-Test	Post-Test	Mean
	Mean	Mean	Gain	Mean	Mean	Gain
Tonal Aptitude	32.50	34.625	2.125	31.725	34.425	2.675

Figure 1 illustrates the pre-test and post-test means for the control and experimental groups in tonal aptitude. Both groups improved on their tonal aptitude after 12 weeks of instruction.

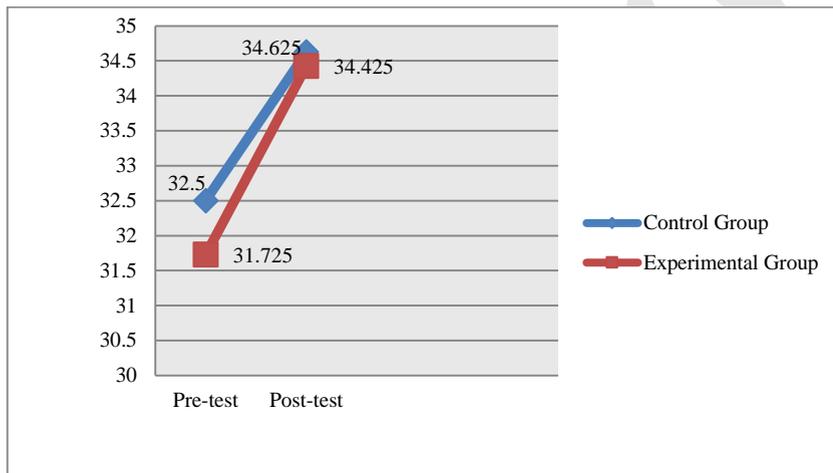

Figure 1. Pre-test and post-test on the IMMA tonal aptitude by group

A *t*-test for paired samples was used to examine whether there was a significant difference in mean gain scores from pre-test to post-test between the control and experimental groups. No statistically significant difference was found ($t = -1.529, p > .05$) for IMMA tonal aptitude between the control and experimental groups of the primary two children (see Table 4).

Table 4. Paired sample t-test comparisons of pre-test and post-test mean gain scores on tonal aptitude

Source	Control Group	Experimental Group	SD	t	p
	Mean Gain	Mean Gain			
Tonal Aptitude	2.125	2.675	2.275	-1.529	.134

No significant differences

2.2. Rhythm Aptitude

The differences between pre-test and post-test percentages of increased score, static score, and reduced score on IMMAR are presented in Table 5. The IMMAR mean scores of primary two children in both the control and experimental groups increased after the instruction period. Thirty-one children, or 77.5% of the control group, increased their IMMAR scores, 6 children, or 15%, kept the same scores and three children, or 2.5%, had lower IMMAR Scores. However, the experimental group achieved slightly better results than the control group. Thirty-seven children, or 92.5%, of the experimental group increased their IMMAR scores, 2 children, or 7.5%, kept the same scores and three children, or 7.5%, had lower IMMAR scores.

Table 5. Comparison of IMMAR percentage changes by group

Type of Change	Control Group		Experimental Group	
	n	(%)	n	(%)
Increased	31	77.5	32	80
No Change	6	15	5	12.5
Decreased	3	7.5	3	7.5
Total	40	100	40	100

The difference between pre-test and post-test scores in control and experimental groups is shown in Table 6. The experimental group showed more improvement than the control group on the rhythm aptitude test. The mean pre-test score was increased from 32.15 (SD= 1.64) to 33.925 (SD= 1.64) for the post-test. The control group mean pre-test score was 31.775 (SD=2.17), and it increased to 33 (SD= 1.40) for the post-test.

Table 6. Differences between pre-test and post-test mean of the control and experimental groups on rhythm aptitude

Test	Control Group (n=40)			Experimental Group (n=40)		
	Pre-test Mean	Post-test Mean	Mean Gain	Pre-Test Mean	Post-Test Mean	Mean Gain
Rhythm Aptitude	31.775	33	1.225	32.15	33.925	1.775

Figure 2 illustrates the pre-test and post-test mean for the control and experimental groups on rhythm aptitude. Both groups achieved better on their rhythm aptitude scores after 12 weeks of instruction.

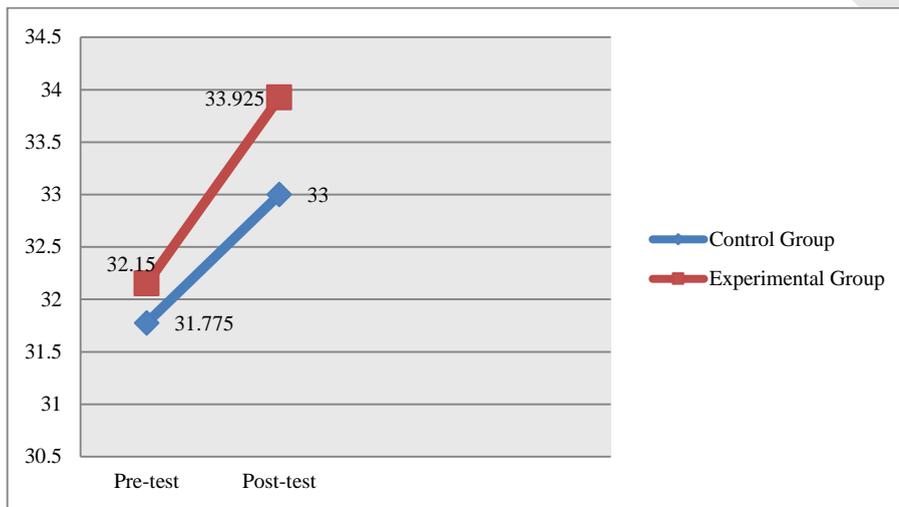

Figure 2. Pre-test and post-test mean on the IMMA rhythm aptitude by group

A paired samples t-test comparison shows no significant difference in mean gain scores ($t = -1.667$, $p > .05$) between the control and experimental groups of the primary two students on the IMMA rhythm aptitude (see Table 7).

Table 7: Paired Sample T-Test Comparisons of Pre-test and Post-test Mean Gain Scores on Tonal Aptitude

Source	Control Group Mean Gain	Experimental Group Mean Gain	SD	t	p
Rhythm Aptitude	1.225	1.775	2.087	-1.667	.104

No significant differences

3. Discussion

4.1. Tonal Aptitude

A t-test analysis indicated that no significant difference ($t = -1.408, p > .05$) existed between the control and experimental groups in IMMA tonal aptitude. The findings of this study support results found in previous research conducted by Atterbury and Silcox (1993), Guilbault (2004), Pelphrey (1998), and Stauffer (1985), who determined that harmonic accompaniment had no significant effect on children's music aptitude.

Figure 3 illustrates the comparison between percentage changes in IMMAT scores for the two groups. A greater percentage of children in the experimental group experienced improved tonal aptitude than in the control group. As a result, the bamboo xylophone may be considered an appropriate musical instrument for the development of musical aptitude.

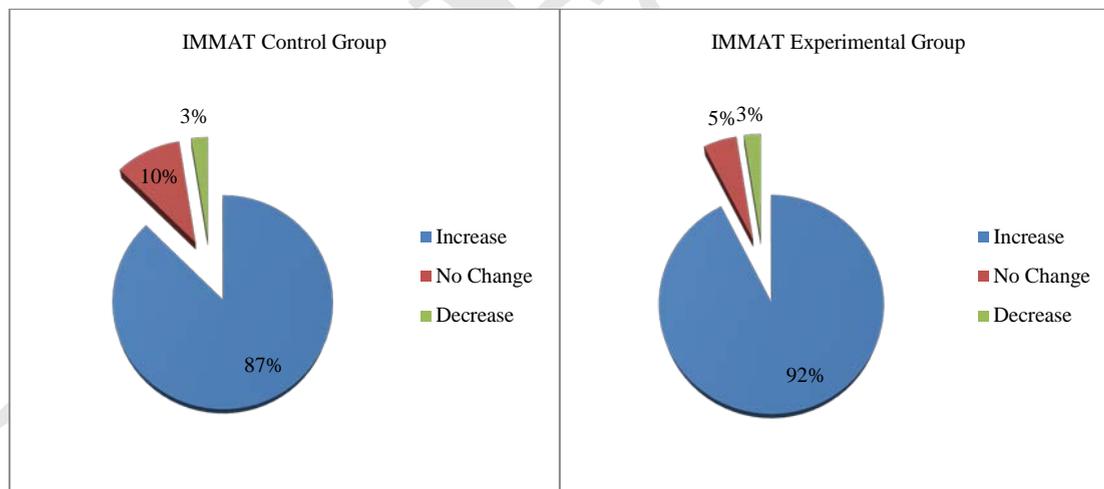

Figure 3. Comparisons of IMMAT changes between control and experimental groups

In the present study, the addition of a bamboo xylophone as harmonic accompaniment did not show a significant effect on children's music aptitude. The length of the instruction period—12 weeks with 60 minutes of

music instruction per week—may have influenced the result. It may be necessary to have more time to detect a statistically significant difference.

The range of population difference scores for each participant should be normally distributed. The sample size of the study should be 30 or above. Thus, it might be necessary to strengthen the study by increasing the sample size to detect any significant effect between the groups.

Children who received music instruction with an additional harmonic accompaniment scored higher than children who received music instruction without harmonic accompaniment. The researcher observed that one of the differences between groups was that the children in the experimental group enjoyed attending music class more.

Although there were no statistically significant differences between the experimental and control groups, it should be noted that both groups scored higher on the post-test than on the pre-test on the tonal aptitude tests. Recommendations for future study might include some longitudinal data to increase the possibility of finding a greater difference in music aptitude. Furthermore, it would be advantageous to investigate the effect of harmonic accompaniment on children's music aptitude with a wider span of age groups.

It would be beneficial for music educators to investigate the various types of accompaniment, the sequence of accompaniment, and teaching music instruction strategies, which might yield different results on music development. In addition, it would also be interesting to include students' interest level in the music class in future studies. Students' interest in playing musical instruments or in music may affect their music aptitude.

3.2. *Rhythm Aptitude*

The results showed no significant difference ($t = -1.712, p > .05$) between the control and experimental groups on IMMA rhythm aptitude. Figure 4 illustrates the percentage of students in the control and experimental groups whose IMMAR scores increased, decreased, or remained unchanged. Moreover, the percentage of students in the experimental group whose rhythm aptitude increased is higher than the percentage of students in the control group whose rhythm aptitude increased. It seems appropriate to conclude that the use of a bamboo xylophone can enhance children's developmental musical aptitude.

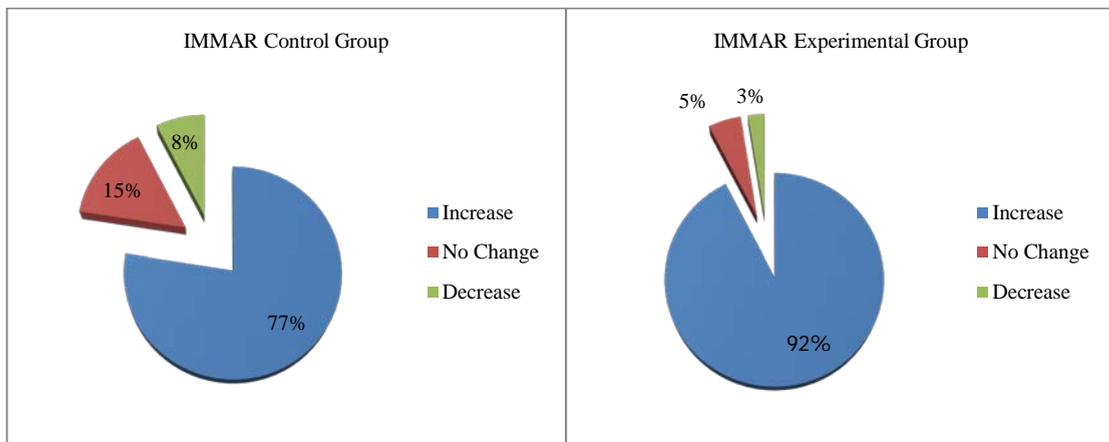

Figure 4. Comparisons of IMMAR changes between control and experimental groups

Some previous studies have supported the view that the level of rhythmic ability is affected by maturation (Groves, 1969; Serafine, 1975). Nevertheless, 92% of the experimental group increased their scores, and this is higher than the 77% of the control group whose scores also increased. Although these differences are not statistically significant, the data seem to support the view that the bamboo xylophone is an appropriate musical instrument for developing rhythm aptitude. It seems necessary to have a study with a larger sample size, and additional longitudinal investigations.

Both control group and experimental group received exactly the same music instruction, such as vocal warm up exercises, listening, singing, movement, playing percussion instruments, and tonal and rhythm pattern training. Also, the present study did not emphasize rhythm training. That the additional bamboo xylophone did not show a statistically difference might be due to the fact that the music instruction was the same and as a result, it did not obviously determine the effect of an additional harmonic accompaniment on primary two children's music aptitude.

Parents and teachers should be encouraged to understand the importance of early childhood formal and informal music instruction on the development of musical aptitude. Gordon (2007) states that, a child can positively or negatively influenced both through his or her innate potential and through the quality of his or her music environment. Some researchers also found that appropriate music instruction can increase children's development of musical aptitude (Flohr, 1981; Hudgens, 1987; Moore, 1984).

4. Conclusion and Recommendations

The bamboo xylophone can be an alternative musical teaching aid for music classroom teaching. It would be advantageous for music teachers to teach this local made and portable pitch percussion instrument. The children may benefit most from the use of a xylophone in music instruction for singing activities and ear training skills. Through the observation learning to play the xylophone also seems to enhance children enjoyment of music class.

Although there were no statistically significance differences between the experimental and control groups, it should be noted that both groups scored higher on the post-test than on the pre-test on the tonal and rhythm aptitude tests. Recommendations for future study might include some longitudinal data to increase the possibility

of finding a greater difference in music aptitude. Furthermore, it would be beneficial to examine the effect of harmonic accompaniment on children's music aptitude with a wider span of age groups.

It would be advantageous for music educators to investigate the various types of instruments accompaniment, the sequence of accompaniment and teaching music instruction strategies, which might yield different results on children music development. In addition, it would also be interesting to include students' interest level in the music class in future studies. Students' interest in playing musical instruments or in music may affect their music aptitude.

Abstract

Employees with sound educational backgrounds are crucial determinants of competition among the businesses. The importance of the employees in this field makes it necessary that students should be offered good education which should be supplemented with implementation from the field. In this implementation phase the internship takes an important place. In this study which deals with the expectations and post-internship experience of the vocational higher school students, the questionnaire technique was employed as the means of data collection. The findings of the study suggest that the opinions of the students who completed their internship and who have not completed their internship have been found out to be over 3 (positive) out of 5. This study draws a picture of the internship experience perceived by the statements and suggestions have been put forward.

Keywords: internship, vocational high school, Eskisehir -Turkey

INTRODUCTION

Employees form the social and economic focus point of enterprises. Employees take place at each stage of operating activities and perform efficient tasks. The existence of employees who received a decent education and have a high level of professional and social responsibility keeps the enterprises ahead of the game. For the enterprises to survive and achieve their goals in this competitive environment, it is necessary to use the resources efficiently and take decisions actively and quickly (Tengilimoğlu and Acar, 2004). Therefore, employees with a good education in their field are at a determining position in providing both the competition at both national and global level. Especially with the growth of service sector, educated and qualified labor requirement has become more important (Kızıllırmak, 2000). Additionally, the imperative of providing quality service considerably necessitates a higher level of professional and technical education for the labor to be employed in the related sector (Timur, 1994). This situation necessitates the business life and vocational education/training to be performed in parallel with each other (Sevim and Karamete, 2003). Vocational education is “*the education by which the individuals are coached for a profession, the ones who already have a profession are provided assistance for career development and accommodation to new professions, the individuals receive certificates and diplomas through education in accord with the interests, desires and needs in their daily lives, knowledge and skill are provided*” (Resmi Gazete, Official Gazette, 2002). Employees who are going to work at intermediate and mid-levels are educated through vocational education. Organizational

E-mail address: oktayemir@anadolu.edu.tr

structure of an enterprise consists mostly of the employees working at mid and lower levels. Hence, the enterprises should pay attention to qualified work force to compete and meet the expectations of customers. Especially, the purpose of vocational educational lies behind the activities aimed towards the use of theoretical knowledge, which the students receive by vocational education, in the business life (Bahadır and Oğuz, 2012).

Attitudes and approaches of enterprises towards interns are of great importance. Covering the expectations of interns make them love their jobs. In the previous studies carried out, it stands out that the interns whose expectations are not covered and who have experienced malpractices turn onto different jobs. Especially in the service sector in which individual labor is intense, high labor turnover rates affect the decisions of interns related to their careers negatively and causes an outward mobility in the sector (Türkay and Tüzemen, 2009). Among the reasons which increase the rate of labor turnover rate and force the interns to leave the sector are physical insufficiency in working conditions, lack of social rights, low wages, failing to satisfy the expectations of interns, individual factors and the imbalance of working hours etc. (Çimen, 2008; Duman et. al., 2006). In a research carried out by Sarıışık (2007), it is stated that the students of Vocational High Schools doing training in the field of tourism think that the job fits in their skills and do not plan to change the sector they are working. On the other hand, in a research carried out by Avcı (2011), it was indicated that the students receiving tourism education at undergraduate level want to work at the tourism sector after graduation. In the research carried out by Bahadır and Oğuz (2012) related to the training practices of the students of Vocational High School of Technical Sciences, it is stated that the students are content with the training practice and the advantage of finding a job is provided. Moreover, in a research conducted by Terim and Öztürk (2009) on students having the education of accounting, it was revealed that the students both find the education sufficient for training and are disposed to work in their fields after graduation. Actually, this situation presents an expected or ordinary result.

It is indicated that in Turkey, there are substantially a lot of skilled labor who completed their vocational education especially at the level of secondary and higher education but in general, the enterprises do not take advantage of this labor (Hacıoğlu et. al., 2008). Numerous variables might create this situation. Yet, what is important here related to this problem is to look for whether the labor demand that the sector needs and supplied labor expectations are met or not. First of all, training a work force qualified enough to meet the expectations of the business world should be the priority of educational institutions. Especially, the institutions providing education in vocational and technical field to train personnel for intermediate level should continuously revise and develop their curriculums. Moreover, Vocational High Schools should update the content of education provided within the criteria of expectations and training individuals who have flexible skills (Vurgun, 2009). On the other hand, considering the contribution of employee satisfaction to the organizational commitment, these enterprises should be sensitive to the interns (Kuşluyan and Kuşluyan, 2005). Furthermore, legal regulations which offer incentives to support the sector and individuals for vocational and technical education will enable the students to make more positive evaluations about career planning (Duman et. al., 2006).

CONCEPTUAL FRAMEWORK

In Turkey, training within the scope of university education give the students a chance to observe business life by providing experience for their jobs/professions and an opportunity for them to compare their theoretical knowledge with

practice. In the sense of the students gaining vocational experience before professional life and being ready for the problems of the professional life with these experiences, training period is one of the essential levels of education (Karacan and Karacan, 2004). Vocational High Schools are the schools providing two years higher education with the related areas after high school and their equivalents. The purpose of Vocational High Schools is to train intermediate level employees that the relevant sectors need. At these schools, students receive theoretical education for four semesters. In addition to that, each university organize a training directive within the framework of Training Regulations issued by the Council of Higher Education being in accordance with their programs and implement this directive. The Council of Higher Education arranges the activities targeted at the skill training of students with a regulation within the frame of the legislation. The purpose of this Regulations Concerning the Basis and Procedures Related to the Education, Practice and Training of Vocational High School Students within the Vocational and Technical Education Area is *“to reinforce the theoretical knowledge and experiences, improve the skills and experiences acquired through laboratory and workshop practices and to enable these students who are being educated at the vocational high schools within the Vocational and Technical Education Area to learn the responsibilities, relations, organizations, production process and new technologies of the work place to be worked”*. Furthermore, training period of these students is arranged in the 17th Article of the same Regulation as being not less than 30 workdays (240 hours) and more than 60 workdays (480 hours) according to the qualification of program (www.yok.gov.tr). Starting from this point, Vocational High Schools should plan and coordinate their education and training programs in line with the purpose stated in the Regulations. The intensity of competition forces the business world to create differences. In this respect, qualified labor force creates the most important differences for the enterprises. Since this qualified labor force will tip the balance in the creation of other differences, qualified labor force being one of the main factors of development in any field is the key to competition and quality (Sems and Clements, 1996; Ünlüönen, 2000). Vocational High Schools training intermediate personnel have to conduct their educational and training programs in a way to integrate theory and practice at each stage. In other words, for the education provided to students to be successful, theoretical education should be supported by hands-on training (Fırat, 1997; Rimmington, 1999; Velde and Cooper, 2000; Morrison and Q’Mahony, 2003; Çetin, 2005; Pelit and Güçer, 2006; Alexander, 2007). Evaluating the studies (Çetin, 1995; Altınay, 1996; Cooper et. al., 1996; Kozak, 1999; Kuşlivan and Kuşlivan, 2000; Tan and Morgan, 2002; Riley et. al., 2002.; Yıldırım, 2002; Ilgaz and Çakar, 2002; King et. al., 2003; Karacan and Karacan, 2004; Gören, 2005; Benli and Karaosmanoğlu, 2005; Çetin, 2005; Duman et. al., 2006; Taşkın, 2006; Pelit and Güçer, 2006; Sarıışık, 2007; Dağdeviren, 2007; Terim and Öztürk, 2009; Türkay and Tüzemen, 2009; Wang et. al., 2009; Bahadır and Oğuz, 2012) carried out for the training practices of schools providing education oriented at a profession, it is possible to draw inferences that the skill training is not at a desired level, since the curriculum of these schools are predominantly based on theoretical education. This situation reveals the explicit face of the problem. Therefore, determining the real issues that cause the problem would eliminate the problems. It is known that in Turkey, public institutions carry out many activities to enhance the quality of education and improve vocational and technical education as in other areas/fields. To understand this subject better, first of all, it would be useful to investigate where the Vocational High Schools in Turkey stand in numbers. According to information provided by the Council of Higher Education on the date of 10 May 2013, there are 976 Vocational High Schools and with 13508 programs, education and training are provided. In 2011-2012 academic year, the number of students registered to these programs being 420922, total of 109552 graduated from these programs at the end of 2012. The numbers given above indicate the importance that our country places on vocational and

technical education. What should be taken into consideration here is that in these schools, qualitative quality should also be improved as well as the quantitative quality. With the sense of the requirement that the country resources should be used wisely, at the stage of establishment of these schools, feasibility studies should be conducted and region(s) in need of schools and programs should be determined. For example, whether there is a chance for the students to do training during the program and to find a job after graduation within the region where these schools will be established or the immediate vicinity or not is a question to be answered beforehand. For this reason, the development of the cooperation between the related sector(s) and educational institutions will increase the local, regional and national contribution to the satisfaction of need(s). In addition to that, physical structures of these schools should not be designed just for theoretical education but also should include classrooms and functional workshops that will serve the needs. Another important problem confronted related to this issue is that there are differences among the training directions and training practice processes of Vocational High Schools. It is seen that there are major practical differences among the schools and programs in terms of both training period and training practice. In the studies (Kuşlivan, 2000; Koyuncu 2000; Demirer, 2000; Yağcı, 2001; Güçer, 2004; Kozak, 2005; Çelik 2006; Çevik, 2007; Temircan, 2009; Başer, 2010; Türkseven, 2012) carried out for this issue, the representatives of sectors stated that the students especially at the level of higher education do not have enough practical knowledge and this causes adaptation problems within the enterprises. In accordance with either the results of studies conducted related to this issue or the regulations arising from the implementations of the union countries during the process of adaptation to the European Union, it is still possible to express the existence of these problems even though the related schools show a great effort for making up their deficiencies (Emir et. al., 2010). The way to eliminate these problems is providing students the skill training for practice at schools in the field of practice. These kinds of practices should guide the students later for the training period they will attend (Velde and Cooper, 2000: 83; Pelit and Güçer, 2006). This research attempts to measure the perceptions related to training practice of the students who performed and did not perform training. To the term of training, writers have made different definitions, the essence being the same. According to Çetin (2005), training is *“the use and practice of academic knowledge of individuals who have theoretical professional knowledge in real life, in other words, the experience of turning the acquired information into behavior by practicing and experiencing.”* Training is defined as *“the process of putting the theoretical knowledge received at Vocational High Schools into practice under the custody of a master trainer in the appropriate enterprises”* by Bila (2006). And Turkish Language Association (2013) defines training as *“The period spent by an individual by working at one or more than one department of an enterprise to improve his vocational knowledge”* or *“Practical learning period experienced by an individual who will acquire a profession”*. As it can be understood from the definitions, training enables students to see the working conditions, to learn the necessary competencies for their professional developments, to make a professional circle, to socialize and to meet with realities (Ilgaz and Çakar, 2002: 385; Çalık, 2006). Accordingly, the first acquaintance and perceptions of students with the business world start with the training period (Türkay and Tüzemen, 2009; Başer, 2010). Training activities of students carried out within the enterprises during the academic period offers the students an opportunity to practice and observe the real applications at the enterprises by helping the update of information out of date being one of the significant problems of vocational education (Sevim and Karamete, 2003; Çetin, 2005; TOBB, 2007). Thus, while the professional ethics and work discipline senses of students are improving, they will exert effort to develop themselves with the pleasure taken in the contribution that they are providing to the production during their training activities (Buluç, 1992). A conscious and systematic training will enable the students to make a good preparation for

the future. Therefore, enterprises bear a great responsibility (Cho, 2006). These enterprises should regard the interns as their backyards in other words, each contribution made for the interns are making investment on the future of the enterprise. In this respect, the enterprises can train personnel suitable to their identities by employing interns and thus they would not have difficulty in finding personnel. Hence, the training practice contributes both to the enterprises and interns. During the training period, difficulties and technical points of the job, faults and deficiencies should in particular be informed to the interns. Training process should be taken as a part of educational process. In this regard, training might be evaluated as an educational system that provides benefits to the students such as experiencing the working conditions related to the tasks to be carried out by them in the future, learning and consolidating the work processes, being responsible and adapting to the work. Hence, the enterprises should conduct the training process of interns within a plan under the coordination of a consultant (Çetinkaya, 2004; Çetin, 2005; Yer, 2006).

Broadly speaking, training makes up an important part of the professional and technical education of students. The studies carried out related to this subject up to date have brought forward many proposals to the parties (relevant sector and school) about the training. In line with the proposals, those parties have adapted the changes regarding their own shares. Today, competition is a subject that not only applies to the enterprises but also other sectors such as education, health, etc. From this point of view, students who receive a qualified education in a related field will be more successful in their business life. Accordingly, it is possible to indicate that knowing the state of expectation and satisfaction of students from the training will make a contribution to both the literature and the parties (related sector and school) related to the subject and the ones who will develop a plan and project.

2. PURPOSE OF THE RESEARCH

The purpose of this research is to emphasize the effect of training on the professional development of Vocational High School Students. Within this framework, by determining the perception of training by the students who did not do training and completed the training period, the differences are specified. By means of specifying the mentioned differences, the effect of training on the professional development of students are tried to be determined.

3. METHOD OF THE RESEARCH

Sample group of this research consists of 275 (63,8%) students who have not performed training yet and 156 (36,2%) students who have completed their training out of a total number of 431 students from Anadolu University Eskisehir Vocational High School and Porsuk Vocational High School. For the research, questionnaire technique is used as the data collection method. The questionnaire was conducted to students within the scope of research through face to face interview method. Of the questionnaire comprising of two sections, there are some questions about demographical features (sex, current grade, the Vocational High School they receive education and the methods by which they have found the enterprise they do training) of participants within the first section. The second section of the questionnaire consists of 17 statements designed as 5 point Likert Scale (1=strongly disagree, 2=disagree, 3=neutral, 4=agree and 5=strongly agree) to determine the expectations of students to do training and the evaluations of students regarding the training. The second section of the questionnaire used in the research are created upon the revision of previous studies (Kozak, 1999; Kuşluyan and Kuşluyan, 2000; Kozak and Kızıllırmak, 2001; Jenkins, 2001; Sevim and Karamete, 2003; Karacan and Karacan, 2004; Ünlüönen, 2004; Kozak, 2005;

Güçer, 2004; Aksu and Köksal, 2005; Benli and Karaosmanoğlu, 2005; Pelit and Güçer, 2006; Saruşık, 2007; İçli, 2007; Emir et. al., 2008; Richardson, 2009; Wang vd., 2009; Terim and Öztürk, 2009; Ünlüönen et.al., 2010; Bahadır and Oğuz, 2012) related to the subject. Appropriateness of this section of the questionnaire in terms of both the content and comprehensibility is controlled by taking expert opinions and making face to face interviews with 30 individuals who have the same features with the target audience (students of Eskisehir Vocational High School) with a preliminary application. Thanks to the interviews made with the aforementioned group and the feedbacks, comprehensibility of all the statements in the questionnaire is checked.

The data collected in scope of the research analyzed by using statistical data analysis techniques by SPSS (Statistical Package for Social Sciences) program in accordance with the purpose of research. In the analysis of collected data, percentage and frequency distribution, arithmetic mean, standard deviation and independent samples t test are used. Regarding the reliability analysis in relation to the second section of the questionnaire, Cronbach's Alpha is computed as $\alpha=0,908$ for the students who did not perform training and $\alpha=0,911$ for the students who did not. The results seem to be sufficient in terms of the reliability of the scale used in the research (Alpar, 2011).

4. RESULTS

Frequency and percentage distribution with reference to some demographical features of students consisting of the sample group of the research are given in Table 1. When the individual features of participants are evaluated in Table 1, it can be seen that of the participants; 63,8% have not performed training, 36,2% have completed training period, 58,2% male, 41,8% female, 75,2% are among 18-20 age group and 42,0% first grade, 58,0% are second grade students. The results of t test concerning the comparison of training practice status, grade and gender of the students with participants' opinion is presented in Table 2.

Table 1: Demographical Characteristics of the Participants

Variants	Groups	f	%
Status of training	Have not performed	275	63,8
	Have performed	156	36,2
Sex	Male	251	58,2
	Female	180	41,8
Age	18-20	324	75,2
	21-23	95	22,0
	24 and over	12	2,8
Grade	1 st Grade	181	42,0
	2 nd Grade	250	58,0

Table 2: The Comparison of the Participants' Opinion According to Training Status and Gender.

Variables	Groups	\bar{X}	s.d.	t	p
Training Status	Those who have not	4,09	0,55	2,731	0,007*
	Those who have	3,93	0,67		
Grade	1 st grade	4,15	0,48	3,528	0,000*
	2 nd grade	3,94	0,67		
Gender	Male	4,02	0,61	0,373	0,710
	Female	4,04	0,59		

* $p < 0,05$

According to findings in Table 2, the general (total) opinions of the students who have not performed training ($\bar{X} = 4,09$) is higher than ($\bar{X} = 3,93$) those who performed their training. It was found that the opinions change meaningfully according to the grades of participants ($p < 0,05$). When we evaluate the mean values, we see that the mean value of the first grade students ($\bar{X} = 4,15$) is higher (more positive) than that of the second grade students ($\bar{X} = 3,94$). This is because second grade students are mostly consisted of the ones who performed their training. On the other hand, it was observed that there is no meaningful difference in general training evaluations according to genders ($p > 0,05$). It was concluded in a research carried out by Bila (2006) that the level of utility of summer training does not meaningfully change according to gender.

Opinions of Vocational High School students who have performed and have not performed training regarding the practice of training and findings related to the comparison of the mentioned opinions are provided in Table 3. According to the findings in Table 3, it is concluded that the opinions of the students who have not practiced their training yet and who completed their training about the training practice are generally positive above 3 points, which is medium level. In other words, the mean values in Table 3 revealed that training expectations of those who do not practice training and perceptions for training of those who did training are positive. On one hand, there is no statistical meaningful difference between the opinions of the students who have not practiced their training yet and who completed their training about the 10th, 11th, 14th, 15th, 16th and 17th items ($p > 0,05$). On the other hand, opinions of students meaningfully become different according to 2nd, 3rd, 4th, 5th, 8th, 9th, 12th and 13th items ($p < 0,05$). Evaluations about these differences have been presented below.

- The expectations, of students who did not perform their training, in the subject "Application of the theoretical knowledge learned at school during training (item 2)" ($\bar{X} = 4,07$) is higher ($\bar{X} = 3,75$) than the perceptions of the students who did their training (more positive).

•The expectations, of students who did not perform their training, in the subject “The parallelism between theoretical education and practices in enterprises (item 3)” ($\bar{X}=3,85$) is higher ($\bar{X}=3,56$) than the perceptions of the students who did their training.

•The expectations, of students who did not perform their training, in the subject "Seeing current issues and new developments not seen during theoretical training in the practice (item 4)" ($\bar{X}=4,24$) is higher ($\bar{X}=3,88$) than the perceptions of the students who did their training.

•The expectations of students, who did not perform their training, in the subject “The interest in the field of education after training (item 5)” ($\bar{X}=4,05$) is higher ($\bar{X}=3,79$) than the perceptions of the students who did their training.

• The expectations of students, who did not perform their training, in the subject “Contribution to foreign language development (item 8)” ($\bar{X}=3,35$) is higher ($\bar{X}=3,14$) than the perceptions of the students who did their training.

• The expectations of students, who did not perform their training, in the subject “Contribution to success of business life after graduation (item 9)” ($\bar{X}=4,17$) is higher ($\bar{X}=3,96$) than the perceptions of the students who did their training.

• The expectations of students, who did not perform their training, in the subject “Contribution to the will to work after school is finished (item 12)” ($\bar{X}=4,16$) is higher ($\bar{X}=3,98$) than the perceptions of the students who did their training.

• The expectations of students, who did not perform their training, in the subject “The idea of receiving in-service training in places where training is performed (item 13)” ($\bar{X}=3,96$) is higher ($\bar{X}=3,63$) than the perceptions of the students who did their training.

Table 3: The results of t test regarding the comparison between the ideas of students who will do training and who did their training.

Item No	Expressions	Training Status	\bar{X}	Standard Deviation	t	p (sig)
1	I believe that I will do training in the field which is appropriate for my education programme.	**	4,36	0,83	1,469	0,143
	I did training in the field which is appropriate for my education programme.	***	4,22	1,07

	I had the opportunity to meet people from different cultures.	***	4,03	1,19		

* $p < 0,05$, **The ones who have not performed training, *** The ones who performed training

CONCLUSION AND SUGGESTIONS

Education is a process of educating people for specific purposes in general terms and the sum of processes in which an individual learn behaviors in the society he/she lives (Erden and Fidan, 1998; Varış, 1996). In other words, education is a socialization process in which an individual learns a specific life style Education can be defined as creating the desired behavior change in the individual through the arrangement of environment. In order to develop this kind of behavior change in individual, environment of education should be consistently organized and controlled; in other words it should be evaluated and improved (Sönmez, 1987). Primary objective of the education should be to convey cultural heritage to generations, to create a facilitator effect for the individuals to perform social roles by forming their behaviors and raising well-educated individuals (Çevik, 2007; Türkseven, 2012). In order for educational institutions to achieve this goal, all parties should participate in the process and there should be a continuous development and customer-oriented point of view (Çevik, 2007). Total of 431 students who have not undergone training yet and who completed training participated in this study, the aim of which is to determine the effect of training on the development of vocational school students. It can be concluded that the evaluations of students on training is generally positive. It can also be stated that the perceptions of the students who have completed their training about the subjects application of the theoretical knowledge learned at school during training, foreign language development, contribution to success of business life after graduation, increased desire to work after education is completed and receiving in-service training during training is higher and more positive. This assessment applies to the overall scale of training. When we analyze the studies related to research, it is possible to achieve different conclusions in terms of both training programs and sector. For example, in a study carried out by Başer (2010), it is highlighted that the current training program is not efficient and students see it as a formality; and there is lack of coordination among the units regarding vocational training. In another research, it was reported that students think that business world see them as cheap labor, which leads them not to place enough emphasis on implementation of skills training (Yılmaz, 2011). In a research bu Bila (2006), the level of practising on the master trainers by trainees in private sector is much higher than that of the ones in governmental institution (Bila, 2006). Furthermore, it is stated in a research by Yılmaz (2011) that students prefer private sector to perform their training rather than public one. The main reason is that students assume that they will have the chance to be accepted as an employee after graduation. Temircan (2009) suggests in his study that students are in the opinion that the foreign language education is insufficient at schools. On the other hand, it is pointed out in a research by Çevik (2007) including the expectations of vocational school students that the students have great expectations as to acquire "knowledge and skills of foreign language ". In a research conducted by Emir, et. al., (2010) The trainees remarked that the training is useful in that it creates the opportunity to gain experience about the duration of training, work division of training, coordinated working and to introduce people from different cultures and with different life styles. Within the frame of the results obtained in the research, it can be recommended that theoretical knowledge should be supported by practical knowledge and especially more importance should be given to foreign language education. Besides, the cooperation between the related sector and educational institution will be useful while establishing curriculum. What is more, trainees should not be seen as cheap labor. Trainees are the future of the operations and that is why they should be trained in a quality way. For this reason, legal regulations which will effect parties in a positive way should be conducted by public in order to make training program more attractive. Employment of the trainees in work places should be a priority. Therefore, it will be an element of oppression for

the authorities to carry out the training program appropriate for the philosophy of it apart from the routine implementation. By means of training practice, students compare theoretical knowledge with practical knowledge at work places. In this respect, the coordination between work place, educational institutions and students will be effective in the success of training.

4th International Conference on New Horizons in Education

The Effect of Environmental Education on the Pre-Service Teachers' Affective Tendency towards the Environment and Cognitive Structure

Sinem Dinçol Özgür^{a*}, Ayhan Yılmaz^a^a Faculty of Education, Hacettepe University, Ankara, 06800, Turkey

Abstract

The aim of this study is to examine the effect of the 'Environmental Protection' course on the pre-service chemistry teachers' affective tendency towards the environment and cognitive structure. Moreover, the pre-service teachers' opinions on the content, applications and contributions of the Environmental Protection course have been also evaluated. One group pretest-posttest design has been used in the study. 12 pre-service teachers, who study in Hacettepe University, Faculty of Education, and Department of Chemistry Education and have registered for the Environmental Protection course during fall semester 2012-2013, have been included in the study. Trends in Environmentally Oriented Affective Scale, Word Association Test and open-ended questions intended for learning the pre-service teachers' opinions have been used in the study as a data collection tool. Consequently, it is found that the Environmental Protection course led to a positive increase in the pre-service teachers' sensorial tendency towards the environment and that it is influential in their setting up associations between concepts through the knowledge of environmental concepts. Regarding the views held by the pre-service teachers, it is found in their personal statements that the course was effective in their learning the new concepts about the environment, in making them more sensitive to the environment, and in their gaining awareness of the environment.

Keywords: environmental education, word association test, cognitive structure, pre-service chemistry teachers

1. Introduction

Against the environmental problems increasing every day, it becomes more important to raise sensitive and concious individuals. This result establishes the need for an effective environmental education. Environmental education is a life-long lasting, interdisciplinary approach in order to develop a world population that has individual and sociological duties and responsibilities, knowledge, skills, attitudes and incentives to contribute to solve the current environmental problems and preventing the formation of the new ones (Moseley,2000). According to Vaughan, Gack, Solorazano and Ray (2003) environmental education is a continual learning procedure which enables people to be aware of their environment and aims new generations to gain the necessary knowledge, skills, attitudes and experiences to solve the environmental problems. With an environmental education, developing individuals' environmental consciousness, enabling them to have positive attitudes and behaviours, increasing their sensitivities towards environments environmental problems and providing positive contributions to the sustainability of a more livable environment is aimed (Roth, 1992; Hsu, 2004; Reid, Teamey & Dillon,2004; Xingcune, 2004; Venkataraman, 2008; Davis, 1998). Our merits, attitudes, awareness and intentions towards the environment generate our affective tendencies. If an individual think about an environmental problem at an interpersonal level and this problem requires an action, all factors that lead to take

* Sinem Dinçol Özgür. Tel.:+90-312-2976787
E-mail address: sinemdincol@hacettepe.edu.tr.

action for the individual show his affective tendency (Trudi Volk & Mcbeth 2001; as cited: Aksoy & Karatekin, 2011).

In studies concerning environmental education, emphasis made on sustainability / lifelong concepts catches the attention. For the sustainability of a livable environment, environmental education should be continuous and sustainable. Environmental education starts in the family which individuals live with and continues with the formal and informal educations all through their lives. Plevyak Noe, Henderson, Roth and Wilke (2001) expressed that the most important factor to determine the success of environmental education is teacher, and they stated that, unless teachers have the knowledge ability and responsibility to prepare their lessons towards environment, it would be impossible to raise environmentally literate students. Considering the development of susceptible behaviours towards environment, significant tasks are under the responsibility of teachers who are the most important items of the formal education, (Groves & Pugh, 1999; Khalid, 2001; Karatekin & Aksoy, 2012; Artun, Uzunöz & Akbaş, 2013). In this context, the pre-service teacher's possession of knowledge, conscious and positive affective tendencies is important in terms of raising environmentally-conscious generations.

1.1. The aim of the study

In this study, it is aimed to examine the effect of the 'Environmental Protection' course on the pre-service chemistry teachers' affective tendency towards the environment and cognitive structure. The pre-service teachers' opinions on the content, applications and contributions of the Environmental Protection course are also evaluated.

1.2. The Sub- Problems

The sub-problems of the study are as stated below:

- 1) What is the effect of environmental education on the pre-service chemistry teachers' affective tendency toward the environment?
- 2) What is the effect of environmental education on the pre-service chemistry teachers' cognitive structure?
- 3) What are the opinions of the pre-service chemistry teachers' on the content, applications and contributions of the Environmental Protection course?

2. Method

One-group pre-test, post-test design was used in the study.

2.1. Sample

12 pre-service teachers, who study in Hacettepe University, Faculty of Education, and Department of Chemistry Education and have registered for the Environmental Protection course during fall semester 2012-2013, are included in the study.

2.2. Data Collection Tools

The measuring tools used in the study are: Trends in Environmentally Oriented Affective Scale, Word Association Test, Open- Ended Questions. The following sections give detailed information about these instruments.

2.2.1. Trends in Environmentally Oriented Affective Scale (TEOAS): In order to determine the pre-service chemistry teachers' sensorial tendency towards the environment, Trends in Environmentally Oriented Affective

Scale originally developed by Wisconsin Center for Environmental Education (1994, 1997) and adapted into Turkish by Karatekin (2011) was used. The Scale is composed of 27 items with 5 point Likert scale. The Cronbach alpha reliability coefficient was calculated as .78 (by Karatekin, 2011).

2.2.2. *Word Association Test (WAT)*: In order to determine the cognitive structure of participants WAT was conducted. To construct the Word Association Test, six important stimulus words which are relevant to the course content were chosen in this study. These words were as follows: environment, sustainability, ecology, environmental issues, pollution and waste. WAT was prepared as stated below (one word on each page):

Environment
 Environment
 Environment

Bahar and Özatlı (2003) stated that the reason for writing the stimulus words one under the other is to prevent the risk of continuous answering. If one does not look at the stimulus word at every turn, the words which the concept reminded him will come back to his memory. So, this situation will affect the aim of the test (Bahar & Özatlı,2003).

2.2.3. *Open- Ended Questions:*

The pre-service teachers were asked open-ended questions to reveal their opinions on the content, applications and contributions of the Environmental Protection course. These questions were as follows:

1. Do you evaluate your knowledge about the environment before and after the Environmental Protection course and your attainment within the scope of the course?
2. Are the activities (methods and techniques) which were applied within the scope of the course useful for you? Why?

2.3. *Application stages of the research:*

The research was conducted on the Environmental Protection course during fall semester 2012-2013.

•In the first week, the pre-service chemistry teachers were offered general knowledge on the research content, and the purpose of the study was explained to them. Before the application, the word association test was explained and several examples about different issues were given. Pretests (WAT and TEOS) were applied. Considering the studies in the literature (Kempa & Nicholls,1983; Bahar, Johnstone & Sutcliffe,1999; Bahar & Özatlı, 2003), thirty seconds were given to the pre-service teachers for each word in the word association test. The researcher controlled the time and administrated WAT and TEOAS. During the education semester, within the scope of the Environmental Protection course, the pre-service teachers learned about the emergence of the environmental problems, evaluation of the environmental effects, definitions related to the environmental terms, environmental problems, environmental organizations and watched videos related to these subjects. Moreover, they prepared presentations on the environmental issues and presented them during the course. At the end of the semester WAT and TEOAS were given as the post test. Open-ended questions were asked for learning the opinions of the pre-service teachers about the course.

2.4. *Data Analysis*

In order to determine the effect of the environmental education on the pre-service chemistry teachers' affective tendency towards the environment, the analysis of Wilcoxon Signed- Ranks Test was made. Pre and post "Word association test" was conducted to determine the cognitive structures of the pre-service teachers and the results were examined thoroughly. A frequency table was prepared to show the number of the repetition of the words which were written related to each stimulus words and also concept maps were created. "Cut-off point" technique presented by Bahar, Johnstone and Sutcliffe (1999) was used in the construction of the concept maps. According

to this technique, the 3-5 points below the highest response word for any stimulus word in the WAT is used as a cut-off point. The responses whose frequency is over the cut-off point are written on the top of the map. Then the cut-off point is gradually lowered and this process continues until the appearance of all stimulus words on the map (Bahar & Özathı, 2003; Ercan, Taşdere & Ercan, 2010; Demircioğlu, Vural & Demircioğlu, 2012). Since there is limited number of students, the cut-off point was determined two points below considering the concept that was widely accepted (Demircioğlu, Vural & Demircioğlu, 2012). For example, in the pre-test, the concept “environment” was associated with the concept “pollution” eleven times (11 students). Under normal circumstances, the cut-off point is determined as 8-11 points in the first stage and as 7-4 points in the second stage. However, due to the number of the students, the cut-off points were determined in short intervals (for example, the cut-off points in the first stage is between 10-11 and in the second stage between 8-9). The words with 1 frequency were not included because they could cause a complicated and disintegrated concept map. The pre-service chemistry teachers’ opinions on the content, applications and contributions of the Environmental Protection course were evaluated according to their responses to open-ended questions.

3. FINDINGS

The findings were examined in line with the research questions of the study.

Regarding the first sub-problem of the study, the results of the Wilcoxon Signed-Ranks Test were shown in Table 1 to analyze the points of the pre-service teachers’ affective tendencies towards the environment before and after the Environmental Protection course.

Table 1. The results of the Wilcoxon Signed-Ranks Test for the points of the affective tendencies towards the environment before and after the Environmental Protection course

Post test- Pre test	n	Mean Rank	Sum of Ranks	Z	p
Negative Ranks	2	4,25	8,50	2,39	0,017
Positive Ranks	10	6,95	69,50		
Ties	0				

*Based on negative ranks

The results indicate that there is a significant difference between the points of the pre-service teachers’ affective tendencies towards the environment before and after the Environmental Protection course ($z=2.39$, $p<0.05$). Considering the mean rank and sum of ranks of the variable points, it is understood that this difference is on the side of positive ranks, that is post-test point. According to these results, it can be stated that the Environmental Protection course affected the pre-service teachers’ affective tendencies towards the environment positively.

In regard to second research question, the total number of different response words to each stimulus words in pre- and post-WAT is given in Table 2. The concept maps drawn according to the stimulus words after the word association test prepared for the pre-service teachers before and after the Environmental Protection course are given in Table 3.

Table 2. Total number of different response words to each stimulus words in pre- and post- WAT

Stimulus words	Total number of response words	
	Pre- WAT	Post-WAT
Environment	78	85
Sustainability	32	53
Ecology	43	55
Environmental issues	68	88
Pollution	40	59
Waste	35	38
Total	296	378

The total number of valid response words is 296 for pre-WAT and 378 for post-WAT. It can be expressed that the Environmental Protection course influenced the establishment of the connections with the stimulus words in the cognitive structures of the pre-service teachers regarding the stimulus words and also the increase in these connections. The pre and post concept maps drawn according to the results of the word association test applied to the pre-service teachers before and after the Environmental Protection course are given in Table 3.

Comparison between the pre and post concept maps drawn according to the results of the word association test applied to the pre-service chemistry teachers before and after the Environmental Protection course:

The pre-service teachers' cognitive structures before and after instruction:

- 1) **Cut-off point 10-11:** At this cut-off point, in the pre-test, only the stimulus word "sustainability" and two more concepts related to this stimulus word (wind and solar energy) came forward. It is seen that many stimulus words were not included at this cut-off point. However, in the post test, it is seen that the stimulus words "sustainability, pollution and environment" were given in relation to one another and also the concept "protection" was given in accordance with the concept "environment".
- 2) **Cut-off point 8-9:** At this cut-off point, in the pre-test, the relation between the stimulus words "environmental issues" and "pollution" came forward. Moreover, the stimulus word "ecology" and in accordance with this concept the concept "balance" were included. In the post test, the relation between the stimulus words "environment" and "pollution" and also the concept "air pollution" related to the concept "pollution" were stated. Furthermore, the stimulus word "sustainability" and the concept "water" in accordance with this concept were also expressed.
- 3) **Cut-off point 6-7:** At this cut-off point, in the pre-test, the pre-service teachers mentioned the stimulus words "environment, waste, sustainability, pollution and ecology" and also the relation between the stimulus words "environment" and "waste". Moreover, several concepts related to each stimulus word came forward. In the post test, all stimulus words were included. However, except for the relation between the words "environment" and "ecology", all stimulus words were unrelated and disconnected. Response words were also written regarding all stimulus words.
- 4) **Cut-off point 4-5:** At this cut-off point, in the pre-test, all stimulus words were mentioned. However, only the relation between the concepts "pollution, environment and sustainability" was given and

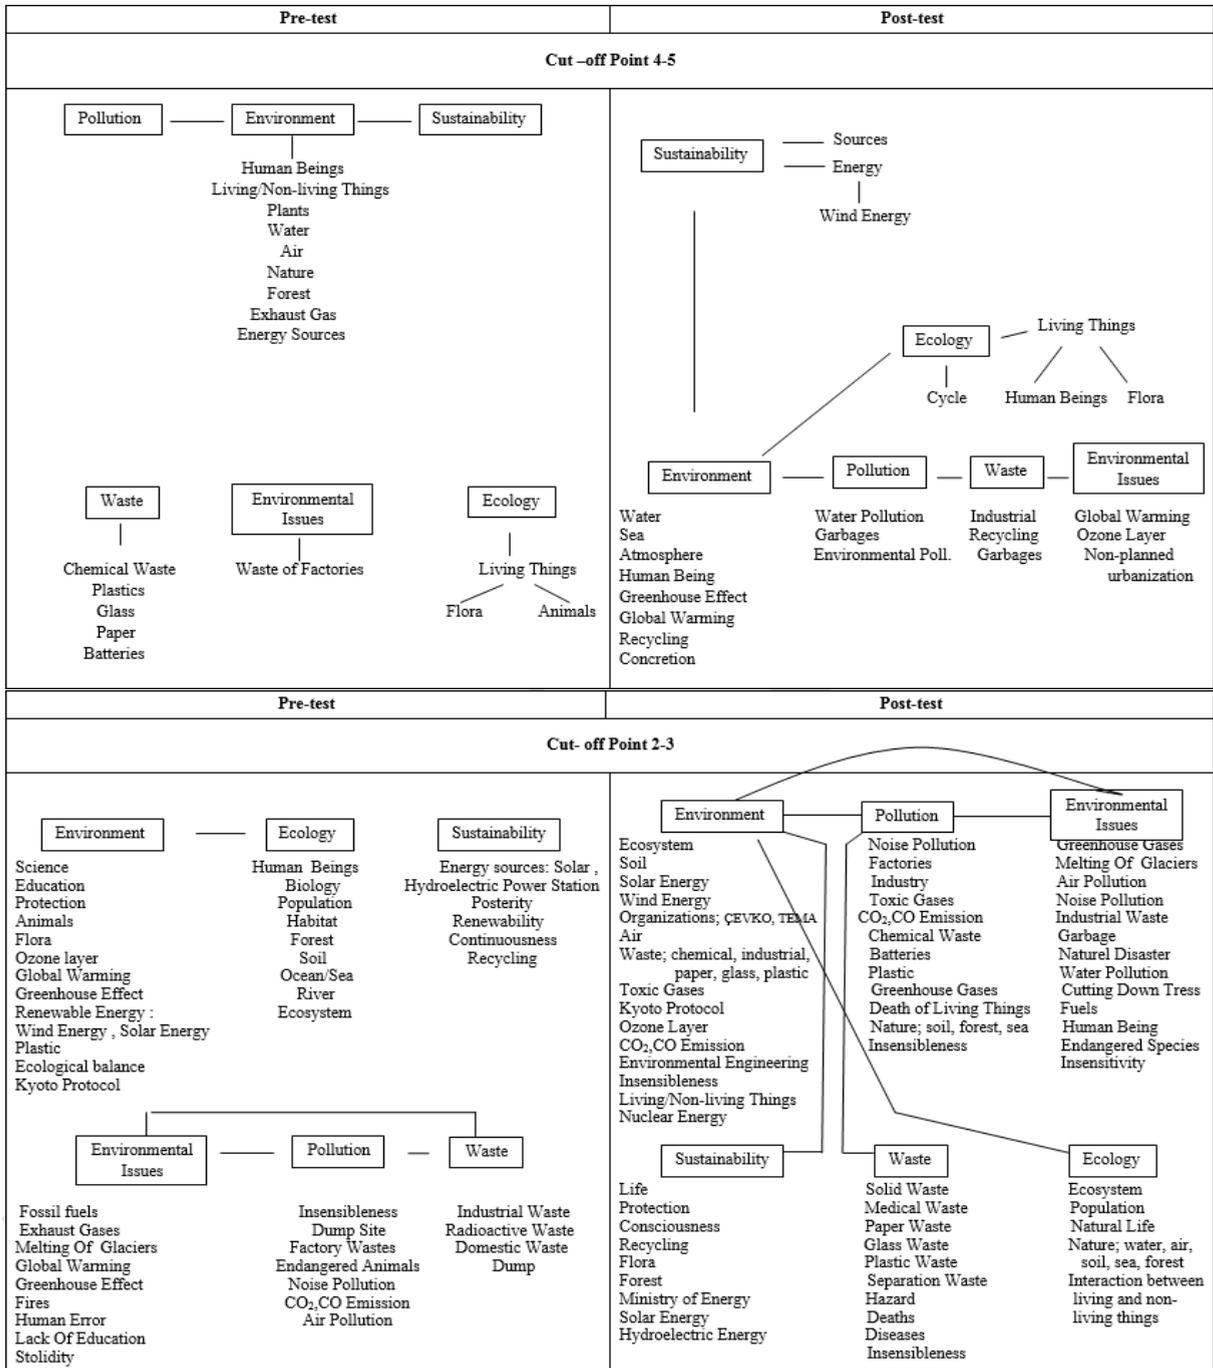

several concepts related to concept “environment” were written. The concepts “waste, environmental issues and ecology” were unrelated and disconnected. Several concepts related to these concepts were written. In the post test, all stimulus words were connected with each other. Related concepts for each stimulus words were also mentioned.

- 5) **Cut-off point 2-3:** At this cut-off point, in the pre-test, all stimulus words came forward. The relations between the stimulus words “Environmental issues, pollution and waste” and also related concepts were written. The stimulus words “environment” and “ecology” were associated. Although related concepts were written, the stimulus word “sustainability” was mentioned unrelatedly considering the cognitive structure and related concepts were written. Although the pre-service teachers wrote all concepts in the pre-test, the concepts were not associated with each other. In the post test, it is seen that there were relations between the concepts which show the cognitive structures of the pre-service teachers. At this cut-off point, all stimulus words were associated with each other and they were mentioned with their related concepts.

Table 3. The concept maps drawn according to the stimulus words in pre- and post WAT

Table3. (continue)

When the results of pre- and post-WAT have been examined, it can be expressed that the Environmental Protection course influenced the establishment of the connections with the stimulus words in the cognitive structures of the pre-service teachers regarding the stimulus words and the conceptual development.

Regarding the third research question, the responses of the pre-service teachers to two open-ended questions have been examined:

The pre-service teachers' opinions on their knowledge about the environment before and after the Environmental Protection course and also educational attainments within the context of this course are as follows:

A: *"Before taking this course, I had no idea about several concepts such as the Kyoto protocol, sustainable energy and renewable resources. However, after the course, as a university student, I have found a personal response for the question "how can we leave a better world for the future generations?"."*

B: *"Before taking the Environmental Protection course, nothing about this issue got my attention in our campus; however after the course I began to look everything about the environment carefully. I used to think that throwing trash on the ground is not an ethical behavior socially, but now I have realized that it is also important environmentally. Now I think that I do not throw trash on the ground in order to protect the environment."*

C: *"Before taking this course, I didn't know that I damage the environment rather than protecting it by retrenching. I also had no idea about the existence of foundations to protect the environment. I also learned a new vocabulary: sustainable, renewable, waste etc. I have seen everybody accepts that there is an environmental pollution, but nobody struggle for recycling. From now on, I live and act more consciously. I'm more careful about retrenching and I know that living or non-living things around us are also the possession of the future generations."*

D: *"Before taking this course, I had little information about recycling. After the course, I have realized its importance and benefits again. I have also learned the current concept of "sustainability". The environmental sustainability means recycling the renewable resources and protecting the recent conditions for the future generations. After taking this course, I have noticed how a small damage to the environment could cause a disaster after years."*

The pre-service teachers' opinions on the benefits of the activities (methods and techniques) which were applied within the scope of the Environmental Protection course are as follows:

E: *"I think that the interactive and updated methods (using videos and focusing on the recent events) are very useful. The videos have influenced the permanence of knowledge."*

F: *"We have used several techniques during the course such as interview, explanation and presentation. Each of us has chosen a topic according to our interests and needs, conducted research and presented the information we obtained by using a method in the class. I have enjoyed the course very much. It was a beneficial course as we participated actively. We have also found a chance to evaluate our abilities as being pre-service teachers. It was an active learning environment."*

G: *"The presentations made by our teacher or the students in the class and also the videos have raised my consciousness. I have shared the information I learned with my family and other people and tried to awaken their conscious towards the environment."*

D: "The activities which were applied within the scope of the course were very beneficial. First of all, we were informed about "Environmental Protection" by our teacher. We have learned about several updated information and concepts. We have shared information with each other while having a conversation. We have got a vision of "environmental protection". We emphasized the importance of the issue in an audio-visual way with the videos we watched. Then we improved ourselves by making research during the preparation of our presentations.

4. CONCLUSION AND DISCUSSION

In this study, the effect of the 'Environmental Protection' course on the pre-service chemistry teachers' affective tendency towards the environment and cognitive structure has been examined. Moreover, the pre-service teachers' opinions on the content, applications and contributions of the Environmental Protection course have been also evaluated. It is determined that the Environmental Protection course which the pre-service teachers took during a semester as an elective course leads to a positive increase in the pre-service chemistry teachers' affective tendency towards the environment. In general, the Environmental Protection course is effective in the development of the pre-service teachers' affective tendencies consisting of attitudes, awareness, merits and also sensibility towards the environment. When the literature is examined, it is seen that there is not any study consonant with the research results. However, there are studies which demonstrate that the affective tendency of the pre-service teachers who took a course related to the environment or environmental problems is higher than the pre-service teachers who did not take any related courses (Owens, 2000; Kayalı, 2010; Uzun & Sağlam, 2007). Furthermore, it is stated in some studies (Aksoy & Karatekin, 2011; Deniz & Genç, 2007) that the environmental education has no effect on the affective tendencies of the students. Tikka, Kuitunen and Tynys (2000) express that the environmental education has a positive effect on the attitudes towards the environment. Erten (2000) points out that the development of positive attitudes and value judgment towards the environment is only possible with the environmental education. In this context, the positive increase in the pre-service teachers' affective tendencies towards the environment can also be explained with the increase in the knowledge about the environment after the course.

After the Environmental Protection course, there is a development in the pre-service chemistry teachers' cognitive structures related to the environment and the environmental issues and the connections related to the stimulus words. The pre-service teachers wrote totally 296 words (response) in the pre-test and totally 378 words (response) in the post test after the Environmental Protection course. When the concept map drawn according to the pre and post word association test of the pre-service teachers is examined, it is seen that the concepts given by the pre-service teachers were unrelated and disconnected in the pre-test, however they were related to each other in the post-test. Moreover, there was an increase in the number of the associated concepts. There are also many studies in different fields (education of chemistry, biology, solar system and space, Atatürk's principles) including the research about the cognitive structures of the students with word association test (Bahar & Özatlı, 2003; Bahar, Johnstone & Sutcliffe, 1999; Nakiboglu, 2008; Ercan, Taşdere & Ercan, 2010; Işıklı, Taşdere & Göz, 2011); however there is not any study on the environmental protection. In many studies (Khalid, 2003; Pe'er, Goldman & Yavetz, 2007; Timur & Yılmaz, 2011;), the pre-service teachers' knowledge about the environment and their relations with different factors are examined. However, the number of the studies which examine the effect of the environmental education on the knowledge and cognitive structures of the pre-service teachers is limited. Deniz and Genç (2007) demonstrate in their research that the students of the department of primary school teaching who took environmental science course were much more successful in the test than the

ones who did not take the course. Yavetz, Goldman and Pe'er (2009) state that there is an increase in the environmental literacy of the pre-service teachers after taking related courses.

Considering the pre-service teachers' opinions on the content, applications and contributions of the Environmental Protection course, they expressed that the course was beneficial as it is seen in the results: They have learned about several updated information and concepts related to the environment. These information and concepts have provided positive changes in their attitudes towards the environment. The environmental education given within the scope of the 'Environmental Protection' course have led to a development in the pre-service chemistry teachers' cognitive structures related to the environmental issues and an increase in their affective tendencies towards the environment. Ünal and Dımişkı (1999) state that the best education level for taking the environmental education is secondary education. Thus, the teachers who will work in the secondary school should be trained in such a way that they can give environmental education (Ünal & Dımişkı; 1998; IEEP, 1994). If teachers do not have enough knowledge, ability or responsibility to prepare their lessons oriented to the environment, it will not be possible to raise students with educational literacy (Plevyak Noe, Henderson, Roth & Wilke, 2001). So, it is quite important that the pre-service teachers should take effective and sufficient environmental education courses during their undergraduate education.

4th International Conference on New Horizons in Education

The environmental education as a path for global sustainability.

Samantha Ribas Teixeira^{1*}*¹Pontifícia Universidade Católica do Paraná, 1155 Imaculada Conceição street, Curitiba 80215-901, Brazil.*

Abstract

Based on the theory of risk society, formulated by the German sociologist Ulrich Beck, the present study aims to examine how environmental education is a decisive step towards achieving sustainability amid global environmental crisis experienced by modernity. In this perspective, it should be initially mentioned that the risk society is characterized by being pervaded by abstract, invisible, unpredictable, uncontrollable, transtemporal and transboundary risks which arose from the reckless quest for technological innovations and intense industrialization. This risks currently forge the environmental crisis that plagues humanity. It is clear, therefore, that in order to achieve sustainability it is necessary to combat the crisis directly in its origin and source, which is the production system and the way of life generating the risks that are carried out in modernity. In this context, it is clearly important to analyze how environmental education may represent an important and decisive step in this fight, which binds the very essence upholding the fundamental right to life and human dignity.

Keywords: Risk Society. Environmental education. Sustainability. Ecologically balanced environment.

1. Introduction

Currently the world is experiencing a situation hitherto unique: it is known to mankind that the intense industrialization and frantic search for new technologies leaves a huge trail of environmental destruction; that this production system and consumption rate does bring along such drastic ecological problems that the very continuity of life on the planet is put in doubt. What is not known, though, is how to change this scenario or even if that change is indeed possible at this point. It can be seen, therefore, that the modern society experiences an environmental crisis forged within the context of a risk society.

Reflecting the growing concern of the population with such crisis and its potentially catastrophic effects, around the world scientists began to look for solutions, alternative measures that could be taken to resolve the crisis or at least contain it. Thus arises the idea of sustainability and sustainable development, whose foundation is grounded in the idea of rational use of natural resources in order to allow future generations to use these same resources to meet their own needs. This way it would be possible to protect the environment from unneeded environmental degradation and still keep the economy running, since the current production system remains intact.

For this to work, however, it is required the participation of the population in the most various aspects - in the promotion of a gradual change of environmental harmful habits, in responsible consumption and in

* Corresponding author. Tel.: +55 41 9870-4820; E-mail address: samantha.rt@hotmail.com.

collective monitoring both of enterprises and the government on environmental issues, to mention a few. In other words, it requires active and participative environmental citizens. This is why in parallel to the institution of this new way of viewing economy and production, there is also the need for a concern with the environmental education of the population, once considering that it is only through education that environmental citizens can be forged.

Therefore, this article aims to study the key role played by environmental education in the implementation of a sustainable development and to the overcoming of the environmental crisis forged within the paradigm of risk society.

2. Risk Society and the current environmental crisis.

The "Risk Society" is a social theory formulated by the German sociologist Ulrich Beck, featuring the social formation subsequent to that wrought by the Industrial Revolution as a society that experiences a crisis in its own premises, whose greatest consequence is the production of abstract, unpredictable and uncontrollable risks, not only for the general population but also for the scientific community, the very people who fomented the entire process of industrialization and all the technological advances, generating considerable uncertainty and fear (Beck, 1995).

Such risks are characterized also by being transboundary, because they affect all people on the globe regardless of where the risks were produced, and for leading to an imbalance between government and the people, since the politicians when asked or charged by the population for resolutions to these uncertainties what happens is an rhetorical legislative internalization of the matter without, however, having any pretense that this measure will produce practical effects. One type of risk in particular draws the populations' attention: the environmental issues (Beck, 1995).

What can be glimpsed is that these risks / uncertainties forge, in a great part, the environmental crisis experienced today by the global population, given the irrational use of natural resources, fueled by the aforementioned scientific-technical rationality, and no doubt by abundant production of toxic waste and garbage, due to industrialization, rampant mass production of goods and consumerism society that has co-opted this post Industrial Revolution (Machado, 2008). The perception of such issues has evolved gradually, largely due to major environmental disasters that terrorized the population, and so they realized that by degrading its own ecosystem as perpetrated for so long, mankind would perish along with it. But, at the same time, the population got struck by the perception that at the current stage of scientific and industrial development, a dramatic change to solve these issues is no longer an option (Leite and Ayala, 2008). Thus, the environmental crisis is currently experienced is, at the same time, generated within the this Risk Society and perpetuated by it.

3. Sustainability and sustainable development.

Before entering the topic of environmental education, it is necessary to explore what is, after all, this so called sustainability, or sustainable development. The term "sustainable development" is relatively recent, as well as the actual concern about the environmental degradation and the depletion of many signs that the planet begin to show after so many centuries of exploitation. Although the content itself has already been the subject of previous discussions (especially the name "eco-development"), such expression was enshrined in the Brundtland Report (1987), better known as "Our Common Future", resulting from the work of the World Commission on Environment linked to the United Nations (UN) (Desai and Soromenho-Marques, 2010).

The definition of sustainable development contained in this document is that which "meets the needs of the present without compromising the ability of future generations to meet their own needs" (WORLD COMMISSION ON ENVIRONMENT AND DEVELOPMENT).

In other words, what is evidenced is a mismatch between the three spheres - environmental, economic and sociopolitical - that generates a range of serious consequences (depletion of the environment, inequality and social exclusion, crisis of confidence in the state and its institutions, to mention a few), and it is necessary to find a balance between them to allow the maintenance of the way of life currently experienced by some and desired by many. This balance is precisely what the scientists behind the idea were seeking to achieve through the implementation of sustainable development: the conscious exploitation of resources (natural and human) so that future generations can benefit from the same environmental conditions to meet their own needs (whether real or imagined) (Sawer, 2011).

Currently there is talk of a shed/enabler of sustainable development, which is called "green economy". This, according to the definition offered by the United Nations Environment Programme (UNEP) in the publication "Towards a green economy: pathways to sustainable development and poverty eradication" is "one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities" (UNEP, 2011). This, despite being an initial concept, proposes guidelines for the feasibility of the proposed forging an economy concerned with protecting the environment and the social aspect of the current environmental crisis finally bringing a solution truly focused on socio-environmental issues.

The implementation of such idea, though, is it called a "sustainable development" or its enabler "green economy", the fact is that apart from society it is ineffective, if not truly impossible. It turns out, though, that the population, in spite of the pressing concern about environmental issues do not know how to change, or if they are ready to give up completely the comfortable way of life way of life produced by industrialization during the first modernity. To be possible to expect any different or active attitude from them, it is necessary to educate them to see the real problems involving this environmental issues and to teach them how they can help – why they are so necessary to promote the safekeeping of the land. In other words, it is necessary to educate the people so that they can act as environmental citizens, preserving nature in their own private circled and, also, demanding from the government and from private companies different strategies of economic growth that doesn't impact the environment – the environmental citizen is both an individual guard of the environment, through its own actions, and a concerned citizen that demands the same concern from political institutions and big companies.

4. Environmental education as a path to a sustainable future.

One may visualize from all the foregoing, that the current global population, were born and educated in the cultural and social structure that constitutes the rich society and, therefore, this environmental crisis. What did not occur, though, was its inclusion in the reality of side effects arising from the consumer market, industrialization and capitalist rationality. However, to be able to overcome the challenges posed by this crisis, achieving sustainable and effective protection of the ecologically balanced environment, it is necessary that citizens are aware of their role and how to exercise it, a goal that can only be achieved through environmental education.

The term "education", originating from Latin, means, in a broad sense, the act of instructing, develop, teach or convey to others previously acquired knowledge. Education, specifically in the environmental sphere, is a necessity in the context mentioned above, in order to create environmental awareness into the people, so that they can understand the dependency relationship that humans have with the environment that surround them, as well as the dangers that current social and economic situation creates for humanity itself by degrading it so unreasonably and continuously.

Thus, when a programme for environmental education is proposed, what it aims to achieve is to educate the population about what would be the sustainable development, the means of attaining it and the individual and collective role played by each person in this process (Guimarães, 1995). The importance of elucidating the population through environmental education was recognized by UNESCO in 1977, in the document "Educating for a Sustainable Future" ("Educating for a Sustainable Future"), which outlines the crucial importance of environmental education and its role in shaping society:

(...) Education can facilitate this change. However, for this to be done, students will need a new framework of knowledge, skills and values, they also need to demonstrate in practical measures that reflect an understanding of the interdependence between health and human welfare, the environment and the economy. Students should be encouraged to understand and apply the concepts of sustainability and view a sustainable future. They need to know the following goals for their future and understand that they have the personal power to make a difference and bring about change. Humans have always understood that some things may not be possible, however, we are beginning to understand that everything is possible it may not be wise or desirable. We have reached a point in human history when we have the technological capacity, social and ethical to make a sustainable world a reality, and therefore have an obligation to do so. Students should have the opportunity to understand this reality. (translation). (UNESCO)

The purpose of environmental education would, therefore, be to instruct, teach, educate people, inside and outside educational institutions (formal or informal) about the possibility of forging a society that develops in a sustainable and individual and collective duty to seek to achieve this objective (Guimarães, 1995). In other words, to educate the individual about their environmental responsibility as a citizen and a consumer (and as a supplier of goods and services, which is nonetheless may ultimately also consumers). This environmental responsibility of the consumer is defined mainly by the conscious action in the consumer market in order not to work, consume or encourage socially and environmentally inappropriate and abusive practices, which can be

defined in four main aspects: engagement, which implies a behavior activist consumer expresses intentionality consumption as an expression of a particular ideological position, policy, altruism, and ethical consumption, which occurs when the consumer's account of concerns about the welfare of others, environmental responsibility, which is based in the behavior consequences of private consumption on the environment, and ethics in the exchange ratio itself, which involves the consideration of ethical issues in the exchange process itself (Casali, 2011). The responsibility as an environmental citizen is outlined by the duty to individually act in order to promote a sustainable future even on the smallest things (washing the dishes, separating organic trash from that part that can be recycled, and so on), and also to act, on a public sphere, taking care of natural resources and demanding from both the government and private companies that they change to the best strategy possible for maintaining their agenda/businesses and protecting the environment at the same time.

Important to emphasize that this learning process should be in accordance with the culture and needs of each populational group, within the same country or not, in order to become part of everyday life for all people (Santos, 2003), regardless of their culture or way of living, and be capable of being applied in practice, preventing the theory about environmental education from being simply rhetoric.

Acknowledgements

From the exposed, it is possible to see that the Risk Society paradigm, born along with the massive industrialization and technological advance that constitute modernity, forges a society based on the fear of the invisible and uncontrollable consequences of its own creation. These risks, characterized also by being abstract, unpredictable and transboundary, are an important point of concern when it comes to the environmental sphere, once the frantic industrialization and production system adopted since the Industrial Revolution have left a huge environmental deficit, that single handed constitutes a difficult problem to face. Now, there are also these so called risks to add to the amount of concerns revolving the subject. It is within this context that an environmental crisis announced.

In spite the preoccupation on this matter, it is not yet known how to promote effective change into this scenario. In a response to the social concert over the matter, group of scientists started thinking about the case and trying to find alternatives, if not to solve the case completely, at least to contain the damage to its minimum. It was this way that in one of these groups financed by UN, it was forged the concept of sustainability, or sustainable development, that addressed the problem and offered a solution based on the ration use of the natural resources and the reinvention of the industry so that it could be more eco-friendly without losing growth or money. This concept, presented to the world in 1986, is now followed by an enabler called "green economy".

But the fact is that without a popular participation in large scale, any project that tries to solve the environmental crisis is doomed to fail, once it is them who perpetrate the damage, by their own hand, through their businesses, or simply by being supportive of companies and governments who do. To induce the population to join the cause for a sustainable future, it is necessary to educate them in an environmental sense, so they can truly understand why it is so important to protect the environment and the role they individually pay in this

scenario. This way environmental citizens are forged and along with them the possibility of implementing and sustainable development programme.

From this point of view, it is clear why the environmental education is so important. Without it there is no effective way of stopping the environmental crisis, neither of containing it. Education is the only way of shifting paradigms and creating a new form of seeing things, and in the environmental sphere it is no different – the environmental education constitutes a path for sustainability simply because without it any programme, any idea surrounding the case would not work. The population have to be aware of the cause and consequences of its actions, have to be able to address their government directly to discuss the issue and to demand results, have to be able to consume careful and wisely, always preferring those companies who are eco-friendly. This way, chance is possible, as it is possible a sustainable future.

4th International Conference on New Horizons in Education

The evaluation of websites teaching english as a foreign language (efl)

Elif Kır^{*a}, Selda Kayak^b*^aIstanbul Medeniyet University, Faculty of Educational Sciences, Foreign Languages Teaching Department, Turkey elifk@medeniyet.edu.tr**^bYıldız Technical University, Faculty of Education, Computer Education and Instructional Technologies Teaching Department, Turkey skayak@yildiz.edu.tr*

Abstract

English is the most commonly taught foreign language all over the world. As a result of this fact, materials designed for English language teaching has been increasing enormously. Besides coursebooks and other written resources technology integrated language teaching provides many materials for language learners as well. Websites might be regarded as online teaching tools which can be very effective resources both for learners and teachers. However, if the website which is aimed to use as a resource was not designed in an efficient way, it might lead to wasting time. In addition, not well designed websites might include wrong guidance for language development.

Taking the role of websites in language teaching into consideration this study focuses on the evaluation of websites designed for teaching English. For this aim, a questionnaire prepared for website evaluation was modified with the views of experts and results gotten from a group of students as the first step of ongoing project on the evaluation of language learning websites. Latest version of the questionnaire was given to totally 56 English language learners studying at the school of foreign languages. The learners stated how much they use the internet and the websites in their language learning and how find the websites they have been using. Learners also evaluated the websites of their own choice. Some suggestions were made with the help of the results.

Introduction

The role of websites in learning foreign languages has been progressively increasing as a result of the developments in educational technology. As English is one of the most commonly taught languages, the numbers of English teaching websites have been developed accordingly.

Internet, computers, and online websites that contain well designed, established and evaluated pedagogical materials offer a significant potential for education (eg. Wang & Coleman 2009 cited in Kartal & Uzun, 2010). Aydın (2007:18) states that the Internet has been a chance for learners who learn English as a foreign language to improve their discourse, grammar, vocabulary and language skills in a real and natural environment. This fact has attracted attention of many researchers. However, Yang and Chan (2008) argue that even though there are many studies on developing general guidelines for evaluating educational websites, these studies are not that specific to have a practical value. As a result, needs of English learning website users are not yet met. Similarly, Lancien (1998) states that although there are many foreign language teaching websites, it may not be possible to ascertain that these are well organized, and pedagogically and methodically well established (cited in Kartal & Uzun, 2010). In sum, while language learning websites using Web 2.0 technology may offer great promise for foreign language education, there is a lack of research on how users currently use these sites for collaborative learning and social interaction purposes. There is also a lack of research on the pedagogical and technical usability of these sites and how potential language learners could use these sites to enhance their own language learning abilities (Stevenson and Liu, 2010:233).

Kartal and Uzun (2010) define characteristics of websites in three categories. According to them a good website should have a good, user-friendly design where each part and section should be clearly seen and easy to use, it should allow for easy transition between sections, the color should not tire the eyes, it should be able to use some other programs. In addition, a good website has to include some contextual features. Users should be able to find materials appropriate for the level, subject, or type of their choice, the materials should be up to date and authentic in order to match the needs and interest of the users, there should be materials of every type for every level and every subject, the available materials should be supported by extrinsic sources and programs, the exercises in the site should allow for customization and contribution of the users, the users should receive feedback and the construction of practice and testing tools should serve option for learners. A good website should have some pedagogical characteristics like having explanation and guidance about exercises, providing feedback and having appropriate materials for level and needs of the users. Stevenson and Liu (2010:236) also emphasize the importance of technical and pedagogical usability of online language learning environments because according to them the ease of use of a website may be just as important as the effectiveness of its learnability. In addition to this, according to Shield and Kukulka-Hulme (2006) components of usability includes idea of easy to learn and easy to use. So, a system with good interaction design should be easy to use and generally offer a better user experience.

Researchers tend to conduct studies on developing website evaluation criteria and website evaluation. Thus, developing evaluation guidelines by taking features of good websites provides a kind of decision making both for the learners and the students. At this step not only the comments of the experts but also the opinions of language learners play an important role. However, as it was stated by Liu and the others (2011:66) most studies focus on developing evaluation guidelines based on experts' comments or theoretical knowledge so the opinions of language learners are often neglected. Furthermore, the criteria should take multi-dimensional aspects of the websites into account. As a result, to develop an evaluation criteria for English learning websites based on both expert and learners opinions is still an important and challenging issue.

Purpose of the Study

This study is a part of an ongoing study on the role of websites in language teaching. The overall purpose of this study is to investigate how language learners evaluate the websites they use to learn English or other foreign languages and how they perceive the role of websites for their language development. As part of this research, this study focused on the following research questions as below;

1. Do students use the Internet when they study English?
2. What is the level of satisfaction of the learners in using websites?
3. What is the overall evaluation of the learners on English teaching websites?

Data Collection Tool

In order to address research questions background information about the learners and site feedback were collected through a questionnaire consisting of a) demographic information, b) English learning and web experience and c) site feedback parts. The instrument was originally developed by Liu and the others (2008). The original questionnaire was given to 5 experts in English language teaching, computer science and curriculum development to take their opinions. Some modifications were made like deleting some items and changing wording. Some new open ended questions were also added to get more information from the students. After this step, first version of the questionnaire was given to the students studying at Linguistic department of a state university in Istanbul. They were given one week to complete the questionnaire as a part of their "language teaching methods" course and they evaluated an English teaching website of their own choice. After the analysis of collected data, the questionnaire was modified by adding some more questions. Latest version of data collection instrument consisted of 19 questions and two Likert scales. In site feedback evaluation part, participants evaluated a chosen website by the help of a scale of 1 (very unsatisfied) to 5 (very satisfied). In the second part, participants were asked to rate how useful each site was to improve different English skills on a scale of 1 (useless) to 5 (very useful).

Participants

Totally 56 students studying English at the school of foreign languages participated in the study. The university is a state university located in Anatolian part of İstanbul. All students have already passed central exam in order to be a student at the university and have to continue one year long English language preparation programme. After preparation year they will start studying at different departments like history, international relations and philosophy.

%37,5 (21) percent of the participants are male and %62,5'i (35) are female students. %69,6 (39) of the students are aged between 16-20, %26,8 of the students are aged between 21-25 and %3,6 of the students are aged between 26-30.

English level of the students is given in the table below

Table 1. English Level of Participants

English level	Percentage	Number
Intermediate	%87,5	49
Advanced	%12,5	7

In the study, information about how long the participants have been using computer and how long they have been learning English was gathered. This information is given below;

Table 2. Duration of Computer Usage and English Learning

Years	Computer Usage		English Learning	
	Percentage	Number	Percentage	Number
Less than 2 years	% 7,1	4	% 26,8	15
2-5 years	% 12,5	7	% 17,9	10
5-10 years	% 44,6	25	% 39,3	22
10-15 years	% 28,6	16	% 16	9
More than 15 years	% 7,1	4	% 0	-

It is seen that most of the participants chose the option of 5-10 years both for computer usage and English learning. Therefore, it can be said that there is correlation between the duration of computer usage and English learning.

Information About the Internet Usage

%87,5 (49) of the participants stated that they prefer using PC while others %12,5'i (7) prefer using MAC.

Participants shared information on where they access the Internet. They were able to give more than one answer for this question. Home comes as first place of the Internet access and university follows it as the second place of access. Analysis of their answers is given below.

Table 3. Internet Access

Place of the Internet Access	Percentage	Number
Home	% 87,5	49
Work	% 8,9	5
Dormitory	% 10,7	6
University	% 58,9	33

It was learned in the study that how much time they spend on the Internet per day. Daily internet usage of the participants is given in table 2.

Table 4. Daily Internet Usage per Hour

Daily Internet Usage per Hour	Percentage	Number
less than one hour	% 10,7	6
1-2 hours	% 39,3	22
2-4 hours	% 41,1	23
4-7 hours	% 5,4	3
more than 8 hours	% 3,6	2

The questionnaire included a question to learn for what the participants generally use the Internet. They were given seven options. Their responses were shown in the table below.

Table 5. Purposes of the Internet Usage

Purposes of the Internet Usage	Percentage	Number
Study	% 73,2	41
Research	% 76,7	43
Education	% 64,2	36
Entertainment	% 46,4	26
News	% 75	42
Shopping	% 35,7	20
e-mail	% 71,5	40

As it is seen on the table, research comes as the first reason of internet usage. Following news, study and using e-mail follow the option of research. Shopping is the least preferred reason to use the Internet.

In the study, participants were asked to rate their level of computer skills. Most of the students defined themselves as experienced users of the computer (%51,8) and less experienced users (%37,5) while only %7,1 of the students stated that they are not experienced.

Table 6. Computer Skills

Computer Skills	Percentage	Number
Not experienced	% 7,1	4
Less experienced	% 37,5	21
Experienced	% 51,8	29
Very experienced	% 3,6	2

The Role of Internet in Learning English

Participants were asked whether they use the Internet to study English or not. %87,5(48) of the students stated that they use the Internet to study English. On the other hand, a very small percent of the students (% 14,3) do not use the Internet to study English.

In the study, it was also aimed to learn how much the students like using the web to learn English. It was found that most of the participants %44,6(25) like using the Internet in learning English. Only %5,4 (3) of the participants does not like using the Internet at all. In addition, %19,6 (11) likes using the Internet a little, % 7,2 (4) likes it very much while %23,2 (13) does not like very much.

Participants gave information about how much time they spend on the Internet for studying English. According to results, %28,6 (16) spends less than an hour, %53,6 (30) of the participants spends between 1-2 hours and %17,9 (10) spends time between 2-4 hours.

The survey also included an open ended question in order to learn for what specific purposes is the Internet used while studying English. As all the participants did not give their comments not the information about the percentage but number of the participants is given in the table.

Table 7. Specific Purposes of Internet Usage in English Learning

Specific purpose	Number
Dictionary	6
Listening	5
Speaking	4
Reading	3
Grammar	3
Translate	2
Learning	2
Research	2
Understaning	1
Social media follow for agenda	1

As it is seen on the table, 6 of the participants use dictionary while studying English. Total number of the participants who use the Internet to develop skills (listening, speaking and reading) is 12. 3 students use the Internet for grammar. Translation, learning and research are each stated by two students.

Evaluation of Websites

Participants were requested to give their opinions about the website they use frequently in learning English. They rated their level of satisfaction with 5 scaled statements. The criteria consisted of totally nine statements. Each of them was evaluated separately.

Table 8. Evaluation of Websites Used for Learning English

Statements	Mean
1. Ease of finding the information/activities	3,5
2. Quality of information/activities	3,8
3. Ease of reading the text	3,5
4. Appearance of site, including colors and graphics	3,2
5. Speed of pages displaying	3
6. Fun, entertainment value	3
7. Overall learning experience	3
8. Ease of understanding the instruction for activities	3
9. Ease of moving around the site without getting lost	3,2

With the help of another 5 scaled criteria participants evaluated usefulness of websites in developing some skills including grammar and culture.

Table 9. Usefulness of Websites in Developing English

English Skills	Mean
Speaking	2,9
Listening	3,2
Reading	3,6
Writing	3,4
Grammar	4
Culture	3,3

Site feedback part of the questionnaire included a question on recommendation of participants. They gave their recommendation for the website they evaluated. According to results, %48,2 of the participants is not sure to recommend the website. %30,3 stated that they definitely recommend.

Table 10. Participants' Recommendation

Opinions on Recommendation	Percentage	Number
No way	% 7,1	4
I am not sure	% 48,2	27
I'll definitely recommend this site	% 30,3	17
No answer	% 14,4	8

Characteristics of Websites

The study included open ended questions in order to get more detailed information about website users' opinions and learn more about characteristics of a good website from language learners' perspectives. The participants were asked "what should an English teaching website include?". Their answers and the number of the participants for each answer are given below.

Table 11. Characteristics of Websites From Learners' Perspectives

Characteristics of English teaching website	Number
It should include listening part	6
It should include reading part	3
It should include speaking part	3
It should include useful information	3
It should include enjoyable games	3
It should include explanation on content	3
It should be understandable	3
It should include Exercises	2
It should include Unknown words	2
It should include scale of difficulty	2
It should include Everything	2
It should be easy to use	2
It should be colourful	1
It should be visual	1

Results and Discussion

This study is a part of an ongoing research on the evaluation of websites developed for foreign language teaching. As first step of the research, it was aimed to learn English preparatory students' views on using websites and the Internet in English language learning, to make them evaluate the websites they frequently use. For this aim, a questionnaire developed by Liu and others (2008) was modified with the help of the experts' views and students studying at Linguistics department. Latest version of the questionnaire was given totally 56 students studying English.

It was found in the study that almost all the students defined their level of English as intermediate. Most of the participants stated that they have been learning English between 5-10 years. Similarly, again most of the participants stated that they have been using computer between 5-10 years. Most of the learners find themselves as experienced computer users as well.

Home is the most preferred place for the Internet access. University comes after home for the Internet access. When participants' responses for daily Internet usage it was found that most of them spend between 2-4 hours on the Internet.

They were given options to the participants in the study to learn why they use the Internet. It was found that they mostly use the Internet for research and to follow news. To use the Internet to study and e-mail were also given among the most preferred reasons. They were also asked for what specific purpose they use the Internet in learning English. Dictionary comes on top of the list. Three language skills, listening, speaking, reading, follow the reason of dictionary.

The learners were asked to evaluate a website of their own choice. They firstly wrote down their favourite websites in learning English and then evaluated one of them. The results were analyzed together as the aim of the study is not to get information about the websites or evaluate each website separately but to learn overall evaluation of the learners as the first phase of ongoing study.

The learners rated their level of satisfaction for the website with the help of a scale from 1 (very unsatisfied) to 5 (satisfied). There were nine statements in the site feedback part of the questionnaire. Mean of all statements is not less than three. It shows that all the participants are satisfied with the websites they chose. However, mean of quality of information/activities, ease of finding information/activities, ease of reading the text, appearance of site and ease of moving around the site got higher mean comparing to speed of pages displaying, fun, entertainment value, overall learning experience and ease of understanding the instruction for activities.

In site feedback part, the learners were also required to evaluate the usefulness of the website by rating between 1 (very useless) to 5 (very useful). Grammar got the highest mean. Reading, writing and culture followed the option of grammar. It was seen that speaking is the least preferred option.

Most of the students were not sure to recommend the website they evaluated whereas almost %30 percent stated that they definitely recommend that website.

It was aimed to learn what a website should include from the learners' views. Language skills are the most given parts for an English teaching website. Useful information, games and explanation were also stated among the characteristics of website.

After the analysis of the results it was seen that most of English language learners use the Internet to help their English language learning. There are various reasons for their usage. It might be concluded that learners who participated in this study are satisfied with the websites they have been using. Moreover, they find them useful to develop their language skills and their knowledge in culture.

For further research, weak points of the websites stated by the participants and their views on the components of the websites might provide useful information both for a much more detailed analysis of the websites and developing new websites appropriate for language learning.

The evaluation of responsibility education strategies of primary school teachers

Rüştü Yeşil^{a*}^a *Ahi Evran University, Faculty of Education, Terme Street, 40100, "Kırşehir, Turkey*

Abstract

The main purpose of this study is examining the responsibility education applications of kindergarten and elementary school teachers. The research was done in survey model. The study group of the research consisted of 199 teachers. The data of the research was collected with "Responsibility Education Strategy Scale". For data analysis, arithmetic mean, t test, variance analysis and Pearson's r test were used. After the research, it was determined that teachers use informative responsibility education strategies more frequent than applied responsibility education strategies.

Key words: Primary school, responsibility education, education applications, teacher

1. INTRODUCTION

Sense of responsibility is accepted as an important characteristic from the point of socialization, generativity, self-realization and social and personal development of an individual and being a useful individual (Sierra, 2010; Töremen, 2011; Packer & Sharrar, 2003). Illeris (2003) stated that responsibility is a key problem in terms of personal and social development. It is frequently mentioned that responsibility underlie lots of problems that are encountered in personal, social, political and economical life (Töremen, 2011; Yeşil, 2013; Şahan, 2011; Shavelson, 2007; Clouder, 2009; Gosselin, 2003).

Individuals acquire sense of responsibility in the course of life through education. (Töremen, 2011; Gosselin, 2003). According to Macready (2009), schools are significant places for giving responsible behavior habits. Teachers are very important educational factors because of being determiner in planning, applying and evaluating the teaching period (Sönmez, 2010; Şahan, 2011). Therefore, the quality and quantity of the applications which teachers plan and do for educational purposes are important for getting students to acquire sense of responsibility.

Evaluating generally, it is seen that teaching approaches and applications are examined under two heading as traditional and modern approaches and applications in the literature. While the traditional perspective contains teacher-centeredness and a knowledge and informational priority approach, the modern approach prioritizes some terms and applications such as student-centeredness, active participation, individual differences and developing self-regulation and self-control skills of learners (Sönmez, 2010; Ellinger, 2004; Illeris, 2003).

When considered responsibility education from this point of view, it can be said that two approaches could be basically used. One of them is mostly external control dependent as part of traditional education and contains some applications such as information transfer, teaching good things to students and asking them to behave in the

* Corresponding author. Tel.: +90 386 280 51 69; fax: +90 386 280 51 45.

E-mail address: ryesil40@gmail.com; ryesil@ahievran.edu.tr

same way. The other application includes the activities that need students being active participants during teaching-learning process, managing their own learning processes, exploring and researching.

The results of the researches on responsibility education show that modern educational approaches and applications which are learner participation-driven and by which students could use and develop their autonomous learning, self-regulation, self-control and self-evaluation skills need to be used for resulting the process in success (Packer & Sharrar, 2003; Sierra, 2009; Stockdale & Brocket, 2010; Shavelson, 2007). Coeckelbergh (2006), Ellinger (2004) and Illeris (2003) stated that self-control and self-regulation skills are effective on students acquiring sense of responsibility and Carnell (2005) stated that participative learning applications are effective on it. Therefore, it can be said that some applications such as giving responsibility to students in educational environment by teachers, following students, making students participate in learning process and allowing students to determine in planning, executing and evaluating learning processes would make a significant contribution to students acquiring sense of responsibility.

However, it is seen that traditional educational understandings and applications are still applied by teachers in lots of educational institutions. This situation can be interpreted that responsibility education workings in schools can be hard to result in success. Also, it is important that wrong or ineffective teaching applications of responsibility education by teachers should be determined and required precautions should be taken. Constitutively, this study is about determining the quality and quantity of instructional applications about which primary school teachers get their student to gain sense of responsibility.

1.1. Purpose of Research

The main purpose of this research is determining how often and which instructional applications kindergarten and primary school teachers do for responsibility education. Under this general purpose, these questions are primarily answered in the research:

1. How often do primary school teachers give places to the informative and applied responsibility applications?
2. Is there any differentiation between teachers in using informative and applied responsibility education strategies?
3. Do the frequencies of teachers' responsibility education applications differentiate according to variations of branch, gender and professional seniority?
4. Is there any relation between the professional seniority of teachers and the frequency of their responsibility education applications?

2. METHOD

2.1. Model of Research

The research is a descriptive and quantitative study which is done in survey model. The strategies and teaching applications used by primary school and kindergarten teachers for getting their students to acquire sense of responsibility were tried to be described.

2.2. Target Population and Sample of Study

The primary school and kindergarten teachers working at 30 schools in the Centrum of Kırşehir are the target population of the research. The 199 teachers who participated in the education seminary organized by National Education Directory at the end of 2011-2012 school years and voluntarily filled in the data collection tool are the sample of the research.

2.3. Data Collection

The data of the research was collected with “Personal Information Form” and “Responsibility Education Strategy Scale” (RESS) which was prepared for determining the frequency of the applications of teachers for getting their students to acquire sense of responsibility from reference teacher group.

2.3.1. Data Collection Tool

Personal Information Form: It was used for collecting the data related to the independent variables of the research.

Responsibility Education Strategy Scale (RESS): It is a scale developed by the researcher which is 34-point, five-point likert type and is collected under two factors. It was determined that KMO value of the scale is meaningful at the level of 0.947; the values of Bartlett Test are meaningful at the level of $\chi^2=6502,170$; $sd=561$; $p<.001$ and the item-total correlation values by Pearson’s r test are meaningful at the level of $p<.01$ for each of the items. The name of the first factor is “Informative Responsibility Education (IRE)” and the name of the second factor is “Applied Responsibility Education (ARE)”. There are choices of “(0) never”, “(1) rarely”, “(2) sometimes”, “(3) mostly” and “(4) always” across the items in the scale.

The information of statistical features of the scale is summarized in Table 1:

Table 1. The Values of Reliability and Validity Analysis of Responsibility Education Strategy Scale According to the Factors

Name of Factor	The Number of Item	Variance (%)	Cronbach Alpha
IRE	21 items	24,289	,925
ARE	13 items	20,422	,857
RESS	34 items	44,711	,942

2.4. Analysis and Interpretation of Data

Arithmetic mean, standard deviation, related and non-related sample t test, ANOVA, Scheffe and Pearson’s r correlation test were done on the data; the level of $p<.05$ was seen as adequate for meaningfulness of difference

and relation. For the interpretation of arithmetic mean values of the frequency of teachers' responsibility education applications, the values between 0.00-0.80 for "never", the values between 0.81-1.60 for "rarely", 1.61-2.40 for "sometimes", 2.41-3.20 for "mostly" and 3.21-4.00 for "always" were seen as meaningful.

3. FINDINGS

The findings obtained at the end of the research are presented and explained above in tables:

3.1. The level of teachers performing responsibility education applications

The findings related to the frequency of the applications teachers do in the framework of responsibility education through teaching processes are presented in Table 2 and Table 3 according to the factors:

Table 2. The level of teachers' giving places to informative responsibility education applications through teaching processes

Items	N	X	Ss
1 I explain how they should do their homework	198	3,41	,88
2 I give feedback about the quality of their studies	199	3,48	,71
3 I give examples from responsible and irresponsible, I explain.	198	3,18	,75
4 I explain my expectations about doing their duty at group works.	197	3,18	,75
5 I pay more importance to pull their weight for others.	198	3,18	,77
6 I make them discuss by telling precedents about pulling or not pulling their weight.	199	2,99	,91
7 I tell/remember them negative cases they would come across if they didn't do their duty.	198	3,10	,80
8 I tell to them that I trust them about behaving according to responsibilities that I give.	198	3,40	,77
9 I allow and guide them to determine/plan the time, the works to do, the people and sources to benefit from about their responsibilities on their own.	198	2,95	,86
10 I write and post responsibilities with general and slogan expressions on the wall of school or class	198	3,28	,77
11 I lead them to connect their speech and behaviors with their results.	197	2,97	,85
12 I remember/make them feel that I pull my weight for them.	198	3,10	,90
13 I try to persuade that success is possible only if they pull their weights.	198	3,25	,89
14 I lead them to find their needs by evaluating themselves about their homework	198	2,91	,93
15 I remember responsibilities of students to their parents and I want them to control it	198	3,24	,89
16 I explain to parents how they should behave their children to get them to acquire sense of responsibility	199	3,25	,89
17 I am a model by obeying the rules of school and class	199	3,47	,77
18 I inform about the subjects related to in-class and in-school responsibilities	197	3,13	,84
19 I give more importance to pull their weights	197	3,21	,87

20	I tell stories, have them read books or have them watch movies about the subject of responsibility	198	2,95	1,12
21	I collaborate with the other different branch teachers about following students' pulling their weights	199	2,96	,96
Informative Responsibility Education (IRE)		192	3,18	,60

As seen in Table 2, the frequency of teachers' giving places to IRE applications is between $x=2.91$ (mostly) and 3.48 (always). The teachers stated that they do at most giving feedbacks to students about their studies and being a model; at least leading students to find their own mistakes by getting them to self-evaluate about their homework from the applications of informative responsibility education factor. This can be interpreted that teachers give more places to make students hear and feel external expectations while they give less places to have students use auto-control skills.

Table 3. The level of teachers' giving places to applied responsibility education applications at teaching processes

Items	N	X	Ss	
22	I give little tasks out of lesson that students can overcome	199	2,93	1,04
23	I do groundwork for students' taking responsibility by having them do group works	198	2,46	1,23
24	I want them to care for an animal or a flower, etc that can be cared at home	199	2,68	1,16
25	I give responsibilities to students to manage different works, work groups and work processes (leadership, representation, etc)	199	2,97	1,04
26	I have lists prepared for answering questions of "Which tasks do I retard today? Which one do I fulfill?"	198	2,19	1,13
27	I give responsibilities to all of students by organizing in-class and in-school social and cultural activities	198	2,79	1,16
28	I want them to take responsibilities about their house (paying bills, helping housework, shopping, etc)	198	2,56	1,22
29	I give presents (thank-you note, etc) to parents who try to educate and control their children in terms of responsibilities	199	2,12	1,35
30	I have them play in-class games that need to take responsibility	199	2,82	1,08
31	I prepare study plan with students and I control to make them behave appropriately	198	2,80	1,12
32	I direct parents to give responsibilities to their children about housework, etc.	198	3,08	1,03
33	I provide students to share their responsibilities with their friends in class that they fulfill out of school (at home, on the street, etc)	198	2,92	1,07
34	I hold competitions between group about fulfilling their responsibilities	198	2,60	1,14
Applied Responsibility Education (ARE)		195	2,70	,83

As seen in Table 3, the frequency of teachers' giving places to ARE applications is between $x= 2.12$ (sometimes) and 3.08 (mostly). The teachers stated that they give places at most to applications of directing parents about giving responsibility to their children; they give places at least to applications of rewarding parents

who make a point of responsibility education ($x=2.12$) and having students prepare checklist for themselves. The teachers stated that they give places at most to applications of directing parents about giving responsibility to their children; they give places at least to applications of rewarding parents who make a point of responsibility education ($x=2.12$) and having students prepare checklist for themselves ($x=2.19$) around ARE applications. Therefore, it can be said that teachers pay attention to parent support about responsibility education, on the other hand, they don't give much places to encouraging parents and having students prepare auto-control list for themselves.

3.2. The levels of teachers' using informative and applied responsibility education strategies and the differentiation between them

Table 4. The level of teachers' giving places to applied responsibility education applications during teaching processes and the differentiation between them

	N	X	Ss	t	sd	p
IRE	190	3,18	,60	7,448	189	,000
ARE	190	2,70	,84			

In Table 4, it is seen that teachers give places to IRE applications at the value of $x=3.18$ (mostly) and ARE applications at the level of $x=2.70$ (mostly). The teachers significantly differently give more places to IRE applications ($p<0.01$). So, it can be said that teachers make more time for informing works with the purpose of responsibility education. That applications take much time, opportunities are limited and pursuance is hard may cause this situation.

3.3. The differentiation of the frequency of teachers' giving places to responsibility education applications according to branches

Table 5. The differentiation of the frequency of teachers' giving places to responsibility education applications according to their branches

	Branch	N	X	Ss	Levene		t	sd	p
					F	p			
IRE	Kindergarten	33	2.73	,70	,826	,355	5.001	190	,000
	Primary school	159	3.27	,53					
ARE	Kindergarten	33	3.14	,81	,899	,297	3.503	193	,001
	Primary school	162	2.60	,80					
RESS (Generally)	Kindergarten	33	2.89	,51	,127	,751	1.269	188	,206
	Primary school	157	3.02	,55					

As seen in Table 5, while the branches of the teachers cause a meaningful differentiation on the frequency of teachers' using IRE and ARE strategies, no differentiation is generally found. While primary school teachers use IRE applications more frequent, kindergarten teachers use ARE applications more frequent with a meaningful difference ($p<.05$). This can be derived from the differentiation of the literacy and note-taking levels of students.

It can be said that while games and activities are chosen more at kindergarten, the methods based on information transfer are preferred more at primary schools.

3.4. The Differentiation of Teachers' Responsibility Education Applications According to Their Genders

Table 6. The differentiation of the frequency of teachers' giving place to responsibility education applications according to their genders

	Gender	N	X	Ss	Levene		t	sd	p
					F	p			
IRE	Male	103	3,12	,60	,197	,657	1,368	188	,173
	Female	87	3,24	,59					
ARE	Male	102	2,60	,80	1,086	,299	1,511	191	,132
	Female	91	2,78	,85					
RESS (Generally)	Male	101	2,92	,57	,003	,953	1,813	186	,072
	Female	87	3,07	,52					

In Table 6, it is seen that the frequency of teachers' using responsibility education strategies according to their genders militate in favor of females in terms of sub-factors and the general of the scale; however, there isn't any meaningful differentiation. Therefore, rather than the differentiation is not meaningful, female teachers generally behave more sensitive about using responsibility education strategies

3.5. The differentiation of the frequency of teachers' giving places to responsibility education applications according to their professional seniority

Table 7. The differentiation of the frequency of teachers' giving places to responsibility education applications according to professional seniority

Factors	Groups	N	X	Ss		K T	df	KO	F	p	Scheffe
IRE	(1) 1-7 years	35	2,92	,56	Between groups	6,530	3	2,177	6,532	,000	
	(2) 8-14 years	31	2,93	,82	Within groups	62,647	188	,333			
	(3) 15-21 years	47	3,28	,55	Total	69,177	191				1-4
	(4) 22+ years	79	3,33	,47							2-4
ARE	(1) 1-7 years	37	2,76	,85	Between groups	1,682	3	,561	,809	,490	
	(2) 8-14 years	33	2,83	,86	Within groups	132,341	191	,693			
	(3) 15-21 years	46	2,56	,85	Total	134,023	194				---
	(4) 22+ years	79	2,68	,79							
RESS (Generally)	(1) 1-7 years	35	2,86	,55	Between groups	1,387	3	,462	1,525	,209	
	(2) 8-14 years	30	2,91	,73	Within groups	56,384	186	,303			

(3) 15-21 years	46	3,01	,51	Total	57,770	189	---
(4) 22+ years	79	3,08	,48				

As seen in Table 7, the levels of teachers' applying IRE strategy are at the value of between $x=2.92$ and 3.33 , and the frequency of their ARE strategy is at the value of between 2.56 and 2.83 according to their professional seniority. When looking comparatively at the results on tables, it is seen that IRE strategy is at most used by the teachers who has 22 year-old and over seniority ($x=3.33$), it is used at least by the teachers who have 1-7 year-old professional seniority ($x=2.92$). ARE strategy is used at most by the teachers having 8-14 year-old seniority ($x=2.93$) while it is used at least by the teachers who have 15-21 year-old seniority (2.56). So, it can be said that IRE strategy is used more by teachers as soon as their professional seniorities increase.

On the other hand, it is determined that there is a meaningful differentiation on the frequency of teachers' giving places to IRE applications according to their professional seniority. After Scheffe test used for determining the cause of differentiation, it is determined that the differentiation is derived from the frequency of the teachers who have 1-7 and 8-14 year-old seniority and the teachers having 22 and over year-old seniority giving place to IRE applications. Therefore, it can be said that teachers give more places to IRE applications as soon as their professional seniority year increase.

3.6. The differentiation of the frequency of teachers' giving places to responsibility education applications according to their professional seniority

Table 9. The relation between the frequency of teachers' applying responsibility education strategies and their professional seniority

		IRE	ARE	RESS
Professional seniority	r	,226	-,039	,123
	p	,002	,586	,091
	N	192	195	190

In Table 9, it is seen that there is only a meaningful and positive relation at IRE factor between the frequency of teachers' applying responsibility education strategies and their professional seniority ($p<.05$). Therefore, it can be said that the frequency of teachers' giving place to IRE applications increase as soon as their professional seniority year increase.

RESULT AND DISCUSSION

At the end of the results reached by researches , with the purpose of determining general quality of applying responsibility education and determining the applying frequency that primary and kindergarten teachers did are presented above by discussing.

1. Teachers prefer to have students acquire sense of responsibility shaping according to external expectation both around IRE and ARE strategies especially open to the external control. But while teachers more frequently explain about homework and give feedback, they give fewer places to students' auto-control applications. It can be said that it is contrary to the fact of responsibility and to the concept of modern education and training. Individuals' feelings are shaped according to expectation of external world and according to the internal values like aims, ideals, and beliefs (Carnell, 2005; NREL, 1982; Töremen, 2011). But Coeckelbergh (2006) indicates

that sense of responsibility is shaped with internal motivation instruments or with external control instruments like law, social investment. According to him, these are the formations which are more permanent and effective, compatible with the life and supported with the internal process. Even excessive dominance of external control instruments create disadvantage about acquiring a sense of responsibility permanently by decreasing effects of internal control instruments. Yurtal and Yondar (2009) also reach the similar results at the end of their study. On the contrary, Illeris (2003) indicates that at small ages, the effects of external stimulus and at bigger ages, the effects of internal stimulus are becoming more determining about responsible behavior rather than internal stimulus.

On the other hand it draws attention that improving and making clear one's own feelings and ability are focused at the important part of modern education approaches and application. Notions like self-evaluation, self-management, self-control, self-audit and inner motivation are noticed and put on the central position. (Coeckelbergh, 2006; Illeris, 2003; Ramos & Anonuevo, 2011).

According to this it can be said that it has a contradiction about both tendency about modern education approaches and applications and responsibility's nature with teachers' choice about applications' frequency. There can be problems about responsibility senses or conscious to be permanent and effective which does not base on inner motivation and beliefs which is shaped according to external expectation.

2. Teachers "mostly" turn to applications around IRE and ARE strategies. Nevertheless with a big difference IRE strategy is used mostly by teachers. It can be resulted in like that since applied learning takes too much time and following it makes the work hard for them. This situation contradicts with generally nature of learning and scientific findings. Because, nearly all the scientists agree on the fact that permanent and effective learning is learning by doing (and it is verified by lots of researches (Sönmez, 2010; Gosselin, 2003; Carnell, 2005; NREL, 1982)). It is same for learning responsibilities. It takes attention in the literature that there are lots of scientists and the results of researches which state that taking responsibility happens by pulling one's weight (Clouder, 2009; Carnell, 2005; Barr & Tagg, 1995; Stockdale & Brockett, 2010).

On the other hand, it can be said that since the children between 6 and 11 is at concrete operational stage, ARE strategies should be given more places especially in primary schools. According to this, it can be suggested that teachers should take a formative education especially about the nature of responsibility and necessity and thus teachers can be encouraged to give more places to applied responsibility education. It can be useful to prepare activities which provide applied learning and introduce it to teachers around responsibility education.

3. IRE strategy is used by class teachers much more often rather than kindergarten teachers but ARE strategy is used by kindergarten teachers much more often rather than class teachers. It can result in like that because of students' differences about understanding what they read and write and reading and writing and differences about their ritual taking notes. This situation shows consistency with the literature about developmental features of children. However to lay a foundation of sense of responsibility and conscious is a common purpose of both kindergarten and primary schools. In literature gaining sense of responsibility is going around much more in moral education rather than in informative education (Barr ve Tagg, 1995; Yeşil, 2013; Gosselin, 2003). Because of this, it can be said that nature of moral education and its necessities should be taken into much more attention. In this case it can be suggested that both in kindergarten and in primary schools, beyond informing, it should give more places to the activities like that doing applied education by giving responsibility, being a model, utilizing from reinforcers and have them judge.

4. There is not a big difference between female and male teachers about frequency of using responsibility strategies. However either sub-factors or generally female teachers give much more places to application around responsibility education. According to this, rather than there is not a big difference, it can be said that female

teachers are much more sensitive about this. Due to the fact that female teachers are much more emotional than male teachers and they are afraid of the problems deriving from not being able to manage the class, they give much more importance to responsibility education than male teachers do.

5. Teachers' seniority causes an important difference on frequency of using application in IRE strategy. Applications in IRE factor is used much more by teachers having 22 and over year-old seniority than teachers having 1-7 year old or 8-14 year-old seniority. Therefore it can be said that as soon as their professional seniority increase, their frequency of using IRE strategy increase. It can be because of teachers that they don't have enough energy because of their seniority and because of that they cannot perform the necessities of applied education. That teachers having more professional seniority fall short of new teaching methods and techniques, teaching materials and testing-evaluation applications suggested in new curriculum and they couldn't understand the philosophy of curriculum may cause that they keep traditional teaching applications going. Whereas, the modern educational science researches and findings give point to the importance of students' involving actively in education process; learner centered applications such as self-regulation, self-evaluation, self-management and active participation and it suggest that teaching process should be organized according to such concepts and applications (Ramos & Anonuevo, 2011; Clouder, 2009; Coeckelbergh, 2006). Thus, the primary school curriculum carried into execution since 2005 is an activity centered curriculum build on these features (MEB, 2006). Therefore, it can be suggested that especially the teachers having more professional seniority should be subjected to in-service training about modern education approaches and applications and the responsibilities and proficiency that the new curriculum encumber to teachers.

On the other hand, rather than there is not any meaningful differentiation between them, the applications of ARE strategy are used at most by the teachers having 21 and over year-old seniority and at least by the teachers having 8-14 year old seniority. It takes attention that teachers having 8-14 year old seniority use ARE strategy more than the teachers having 1-7 year-old seniority. This can be interpreted that the applications of ARE strategy need to have experience. It can be said that it should be increased by giving applied education to teachers in pre-service process and as soon as they begin to work, it can contribute them for applying these.

6. While there is a meaningful and positive relation between teachers' professional seniority and their application frequency of responsibility education strategy from the view of IRE factor, there is not a meaningful relation from the general view of ARE factor and RESS. Therefore it can be said that as soon as teachers' professional seniority increase, their frequency of giving more places to IRE strategy increase. In other words while professional seniority increase, it directs teachers to use IRE strategy much more, there isn't seen a regular increase generally in frequency of giving more places to applied responsibility education and ARE factor. This situation can be interpreted that it confirms the explanations above.

Abstract

This study was conducted to determine the current condition of interest corners and materials used in these corners in pre-school education institutions in Istanbul. The research suits a scanning model which was performed via filling out a survey form created by researchers in 74 pre-school classes of 25 different schools in 12 districts of Istanbul. It was seen in the study, where frequency distribution and percentage calculations were used in statistical analysis, that although playing house, library and music corners were highly available, number of materials used in these corners weren't sufficient enough. Moreover, we observed that visual-audial, woodwork-joinery and computer corners were rarely used whereas water and sand corners weren't available in any of the classes. The study has shown that despite materials of art were the most common ones, art corners weren't the mostly seen corners in the classes. Temporary interest corners like jobs, new year, health and traffic were mostly available but tailoring and writing corners weren't available in any of the classes. The most materials observed were related to health, writing and traffic corners, whereas the least materials observed were related to new year and grocery corners.

Keywords: Pre-school Period, Interest Corners

1. INTRODUCTION

Education has been one of the main struggles of societies from the existence of human till today. The general goal of educational studies is to support the growing generation to adjust them to the society, age and world.

In pre-school education, which is the most critic period in a child's education, it is aimed to provide classroom environments to support the education of children, to motivate children to fulfil the activities and to contribute to the them to finish the activity successfully, as well as to help achieve goals like (1) ensuring physical, mental, emotional and social development and achieving basic behaviour; (2) taking responsibility and being tidy; (3) enabling the children with the opportunity to develop a personality, express him/herself, gain independence and self-control (MEB, 2006).

To simplify achieving these goals, pre-school education institutions need to have a stimulant environment. The stimulant environment mentioned here is provided by interest corners and materials which have to be present in every classroom. Interest corners which have a significant role in educational environments provide different learning experiences to the children. Maria Montessori states how important the environment created for the

*This research was supported by Marmara University grant EGT-D-150513-0214.

children is by saying “*Education is not achieved with the words a teacher tells to his/her students, but with time they spend in a physical and social environment*” (Önder, 2006).

Interest corners can be described as activity spots such as permanent playing house, blocks, art, science-nature, music, library-bookcase, table toys, puppets, computer, water and sand corners etc. and temporary new year, jobs, health, traffic corners etc. These are areas which should be designed apart from resting, sleeping and food areas (Demiriz, Ulutaş, Karadağ, 2011).

It is an undeniable fact that the diversity of materials in learning spots that need to be present in pre-school education institutions has a great impact on child development. Besides the contribution of interest corners in development areas, the presence of interest corners and diversity of materials is important for the encouragement of children to free play. To have children playing in unstructured environments with materials and other children they choose is especially important for them to gain autonomy and independence.

This study was conducted to determine the present state of interest corners and materials used in these corners in pre-school education institutions in Istanbul. It also has a consequence for creating awareness among pre-school teachers about the importance of interest corners and materials.

2. Method and research group

A survey model was used in the study. The study was conducted in 74 pre-school classes in 25 schools from Kadıköy, Üsküdar, Pendik, Ataşehir, Fatih, Maltepe, Kağıthane, Zeytinburnu, Avcılar, Beşiktaş, Ortaköy and Sultanbeyli districts of Istanbul.

2.1. Data collection tool

The survey form used in the study was prepared by 18 students studying at Marmara University Pre-School Teaching Research Project class and two lecturers in the 2011-2012 academic year. The survey form consists of temporary and permanent interest corners and materials used in these corners. The number of materials located in the corners is as follows: 68 in playing house, 29 in music, 26 in puppet, 34 in block, 24 in science-nature, 33 in art, 19 in water/sand, 11 in computer, 25 in table games, 23 in library/bookcase corners which are permanent corners, 24 in health, 18 in traffic, 20 in grocery, 46 in writing, 6 in jobs, 34 in woodwork/joinery, 19 in new year, 31 in tailoring and 15 in kızılây corners which are temporary corners.

The project was ended after a 10 week study with 22 interns under Teaching I class in the 2012-2013 academic year. After the interest corners were marked in the survey forms, data was collected by marking the materials available as “available (1-one)” and “unavailable (0-zero)”.

2.1.1. Data analysis

The frequency distribution and percentage calculations in the statistical analysis were calculated from data collected by researcher via survey forms available “1-one”, unavailable “0-zero”.

3. Results

Table 1. Percentage table of the current situation of interest corners in classes

Main Interest Corners	Available	Unavailable	Main Interest Corners	Available	Unavailable
	%	%		%	%
Playing House	84	16	Puppets	60	40
Block	76	24	Water and Sand	0	100
Art	28	72	Computer	16	84
Library-Bookcase	84	16	Music	84	16
Science-Nature	32	68	Visual/Audial	8	92
Table Games	48	52	Woodwork/Joinery	36	64

According to Table 1, the most present corners were Playing House, Library-Bookcase and Music (% 84), Block (% 76) and Puppet corners (% 60); where Visual-Audial (%8) and Computer (% 16) corners were the least present. The study didn't come across a water/sand corner.

Table 2. Percentage table of the current situation of temporary interest corners in classes

Temporary Interest Corners	Available	Unavailable	Temporary Interest Corners	Available	Unavailable
	%	%		%	%
New Year	20	80	Kızılay	8	92
Tailoring	0	100	Traffic	20	80
Jobs	24	76	Writing	0	100
Health	20	80	Grocery	4	96

According to Table 2, the most present corners were Jobs (% 24), New Year, Health and Traffic (% 20); whereas Tailoring and Writing corners weren't available.

Table 3. Frequency distribution and percentage table of the current situation of materials in main interest corners in classes

Main Interest Corners	Available		Unavailable	
	f	%	f	%
Playing House Corner	2186	42.78	2923	57.22
Block Corner	437	21.78	1569	78.22
Art Corner	1474	54	1256	46
Library/Bookcase Corner	736	43.24	966	56.75
Science/Nature Corner	1153	28.46	2897	72.34
Table Games Corner	873	47.25	975	52.75
Puppet Corner	284	16.30	1458	83.70
Water & Sand Corner	378	27.63	990	72.37
Computer Corner	170	21.80	610	79.20
Music Corner	721	33.59	1425	66.41
Visual-Audial Corner	254	4.79	1590	95.21
Woodwork/Joinery Corner	778	10.51	1738	99.49

According to Table 3, corners with the highest number of materials were Art (% 54), Table Games (% 47.25), Library/Bookcase (% 43.24) and Playing House (% 42.78) corners; whereas corners with the least number of materials were Visual/Audial (% 10.51) and Woodwork/Joinery (% 16.30) corners.

Table 4. Frequency distribution and percentage table of the current situation of materials in temporary interest corners in classes

Temporary Interest Corners	Available	Unavailable	Available	Unavailable
	f	%	f	%
New Year	117	8.32	1289	91.68
Tailoring	438	19.54	1804	80.46
Jobs	92	20.72	352	78.28
Health	472	27.69	1232	72.31
Kızılay	179	16.57	901	83.43
Traffic	304	23.13	1010	76.87
Writing	798	23.76	2560	76.24
Grocery	195	13.35	1265	86.65

According to Table 4, corners with the highest number of materials in temporary interest corners were Health (% 27.69), Writing (% 23.76) and Traffic (% 23.13); whereas corners with the least number of materials were New Year (% 8.32) and Grocery (% 13.35) corners.

4. Discussion

It is expected for the playing house corner to have a current rate of %84 in classrooms since it is one of the most important permanent corners. The reason why pre-school teachers use this corner in their classrooms is because it contributes to the children's social-emotional development, it teaches them pre-school gender roles, it establishes a connection with their homes and it strengthens the home-family concept (Demiriz, Ulutaş, Karadağ, 2011). This is also a corner where dramatic game play is emphasised and where communication is created by language whether the child is playing by him/herself or with his/her friends (Kamaraj, 1996). It is important both because the teachers use it in their classrooms and it is one of the most preferred corners in the classroom. The study shows that materials related to this corner are %42.78 available.

It is also expected for the library/bookcase corners to have a rate of %84 as it is one of the main interest corners like playing house corners. Reinforcing the children's existing knowledge, providing book-related experiences, creating emotions and attitudes on children for the coming years about reading, enhancing the love for books and rising an interest for literature can be given among the reasons why teachers create these corners in their classrooms (Demiriz, Ulutaş, Karadağ, 2011). The study shows that materials used in this corner are %43.24 available. When we take into consideration that the study was conducted in fall, we should be aware that the number and type of materials need to be renewed in spring. As children need books as much as they need friends, having books that cause interest and are suitable to their age and cognitive level will increase the level of interest towards this corner.

As the music corner is a main interest corner just like playing house corner and library/bookcase corner, its %84 availability can be predicted. The reason why pre-school teachers use this corner in their classrooms is because children have rhythm in their nature (they hum some tune at very small ages), it provides rhythm and movement coordination (listening to music, clapping hands, tapping feet while listening) and it also enhances art skills (Kamaraj 1996; Tok, 2012). The study shows that materials related to this corner are %33.59 available.

When compared to playing house and library/bookcase corners with the same rate of availability (%84), it is seen that the number of materials aren't as high as the others. It seems like this is due to the lack of music knowledge level of teachers.

As the block corner is a main interest corner just like playing house corner, library/bookcase corner and music corner, its %76 availability can be predicted. The reason why pre-school teachers use this corner in their classrooms is because it supports small and big motor muscles in children, it provides a connection between cause and effect and it is an activity that supports creativity (Demiriz, Ulutaş, Karadağ, 2011). The study shows that materials related to this corner are %21.78 available. When compared to playing house and library/bookcase corners with the same rate of availability (%76), it is seen that the number of materials aren't as high as the others. It seems like this is due to the lack material diversity.

As the puppet corner is a main interest corner just like playing house corner, library/bookcase corner, music corner and block corner, its %60 availability can be explained. The reason why pre-school teachers use this corner in their classrooms is because it uncovers the creativity of the children, it supports mental and language development and it also reveals the children's emotions (Oğuzkan, Tezcan, Tür, Demiral, 1997). The study shows that materials related to this corner are %16.30 available. When compared to playing house and library/bookcase corners with the same rate of availability (%60), it is seen that the number of materials aren't as high as the others. It seems like this is due to the lack material diversity.

The study has shown that visual/audial corners (%8), woodwork/joinery corners (%10.5) and computer corners (%16) were seen less and water/sand corner wasn't seen in any of the included classrooms. The number of materials is also not sufficient due to lack of space and economical reasons.

Water and sand corners are one of the most popular and educational corners for pre-school children due to its relaxing, flowing and calming nature. This corner is irrevocable for both the children's emotional and social development. Children also have great fun playing in this corner (Aktaş Arnas, 2002). The reason why this corner wasn't available in any of the visited classrooms is predicted because of lack of sufficient space and the need of an open air space which is much more suitable for this corner.

The study has shown that despite with the highest number of materials, the availability of art corners was less than expected (%28). It is thought that the reason why pre-school teachers don't prepare a special corner for art studies is because they think of it as an activity to be carried out on a desk.

The reason why science/nature corners have an availability of % 28.46 is the lack of sufficient space in classrooms and the economical situations of the institutions but it can be supported by activities carried out in open air.

The research has shown that among temporary interest corners the most available one were jobs (%24), new year, health and traffic (%20); whereas tailoring and writing corners weren't available in any of the classrooms. Temporary interest corners are corners implemented for a specific period of time according to the field of interest of the children to reach specific goals and achieve desired behaviours (Demiriz, Ulutaş, Karadağ, 2011).

In the study among temporary interest corners, health corners (%27.69), writing corners (%23.76), traffic corners (23.13) were with the highest numbers of materials; whereas new year (%8.32) and grocery (%13.35) corners had the least. As these corners aren't permanent as main corners, the low numbers of availability can be perceived as natural. Interest corners should be prepared as special activity spaces of a classroom or school environment in pre-school education institutions and they should be implemented apart from resting, sleeping and food areas. Children should have the opportunity to choose independently and every child should benefit from these corners in turns (Demiriz, Ulutaş, Karadağ, 2011).

The educator should prepare all of the main interest corners at the same time. But in situations where space isn't enough or the number of children is high, the corners can be prepared in succession. The teacher can

decide which corner to implement when, according to the acquisitions s/he wants the children to achieve and the tool s/he has chosen. However the teacher has to change the places of the corners from time to time to attract the children's attention. To attract the attention it is possible to change old materials with new ones and to change material with ones from another classroom (MEGEP, 2011).

4th International Conference on New Horizons in Education

The faculty of restoration, university of pardubice – national heritage in specialists' hands

Jana Tmejova*

University of Pardubice, Faculty of Restoration, Jiráskova 3, Litomyšl 570 01, Czech Republic

Abstract

The paper deals with the introduction of the Faculty of Restoration, the smallest faculty of the seven faculties belonging to the University of Pardubice. The Faculty offers four study courses on Bachelor level and two study courses on Master level.

The Faculty is involved in many projects within the Czech Republic, but also co-operates in a lot of international ones. It offers places for foreign students at the Faculty or sending the students either for a kind of study or practical fellowship. The Faculty also organizes courses for foreign students and specialists in restoration and invites lecturers from abroad.

Keywords: restoration, conservation, studio, department, Bachelor study course, Master study course, international projects, interdisciplinary co-operation, cultural heritage preservation

INTRODUCTION

The Faculty of Restoration, Litomyšl is located in the Czech Republic, about 140 km south-east of Prague. It belongs to the University of Pardubice, where it is the smallest faculty out of seven faculties of the University Pardubice. The Faculty of Restoration has only about 100 students, but its importance crosses the boundaries of the region and even of the country, as there are such branches of study that are not offered at any other university in the Czech Republic or within Europe.

From the Institute of Restoration to the Faculty within University

The fact that the Faculty of Restoration is situated in Litomyšl is not just a coincidence; the Town of Litomyšl is famous for its renaissance castle which was included in the UNESCO list in 1999; apart from that there are a lot of other places of interest, such as the Baroque Piaristic church or burgher houses on the square. Unfortunately, not all of the buildings were looked after with the greatest care, which was also true about a house called "Portmoneum" with paintings on the walls by Josef Váchal. The house was bought by a private publishing house who called restorers – experts to restore the murals. That was the time when the idea to set up a school of

* Corresponding author.
Email address:

restoration was born as it was clear that there would be many more buildings and other works of art which would require specialists' care. On the other hand, there were not sufficient numbers of restorers capable of dealing with the problems.

Thanks to the support of the Municipal authorities and the National Institute of Conservation, in 1993 the Institute of Restoration, providing further education, could be founded. Later on after a few steps of transformation into a college, it became part of the University of Pardubice as its 7th faculty in 2005.

2. ORGANIZATIONAL STRUCTURE

2.1 Study courses and fields of studies

The Faculty offers four study courses on the Bachelor level and two study courses on the Master level. In the Bachelor study courses students can study Restoration and Conservation of **Stone and Related Materials**, Restoration and Conservation of **Wall Painting and Sgraffito**, Restoration and Conservation of **Paper, Bookbinding and Documents**, Restoration and Conservation of **Artworks on Paper and Related Materials**, while in the Master study courses they can gain education in Restoration and Conservation of **Wall Painting, Sculptures and Architectural Surfaces** and Restoration and Conservation of **Works of Written Culture**.

2.2 Curriculum

To become an erudite restorer, the students have to know what historical background the objects come from, so it is essential to be educated in history and art history. At the same time it is vital to have good knowledge of natural sciences to be able to understand the material nature of historical materials and techniques, their main damage phenomena and corrosion mechanisms as well as the scientific basics of nature modern conservation technologies and their impact on works of art. Last but not least they must have artistic skills. Therefore, the concept of education has three main pillars – each of the segments of the education is provided by a different department or studio – the Department of Humanities, the Department of Chemical Technologies and the Studio of Fine Art Training.

All the branches focus on training of the students within their specialization, but at the same time they equip them with other essential skills and knowledge such as History of Art, Philosophy, Aesthetics, History, Restoration documentation seminar, Law in monument care provided by the Department of Humanities, natural science subjects like Chemistry, Laboratory practice, Basics of organic and inorganic binding media, Basics of pigments, Analytical and diagnostic methods in survey of works of art and Conservation technology and artistic training (Drawing course, Nude painting, Anatomy for artists, Photography). All the students are also obliged to study English and Latin for some semesters of their studies and they can add other foreign languages such as German, Italian and Spanish.

3. PROJECTS

The Faculty keeps up with the latest trends of modern education, therefore it is involved in many projects within the Czech Republic, but also co-operates in a lot of international ones. The students of the Faculty are always integrated into these scientific projects.

3.1 EU projects

3.1.1 STONECORE

Outstanding results have been achieved in the European project **STONECORE** – "Stone Conservation for the Refurbishment of Buildings" (2008 – 2011). The main goal of the project was to develop and apply

nano-materials for the refurbishment of buildings and the restoration of sculptured artwork. In all cases materials which are compatible with the components originally used during construction are required for refurbishment. This is of essential importance for the consolidation of natural stone such as limestone, marble or sandstone as well as for mortar and plaster. However, the materials and components currently available did not fulfil those demands in all cases.

Six small and medium enterprises, four universities, one public research organization and one governmental organization from seven countries joined together in order to find a new approach for refurbishment of natural and artificial stone. The project, which started in September 2008, progressed from investigations in the laboratory and small scale applications on trial areas, to the use of the materials that had been developed on selected objects in the field.

As a result of the STONECORE programme, several nanomaterial products for stone conservation and restoration have been developed.

STONECORE restoration reference objects by country included:

Poland: Torun, The Tower of St. John`s Church

The Czech Republic.: The Church of Santa Barbara, Baroque statue of an angel from Kutna Hora, former convent Rosa Coeli in Dolní Kounice in South Moravia

Greece: The Ancient Theatre of Megalopolis, Fortress Lilaia, The Ancient Theatre of Sikyon

Austria: Marble sculpture from the 18th century, mud bricks from India

Germany: The Church of Hochelten; The Castle of Leuben, The Castle of Dahlen; Xanthen and AachenCathedrals

Recently STONECORE has been accepted as a finalist at the Euro Nano Forum 2013 in the top 11 projects within the 7th Framework EU Programme.

3.1.2 NANOFORART

The ongoing research international project **NANOFORART** – "Nano-materials for the conservation and preservation of movable and immovable artworks" (2009 – 2014) within the 7th Framework EU Programme joins 14 partners with the University of Florence, Italy as the coordinator and is also focused on nanotechnologies. The main objective of the project is the development and experimentation of new nano-materials for the conservation and preservation of movable and immovable artworks. There are 15 institutions from Italy, Denmark, Spain, Great Britain, Germany, France, Slovenia, Mexico and the Czech Republic involved in the project.

The main challenge of NANOFORART is to combine sophisticated functional materials resulting from the recent developments in nano-science technology with innovative techniques in the restoration and preventive conservation of artworks. The research activity is focused on the development of manageable methodologies, based on nanosized structures and with a low environmental impact.

The second part of the project is also of great importance, as the technology will be handed over to small and medium enterprises that will play a significant role in the standardization of applicative protocols, in the up-scale and commercialization of the technology and in the evaluation of the eco-toxicity of the nano-materials. In the final phase the attention will turn to the end-users – e.g. the National Museum of Anthropology and History of Mexico City and the National Museum of Denmark, whose task will be to validate the technology and the methods developed in the first part of the project, and provide training activities and distribution of the developed techniques.

3.1.3 Other EU projects

Some of other projects are listed together with their descriptions:

ROCEM – "Roman Cement to Restore Built Heritage Effectively" (2003 – 2006), whose objective is to re-establish manufacture and use of Roman cements, which were key materials to decorate facades of buildings in the 19th and early 20th centuries in Europe. Unfortunately, they were no longer available on the market. According to the fundamental principle of modern conservation – that the historic buildings should be repaired with the use of materials that are compatible with the original historic substance – could not be met when restoring this important built heritage. The project included studying historic mortars, selecting appropriate raw materials, optimising cement stone calcinations parameters, carrying out a workshop and conservation trials. Results were to be disseminated to material producers and end-users of the technology – restoration workers and authorities.

ROCARE – "Roman Cements for Architectural Restoration to New High Standards" (2009 – 2012) developed the pieces of knowledge gained during the project ROCEM, it was focused on the improvement of the Roman cement technology. The aim was to combine existing knowledge of this historically well established binder with modern aspects of its manufacture, use and marketing.

NAMO – "Nabatean Mortars – Technology and Application" (2003 – 2005) was a project in which mortars and building technologies used in the Nabatean period (Nabatean kingdom) in Jordan and Syria were first investigated. There were two reference objects - Temple Qasr al Bint in Petra, Jordan and Great Cathedral in Bosra, Syria. There were four participating countries in the project - Austria, Syria, Jordan and the Czech Republic. After the investigation of historic materials and of the building situation, the project participants concentrated on defining and testing of possible repair materials and finally the results of the project were presented to the public.

3.2 Projects within the Czech Republic

Low-viscosity inorganic binders and their application (2011 – 2014) – a project in the collaboration with the Research Institute of Inorganic Chemistry Ltd submitted to the Ministry of Industry and Trade of the Czech Republic. In the period between 2011 and 2014 researchers will be trying to relate the new information concerning the composition and the way of preparation of inorganic binders from the group of so called "geopolymers" to their characteristics in order to achieve such a quality that will enable their application in three different fields – special heat resistant coatings production, production of glues resistant to high temperatures and materials used for historic monuments preservation.

Study of several conservation procedures for improvement of monument care systems (2012 – 2015)

– a project within the Programme of applied research and development of national and cultural identity funded by the Ministry of Culture of the Czech Republic. The main objective is to create conservation procedures and certified methodology to be able to solve the problems of sculpture and building conservation.

VEPA – Science for paper artefacts (2012 – 2015) – an EU and Ministry of Education project – the aim of the project is testing materials and methods for consolidation of paint layer on the paper support. The researchers will focus on the development of already existing knowledge in the field of mechanisms of paint layer degradation on paper support and the impact of individual conservation interventions (disinfection, neutralization etc.) on the stability of paper support with a paint layer.

4. Other activities

4.1 Study stays, fellowships, international co-operation

Another way how to contribute to the international co-operation is offering places for foreign students at our Faculty or sending our students either for a kind of study or practical fellowship. Our students have been accepted at the Norway National Museum of Photography – Preus Museum in Horten, National Central Library in Florence, Studio Gurtner in Vienna, Dipl. cons. Christian Binder's Studio in Graz, Universidade Nova de Lisboa, University of Arts "George Enescu" Iași, Accademia di Belle Arti G.B. Cignaroli Verona, Hochschule für Bildende Kunst Dresden.

Bachelor or Master graduates have been sent to European institutions or restorers' studios for short-term study stays during which they worked on their thesis and solved science-research tasks (Switzerland, Great Britain and Portugal). The Faculty of Restoration has hosted three foreign students in the past two years – from Great Britain, Poland and Japan.

The Faculty also organizes courses for foreign students and specialists in restoration and on the other hand it invites lecturers from abroad (Italy, France and Germany) to teach our students. Just as one example of these activities the regular training courses for restorers of the Republic of Iraq can be mentioned. These courses are currently focused on paper and art work on paper conservation.

4.2 Presentation of the Faculty to the public

Furthermore, the Faculty contributes to educating general public by organizing seminars and workshops where the participants can learn how to look after the artefacts they own or what processes are involved to preserve them. Just to illustrate there are some topics seminars "How to care for old books and graphics", "Clay as a traditional building material", "How to care for small monuments made of wood" etc.

The Faculty also organizes its own exhibitions and presentations of the individual studios. The Faculty has just celebrated the 20th anniversary of the study of restoration in Litomyšl. On the occasion of such an event, an international conference was held. The topic of the conference was "Interdisciplinarity in the Care for Cultural Heritage". Some of the contributions were given by specialist from Austria (Austrian Federal Office for the Care of Monuments, University of applied Arts) and Germany (Dresden Academy of Fine Arts).

5. CONCLUSION

Even if the Faculty of Restoration has currently only about 100 students, it co-operates with the most significant institutions engaged in the cultural heritage preservation, such as the National Institute of

Conservation, the National Archive, the National Library of the Czech Republic, the Scientific Library in Olomouc and other institutions. It is an integral part of the University of Pardubice and adds to it in a way which corresponds with the idea everybody should be aware of: the cultural heritage is one of the most precious legacies we have and it is our task to ensure the monuments and artefacts will be preserved for the future generations.

Acknowledgements

I would like to thank the Dean of the Faculty of Restoration, Ing. Karol Bayer for his kind help with the preparation of this paper. Also, I would like to express my gratitude to Bc. Pavla Nováková for collecting the necessary information for the paper.

4th International Conference on New Horizons in Education

The formation in moral values in high school education by means of the transversal axis and the integrated curriculum

Baños-Martinez Juan José^{a*}, Arganis-Juárez Maritza L.^B

^b *Instituto de Ingeniería, Facultad de Ingeniería, Universidad Nacional Autónoma de México, Coyoacán, D.F. 04510, México*

Abstract

This document summarizes the results of a research whose objective was to express some considerations about the formation in values at the mid-superior level. Some proposals about the topic such as Jean Piaget's and Kohlberg's are included extrapolating them in their application to the current times. The design of the investigation was based on a documental analysis and goes from the particular to the general, analyzing the situation in Mexico and the comments made by some international organisms in the field of education about the topic of formation in values in high school education, including also the research results obtained in Mexico. Among the principal discoveries highlighted we include the suggestion to inspect the curriculum in the high school level and to consider the inclusion of formation in values by means of the transversal axis and the integrated curriculum.

Keywords: Moral values, Kohlberg, Piaget, integrated curriculum, transversal axis.

1. INTRODUCTION

This research describes theoretical considerations as the basis for the formation in moral values that allow us to project how these courses could succeed in a teenager (11 to 18 years old) at the mid-superior level adopting behaviors and attitudes oriented towards the common good. There are diverse theories that support the formation in values through psychological and sociological paradigms, among others, and that establish the influence of the formation in values in the development of a human being, and their influence in social relationships. The psychological theories of education upon which we focus are those of Lawrence Kohlberg (Kohlberg, Power and Higgins, 1997), who recaptures Jean Piaget's theory (Piaget et al., 1960) in regards to moral development. This theory defines and determines the factors that shape the contribution of education to answer society's demands of analysis of the current trends of education in universities. The objective of this study is to present the stadia upon which Piaget based his theory, and Kohlberg's dilemmas regarding moral development, and to carry out an analysis of both projecting the education in values nowadays.

2. Psychological theories of education (Piaget-Kohlberg)

Among the most transcendental psychological theories of education in values that were developed in the thirties and towards the end of the fifties, as well as in the sixties, we find the theories of Piaget and Kohlberg about the moral education of the child, covering both childhood and the teenage years.

Jean Piaget

Piaget's theory was founded upon the method of data inquiry to know the evolution of thought, and his investigation was based principally on the knowledge of skill and logical reasoning development, from childhood through the adolescent years, with a systematic focus, to analyze the logical structure of reasoning in children. His methodology contemplated letting the child talk freely (listening to him) as well as observation, while relying on informal tests, and proving hypotheses. However, advanced mental structures were validated through interviews that had their basis mainly on chemistry and physics.

Reflecting upon Piaget's theory, we must mention that an individual learns what he is taught by others; he learns from others' mistakes; he learns from the person who is teaching him...Who teaches him? Society, his family, those around him. How do we evaluate whether what he has learned is correct? How do we ascertain that what he learned was adequately interpreted? Nevertheless, the young person learns and interprets and searches for his own identity; he is building himself. The young person is presented with an offer and choices that gradually form the person. There are several factors that influence his choice, not only the moral judgment factors, but also the genetic, social, psychological and biological factors. The genetic makeup allows us to develop, communicate; it forms the human being. Piaget's theory of cognitive development for moral education set the bases to explain children's education by mentioning concepts that are currently known as values. This theory presents moral education from three viewpoints: the first differentiating between free and subjected individuals; in the case of subjected individuals, coercion, threats and abuse of power will be employed so that the child do the adult's bidding. In the case of free individuals as the desired result of moral education, the cooperation model will be used, to invite the child to follow rules by imitation in first instance and later by conviction. The second viewpoint is the pedagogical technique to be used in the formation of the value, which can be passive or active. The third viewpoint is the procedure used for moral education as a function of the moral domain upon examination.

In the cases mentioned before, it can be observed that moral education is represented by the passive model characterized by subjection and the active model characterized by the model of cooperation and conviction. In Piaget's theory of the moral education of the child mentions four stadia or phases upon which this education is given: the formation of values. Education is the means through which human societies can conserve, transmit, develop and build upon the set of values that make up the human environment (Piaget et al., 1960). In other words, education is the best instrument to convey values to a person and therefore to society, through the axiological focus, in a system of values that is included in the design of curriculum. In regards to this, Piaget recognizes the following four stadia (stages) for education. The first stadium is the egocentric reasoning that is developed from 3 to 5 years old, in which the reason to be good is receiving presents. The second stadium is from five to seven years old, corresponding to the unquestioned obedience, in which the right judgment is what I am

being told by my parents and teachers, with the motivation to avoid problems. The third stadium, that of loyalty, starts towards the end of the sixth year and culminates at ten years of age, during which the right judgment is that which benefits me, being good with those who are good with me, and self-interest as the reason for being good. The fourth stadium starts approximately at nine years old and culminates at sixteen, where the child assumes some responsibilities with the system to which he belongs and his reason for being good is the interpersonal and social approbation and his self-esteem. For all this it is necessary that the child reflect to assume his responsibility and that he decide to adopt positive attitudes, which have to be valued and translated into behaviors that let him feel their congruency with the education in moral values that he has received. It is necessary to reflect upon each one of these stadia, principally at the chronological age of the child, and project that to the practical arena. At these ages children act governed principally by behavior rules that within an educational institution are reflected in a rulebook. Depending upon the severity of the inappropriate act that violates morality, the range of penalizations goes from an admonition to being thrown out of the educational institution. This is why children behave mostly because of regulations and not because of conviction. Moral maturity must be acquired by conviction after having been translated and adopted by the individual once the practical order of doing permeates through to the practical order of being.

Lawrence Kohlberg

He wrote his Ph.D. dissertation in 1978 on the moral judgment of children extending Piaget's investigation. He based his theory on moral dilemmas and divided it into six stages of moral judgment. He explains the cognitive-evolutionary development of moralization and tries to explain (Kohlberg et al., 1997): a) how the stages develop from the interaction between the individual and his environment, b) how an individual passes from one stage to the next, c) Why some individuals develop more than others, d) what is the relationship between those cognitive-based structures and the moral feelings and actions of an individual.

The first level, known as pre-conventional is comprised of two stages. The first is the heteronomous moral where the right action consists of not violating the rules, which are upheld by punishment, and obedience exists to avoid damage to persons and goods. The child's motives to do this are to avoid punishment and the power of authorities. This is an egocentric attitude because it does not consider others' interests and does not recognize them either, which originates a confusion in the perspective of an external authority and the child's own authority. The second stage, individualism or instrumental purpose and interchange, is characterized by an individual following the rules because it suits his interests and needs. Proposing a fair interchange, his motives are his interests and his awareness that socially speaking, everybody pursues his own interests, which in fact means he does recognize others' interests. In the conventional level two stages are included: one which is called relationships, mutual interpersonal expectations and interpersonal conformity. At this stage the individual tries to be at another person's level, and to fulfill the expectations that are held about him. His motivations to do so are to be good in his own eyes and others' eyes; he also has a social awareness of feelings, agreements and shared expectations that have primacy over individual interests. At the stage of social system and awareness, the teenager fulfills the appointed duties to contribute with the institution's functioning. In the level called post-conventional or of principles we can find stages five and six. Stage five, named social contract or social usefulness and individual rights, the right judgment is having the awareness that others have a diverse variety of values and opinions which are relative to the group. The motivations to be good are duty, commitment and the desire to fulfill laws and social, familiar and work-related duties. Socially, he is aware of the values and rights established by contracts and he integrates objectively moral and legal points of view. In the stage six of universal ethical principles, the young person seeks to abide by ethical principles that he has chosen. Laws or social

agreements tend to be valid because they are based on such principles. His motivations to abide by them are their validity and his personal commitment to them. The social perspective is that of moral recognition.

As has been mentioned before, we must not forget that the moral value is adopted or learned by the young person in a reference framework that must be qualified axiologically to determine that those acts and those moral values are in pursuit of a licit end. Philosophically speaking, the ultimate end of man within evolutionary parameters is towards good. Kohlberg's theory of moral development uses the results of philosophical ethics to describe the cognitive structures that are found at the foundation of moral judgments formulated on principles. As Kohlberg studied it in its stages and the reasons to be good, we must not wait until 16 years of age or more to determine the stages of moral development since self-sufficiency can be achieved from 3 to 5 years of age and in each of the individual's life stages. The development of values must arise within the family unit, in the social nucleus where a human being develops. The main problem is to determine the validity of "the moral viewpoint" so that the development of the moral judgment have results directed to the common good and allow for the evolution and not the destruction of mankind. According to this, Kohlberg's theory is based on fundamental philosophical assumptions that imply that a true moral reasoning must contain features such as impartiality, universality, reversibility and prescription (Habermas, 1987).

It must be pointed out that Piaget and Kohlberg's theories on constructive learning describe the cognitive structures through which learning processes ensue. This relationship has a reference back in the stage of moral judgment development in three aspects which Kohlberg tries to expound on the moral taking into account cognitive ethics: cognitivism, universalism and formalism. In the moral stages indicated by Kohlberg the main ones are post-conventional order and of principles where moral decisions are generated from rights, values and principles that are (or could be) admitted by all persons that comprise or create a society with fair and beneficial practices. In the stage of prior rights and social contract or social usefulness that antecedes the stage of universal ethical principles it is the previous learning which must activate the decision to act. That is the reason for delimitating moral tasks in this stage through dilemmas that will be adopted and acted upon by the individuals. It is necessary that educational institutions acknowledge that education must convey and create values that will allow the individual to be a part of a free and harmonious society, so that he can lead his life in agreement with the integrity of each one of the persons that form part of it. Once these institutions acknowledge so, they will create an educational system that can permeate in the formation of values, in the practical order of doing, for each individual's own being. Why should the education in values be emphasized? Because society demands that people act pursuant to our own evolution towards a being and a society without violence, in the search of the spiritual light in this material world. Once the need for the formation in values in education has been recognized, we must analyze what is the ideal way to accomplish this objective. Education has acknowledged that the formation in values is necessary and to this end the educational institutions have based their philosophy, mission and vision or objectives on moral values.

3. Values in education

Most organizations have their foundations on values through their own philosophy, and their values can be observed within their vision or mission. The persons that execute the organization's plan must commune with the organization's values. The education in values is a topic that has captured the attention of specialists in education

in the last years as one of the possible ways to solve social problems that are broadcast in different mass media, such as manifestations of violence, not only towards women (even within the classroom arena), but also racial discrimination, family violence, frauds and others that prevent a moral evolution and a social coexistence directed to the common good. A premise to eradicate or diminish these symptoms of societal disease is through education, forming values within the society through the educational institutions. This controversial topic is undoubtedly important and there are currently studies that indicate the advisability of forming in values through education.

It is necessary to conceptualize values from the philosophical paradigm in virtue of the existence of diverse meanings but in education values must be defined as a set of behaviors that make up the way of living of the individual and that have a meaning and an appreciation (a value) to fulfill them, and that to be directed towards social equilibrium must be applied to the common good. To comprehend this concept, we will refer to a parable that situates us at the center of the problem of the conceptualization of values since this term has different and multiple meanings and derives into the expression “education in values,” without any rules for its use neither in common day language nor in philosophy nor in any other science. *“Once upon a time a man was walking through the desert. He heard a voice that told him: pick up some pebbles, put them in your pocket and tomorrow you will feel both sad and happy. That man obeyed, he bent over, picked up a handful of pebbles and put them in his pocket. The next morning he saw that the pebbles had turned into diamonds, rubies and emeralds. And he felt happy and sad. Happy for having picked up the pebbles and sad for not having picked up more. The same thing is true of education”* (William Cunningham, based on a Bible passage, Job 21-25).

The previous parable places us at the beginning in the order of the value given to things by the individual and when this value makes no sense for him, he doesn't see it as a value. (This is the way of behaving of some persons in several situations, such as apathy, indifference, being upset, etc., which makes their behavior contrary to moral). When an individual can observe that pebbles have been transformed, he regrets it and wishes he had taken more since these would have a value; the man is saddened for when he sees them transformed, now they have a value for him, although this person sees this value as an economic value. However, the value to which I am referring is not a mercantilist or economic value (understood as the value that substitutes a material good for another material good; that is the reason why some students choose a major pursuing an economic value, without any relationship to a life plan that includes self-fulfillment through family, society, which is the ultimate end of mankind). Many individuals define themselves by what they do, by what they value and by certain social relationships (social status) but in the philanthropic sense this does not constitute an element for the individual preservation and evolution (what we authors call the spirit of education) thus losing the meaning of education.

For Jerez (1997) values in education are expressed as normative goods of moral orientation closely linked to the individual and social consciences and are the individual manifestation expressed socially, through the feelings, verbalized and congruent with actions. To encourage valuable or good attitudes it is imperative to do it through values, task undoubtedly associated with an educational act that considers education of personality, of character, of sensibility and is differentiated from the conveyance of knowledge and the intellectual instruction. From all this it can be deduced that values and education are inseparable terms since education is involved in the formation of the individual. Education cannot be conceived in the absence of a conception of the world and of life.

What type of value are we referencing? We will quote some considerations in this regard: When value is discussed “*a quality or perfection of reality related to the human functions and capacities*” (Pereira, 1997), we are directed to a reflection upon the ends of education in human development, in love and in wisdom. Garza (2000) mentions several authors that link education with values, such as Plato who considered that education consists in supplying body and soul with all the perfection and beauty they can muster. Bertrand Russell established that the four objectives of education are vitality, intellectuality, sensibility and value. Pestalozzi stated that true education leads to perfection, grace and the fullness of human capacities. Justo Sierra Méndez indicated that the development of the personality is based on moral, intellectual, physical and aesthetic education. In axiology, the study of values needs of a consignee so that a value can exist. Nietzsche indicates this when he speaks about the need of transmutation of values so that a new human culture can arise and he gave an important impetus to the study of values when he interpreted them as acts of preference. This implies an intellectual development so that the individual can discern and refer and carry out any act. This act, from an epistemological paradigm, presupposes three dimensions: the conscience of the value, the classification of values, and the life experience of values. In Plato’s dialogues, Aristotle indicates the four governing values: Prudence, Justice, Strength and Temperance. For Russell, the fundamental values are Justice, Decency and Morality. For Scheler, values are classified as Sensitive, Vital, Spiritual and Religious. As for life experience, values are personally preferred or chosen; churches have a great influence on that.

Moral values are universally accepted and are those that are sufficiently firm and acceptable beyond any particular person’s circumstances and beliefs, because their observance is deeply desirable for every human being in all time and place, for example: the protection of the environment, respect, love, mercy, solidarity, equality, or the values expressed in the universal declarations for children, for women, of human rights, in all of which are recognized the virtues of attitudes in facts, situations, circumstances or concepts referring to human development. Many values are contemplated within the legal framework of society such as constitutional documents, regulations and formal declarations of international organisms.

4. The universe of values.

Benito Juárez based his motto “Between individuals and between nations, the respect for the rights of others is peace” on a moral value that is respect, and became immortal when he founded law on values. National values are promoted by the State through educational processes, attempting to forge a national identity, with the will of the individuals to love and care for a territory, weather, race, language, institutions and other cultural goods that are common to the inhabitants of a shared space with a series of historical happenings, traditions, uses, customs, religion, etc. In Mexico, values express the profile of a Mexican citizen, as a result of a cultural context and an ever changing concept of the nation; the educational challenge lies in including, promoting and establishing them as part of life, that is, to live them. (How can we conceive then, that some curriculums have included theoretical subjects of social science, ethics, etc., if they are not applicable and provable?)

Education in all societies is one of the “*the main motors of development and has as one of its functions to make it possible for man to thoroughly direct his own development*” (Delors, 1996). In this context we attempt to mold attitudes based on moral values and endeavor to inspire superior spirits so that individual can fulfill ideals that are essentially human such as: assistance, service, kindness, fulfillment, mercy, piety, solidarity, helpfulness, union, work ethic, equality, justice. In view of these needs, educational competencies, reading and the magisterial labor have an effect on human development.

The concern at the international level is centered principally upon events such as when in the news atrocities, violence, power struggles can be observed, including also genocide, suicides, attacks upon people unknown to individuals, national hatred, international hatred, terrorism and countless data that show we must take drastic measures in the formation of moral values that will allow for the eradication of those acts that only lead to degradation and the extermination of society. If each one of the persons that have perpetrated immoral acts had been educated in values they would have not committed those inhuman acts. But what happens? That many persons that have perpetrated acts against morals such as corruption, fraud and countless ill-disposed acts have been part of an education in values. Then, what is at fault? One of the main reasons is that the education in values has been founded on and has emphasized the education in values at the primary and secondary levels, but there has been no proposal for education in values at the mid-superior level. We intend to promote the acquisition, the enrichment, the dissemination of goods and values of the Mexican culture and its adaptation to universal ones. Additionally, from the international perspective, know and practice democracy as a way of life; that is, as a value since the way of thinking about government was a central concern in the agenda of educational policies during the decade of 1990. Thus, in 1998, this was the central theme of the Ibero-American Conference on Education held in Sintra, Portugal (Organization of Ibero-American States, 1998) and has been kept in the agenda ever since.

The countries in the region approach the problem of the quality in education stressing sometimes the development of the necessary raw materials -- curricular changes, infrastructure development and equipment, better formation of teachers—and at other times, less frequently, in the establishment of goals related to national and international indicators of educational performance. This is one of the themes on which precise goals are set for higher education on the basis of the Organization of Ibero-American States' Report "Educational Goals 2021, The Education We Want for the Bicentennial Generation" (Organization of Ibero-American States, 2010). This Organization has designed a program for the education in values and citizenship indicating that it is necessary to promote the participation in the school environment and to promote a satisfactory climate that helps the students live together and be tolerant and practice solidarity. To achieve this, it is necessary to promote innovations and find strategies that are attractive for students and allow them to live with satisfaction in the exercise of values. From this perspective, the education in arts and sports may become important instruments for the education in values, the knowledge of others, the respect of differences and for teamwork, all of this through goals, strategies and lines of action on education for values and responsible citizenship. As has been stated by UNESCO, 1998, and diverse other actors, *"higher education is a public good, one of the fundamental pillars of human rights, democracy, sustainable development and peace; to strengthen it is our obligation and our commitment."*

5. The transversal axis and the integrated curriculum

It is evident that the foundation of education in the formation of values must be studied and analyzed to determine the need of incorporating values in education through the transversal axis. *"...The formation in values constitutes a pedagogical problem that is only understood from the psychological analysis of the nature of value in its regulating function of human action. The new curricular models are usually based on their 'transversality' or transversal axes that are included in the curriculums to fulfill specific objectives of supplying elements for the transformation of education. Transversal axes allow for the establishment of an articulation between the education based on the disciplines of knowledge, the themes and courses with the courses of higher education to form integrated human beings."* (Botero, 2008). One of the instruments through which values in higher education

can be included is the transversal axis, which can guarantee the formation of persons committed to society, well-adjusted, happy, that live in the acting out of these values... *“It is the duty of curricula in higher education to generate the formulation of “being” a professional, to create and interpret that reality in the short term to eventually unfold one’s career with a high sense of professional integrity in the workplace. For Nietzsche, ‘the best interpretation of reality proposes three ideas: of truth, of language and of values’* (Piaget and García, 1982). Values in education must be implemented in universities to commune with the educational tasks as set forth by international organisms in education through strategies of axiological character that will let the teacher form and motivate attitudes in alignment with moral behavior, and that will allow the student to learn in values. These strategies must be included in curricula. Therefore, the necessity to analyze that curriculum is born and we propose the transversal axis to determine whether values are present, how their application is instrumented, didactically speaking, and the evaluation of the student to determine if the objective is reached. Thus, some curricula in higher education include ethics as a course, while only rarely is this course found at the university level. The instructor, within his performance, has the noble task of forming the future professional within a scientific-axiological scheme.

The concept of curriculum that Aristizábal carries out references Félix Angulo who quotes Hanesson indicating that *“...the curriculum was conceived as a form of organization and an instrument of social efficiency; that is, an organizational structure imposed by educational authorities to order the conduct of schooling”* (Aristizábal, 2005). *Given the importance and the contribution of curricular transversality, for the holistic formation inherent aspects to this subject on the following lines will be developed, in the way they are presented by Bravo (2006).* Including transversal themes into the curriculum means incorporating cognitive and affective lines, where both knowledge and information are conjoined to the world of values, the decisions, feelings and attitudes, as well as action.

Transversal axes contribute to the formation of the human being because they are instruments to insert values, give sense to education; a vehicle through which the objective or hidden discourse of education is conveyed. These axes are not longitudinal nor lineal; they permeate the curriculum; they are the spirit or soul of the curriculum. From this perspective, transversality connects school with life, by recognizing and assuming two dimensions of knowledge that complement and inter-relate with the process of the integral formation of personality: the knowledge that originates from curricular contents (conceptual, procedural and attitudinal) and the knowledge that emerges spontaneously from reality and the experience lived by students in their everyday life.. *Transversal themes are interpreted by various authors as bridges between vulgar knowledge and scientific knowledge, in the sense of connecting academic insight with reality or with the needs and interests of student, all of which is reverted into a greater functionality in learning* (Yus, 1997, as cited in Paredes, 2008).

Once we have established that the formation in moral values is necessary, we retake Kohlberg’s posture. It is necessary that through stadia values be formed; the curriculum integrated through the transversal axis must include them, but emphasizing values that are fulfilled in the practical order of doing. This is the reason why they must first be based on theory, on their meaning, on their logical reasoning, on their projection so that once they reach the students’ awareness they may be adopted by their own nature, buy conviction. This happens when one is not glad of another person’s suffering, when one tries to “be good,” on an adequate assessment and not according to circumstances. When a 3 or 4 year old child begins his comprehension and meaning of things, at school, in religion, in the family, in the society to which he belongs, he acquires values through the stadia that

form him; but can a 10, 12 or 13 year old child be able to practice them? Although the answer is positive, it can be negative as well because at this age education and society are viewed as heterogeneous and coercive by the child. Many juvenile delinquents shield themselves in the protection of the law when they perpetrate illicit acts and they cannot be penalized because they are not conscious of what they are doing. To cite an example: an eighteen to twenty-three year old adult that engages in sexual intercourse with a 16 year old minor is penalized by saying she was manipulated and raped because she is not emotionally nor morally mature to react to an immoral act. Why does the education in values in high school set aside this formation? In primary and secondary education most children are formed through a norm; they are even taken to and picked up from school under the protection of their parents. These children are not acting freely! These children act freely in the teenage years, when they start carrying out acts through which they must translate the values that were impressed upon them, but when they feel free they start a new phase: the same one that in childhood but in the practical order of doing. They start with communication codes, with rules created by themselves, for example: we will hit whomever rats us out; that is why they keep silent (an example of bullying) and that is why loyalty starts degenerating in its concept, but it is during this phase that they need to be formed in this new concept that will become the decisive one in their future life. That is, during this phase their preparation starts afresh and they act by themselves. It is here that we must apply Kohlberg's theory in emotional maturity, in the creation of firm attitudes generated by conviction. It is the creation of what Abraham Maslow calls self-fulfillment.

A strategy that can contribute in the formation of values at the mid-superior level is through the integrated curriculum. "The integrated curriculum is an holistic educational project defined as a process that expresses the relationships of interdependence in an historical and social context, the progress of science and the needs of the students, that must be translated in the education of the personality of the citizen that the teacher aspires to form" (Addine, 1997). For an integrated curriculum to be effective and efficient the student must have his own rhythm of development; the curriculum must include particular strategies specialized in learning that will incorporate the personal idiosyncratic experiences and expectations, previous information, all within an environment of globalization, interdisciplinary action, within a global society. Consequently, a discourse of interdisciplinary action must take in the schoolrooms and curricular tasks from the viewpoint of cultural contents; that is, attempt to see what relationships and grouping of contents may be executed through courses, through content blocks, through knowledge areas and experiences. As indicated by Torres (2013) in his article "Without walls in the schoolrooms: the integrated curriculum," the argumentative line in defense of the integrated curriculum is through the psychology of development and learning. This reasoning axis uses the theme of globalization which implies taking decisions on the way of organizing work in the schoolrooms and teaching centers respecting the peculiarities of boys and girls as is described in evolutionary and learning psychology.

6. Conclusions

Without education in moral values mankind would disappear; it would retrogress to a state without conscience where the most fit is the one that survives, and not the more human individual. It is required that society transmits moral values but from a global and updated perspective. If these values are also part of the societal culture, we must find the way in which the individual by himself reasons and finds his own spiritual evolution with a moral conscience towards peace and the evolution of being. There is a most important specific characteristic, which is the decision from among what is new, what I like, what makes me feel good, what I am told, what is good for me, what I consider makes me feel grown up, what I do not dislike, what does not hurt me, what does not make me angry, what does not make me feel bad.

The young person sees education as a link to the workforce rather than as an instrument of identity and moral development that will help him to live and transcend as an individual. It is time to create a new measure of value with tendency towards valuing what I do not only economically, but as in altruistic acts, also because they generate value in the common good. We must create in our youth the inclination for the development of highly acknowledged convictions. Individuals must be formed with tendencies towards morals and ethics, prepared for their spirituality with a focus on moral values.

There are diverse pedagogues that have considered the need of incorporating moral values in the curriculum. Based upon the theories of Kohlberg and Piaget, the formation of values in students at the mid-superior level from 13 to 19 years of age can be projected, which is necessary at this phase because the independence of conscious acts is established in this stage. Education must then form in the scope of values, totally influenced by a globalized social and interdisciplinary environment through the integrated curriculum. It is necessary to reflect upon the incorporating the formation of values at the mid-superior education through an analysis of the curricula of universities through the transversal axis and the integrated curriculum, thus projecting an integral formation of the individual so that he may transcend and achieve the common good: human coexistence in the path to perfection.

It is important to consider the relationship that is given to values from a perspective for human development based on moral values. Alternatives are required to reflect upon and to propose the scope that moral values have in their application to the student community at the mid-superior level as an instrument of prevention and determent of felonies such as fraud, corruption, racial discrimination, pollution of the environment, terrorist acts, violence, murders and others that negatively impact social stability currently. Although it is true that there is a tendency towards education in values at the international level, it is also important to decrease the indices of violence that is generated by the absence of moral conscience that must allow the practical order of doing.

To educate is not to provide a major to live but rather to temper the soul so that the individual can face the difficulties in life and act with values to transcend, evolve, interact and be part of his nature. It is time for man to transcend ethically; let us awaken the individual so his spirit may find happiness.

The Gender-Marital Status Job Satisfaction Relationship of Academics

Tülen Saner*, Şerife Zihni Eyüpoğlu

*School of Tourism and Hotel Management, Near East University, Lefkosa, 98010 North Cyprus
Business Administration Department, Near East University, Lefkosa, 98010, North Cyprus*

Abstract

This study examined the marital status-job satisfaction relationship in higher education. The study instrument used was the short form Minnesota Satisfaction Questionnaire (MSQ) which measures overall job satisfaction, intrinsic satisfaction, and extrinsic satisfaction using 20 facets of the job. The instrument was personally administered to the respondents. The population for the study consisted of academics in North Cyprus. The results show that the job satisfaction of married academics is on the whole higher than not married academics. Overall job satisfaction and extrinsic satisfaction levels varying for different marital status.

Keywords: Job satisfaction; intrinsic satisfaction; extrinsic satisfaction; academics; marital status; North Cyprus.

1. Introduction

Satisfaction has been widely studied in the management literature (Spector, 1997) due to its relevance to the physical and mental well-being of the employee, as well as its implications for such job-related behaviours as productivity, absenteeism, turnover and employee relations. Job satisfaction also plays an important role in improving the financial standing of organizations (Aronson et al., 2005). In this respect, job satisfaction today still is a topic of major interest for many researchers and is an organizational variable that should be understood and constantly monitored for the welfare of any organization. In fact, understanding the job satisfaction of employees is an important organizational goal of any organization (Aronson et al., 2005) and indeed, has been a matter of growing interest for those concerned with the quality of working life and organizational efficiency (Maghrabi, 1999).

High quality academic staff is the cornerstone of a successful educational system (Sharma and Jyoti, 2009). As Johnes and Taylor (1990) state, the goals of higher education are to provide in-depth knowledge, seek academic development, educate students, as well as to coordinate national development demands, cited in Chen et al. (2006). None of these goals can be accomplished efficiently if low satisfaction or dissatisfaction exists

amongst the university teachers in higher education organizations. Thus, the study of job satisfaction of university teachers seems inevitable. The job satisfaction of university teachers (academics), their commitment, and their retention are crucial to effective academic institutions. The understanding of factors affecting the job satisfaction of university teachers is of utmost importance for the implementation of a successful, innovative, and vibrant educational system. Furthermore, their job satisfaction translates into a healthy and positive academic environment. Thus, attracting and retaining high quality university teachers should be a primary requirement for any educational institution (Sharma and Jyoti, 2006, 2009). Although some degree of turnover is inevitable and perhaps desirable, high rates of faculty turnover can be costly to the reputation of an institution and to the quality of instruction (Al-Omari et al., 2008).

A review of published works reveal that there does appear to be general agreement that job satisfaction is an affective reaction to a job that results from the comparison of actual outcomes with those that are desired (Oshagbemi, 2003). Research findings have indicated that many personal characteristics affect job satisfaction in different and complex ways, these personal characteristics including gender, age, marital status, and working experience, to name a few (Koustelios, 2001).

Research focusing on job satisfaction in higher educational organizations has indicated that, on the whole, academics are generally satisfied with their work. Findings indicate that academics want work tasks that correspond to their personal interests and allow them considerable autonomy in task selection and decision-making; they want a sense of achievement, facilitated by feedback from supervisors; they want clarity as to what is expected of them and harmony among the various people they work with; and they want salaries awarded equitably and at a level that meets their expenses; and they want promotions to be awarded fairly (Kelly, 1989). The job aspects that are most frequently perceived as responsible for low satisfaction are pay, university administration policy, availability of resources, and working conditions (Kelly, 1989).

Dissatisfaction amongst workers is undesirable and dangerous in any profession, but it is suicidal if it occurs in the teaching profession (Sharma and Jyoti, 2009). As Johnes and Taylor (1990) state, the goals of higher education are to provide in-depth knowledge, seek academic development, educate students, as well as to coordinate national development demands (cited in Chen, 2006). None of these goals can be accomplished efficiently if low satisfaction or dissatisfaction exists amongst academics. The job satisfaction of academics, their commitment, and their retention are crucial to effective academic institutions (Saner and Eyupoglu, 2012). Academics find themselves in a profession that is highly stressful. The requirements of career completion, excessive course loads that tend to hinder research and insufficient payment are all factors that may cause financial and physiological discomfort for individuals (Koyuncu, 2001). Unless they maintain positive attitudes towards their profession they will inevitably fail in their professional career (Sirin, 2009).

The main purpose of this study is to examine the marital status-job satisfaction relationship in higher education, more specifically academics in North Cyprus, and to identify which aspects of the job are sources of satisfaction and which are source of dissatisfaction. Also the study will identify gender differences in relation to marital status. The results of this study will enable university authorities and policy makers to develop and implement policies towards the improvement of the undesirable conditions and the strengthening of the desirable conditions, reinforcing the higher-educational system.

2. Methodology

To measure the job satisfaction of the academics the short-form Minnesota Satisfaction Questionnaire (Weiss, Dawis, England, and Lofquist, 1967) was utilized. The Minnesota Satisfaction Questionnaire (MSQ) is one of the most widely used instruments in the measurement of job satisfaction (Scarpello and Campbell, 1983) and its validity and reliability has been proven over the 40 years that it has been in use. It has been used to measure job satisfaction in a variety of sectors, including education. The short-form MSQ is composed of twenty facets, each facet represented with just one satisfaction item. The short-form MSQ measures three satisfaction scales, namely intrinsic satisfaction, extrinsic satisfaction, and overall job satisfaction. Intrinsic satisfaction refers to occupational conditions (how people feel about the nature of the job's tasks), and extrinsic satisfaction refers to environmental conditions (how people feel about features of the job that are external to the work). Respondent academics were asked to express the extent of their satisfaction with each of the 20 facets of their job on a five-point Likert scale ranging from 1 (very dissatisfied) to 5 (very satisfied). The original short-form MSQ was translated into Turkish by the authors and tested on ten academics to test its validity and reliability. The internal consistency of the translated questionnaire was 0.85, obtained using Cronbach's alpha coefficient. The questionnaire was accompanied with a personal information form in order to determine the demographic variables of the academics that participated in the study.

The population for this study comprises academics from 5 of the North Cyprus universities. A total of 600 academics were randomly approached with 412 agreeing to take part in the study, resulting in a response rate of 69%. The questionnaires were administered in an interview format. Though extremely time consuming, this method was utilized so as to ensure as high a response rate as possible, hence the use of the short-form MSQ over the long-form. Of the 412 respondents, 67.7% were lecturers with a master degree, 7.8% were lecturers with a PhD, 13.3 per cent were assistant professors, 4.6% were associate professors, and 6.6% were full professors. The low number of respondents from the academic ranks associate professor and full professor is an indication of their relatively small numbers in the academic population in North Cyprus compared to the other ranks, though this is not surprising for a developing country. However, it is not felt that these percentages have had an affect on the final results as comparable studies conducted have also yielded both similar sampling percentages and similar results. Such studies include Ssesanga and Garrett (2005) and Oshagbemi (1997). Just slightly over half the respondents (53.4%) were male and 46.6% were female, and 63.8% were married and 36.2% were not married. The greatest percentage of respondents (37.6%) were in the age range 21-30, 34.5% were in the age range 31-40, 17.2% were 41-50, 6.1% were aged 51-60, and the remaining 4.6% were in the age range 61 and above.

The statistical package for the social sciences (SPSS) version 13.0 was used to analyze the data collected. Analysis consisted of the computation of descriptive statistics and ANOVA in order to examine the different job satisfaction levels of the academics in relation to their marital status.

3. Findings and Discussion

The mean scores (M) and standard deviations (SD) for the job satisfaction of academics in North Cyprus in relation to marital status can be seen in Table 1. Mean scores below 3.50 are considered to be more on the "dissatisfied" side of the "satisfaction-dissatisfaction" scale with mean scores above 3.50 being more on the "satisfied" side of the scale (Pearson and Seiler, 1983). As Table 1 presents the level of overall job satisfaction experienced by married and not married academics are above 3.50 thus indicating job satisfactions except for

extrinsic satisfaction of not married academics indicating a mean level of 3.41. The analysis indicates that married academics are more satisfied than not married academics. This is supported by Sharma and Jyoti (2009).

Table 1 Marital Status-Related Mean Satisfaction Scores

Variables	Overall Job Satisfaction		Intrinsic Satisfaction		Extrinsic Satisfaction	
	mean	sd	mean	sd	mean	sd
Not Married	3.61	0.70	3.71	0.75	3.41	0.72
Married	3.74	0.61	3.84	0.59	3.56	0.75

Table 2 Marital Status/Gender Related Mean Satisfaction Scores

Variables	Overall Job Satisfaction		Intrinsic Satisfaction		Extrinsic Satisfaction	
	mean	sd	mean	sd	mean	sd
Not Married Male	3.52	0.66	3.64	0.65	3.30	0.78
Married Male	3.71	0.61	3.82	0.60	3.50	0.74

Variables	Overall Job Satisfaction		Intrinsic Satisfaction		Extrinsic Satisfaction	
	mean	sd	mean	sd	mean	sd
Not Married Female	3.76	0.73	3.83	0.90	3.61	0.74
Married Female	3.77	0.62	3.85	0.59	3.61	0.76

From Table 2 it is possible to see the mean satisfaction scores of the academics in relation to marital status and gender. Not married female academics are clearly more satisfied than not married male academics. With a mean score of 3.30 not married male academics indicate dissatisfaction with extrinsic job satisfaction.

It is also evident from the table that married female academics indicate higher levels of satisfaction compared to married male academics. The satisfaction of female university teachers may be explained by their role in the family, especially if they are not the sole or the primary income earner (Oshagbemi, 2000). This finding is consistent with Saner and Eyüpoğlu (2012) who indicated that the intrinsic and extrinsic satisfaction mean scores are highest for the female university teachers. This is also further supported by Sharma and Jyoti (2009), and Oshagbemi (2000, 2003).

4. Conclusion

The main purpose of this study was to examine the marital status-gender job satisfaction relationship amongst academics in North Cyprus. The results show that the job satisfaction levels of the married academics are on the whole higher than the not married academics. Results further indicate that the female academics (married and not married) are more satisfied when compared to the male academics (married or not married).

The results of the study suggest that university management and higher education authorities need to pay attention to the job satisfaction issues of the married and not married academics on a gender basis and understand their concerns regarding their job satisfaction. Furthermore, academics with different levels of job satisfaction may result in the need for university management to consider different motivational techniques in order to improve overall performance.

The Good, the Bad, and the Ugly: Teaching Critical Media Literacy with Disney

Michelle Garofalo*

Brock University, 500 Glenridge Ave, St.Catharines, Ontario, Canada, L2S 3A1

Abstract

This research uses a qualitative approach to studying Critical Media Literacy (CML) with young girls by collaboratively analyzing Disney animated films with young girls age seven to eleven. The Ontario Curriculum in Canada has recently introduced CML as a new implementation to aid children in becoming active agents in interpreting media images. Using Disney as an educational tool, two focus groups were used in order for the girls in this study to analyse ideologies present in Disney animated films for the purposes of opening up dialogue surrounding CML and Disney female characters. This paper is based on a larger graduate project which I conducted at Brock University, and focuses only on one topic of powerful Disney female characters.

Keywords: Critical Media Literacy; Disney; Femininity; Female Power; Animated Films

1. Introduction

This research engages young girls in critical media literacy (CML) in order to become active agents in consuming media. Children are being bombarded with invasive media images multiple times a day. It is vital that children become active agents by being able to critically interpret media images and in-turn use education to have control over their culture. Therefore, the Ontario Curriculum (2009) introduced the importance of CML so that children will be able to differentiate between “fact and opinion; evaluate the credibility of sources; recognize bias; be attuned to discriminatory portrayals of individuals and groups, including women and minorities; and question depictions of violence and crime” (p.13).

In turn this research will provide a platform for young girls to contribute to the existing information about Disney in relation to young girls. Using Disney as an educational tool and conveyor of femininity, the girls in this study analyze ideologies present in particular animated films for the purposes of opening up dialogue about what CML is, how it can be used, and why it is an important skill to acquire, particularly in relation to girls’ viewing of Disney films. CML skills can provide the opportunity for girls to assess texts and images in relation to understanding “relationships between power and domination” that underlie and form texts (Gainer, 2007, p.107). Therefore, CML enables girls to understand immediate images while simultaneously reading between the lines and beyond the screen (Gainer, 2007).

The larger portion of this study includes several different topics in both the literature review and the analysis including the physical appearance of the Princesses, gender conformity in Disney female characters and

heterosexuality between characters. However, for the purpose of this paper only one section will be the main focus. The area of analysis is centred on powerful female Disney characters and the young girls' interpretations of these characters. *Cinderella* (1950) and *The Little Mermaid* (1989) are two films that were used for this specific area of the study and allowed the participants to participate in critical media literacy and in turn become critical viewers of media.

1.1. Research question

This study explored the following question: How might critical media literacy skills create a space for discussion and promote awareness of ideologies in Disney films for girls?

2. Critical Media Literacy

Critical theory promotes examining and critiquing society as a whole by unearthing the underlying ideologies by which society is governed. CML grew out of critical theory as this critique of society often included more specific components, such as media and popular culture. CML is a branch of critical theory and comprises my theoretical framework for this research. CML can be defined as, "a pedagogy that positions students to analyze relations among media, audiences, information, and power to produce alternative media texts that challenge messages in dominant discourse" (Kellner & Share, 2007, p.62). Moreover, CML encourages viewers to draw "on their cultural resources and life experience as they deconstruct, debate, resist, and reimagine dominant narratives" (Kellner & Share, 2007, p.63).

Kellner and Share (2007) use the metaphor of an iceberg to further explain CML. Many students have the ability to analyze the obvious parts of media, the part of the iceberg that is exposed atop the water. However, CML allows students to not only analyze the exposed iceberg, but also the entirety of the iceberg that is submerged underwater. This will allow students to see beyond the immediately visible aspects of Disney films and explore below the surface of Disney characters, which may contain the "embedded ideological notions of white supremacy, capitalist patriarchy, classism, homophobia, and other oppressive forces" (Kellner & Share, 2007, p.8).

Kellner and Share (2005) advocate for CML as it not only teaches students to learn from and constructively use media, as well as resist its manipulation forces, but also to develop skills that will "help create good citizens and that will make individuals more motivated and competent participants in social life" (p.372). The use of CML allows viewers to become agents in the construction of their own interpretations of media texts. The importance of this theoretical framework is that it enables children to gain power over and knowledge from their culture rather than being passive recipients of media, thus enabling them to create personal meanings and identities that may result in transforming the world around them. The understanding of the social construction of knowledge through media interpretations enables students to expand critical inquiry into all outlets of information and communication. Children become active agents in the process of media interpretation, allowing them to deconstruct injustices, express their own voice, and in turn create a better society.

2.1 Critical media literacy and Disney

Giroux and Pollock (2010) suggest “animated films operate on many registers; one of the most persuasive is the role they play as the new ‘teaching machines’ as producers of culture” (p.164). Therefore, films can be learning tools for children, especially because “film discourses engage viewers not simply in the active construction of knowledge but also in the construction of knowledge from a particular point of view” (Gainer, 2007, p.365). The Disney Corporation own the majority of media that children consume, allowing Disney to provide children with a limited worldview, skewed and dominated by corporate interests. Often children and parents alike do not have the tools necessary to critically analyze the images provided by Disney.

More importantly, Disney is a “global cultural institution that fiercely struggles to protect its mythical status as purveyor of moral virtue” (Giroux & Pollock, 2010, p.93). Disney is one of the primary institutions constructing childhood culture around the globe; Giroux and Pollock (2010) suggest that Disney warrants healthy suspicion and critical debate. Giroux and Pollock (2010) also advocate that “Disney films will have *better* educational and entertainment value the more young people think about the conscious and unconscious messages and effects the films promote while resisting the temptation to view them as non-ideological” (p.99). Furthermore, Disney films resonate powerfully with dominant perceptions and meanings because of the context in which they are situated. This critique suggests the need to critically analyze how the “privileged dominant readings of Disney’s animated films work to generate and affirm particular pleasures, desires, and subject positions that define for young people specific notions of agency and social possibility” (Giroux & Pollock, 2010, p.103). This analysis can be accomplished with the use of critical media literacy, which allows children and others to read films “within, against, and outside the dominant codes” (Giroux & Pollock, 2010, p.103).

The development of CML provides a space for children to question images and ideologies presented in Disney films. Children may not have definite answers to questions, but the questions are asked in order for children to critically think about the entertainment to which they are exposed. The notion of hidden ideologies is “not necessarily invented by Disney, but what they do with these notions is caricature them, wrap them up in magic kingdom wrapper and sell them to children; that is the power of Disney” (Sun & Picker, 2002). CML will allow children to critique these wrapped up notions and in turn create a space to challenge the information provided by Disney. The importance of CML is that it does not force a child to choose whether Disney is good or bad; instead it allows space for questioning. Children may not be aware of the hidden ideologies that have been referred to as “oppressive forces,” however, CML will enable children to become active agents in the construction of their own media interpretations, thus providing a safe space to discuss injustices, personal opinions, and hidden themes in Disney films.

2.2 Feminist views

The notion of the feminine beauty ideal, defined as “the socially constructed notion that physical attractiveness is one of women’s most important assets, and something all women should strive to achieve and maintain” is of particular interest to feminist scholars (Baker-Sperry & Grauerholz, 2003, p.711). The feminine beauty ideal idealizes the attractiveness of a female which in turn reaps social and psychological rewards. The perception is that physically attractive individuals possess more positive qualities, thus making them more relatable and likeable opposed to the unattractive individuals. Baker-Sperry and Grauerholz, (2003) argue the feminine beauty ideal is often viewed in a negative light as an oppressive force in which patriarchal power objectifies, devalues, and subordinates women. However, it is widely accepted that females understand and

perceive beauty or becoming beautiful as an empowering force, rather than oppressive (Baker-Sperry & Grauerholz, 2003). It is interesting to note a paradox of the feminine beauty ideal is that “in a patriarchal system, those women who seek to gain power through their attractiveness are often those who are the most dependent on men’s resources” (Baker-Sperry & Grauerholz, 2003, p.712). Unquestionably, Baker-Sperry and Grauerholz (2003) claim the group which benefits the most from this ideal is white, heterosexual, middle- and upper-class women; and in turn, this group of women to whom the feminine beauty ideal is directed is the majority depicted in children’s fairy tales. Baker-Sperry and Grauerholz (2003) concluded from their study that young women are often described as “beautiful,” “pretty,” or “fair” compared to older women or men in children’s fairy tales. More importantly, the authors concluded media, including children’s media, often conveys the message of high importance of feminine beauty by not only having beautiful characters in main roles, but also demonstrating how beauty results in gaining rewards (2003). Bazzini, Curtan, Joslin, Regan, and Martz (2010) further support the feminine beauty ideal in children’s media by suggesting the “heroic prince and virtuous princess are attractive, but the wicked witch and evil giant are ugly” (p.2688). The implications and significance of this ideal is further asserted by Myers (2002) who emphasizes that, “children learn the stereotype quite early; Snow White and Cinderella are beautiful and kind, the witch and the step-sisters are ugly and wicked” (p.248). Baker-Sperry and Grauerholz (2003) suggested past and recent Disney animated films often alter retellings of popular fairy tales by changing previous female characters in aspects of “ingenuity, activity, and independence but not physical attractiveness” (p.722). It is evident that Disney may be attempting to put a positive spin on outdated female characters by possibly adopting different gendered behaviours, however the attractiveness of the female characters remain untouched.

2.3 Relevance

CML is important in order to deconstruct images that construct knowledge in childhood. Disney produces specific ideologies through its characters, which young children may internalize as norms or specific ideals that must be attained. CML can empower children to actively challenge, question, and critique images found in the media. But while Disney is a multi-national corporation whose goal is to make money, its films can also be used as educational tools. Disney characters have the potential to become role models for young children, thereby emphasizing the importance for CML. Considering Disney’s control over childhood culture, it is imperative to understand the influence it can have on young children.

Altogether, the Walt Disney Corporation is the world’s largest media conglomerate in terms of revenue. The Walt Disney Corporation earned approximately \$40.8 billion US dollars in revenue in 2011, emphasizing the power of Disney as a corporate giant. According to data dating back to 1995, Disney is consumed by millions of people. For example: approximately 200 million people watch a Disney film per year, 395 million people watch a Disney-produced television show each week, 212 million people listen to Disney produced music each week, 50 million people visit a Disney Theme park per year, and 42 million people per year make a purchase at a Disney store (Giroux, 1995). With the construction of new parks and the addition of multiple films since the mid 1990’s, one can only imagine the increase of visits and purchases that contribute to the Disney Corporation. With such an enormous fan base, it is evident that the Disney Corporation is well respected and highly valued by families. The enormity of the Disney Corporation and its control over children’s media is what provokes me to further explore how girls can engage with CML to think critically about Disney films.

This research is also relevant as it contributes to the field of Child and Youth Studies in several ways. This study is focused on doing research with children and allowing children to share their opinions, instead of professionals or parents speaking on their behalf. Furthermore, CML is a great strategy that is being implemented into the elementary grades of the Ontario Curriculum. My study adds to this body of research on why CML is crucial to the intellectual lives of children. Child and Youth studies is a growing field and much research has been done on the Disney Corporation, however most research takes a stand on Disney as being either beneficial or detrimental to children. My research contributes to the field as it shares the opinions, concerns, and voices of young girls, without forcing children to choose whether or not Disney is beneficial or damaging to their lives.

3. Literature Review

Disney's binary colour symbolism often associates white with goodness and black with evil (Hurley, 2005). This binary leaves little leeway for alternate personalities to be displayed other than "good" and "evil." In relation to this colour schema, Disney solidifies a dichotomy within femininity through the portrayal of certain female characters. The dichotomy constructs feminine roles as either powerful or passive. Power, in Disney, is represented in a negative light, whereas, passivity is associated with the positive. The colour symbolism supports this dichotomy by associating black with power and evil and white with goodness and passivity. The powerful characters are portrayed as independent, unattractive, mean, hated, single and represented and associated with the colour black; whereas, the passive characters are associated with the colour white, and are portrayed as dependent, nice, pretty, and often, eventually become coupled or married. The dichotomy between the powerful and passive characters is emphasized through their physical appearance. Ursula, Maleficent, and Cruella de Ville are described as mistresses of all evil, and are thus represented as unattractive, loud, bawdy, and inappropriate women (Zarranz, 2007)

Ursula, the wicked sea witch from *The Little Mermaid* (1989) is the very essence of the evil-but-powerful woman who does not fit the stereotypical body image of the Disney Princesses. Ursula, is half human, half octopus, and is portrayed as an obese black and purple squid that "oozes with evil and irony" (Giroux & Pollock, 2012, p.101). She is composed of six octopus tentacles and two human arms. Her resemblance to a non-human, monster-like creature further dehumanizes her and emphasizes her ugliness. Her body's physical presence emphasizes her dominance in the sea world. This physical presence diminishes the spotlight from other characters, which stresses the evil power she possesses to overcome anyone in her wake. Do Rozario (2004) describe Ursula as a "grotesque parody, who expands, suffocates, and overwhelms as an overweight, ugly woman" (p.44). Ursula also has an army of black eels that she uses to spy on and sabotage other characters.

Ursula's true evilness is expressed by her actions. Her manipulative nature negatively affects other characters. Ursula's desire to dominate the underwater kingdom can only be achieved by destroying King Triton's rule. She chooses to do so through the manipulation of his daughter, Ariel. Ursula takes advantage of Ariel's desire to be a human, and Ariel exchanges her voice for three days of human life. Ursula's manipulation and disregard for others displays her selfish actions, reinforcing her unattractive and evil character. Through Ursula, Disney constructs a deeply damaging view of female power. Ursula can be regarded as a powerful woman in a Disney film; however she uses her power for evil, and not for good. The depiction of powerful females is thus associated with evil, suggesting that power and kindness/beauty are mutually exclusive in women (Do Rosario, 2004).

Maleficent, from *Sleeping Beauty*, is one of the most dark and intense characters ever produced by Disney (Hurley, 2005). Her evil character is reinforced through her gloomy, unsightly appearance. She is a tall, thin, pale-green skinned woman with yellow eyes. Her facial characteristics have sharp definition. She is dressed in an oversized, black, and purple robe, which hides her true body shape. Maleficent is accented with a horned headdress, which symbolizes her dark, evil magic. Her wickedness is further heightened by her ability to shape-shift. Shape shifting deviates her character from being human; allowing her to change her physical form so her

victims are unaware of her presence (Hurley, 2005). By doing so, Maleficent is displaying extreme power, which is only used for selfish and evil ends.

Female power is repeatedly shown in a negative light in Disney animated films. The evil characters are arguably the most powerful female characters in the films; however this representation of power is controversial, as they are purely evil. Disney lacks a positive powerful female character for young girls to observe. Discussion around what it means to be a powerful woman will take place in my focus groups. I am interested in learning how young girls perceive these powerful women and how their representation as evil and ugly factor into their perceptions.

4. Methods

The focus of my research was to provide a space for young girls to share their opinions and make their voices heard, all of which was possible through qualitative research. I recruited four girls between the ages of 7 and 11 and two focus groups were used in order to collect data. Each participant has a pseudonym in this paper to protect her confidentiality. The same four participants partook in two separate focus groups. The participants were encouraged to provide answers and opinions to critical, thought provoking questions, and were encouraged to ask their own questions, as well. The focus groups lasted 60 minutes each

A semi-structured question guide was followed in order to create open discussion with the participants. The second focus group included media analysis of Disney animated films. The participants were asked to voice their opinions on the female characters featured in each clip and provide insight on topics that included: After discussion of each film clip, wrap up questions were asked in order to collect an overall understanding and connect all the clips together. This wrap up also provided a chance for the participants to share any final thoughts which they may not have had the chance to throughout the focus group.

4.1 Focus group one

The first focus group allowed for a general discussion of Disney and displayed the participants' interest and broad opinions of Disney films. The first focus groups was intended for me to gain a basic understanding of the child's position on Disney by exploring topics such as favourite movie, favourite character, and any other stories the participants wanted to share. Some example questions included: Why do you like Disney? Is Disney educational or only entertainment and why? The questions moved into a more specific focus of female Disney characters with questions such as: Does anyone have a favourite female Disney character? Why is that particular character your favourite? This focus group was intended to set the foundation that would lead to more specific questions of female characters in the follow-up focus group. The first focus group was intended to explore how much understanding the participant's showed in relation to female Disney characters. Questions were also asked that might provide an understanding of the participants' engagement with critically analyzing media through an inquisitive approach. Questions to evaluate critical thinking included: Who creates the Disney movies? If you could change one thing about the princesses what would you change? The participants also discussed which films they preferred to watch in the second focus group, which allowed them to have a voice in the research process as these films were selected for critical analysis.

4.2 Focus group two

The second focus group consisted of watching clips from Disney films, followed by asking the participants questions that opened a critical discussion of female characters. The first film clip that was shown was from the film *Cinderella* (1950). The clip included the part when Cinderella's stepsisters were about to leave for the ball to meet the prince. Cinderella's animal friends had just collected scrap material from the stepsisters and sewed a brand new dress for Cinderella to wear so she also had a chance to go to the ball. Cinderella walked down the stairs to join her stepsisters, until they became aware that Cinderella's wardrobe was made up of their belongings. The stepsisters proceeded to rip and tear Cinderella's dress until it was completely spoiled so that she could no longer attend the ball. The stepmother was present for the whole scene, which ended with Cinderella running up the stairs to her room crying, while the stepsisters continued on their way to the ball.

The second film clip was from the movie *The Little Mermaid* (1989) with a main emphasis placed on Ursula, the evil sea witch. The clip featured the song "Poor Unfortunate Souls" in which Ursula explains and demonstrates her powers to Ariel, who is passively watching her sing. The scene begins with Ursula explaining the potions she has used and the people she has cast spells on in the past, whom are all now trapped and under Ursula's control. Ursula explains to Ariel that in order for Ariel to be granted her wish to have feet, Ariel must give up her voice to Ursula. The only way for Ariel to get her voice back is that if she shares a true love kiss with the Prince above the sea on land. If the kiss does not happen, then Ursula makes it clear that she will have control of Ariel for eternity, and she will become Ursula's minion. The clip ends with Ariel being granted feet.

5. Analysis and Discussion

"I think they made Ursula look like that because she's mean, and usually mean people look bad" – Cayley, age 7

The goal of this research was to open a discussion around ideologies that can be noted in Disney animated films, especially with regards to female characters. One of the main themes in my literature review covered existing literature on powerful female characters which are notoriously the evil characters in Disney. Power, in Disney, is represented in a negative light and I was looking to understand if young girls' grasp this ideology on their own. The feminine beauty ideal is of particular concern as Disney seems to adopt this notion, constructing the villains in an unattractive manor.

During the first focus group, the participants did not focus much attention to power from female characters. However, a main character that was briefly focused on for this section was Ursula from *The Little Mermaid* (1989). As stated in the literature review, Ursula's physical presence diminished the spotlight from other characters, as her large body and negative actions dominate throughout the film. It is interesting to note that Cayley was elaborating on her favourite character Ariel, which led her into a discussion about the "bad person" in *The Little Mermaid* (1989). It is fascinating that Cayley extended the discussion from Ariel as a favourite character, to Ursula who was disliked. This example creates a link to how Ursula is a dominating character in the film. At the first mention of Ursula, she was referred to as "this mean bad person in [The Little Mermaid.]" Upon the mention of Ursula, an overwhelming uniform response from all participants was that she was "mean and evil." The participants repeatedly referred to Ursula as "that mean person" or the "evil person" instead of using her characters' name throughout the discussion in the first focus group. The participants gave simplistic reasons for disliking Ursula which connected directly to the plot of the film, mainly Ursula's power to take away Ariel's voice. I was surprised that the participants did not elaborate or divulge deeper into reasons for disliking Ursula because of her evil ways in the film.

Brittney veered away from Ursula and shared that a character that she did not like in Disney films was “the evil person in Snow White, because she gave Snow White the poison apple.” Jade interjected and added that it was the “Evil Queen” who was trying to poison Snow White, and that she was disguised as “old and ugly.” Although in the first focus group the participants did not connect the evil characters to be powerful, there was overwhelming response to referring to these characters as mean and ugly, and this was the main reason for disliking them. I recognized the participants picked up on the unattractiveness of specific characters and connected it to these characters being disliked.

The second focus group rendered much deeper critical discussion about Ursula specifically, as well as the step sisters and step mother from *Cinderella* (1950). The second focus group included viewing film clips which created a deeper discussion and allowed for more critical thinking because the images were so fresh in their minds. I realized there were clearly much deeper and stronger connections in the second focus group and I attributed the deeper criticality to the inquisitive approach of CML.

The first clip the participants watched was a scene from *Cinderella* (1950). The clip centered around Cinderella’s step sisters spoiling Cinderella’s dress and destroying her outfit so that she could not attend the ball. Cayley, Kara, Brittney and Jade all simply referred to the step sisters as “mean” for spoiling Cinderella’s dress, but did not go into more detail. I further encouraged the participants to discuss the scene in terms of how the sisters treated Cinderella but the descriptor word remained as “mean.” I suggested to the participants to try and connect the actions of the step sisters to something in their own lives. An automatic and very quick response was given that paralleled the steps sisters’ actions to “bullies.” The participants were able to recognize the power imbalance between the step sisters and step mother compared to Cinderella, by paralleling the scene to a victim and a bully, Cinderella being the victim. The consensus for this happening was because Cinderella was younger than the step sisters, so the participants believed the power imbalance was due to a hierarchy, similar to older children bullying younger children. I argue this as all four participants displaying critical thinking as they were able to make a connection between the film and their personal experiences as this demonstrated how the participants were able to make connections that went beyond the film. By discussing the behaviours of bullies, it raised a conversation surrounding people’s actions and how we are all responsible for our own actions. The participants collectively agreed that they would not enjoy to be treated the same way Cinderella was, and in turn it would not feel good if they treated anyone the same way.

Furthermore, a key component of CML is encouraging children to become critical viewers of media, which is supported by raising ideas that challenge children to begin to ask their own questions. Interestingly, during the second focus group, the participants began to critically assess Ursula’s intentions and in turn began asking questions that lead to a group discussion. For example, when discussing Ursula’s plan to take Ariel’s voice, Cayley raised an interesting question, stating “I don’t really get it, when [Ursula] takes away [Ariel’s] voice and she gets feet, if [the prince does not fall in love with Ariel] will she get her voice back?” Kara interjected, and further inquired, “If she has to live with Ursula, does she get her voice back?” Brittney answered her peer’s question by suggesting that she does not think Ariel would get her voice back, because “Ursula’s mean and she might not give it back.” Therefore, this dialogue shown between the participants demonstrates critical thinking by engaging in a dialogue assessing potential outcomes that were not provided directly in the film. The participants had to extrapolate their understanding of Ursula’s behaviours and use their own ideas to arrive at an outcome for what would happen to Ariel’s voice.

The participants’ observations and paralleling to the film clips to bullying reiterates Gainer’s (2007) understanding that CML allows children to understand immediate images in films while simultaneously reading beyond the screen. The way the participants stated they would feel unhappy to be treated or treat someone similar to the experience in the *Cinderella* (1950) clip, the participants gained an understanding of a power imbalance and in turn challenged the media image by disagreeing with it, which is a key component that makes up the

definition of CML (Kellner & Share, 2007). Kellner and Share (2007) also suggest CML encourages viewers to utilize personal life experiences to debate dominant narratives, something which the participants were able to do a great job disagreeing with the actions performed by the “evil characters.” Overall, based on the existing literature on powerful female characters in Disney films, I argue that my focus group data suggests that although young girls are able to identify evil characters and describe them as being unattractive, I do not believe young girls’ grasped the essence of female power necessarily equating evilness. I do not believe the participants made a clear link or understanding that emphasized Disney’s use of female power to be negative. I do believe the participants were able to observe females as having power and simultaneously described them as “ugly” however I argue the participants did not have a comprehensive understanding of Disney’s use of unattractive female’s that uses power in a negative light.

6. Conclusion

A particular focus of this study was to provide a platform which allowed the voices and opinions of young girls to be shared with regards to their understanding and interpretation of Disney female characters through the use of CML. After collaboratively viewing animated Disney films, it is evident that the young girls in this study were able to be critical viewers by answering questions with relation to specific films. Disney is an enormous corporation which holds immense power over childhood culture worldwide and in turn makes Disney a very important aspect of many children’s lives; and in turn, it is important that children are able to critically view Disney to have power over their own culture. CML is an important tool which is being implemented into the Ontario curriculum in order to provide children with the means necessary to understand the abundance of media which bombards them daily. CML is implemented in schools Ontario wide, but it is also important that CML is also used in the daily lives of children. The benefits of CML is that children are able to become critical viewers of media, without boycotting the media which brings them entertainment and happiness.

There are many suggestions for future directions in this research topic. There is limited research on CML and Disney that voices the opinions of children and therefore many gaps exist with the point of view from children themselves. Furthermore, the sample for this study was very limited and homogenous, so a larger and more diverse sample would be able to produce a richer discussion from different points of view. Overall, I strongly recommend that parents and/or guardians recognize the importance of CML, and understand that children’s movies are a form of entertainment which can also be very educational simply by asking questions.

Acknowledgements

I would like to extend my gratitude to my advisor Dr. Shauna Pomerantz at Brock University for her unconditional support, continued assistance, and patience. Much appreciated!

The Image of School Principals Based on the Views of Teachers in Turkey

Soner Polat^{a*}

^aKocaeli University, Faculty of Education 41380, "Kocaeli", Turkey

Abstract

The goal of the study is to exhibit and describe the image of school principals based on the views of teachers. The participants of the study are 127 teachers working in ten different state schools in Kartepe region of Kocaeli province, Turkey in the educational term of 2012-2013. In this qualitative research, the data have been obtained by means of "Survey of Metaphors attributed to School Principals". The data obtained have been analyzed and interpreted by using the content analysis method. At the end of the research, 127 different metaphors developed by primary school teachers were ascertained. 53 of these metaphors were seen to put emphasis on the positive roles of school principals while 74 of them underline the negative ones. In this regard, it is concluded that school principals own a positive image according to the views of teachers.

Keywords: School Principal, image of principals, metaphor

1. INTRODUCTION

Today people's appearances and the impressions in social life and business life have great importance. The concept of "image" which includes both these appearances and impressions are very important for both individual and organizational success. The concept of "image", which is used to express the positive and negative sides of humans, organizations, products, or services, has become a popular research topic recently.

Image is the opinions of a person on an object, organization or another person and it occurs as a result of an enlightenment process (Öneren, 2013). According to Dichter(1985) the image is positive or negative opinions about an object or an entity which occur as a result of interactions of ideas in a person's mind and they occur in a period of time. In other words the image is the association of ideas, feelings and impressions and the perception that is the result of the positive or negative evaluations of these(Örer, 2006). Firstly, the previous judgments and knowledge of people, the services received and the provided opportunities are perceived and they make up the general idea about a subject, organization or a person. This is called as "image" (Örer, 2006; Öneren, 2013).

Everyone has an image about a person working in an organization in social or business life consciously or unconsciously, and this image causes him/her to be evaluated positively or negatively (Öneren, 2013). So the concept of image is important both individually and organizationally, because to be successful, it is important to have a positive image (Özata ve Sevinç, 2009).

In literature, many types of image such as personal image, organizational image, positive image, negative image, brand image, product image, professional image, country image, perceived image, desired image, current image, transfer image are described(Özata ve Sevinç, 2009). This study focuses on "personal image". The image that occurs as a result of evaluations on a person's characteristics is considered in the personal image context(Bakan, 2004). It is possible to describe the personal image as "the impression, opinion, appearance in people's mind and they occur depending on knowledge and data which have been gained as a result of personal and environmental factors during interaction process with other person.

The struggle for creating an image has always make its presence felt in consequence of people's want to identify the perception towards themselves(Öneren, 2013). According to Ersoy (2011) the physical appearance of a person, his/her verbal and non-verbal communication, his/her character (charisma, self-confidence, self-esteem,etc.), his/her competences (his/her background, potential, personal development, experience, noticeability) affect his/her personal image.

The personal image helps the other people understand who the person is, what s/he does, how successful s/he is. The personal image comes up as a combination of self image, perceived (current) image, and desired image.(Peltekoğlu, 2001; Bakan, 2004; Örer, 2006; Ögüt, 2008). This research has aimed at the perceived image of school principals, because it has given on to teachers' image perceptions towards their principals. The perceived (current) image is how other people see the (Örer, 2006). In other words, it is described as the current image of a person, a group, an organization, a corporation, a system or a society (Peltekoğlu, 2001; Bakan, 2005; Ögüt, 2008). The desired image reflects the ideal, so it can be different from the current image. When the current image and desired image are different from each other, the person, group, organization, corporation, system or the society might need to change the meanings that it generates in others' minds (Rekom, 1997; akt: Bakan, 2004). Because of this, it is necessary to understand the current image to define the desired one. This research aims at understanding school principals' current images which is why it is important.

Another way of classifying images has been dividing them into two categories: positive or negative images and it has been decided according to the of a person, a group, an organization, a corporation, a system or a society's "created image"s' being positive or negative. Positive image defines sympathetic and positive perceptions that occur as a result of a person's intra-organization and inter-organization experiences. However, negative image defines the image which comes up in consequence of negative perceptions in people's minds depending on intra-organization and inter-organization behaviors (Peltekoğlu, 2001; Bakan, 2004; Örer, 2006;

Öğüt, 2008). This research will also try to understand whether the school principals' images are positive or negative images.

2. Methodology

In this research that has been designed with qualitative research, content analysis has been performed and the motif of phenomenologic method has been used.

A semi-structured questionnaire form has been used by the researcher in order to describe the image perception of teachers relating to the principals. In the semi-structured questionnaire forms, 4 descriptive questions which are related to gender, seniority, types of schools, and the number of the teacher at the school, and 2 metaphoric and justification questions have been asked in order to determine the image of principals. In the first question, the teachers have been asked to assimilate the principals to something, in the second question they have been asked why they have assimilated the principals to those things. The teachers have been provided with filling in the forms on electronic media by giving the link of the questionnaire form which has been prepared on electronic media to them.

In order to determine the image perception of nursery school, primary, secondary school and high school teachers related to principals, the sample has been chosen by means of maximum variation sampling method which is suitable for qualitative research methods among teachers. The purpose of the maximum variation sampling is to form a relatively micro sampling and, to reflect the variety of people who can be at the side of this problem in maximum amount (Yıldırım and Şimşek, 2008: 108). For this purpose, the variety has been taken into consideration according to the type of school and the locations of the schools. According to this, the study has been carried out on 2 nursery school teachers, 5 primary school teachers, 5 secondary school teachers and 5 high school teachers.

The diversification of the data has been preferred to increase the validity and reliability. This diversification of the data is important by means of counting participants that have different characteristics, by means of setting forth different perceptions and experiences so that multiple realities will be reached. (Yıldırım and Şimşek, 2008: 207). In this sense, in order to provide the diversity, the research has been carried out by choosing the teachers that have different characteristics (gender, seniority, class and branch) from different schools (nursery school, primary school, secondary school, high school and the spacious of the school.)

The data which have been collected on the electronic media have been analyzed with content analysis. First of all the metaphors, which the teachers have produced, have been encoded according to the qualifications of the teachers who developed that metaphor. Then the encoded metaphors have been evaluated whether it is a metaphor or not and the coherence of the developed metaphor and its explanation and the metaphors that have been developed by some of the teachers are invalid. The developed metaphors and its justifications have been put to content analysis and it has been divided into two categories as positive and negative. In order to check out the validity and reliability of the categories, 5 PHD program student have conducted the same process. For reliability, the Reliability= $\frac{\text{Agreement}}{\text{Agreement} + \text{Disagreement}} * 100$ formula has been applied on encodings that have been done by a researcher and a person other than the researcher for reliability (Miles and Huberman, 1994). The harmony between two researchers has been calculated as 79%. After reaching the result that it is valid and reliable the data have been interpreted after they have been calculated according to frequency and percentages on the electronic environment.

3. Findings and comments

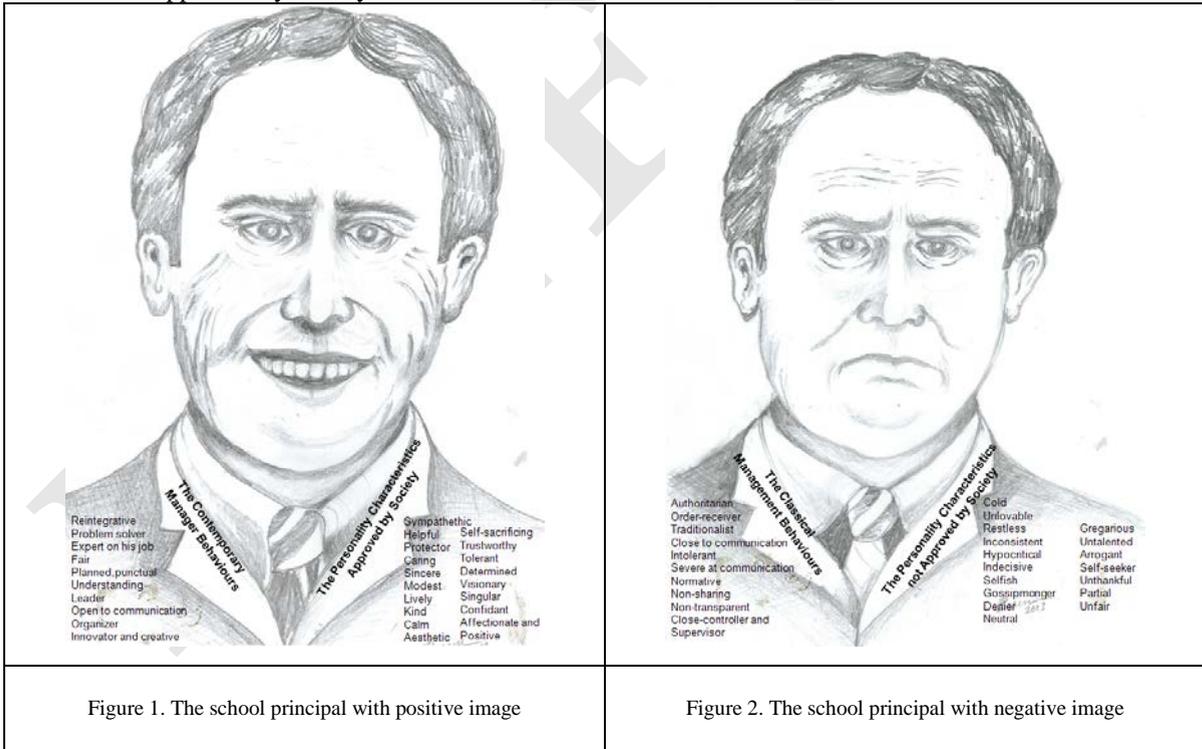

The 53 out of 127 metaphors which have been developed by the teachers have been positive, 74 metaphors out of 127 have been negative. There are 89 female teachers and 40 of them have developed positive metaphors, while 49 of them have developed negative metaphors. There are 38 male teachers and 13 of them have developed

positive metaphors, while 25 of them have developed negative metaphors. It is possible to say that the female teachers have perceived the image of school principals more positively than male teachers. The 3 kindergarten teachers have developed negative metaphors. 16 out of 41 primary school teachers have developed positive metaphors while 15 of them have developed negative metaphors. 10 high school teachers out of 21 have developed positive metaphors while 11 of them have developed negative metaphor. When examined positive and negative metaphors according to the professional seniority, there was not a significant accumulation on frequencies.

3.1. The positive image of school principals

According to teachers, most significant characteristics of school principals who have positive images are leadership, being sympathetic, helpfulness, being re-integrative, problem-solver, protector, expert, fair, caring, and sincere. The other characteristics of school principals who have positive images are being modest, lively, punctual, kind, calm, understanding, aesthetic, effective, self-sacrificing, trustworthy, tolerant, foreseeing, open to communication, determined, an organizer, singular, planned, confidant, affectionate, constructive, creative and innovative (Figure 1).

Leadership, being re-integrative, problem-solving, expertness, fairness, being planned and punctual, being understanding, effectiveness, openness to communication, being an organizer, innovativeness and creativeness are basics of the contemporary management behaviors. On the other hand, being sympathetic, helpful, protector, caring, sincere, modest, lively, kind, calm, aesthetic, self-sacrificing, trustworthy, tolerant, determined, visionary, singular, confidant, affectionate and constructive are the qualities which are approved by society and also which are seen as necessary in contemporary management theories. It has been seen that some of these positive image characteristics are about the contemporary manager behaviors, and the others are about the personality characteristics approved by society.

3.2. *The negative image of school principals*

According to teachers, most significant characteristics of school principals who have positive images are being authoritarian, order-receiver, ineffective, inconsistent, cold, unlovable, changeable, indecisive, traditionalist, and close to communication. The other characteristics of principals who have negative images are being selfish, gossipmonger, hypocritical, denier, neutral, gregarious, untalented, unfair, intolerant, arrogant, self-seeker, severe, unthankful, partial, bureaucratic, non-transparent, restless, close controller and supervisor (Figure 2).

Being authoritarian, order-receiver, traditionalist, close to communication, intolerant, severe, partial, non-transparent, close controller and supervisor are the basics of the classical management behaviors. Teachers evaluate classical management behaviors as elements of the negative image. Also being cold, unlovable and restless are characteristic features which are appropriate for classical management behavior and they are among characteristics of the negative image. In addition to them, being inconsistent, changeable, indecisive, gossipmonger, hypocritical, denier, neutral, gregarious, untalented, arrogant, self-seeker, unthankful, partial, and unfair are the personality features not approved by society. It has been seen that some of these negative image characteristics are about the classical manager behaviors, and the others are about the personality characteristics not approved by society.

4. Result, findings and suggestions

It has been found out that three fives of the metaphors which have been developed by teachers and which are about the image of school principals are negative, two fives are negative.

. It has been seen that some of the negative image characteristics of school principals are about the classical manager behaviors. At the same time, the school principals' having characteristics which are personality characteristics not approved by society is of great importance. As opposed to this, it has been seen that some of the positive image characteristics are about the contemporary manager behaviors. Also, showing behaviors approved by society is of great importance in school principals' having positive image.

This research shows the negative and positive image features of current images of school principals. Monroe (2003) claims that the school principals' positive or negative images affects his/her leadership style and shapes the school culture, so the findings of this research is important. The way the teachers perceive the school principals' images is seen as important in terms of defining the current situation and maintaining or changing this situation. In this sense, this research lights the way for principals. This research is expected to help principals' to analyze their current situation and change their image from negative to positive.

As any other research, this research has some limits. Firstly, it has been conducted by collecting the views of limited number of teachers, so the results of the research can be more reliable and generalizable with a larger sample. Secondly, it has been conducted with just teachers' view. Other researches can be done through collecting the views of supervisors, students and parents. With the help of this, more holistic image of school principals can be understood.

^bEastern Mediterranean University, Department of Educational Sciences, Gazi Mağusa, via Mersin 10 Turkey

Abstract

The exam for Admission to Higher Education (YGS) and exam for Placement for Undergraduate Studies (LYS) are required for admission to universities in Turkey. Yet teachers complain about the inconsistency between the contents of these exams and 12th-grade curricula. This qualitative study aims to analyse teachers' perceptions of the impact of these exams on the content of the science lessons. Using a stratified purposive sampling method, 30 teachers from high schools in North Cyprus were interviewed using a semi-structured interview technique. Content analysis was performed on interview data. Results revealed consistency between the contents of LYS and 12th-grade science curricula but inconsistency between the contents of YGS and 12th grade science curricula, as well as a negative effect on the content.

Keywords: external exams; curriculum; high schools; qualitative; content analysis; consistency.

1. Introduction

Every year in the Turkish Republic of Northern Cyprus (TRNC), thousands of 12th-grade students from public high schools or colleges who want to attend higher education programs in Turkey enter the initial phase of the matriculation examinations, which is the Examination for Admission to Higher Education (YGS). Those who score 140 and above take the second phase of these examinations called the Examination for Placement for Undergraduate Studies (LYS). Since these examinations provide students direct admission to higher education, they are crucial for teachers as well. Research by Fırat (2013) revealed that, for 96% of teacher-participants, these exams are crucial since students perceive their success on them as the success of the teachers. These matriculation examinations are prepared and administered by the Student Selection and Placement Centre (ÖSYM), which is affiliated with the Board of Higher Education (YÖK) in Turkey. Thus they are external examinations for teachers and students in North Cyprus. Similar to newspapers in England and Wales that publish league tables reporting examination results for each school (Golstein and Thomas, 1996), the media in North Cyprus also publish matriculation examination results and reproach the education system for Turkish Cypriot students' poor results on the YGS and LYS. Similarly, research by Kelecioğlu (2002) revealed discontent with the examination results among teachers and students in Turkey because they perceived inconsistency in the alignment of the YGS and LYS content with the content of school curricula. Kelecioğlu's research also verified nonalignment between the content of the Student Selection Examination (ÖSS) and the grade-12 curriculum.

E-mail address: hicran.firat@emu.edu.tr

Yet, in 2002 there was only one stage in the matriculation examination, and the educational system did not implement a student-centred curriculum; moreover the course books were not revised yet. In 2005, student-centred education was first introduced in the six provinces, then in the whole country and North Cyprus. In 2010 the ÖSYM again implemented a two-stage matriculation examination. In 2012 the Turkish Ministry of Education (MEB) revised all textbooks to provide a student-centred education, thus compelling a new study.

This paper concerns secondary education for ages 15–18 and its college and multi-programmed high schools (The Department of Educational Planning and Program Development-DEPPD, 2005) In colleges in North Cyprus, there are programs for those students who want to take matriculation examinations instead of International General Certificate of Secondary Education (IGCSE) examinations or Certificate of Secondary Education (GCE) advanced (A) and advanced subsidiary (AS) levels.

The first stage of the two-stage examination introduced by the ÖSYM in 2010 was called the Examination for Admission to Higher Education (YGS), and the second stage was called the Examination for Placement for Undergraduate Studies (LYS). Included in the first stage, or YGS, were sections on Turkish language, social sciences, mathematics, and sciences, for a total of 160 questions (40 questions in each section). The examination took 160 minutes. The second stage, or LYS, consisted of five tests: LYS1 (mathematics and geometry), LYS2 (sciences), LYS3 (geography 1 and Turkish language and literature), LYS4 (history, geography 2, and philosophy), and LYS5 (foreign languages) (ÖSYM, 2006). Each LYS had varied in the number of questions and duration. In LYS2, there were 90 questions, lasting 135 minutes. This study examines YGS sciences and LYS2.

This study aimed to determine how teachers perceive the effects of the YGS and LYS on the 12th-grade science curricula with respect to content, implementation, and teacher-made assessments. More particularly, the study posed the following research question: How do teachers perceive the consistency between matriculation examinations and the content of 12th-grade science curricula?

2. Method

A qualitative research paradigm was used in this study to select samples, develop data collection tools, and analyse the data. The data was used only to describe and generalize the phenomenon in North Cyprus. The population of this study was science teachers of 12th grades in the multi-programmed public high schools and colleges in North Cyprus. The population did not include science teachers in private schools, fine arts high schools, Anatolian high school, or modern vocational technical high schools. Stratified purposive sampling was used to select samples from each school (Fraenkel & Wallen, 2006; Kuzel, 1992; Miles & Huberman, 1994; Morse, 1994). Participating teachers were required to teach 12th grade and be familiar with the content of the YGS and LYS. About 35% of teachers were purposefully selected for the samples.

The study was conducted from October to May in the 2011–2012 academic year at 16 schools in 5 districts: 4 schools in the Mağusa district, 3 schools in the Güzelyurt district, 2 schools in the İskele district, 4 schools in the Lefkoşa district, and 3 schools in the Girne district. Thirty-three science teachers were selected, but only 30 teachers could be interviewed, resulting in a return rate of 91%. Among these 30 science teachers, there were 12 physics (10 males, 2 females), 9 chemistry (5 males, 4 females), and 9 biology (2 males, 7 females) teachers. Twenty-four of these teachers taught in public high schools and six of them in colleges.

Data were collected using a semi-structured interview technique (Stewart & Cash, 1985). Two semi-structured open-ended questions were prepared by the researchers and used to collect information about the

participants' perceptions of the effect of external exams on curricula. During the design phase, the interview questions were piloted with seven teachers from two different schools in two different regions. The responses of the interviewees were transcribed and analysed, and then the questions were modified to ensure consistency in responses for their reliability (Sanders, 1994, p. 153). Moreover, three field experts were consulted about the content validity of the questions (Sanders, 1994, p. 145).

Consent forms given to teachers included the aim of the study, research questions, and information about the researchers. Appointments were made one or two days before the interviews. The teachers' responses were recorded using an audio recording device to eliminate the possibility of misunderstanding or loss of data. Data were collected from one-on-one interviews at a time convenient to the participants. Interviews were carried out in the respondents' native language, Turkish.

Conventional content analysis technique was used to analyse the data (Marshall & Rossman, 2011; Miles & Huberman, 1994). Data were analysed based on the concepts driven by the semi-structured open-ended questions. These concepts comprised the codes in the analysis (Miles & Huberman, 1994, p. 56). For research findings, teacher responses from interviews were often quoted. The names of the interviewees were not used in the direct quotations; instead, code names—such as T1, T2, T3 for teachers, C for colleges, and P for public high schools—were used. In addition, the frequency and percentage of repeated comments by the teachers and students were calculated and expressed as frequencies and percentages in the data analysis.

3. Findings

Teachers were asked the following two questions:

1. What do you think about the consistency between the content of the curriculum and the content of the matriculation examinations?
2. How do you regulate the consistency between the content of the curriculum and the content of the matriculation examinations?

Content analysis was performed on the teachers' responses related to the consistency of the exams' content with that of the 12th-grade curriculum in order to answer Question 1.

Sixty-seven percent of the science teachers perceived consistency between the contents of the YGS and the 9th-, 10th-, and 11th-grade textbooks, as well as between the contents of the LYS and the 12th-grade physics, chemistry, and biology textbooks. They said that a great degree of consistency between the content of the test question and that of the textbook indicated consistency. Most of them noted a significant correspondence in content between the YGS and 9th-, 10th-, and 11th-grade science textbooks, but very little match between the YGS and 12th-grade science textbooks. They thought the content of the LYS corresponded significantly with the 12th-grade science textbooks. The following interview excerpts are examples of such opinions.

TP16: Ninety percent of YGS covers 9th-, 10th, and 11th grade topics, so it largely overlaps with them. LYS covers 12th-grade topics at the same rate. But the YGS 12, I can say that the YGS's content coverage of 12th-grade topics is very low.

TP14: Now, 9th- and 10th-grade topics are mostly in the YGS. LYS has topics of 11th and 12th grades. Because of that, in 12th grade, students forget the topics they studied in the 9th grade. That's why they

start to go to *dersane*[†], because they've already forgotten the topics studied in the 9th and 10th grades. Plus, we hardly have time for revisions. I think YGS content overlaps with 9th- and 10th-grade content, and LYS content with 11th- and 12th- grades content mostly.

On the other hand, 23% of the science teachers perceived significant inconsistency between the contents of the YGS, LYS, and the 12th-grade science textbooks. They thought that the content of the textbooks was not aligned with the contents of the tests. The test topics were from various grades and did not include a large amount of the topics in the 12th-grade textbooks, which was the reason they perceived inconsistency in the contents. Transcript excerpts elaborate on these observations:

TP12: Till two, three years ago, they were entirely consistent, corresponding to the curriculum. But the current books, they changed them, you know, these newly released books. I do not know whether you've checked their contents or not, but if you looked at the content, lots of differences occurred. These books in 12th grade are not sufficient. The books we used 2–3 years ago were much better. For me, the new books, in terms of content, are inadequate. They do not match the exams. What questions will be on the exam is another mystery.

TP4: If I'm not mistaken, this system started two or three year ago. Not improved yet. Thus, the first stage, if we consider the first stage of the exam [YGS], topics do not include the 12th-grade topics. In the second stage, there are a couple of topics from 12th grade, but not all. For example, in the book there are at least 20 topics, but they ask about only 3 of them. When you check, you see that they ask at least 10 question from the same 3 topics. However, these 10 questions can be on 10 different topics. There are also questions that are not part of the 12th-grade curriculum, so we have to review them in class. Because they were from the books of the previous years.

Ten percent of the science teachers were indecisive about whether there was consistency or inconsistency between the contents of the tests and the textbooks. They said that there was no clear distinction among the topics. According to them, some of the topics were common in all high school science textbooks. There were questions on the YGS or LYS from these topics. TP8 said,

There is such an issue, you cannot distinguish some topics as this is 10th-grade topic and this is 12th-grade topic. They are common topics. You can find them in different grades' textbooks. You have it in 9th grade and you have it in 12th-grade textbooks as well. So can we say, study this for the YGS and study this for the LYS? We can't. So we advise students to study all for both stages of the exams.

The content of the participants' responses were further analyzed to explore how teachers regulated curricula for consistency with exams and found that 7% of the science teachers said that they could not cover all the topics in the textbooks because of limited contact hours. They said that the many official holidays during the

[†] Institutions providing private education to prepare students for external examinations are called *dersane*.

academic year made for a shortage of time. Moreover, 12th-grade students are given a 30-day official leave by the MEB just before these examinations. As one teacher (TP13) noted, “We can’t finish the books. A lot of things to cover, but not enough time for all.” Another (TP3) said,

The length of academic year is not enough to cover all. We have many holidays. We have Turkish Cypriots’ holidays, we have Turkey’s holidays. In addition to this, the directorate of secondary education gives a 30-day official leave to 12th-grade students to stay at home and study for these exams. Then how can we finish the book?

Ten percent of the teachers said they follow the order in the book, never make any addition or deletion to the content, but put more emphasis on the chapters and topics that were more likely to be asked about in these exams. Eighty-three percent of the teachers said that they change the order of the chapters of the topics according to their probability of being covered in the examinations. They said that they gave priority to the topics that had a high probability and covered those first. Some said they did so upon the students’ request. When students insisted, they focused on the topic(s) asked in the previous examinations. The following teachers explain this adaptation:

TC27: There are important parts. If no question was asked from that part in the [previous] exam, students don’t study that part. There are parts I think are important, so I give priority to them. So the exams are limiting us. We focus on the topics they ask about in the exams. Students also put pressure on us. They don’t want to listen to or learn anything that is not asked in these exams. We have no other choice. To control the class, we do what they want.

TP23: We still continue with the old method. We look at the exam questions. For example, questions such as were asked last year, and accordingly we adjust our methods, accordingly we arrange the topics. So close to the time of the exam, we base our curriculum on the YGS and LYStoward the exam. We look at the questions and make our syllabus. So, for example, together with colleagues we decide which topics will be the focus, which ones will be skipped, and which ones will not be covered at all. Yet we do this every year because they can change the topics in the exams. But this rarely happens.

Another way teachers regulated the curricula was to abolish the laboratory activities of these lessons. About 94% of science teachers stated that they did not do lab work because of time constraints. Another reason teachers said they stopped including laboratory activities was the lack of laboratory materials and instruments and the bad conditions of laboratories in public high schools and colleges. Only about 6% of science teachers claimed that they do laboratory activities in public high schools, but no more than twice in an academic year. As one participant (T20) explained,

The questions on the test were not about labs. They are all about theories. Why should we do it then? We don’t have enough time during the academic year to cover all. We finish schools at noon, at one o’clock. No school in the afternoon. If we try to do labs as well, then we cannot finish the book.

Another teacher (TP21) added,

We do it but frankly we do one or two in an academic year. Why? We don't have enough materials, equipment. Most of the furniture and equipment were broken. Or you do one and all students watch. It should be hands-on, don't you agree?

4. Discussion and Conclusion

It is primarily teachers who make decisions about curricula content and the length of time to spend on that content (Porter, 2006). According to Posner (2004), several studies revealed a close connection between instruction and standardized tests (Madaus & Kellagher, 1992; Stodolsky, 1988). For that reason, teachers might be forced by the students and the parents, or feel obliged, to teach toward tests since admission to higher education depends on scores on these tests (Posner, 2004). Moreover, such a connection between testing and learning was addressed by a number of studies in the assessment literature; Alderson and Wall (1993) used the term “wash-back effect” to refer to this impact of the tests on teaching. In this study, the perceptions of science teachers revealed that external exams had this wash-back effect on teaching, as teachers said they emphasize the content likely to be covered and eliminate or skip the content that is not. Moreover, they not only adjusted accordingly the content of the instruction but also contact hours. For example, they abolished the laboratory studies of the science lessons. Mamlok-Naaman and Barnea (2012) cited a number of studies emphasizing the benefits of laboratory activities in science education, namely, “facilitating the attainment of cognitive, affective, and practical goals” (p. 49). However, the findings in this study revealed that the laboratory activities of physics, chemistry, and biology lessons were abolished. Considering the benefits mentioned by Mamlok-Naaman and Barnea, re-addition of these activities to high school and college science curricula is highly recommended. According to Posner (2004), teachers most of the time experienced the dilemma of coverage versus mastery of the contents. This study's participants mostly sacrificed mastery (as well as laboratory studies) for the coverage of content. More emphasis was placed on “knowing that” (the subject matter) instead of “knowing how” (the skills) (Ryle, 1949).

4th International Conference on New Horizons in Education

The implement of the sub-district virtue school project

Thitiphan Aunsri^{*a}, Wallapha Arirattana^b

^aGraduation School, Khon Kaen University, 40002, Thailand.

^aBan Dong Krang Noi School, Roi-Et Educational Seervice Area Office 2, 45150, Thailand

^bKhon Kaen University, Faculty of Education, 40002, Khon Kaen, Thailand

Abstract

This research is a Mixed Method Research. Its purposes are 1) to study processing condition of the The Sub-district Virtue School Project and 2) to be a guideline of the project. This study is separated into 3 parts. First part, researcher collects information about processing condition of 3 schools where 47 directors and teachers are questioned by a questionnaire. An instant application is used to analyze those results in order to explore the percentage and deviation. Next part, Semi structured interview and normal interview are used to look for the most effective school that perfectly follow the researching plan in order to improve the plan. Final part, Focus Group which takes effective schools into a meeting to share how they process in order to find the better solution is brought to analyze the qualitative information. The research findings:

1) The processing condition of The Sub-district Virtue School Project is in the “BEST” condition. Plus, when looking deeply to each area, nearly every area such as surrounding, planning and learning management is in the best condition except only behaving and processing

2) Processing guidelines of The Sub-district Virtue School Project

2.1) In planning area, the process accentuates the importance of the project in vital areas; for example, household, temple, school and local administration. It also increases more teachers and quality group to give their attention when planning the plan.

2.2) In learning management, the curriculum is improved to be more realistic and aims to learn a real-life lesson and ICT world.

2.3) Surrounding management is aimed to improve a school environment to be beautiful and safe by gathering all sources from local area by letting the director and teachers to be the first role-model.

2.4) Behaving students by using the participation of household, temple and school, teachers need to take Buddhism up to be the main part of this process.

2.5) Results of the project needs to mainly consider about the advantage and disadvantage of student, teacher, director and community.

Keywords: Implementation, The Sub-district Virtue School Project

GENERAL BACKGROUND AND PROBLEM

The Ministry of education appoints the trend of education development by focusing on student-center learning method, dissemination studying chance to rural area for offering an education to be one of the people's powers. (Bureau of Policy and Strategy, Ministry of Education, 2012) But, the report of World Bank shows that Thai education efficiency trends to be lower. Most schools are located in rural area, and having many small-side schools causes the ineffective use of country budget if considering about the result of National Test. (Office of the Basic Education Commission (OBEC), Ministry of Education, 2011) Therefore, OBEC aims to terminate the small-side schools in order to spend more budget to only one school in each district. This goal is set to achieve before 2018. (Office of the Education Council, 2011) The Sub-district Virtue School Project eventually set to develop the quality of school in district area.

Nowadays the "ONE SCHOOL ONE DISTRICT" project changes its name to Quality Sri-Tambon (virtue) School in order to add more moral and ethical activities. (OBEC, 2012) Every participating school will be given enough amount of budget to support them to be quality school which means having good lessons and activities for student and also coordinating with locals and other schools.

School management by basing on The Sub-district Virtue School Project accordingly aims to a coordinating management. (Cohen, John M. and Uphoff, Norman T, 1980) school staff and committee including every part of a community need to be united to organize teaching, lessons in order to lead them to an effective education. Thailand Productivity Institute (2007) presents a managerial guideline by using PDCA Cycle which conforms to Yoshio Kondo's theory about Demming Cycle consisting of 4 steps. (Plan, Do, Check, Action)

To sum up, researcher, one of the teacher in wannabe Quality Sri-Tambon School, is interested in studying condition and guideline of The Sub-district Virtue School Project which will lead us to a better information for planning and reaching the goal.

RESEARCH DESIGN

This research uses Mixed Method Research design. There will be a combination of quantitative and qualitative methods which will start from the quantitative one and bring that result to analyze which school to do the qualitative one consecutively. Also, qualitative method is higher priority.

RESEARCH PARTICIPANTS

Period 1 - Selected schools in the third generation of the project are under Roi-Et Education Service office, area 2. There are 3 school, 44 directors and teachers participating.

Period 2 – 15 of directors, teachers, OBEC committees, Buddhist representatives, students and parents from the most effective Nongpakkad School (made up name) are participating.

Period 3 – Directors and teachers of participated schools and practitioners from Roi-Et Education Service office, area 2 are overall 11 persons.

RESERCH INSTRUMENT

Period 1 - Questionnaire asking about processing condition of The Sub-district Virtue School Project

Period 2 – Interview record about how to process the project

Period 3 – Concept idea from face-to-face interview trying to make participants share their ideas

DATA ANALYSIS

Period 1 – Analyzed by instant computer program which calculates numbers from questionnaires – part 1 is finding percentage and frequency and part 2 is about showing \bar{X} and S.D. There are 5 levels of calculations

Period 2 – Using Analytic induction method

Period 3 – Analyzed and decode the data by qualitative research method

SUMMARY

SUMMARY – the summed up results on the research purposes are as followed

1) By PDCA, the processing condition of The Sub-district Virtue School Project is in the BEST condition following by , learning management, behaving and result.

1.1) Planning – the most effective result is that each school has an purposed strategy, and the ineffective one is the participants do not consider what it needs to the project together.

1.2) Learning management – three most effective results are Teacher Training, participants can apply their school curriculum, school supports student to study ICT and folk wisdom. Plus, the most ineffective result is supporting education by various learning innovations.

1.3) – the highest percentage result is postings and posters, porting in the school area, look beautiful and modern, and the most ineffective result is conforming learning recourse to learning lesson.

1.4) Behaving – the most effective result is the successful meeting about how to improve students behavior, and the most in effective result is rarely real-life activities.

1.5) Results – the highest percentage is students participate in improving social and environmental activities which arrange by school and community, and the lowest percentage is the number of student in school does not increase.

2) The Sub-district Virtue School Project process 2.1) Planning – School should participate Buddhist training which arranges by community or temple. Teacher should be also attend the training themselves in order to improve their vision about developing school. School should do the MOU with local district office, and after having done that school check the solution unofficially by letting experts control. 2.2) Learning Management -

School curriculum should add more real-life activity basing on each community, ICT lab and learning through Klaikangwon satellite TV. Also, those activities should start right from primary level. 2.3) Managerial Environment – With school and student participating, environment in school should be clean, beautiful and safe. Full-option learning center should be set around the place by using the budget from community. 2.4) Behaving - The goal is to plant four international goodness which are clean, nice and tidy, punctual and healthy. Plus, student should be planted three fundamental kindnesses which are self-discipline, respectful and patient by arranging a Buddhist classroom. Coordinating with parents is important to build the student inspiration. 2.5) Solution – Getting brand-new school with good and nice environment, getting brand-new teacher with modern teaching method and kindness, getting brand-new student with good kindness and having dignified community.

RESEARCH RESULTS

Research finds that The Sub-district Virtue School Project process following guideline in all areas (planning, learning management, managerial environment, behaving and solution) is in the BEST condition. The result shows that the project under OBEC conforms to the need of directors, teachers and community. In addition, the result also conforms to the study of factors reflecting school management of Patiwat Janpasit (2008). One of his quotation is “everybody wants to see their school and student reaching the word quality.”

If look deeply to each area, planning will be the most effective area, although when looking deeper to each clause, coordination between community and school staff is the most ineffective area. It is because the analyzing process has finished when planning the plan (no community in the meeting). So, the solution is the addition of revising project vision and integration. It goes the same way with an interview of a school director (2013) what quotes “revising plan and adding activities to the project are simple to do because The Sub-district Virtue School Project budget is separated to the previous project”

Learning Activity – In the whole image, the process is in the BEST condition. When looking deeply to clauses, it indicates that Learning by Innovation does not reach standard because school and OBEC only pay a lot attention to Buddhist training and ignore a learning innovation development. Teacher, so, does have various and enough skills and knowledge about a learning innovation. Like in a teacher’s interview (2013), teachers are taken to Buddhist training, but no one talks about learning activity.

Environmental Management – the whole process is in the BEST condition. When looking deeply into clause, it indicates that Learning Resource Development is not in good condition because developing the resource need school staff to run it. Also, school staff has enough busy hands because they have to response lots of work. According with a meeting interview (2013), a successful director says that in one person, there are ton of works to do, so one person responses too much works.

Behaving – The whole process in in the BEST condition. In the same time, real-life skills is not in standard because preparing student for the national test already take so much time, so there is not enough room for any other activities. Hass, Glen. (1980) says that time is one of the Learning Resource; therefore school should give time to student to learn more than anything. Learning hours should be suitable for what student study, and teacher and director needs are less priority.

Solution – the whole practice is in the BEST condition which school and community improvement activities are best participated by students because it makes them take actions. Yin Cheong Cheng. (1996) says that improving school surrounding is one factor that can show the relationship between local and school, one of

school effectiveness. Quantity and quality of people take a lot action in school activity. For example, school support an activity about increasing students' number, but the population structure is decreasing as OBEC (2010) reports that the birth rate is decreasing about 200,000 people per year.

SUGGESTIONS FOR THE STUDY

Researcher brings 5 areas of The Sub-district Virtue School Project not reaching the Conceptual framework to talk as followed

1) Planning – It shows that school staff and locals do not coordinate to each other well enough, so director should be the one who are between them and listen to all comments and ideas. At the same time, director has to consider building a shared vision.

2) Learning Activity – Learning Innovation does not reach the goal, so besides, the Buddhist training, school should develop teaching and learning ability as well.

3) Environmental Management – it does not conform to any learning skills because school staff is not enough for responding. So, OBEC should send more hands to The Sub-district Virtue School Project .

4) Behaving – It shows that real-life learning activity is the most ineffective activity because there is no enough time for all 8 subjects. So, director and teacher should adjust and apply normal knowledge into Buddhist training in the same time.

5) Solution – The number of student is not increasing because the birth rate decreases. School should look more to near villages or communities in order to really be the learning center of district.

4th International Conference on New Horizons in Education

The importance of vocabulary conceptualization in digital dictionary software development

Gamze Sarmaşık Abur^a, M. Volkan Coşkun^{b*}

^a *Assist. Prof. Dr., Department of Computer Education & Instructional Technology, Education Faculty, Muğla University, Turkey*
^b *Prof. Dr., Department of Turkish Education, Education Faculty, Muğla University, Turkey*

Abstract

While the world is becoming global, one language is rapidly spreading all over the world. Determiners of the answers to these questions will be software engineers and software specialists working on language. If the specialists working on informatics are encouraged to work on language and effective software are developed in this field, then, mastering the mother tongue will be enough to be an effective citizen in the global world. If we look through the existing software, we can see that search engines on the internet are started to be designed to translate a text written in a foreign language into one's mother tongue. Moreover, the digital dictionaries on the internet are developing rapidly. However, in these dictionaries, the main focus is on the meanings of the words. But this is not enough and works should be performed on the conceptualization of the word. It is very common in our language for words to be used with their connotative meanings. Accordingly, dictionaries should help to sort out the main and connotative meanings of the words because languages were born out of the necessities to express the existence of objects. Moreover, there are dialectical differences among the speakers of the same language. Within the same nation, the same word may convey different meanings. Overlooking the cultural differences and using general words to express objects in one language will restrict the power of the language and make the communication superficial. Yet, the software engineers and specialists who will develop such software should be knowledgeable about the characteristics of our language. Therefore, software to be developed in the field of digital dictionary preparation should be projected and encouraged. In this paper, we want to draw the attention to the importance of informing software designers who will develop dictionary software to make translation from Turkish to Turkish or to another language about the conceptual meaning of the words apart from their meanings and to the importance of supporting research into this field.

Keywords: Digital Dictionary, Computer Assisted Language Learning, Computer Based Learning

1. Introduction

This century is the age of information and communication. Easiness of having access to information and speed of information sharing has facilitated the works of researchers in conducting scientific research particularly in developing countries. Foreign language competency can be a barrier hindering researchers from enhancing their qualifications and sharing their works with the world. Development of software enabling researchers to use their mother tongue will help them to broaden their horizons and increase the number of studies. This support can be

* Corresponding author. Tel.: +90 252 2111761
E-mail address: vcoskun@mu.edu.tr

provided by software engineers who can develop a search engine, digital dictionary or translation software. But for such tools to be effective, these engineers should be knowledgeable about the features of the language.

Performing translations through general dictionaries or having a vocabulary repertoire dominated by words not conceptualized may solely serve the daily life needs; they are not much helpful in creating, developing, maturing the ideas or problem solving. Vocabulary repertoire of people is determined by the number of words they can conceptualize. Development of digital dictionaries without a conceptualized vocabulary repertoire may lead to superficiality in scientists' explaining their works and understanding other scientific studies.

2. Cognitive Evolution of Human

Historical periods are analyzed as prehistory and history. The division between these two periods is the invention of writing. The scientific evolution of human starting with the pictures they drew on the walls of caves proceeded with the invention of paper, printing press, telegraph, telephone, radio, television and finally with the invention of computer technologies in the last century. Cognitive development of human beings has come up to now with further developments such as internet, satellites, laptops, mobile phones, etc., see Fig 1 (Sarmaşık, 2012).

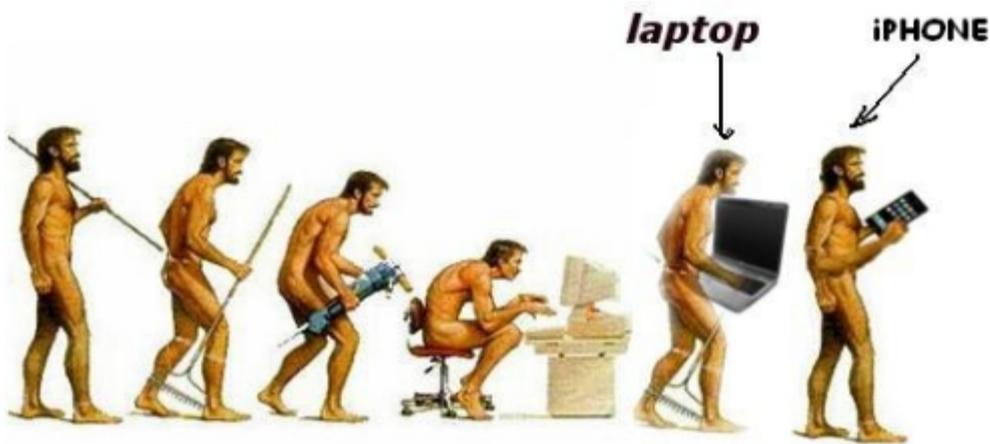

Fig. 1. cognitive evolution of human

2.1. Future of the Cognitive Evolution of Humans

The main question to be answered today is how the cognitive development of humans will go on. The new patterns and mechanisms that will emerge in future may exclude the individuals lacking the required skills or put them into position of someone not producing but consuming information (Akpınar, 2005).

2.2. Technological Developments

The computer screen will be replaced by digital glasses or lenses that have GPRS, chronometer and can take photos and record videos, see Fig 2.a & b. Such tools are already on the market.

Fig. 2. (a) digital glasses; (b) digital lenses

We can translate the texts written in our mother tongue into other languages through free digital dictionaries and search engines in internet. This may help the elimination of dependence on one language in the globalized world and in the near future, software programs that will enable us to translate spoken or written foreign languages into our language will make it possible for us to carry out spoken or written communication in any language.

3. Digital Dictionary Software and Meaning in Word

The already existing digital dictionaries mostly focus on the main meanings of words. However, words are living organisms like languages. Words may attain new meanings different from their main meanings over time.

3.1. Meaning in Word

The primary and general meaning conveyed by a word is called its real meaning. The meaning of a word given in a dictionary is usually its primary meaning. The real meaning of a word is its common meaning known by everyone. Different meanings emerging in association with the real meaning over time are called auxiliary meanings. Apart from its real meaning, a word may attain auxiliary meanings over time.

3.2. Word Conceptualization

Word conceptualization means understanding what main and auxiliary meanings of a word. "Conceptualization is related to conception and sorting out of emotional and intellectual worlds of words. Every word has its own emotional and intellectual worlds emerging from its historical evolution. Penetrating into emotional and intellectual worlds of words requires chronological and spontaneous thinking and researching. For instance: In order to conceptualize the world of 'stone', there is a need, on one hand, to set out a chronological journey in which its functions in hunting, defending, sheltering and communication are considered and on the

other hand, set out a spontaneous journey in which its functions in the fields such as art, literature, shelter, offense, transportation, secrecy should be considered (Coşkun, 2008)”

Words can have meanings on their own and may attain new meanings depending on the context in which they are used. Therefore, the digital dictionary software programs to be developed should be arranged in such a way as to include examples for their usages.

4. Result

The new generation consist of individuals not crushed under the unknown, because having access to any topic over the internet and also having the skill of using technologies better than their instructors. So instructors should redesign the education system for this new generation should be able to determine the needs of future and arouse the curiosity of researching information by making use of the opportunities of information technologies. In order to be able to supply such information systems, there is a need to make great investments in information technologies and software development issues. The present paper talks about why software engineers and specialists should be aware of the importance of word conceptualization for information technologies. In this way, software specialists should be able to develop digital dictionaries and translation software that can translate the sentence by considering the meanings of the words within their context. Hence, we need to direct software engineers and specialists towards to such projects.

4th International Conference on New Horizons in Education

The importance of etymological studies in Turkish language education: comparative study of the word “bacanak (sister in law's husband)” in Turkish dialects

Meva Apaydin^{*a}

^aBülent Ecevit University, Ahmet Erdoğan Vocational School of Health Services, Zonguldak, Turkey

Abstract

One of the issues faced through students in the Turkish Language and Literature classes in high schools is the lack of knowledge germane to the origins of words. As such, students are estranged from the meaning of words of their own languages and fall into the clutches of cultural degeneration. In the study, etymological studies are rendered in a comparative way with an eye to ensure the teachers to convey information more easily to the students thereof. Also in this study, it is aimed to increase the interest of students to their ethnic origin through inclusion of information vis a vis Turkish dialects.

Keywords: Turkish Language, Education, Etymological, Dialects.

* Corresponding author.
Email address:

1. Introduction

Kinship ties are very substantial in Turkish society. Turks, throughout the history, have underlined the importance of solidarity between relatives and reflected the most beautiful examples thereof to social life. Foregoing developments naturally affect the Turkish language and the presence of rich vocabulary incident to names of family members stand out.

Much as, many societies lack family names even for close relatives such as "grandfather" and "grandmother" Turks have given names even to family members who may be regarded as distant relatives. So much so that, it is possible to classify such names under the categories such as "lady's relatives, man's relatives and relationships arising due to marriage".

The widespread utilization of the names of family members also applies to Turkish dialects and accents. The best dialect that has protected the family names in a rich manner is Kazakh Turkish. We can easily reach the element causing foregoing richness should we consider the fact that Kazakhs are the last representatives of nomadic life style. In addition, there are also, unfortunately, some concepts we have lost under the influence of Western languages.

2. Etymological Analysis

Etymological searches of many words employed in the Turkish language have been made and substantial information has been provided to researchers in this field. I want to examine the word "bacanak (sister in law's husband)" which is a name given to some family members due to marriage.

2.1. Studies Of The Linguists

The meaning of the word "bacanak (sister in law's husband)" in *Büyük Türkçe Sözlük* (Great Turkish Dictionary) published by TDK (Turkish Language Association) is given as: 1. Each of the men whose wives are sibling, 2 Friend, crony. (TDK, 1998:190). We will focus on the first meaning in our study.

We see the word "bacanak (sister in law's husband)" in *Diwan Lugat at-Turk*, the first known dictionary of Turkish Language authored through Mahmud al-Kashgari as "namija (?)". Mahmud al-Kashgari has given the definition of this word as "woman's sister's husband, bacanak" and stated that the origin of the word is from the Chigil language. (Mahmud al-Kashgari, 2006:446-2) I have only met this word as "namija" only in *Diwan Lugat at-Turk* in the researches conducted through me. I assume that the question mark next to the word may denote that Mahmud al-Kashgari is also not sure the origin of the word.

Süer Eker has stated that presence of "n-" at the beginning of the words save question words is unusual in the Turkish language and that the word *namija* is one of the few words with "n" used at the beginning of a word in *Diwan Lugat at-Turk*. According to Clauson this word is a word from the Sogdian language due to the sound of "j". (Eker, 2009:290)

Prof. Dr. Tuncer Gülensoy has mentioned the origin of the word in his etymological dictionary styled "*Köken Bilgisi Sözlüğü* (Turkish etymology dictionary)" and included the word into Turkish language spoken in the Republic of Turkey. He also showed that + (lık) suffix could be added to the root word to use it as *bacanak+ (lık)*. The word *bacanak* is also used as *bacınak* in Anatolian dialects. Gülensoy, who has itemized the use of the word in dialects Dialects has provided theof "*bacanak*" as follows:

When we examine the foregoing etymological analysis we can see the changes in cited sounds. However, Gülensoy did not provide information as regards the function of the "NAK" suffix and evaluated the word as "*bâcı (*bâça) +nak*". Given this fact, it would be possible to consider that word the actually rooted from the word

*baça<bâca<bâcı' denoting sister and showed changes which means that "baça" is the hypothetical root of the foregoing word.

Tuncer Gülensoy itemized the use of "bacanak" in other dialects as follows:

An.ağl. : bacınak (DS. II, 458)
 Bacanağ (DAO, 55)
 Bacınak(İM.)
 Baca (Trkm.)
 Bacanak (Osm.) (> Blg.Bacanak)
 Bacanağ (Az.)
 Baca (Blk., TatK.)
 Baja (Kırg., Nog., Kklp.)
 Paca (Te.)
 Pācnak (Terc.)
 Paça (Kum.)
 Pušana (Çuv.)
 (Gülensoy 2006:100)

Furthermore, Gülensoy has indicated that the word in question is employed as badžanak in Serbian and Bulgarian; bacanağ in Kurdish, bacenax in Zazaki, bācenāk in Persian. (Gülensoy 2006:100)

Hasan Eren's has defined the word in his work styled Türk Dili Etimolojik Sözlüğü (Turkish Etymological Dictionary) as " a man's wife's sister's husband" and expressed that it is used as bacınak in dialects; and evaluated the word in the form of baca+nak and described the "-nak" suffix as diminutive suffix. He has also reported that there is great proximity in terms of meaning and a profound analogy in terms of sound between the words baca "bacanak" and bacı "sister" used in Turkish dialects. (Eren, 1991:31) Thus, we can say that Eren agrees with Tuncer Gülensoy. Hasan Eren, in addition to Gülensoy'un etymology, has described the "-nak" suffix as diminutive suffix.

Another etymological analysis belongs to Poppovskaya. Poppovskaya has reflected the analysis thereof as follows: <bacı-baca+nak. (İRLTJa 66-67). Poppovskaya desired to combine baca and bacı forms, but Sevortyan has opposed to this combination.

Sevan Nişanyan the author of Çağdaş Türkçenin Etimolojik Sözlüğü (Etymological Dictionary of Contemporary Turkish) has included the word "bacanak" in his dictionary. According to Nişanyan it is uncertain whether the word meaning "Each of the men whose wives are sibling" is Turkish:

Tur: baca / paca [XV.+ Present] (Nişanyan stated that the word belonged to the Cagatay language of the 15th century)

Sister, elder-sister - Moğ.baca.aa (The word has the same meaning in Mongolian)

Nişanyan has stated that the word relationship of bacı (sister) and the meaning of the suffix "-nak" as obscure. Nishanyan has a different opinion than Hasan Eren with this view. (Nişanyan.2002: 31)

We can see the word in question in the work styled "Halk Ağzından Derleme Sözlüğü as (Supplement Dictionary from People's Dialects in Turkey)" as follows: bacınak: Bacanak (Karahisar *Tavas- Denizli; Hamzabali *Bozdoğan- Aydın) (TDK, 2009:458)

The etymology of "bacanak" in Ötüken Türkçe Sözlük (Ötüken Turkish Dictionary) is as follows: bacı/baca (sister)> bacı-nak > baca-nak (Ötüken Turkish Dictionary, Volume.I, page.416)

In Selcuk Kırbaç and Ebubekir Sofoğlu's articles styled "Gora Dilinde Türkçe Kelimeler (Turkish words in Gora language)" it is reported that a large part of the relationship names utilized in the Gora language has passed from the Turkish language. "Badžanak" word is the equivalent of the word the word "bacanak" in the Turkish language. (Kırbaç, Sofoğlu>37)

Celal Soydan's reveals in his research article "Urdu Dilinde Akrabalık Terimleri ve Müslüman Hint Aile Yapısı (Relationship Terms in Urdu language and Formation of Muslim Indian Family)" that "bacanak" is used in the form of sârhü (r.), hamzulf (v.) in Urdu.

The word "bacanak" in Russian is used as "Svoya". If we look at the use of the word in Turkish language, we can see that the last sounds are similar. (Ministry of Culture, 1991:42)

In Rıdvan Öztürk's article named " Kıbrıs Rumcasındaki Türkçe ve Türkçe Yolu ile Girmiş Alıntı Kelimeler (Turkish words in the Cypriot Greek Language and borrowed words that have entered by the way of Turkish Language)" reports that Language for relationships in general does not reflect first degree of kinship and there are also words used symbolically. "Bacanak" is one of these words and a word that has entered Cypriot Greek Language from Turkish, and is used in the form of "pajanákhis". (Öztürk: 12)

Orhan Güdül Kutalmış and Mehran Bahari who have prepared the research article styled " Türkçe İnsan Adları ve Hayvan Kökenleri (Turkish Human and Animal Origins of Names)" have reported the word "bacanak" in a way that has not been seen until present. According to the research the meaning of the word Peçenek is as follows: 1 Pasture, 2 Bacanak. (Kutalmış, Bahari 2003:221)

In Mustafa Yağbasan's article named "Kültürlerarası Etkileşim Bağlamında Türkçe ve Yunancadaki Ortak Sözcüğünün Değerlendirilmesi (The Evaluation Of The Joint Vocabulary In Turkish And Greek In Point Of The Cross-Cultural Interaction)" it is reported that there are 5000-7000 Turkish words in Greek but no noteworthy researches have been carried out due to the negative attitudes of Greek scholars against Turks. "bacanak" which is one of these words is among naming (address) words and the use of the word in Greek is "bacanákis". (Yağbasan, 7)

A researcher named Elif Cora has given the equivalent of the word bacanak as "Silf" in her master thesis styled " Burhân-i Katı'da Yer Alan Türkçe Sözcükler ve Deyimler Dizini (Index of Turkish words and expressions in Burhan-i Kati)". Burhan-i Kati is a Persian to Persian dictionary written by Muhammed Hüseyin b. Halef et- Tebrizî. Use of the word "uht" for the word bacı meaning sister in the same dictionary makes me think if the use of the word bacanak is the same as the one in Turkish language. (Cora, 2007:24)

Fikret Yıldırım in his master's thesis named Kaşgar ve Yarkend Ağzı Sözlüğü (Dictionary of Kashgar and Yarkend dialects), has given the word bacanak as baca and defined it as a person's wife's sister's husband, bacanak. Equivalent of the word in Mongolian has also been stated as baca. (Yıldırım, 2007:97)

This word which we often use in our daily lives almost can never be seen in the periods when Ottoman Turkish was used. I screened almost two hundred works of Classical Ottoman (Divan) Literature but I did not come across this word in any one of them. Some of these works of Classical Ottoman (Divan) Literature that I screened are as follows: Adlî, Adnî, Ahmet Paşa, Ahmedî, Amrî, Antepli Aynî, Avnî, Karamanlı Aynî, Bâkî, Bâlî, Behiştî, Es'ad, Fasîhî, Fatîh, Figânî, Fuzûlî, Gârîkî, Hâlet Efendi, Hayâlî Bey, Hayretî, Hüsn ü Aşk (Şeyh Gâlib), Karamanlı Nizâmî, Lebîb, Leylâ Hanım, Leylâ ü Mecnûn (Fuzûlî), Mekkî, Mesîhî, Mihrî Hatun, Mirzazâde Sâlim, Nakşî, Nâmî, Nâşid, Nesîmî, Neşâtî, Nedîm, Necâtî Bey, Revânî, Sâkı Mustafa Dede, Sâmi, Bâhti, Süheylî, Şeyhî, Usûlî, Vâsî, Yahyâ Bey Divanı... I did not also come across this word in books like Misalli Büyük Türkçe Sözlük (The Comprehensive Turkish Dictionary with Examples), Mazmunlar (Mazmoons (topics/issues) book in the Old Turkish Literature, Ansiklopedik Divan Şiiri Sözlüğü (Encyclopedic Dictionary of Divan poetry), Yeni Tarama Sözlüğü (New Dictionary Glossary) of Turkish Language Association, Dede Korkut stories and concise glossary of Muhâkemetü'l-Lugateyn ("Judgment between the Two Languages").

2.2. The Word "Bacanak (Sister In Law's Husband)" In Contemporary Turkish Dialects

In the word seen as "bacanağ" in Azerbaijani Turkish there is the k #> g # vocalization as a common language structure of the Azerbaijani Turkish. Only in the Azerbaijani Turkish among other Turkish dialects

bacanak was used with –nak suffix. The word first was used in its first form without suffix in dialects other than Azerbaijani Turkish.

Prof. Dr. K.K. Yuhadin in his work named “Kırgız Sözlüğü (Kyrgyz Dictionary)” has reported that Kyrgyz people employ “baca”, the initial form of this word, in lieu of the word “bacanak”. (Yuhadin, 1998:76)

In Gülsine Uzun’s article styled “Common Words in Kyrgyz Turkish of East Turkestan and Mongolian -I-“, the word in question is included as baca “bacanak” and it is stated that its equivalent in Mongolian is again baca. (Uzun, 2011:5) and basing on this we can say that this word is always seen in the same manner in Kyrgyz Turkish.

The word in question is used Kumuk Turkish within the Avar language is as Baca ‘bacanak’ (Avar) < baca (Kumuk) (Tavkul, 2005:6)

In Bashkir Turkish we notice the words baja and bajay. (Ministry of Culture, 1991:42). Here we see baca> baja, c> j continuousness and “y” derivation at the end of the baca < bajay word.

Usage of the word in Tatar Turkish is similar to that of the Bashkir Turkish. Tatars also employ the word “baca”. (Ministry of Culture, 1991: 42)

The usage is as “baca” in Uighur Turkish like Tatar Turkish. In Turkmen Turkish “a”, the first is vowel is uttered in a long way: Bāca (Ministry of Culture, 1991:42)

Vowel shift is observed in Uzbek Turkish. The first vowel is in the form of á while the second vowel is in the form of ä, and an inclination towards thinning is obvious: bācä (Ministry of Culture, 1991:42)

The word “bacanak” in Kazakh is in the form of baja. In other words bac>baja change has occurred. Continuity stands out. (Bayniyazov, Bayniyazova 2009:74)

Nesrin Güllüdağ, in the doctoral thesis prepared thereby styled “Kırımçak Türkçesi Grameri (Krymchak Turkish Grammar)”, has included the word in the words used by Crimean Jews known as the Krymchaks. In this thesis we see the word Bacanak as an example of o>a change in the “Rounding of Unrounded Vowels” article. Bocana (KS)> bacanak. (Güllüdağ, 2005:134)

3. Conclusion And Evaluation

After extensive researches, I have reached the conclusion that the word “bacanak” which we use in today’s Turkish language in the meaning of “1. Each of the men whose wives are sibling, 2 Friend, crony. (TDK, 1998:190)” comes from the word, “baca” and the word, “baca” is the same word with “bacı meaning “sister in the Turkish language used in Anatolia” in our day.

4th International Conference on New Horizons in Education

The influence of the implementation of a dialectical reconstruction of knowledge teaching approach on the evolution of self-perception in mathematics of students enrolled in a primary education program.

Jean-Claude Boyer^{a,*}, Nicole Mailloux^a

^aUniversité du Québec en Outaouais, Département des sciences de l'éducation, Gatineau, Canada

Abstract

Student teachers enrolled in primary education appear to be strongly influenced by their relationship with mathematical contents and their perception about their own ability to master these contents. Like Terrier (2011), we believe that "self-perception is not fixed once and for all. It evolves by our encounters and experiences. ". In this context, we wanted to verify whether the teaching approach based on the model of dialectical reconstruction of knowledge (Boyer 2001) implemented in the mathematics' teaching courses at the Université du Québec en Outaouais could positively influence students' self-perception in mathematics. The teaching approach encourages student teachers to deconstruct and then rebuild their understanding of mathematics and mathematics teaching. To do this, we used an Osgood type questionnaire (scale of 1 to 7) with 33 pairs of adjectives taken from texts written by students describing their attitude towards mathematics. We administered the questionnaire before and after the first mathematics course and after the second mathematics course. This paper presents the results and analysis of the possible influence of the teaching approach on self-perception in mathematics implemented in the two courses in mathematics education.

Keywords: self-perception; learning; mathematics

1. Introduction

In mathematics, the concept of self influences the self-perception of the student's skills in this discipline. Self-perception in mathematics is the representation that the student has of what he can and cannot do in mathematics. The self-concept itself can be positive or negative, realistic or unrealistic (Palascio & Lafortune, 2000). The self-concept emerges from various perceptions that the individual has of himself, but also in comparison with others, in a specific situation in a given environment (Ruel, 1987). We would like to think that the dialectical reconstruction of knowledge model (Boyer, 2001; Boyer & Mailloux, 2006) implemented within the framework of the courses in mathematical didactic for primary education can positively influence the self-perception that students have of themselves in mathematics and therefore on their skills in teaching mathematics in primary education.

E-mail address: jean-claude.boyer@uqo.ca

The future teachers registered in the primary education program present major difficulties in integrating their mathematical knowledge and their didactic knowledge in teaching mathematics (Wilkins & Brand, 2004; Morin, 2003; Cavey, 2002). Several studies showed that these difficulties are related to three elements: beliefs and knowledge about the teaching and the apprenticeship of mathematics (Scott, 2005; Wilkins & Brand, 2004; Lafortune, Deaudelin, Doudin & Martin, 2003) as well as a defective basic training in mathematics (Arsenault and Voyer, 2003; Sanders & Morris, 2000; Fennema & Franke, 1992). These difficulties are not limited to Quebec universities; this observation has been made in North America and in many European countries.

We noticed that the students of the UQO are fully conscious of their difficulties when confronted with the concepts and the mathematical processes within the framework of mathematical activities illustrating what their future pupils will go through. Division by a fraction is a striking example. The majority of the students are quick to remember a procedure to be followed to divide by a fraction; one only needs to “invert the divisor and multiply”. But the majority is not able to explain the meaning of the procedure and is unable to say what the quotient represents (ERIC Digest, 2003; Hanselman, 1997). We observe an ignorance of the meaning of symbols and mathematical terms as well as a discarding of creativity, judgement and reasoning. The awakening to their gaps about the concepts and the mathematical processes causes a deep malaise in the students and this imbalance encourages them to re-examine this knowledge while calling in question the way in which they “learned them”.

Students are strongly influenced by their relationship with a-priori mathematical content, concepts and beliefs gradually built on the teaching and learning of mathematics (Holt-Raynolds, 1992; Goodman, 1988). It seems that over the years, they have built a rather negative perception of themselves in mathematics. Research shows that people with poor self-esteem rarely attend uncertain paths and engage only in known ways. This protective attitude towards self-concept limits the opportunities for learning and self-actualization. (Viau, 1995). We thought that the implementation of the teaching approach of the dialectical reconstruction of knowledge model should positively influence the self-perception of students in mathematics and improve their mathematical competency.

In this article, we will briefly present the dialectical reconstruction of knowledge model and its teaching approach, which led us to our questioning. We will then describe the self-perception in mathematics stated by future primary teachers before and after the mathematics teaching courses and finally we will analyze the results in terms of the dialectical reconstruction of knowledge model.

2. The dialectical reconstruction of knowledge model

Four principles are exploited in the teaching device: learning precedes development and consequently the learner starts with his own representations to learning; learning situations of “co-constructions” are essential therefore problem solving and group work are important in teacher training; mediation processes by the course instructor or his peers are necessary to the extent that they are located in the students’ proximal zone of development; and that consciousness of its learning by metacognition is fundamental.

The reconstruction model of knowledge illustrated in Figure 1 consists of three steps. The first is to update and clarify the experiential knowledge. It proceeds from the first principle above. The second step is one of assimilation in which the student takes over the theoretical tools needed to properly symbolize his experience. This step reflects the principles two and three. The third step is a process of integration that is to say that the student makes use of these instruments to restructure his perceptual field. We recognize here the fourth principle, the awareness of learning through metacognition (Boyer, Mailloux 2012).

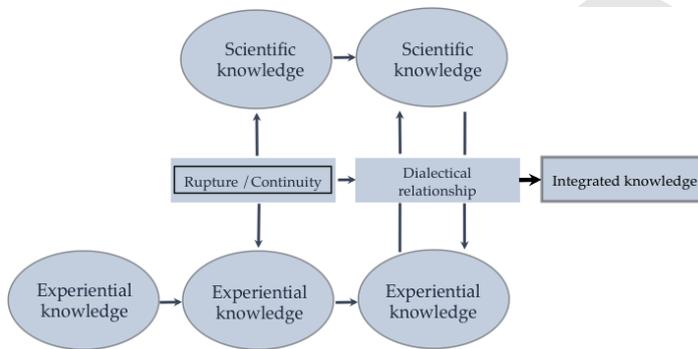

Fig. 1. The dialectical reconstruction of knowledge model (Boyer, 2001)

The teaching device must create an environment where both types of knowledge question each other. The mutual questioning must lead to an integrated knowledge, a reconstruction of knowledge. This integrated knowledge should make students more competent and should influence their perception of themselves in mathematics.

The teaching device does creates an environment where experiential knowledge and scientific knowledge are questioning each other thus leading to integrated knowledge, a reconstruction of knowledge. Learning through problem solving is at the heart of the device and becomes the thread. As shown in figure 2 the process experienced in each course consists of four phases: updating and clarifying the students experiential knowledge; placing students in real life situation by setting a problem that causes cognitive discomfort; prehension by the students of the theoretical tools necessary for the symbolization of experiential knowledge; and the restructuring of the conceptual field.

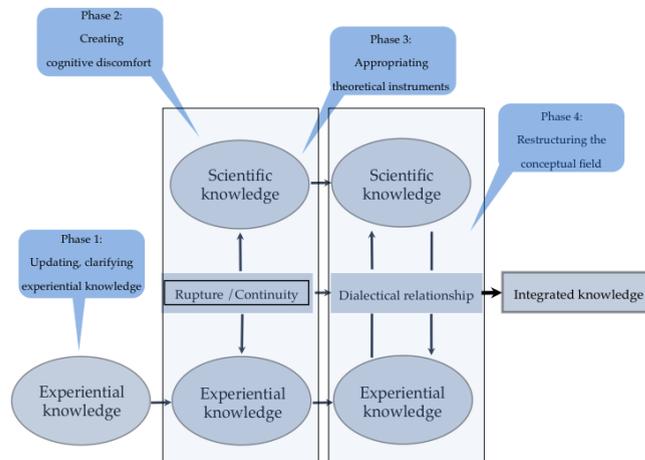

Figure 2: Links between the four phases of the teaching approach and the dialectical reconstruction of knowledge model (Boyer, Mailloux & Boyer, 2012).

In Phase 1, the updated experiential knowledge explored on a personal level and shared with fellow students allows students to become aware of their beliefs and knowledge, and those of others, on a specific educational theme. For example, the following knowledge was presented by students in a course on the process of addition: each step must clearly be explained, pupils must pay attention to the teacher's explanations, pupils must understand the meaning of the concept before learning the procedure and the teacher must proceed from simple to complex situation problems. The presentation, by some students in phase one, of these beliefs and experiential knowledge provoked socio-cognitive conflicts among several students.

In phase II, the group is placed in a didactic or an a-didactic situation (Brousseau, 1986). The didactic situation presents a teaching/learning situation where the students are asked to solve one of three types of didactical problems: situations of an organizational nature, situations involving the devolution of a concept and problems involving learning a mathematical process. The a-didactic situation is one where the course instructor plays the role of a primary school teacher and students play the role of pupils during a math lesson. Here, students try to solve the mathematical problem situation, as would pupils in a primary classroom. This second phase is crucial because this is where a socio cognitive imbalance is often experienced with a lot of intensity. The limits of experiential knowledge rapidly emerge, the need to distinguish between beliefs and scientific knowledge arises as well as the importance of understanding and implementing this “knew” knowledge in the classroom.

During the second phase, students attempt to mobilize and implement their beliefs and experiential knowledge to resolve the situation (didactic or a-didactic). They engage themselves in the situation and they continue the analysis of the situation began with the presentation by the course instructor of the problem situation through written or oral statements or by simulations. At this point associations with similar situations encountered beforehand come into play. Students often request the clarification of constraints as they try to identify relevant information. In a sense they try to determine if their beliefs and experiential knowledge are enough to solve the didactical or a-didactical situation. Students then develop an action plan that has the potential to work and how they can implement it. They must somehow make an assessment of their experiential knowledge and choose among these and scientific knowledge what will be useful in solving the problem situation.

In Phase III, students attempt to resolve the situation by implementing their plan. They can then identify and track milestones, seek and obtain additional information, make use of mathematical “manipulatives”, determine another representation of the problem, etc. They finally arrive to data processing. The theoretical tools necessary for the symbolization of their experimental knowledge are acquired by the students through specialized readings and the presentation of scientific knowledge by the course instructor. These theoretical concepts are illustrated by mathematical and didactical activities modeled by the course instructor or the students themselves. The problem situation is thus clarified and reformulated and students can generate new solutions. Part of the work is individual and the other is collective in the context of didactic exchange (sharing) led by the course instructor.

As Hart (2002) points out the more skills and concepts are complex, the more the need to observe and “experiment” them becomes necessary. Students thus have many opportunities to observe pedagogical and didactical practices and to make inferences about approaches to teaching and learning mathematics based on their classroom experiences and readings. Students are encouraged to reflect on personal and collective elements of ruptures and continuities between their experiential knowledge and their scientific knowledge.

In Phase IV, students become fully aware of what was learned. This is somehow a validation process by which they examine the appropriateness between what they wanted to do and what they actually did. The validation can lead to minor adjustments or a refusal or an acceptance of the solution. Two types of validation are considered, the validation of the resolution process and the validation of the solution.

This is accomplished by the use of a mathematical journal worked on at the end of the fourth phase (weekly). Students are asked to reflect on three questions: what are the key elements of this week's course; how do you plan to use or integrate these elements into your teaching; how will the use of your new knowledge contribute to improve the academic success of your future students? Students also write summaries of readings, personal comments and annotations. The mathematical journal allows students to list the most significant learning, new knowledge and do a reflective analysis. Subsequently, the students present and justify their processes and solutions. By participating in these discussions, students gain a clearer awareness of their learning. It is a form of assessment where they update the implications of their reconstructed knowledge in the didactic action.

The implementation of the teaching device was shown to positively influence the students' conceptions about learning and teaching mathematics to primary school children (Mailloux & Boyer, 2012). We thought that the mathematical work done by the students during classes and the conceptual work done during and between classes could influence students' self-perception in mathematics. This leads to the following research question: does the implementation of the dialectical reconstruction of knowledge model and its teaching device can positively influence students' self-perceptions in mathematics?

3. Methodology

An Osgood type questionnaire was used (scale of 1 to 7) with 33 pairs of adjectives taken from texts written by students describing their attitude towards mathematics. The questionnaire was administered before and after the first mathematics education course and after the second mathematics education course. Initially we had 48 respondents but we only analysed the answers of the 13 students who completed the three questionnaires.

4. Results

To compile and analyse the results, we grouped the pairs of adjectives under five themes: methods of work, attitude, motivation, affect, and competence. We calculated the average (minimum 1 up to 7) obtained for each of

the adjective pairs at each step: before the first course (A), after the first course (B) and after the second course (C). To facilitate the reader's understanding, the tabulated results show the pairs of adjectives always in the same order, the negative adjective first. However, the questionnaires completed by the students presented the pairs of adjectives in different orders to prevent them from repeatedly choosing the same value.

Table 1 shows the self-perception of the students regarding their working methods before (A) and after (B) the first course and after the second course (C). The students seem to have a positive perception of their working methods but see themselves as rather passive. We note that the pair of adjectives that gets the lowest score in each of the steps is that concerning competitiveness. It seems that students tend towards a more cooperative working method by the end of the two courses, an approach strongly advocated by the learning device they experienced.

Table 1. Self-perception of the students regarding their working methods

Statements	A	B	C
Neglecting/conscientious	5,23	6,23	5,85
Undisciplined/disciplined	5,62	6,08	6,00
Lazy/worker	5,69	6,08	5,92
Inconstant/perseverant	5,69	5,92	5,77
Passive/active	5,08	5,00	4,92
Cheater/honest	5,23	6,62	6,62
Straggler/assiduous (school work)	5,62	6,31	6,31
Disordered/ordered	5,69	5,92	5,54
Lax/perfectionist	5,69	5,77	5,77
Careless/applied	5,08	6,00	5,85
Competitive/non-competitive	5,23	4,77	4,54
Averages	5,57	5,58	5,74

Table 2 shows student attitude towards mathematics. We can see that their attitude towards mathematics is rather positive but they perceive themselves as not participating much in mathematical activities and as being much less attentive after two courses in teaching mathematics. These results are disturbing by the fact that active participation and attentiveness are strongly encouraged during classes. On the other hand they perceive themselves as being serious and “present” while doing mathematics.

Table 2: self-perception of the students' attitude towards mathematics

Statements	A	B	C
Absent/present	5,54	6,23	6,15
Distracted/attentive	5,08	5,15	4,69
Mute/participant	5,31	4,92	4,77
Non studious/studious	5,85	5,54	5,38
Light/serious	5,77	5,54	5,62
Averages	5,51	5,48	5,32

Table 3 shows that students do not seem enthusiastic when it comes to mathematics. Their interest in mathematics increases while their self-perception of being ambitious and encouraged in mathematics increases slightly. Except for the fact that they see themselves forced or compelled to do math, they maintain their motivation after two courses of mathematics education.

Table 3: self-perception of the students' motivation towards mathematics

Statements	A	B	C
Disinterested/interested	4,77	5,46	5,46
Bored/interested	4,69	5,38	5,23
Disgusted/enthusiastic	4,23	4,85	4,77
Bound/free	5,31	4,77	4,85
Discouraged/encouraged	4,62	5,08	4,77
Unambitious/ambitious	5,62	5,69	5,77
Unmotivated/motivated	5,08	5,46	5,15
Averages	4,62	5,08	4,77

Table 4 shows that students do not feel very secured or able when it comes to mathematics. The teaching device does not seem to create an environment that increases the students' sense of "security" in mathematics. Students' perception of being valorised in mathematics increases while their perception of being revolted diminishes slightly.

Table 4: self-perception of the student's affect

Statements	A	B	C
Disgusted/attracted	4,62	4,69	5,23
Lost/able	5,00	4,85	4,77
Insecure/secure	4,31	4,23	4,46
Revolted/conformist	5,08	5,38	5,38
Devalorized/valorized	4,62	5,00	5,15
Defeatist/optimist	5,00	5,85	5,00
Averages	4,77	5,00	5,00

Table 5 shows that students do not perceive themselves very competent in mathematics and they see themselves less competent after two courses in mathematics teaching. The results show an increase in the students' perception of competence after the first course and that they feel less competent after the second course.

Table 5: self-perception of the student's competence

Statements	A	B	C
« Dumb »/clever	4,38	4,69	4,00
Incapable/capable	5,46	5,54	5,31
Unsatisfied/satisfied	5,00	5,46	4,85
Saphead/bright	5,23	5,31	5,00
Averages	5,02	5,25	4,79

5. Discussion

The implementation of the reconstruction of knowledge model contributes in developing more complex beliefs about the teaching and learning of mathematics. As we said earlier, students seem to have a positive perception of their working methods but see themselves as rather passive. The pair of adjectives (statements) that gets the lowest score in each of the steps is that concerning competitiveness. The social constructivist approach can explain this situation since we encourage cooperation.

The results shows that students' attitude towards mathematics is rather positive but that they do not participate much and that they are much less attentive after two courses. Even if the students do not seem enthusiastic when it comes to mathematics, except for the fact that they see themselves obligated to do mathematics, they seem more motivated after two courses of mathematics education. We probably can say that living the reconstruction of knowledge model through the four phases teaching approach helped improve their motivation by giving them the opportunity to address the scientific knowledge in the field of learning and teaching mathematics with

personal reflections. Students seem to develop a creative power in the construction of new didactical knowledge in mathematics.

Students do not feel secure when it comes to mathematics; they perceive themselves as being overwhelmed even after two courses in mathematic education. We must say that we probably have to take into account the teaching internship that immediately follows the second course and its potential influence that can destabilize students who's integrated knowledge is still fragile after two courses.

The difference in self-perception in mathematics from the beginning of the first course to the end of the second course is not very significant. However, reading the results, one can say that after two courses of mathematics education students seem to think they have better working methods, they are more motivated and valued in mathematics. They never the less have a less positive attitude towards mathematics and they feel less competent. It seems that the reconstruction of their knowledge in mathematics undermines their sense of competence even if they perceive themselves as having better working methods. The model for the reconstruction of knowledge allows students to approach the content of the scientific knowledge with a clearer awareness of what they know as they consider themselves as subjects in their own right in the act of knowing.

The most negatively perceived questionnaire statement at each of three steps point brings us to say that the students seem to perceive themselves to be less competitive and to participate less in mathematical activities. They consider themselves more enthusiastic and strong after the first course but less so after the second course. Cognitive discomfort of the second phase of the device could explain that students feel less "secure" after the first course.

We can observe the greatest positive difference for the following questionnaire statements: conscientious, interested, encouraged, valued and attracted by mathematics. It seems that the implementation of the reconstruction of knowledge model and its teaching device contributes in developing in students more complex beliefs (the experimental knowledge) about the teaching and learning of mathematics (Boyer, Mailloux, 2012). The implementation of the model may have contributed, albeit modestly, to positively change the perception that students have of themselves in mathematics.

6. Conclusion

We thought that the implementation of the teaching approach of the dialectical reconstruction of knowledge model could positively influence students' self-perception in mathematics and improve their mathematical competency. The data shows little difference in students' self-perception in mathematics and there is no evidence that the teaching approach improves students' mathematical skills. Self-perception in mathematics is rather positive (average of 5,20 on a scale of 7, which is 74%) before the first mathematics education course, is more positive after the first course (average of 5,45 or nearly 78%) and returns to an average of 76% after the second course. This seems to confirm the pertinence of our research problem, namely that self-perceptions of students on learning and teaching mathematics are well established at the beginning of teacher training and that these self-perceptions seem particularly difficult to change.

Although our data show little change in students' self-perceptions towards mathematics, our preliminary results seem to show that self-perception is not fixed once and for all. It can slowly evolve through our encounters and experiences. The analysis of students' mathematical journals suggests that interventions based on the reconstruction of knowledge model may have the potential to positively influence the perception students have of themselves in mathematics. This leads us to further investigate how the use of the mathematical journal can influence self-perceptions in mathematics of future primary teachers.

The influence of secondary education entrance examinations practiced in Turkey (the placement test, sbs) on the students' social life

Kerim Karabacak*

**Sakarya University Faculty of Education, Sakarya, Turkey*

Abstract

This study, between the years 2008-2011, was carried out to find out the effects of the Placement Tests on the students' social life. The Placement Test is conducted with the aim of determining which secondary school the students will continue for their education in Turkey. The universe of the research that was performed in the screening model is composed of the 6th, 7th, 8th grade primary school students in the province of Sakarya, Turkey. The sample determined according to the method of purposive sampling, consisting of a total of 951 students; 684 of them attending state school, and 267 of them attending private school. "Student placement test questionnaire" was used for data collection. After being transferred the collected data to the SPSS programme, descriptive statistics (Average frequency distributions) were analyzed by using "t-test" whether there are differences of opinion between the averages of only one independent variable, to dependent variable in two groups. According to the obtained findings, it is concluded that due to the preparations for the Placement Test, students spend most of their time in triangle of courses, school and tutoring, so they can no longer spend time for their interests, needs, and hobbies, doing sports, social and cultural activities, and they are able to spend very little time with their families.

Keywords: Exams, the Placement Tests, The effects of test to the students' life.

1.Introduction

In Turkey, since 2004 the new curriculums that were implemented in steps, adopted the understanding of student-centered education as constructivist, multiple intelligences, Project-based learning. This condition brought many changes according to the curriculums that are dominated by behavioral learning theories regarding the dimensions of objectives, content, level of education and assessment. Thus, the perspective has changed too, on the evaluation of knowledge acquired in the line with modern approaches.

Assessment and evaluation based on the traditional teaching intended to assess the information and encourages memorization. In the modern approach, assessment is a tool that supports learning. It reveals not only what the student knows, but also what could achieve and what is ready to achieve. However, since 1970s; schools, colleges, secondary schools in Turkey, have become the institutions that prepare students to the universities. System that is not educational but selective and sifting, moved the test anxiety

*Kerim KARABACAK
e-mail: kerimk@sakarya.edu.tr

to the under aged students, consequently in the past 30 years, our youth that we grew up without living their childhood, was accustomed to see the answers to all the problems faced, in the responses to the questions with 4-5 options.

According to Turgut (1992) exams are the assessment of situations that have been prepared to the aim of observe and conclude the students' behaviors. According to the objectives of your usage, the exams can be classified as selection, competition, qualification, classification, screening. However, its results are not evaluated alone. In fact, the Placement Test is one of the elements of the system. Therefore, it is taken up in an evaluation system "Transition to Secondary Education System" (OGS) that is containing the other elements in the placement of a student in secondary education. OGS is a system covering the principles that determine in which secondary education institution students will continue. In this system, some elements are located like Placement Test (SBS), Year-end Overall Score (OYP), Behavior Score (DP), Class Score (SP), Secondary Education Placement Score (SBSP). For this reason, in order to explain the system strictly, description of each component and relationship with one another was revealed. The Placement Test is on the basis of the system. Transition to Secondary Education System which was started to be implemented in the academic year of 2007-2008 and ended in the academic year of 2011-2012, was developed with the aim of the need for training qualified people; as a result of rapid changes, developments in science and technology. This system is the continuation of the process of harmonization of training programmes that changes gradually, rather than just a test, since 2004.

The Placement Test is a central examination which is implemented at the 6th 7th and 8th grades of primary schools at the end of school year. The test includes the compulsory courses except from Visual Arts, Technology and Design, Music, Physical Education, Counseling and Social Activities (MEB, 2007). In other words, the Placement Test is an exam applied at the end of school year by Ministry of National Education (MEB) with the aim of determining the level of achievement in the courses named Turkish Language, Mathematics, Science and Technology, Social Sciences and Foreign Language. In the Placement Test, questions are posed to the students based on the curriculum which is implemented through the school year. Those questions are asked from the courses named Turkish Language, Mathematics, Science, Social Sciences (Social Sciences, Atatürk's Principles and History of Turkish Revolution, Religious Culture and Ethics). The number of questions that are asked in the exam differs for each class. The questions are prepared by considering the achievements that are planned to have the students in that school year. Those questions are arranged in the quality of measuring the proficiency of student's interpretation, analyzing, critical thinking, prediction, problem solving and so on. Each course possesses weight coefficient to use in calculating the weighted standard score (MEB, 2007). The Placement Test is not a compulsory exam that every student studying in a primary school should attend. However, as it is an exam determining which secondary school the student will attend; it is considered as an important exam by the society.

It has been revealed by the researchers that selection and placement tests such as the Placement Test psychologically cause crucial problems such as "stress" and "anxiety" on students. However, the issue that should not be ignored is the Placement Test's influence on the social life of students. This influence on the social life will indirectly affect the psychology of the student as well. According to Hoffer (1980), training a person in philosophical basis means educating that person. To train means understanding the reasoning of the area of study. Also, there will not be any decision-making process in an area that is not reasonable. This is the principle that determines the existence of a human being. Education is efficient as long as it develops and increases the psycho-social side of a person. It is also effective as long as it

increases the human quality of an individual. It includes all the influences that are exposed in every moment of life and it creates more or less some psycho-social and even bio-physical changes in the human being. As a result, education is a tool to make an individual healthy in body and soul, successful, and happy (Yılman, 1994). It is quite important to allow time for the activities that are suitable for a student's age, his/her interests and needs and hobbies of himself/herself in order for them to be happy.

According to Kurtkan (1987), it has been a must for those who really deserve to be trained in further education due to the increase in demand. For this reason, competitive examinations for the entry to the universities were primarily started to be applied. In the long run, as a result of the increase in demand for the high schools giving intensive courses that are effective in entering a university, examinations to enter high schools were started to be applied. In that sense, the families who would like their children to be trained up to the highest possible level of education, started to invest on the education. The families mobilize all their sources in order to increase their children's level of education. In addition, they started to get their children to tutor in order to increase their level of knowledge on the courses that are tested in the exam. These are the courses that the children are less proficient. As a result of the increasing demand on the private tuitions, private teaching institutions, which are discussed continuously in Turkish Education System, occurred (Coşkun, 2005). Private teaching institutions giving courses related to some art activities in the beginning, started to act as private institutions giving additional courses after the legal regulations and with the spread of central exams they became institutions preparing students for those exams (Temel, 2002). The examination system caused the increase in demand on the private teaching institutions (Yıldız, 2005) and as a result, private teaching institutions gained an important place in the social structure. According to Eşme (2002) who defines Turkish Education System as old-fashioned due to being based on exams, most parents became a part of this education system instead of reforming the system. Because families have achievement expectations from their children in exams like the Placement Test, their attitudes and behaviors towards their children lead to a pressure on the children and started to increase exam anxiety. According to Eşme (2002), high school and university entrance exams which occurred especially in the last thirty years have brought about significant changes in the teaching profession. With the entrance of these exams into Turkish Education System, the teachers became a part of the examination system and that system made them individuals who prepare students for the exams. In this regard, teachers put the courses such as Art, Music and Physical Education which specifically develop students' emotional intelligence into the background, and then they started to struggle for completing the existing training programs and educate students with rote-learning approach.

Because the Placement Test has begun to be implemented since 2007-2008 school year in Turkey, there has not been much research on it. There are some studies related to university entrance exam and secondary education entrance exam practiced with different names in the previous years. However, there are many investigations about the influence of exams on students' psychology (Aslan, 2005; Baltaş, 1999; Başarır, 1990; Çavuşoğlu, 1993; Duman, 2008; Erkan 1991; Gökçedağ, 2001; Kaya, 1997; Kayapınar, 2006; Keskin, 2001; Olgun, 1998; Yıldırım, 2004). It has been observed that a huge number of these studies focus on exam anxiety. There are some studies about the influence of anxiety on students' success on exams which are conducted by Munz and Smouse (1968), Wine (1971), Önler (1972), Başarır (1990), Erkan (1991), Gülen (1993), Keskin (2001), Kabalıcı (2008). According to Alpert and Haber (1960) who were the pioneers of examining the impact of exam anxiety on individuals' success, there is a difference between those feeling high level of pressure for the exam and those who feel lower level of pressure with regard to the performance that they presented in the exams. According to the authors, the individuals under high pressure are less successful than those who are under low pressure. Besides, Munz and

Smouse (1968) support this view. Moreover, according to Wine (1971), individuals having low level of exam anxiety achieve more success than those possessing high level of exam anxiety. The common point in those studies is the fact that every individual has anxiety because of the exams and the level of anxiety affects the individuals' achievement in exams. According to Kayapınar (2006) who revealed the influence of exams on students' social life, anxiety level of the students who do sport regularly is significantly lower than the others. At this point, it should not be underestimated that participating in social and cultural activities, spending time with their family and friends, and allowing time for themselves and hobbies will provide lower level of anxiety for the students. All these activities take part in students' social life. However, even though the investigations focus on the psychological effects of the exams, it can be claimed that there is a scarce of research on the sociological and economical influences of the exams. For this reason, the present study has centered on the influence of the exams such as the Placement Test on the students' participation in sport, social and cultural activities. With this aim in mind, answers for the following question and sub-questions have been searched in this study.

1.1. Problem

Is there any influence of the Placement Test (SBS) on the social life of the students?

1.1.1. Sub-problems

1. What are the students' views on the influence of the Placement Tests on their social life?
2. Is there any difference on students' views about the influence of the Placement Test on their social life with respect to some variables (gender, type of school, the number of attendance in Placement Test, to attend private teaching institution)?

1.2. The Significance of the Study

This study is significant in terms of revealing whether the students allow time for the common needs of their age and themselves because of the fact that they are always in hustle and bustle from exam to exam, from school to private teaching, from private teaching to school, from private teaching to private tutorials, from private tutorials to another private tutorial.

1.3. Assumptions and Limitations

Students are considered to have responded the questions in a sincere manner. The study is limited to the students who are trained in 6th 7th and 8th grades in the Sakarya province of Turkey.

2. Research Method

The study was carried out in "General Screening" model.

2.1. Participants

The population of the research includes 6th 7th and 8th grade students at primary schools of Sakarya. Among the students, 14.392 of them were at 6th grade, 14.278 of them were at 7th grade and 14.121 of them were at 8th grade. The sampling of the study includes sixth, seventh and eight grade students who

study at a state and private school in the province of Sakarya, a state and private school in Serdivan district and a state school in Arifiye district. The sampling was determined according to purposive sampling. Among the students in the sampling, 1871 of them study at a state school and 367 of them study at a private school.

2.2.Measures

“The Placement Test Student Scale” developed by Karabacak (2010) was used in the current study. The Cronbach alpha value of the scale is “0.928”. In the validity study for the factor named “The Influence of The Placement Test on The Social Life”, “the value of measuring the adequacy of the sample” is “0.793” and the correlation value between the number of sampling and the number of items in the sampling is “ $p=0.00<0.05$ ”. Besides, the scale measures 54.10% of the quality that is aimed to be measured in the factor named “The Influence of The Placement Test on The Social Life” (Karabacak, 2010).

2.3.Procedure and Data Analysis

The data was collected through the implementation of surveys by the researcher. The researcher visited the schools that were noted in the sampling at different times. The analysis of the data was transmitted to SPSS 15 software program in a computer. Descriptive statistics (mean and frequency distribution) for the data was applied. Additionally, “independent Sample t-test” was used in order to determine the difference between the mean score of the two groups.

3. Findings

951 students participated in the survey, 28.1% of them were studying at private schools, 71.9% of them were studying in state schools. 50.9% of them were female, 48.9% of them were male. Among the students, 40.9% of them were at 6th grade, 39.1% of them were at 7th grade, and 20% of them were at 8th grade. While 65.2% of the students attended in private teaching institution, 34.8% of them did not attend any private teaching institution.

3.1. Students’ views on the impact of Placement Test on their social life

Table 1. Frequencies for the students’ views on the impact of Placement Test on their social life

Dependent Variables		1*	2	3	4	5	Total
I can have time for myself while preparing for the Placement Test	f	258	193	193	127	168	939
	%	27.5	20.6	20.6	13.5	17.9	100
I can have enough time for doing sport while preparing for the Placement Test	f	336	192	188	91	123	930
	%	36.1	20.6	20.2	9.8	13.2	100
I can have time for the social and cultural activities while	f	293	242	175	106	112	928

preparing for the Placement Test	%	31.6	26.1	18.9	11.4	12.1	100
We can go somewhere as a family on holidays while I prepare	f	324	180	160	111	158	933
for the Placement Test	%	34.7	19.3	17.1	11.9	16.9	100

*1=Completely Disagree, 2= Less Agree, 3= Agree on average, 4= Much Agree, 5= Always/Certainly Agree

1. Findings for the item named "I can have time for myself while preparing for the Placement Test."

When Table 1 is examined for the students' level of agreement on the item "I can have time for myself while preparing for the Placement Test", it has been found out that 17.9% certainly agree, 13.5% much agree, 20.6% of them agree on average, 20.6% of them less agree on the item. Also, it has been determined that 27.5% of the students thought that they certainly cannot spare time for themselves while preparing for the Placement Test. These findings indicate that the students, who will enter the Placement Test, have an intensive study program. In other words, students can spare time neither for themselves nor for their needs and interests as they prepare for the Placement Test.

2. Findings for the item named "I can have enough time for doing sport while preparing for the Placement Test"

For the item "I can have enough time for doing sport while preparing for the Placement Test", it has been revealed that 13.2% of the students certainly agree, and 9.8% of them much agree on this view. It has been confirmed that while 36.1% of the students certainly disagree, 20.6% of them less agree on this item. According to the findings, 56.7% of the students cannot have enough time for doing sport. It is considerably difficult for these students to have time for sport activities as they are busy with preparing for the exam intensively.

3. Findings for the item named "I can have time for the social and cultural activities while preparing for the Placement Test"

When the students' answers for the item "I can have time for the social and cultural activities while preparing for the Placement Test" is examined in Table 1, it has been verified that 12.1% of them certainly agree, 11.4% of them much agree, 18.9% of them agree on average. 26.1% of the students less agree, 31.6% of them completely disagree on the item named "I can have time for the social and cultural activities while preparing for the Placement Test".

4. Findings for the item named "We can go somewhere as a family on holidays while I prepare for the Placement Test"

According to table 1, 16.9% of the students certainly agree, 11.9% of them much agree, 17.1% agree on average, 19.3% less agree on the item "We can go somewhere as a family on holidays while I prepare for the Placement Test". It has also been confirmed that the percentage of the students who completely disagree on the item "We can go somewhere as a family on holidays while I prepare for the Placement Test" was 34.7.

3.2. Students' Views on The Impact of The Placement Test on Their Social Life With Respect to Some Variables

1. For Gender:

Table 2. T-Test results for the students' views on the impact of the Placement Test on their social life according to gender

		N	X	ss	t	sd	p
I can have time for myself while preparing for the Placement Test	Female	479	2.70	1.41	.820	934	.412
	Male	451	2.78	1.48			
I can have enough time for doing sport while preparing for the Placement Test	Female	474	2.26	1.34	3.737	925	.000*
	Male	453	2.60	1.44			
I can have time for the social and cultural activities while preparing for the Placement Test	Female	475	2.45	1.36	.281	923	.779
	Male	450	2.48	1.35			
We can go somewhere as a family on holidays while I prepare for the Placement Test	Female	478	2.65	1.49	1.600	928	.110
	Male	452	2.49	1.46			

* $p < 0.05$

According to t-test results presented in Table 2, there is not any significant difference for gender with respect to the items "I can have time for myself while preparing for the Placement Test", "I can have time for the social and cultural activities while preparing for the Placement Test", and "We can go somewhere as a family on holidays while I prepare for the Placement Test" ($p < 0.05$). However, t-test results for gender for the item "I can have enough time for doing sport while preparing for the Placement Test" confirmed $p = 0.00$ value, so considerably significant differences were revealed with respect to $p < 0.05$. When the same table is examined, the mean score for the female students who answered the item "I can have enough time for doing sport while preparing for the Placement Test" was " $X = 2.26$ " and it was " $X = 2.60$ " for the male students. These findings indicate that female students spare less time for the sporting activities while they prepare for the Placement Test than the males. No significant differences were found for gender with respect to the items "I can have time for myself while preparing for the Placement Test", "I can have time for the social and cultural activities while preparing for the Placement Test", and "we can go somewhere as a family on holidays while I prepare for the Placement Test".

2. For Type of School:

Table 3. T-Test results for the students' views on the impact of the Placement Test on their social life according to type of school

		N	X	ss	t	sd	p
I can have time for myself while preparing for the Placement Test	State	679	2.98	1.44	8.640	937	.000*
	Private	260	2.10	1.27			
I can have enough time for doing sport while preparing for	State	670	2.62	1.43	6.657	928	.000*

the Placement Test	Private	260	1.95	1.19			
I can have time for the social and cultural activities while preparing for the Placement Test	State	670	2.64	1.37	6.383	926	.000*
	Private	258	2.02	1.20			
We can go somewhere as a family on holidays while I prepare for the Placement Test	State	676	2.68	1.51	3.863	931	.000*
	Private	257	2.27	1.36			

*p<0.05

According to t-test results that were performed for the students' answers for the item "I can have time for myself while preparing for the Placement Test" with respect to type of school in table 3, it can be seen that " $p=0.00<0.05$ ". According to these findings, it can be stated that there is considerably significant difference between the students studying at state schools and those who study at private schools. When the mean scores of the two groups with respect to their answers for that item according to the type of school that they study are examined in the same table, the mean score for the state school students was " $X=2.98$ ", and the mean score for the private school students was " $X=2.10$ ". These findings indicate that private school students can have less time for themselves than the state school students while they prepare for the Placement Test. However, while the expected result is the opposite of this finding, it is surprising that private school students can spare less time for themselves. On the other hand, it should be born into mind that the private school students' attendance to classes for full-time may have caused such finding.

As is seen in Table 3, " $p=0.00$ " value was found for the t-test results performed for the item "I can have enough time for doing sport while preparing for the Placement Test" as a result of analyzing students' answers according to the type of school that they study. Based on this value, it has been confirmed that there is considerably significant difference between the private school students' views and the state school students' views in terms of $p<0.05$ value. While the mean score for the state school students' answers was " $X=2.62$ ", the mean score for the private school students was " $X=1.95$ " in the same table. The difference between the two groups' mean score was " 0.67 ". Based on these findings it may be easily claimed that state school students can spare more time for doing sport than the private school students while they prepare for the Placement Test. However, such result may occur due possibly to the private schools' additional programs for the Placement Test preparation. Nevertheless, according to Sullivan (2002) additional programs cause increase in burden and so sporting activities become more crucial for the emotional health.

As is seen in table 3, results of the "t-test" conducted for the students' answers for "I can have time for the social and cultural activities while preparing for the Placement Test" according to the type of school confirmed " $p=0.000$ " value. This data indicate considerably significant differences with respect to the views of the students. While the mean score of the state school students' answers for the item "I can have time for the social and cultural activities while preparing for the Placement Test" was " $X=2.64$ ", the mean score for the private school students was " $X=2.02$ ". When the mean scores of both groups are examined, it can be possible to express that private school students can spare less time for the social and cultural activities than the state school students while they prepare for the Placement Test.

According to the type of school, " $p=0.000<0.05$ " value was revealed with respect to the results of the "t-test" conducted for the students' answers for the item "we can go somewhere as a family on holidays

while I prepare for the Placement Test” can be seen in table 3. When the table is examined, the mean score for the state school students was “ $X=2.68$ ”, the mean score for the private school students was “ $X=2.27$ ”. Based on these findings, private school students can go out with their families on holidays less than the state school students.

3. For Number of Taking the Placement Test:

Table 4. T-Test results for the students’ views on the impact of the Placement Test on their social life according to the number of taking the Placement Test

		N	X	ss	t	sd	p
I can have time for myself while preparing for the Placement Test	First	399	3.00	1.45	4.900	931	.000*
	Second	534	2.54	1.41			
I can have enough time for doing sport while preparing for the Placement Test	First	394	2.74	1.45	5.849	922	.000*

I can have time for the social and cultural activities while preparing for the Placement Test	First	393	2.68	1.39	4.362	920	.000*
	Second	529	2.29	1.30			
We can go somewhere as a family on holidays while I prepare for the Placement Test	First	395	2.68	1.49	1.993	925	.047*
	Second	532	2.48	1.47			

* $p<0.05$

According to the results of the “t-test” conducted for the students’ answers on “I can have time for myself while preparing for the Placement Test” with respect to the number of taking the Placement Test in Table 4, “ $p=0.000<0.05$ ” was found. Based on this finding, there is a significant difference between the views of those who will take the Placement Test for the first time and those who will enter for the second. With regard to the item “I can have time for myself while preparing for the Placement Test” answered by 933 students in total, the mean score for the students who will enter the Placement Test for the first time was “ $X=3.00$ ”, the mean score for those who will take the exam for the second time was “ $X=2.54$ ”. According to these findings, while preparing for the Placement Test the students who will enter the Placement Test for the second time spare less time for themselves than those who will take the exam for the first time.

As is seen in table 4, “t-test” was performed for the students’ answers on the item “I can have enough time for doing sport while preparing for the Placement Test” with respect to the number of taking the Placement Test. According to the results of the t-test, “ $p=0.000<0.05$ ” value was obtained. In accordance with these values, there is significant difference between the views of those who will take the Placement Test for the first time and those who will enter for the second. While the mean score for 394 students who will enter the Placement Test for the first time was “ $X=2.74$ ”, the mean score for 530 students taking the exam for the second time was “ $X=2.20$ ”. The findings obtained reveal that the students who will take the

exam for the first time spend more time for doing sport while they prepare for the Placement Test. The basic reason for that may be the students' experiences on the Placement Test.

With respect to the number of taking the Placement Test, "t-test" was performed for the students' answers on the item "I can have time for the social and cultural activities while preparing for the Placement Test", the results obtained " $p=0.000<0.05$ ". For this reason, there is significant difference between the students who will take the exam for the first time and those entering for the second time. Regarding the item "I can have time for the social and cultural activities while preparing for the Placement Test", the mean score for the answers of the students who will take the exam for the first time was " $X=2.68$ ", the mean score for those who will enter the exam for the second time was " $X=2.29$ ". Along with these findings, the students who will take the exam for the second time spare less time for the social and cultural activities than those entering for the first time.

In accordance with number of taking the Placement Test, as the value of " $p=0.047<0.05$ " was obtained from the result of the t-test performed for the students' answers on the item "we can go somewhere as a family on holidays while I prepare for the Placement Test", significant differences regarding the students' views on that item were revealed. According to table 4, the mean score for the students taking the exam for the first time was " $X=2.68$ ", the mean score for those entering for the second time was " $X=2.48$ ". Consistent with these findings, the students taking the exam for the second time can go out or visit someone with their family less than the students entering the Placement Test for the first time.

4. For Going to Private Teaching Institution:

Table 5. T-test results for the students' views on the impact of the Placement Test on their social life according to attendance in private teaching institution

* $p<0.05$

As the value of " $p=0.000<0.05$ " was found for the "t-test" result seen in table 5, it can be stated that there is significant difference between the students attending private teaching institutions and those who do not attend any private teaching institution regarding the item "I can have time for myself while preparing for the Placement Test". According to the data regarding the answers on the item "I can have

time for myself while preparing for the Placement Test” given by students (602 of them attend classes in private teaching institutions, 323 of them do not attend any classes in those institutions) presented in table 5, the mean score for the answers of the students attending classes in private teaching institution was “ $X=2.60$ ”, yet the mean score for the answers of the students who do not attend any classes in those institutions was “ $X=2.99$ ”. In relation to these findings, students attending classes in private teaching institutions have naturally less time for themselves than those who do not attend any classes in private teaching institution. Doubtless, this is an expected finding. Students attend classes at school in the morning and attend extra classes in the private teaching institutions in the afternoon or vice versa. At the same time, students attending classes for full-time do not have any weekend breaks. When the matter of students’ being busy with doing homework assigned both from school and private teaching institution is taken into consideration, it is impossible to believe that students attending classes in private teaching institutions can have time for themselves.

When the value of “ $p<0.05$ ” is considered, there is significant difference between the students who attend classes in private teaching institutions and those who do not regarding their answers for the item “I can have enough time for doing sport while preparing for the Placement Test”. When the mean scores for the answers of the students who attend classes in the private teaching institution and those who do not are examined in the same table, it can be seen that the mean score for those attending classes in private teaching institution was “ $X=2.31$ ”, yet the mean score for the students who do not attend any classes in private teaching institution was “ $X=2.66$ ”. Along with these findings, the students who attend classes in private teaching institution spare less time for sporting activities than the students who do not attend any classes in private teaching institution. This was an expected finding. Just think of a student who spends all day at school and all weekends in private teaching institution or a student who spends half of his/her day at school and spend the rest of the day in private teaching institution. In addition, when the extra teaching programs at school and private teaching institution and the shuttle time are considered, it is hard to spare time for different activities.

As is seen in table 5, “ $p=0.43<0.05$ ” value was obtained from the “t-test” performed in order to determine if there is significant difference between the students who attend classes in private teaching institutions and those who do not regarding the item “I can have time for the social and cultural activities while preparing for the Placement Test”. When the mean scores both for the students who attend classes in private teaching institution and those who do not are examined in the same table, it can be observed that there is slight difference between the means. As the mean score for the students attending classes in private teaching institution was “ $X=2.39$ ”, the mean score for those who do not attend any classes in private teaching institution was “ $X=2.58$ ”. It can be claimed that the students who do not attend any classes in private teaching institution can spare more time for social and cultural activities while they prepare for the Placement Test.

As the value of “ $p=0.031<0.05$ ” was obtained from the results of the “t-test” performed for the students’ answers on the item “we can go somewhere as a family on holidays while I prepare for the Placement Test” whether they attend classes in private teaching institution or not, significant difference was revealed. When table 5 is examined, it can be seen that the mean score for the students attending classes in private teaching institution was “ $X=2.48$ ”, yet the mean score for the students who do not attend any classes in private teaching institution was “ $X=2.27$ ”. In accordance with these findings, it has been found out that the students attending classes in private teaching institution can go out with their families on holidays less than the students who do not attend any classes in private teaching institution.

4. Conclusion, Result And Suggestions

4.1. Conclusion

According to these findings, only 56.7% of the students can spare time for social and cultural activities. The public school students can have more time for social and cultural activities than the private school students while they prepare for the Placement Test. In addition, the students who will take the Placement Test for the first time spare more time for the social and cultural activities than the students who took the Placement Test previously. The views of the students who attend classes in private teaching institutions are different from those who do not attend any class in private teaching institution. Likewise, those students who do not attend classes in private teaching institution can spare more time for social and cultural activities than the students attending classes in private teaching institution. In the final declaration of the 5th Turkish Culture Convention (2005), “there should be an emphasis on art education at each grade of MoNE programs and emotional intelligence which is crucial in learning should be highlighted”. Another expression noted in this convention was that complete learning can be possible by a system of education which will be formed by taking both parts of a person equally. However, the findings indicate that the Placement Test lead to a situation which is opposite of the expressions noted in this convention.

Findings indicate that more than half of the students cannot have time for themselves; about 2 out of 3 of them (2/3) can participate in neither sporting nor social and cultural activities. In this respect, both Sullivan (2002) and Eşme (2002) claim that the Placement Test seems to be an obstacle that should be overcome in developing children’s emotional intelligence. As these children are in pre-puberty, struggling for the Placement Test while they are trying to adapt at puberty, influence their normal developmental process negatively. In this regard, it is unreasonable when the view of Sullavin (2002) termed as “individuals become successful especially at various sports and playing an instrument in puberty” is considered in Turkish Education System. As a matter of fact, our children the guarantee of our future commit themselves only for academic success. It should not be ignored that this may be the reason why our country is unsuccessful in Olympics or falls behind the artistic activities when it is compared with other countries. For this reason, Deniz (2002) suggests that adolescents should be guided extracurricular activities and it should be provided for them to participate in various activities along with their interest. The author also emphasizes that this will contribute to the adolescents’ both friendship relations and socialization process.

Another remarkable finding is that private school students spend less time for themselves, sporting, social and cultural activities than the public school students. Actually, it is surprising to obtain such finding because private schools perform these activities a lot on their own. In this respect, the full-time education schedule of private schools may lead to obtain such findings; moreover, it should not be underestimated that those schools may work as a private teaching institution in order to present their success in the Placement Test which will be an advertisement for them. However, this situation may result from the private schools’ extra teaching programs or it may be the reason why parents with the economic power send their children to private teaching institution and get them tutor.

Private teaching institutions use the time that the students can spend for themselves, sporting, social and cultural activities. In this regard, it is difficult for students who attend classes in private teaching institution to spare time for such kind of activities as they spend time at private teaching institution and for doing homework assigned. Based on these findings, it can be said that private teaching institutions have an indirect impact on the development of students’ emotional intelligence.

4.2. Results

1. Students cannot spare time for their selves due to preparing for the Placement Test. 48.1% of the students cannot have time for their needs, interests and hobbies while preparing for the Placement Test. Private school students have less time for themselves than the public school students; students who will take the Placement Test for the second time spare less time for themselves than those who will enter for the first time; students who attend classes in a private teaching institution spare less time for themselves than those who do not attend any courses in a private teaching institution.

2. Students cannot allow time for doing sport because of preparing for the Placement Test. Private school students have less time for doing sport than the public school students; girls spare less time for doing sport than boys; those who will enter the exam for the second time have less time for doing sport than the ones who will take the exam for the first time; students who attend classes in a private teaching institution spare less time for doing sport than the ones who do not attend any classes in a private teaching institution while they prepare for the Placement Test.

3. Students cannot spend time for social and cultural activities as they prepare for the Placement Test (57.7%). Due to preparing for the Placement Test, private school students have less time for social and cultural activities than the public school students; those who will enter the Placement Test for the second time spare less time for social and cultural activities than the ones who will take the exam for the first time; the students who attend classes in a private teaching institution have less time for social and cultural activities than the ones who do not attend any classes in a private teaching institution.

4. Students cannot spend time with their families as they prepare for the Placement Test. 54% of the students cannot go out with their families on holidays when they prepare for the Placement Test. Private school students have less time with their families than the public school students; the students who will take the Placement Test for the second time spend less time with their family than the ones who will enter for the first time; the students who attend classes in a private teaching institution spare less time with their family than the students who do not attend any class in a private teaching institution.

4.3. Suggestions

1. The importance of students' participation in sporting, social and cultural activities should not be ignored. Further, it will be better to accept the time that students spend for sporting, social and cultural activities as mental relaxation and staying away from stress rather than accepting this as a loss of time. It should be remembered that this will enable the growth of healthy generations at the same time. Guidance should be provided for the principals, teachers, students and parents at private schools.

2. Because of the fact that students attending classes in a private teaching institution have more problems with regard to sparing time for themselves, their family, social and cultural activities, a good study program should be prepared for them instead of expecting increase in success from the private teaching institution, study center and private tuition. Preparation before the courses, listening to the lessons and repetition should take place on the basis of this study program. Therefore, the need to attend classes in a private teaching institution will be eliminated and there will be time for other activities.

3. To implement an education system which students can go on their academic studies without influencing their social life will be the best approach in Turkey. The authorities for taking educational decisions should make the necessary regulation in this sense. To abandon the mistake of practicing the Placement Test once in a year for three years time will provide at least for 5th and 7th grade students to have more time for themselves, their family, friends, their needs and interests. This regulation will be very beneficial. However, the way to make the system of transition to secondary education without examination should be explored. With respect to equal opportunity in education, assessment approaches providing the evaluation of all the intelligence types, can be an alternative for the Placement Test.

Suggestions for the researchers: The findings between private school students and state

school students indicate that private school students have more difficulty in sparing time for themselves, sporting, social and cultural activities, they have also difficulty in spending time with their family. As this result may be valid for Sakarya province, investigations for the other provinces can be made and those studies may be compared with Sakarya sample. Also, the influence of the exams such as the Placement Test on the family institution should be investigated.

4th International Conference on New Horizons in Education

The influence of instructional leadership of school administrators on school effectiveness.

Ritthirong Setwong^{*a}, Thanomwan Prasertcharoensuk^b

^a Graduate School, Khon Kaen University, 40002, Khon Kaen, Thailand

^a Jaturakam Pattana School, Roi-Et Educational Service Area Office 2, 45150, Thailand

^b Khon Kaen University, Faculty of Education, 40002, Khon Kaen, Thailand

Abstract

The purposes of the study were 1) to validate the fitness of structural equation model of instructional leadership affecting school effectiveness with empirical data; 2) to study direct, indirect, and total effect of instructional leadership on school effectiveness; and 3) to test for measurement invariance in structural equation model across two sample groups. This research was quantitative. The sample included 270 schools under the Office of Roi Et Primary Educational Service Area 2. The research instruments included a five point scale rating questionnaire. Structural equation model was implemented. The results showed that: (1) The structural equation model of instructional leadership of school administrators affecting school effectiveness was fitted with empirical data. (2) Instructional leadership had direct, indirect, and total effects on school effectiveness. (3) Measurement of invariance between new administrators and highly experienced administrators showed a non-significant chi-square statistic and good practical values, indicating a one-factor model for both groups.

Keyword: Instructional leadership, School Effectiveness, Structure Equation Model

Background and Importance of the Problem

The effectiveness of Thai schools is usually evaluated by national as well as international evaluations. For instance, the new Program for International Student Assessment (PISA), education indicators of the United Nation Development Program (UNDP), and evaluation by the Office for National Education Standards and Quality Assessment as well as the results of foundation education evaluation (O-Net) have shown that as a whole, Thai education still lacks competitive capacity at an international level and still has not achieved the goal of the 1999 National Education Act and the Amendment Version 2002. Schools are the most important minor unit that will raise the educational quality towards international goals. Hoy and Miskel (2001) said that schools with capacity in this respect are effective schools, which teach high-achieving students. They are capable of developing students who have positive attitudes and who can adjust to stressful environment and can solve problems arising at school. Research studies on school effectiveness from the 1980s until today (Hallinger and Murphy, 1985; Hallinger and Heck, 1996; Southworth, 2002; Hallinger, 2003; Leithwood, Day, Sammons, Harris,

* Corresponding author.

Email address:

& Hopkins, 2006, Lyons, 2010, Packard, 2011) show that the major factor affecting school effectiveness is the strength of the instructional leadership of school administrators who are involved with curriculum and instruction. Studies on the cause and effect relationships and relationships between instructional leadership of school administrators and school effectiveness are not widely conducted in Thailand. The researchers therefore, saw the importance in developing a model for causal relationship in order to test the validity and fitness of the model with empirical data, studying effects of variables, and testing for measurement invariance between different sample groups so that the model can be used as a means to develop educational effectiveness in the future.

Objectives of the Study

- 1) to validate fitness of structural equation model of instructional leadership affecting school effectiveness with empirical data.
- 2) to study direct, indirect, and total effect of instructional leadership on school effectiveness.
- 3) to test for measurement invariance of structural equation model across two sample groups.

Methodology

This research applied a quantitative research methodology focusing on cause-effect relationships in 2 phases:

Phase 1 - Study of relevant theories and research in order to develop a hypothetical structural equation model

Phase 2 – Statistically analyze the structural equation model (SEM)

1. Population and sample group

The population consisted of the 339 schools affiliated with the Office of Roi Et Primary Educational Service Area 2. The sample group was composed of 270 schools sampled by stratified random sampling.

2. Research instrument

The instrument used was a 5-point rating scale questionnaire. The alpha coefficient of each aspect in the questionnaire was 0.807- 0.890. Structural linearity was found by a confirmatory factor analysis.

3. Data analysis

3.1 Descriptive statistics were used to analyze data frequencies, percentages, means, standard deviations, kurtosis and skewness.

3.2 Referential statistics were used to perform factor analysis and fitness of structural equation modelling with evident data. Model invariance was then tested.

Conclusion and Discussion

Conclusion

1. The result of testing of fitness of instructional leadership structural equation model on school effectiveness

The structural equation model for instructional leadership affecting school effectiveness was found to fit the empirical data at a good level ($X^2= 5.861$, $df=4$, $P\text{-Value}= 0.209$, $RMSEA=0.042$, $CFI=0.998$, $TLI=0.992$, $SRMR=0.013$, $X^2/df<2$). These values met the criteria set, indicating that the model correlated to the empirical data according to the acceptance levels as shown in Figure 1.

2. The result of direct, indirect, and total effects of instruction leadership on school effectiveness

2.1 Direct effect – Three factors of instructional leadership found to have direct effect on school effectiveness, listed from high to low, are: creating of learning climate, professional development and curriculum and instructional development.

2.2 Indirect effect - Three factors of instructional leadership found to have indirect effect on school effectiveness, with direct influential coefficients from high to low, are: educational supervision, professional development, and creating of learning climate.

2.3 Total effects - Four factors of instructional leadership found to have total effects on school effectiveness, with total influential coefficients from high to low, are: professional development, educational supervision, creating of learning climate, and curriculum and instructional development.

3. The result of the test for measurement invariance of the structure equation model between new administrators and high-experience administrators

The test for measurement invariance of structural equation model to test the base-line invariance between the new administrators (with 0-10 years of experiences) and highly experienced administrators (over 11 years of experiences) showed that the model did not vary if the sample groups were different as shown in Figure 2.

Discussion

From the study of structural equation model of instructional leadership of school administrators affecting school effectiveness, the researchers found the following important issues that need to be elaborated: 1) the influential route and size of causative variables that affect school effectiveness and 2) invariance of the structural model in different sample groups. Professional development was the causative variable shown to have the highest total effect on school effectiveness both directly and indirectly. Indirect effects occurred through curriculum and instructional development and creation of learning climates. Professional development was shown to have the highest total effect because the planning for development and promotion of professional progress, promotion of action research and promotion of life-long learning for teachers bring positive impact on school effectiveness- students' achievement. All of these correlate with the finding of Mckensy (2007), that highly successful schools around the world have teachers with high capacity. Thus, the heart of learning reform lies in teacher development.

Clever, competent, and high-spirited personnel should be drawn into the teacher training process. Guskey (1986 cited in Evans, 2010) mentioned that professional development is a systematic approach that will change instruction of all systems based on the teachers' beliefs and attitudes towards classroom instruction. Studies by Cohen & Hill, 2000; Ferguson, 1991; Rosenholtz, 1989; Wenglinski, 2000 (cited in Addison, 2007) showed that students taught by teachers who have been trained professionally achieve more than students taught by teachers who have not been trained in the profession.

Educational supervision is a causative variable receiving the highest indirect effect on school effectiveness through 4 channels. This indicates that educational supervision is vital for raising the effectiveness of schools. It is a process that assists in the adjustment of teaching paradigms and hence results in teacher development in all aspects, leading in turn to good outcomes or high learner achievement. This correlates with Glickman, Gordon & Ross-Gordon (2006) which said that educational supervision is the function of school administrators to improve instruction for teachers in curriculum development, staff development, group development, and classroom action research. It also correlates with Blasé and Blasé, 1998; Blasé and Robert, 1994 (Cited in Lineburg, 2010) who said that supervision of teachers' instruction by administrators has a high impact on instruction. A study by Wolfrom (2009) showed that school administrators' supervision can indicate needs of teachers more clearly and can enhance professional development.

Creation of learning climates is the causative variable having the highest direct effect on school effectiveness and indirect effect on curriculum and instructional development. This finding showed that good creation of learning climates, including both the environment and co-living culture makes an organization effective. Freiberg (1998, cited in Thanyaporn, 2011) said that school climate enhances teaching and learning bringing about school reform. Multiple factors of school and classroom climate build an environment that enables all members in the school to reach a good level of learning achievement. This correlates with the findings of Marten (2012), which revealed that the learning achievement of students is affected by appropriate atmosphere in teaching and learning in School; most students can develop and retain their achievements. School climate is important for students in terms of education, social, emotion, and moral and physical development. Students who feel safe, are taken care of by adults, and have good friends will be respectful and have a sense of belonging to the school. They will participate in maintaining and creating a good school climate. Additionally, a good learning atmosphere in schools also build good relationships between the school and the community as shown in Communtzis-Page (1996 cited in Crites, 2008), which showed that the community will not cooperate with the school if community members do not feel welcomed by the school climate. These people need to be respected, trusted and wanted. This research suggested that linking of school atmosphere with parents and community participation is related to students' education. When a school creates a positive climate and invites others by preparing the structure that opens for external participation, the outcome is school effectiveness.

Additionally, the research findings showed that curriculum and instruction development has the least total effect on school effectiveness. Most administrators lack knowledge and understanding in implementing the principles of the national core curriculum into the school's curriculum, learning activity plan, and classroom evaluation. Blasé & Blasé, 1999; Fullan, 2001; Kouzes & Posner, 2002; Lashway, 2003; Prestine & Nelson, 2003 (Cited in Lyons, 2010) concluded that administrators as leaders in curriculum and instruction need to develop themselves intensively and become prototypes for their personnel. Administrators have to be eager in professional development. However, the curriculum and instructional development variable still showed the linear influential coefficient of 0.033 at a statistically significant level of 0.05. This suggests that school effectiveness is affected by curriculum and instructional development. According to the studies by Lyons (2010), Lineburg (2010), and Mosenthal, Lipson, Torncello, Russ, and Mekkelsen (2004) can be concluded that the

factor behind the success of schools especially in learner achievement and excellence is learner-centered curriculum and instruction development because this factor affects school effectiveness directly.

Finally, the testing of measurement invariance of the model by analysis of multi-group models between new administrators and high-experiences administrators showed that the model structure did not change. The statistics of multiple models also correlated and fit with the empirical data at a good level. This finding indicates that the structure equation model of instructional leadership that affects school effectiveness can be used for two different groups. This can be explained by the study by Taciano and Fischer (2010) who tested the invariance between groups in cross cultural research. The result would be satisfactory if the structure of the model did not change between the groups. It can be explained that informants of each group of population hold the same concept in building the structure.

Recommendations

1. Recommendations for application of the findings

1.1 From testing the fitness of the model with empirical data, this study suggests that the four characteristics of instructional leadership of administrators are very important for school effectiveness. Therefore, policy administrators should set integrated policies to develop instructional leadership for administrators in the four aspects because school effectiveness can be achieved directly or indirectly from instructional leadership.

1.2 The analysis of total effects of instructional leadership on school effectiveness showed that professional development had the highest total effects. Thus, administrators at all levels should see the importance of teachers' professional development by planning systematic teacher professional development, promoting and supporting teachers in training and continuing education, and strengthening teachers' networks.

2. Recommendations for further research

2.1 From the findings and the studied theories in the course of this research, it has been shown that professional development is an extremely important variable in the increase of school effectiveness. Hence, studies should be conducted on models for teacher professional development to support the Office of Foundation Education and Teacher Training Organizations to prepare teachers appropriately.

2.2 The educational scope should be expanded through studies of multi-level models in order to consider models at individual, organizational, or education service area levels.

The integrated learning of community-based tourism in Thailand

Gulapish Pookaiyudom*

*International College for Sustainability Studies, Srinakharinwirot University
Soi Sukhumvit 23, Sukhumvit Rd., Khlong Toei, Bangkok, 10110*

Abstract

This paper presents an initial effort to evaluate college students' understanding of the concept of community-based tourism (CBT) based on integrated learning. In particular, it examines the perceptions of students towards the components of traditional classroom-lectures, fieldtrips, fieldworks and also business plan proposals from the students for distinctive community-based tourism destinations. Forty eight questionnaires will be distributed among the 4th year students of the International College for Sustainability Studies, Srinakharinwirot University, Thailand that undertook the course in the second semester of 2012. Data analysis is to be processed by statistical programme software and accordingly categorised into groups of data by thematic analysis. The findings revealed that students had a high satisfaction of integrated learning of CBT as they provide a holistic understanding of community-based tourism from the principles and practices based on integrated learning, as they need to study the theories and principles in the classroom, observe and survey by fieldtrips and fieldwork and practice the development of business plans for community-based tourism destinations through group work. The paper finishes with a concluding discussion and implications for future research and practitioners.

Keywords: integrated learning; community-based tourism; tourism learning in Thailand

1. INTRODUCTION

Community-based tourism (CBT) has tended to increase in popularity in recent times especially in developing countries as it is considered as the appropriate approach that can bring benefits to the community as well as encourage the traditional and cultural way of life and environmental resources (Scheyvens, 2002). In the context of Thailand, CBT development is encouraged by the government as it has been scoped in the 8th National Economic and Social Development Plan (NESDP) during 1997-2001 until the recent one the 11th NESDP during 2012-2016 as it could highlight the sustainability issues of environment and local benefits (Ministry of Tourism & Sport, 2011). In concerning the significance of CBT, International College for Sustainability Studies, Srinakharinwirot University, Thailand has provided the course ECO413 Community-based tourism development since 2002 in order to enhance students with the comprehensive ideas and concepts relating to community based ecotourism development. The expected outcome from this course is that students gain the ability to create their own business plans for communities of their choosing that can be of benefit to CBT destinations. This course has been instructed by traditional classroom-lectures, field work, field trip and business plan proposals.

However, there are still limited studies that evaluated the outcomes from a student perspective, whether or not they are satisfied and deeply understand the concept of CBT through this integration of learning. Hence, this study aims to evaluate the students' understanding of the concept of CBT and their ability to apply this

E-mail address: gpookaiyudom@gmail.com

comprehensive knowledge towards the creation of a business plan for a CBT destination and thus propose the implications for future research and practitioners.

2. OBJECTIVES

- To assess the satisfaction and better understanding of students from the integrated learning of CBT
- To propose suggestions for CBT learning which could provide benefits to community within the principles of sustainability

3. LITERATURE REVIEW

According to Hatter (1999), community-based tourism or CBT is under the umbrella of sustainability, which emerged from fears of overconsumption of resources and degradation of the environment, seeking to ensure that meeting the needs of the present did not affect the needs of future generations and focuses on well-being of people as well as the conservation of the environment (World Commission on Environment and Development, 1987). CBT can be defined as ‘a situation in which local people, usually those that are poor or economically marginalised in very rural parts of the world, open up their homes and communities to visitors seeking sustainably achieved cultural, educational or recreational travel experiences’ (O’neil, 2008). CBT’s main focus is on the host community, encouraging their involvement, participation and their benefit from tourism and also to educate and encourage them towards sustainable tourism development (Pookaiyaudom, 2012: 65). Hence, CBT mainly concerns the participation of local people who welcome visitors to seek experiences of their cultural, educational and recreational communities. However, the visitors themselves have limited evidence of responsible tourist behaviours based on environmental concerns (Sharpley, 2006; Swarbrooke & Horner 1999), consequently, pollution caused by tourists is the effect (Mowl, 2002).

To enhance the student’s grasp of these aspects, integrated learning is essential in order to form a comprehensive understanding of the contemporary issues of CBT in Thailand along with an increased awareness of responsible tourist behaviour as well as the ability to create a business plan for community based tourism using the concepts of local participation and the sustainable approach.

In regards to the term of integrated learning, it refers to ‘an educational outcome of collegiate education based on the premise that intellectual study should connect in meaningful ways to everyday life (AAC & U 2002; Wabash National Study of Liberal Arts Education, 2004; Barber, 2009). Roberts and Kellough (2000) also suggest that the integrative teaching and learning is an appropriate design to bring about effective learning as it encourages learners in establishing a constructive connection between school and life, knowing and doing and content and context. Integrated learning should have activities that can be arranged with different styles of teaching and learning; teachers may utilise problem-based, inquiry-based, project-based learning, and other approaches with appropriate arrangement, while students should study the topic through individualised and group learning in order to become more independent and problem solvers (Sintoovongse, 2005; Sintoovongse *et al.*, 2005). Hence, in considering CBT, integrated learning can reinforce learners understanding of the concept of CBT through multiple approaches which are 1) traditional lectures: to provide deep understanding of the theories and principles of CBT and discussion of case studies to experience and exchange different opinions, 2) field work: to bring up the direct experience of observation and involvement with the local community, 3) field trip: to experience the real situation of CBT, the case study of Tha Nam Kham Pob, the existing authentic CBT destination establishing by community participation and finally 4) business plan proposal: to behave responsibly by tailoring business plan creation of 10 CBT destinations that groups of students chose by themselves.

4. METHODOLOGIES

This research used questionnaires to examine the evaluation of the course towards the concept of integrated learning among the 4th year students of the college. In the phase one, eight questionnaires were handed to the 4th year students, one sixth of the total students who took this course undertook the pilot study in order to test the reliability of the questionnaires. The result from the pilot study revealed that the reliability of the Alpha-Co efficiency was 0.80 and the content reliability was considered by 3 expertise in community-based tourism and represented the index of item objectives congruence (IOC) equivalent as 0.83.

In phase two, forty eight questionnaires were distributed at the end of the course, among the samples were the 4th year students who took this course were in their final semester before completion of their bachelor degree.

The questionnaires are divided into two parts. The first part is demographic information (such as age, gender and hometown), while the second part contains the questions assessing the evaluation of integrated learning of CBT (such as satisfaction of traditional lecture in classroom, level of understanding and experience received from field work and the level of comprehensive understanding from integrated learning). Participants were also asked to provide further recommendations and/or suggestions at the end of the questionnaires.

Samples responded their opinions towards a Likert Scale. Then, data was processed by statistical programme software with higher numbers indicating high in agreement with a concept of integrated learning of CBT.

Following the previous phase, thematic analysis is used to group the data from rating scale and further recommendations into the following categories: lecture, field work, field trip, and business plan proposal. Thereafter, all collected data is interpreted and analysed for the broader objectives of the research.

5. FINDINGS AND DISCUSSION

Forty-eight questionnaires were completed by all the students who took the CBT course. It reveals that the gender ratio of the participants was 62.5% female to 37.5% male. The mean of the participants' ages was 21.71 years old, while the mean of frequency of community tourism traveling in their spare time is 4.6 times per year. The details regarding demographic information are displayed in the Table 1.1.

Table 1.1 Demographic information

Demographic Items		Frequency	Percent
Gender	Female	30	62.5
	Male	18	37.5
	Total	48	100
Hometown	Bangkok and Metropolitan area	40	83.3
	Provincial area	8	16.7
	Total	8	100
Attendance	None of absence	26	54.2
	Absent for 1-2 times	19	39.6
	Absent more than twice	3	6.3
	Total	48	100

The overall findings represented the objective of the research as they revealed that the participants had a high satisfactory level with the integrated learning of CBT which contained lecture, field work, field trip and business plan proposal (question 8). Aspects of learning by field work and field trips broaden experience, understanding of CBT and involvement with community (question 4 and 5), while the participants also highly agreed that they had better understanding in CBT after the course completion (question 9). Significantly, samples had very high agreement in the increase of awareness of responsibility towards community and motivation of visitation or recommendation others to visit CBT destinations which are the essence of CBT principles from the aspect of visitors (question 10 and 11). None of them expressed their disagreement towards the questions at any level. The items that received agreements with fairly equal levels (question 3, 6 and 7), while the items showed low agreement of CBT knowledge before attending the course and learning by lecture satisfaction (question 1 and 2). The satisfaction of students learning in CBT course is shown in the Table 1.2.

Moreover, some of respondents provided further opinions of the learning from this course which can be categorised into 4 groups and are included in the following discussion regarding the approaches of learning as following:

5.1 Lecture

This course contained 9 lectures which provided the orientation of the course, the topic of the principal concept of CBT, CBT in Thailand and the linkage to National Tourism Plan, indigenous tourism and homestay, agro-tourism and rural tourism, community empowerment and relationships with power holders, indicators of successful CBT destinations, CBT development, and finally, the business plan for CBT development. The courses provide intensive knowledge of CBT in order to enhance the understanding of the context of CBT for students. Moreover, in class discussions were also provided towards various topics to give students opportunities to exchange their opinions and brainstorm to solve the problem in the providing of case studies relevant to CBT. To evaluate the understanding of CBT principles, mid-term and final examinations were required as well as two in class-quizzes. However, as the lectures and in-class discussion remained only theory and the study of CBT principles, students could not practice what they had learned within a real situation, as the results showed a fair amount of agreement in satisfaction towards learning only by lecture. Hence, field work and the field trip were adopted in order to bring more effective learning (Roberts & Kellough, 2000) as was previously reviewed.

Table 1.2 The satisfaction of students learning in CBT course

No.	Questions	Mean	Std. Deviation
1.	Did you already have enough CBT knowledge before attending this course?	2.81	1.003
2.	Are you satisfied with learning by lecture only?	2.54	1.184
3.	Can you exchange your opinions and receive more understanding of CBT from in class-discussion?	3.67	0.907
4.	Have you broadened your experience, understanding of CBT and involvement with community ways of life from the field work of the site you have chosen?	4.10	1.036
5.	Have you broaden your experience, understanding of CBT and involvement with community ways of life from the field trip chosen by your lecturer?	4.15	0.922

6.	Do you have a broader understanding of CBT from the field trip's guest speaker?	3.85	0.875
7.	Do you agree that your business plan proposals would benefit communities?	3.98	0.785
8.	Do you agree that the integrated learning of CBT which contains lecture, field work, field trip and business plan creation would increase success in CBT learning?	4.08	0.767
9.	Do you have a better understanding of CBT after the course completion?	4.06	0.755
10.	Would you agree that after course completion you have increased your awareness of responsibility towards communities you would visit in the future?	4.25	0.786
11.	Will you want to visit or recommend others to visit CBT destination?	4.13	0.841

5.2 Field work

After students studied for 5 classes, they gained an understanding that the destination community that could be classed as CBT may include indigenous tourism, homestay, agro-tourism and rural tourism, the instructor then asked the participants to visit sites for field work in order to develop a business plan for a selected community as the final project of the course. The participants were required to gather themselves into 10 groups, 5-6 members for each group as the group learning to become more independent and gain initiative as problem solvers (Sintoovongse, 2005; Sintoovongse *et al.*, 2005), in the selected communities. Students needed to visit the site once and observed or interviewed with samples of locals or the representatives of local administrative bodies and give a presentation of the selected location addressing the scope of the reasons why the students considered particular destinations as CBT sites along with their proposed methodology to collect data. Concerning this stage of the course, students agreed that they had broadened their experience, understanding of CBT and high involvement with community ways of life as they were required to visit the site at least twice and updated with feedback such as problems and barriers to the instructor. Moreover, some participants commented that from the field work, they had gained a better understanding of the community's problems, part of which being the pollution derived from tourism business, so they mentioned that from this perspective, they felt more responsible to communities by addressing the issues of minimising pollution, especially waste, respecting community's traditions and culture, and the purchase of some local handicraft to generate income to local people. In this context, it reflects the increase of an awareness of responsibility to the community that was considered as limited in tourists' actions (Sharpley, 2006; Swarbrooke & Horner, 1999), thus field work can reinforce this aspect according to the respondents' comments.

5.3 Field Trip

Regarding the field trip, the instructor chose the community of 'Tha Nam Kham Pob' which is a new CBT route that was formed by community participation and reflects the way of life of the local Thai people in the Province of Petchaburi. In this one day field trip, the students were firstly asked to listen to the lecture by the community guest speaker about the background of community. In the stages that followed, students were grouped into 3 groups to interview 3 groups of residences who are not involved with the business around the route, the local entrepreneurs and tourists in order to develop the business plan for Tha Nam Kham Pob. In the end of the field trip, the discussion was provided and all the groups needed to submit the business plan proposal for the field

trip destination. This kind of learning would benefit students by their engaging with the locals and critically analyse the plan according to the perspectives of the 3 groups they interviewed. The participants would increase their confidence when they created their grouped business plan proposal. Overall, students were satisfied and perceived that they had broadened their experience and better understood CBT by interacting with the local's way of life through field work, nevertheless, some of them mentioned that the local guest speaker might speak towards irrelevant topics that rarely brought about a better understanding of the case, whilst the others agreed that to interview locals and tourists in different groups provided more understanding leading them to the strengths and weaknesses of the site more effectively. Another interesting point is that some of the respondents commented that their visitation to this local site brought them a sense of existential authenticity that they could participate with the locals' simple lifestyle which they could not have experienced at home, encouraging the idea that more than one field trip would be better. Considering this point, it is true that the majority of students that undertook this course are from Bangkok and the metropolitan area, so it can be representative that the target market of CBT tourists are most probably people from city life who seek/find appeal for the simpler way of life of local communities that they cannot experience where they live.

5.4 Business plan proposal

At the essence of CBT the consideration of how the community can benefit from local tourism, business plan proposals should help and highlight aspects to benefit communities. This section of learning is connected with all aspects that the students requires to develop a business plan for a selected community based on the principles and theories from lectures, the data collection from fieldwork, the group learning practice from field trip assignment while also the instructor provided the consultation week for students to discuss the process and address any problems facing the project. In the end result, there were 10 business plan proposal projects from a variety of CBT destinations such as Mon village as an indigenous tourism destination, Ban Khun Samut Chin as an agro-tourism site, and Bang Nam Pueng Market as a floating market, a famous site of Thailand that retains local involvement. As a result of this, students fairly agreed that business plan creation would increase success in CBT learning because some of the respondents were unsure if those plans would benefit communities or not as they had limited time to be involved with their selected communities, so it may not wholly representative of all aspects of CBT planning. Moreover, some participants commented that to create a business plan, they needed to analyse data and link the project to the theory and principles they had learned from the lectures, hence they felt they may present the wrong concept from what they have studied through. Nevertheless, the other respondents mentioned that they can apply the comprehensive knowledge from the integrated learning to this business project. To conclude the expected outcome of the CBT course, the majority of students revealed that after the course completion, they had a better understanding of CBT which was increasingly higher than before attending the course (question 1). Furthermore, increased consideration for other aspects, indicated in examples of opinions towards responsibly awareness, it can be summarised that the students reached the intended outcome of the course derived from the integrated learning.

6. CONCLUSION AND SUGGESION FOR THE FUTURE RESEARCH

From this research, it can be concluded that integrated learning approaches should be attached to the learning of CBT and implemented within the course as it would provide better, in depth understanding and enhance the experience of the learners. Moreover, the creation of business plan proposals by students are essential, although few students remarked uncertainty towards the effectiveness of their planning due to limited time or data, students questioning whether or not their own plans really would benefit the community is indicative that essence and theory of CBT is carried on into practical application, such practice of planning, field work and research is invaluable, opening up suggestions for communities and the potential for new innovations. To create more

business plans to various communities, would expand the benefits to a variety of local destinations as many of the plans included suggestion for local pride and wisdom reinforcement linked to the sustainability of community. Another significant point from this study is that students can both respond as a tourist but also perform as planners. Therefore, having an enhanced understanding of CBT and representing the local voice through planning, the students are as a beneficially long term model example for tourist responsibility through their future practice, conduct or influence such as through Word-of-Mouth which is the most incredible source to motivate tourists visiting sites (Govers, Go & Kumar, 2007). Hence, it can be summarised from this research that apart from integrated learning, business plan proposals will be the outcome that not only represent the understanding of CBT principles but also the adaption of knowledge from lecture, field work and field trip to benefit CBT destinations.

As this research only focused on learning CBT in Thailand, the future research may consider of the comparison of learning CBT in other countries in the regional of ASEAN as in this area will become the Asean Economic Communities (AEC) in 2015. Therefore, to study the learning of CBT in other countries in this region may lead to a better understanding of CBT and develop the new routes of CBT that can effectively compete in tourism industry in the future.

Abstract

The purpose of this study is evaluation of school readiness level of six years old preschool children within the framework of different variables. This study is a survey model and includes the steps on surveying the six years old children who attend preschool in 2010-2011 academic year in Sakarya. In this survey, Demographic Information Form, Bracken School Readiness Assessment was as data collection tools. The gathered data were analyzed using SPSS 16 program. At the end of this research, At the end of the research , it was concluded that the level of parents education had a strong positive effect on the children's school readiness. The jobs and age levels of the parents had also impact the level of children's school readiness.

Keywords: preschool education; school readiness; Bracken; early childhood.

1. Introduction

Nowadays, the importance of preschool education, are now accepted by almost everyone. During this period, for the researchers, the child is seen as a period of higher learning potential. The children who grow up in the appropriate physical and social environmental conditions and healthy interaction environment show a more rapid and successful development (Omeroglu and Can Yasar 2004).

Healthy and have the desired behavior, educate children, according to their developmental characteristics and needs of these features are dependent on the knowledge of what's on. Developments in early childhood, preschool education, the parents no longer had ceased to be a subject alone is capable of doing so. At this point, pre-school education institutions have an important role (Oktay 2002).

Objectives and tasks of national education, pre-school education is determined in accordance with the general objectives and principles (MEB 2012). They are:

1. Children's physical, mental and emotional development and ensure that they acquire good habits;
2. Prepare them for primary education;
3. Terms and families for children from disadvantaged background to create a joint training environment;
4. Turkish children is to provide accurate and nice speeches.

School Readiness, the child's cognitive, social and emotional development level is defined as the minimum qualifications and meet the demands of school (Lemel et al. 2007). School Readiness, is implementing the child's basic education and skills needed to win before you begin is defined as a whole (Bierman et al. 2008; Kagan 1990).

Starting school is an important process for the period of the family and children. School readiness of the child should be received by the school to begin. Generally, each child (especially pre-school education is very widespread nowadays) will reach the maturity level that comes around the age of six. However, due to individual differences, reaching the age of maturity of the school may vary. Although the steps the same for all children in all areas of development, some children climbing the steps, others may be faster or slower than. (Dogus College Guidance Services 2006)

Children starting school, which reached the school readiness remains elusive. Not ready for a child to an environment, forcing it to force the reading and writing, the child against the negative responses to school failure and school cause to live (Yilmaz, 2003).

Children will enter the environment during the pre-primary education to prepare, to make the necessary environmental regulations and steer children according to individual characteristics, will prevent the children to live in the negative experiences (Yilmaz 2003).

This main aim of the study were to evaluation of school readiness level of six years old preschool children within the framework of different variables (gender, mother-father ages, jobs and education level).

2. Methodology

The sampling, simple random sampling method selected public elementary schools in the heart of Hendek kindergarten due to the ongoing 119 (49.6%) were female and 121 (50.4%) males constituted a total of 240 children. Demographic characteristics of families of these children is examined, the vast majority of mothers in terms of educational status of high school graduates (37.5%) and primary school graduates (29.2%), the vast majority of parents were high school graduates (37.5%) and university graduates (34.6%) was found. The vast majority of parents in the study group 31-40 years (77.5%, 82.5%) in group shows. Looking at the vast majority of

mothers in terms of occupations were housewives, while the vast majority of fathers observed that self-employed. Considering the number of siblings and siblings of children according to the gender distribution of the vast majority of children with a sibling (50.4%) seems to possess.

2.1.Data Collection tools

2.1.1.Bracken School Readiness Assessment -3

Bracken School Readiness Scale, 3 years, 0 months (3:0) to 6 years,11 months (6:11) in order to measure the levels of school readiness of children the Bracken (2002) developed by. Scale, Colors, Letters, Numbers / Counting, Sizes / Shapes, including comparison and five sub-tests and 85 items. Located on the sub-scale of the following sub-dimensions of the tests measure the levels of school readiness of children.

Colors Subtest: basic color concepts for this sub-test showing the main colors in all languages, includes intermediate colors. Consists of 10 items.

Letters Subtest: This subtest consists of 15 items and includes uppercase and lowercase letters. Numbers / Counting Subtest: This subtest to recognize the one-and two-digit numbers (Numbers) and consists of the number-object mappings. (Counting) consists of 18 items.

Dimensions / Comparisons Sub-Test: This test lower one dimension (eg, long (tall) vertical length of the concept, as well as (long) defines the length of the horizontal), the two short-Dimensional (Short) define the concept again, both vertical and horizontal length) or three-Dimensional big (big) and small (small) size of such concepts must also be considered significantly different from each other.) Additionally, this sub-test objects from one or more children prominent feature of the pairing, discrimination, and measures or benchmarking skills. This sub-test consists of 22 items.

Shapes Subtest: This subtest consists of one-, two and three-dimensional shapes. One-Dimensional, curve, angle, includes such concepts as the diagonal. Two-Dimensional, circle, square, triangle, cube and pyramid-like concepts such as concepts and includes a three Dimensional. This sub-test consists of 20 items. School readiness of these six sub-test total score (School Readiness Composite-SRC) is called.

2.1.2.Scoring Bracken School Readiness Scale-3

Bracken School Readiness Scale-3 for the lower test items and record the picture book form, consists of the application. The number of correct answers at the bottom of each subtest, the child's test scores are collected. The sum of the lower test scores School Readiness Score (SRC) states. Bracken School Readiness Scale 3:0, 6:11 developmental levels of the concept of children between the ages of art-minus one standard deviation is calculated by.

2.1.3.Adapting Bracken School Readiness Scale-3

Bracken School Readiness Scale for Turkish version before the English form translated into Turkish by two experts. Then dial back-translated into English by two expert evaluation form technique and compared with English expressions. Cooperation with the Turkish to express a form of English that was translated into English form. Later translated into Turkish by the Bracken School Readiness Scale two Turkish language specialist analyzed in terms of clarity of the statements made and the necessary corrections to the form given its final form.

The items on the children's psychology translated into Turkish in order to evaluate compliance have been consulted by a specialist working in the field of psychology. Turkish version of the scale of child development / pre-school education by three experts working in the field and the scale of the Turkish Culture in the expression evaluated for its suitability and appropriateness for the children were asked to rate pictures.

For this purpose, "Expert Opinion Form" was prepared. That will contribute to the study of child development as a volunteer, and training / working in the field of preschool education, as well as three experts Expert Opinion Evaluation Form, a copy of the original scale, the scale of the original English Turkish Evaluation Form Evaluation Form are given.

Consensus of experts they deem appropriate with substance, form of expression and Turkish as well as pictures taken from the scale. Matter experts expressed suggestions for correction and pictures on conducting the necessary corrections were made. Under Sub-scale 2, Turkish alphabet, for example non-"X, W, Q" in the same order of the letters ", V, Y, G" are included. At the same time in the Sub-scale 3 of the "forty-one, eleven, ninety-five, twenty-seven, fifty-three" in terms of the number sequence from easy to difficult to adhere to the principle "eleven, twenty-seven, forty-one, fifty-three, ninety-five," are .

Subtest 5, "square, triangle, cone, ring," to be conformity with the principle in terms of patterns from easy to difficult sequences "triangle, square, cone, and ring" organized. Again Subtest 5, "tile" instead of the word "rhombus" was organized by writing the word.

Form of the scale was created based on expert opinion were considered to have the validity of coverage. A small scale first group (n = 5) on the intelligibility of the statements and pictures by children to get an idea about the average time to evaluate and applied. Scale trial of an application made in the form of statements and images were understood by children. As a result, the concept development of children six years of age in order to measure the form of Bracken School Readiness Scale-3 trial is given the final shape.

2.1.4.Bracken School Readiness-3 Reliability

Cronbach's alpha internal consistency reliability coefficients calculated for the average of the scale was calculated as .952. Subscales of the scale, Cronbach Alpha internal consistency reliability coefficient for the .954 for subtest Colors, .940 for Letters Sub-scale, .946 for subtest Numbers, -.896 for Sizes- Comparisons Sub-scale, .871. for Shapes Sub-scale was calculated. According to these values is demonstrated, that the internal consistency of the scale (Buyukozturk 2011).

2.1.5.Procedure

Scale, were administered individually by the researcher. Practice in a quiet environment, where only the materials needed for measurement, including a desk and chair, in classrooms or meeting rooms were empty.

Age and individual characteristics of the application time (the concept of data, note duration, etc.), Depending on the range of approximately 20-45 minutes.

3. Findings

Research findings are shown tables below. Table 1 shows the results of Mann Whitney-U analysis on gender variable. As shown by Mann Whitney U test results, there is not a meaningful difference between childrens school readiness with their gender ($U= 7086,500$ $p>0.05$).

Table 1. Mann Whitney-U test results of gender variable.

Gender	n	Mean Rank	Sum of Ranks	U	p
Female	119	121,45	14452,50	7086,500	,833
Male	121	119,57	14467,50		

$p \leq 0.05$

The results of Kruskal-Wallis test related to school readiness of preschool Children with respect to their parental variables are indicated in Table 2. According to the results given in Table 2, school readiness of children varied with respect to their parental variables. As seen in Table 2 the school readiness level of children increases with the increase of parents education level (Mother/ X^2 : 22,681, $p < 0.05$; Father/ X^2 : 21,472, $p < 0.05$). As in this findings with the increase of parents' age also increase school readiness level of children (Mother/ X^2 :7,379, $p < 0.05$; Father/ X^2 :21,077, $p < 0.05$).

Findings and results show that childrens school readiness levels varied with the respect of morher and father's job status. As seen on the Table 2 school readiness level of self-employed mother's children are higher than the others. Also pensioner father's children have higher level of school readiness rather than self employed or unemployed fathers.

Table 2. Results of Kruskal-Wallis test related to the school readiness of children with respect to parental variables.

		n	Mean Rank	sd	χ^2	p	Signifant Difference
Mother Education Level	Primary School	70	88,77	3	22,681	,000*	1-2, 1-3, 1-4
	Elementary School	32	126,03				
	High Schol	89	129,86				
	University	49	145,21				
Father Education Level	Primary School	28	74,71	3	21,472	,000*	1-2, 1-3, 1-4, 2-4
	Elementary School	38	107,12				
	High School	91	120,70				
	University	83	141,86				
Mother Age	20-30	50	99,88	2	7,379	,025*	1-2
	31-40	186	126,92				
	41 age and over	4	79,88				
Father Age	20-30	23	70,20	2	21,077	,000*	1-2, 2-3
	31-40	198	129,88				
	41 age and over	19	83,63

	Officeholder	57	121,39				
	Employee	58	109,86				
	Self-employed	112	125,45				
	pensioner	5	196,80				

$p \leq 0.05$

4. Conclusion and Discussion

This study shows that generally there were high levels of school readiness amongst the six year olds related to their families characteristics. The results show that childrens gender did not a meaningful difference on school readiness. This could be probably explained by that gender is not only variable on school readiness level. This finding is consistent with the findings of Cinkılıç (2009), Oktay (1983) and Arıkök (2001) that support gender could not be only variable to evaluate the school readiness of the six year old children.

The results show that the level of school readiness for children whose parents education level and ages higher than those children whose parents are lower education level and ages. These findings about parents education level are consistent with the findings of the study by the Fitzgerald, Spiegel and Cunningham (1991), Unutkan (2003), Yazıcı (2002) that support parents education level make a deep impact on childrens academic success and school readiness levels. But findings about parents ages are contrary to the findings of Yazıcı (2002) and Kırca (2007) that parents ages are not enough to impact the school readiness generally.

Also the results show that the level of school readiness for children whose mothers are self employed higher than the orthers. And children whose fathers are pensioner have higher school readiness levels than the others. This

results are contrary to Ergül (2007) that there was no significant difference between the parents job status and childrens school readiness.

4th International Conference on New Horizons in Education

The issue of children with visual handicap school matureness as one of inclusion determinants

Dita Finková, Libuše Ludíková*

Palacky University, Žižkovo nám. 5, Olomouc, 77140, Czech Republic.

Palacky University, Žižkovo nám. 5, Olomouc, 77140, Czech Republic.

Abstract

What should we imagine when we hear the term school matureness? This term contains physical, psychical and social readiness of a child to enter the primary education system. The benchmark for entering is set in the Czech republic by the age of six, when certain criteria are met also by the age of five. In the case of children with visual handicap, the benchmark seems not to be ideal, so we usually talk about the delay of entering the primary education system. If we talk about those children, it is necessary to take into account the full scope of the progress pattern. The most frequent reasons for the delay are for example insufficient work pace, low perception level or intellectual abilities.

Keywords: school maturity; visual disability; education; diagnostics; inclusion.

1. Introduction

The issue of **school maturity** is a theme of enormous extent as well as considerable complexity, and it depends on the point of selected view when examining this field. Then it is more effective to clearly determine the boundaries of this term and its specifications.

Mertin and Gillnerová (2003, p. 219) define school maturity as follows: “Traditionally, school maturity refers, almost exclusively, to children. Their current cognitive, perceptive social and working maturity/readiness is being examined; their development in the earliest infant stages is being taken into account, as well as their actual health condition, laterality, the various aspects of their verbal communication, graphomotorics, etc. A child with certain parameters is then regarded as mature or ready for commencing school attendance.”

Bednářová and Šmardová (2011) state that: “school maturity can be defined as reaching such a stage of development (in the physical, mental, emotional and social spheres) that a child is, without difficulties, capable of taking part in the education process; or at least without major difficulties, and preferably with joy and eagerness.”

* Corresponding author: Dita Finková, Tel.: +420 604 337 211

E-mail address: ditafinkova@seznam.cz, dita.finkova@upol.cz

For a long time, the notion of **school readiness** was attached to the term of school maturity. Vágnerová (2000), however, comments on this issue that unlike school maturity, the development of school readiness is, to much greater extent, affected by learning. Kindertgartens and family thus play an essential role here.

Zelinková (2001, p. 111) defines school readiness in the following way: *“the notion of school readiness (competency) refers to more than biological maturing, to the level of pre-school preparation in terms of the child’s abilities, the influence of the environment and the family upbringing.”*

According to the authors Bednářová and Šmardová (2011), school readiness in principle encompasses competencies in the cognitive, emotional, social, working and somatic fields acquired and developed by the child through learning and social experience, especially in the kindergarten.

Růžičková (in Finková, Růžičková and Stejskalová, 2011) mentions the findings of Zelinková (2001) in relation to the terms and definition of both – school maturity as well as school readiness. *“We consider the term school competency as a suitable superior concept of school maturity and school readiness, which encompasses all requirements for the future first-class pupil from the psychological, medical, pedagogical and special-needs education point of view. The term is also fully acceptable for the purpose of the special-needs educators.”*

What is important then? Regarding the issue of both “school maturity” and “school readiness”, it is necessary to direct our attention to all aspects associated with the child’s development, whereas a substantial role is played by the involvement of the family and the pre-school facility. Cooperation between these two subjects is always required, together with communication, respect towards the activities of the other party (both from parents towards the kindergarten and vice versa) and mutual support. Effective interaction between the two parties has, among others, also a preventive character when it allows for partial elimination of the chances of school failure in the following period and also for enhancing the quality of life for the child’s future Růžičková (2011).

Further, we intend to tackle the issue of the correlation between school maturity and inclusion. This relation is evident from the point of view of incorporating a child into one of the educational trends in the Czech Republic, which significantly differs from the main stream. Here, we either speak of “special-needs” education or, on the contrary, of the so-called “inclusion”. This decision is made by the parents just at the moment of registering the child to compulsory school attendance. The level of the child’s school maturity is thus often one of the most crucial arguments for enrolling the child in a standard school, or, on the contrary, in a school specialised in children with certain impairments. A significant role is also played by the fact that whether the commencement of the child’s school was already deferred by one year or not.

Inclusion can be defined in the following way. Etymologically, the notion inclusion can be derived from the Latin word “inclusion”, which means a process of including or incorporating something within a whole. In case of people with specific needs, inclusion is associated mainly with the field of education, or possibly with socialization, i.e. social inclusion. Inclusion is interpreted as a condition when a person with a handicap is born into a society, which accepts dissimilarities and finds being different as normal. Inclusion is based on the acceptance of dissimilarities, whether it is gender, race, nationality, social background or a health condition. In accepting a child with impaired vision and incorporating it to a common education system, it is more accurate to speak of a form of integration than inclusion. Nevertheless, in a certain form and in respect to the society development and current tendencies, our society is advancing closer to near actual inclusion more than ever before. Inclusive education means arranging a standard school in such a way that it can facilitate adequate education to all children, regardless of their individual differences, the requirements for special needs and the resulting performances.

2. Diagnostic process focused on school maturity in children with visual impairment

Evaluating school maturity (and readiness) is an act of gathering information on the entire development of the child towards enrolment in compulsory school attendance. At present, assessing school maturity is most often carried out at the following stages: **evaluation at enrolment in the first class**, **evaluation at the school-consultancy facility** (mainly special-needs education centres or educational-psychological consultancies). However, a third subject - the **kindergarten** - may enter into this equation.

From the point of view of prompt intervention, finding the shortcomings in school maturity during enrolment in the school is rather belated. However, it is not rare that an educator discovers certain handicaps in children only at enrolment to school and only then recommends them for detailed examination in one of the school-consultancy facilities.

In case of children with visual impairment, the standard practice is that these children are enlisted in the records of the school-consultancy facilities, the special-needs education centres for the visual impaired, where each respective child is long-term monitored and the diagnostics pertaining to school maturity is then automatically conducted from the perspective of special-needs education and psychology.

The third possibility of how to diagnose school maturity is through the kindergarten teachers. This method of monitoring the child is rather marginal, but it can indicate a lot about the child and his/her prerequisites for school maturity and readiness. The outputs generated from a kindergarten teacher can be used for various purposes:

- The teacher can use this diagnostic tool as a benchmark for his/her own work, further on how to work with the child, what to develop towards the child's school readiness, etc.
- The outputs can serve for the teacher as a basis for recommendations to the parents, as to how to work with the child in the domestic environment.
- This diagnostic tool can be also used as an underlying material for further examination at a school-consultancy facility, in terms of diagnosing school maturity both from a psychologist and a special-needs educator.

In our text, we aim to focus more on the issue of diagnosing school maturity by a kindergarten teacher.

2.1. Conditions of the diagnostic process carried out by a kindergarten teacher

The diagnostic process in kindergartens tends to be related to and construed as a form of a continual diagnostics when a child is evaluated regularly in the course of the entire kindergarten attendance, i.e. 1-4 years. The child's development within the kindergarten focuses on a single aim – to prepare the child for primary school attendance, naturally taking into account the developmental specifics of each individual. The teacher knows the child well, the child knows the teacher and the environment and that is why, also from the point of view of the diagnosing school maturity, we prefer to conduct the examination in conditions that are relatively amicable and natural to the child. Diagnostics in kindergarten is favourable also due to the fact that the performance of a child coming to a school consultancy facility only a few times may be hindered by the rather unknown environment and the hitherto "unknown" people who are expecting to see a certain accomplishment at a certain given moment.

Another argument supporting our attempt at conducting the diagnostics in kindergartens results from the **teacher's profile** and the competencies, when it is obvious that a teacher should be capable of conducting the diagnostics. A teacher's profile includes, according to Průcha (1997), four fundamental moduli relating to

profession/subject, teaching/psychology, and the general and practical competencies moduli. According to Spilková (in Nezvalová, 1998), the following teacher's **competencies** can be subsequently deduced - competencies relating to profession/subject, psycho-didactic, communicative, organizational and managerial, **diagnostic competencies**, interventional and consulting competencies and the ability of reflection on one's own activities. We assume then that a kindergarten teacher is not only able to use this diagnostic tool for assessing school maturity but also to evaluate the results for his/her needs.

What do we stem from? For the purpose and possibilities to conduct the diagnostics of school maturity in a kindergarten, we apply the general well-established diagnostic tools. In general, these methods include: **anamnesis or history taking, dialogue, tests, and the analyses of activity results**. In terms of a concrete diagnostic approach, we focus on the following fields: **motorics, perception, communication, mental powers, laterality, spatial and time orientation, social factors, psychical and physical characteristics, behaviour, and the level of abilities and skills**.

In this respect, there exist many standardized as well as non-standardized diagnostics tools, which are, however, usually applied separately. Due to effectiveness and for the purpose of basic orientation of a kindergarten teacher, **it would be suitable to use only one time-undemanding diagnostic tool**. This diagnostic tool should be designed to include all basic fields necessary to monitor children, to be brief and it should be possible to interrupt the process due to the child's needs. We find it also necessary to abide by the rules of visual hygiene during conducting the diagnostics in children with visual impairment. Another important factor is the creation of such a diagnostic tool, the results of which might be applicable both for a special-needs kindergarten teacher for visually impaired children and for a standard teacher from the kindergarten where the child is integrated.

3. Screening of school maturity in short-sighted children

The issue of school maturity from the special-needs-education point of view is one of the project inputs, which the authors are working on at the moment. This project is called "Initiatory analysis of the conditions for inclusion of people with specific needs", which is solved within the student's grant competition at the Palacký University in Olomouc (Czech Republic) Pdf_2013_016.

One of the objectives of the project was to design and verify the diagnostic tool (screening), which would correspond with the needs of kindergarten teachers and with the conditions mentioned above. Further on, we are going to speak of screening. This **screening** is designed as a fundamental orientation (exploratory) tool, which should indicate to a kindergarten teacher whether the short-sighted child appears to be mature for entry to compulsory school attendance or not.

3.1 Definition of procedures and methodology

In principle, the authors followed their studies of professional literature relating to the diagnosis of school maturity in children. Further on, the issue was consulted with a psychologist and a special-needs educator operating in a special-needs-education centre for visually impaired children. At first, it was ascertained which diagnostic tools (standardized as well as non-standardized tests, clinical methods, development scales, etc.) are available for examining school maturity. School consultancy facilities carry out the diagnosis from a complex point of view, i.e. they apply more diagnostic tools as per need. The application of this practice is not suitable for kindergartens, both for time and professional reasons. Consequently, a complex **screening** was designed as a fundamental orientation (exploratory) tool.

From the methodological viewpoint, this can be classified as a qualitative research. We regard the following **definition of qualitative research** by Švaříček, Šed'ová and coll. (2007, s. 24) as befitting: “*The substance of the qualitative research is a wide-spread gathering of data without determining the basic variables at the beginning. Similarly, no hypotheses are set in advance and the research project is not dependent on the theory established prior to the research. The aim is to investigate, in detail and in relevant context, a certain loosely defined phenomenon and to present the maximum amount of the collected information. The logics of the qualitative research are inductive; only after gathering a sufficient amount of information can the researcher begin to search for regularities, conceive the preliminary conclusions and only then look for further arguments supporting these conclusions from the data*”. The output is seen, by the authors, in a newly formulated hypothesis or theory. They continue to quote Strauss and Corbin (1999) that the methods of qualitative approach are applied for discovering and understanding the very substance of phenomena still rather obscure for us so far. Simultaneously, the method might also uncover some new views on the phenomena apparently well-known to us.

By a definition derived from empirical medicine, which works with this term, **screening** can be specified as a method of detecting the early forms of disorders or deviations from the standards within a certain population through tests. *Slovník cizích slov.net*, [on line]. [cit. 12.5.2013] Available from: <http://www.slovník-cizich-slov.net/screening-skrinyng/>

In medical interpretation, screenings play an important role especially in prophylactic medicine and are a part of the routine medical examination. Medical screening brings about two advantages – an impulse to a change and early discovery. For the purpose of this work, it is possible to find an analogy with defining the term screening. **It is a method of finding children who are not mature enough to commence compulsory school attendance and thus differ from majority population of children at the given age range.** On the basis of the conducted screening, parents as well as educators acquire information revealing the pending risk of failure in school performances and, at the same time, the fields where the risks occur are indicated.

In the course of creating the screening itself, we took into consideration the need to embrace the following fundamental fields to be monitored in a child:

- **Maturity level of cognitive functions:** here, we focused on evaluating the motoric, perceptive and communicational levels. Pre-mathematic images were also assessed.
- **Monitoring of ability to work (working prerequisites and habits)** concentrated on measuring attention and evaluating working maturity.
- **Maturity level of the personality (emotional-social maturity)** required targeting the evaluation of the emotional and social maturity.
- **Evaluation of the somatic development and the health condition** was focused, above all, to the specification of the diagnosis and the related aspects.
- **Evaluation of laterality** in terms of focusing on the phenotype.
- **Evaluation of mental powers** subjected to examination, e.g. ability to differentiate objects by certain criteria, generalization of the findings and mental processes.
- **Evaluation of memory** measured the skill to memorize intentionally, endurance, etc.
- **Evaluation of the self-service level.** In the given case, it was necessary to monitor self-service activities in every-day life.

Certain parts of the screening were adjusted to the needs of the short-sighted children – e.g. pictures respecting principles of eye hygiene (first of all, requirements for clear contrast); the picture size was also taken into account. It was, however, possible to use standard sizes providing that the child can use, e.g. table camera magnifying glass.

Among others, the research focused on verifying the possibilities to apply screening in short-sighted children. Prior to the core research, the authors themselves conducted pre-research using the compiled screening and based on the ascertained data, individual **case studies** of tested children were elaborated.

A case study is defined by Průcha, Walterová and Mareš (2001, p. 104) as follows: “*a research method in the empirical education research when the examination is subject to the individual case (e.g. pupil, small group of pupils, individual class, school, etc.), described in detail and explained thoroughly to such an extent, which is not possible to achieve in collective gathering. The advantage of this method is the possibility of deeper knowledge of the substance of the case; the disadvantage is the limitations in generalizing the outputs*”.

It can be added that the adjective “*empiric*” stands for the basic needs of the case study based on the collection of real facts related to the research object. According to Yin in (Švaříček, Šed'ová and coll., 2007), a case study is considered to be a comprehensive strategy of the scientific research, which shows certain characteristics, such as:

- The case as a subject of the research of the case study is an integrated system with defined borderlines (spatial as well as time limits),
- Investigation of the basic phenomenon is always done in real context and under conditions as close to natural occurrence of the phenomenon as possible,
- All available sources and methods of data gathering are applied in order to acquire the relevant information.

In the case of this research, the **case study is focused on children with short-sightedness in the diagnostic process aimed at determining school maturity**. The individual above-mentioned characteristics are fulfilled as follows:

- Within the framework of the case study, children with short-sightedness were examined in a specific time span of 4 hours/1 child in the period from January to June 2013. The selection of children was targeted, the fundamental criterion is the level of the visual impairment “short-sightedness” and also that the children be born between 01.09.2005 and 31.08.2007, who will commence (or should commence) compulsory school attendance on 01.09.2013 according to the valid legislation of the Czech Republic.
- Examination is conducted in conditions that are very natural for children, i.e. the kindergarten they regularly attend.
- Relevant data is obtained from several available sources, such as screening and its evaluation, child monitoring and the study of the child’s documentation presented in the form of casuistry (form of a case study).

Our research objective focuses on examining several cases with the aim to verify the applicability of screening in short-sighted children and gathering the necessary underlying material confirming or contradicting the usability and needfulness of the compiled screening.

4. Pre-research and its results

Pre-research was conducted mainly in Moravia (Eastern part of the Czech Republic) located in the former district of Olomouc on the grounds of good accessibility and satisfactory long-term cooperation with the Special-Needs Centre for visually impaired children in the given region, and in Prague (the capital of the Czech Republic). 10 children took part in the pre-research. **The basic research investigations** shall be conducted in the following period at various locations all over the Czech Republic, depending on the possibilities and the availability of individual children recommended by particular special-needs centres for the visually impaired.

The selection of children was targeted, the basic criterion being the level of the visual impairment

“short-sightedness”. All children were born between 01.09.2005 and 31.08.2007 who will commence (or should commence) compulsory school attendance on 01.09.2013, according to the valid legislation of the Czech Republic.

The research was conducted in natural conditions well-known to the children – in their respective kindergartens.

Table 1. Case study 1. Girl K. J., 5 years and 6 months, (severe short-sightedness, cortical blindness, hydrocephalus)

Field of fine and rough motorics	
Rough motorics	Within standards
Fine motorics	Shortcomings in the field of fine motorics, lack of skills when working with small objects, cutting, etc.
Field of graphomotorics	Difficulties with gripping the pencil. Difficulties in painting: drawing a human figure is at infantile level, the picture is still missing significant details. So far, she is not able to draw a circle, a straight line, she has difficulties in copying a group of dots (difficulties with a single dot as well).
Laterality	Phenotype: the girl is left-handed.
Perception	
Visual perception	With respect to her diagnosis, certain problems with distinguishing colours (similar in shades) may occur occasionally.
Acoustic perception	Within standards
Speech and skill to express oneself	
Contextual side of speech	Within standards
Formal side of speech	Within standards, only pronunciation of “ r and f” is disturbed
Mental power	Minor shortcomings in the field of general knowledge in relation to acts, objects and the Nature.
Attention	She can keep her attention focus for a limited period of time. Concentration of her attention depends more on the task to be done.
Memory	Minor disproportions occur.
Pre-mathematical images	She is not mature in this field. She needs to be trained with illustrative objects. The activity has to be changed frequently!
Emotional maturity	She finds it occasionally difficult to postpone fulfilment of her wishes. She is sometimes impatient.
Social maturity	Within standards
Self-service skills	Within standards
Working maturity	She manages to fulfil the submitted tasks, respects the work routine, but only under the guidance of a suitable educator.

The girl was born prematurely in the 7th month of pregnancy. She is a twin. At present, she attends kindergarten. She is allocated to a group of children with diagnosis of autism, mental retardation and ADHD.

Examination results by applying screening:

With respect to the above-stated outputs, the girl is recommended to practise exercises for developing fine motorics so that she is, in case of further deterioration of her visual impairment, able to use the braille alphabet and to orientate herself in micro-space. Difficulties in graphomotorics may, in the future, lead to problems in the practice of writing skills. On-going speech therapy is required. Intentional attention is, for the time being, rather short and does not correspond with the average for this age group. Frequent motivation to work is necessary. She is not mature in the field of pre-mathematical images. Certain problems occur with being patient; she does not accept putting off satisfying her needs. She is within standards in the fields of social maturity and self-service. Occasional supervision and regulation from a teacher is required in the field of work maturity.

Taking into account the diagnosis, the age and the examination results, it is recommended to defer regular attendance due to the overall immaturity of the girl. It might be desirable to change the kindergarten or, at least, the class. The class the girl attends is not an impulse or interesting for her any more. There exists a likely relation between the general immaturity of the girl and the uninspiring and un-motivating environment of the kindergarten class. Deferring school commencement by one year and changing the kindergarten should allow her a satisfactory start to compulsory school attendance.

Conclusion

The study brings a view of a specific issue of diagnosing school maturity in short-sighted children. The objective of the study was to show that even a kindergarten teacher is competent enough to carry out the diagnosis and is able to draw general conclusions from the research outputs, which is important for the educator as well as for the child's parents. The created screening serves then as a fundamental tool indicating to the people involved whether the child is ready for compulsory school attendance or not. The application of screening and its results was demonstrated in the brief case study of a girl. With respect to her diagnosis and the examination results through screening, it is evident that the girl requires a one-year deferral of compulsory school attendance. In the future, it might be, however, possible to consider inclusion of the girl, owing to her abilities and the absence of mental retardation. In a year's time, the girl will undertake another control examination at the school consultancy facility and, based on the acquired results and subsequent discussion with her parents, a suitable form of school education will be devised. In the Czech Republic, it is always up to the child's parents to make the final decision.

4th International Conference on New Horizons in Education

The leading as a factor of readability: development of the methodology for educational use

Dmitry A. Tarasov^a, Alexander P. Sergeev^{a*}

^aUral Federal University, Department of Printing Arts and web-design, Mira, 32-R041, Ekaterinburg 620002 RUSSIA

Abstract

The work is dedicated to the development of methodology for assessing the readability on paper substrates (as textbook samples) and laptop screens (as web content samples) and analyze the influence of leading on the reading speed. New approach: the readability was assessed by the continuous reading speed of dissociated texts on paper substrates and laptop screen. The research was conducted on the sample of 100 student age persons in Ufa city, Russian Federation. It is found that the dependence of continuous texts reading speed on the paper substrates and laptop screens from the leading has a maximum in range of 1.6–2.2.

Keywords: Education, Leading, Qualimetrics, Readability, Reading speed, Text.

Introduction

In recent years, it is observed a decrease in demand for printed media and so in electronic book readers and in whole electronic media. Serious, but technically avoidable lack of electronic publications is a lower resolution of text on computer or book reader screen in comparison with its printing reproduction. The consequence is a reduction in the readability of electronic text, large burden on the user's eyes than when reading printed material. These problems are especially sharp in educational process because of the influence of readability on the text perception and so on the quality of education in the end. The perception of the text presented in digital form depends on the characteristics of the screen display. The perception of the printed text depends on some spatial characteristics of the page and font used. Therefore a necessity to adjust the typesetting of print and electronic media rules in order to improve readability appears.

The aim of the research was to develop the methodology for assessing the readability in education and to investigate the perception of the text-based information from one of the main spatial characteristics of a type page area — leading. The research was conducted by direct interview and questionnaire. It involved 100 student age respondents from the Institute of Professional Education and Information Technologies of the Bashkir State Pedagogical University and Military department of Ufa State Aviation Technical University.

1. Readability investigations

1.1. Readability and main features of text and font

The analysis of researches in the field of readability shows insufficient scrutiny of issues related to finding the best representation of the spatial characteristics of textual information. Thus, the research of perception of the spatial characteristics of the type page area on the example of leading seems to be much actual. Readability is a property of the text material which characterizes the ease of perception of it by a man. The main readability criteria of the specific typographic sample is reading speed of this sample. The measure of readability is the time in which one can read the text.

Also readability is one of the major advantages of a good ("readable") font. The readability of fonts is determined by speed, i.e. quickness of perception, and the readability of individual characters, and the text as a whole, as well as the accuracy of comprehension without undue stress and fatigue. When reading due to a readable font the eye pressure doesn't increase (Glushkova, 1987), the attention concentrates mainly on the information itself, rather than the means of transmission. So it is advisable to choose a set of quality and legible fonts to text typing on the prepress stage, as well as the correct choice of other text typing parameters and layout. Font readability is influenced by:

1. Form of font characters: a picture or font type, size, sign proportion ratio of the width to its height, rhythm shape, weight, color;
2. Typographic composition: the string length or font field width, space around the line or font field, leading, the form of lines, rhythm of lines and text composition, color solution;
3. Font definition: the ratio of the font color to the background color, texture, quality of performance;
4. Font clarity: recognition of signs, it's differentiation, justified shapes simpleness, represent of the content.

Necessity of obeying the readability requirements caused by psychophysiological characteristics of man, manifested in the process of reading and understanding the text (Smirnov, 2007).

Question of the font size influence on legibility in a coherent text is well studied and confirmed by practice. Most readable font size for the text connected to adult skilled readers is the size of 10 points (Dubina, 2004). Smaller font sizes are read with a lot of stress when placing signs. If the font is too small, the reader is often "lost line": having read to the end of the line, hardly finds the beginning of the next one. With too large font sizes line, by contrast, are shortened, resulting in some of the transitions to the next line. Because of the lower resolution of the PC screen font characters legibility is deteriorates. Therefore, the screen font has to be larger than paper printed.

James Felichi (2004) gives several ways to determine the optimal length of the line:

1. The optimal length is equal to 1.5-2 lengths of alphabet line length. Alphabet line length - a line that contains all lowercase alphabetic characters.
2. Optimal length line should contain 9.10 words on average consist of five letters each.
3. The minimum length of the line is 27 characters, the optimum length - 40 characters, and the maximum - 70.

Leading factor is calculated by dividing the line spacing to the font size (in points). Line spacing - the distance between the baselines of the text. Baseline – an imaginary line along the bottom edge of the main element of character. In Fig. 1 shows the basic lines of text, and the distance between them.

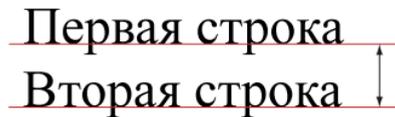

Fig. 1. Line spacing

1.2. Readability researches

History of readability research dates back more than 100 years. Cattell (1885) attempted to assess the readability by tachystoscopic measuring of the recognizability threshold. Tachystoscopia is allow to determine the minimum time required for recognition of characters, words, groups of words. Cattell found that sight when man reading is not moving monotonically in line, but jumps with short intervals, covering just eight or nine characters. With each fixation eye takes three or four letters. But in fact, sight motion when reading text is even more irregular, since fluency, knowledge of the meaning and syntactic structure of the text allow to not peer into individual letters.

Based on these studies, Cattell placed lowercase letters of the alphabet in their degree of recognizability in sequence. Sanford (1987) had repeated studies, but using a different font, he received another letter order. This suggests that the fonts do differ in their recognizability.

A report by Pyke (1926) summarized the results of studies of readability. Report noted the fragmentation of research and the lack of a systematic approach to the research of text recognition and readability. Pyke himself singled out 15 readability criteria:

1. reading speed;
2. recognizability threshold distance;
3. volume of perception;
4. threshold of focus;
5. fatigue;
6. number of fixations;
7. number of returns;
8. eye movement regularity;
9. rhythm of reading;
10. readability factor (sum of letters area, divided by the total area of perceived letters);
11. specific readability (the multiplication of the readability on the printed area of letters);
12. height of letters;

13. height of signs;
14. subjective judgments of readers;
15. aesthetic judgments of readers.

Based on the analysis, Pyke concluded that readability is not to be confused with the letters and words discernibility, it should be studied separately from the discernibility. He proposed to assess the readability by comparing the text read with that is understood when read. Thus, it was concluded that the readability should be judged not by the disparate characters, but on the examples that contain meaningful text. Then there was the question of the speed of reading. The reading speed means the amount of time which takes to read a particular text. First reading speed as a readability criteria was proposed by Weber in 1881, but actually became considered after the Pyke's report.

In 1920th U.S. researchers (Tinker, Paterson, 1929) got the following results:

1. Text typed with capital letters, read by 11.8% slower than typed with upper and lower letters;
2. Italics not slow reading speed, if used short;
3. Bold no less readable than light, and sans-serif fonts are not inferior to the readability of serif fonts.
4. Fonts from a size 8 to 13 are equally readable with a size optimal for a given length of the string.

Black text on yellow paper, green or blue text on white paper, read a bit slower than the black text on white paper. White on black read about 10% slower than black on white.

In the USSR the research of a comparative readability of fonts was conducted in 30-40th of XX century in OGIZ research institute, in 50-60th of XX century in the department of movable types of Polygraphmash institute. Artemov (1933) proposed to distinguish the concept of visibility and readability of font, as readability significantly affected by the certain physiological reading characteristics of the reader, while the visibility of the font depends on the quality of type faces and features of the person's vision. In 1973, in the Moscow Polygraphic Institute Geshev (1973) and Kolosov where investigated the effect of font size, string format, inter-word spacing and leading on the text readability. It was concluded that the optimal value of inter-word space is constant and independent of other factors. The optimal value of the font size and format of the string is the smaller, when the font is more readable (Tokar, Zilbergleit, Petrova, 2004).

Wide paragraph gives the best results in reading speed, but eyes get tired faster. The fact is that after reading one line, the eye must be tuned to the next line. And in a long line, the eye has to overcome a greater distance, making it harder to find the following line (Vakorin, 2005). Also since the late 19th century, there have been many studies on the optimal line length for printed publications made, but the ideal solution has not appeared.

Readability is also associated with the color. Text in black and white is hard to read on a computer screen. The human eye is much easier to perceive colored letters on a colored background. (Teksheva, 2008) When reading from the computer screen during the stable performance does not occur, underscoring the increasing complexity of visual work when reading from the monitor. Considering not only the speed of reading, but also the number of errors, the optimal screen colors will be slightly different. Preference should be given to the blue signs on a yellow background, the yellow signs on a blue and red signs on the green. In addition to the best color combinations, is set the screen brightness level (from 35 to 120 cd/m²), and the total uneven brightness on the screen should not exceed 40%.

The most objective and functional method of readability researching is considered to be the method of reading speed measuring. It is to determine the time of reading a text of a given size (Tokar, 2011). And this method is used in this work. The new approach was to develop (by special software) the artificial dissociated text for use in the assessments. It was made to eliminate the cognitive component affecting to the reading speed. In this research, the text reading speed was adopted as a main criterion of specific printing solution in the hard copy version readability. When considering the various leading readability some contradictions that have led to finding the optimal ratio spacing for printed and electronic texts have been found.

2. Sampling and procedure

2.1. Sampling

As respondents 100 students (age 20-22) were selected. The experiment was conducted in daylight in the classroom of the Bashkir State Pedagogical University, Ufa, Republic of Bashkortostan, Russia.

As a stimulus material 13 dissociated texts of 1000 characters were generated. Texts were placed to individual pages with different leading values and under identical set of other parameters: font Times New Roman (known as knowingly readable), font size 14 points, margins 2 cm, indentation 1.25 cm, justification for the width of the page, text color is black, paper color is white. Selected leadings (according to MS Word 2007): 0.8, 1.0, 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.7, 1.8, 1.9, 2.0, 2.2. Stimulus material was printed on writing paper A4, 80 g/m² by electrostatic laser printer Konica Minolta bizhub C220. And so it was generated as set of PDF files to preview on the laptop. The average line length was 164.84 mm and 73 characters (include spaces). As addition line spacings and leadings on all printed pages were measured by microscope with a metric ruler, and metric leading factors were calculated. The following values (accordingly leading values given above) have been obtained (see Table 1).

In the first phase of the experiment the time of reading the texts with various leadings has been measured, and the perception of the paper printed text patterns has been evaluated. Respondents were asked to read the series of 13 variants of stimulus material with a comfortable for themselves speed, without gaps or repetitions. Reading time of each page was controlled with stopwatch.

Table 1. Values of line spacings and leadings on the printed texts

Leading (by MS Word)	0.8	1.0	1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8	1.9	2.0	2.2
Line spacing, mm	4.56	5.66	6.21	6.80	7.35	7.95	8.54	9.04	9.64	10.18	10.78	11.33	12.50
Font size, mm	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50
Calculated leading factor	1.01	1.26	1.38	1.51	1.63	1.77	1.90	2.01	2.14	2.26	2.40	2.52	2.78

For the second phase of the experiment nine texts of the stimulus material created in the first phase were selected. Leadings were the following: 1.0, 1.2, 1.4, 1.5, 1.6, 1.7, 1.8, 1.9, 2.0. At this stage, the values of text

samples reading speeds from the screen of laptop Asus A52F (15.6", ratio 16:9, resolution HD (1366x768 pix), LED backlight, color profile AdobeRGB1998) were obtained. Respondents were asked to alternately read 9 pages of the stimulus material. Reading produced in Adobe Acrobat 9 Pro at full screen, fit page. Reading time was controlled with a stopwatch.

2.2. Data preparation and processing

For the preparation for processing of data obtained during the experiment Microsoft Access 2007 was used. The file structuring the data obtained was created in the program. Values of time spent on reading the text of 1 000 characters were transferred to the values of reading speed in characters per second. For the further work with the data an arithmetic average of reading speed for each leading, standard deviations, standard errors, confidence intervals $p = 0.95$ were calculated.

3. Results and discussion

On the basis of a structured database the plots of dependence of reading speed from the value of leading were drawn for printed and electronic texts (see Fig. 2) as well as the corridors of confidence intervals $p = 0.95$ for both curves. For clarity, each of the plots was approximated with polynomial curve. Plot in Fig. 2 shows that the maximum paper printed text reading speed is observed with leading 1.7. Reading speed at this point - 21.0 char./sec. Thus, it is shown that the dependence of the text reading speed from the leading has a maximum. In particular, the observed maximum lies in the range 1.6-2.2. On the plot of dependence of electronic text reading speed from the value of leading the maximum reading speed is 17.7 char./sec. It achieved with leading 1.9. However, it's found no statistically significant effect of leading on the electronic text reading speed (determined by visual comparison of plots).

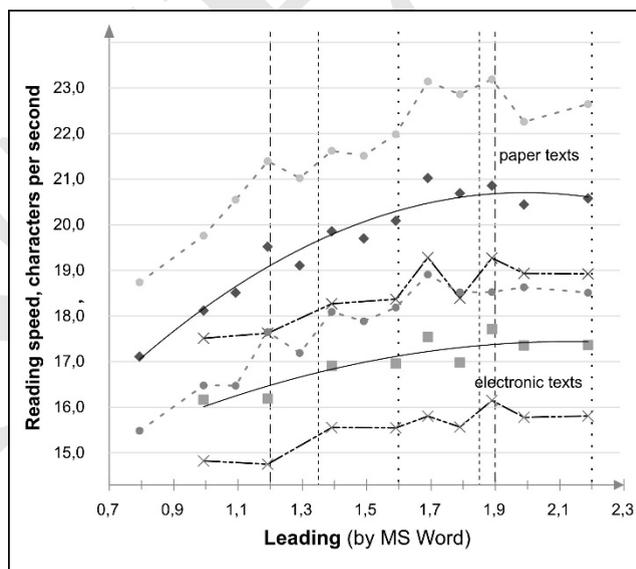

Fig. 2. Dependence of printed and electronic texts reading speed from the value of leading, corridors of confidence intervals $p = 0.95$

4. Conclusion

When considering the question of readability with various leadings some contradictions have been found. It has led to the need to find the optimal leading for printed and electronic texts. It was also noted that in the national researches of readability the factor of subjective perception not taken into account or had no effect on the final conclusions. Therefore, we attempted to identify the laws relating the perception of the text and its spatial characteristics. The analysis of the literature led us to the formulation of hypotheses: the dependence of reading speed from text leading has a maximum. To test the hypotheses two experiments with 100 respondents were designed and conducted. Then developed a method of processing the data, allowing to obtain the valid conclusions in terms of research objectives.

Processing reading speed data using t-test showed that the dependence of printed text reading speed from the leading has a maximum. In particular, the observed maximum located in the interval (1.6;2.2). Statistically significant effect of the leading on the electronic text reading speed was not found.

Results of research can be used to optimize the texts makeup in order to facilitate its perception, which will improve the quality of information assimilation, especially in field of education. Because the research was based on Cyrillic texts it's much of interest to get the same data about Latin ones.

4th International Conference on New Horizons in Education

The ludic and powerful Mayan mathematics for teaching

L.F. Magana*

Instituto de Física, Universidad Nacional Autónoma de México. Apartado Postal 20-364, Código postal 01000, México, Distrito Federal, México.

Abstract

Apparently, the Mayas discovered and used the abstraction of zero many centuries before any other culture, about 400 years before our era. Some of the remarkable cultural achievements of the Maya people show the need for a mathematical tool, powerful, and accurate. In this work, we describe the numbering system that was positional, similar to that currently used, but using base 20, and with only three signs: the point, the bar, and the zero. The latter was represented in different ways. The most common was the snail shell. Here we show, how with these three signs, all operations were performed. We exhibit the advantages of using dots, bars, and snail shells, to perform arithmetic operations. We show how to use the Mayan system in base 10, for a fast understanding. We display on this basis, the operations of addition, subtraction, multiplication, division, and square root without using tables. It is an elegant, dynamic, ludic, and intuitive process. We also show some initial results obtained from the application of this method for teaching mathematics in elementary schools in Yucatán, México.

Mayan mathematics; base 20; base10.

1. Introduction

The Mayas wrote their numbers vertically and using dots, bars and seashells. They used base 20. In figure 1, we show the first 21 Mayan numerals. Notice the blocks of powers of 20 in the vertical direction and notice that 5 points are equivalent to a bar. In figure 2, we show the representation of the number 4002 using the Mayan system. The methodology that, more likely, used the Maya to conduct their operations included the following rules [Morley, 1968;Thompson, 1941].

- I. Five points are equivalent to one bar in the same level.
- II. One bar is equivalent to five points in that level.
- III. Four bars in a level are equivalent to one point in the superior immediate level.
- IV. One point in a level is equivalent to four bars in the inferior immediate level.

☉	0X20	20 ¹
..	2X1	20 ⁰

Figure 2

Here, we will use the same methodology to perform arithmetic operations, but we will do it in base 10 for reasons of clarity. We show, in figures 3 and 4, Mayan numerals in base 10. Notice now the blocks of powers of 10 in the vertical direction. To perform arithmetic operations in base 10, we will use the following rules [Magaña, 2003, 2010, 2012], which are the same as the Mayan rules, with a small change only.

- I. Five points are equivalent to one bar in the same level.
- II. One bar is equivalent to five points in that level.
- III. Two bars in a level are equivalent to one point in the superior immediate level.
- IV. One point in a level is equivalent to two bars in the inferior immediate level.

It is not necessary the use of tables of any kind to carry out the arithmetic operations. We can perform the addition, subtraction, multiplication, division and square root. The mathematical proofs that support this methodology are suggested by Calderón (1966) and given by Magaña (1990).

Figure 4

2. Addition

We make the operation $161 + 671$, as we indicate in figure 5. We make the addition in figure 6, grouping points and bars on each level and transforming bars into points, as shown figure 7. For every two bars, we put a point in the superior immediate level, like in figures 7, 8 and 9. We show the result in figure 9, and is 832. For adding several numbers, the procedure is the same. The addition of many numbers can be done very quickly.

Figure 5

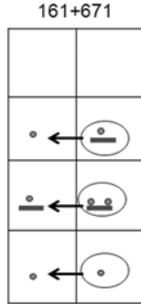

Figure 6

Figure 7

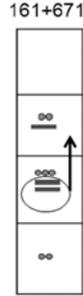

Figure 8

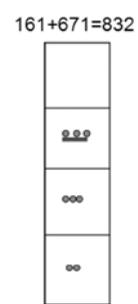

Figure 9

3. Subtraction

The rule for the subtraction is that one point annihilates one point, and one bar annihilates one bar. We will perform the subtraction $752-644$. Notice that in figure 10, the number 752 is in the column on the left, and the number 644 is on the right. We work on the minuend without altering the subtrahend. We proceed along for each level, starting from the lowest one. In figures 10 to 16, we describe the subtraction procedure. In figure 12, we change one bar by five dots. Then, one dot goes one level down, becoming two bars, as shown in figure 13. Afterwards, we convert one bar into five points again, as we show in figure 14. Then, we culminate the subtraction as we show in figures 15 and 16. Notice that we can make the test of the subtraction just by summing the final numbers on the left column, and in the column on the right in figure 16. This means $108+644=752$.

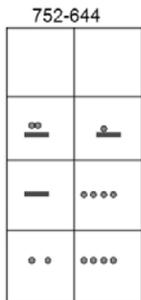

Figure 10

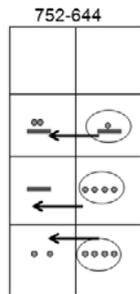

Figure 11

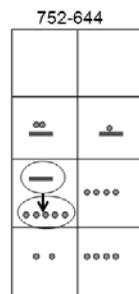

Figure 12

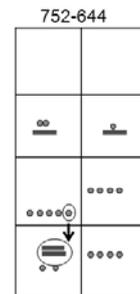

Figure 13

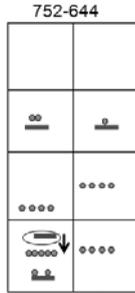

Figure 14

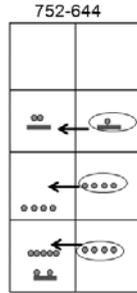

Figure 15

Figure 16

4. Multiplication

We do not need tables to perform a multiplication. We show this in the following example. Let us make the product 312×135 . We put the factors outside the board; one (312), vertically and the other horizontally, like we show in figure 18. Then, we reproduce in each square, the figure that we have to the left by outside the board, so many times, as the number of the superior part indicates. Clearly, we can perform the reciprocal operation too. We do the easier of these two possibilities. We put a group of three dots, or thrice a dot in the first square of the left column. In this way, we solve the squares of the initial column on the left, as we show in figure 19. We solve the squares of the following columns in a similar fashion, as we show in figures 20 and 21. We have almost finished the multiplication.

Then, we start the final part to obtain the product. We group along the main diagonal, as we show on the figure 22. Each transversal diagonal corresponds to a power of 10. Afterwards, we use the rules we have given above. Each group of five dots is transformed into a bar, and every two bars become a dot in the superior immediate level, leaving a zero (this is a seashell) in its place. After doing this, we read the result directly along the main diagonal. The square of the right inferior corner corresponds to the units. We show the sequence in figures 23 to 25. Notice that in the figure 26 we have left a seashell in the square corresponding to the units. Now we read in the figure 25 the result: 42120.

Figure 17

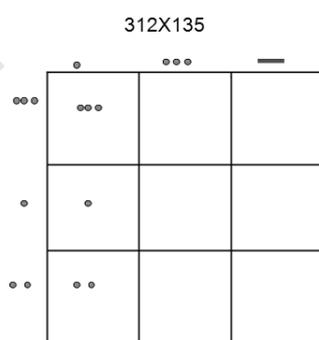

Figure 18

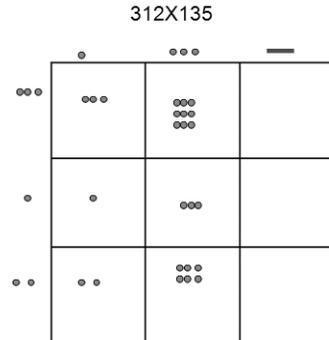

Figure 19

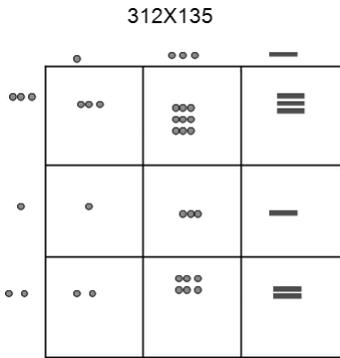

Figure 20

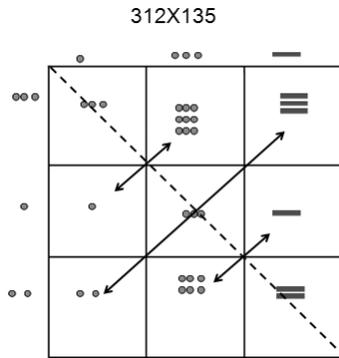

Figure 21

Figure 22

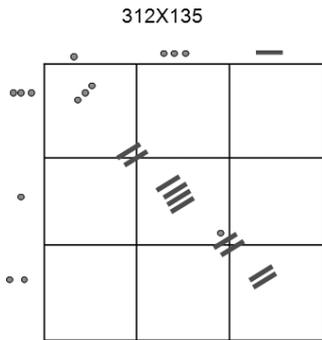

Figure 23

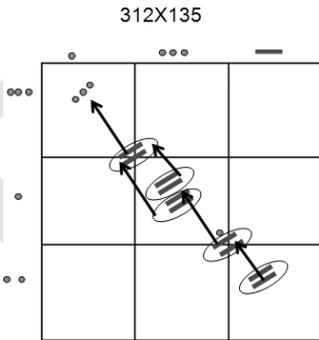

Figure 24

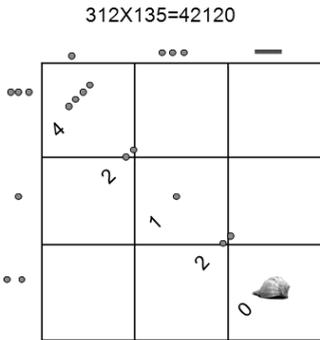

Figure 25

4.1 Non square matrix products

Now let us make the product of two numbers, which does not lead to a square matrix. We perform the product of 12 times 251. We show the sequence in figures 27 to 35. The dashed line indicates the main diagonal. We group along this diagonal, as we show in the figure 29. Then, we transform each group of five dots into a bar, and

every two bars become a dot in the superior immediate level, leaving a zero in its place. The result is in the figure 32, along the main diagonal: $12X251=3012$.

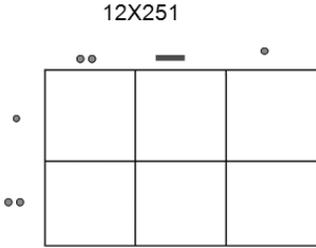

Figure 26

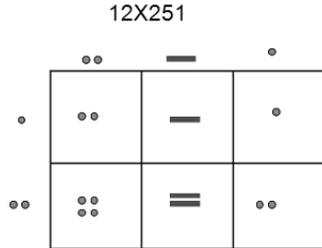

Figure 27

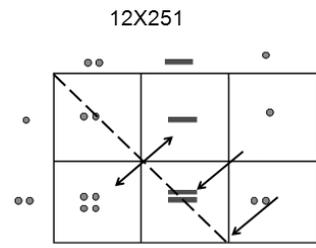

Figure 28

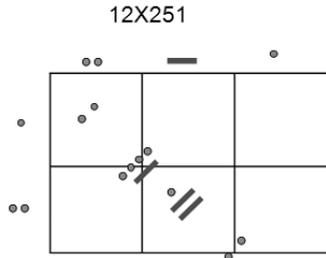

Figure 29

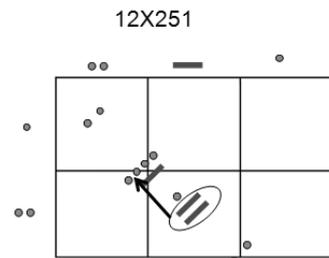

Figure 30

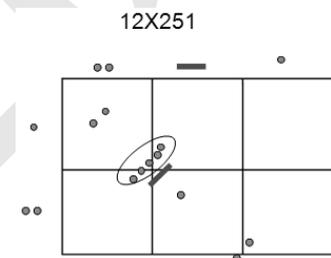

Figure 31

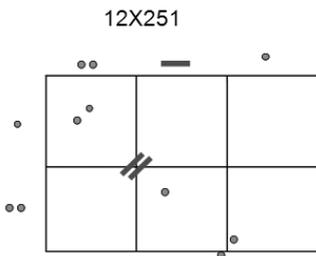

Figure 32

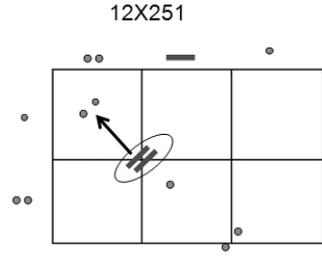

Figure 33

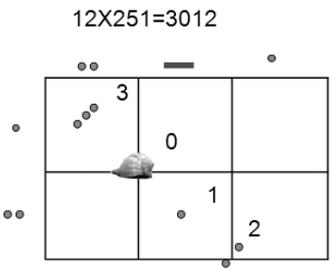

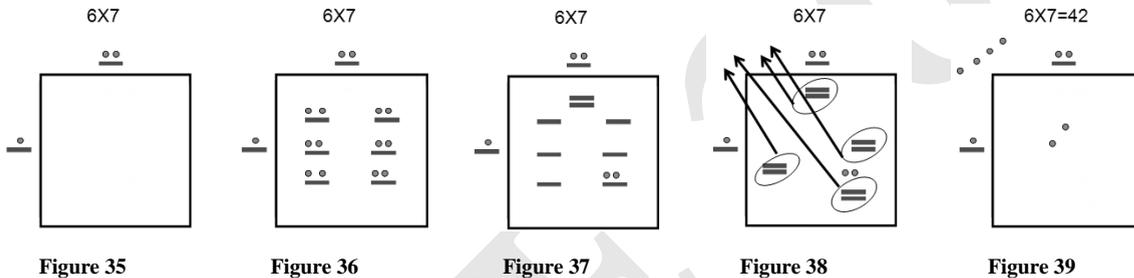

Figure 34

4.2 Constructing the multiplication tables

Let us now consider the product of two digits. We show how to obtain the product of six times seven. This is a typical case when students memorize without understanding the meaning of what they are doing. With this method, it is not necessary to memorize the product. They can reproduce it as many times as they need. However, what is more likely is that at large, they will memorize the result after going through the procedure enough number of times. For this case, our board is made of only one square. We place the factors outside of our board, as we show in figure 35. In the only square of our board, we reproduce six times one bar and two dots, as we show in the figure 36.

Then, we exchange every five dots with one bar. This means that we have to put two additional bars; see the figure 37. Afterwards, we substitute every pair of bars for one dot on the immediate superior level. We have four pairs of bars, which we show encircled in the figure 38. These four pairs correspond to four dots in the immediate superior level; see the figure 30. Finally, we can read the result: 42, in the figure 39.

5. Division

This is the inverse operation of the multiplication, and thus we will solve it. The dividend is conceived like the product of two numbers. One of them is the divisor and the other, unknown, is the quotient. Therefore, the dividend is placed on the main diagonal of the board. We use our knowledge on the multiplication to go backwards, in order to find the missing factor, which is the quotient.

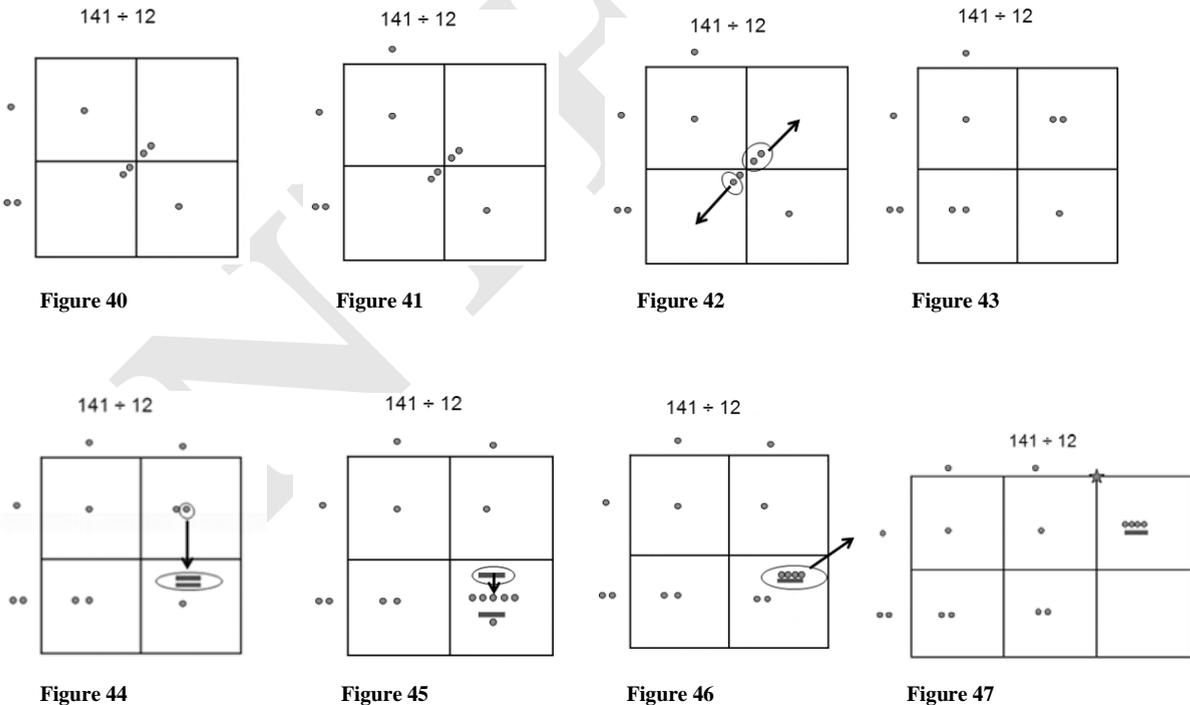

Let us consider $141 \div 12$, see figure 40. We will put the divisor in a vertical form and by outside of the board. The quotient will be in a horizontal form and by the exterior of the board too. These locations can be exchanged with no problem. We begin the division proposing a number to be in the external part, by above of the square of the left corner. This choice is such that, reproducing the first figure external to the left (one dot) as many times as the number that we are looking for, we obtain the dot of the left superior square on the board. Clearly, we are following an inverse way from the multiplication.

We find that we have to put one dot, as we show in the figure 32. With this, we satisfy the multiplication rules for the first square of the initial column. In order to complete the inferior immediate square of the same column, we see that we need two points. We take those two points from the number that is in the diagonal, as we show in figures 41 and 42. In this way, we have completed satisfactorily the first column.

Now, we work with the second column, see figure 43. We must find the following number of the quotient that goes in the external part of the board by above of the second column. If we use a number two (i. e. two dots) we complete the first square of this column, but we exceed what we have in the inferior square of this column. In this way, we try a solution by using one dot, as we show in the figure 44. In the first square of the second column, one dot is in excess, thus we lower it to the inferior immediate square like two bars. We show this in figure 44. Then, we convert one of bars into five points, as we show in figure 45. We take the required two dots to leave in that square, and we displace the rest (one bar and four dots) to the first square of the third column. Clearly, $141 \div 12$ results in 11 plus a residue of 9. We show this in figures 46 and 47, and we use a star to begin with decimal fractions.

Afterwards, we work with the third column; see figures 47, and 48. We must find the following number of the quotient that goes in the external part of the board by above of the third column. We try with a bar and two dots, as we show in the figure 48. A pair of dots is in excess in the first square on the third column. We lower the two dots to the immediate inferior level, as four bars; see figure 48. Then, we convert one bar into five dots. We leave the required two bars and four dots in that square; see figures 49 and 50. We displace the remaining bar and dot, to the upper square of the fourth column; see figures 50 and 51.

Then, we work with the fourth column; see figures 51, and 52. We must find the following number of the quotient that goes in the external part of the board by above of the fourth column. We try with a bar, as we show in the figure 52. A dot is in excess in the upper square of the fourth column, as we show in the figure 52. We lower that dot, as two bars, to the immediate inferior level. See figures 52 and 53. In the inferior square of the fourth column, we must have two bars, and we have exactly that. Thus the division has concluded, and $141 \div 12 = 11.75$, as we show in the figure 53.

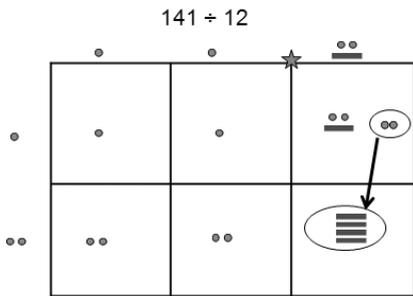

Figure 48

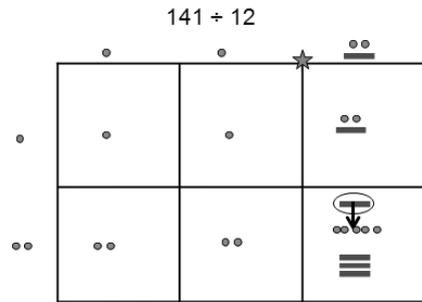

Figure 49

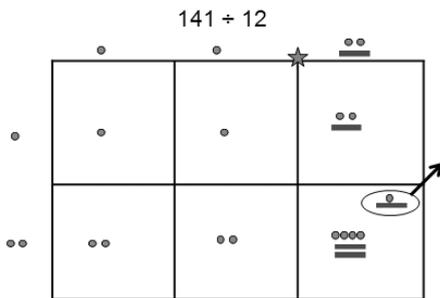

Figure 50

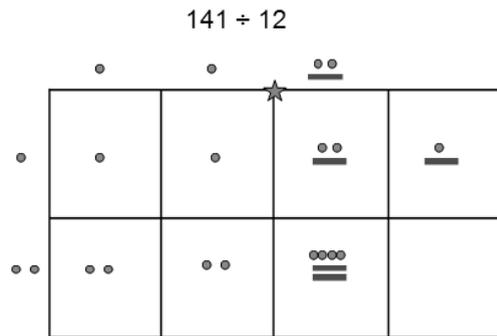

Figure 51

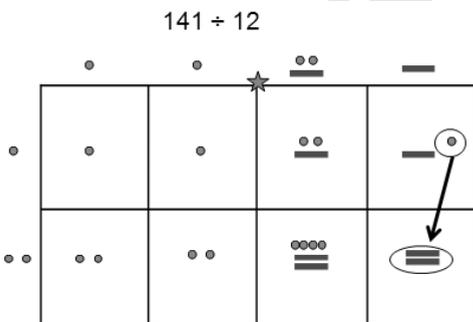

Figure 52

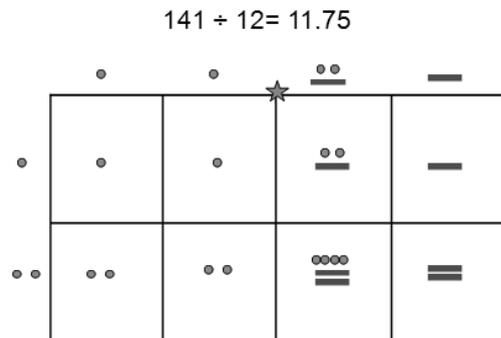

Figure 53

6. Square root

We solve the square root in the same manner that we solve the division. The radicand is the dividend. Of course that we do not know the divisor or the quotient, but we know that they are the same, and we use this fact to find the solution.

Let us find the square root of 225. As we are considering it as a division, we place the radicand along the main diagonal of the board; see the figure 54. We proceed as we did in the division, but knowing that the quotient must be equal to the divisor. We have two dots within the square of the left corner of the board. We try one dot like the first digit of the divisor and of the quotient, as we show in the figure 55. With this trial, one dot is in excess in the upper square belonging to the column on the left. We lower this dot to the immediate inferior level, along the main diagonal, as two bars. See figures 55 and 56. After finding the solution for the first square, we follow an additional rule for the square root. We have to distribute symmetrically as possible, the number of the radicand located in the immediate inferior level. We distribute among the squares located on the diagonal that corresponds to the same power of 10. We show this distribution in figures 57 and 58.

Now we proceed to find the following number of the solution. We may try a bar in the external superior part of the second column, and simultaneously, in the external part of the second row on the board, see figure 59. We see that with this trial, we require having only one bar in the first square of the second column, and we have one dot in excess. We lower that dot to the immediate inferior level, as two bars. We also require having only one bar on the first square of the second row. Again, we have one dot in excess. We lower it to the immediate inferior level too. See the figure 60. Finally, we need to solve the second square of the second column. In this square, we already have five bars. These five bars correspond to the number of bars that we need, according to our trial of a bar. In this manner, the square root is solved, see figure 61. The result is exact and is 15.

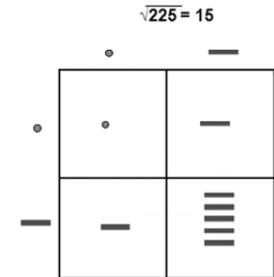

Figure 61

7. Preliminary results from the application of this method

This method has been used as an auxiliary tool for teaching mathematics in some of the elementary schools in Yucatán, Mexico. These schools are located in the rural zones.

It is convenient to mention that the resulting algorithms from this method, when using Arabic notation, are simpler than the ones which are currently taught [Magaña, 2012]. However, it is necessary to master Mayan mathematics previously. Besides,

The students at those schools are traditionally very weak in mathematics learning. In 2010, the Yucatan Public Education Secretary asked me to start a training pilot program on Mayan mathematics. This was for teachers of the elementary school level. Then, since 2011, those teachers taught Mayan mathematics during half an hour at the end of the day, after the regular program was satisfied. The ludic nature of Mayan mathematics was very useful to attract children's attention. The national tests on mathematics for the elementary schools in 2011 and 2012 were very satisfactory for those children. It is convenient to mention that the elementary school in Peto in a distant rural zone in Yucatan was the second place in the last two years. This suggests the convenience of changing the traditional way of teaching mathematics to this manner.

As a final comment, we should mention that the nature of Mayan mathematics induces to mathematical reasoning. It is not necessary at all, to memorize tables of any kind. This occurs with each of the arithmetic operations. With Mayan mathematics, children understand the concept behind each arithmetic operation.

Abstract

A new business model for MOOCs is described in this paper. This model allows for learning interaction between students and teachers on demand using a system that enables the services of the participating teachers to be financed. By integrating three different learning models, the learning process of the students can be enriched with certain elements and the services provided by teachers can be funded through a specific payment system.

Keywords: Massive Open Online Courses (MOOCs); Model; Social Media; e-Learning

1. Introduction

MOOCs are a hot and current topic within the field of e-learning. Many courses are available on all possible themes and topics– most of them for free and organised by each institution as marketing tools and channels. Only a small proportion of these **Massive Open Online Courses** are financed by examination and diploma activities.

This paper presents the innovative idea for a MOOC business model which funds the teachers involved in these courses. Based on three social media models for e-collaboration developed by the Swiss Special Interest Group for E-Collaboration (SIG eCo), the present business model demonstrates how social media can be used and implemented to establish a more interactive approach in the field of MOOCs.

To this end, the paper starts by looking back at the history of the models by briefly introducing these three social media models as basis for the MOOC business model. In section 3, MOOCs are embedded in their current setting of e-learning before the subsequent section 4 unfolds the core theme of this paper by combining these social media models to create an innovative and new *business* model for MOOCs. The paper concludes with a short summary of its important results and provides an outlook on any remaining questions and future steps.

2. History

A large part of learning happens up there – in the virtual cloud. Learners make use of the wide range of technology-based multi-media activities for managing and reflecting on their learning process, for creating (learning) content and/or for collaborating and communicating with others. Social media in particular with their various functionalities of networking, sharing, blogging, chatting etc. have a considerable impact on how learning experiences are designed as a collaborative activity these days.

Thus since Twitter, Skype, Dropbox, wikis etc. have become a hot and challenging topic in the e-learning field, the Swiss Special Interest Group E-Collaboration (SIG eCo) started to develop three conceptual models in 2012 which describe, analyse and promote hands-on learning with, in and through social media.

Later on, these models were developed further and presented at a Learning Café to the Swiss Academic E-Learning Community eduhub (www.eduhub.ch) at the eduhub days in January 2013.

This section will present a brief overview of the three models and their application in higher education settings since they form the basis for the MOOC business model which will be introduced later in this paper. Starting with a functional definition, social media are thereby perceived as digital applications which allow and promote social interactions and social exchange among their users (Hansen et al. 2011).

2.1. The Social Student Model

The social student model refers to the fact that the students' learning process is never fully accessible to the teacher as shown in figure 1.

In other words: students design their learning experiences in an individual and partially informal way by using social media for working with others on shared tasks. Instant messaging, for example, facilitates collaboration among students by enabling prompt and immediate exchange on specific topics. The advantage for the student here lies in instant communication: instead of spending time waiting for the teacher's answer via email or in the next lesson, the learner receives the desired information more easily and quickly by asking his/her schoolmates via Skype, Facebook or other social media.

The model points out this informal side of learning where teachers do not have (and do not need to have) full insight. Thus the model aims to raise awareness of the fact that the teacher's role is limited to task-related support within the learning process and that the organisation of this learning process on the other hand (partially) depends on the responsibility of students themselves. Social media offer needs-oriented and flexible channels for designing these learning experiences in a collaborative way.

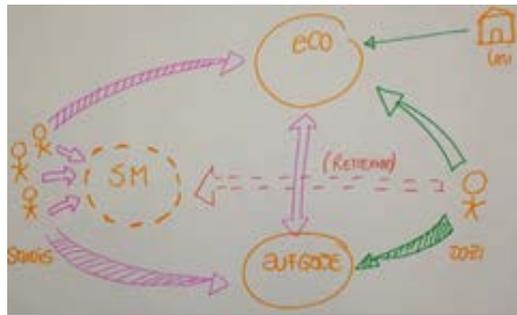

Fig. 1. The Social Student Model

Legend: Studis=Students, SM=Social Media, Aufgabe=Task, eCo=eCollaboration, Dozi=Teacher, Reflexion=Reflection

2.2. The E-Helpers Model

Following the social student model and its claim that social media support the informal aspects of the learning process by enabling social exchange among students, the e-helpers model introduces the idea of an open helping community for learners, based on the two aspects of *task* and *time*.

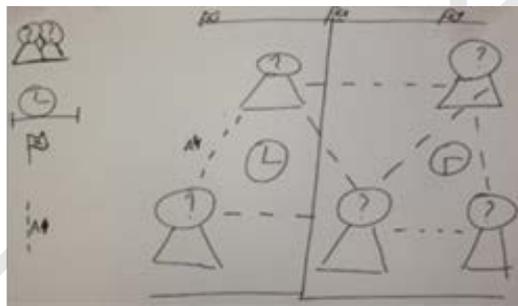

Fig. 2. E-Helpers Model

The model responds to the question of where learners can find out certain information at a certain time for solving a certain task by making use of shared knowledge and experience.

Assuming that others have the same or similar problems to solve, users come together and build a temporary online community based on their specific needs. When the learners have found out the information they were looking for, they leave this temporary community again.

What distinguishes the e-helpers community from other social media channels is its focus on the users' current needs and not on the social relationship between them. Its objective is to generate fast and prompt information by users *for* users who are not necessarily emotionally linked to each other. Thus, while the members of this community change continuously, the information that is collected on the platform is retained over time for future use.

2.3. The Antibody Model

The last of these three social media models introduced in this section presents the idea of using social media to boost innovation through collaboration.

In higher education settings, collaboration normally takes place among students who know each other or who are linked with each other through a topic, personal skills or affinity. On the contrary, this model promotes the idea of collaborating with unexpected people based on the assumption that unknown people, people from other fields and people with other views and interests etc. offer deeper and different insight into the learner's perspectives. Social media create a valuable environment for this kind of unexpected collaboration since they allow learners to find people, knowledge and experiences which extend beyond their own background.

Fig. 3. The Antibody Model

To this end, the model creates the figure of the antibody – a kind of devil which engages the learner to overthink his/her ideas and views by asking questions, criticising or by having complementary needs or objectives. Regardless of whether this other person doesn't understand, doesn't like or doesn't agree with the learner's view, this "devilish" feedback takes the learner out of his/her comfort zone and thus creates room for new, innovative, unexpected and unusual ideas as added value within the personal learning process.

The following section briefly presents MOOCs as a recent trend in the e-learning field, before the MOOCs business model is introduced in section 4.

3. MOOCs

Massive Open Online Courses (MOOCs) have been one of the most recent developments in the field of online learning. As the name implies, MOOCs are online courses that are designed to offer learning content to a large group of people. Gaebel (2013) characterised a MOOC as a free, credit-less online course where people can participate without entry requirements and without limits on the amount of registrations. For example, the course "Introduction of Artificial Intelligence" by Dr. Sebastian Thrun received 150,000 registrations and Stanford University started three online courses that each amassed at least 100,000 applications (Pappano, 2012). There are currently many other Universities which offer MOOCs and several platforms/companies have distinguished themselves as leaders in this area, such as edX, Coursera, Udemy MITx and Udacity.

Two kinds of MOOCs can be distinguished: the cMOOC model and the xMOOC model (Siemens, 2012). According to Siemens, the cMOOC Model "emphasizes creation, creativity, autonomy and social networking learning" and a "focus on knowledge creation and generation". On the other hand, the xMOOC model is based on

“a traditional learning approach through video presentations and short quizzes and testing” and “focuses on knowledge duplication”.

Even though MOOCs are a recent development, several benefits can be noted. According to De Waard (2012), MOOCs are time and cost efficient. There are free tools available for building these courses, languages can be chosen and changed freely, tools can be tailored to the preferences of the participants and courses can be set up quickly. Secondly, another benefit is openness. Signing up does not usually require any specific certification. The only pre-requisites for most Massive Open Online Courses are access to an Internet connection and a device to access the course. The scale and nature of the course make time zones irrelevant. Thirdly, there are several benefits for student learning. MOOCs can easily be added to one’s personal learning environment. The setting is usually more informal and therefore might be more productive for some students. Everybody can sign up for a course but this process will force students to evaluate their own learning processes. A further advantage of MOOCs is cross-disciplinarity and promotion of exchange between the different fields of expertise.

However, MOOCs lack ways of promoting social interactions as well as funding teachers’ activities. The MOOCs business model is aimed at filling in these gaps, as described in the following section.

4. The MOOCs Business Model

4.1. Promoting social interaction in MOOCs

MOOCs are trendy; there are a lot of courses available where everybody enrolls in a MOOC course for free. Currently, MOOCs are mainly financed and treated as marketing tools. Only a small proportion can be financed by examination and diploma activities.

MOOCs have become very popular because publication and participation are easy to manage. Students do not have to pay for a MOOC which is an advantage. However, they cannot really interact with teachers. There is currently no way how teachers could earn money for teaching and collaboration services within a MOOC.

By integrating the aforementioned learning models into a MOOC, the learning process of students as well as the interaction between teachers and students can be improved and a payment system can be created. By combining the learning models, an interesting business model for MOOCs is set up which finances the teachers involved in the courses and lets the students interact with them.

Before those learning models can be integrated, every model shall be briefly summarised in terms of its core message:

- **Model E-Helpers:** A group of learners come together for a certain period of time to work on a specific task. The group members can be anonymous as their personalities are not of interest. When the task has been resolved, the group will disintegrate. The group is mainly task and not member related.
- **Model Social Student:** A group of learners learn on their own via social media interactions; their contact with teachers is only task-related via e-collaboration. Teachers do not have (and do not need to have) insight into the learning process of their students as their contact is only a task-related one.
- **Model Antibody:** The antibody stands for the opposite of what you normally are looking for. In our subject matter, it allows for the creation of a wide learning space and lets students experience and create different views and new perspectives.

- How the MOOCs Business Model works

Figure 4 below shows how the MOOCs business model will work.

Example: Students register for 100\$ to participate in a MOOC (it is possible to allow students to participate without registration just to gain an overview of the course topics first. However, these students cannot participate in the activities described below until they register for the MOOC and pay the fee).

Registered students will learn and work by themselves through the learning material for the MOOC; from time to time, they have to solve exercises. For each exercise, there is a standard solution provided as part of the course but it is the students' task to look for other, non-standard solutions. Here the antibody model comes into play as it promotes innovative and new ways of thinking. For example, in order to find another way to solve a mathematical problem, the student is forced to leave his or her comfort zone of standards.

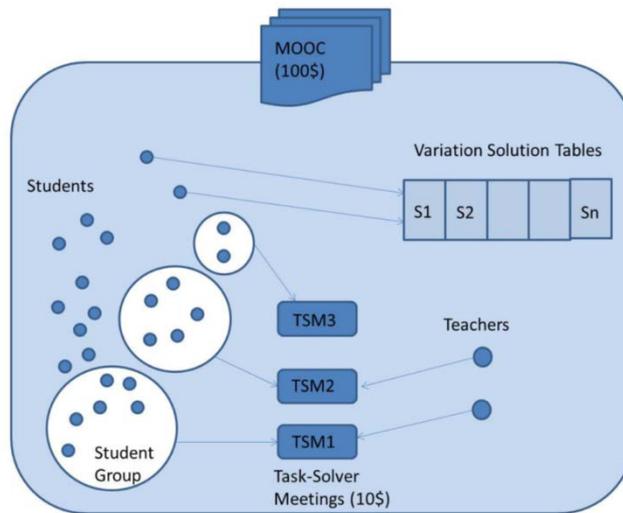

Fig. 4. Operation of the MOOCs Business Model

This is of great benefit for the students' learning because they have to look at the problem from different perspectives and have to work actively within the given subject matter - not just by reading through it. Finally, they have to enter their solution into a Variation Solution Table which is public for all students. The additional solutions must be different from the existing ones already listed in the table.

While trying to find solutions, students experience problems and realise that they need more help in order to understand the subject matter better. To this end, registered students can open up a new Task-Solver Meeting where they describe what problems, issues or questions they want to discuss with a teacher in an online meeting. Alternatively, students can look for existing open calls for a Task-Solver Meeting which fulfils their needs. If there are enough participants for a certain call, a teacher will schedule and hold the meeting. This is where the task/time related e-helpers model which forms the student group comes into play. An active meeting will cost every participant 10\$ for example, so the teacher is paid for his/her job.

As registered students already paid 100\$ at the beginning of the course, each meeting will be paid for using a fraction of this amount. The registration fee allows students to participate in 10 meetings. As the teachers will only be active based on demand for a Task Solver Meeting, the social student model is deployed here.

There are also several options which can be implemented:

- For every additional solution entered into the Variation Solution Table, students can gain virtual money (for example 5\$) that can be used for further Task-Solver Meetings to enhance the chance for having enough participants for a certain meeting.
- Students receive scores for their solutions. The scores will be provided by teachers. If a student reaches 100 scores he/she will receive a course certificate or diploma. The diploma will contain a written statement about the graduation process. As part of the registration, students have to confirm that they are the authors of their solutions.

5. Conclusion and Outlook

This paper gives an overview of the development and application of three social media models developed by the Special Interest Group for E-Collaboration consisting of members from Higher Education Institutions in Switzerland. The models integrate social media as hot topic in e-learning and present concrete ideas on how to enable, support and reflect learning in higher education with the help of digital applications. Thereby the models focus on learning as a collaborative process in which shared knowledge and experiences are provided by the teacher as well as by the students themselves and made accessible within a wide range of social technologies.

These learning models form the basis for the MOOCs business model. This model enables learning interactions between students and teachers *on demand* and the funding of services provided by teachers through a specific payment system. One of its elements includes interaction between students and teachers whereas subject matter and requests are formed by a self-regulated group of students. Another element is the use of learning material which is connected with specific tasks and which requires a self-created, individual output from students.

The next step will be to setup and run a MOOC with this business model. In the long-term, the model should allow for small and medium-sized universities to offer MOOCs and let students invest in learning based on their own requirements.

Acknowledgements

The authors of this paper were able to benefit from the valuable contributions of the Swiss Special Interest Group for E-Collaboration. The Social Media models which serve as a basis for the MOOCs business model were designed, discussed and further developed here.

Abstract

Insurance market is still evolving and an important part of this evolution includes innovation in risk coverage. Such innovation are based on various solutions and a good knowledge of these provides framework for successful implementation of insurance innovation. Lack of such knowledge often results from education gap in insurance-related themes. In this paper we examine whether there is education gap among non-financial companies in Poland. We use respondents' subjective assessment of their level of knowledge and understanding of selected solutions. We found that there is a visible insurance education gap with regard to more sophisticated solutions and the level of this gap is not associated to company's size.

Keywords: financial education; insurance market; financial innovation; risk management;

1. Introduction

An important course of recent changes of non-life insurance offer for companies is product innovation. These types of innovations are designed with intention to find a better coverage for the financial consequences of the risk. Companies are willing to implement such innovation as their awareness of the integration of risk management and corporate finance issues is growing (Culp, 2002, p.13-14). In other words, companies are aware that the proper implementation of risk management procedure and risk treatment techniques (including insurance as well) helps to create the value of a company (Meulbroek, 2002, p. 56-70; Stulz, 1996, p. 8-24; Smithson & Simkins, 2005, p. 8-18), which is a prime goal of company's existence (Baker & Powell, 2005, p. 10; Damodaran, 2001, p. 11-15; Ehrhardt & Brigham, 2009, p. 9).

In general, the types of innovations within non-life insurance products for companies are based on the combination of risk retention and risk transfer in desired proportions. In particular, risk retention and risk transfer are treated as complementary rather than substitutive methods. Two main types of innovations are to be distinguished. The first type is connected to the final shape of insurance contract, whereas the second type involves the application of more sophisticated mechanisms that combine insurance and financial market instruments (such as derivatives) (Banks, 2008, p. 60; Pain, 2011, p. 16; Wieczorek-Kosmala, 2010).

The problem of innovation within non-life insurance products for companies in countries such as Poland is still a novelty. The insurance market in Poland is relatively young as it was established together with the release of the market economy in 1989. Currently, on the non-life insurance market operates 32 domestic insurance companies

E-mail address: m.wieczorek-kosmala@ue.katowice.pl

(Quarterly Bulletin. Insurance Market 4/2012, Part A. Information on Insurance Companies). The market is far more advanced than in previous years. In 2012 the number of insurance policies written for companies was c.a. 7,5 million pieces (Quarterly Bulletin. Insurance Market 4/2012, Part D. Statistical Statement KNF-02.Domestic Insurance Companies), as compared to 4,5 million in 2002 (Yearly Bulletin. Insurance Market 2002 (verified data). Part D. Statistical Statement KNUiFE AI/02). It seems that the next important step in the development of non-life insurance market will be connected with the spread of innovation. Thus, in this study we focus on examining whether there is sufficient level of insurance education for designing and then implementing innovative solutions. The problem remains valid from macro-perspective as well, as it is required to balance the supply of innovation offer by innovation-creators (insurance companies) with the adequate demand of innovation end-users (non-financial companies).

Assuming that the evolution of the insurance market is inevitably going to the growing interest in innovative solutions, we aim at identifying if there is any education gap within the level of knowledge and understanding of some fundamental insurance-related issues. Additionally, assuming that there are symptoms of such education gap, we aimed at establishing if it is connected with the company's size. The examination is based here on the results of a questionnaire. In the questionnaire, a sample of non-financial companies operating in Poland declared their subjective level of knowledge and understanding of selected solutions (this paper presents only partial results of the query which touched numerous aspects of risk finance, including the problem of insurance). The design of the study assumes that the good knowledge and understanding of selected insurance market related solutions (as the result of proper insurance education) creates opportunities for successful implementation of the innovative insurance solutions.

The presented paper contributes to the existing knowledge by bringing to a focus relatively novel problem and, additionally, by proposing original approach and design of research. In didactic context, the findings provide useful indications how to shape insurance education programs.

The remainder of the paper is organized as follows. In section two we discuss the methodology of our research, including the explanation of the method, source of data and questioned issues. In section three we present and discuss the results. The last, fourth section, offers some final conclusions.

2. Methodology

As previously mentioned, the presented data were gathered in a questionnaire by the usage of PAPI method. The questionnaire was conducted in December 2012/January 2013 on a sample of Polish non-financial companies. The 135 questionnaires were accepted for further analysis. In the analysed sample 80 companies (59,26%) were regarded as small and medium sized due to the number of employees up to 249 persons. The remainder 55 companies (40,74%) are regarded as large ones as they employ 250 persons or more (Commission Recommendation 2003).

The questionnaire was directed to non-financial companies of different branches. These companies were exclusively the entities that previously implemented the procedure of risk management. Thus, the respondents represent entities that are somehow involved in different aspects of risk treatment, including insurance.

The questionnaire included (among other issues) a set of questions that were designed to gather data on the subjective assessment of knowledge and understanding of some insurance market related solutions. For this assessment we used a 5-grade scale where answer '1' meant very good knowledge and understanding and '5'

that the respondent had never heard about the questioned issue (indicating the lack of knowledge about the enquired issue).

In particular, the respondents were asked about their subjective assessment of knowledge and understanding of the following solutions:

- deductibles
- caps (limits of coverage)
- excess insurance
- currency derivatives.

The first two solutions (deductibles and caps) are commonly included in the insurance contracts. Thus, we expected that the level of knowledge and understanding of these issues will be assessed by our respondents as high. A deductible means a portion of covered loss that is not paid by the insurer. In other words, deductible represents a sum that is always subtracted from the loss payment. Usually, deductible is expressed in percentage points (Banks, 2008, p. 66; Rejda, 2001, p. 51; Bennett, 2004, p. 90). Deductibles are very common in property insurance. A cap is the limit on the insurer's loss payment liability in the insurance contract (Vaughan & Vaughan, 2003, p. 650; Bennett, 2004, p. 188). Thus, policy caps force the company to retain the risk over and above the cap, which means that the scale of retention may be potentially large. At the same time the company remains uninsured for a large burden of loss. Caps are typically used in commercial liability insurance.

The following two solutions (excess insurance and currency derivatives) are less common. Under excess insurance, the insurer does not participate in coverage of loss until the actual loss does not exceed the agreed amount. Thus, from a company's perspective, the excess insurance covers the burden of loss a company is unable to cover from the retained funds. Formally, excess insurance adds an excess layer to a primary coverage (Rejda, 2001, p. 51; Bennett, 2004, p. 115). Excess insurance is usually offered for larger companies, within custom-made insurance contracts. It is often accompanying innovative risk transfer solutions, such as multi risk products (Banks, 2008, p. 103). Currency derivatives are not directly connected with insurance market issues. However, the mechanism of derivatives is used in most of the more advanced innovation in transferring risk. Thus, a question about the knowledge and understanding of these reflects the potential education gap, which may be an obstacle in the implementation of insurance innovation. Currency derivatives in general, are contracts that specify the prices at which a currency can be bought or sold in the future (as a result the future foreign exchange rate is settled in advance). Currency derivatives consist of a wide variety of instruments, including currency forwards and futures, currency options and currency swaps, traded both on the stock-exchanges and on the OTC markets. Currency derivatives are primarily used to hedge against foreign exchange risk. They are also applied in arbitrage and speculation strategies. (Chance & Brooks, 2010; Flavell, 2010; Kolb, 2003). In the questionnaire we asked about currency derivatives as a few years ago Polish companies involved in trading with these derivatives faced high losses. The issue was widely discussed in media (Mazurek, 2009; Kraskowski, 2009; Domagalski 2012, Karkowski 2009, Chisholm 2010), thus we assumed that the respondents had a chance to familiarise with the functioning of these particular type of derivatives.

The research methodology was designed to test the following two hypotheses:

H1: There is a visible education gap between the level of knowledge and understanding of the most common insurance solutions (deductibles and caps) and more advanced solutions (excess insurance and currency derivatives).

H2: The education gap within the examined issues is higher in small and medium sized companies as compared to large companies.

3. Results and discussion

In order to support or reject the first hypothesis, we conducted the analysis of the percentage share of respondents' indication of the following levels of knowledge and understanding of deductibles, caps, excess insurance and derivatives.

Out of 135 examined companies the majority (c.a. 70%, 90 companies) admitted that they know and understand the functioning of deductibles very well (see fig. 1 and panel A in appendix A). About 16% of companies (22) declared a good knowledge and understanding of deductibles. Assuming the lowest levels of assessment according to the adopted scale (so answers '4' and '5'), 7 companies (5%) declared that they have never heard about such an instrument, similarly 7 assessed their knowledge and understanding of deductibles as poor. With regard to the size of companies, the results are similar regarding the percentage structure of answers (see fig. 1).

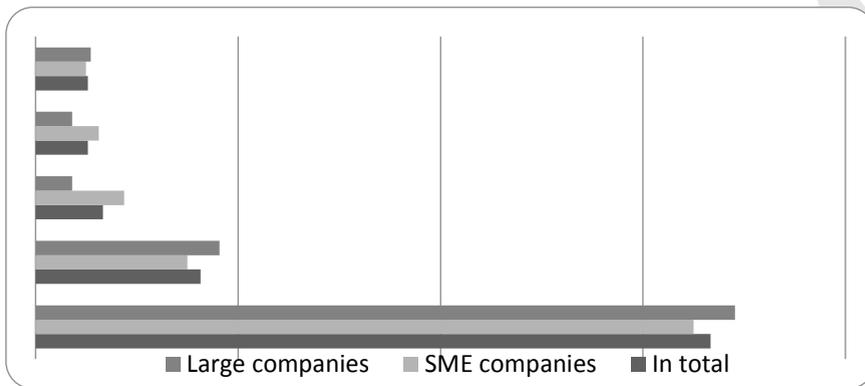

Fig. 1. The respondents' subjective level of knowledge and understanding of the functioning of deductibles (where '1' means 'very good', '5' means 'never heard about it')

Source: Own study based on questionnaire results.

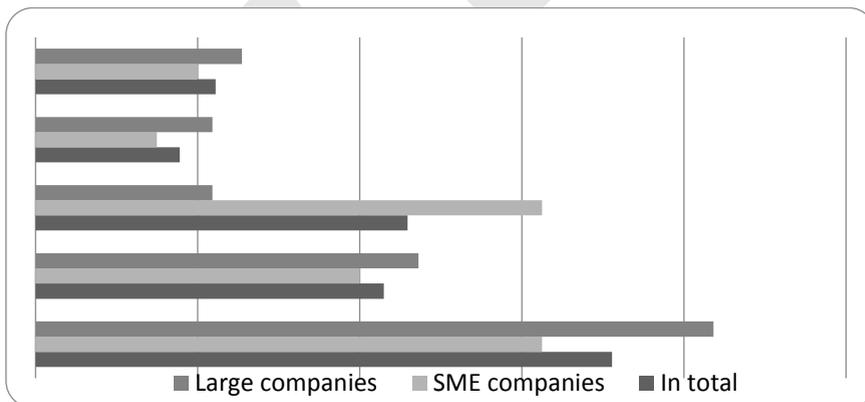

Fig. 2. The respondents' subjective level of knowledge and understanding of the functioning of caps (where '1' means 'very good', '5' means 'never heard about it')

Source: Own study based on questionnaire results.

Fig. 2 presents the structure of answers regarding the knowledge and understanding of the functioning of caps. In this case c.a. 35,5% of the questioned companies admitted very good knowledge and understanding. This solution seems to be a little more familiar to bigger companies (more than 40% of answers) than to small ones (c.a. 31%). Assuming the lowest labels ('4' and '5') about 20% of the questioned companies admitted low or no knowledge and understanding of caps (see also panel B in appendix A).

Fig. 3 presents the structure of answers regarding the knowledge and understanding of the functioning of excess insurance. As expected, a large portion of the questioned companies admitted no or poor knowledge and understanding of this solution. About 47% of the respondents subjectively assessed their knowledge and understanding of excess insurance on the level '5' (which means 'never heard before'). Very good knowledge and understanding was declared only by c.a. 10% of the respondents (see also panel C in appendix A).

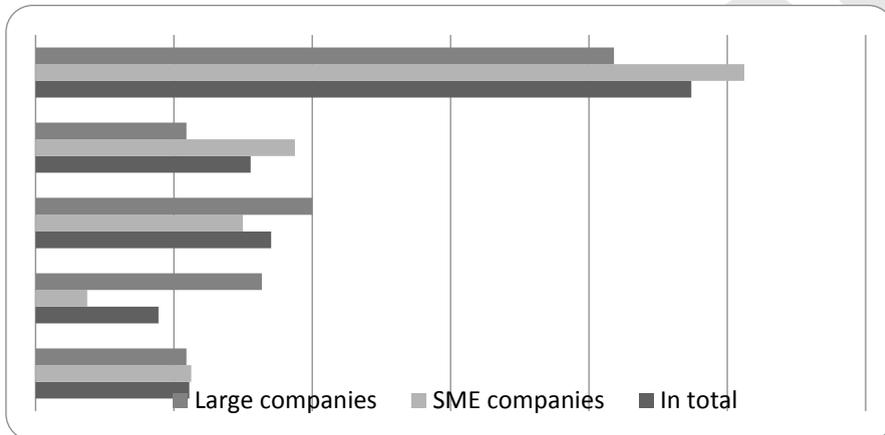

Fig. 3. The respondents' subjective level of knowledge and understanding of the functioning of excess insurance (where '1' means 'very good', '5' means 'never heard about it')

Source: Own study based on questionnaire results.

The results of the assessment of the knowledge and understanding of the functioning of currency derivatives gave no such visible differences as in the case of deductibles, caps and excess insurance. The data presented in fig. 4 indicate that c.a. 27 % of the questioned companies selected label '1', the following 24% label '2' and also 24% label '3'. Thus, the knowledge and understanding of currency derivatives is very good or medium. Similar percentage of the questioned companies indicated labels '4' and '5' (which means very poor or zero knowledge and understanding of currency derivatives).

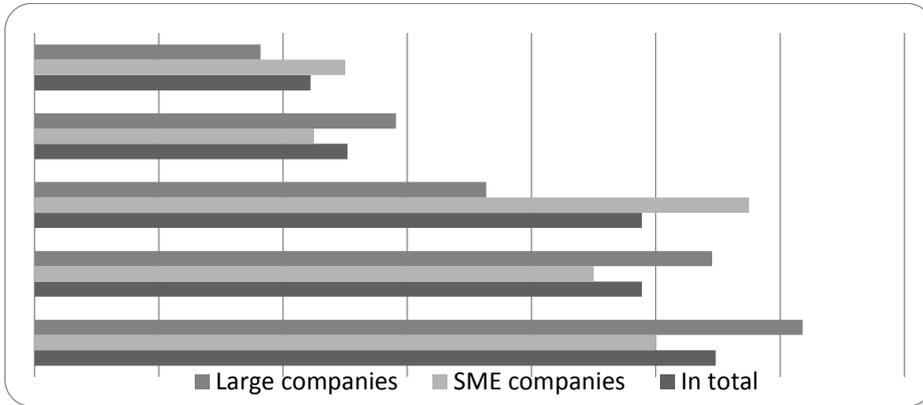

Fig. 4. The respondents' subjective level of knowledge and understanding of the functioning of excess insurance (where '1' means 'very good', '5' means 'never heard about it')

Source: Own study based on questionnaire results.

With regard to the second hypothesis about the association between the level of knowledge and understanding of the examined items and company's size, the gathered data were subject to statistical verification with the use of Cramer's V coefficient. We used here Cramer's V coefficient as a measure of association applicable for qualitative data, according to the formula:

$$V = \sqrt{\frac{\chi^2}{N(q-1)}}$$

where χ^2 is derived from Pearson's chi-squared test, N is the ground total observations and q is the number of rows or columns in a table, whichever is less.

As Cramer's V coefficient varies from 0 to 1, where 0 indicates no association whereas 1 indicates complete association, we interpret the Cramer's V in our analysis as follows: (0-0,2) as very weak association, (0,2-0,4) as weak association (Durrheim & Tredoux, 2002, p. 372; Healey, 2012, p. 320). The results are presented in table 1.

Table 1. Cramer's V coefficient for association of the companies' size and questioned items (deductibles, caps, excess insurance and currency derivatives)

Examined items	Deductibles	Caps	Excess insurance	Currency derivatives
V	0,1218705	0,2394648	0,2466850	0,1447884
Interpretation	very weak association	weak association	weak association	very weak association

Based on statistical analysis, there can be observed very weak association between the knowledge and understanding of the functioning of deductibles and the size of company (as the V coefficient is between 0 and 0,2). Similarly, very weak association was observed association between the knowledge and understanding of currency derivatives and the size of company. However, we found a weak association between the knowledge and understanding of the functioning of (a) caps and (b) excess insurance and the size of a company (as the V coefficient is between 0,2 and 0,4).

4. Conclusions

As it was outlined, there were two plausible hypotheses addressing the problem of education gap regarding the knowledge and understanding of insurance solutions ('traditional' and 'innovative' ones) among Polish non-financial companies. The analysis of the questionnaire results provides some support for the first of the tested hypotheses, but no support was found for the second one.

With regard to the first hypothesis, stating that there is a visible education gap between the level of knowledge and understanding of the most common insurance solutions (deductibles and caps) and more advanced solutions (excess insurance and currency derivatives), only a partial support was found. Regarding two solutions that are common, the results indicate that there is an education gap regarding the functioning of caps. It was expected that the knowledge and understanding of deductibles (commonly met in property insurance) and caps (commonly met in commercial liability insurance) is relatively high. However, the data confirmed this presumption only in case of deductibles. The problem of caps is far less known and understood. There again, regarding two solutions that are less common (excess insurance and currency derivatives) the research results were not homogenous. There is a visible education gap with regard to the knowledge and understanding of the functioning of excess insurance as only small percentage of respondents admitted very good or good level. With regard to currency derivatives, the research results indicate that in the questioned group of respondents this issue is familiar, but with medium level of knowledge and understanding.

With regard to the second hypothesis stating that the education gap within the examined issues is higher in small and medium sized companies as compared to large ones, we found no support. Statistically, there is very weak (deductibles and currency derivatives) or weak (caps and excess insurance) association between the admitted level of knowledge and understanding of the examined issues and the company's size (with the application of Cramer's V coefficient).

To conclude, the study indicated that even in the group of companies that are familiar with risk management issues, which requires the knowledge of insurance as well, there is a visible education gap. This gap covers aspects that are relevant for the spread of innovation within insurance programs for companies.

Finally, we would like to stress that we are aware of the limitations of our study. First of all, the questioned sample of companies is not a large one. It is mostly due to the basic assumption that the questioned companies should be the ones that introduced risk management process in practice, and this is not so common in Poland. Secondly, the examined problems represent only few selected aspects of insurance education – and maybe the proper assessment of the education gap within insurance knowledge requires more questions, addressing other insurance-related issues to draw convincing conclusions. Further inquiries may address problems that have not been examined in our study.

The discussed research results indicating the significant education gap can be used as a motivation to modify the education programs within financial higher education system, introducing more innovation-related information presented in understandable way. It can be also regarded as a contribution to the general discussion about the form and direction of evolution of the contemporary financial education.

4th International Conference on New Horizons in Education

The paradigm shift of the legal education in Malaysia: a research on the global perspectives

Mohd Fuad Husaini^{a*}, Kamaliah Salleh^b

^bUniversity of Sultan Zainal Abidin, Faculty of Law and International Relations, "Kuala Terengganu", Malaysia

Abstract

The professional training of law graduates in Malaysia has intersects with multiple avenues into the legal profession requiring variant standards of admittance. This scenario has instigated the need to remonstrate the existing state of affairs. Therefore, there has been a great urge by the Bar Council prompting a Common Bar Course (CBC) an90d Examination (CBE) marshalling a new direction in the training of law graduates for legal practice to become a single entry point into the legal profession for both local and foreign law graduates. However, the path to the implementation of CBE into the legal education is not as attractive as it is thought it would be, referring to the amount of effort needed to progress along the way. It has been an ongoing debate among the law practitioners on whether it should be implemented or vice versa, considering some substantial factors. This article begins with the introduction of the legal education in Malaysia. Secondly, it analyses the current entry requirements into the legal profession and how it fair with the standards across the Commonwealth jurisdictions. Thirdly, it examines the global development of legal education systems, the legal framework of CBC together with the justifications by the proponents and the objections raised against such proposal. Then this article attempts to deliberate on the need of the reformation of the legal education in tandem with the global development of legal education across common jurisdictions. Finally the article concludes on the viability of the CBC proposal or any other proposal to resolve the legal education debacle in Malaysia.

Keywords: legal education, entry requirements, malaysia, commonwealth, common bar course (cbc)

1. INTRODUCTION

The development of legal education in Malaysia was set in motion with the establishment of the first Faculty of Law at the University of Malaya in 1972. Local students read law either in University of Malaya, which was based in Singapore, or England preceding the inauguration of the legal education in Malaysia[†]. The syllabuses taught back then in England were pure English law and the students were compelled to study both Singaporean and Malaysian law in Singapore. This legal knowledge taught in both countries fell short to cater the need of the multiracial people in Malaysia[‡]. The existing Malaysian law that time lacks coverage of these other fields of law

[‡] Malaysia's multi-racial society contains many ethnic groups. There are 3 predominant ethnic groups in Malaysia, which comprise the Malay and other indigenous groups, the Chinese and the Indians. This is supplemented by a wide array of other groups both 'pure' and 'blends' that include those of European, Middle Eastern, Chinese, Indian, Cambodian, Vietnamese descent. In Peninsula Malaysia the Malays are dominant while non-Malay indigenous groups are small in number and called "Orang Asli". In Sabah and Sarawak it is in reverse as non-Malay indigenous groups make up more than half of the population in the two states. In Sarawak the largest indigenous tribe is the Iban

as well. Being an independent country, having its own learning institution is important not only to study and circularize the Malaysian Constitution and laws but also to avoid too much reliance on the universities and professional organizations in other countries to educate the local students[§]. Concurrently, it can also promote the use of Malay language in legal institutions such as the courts^{**}. These were among the driving forces behind the establishment of the Malaysia's first faculty of law^{††}.

There are seven public local universities in Malaysia that offer law programme in their respective law schools namely University of Malaya, National University of Malaysia, International Islamic University of Malaysia, University of Mara Technology, Northern Malaysia University, Malaysia Islamic Science University and University of Sultan Zainal Abidin. However, not all public law schools' graduates will be regarded as a "qualified person" to practice law under the Legal Profession Act (LPA) 1976 due to their law degree recognition^{‡‡}. Currently, there are only five public local law schools that are recognized while University of Sultan Zainal Abidin and Malaysia Islamic Science University are still on attempts to seek recognition of their law degrees from the legal professional body, the Legal Profession Qualifying Board (LPQB)^{§§}, to enjoy the same privileges as the other public local universities that offer law programmes. Besides these public local institutions, there are also several private local law schools, which also offer law programmes in Malaysia^{***}. Multimedia University, HELP and Taylor's University offer local contents in their law programmes while other private law schools such as Nilai University, Advanced Tertiary College, Brickfields Asia College and Kolej Damansara Utama (KDU) offer twinning law programmes with foreign (United Kingdom) universities offered by their foreign collaborators. Management and Science University on the other hand is a mix of business and law degree programme. All the graduates from these private local institutions' with the exception of Multimedia University, are not automatically regarded as "qualified person" under section 3 of the Legal Profession Act 1976. These graduates have to take and pass the Certificate of Legal Profession ("CLP") Examination before they can qualify to practice as an advocate and solicitor in Malaysia. Only Multimedia University has attained full recognition of its law programme recently in December 2012 whereby its graduates are regarded as "qualified person" to practice as an advocate and solicitor in Malaysia.

The syllabus of law programmes in public law schools is very much reflected by the characteristics of Malaysian law, which are pluralistic in nature. In Malaysia, there is an existence of common Law, statutory law, Islamic law and customary law. The supreme law of the land is the Federal Constitution. It dictates the enactment and implementation of other laws, substantive or procedural. After independence in 1957, as the country develops into the new era of modernization and globalisation, Malaysian Parliament has passed various statutes. Legislations were enacted and passed to act as to the framework of new economic activities related to institutional establishment, intellectual property, telecommunication, information technology, science and many

followed by the Bidayuh while in Sabah it is the Kadazan-Dusun. (See: <http://www.visitorsguide.com.my/about-malaysia/13-people-and-culture.html>)

[§] Malaysia has been relying on the professional organizations such as the Inns of Court and the Law Society Solicitor in United Kingdom and the National University of Singapore in Singapore.

^{**} Malay is the official language of Malaysia. See: http://en.wikipedia.org/wiki/Languages_of_Malaysia.

^{‡‡} "Qualified person" is defined in Section 3 of the Legal Profession Act 1976.

^{§§} The Legal Profession Qualifying Board (LPQB) is established pursuant to Part II Section 4 of the Legal Profession Act 1976.

^{***} Private local institutions in Malaysia, which provides law programme are Multimedia University, HELP, Taylor's University, Nilai University, Management and Science University, Advanced Tertiary College, Brickfields Asia College and Kolej Damansara Utama.

others. There are also statues pertaining to consumers, finance, environment, human resources, copyright and so on.

All of these developments are very much reflected in the law syllabus. Law students are required to grasp basic knowledge relating to the combination of the law. However, the emphasis on customary law is quite minimal as emphasis is given to statutory law and in some universities especially International Islamic University of Malaysia, Malaysia Islamic Science University and National University of Malaysia, the Islamic law. Islamic law has become important in Malaysia. It started with the implementation of Islamic law in mainly family matters but now Islamic finance has gained a significant place in Malaysian financial activities. Study of Islamic banking or finance has already become part of law syllabus. Statutory law and case law form the main syllabus in all the law schools. Besides acquiring basic knowledge in the law, students are also exposed to the methods of practicing the law. Although the aims of the law school in exposing students in this aspect is commendable but there are challenges in running these practical courses. Most law schools have to rely on practitioners^{†††} and being part-timers they have to juggle between their own practicing commitment and teaching at law schools^{†††}.

Lawyers are often condemned to cruel jokes, such “*lawyer a liar*” and even called as leeches. But being a lawyer is not just as simple or lucrative as some thought. It is a tough profession, which requires professional skills. It is not a mere profession in the sense of completing the required task and earning an income for it. There are important roles connected to the legal profession. A lawyer is a social guardian. A lawyer has the extra responsibility in society because a lawyer should have the required training and knowledge to speak about social injustice and abuse of power. Lawyer is put a heavy burden on their shoulder in order to ensure that justice is given to the person who deserves it. However, the great responsibility thrust on them may be betrayed by some scrupulous quarters. These are the ills of some of the legal practitioners, which tarnish the nobility of the profession. These ills are supposed to be circumvented by proper legal training, if such a thing is ever possible.

2. ENTRY INTO THE LEGAL PROFESSION IN MALAYSIA

The legal profession in Malaysia is fused; a legal practitioner would be admitted as both advocate and solicitor. Unlike the in United Kingdom counterpart, the legal profession is separated; the graduates may chose to be either solicitor or barrister. In Malaysia, the requirement to enter the legal profession is guided by the Legal Profession Act 1976. In order to enter into the legal profession, the person must be a “qualified person”^{§§§}. What amounts to a qualified person in Malaysia? There are three categories of a qualified person. First, a qualified person means any person who has passed the final examination leading to the degree of Bachelor Laws of the University of Malaya, the University of Malaya in Singapore, the University of Singapore or the National University of Singapore. Second, any person who is a barrister-at-law of England and the third, any person who is in possession of such other qualification as may be notification in the Gazette be declared by the Board to be sufficient to make a person a “qualified person” for the proposes of the Act.

^{†††} By virtue of section 30(1)(c) of the Legal Profession Act 1976, an advocate and solicitor can only have a single profession. This circumvents law lecturers to practise as advocate and solicitor to further enhance their practical knowledge of the law. However, practicing legal practitioner can impart their knowledge as part-time lecturers only.

Table 1. List of Programme and Universities Recognised by the LPQB

MALAYSIA	SINGAPORE	UK AND IRELAND	AUSTRALIA	NEW ZEALAND
University of Malaya's Bachelor of Law (LL.B)	University of Singapore's Bachelor of Law (LL.B)	The Inner Temple Barrister-at-Law	Australian National University's Bachelor of Law (LL.B)	University of Auckland's Bachelor of Law (LL.B)
University Technology MARA's Bachelor of Law (LL.B)	National University of Singapore's Bachelor of Law (LL.B)	The Middle Temple Barrister-at-Law	University of Sydney's Bachelor of Law (LL.B)	University of Canterbury's Bachelor of Law (LL.B)
International Islamic University Malaysia's Bachelor of Law (LL.B)	University of Malaya in Singapore's Bachelor of Law (LL.B)	Gray's Inn Barrister-at-Law	University of Adelaide's Bachelor of Law (LL.B)	Victoria University of Wellington's Bachelor of Law (LL.B)
National University of Malaysia's Bachelor of Law (LL.B)		Lincoln's Inn Barrister-at-Law	Monash University's Bachelor of Law (LL.B)	University of Otago's Bachelor of Law (LL.B)
Northern University Malaysia's Bachelor of Law (LL.B)		The Law Society Solicitor of the Supreme Court of Judicature	University of Melbourne's Bachelor of Law (LL.B)	University of Waikato's Bachelor of Laws (LL.B)
Multimedia University's Bachelor of Law (LL.B)		King's Inn, Dublin Barrister-at-Law	University of Western Australia's Bachelor of Law (LL.B)	
			Macquarie University's Bachelor of Law (LL.B)	
			University of New South Wales's Bachelor of Law (LL.B)	
			University of Queensland's Bachelor of Laws (LL.B)	
			University of Tasmania's Bachelor of Law (LL.B)	
			University of Technology, Sydney's Bachelor of Law (LL.B)	
			Bond University,	

Queensland's Bachelor of
Law (LL.B)

Murdoch University's
Bachelor of Law (LL.B)

Queensland University of
Technology's Bachelor of
Law (LL.B)

However, it should be noted that a person who has passed the final examination conducted by any of the universities in Australia and New Zealand above leading to the degree of Bachelor of Laws after 1st May 1999 is required to sit and pass the CLP Examination in order to be a “qualified person”. Thus, students who have graduated from the above universities and institutions in Malaysia, Singapore and United Kingdom are exempted from the CLP examination to practice as advocate and solicitor in Malaysia. However, there are 30 other LL.B programmes in selected United Kingdom universities^{****} which are recognised for their graduates to be eligible to sit for the CLP examination in order to be a “qualified person” similar to Australia and New Zealand.

Another criterion of legal practitioner is the person must either be a Federal citizen or a permanent resident of Malaysia^{††††}. In addition, the person must have satisfactorily served in Malaysia the prescribed period of pupillage for qualified persons^{††††}. As from the 1st January 1984, no qualified person shall be admitted as an advocate and solicitor unless, in addition to satisfying the requirements as being stated before and he has passed or is exempted from the Bahasa Malaysia Qualifying Examination^{§§§§}.

The multifariousness of the entrants into the legal profession as mentioned above has raises concern of the declining quality of the legal practitioners due to the very accommodating and lenient mode of entrance. Realizing the increase challenges in the legal world, it has become an eye-opener for the Bar Council to set a reform to challenge the status quo of the legal education system. This is among the rationale to implement the Common Bar Course as a single entry point into the legal profession in Malaysia.

3. THE CERTIFICATE OF LEGAL PRACTICE

The Certificate in Legal Practice, or more commonly known as CLP, was originally introduced in 1984 as a course and examination taken by law graduates from outside Malaysia, who at the time was unable to meet the entry requirements of the Bar Vocational Course in England, in order to become a qualified lawyer in Malaysia. It was originally designed only as a temporary stopgap measure or rescue mission to assist those Malaysians who were not able to sit for the English Bar Finals Examinations because they failed to obtain at least a Second Class

^{****} See the list of universities at LPQB portal (website: <http://www.lpqb.org.my>).

^{††††} Section 11(1)(c) of the Legal Profession Act 1976.

^{††††} Section 11(1)(d) of the Legal Profession Act 1976.

^{§§§§} Section 11(2) of the Legal Profession Act 1976.

(Lower Division) Honours in their British university law degrees^{*****}. It was then a solution to those who cannot apply to be a Barrister but ends up as another recognised legal qualification to be an advocate and solicitor in Malaysia. Later on, it became compulsory for all Malaysian holders of LL.B's from overseas universities who were not called to the Bar in the United Kingdom.

The examination is conducted by the Legal Profession Qualifying Board of Malaysia and is governed by the Legal Profession Act 1976. The Board allows degree holders from certain universities in the United Kingdom, Australia, and New Zealand to sit for the examination. Law graduates from local universities are not required to take CLP, but are required to complete an additional year of practical studies in their respective universities. After obtaining the certificate, the student will normally proceed to do chambering which is a form of apprenticeship similar to a pupillage in England. After completing nine months of chambering, the student may finally be called to the bar and become a qualified lawyer.

The CLP was originally formulated and taught in University of Malaya. However, due to the increasing number of law graduates per year, it was soon obvious that University of Malaya would not be able to accommodate every student who wished to study for the CLP. Thus, in order to handle the entry of law graduates, such private institutions such as Advance Tertiary College and Brickfields Asia College were brought in to handle the problems and University of Malaya no longer plays a role. The students are required to take and pass 5 papers in one sitting and may not accumulate the results. The papers are General Paper, Evidence, Civil Procedure, Criminal Procedure and Professional Practice.

Prior to 1999, only law graduates from United Kingdom and Ireland were required to study for the CLP after completing the LL.B, unless they completed the United Kingdom/Irish BAR course. Australian and New Zealand graduates, having studied the relevant compulsory subjects during their LL.B, would be called to the BAR in their respective country, and would be regarded as "qualified persons" under section 3 of the Legal Profession Act 1976. This changed after 1999, where the qualification rules were amended to require Australian or New Zealand LL.B holders to pass the CLP exam as well. The reasons for the amendment can loosely be described as quality control. Thus, under current system the CLP is now compulsory for those without the following qualifications:

- LLB degrees from recognized Malaysian Public Local Universities.
- LLB degrees from the National University of Singapore and the University of Singapore.
- Barrister-at-law from the four Inns of Court, United Kingdom, and King's Inn, Ireland.

4. ENTRY INTO THE LEGAL PROFESSION ACROSS JURISDICTIONS

The study of law is unique as the substance of the programme is regionalised, unlike other professional studies such as medicine, engineering or accounting. A university providing law programme would eventually offer law courses tailored specifically to a certain locality. In fact, a law study is usually accommodative or relevant to a particular geographical area. Even in the South East Asia Region, the study of law in Malaysia could not even be the admission benchmark to the legal profession in Indonesia and vice versa. This paper summarizes the diversity of admission requirement to the legal profession of various common jurisdictions i.e. Singapore, Australia, Hong Kong and England and Wales. These countries are selected mainly because they are Commonwealth countries, having their initial laws substantially sourced from the common law of England.

4.1. Singapore

The requirement to become a “qualified person” in Singapore is provided under section 2 of Legal Profession Act (Cap. 161) (Singapore). It requires the candidate to have a Bachelor of Law degree with at least lower second-class honours from National University of Singapore or Bachelor of Law degree from Singapore Management University with at least grade point average of 3.00 or above. However, for foreign law graduates without a law degree from the 2 local universities, Singapore only recognised LLB (Hons) awarded by the selected law schools from the United Kingdom, Australia, New Zealand and United States of America. In addition to fulfilling certain other criteria^{††††}, the foreign law graduates from the recognised institutions are required to pass Part A of the Singapore Bar Examinations that cover the following areas; Criminal Law, Singapore Legal System and Constitutional Law, Land Law, Company Law and Evidence Law, before they can be considered as “qualified person”.

The qualified person must then complete successfully two other steps before he can be admitted into the legal practice. Firstly, attending preparatory course leading to Part B of the Singapore Bar Examinations, and thereafter must pass the examination. Secondly attending practice training period, which is to be served for 6 months. The candidates will be supervised by a practising solicitor and they are exposed to 2 or more areas of practice such as civil litigation, criminal litigation, corporate practice and conveyancing practice^{††††}.

The preparatory course leading to Part B of the Singapore Bar Examinations is conducted full time for duration of 5 months. It consists of 3 major components as follows:

- 7 examinable compulsory subjects - The courses are Civil Litigation Practice, Criminal Litigation Practice, Corporate & Commercial Practice, Real Estate Practice, Family Law Practice, Ethics & Professional Responsibility and Professional Skills.
- Electives subjects - The candidates must choose 2 out of 6 courses namely Admiralty Practice, Advanced Corporate Practice, The Law and Practice of Arbitration, Mediation Skills, Wills, Probate and Administration Practice and Intellectual Property Law Practice.
- Non-examinable components - The components are Legal Technology, Clinical Training Programme, Revenue Practice Lectures and Analysing Company Financial Statements for Legal Practice.

Both Part A and Part B of the Singapore Bar Examinations are conducted by the Singapore Institute of Legal Education^{§§§§§}, a statutory body established under the Legal Profession Act (Cap. 161). The Institute is managed by a Board of Directors comprising representatives from various stakeholders in the legal community. It is entrusted with maintaining and improving the standards of legal education in Singapore, and has powers to review the implementation of initiatives, programme and curricula relating to legal education in Singapore, including diploma, undergraduate and postgraduate programme, and continuing professional development. Its objectives are:

- Maintains a register of qualified persons seeking admission to the Singapore Bar.

^{††††} The foreign law graduates for Singapore’s admission must fulfill the following criteria namely; obtain at least lower second class honours, rank amongst the highest 70% of the batch, full-time internal candidate of the particular university and complete the degree at least within 3 academic years.

^{††††} David Quark (2011). The Singapore Bar Examinations. *Conference on Legal Education in Malaysia – Qualifying for the Bar: Standards Across Jurisdictions*. Kuala Lumpur.

^{§§§§§} For further information, see website: <http://www.sile.org.sg>.

- Oversees Part A of the Singapore Bar Examinations.
- Conducts Part B of the Singapore Bar Examinations and the Preparatory Course leading to the Examinations.
- Conducts the Foreign Practitioner Examinations.
- Coordinates and supervises the Continuing Professional Development scheme.

4.2. Australia

Similar to United Kingdom, the Australian legal profession in private practice is divided into two, namely barristers or solicitors and they are known as “legal practitioner” in common. This profession is regulated at the state or territory level. Practical Legal Training (PLT) takes place prior to admission to practice, which focus more on solicitors’ works. In addition to PLT and upon being admitted to practice, to become a barrister, a person is required to undertake Bar Training Course^{*****}. Although PLT is administered and regulated at the territorial level, the requirements for admission to practice in Australia are essentially similar to all territories which consists of:

- Completion of specified academic requirements
- Completion of specified Practical Legal Training (PLT)^{†††††} requirements
- Assurance that the person is a fit and proper person to be admitted to practice.

The objective of PLT is to ensure a person to attain the standard of competencies as set forth in the National Competency Standards^{†††††}. The core statement in the National Competency Standards is that at the point of admission, each applicant will be expected to provide evidence that the applicant has achieved the requisite competence in the following Skills, Practice Areas and Values:

Table 2. National Competency Standards

SKILLS	PRACTICE AREAS	VALUES
Lawyer’s Skills	Civil Litigation Practice	Ethics and Professional Responsibility
Problem Solving	Commercial and Corporate Practice	
Work Management and Business Skills	Property Law Practice	
Trust and Office Accounting	One of the following: Administrative Law Practice	

^{*****} Christopher Roper (2011). The Legal Practice Courses in Australia (pp 33 – 40). *Conference on Legal Education in Malaysia – Qualifying for the Bar: Standards Across Jurisdictions*. Kuala Lumpur.

^{†††††} The PLT requirements vary according to states/territories.

^{†††††} The National Competency Standards outline the core standards, which are required by way of Practical Legal Training. These standards were developed by Australian profession Legal Education Council (APLEC) in conjunction with the Law Admissions Consultative Council (LACC).

Criminal Law Practice

Family Law Practice

And one of the following:

Consumer Law Practice

Employment and Industrial Relations Practice

Planning & Environmental Law Practice

Wills and Estates Practice

In this regard, it is important to note that the curricula of all PLT courses conform to the National Competency Standards. In the course of undertaking a PLT course, the person is required to take a Graduate Diploma in Legal Practice for a certain period depending on the curricula set by the PLT providers^{§§§§§§}.

On the other hand, the Bar Training Course or also known by various names^{*****} by states in Australia, are conducted at territorial level and the syllabus of the course depends on the contents set by each training providers. Despite the variations in the syllabus, the course generally focuses on advocacy, ethics drafting of pleadings and procedural matters.

4.3. *Hong Kong*

Similar to Australia and United Kingdom, the legal profession in Hong Kong is separated between solicitor and barrister. There are two routes for a law graduate to practice as a solicitor in Hong Kong; via the “trainee solicitor” and the “overseas lawyer” route.

In the “trainee solicitor” route, the person who wishes to qualify as a solicitor must hold a law degree either from the University of Hong Kong, the City University of Hong Kong, The Chinese University of Hong Kong or other recognised tertiary institution under Common Law jurisdiction. Such person must obtain a Postgraduate Certificate in Laws (PCLL)^{††††††}. In addition, the person must also complete employment as a trainee solicitor for a period of 2 years in order to be eligible for admission to practice as solicitor in Hong Kong. For those who are not eligible to PCLL admission, they must pass the Hong Kong Conversion Examinations for PCLL Admission, which is conducted twice a year covering the following courses:

Table 3. Hong Kong Conversion Examinations for PCLL Admission

§§§§§§ The PLT providers in Australia are Australian National University, Bond University, The College of Law (Brisbane, Melbourne, Perth and Sydney), The Law Society of South Australia and Leo Cussen Institute.

***** It is known as “Bar Practice Course” in the states of New South Wales and Queensland, and as “Bar Readers’ Course” in the state of Victoria.

†††††† PCLL is defined in section 2(1) of the Legal Practitioners Ordinance (Cap 159) as “a Postgraduate Certificate in Laws awarded by the University of Hong Kong, the City University of Hong Kong, the City Polytechnic of Hong Kong or The Chinese University of Hong Kong”. In PCLL, all students have to demonstrate competence in 11 core subjects as set by the Law Society of Hong Kong namely Contract, Tort, Constitutional Law, Criminal Law, Land Law, Equity, Civil Procedure, Criminal Procedure, Evidence, Business Associations and Commercial Law.

Core Courses	:	Civil Procedure Criminal Procedure Commercial Law Evidence Business Associations
Top-up Courses	:	Hong Kong Constitutional Law Hong Kong Legal System Hong Kong Land Law

Upon completion of the traineeship and with the declaration by the supervisor that the trainee solicitor is fit to be a solicitor, he can then apply for admission as a solicitor.

In the “overseas lawyer” route, if the person has been admitted in a common law jurisdiction, he must have at least 2 years experience in the practice of law of his original jurisdiction to be eligible to sit for the Overseas Lawyers Qualification Examination. There are 4 written and 1 oral examinations that must be passed by the person, namely written examination covering Conveyancing, Civil & Criminal Procedures, Commercial & Company Laws and Accounts & Professional Conduct; and oral examination covering the principles of Common Law^{*****}.

To become a barrister, a person must be qualified for admission under section 27(1) of the Legal Practitioners Ordinance (Hong Kong) by being a PCLL holder, a solicitor in Hong Kong or an overseas lawyer. Holders of non-law bachelor degrees can either complete the LL.B course or pass the Common Professional Examination of England and Wales (CPE) before taking the PCLL. For qualified solicitors in Hong Kong, they must have been admitted as such for at least 3 years (either immediately or in any case not more than 12 months) before the date of their application for admission as barrister and during that time they were in practice as solicitors in Hong Kong or were employed by the Government as legal officers^{§§§§§§}. The applicants must undertake pupillage (similar to being “trainee”) for 6 months in order to be eligible for admission as barrister. In order to practice, however, they must undertake pupillage for a further six months during which time they have a limited right of practice^{*****}.

4.4. *England and Wales*

Within England and Wales jurisdiction, the legal profession is separated between solicitors and barristers. In order to practice as solicitor, the person must have a Bachelor of Law degree programme with a minimum of 3 years study duration. The law graduates will then undergo Legal Practice Course (LPC) for a period of one year

^{*****} Becoming a Solicitor (January 2010). The Law Society of Hong Kong (pp. 3 - 8). Hong Kong.

^{§§§§§§} Legal officers as defined in the Legal Officers Ordinance, Cap. 87.

^{*****} The details of the qualification and admission requirements are detailed provided by the Hong Kong Bar Association.

and followed by traineeship for a period of two years^{††††††††}. For Non-law degrees programme, it must be followed with a conversion course vide a Graduate Diploma in Law (GDL). Upon completion of GDL, they would join the LPC and followed by a two-year training contract. For legal officers with at least 5 years professional experience in law offices, they can follow a mix of evening and weekend courses and examinations. They are also required to pass LPC, and are eligible to apply for exemptions from the two years Training Contract based on their professional experience. For foreign lawyers, they are required to pass the Qualifying Lawyer Transfer Test before they are allowed to practise as solicitors in England and Wales^{††††††††}.

As for the route to become a barrister, the person must hold a law degree under a minimum of a three years programme and must undergo a Bar Professional Training Course (BPTC) of one year that provides practical training focusing on advocacy skills. Upon completion of the BPTC, the person will undergo practical training called a pupillage for one year. The following are some the salient points with regard to the legal education and the training that must completed before a person can practice as solicitor or a barrister in England and Wales:

4.4.1. *The law degree*

The degree must be one that is recognised as a Qualifying Law Degree (QLD), and to fit this purpose, all law schools must comply the requirements of the Joint Academic Study Board (JASB). The Board are consists of a joint committee of the Solicitors Regulation Authority and the Bar Standards Board that determines substantive aspects of the minimum necessary content of a QLD.

4.4.2. *The duration of the a law degree*

- 3 years law degree - The standard undergraduate law degree normally takes three years to complete. When the study of law is entwined with another discipline, then the course often takes four years to complete.
- 2 years law degree - In respect of such degree, the entry requirement is that candidates must have an undergraduate degree. The senior status degree takes two years and very often complies with the JASB requirements so that its graduates are considered to have completed the appropriate academic stage.
- One-year law diploma - This is known as GDL where the students have to undergo one-year period of study under this programme.
- Four-year exempting law degree - Some universities in England and Wales provide exempting law degrees whereby students can do both academic and professional courses in one continuous stream.

4.4.3. *The law school*

Apart from complying with the requirements outlined by the JASB, the law school must also comply with the subject benchmarks established by the Quality Assurance Agency for Higher Education that operates within the Framework for Higher Education Qualifications.

^{††††††††} This is considered as the mainstream, route to enter the profession of solicitor. See: Julian Lonbay (2010), Legal Education in England and Wales. PILnet. p. 3.

^{††††††††} See: Lonbay (2010). p. 4.

4.4.4. *The mandatory elements in the QLD*

As required by the JASB, the curriculum of the QLD must cover the foundation courses namely Criminal Law, Equity & Trusts, law of the European Union, Obligations 1 (Contract), Obligations 2 (Tort), Property / Land Law and Public Law that consists of Constitutional Law, Administrative Law and Human Rights Law. On top of these courses, the students must receive training in legal research.

4.4.5. *The vocational stage*

The LPC and the BPTC are undertaken after the academic stage. The contents of these courses are strongly regulated by the professions, namely the Solicitors Regulation Authority and the Bar Standards Board respectively. In order to become a solicitor, one must pass LPC and enrol in the Solicitors Regulation Authority. Whilst in order to become a barrister, one must join an Inns of Court and thereafter undergoing and passing the BPTC. It is also a pre-requisite that the candidate must achieve at least a lower second-class degree at the undergraduate if he intends to become a barrister.

4.4.6. *Apprenticeship under the tutelage of practitioners*

Professional training under supervision of practising and experienced practitioners are made compulsory for both branches of professions. To become a solicitor, a person must complete the traineeship under a training contract for a period of 2 years and he will be supervised by a senior solicitor within that duration. As for barrister, the person must place himself in pupillage for a period of one year under the supervision of an experienced barrister. The pupillage is divided into 2 parts; the first part, the non-practising six months where the pupil will work with his supervisor, and the second part, practising six months where the pupil can undertake to supply legal services and exercise rights of audience in court, with the supervisor's permission.

5. REFORMS OF LEGAL EDUCATION IN MALAYSIA

Studying law is not a stroll in the park. There are so many challenges waiting for law students. Among the challenges facing by law students were discussed at the 12th Biennial Malaysian Law Conference organized by the Bar Council that is on the issue of the common bar examination. This issue arises as there are many complaints on the CLP. The CLP examination is very difficult to pass. The passing rate lingers at 40% during the recent years. Furthermore its initial objective was only to act as temporary measures. In 1989, C.A. Morrison QC who had conducted a study on the CLP examination recommended that it should continue but noted it lacks skills training.

As a result, the Bar Council set up a Special Committee to examine the entry requirements into the profession in 1993. The Committee had made a few recommendations which among others, all recognition of overseas law degrees including that from the United Kingdom, for the purpose of admission to the Bar be henceforth undertaken by the Qualifying Board; a review be undertaken of all United Kingdom law degrees from the standpoint of standard and quality; that the Qualifying Board stipulates a minimum requirements for entry into local universities; the minimum requirements for entry into the CLP programme be set at second Class lower of LL.B Honours; only LL.B external of University of London is recognized; the historical relationship with the

Council of Legal Education in United Kingdom be reviewed and there should no longer be any automatic recognition of a law degree in Malaysia for purposes of admission.

Consequently, the Ministry of Education of Malaysia in 2001 on the other hand proposed that the legal education be reviewed in order to face the developments in the new millennium. University of Malaya was requested to conduct the study and submit a report namely “Aims and Objectives of the Law Programme in Public Institutes of Higher Education”. The report inter alia recommended for a common bar examination. The Minister at the Prime Minister Department called for a meeting in 2003 comprising of members of the Bar, judges and academician to look at the possibility of implementing the common bar examination but so far nothing materialized until today except for proposals of its implementation by the joint working committee between the Bar Council and the LPQB. Through a mix of tense human reactions and ambiguity in the entrance system into the legal profession in Malaysia, the Bar Council infuses the legal education in Malaysia with an energy that makes for a compelling reform through the CBC proposal. The Executive Summary of the Bar Council’s Proposed Framework vehemently stress that the Bar Council has consistently taken the stand that the CBC should be the ultimate filter for entry into the legal profession to ensure quality. From the proposed framework, the debut of the CBC is to ascertain that only person who is most outstanding and excellent can permeate the gates into the legal profession.

The need for a new legal education structure is further enhanced by the findings of the Bar Council Employability Survey^{§§§§§§§§}. The survey obtained the evaluation by the law firms of the current law graduates (based on a set of individual attributes and skills set) with regard to the following “categories” of law graduates:

- Local law graduates;
- Foreign law graduates with CLP;
- Foreign law graduates without CLP; and
- London External with CLP.

The Employability Survey revealed that comparing graduates across the board, the best performers were clearly foreign law graduates, both with and without CLP. Foreign law graduates without CLP performed better in English proficiency, with 68% and 67% as against 66% and 65% on oral and written scores respectively. Foreign law graduates without CLP also scored higher in communication skills, confidence, self-presentation, analytical skills and providing creative solutions, whereas those with CLP scored higher in knowledge of the law.

The overall “sentiments” of firms employing law graduates shows that while the levels of satisfaction are relatively even amongst the different graduates, however the levels of dissatisfaction is most prevalent towards local law graduates. In this regard, 23% of the respondent-employers were satisfied with foreign law graduates with CLP, with 3% stating their dissatisfaction. 13% stated their satisfaction with foreign law graduates without CLP, whilst 17% were satisfied with graduates from the London external with CLP programme. 16% of the respondents were unsatisfied or very unsatisfied with local graduates.

^{§§§§§§§§} Steven Thiru and Kenneth Ang (2012). The Bar Council’s Employability Survey: How Employable are the New Entrants to the Bar?. *Praxis*. Oct - Dec 2012. (pp. 16-19). Kuala Lumpur: Bar Council.

An independent survey by University of Sultan Zainal Abidin on the students and academicians of public and private local law schools was conducted in 2012 on the reforms of legal education in Malaysia. Surprisingly, the perception of students of private local law schools tilt to agree (19%) that the current CLP programme and structure failed to produce quality legal practitioner, as compared to 7% disagreeing. Majority of the students from public (59%) and private (18%) institutions also agreed that admission to the legal profession need to be re-structured to enhance the quality of legal practitioner. The others appear to be neutral or unable to rate. 43% of the private local law students and 30% of the public local law students agreed for CBC to be the single entry point for both local and overseas law graduates into the legal profession, as compared to 3% and 29% disagreeing respectively. However, the majority voted to disagree that CBC should be conducted separately from the university education system.

6. THE PROPOSAL FOR COMMON BAR COURSE

CBC was the effort from the Bar Council in order to improve the quality and enhance the standards of the legal expertise as well as the administration of justice. This examination under the CBC which is said to be fair to all law graduates by the Bar Council will be the ultimate filter for the entry to the legal profession and ensure the law student to be well prepared and trained before enter the legal profession. The proposed framework of CBC includes the governing principles of CBC, which are as follows:

- The focus of the CBC should be on skills/practical training (as opposed to testing on legal knowledge) to equip the “student-at-law” for legal practice in Malaysia.
- The vocational nature of the training will be complimented with academic (substantive law) elements, only where necessary. Thus, the CBC will not deal with substantive law, which should remain the domain of the universities/law colleges.
- The CBC must combine the modern experience of other commonwealth jurisdictions and the local peculiar requirements (in a fused profession, with the inherent weaknesses).
- The CBC should prepare the “student-at-law” for the first two years of practice.
- The CBC should also enable the “student-at-law” to choose (if they so desire) to become either an advocate (litigation) or a solicitor (non-litigation). This is achieved by giving the student-at-law the option to fashion their training to cater for their choice.
- The CBC must deal with some of the shortcomings in pupillage and enhance the training during pupillage.

The Common Bar Course proposed structure has gone through some changes since 2008. The initial proposal incorporate the following structure:

- 5 semesters over a period of 20 months (84 credit hours).
- Semesters 1, 2 and 3 entail full time study and compulsory subjects – aptitude, basic legal skills and core areas of practice.
- The first three semesters: bedrock of legal practice – stringent assessment system and would sieve out those who do not possess the requisite qualities – “a guillotine”.
- Student Law Office Programme (Semesters 2 and 3) – to stimulate a legal environment in a small law firm.
- Semesters 4 and 5 would be part-time with the mixture of compulsory and elective subjects – tailor training to meet choice of practice.

- Pupillage to run concurrently with Semesters 4 and 5 / Peer learning and to deal with the shortcomings of pupillage.

The 2008 proposal of the CBC's syllabus and course content was completed by the committee and was debated on October 2008 at the Council meeting. The main subjects that have been proposed by the committee are as follows:

Table 4. 2008 CBC Syllabus Proposal

SEMESTER 1	SEMESTER 2	SEMESTER 3 & 4	SEMESTER 5
<ul style="list-style-type: none"> • Practical Aspects of Malaysian Law. • Legal Interpretation Skills (Constitution, Statutes and Case Law). • Practice Management Skills. 	<ul style="list-style-type: none"> • Legal Language (English and Bahasa Malaysia for law) and Communication Skills (including IT skills). • Lawyering Skills (e.g. Techniques of analysis) and Practical Legal Research. • Legal Ethics and Professionalism, Business and Solicitors Accounts. • Interviewing and Client Counselling Skills, Opinion Writing. 	<ul style="list-style-type: none"> • Civil Procedure. • Criminal Procedure. • Drafting Skills. • Evidence. • Real Property Practice. • Commercial and Corporate Practice. • Introduction to Advocacy. • Negotiation Skills. • Alternative Dispute Resolution-Mediation and Arbitration. 	<ul style="list-style-type: none"> • Remedies and Enforcement / Execution Proceedings as well as a host of other electives.

Based on the above-proposed syllabus, the programme will run for the period of two and a half years. Apart from the core subject that must be taken during the LLB course, the committee also inserted practical courses to familiarize the lawyer-to-be with the lawyering skills and practical area.

However, CBC structure has undergone another proposal change in 2012 where it is now divided into 2 parts; the Professional Year and the Advanced Professional Year after taking into account some of the objection raised by the public local law schools. The Professional Year shall have 2 semesters period of study and students who has graduated from local law school and completed the fourth year local LL.B programme would be exempted from the Professional Year structure. The Advanced Professional Year would also have a 2 semesters period of study with semester 1 focusing on aptitude, advanced legal skills and core areas of practice whilst semester 2 would be part-time incorporating concurrent pupillage period. The Professional Year utilising the CBC curriculum and the Advanced Professional Year will be supported by the Bar Council working in collaboration with the CBC Committee and the LPQB.

Further, in connection with finances, the Bar Council has decided that the CBC should be run on a non-profit basis. Thus, public funding from the government would be required to set up the necessary infrastructure and to cover administration costs. CBC has actually had been discussed for over past 15 years but several attempts made related to the Course over those years ended in futility. The Bar Council opined that CLP is outdated and no longer relevant to the current situation as in most of countries today had adopted more innovative and practical professional legal education in order to train their lawyer.

With the introduction of a CBC, law faculties in universities can be left to design their legal education at the academic level and leave the professional training to those running the common course and examination. This way, law lecturers in universities can pay full attention to the academic, theoretical and conceptual aspects of the law and the legal system rather than mixing their roles as academics as well as professional legal trainers. The CBC will also provide fair and clear opportunities for law faculties in universities to measure the quality of the legal training they had been providing.

7. THE OBJECTIONS AND CHALLENGES

In setting up this programme the challenges to implement CBC cannot be avoided. The Bar Council initiatives are not without hindrance from the other stakeholders. The Public Law School Deans' Council has issued a joint memorandum objecting to the 2008 CBC Proposal^{*****}. Despite appreciating the concern shown by the Bar Council in the need for a reform in the professional legal education in Malaysia by upgrading the teaching and learning of courses taught in the professional year through the implementation of the CBC, the public law schools have decided that the 2008 CBC Proposal cannot be accepted in entirety.

The first guiding principle adopted in the CBC proposal relating to a single point of entry into the legal profession would consequent in withdrawal of recognition of the Bachelor of Laws (Honours) graduates of 6 local universities as "qualified persons" under the Legal Profession Act 1976. These established public law faculties already have national and international accreditations for providing a solid foundation to produce law graduates who have proven their ability to enter the legal profession in Malaysia and elsewhere. Such consequences would downgrade the law degrees presently offered by the public universities that could raise important legal issues of substantive and procedural justice, if done arbitrarily. Universities have a legitimate expectation that recognition, once granted, should not be revoked without just cause and without an adequate prior hearing. It would also be extremely unfair for the younger public schools such as Northern University Malaysia, University of Sultan Zainal Abidin, Malaysia Islamic Science University and Multimedia University that have in the last 2 years, undergone rigorous auditing of its programme by the Bar Council for recognition of its programme, to be subsequently required to overhaul its programme again to accommodate the CBC. The CBC proposal appears to discount the wealth of experience accumulated by the long standing law faculties, their curriculum, the success of their students and the seniority of the teaching staff, some of whom have been campaigners in the law for many years.

As the Bar Council continues to propagate the programme for the purpose to cure the problems and "illness" in the legal profession, it is contended CBC is not the solution to the problems and can never be the instrument to enhance the integrity of the legal profession. It appears to be another paper qualification and the problems inflicted to CLP would be inherited by CBC. It cannot ensure inculcation of professionalism. The real root for the problem can be traced to human trait of greed, which causes corruption and abandonment of ethics and morality in their personal pursuit of self-wealth.

The proposed CBC was borne out of the failure of the CLP. The CLP was established as a 'rescue operation' to create a 'qualifying pathway' for Malaysian students who had undergone their legal education in England or offered by English universities who are unable to be admitted into the Inns of Court and Bar Examination due to not achieving an honours degree of 2nd class lower division and above. It has been acknowledged that the CLP is no longer able to prepare student lawyers to meet the demands and challenges in the field. Weaknesses in the

^{*****} The Joint Memorandum was endorsed by all the 7 Public Law Schools Deans in 2011. Some of the objections mentioned in this Article are extracted from the Joint Memorandum document.

CLP should not be used as a reason to withdraw the recognition already given to law graduates of local universities.

The law faculties of public universities support concrete efforts of the Bar Council to incorporate continuous skills training during the practical and professional stages of legal training. Even at the academic stage, the lines between academic teaching and professional teaching, especially for professional courses like law, over the years, are quickly blurring. The gap between theory and practice is constantly being bridged in all the law faculties of public universities specifically during the very comprehensive nature of the curriculum review prescribed by the Malaysian Qualifications Agency (MQA) and the Ministry of Higher Education. Such curriculum review includes aspects such as specifying learning outcomes and the inculcation of soft-skills in the teaching and learning. Much like the professional training programme in other jurisdictions like Singapore, Hong Kong and Australia, the law faculties in public universities have also inculcated skills training in their teaching and learning, incorporating methods such as problem based learning, advocacy skills, blended learning strategies using IT and experiential learning in the form of compulsory and credited industrial attachment. The law faculties of public universities are mindful of the merits of having practitioners or those who have had experience in practice to teach professional papers and towards this end have employed practising lawyers as well as retired lawyers to teach such papers. At the least, lecturers teaching such papers must first qualify as an advocate and solicitor.

The most crucial challenge would be in respect of financial, as the implementation will involve setting up a new legal institution to gather up and train more than thousands of law graduates at a single time. Although the 2008 CBC Proposal mentions that the CBC should be run on a 'non-profit basis' through public funding for infrastructure and administrative costs, considerable costs would still be likely incurred in implementing the course in light of the experience of other jurisdictions that implement Bar Courses and professional training courses such as United Kingdom, Singapore, Hong Kong and Australia. Inevitably, the costs will be transferred to the students, rendering the profession to be beyond the reach of many, especially the low and medium income families. The result is that the large majority of the Malaysian population, especially those coming from the rural areas or those from the poorer communities would be marginalised. Public institutions of higher learning have historically played the role of providing affordable education for equitable social redistribution so as to enable all sections of society to participate in the various sectors of the economy. It is therefore wise to preserve this important role of the public law schools in relation to legal education in light of Malaysia's status as a developing nation and in line with the economic developmental policies of the country.

This aim of CBC to be the ultimate filter for entry into the legal profession is not in line with the national education system that seeks to enable access to education that would then lead to gainful employment. It also disregards the fact that "filtering" of candidates into the law programme of public universities has already been done at the admissions stage, both at the foundation studies and at direct intake levels.

The vacancy of professional full time legal trainer and staff also needed to be filled to avoid any hiccups while running the programme. Reliance to part timer may cause difficulty to the management of the programme. The qualification to be appointed as the legal trainer will be determined by the Bar Council and the LPQB. On the other hand, the universities and the law faculties have trained large numbers of teaching staff most of whom hold postgraduate qualifications and have acquired international exposure. It is the business of the universities to teach and therefore the academic staffs are well trained in pedagogy, which cannot be said of those who come only from purely legal practice backgrounds.

For the public local law schools' graduates, the introduction of this new system will burden them. Distinct from their overseas law graduates, the public local law schools' duration of study is one year longer. This

additional one-year is used by the local law faculties to teach the law graduates about the practical subjects rather than theoretical subjects, which is the crux for the introduction of CBC. Graduates from local public universities are more sceptical of CBC, as their advantage to be exempted from taking CLP is coming to an end. There is also the further issue of costs to take CBC. The obvious burden is for those who took study loans from National Higher Education Fund or another financial body. Additional loan need to be applied for them to continue another two and half years For CBC. Thus, such extended duration will have financial implications on the students that have not been adequately dealt with in the CBC Proposal.

Those who propagates CBC maintains that the course is not and should not be viewed as a tool to cover any policy in favour of the foreign law graduates. The situation is that there will be one single underlying criteria for the qualification to be a legal practitioners in which this qualification are not determined by the university from which one obtained his or her law degree. This course will abolish the discriminatory nature and effect of the dual-system of qualification in Malaysia. The CBC examination would be a standard benchmark for all in producing good and competent future lawyers. This justification makes the questionable assumption that the Bar examination are inadequate and burdensome are irrelevant. In taking such examination, pressure to maintain high grades for prestige, pride, and employability will encourage the law graduates to work harder.

8. RECOMMENDATIONS

Malaysia has to move in line with its counterparts. Every other common jurisdiction has evolved to require some sort of standard benchmark for admission to the legal profession. Thus, the proposition for CBC as the ultimate filter is not without merit. It could at least ensure a minimum standard for legal practitioner. However, the Bar Council and LPQB should strongly engage with and work together with the law faculties of public universities in enhancing the teaching and learning of the professional papers as well as promulgate a viable proposal structure for CBC. The current 2012 CBC proposal, which do away with the Professional Year for local law schools which has a 4-year programme would also signify that the CBC does not trespass into the realm of the academic institutions. While the law schools may argue that initially the CBC structure was inconsiderate of their 4-year academic structure, it have somewhat been resolved by the current proposal. Thus, the law schools cannot dictate the professional body to determine its admission requirement as well as its efforts to improve the quality of the legal practitioners, especially when such efforts do not trespass into the tuft of the academic local institutions. Even surveys on the prospective employers as well as the current prospective graduates and academician has somewhat agree that the admission to the legal profession should be re-structured to enhance the quality of legal practitioners. However, proper considerations should be made in the following aspects:

- Academic and Professional Education.
- The Standard of Professional Training.
- The Training Providers.
- The Regulatory System.
- Financial Impact.

The academic and professional education should flow in a single stream towards the profession. It cannot and should not be administered separately. The turmoil of separate regulation between higher education provider and the professional body can be seen in the recognition process of the law programme for the new public law schools, wherein the requirement between the higher education provider and the professional body seems distinct

and do not justify a separate evaluation exercise between the accreditation process and the recognition process. The curriculum offered by the public law schools should meet the requirements of MQA and the Education Ministry, which employs the needs and standards set clearly by the professional body. Only law degree, which fulfils this element should be recognised.

The enforcement of standard by MQA or the professional body should be conducted through audit on the Institution and the law schools would encompass the compliance of standard required by MQA, the Education Ministry and the professional in one single exercise rather than repetitious audits of the same nature. In short, the authority should work hand in hand to ensure that the law schools curriculum and delivery has achieved the standards required, rather than mere downplay of the local institutions by the professional body.

The aim and objectives of CBC is to enhance standards of the legal practitioner. However, the standard must be properly indicated and achievable. It cannot be dictated by the whims and fancies of certain quarters of who claims to be experts in the field. The CBC structure must set at the core on what is required by way of professional training. For example, in Australia there is the National Competency Standards. In order to set the standard for it to be achievable, it could not be relied on a particular body. It should be done in a concerted effort by all the stakeholders and the standards will then be adopted and streamlined by all the training providers.

For the training providers, the issue is pertaining to the selection of the provider and how the providers can ensure that their training achieve the required standard. Thus, an evaluation or assessment method must be created rather than letting it flourish in the wild. Then, there is also the structure of CBC curriculum and methodologies to be used. If CLP failed than CBC must succeed. Thus, the high failure rate in CLP should not continue in CBC in grounds that proper training has been given prior to any examinations under the CBC. High failure rate in CBC does not equate to low quality of the graduates, but can also imply the failure of the training providers. It should be noted that CLP is examination orientated while CBC is all-encompassing course with some examination assessment. In order to fully achieve the aim to be single entry into the profession and the maintain a minimum standard for legal practitioner, the best would be to have a single independent institution for that purpose, though it translate to higher expenditure to create that institution. There was a proposal for a Law Academy in Malaysia could be use the spearhead the CBC agenda.

This independent institution could also become a new regulatory body to govern and maintain CBC structure. Otherwise, LPQB could be developed to be the regulatory body for that purpose to administer the standards. In order to streamline nation policy and the legal profession, the government should bear the responsibility to set up the regulatory body and institution. Thus, the funding could come partly from the government coffers to ensure that no expenses spared for enhancing quality of the legal practitioners. In turn, quality lawyers ensure that law and order of the nation is well preserved.

However, from the students' point of view, the issue is whether CBC is fair, accessible and equitable. If it is too costly, the legal profession would be the luxury of wealthier family. This would definitely be against national policy to open up the profession to all irrespective of financial background and must be based solely on merits. Thus, the enrolment fees should not be exorbitant to curtail admission by graduates from low-income group.

In an effort to ensure the delivery of effective professional training at public law schools, the Bar Council should consider allowing law academics to also practice as advocates and solicitors, by amending section 30 of the Legal Profession Act 1976. This approach has been adopted by many countries such as Indonesia and Turkey and has enabled the active infusion of practical legal skills in the legal education curriculum at all public universities. This suggestion is also in accordance with the aspiration of the establishment of the National Legal Aid Fund to enable academic staff of public universities to represent their legal aid clients in court.

9. CONCLUSION

The CBC is focused primarily on the professional practice skills to ensure that new legal practitioners is equipped with vocational skills required as a legal practitioners in their first 2 years of practice. Proponent for CBC maintains that it could ensure a minimum standard of legal professionals rather the current disparity between existing between one practitioner and another. However, in order CBC to achieve its true purpose, many aspects have to be considered and analyze thoroughly. The standards, the evaluation, financial factors and the selection of the training providers are among the issues that need to be settled for CBC to be successful than simply inheriting the problem and deficiencies of CLP. Again, it should be warned that although CBC promulgate a single course and examination for admission to the legal profession, ultimately the course is just a practical training course based on fictitious legal scenarios and may not necessarily equip law graduates with the very minimum skills needed to survive as an independent albeit employed practitioner. That, to a larger extent, is provided for by pupillage and experience gained throughout the legal career.

4th International Conference on New Horizons in Education

The personality of an ethical educational teacher

Mgr. Gabriela Bradová*

Slovak, Pedagogical Faculty, University of Matej Bell, Department of Ethics and Citizenship, Banská Bystrica

Abstract

We attempt to characterize the personality of ethics' teacher in this submitted contribution. The only real wealth of a person is his or her own personality. But at the same time there's nothing more complicated than a human personality. Only a person with a full-value can tutor other persons with a full- value. Thus, it seems necessary that every teacher of ethics should be a mature, authentic, creative, responsible, universal and complete personality. (Kosová, 1995).

Keywords: personality, teacher, ethics

1. INTRODUCTION

Having become a teacher also bears the task of being a carrier of educational ideas and ideals of education, being a personality in a first place, which in the true meaning can not be trained nor learned. Having consider all that, only the one can become a good teacher, who is able to withstand a constant self-education and self-development and is capable of empathizing with all the problems of human existence, who can self-study and raise a question of whether he is competent enough to foster up what he in fact requests of others. (Elevation 1994) The subject of Ethics is just the subject that actually fully allows us to do that. The prime intention of ethics education is to develop a pro-social personality, whose action is characterized by a good conduct. According to P. Fridrichová "The role of Ethics is to contribute to the education of personality, in which all positive values such as humanity, freedom, responsibility, tolerance, authenticity, initiative, diligence and fairness are fully integrated. These values, the corner stones of ethical education are in compliance with the ideals defined in the National Programme of Education and to these all remaining lower hierarchical objectives should subject to these values." (2012, p.9)

However, the general objectives are elaborated in more comprehensive manner and portray broader scale of values, not just the goodness alone in a mankind. The purpose of ethics is to educate oneself by a national education program of Slovakia and it's defined as follows:

- has its own identity, is her own self while this identity also includes the pro-social orientation, has a positive attitude towards life and people associated with a healthy criticism, where its behavior is determined by personal believes and interiorized ethical standards, resulting in universal solidarity and justice, and this is why its social pressure is free to some extent

* Corresponding author.

Email address:

- attains a mature moral judgment relying on generalized principles, therefore is capable of an appropriate reaction when encountering a problematic situations
- characterized by relation of the right mindset and appropriate actions in accordance with its fundamentals, but also with the emotional involvement - consistency between emotions and volition - not acting solely on duties and with the lack of enthusiasm driven by sense of self-pity
- accepts difference in others, fairs their opinions and it is willing to tolerate a fair compromise, which is not in contrary with universal human values
- is willing and able to cooperate and initiate cooperation. (State Education Programme Annex Ethics, 2011, p.3) According to K. D. Ušinskij (1962, p.62) The real education is impossible without an immediate personal impact of educator on a pupil that would actually penetrate the character. Only a personality can have an affect on a process and determination of a personality development where only true character can shape the character. "Teacher in a class of ethics is only a facilitator, so the lesson is actually just supervised." According to B. KOSOVO (2009, p 14). The teacher is fully capable to supervise others if in accordance with oneself, acting as a subject in accordance with the situation of children and himself alone, with the necessity of distance and independent decision-making with the need for reflection and questioning his own actions. The teacher of ethics should have a style of the teacher humanist, which describes B. Kosov (1995, p.53, 54) as follows:

1. Tolerates: feelings, needs, interests and individual differences of students, idiomatic style of learning and behavior of pupils, other opinions than his own, discusses problems, errors and omissions of the student's as well as his own mistakes and errors.
2. Supports: independent thinking and acting of student, finding problems and information, diversity and unconventional solutions to problems, positive approach to a student learning, positive informal relations of students, collaboration between students and reasonable competitiveness and needs of students in terms of self-improvement.
3. Requires: an active conscious discipline and responsibility, own opinion, assessment and self-assessment so that the learner understands the nature of its own activities, so the pupil gets to know himself, cause of their own mistakes and shortcomings and their own and classmates eligibilities.
4. Anticipates and creates conditions for: the success of each student, curiosity and students questions, discussion and open communication and thought-provoking ideas and criticism.
5. Rejects: blind obedience and forced activity, the atmosphere of fear and tension, ridicule and pigeon students satisfied with mediocrity, servility and acting only on the challenge and the view that everything should be clear.

The chosen approach of the Ethics teacher truly forms a personality capable to motivate students towards the educational process by pro-social, empathic and assertive behavior that is characteristic for ethical education. The task of teaching ethics is to promote the personal development of the child / young person characterized by pro-social behavior.

In order to achieve this objective, the teacher of ethics should posses the following competencies:

- Professional
- Moral and ethical
- Educational and psychological
- Didactic and methodological
- Self-development

Based on the analysis of current trends and ethics, the teacher of ethics is understood as a professional who is qualified for theoretically profound and critical analysis of educational phenomena and processes of teaching the subject. This allows him to create educational strategies and procedures in order to achieve the objectives

without practicing manipulation on students and creating optimal conditions for their moral self-development. Along the way, they are able to explain their teaching practices as well as defend them in argumentation, modify and successfully implement and continuously evaluate. (Valica et al, 2011) The teacher is then understood as a reflexive professional who is through permanent-reflection and self-reflection able to confront theory and practice, which leads to the integration of the professional competencies and creation of individual educational theory (implicit and explicit), which significantly affects its pedagogical decisions and actions. The teacher of ethics should fill the content of ethics, which is focused on the attributes needed to be developed in the child so that we can achieve educational goals. These attributes are incorporated in the following basic topics elaborated by R.R.Olivar, these form the foundation of Slovak educational ethics:

1. Open communication
2. Dignity of the human person, self-esteem, positive evaluation of oneself
3. Positive evaluation of others
4. Creativity and initiative
5. Expression of feelings
6. Empathy
7. Assertiveness
8. Realistic and displayed patterns
9. Pro-social behavior (help, gifting, sharing, cooperation, friendship)
10. Comprehensive pro-social behavior

The aim of ethics education as a mandatory elective subject in an earlier stage of secondary education is to:

- provide pupils pulses and positive experiences that support basic trust, autonomy and initiative
- enable them to acquire basic communication skills, basic operations of social behavior, to evaluate oneself and others positively, solve everyday situations in interpersonal relationships in a creative way
- explain students concepts of empathy, assertiveness, cooperation and pro-social (positive social) behavior
- enable pupils to acquire more social skills, for example how to express emotions, empathy, assertive behavior
- enable pupils acquiring basic attitude that makes cultured maturation, teach them to explore themselves, discover their identity, develop self-appreciation
- explore and acquire rights and responsibilities in a family, teach them to express their opinion politely, gradually take responsibility for their decisions, while respecting parents and conduct a constructive dialogue with them
- enable pupils to realize their sexual identity, understand the positive values of friendship, love, marriage and a family, aware of the risks associated with early sexual life, justify basic moral standards, adopt the right attitude to issues related to sexuality
- develop pupils' positive attitudes towards disabled, sick, and other groups of people that need help and understanding
- explain students the basic concepts related to the choice of life goals, worldview, religion, ethics and norms
- enable pupils to understand the basic ethical issues related to economic values, truth and good reputation
- explain students the basic concepts related to the conservation of nature and the environment
- teach students to respect other people's opinions, while remaining themselves, formulate their goals in life, be free from improper inducements, remain free of addictions that degrade and threaten our lives, to develop pupils' awareness of their own dignity and worth of the human being, and in this sense being able to evaluate the effects of mass media critically, and critically educate the viewer. (National Educational Programme, Annex Ethics, 2011, p.4)

The outcome of ethical objectives is that ethics teacher should be as stated by B. Kudláčová (2003) a mature personality, educator and also a professional who is educated by a sufficient knowledge in their field and is constantly broadening ones knowledge, is able to support ethical views rationally, able to lead argumentation and convey it to students clearly. Relationship of an ethics teacher and student should be based on mutual understanding, trust, respect, acceptance and tolerance. The ethics teacher should be empathetic, creative, tolerant, assertive, pro-social and should be a role model for the surroundings, especially to his students. Based on these assumptions alone and personal qualities he would be able to manage and fulfill the objectives of ethics, and as a consequence raise a good man by supporting and developing basic moral values in students.

2. Conclusion

We can't refute the fact that the personality of the ethics teacher is significantly determined by actual learning process of students, their way of thinking, educational results, relations in the classroom, and the success of young people in life. As we have already described the personality of the ethics teacher, he & she greatly affects the educational process in the ethics classes. The aim of this subject is to educate pro-social personality - a person who is characterized by autonomy in thoughts and feelings, personal integrity, consistency between emotion and volition, clear ethical standards and principles that is able to control his life and actions in it. By making a choice in terms of willingness of the ethics teacher to educate himself further and try to solve problems with pupils brought on by educational process, regularly reflect on their lessons, plan them in advance and at the same time take into consideration pupils' needs and guide them, ensures that the subject of ethics will become a subject which fully meets the requirements of the general objectives.

The place and the importance of history learning on architectural education

Zafer Sagdic^{a*}, Ipek Kosova^b^a*Yildiz Technical University, Faculty of Architecture 81840 "Istanbul", Turkey*^b*Yildiz Technical University, Faculty of Architecture 81840, "Istanbul", Turkey*

Abstract

Before writing or reading any text on history or related with history, it should be known clearly that past and history are not referring to mainly the same thing. What is past? And what is history? The answers of these questions should be known clearly to not only to understand the developments on architecture, but also to design any basic thing. Thus, the importance of history and the meaning of history writing on architecture should be known by architects and architecture students before designing. It is also important to understand that each of us has a historicity point of view on our life as designers or architects. Thus, in this point of view we design our new creations by using images, as they are some data on our historicism. Thus, the paper will not only have answers of these questions above, but also it will describe how we can design as architects by learning history on architecture and the place and the importance of history learning on architecture.

Keywords: history, past, historicity, historicism, architecture

1. INTRODUCTION

As a result of rapid search through digital technology, one of the general definitions of expression of history is "as a research area, a knowledge depending on human records, and on written and verbal sources" or "a knowledge at which known past events are expressed". Most popular and most widely used one, on the other hand, is "that is depended on cause and effect relationship". The past, embraces every moment prior to the present and the history, needs to be read with consciousness and time perception within the existence of present and past. Thus, past is obviously different than the history. History or history writing is to reproduce the past. History is a construction; a constructed expression, a form of past scenario written by the owner of the text; by the author. It is an editing. What happened actually in the past is not and cannot known as the way it has lived. As believed, visualized and been at ease as it is, history is in fact edited, constructed and seen by different eyes through different "glasses". History is an editing area. Although the duty of a historian is to convey the past to the future generation impartially and directly, all written and verbal conversion will be molded with the history of personality of that historian, in other words, writing and an editing of history reflecting personality of the historian will emerge. Of course, there is no an unbiased historian. That is impossible. Nothing is expressed in an absolute objectivity and neutrality.

2. What Is The History?

The history is a definition through “the glasses” of the one, who describes it. Because the mind of a human being cannot think on an absolute gap, the history can be written into a construction of a World, which was transmitted by judgement. Thus, there is never an objective history fiction. The history can only be written through the theme, which was transferred by its’ author. There cannot be any definition, which is not supported by its’ author; although there is always an assumption of it. Every definition is belonged to its’ author, as long as it carries “the name” of him and its’ author is attributed by whatever he writes. Without any doubt, it is like a vicious circle; all of the definitions form the author.

The most beloved type of history telling is giving a definition out of biological analogy; bureaucratically structure of the government is tried to be read out of the living environment network, and thus, there are some definitions, which have vital periods such as foundation, growth and fall. Through the concept of those ideas and definitions of the history writing, possibilities of making sense of various deductions of the bureaucratically structure, the political relationships, socio-cultural activities and so on so forth can be caught. All of those definitions of the history are like small pieces of a big “puzzle” and the history is only lived into the fictional writing through the “glasses” of its’ authors. The history authors are writing the history as the subjects of the moment and their readers can have their own subtractions as the subjects of the moment of the reading activity through their fictional definitions. Every definition has its own problematic. Always, it is waited to have only one absolute truth from the history. However, there is never only one. There is never only one absolute truth, and it has not been. Because there is never existed an absolute neutrality. Thus, the history writing cannot have a neutral point of view. It is not right to expect to have a history, which has absolute neutrality. Thus, history writing of staying in a vicious circle, and having without any prejudice, can not be read, explained and can not be solved without having any prejudice, as well.

Because history writers cannot live on an absolute individuality, they can put their signatures on the parallel of their social identity. They know their own act/ role. These roles are written according to the corners on where they stand. Without any doubt, this situation is an epistemological problem.

3. What Does Past Include?

The truth is that the field, which is called as the past cannot be written with all of its’ hint points and already existed data. The data of the history, different words of the other history writers, the borders of what the powerful have on his hands are structured over again, from the beginning and by given new definitions.

Thus, why all of the architects need to know the past? Without any doubt, architecture cannot be made without knowing this praxis as an architect, without standing inside the borders of this praxis. Not only of being a human, but also the fact of making architecture are historical, they are insisted on a historical platform, thus, history of architecture is read and touch during architectural education. To seen and understand of the historical process of

the architectural praxis, history of architecture should be learned. In a strange way, this situation has a big obscurity. There is not a certain truth; there is not an eternal truth. Everything and also we are all existed in a historicity. Nothing is constant and fixed and stable. Everything forms the physical environment is historical. Everything that has made, that has created and designed are historical and they can find an existence of a specific historicity. Nothing, even functionality is trustable. It has existence trough its' historicity. It has a kind of suitability and harmony according to the space, time and its' socio-cultural community. Every excepted, found and situated idea is changing continuously and thus, there are infinite numbers of opportunities to open wide view on discussions.

4. History Learning On Architectural Education

Architecture lives on a world like which is defined above. Especially, all of the buildings that were designed and constructed have been created like this during last 200 years; they are the products of discussions, answers of asking of design questions and architectural critical. However, architectural designing can be only done by this and that discussions and critics. The truth is not on the products, but on the ideas and believing of the ones by whom they are created. The truth is on the subject, about whom the speech is going on. All of the existed narratives and texts are right inside their borders; these narratives and texts can not be continuously live as the life of other than their own truths on outside of the limited and defined borders. They are all about fictions. They can be real and existed only on the atmosphere of the space, where are becoming fictional. There is not an eternal result, which is an absolute truth. The effort of trying to make scientifically architecture is wrong. It is for sure that, the absolute socio-historical process, on where architects want to be located is not existed. Because of this, the history of architecture is touch during the architectural education. Not only the question of which socio-historical processes are existed, but also how the buildings and their architects can be attached to them and with what they are interacted or with what they have been fought during the creation process, are important to be asked here. The answers of these questions are forming the historical identities of the architects, their design paradigms, the needing and wills of the architects as well. The architectural identities of architects, their architectural problematic, and the solutions can be only formed like this. The original signatures of architects can be given only by this way.

Fig. 1. (a) the valley of Gizah; (b) the transparent glass pyramid of Louvre Museum by Im Pei.

Fig. 2. (a) A Greek Temple; (b) A Villa by Palladio, Renaissance Period; (c) White House.

Fig. 3. (a) Supermercado de Colon, Valencia; (b) Supermercado de Santa Caterina, Barcelona, by Enric Miralles.

Fig. 4. (a) a hieroglyph wall from USA; (b) a traditional hieroglyph wall from Egypt.

5. Conclusion

It is a common idea that examples of World Contemporary Architecture generally have references from history, such as the transparent glass pyramid of the Museum of Louvre by Im Pei, has a connection with antique pyramids of Valley of Gizah; the front facades of Palladio's villa and White House have references from the antique Greek Temple, etc. almost every new architectural design has a historical connection or references, which shows us that without having a powerful historical background it is almost impossible to design a new architectural form.

4th International Conference on New Horizons in Education

The pronunciation problems for Turkish learners in articulating of the diphthongs in English learning.

Mehmet Deniz Demircioglu

Uludağ University, School of Foreign Languages, 16369 "Bursa", Turkey

Abstract

In our modern and digital world, learning English at the upper-intermediate and the advanced levels is inevitable necessity for everybody to learn in terms of every skill, such as, speaking, listening, reading, and writing. Pronunciation, in particular, has been neglected in English teaching at the primary, secondary, and high state schools in Turkey. Neither teachers who teach English nor students who are willing to learn English give more importance to pronunciation owing to different articulations that are unavailable in Turkish language. This issue predominantly arises from the completely different language families to which Turkish and English languages are members. The main articulation problems that Turkish learners encounter are diphthongs, the voiced, and the unvoiced "th" sounds. In the syntax structure of Turkish language, two vowels are hardly ever in juxtaposition. So, Turkish learners are used to articulating the word forming monophthong sound because of the structure of Turkish language.

The pronunciation problems for Turkish learners are not entirely limited to either the diphthongs or the voiced and unvoiced "th" sounds. In addition to those, the great majority of Turkish teachers teaching English at the state secondary, and high schools are beyond giving importance to the listening ability in which the consonant assimilation plays a significant role for learners to comprehend the sounds that they encounter in listening activities. As for one of the examples of how we can overcome the issue of some diphthongs' articulation, we can put our sign finger to the front of our lips before we start the articulation of the diphthongs such as "go" or "home," the lips should push the finger forward during the articulation of "go" or "home." Otherwise, it means that it is not the accurate articulation for the sounds of "go" and "home," as two examples of the diphthongs.

I am going to put forward the issues of diphthongs in English for Turkish learners and present the ways, and techniques for the students in my classroom that they put the techniques and the ways that are taught into practice to overcome the articulation problems of the diphthongs by the power point presentation.

Keywords: Diphthongs; articulation; pronunciation; Turkish learners; Language families.

1). Introduction

In our modern, digital world, having fluent English is a necessity for everybody from every point of view, such as science, technology, international trade, diplomacy, medicine and so on. Having a competence in English grammar is no longer sufficient for someone who wants to communicate effectively in English, they also need to use skills particularly listening and speaking in an integrated fashion.

In the Turkish education system, speaking (accurate pronunciation, in particular) and listening have been consistently neglected by not only Turkish teachers who teach English but also Turkish students at the state primary, secondary, and high schools. Most Turkish students reach an intermediate level in English Grammar .

However, Upper intermediate and Advanced levels of English are generally thought to be a step too far for Turkish learners to attain owing to problems pronouncing specific vowels and consonants that are not available in Turkish language.

1.1) The difficulties that Turkish learners encounter in English learning.

Some vowels and consonants that are unavailable in Turkish language create articulation problems, which form barriers for Turkish learners to overcome easily. These are generally the voiced dental fricative “ð” and the Voiceless dental fricative “θ” sounds. In addition to those, some diphthongs in English language also create some difficulties in accurate pronunciation. The negligence and not giving importance to accurate pronunciation, in particular, in English lessons by teachers who teach English bring about the fossilization in pronunciation of English.

The reasons why Turkish learners at the state primary, secondary, and high schools are not good at articulating “th” sounds and some diphthongs in terms of pronunciation are because the classroom size in English lessons is more than thirty students, and because there is scarcely any skill lesson but grammar. First of all, the essential problem that cannot be ignored is that Turkish language is not in the same language family as English.

1.2) The analysis of the Turkish learners’ cultural differences and problems of articulation in the process of English learning.

In the field of language education, there are four basic skills that are essential in the process of teaching and learning. These are: reading, writing, listening, and speaking. In many foreign languages teaching methodology publications, all these skills are integrated into one particular learning context. That is the cultural aspect of the target language. Kramsch (1993) was among the first to argue that culture is the fifth skill in teaching. This skill is evident at every step of the process not only in language teaching but also in other fields of study. According to Ommagion (1993) teaching culture is considered important by most teachers, but it has remained “insubstantial and sporadic in most language classrooms.” Few Turkish teachers who teach English at the state schools give importance to the culture of the target language. The importance that is given to Grammar at the state secondary and high schools’ English classrooms shadows the four basic skills that are essential in the process of teaching and learning. The pronunciation and the culture of the target language take its share from the eclipse of negligence as well. A few idealist teachers who give importance to the articulation and pronunciation of the target language lose the belief of being good at pronunciation because of reluctant learners and insufficient curriculum of English teaching. Even if a teacher of English is willing to identify the pronunciation problems, he / she does not know any technique, which helps learners overcome the fossilization in the pronunciation of English. The most of Turkish learners have difficulty in articulating the voiced and the unvoiced “th” sound and the back sounds of the diphthongs. It is necessary for learners to learn English culture by hearing some examples from their teachers of English when they lose their concentration on the lesson of English. Some interesting examples for culture of the target language may be given to the learners at least for starting the first lesson of the week with the aim to attract the students’ attention to the lesson.

In my classroom at the School of foreign languages, Uludag University, the students at the pre-intermediate level practiced the sounds of the eight diphthongs under my control. I noticed that most of them found the pronunciation of the diphthongs difficult to articulate. The articulation of the frontal sounds of the Diphthongs is easier for them than that of back sounds of the ones in English learning. In order to overcome this issue, I practiced the table 2 and the table 3 so that they could overcome the articulation and pronunciation problems. As a result, by means of the techniques which take place in appendix section put into practice with the aim to make them gain the habit of good pronunciation,

So long as the learners find a foreign language interesting and necessary in terms of its culture, they try to concentrate on the subject that is taught during the lesson.

2) Tables:

THE TABLES THAT HELP THE LEARNERS PRACTICE THE ARTICULATION OF THE DIPHTHONGS.

Table 1)The phonetic symbols of the Diphthongs (eight diphthongs in English language

Table 2) The steps to be followed by learners in learning the sounds of the diphthongs to attain the accurate pronunciation.

Table 3) The key table for the pronunciation of the diphthongs.

Turkish students have difficulty in learning the articulation and pronunciation of English sounds because there is no such a sound of articulation in the Turkish language. These sounds are generally the voiced and unvoiced “th” sounds and the diphthongs. Particularly, some diphthongs such as in the articulation of “Go,” “Home,” “Cow,” in English language create certain difficulties for Turkish learners because inadequacy of listening comprehension in English lessons at the state secondary and high schools affect the use of English speaking negatively. 6th, 7th, and 8th sounds are not easy for Turkish learners to articulate and pronounce easily. In this presentation, I have given a place to the presentation of the diphthongs. The detailed explanations of the diphthongs in which the positions of the tongue during the articulation of the sounds are explained about how Turkish learners articulate and pronounce those sounds. The aim of this presentation is to propound the diphthongs that are not available in Turkish language, and their articulation problems in terms of Turkish learners. In this presentation, I am going to emphasize the use of the diphthongs and their difficulties for Turkish learners, and point out how we can overcome the issues that Turkish learners encounter by the help of oral practices, which will help them learn the correct articulation of the diphthongs.

Is it possible for Turkish learners who are accustomed to having inaccurate articulation to overcome the problems of the pronunciation in English by breaking fossilization through exercises that will make students gain confidence?

Can anyone learn any foreign language without giving importance to the skills (Reading, Writing, Speaking, Listening)? Can learning only grammar of English provide new learners with fluent English in the international area? The Turkish students in my classroom generally have difficulty in articulating the sounds, in particular, are unavailable in Turkish language even if they try to produce the pronunciation of the diphthongs. A few techniques to be used easily by everybody, if you are unfamiliar with the sounds such as the voiced and the

unvoiced “TH” sounds and the diphthongs, can lead you to the desired, accurate pronunciation level. This is “The sign finger technique “. After you watch the shape of the teacher who shows you how you are going to articulate and pronounce the sounds of the diphthongs, you can imitate the way of articulating of, the diphthongs under the control of the teacher in the classroom.

If you fail in articulating of the sounds that you are supposed to do so, do not let you have the feeling that you are far beyond doing so. You should encourage you to do the best sooner or later. Perhaps, you can articulate those sounds separately. Yet, the ability that you have just gained from the articulation practices might turn to the inability while you are using a full sentence in which more than one diphthong is evident. Before repeating the same sentence, you should put your sign finger the frontal part of your lips. When your lips push your sign finger out during the articulation of the diphthongs such as ə:ʊ, əʊ, ɜ:, ɔ: sounds, e.g. ”go “, “home”, “toast”, “ I go home when I finish my work.” Or “ I saw a girl eating a toast at home.” So long as you repeat that technique when you make practices in the articulation of the diphthongs, you can gain the habit to articulate accurately by yourself. Having accurate and desired pronunciation in English speaking enables you to reach to the correct pronunciation which gives you an opportunity to speak to English-speaking people interactively.

3.0) The essential problem that cannot be ignored is that Turkish language is not in the same language as English language

(*) World languages are divided into three groups with regard to the sentence structures.(Ceritoglu,M)

3.1) *The Isolating languages:*

In monosyllabic languages, every word is made up of one syllable. The word is in the form of root. No conjugation is available. The Sentence structure is formed by using the uninflected verbs. The meaning of the sentences is understood in accordance with conjoining of the words. In speaking, very rich stress /emphasis system is used to distinguish the words that resemble one another. (Chinese, Tibetan language)

3.2) *The Inflexional languages:*

In these languages, word stems show variation while lexicalising new word, and the word stem becomes unrecognizable. The particles can take place in the word as prefix, infix, and suffix. The main voices in the word stem remain the same while articulating a new sound.

(Hindu-European languages take place in this language family.)

3.3) *The Agglutinating languages*

In these languages, while lexicalising new word or a verb and noun inflection, word stem remains recognizable. Some particles, as a prefix or a suffix, are used to form a new word.

(Ural-Altaic languages are in this group.)

Turkish is an agglutinating language and a member of the Altaic language family.

4.0) Why do most learners find diphthongs difficult at first?

There are eight English diphthongs altogether. To make diphthongs, your tongue, lips (and your jaw on occasions!) have to move. Sometimes the journey your tongue makes is short and very controlled; in some of the diphthongs, It has to move a long distance in your mouth, involving a lot of jaw movements too.

Learners find diphthongs difficult because producing them is a motor skill (like body building!) which has to be practised in order to obtain a good result. You cannot succeed in English pronunciation by understanding alone. The muscles you have to train to make English diphthongs are unlikely to be identical to those you use in production of vowel sounds in your first language.

5.0) Presenting diphthongs- similarities and differences:

The English language has twenty vowel sounds. To see all the English sounds, The first 12 of the English vowel sounds are MONOPHTHONGS. The tongue stays at ONE fixed location in the mouth to produce each MONOPHTHONG Sounds 13 to 20, the next eight English vowel sounds, are DIPHTHONGS. They present greater difficulty to people learning English because the tongue travels between two fixed locations. It is important to know exactly what to do with the speech organs (i.e. the position of the tongue, lip-shape & tension, size of mouth opening) in each location and the manner and direction of the movement. (Power,Ted)

Turkish learners generally have difficulty in articulating the vowel phonemes in which seven monophthongs and five diphthongs are evident and the consonant phonemes in which the voiced and unvoiced “th” sounds are evident. The articulations of monophthongs such as pat; ago; car; too; luck; meat; door; and of the diphthongs such as beer; bear; tour; go; cow, and the articulation of the consonant phonemes such as the voiced and the unvoiced “th” sounds such as that; and think create unwillingness for most of Turkish learners to learn English language at the state secondary and high schools.

6.0) How can one easily distinguish between monophthong and diphthong sounds?

A monophthong is a single, pure vowel sound. While pronouncing a monophthong, the positions of the mouth and tongue remain fixed. Because of that peculiarities of the monothongs, Turkish learners do not have any difficulty in articulating the monothongs On the other hand, the diphthongs are difficult for Turkish learners to articulate at first especially, when they start to learn English. A diphthong is a vowel sound that changes from the beginning to the end, while still being pronounced in the space of a single syllable. While pronouncing a diphthong, the positions of the mouth and tongue change, or slide, from the beginning to the end of the vowel sound. Both English and Italian contain both monophthongs and diphthongs. However native English speakers are often unaware of the distinction between these two types of vowel sounds because English spelling usually doesn't give you very obvious clues about which type of sound is used in a particular word. In fact, in some

instances the exact same word is pronounced with a monophthong in one variety of English and a diphthong in another. In contrast, Italian makes a very clear distinction between monophthongs and diphthongs. Monophthongs are always represented by a single written vowel and diphthongs are always represented by two written vowels. In order to develop an accurate Italian pronunciation it's vital that you understand the difference between monophthongs and diphthongs, and that you are able to always use the correct type of vowel sound. There are some examples that demonstrate the sound of monophthongs and that of the diphthongs. (Power, Ted; Eng.Lang.)

Examples:

æ: man

æɪ: main

ɪ: bit

ɑɪ:

bite.

ɔ: lot

əʊ: low

o: tall

ɔɪ: toy .

7.0) Conclusion and comment:

One of the main reasons why Turkish students are not good at learning English at the state primary, secondary, and high schools is because they are hardly ever taught the articulation and the pronunciation of English. The importance is mostly given to the teaching of grammar rather than the skill lessons. No matter how well you are in learning grammar of English, it is impossible for them to enrol their levels from intermediate to upper-intermediate or advanced level. Having competence in comprehending the reading, writing, listening, and speaking skills supported by a fluent pronunciation of English accelerates the desire to learn English in such a way as to communicate with people who speak English well in every field.

Comment:

As long as the target language's culture emphasised as the fifth skill (Ommagion,1993) is neglected by the non-native English teachers or the native ones , at the state schools in Turkey, it is not easy for the learners to learn English In order to emphasize the difference between English and Turkish cultures, an example relating to the cultural differences may be given in the.warm up and motivation activities before starting the lesson.

Here is an example for the cultural differences: Student (S), Teacher (T) in the dialog.

Original short films or videos that explain the cultural differences including limited a few minutes during the lesson prepare the ground for the Turkish learners to not only learn how they attain the desired articulation but also focus on the lessons even if they sometimes fail in following the lesson. Those activities accelerate students' performance of learning English Using correct articulation and pronunciation means that you have caught a chance to communicate with people all over the world. Those activities help learners make easy to articulate and pronounce the sounds such as "th ",diphthongs, and the assimilation in consonants, both visually and aurally.

1)	/eɪ/	2)	/aɪ/	3)	/ɔɪ/
4)	/ɪə/	5)	/eə/	6)	/ʊə/
7)	/əʊ/	8)	/aʊ/		

A.2. Table 2: The steps to be followed by the learners in learning the sounds of the diphthongs :

Your tongue needs to start off near the middle of your mouth, with your mouth open. Then your tongue needs to move back and up slightly at the same time as you close your lips. Your lips also need to be 'rounded' slightly.

Here is a technique you can use to feel the difference in different mouth shapes:

- Start by putting your finger on your lips like you are saying 'shhhhh' and telling someone to be quiet. (Perhaps you don't make this gesture in your culture, or it is rude to do so. Actually, it can be a little rude in European cultures also, so you need to use it with care. You're most likely to see it among audiences at live shows, at the movie theatre, or in the library if someone is rudely talking.)
- Hold your finger still don't move it when your lips move. Now make an 'ee' sound. You should feel your lips come back to be flat against your teeth. Your finger should now not be touching your lips.
- Now make an 'au' sound sticking your lips out. You should feel your finger be pushed out, away from your mouth. This is what 'rounding' your lips means.

Now say the word 'goat' with your finger touching your lips, and check that your lips become rounded at the end of the vowel sound.

A.3. Table 3: The key table for the pronunciation of the Diphthongs

[The diphthongs that Turkish learners have mostly difficulty in articulating are the sounds, such as (long) ə:ʊ (reduced) əʊ. The exercises given below aim to practice those sounds so that the students in the classroom can get used to articulating those sounds .

Long [ə:ʊ - go, toe, home, road, pose]

Reduced [əʊ - goat, rope, oak, post, both]

Compare [ə:ʊ , əʊ - robe, rope ; toes, toast ; grows, gross ;

Road, wrote ; cold, colt.]

əʊ /, / ɜ:/- foe, fur ; own, earn; goal, girl; oath, earth;

Coat, curt, foam, firm.

/ əʊ, ɔ: /- so, saw ; pose, pause ; bold, bald ; load, lord;

Boat, bought ; choke, chalk

/ əʊ /, / ɜ:/, / ɔ: /-foe, fur, four ; bone , burn , born ;

Woke, work, walk ; coat, curt , caught; (Power)

Coal, curl , call.

The bibliography of the writer

I have been teaching English as an ELT lecturer at English department, School of Foreign Languages since 1985, when I graduated from the department of English language at Uludağ University, Bursa. Teaching English is our family business because every individual of my family is predominantly engaged in teaching English at the schools and the university. The lessons that I am responsible for are writing, reading, speaking, listening, and international trade English.

As a person who believes in the idea that everybody should refresh himself in his own field every time without considering how old he /she is, I participated in some courses in not only Turkey but also The U.K. Some of them are:

Fulbright in İstanbul,(1988), “Methodology in teaching English” in Norwich, the U.K. (1990), “Creative methodology for the classroom” Kent University, The U.K. (2012), “Workshop presenters’ training” at ITI in İstanbul.I have been doing DELTA [Diploma for English language teaching to adults] (module 3)at ITI in İstanbul (International Training Institute of Cambridge University).

On the dates of 2nd and 6th of May 2013, My article the pronunciation problems for Turkish learners in articulating of the voiced and unvoiced “ th “ sounds and the techniques of overcoming the difficulties for Turkish learners in English learning.” was accepted by the International Burch University, Sarajevo.

4th International Conference on New Horizons in Education

The quality improvement of the university education

Alžbeta Kucharčíková*

University of Žilina,, Faculty of Management Science and Informatics, Univerzitná 8215/1, 010 26 Žilina, Slovakia

Abstract

Much of the criticism has been directed to higher education in Slovakia over the decades. It is argued that the current education focuses more on acquiring encyclopaedic knowledge rather than promoting the creativity to develop ability to identify problems. As a result, students are less able to analyse specific situation, to present and evaluate alternative solutions, stand up for their own opinions and use their knowledge in practical applications. The aim of this paper is to point out the possibility to apply an appropriate combination of different teaching methods in order to make corrections in both students learning styles and teachers methods. These applied tools will help us enhance the quality of education and attract the attention to more effective learning at the universities as the imperative of successful preparation of students for both their professional and personal life.

Key words: motivation, learning methods, learning styles, education styles

1. Introduction

University teachers in Slovakia are, more than ever, evaluated according to its assessment of research and publication activities. Demands for publication in prestigious journals and participation at major international conferences are continually increasing for them. On the verge of interest remain their teaching activities. However, paradoxically, just these activities are perceived by the public and students in the first place. Students is much more interested in how the teacher explains a particular topic or draws an attention about this topic, and not what the teacher achieves success in publishing.

2. Motivation

The key elements in the implementation of education are the students themselves. Their motivational readiness to learn depends inter alia on the emotional state of mind, cultural and educational backgrounds. Emotional status and disposition also have an effect on what will be their approach to learning. Motive is an internal momentum that causes a change in human's behaviour and to leads to his needs.

There are a lot of motivational factors, of course. Interest in the subject depends on the content and form of teaching, nature of teachers and students and of other factors. Everything is determined by the time possibilities arising from the timetable, the number of students in a class, surround possibilities, teacher's readiness and alike.

E-mail address: Alzbeta.Kucharcikova@fri.uniza.sk

For students is motivating when the teacher at the beginning of the semester informs about content and goals of the course, and also gives them space to comment about what they interested in, respectively what another topic related to the content of the course would be welcomed and what are their expectations. This is useful information for teachers about what could be added to the content part to meet the requirements and the interest of teachers and students, too.

At universities, unfortunately, studying also those students who do not wish to periodically prepare and they decided to study only because this wished their parents or because of their field of study is the low interest from other students. The idea of obtaining a university degree is great, but interest in the study and willingness to make an effort - it is negligible for some of students. What to do in such cases? Is it possible to motivate some young people with no interest in anything?

Motivation increases the amount of effort and energy that learners expend in activities directly related to their needs and goals (Csikszentmihalyi & Nakamura, 1989). It determines whether they pursue a task enthusiastically and wholeheartedly or apathetically and lackadaisically.

Motivation increases initiation of and persistence in activities. Students are more likely to begin a task they actually want to do. They are also more likely to continue working at it until they've completed it, even if they are occasionally interrupted or frustrated in the process Motivation increases students' time on task and it is an important factor affecting their learning. (Larson, 2000)

Motivation affects cognitive processes. Motivation affects what learners pay attention to and how effectively they process it. For instance, motivated learners often make a concerted effort to truly understand classroom material—to learn it meaningfully—and consider how they might use it in their own lives. (Ormrod, 2006)

We can say that motivation is the force that drives us to carry out activities. We are motivated when we feel like doing something and we are able to sustain the effort required during the time required to achieve the objective we set ourselves. Motivation should be considered carefully by teachers, trying to mobilize the capabilities and potential of each student for academic success. (Ferreira, Cardoso & Abrantes, 2011)

Educational science defined two basic types of motivation: intrinsic and extrinsic, that have a potentially different consequences on learning (Standage, Duda, & Ntoumanis, 2005). These are based on self-determination theory that considers humans to actively seek optimal challenges and new experiences to master and integrate. The most self-determined type of motivation is intrinsic motivation. Intrinsic motivation refers to engagement in activities for their own sake, namely for the feelings of pleasure, interest, and satisfaction that derive directly from participation. When intrinsically motivated, individuals are fully self-regulated, engage in activities out of interest, experience a sense of volition, and function without the aid of external rewards and constraints (Deci & Ryan, 1985).

Teachers should also create an active learning environment that enhances students' perceived autonomy and competence, providing students with choices and opportunities for self-directed learning, and planning learning activities that might increase their feeling of mastery. In fact, intrinsic motivation was shown to be a factor of great importance that can lead to higher perceived learning in the course. (Ferreira, Cardoso & Abrantes, 2011)

Motivation of students varies depending on which phase of the cycle of motivation they are. The role of the teacher is to estimate this and adjust the communication strategy and interventions during the learning process.

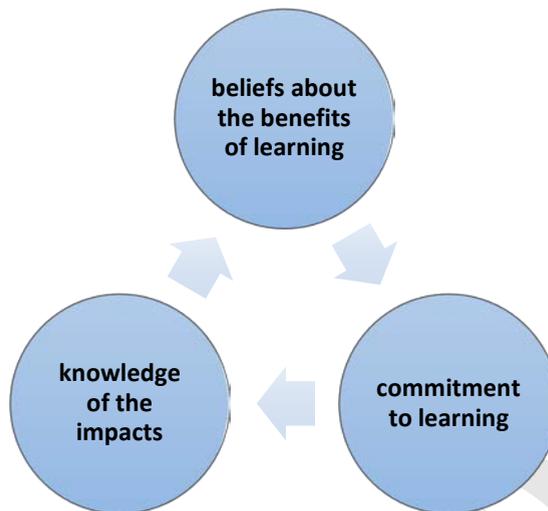

Fig.1. Cycle of motivation

It is very useful at the beginning of the semester to establish clear rules of communication, of granting credits, of passing an examination - clear rules of the game that both sides will actually follow. If student knows it is necessary at university to study apart from fun, then it's up to him whether the rules adopted or not.

According to feedback from students shows that much easier and more interesting for them is the theme which application in practice is clear. It is therefore appropriate to close the lecture with question: "What do you think, where you use it?", "What is it good for?". If students find the answer yourself, they better remember the subject matter of lecture, but if you can not imagine a practical use, it is necessary to tell them what it is.

It is interestingly, the students better and more open to receiving information from a teacher who has had some experience outside of education, or working on projects in practice.

3. The students and their learning styles

Everyone has their own learning style. Some prefer practical exercises and is ready to learn from their mistakes, while others prefer abstract discussion and others prefer to acquire new information and skills that can be transferred to their environment. Kolb, Honey and Mumford (2000) studied the learning styles and they analysed the effects of learning styles. On this basis, Honey and Mumford defined four basic learning styles: activist, reflector, theorist and pragmatist. Profile and preferences for different styles of individuals can be determined by questionnaire and observation of participants in action.

Activists – typical is: “here and now”, gregarious, seek challenge and immediate experience, open-minded, bored with implementation. The activists dominate their immediate experience. They tend to occur in the short-term crises as a fire fighters. They love to take new challenges, but they can be poisoned by the implementation

of long-term activities. Activists learn best, when: there are new experiences, exercises and problems; making a short action immediately and on the spot (management games, team tasks, exercises), where they play a role; there is excitement and drama, things have created momentum and unexpected twists and turns with a variety of activities which need to be tackled. The activists are best dealt with difficult tasks when they are thrown into water.

Reflectors: “stand back”, gather data, ponder and analyze, delay reaching conclusions, listen before speaking, thoughtful. Reflectors are people who stand in the background, thinking and observing people and situations from different viewpoints. They consider different approaches and consequences before moving forward, and thus tend to exhibit caution. They joy of watching other people in their activities and often sit down in a classroom in the back seat. Reflectors learn best when activities can watch or think about them, they can be on top of things, listen, observe and think (twice measured and cut once) and have adequate time to prepare.

Theorists: think things through in logical steps, assimilate disparate facts into coherent theories, rationally objective, reject subjectivity and flippancy. Theorists concern with the underlying assumptions, principles, theories, models and systems. They appreciate the rationality and logic, they are objective and analytical, not live content with subjective or ascribed. They prefer if you take the rational subject. Theorists learn best when: teaching material is part of a system model or theory, seeing the subject logic structure and a clear purpose, when they have to understand complicated situations and procedures to solution.

Pragmatists: seek and try out new ideas, practical, down-to-earth, enjoy problem solving and decision-making quickly, bored with long discussions. Pragmatists are people who often look for new ideas and like to experiment. They want to try new ideas and knowledge into practice immediately. Pragmatists learn best when: they see a clear link between teaching topic and its practical application; when learning practices that have practical benefits and solutions that are justified and when they can focus on practical problem with a clear end result or product.

Honey and Mumford's extended Kolb's learning cycle with 4 phases (1. having an experience, 2. reflecting on it, 3. drawing their own conclusions, 4. Putting their theory into practice to see what happens) with learning styles, as shown in Fig. 2. Students prefer different methods of learning, depending upon the situation and their experience level, thus they move between the four modes of learning, rather than being dominantly locked into one mode. According to Honey and Mumford's learning cycle, the students can move around the cycle again, jump in any part of the cycle, and then quit when they deem them self as successful.

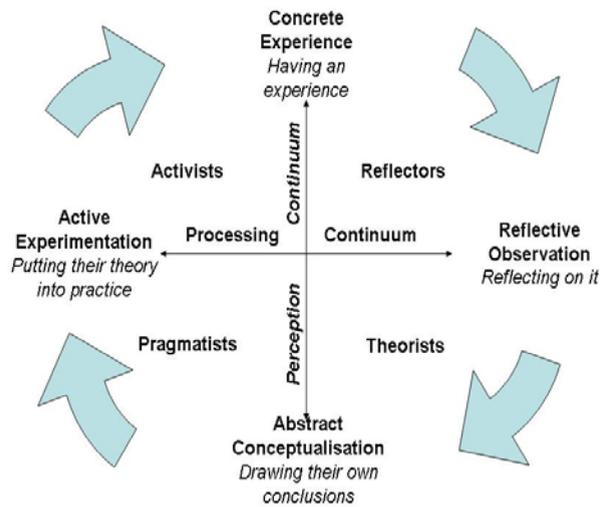

Fig. 2. Honey and Mumford's learning cycle

It is appropriate to understand the learning styles are not as strong personality trait, but rather as the principle of adaptive orientation, which is affected by psychological foundation and specialized nature of the problems that the person is mostly solved. If you manage to synchronized the education styles of teachers with learning styles of students, then educational activities will be useful for students more than they themselves expected. Therefore, it is very beneficial if the teacher uses knowledge of the learning styles of students in the entering group work or other participatory methods of teaching.

4. Methods of learning

Learning methods are an important tool for the implementation of the educational process. Selection and use appropriate methods should reflect the needs of students and respond to current global trends in technological and economic development. Choosing appropriate methods course is determined by various factors such as the number of students in the study group, spatial and technical capabilities, motivating students to learn, professional level and experience of teachers, as well as the quality and availability of teaching resources and supporting textbooks.

The most frequently used methods of teaching at universities are lectures and seminars. Lectures are suitable for the transmission of large quantities of information to large numbers of students, but this is missing the opportunity of interaction. Seminars realised as seminary works or discussions allow the exchange of information and views on certain issues, but the quality of learning depends on the knowledge level and responsible preparing of students.

To achieve higher efficiency of education is necessary to use a combination of several methods. They should also include participative methods. Participative methods assume a high degree of student activities. Their advantage is that they support better remember learned. They represent the current modern methods, which is typical for active practice, experience and direction to the learning of "learning by doing". They are thus based on

the fact that people will learn more if you try to do something, than if they just read or listen to the new information, such as a lecture. Lectures prefer the content of learning, participative methods prefer the procedural aspect. Students can be activated using a combination of various participative methods such as group work, brainstorming, case studies, role playing, management games, and so on. An important part of this method of teaching is to provide feedback and evaluation of activities.

Because participative methods are used for education (training) small groups, universities can be applied mainly in seminars or tutorials. In this way there is a better choice than strengthen knowledge accumulated in lectures and linking them to practical model situations.

Successful managers understand that a reasonably activity in processing information not only accelerate their use, but primarily improves the quality of decision-making. (Chodasová, 2012). And it is this activity which students should be prepared using participative methods.

Development of information and communication technologies enables universities to introduce e-learning. Its advantage is the speed of communication, the opportunity to reach a large number of students at the same time. Students themselves can choose the pace of learning. Students also learn to use this advanced technology, but there is no personal contact between the teacher - student and direct feedback, which may be disadvantageous in teaching some artistically and socially oriented subjects. It also limited the possibility of developing communication and verbal presentation skills themselves. Because students are very happy to work with ICT, e-learning is very useful as a complementary tool to the above methods.

In the context of teaching are often created problems with space, time, time-tables and the like. Many students take more than the studies focus on "chasing credits" and often they are not interested about course itself. However, for all those who are interested in learning, it is important that teachers do experiments and use the innovative, non-traditional teaching methods and practices.

Table 1. Same of the participative methods

METHOD	DESCRIPTION	ADVANTAGES	DISADVANTAGES
BRAINSTORMING	Frequently used method to solve problems. It is necessary to respect the principle of non-criticism, fantasy release, mutual inspiration and equality of participants	<ul style="list-style-type: none"> - speed - the involvement of a large number of students 	<ul style="list-style-type: none"> - necessity of clearly explain the method before using - the need for compliance with the rules of the method
WORKSHOP	Popular method addressed to discuss specific situations and find possible approaches to their positive management.	<ul style="list-style-type: none"> - informality - use in the more numerous group 	<ul style="list-style-type: none"> - requirements for teacher facilitation skills
AQUÁRIUM	One group of students solves the problem, the second group observes and then provides the feedback.	<ul style="list-style-type: none"> - practicing of giving feedback - solid training of the learned skills 	<ul style="list-style-type: none"> - stage fright and nervousness participants who solves the role and who are observed - demanding facilitation by the teacher
ROLE PLAYS	The group gets the script with roles. Students play a selected situation and examine the various possible approaches to solving problems or unforeseen events.	<ul style="list-style-type: none"> - fun - practicing well as unpleasant situations 	<ul style="list-style-type: none"> - games can be considered unrealistic - stage-fright and fear of missed "actor's" performance
SOLUTION TO THE INCIDENT	The method is similar to the case study. Enter the basic facts of the incident and the group decides what further information needs and what needs to answer questions.	<ul style="list-style-type: none"> - exploration real problems without the risk - good simulation of reality 	<ul style="list-style-type: none"> - possible sense the artificial situation by the participants
LABYRINTH	Used induced situation. At some point, students have to solve several tasks simultaneously and options identified consequences of one of the selected options. Proceed in this way until the successful solved task.	<ul style="list-style-type: none"> - it can keep its own pace of work - a high degree of student participation 	<ul style="list-style-type: none"> - time-consuming - difficulty preparation for teachers

5. Teachers and education styles

Preparation, implementation, evaluation of education is often a complex process which places different demands on the teacher. There are a variety of specific skills that are needed for education of large and small groups, and facilitation and preparation of the necessary materials. The status of the teacher in Slovakia is getting worse. This is due to the fact that universities are trying to get as many students due to the established system of financing. But the quality of the teacher is evaluated more on the basis of their scientific activities, participation in grant tasks, obtained grant funding, publication outputs and less on the personal and pedagogical assumptions.

So, on the one hand, there is a school that requires the teacher work out more and more publications. On the other hand, there are students who require a high level of teacher's presentation skills, abilities and art as to attract attention. How teachers implement this, it is a matter of motivation, presentation, education methods used, as well as communication with the student.

The quality of education and students' satisfaction depends primarily on the ability teacher how to explain a theme by the right way (for example, through experience and examples). The teachers in the education process can apply different education styles.

Structuralistic style is characterized by the fulfilment of criteria of teaching and continuous testing of education effectiveness. The teacher in the education process prefers an activity analysis, an accurate planning of teaching, appropriate system, structure and methods. The disadvantage is too much focus on education tools and structure, underestimating the emotional state of students, low flexibility in relation to the learning needs of students. The teacher will teach at any price planned range of subject matter, regardless of whether students understand the topic and have been able to absorb new knowledge.

Functionalist style is based on the principle that people learn best by what they considered to be practical. Education is focused on the problem (task), performance enhancement, recognition and praise. Teachers put students ambitious goals, emphasize their usefulness, but on the other hand, they can sometimes be impatient or insensitive to students who learn slowly.

Humanistic style is typical of those teachers who aim to improve the personality traits. The educational process is focused on building a relationship. Typical is the acceptance, empathy, spontaneity and openness in relation to the participants - students. Weakness of this style can sometimes be weak control of student groups and particularly unclear direction of learning. Students are actively working, but they cannot summarize and evaluate what they learned.

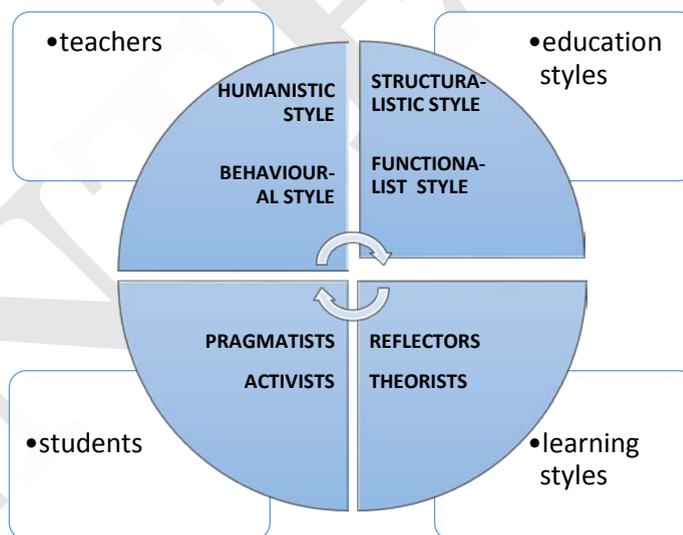

Fig. 3. Connection the education and learning styles

For **behavioural style** is characterized that the teacher designs and implements a sequence of steps that have lead to expected target behaviour. The educational process is a result-oriented and it is a fun way led to the

application of new methods and tools. That style is difficult to prepare teachers, on the other hand, creates a conducive environment for students. Students know what they have learned, they can better remember new knowledge thus grows the attractiveness of these topics or subject.

Let the teacher near any educational style, it is important to handle a wide range of interpersonal skills, such as:

- listen well and ask appropriate questions,
- flexibility in the use of learning methods,
- adapt the pace and methods of teaching for learning students style (this is easier to implement in small study groups),
- improve their expertise, presentation skills and increase the value of their human capital.

It is very important that teachers carried out the evaluation, which is the final and most important phase of the educational process. Evaluation allows the back to look at the educational activities, the success and interest of the students and provides information on how to do in the future in another way, what to improve, which topics to miss out, which topics to supplement and under. Evaluating creates conditions improving the quality of teaching and increase student interest. This is realized by several methods, such as interviews, questionnaires, feedback, self-reflection. Short evaluation can be done after each seminar or tutorial and lecture after the control test at the end of the semester, after the end of the examination period, but also the beginning of the next semester, when we find out the reasons why the students signed up for the course.

6. Conclusion

The amount of relevant information in the world is growing exponentially and the levels of human knowledge are changing rapidly. Although our own experiences are irreplaceable, it is not conceivable that everyone could try everything. Therefore we must also draw from other people's experiences and knowledge. (Tokarčíková, 2011).

A longer period in Slovakia discussed that formal education is becoming more focused on the obtaining of encyclopaedic knowledge. Teaching is less focused on promoting creativity and use creativity to develop the ability to identify problems. Students are less oriented on how to analyze specific situation, present and evaluate alternative solutions, present and defend their own solution. A serious shortage is the low ability pupils and students to use the knowledge in practical applications.

However, businesses need not only educated, but also creative, innovative, proactive and flexible workers. If workers do not meet these criteria, are in an era of globalization and high competition for business rather risk factor. (Klučka, 2011)

When are properly used different modern methods of education and when learning styles of students are correct linked to teachers' educational styles, it is possible to improve the quality and attractiveness of higher education and student preparedness for successful completion of the examination, thesis defense, state exams, but also to deal with everyday and work situations. This is in a presumption for successful application of students in business practice.

4th International Conference on New Horizons in Education

The reality of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development “a comparative study between Egypt and Saudi Arabia”

Dr.Mohamed Abdelrahman Al Saadany*

*Associate Professor of Educational Technology
King Saud University, Teachers College ,4341,Riyadh, Kingdome of Saudi Arabia
Port Said University, College of Specific Education,Port Said,Egypt*

Abstract

The present study was geared to investigate the reality of Using Learning resource centres’ specialist for libraries and digital resources as a tool for continuing professional development “A Comparative Study between Egypt and Saudi Arabia” limitation of the study consisted of 120 Egyptian and Saudi learning resource centres’ specialist ,Who Charcot-mail in the questionnaire addressed to them, by using the descriptive method approach – the way the causal comparison- Based on the conclusion that the difference between specialists learning resource centres’ of both country of the application in their estimates the reality of the use of libraries and electronic resource as a tool for professional development and substantial due to differences in demographic variable. The result showed substantial convergence in the reality of use between specialists from both country of the application, and the great care of them to develop themselves professionally.

Key words: Learning Resource Centres’ Specialist, Digital Resources, Educational Digital Libraries, Continuing Professional Development

INTRODUCTION

Information and communications technology represents a pillars of support for the development of modern societies, as it’s being a component of modern infrastructure for all institutions of society seeking for excellence and leadership, the tremendous development of modern communication techniques lead to deepen the utilization of information and data; leading to tremendous developments in information systems , and the potential for and methods of storage, processing, and tied together at the global level through information networks, which is clearly manifested in the huge boom that occurred in the libraries and learning resource centers, and the quality of services they offer.

The growth of knowledge and information technology which happen in world today leads to do rapidly substantive exchanges in the educational communication methods with all its physical and human dimensions ,

* Corresponding author. Tel.:+ 966 508 616 835; fax: +966 011 445 534 8
E-mail address: dr.malsaadany@gmail.com

that significantly coincided with the evolution of the elements of contact educational and scientific, which is reflected heavily on the development of systematic attention to issues of education, and its tools which are libraries and Learning Resource Centers one of the most important tools that support self-learning strategies, continuous learning and lifelong learning, and urges that research and investigation.

From this standpoint witnessed libraries profound changes as a result of an explosion of knowledge and informational, and the subsequent technical innovations have contributed to the increasing information, and developed methods of transmission and retrieval; which led them to search for the most successful ways and means to adapt with these new realities, and meet its challenges, according For two directions: the first is supported by scientists specialize in library science, such as Wilfred Lancaster, who believes that libraries in light of the information society on its way to demise (Lancaster, 1978, p345-357), and the second is supported by a team of scientists who believes that libraries libraries have gained prestige thanks to modern technology (Renni,1997,p.21)

As a result of this importance and the new roles of the library in the communities of teaching and learning in different levels, and to expand the activities of electronic publishing raised issues not get used by traditional environment of libraries, and appearance new concepts accompanied the development of libraries to turn for electronic, digital, or virtual library, which required radical changes in the schemes, system, methods and sources of the education.

Which is reflected in a large and influential on the learning resource centers as a natural extension of the school library by its traditional form, which it shall develop plans and strategies for identifying opportunities and challenges, and issues of the near future and long term in order to ensure its continued survival, and excellence in providing services, that is stems by the ability of the existing specialist who working in these centers to provide all services in accordance to the standards of quality and availability.

The educational institutions pursuit to provision new form of information services based on digitization, which allows all parties of the educational environment to sailing in the world of information, overcoming all obstacles spatial and temporal, through the potential of electronic publishing and accounts access to the rules of digital information, which dependent on what can be provided by these institutions of services and technical support for all beneficiaries via learning resource centers specialist, this requires developing the capabilities and skills of learning resource centers specialist, through increase professional development, and invest his energies and his own abilities.

Teaching and learning scope, and even the educational process in general during the second half of the twentieth century faced several challenges represented in the population explosion, cognitive, communications, information revolution and the consequent them of the speed of transfer of knowledge and modernity, which prompted the leading countries to use new educational systems, based on interactive and integrated strategies. Stems from the theory and educational frameworks aimed at achieving integrated education through the provision of effective educational environment inside and outside the classroom, characterized Cooperatively, activity, efficiency, taking into account individual differences among students.

Which require the use of educational and information technology in varying degrees to face these pressures, challenges and overcome those obstacles. We find mass communication offer a solution to the problem of the high demand on education and increase the number of students, thus the inability of educational institutions on the provision of infrastructure such as buildings, facilities and equipment that can be met this huge number of learners, but exceeded this means the limits of time and space and provided education to those who desire it in place according to his time available and cognitive abilities and mental health, and we find educational T.V networks offer the ideal solution to overcome the problem of shortage of teachers especially qualified them and increase the number of students and differentiate they could geographical, and we find audio recordings and video in different shapes and patterns, and ways to provide services offer an important and essential for the breeding process to improve the teaching and the development of vocational training programs, in addition to

making available computer programmers of new forms of learning individual resulting in improved operational performance for students using simulation methods varied and other various computer applications.

Which led to changing the role of both teacher and learner through application-oriented formal educational technology, where the student became in focus of operation instruction, and change the teacher's role to be not limited in traditional role confined to being a specific article of study and advance them, explaining the information textbook, picks the educational means, taking educational decisions, making evaluating tests, , planning ,design , preparation educational process, in addition to being a supervisor , manager , mentor and a resident for all the activities of the educational process which is inside and outside the classroom.

So the learning process became participatory between teacher and learner. enabled the learner chances of self-learning , cooperative, and he had the resources to learn a variety of attractive addresses senses multiple works on development in order to achieve the degree of excellence in education which aims to prepare a generation of students is awareness and creativity, with attention to the economic aspect of the educational process

LITERATURE REVIEW

Digital libraries and digital learning resources centers have increasingly become a gateway to access electronic resources. To provide effective professional development services, for teachers and learners which need to have a good understanding of the role of digital libraries, user's perceptions, and satisfaction. Buckland observes that all digital libraries have been designed backwards because "library services should be user-centered rather than data-centered." He further points out that: "Only when substantially more research and development has been completed from the library user's perspective can the digital library environment begin to have the look and feel of good library (Buckland,2003)

Learning resource center specialist face a new challenge in reaching continuing professional development them self to met invisible users who have only electronic access to libraries. The increased reliance on electronic resources requires reexamination of whom we serve. In a comprehensive study of 4678 respondents in 119 institutions of higher education in the United States, McMartin et al. explore the uses, motivations, and barriers surrounding the use of educational digital libraries by faculty members and instructors. Their survey results of how faculty members and instructors differ in their use and non-use of digital libraries reveal that these groups are "more alike than different use of online digital materials" in variables such as level of experience, institution type, and academic appointment. They find that commonly used demographics in higher education that categorize population could not reliably predict the use of digital resources. (Mc Martin & other, 2008)

Several studies conducted on the effectiveness of the use of libraries and digital resources, including a study of Badawi , which sought to develop the skills to use digital sources for learning resource centers specialist using the tools of the second generation of the Web and measure their attitudes towards these libraries and digital resources, believing the great role and effective achieved by the use of libraries and digital resources in the development of the educational process, and the study found a significant evolution in the skills to use libraries and digital resources have learning resource centers specialist undergoing the training program prepared for this and submitted through the Web 2.0 technologies and specifically blogging (Badawi, 2011)

Study of Liu & Luo that explores the extent to which undergraduate and graduate students in China differs in their digital library use. Unlike the factors promoting digital library use, non-use factors, perceived influences, and degree of satisfaction are quite different between undergraduate and graduate students due to their differing emphases and expectations for information. The implications for digital library services are also discussed.(Liu & Luo,2011). That correspond to each of the studies Bahga Boumarave 2001, that aimed to know the reality of the use of faculty members at the University of Sharjah for the Internet by identifying the areas of use of the network and the usefulness of using the application on a sample of 70 of faculty members at the University of Sharjah all levels of scientific and diagnosis of the problems faced by the use of faculty members to network Internet, where occupied the surf and email, scientific communication between searcher, and search library

catalogs, and the use of digital libraries highest rates of Internet usage with faculty members, and that the time constraints and network slowdowns and a lack of training and the language barrier is the biggest impediments to the use of the network, and the study recommended the need to hold training sessions and workshops to develop the skills to use the Internet and activated in the teaching faculty, and work to raise speed internet connectivity within the university(Boumarave,2001), and the study of Abdul Latif Abdul Rahman; Adnan Jamal al-Din; Zamela Mahmoud 2011, Which aimed to investigate factors that are expected to influence the intention of postgraduate students to use digital library based on modified UTAUT model. The modified model comprises of constructs represented by several latent variables, namely performance expectancy (PE), effort expectancy (EE), information quality (IQ) and service quality (SQ) and moderated by age, gender and experience in using digital library. Results show that performance expectancy, effort expectancy and information quality are positively related to the intention to use digital library, while service quality is negatively related to the intention to use digital library. Age and gender have shown no evidence of any significant interactions, while

experience in using digital library significantly interacts with effort expectancy and intention to use digital library. This has provided the evidence of a moderating effect of experience in the intention to use digital library. It is expected that this research will shed new lights into research of acceptance and intention to use the library in a digital environment.(Abdul Rahman; Jamal al-Din; Mahmoud,2011)

All of the above largely complies with Katherine Howard 2010 ,Which aimed to identify the educational needs of information specialist who work in Australian digital libraries environments, through research the professional skills and information required to work in digital libraries ,which classified to public and personal skills via a poll beneficiaries of the services of academic libraries and traditional digital universities in Australia, from educators and practitioners to work office. The study found that the technical skills such as programming skills using high programming languages , such as: Perl, Java, JavaScript, Python, SQL, from less skills required of the beneficiaries of the services digital library, whereas the skills of programming languages dealing with the Internet such as XML, HTML higher skills required of especially among teachers, and skills of designing infrastructure for digital libraries, such as the establishment of networks of peer-to-peer services building networks higher skills required of the beneficiaries in general and practitioners to work desktop in particular, the study recommended the necessity further research dealing with the use of digital library education.

THE AIM OF THE STUDY

The aim of this research is to describing the reality of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development. By Comparing between Egypt and Saudi Arabia

The main question of this research is: what is the reality of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development in both of the Arab Republic of Egypt and Kingdom of Saudi Arabia? , And fork to the following questions:

1. What is the importance of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development?
2. What is the range of use of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development?
3. What is obstacles of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development?

PURPOSE OF THE STUDY

The main aim of this study is to investigate the reality of the use of learning resource centers specialist For libraries and digital resources as a tool for continuing professional development, via comparing between learning resource centers specialist in Egypt and Saudi Arabia to identify:

1. The reality of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development.
2. Change professional development approach's in the development of learning resource centers specialist to be more effective , based on the use of modern technologies.
3. explore the obstacles to the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development.

THE IMPORTANCE OF THE STUDY

- Pursuing new approaches to implement continuing professional development for learning resource centers specialist, based on new technology becomes a means to develop the learning process itself.
- Renewal through the employment of new services represented in library and electronic resources as a tool for continuing professional development for all parties of the educational process.

METHODOLOGY

Research Model

The researcher follow in the study descriptive approach - way causation comparison - which is based on the differences between the learning resource centers specialists in their estimates of the reality of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development and the resulting differences in demographic variables.

The study hypotheses

After extrapolation of previous studies researcher formulate hypotheses as follows:

- There is different relative weight, which puts the learning resource centers specialist of the importance of the use of digital libraries and resources as a tool for continuing professional development.
- There is different relative weight, which puts the learning resource centers specialist to the extent of the use of digital libraries and resources as a tool for continuing professional development.
- Estimates vary learning resource centers specialist for each disabled impediments to the use of digital libraries and resources as a tool for continuing professional development.

Participants

The population of this study is all learning resource centers specialists, who in job during the second semester of the academic year 2012/2013 in all of Arab Republic of Egypt, and Kingdome of Saudi Arabia. The sample consists of totally One hundred and sixty (160) learning resource centers specialists from Arab Republic of Egypt, and Saudi Arabia The distribution of the sample subjects are given in Tables 1, 2, 3.

Table 1: Study Sample (Sex/State)

State	Male		Female	
	Number	Percent	Number	Percent
Egypt				
Saudi Arabia				
Total				

Table 2: Study Sample (Center Type Witch learning resource centres specialists work in)

State	Egypt		Saudi Arabia		Total	
	Number	Percent	Number	Percent	Number	Percent
Kindergarten	3	3.8	39	48.8	42	26.2
Primary School	28	35.0	34	42.5	62	38.75
Prep School	27	33.8	4	5.0	31	19.4
Secondary School	16	20.0	3	3.8	19	11.9
Department of Education	2	2.5	0		2	1.25
A major center of the ministry	4	5.0	0		4	2.5
Total	80		80		160	100

Table 3: Study Sample (Experience of learning resource centres specialists)

State	Egypt		Saudi Arabia		Total	
	Number	Percent	Number	Percent	Number	Percent
1-5 year	11	13.8	5	6.3	16	10
6-10 year	44	55.0	65	81.3	109	68.15
11-16 year	19	23.8	2	2.5	21	13.15
more than 16 year	6	7.5	8	10.0	14	8.75
Total	80		80		160	100

Gathering Data

In order to collect data for the study the following data collection tool were used: Electronic questionnaire, send to the study sample via E-mail, social network, wiki, composed of three areas on fifty-seven phrase, covering the following areas:

1. Importance of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development, and is integrated under this dimension Twenty phrase
2. The extent of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development, and is integrated under this dimension fifteen phrase
3. Impediments to the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development, and is integrated under this dimension of the twenty-two phrase

Data Analysis

SPSS v.18.0 was used to analyze the data. Frequencies, Mean, Std. Deviation and Independent Samples T-Test was used to determine whether there was a significant difference between Egyptian & Saudis learning resource centres specialist in the three areas of study tool(Importance, extent, Impediments of the use of learning resource centres specialist for libraries and digital resources as a tool for continuing professional development)

FINDINGS

Findings Related to the First Sub-Problem: In this sub-problem, the answer of the question “What is the importance of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development?” was searched for. The aim of examining this problem was to identify the relative weights set by the learning resource centres specialist of the importance of the use of digital libraries and resources as a tool for continuing professional development. The test scores were analyzed by Mean, Std. Deviation, Std. Error Mean .Frequency& Independent Samples T-Test (Tables 4, 5,6).

Table 4: Group Statistics (Mean & Std. Deviation, Std. Error Mean)

Grade	Egypt	Saudi Arabia
Mean	3.6	3.9125
Std. Deviation	1.026238060569781	1.081416675161085
Std. Error Mean	0.11473690322657883	0.12090605988309971

Table 5: (Frequency)

Grade	All Sample		Egypt		Saudi Arabia	
	Number	Percent	Number	Percent	Number	Percent
Very Weak	1	0.6%	1	1.3%	9	11.3%
Weak	19	11.9%	10	12.5%	23	28.8%
Medium	51	31.9%	28	35.0%	14	17.5%
Big	36	22.5%	22	27.5%	34	42.5%
Very Big	53	33.1%	19	23.8%	80	100.0%
Total	160	100.0%	80	100.0%	9	11.3%

Table 6: (Independent Samples T-Test)

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.775	.380	-1.875	158	.063	-.31250	.16668	-.64171	.01671
Equal variances not assumed			-1.875	157.569	.063	-.31250	.16668	-.64172	.01672

Accordingly, there is not a significant difference between the Egyptian & Saudis learning resource centres specialist in levels of importance of the use of learning resource centres specialist for libraries and digital resources as a tool for continuing professional development ($F=0.775$, $p > .05$)

Findings Related to the Second Sub-Problem: In this sub-problem, the answer of the question “What is the extent of use of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development?” The aim of examining this problem was to identify the relative weights set by the learning resource centers specialist of the extent of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing professional development. The test scores were analyzed by Mean, Std. Deviation, Std. Error Mean .Frequency& Independent Samples T-Test (Tables 7, 8, 9).

Table 7: (Mean & Std. Deviation, Std. Error Mean)

Grade	Egypt	Saudi Arabia
Mean	1.7375	2.05
Std. Deviation	0.8228347112423712	0.8700356460033438
Std. Error Mean	0.09199571742921764	0.09727294236557099

Table 8: (Frequency)

Grade	All Sample		Egypt		Saudi Arabia	
	Number	Percent	Number	Percent	Number	Percent
Very Week	68	42.5%	40	50.0%	28	35.0%
Week	41	25.6%	21	26.3%	20	25.0%
Medium	51	31.9%	19	23.8%	32	40.0%
Total	160	100.0%	80	100.0%	80	100.0%

Table 9: (Independent Samples T-Test)

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.136	.713	-2.334	158	.021	-.31250	.13389	-.57694	-.04806
Equal variances not assumed			-2.334	157.511	.021	-.31250	.13389	-.57694	-.04806

As shown in table 9 above, there is not a significant difference between the Egyptian & Saudis Learning Resource Centers Specialist in levels of extent of the use of learning resource centres specialist for libraries and digital resources as a tool for continuing professional development ($F=0.136$, $p > .05$), but when the means are taken into consideration, it is seen that the scores of extent of Saudis specialist are higher than Egyptian, This result shows that Saudis specialist better and show higher performance when compared with the Egyptian Learning Resource Centers Specialist.

Findings Related to the Third Sub-Problem: In this sub-problem, the answer of the question “What are obstacles of the use of learning resource centers specialist for libraries and digital resources as a tool for continuing

professional development?” The aim of examining this problem was to identify the relative weights set by the learning resource centers specialist of Impediments to the use of Learning Resource Centers Specialist for libraries and digital resources as a tool for continuing professional development. The test scores were analyzed by Mean, Std. Deviation, Std. Error Mean .Frequency& Independent Samples T-Test (Tables 10, 11, 12).

Table 10: (Mean & Std. Deviation, Std. Error Mean)

Grade	Egypt	Saudi Arabia
Mean	2.8625	3.2125
Std. Deviation	1.3382753874514124	1.4292934432213151
Std. Error Mean	0.14962373694781134	0.15979986494187984

Table 11: (Frequency)

Grade	All Sample		Egypt		Saudi Arabia	
	Number	Percent	Number	Percent	Number	Percent
Very Week	21	13.1%	11	13.8%	10	12.5%
Week	48	30.0%	28	35.0%	20	25.0%
Medium	35	21.9%	18	22.5%	17	21.3%
Big	16	10.0%	7	8.8%	9	11.3%
Very Big	40	25.0%	16	20.0%	24	30.0%
Total	160	100.0%	80	100.0%	80	100.0%

Table 12: (Independent Samples T-Test)

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	1.444	.231	-1.599	158	.112	-.35000	.21891	-.78237	.08237
Equal variances not assumed			-1.599	157.321	.112	-.35000	.21891	-.78239	.08239

When table 10 is analyzed, it is observed that the mean of Saudis learning resource centers specialist (3.2125) is higher than the mean of Egyptian learning resource centers specialist (2.8625). According to the result of Independent Samples T-Test used (table 10) to investigate whether the difference between Egyptian and Saudis specialist was not significant, ($p > 0,05$). In the light of this result, it can be said that Saudis specialist face more observed than Egyptian.

CONCLUSION, DISCUSSION AND IMPLICATIONS

It was found, after the application the electronic questionnaire in both country (Egypt and Saudi Arabia) great compatibility in the use of libraries and digital resources to achieve professional development for Learning Resource Centers Specialist at an average of rate of 85.83%, which vary according to the variable state, we find the percentage of agreement with the Egyptian Learning Resource Centers Specialist amounting to 84.12%, the rises have reach to 87.55%, in Saudi Arabia Learning Resource Centers Specialist, which is very good rates reflect the importance of the use of digital libraries and resources as a tool for sustainable professional development, and the big motivation in study sample to develop themselves professionally

The study sample (Learning Resource Centers Specialist in Egypt and Saudi Arabia) agree with average of rate 61.10%, that the uses of libraries and digital resources by learning resource centers specialist as a tool for continuing professional development for himself and for all partners of educational process, the ratios are good that reflects the use of libraries and digital resources as a tool for continuing professional development need for more outreach and advertising for what they can contribute in the field of professional development in general and the development of learning resource centers specialist in particular.

Learning resource centers specialist faces many obstacles preventing the employment of libraries and digital resources efficiently to achieve professional development with an average total rate of 78.37% on the specialist learning resources study sample faces obstacles to the use of libraries and digital resources as a tool for professional development sustainable, a percentage that reflects the existence of impediments to the use of digital libraries and resources as a tool for sustainable professional development

Human constraints take the highest level of constraints, that facing continuing professional development of learning resource centers specialist in both country (Egypt and Saudi Arabia), followed by administrative constraints, physical constraints. That reflects the great support provided by the ministries of education in Egypt and Saudi Arabia to provide libraries and digital resources to all partners of educational process, and adopted ambitious plans for the professional development to their members

Differences in the rates of agreement on the terms of the questionnaire axes due to the lack of a university degree to graduate learning resource centers specialist in Saudi Arabia compared to Egypt, where there is a Bachelor of Education Technologies

Poor English language skills for learning resource centers specialist, preclude the desired benefit of libraries and digital resources in achieving continuing professional development

The study recommends that:

- Embrace vision and a clear message to Learning Resources Centers, and clear tasks to the Specialist Working on it.
- Attention to development of English language skills for learning resource centers specialist
- Create educational technology department in college of education to Graduation learning resource centers specialist in Saudi Arabia

^bFaculty of Education, Siirt University, SIİRT, 56100, TURKEY

Abstract

People react to environmental problems that threaten themselves according to their perception. How does knowing the actual prices of the products that we buy affect our lives? This study aims to prove the relationship between teacher candidates', who raise the posterity and will be model for them; environmental responsibilities and attitudes towards green advertising. Moreover, the teacher candidates' environmentally responsible behaviours and attitudes towards green advertising are investigated through considering the variants, their genders and the programmes that they have been studying. The data is collected by using Haytko and Matulich (2008)'s attitude toward green advertising scale which was translated to Turkish by Küker (2012). The analysis shows that the teacher candidates' environmentally responsible behaviours and attitudes towards green advertising are on the average level and there is a positive significant relationship between environmental responsibilities and attitudes towards green advertising

Keywords: environmental responsibility, green advertising, teacher candidates, attitude

1. Introduction

It is stated that to be sensitive and to take precautions to environment and its problems, to react against the factors that have negative impact on world ecology, to be sensitive to the products that pave the way for environment problems, to be aware of those products and to boycott them if necessary, to raise awareness about ecological problems among people, and to be ecological literate are common and necessary features of the people that have ecological intelligence (Baş, 2011). To understand the problems affect the nature, to react and take precautions are highly important for the solution of these problems. As Daniel Goleman is stated in his book, *Ecological Intelligence: How Knowing the Hidden Impacts of What We Buy Can Change Everything*, we buy "herbal" shampoos that contain industrial chemicals that can threaten our health or contaminate the environment. We dive down to see coral reefs, not realizing that an ingredient in our sunscreen feeds a virus that kills the reef. We wear organic cotton t-shirts, but don't know that its dyes may put factory workers at risk for leukaemia (Goleman, 2011). We are not informed enough about the impacts of the products to the nature that we consume as a consumer. On the other hand, in recent studies it is stated that individuals are aware of the risks that threaten the environment and they are concerned about it (Slimak and Dietz, 2006; GURSOY et al. 2008; Altunoğlu and Atav, 2009; Kahyaoglu, 2012). People react to environmental problems that threaten themselves according to their perception. If their perceptions are wrong, the efforts to protect the environment and society will fail (Altunoglu ve Atav, 2009). In the study of Straughan and Roberts (1999) it is asserted that the youth are more sensitive about the environmental concerns and

* Corresponding Author name: Mustafa Kahyaoglu Tel.: +0-484 223 12 24
E-mail address: mustafa.kahyaoglu56@gmail.com

the urban population is more concerned about the environmental issues than the rural population. The consumption habits of humankind are an important factor of environmental issues. What the people consume, how to consume and the amount of consumption present a dramatic and critical pressure, and if the people all around the world continue to consume the natural sources in this high rate, three planets would be needed to support the people (Knight, 2004). Furthermore, in his study about the behaviours of university students regarding their ethic of consumption Torlak (2001) states that the university students tend to pay more to environmentally friendly products in food and cleaning products whereas they tend to pay less in cosmetic and oil products. Babekoğlu (2009) asserted that if there is one possibility for buying a product for the consumers, they prefer to buy the least damaging for the environment and when they are aware of the product is harmful for the environment, they do not buy the product. Besides, the consumers do not prefer the products including chemical substances that damage the environment and do not have the impulse buying behaviour and generally avoid buying extra packaged products. Having been a progressive increase in the consciousness for environmental issues and problems recently, the terms green consumerism, green marketing, green product and green advertising come into prominence correspondingly. The “green consumers” term is defined as the individuals who are sensitive to environment and act environmental consciously all the stages of buying behaviour process, to use both the purchasing power in order to build the sustainable environment conditions and consumer rights, and to think that they are also responsible for both the society they live with and the posterity in terms of habitat (Nakıboğlu, 2003). Green marketing is defined as a marketing strategy not only meeting the needs and desires of the consumers but also comprising the companies’ goals by producing, pricing, distributing and promotion of eco-friendly products including the process of after consuming (Keleş, 2007). Green products refer to the products that will not threaten the environment, deplete the natural source, can be recycled or preserved (Shamdasani et. al. 1993). Green advertising is defined as the advertising that target the needs and desires of the shareholders and includes the messages such as ecological, nature friendly and environmental sustainability. In other words, green advertising refers the advertising that emphasizes both the company and the products are nature friendly and the company produces the products that do not threaten the environment (Zinkhan & Carlson, 1995; Ulusu & Köksal, 2012). Recently, the attitudes regarding environmental responsibilities vary among the people who are sensitive and conscious about the environmental problems. Especially the advertising has an impact on this issue as the most important feature of the advertising is being persuasive. Persuasion is defined as a way of communication to influence the actions, beliefs and attitudes of people and it contains the process of adoption, enhancement or changing any kind of idea, behaviour or attitude (Simons et. al. 2001). In this process, the attention of the consumers has increased towards the green advertising as they have focused on the environmental problems and environmentally oriented consumption. However, there is not enough study about this issue in our country. This study aims to prove the relationship between teacher candidates’ environmental responsibilities and attitudes towards green advertising. In this respect, the answers were sought to the following questions:

- 1- How are the environmentally responsible behaviours of teacher candidates and their attitudes towards green advertising?
- 2- What kind of a relationship is there between the teacher candidates’ environmentally responsible behaviours and attitudes towards green advertising?
- 3- Is there a significant relationship between the teacher candidates’ environmentally responsible behaviours and attitudes towards green advertising regarding the variants; their genders and programmes they have been studying?

2. Method

2.1. Participants

The study was conducted at Siirt University in Turkey. Participants were 290 prospective teachers who were attending at class and science education department in faculty of education.

2.2. Data Collection

In the research, "Environmentally responsible behaviour scale and the attitude towards the green advertising scale" developed by Haytko and Matulich (2008) was used in order to put forth the candidate teachers' environmental responsibilities and attitudes towards green advertisement. The adaptation of the scale into Turkish was realized by Küker (2012). The scale has two parts: environmentally responsible behaviour scale and attitudes towards the green advertising scale. The scale includes 5-point Likert scale as 1=Strongly disagree, 2=Disagree, 3=Neither agree nor disagree, 4=Agree, 5=Strongly agree. Original scale's Cronbach alpha coefficient reliability is stated as .70. In our study, environmentally responsible behaviour scale's Cronbach alpha coefficient reliability is ascertained as .82.

2.3. Data Analysis

In analyzing the collected scores for the determination of teacher candidates' environmentally responsible behavior and attitudes towards green advertising, arithmetic mean and standard deviation were used. For the determination of the differences among groups t-test was used. Pearson Product Moment Correlation Coefficient analysis was used to examine whether there was a significant relationship between teacher candidates' scores of environmentally responsible behavior and attitudes towards green advertising or not.

3. Results

Findings of the study that aims to determine of relationship between the teacher candidates' environmentally responsible behaviour and attitudes towards green advertising qualifies are given below.

Table-1. Descriptive results related to teacher candidates' environmentally responsible behaviour and attitudes towards green advertising

	N	\bar{X}	SS
Environmentally responsible behaviour	290	2.98	.555
Attitudes towards green advertising	290	3.03	.511

As shown in Table-1, it is determined that teacher candidates' environmentally responsible behaviours arithmetic mean is 2.98 and standard deviation is .555; attitudes towards green advertisement's arithmetic mean is 3.03 and standard deviation .511. In this respect, it can be said that teacher candidates' environmentally responsible behaviour and attitudes towards green advertisement are on average. Furthermore it is identified that teacher candidates' attitudes towards green advertising is higher than their environmentally responsible behaviour.

Table-2. The relationship between teacher candidates' environmentally responsible behaviour and attitudes towards green advertisement

		Attitudes towards green advertising
Environmentally responsible behaviour	r	.415*
	p	.000
	n	290

*p< .01

As shown in Table 2, it is determined that there is a positive mid-level significance between teacher candidates' environmentally responsible behaviour and attitude towards green advertising ($r = .415$; $p < .01$).

Table-3. Arithmetic mean, standard deviation and t-test results related to the teacher candidates' environmentally responsible behaviour and attitude towards green advertisement according to gender

	Gender	N	\bar{X}	SS	t	p
Environmentally responsible behaviour	Female	115	2.92	.519	-3.438	.001*
	Male	175	3.16	.605		
Attitudes towards green advertising	Female	115	2.99	.488	-2.142	.033*
	Male	175	3.13	.555		

*p<.05

As shown in Table-3, it is determined that there is a significant difference between teacher candidates' environmentally responsible behaviours and the variance of gender ($t_{288} = -3.438$; $p < .05$). In addition, it is determined that the arithmetic mean of male teacher candidates' environmentally responsible behaviours are higher than female teacher candidates'. Also there is a significant difference between teacher candidates' attitudes towards green advertising and the gender ($t_{287} = -2.142$; $p < .05$). It can be seen that the arithmetic mean of male teacher candidates' attitudes towards green advertising are higher than female teacher candidates'.

Table-4. The arithmetic mean, standard deviation and T-test results for related to the teacher candidates' environmentally responsible behaviours and attitudes towards green advertising according to the programmes they have been studying

	Programme	N	\bar{X}	SS	t	p
Environmentally responsible behaviour	Science teaching	207	2.89	.518	-4.549	.000*
	Social studies teaching	83	3.21	.581		
Attitudes towards green advertising	Science teaching	207	3.00	.521	-1.742	.083**
	Social studies teaching	83	3.11	.478		

*p<.01; **p>.05

As shown in Table-4, it is determined that there is a significant difference between teacher candidates' environmentally responsible behaviours and the programmes they have been studying ($t_{288} = -4.549$; $p < .01$). Moreover, it is determined that the arithmetic mean of the social studies teacher candidates' environmentally responsible behaviours is higher than the science teacher candidates'. It is revealed that there is not a significant difference between teacher candidates' attitudes towards green advertising and the programmes that they have been

studying ($t_{287} = -1.742$; $p < .05$). It is also found out that the arithmetic mean of the social studies teacher candidates' attitudes towards green advertising is higher than the science teacher candidates' scores

4. Conclusion and Discussion

As a result of the study it is ascertained that the teacher candidates' environmentally responsible behaviours and attitudes towards green advertising are on average level. The individuals that have environmentally responsible behaviours are conscious and sensitive to the environment. These people act solution oriented to the environmental problems, care for social and physical environment more than their economic interest, realize the environmental risks, have positive attitudes towards environment and its problems, and are ecological literate. The individuals who have high responsibility for the environment are aware of their actions against environmental pollution and have a sensitive attitude for humankind. According to Roberts (1995) the individual who has environmentally responsible behaviour chooses the products that do not harm the environment or the least harmful products to the environment in the process of both production and consumption in his/her daily life.

Furthermore the individuals who are environmentally responsible prefer to consume ecologic and green products. This leads the companies to produce and market the green products. Abdul-Muhmin (2007) stated that with the help of purchasing ecologic products the consumers will contribute to increase the quality of environment. This study shows that there is a significant relationship between environmental responsibilities and attitudes towards green advertising. In this respect it can be said that the more environmentally responsible behaviours are increased the more the attitudes towards green advertising are increased or vice versa. Kahyaoğlu (2012) stated that there was a positive relationship between the environmental risk perception and problem solving skills. He also stated that there was a positive significant relationship between environmental risk perception and problem solving skills. Küker (2012) stated that the people who have low environmental responsibilities have negative attitudes towards green advertising and the people who have high environmental responsibilities have positive attitudes towards green advertising. There is a significant difference between teacher candidates' environmentally responsible behaviours and attitudes towards green advertising according to their gender. In the similar study of Ulusu & Köksal (2012), it was stated that there was a significant difference between the gender of university students and their attitudes towards green advertising. Alnıaçık (2010) stated that the ecologically friendly behaviours of females' were higher than males'. In their study concerning consuming behaviours of the university students, Yılmaz & Arslan (2011) stated that the gender of these students affect their environmental behaviours and sensitivity. They also stated that the university students' environmental sensitivity was high whereas their environmentally friendly consuming behaviours were at moderate level. In their study, Aracıoğlu & Tatlıdil (2009) asserted that environmental consciousness and its effect on buying behaviour varied according to gender variance.

In this study it was determined that there was a significant difference between the teacher candidates' environmentally responsible behaviours and their programs that they have been studying; however there was not a significant difference between their attitudes towards green advertising. In their study, Ulusu and Köksal (2010) stated that there was not a significant relationship between the educational background and income level of families and attitudes towards green advertising. Yılmaz et.al (2009) pointed that environmental sensitivity did not affect the environmental behaviour directly. On the other hand, it was pointed that environmental attitudes affected environmental behaviours and accordingly this situation had an important contribution of buying ecologic products among the students. Mainly the families, then the teachers have a big responsibility for developing environmentally responsible behaviours. Besides, our consumption patterns have a significant impact on minimizing the environmental problems. The education and buying behaviours of consumers, their environmentally responsible behaviours and attitudes towards green advertising come into prominence on this issue. Therefore, the examination of the environmentally responsible behaviours and sociological, psychological and demographical features of attitudes towards green advertising are highly important for an effective environmental education.

4th International Conference on New Horizons in Education

The relationship between individual innovativeness and change readiness conditions of students attending faculty of education

Duygu Gür Erdoğan^{*a}, Demet Zafer Güneş^b

^a Sakarya University, Faculty of Education 54300, "Sakarya", Turkey

^b Sakarya University, Faculty of Education 54300, "Sakarya", Turkey

Abstract

The aim of this study is to determine the relationship between individual innovativeness and change readiness conditions of the students of Sakarya University Faculty of Education. In addition, students' conditions of change readiness were analyzed according to gender, type of instruction, academic average and department in the study. Relational survey model was used as the research method. "Change Readiness Scale" developed by Kondakçı, Zaim and Çalışkan (2013) and having 12 items and 3 dimensions (change readiness in determination extent, change readiness in emotion and change readiness in cognitive extent); and "Individual Innovativeness Scale" adapted to Turkish by Kılıçer and Odabaşı (2010) were used as the data collecting tool in the study. The population comprised 4279 students studying at Sakarya University Faculty of Education in 2012-2013 academic year while the sample included 503 students determined through the method of determining simple random sampling used where number of individuals are known. The findings of the study are as follows:

1. When examining individual innovativeness of pre-service teachers, it was found that 4,4% of them were innovator, 34,2% of them were early adaptors, 49,5% of them were early majority, 9,1% of them were late majority and 2,8% of them were laggards.
2. There is a positive relationship at .70 between individual innovativeness and change readiness of pre-service teachers.
3. The change readiness conditions of the students differentiate in terms of gender, academic average and department variables.
4. The change readiness conditions of the students do not show a significant difference in terms of type of instruction variable.

Key Words: pre-service teachers, change readiness, individual innovativeness

1. INTRODUCTION

Some of the characteristics of 21st century can be expressed as globalization, technological advances, facilitation of information accessibility, innovation and accompanying change. Cultures stay the same, but they also change.

^a Corresponding author. Tel.: +90 532 588 15 03 *E-mail address:* dgur@sakarya.edu.tr

^b Corresponding author. Tel.: +90 536 234 71 06 *E-mail address:* dzafer@sakarya.edu.tr

Culture is the outcome and presentation of the development of organizations, societies, and nations. It is "the commonly- held and relatively stable beliefs, attitudes and values" (Hall, 1995, Cit. Xu, 2009). Economical improvement, structural and social problems and technological reforms are among the factors that force the world to change (Cenker and Akgül, 2011). Change was summarized by Dewey (1916) as follows: "How act is physical

Email address:

real, then change is social fact.” As stated by Heraclius, the only thing that does not change in the world is that everything changes (Dönmezer,1978).

The change lived extensively in all areas of society has altered the properties which individuals should have in a fundamental way. It is stated that making habit of lifelong learning; meeting individual responsibility and flexibility in personal space and open to public and business areas; having the ability of analysis, access, use, adaptation, evaluation and creation of information in different forms and environments; gaining the ability of identifying, analyzing and solving a problem; not only developing ideas, implementing them and sharing them with others but also being open and willing to new and different perspectives at the same time are necessary for individuals in 21st century (Partnership for 21st Century Skills, 2003). According to Rogers (1995) it can be said that those individuals having these skills are generally the ones who can access information in any condition, can solve problems, can produce innovation; briefly, who can show innovativeness features (Cit. Kılıçer, 2011).

According to Goldsmith and Foxall (2003), in terms of educational researchers, innovation is the thing or the idea which is new for a particular individual or group and causes change through its adoption/ use. Innovativeness is defined by Braak (2001) as willingness to change. Innovativeness contains both “positive reaction to the new” and “being on innovation” (Cit. in Kılıçer, 2011). Individual innovativeness is related to individual’s willingness to innovation and to making difference through making a positive reaction to innovations as a behavior (Uzkurt, 2008).

In addition, innovativeness is considered as an umbrella concept which hosts the characteristics of such terms of risk-taking, openness to experience, creativeness and thought leadership. Accordingly, individuals in society differ from each other in the context of innovativeness in terms of their characteristics. According to the classification made by Rogers (1995), individuals are divided into 5 categories according to their innovativeness level. These categories are called as innovators, early adopters, early majority, late majority and laggards (Cit. Kılıçer ve Odabaşı, 2010).

According to the classification made by Rogers (1995), innovators are the first ones who adopt innovations in the social system. They are such individuals who differ from others in the social system in terms of their contrary properties and who likes trying out new ideas and risk-taking and have vision. Early adopters have such properties as providing information about innovations to other members of the community and guiding them. Especially late adopters of innovations view early adopters’ attitude towards innovations and give direction to decision-making process of innovation. Early majority act prudently and cautiously to innovations. Before adopting a new idea, they spend a great time to thinking about them. Therefore, early majority’s decision-making process of innovation is longer than innovators’ and early adopters’. Neither early majority are the first to adopt innovations in social system nor do late majority demonstrate a suspicious and timid attitude towards innovations and wait until the majority of social system adopt that innovation. Therefore, late majority adopt innovations after the average members of social system. Laggards prejudge innovations and exhibit a trend to adopt innovations most recently. Because laggards’ decision-making process of innovation is too slow, the innovators in their social system already start to use an innovation and adopt it while laggards decide to adopt that innovation (Cit. Kılıçer ve Odabaşı, 2010).

Training of the required human resource for innovation necessitates reconstruction of educational policies and education system based on this situation. This reconstruction requires fundamental changes. Educational organizations also experience change in order to keep up with the developments in the external environment and to bring up the students with the requirements of the modern world (Aydoğan, 2007). Changes in education reflect in training programs, students and teachers. Teacher’s role is great for conducting change in a healthy way in organizations. It is not possible to switch to a new society painlessly and untroubled in company with the teachers who do not comprehend change and are not aware of their importance and function against change (Doğan, 1998). It can be said that the qualifications of trainers stands between the factors that may be obstacles to

being an innovative individual. To do this, it is stated that education system should advance in the manner to give direction to training required innovative individuals (Bo ve Ye-mei, 2010, cit.Kılıçer, 2011). In accordance with reconstruction, it is emphasized on the necessity of innovation and entrepreneurship based on innovation, gaining the culture of innovation to individuals at an early age, and being kept alive in all educational periods (Elçi, 2006).

Teachers and pre-service teachers who are to guide future generations should be open to change and innovative in order to provide to gain innovation culture to future generations at an early age and to grow such individuals open to change. When examining the literature in this context, such studies of being open to change, attitudes towards change and tendency studies about teachers and administrators were found (Akpınar and Aydın, 2007; Zayim, 2010; Cenker and Akgül, 2011; Helvacı and Kıcıroğlu, 2010; İnan, 2011; Helvacı, Çankaya and Bostancı 2012; Beycioğlu and Aslan, 2010; Aydoğan, 2007; Demirtaş, 2012). However, any study made for determining the relationship between openness to change conditions and individual innovativeness of pre-service teachers who will be the tutorials of future generations could not be found. The aim of this study is to determine the relationship between the relationship between individual innovativeness and change readiness conditions of pre-service teachers. For this purpose, the following problems and sub-problems were questioned:

1. What are pre-service teachers' conditions of individual innovativeness?
2. Do students' conditions of change readiness differentiate according to gender, academic average, type of instruction and department variables?
3. Is there a relationship between individual innovativeness conditions and change readiness conditions of pre-service teachers?

2. METHOD

In the current study, the case study method was used as relational survey model. Relational survey model is a research model which aims to determine the presence and degree of simultaneous change between two or more variable (Karasar, 2005).

The population comprised 4279 students studying at Sakarya University Faculty of Education in 2012-2013 academic year while the sample included 503 students determined through the method of determining simple random sampling used where number of individuals are known.

“Change Readiness Scale (CRS)” developed by Kondakçı, Zaim and Çalışkan (2013) and having 12 items and 3 dimensions (change readiness in determination extent, change readiness in emotion and change readiness in cognitive extent) was used as one of the data collecting tool in the study. Cronbach's Alpha value of this scale was found to .89 in this study.

For the purpose of evaluating individuals' innovativeness in general sense, “Individual Innovativeness Scale (IIS)” of which original name “Innovativeness Scale” developed by H. Thomas Hurt, Katherine Joseph and Chester in 1977 and which was adapted to Turkish by Kılıçer and Odabaşı (2010) was used as the other data collecting tool in the study. The scale is 5-point Likert type and consists a total of 20 items, including 12 positive and 8 negative items. Cronbach's Alpha value of this scale was found to .71 in this study.

Innovativeness score in IIS is calculated by adding 42 points to the score obtained by subtracting the total points of negative items from the total points of positive items. The lowest 14 score and the highest 94 score can be retrieved from the scale. According to the scores calculated on the scale, individuals can be categorized in the

context of innovativeness. Accordingly, individuals are interpreted as “Innovators” if the calculated score is higher than 80, as “Early Adopters” if between 69 and 80, as “Early Majority” if between 57 and 68 as “Late Majority” if between 46 and 56, and as “Laggards” if under 46. According to the scores calculated on the scale, it can be also made evaluation about individuals’ innovativeness in general sense. Accordingly, the individuals whose score is over 68 are evaluated as highly innovator while the individuals whose score is lower 64 are interpreted as low in innovation.

The data were analyzed by SPSS 20 package program and frequency, t-test, one-way ANOVA and simple partial correlation analyzes were used.

3. FINDINGS

The analysis of the study made for determining the relationship between pre-service teachers’ conditions for individual innovativeness and change readiness; and the change readiness conditions’ relation with gender, department, type of instruction and academic average are given in the tables below.

Table1: Pre-service Teachers’ Conditions of Individual Innovativeness

		Innovators		Early Adopters		Early Majority		Late Majority		Laggards		Total	
		N	f (%)	N	f (%)	N	f (%)	N	f (%)	N	f (%)	N	f (%)
Gender	Male	11	6,0	54	29,3	88	47	24	13	7	3,8	184	100
	Female	11	3,4	118	37,0	161	50,5	22	6,9	7	2,2	319	100
Type of instruction	Day Instruction	12	4,9	82	33,7	119	49,0	22	9,1	8	3,3	243	100
	Night Instruction	10	3,8	90	34,6	130	50,0	24	9,2	6	2,3	260	100
General Academic Average	Below 2	0	0,0	9	31,0	13	44,8	4	13,8	3	10,3	29	100
	Between 2-3	12	4,8	75	30,0	132	52,8	26	10,4	5	2,0	250	100
	Between 3-4	10	4,5	88	39,3	104	46,4	16	7,1	6	2,7	224	100
Department	PST	2	2,2	34	37,4	38	41,8	11	12,1	6	6,6	91	100
	CIT	5	4,1	44	36,1	62	50,8	10	8,2	1	0,8	122	100
	PCG	12	7,1	62	36,5	83	48,8	11	6,5	2	1,2	170	100
	SE	3	5,1	17	28,8	27	45,8	8	13,6	4	6,8	59	100
	ME	0	0,0	15	24,6	39	63,9	6	9,8	1	1,6	61	100

When examining the Table 1, it is seen that according to gender, 47% of male teachers are “Early Majority” and 3,8% of them “Laggards” while 50,5% of female teachers are “Early Majority” and 2,2% of them “Laggards”; according to type of instruction, 49% of day instruction students are “Early Majority” and 3,3% of them “Laggards” while 50% of night instruction students are “Early Majority” and 2,3% of them “Laggards”; according

to general academic average, 44,8% of the pre-service teachers whose average is below 2 are “Early Majority” and 0% of them “Innovators”; 52,8% of the pre-service teachers whose average is between 2 and 3 are “Early Majority” and 2% of them “Laggards” while 46,4% of the pre-service teachers whose average is between 3 and 4 are “Early Majority” and 2% of them “Laggards; according to department, 41,8% of the pre-service teachers of PST (Primary School Teaching) department are “Early Majority” and 2,2% of them “Innovators”; 50,8% of the pre-service teachers of CIT (Computer and Instructional Technologies) department are “Early Majority” and 0,8% of them “Laggards”; 48,8% of the pre-service teachers of PCG (Psychological Counseling and Guidance) department are “Early Majority” and 1,2% of them “Laggards”; 45,8% of the pre-service teachers of SE (Special Education) department are “Early Majority” and 5,1% of them “Innovators”; 63,9% of the pre-service teachers of ME (Mathematics Education) department are “Early Majority” and 0% of them “Innovators”. From the pre-service teachers’ innovativeness, it can be generally said that they are in “early majority.

Table 2: t-Test Analysis Results of Pre-Service Teachers’ Conditions of Change Readiness According to Gender and Type of Instruction Variables

Variable	N	\bar{x}	SS	Sd	t	P
Gender	Male	184	45.62	8.15	501	2.385
	Female	319	47.10	5.62		
Type of Instruction	Day	243	46.24	7.43	501	1.038
	Night					
	Instruction	260	46.86	5.91		

* $P < 0.05$

As seen in the Table 2, pre-service teachers’ conditions of change readiness show a significant difference according to gender variable [$t_{(501)} = 2.385$; $P < 0.05$]. Examining arithmetic means, it is stated that male change readiness conditions of pre-service teachers ($\bar{x} = 47.10$) are higher than the male pre-service teachers’ ($\bar{x} = 45.62$). Pre-service teachers’ conditions of change readiness do not show a significant difference according to type of instruction variable [$t_{(501)} = 1.038$; $P < 0.05$].

Table 3. ANOVA Analysis Results of Pre-Service Teachers' Conditions of Change Readiness According to Gender and Department Variables

Değişken		N	\bar{X}	SS	sd	F	P (Scheffe)
General Academic Average	Below 2	29	43.10	8.711	2-500	6.387	.002* 1-2,1-3
	Between 2-3	250	46.17	6.366			
	Between 3-4	224	47.44	6.600			
	Total	503	46.56	6.693			
Department	PST	91	46.11	8.625	4-498	4.651	.001* 4-2,4-3
	CIT	122	47.57	5.835			
	PCG	170	47.47	5.535			
	SE	59	43.91	8.023			
	ME	61	45.21	5.707			
	Total	503	46.56	6.693			

*P<0.05

When examining the Table 3, there is a significant difference in the pre-service teachers' conditions of change readiness according to academic average [$F_{(2-500)} = 6.387$; $P < 0.05$]. In this context, pre-service teachers' conditions of change readiness change according to their academic averages.

According to Scheffe test conducted for determining of which groups there is a difference in terms of general academic average, the views of the pre-service teachers whose general academic average is below 2 ($\bar{X}=43.10$) differ from the views of the ones whose general academic average is between 2 and 3 ($\bar{X}=46.17$) and from the views of the ones whose general academic average is between 3 and 4 ($\bar{X}=47.44$).

It is seen that there is a significant difference in the pre-service teachers' conditions of change readiness according to department variable [$F_{(2-500)} = 4.651$; $P < 0.05$]. In this context, pre-service teachers' conditions of change readiness change according to their departments.

According to Scheffe test conducted for determining of which groups there is a difference in terms of department variable, the views of the pre-service teachers studying in Special Education department ($\bar{X}=43.91$) differ from the views of the ones studying in Computer and Instructional Technologies ($\bar{X}=47.57$) and the views of the ones studying in Psychological Counseling and Guidance ($\bar{X}=47.47$).

Table4: The Relationship between Pre-Service Teachers' Conditions of Individual Innovativeness and Change Readiness

		Individual Innovativeness	Change Readiness
Individual Innovativeness	Pearson Correlation	1	,70**
	P		,000
	N	503	503
Change Readiness	Pearson Correlation	,70**	1
	P	,000	
	N	503	503

P<0,05

There is a significant difference*

When examining the Table 4, it is seen that there is a high-level positive and significant relationship between pre-service teachers' conditions of individual innovativeness and change readiness, $r= 0.70$, $P<0,05$. Accordingly, it can be said that if individual innovativeness increases than change readiness also increases. Taken into account the coefficient of determination ($r^2= 0,49$), it can be said that 49% of total variance (variability) in the change readiness condition stems from being an individual innovativeness.

4. RESULTS AND DISCUSSION

503 students including 319 female and 184 male students participated in the conducted research related to pre-service teachers. 243 of these students study in day instruction and 260 of them study in night instruction. The pre-service teachers' conditions of individual innovativeness was found 4,4% as innovator, 34,2% as early adopter, 49,5% as early majority, 9,1% as late majority and 2,8% as laggards as the result of the data analysis. This result overlaps with the findings showing that the participants have largely "early adopter" characteristic in the studies conducted with pre-service teachers by Adıgüzel (2012), Kert and Tekdal (2012), Kılıçer (2011) and İncik and Yelken (2011).

Additionally, when the pre-service teachers' conditions of individual innovativeness were examined according to gender, it can be said that male and female pre-service teachers have largely "early adopter" characteristic. Examining the data in terms of department, it can be stated that the pre-service teachers studying in Psychological Counseling and Guidance department show more innovator characteristic while the pre-service teachers studying in Primary School Teaching and Special Education departments are more in terms of laggard characteristics.

It was found that the pre-service teachers studying in Mathematics Education are less than the ones in the other departments in terms of individual innovativeness. This finding show similar features with the findings in the

study of “The relationship between individual innovativeness and information gaining skills of pre-service teachers” conducted by Bitkin (2012).

The pre-service teachers’ conditions of change readiness according to gender show a significant difference. Examined the results, it was stated that the female pre-service teachers’ conditions of change readiness are higher than the male pre-service teachers’. This situation shows that there is a significant difference for the benefit of the female pre-service teachers in terms of gender. The pre-service teachers’ conditions of change readiness according to type of instruction do not show a significant difference.

It is seen that the pre-service teachers’ conditions of change readiness according to general academic average show a significant difference. It can be stated that the pre-service teachers’ conditions of change readiness change according to general academic average. According to Scheffe test conducted for determining of which groups there is a difference in terms of general academic average, the views of the pre-service teachers whose general academic average is below 2 differ from the views of the ones whose general academic average is between 2 and 3 and from the views of the ones whose general academic average is between 3 and 4.

It is seen that there is a significant difference in terms of the pre-service teachers’ conditions of change readiness according to department variable. It can be said that pre-service teachers’ conditions of change readiness change according to department variable. According to Scheffe test conducted for determining of which groups there is a difference in terms of department variable, the views of the pre-service teachers studying in Special Education department differ from the views of the ones studying in Computer and Instructional Technologies and the views of the ones studying in Psychological Counseling and Guidance.

It is seen that there is a high-level positive and significant relationship between pre-service teachers’ conditions of individual innovativeness and change readiness, $r = 0.70$, $P < 0.05$. Accordingly, it can be said that if individual innovativeness increases then change readiness also increases. Taken into account the coefficient of determination ($r^2 = 0.49$), it can be said that 49% of total variance (variability) in the change readiness condition stems from being an individual innovativeness.

According to the research findings, it is seen that the pre-service teachers’ conditions of individual innovativeness are largely “early adopters”. Therefore, it can be said that the pre-service teachers will act prudently and cautiously against innovations to be made in education systems. However, it is expected that teachers should be the pioneer leading the society, bringing innovations to the society and pointing the way for innovations. Therefore, it can be suggested that pre-service teachers should be trained in the manner of being more open to innovations and having vision, and that teacher education programs should be arranged accordingly.

According to the research findings, the pre-service teachers’ conditions of change readiness show significant differences in terms of gender, academic average and department variables. However it is expected that all teachers and pre-service teachers should not stay behind innovations in 21st century and in such a world where nothing is stable. Teacher is the key of innovation. Therefore, it can be proposed that educational programs should include such activities which are to bring the consciousness of readiness for constant change in order to provide pre-service teachers such a training in which their readiness levels are high and they can keep up with what change brings.

According to the research findings, it is seen that there is a high-level positive and significant relationship between pre-service teachers’ conditions of individual innovativeness and change readiness. Pre-service teachers ready for change are needed to keep up with changes in technology, science, art and society. Based on the

positive high relationship between individual innovativeness and change readiness it can be expressed that we should train such pre-service teachers who can accept change more easily, can adopt to change more quickly as a teacher.

More new researches can be conducted through using the findings of this study and through further deepening of the scope of the research. At the same time, new researches can be expanded by taking into account of socio-demographic variables of pre-service teachers.

The Relationship between Mathematics Teaching Self-efficacy and Mathematics Self-efficacy

Melihan Ünlü^{a*}, Erhan Ertekin^b^a*Aksaray University, Faculty of Education 68100, "Aksaray", Turkey*^b*Necmettin Erbakan University, Faculty of Education 42100, "Konya", Turkey*

Abstract

Self-efficacy is one of the important factors for teaching mathematics effectively. For this purpose, the study aims to investigate the relationship between mathematics teaching self-efficacy and mathematics self-efficacy of pre-service elementary mathematics teachers. A Self-efficacy Beliefs towards Mathematics Teaching Scale was developed by Dede (2008) and Mathematics Self-efficacy Scale was developed by Umay (2002) were used. The scale was conducted to 144 pre-service elementary mathematics teachers in 2012- 2013 academic year. Data was analyzed by using SPSS 17.0 Package program. The results of the study revealed that pre-service elementary mathematics teachers' self-efficacy beliefs scores towards mathematics teaching and mathematics are high and there is a positive relationship between mathematics teaching efficacy and mathematics self-efficacy. In addition, the results of the study have been discussed by comparing it with literature. Then, some suggestions have been presented for the researchers who are interest in self-efficacy beliefs towards mathematics teaching.

Keywords: self-efficacy, teaching mathematics, pre-service elementary mathematics teachers

1. Introduction

Affective domains influence mathematics learning and teaching such as cognitive domains. One of the most important affective factor is self-efficacy. According to Bandura's social cognitive theory (Bandura, 1977), self-efficacy is one's beliefs about his or her ability to achieve a certain level of accomplishment. Mathematics self-efficacy is a person's belief in their ability to successfully perform mathematics (Burnham, 2011). Bandura asserted that "self-efficacy beliefs are manifested from four primary sources: personal accomplishments, vicarious learning experiences, verbal persuasion and emotional arousal" (Perepiczka et.al, 2011). If self-efficacy beliefs are high, it causes that individuals effectuate high targets and they consists with their decisions. This effects their cognitive processes and motivation more. (Locke & Latham, 1990 cited by Akbaş & Çelikkaleli, 2006).

On the other hand self-efficacy belief is one of the important factors of teaching mathematics' effectively (Dede, 2008). Teacher efficacy has been defined as "the extent to which the teacher believes he or she has the capacity to affect student performance" (Tschannen-Moran et al. 1998: 202). Teachers' self-efficacy beliefs have been associated with positive teaching behaviors and student outcomes (Henson, 2001). Studies have revealed that a significant relationship between teacher self-efficacy and students' achievements (Siegle, 2003). Teacher efficacy directly affects the teaching processes, the way teachers teach the lesson and classroom environment

* Corresponding author. Tel.: +90 3822882263.

E-mail address: melihanunlu@yahoo.com

(Gordon, 2001). Woldo stated that even if teachers who have high self-efficacy meet unsuccessful or difficult learning students, they effort more during teaching process because of they believe themselves and their students (cited by Zengin, 2003:15).

A large body of researches are about self-efficacy related to academic performance (Azar, 2010; Denise & O'Neil, 1997; Sewell & George, 2000). Nevertheless, many researchers indicate that examining pre-service elementary mathematics teachers' self-efficacy beliefs in learning and teaching is an important factor in education. However, studies examining the relationship between students' mathematics teaching self-efficacy beliefs and mathematics self-efficacy beliefs are rather limited. In this context, pre-service elementary mathematics teachers' perceptions who will be teacher in the future self-efficacy beliefs are needed to determinate and the result needs to be revealed.

The study aims to investigate the relationship between mathematics teaching efficacy and mathematics self-efficacy of pre-service elementary mathematics teachers. Four research questions were included in this study: (a) what is the pre-service elementary mathematics teachers self-efficacy level? (b) what is the pre-service elementary mathematics teachers' teaching self-efficacy level? (c) is there any significant difference of pre-service elementary mathematics teachers' mathematics teaching self-efficacy scores and mathematics self-efficacy scores by gender? (d) is there any relationship between mathematics self-efficacy and teaching self-efficacy?

2. Methods

2.1. Research Design

The correlational model was used in the process of the research. Correlational model is a quantitative method which investigate the possibility of relationships between two or more variables from the same group of subjects (Fraenkel & Wallen, 2005; Karasar, 2005).

2.2. Sample

The study was conducted 144 pre-service elementary mathematics teachers in 2012- 2013 academic year studying at Aksaray University. The convenience sampling method was used to determine the sample for this study. From 144 participants, 35 were male and 109 were female. 36 were freshman, 40 were sophomore, 43 were junior and 25 were at senior level.

2.3. Instrument

A Self -efficacy Beliefs toward Mathematics Teaching Scale was developed by Dede (2008) and Mathematics Self – efficacy Scale was developed by Umay (2002) were used as a data collection tool. Mathematics self-efficacy scale consisted of 12 likert type items. It contains three subdimensions: Mathematics self-concept, awareness of the behavior of mathematics and transforming mathematics to life skills. The reliability of the scale was 0.88. A Self -Efficacy Beliefs towards Mathematics Teaching Scale consisted of 14 likert type items which were developed by the researcher. The reliability of the scale was 0.79. Some of items of the scale were based on the work done by Riggs and Enochs (1990). It contained sub-factors items measuring mathematics teachers' efficacy in teaching (including 4 items), make to motivate and take on responsibility (including 6 items), and effective teaching (including 4 items).

2.4. Data Analysis

Quantitative techniques were used in the analysis of data. Data were analysed by using the SPSS 17.0 statistics programs. To determine the gender differences of self-efficacy scores independent sample t test were used. To find out relationship between pre-service teachers' mathematics self-efficacy and their mathematics teaching self-efficacy, a Pearson product-moment correlation was applied to the data.

3. Findings

3.1. Pre-service Elementary Mathematics Teachers' Self-Efficacy Beliefs toward Mathematics Teaching

The means and the standard deviations of the pre-service elementary mathematics teachers' self-efficacy beliefs towards mathematics teaching for the each item of the survey are shown in Table 1. Items are given in terms of the dimensions of the survey.

Table 1. Descriptive statistics of dimension of Mathematics Teaching Self-efficacy .

Items	N	Lowest score	Highest score	\bar{X}	sd
Mathematics teachers' efficacy in teaching	144	7	20	14.41	2.64
Make to motivate and take on responsibility	144	13	29	21.65	2.90
Effective teaching	144	5	20	15.94	2.04

Data presented in Table 1 reveals that pre-service elementary mathematics teachers' means of self-efficacy scores and standard deviation values regarding mathematics teaching self-efficacy scores was found to be 14.41 and 2.64 in mathematics teachers' efficacy in teaching dimension; 21.65 and 2.90 make to motivate and take on responsibility dimension; 15.94 and 2.04 effective teaching dimension. These values show that, pre-service elementary mathematics teachers have high self- efficacy beliefs towards mathematics teaching.

3.2. Pre-service Elementary Mathematics Teachers' Self-Efficacy Beliefs toward Mathematics

The means and the standard deviations of the pre-service elementary mathematics teachers' self-efficacy beliefs towards mathematics for the each item of the survey are shown in Table 2. Items are given in terms of the dimensions of the survey.

Table 2. Descriptive statistics of dimension of Mathematics Self-efficacy .

Items	N	Lowest score	Highest score	\bar{X}	sd
Mathematics self-concept	144	12	25	20.88	2.65
Awareness of the behavior of mathematics	144	15	30	25.31	2.84
Transforming mathematics to life skills	144	3	15	10.31	2.11

Data presented in Table 2 reveals that pre-service elementary mathematics teachers' mean score and standard deviation values regarding mathematics self-efficacy scores was found to be 20.88 and 2.65 in

mathematics self-concept dimension; 25.31 and 2.84 in awareness of the behavior of mathematics dimension; 10.31 and 2.11 transforming mathematics to life skills dimension. These values show that, pre-service elementary mathematics teachers have high self- efficacy beliefs towards mathematics.

3.3. The Effect of Gender on Self -Efficacy Beliefs toward Mathematics Teaching

For the purpose of determining whether pre-service elementary mathematics teachers' self -efficacy beliefs toward mathematics teaching show a significant difference according to gender, independent t-test was applied to the data with a significance level of 0.05.

Table 3 .t test of pre-service elementary mathematics teachers' Self -Efficacy Beliefs toward Mathematics Teaching by gender

Group	N	\bar{X}	Sd	df	t	p
Female	109	52.54	6.09	142	0.900	0.370
Male	35	51.40	7.73			

As seen from Table 3, female pre-service elementary mathematics teachers' average of beliefs scores about mathematics is 52.54, while male, whether pre-service elementary mathematics teachers, average of beliefs scores about mathematics is 51.40. Independent t-test results show that there is no significant statistical difference between averages. ($t_{(144)}=0.900$), $p<0.05$).

3.4. The Effect of Gender on Self -Efficacy Beliefs toward Mathematics

For the purpose of determining whether pre-service elementary mathematics teachers' self -efficacy beliefs toward mathematics show a significant difference according to gender, independent t-test was applied to the data with a significance level of 0.05.

Table 4. t test of pre-service elementary mathematics teachers' Self -Efficacy Beliefs toward Mathematics by gender

Group	N	\bar{X}	Sd	df	t	p
Female	109	47.48	5.53	142	0.342	0.733
Male	35	47.11	5.77			

As seen from Table 4, female pre-service elementary mathematics teachers' average of beliefs scores about mathematics is 47.48, while male, whether pre-service elementary mathematics teachers, average of beliefs scores about mathematics is 47.11. Independent t-test results show that there is no significant statistical difference between averages. ($t_{(144)}=0.342$), $p< 0.05$).

3.5. The Relationship Between Mathematics Teaching Self- Efficacy and Mathematics Self-Efficacy

The relationship between mathematics teaching self-efficacy scores and mathematics self-efficacy scores was investigated by using pearson product-moment correlation coefficient. Preliminary analyses were performed to

ensure no violation of the assumptions of normality, linearity and homoscedasticity. There was a positive correlation between the two variables, $r = ,447$, $n = 45$, $p < ,001$, with high levels of mathematics teaching self-efficacy associated with high levels of mathematics self-efficacy.

Table 5 . Pearson product-moment correlations between mathematics teaching self-efficacy scores and mathematics self-efficacy scores

Variables	1	2
1. Mathematics teaching Self-efficacy scores	-	,447**
2. Mathematics self-efficacy scores	,447**	-

4. Conclusions and Recommendations

The findings of the study revealed that pre-service elementary mathematics teachers have high self-efficacy beliefs towards mathematics and mathematics teaching. Results of this study indicated that the mean scores of items measuring mathematics teachers' efficacy in teaching, make to motivate and take on responsibility and are well above the mid-point of five-point Likert scale indicating pre-service elementary mathematics teachers have high self-efficacy on each self-efficacy domain and this study also found out that there is no significant statistical difference between mathematics self-efficacy beliefs averages by gender. Dede (2008) indicated that primary school mathematics teachers, high school mathematics teachers' efficacy in teaching, making to motivate and taking on responsibility, and effective teaching sub-factors of the scale had quite high self-efficacy beliefs. The present data are in congruent with the results of Dede (2008). Yenilmez and Kakmacı (2008) found out that elementary mathematics education students' self- efficacy levels were high for the items under student control, while it was low for the items that needed the help of other people.

In addition, current study revealed that there is a strong positive relationship between pre-service teachers' mathematics teaching self-efficacy and mathematics self-efficacy. A statistically significant positive relationship also was found between mathematics teaching efficacy and mathematics self-efficacy (Bates, Latham, & Kim, 2011). In general, it is suggested that in order to enhance pre-service mathematics teachers teaching self-efficacy, mathematics education programs are structured to get experience teacher candidates for make to motivate students' and take on responsibility. For future research, a qualitative study will be implemented to find out relationships among mathematics teaching efficacy, mathematics self-efficacy.

Abstract

School leaders are aware that their effectiveness is often defined by student performance as measured by test scores. Of particular interest in the global arena are the results of the TIMSS and PISA international assessments that rank student performance by country. While researchers and educators seek to account for the high achievement on these assessments, many turn to the characteristics and behaviors of school leaders to explain the difference in rankings. However, to view effective school leadership behaviors and characteristics from a global perspective poses some challenges, as societal culture influences the leadership process. As way to investigate leadership by societal cultures across the globe, the investigators of this study turned to The Global Leadership and Organizational Behavior Effectiveness (GLOBE) research survey, in which a research team described a large number of characteristics and behaviors, or universal leadership dimensions, to assess the different ways in which various societal clusters viewed leadership. The investigators of this study explore the relationship of global leadership using the GLOBE cultural leadership dimensions and student achievement as measured by TIMMS and PISA within cultural clusters. Findings indicated that four universal leadership dimensions, including charismatic/values based leadership, participative leadership, autonomous leadership, and self-protective leadership, were identified through ANOVA to be significant in predicting student achievement, which led the researchers to conclude that administering the GLOBE Survey to school leaders is necessary to determine the importance and value of the leadership dimensions relative to educational leaders across all cultures.

Keywords: leadership; leadership dimensions; student achievement; international; GLOBE

1. Introduction

School leadership and student achievement are now global issues (Zhao, 2010). One only has to study student achievement measures as put forth by the Programme for International Student Assessment (PISA) and Trends in International Mathematics and Science Study (TIMSS), launched in 1995 and 1997 respectively, to determine that the world's eyes are on international comparisons of student performance across the globe. In a major large-scale cross-cultural research program, Global Leadership and Organizational Behavior Effectiveness (GLOBE) researchers studied inter-relationships of leadership, organizations, and societal culture, using data from 62 countries of the world. Recognizing that leadership and student achievement have gone global, the investigators

* Corresponding author. Tel.: +1-912-478-0510 ; fax: +1-912-478-7104
E-mail address: tamelton@georgiasouthern.edu

of this study were motivated to explore the relationship between leadership behaviors and characteristics and student achievement from an international perspective.

In the world of education, what is known about global student achievement and school leadership? First, two international testing programs provide reliable data on mathematics, science, and reading achievement of students that can be used to compare student performance by participating countries. For example, one international testing program, PISA, assesses skills and knowledge of 15-year-old students to determine how equipped students are “for full participation in society” (<http://www.oecd.org/pisa/aboutpisa/>). From the assessment data collected from both PISA and TIMSS over the last decade, educators find extreme variances in student readiness for global engagement. The concept of globalization advanced in Friedman’s book, *The World is Flat: A Brief History of the Twenty-First Century* (2007), posited: “The playing field has been leveled” (p. 7). However, the playing field in education is not level, as evidenced by the global problem of disparity in student achievement.

As far as school leadership effectiveness across the globe, very little is known about the school leader’s role in student achievement from a culturally contextual perspective. Much of what is known about leadership effectiveness emanates from leadership studies in business and industry. Researchers House and his colleagues (2007) and Kouzes and Posner (2007) have advocated that universal truths about leadership transcend to leaders in schools and other disciplines across societal cultures. The GLOBE studies produced views and perspectives of what universally constitutes good and bad leadership. Most societal clusters, for example, accept that leaders will demonstrate integrity and interpersonal abilities. However, the GLOBE researchers also found that leadership occurs in situational contexts and within cultures, and culturally contingent differences were found to influence conceptualizations of leadership.

Therefore, the investigators of this study were challenged to identify a way to approach an exploratory study on global school leadership and student achievement. The GLOBE research yielded a means by which to begin, as House and colleagues (2007) identified six universal leadership dimensions as a gateway to assess different ways in which various cultural clusters view leadership. Facing one of major challenges of cross-cultural research, that of research methods, the researchers made the decision to explore the relationship between global achievement and leadership dimensions, using TIMSS and PISA data to represent the student achievement variable and GLOBE’s six universal leadership dimensions.

In this paper, the authors first present a brief background of the literature on cross-cultural leadership research and global student achievement. Then, the authors present methods and findings from this study, followed by a brief discussion. While the investigators recognize limitations imposed by the variables of the study, this paper serves as a precedent to a preliminary exploration of the relationship between global school leadership and student achievement.

2. Cross-cultural Leadership Research and Global Student Achievement

Since World War II there has been a dramatic increase in globalization throughout the world. Globalization has created a need for leaders with greater understanding of cultural differences and increased competencies in cross cultural communication and practice. Culture is defined as the commonly shared beliefs, values, and norms of a group of people. In the past 30 years, many studies have focused on identifying various dimensions of culture. The best known is the work of Hofstede (1980, 1991, 2001), who identified five major dimensions:

power distance, uncertainty avoidance, individualism–collectivism, masculinity–femininity, and long-term–short-term orientation.

Expanding on Hofstede’s work, House and his colleagues (2004) delineated additional dimensions of culture such as in-group collectivism, institutional collectivism, future orientation, assertiveness, performance orientation, and humane orientation. After many years in development, the work of Dorfman, House, and more than 150 colleagues (The Globe Foundation, 2006) around the world resulted in the Global Leadership and Organizational Behavior Effectiveness Project (GLOBE Project). The Globe researchers described leader effectiveness as contextually embedded in the values and norms of people within a society, identifying 35 leader characteristics that are described as “culturally contingent.” From the study of over 17,000 business and financial leaders in 62 countries, the GLOBE Project also yielded 21 universally desirable and undesirable characteristics of effective leaders across all cultures, which they grouped into six universal leadership dimensions. Given that the GLOBE research team described universal characteristics and behaviors that account for a leader’s effectiveness, or lack thereof, across all cultures, the researchers of this study decided to use these universal leader dimensions to study their relationship with student achievement.

As part of the GLOBE research team, House and Javidan (2004) identified the six dimensions as: charismatic/value-based, team-oriented, participative, humane-oriented, autonomous, and self-protective leadership. As universal dimensions, these six dimensions provide a common ground to study perceptions of leadership across cultures.

- Charismatic/value-based leadership refers to the capacity to inspire, to motivate based on strongly held core values. The behaviors are those of a visionary, inspirational leader, one who is trustworthy and performance-oriented.
- Team-oriented leadership includes the capacity for team building and encouraging a common purpose among team members. The behaviors are those of a collaborative, nonmalevolent leader, one who is integrative and diplomatic.
- Participative leadership refers to the capacity to involve others in decision-making. The behaviors are those of a nonautocratic leader, one who seeks to make and implement decisions with others.
- Humane-oriented leadership involves the capacity to be compassionate and generous. The behaviors are those of a supportive leader, one who is modest and sensitive to others.
- Autonomous leadership reflects the capacity to lead individually and independently. The behaviors are those of an autocratic leader.
- Self-protective leadership encompasses being self-centered, status conscious, and procedural. The behaviors are those of a face-saving leader, one who will ensure his or her own security, or from a group-protective style, one who will ensure the safety of the group.

One of the criticisms of the GLOBE research is that they conceptualized leadership based on perceptions of leadership from 17,300 middle managers in the food processing, financial services, and telecommunications services industries (Northouse, 2013). The six dimensions were framed from perceptions and implicit beliefs that individuals have about leaders, not specifically about what leaders do. GLOBE data were not collected from leaders in educational organizations. However, the research team’s justification for using the GLOBE leader dimensions is the argument that these dimensions represent universal principles, or behaviors and characteristics, that were perceived culturally as “leadership.” Even though data were collected from those in mid-management in business industries and not the educational industry, the findings provide a common metric to study leadership across societal cultures.

The idea that these dimensions might also be related to how school leadership is viewed is the assumption of this study, with some basis on which to make the assumption. From an Anglo cultural perspective, Richardson and Lane (1996) polled 1,225 teachers from four states in the United States and asked: “What are the characteristics of principals that make them leaders?”

The findings of Richardson and Lane’s (1996) survey indicated correlation between traits that are valued in both business and education. This study also reflects the findings of Kouzes and Posner (2007) who describe leaders, across different industries, professions, and countries, with similar behaviors and practices. Many researchers (Lord & Maher, 1991; Northouse, 2013; Yukl, 1999) have emphasized that leadership occurs in context and under conditions of the expectations of followers and organizational culture, but they also cite universality of some behaviors and characteristics across cultural contexts. It makes sense that education would be reflected within cultures, which would pose little difference in leadership as perceived by those in other institutions.

Given that the GLOBE research team reported empirical evidence of universal leadership dimensions as a way to understand how leadership is perceived across societal cultures, the researchers of this study decided to frame this exploratory study of the relationship of leadership and student achievement around one overarching question: Does the way a global society views leadership have a relationship with student achievement?

3. Methods

This study was designed as an exploratory study to determine the relationship between universal leadership dimensions and student achievement from a global perspective. The researchers sought to determine whether universal leadership dimensions identified in the GLOBE research were associated with student achievement as measured by international student achievement scores from PISA and TIMSS data.

The data used to represent the variables for this descriptive study were from the GLOBE research, the TIMSS database, and the PISA database. To study the association between leadership and student achievement, the researchers first identified the six universal culturally-endorsed leadership dimensions reported in the GLOBE research by societal culture. These six dimensions do not describe outstanding leadership, but rather describe the views of how cultures distinguish effective leadership. The dimensions are: charismatic/value-based, team-oriented, participative, humane-oriented, autonomous, and self-protective leadership. The societal cultures, including the countries that constitute the cluster, in the GLOBE studies were:

- Anglo: Australia, Canada, England, Ireland, New Zealand, South Africa (White sample), United States
- Germanic: Austria, Germany, the Netherlands, Switzerland (German speaking)
- Latin Europe: France, Switzerland (French speaking), Israel, Italy, Portugal, Spain
- Eastern Europe: Albania, Georgia, Greece, Hungary, Kazakhstan, Poland, Russia, Slovenia
- Southeast Asia: India, Indonesia, Iran, Malaysia, Philippines, Thailand
- Middle East: Egypt, Kuwait, Morocco, Qatar, Turkey
- Confucian Asia: China, Hong Kong, Japan, Singapore, Taiwan, South Korea
- Sub-Saharan Africa: Namibia, Nigeria, South Africa (Black sample), Zambia, Zimbabwe
- Latin America: Argentina, Bolivia, Brazil, Colombia, Costa Rica, Ecuador, El Salvador, Guatemala, Mexico, Venezuela;

- Nordic Europe: Denmark, Finland, Sweden.

The researchers excluded countries where both TIMSS and PISA scores were not reported. The non-examined countries in each societal cluster did not participate in international testing. The researchers excluded the Sub-Saharan Africa cultural cluster, as there were no countries in this cluster that participated in international testing.

To perform the correlational study, first, countries were grouped into three clusters based on their rankings of the value of each universal leadership dimension. For example, on the *charismatic/value-based dimension*, if a country ranked that dimension as 1, 2 or 3, they were in the first group (LOW) and if they ranked it 8, 9 or 10 they were in the last group (HIGH). The rest of the countries (ranks of 4 through 7) comprised the middle group. Thus, the first group of countries are those that most value a dimension and the last group of countries are those that least value that dimension. The following table represents the value rankings of the 6 leadership style dimensions by cultural cluster:

Table 1: Grouping of Culturally Endorsed Leadership Dimensions

Leadership Dimension	Societal Value Dimension Most (1)	Societal Clusters that the Dimension Moderately (2)	Societal Clusters that Value Dimension Least (3)
Charismatic/value-based	Anglo; Germanic; Nordic Europe	Latin Europe; Southeast Asia; Confucian American	Eastern Europe; Middle East
Team-oriented	Southeast Asia; Confucian Asia; Latin America	Latin Europe; Nordic Europe	Eastern Europe; Anglo; Germanic; Middle East
Participative leadership	Anglo; Germanic; Nordic Europe	Latin Europe; Latin America	Eastern Europe; Southeast Asia; Middle East; Confucian Asian
Humane-oriented leadership	Anglo; Southeast Asia	Germanic; Latin Europe; Middle East; Confucian America	Eastern Europe; Nordic Europe
Self-protective leadership	Southeast Asia; Middle East; Confucian Asia	Latin Europe; Latin America	Eastern Europe; Anglo; Germanic; Nordic Europe
Autonomous leadership	Germanic; Eastern Europe; Confucian Asia	Anglo; Southeast Asia; Nordic Europe	Latin Europe; Middle East; Latin America

3.1 Analysis

The relationship between the leadership dimensions and student achievement was analyzed in two ways. First, correlations between the leadership style rankings and the average achievement scores were established.

Second, the researchers conducted an ANOVA to study the relationship of leadership dimensions and student achievement. These groupings were then used to represent a fixed factor in an ANOVA analysis of each of the achievement variables. The achievement variable was the average reported value of the PISA and TIMSS scores available for each country. Due to the fact that average scores were used and the number of students in each country used to form the averages was not available and thus not weighted to account for the variable, this analysis should be considered exploratory.

3.2 Results

It should be observed that, with the correlations between cultural leadership dimension scores and international standardized achievement scores, higher scores represent less value of that style so negative correlations indicate higher achievement scores are associated with higher value rankings. The data suggest that the charismatic/value-based orientation score has a significant negative correlation with the PISA–Reading score. Likewise the data suggest that the autonomous leadership orientation score has a significant negative correlation with all three international achievement measures. However, the data suggest that the protective leadership score has a significant positive correlation with the PISA–Reading score.

These initial correlation results prompted the researchers to calculate ANOVAs to further investigate relationships and/or predictors of international student achievement data with the leadership dimensions as defined in GLOBE studies.

3.2.1 Mean Achievement Scores by Leadership Dimension.

The leadership dimension scores were recoded into High (8-10), Medium (4-7) and Low (1-3). Mean scores on the achievement measures for each of these groups were calculated, and correlations were established as follows:

- ANOVAs for Charismatic/values based Leadership Style demonstrated a significant difference between groups on the TIMSS and PISA-Reading.
- ANOVAs for Participative Oriented Leadership Style showed a significant difference between groups on both PISA-Reading and PISA-Math.

- ANOVAs for Autonomous Oriented Leadership Style showed significant difference between groups on TIMMS, PISA-Reading, and PISA-Math.
- ANOVAs for Self-or Group-Protective Oriented Leadership Style showed a significant difference between groups on PISA-Reading and PISA-Math.
- See Table 2 for a summary of significant findings.

INTE 2013

Table 2: Summary of Significant Findings

Leadership Orientation	Correlations	ANOVA
	Leadership Orientation / PISA-Reading / PISA-Math	Leadership Orientation / TIMSS /PISA-Reading / PISA-Math
Charismatic/ value-based	Negative Correlation with PISA-Reading scores	Significant difference between groups on TIMSS and PISA-Reading
Team		
Participative	Positive Correlation with PISA-Reading	Significant difference between groups on both PISA-Reading and PISA-Math
Humane		
Autonomous	Negative correlation with PISA-Reading, PISA-Math, and TIMSS	Significant difference between groups on TIMSS, PISA-Reading and PISA-Math
Self- Group Protective		Significant difference between groups on PISA-Reading and PISA-Math

4. Discussion

As an exploratory study, the researchers observed several interesting relationships in the ways that cultural clusters conceptualize leadership and student achievement within the clusters. ANOVAs established that four of the leadership approaches were found to be significant in predicting student achievement. For example, the findings indicated that charismatic/value, participative, autonomous, and self-protective styles of leadership predict student achievement, while humane and team styles were not found to be related to student achievement. Even though, across all 62 countries of the GLOBE study, all cultures see all six dimensions as substantially contributing to leadership, those that approach leadership with a higher regard of a charismatic/value-based conceptualization and an autonomous conceptualization seem to generate higher student achievement. Initial findings indicated that societal clusters who exceedingly value participative and self or group protective approaches to leadership have little or negative impact on student achievement.

In considering the relationship of leadership and variance in student performance, results suggest that charismatic/value-based conceptualization of leadership, for example, inspires student achievement. For example, at the level of the ten societal clusters, the Anglo cluster most positively associated charismatic /value-based leadership with leader effectiveness, whereas the Middle East cluster least associated charismatic /value-based orientation with outstanding leadership. In observing average scale scores from the 2009 administration of PISA to students in countries within these two cultural clusters, Middle Eastern countries who participated in PISA reported average scale scores of 407, compared to the average scale score of 504 in the Anglo cultural cluster. One of the characteristics of the charismatic/value-based leadership approach is a strong performance orientation; therefore, it is not surprising that leading with values and a results-orientation style contributes to positive outcomes. If results matter in leadership, then the laser-focus on generating positive results is to be expected.

In another interesting observation, the Confucian Asia cluster, which basically holds a self-protective, team oriented, and humane oriented style of leadership in high regard, had the highest scale scores on the PISA, but two of the predominant ways they conceptualize leadership, team and humane, were not found to be related to student performance. Furthermore, the protective approach to leadership, which was related to student performance scores, seemed to suggest a negative correlation. The more a cultural cluster conceptualizes leadership from a protective perspective, the lower the achievement. However, the achievement scores from the Confucian Asia cluster are among the highest in the world. These findings may suggest that students within the Confucian Asia cluster are self-motivated to achieve, and presence or absence of leadership style is inconsequential.

The autonomous approach to leadership, held in highest regard in the Germanic, Eastern European, and Confucian Asia clusters, was also related to positive outcomes of higher student achievement. Again, the suggestion that approaching leadership from an independent perspective is related to higher student achievement. The relationships of achievement and leadership seem to suggest that high achievement is a product of a cultural disposition to be self-motivated and independent, securing one's own position in the culture by working hard to achieve.

While these generalizations stimulate some discussion about how leaders and culture influence educational improvement, the fact remains that leadership and achievement are situational. How a culture approaches leadership certainly conveys values and beliefs about life, and education is largely a human enterprise, influenced by those values and beliefs. In a broad sense, the authors of this study discovered that how a cultural cluster views leadership matters in student achievement.

In brief, the correlations generate more questions about how school leadership is viewed within cultures as compared to leadership in business and industry. By studying leadership characteristics of principals/headmasters, researchers may provide a useful portrayal of how educators around the world conceptualize leadership. More importantly, they may learn more about the leadership process and how it is influenced by culture and how it influences effectiveness of schools. By exploring the relationship of school leader behaviors and student achievement, researchers place a spotlight on school leaders and how they view their leadership as contributory to student academic performance.

5. Summary and Conclusions

With a desire to conduct and coordinate research that spans diverse cultural environments and school leaders within those environments, the researchers recognize that cross-cultural research is challenging and complex. Studying leadership in cultural context, both from a linguistic and methodological design perspective, presents problems. By administering the GLOBE instrument to school leaders, researchers could, first of all, establish the importance and value of leadership dimensions within cultural clusters, as reported by school leaders. By identifying the broad dimensions that are universal and the broad dimensions that are culturally contingent, researchers can generate an approach to understanding cross cultural school leadership. Data from such studies generate the possibility of understanding the diverse ways in which school leadership is perceived by educators from different regions of the world. The leadership dimensions also, by representing a broad range of leader behaviors, offer a passageway into the flat world and understanding the cultural context of leadership, as researchers seek to discover variances of school leader behaviors and influence of situational effects.

6. Dissemination

In reviewing the literature, it is apparent that the study of school leadership effectiveness from a global perspective poses many challenges (Zhao, 2010). Language barriers, accessibility to school leaders, and the need for large-scale coordination of researchers to undertake such a project led the investigators of this study to the Global Leadership and Organizational Behavior Effectiveness (GLOBE) research. The researchers are seeking research partners from around the globe to collaborate in collecting data for the next steps in this international project.

The relation between education and economic crime: an assessment for Turkey

Seda Tekeli^{a*}, Güler Günsoy^b

^aAnadolu University, Faculty of Economy, "Eskisehir", Turkey

^bAnadolu University, Faculty of Economy, "Eskisehir", Turkey

Abstract

Crime has been perceived as a distortion in social rest and order since people had started living as a community and still keeps its importance. For that reason, societies have been trying to specify the reasons that drive people to commit crimes and to eliminate those reasons. Social sciences' concerns about the crime are generally limited to the reasons and the consequences of crimes, both theoretically and empirically. The fight against crime is crucial especially for its effects on social welfare. In this sense education level and welfare of a society is important for crime types and crime rates. Hereunder, convict statistics of age, education and occupation from justice statistics from Turkish Statistics Institute and their relation between economic crimes will be investigated. Since there are limited studies on crime for Turkey, this study is an expected contribution to the literature. Further, it is aimed to find connections between reasons of economic crime and age, education and occupation statistics and to prevent crimes by helping the policies of the fight for crime.

Keywords: Education, Crime, Economic Crime, Turkey

1. INTRODUCTION

Crime is a phenomenon which affects economic and social welfare of societies and is affected from economic and social welfare of societies as well. On the other hand, there are significant differences in crime types and formations and crime rates of all developing and developed countries. Economic, social, regional and demographic features of countries are important factors that create the difference in crime types, formations and rates. These differences in crime types and crime rates lead policy makers and different disciplines to focus on this area. As a result of developing world and globalization trends and advanced information technologies, crime types and especially economic crime types are getting diversified. In this scope, crime does not necessarily mean causing damage or using violence against human. Economic crimes should also be remembered as they cause damage to property rather than human life. Accordingly, theft, forgery, embezzlement, extortion, fraud, check and bond crimes, bribery, identity theft, online fraud, money laundering, intellectual property theft, software piracy etc. take place in the type of economic crimes which are committed to property. Factors leading people to commit crimes and economic crimes differ by countries. Economic structure of a country is a very important factor for crime formation and also educational levels, migration and urbanization, unemployment, income and expenditure distribution, poverty, wage level and such socio-economic factors are effective on crime rates and types. In this scope, education has a particular importance in all socio-economic factors. In this scope, the aim of this study is to investigate the education and economic crime relation in specific to Turkey. For this purpose, in the first chapter education and economic crime relation is summarized in the scope of theoretical and empirical literature. In the second chapter, materials, method, objective and the importance of the study are explained and

E-mail address: sakyalcin@anadolu.edu.tr

general view of economic crimes in Turkey and demographic features of economic offenders are analyzed. In the last chapter, educational level of offenders are analyzed in the scope of economic crimes in specific to economic crime/s in Turkey.

2. EDUCATION AND ECONOMIC CRIME RELATION: THEORETIC AND EMPIRICAL LITERATURE

There are significant differences in crime types, formations and crime rates in all countries, especially the underdeveloped ones and in every society. There is a close relation between the reasons of these differences and economic, social, regional and demographic features of countries. This difference in crime types and crime rates leads policy makers and different disciplines to focus on this area. In the literature, there are many studies investigating the effect of economic and demographic factors on crime rate in a society. Not only economics but also different disciplines such as sociology, psychology and criminology investigate the motives and develop policies for factors pushing people into crime. In this scope, "crime" does not necessarily mean causing damage or using violence against human. Economic crimes should also be remembered as they cause damage to property rather than human life. Accordingly, theft, forgery, embezzlement, extortion, fraud, check and bond crimes, bribery, identity theft, online fraud, money laundering, intellectual property theft, software piracy etc. take place in the type of economic crimes which are committed to property (Akdeniz and Öcal, 2011: 140).

Economic crime is defined as; "acts that are not recorded and out of the control of public authority and punished as they are committed in defiance of laws enacted to protect public order". However, the question of which crimes can be regarded as economic crime is being discussed in the literature. Demirbaş (2005) state that in order to define a crime as an economic one, it should have some specific features. Accordingly; "to define a crime as an economic one, an economic officer should commit a criminal offence and this offence should be committed in a practice and should be abuse of confidence." (Akdeniz and Öcal, 2011: 140). In another definition, economic crimes are defined as "white collar crimes". Accordingly, white collar crimes refer to crimes related to the profession and business world. However, this term was valid until 1940s and now there is a need for a new and modern definition. According to modern definition, economic crime can be defined as ;"an illegal action committed by professional people or those with technical skills with the purpose of gaining personal or organizational income or acquiring illegally against other persons and units by means of misleading or making false statements". In order to comprehend the term of economic crime, we should take a look at types of economic crime. As a result of developing world and globalization trends and advanced information technologies, economic crime types are getting diversified. According to statistics on global scale and predictions, especially embezzlement, bribery, fraud, misuse of assets etc. comprise a great part of economic crimes. Moreover, as a result of globalization and advanced information technologies, economic crime types are reaching different dimensions. Today, identity theft, online fraud, money laundering, intellectual property theft, software piracy and hacking and such crime types are included in economic crimes. From this aspect, new economic crimes and opportunities increase and start to find new dissemination areas overseas (Güvel, 2005: 29-31).

There are different approaches on crime and crime factors which affect economic and social welfare of societies and are affected from economic and social welfare of societies as well. The approach which explains crime especially in economic level is Becker (1968)'s approach which is also developed by Ehrlich (1973) later. This approach is shaped according to cost-benefit analysis. Economic theory models developed by both Ehrlich and Becker, mostly explains crimes committed against property. According to this model, a person decides to commit

a crime following a cost-benefit analysis. Accordingly, the person compares the income to be acquired by the crime and the punishment to be sentenced in case of being caught. At this point, the income that the person will acquire if s/he is not caught is the benefit and the punishment s/he will be sentenced to if s/he is caught is the cost (Becker, 1968; Ata, 2011: 119). Pursuant to this comparison, the person will decide whether to commit the crime or not (Ehrlich, 1973; Raphael and Winter- Ebmer, 2001; Pazarlıoğlu and Turgutlu, 2007: 2). According to the model, if the benefit is bigger than the cost, the person will decide to commit the crime. In this theoretical model created by Becker and developed by Ehrlich, it is pointed out that gain structure, employment opportunities and skills to participate in labour force are important factors in criminal tendency (Cömertler and Kar, 2007: 3). In the literature, there are many theoretic and empirical studies investigating the reasons behind committing crime and economic crime. Economic models on this issue are based on models developed by Fleisher (1963), Becker (1968) and Ehrlich (1973) (Scorcu and Cellini, 1998: 279; Cömertler and Kar, 2007: 2-3; Alcan and Şahin, 2011: 4). Although economic structure of a country is an important variable that explains the crime, it is not sufficient alone. Apart from economic structure, educational levels, migration and urbanization, unemployment, income and expenditure distribution, poverty, wage level and such socio-economic factors are effective on crime rates and types. Education, as the origin of all other reasons, has a particular importance in all socio-economic factors (Tsushima, 1996: 500-505; Cömertler and Kar, 2007: 5-8; Scorcu and Cellini, 1998: 208). According to Entorf and Spengler (2000), market conditions, crisis, inflation, poverty, wages and unemployment are important factors in economic crimes or crimes committed against property (Entorf ve Spengler, 2000: 77-78). As is known, social harmony and order is possible only when people act in line with the expectations of society. In this scope, people can give right reactions to expectations with proper behaviors only by means of education. In this scope, education is not only an important socializing tool but also has an important function in relationship and behavior formations (Kızmaz, 2004: 292). It is possible to evaluate the relation between education and crime from different perspectives. Primarily, education supports conscious formation in a certain level. In this way, social awareness increases the commitment of individuals to society and helps them to exhibit behaviors in line with social expectations. In addition, education is not sufficient alone. The level of education is of importance to explain the crime and education relation. Accordingly, as educational level increases, crime rates and especially rates of economic crimes committed to property decrease. However, what is stated here is the fact that as educational level increases, the possibility to commit a crime tends to decrease. It should be accepted that high level of education is not a factor preventing crime alone. Another factor to discuss about the crime and education relation is school. In the literature, studies conducted on crime and school relation focus on factors such as academic success, attitudes towards school, educational system, attitudes of school management towards children, school environment, relationships among students, sense of discipline of school management, success level and exam marks, frequency of truancy and dismissal from school. Accordingly, apart from education and educational level, these variables should also be considered to determine the crime and education relation in terms of criminalism (Kızmaz, 2004: 293-295). While crime and education relation is investigated, in the literature, it is emphasized that educational level that the profession requires and profession quality are effective in committing crime. La Free and Drass (1996), state that the possibility of those having a quality profession is low (La Free and Drass, 1996: 615). In addition, Braithwaite (1989) reveals that young people having high level of education and a professional aim commit crimes less than others (Braithwaite, 1989: 1). Locher (1999), developed a two-stage model through which people decide to allocate their times to working, education and committing crime. Accordingly, education reduces the crime rates of adults and a negative relationship occurs between committing crime and wages as age increases. The increase of wages for qualified labor force in market increases crime tendency of young people. On the other hand, as quality level increases, possibility to commit crime decreases for adults. Another important findings of Locker (1999)'s study is the fact that tendency of young people in the age group of 14-25 to commit crime is higher. In this scope, it is pointed out that it is important to implement policies to prevent young people in this age group from crime. Lochner and Maretti (2001)

investigated the relationship between the benefit to be obtained from crime and the possibility of committing crimes. Accordingly, the possibility of committing a crime is as high as the benefit to be obtained from the crime. (Alcan and Şahin, 2011: 9-10). In their study analyzing the relationship between education and crime, Alcan and Şahin (2011) revealed that being illiterate increases the rate of crime against property and as the educational level increases, levels of committing crime decrease (Alcan and Şahin, 2011: 23).

3. MATERIALS AND METHADODOLOGY

3.1. Objective and Importance

The objective of this study is to analyze the relationship between economic crime and education. For that purpose, demographic data related to the convicts between the years of 1990-2011 in Turkey which takes place in justice statistics in official web site of Turkish Statistical Institution is used. In this scope, demographic profile of crime in Turkey is created through demographic features such as age, gender, educational level, marital status and occupation specific to theft, embezzlement, bribery, forgery and fraud crimes which are defined as economic crimes and the relationship between crime and education in Turkey is explained.

3.2. Methodology

As the aim is to explain the relationship between crime and crime types and educational levels of people sentenced due to economic crime between the years of 1990-2011, in this study relationships between age, marital status, educational level and occupation and the crime types are investigated by means of descriptive analysis. In this way, the relationship between crime type and educational level of the convicts is investigated. While obtaining the data of people sentenced in 1990-2011 period, justice statistics in official web site of Turkish Statistical Institution are used.

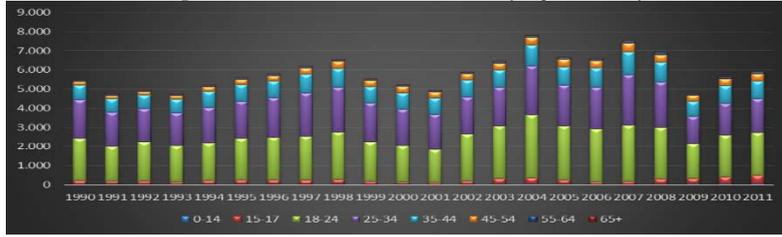

3.3. General View of Economic Crimes in Turkey

It is possible to investigate the distribution of economic crime types in Turkey between the years of 1990-2011 in total and by genders through the graphs below. 96.4% of 5.938 offenders who committed the crime of theft in Turkey between the years of 1990-2008 were males and 3.6% of them were females. Analyzing this relation by years, it can be said that the sentence rate of male offenders for theft is higher than the rate of females. In terms of embezzlement, similar results can be obtained. 96.4% of 213 offenders who committed the embezzlement crime between the years of 1990-2008 were males and 3.6% of them were females. Analyzing this relation by years, it can be said that the sentence rate of male offenders is higher than the rate of females. 97.74% of 5.290 offenders who committed the fraud crime between the years of 1990-2008 were males and 2.3% of them were females. Analyzing this relation by years, it can be said that the sentence rate of male offenders for fraud is higher than the rate of females. In average 1.721 crimes of forgery were committed between the years of 1990-2008. 97.6% of 5.290 offenders who were sentenced for fraud were males and 2.4% of them were females. Analyzing this relation by years, it can be said that the conviction rate of male offenders is higher than the rate of females.

3.4. Demographic Features of Economic Offenders in Turkey

Demographic features of economic offenders in Turkey can be summarized by age, marital status and occupation as follow: Between the years of 1990-2011, 34.7% of those who were sentenced for an economic crime were in the age group of 25-34. For the same period, 24.1% of them were in the age group of 35-44. 23.6% of them were people in the age group of 18-24. The rate (6.0%.) of those aged 65 and over was very low.

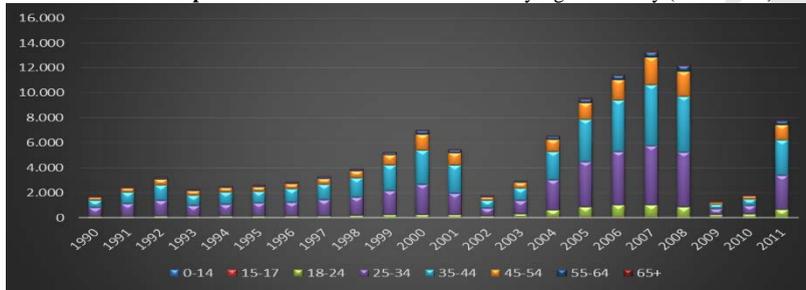

Graph 1: Distribution of Theft Convicts by Age in Turkey (1990-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

In terms of the types of crime, during that period 39.2% of theft convicts were in the age group of 18-24 and 34.2% were in the age group of 25-34.

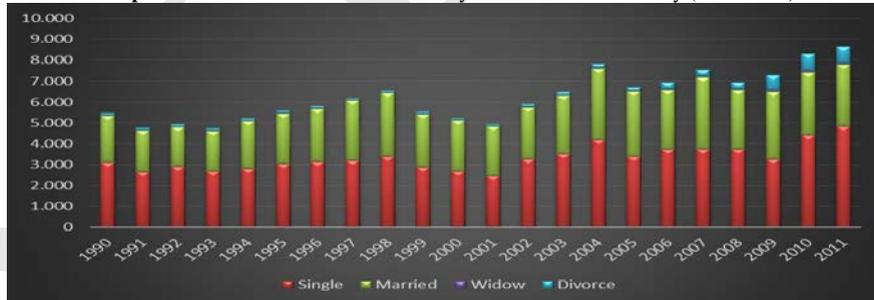

Graph 2: Distribution of Fraud Convicts by Age in Turkey (1990-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

Distribution of fraud convicts varies by age. According to analysis results; 37.2% of fraud convicts were in the age group of 25-34 and 36.1% were in the age group of 35-44. This rate (0.7%) is very low for those aged 65 and over. Between the years 1990-2011, 59.8% of those sentenced for an economic crisis were married and 35% of them were single.

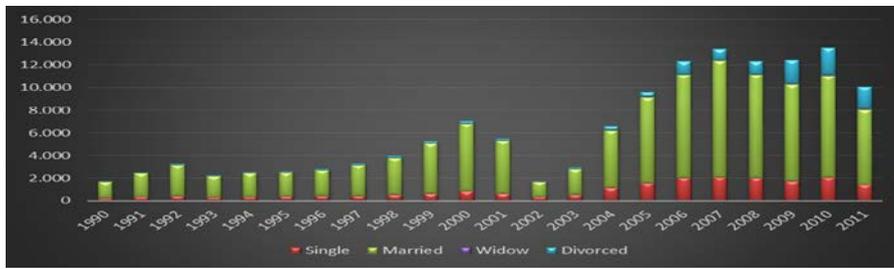

Graph 3: Distribution of Theft Convicts by Marital Status in Turkey (1990-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

The relationship between economic crime types and marital status is determined through theft and fraud which are most frequent crime types. Accordingly, results are different for the relationship between fraud and marital status. Accordingly, 79% of 137.286 fraud convicts were married and 14.6% of them were single.

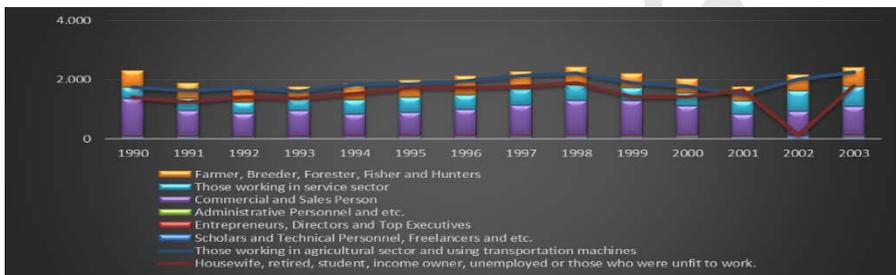

Graph 4: Distribution of Fraud Convicts by Marital Status in Turkey (1900-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

Analyzing people sentenced for economic crime(s) by occupation, we can obtain following results. 34.8% of 5.404 theft convicts between the years of 1990-2003 were those working in agricultural sector and using transportation machines; 26.7% were housewife, retired, student, income owner, unemployed or those who were unfit to work. 24.3% of 5671 people sentenced between the years of 2004-2011 were craftsmen and those working in related areas; 24.1% of them were housewife, retired, student, income owner, unemployed or those who were unfit to work.

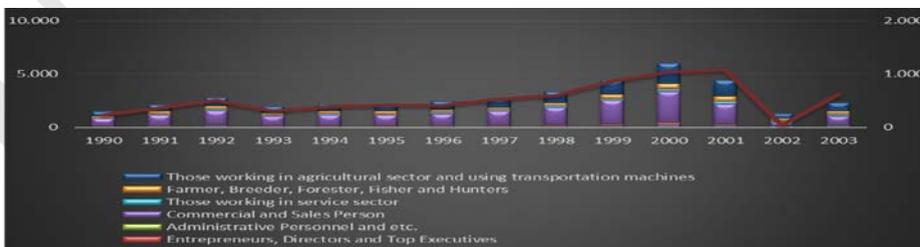

Graph 5: Distribution of Theft Convicts by Occupation in Turkey (1900-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

Results for fraud within same years are also similar. 37.7% of 3346 fraud convicts were commerce and sales personnel; those working non-agricultural sectors and using transportation machines ranked number two with the rate of 26.8%.

Graph 6: Distribution of Fraud Convicts by Occupation in Turkey (1900-2011)

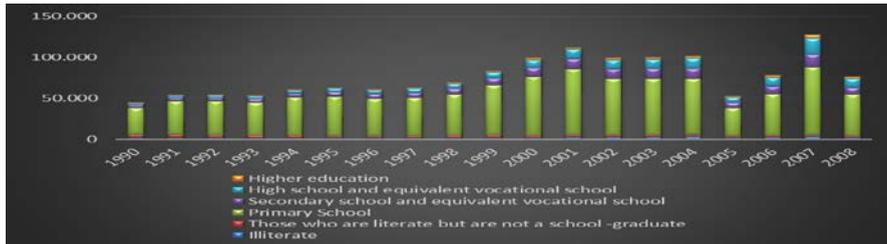

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

3.5. Economic Crime and Educational Relation in Turkey

Analyzing people sentenced for economic crime(s) by educational level, we can obtain following findings; 61% of people sentenced for economic crime between the years of 1990-2011 were primary school graduates. High school graduates (12.2%) and secondary school graduates (10.5%) ranked the second and third ranked number two and three respectively. University graduates had the lowest rate with 3.4%

Graph 7: Distribution of Economic Offenders by Educational Level in Turkey (1990-2008)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2008)

Analyzing people sentenced for economic crime(s) by educational level and gender, we can obtain following findings; 62.2% of 64.185 males sentenced for economic crimes between the years of 1990-2008 were primary school graduates. Crime rate of illiterate males is very low (2.2%).

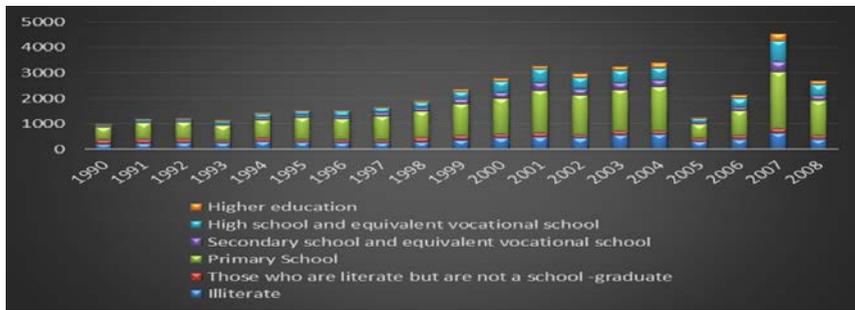

Graph 8: Distribution of Male Offenders by Educational Level in Turkey (1990-2008)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2008)

44.9% of 1.863 females sentenced for economic crimes between the years of 1990-2008 were primary school graduates; 15.6% of them were illiterate. Comparing the results with those of males, no significant difference is found.

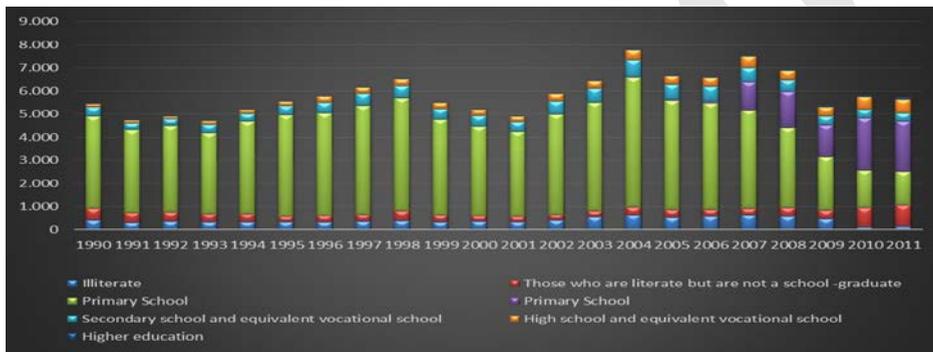

Graph 9: Distribution of Female Economic Offenders in Turkey by Educational Level (1990-2008)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2008)

As the educational level of female and male increases, crime rate falls. Analyzing the relationship between economic crime types and educational level, we can say that the crime type is directly related to education.

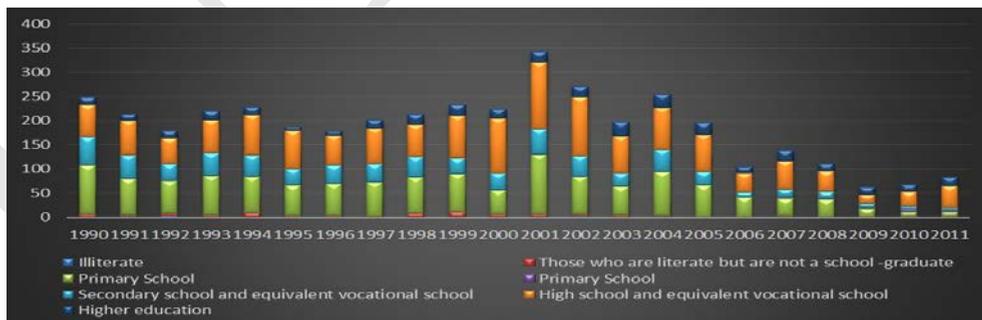

Graph 10: Distribution of Theft Convicts by Educational Level in Turkey (1990-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

According to the certain period of time, 73% of 129.99 theft convicts were primary school graduates. However, analyzing the embezzlement convicts by educational level, we can reach different results. Accordingly;

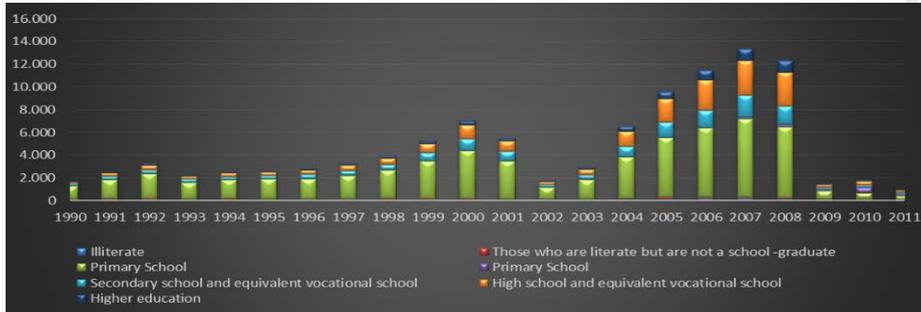

Graph 11: Distribution of Embezzlement Convicts by Educational Level in Turkey (1990-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

38% of 4.154 embezzlement convicts were high school graduates and 31.5% of them were primary school graduates. Another important issue to point out is that the rate of university graduates among embezzlement convicts sentenced between 1990-2011 tends to rise. 6% of fraud convicts sentenced in 1990 were university graduates and this rate reaches 8.5% in 2000 and 21.7% in 2010.

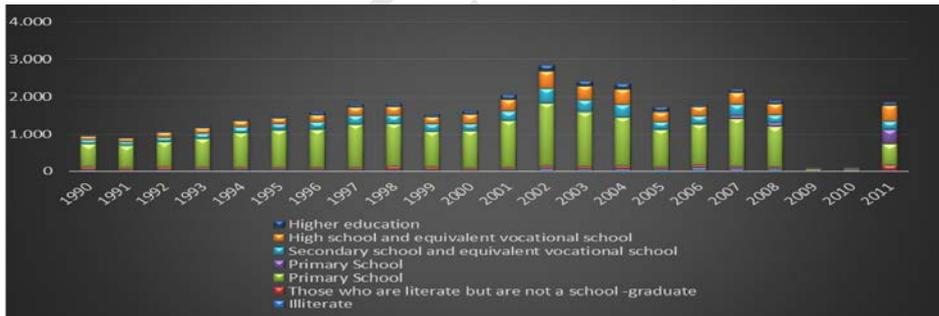

Graph 12: Distribution of Fraud Convicts by Educational Level in Turkey (1900-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

The number of fraud convicts between 1990-2011 was 104.793 in average. More than half of them (60.5%) were primary school graduates. High school graduates rank the number two with 16.7%.

Graph 13: Distribution of Bribery and Forgery Convicts by Educational Level in Turkey (1900-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1990-2011)

The number of fraud convicts was 34.741 in average. As in other economic crimes, most of bribery and forgery convicts were primary school graduates. Accordingly, 61% of bribery and forgery convicts were primary school graduates; 14.4% were high school graduates and 12.3% were secondary school graduates.

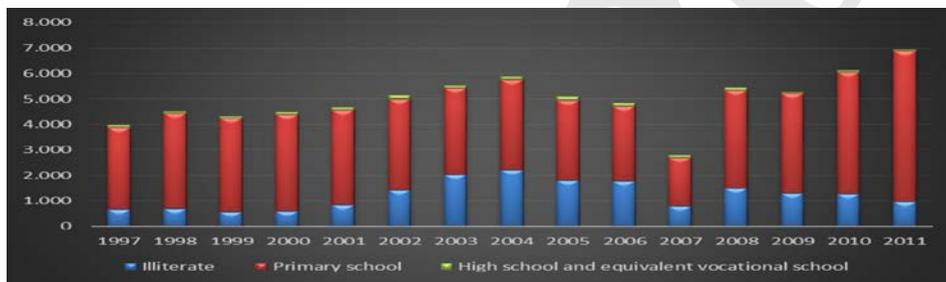

Analyzing the educational level of children in Penal Institution, we can see that most children are theft convicts. Analyzing children sentenced for economic crimes by educational level, we can see that the rate of primary school graduates, those who dropped out primary school, high school and equivalent vocational schools is high. In this study, the distribution within last five years is presented in Table 1.

Table 1: Distribution of Child Convicts in Turkey by Educational Level (2008-2012)

Years	Illiterate	Primary school dropout	Primary school graduate	High school and equivalent vocational school dropout	High school and equivalent vocational school graduate
2008	4,1	32,0	51,5	11,2	1,3
2009	5,2	33,0	49,8	11,2	0,7
2010	5,3	35,7	44,2	13,2	1,6
2011	7,3	35,5	47,0	8,9	1,2
2012	7,8	35,1	44,0	10,2	2,9

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (2008-2012)

According to Table 1, averagely 47.3% of 15.242 children sentenced for economic crimes between 2008-2011 were primary school graduates and averagely 34.3% were those who dropped out the primary school. In addition, this rate is 10.9% for children who dropped out high school and equivalent vocational schools. Analyzing changes within the same period we can say that while crime rate of primary school graduates tends to fall; rate of children who dropped out primary school and high school and equivalent vocational schools tends to rise.

Graph 14: Distribution of Children Sentenced for Theft by Educational Level in Turkey (1990-2011)

Source: Turkish Statistical Institute, Official Web Site Justice Statistics (1997-2011)

Analyzing child convicts by crime type and educational level, we can see that the rate of theft convicts is high. Accordingly, 66.8% of 5.504 children sentenced for theft between 1997-2011 was primary school graduates and 22% of them were illiterate. This rate is very low for high school and equivalent vocational school graduates with 1.9%.

4. CONCLUSION AND ASSESSMENT

Studies conducted on crime in the literature emphasize that there is a close relationship between educational level and crime rate and it is observed that as educational level decreases, crime rate significantly rises. The study conducted on convicts sentenced for economic crimes in Turkey revealed that economic crime is a result of low educational level. When crime rates are assessed by educational level, it is found that 61% of convicts sentenced for economic crime were primary school graduates. High school and equivalent vocational school graduates (12.2%) and secondary school graduates (10.5%) ranked the number two and three respectively. The rate of university graduates is the lowest with 3.4%. In this scope, the fact that university graduates commit less crimes is another finding emphasized in studies on crime in the literature. This result supports the results of studies conducted in Turkey and abroad (Braithwaite (1989); LaFree and Drass (1996); Locher (1999); Kızmaz (2002);

Alcan and Şahin (2011)) In the scope of the study, economic crimes committed mostly are theft, fraud and bribery and forgery. According to the certain period of time, 73% of theft convicts were primary school graduates. However, analyzing the embezzlement convicts by educational level, we can reach different results. 38% of embezzlement convicts were high school and equivalent vocational school graduates and 31.5% of them were primary school graduates. Considering the fact that embezzlement is a crime based on qualified profession; the need of higher educational level to work in such professions explains why embezzlement convicts have higher educational level than theft convicts. Distribution of fraud convicts by educational level also has similar features. More than half of fraud convicts (60.5%) were primary school graduates. High school graduates rank the number two with 16.7%. It is found that economic crime rate of children who are primary school graduates is high similarly to the rate of adults. It is possible to say that as educational level rises, economic crime rate falls for children as well. Another findings of the study is the fact that the rate of primary school graduates, those who dropped out primary school, high school and equivalent vocational schools is high especially between the years of 2008-2012. In addition, we can say that there was a rise in crime rates of children who dropped out primary school and high school and those who were high school or their equivalents graduates in the same period.

To conclude, when the relationship between economic crime and education is analyzed, we can say that the rate of theft, fraud, bribery and forgery is high among both children and adults having education at primary school level. In this scope, as Kızmaz, 2004 emphasized in his study, by means of the rise of educational level, people exhibit conscious behaviors individually and socially, the awareness towards obeying legal, social laws and arrangements is raised and mentalities change and thus crime rates fall. When the relationship between economic crime and education is assessed for children, it is remarkable that the crime rate of those who are primary school graduates and those who dropped out primary school and high school and equivalent vocational schools is high. In this scope, low educational level and drop out leads people to be deprived of institutional discipline and to keep away from the interaction with social environment. All these problems cause children not to be able to raise awareness towards legal and social rules and laws. In such cases, awareness of children towards crime can be evaluated as a result increasing their tendencies and potentials to commit crime. Since the early ages when people started to live together, crime has been perceived as a problem disturbing social peace and order and it is still valid with new forms of crime occurring due to constant economic and social development. In this scope, to determine motives and develop main solutions and policies to prevent people from committing crime has been main objectives in all developed and developing countries, The most important factor pushing societies into combating with crime is probably the fact that crime affects the welfare level of societies. In this scope, educational and welfare levels of countries are very important factors affecting crime behaviors and rates in countries. In this framework, this study concludes that there is a close relationship between educational level and crime rates both for children and adults and as educational level decreases, crime rates significantly increases. In this scope, as it is known that education and educational investment are very important for economic growth and development, it is also clear that to implement educational policies is important as well to decrease crime rates. To develop and implement economic and social policies towards overcoming the education obstacle of adults and children, increasing educational investments to make people develop their personal skills and abilities and extending different education types will be a successful step to prevent people from committing crimes.

4th International Conference on New Horizons in Education

The relation of the school effectiveness and the achievement motivation of the school age pupils

Dana Malá^{a*}, Michal Čerešník^{a**}

^a *Constantine the Philosopher University in Nitra, Faculty of Education, Department of Pedagogical and School Psychology, Dražovská 4, 949 74 Nitra, Slovakia*

Abstract

In our paper, we focused on the age specifications of the relation between school effectiveness and achievement motivation of school age children. In our research we worked with two basal variables: learning motivation measured by Kozeki's questionnaire and school effectiveness presented by mark in the Math. Our research was realised on the sample of 140 pupils of the elementary schools. We found the differences in the learning motivation in the relation with school effectiveness in the groups of the children in the age 10-11 and 12-13 years. The identified differences covered the affective, cognitive, effective dimensions of the learning motivation.

Keywords: school effectiveness, achievement motivation, school age pupils

1. School effectiveness

We meet with the term effectiveness in various psychological contexts; especially within research of basic human needs, performance motivation with the connection to applied psychological explorations. In the area of school psychology the main subject of interest is the school effectiveness and its determination by children in all development stages.

School effectiveness is disputed a lot and still variable and insufficiently clarified term. It can mean: managing requests placed by school onto individual, which demonstrates itself in positive evaluation of pupil's results and/or a product of cooperation between teachers and pupils leading to achieve certain education goals (Průcha, Walterová & Mareš, 1995).

In relation to the term school efficiency, we can find one more term in professional literature and that is a school ability which assumes the connection of this term with performance. Based on this idea, Vágnerová (1997) states that the school is a place where the achieve level is verified using performance which is rated.

Hrabal (1989) defines both and sees them in the same way through mutual link. School effectiveness represents social evaluation of pupil's activity and its confirmation with school requirements; while on the other hand, the school ability is a complex of dispositions which conditions this activity. To be able to measure school effectiveness, we are supposed to discover the pupil's performance in individual school disciplines. Therefore school performance becomes an important component of pupil's school effectiveness.

Hrabal (1989) also states components which contribute to pupils' effectiveness in school: cognitive presuppositions, memory, learning style, motivation and auto-regulation processes. Learning motivation is characterized as a complex of dynamic and directional dispositions which essentially and individually influence pupil's school effectiveness. It lays in social, cognitive and performance personal needs and flows into complex of socio-psychic dispositions.

2. Achievement motivation

There are many theories which content is directly or indirectly related to human activity motivation. In relation to performance motivation, we can reduce the number of theories. Despite this effort there are too many to fully exhaust their content and extent. Therefore we pick from them the ones which from our point of view seem as key, basic. Namely, it is self-determination theory (Deci and Ryan), theory of cognitive dissonance (Festinger), theory of dual factor motivation (Herzberg), ARCS theory (Keller), hierarchy of needs theory (Maslow), theory of performance needs (McClelland), manifest of needs (Murray) (theories arranged in alphabetical order). In the next paragraphs, we will briefly introduce the contribution of these theories.

Self-determination theory (SDT) is considered to be the macro-theory of human motivation (Ryan & Deci, 2008). Its authors formulate it in close relationship with the development of personality, self-regulation, life aims and aspirations, vitality, unconscious processes, personal well-being and universal psychological needs. Ryan and Deci (2008) consider universal psychological needs, contributing to efficient operation and psychological health of a human the triad of needs, where they include the need for competence, need for autonomy and need for relationships. That means that except the freedom and social interactions the authors understand as the crucial need the need for production of quality performance.

Festinger (1957 in Harmon-Jones & Harmon-Jones, 2007) assumed that people are motivated by an unpleasant condition of dissonance to activation of "psychological work" which leads to reduction of inconsistency. The most common situation is the change of attitude in the cognitive sphere which are the most resistant to change. This means that the human effort is not to change those cognitive structures which would require "investment" of a high amount of energy and time and to stay in a stable condition. In light of performance activation this means that if we want to motivate a person we have to build on a positive personal setting and search for balance between different contexts.

Herzberg (2003) in his theory distinguishes activity motivators and satisfactors. He understands satisfactors as factors which cause dissatisfaction (he assumed that these are factors of environment). Motivators are understood as factors causing satisfaction (he assumed this is human activity). He identifies six motivators: responsibility, personal fulfilment, recognition, scope of work, personal growth and achieved performance. He therefore considers motivation to performance as one of the key factors of human activity.

Keller (2010) defines his ARCS motivation model through four dimensions: attention (A), relevance (R), confidence (C) and satisfaction (S). All variables are always saturated by three sub-dimensions. Attention is saturated by perception arousal, information arousal, and variability. Relevance is saturated by orientation to targets, choice of motives, confidence. Confidence is saturated by requirements on learning, opportunities of success, personal control. Satisfaction is saturated by inner strengthening, outer rewards, and justice. From the point of motivation to performance is important process side consisting of concentration on performance, understanding the importance of the task, personal well-being and personal gain from production of performance.

Maslow's theory of needs doesn't have to be specially introduced. Here we can just point out that motivation to performance is linked to social needs. Specifically it is related to the need for respect and self-esteem and need for self-realization. The need for self-realization is saturated by the existence of meaningful targets, saturating own potential. The need for respect and self-esteem comes from the feeling of own value gained by production of average to above-average performance (for which the person gains recognition from others) (Maslow, 1987).

McClelland (1961) assumed that human motivation consists of three dominant needs: the need for performance, need for power and need for affiliation. McClelland characterized people motivated to performance as being able to set high and unattainable aims, oriented towards personal performance and not towards recognition, desiring feedback based on evaluation of performance.

In Murray's manifest of needs we can find many needs out of hierarchy. The absence of system comes from the author's conviction that the human is motivated by more needs at once. We choose just some need from them: need for power, order, autonomy, aggression, love. The need to excel by high performance is understood by Murray as the need of individual high aspirations.

Learning motivation can be perceived as a specific part of performance motivation. We have selected Kozéki as a key representative of this perspective. His ideas are presented in chapter 3.

3. Method

The sample consisted of 140 participants whose average age was 12.6. They were the pupils of the elementary schools, concretely the pupils of the lower secondary education. The structure of research sample is inscribed in Table 1.

Table 1. The structure of the research sample according to location and class

Class	Elementary school			Total
	Veľká Lehota	Zlaté Moravce	Nitra	
5 th	-	-	15 (10.70 %)	15 (10.70 %)
6 th	13 (9.30 %)	18 (12.90 %)	-	31 (22.20 %)
7 th	-	-	14 (10.00%)	14 (10.00 %)
8 th	7 (5.00 %)	-	63 (45.00 %)	70 (50.00 %)
9 th	10 (7.10 %)	-	-	10 (7.10 %)
Total	30 (21.40 %)	18 (12.90%)	92 (65.70 %)	140 (100%)

In the research, we operated with two basal variables: school effectiveness and learning motivation. School effectiveness was represented by the mark of the Math, because (according to Vágnerová & Klégrová, 2008) the learning outcomes[†] of the Math are the best predictors of the self-concept and also the school effectiveness in the school age. This relation was confirmed in our earlier study (Malá & Čerešník, 2011). The goal was the differentiation of the pupils into two groups. The first group was the group of the successful pupils. Their mark from the Mathematics was 1 (means excellent) or 2 (means very good). The second group was the group the less successful pupils. Their mark from the Mathematics was 3 (means average) or 4 (means sufficient).

For the learning motivation diagnostics, we used Kozéki's questionnaire. The selection of this research method was inspired by the research of Čerešník (2012a) which was focused on learning motivation differences measurements in the different cultural contexts and also on age specifics of the learning motivation. Kozéki (1980) distinguishes three basic dimensions of learning motivation (affective, cognitive and effect) which he divides into sub-dimensions (we specify their description):

- A affective dimension – represents emotional relationship to people from the closest vicinity,
 - a1 emotional relationship to parents, effort to keep good relations with them,
 - a2 emotional relationship to educator, effort to keep trust of own idol, authority,
 - a3 emotional relationship to classmates, effort to gain and keep good feeling of belonging to class,
- C cognitive dimension – represents relationship to knowledge, possibility to develop own abilities,
 - c1 autonomy and independence, motives of individual reality recognition, trust in own powers,
 - c2 after-intellectual motivation, need for knowledge, competence, pleasure from cognitive process, influence of self-perfection motives,
 - c3 activity, interest as a main motive,
- E effect dimension – represents relationship to expectations of the environment, motivation influence of adopted norms and their harmony with own behaviour,
 - e1 motives, resulting from self-evaluation, from the effort to keep self-esteem; motives coming from tension between real and expected performance based on self-evaluation,
 - e2 motivation influence of adaptation to group, team regulations, influence of personal responsibility for team results; norms and values of surroundings are becoming main motives for learning,
 - e3 motivation influence of moral standards and value system in a given society, its evaluation opinion on learning; motives resulting from the effort to approach the norms of society, mutual ideal.

Kozéki in cooperation with Entwistle later revised the learning motivation dimensions which were categorized into three groups: affective-social motives represented by interactions with teachers and classmates, cognitive motives represented by activity, competence and moral motives represented by self-esteem, responsibility (Entwistle & Kozéki, 1986). The authors further defined the order of motives in Hungarian population. They are characterized as follows:

[†] Learning outcomes are explicitly defined expectations of the knowledge amount the students have to understand and apply after the process of the education. For more information see for example Verešová (2013), Verešová, Čerešník (2013).

legend: N = count; AM = average mean; SD = standard deviation; SEM = standard error of mean; U = value of Mann-Whitney test; p = significance; abbreviations of the learning motivation components are defined in chapter 3

1. emotional warmth: need for safety,
2. responsibility: need for self-integrity,
3. consciousness: need for self-esteem,
4. independence: need for following own way,
5. affiliation: need for fellowship,
6. competence: need for gaining knowledge,
7. order: need for following the values,
8. interest: need for responsibility to new,
9. pressure: need for unattainable aims without understanding,
10. identification: need for acceptance by teachers.

Despite the change in the author's conception of learning motivation, we will come from the original model.

We hypothesize that there exist differences in the learning motivation among the age groups of the pupils in the relation with their school effectiveness.

4. Results

To test our hypothesis we used Statistical Program for Social Science 16.0. We used Mann-Whitney test to test differences among research groups. As a critical statistical value which indicates the statistical significance, we appointed the standard value of $p \leq 0.05$.

The results are presented in Table 2. All significant differences are emphasized by Bold.

We found out that for children with lower school effectiveness (represented by marks from Mathematics) represents the emotional relationship to parents (a1), need for knowledge (c2) a moral values (e3) a zero or negative motive. This result is valid for age groups of 10-11 year and 12-13 year old children.

In the age group of 12-13 year old children has joined these motives also the relationship to authority (a2), relationship to classmates (a3) and trust in own powers (k1).

In the age group of 10-11 year old children is a specific difference in the motive defined as interest (c3).

In the age groups of 10-11 year olds and 12-13 year olds we discovered significant differences between children who are school effective and less effective in all three motivation dimensions – affective, cognitive and effect. At the same time, affective and cognitive dimension has shown in the group of less school effective children in the age of 10-13 years as demotivating (based on achieved averages), by relatively stable value of standard deviation and average error. This finding is valid for all sub-dimensions as well. Less school effective children always score lower and in many cases, especially in age group 10-11, their score is negative.

In the age group of 14-15 year old children we haven't discovered any statistically significant differences in learning motivation in relation to school effectiveness. We believe that this result is caused by the specifics of this age, meaning the child is already able to evaluate own performance in relation to own abilities and effort and is able to perceive the relationship between the chosen learning strategy and education result. The teacher's evaluation is in this case only confirmation of correct or incorrect selected strategy.

Despite the specificity of discovered findings in the age group of 14-15 year old children we can support the defined hypothesis.

4. Discussion

The discovered findings support the fact that the relationship between learning motivation and school effectiveness is clearly identifiable at younger children. The success, in our research represented by a mark, is a variable which influences the learning motivation. Success always leads to motivation of future behaviour or

higher aspirations and failure always leads to demotivation or lower aspirations. This phenomenon is also related to developing ability of children to realistically evaluate own abilities in relation to own performance and performance of peers, in relation to comparisons and creation of more or less precise idea about own strengths and weaknesses. This presumption reflects in self-concept of school effectiveness, in global self-concept, self-evaluation and has a direct relationship to individual preference frames, profiling of education activities and their quality, selection of professional activity and biodrome in general.

The performance therefore represents an interpretation frame which serves to regulate further behaviour or expectations in relation to future success or failure (see e.g. Čerešník, 2012b). It is an inherent part of beliefs in own sources, strategies and own role, in this case specifically, in education environment. We therefore speak about regulation beliefs which directly regulate behaviour in school in relation to cognitive, affective or psychomotor contents of education and their adoption and indirectly regulate the life attitude fed by various variables, e.g. in the form of tendency to look for new, perceiving meaningfulness of an activity or engagement into public affairs.

Motivation dimension of pupil's evaluation in relation to their ability and at the same time in relation to education standards and also relation of personal competences and curriculum is therefore indispensable from the point of research results. It opens questions "how to evaluate?", "in relation to what?", "how and if to define expectations related to education results?" and "how to draft feedback so that it is developing and activating?".

Abstract

The text deals with the reproduction of social risks and social exclusion within the education system of the Czech Republic. In recent years there has been a marked social differentiation. Areas with a high degree of concentration of risks for children (identified in our analysis) display mechanisms of exclusion of children from the educational mainstream. These are explored in the context of pedagogy of the oppressed, limits of human capital, and the role of schools in preserving status quo (Freire, Illich, Bourdieu). The resulting poverty traps are reproduced in the form of limited permeability of the education system from kindergarten to high school (non-participation in nurseries, segregated practical schools, etc.).

Keywords: critical theory, education system, poverty, reproduction of risk, social exclusion

1. INTRODUCTION

The text deals with the reproduction of social risks and social exclusion within the education system of the Czech Republic. This reproduction is related to the total, fundamental transformation of Czech society, which has undergone a marked social differentiation in recent years. The beginning of significant change dates back to 1989, when an extensive socio-economic transformation began, as a result of the end of socialism and the advent of capitalism. The changes contributed to social inequalities and the stratification of society, and also affected the way inequalities are perceived. A society that officially denied and hid its inequalities suddenly displayed them in the process of transformation; moreover, social actors started to perceive success and failure very intensely. Rapid growth of social and economic inequalities and growing social differentiation affected the entire social space, forms of coexistence, as well as perception of the legitimacy of social inequalities. In recent years we have been able to observe processes that Galbraith (1967) called regional poverty, i.e. people become “victims” of the environment in which they live. Transformation processes have been gradually reflected in the new patterns of spatial organization of the population, resulting in spatial and social polarization, deprivation, social exclusion, and segregation. The resulting social and territorial inequalities also negatively affect the quality of life of the population, putting people at a disadvantage in some places, and reducing their life chances. Reproduction of social exclusion and the poverty which can be seen in these places acquires an intergenerational character. The education system becomes part of the marginalization process, affecting both children and youth. Areas with a high degree of concentration of risks for families and children that we have identified in a nationwide analysis display mechanisms of exclusion of children from mainstream education. On a theoretical level, we focus on the pedagogy of the oppressed, limits of human capital, and the role of schools. The resulting poverty traps are reproduced in the form of limited permeability of the education system, from kindergarten to high school. Manifestations of marginalization include non-participation of

* Corresponding author, email address: daniel.topinka@upol.cz.

children in pre-school education, existence of ethnically-segregated practical schools, and selective admissions system.

2. CRITICAL THEORIES OF EDUCATION

The theoretical framework of this study is based on critical theories dealing with school functions – they include the approaches of P. Bourdieu, P. Freire, I. Illich, B. Bernstein, etc. These theories view school as part of the selection system, supporting inequality in society and maintaining the status quo in power distribution. School fails to perform the function of selecting individuals according to their abilities to master the subject matter, but according to their social origins, becoming – if we use a metaphor presented by Bourdieu (1998: 28) – a demon that divides students based on the level of their inherited cultural capital, thereby allowing the growth of social divisions between different groups and constituting one of the causes of social inequalities.

Bourdieu, mentioned above, presents in his text a representation of the education system as a mechanism that is able to separate individuals with low and high inherited cultural capital. Individuals with high cultural capital then find it easier to reach a certain degree than individuals whose capital is low. This creates a new aristocracy that has transformed its titles into school degrees. School thus acts as a tool for growing differences, not as a tool for their reduction, as its function is often defined externally (Bourdieu 1998: 30). This part makes the theory very similar to the theory of language codes, developed by Bernstein (2003: 76). He distinguishes between restricted and elaborated linguistic codes. The restricted code is used mainly by the lower social strata of society, and the elaborated code by middle and upper strata. Based on the use of individual codes that are acquired within socialization (which brings us back to the inherited cultural capital of individuals), school divides students into those who speak the elaborated linguistic code and those who have not acquired this code.

Another group of theories – interpreting the latent function of school – includes critical theories developed by Freire and Illich. The banking model of education presented by Paulo Freire resembles narration – there is a narrator on one side and a listener on the other. The educator feels that he/she stores valuable knowledge in the learner, i.e. knowledge which is useful. Education is thus akin to unilateral presentation of information that the listener receives. However, since the narration is often not relevant for the listener's world, it becomes a transfer of (often for the listener) useless knowledge. Education becomes the process of storing information in students (Freire, 1996: 52). This method of educating supports the reproduction of information acquired in this way – it does not lead to discovering the laws of the world, and it thus serves to fulfill the wishes of the narrator, who transfers his/her world to the listener. Moreover, without critical reflection, it involves the transfer of the structures of power hidden in the language that can be applied by the ruling group to the oppressed (this is also reflected in the name of P. Freire's theory – pedagogy of the oppressed). This view of knowledge is criticized by Lyotard, in his description of the operation of postmodern knowledge, which “is not simply a tool of the authorities; it refines our sensitivity to differences and reinforces our ability to tolerate the incommensurable. Its principle is not the expert's homology, but the inventor's paralogy.” (Lyotard 1984: 25). However, these differences are suppressed in the transfer of a great narrative – Freire assumes that listeners are passive recipients of the deposit, not its active co-creators.

A very similar opinion about school is presented by Illich: “School is the advertising agency which makes you believe that you need the society as it is.” (Illich 2000: 113). Teaching thus involves the transfer of a “hidden curriculum”, which is directed at students during the transfer of the formal curriculum (e.g. transfer of knowledge). This hidden content is a positive evaluation aspect related to the current structure of society. Students are trained by schools to take their position (e.g. in the education system, social stratification, etc.) for granted.

All these theories point to the selective function of school, which is often hidden behind its official purpose. School thus hides its effect in increasing differences (which in the end leads to differences in the social structure of society) behind the formal goal of increasing education of members of society – in some national documents (see, for example, the Strategy of Lifelong Learning 2007: 54), there are also efforts to promote equality. However, according to the authors given above, it is a question whether the objective is actually being implemented and

whether it is not a mere pretext for the exercise of power and an instrument of social differentiation. It is clear that school, as an institution, plays an important role in the distribution of life chances, and that local educational markets are exposed to social exclusion mechanisms.

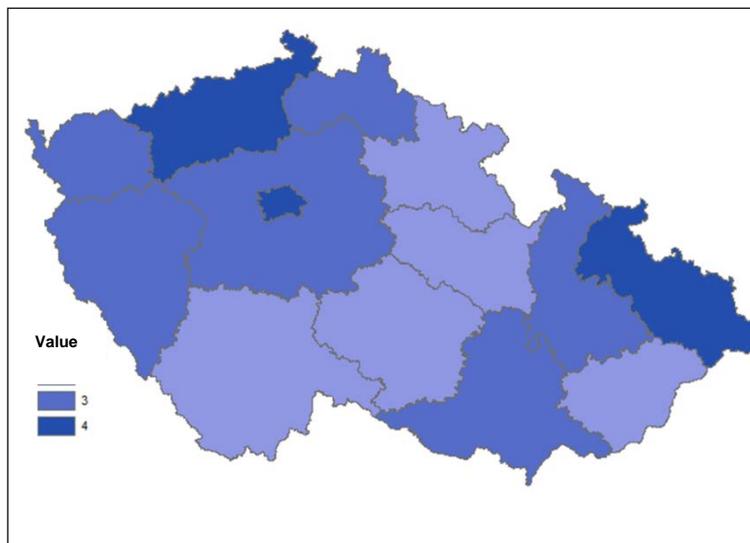

3. SPATIAL DISTRIBUTION OF SOCIAL RISKS

As we already mentioned in the introduction, Czech society has displayed a marked social differentiation in recent years. The changes affected both the economy and lifestyles, and they also deepened the gap between prosperous and stagnant areas. Stagnant areas exhibit a decrease in the quality of life, limited facilities and infrastructure, unemployment, and a general reduction of social activities. Marginalized localities are viewed as having essential ethnicized attributes, and these attributes are associated with impurity (Vacková et al., 2011). The physical map contains places in which significant social risks endangering the “second” generation, i.e. where children and youth are concentrated, and in which reproduction mechanisms of these risks have also been formed.

Areas with a high degree of concentration of risks for families and children, which we identified in a nationwide analysis, display mechanisms of exclusion of children from mainstream education. We have compiled a map of the concentration of these risks. First, we mapped the risk phenomena endangering children and families. Subsequently, we identified the problematic phenomena affecting children, youth and families, and verified the validity of the reported data for individual years. The phenomena associated with risks to children, youth and family were divided into three main categories of risk: demographic and social environment, economic activity, and incompleteness and failure of the family. In total, we collected data for 48 indicators from the above-mentioned three dimensions. Originally, we defined 80 risk phenomena in the operationalization, but due to the lack of data or incomplete data, we had to exclude data particularly in education, housing services, health services, and data capturing some risk phenomena that are generally difficult to quantify (e.g. consumption of addictive substances). The first area of interest includes an overview of general indicators relating to the lives of children and families in the social environment with respect to the selected socio-demographic data. The second area includes the indicators of economic activity, unemployment, and receipt of different types of benefits. The third area focuses on data relating to incompleteness, vulnerability, and failure of the family – this is a list of the consequences of loosening family life.

The data was processed as follows. We divided the data into 5 equally sized intervals and marked them just like in school. The assessment was assigned for each indicator based on the division of data into 5 equal intervals between the maximum and minimum values (measure of variation), with regard to the direction of the indicator. 1 means that the indicator is the most favorable for the administrative unit, while 5 represents the highest load. In conclusion, we prepared a synthetic indicator of threat for all areas. Three zones in which the situation, with respect to the comparison of the indicators, is bad, average, and good can be derived from the synthetic indicator for the entire Czech Republic. From the perspective of children, youth and families, the situation is bad in three regions: the Moravian-Silesian Region, the Ústí nad Labem Region, and the Capital of Prague. An average situation can be found in the following seven regions: the South Moravian Region, the Olomouc Region, the Karlovy Vary Region, the Central Bohemian Region, the Liberec Region, the Pilsen Region, and the Zlín Region. In comparison with the other regions, the situation is the best in the following regions: the South Bohemian Region, the Hradec Králové Region, the Pardubice Region, and the Vysočina Region.

Map 1 – Summarized indicators by region

It is evident that the concentration of risk is unevenly distributed. It is much higher in the border regions, where it makes sense to analyze radical social, economic, and demographic changes during the 20th century (post-war expulsion of Germans and the subsequent settlement of the border regions by ethnic Czechs, industry restructuring, agricultural changes, etc.). It is these regions that show a very strong correlation between the uneven distribution of endangered children/families and poverty or social exclusion. But even regions with lower risk include places with a higher degree of risk, as shown by the results at a much finer level of districts or municipalities with extended powers. In this context, we must mention an example of significant internal difference in the South Moravian Region, which exhibits a significant difference between rural peripheries and the metropolitan area.

4. REPRODUCTION OF SOCIAL EXCLUSION IN THE EDUCATION SYSTEM

Inequalities that are reflected in the social and physical space are manifested in different dimensions of life. We can talk about inequalities in living conditions and in the labor market and the related income inequality, which in turn leads to inequality in consumption and lifestyle. Marginalized areas also display the reproduction of inequalities in education and access to it. Education can be viewed from two perspectives. On the one hand, it offers life chances and it is an instrument of removing inequalities and barriers in society. However, there is also a skeptical perspective, i.e. the education system is seen as a tool for maintaining social inequality (Mareš, 1999: 36). In this section, we focus on the mechanism of the reproduction of social exclusion in the education system.

In the Czech context, educational reproduction has been studied by Tomáš Katrňák (2004). Using the theory of Pierre Bourdieu, Katrňák views cultural capital as the cause of the reproduction of social structures, because always being connected with a certain position in the social structure (social space), it tends to reproduce. This approach is fitting, because educational inequalities in Czech society have “traditionally” been transferred by cultural capital within the family. In the socialist era, inequalities in the education system were reduced and reproduction took place on the level of the parent who achieved a higher educational status. The situation after 1989 is illustrated by research

carried out by Katrňák (2004). According to Katrňák, children from a higher stratum usually have better language skills and are thus able to understand the world in terms of the dominant culture, which operates the education system. While some can use and define concepts and work with abstract meanings, others may not even understand their teachers. This confirms what has previously been expressed by Bourdieu, i.e. that school does not balance inequalities between different levels of cultural capital, but exacerbates them.

Although, in the course of the 20th century, education systems went through the process of democratization, promising to remove traditional inequalities (Keller & Tvrdý, 2010), the reality is quite different. Input differences in cultural capital are exacerbated in the process of education (Simonová & Soukup, 2010). We also present an example that illustrates the “failed” democratization of education. In Czech elementary education, it is the unintended consequences of the system democratization in the form of removal of the “catchment area” rule in districts, incorporating market elements in the educational environment. Parents are free to choose the school they want to send their children to. For this reason, and also because of unfavorable socio-demographic situation in society, schools compete for students, which leads to the improvement of services offered, including specialization. This causes marketization of education, resulting in school hierarchization. This hierarchization is particularly visible in areas with high levels of social exclusion and risk concentration. Less successful children, or more precisely children of less successful parents, are concentrated in schools that are labeled as “bad”. The lack of cultural capital is also evident in marginalized children that do not attend pre-school facilities and do not have such capital which their peers gained. As a result, they are disadvantaged at the very beginning of their education.

An example of exclusion of children from the education system is the “special school”. The change in the status of these schools into “practical schools” failed to remove common practice to concentrate in them socially disadvantaged children together with physically handicapped children. Social disadvantage has often been identified as a mild mental disability, and the inclusion in a practical school *de facto* meant the end of education.

One of the criteria to facilitate the identification of failure is ethnicity. According to estimates, as well as sociological research, about one third of students attending practical schools are Roma children (GAC, 2009). Roma children fail in standard education. According to the “Analysis of Attitudes and Educational Needs of Roma Children and Youth” (GAC, 2007), they are significantly less successful, more often repeat a year or are moved to special classes or schools, and are not ready to start their education.

Ethnicity causing disadvantage is the most evident in relation to “being Roma”, which is a label for school failure. Research into the reproduction of social-spatial inequalities through education in Roma localities has been carried out by Nekorjak et al. (2011). Segregation of the Roma began in the communist regime, but after 1989 the situation of the Roma in the Czech Republic deteriorated. During the ongoing socio-economic transformation, the Roma became a symbol of failure. In a number of what is called socially excluded localities, segregated schools were established – these are ethnic “monoliths”, in which the ethnically labeled children are concentrated. While Roma parents still place their children in schools based on the catchment area principle, non-Roma parents use democratic advantages and send their children to other, more distant schools. Segregated schools were established in a short time, and the chances of their students to advance to high school or college/university are very small. At the same time, based on their own adjustment of the school educational curriculum, schools can meet the requirements of their customers/students, regardless of whether they are Roma or non-Roma schools. If non-Roma schools want to “discourage” Roma students, they emphasize their specialization, for example, in mathematics or languages, adding that the study requires higher financial cost due to higher charges for interest groups, etc. This creates a symbolic, but objective barrier (Nekorjak et al., 2011: 670).

On the other hand, educational institutions that have adopted the identity of “Roma” schools also develop activities and opportunities for their target group, but this activity is an expression of their adaptation to the situation and confirmation of the symbolic exclusion rather than equalization of opportunities (e.g. reduction of the teaching pace, introduction of the position of assistant teachers, joint programs with local non-profit organizations, “preparation” years). Another barrier is the orientation of parents to segregated schools, because they view their environment as safe: children do not have to face pitfalls of contact with children from mainstream society, and the

parents usually have personal experience with the schools. Less conspicuous mechanisms of exclusion stem from a lack of economic capital. The cost of commuting to distant schools or expensive school supplies affects the structure of parents' decision-making process.

Another aspect of the exclusivity of the education system is the accessibility of higher education. This is partly caused by the regulated system of student admissions and the success rate of general upper secondary school ("gymnasium") students, for whom higher education is more open, as opposed to other high school students (Konečný et al., 2010: 68). Admissions are undoubtedly influenced by the shared cultural knowledge of the "Czech" community that outsiders find more difficult to access.

5. CONCLUSION

Over more than the last two decades, we have witnessed a growing social differentiation within society. The changes affected, for example, social inequalities, which are also reproduced by the education system – until now this system has displayed a lower degree of inclusiveness, in comparison with other countries. The appropriate degree of openness of the education system can be discussed, but the discussion is more likely to be limited to the level of interconnection of academic discourse and practical politics. If we remain at the academic level, we describe different aspects of exclusiveness of the education system and show how it becomes part of the marginalization process, and how it affects living conditions and opportunities for children and becomes a tool of the reproduction of social exclusion. As we have shown, it is in places with a high degree of risk concentration and poverty that education is of a very exclusive character. The manifestations of marginalization include non-participation of children in pre-school education and their subsequent exclusion, the existence of ethnically segregated practical schools, and other selective systems (lack of economic capital, construction of the admission system). As it turns out, the primary role in the Czech education system is still played by the reproduction of cultural capital; seen from the perspective of the "failed", the marginalization process is reinforced by the banking model of unilateral transfer of information to passive audience and, within the segregated school system, also by pedagogy of the oppressed, which attempts to discipline and control the "uncontrollable".

The role of the critical friend in leadership and school improvement

David Gurr^{a*}, Marcela Huerta^b.^a *The University of Melbourne, The Melbourne Graduate School of Education, 100 Leicester street, Level 7, Melbourne, VIC 3141, Australia*^b *The University of Melbourne, The Melbourne Graduate School of Education, 100 Leicester street, Level 6, Melbourne, VIC 3141, Australia*

Abstract

This research will investigate the role of the critical friend in supporting school leadership and school improvement. Critical friendship is a versatile form of external support for school colleagues engaged in leadership activities, and one that is subject to increasing professional and political interest (Swaffield, 2004).

The proposal is to explore the notion of the critical friend and investigate the role through a case study, questioning, what is the role and impact of the critical friend in supporting school improvement?

This is an emerging area of interest and support for schools. Critical friends are an under-researched, nonetheless it is an important phenomenon, which is significant because leadership is clearly linked to improving schools, and critical friends have been shown to support the work of school leaders. This research will provide evidence of the critical friendship role and will hopefully lead to further research.

Keywords: critical friend, educational leadership, school improvement

1. INTRODUCTION

This research project, which is being conducted by Dr David Gurr (supervisor) and Marcela Huerta (master student) from the Melbourne Graduate School of Education at The University of Melbourne, is part of a master's thesis.

This research investigates the role of the critical friend in supporting school leadership and school improvement. The use of critical friends is a versatile form of external support for school colleagues engaged in leadership activities, and one that is subject to increasing professional and political interest (e.g. Butler et al., 2011; Swaffield, 2004). Swaffield (2004) argues that the role of critical friend as a facilitator of change has become a significant component of a range of school improvement, health promotion and professional learning initiatives in school communities. The role of the critical friend is a dynamic one, requiring a high level of skill, flexibility, and professional judgment. Rather than following a checklist of scripted "technical assistance", it is about developing a repertoire of strategies and skills, and learning when and how to use them, taking account of the particular context (Butler et al., 2011). Effective critical friends draw on a repertoire of actions, depending on the context, participants and phase in the change process at any particular point in time. This is an emerging area

* Corresponding author a. Tel.: +61 3 8344 8224

E-mail address: d.gurr@unimelb.edu.au

* Corresponding author b. Tel.: +61 3 9035 5962

E-mail address: marcelah@student.unimelb.edu.au

of interest and support for schools and reflects interest in other areas of staff support such as mentoring and coaching.

The critical friend is very often working alone in the particular school or community. The nature of the work means that it is often invisible: nurturing relationships, building understanding and enhancing capacity is work that may not show immediate or tangible results (Hawe et al., 1998)

A critical friend has been described by Costa and Kallick (1993:50) as: “a trusted person who asks provocative questions, provides data to be examined through another lens, and offers critiques of a person’s work as a friend”. Doherty, Macbeath, Jardine, Smith and MaCcall (2001), extend this when they describe the critical friend as helping schools make sound decisions, challenging expectations, patiently playing a role that is interpretative and catalytic, helping shape outcomes but never determining them, alerting the school to issues often only half perceived, and being sympathetic to the school’s purpose.

Critical friends do not necessarily need to be experts in the specific area of work that is focus of the critical friendship. Indeed not being an expert enables the critical friend genuinely to ask the powerful questions. While critical friends are not necessarily required to have high levels of technical expertise, they do need to be familiar with the context. Moreover, some expertises are needs, in this sense. Block (1999) suggests that three sets of skills are needed by the critical friend: technical (expertise about the particular issue), consulting (process skills such as negotiating entry, agreeing the scope of the work and eventually disengagement) and interpersonal skills.

The first two could be considered as competences of the critical friend, and the third one is more about competencies or qualities of the individual (MacBeath and Myers, 1999). In addition, important skills are required for the critical friend such as: listening, observing, questioning, managing conflict and team building, along with qualities such as respect, empathy, genuineness, confidence, optimism, sensitivity, insight, thoughtfulness and commitment (Swaffield, 2002).

Critical friendship is a highly adaptable form of support for the leadership of school improvement. Despite the variety of contexts in which critical friends operate, there are common features to their work such as establishing and maintaining a relationship of trust with others, questioning, critiquing, and providing feedback.

Major Research Question

What is the role and impact of the critical friend in supporting school improvement?

The implementation of change initiatives in school communities has increasingly involved the use of staff whose role is specifically to support the change process. Such staff may be called project officers, trainers, technical assistants, facilitators or critical friends. They may be staff within the school community, but they are often members of a project team based on outside the school in a university, or within a government department or non-government organization or other professional body. The nature of their role depends a great deal on how the change process within the initiative is conceived (Butler, H., Krelle, A., Seal, I., Trafford, L., Drew, S., Hargreaves, J., Walter, R. & Bond, L. 2011).

The work of critical friends can be linked to leadership theories such as the transformational leadership view of Bass and Avolio (1996, p. 11). In this view, an educational leader would take actions to increase staff awareness of what is right and important, to increase the motivational maturity of staff, and to encourage staff to go beyond self-interest for the good of the school. These leaders provide staff with a sense of purpose that goes beyond a simple exchange of rewards for effort provided. These leaders attempt to optimise development, not just performance. Development encompasses the maturation of ability, motivation, attitudes and values. Such leaders help staff to strive to attain a higher level of potential as well as higher levels of moral and ethical standards. Through the development of staff, they optimise the development of the school as well. High performing staff builds high performing schools. Critical friends may have a direct role in supporting school leaders to develop staff, or in supporting the overall improvement of the school. There is a small and emerging literature on the role of critical friends and this study seeks to provide a rich single-site case study of how two

critical friends have worked in helping a secondary school in Melbourne embark on a long-term improvement journey. This study will provide evidence of the critical friendship role, which is important because leadership is evidently associated to improving schools, and critical friends have been shown to support the work of school leaders.

Methodology

Qualitative research is a situated activity that locates the observer in the world, involves an interpretative, naturalistic approach to the world. This means that qualitative researchers study things in their natural settings, attempting to make sense of, or interpret, phenomena in terms of the meaning people bring to them. Qualitative research refers the studied use and collection of a variety of empirical materials that describe routine and problematic moments in individual lives (Denzin & Lincoln, 2005 pp. 3-8).

According to our theoretical position, about how the nature of this phenomena being investigated and epistemologically concerned on our question of knowledge and how we come to possess it, we can affirm that in this research, the methodological paradigm is clearly from a constructivist understanding of the world; this means that the meaning of reality is likely to be constructed differently as a function of the position or perspective taken by a culture, a social formation, or an individual person. Knowledge and meaning are always partial and perspectival. Thus there are a variety of meanings that might be ascribed to any object or process, all of which may be both reasonable and functional given the perspective from which they are viewed or known (Kamberelis & Dimitriadis 2005).

The chosen methodology presuppose a certain view of knowledge and reality, which is mostly interpretivist , because this research will obtain findings in depth, interpretative, individual, idiographic and context dependent, developing a body of knowledge in the form of “working hypothesis” that describe the individual case. According to Kamberelis & Dimitriadis (2005), the term interpretivism refers to an assemblage of theoretical variants that guide approaches to qualitative research. Although each variant shares family resemblances with the others, each also embodies some unique methods and practices.

This research is based on a single case study using qualitative methods. The most important reason, for choosing this methodology is the possibility that we have to conduct an in-depth and detailed study. According to Mike Palmquist (2012), case study is well-known as a form of qualitative descriptive research that is used to look at individuals, a small group of participants, or a group as a whole. However, it is important that the participant pool remain relatively small. The participants can represent a diverse cross section of society, but this isn't necessary. Often, a brief "case history" is done on the participants of the study in order to provide researchers with a clearer understanding of their participants, as well as some insight as to how their own personal histories might affect the outcome of the study.

There are multiple definitions and understandings of the case study, according to Yin (1994) a case study is an empirical inquiry that investigates a contemporary phenomenon within its real life context, especially when the boundaries between phenomenon and context are not clearly evident. Guba and Lincoln (1981) describe case study “types”. These types are factual, interpretative and evaluative. Regarding to this, my researcher’s actions will include recording, constructing and presenting, and producing a chronicle, a profile or facts.

A case study is a specific instance that is frequently designed to illustrate a more general principle (Nisbet and Watt, 1984:72); it is the study of an instance in action. Case studies can make theoretical statements, but, like other forms of research and human sciences, these must be supported by the evidence presented (Cohen, Manion and Morrison, 2002:182). This evidence will be obtainable by the method used, which is the interview, and their respective findings. Additionally this research will be construing, synthesizing, clarifying, and producing meanings and understandings about my topic. In summary the purposes of this case study research will be descriptive and interpretive.

Method

Data will be collected using multi-perspective interviews with participants and school leaders within a school setting who have been involved with a critical friend.

The use of the interview in research marks a move away from seeing human subjects as simply manipulable and data as somehow external to individuals, and towards regarding knowledge as generated between human, often through conversations (Kvale, 1996:11).

This study will explore the role of critical friends in helping to improve a three-campus secondary school in a northern of Melbourne, Hume Central Secondary College. A multi-perspective single-site case study methodology will be used. The multiple perspectives come from asking the critical friends, principal class members and members of the leadership team to comment on the role of the critical friends in helping the school to improve. Single interviews will be held with the two critical friends, and the four principal class members. Group interviews involving 2 participants will be held with three groups from the school's leadership team, which comprises about 6 members. Each interview will last approximately one hour and will be recorded. Transcripts of individual interviews will be returned to participants for checking. For the group interviews this will not be possible as individual members will not be identified in the research. The interview questions are provided in the attached appendices. The study at the school will be conducted over a two-week period. Data will be coded and analysed using the thematic coding methodology espoused by Miles and Huberman (1984, 1994).

The conduct of the research will be monitored by the student researcher and the supervising researcher through on-site and email/phone conversations. All the research will be conducted in the one Victorian government school with the permission of the DEECD and the participants. It is relevant to be mentioned that the supervising researcher is an experienced academic with more than 100 publications, one ARC grant, supervision of more than 40 doctoral and masters research, qualifications as a teacher and psychologist, and 30 years' experience in education.

The use of multiple perspective interviews (critical friend, principal class, leadership team) will provide rich information within the case study school and within the scope of a Master of Education thesis. The range of interviews provides for an adequate range of multiple perspectives on the school related to the role of the critical friend, and the leadership of the Principal, and it will also provide the opportunity to compare and contrast perspectives of the participants from the three categories.

Sampling

The quality of a piece of research not only stands or falls by the appropriateness of methodology and instrumentation but also by the suitability of the sampling strategy that has been adopted (Morrison, 1993:112-17).

The participants will be selected through a purposeful sampling, based on their work at the case study school, and the site will be chosen, according to the main issue of our research that is, improving schools that have been at risk with the support of critical friends, to observe the role of the critical friend in leadership and school positive outcome.

The sampling will be composed by:

- 2 critical friends
- 1 Executive Principal
- 3 Campus Principals
- 3 groups of 2 members of the leadership team who have volunteered to be involved.

All of them are part of the staff of the site selected, which is Hume Central Secondary College.

One of the reasons we chose this type of sampling relates to the opportunity of the opportunity to selecting information-rich cases for study depth. As Margaret Preston (1875) mentioned, the information rich-cases are

those from which one can learn a great deal about issues of central importance to the purpose of the inquiry, thus the term “purposeful sampling”.

The most significant benefits for the research, through the purposeful sampling, will be to obtain an in depth understanding, focuses on selecting information –rich cases whose study will illuminate the questions under study.

Access to sites/ participants.

The student researcher will contact the principal of the school by mail and phone to seek permission to conduct the research. Recruitment of the critical friends, principal class members and members of the leadership team will be done through direct contact at the school.

Participation is, of course, voluntary. The principal is already aware of the research and is supportive as are the two critical friends. Hence we do not anticipate problems in gaining participants.

Once approval has been obtained from the DEECD, the student researcher will formally contact the principal of the school by mail and phone to seek permission to conduct the research. Recruitment of the critical friends, principal class members and members of the leadership team will be done through direct contact at the school.

Data analysis

Research strategies, technique or methods are specific practices and procedures that researchers deploy to collect and analyse data and to report their findings. This qualitative research involves a basic kind of data, which is the interview and the strategy for collecting and analysing this data engage a videotape interaction, with the participants. The type of analysis will be through a discourse analysis, which is used to discover and map recurrent macro patterns that characterize writing practices, contexts and politics. Discourse analysis is used to examine the micro patterns embodied in specific verbal-visual interactions (usually represented in transcripts) to understand both the forms and functions of these interactions and the ways in which they both index and sustain recurrent macro patterns. Thus, discourse analysis often yields powerful exemplars of the various macro patterns found in any study. A primary goal of discourse analysis is to show how specific verbal-visual actions and interactions both index and sustain general and durable patterns of action and interaction common to a given social formation (Kamberelis & Demetriadis, 2005).

Rigor and trustworthiness

Researchers need alternative models appropriate to qualitative designs that ensure rigor without sacrificing the relevance of the qualitative research. According to the Guba’s model (1981), we will be working under four aspects of trustworthiness that are relevant to qualitative studies: truth value, applicability, consistency, and neutrality. Guba's (1981) model identified these four criteria applicable to the assessment of research of any type. Guba argued that these criteria must be defined differently for qualitative and quantitative research based on the philosophical and conceptual divergence of the two approaches.

Ethics procedure

Ethical concerns encountered in educational research produce a dilemma between the demands placed on researchers as professional scientist in pursuit of truth, and their subjects’ right and values potentially threatened by the research. This is known as the cost/benefits ratio, the essence of which is outlined by Frankfort-Nachmias and Nachmias (1992).

Some important aspects to consider in the ethics procedure for educational research are, for example: the informed consent and the access and acceptance to sites by the participants of the research. Firstly, the informed consent plays an important role from the subject’s right to freedom and self-determination. This protects and

respects the right of participant and places some of the responsibility on them, because the subject has the right to refuse to take part as well. According to this principle, we have prepared a specific consent form to the participant from THEMIS, which is the integrated administration system that supports the documentation and management of Finance, Human Resources, Research and Environment, Health and Safety processes at the University of Melbourne. Under the same system is based our request to gain access to the site/participants. In general, Ethical aspects will be well respected, because considered an ethic of respect for the person, knowledge, democratic values, the quality of educational research educational research and academic freedom (BERA, 2004, p.5).

Finally, to protect the confidentiality of the participant in the research, data and records of this research will be securely stored by the University Of Melbourne Graduate School Of Education and destroyed after 5 years.

Conclusion

Critical friendship is a flexible and potentially powerful approach to supporting leadership and school improvement, as the range of contexts drawn upon in this article demonstrates. While the role and functioning of critical friends remain under researched, various studies over the last 20 years provide a considerable source of knowledge. Supported by government policy the critical friend is set to become an integral part of school improvement practice in England. As this happen there is a need both to draw upon what is already known about critical friendship, and to extend our understanding (Swaffield, 2004).

4th International Conference on New Horizons in Education

The role of veterinary education In fostering aquaculture development

Laura-Daniela Urdes*, Cristiana Diaconescu, Monica Marin, Georgeta Dinita

*University of Agricultural Sciences and Veterinary Medicine Bucharest, Faculty of Animal Sciences,
Mărăști bvd No 59, sector 1, Bucharest 011494, Romania*

Abstract

Aquaculture is one of the most promising food producing industries, from both socio-economic and food security perspectives. It is developing fast and, unless there is a well thought-out strategy aimed at supporting this trend, errors can be made when dealing with aquatic animal disease outbreaks. Apart from establishing legislation and policies to assist countries/regions in implementing biosecurity measures, the strategy should focus also upon fostering adequate veterinary education, so that the “day-one” graduate to have a reliable level of understanding of / performance in the aquaculture sector.

Veterinary schools, particularly those within countries which rely upon aquaculture as one of the national food producing industries, should be encouraged to include aquatic veterinary disciplines within their curriculum. Through special designed veterinary curriculums, there would be available more veterinarians specialised on aquaculture to serve the needs of stakeholders and to help ensuring regional food security.

Keywords: aquaculture; aquatic veterinary education

1. SEAFOOD, A WORLDWIDE FOOD COMMODITY

Farmed fisheries are considered currently one of the fastest growing food producing sectors of agriculture globally. With an average growth rate of 8.8 per cent per year, [Arthur, J. R., Bondad-Reantaso, M. G., Campbell, M. L., Hewitt, C. L., Philips, M. J., Subasinghe, R. S. (2009)], it accounts for around 50 per cent of the global fish food consumption, which is sourced actually by farmed and capture fisheries, [R.P. Subasinghe, J.R. Arthur, D.M. Bartley, S.S. De Silva, M. Halwart, N. Hishamunda *et al.* (Eds.) (2012)].

This indicates that the aquaculture sector is overtaking exploitations of capture fisheries, thus, it gradually reducing our dependence on natural aquatic resources. In relation to global animal protein production, animal seafood has come to dominate most livestock and poultry industries, [W.R. DeHaven, A.D. Scarfe (2011)], and this is a trend expected to maintain by 2030, particularly within developing countries [Arthur, J. R., Bondad-Reantaso, M. G., Campbell, M. L., Hewitt, C. L., Philips, M. J., Subasinghe, R. S. (2009)].

There are various factors supporting the growing trend of farmed fisheries all over the world. There is a constant increase of the world population, who is currently estimated at 7 billion people, and is growing at a rate of 1.3 per cent per year, it being expected to reach 8.9 billion by 2050 (U.N., 2013). In relation to these estimations and to

* Corresponding author. Tel.: +40 724 764 764
E-mail address: laurau_2005@yahoo.com

other factors, it is predicted that, by 2025, around 75 per cent of the human population will live within 150 km of a coastline ¹, thus a significant pressure following to be placed on the natural aquatic resources, unless well thought-out strategies aimed at sustaining the development of the aquaculture sector are *a priori* taken.

Today, it is strongly believed that aquaculture represents a solution to many of the food security problems, while also offering to potentially alleviate poverty through employment and country/regional development opportunities. It is also a better alternative to exploitation of natural aquatic resources, i.e. capture fisheries and, as it has recently been shown [R.P. Subasinghe, J.R. Arthur, D.M. Bartley, S.S. De Silva, M. Halwart, N. Hishamunda *et al.* (Eds.) (2012)], aquaculture may contribute to mitigating climate change impacts through production of food types and commodities which are minimally greenhouse gas emitting and carbon sequestering.

Fish food, whether captured or cultured, plays an important role in human nutrition and the global food supply. Fish are valuable through their various and high quality nutrient components, such as protein, retinol, vitamins D and E, iodine and selenium. The fats and fatty acids in fish, particularly PUFAs (n-3 polyunsaturated fatty acids), are highly beneficial and difficult to obtain from other food sources. Hence, it is not surprising that aquaculture has currently become an important production sector, which can contribute significantly to improving the well being of humans, while reducing overexploitation of natural aquatic resources.

2. INCENTIVES FOR CHANGES IN CURRENT VETERINARY EDUCATION

Due to its fast development, new animal diseases and pathogens are emerging in aquaculture [(Subasinghe *et al.*, 2000; Scarfe, 2003; OIE, 2012; Hine *et al.*, 2012)], this leading up to significant economic losses, with seafood safety and public health consequences, which all hinder in the sector development. Therefore, aquaculture seems to be facing now two major challenges: awareness of the public on the importance of this production sector, and an adequate number of knowledgeable and well trained workforce, especially veterinary workforce, prepared to adequately respond to public and aquatic animal health issues. While other professionals than veterinary communities may wish to take the lead in rising awareness on the importance of the sector over the future perspectives of food security within a growing population (e.g. food technologists, animal husbandry professionals, etc.), the veterinary school is expected to provide a necessary number of specialised workforce, prepared to handle the public health and food safety related issues, as well as to monitor and survey on diseases of aquatic animal populations.

The most significant lack in this respect apparently lies in current veterinary educational programmes, which are generally deficient in providing disciplines with relevance to aquatic veterinary medicine. Where such courses are provided by veterinary schools, they are either elective courses, usually identified as “exotic” or “wild” veterinary medicine, or they are available only as extracurricular continuing education and professional development programmes [W.R. DeHaven, A.D. Scarfe (2011)]. In Romania, veterinary schools are not providing basic courses on aquatic veterinary medicine, although aquaculture is acknowledged as being among the important animal food producing sectors of the national agriculture, EATiP, 2012. On the continent, other countries seem to follow the same curriculum template. Therefore, due to the actual importance of aquaculture, and because of the need for adequate aquatic veterinary workforce necessary to support this sector, aspect which has been stressed by the World Organisation for Animal Health (OIE, 2004), the Food and Agriculture Organisation (FAO, 2005) and has been addressed within the directive 88/2006 of the European Commission, an investment is required in aquatic veterinary education, at both basic and specialised levels, within veterinary curricula and through continuing education and professional development programmes of the veterinary practitioners [Laura Daniela Urdes, A. D. Scarfe, Cristiana Diaconescu, St. Diaconescu (2012)], along with rising

public awareness on the importance of aquaculture and its global positive trend, which should target also the academic management staff of veterinary and animal science schools.

3. GLOBAL EFFORTS IN FOSTERING AQUACULTURE DEVELOPMENT

In an effort to provide the aquaculture sector with specialised assistance and guidance on seafood safety and public and aquatic animal health, a number of international codes, guidelines and specific legislation have been issued (FAO - Code of Conduct for Responsible Fisheries, 1995; Directive 88 of the EC, 2006; OIE, 2004).

While it is claimed that the current governing standards and regulations are not perfect, this being a potential reason for aquaculture slow development within some countries/regions (i.e. they seem to be focusing on “listed” diseases, addressing commonly traded species only, not taking into consideration newly cultured aquatic species and their disease associated risks, nor all possible means of pathogens transmission), it is clear that certain national programmes are successfully being implemented in many countries, particularly within developed states such as Australia, Canada and Norway. It is obvious that, along with legislation, there needs to be in place also an adequate infrastructure, a good planning, and sufficient skilled personnel, that all require time and, perhaps more importantly, sufficient funds for the resources to be built therein. Unsurprisingly then, particularly in developing countries, which do not have available the necessary funds to develop their resources for early detection and effective response to diseases, the reaction to disease outbreaks in aquaculture is rightly characterised as “inadequate” (FAO, 2005). Insufficient human resources and a limited understanding of the gravity of a disease outbreak, required for early detection of pathogens, are alleged to be among the causes of failure to respond to aquatic animal diseases timely and adequately. In such countries, this situation persists despite specific rules and recommendations which emphasize that all states “...*must establish necessary legal provisions that are needed for the implementation of contingency plan(s)*” (OIE, 2004). With respect to this aspect, apart from the scarcity of financial resources necessary to build up the necessary infrastructure and human resources previously mentioned, these countries often lack sufficient expertise to assess their own legislative needs. Such countries should be able to ask for assistance on legislative matters from international agencies, such as Food and Agriculture Organisation of the United Nations (FAO), in order for them to be helped to revise or prepare new legislation, suited to the current national/regional expectations and requirements.

4. CONCLUSIONS

While, for many countries, an adequate infrastructure may take long time to achieve, strong foundations can still be established using the readily available resources. Vocational-level courses and workshops which provide hands-on practice to graduates, programmes of credentialing and certifying knowledge, skills and education for aquatic veterinary practitioners, national / international research programmes, technical cooperation programmes, as well as guidance documents and recommendation manuals, are all valuable resources able to assist developing countries/regions in improving or building up technical capacities. However, all these alternative means of achieving expertise useful in assisting aquaculture development are not sufficient, nor have they been proven to be sustainable on long term. At the same time, despite joint efforts, the number of specialists is still insufficient today, it not matching the rapidly developing industry, especially within the developing regions, where most aquaculture activity seems to be taking place. Definitely, there is a need for an increased emphasis to be placed on aquatic veterinary medicine disciplines within traditional veterinary courses, at the undergraduate and postgraduate levels, as clinical science along with a basic understanding of some key disciplines like biology, physiology and patho-physiology of aquatic animal species are of paramount importance in assisting the industry

in its rapid developing trend, which should provide in turn socio-economical development of the country and competitiveness on the trade markets.

The role of dancing in the educational process

Marzia Candela^{a*}, Rosa Conte^a, Nicolina Pastena^b, Cristiana D'anna^a, Filippo Gomez Paloma^b

Abstract

The aim of this work is to show how dancing, as well as other disciplines, may help to fully shape a person by acting at a physical, psychic and intellectual level simultaneously. We talk about educational dance, which looks at the person rather than at the dancer training and refers to a specific environment, the school context.

The reviewed reference literature analyses the so called Free Dance or Modern Dance, a revolutionary movement consolidated in the artistic field at the beginning of the 20th century. It questions the dichotomy mind-body and support a corporeality free from conditioning. Thanks to its pioneers we witness the gradual access of dancing into physical education programs.

Therefore, our inquiry on the relation Dance-School in Italy starts, taking in consideration the earliest normative references: the National Programs 2012.

The carried analysis fosters us to review the methodological approach commonly adopted in the school context, for it is still too fossilized on the cognitive aspect and poor of bodily-playful-creative doing. As a result, we believe the teaching workshop is the best solution to prompt the practice of dancing in the school.

Because it contemplates either the bodily and psychic aspect or the emotional and cognitive one, more than any other expressive languages, dancing can teach children to “dwell” their own body and find out the untapped potential, heightening the self awareness. Furthermore, the flexibility of dancing allows to link it primarily with music but with other disciplines as well, therefore facilitating their bond and contributing to the achievement of a global vision of knowledge.

1. Introduction

Let us imagine some children engaged in listening their own body and finding out its pace, its expressive skills.

Let us imagine some children with bare feet, free to allow feelings to pass across their body and express themselves through the movement while a music is driving them. Let us imagine some children that finally devote their time to the discovery of those aspects belonging to the self, which are often neglected.

Now, just try to recall your school experience: when and how many times did you experience those feelings at school? Probably, we can count them on the fingers of the hand. Perhaps, the words stuck in your mind are: “be quiet, stand still, keep attention”.

Well, if you try to ask the same question to today’s children you will notice that the answers are almost similar. Although the value of the body has been recognized since a long time and the dichotomy mind-body seems already overcome, the reality shows something different. Though many studies confirm the holistic unity of the individual who learns, the school reveals a scenario rather contradictory. Nowadays, it is being given more importance to the cognitive and logical-mathematical intelligence than at the creative, ludic and bodily doing, which is rarely found in a school context and it often lacks a careful planning.

Children, more than adults, because of their feeble control of the verbal language, talk through the body and interact by gestures, they listen with the eyes. Then, why is the school so deaf in dealing with all this? Why does it tend to restrain the children’s free and playful movement?

2. Objective

On this track, the present work is aimed to lead the reader toward a reflection focused on one of those aspects quite often underestimated in the school context and considered a mere recreational activity, we talk about dance. My experience in this sector led me more than once to think about the actual educational values of dancing. This is the reason why I mean to illustrate the purposes, goals and benefits that dancing carries out and its contribution to the integral formation of a person as it acts at a physical and psychic level simultaneously.

3. Method

To achieve all these goals in the school context it is required a specific teaching method that according to us can be represented by the art model by Jacqueline Smith Autard. Born in the eighties, it is a method based on the threefold matrix Creating-Performing-Appreciating. The child, beyond the experience of “doing” dancing, is being driven to “compose” and “view” his own dancing, therefore stimulating executive, creative and analytical skills at the same time. Essentially, the model takes in consideration three aspects: the ability of doing (deepening the experience of movement and dance), the ability of creating (developing skills of exploration and invention of movements by assembling different elements together), the ability of observing (through the vision and comparison of different types of dance, children acquire the skill to develop a constructive criticism free from judgment and competition).

Another valid support to implement good teaching methods in the school is represented by the Pioneers’ theories of the Modern Dance, a revolutionary movement consolidated in the artistic field at the beginning of the 20th century. It questions the dichotomy mind-body and supports a corporeality free from conditioning. It discloses the movement as the raw material of the expression and the necessary tool to express the human’s interior dimension because the movement stems from intellectual and affective experiences.

In opposition to the ballet, this type of dance let the body move freely and allows the student to dance with bare feet or lying down on the floor. Therefore, it rediscovers an authentic movement as a soul’s mirror. (John Martin, 1991)

Finally, the schooling of Modern dance is not focused on the imitation of teacher's movements, but it is based on the improvement of the natural movements for children. It helps children to create their own movements and it does not impose rigorous and stereotyped movements.

Fig. 1 – The Art Model

4. Results

According to our studies, which refer to the Autard method, a dancing lesson in the school context may be built on the basis of a diagram that consists of five stages (Franca Zagatti, 2009):

1. *Welcome*. It is the first explorative contact with the environment in which the activity is going to take place. It is important to create a serene listening atmosphere in order to urge the familiarisation and direct children's attention to the activity that is going to start.

We can employ a greeting ritual based on contact gestures to improve the relation or the meeting between participants. Its length is around 15 minutes.

2. *General activation*. It is based on the preparation of the body at the physical activity. The preparation can be performed by following the movements suggested by the teacher.

3. *Exploration*. It is the central stage in which a path of experimentation and research around a dancing element takes place (the space, the strength, the rhythm etc). Therefore, it is the stage where the topic is being presented.

To arouse the attention and interest on the topic it is important to use some motivations: books, images, objects, fantasies, facts. It lasts around 15 minutes.

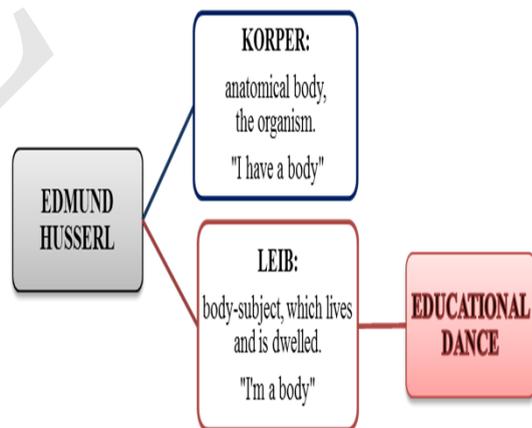

4. *Composition.* In this stage the children's creative ability finds space. They are engaged in composing individual and collective sequences, coordinating the different movements. It is important to make children understand the concept of a phrase or sequence: dancing has to be created starting from a beginning that, through a recognizable development, arrives at the end. On this regard we can assign to children a structure that they can follow, for example an ABA and so dancing will start and end at the same way while the students will fill the central part; or an AB and offer the possibility to work on the dynamic or spatial contrast (light- heavy; little- big).

5. *Conclusion.* It is a dismissal stage and it is important either for the teacher or the student to end the meeting in a satisfying way. A verbal comparison can be proposed whose purpose is to discuss the experience just lived and understand what it is done e how it is done. Otherwise, a greeting ritual or a collective dancing concludes the meeting in an energetic and lively way.

Fig. 3 – Körper and Leib

5. Discussion

Dancing finds its most proper historical and cultural collocation in the educational arts context, whose area of knowledge is shared by similar arts (music, theatre, visual arts) in order to develop a defined set of attitudes and competences. All the arts promote the development of a perception and thinking skill different from that of other disciplines: a thought that is intuitive, flexible, open to imagination, neither linear nor stringent. Therefore, the arts are fundamental components of our history, our culture and last but not least our education.

Although the arts are not yet given the right weight in the institutional Italian school, devoid of appropriate tools and skills in the artistic field, dancing has a precise collocation within the most recent regulatory references. We want to underscore that dancing is already part of the scholastic curriculum of many world's countries, which means that many nations question themselves on the modalities of access in the school. In Italy, only in recent years, research on the introduction of dancing in children's education has aroused interest and curiosity.

Although dancing is not mentioned in the Programs '85, it appears for the first time in the National Programs 2007 and in the current National Programs 2012, which promote an use of dance as a means to convey emotional and affective experiences through gestures and body language.

Its collocation in the physical education discipline emphasizes the connection with the education on one hand and the body and the movement on the other. Dancing has the ability to associate and combine the physical development with the expressive and emotional one.

The sciences argue that the person does not exist without a body revealing its soul and the soul cannot exist if it does not express itself through the body. The body and the psychic are two separate poles that influence each other in a circular way within a single system, the person. And the educational process have to refer to both (Gomez Paloma 2009). Dancing can concretely accomplish this integration. Its aim is to combine body and mind and train the former, for it represents the means through which one can find good qualities because they are natural, innate, and reflect the anatomical structure of the body.

The body is the reference point of the child, it links him to other children and to the world, it is the means through which he expresses and becomes aware of himself therefore building his own identity.

In this regard, the German philosopher Edmund Husserl uses two different words referring to the body: the *Körper*, defined as a tool-body, according to which I can state that "I have a body", and the *Leib*, termed as the body that lives and is dwelled, for which I can state that "I am a body". It is pretty different having a body from being a body (Edmund Husserl, 2002).

When dancing enters the school context it gives primary importance to the *Leib*, an expressive body that moves intentionally to communicate and experience and it denies the word's predominance.

It also underlines the partiality of physical education that, in many cases, is still too based on the tool-body (*Körper*) that can be trained according to a sportive functional perspective.

Dancing values the body as a personality constitutive element and starts from the concept that by training the body we can train the feeling, the thought and accordingly shape the person.

In this way it becomes educational dance where the adjective 'educational' wants to mean a dance teaching that looks at the person more than at the dancer training and is referred to a specific context, the school context. It is a type of dance aiming primarily at the expressive awareness of the movement. It is conceived as an artistic and expressive body language that integrates the pupils' physical and psychological development and not as a specialized path aimed at the dancer's artistic education. It is not based on standard movements to be conveyed to

pupils but it promotes more natural shapes of moves that are being conceived and recognized as such in order to become expressively aware movement (Franca Zagatti, 2009).

Thanks to dance it is possible to achieve goals in psychomotor, cognitive and affective areas, standing in a playful and socializing context.

From a psychomotor point of view, dancing encourages the physiological strengthening because it represents a muscle gymnastic very important for the harmonic development of the organism.

The action of dancing involves all muscles, including the musculature that is not usually employed in daily movements and risks to remain atrophic for its reductive use.

Dancing's exercise affects the osteoarticular system as a whole, the blood circulation and the internal organs. It increases the respiratory ability and strengthens the cardiac muscle, encouraging at the same time the tissues' oxygenation with considerable advantages for every organism's functions (Guido Giugni, 1986).

Moreover, dancing improves other abilities such as the quickness and accuracy of the movement, the vasomotor and visual-spatial coordination but also the laterality and segmental coordination.

Because of the kynesthetic sensations it carries out (postural, thermal, tactile and pain sensations), the body pattern becomes wide. We cannot know much of our body if we do not move it. Finally, dancing consolidates and improves static and dynamic motor patterns that are essential for the movement organization.

For what concerns the cognitive aspect, dancing encourages the spatial-temporal organization: it helps the child to acquire concepts about space and orientation (forth and back, right and left, near and far) and develop notions about time and rhythmic structure (slow and quick, before and after). Dancing improves the development of the rhythmic sense: the rhythm is expressed through the movement and our body is the main tool that allows us to live and express it. Through dancing the student learns to acknowledge different types of rhythm in which the movement can be expressed or he can adapt his movement to the rhythms required by different situations.

It is important to help the child to become aware of the fact that every movement repeated with steady pace in time is a rhythmic activity. Examples of this can be bouncing a ball, marching , jumping, etc.

Furthermore, rhythmic sense will help the child in his school path (in language- reading- writing learning process).

Finally, from an affective-relational standpoint, dancing is an art that fosters socialization, facilitates integration, promotes dynamic relations, stimulates the self-esteem and also helps to overcome relational problems between students of different sex which are quite marked in compulsory schooling.

6. Conclusion

On the basis of the arguments here reported, we foster to consider educational dancing as a valuable tool for the formation of everybody. The right education should not aim at introducing even more notions in the student's mind, rather it would have to chaperon them toward their own trust, the knowledge of their body and of the world. The self is not just the body, neither the mind nor the feelings. It is the overall being and dancing puts it in relation with all three aspects simultaneously.

Through dancing the child understands how his body, his mind and his imagination work. He learns what his body can do, what kind of strength and energy he has. For example, while he is jumping he acquires the meaning of jumping. As a result, not only he reaches the self-awareness and learns to use the movement as a tool of communication with other children, but he perceives the change of his movement according to emotions and sensations as well. Dancing can help to free him from an uneasiness or a fear hidden inside him.

By acting as a trait of union between cognitive and emotional, dancing can actually teach children to "dwell" their own body.

4th International Conference on New Horizons in Education

The role of lecturer related factors in students' perceptions and satisfaction in distance education

Remzi Altunisik*

"Sakarya University, Faculty of Business Administration, 54187, "Sakarya", Turkey

Abstract

Technological advances have a huge impact on our lives. Education is no exception to this. For the last twenty years, many universities and educational institutions are trying to find new ways and methods in order to successfully use internet-based technologies in teaching and learning through distance learning initiatives. But traditional face-to-face classroom teaching paradigm is falling behind in the effective use of these technologies in education; hence we need a new teaching and learning paradigm in order to use online technologies in education effectively. The purpose of this study is to examine the affecting students' satisfaction in distance learning platforms with specific emphasis on the role of lecturer related factors on the satisfaction. A survey was carried out on 465 students attending the MBA distance education program at the Sakarya University of Turkey. Findings provide evidence on the role of lecturer on student satisfaction in distance learning programs.

Keywords: distance education, lecturer, student satisfaction

1. Introduction

Technological advances influence all aspects of modern life. These influences are not limited to changes making human life easier or changes making our lives more colorful, it also shows its influence on teaching methods and learning procedures used throughout our lives. Advances taken place during the last ten years in communication and education technologies force us to change the existing paradigm for education and teaching. In light of technological advances, traditional face to face classroom teaching methods and learning approaches tend to lag behind in meeting needs of existing society. As a response to these changes, use of advances in communication and educational technologies as well as social media applications in order to increase the effectiveness of traditional teaching methods was common practices. This approach was not satisfactory in meeting the changing needs for learning and teaching methods, hence we need to adopt new learning methods and teaching models in education and modify traditional learning approaches and teaching methods to fit the needs of today's society's educational needs.

In this context, traditional face-to-face classroom teaching methods were questioned with respect to the meeting the changing needs of contemporary education system and some educators suggested the distance education model as a solution to the weaknesses of tradition education system. To this end, many distance education technologies were employed to overcome the shortcomings of traditional education systems. But this approach was proven to be ineffective due to paradigm differences between traditional classroom teaching and distance education system. There are a number of reasons for the failure in an attempt to substitute of distance education technologies in traditional education system. First, lecturers with the traditional education mentality wanted to use his/her views for the new approach requiring a different paradigm. Second, factors determining

* Corresponding author. Tel.: +90 264 295 6261; E-mail address: altunr@sakarya.edu.tr

success in distance education were different from that of the traditional mentality. Third, the rolls for teachers and students were different for both approaches. These and other reasons have led to dissatisfaction with results of traditional teaching methods and hence finally resulted with student dissatisfaction. For this reason, it is imperative to understand the requirements of new teaching and education approach (distance education) in the satisfaction of students as well as to determine the antecedents of student satisfaction with distance education system. Hence, the purpose of this study is to identify the factors leading to satisfaction with distance education as well as the role of teacher related factors in the satisfaction.

2. Student Satisfaction in Distance Education

Studies indicate that there is an increasing demand for the distance education methods and technologies in developed countries in lieu of traditional face-to-face interactive classroom teaching programs. Hence it is argued that internet-based and/or distance education programs and courses will be playing more important and critical roles in the future education (Allen and Seaman, 2010). Findings of the literature indicate that there are no significant differences between the traditional classroom teaching methods and distance education programs in terms of outcomes, but there seems to be some differences between the two in terms of student satisfaction (Allen et al., 2002; Settle and Settle, 2007).

Student satisfaction is an important indicator of the quality of learning experience. There are a number of studies on the determinants of student satisfaction with distance education (Bolliger and Martindale, 2004; Reinhart and Schneider, 2001; Sahin, 2007). Wagner et al. (2005) pointed out that there are numerous factors influencing student satisfaction and program performance. Quality of course materials, content of the course, quality and the type of interaction between student and lecturer, interaction with other students, student satisfaction and the structure and presentation style of the course are among those mentioned factors. Even there are studies aimed at modeling student satisfaction with distance education programs via SEM (Structural Equation Modeling) approach (Şahin and Shelley, 2008).

Since the nature of the relationship between students as well as students and lecturers are different in distance education, it is worth to examine the determinants of satisfaction with distance education programs and courses (Yukselturk and Yildirim, 2008). The quality of interaction between lecturers and students are mainly related to, in addition to the distance education technology used, the ability and desire of lecturers to adopt and use the new technology as well as the level of expertise on the distance education technology. Also, lecturer's knowledge of and desire to use interaction methods and tools in line with the new technology will determine the quality of distance education (Parsad and Lewis, 2008). Lack of self confidence as well as poor knowledge level in the use of new technology are likely to lead to low performance or even failure for both lecturers and students, hence to poor satisfaction (Kaminski vd., 2009). Compared to traditional classroom education, in distance education platforms, students have more responsibility in lecturer-student interactions. But it seems inevitable that lecturers' knowledge, expertise and experience in the adoption of new teaching platforms will play critical role in the adoption process (Moore and Kearsley, 1996). Any weakness in this respect is likely to result in low student satisfaction (Puzziferro, 2008).

Periodical assessment and evaluation are important factors in distance education programs. Depending on the aim of the distance education program or course, the assessment procedure is carried out from different dimensions (Olmstead, 2007). In this respect, common practice is to use student scores as an indicator of student performance. But, besides student success scores, there is another factor which is equally important for the success of distance education programs is students satisfaction and enjoyment with the learning experience in the program as an indication of the quality and value of the program (Noel-Levitz, 2011). Student satisfaction is not just an indicator of the quality of students' learning experience, it is also provides us with cues regarding the quality of the program, student loyalty as well as a means in attracting new students to the program or the course

(Allen and Seaman, 2008; Debourgh, 1999; Moore and Kearsley, 1996; Pike, 1993). Creating satisfied students may help improving the quality of education as well as moderate students' resistance to new teaching process and platforms. Hence it is critically important for the program developers, course content designers, educators as well as managers to understand the determinants of student satisfaction with distance education in order to identify the areas needed to improvement and development (Reinhart and Schneider, 2001; Wagner vd., 2005).

3. Research Method

For the purpose of this study, a questionnaire was carried out on students at the distance education MBA program of the Sakarya University with the aim of student's evaluation of the program and their satisfaction with the program and individual courses. This questionnaire is carried out at the end of each term in order to assess the program and individual courses for the purpose of seeking out potential improvement areas as well as developments for the program.

Fieldwork for this study was conducted on January 2013 and May 2013 in two stages. 550 questionnaires were distributed but only 465 of them were usable for the statistical analysis. Of those, 265 were collected during January study, and the rest is collected during the May period. The reason for conducting the study in two stages is try to see if the improvements and various precautions implemented as a result of previous study was effective or not and to make comparisons between two time zones.

Questionnaire was carried for all the courses included in the program. Students are allowed to make evaluations on each course as well as each lecturers involved in a course. The questionnaire was made up of three sections. In the first section, there were questions assessing the quality of the courses as well as the lecturers in terms of some quality indicators. Among these indicators, lecturer's presentation ability, content of the course, quality and sufficiency of the course materials, quality of videos, support of lectures with daily examples, attitudes and behaviors of lecturers towards students, student participation in live lectures, lecturers' ability to respond questions reasonably and effectively, integration of theory and practice in courses, technological infrastructure of the distance education program, ease of communication with lecturers, usefulness of homework in learning processes as well as administrative supports given by the Institute offering the program are some of them. Students assessed each course on these matters on a 5-point quality scales (1-Very bad ... 5- Very Good). In the second part of the questionnaire, there are questions regarding satisfaction with the course (1-10 scale), assessment of lecturer's performance (0-100 scale) and the assessment of overall course performance (0-100 scale). In the third section of the questionnaire, there were questions related to overall MBA program assessment and students' satisfaction with overall program performance. These questions were rated with 5-point Likert type scales. Also, an open-ended question was given at the end of the questionnaire in order to receive any comments or suggestions or complaints about the courses and programs.

4. Analysis and Evaluation

In the context of analysis, various descriptive statistics, t-test analysis, correlation analysis as well as regression analysis were conducted. Results and evaluation of these analysis are given below.

4.1. Demographic Characteristics of the Participants

In the context of this study, 465 people participated to the survey. Of those, 28% of them were female, 26% of them with an age of 25 or lower, 42,8% of them were in the age 26-35 age groups. Nearly all of participants (95,5%) were employed. In terms of occupations, the sample was rich in terms of variety. Among them are engineers, bank workers, lecturers, civil servants, sculptures, chemists, sellers, marketers, auditors, etc.

4.2. Evaluation of SAU e-Business Distance Education Program

In the context of the study, students were evaluated a total of fourteen courses and twenty-two lecturers. Evaluation was covered both Spring and Fall terms of the program. Assessment procedure was carried out on fifteen quality parameters and the results of this assessment are given in Figure 1, below.

In figure, there seems to be students were rated high (high scores) for most of the parameters in the assessment of distance education programs. Lowest assessment was given for the administrative support services for the program due to the problems associated with reaching the contact person as well as getting help in case of need. Students tend to rate technological infrastructure, integration of theory and practice and live course applications as “good”. These results indicate that students tend to behave reasonably and rationally in the assessment process. It can be argued that SAU e-Business MBA program is rated very good in respect to factors related to lecturers’ ability to present, communication skills of the lecturer, lecturer’s ability to respond students’ questions logically and reasonably and lecturers’ attitudes towards students

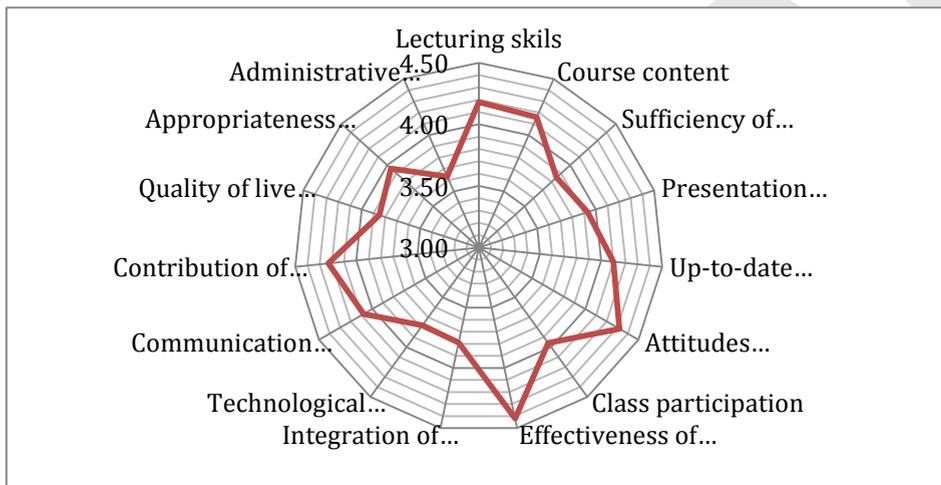

Figure 1- Students' Assessment of SAU e-Business MBA Program

As mentioned earlier, the study was carried out in two different time zones. As a result of first study, the program administrators have taken several steps and precautions in order to improve some problems mentioned in the first study. Among these precautions, the incentives for the lecturers to spend more time for the interaction with students, enrichment of course materials and live lectures with more daily cases and up-to-date examples, selection of homework topics with more caution, and setting up exams in such a way encouraging students to make their judgments on the matters rather than repeating basic knowledge. Also, lecturers were required to reply student requests within two days time period. The results of second study has proven that there significant improvements for nearly on all aspects of the improvement initiatives of the early period (Nearly all changes were significant for t-test results).

4.3. Overall Evaluation of SAU e-Business Program

A summary of students' responses in relation to quality variables in distance education, which have influence on student satisfaction, was given in Figure 1 above. Besides these results, it is believed that students' perception of, and satisfaction with the distance education courses and overall assessment of the distance education program will provide us clues in regard to the performance and development of the distance education program in general. The results of this assessment are shown in Table 1. Table shows that there is an overall satisfaction with the SAU e-Business MBA distance education program. Findings indicate that the SAU e-Business MBA distance education program plays an important role in students' career developments. But there seems to be some areas where there is a potential for improvement. Respondents tend to argue that program's content and overall quality was underperforming the expectations; hence, despite overall satisfaction with the program, there is a need for improvement in the content of the existing program as well as course contents.

Table 1- General Evaluation Towards and Overall Satisfaction With the SAU e-Business MBA Program

Statements	(N=465)	Mean	Completely disagree	Slightly disagree	Neither agree nor disagree	Slightly agree	Completely agree
			%	%	%	%	%
SAU e-Business MBA program meets my expectations.		4,12	2,0	2,3	13,3	46,6	35,8
SAU e-Business MBA program is important for my carrier.		4,10	2,0	2,0	16,7	42,8	36,4
My education experience in the SAU e-Business MBA program is satisfactory.		3,75	2,7	6,3	20,9	54,5	15,7
I suggest this program to my friends.		4,15	2,9	4,5	12,4	35,7	44,3
The content of the program meets my expectations.		3,93	2,0	7,6	18,4	39,5	32,5
It was a right decision to choose SAU e-Business MBA program.		4,08	4,3	1,6	17,9	34,5	41,7
How do you rate the quality of the SAU e-Business MBA program?*		3,93	0,9	3,6	19,5	63,0	17,5
How satisfied with the SAU e-Business MBA program?***		4,11	2,9	3,4	7,4	52,7	33,6

*: 1- Very Bad 5- Very Good ***: 1- Never Satisfied 5- Completely satisfied

In order to examine the relationship between overall satisfaction scores and lecturers' performance assessments of the respondents, a correlation analysis was conducted. The result of this analysis is summarized in Table 2. A review of the table would indicate that there is a strong correlation ($r > 0,9$) between the assessment scores of individual courses and lecturers' assessment score and overall program evaluation scores for the program. This may be considered as an internal consistency of various assessment scores for the distance education program evaluated. Besides, all correlation coefficients in the table are significant at 1% level and magnitudes of coefficients are above 0,4, which is an indication of strong correlation among measures.

On the other hand, there is a strong correlation ($0,67 < r < 0,811$) between overall assessment scores and overall satisfaction scores with the SAU e-Business MBA program. This was an expected result since the scales used to assess overall satisfaction of respondents is proven for their reliability and validity in assessing overall satisfaction and overall performance assessment for the program.

But a detailed review would lead us to point out that there seems to be relatively lower correlation overall program evaluation scores and lecturer assessment scores of the respondents. This finding might be interpreted in such a way that students do not evaluate the distance education courses by only taking into lecturers' performance, but they take into account many other factors in their assessment process.

Table 2- Correlation analysis among various satisfaction indicators*

	Lecturer's score	Satisfaction score with the course	Overall course success score	Choice of SAU e-Business as a right decision	Program content meets the expectations	Suggest to friends	Satisfactory education experience	Evaluation of e-Business program
Course satisfaction score	,866							
Overall course success score	,918	,922						
Choice of SAU e-Business as a right decision	,256	,353	,361					
Program content meets the expectations	,352	,446	,443	,694				
Suggest to friends	,366	,424	,419	,760	,717			
Satisfactory education experience	,317	,430	,442	,681	,698	,667		
Satisfaction with e-Business program	,374	,432	,419	,803	,701	,809	,659	
Evaluation of e-Business program	,306	,422	,394	,760	,676	,760	,607	,811

* All correlation coefficients are significant at 1% significance level.

4.4. Factors Determining e-Student Satisfaction

One of the aims of this study was to examine the role of lecturer related factors in student's satisfaction with distance education programs. To this end, a regression analysis was conducted; results are summarized in table 3. In the table, there are three regression models evaluated. The first model examines the relationship between various quality related variables and student's satisfaction with the distance education course. The second model

tries to establish if there was a relationship between the same quality variables and lecturer's assessment scores. The third model searches for the existence of a relationship between quality related variables and overall course performance scores.

Table 3- Regression Analysis for Student Satisfaction with SAU e-Business MBA Program

Variable	Dependent Variable: Satisfaction with the course*			Dependent Variable: Lecturer's success score**			Dependent Variable: Course success score**		
	B	Beta	t	B	Beta	t	B	Beta	t
Constant	-2,46		-4,60	-8,94		-2,24	-7,27		-1,72
Ability to lecture	0,657	0,271	3,97	4,628	0,229	3,84	6,512	0,316	4,87
Presentation style	0,526	0,244	3,52	-	-	-	3,813	0,207	3,07
Ability to respond	0,457	0,175	3,42	-	-	-	-	-	-
Sufficiency of materials	0,347	0,165	2,95	2,586	0,162	3,43	-	-	-
Contribution of homework assignments	0,282	0,117	2,37	1,905	0,095	2,27	3,068	0,149	3,45
Class participation	0,245	0,111	2,19	-	-	-	-	-	-
Attitudes towards students	-	-	-	5,387	0,240	4,62	0,266	0,116	2,16
Up-to-date examples	-	-	-	4,017	0,219	4,27	2,983	0,159	2,76
Communication with lecturer	-	-	-	3,308	0,166	2,83	-	-	-
R		0,87			0,90			0,90	
F (Significance level)		82,19 (p<0,000)			116,74 (p<0,000)			105,66 (p<0,000)	
R ² (Level of explanation)		%74,4			%80,9			%79,3	

* - (1-10 point scale) ** - (0-100) point scale

A review of the table indicates that nearly 75% of variation in dependent variables is explained by dependent variables in all three models. All three models are significant and all quality related variables have different levels of exploratory power on dependent variables. Only the significant variables for any of three models are shown in the table. Those variables, which were not significant, are excluded from the table. Results indicate that lecturing quality and homework assignments' contribution to learning experience are considered an important factor in the formation of student satisfaction, student's evaluation of lecturer as well as overall course performance assessment. Lecturing ability and style of lecturer is the most significant factor determining student satisfaction and performance perceptions with the distance learning activity. Presentation style of the lecturer was not a significant parameter in the evaluation of lecturer performance although it plays significant role in the formation of course satisfaction and overall course performance assessment. Furthermore, lecturer's ability to respond and the quality of responses to the questions raised by students and the quality of course materials is significant determinants of student satisfaction with distance education courses.

Most significant factor in the evaluation of lecturer's performance are attitudes towards students, lecturing skills and lecturers ability to support lectures with current day-to-day examples. Also ease of communication with the lecturer and the quality of course materials are considered as significant predictors of lecturer performance.

Lecturing ability and presentation styles of the lecturer are considered significant determinants of the overall course evaluation in the distance learning courses. Similarly, attitudes towards students and supporting lectures with current events and examples play significant role in student's overall course performance assessment.

4.5. Conclusions and Evaluation

In light of abovementioned findings, it can be concluded that lecturer related factors play significant role in the formation of students' satisfaction and course evaluation process. But results indicate that students tend to utilize different parameters in the assessment of course satisfaction, lecturer performance and overall course performance perceptions. Especially lecturer's attitudes towards students, communication styles with students as well as lecturers interaction quality are most influential factors in lecturer's performance evaluation. Besides, quality and contents of course materials and the usefulness of homework assignments were important predictors of lecturer quality and performance. In other words, we can conclude that students tend evaluate those lecturers with smiling face, easy to communicate, good communication styles, gentle attitude towards students and serious in his work highly. But lecturer's communication style tends to relatively less important in student's satisfaction with distance education course. Satisfaction is mostly related to lecturing ability, quality and content of the course materials, usefulness of homework assignments and lecturers response quality and styles.

4th International Conference on New Horizons in Education

The university-industry cooperation and its practical application in the Czech Republic

Pavla Odehnalová, Petr Pirožek*

*Lipová 41a, Brno 602 00, Czech Republic**Lipová 41a, Brno 602 00, Czech republic*

Abstract

The aim of this paper is to present the advantages and limitations of university- industry cooperation . This issue is currently very important because of the employability of university graduates in the future. Hence the interest in mutual cooperation of universities and companies. The article presents the results of an empirical research carried out from two perspectives. The former focuses on the interest of students in employment in economic and management professions, the latter presents the results of a survey looking into the interest in cooperation between the branches of multinational companies and universities engaged in tertiary education in the Czech Republic. The results indicate students' interest in their active involvement in the practice itself during college, and lower interest in cooperation with universities shown by branches of multinational companies in the Czech Republic in particular .

Keywords: Tertiary education; cooperation; practice; students

1. Introduction

The contemporary educational system is based on the participation of more actors involved in the education policies that have a direct impact on the way and the chosen method of educational process. Several groups of actors in education policy can be distinguished: elected politicians, school administration, teachers and their organizations, parents and their associations, students, churches, employers and educational experts (Kalous, 1997). They differ not only in the interests they represent, but also in their access to resources (financial and information), in the number of contacts or in the extent of influence they have on decision-making. (Hloušková, 2006). Needs of the participation of teachers with professional sphere, i.e. theorists and professionals were discussed in *Practical Education* (1798), where the authors first mentioned the importance of using a real example to complete the theoretical concept, which leads to a higher perception of shared phenomenon (Edgeworth & Richardson, 1994).

Another important book dealing with the need of the synthesis of theoretical and practical concept of education was written by the John Dewey (1938), a critic of the traditional concept of education. Also the state officials of the European Union are well aware of the importance of practical education in the tertiary sector – that is research and development. Practical training at university level is supported by the Operational Programme Education for Competitiveness, which is co-financed by the European Social Fund and the state budget of the Czech Republic. (Source: European Social Fund).

This program gives rise to projects aiming to promote practical education at universities and colleges.

The need for practical application of theoretical concepts is apparent in all areas of education. Nowadays, its importance is increasing particularly at universities supported by application practice in companies and public and state administration institutions.

Ideally, practical training should mean mutual use of knowledge and skills of both companies, students and university teachers. Research and development, provides universities with access to new knowledge, with the possibility of its practical applications. On the other hand, the application sphere should participate in education and train more practical oriented employees. Benefits can thus be found on both sides of the participating actors.

Given the potential benefits, the cooperation between universities and practice, represented by subsidiaries of multinational companies is observed.

This may represent an interesting view on the development of mutual cooperation for the economy in the post-transition period, where the Czech Republic can be included. Suggestions of the Ministry of Education regarding the future of science and research, define the current troubled state of cooperation between universities and the business community represented mainly by companies. An obstacle is defined as a condition where the infrastructure for knowledge transfer from public research to practice does not exist. Agreements on cooperation between universities and industry are largely formal. In view of these facts, it is important to identify the interest of cooperation between universities and the application area and the corresponding adjustment of assistance (source: Ministry of Education, Youth and Sports, 2012).

2. Methodology

Description and processed results of internship implementation into the syllabus are based on the information from Masaryk University, Faculty of Economics and Administration, which serves as an example for the presentation of the issue. The information covers the period between 2006-2012. The results are evaluated by the graphic display. The sample of students represents about 10% of the students in one year. The issue of cooperation between universities and their practical application was dealt with using methods of qualitative and quantitative research, the sample of 335 subsidiaries of multinational companies operating in the Czech Republic (Blažek et al., 2011).

Answers in the questionnaires used an ordinal scale of 1 to 5, where 1 corresponded to significantly lower ratings to 10 significantly higher rating. The sample consisted of 335 branches MNC, which is 13.35% of the basic sample. From a sectoral point of view, the most represented MNC affiliates were in the industry section C - Manufacturing (59%), G - Wholesale and retail, repair of motor vehicles (13%), M - Professional, scientific and technical activities (6%) and section J - Information and communication (4%). These sections included 82% of the MNC affiliates.

Brief presentation of the sample shows that the proportion of the size of branches according to the number of employees was as follows: 24.2% from 50 to 99 employees, 39.7% from 100 to 249 employees and 36.1% more than 250 employees. In terms of their legal form, there were 20% of corporations and 80% of companies with limited liability.

Statistical processing of the survey was carried out after the completion of data collection, which was carried out by an external company specializing in collecting questionnaire data (address, data acquisition, processing in the

data matrix). Having been checked, the data were recoded and analyzed by the univariate analysis by defining the frequency of occurrence of each response and the arithmetic mean and standard deviation.

3. Results

3.1. The practice of university students in enterprises

If students are interested in optional internship with credit valuation within their field of study, they have to find a specific company where they will be able to work for some time. The interest of students is high; however, a problem arises on the side of companies. Results of the empirical survey show that the interest of businesses to provide students with the experience of business management is limited. The time student has for internship is relatively short - 120 mandatory hours. During this time the student cannot learn about applying theoretical concepts from economics and management.

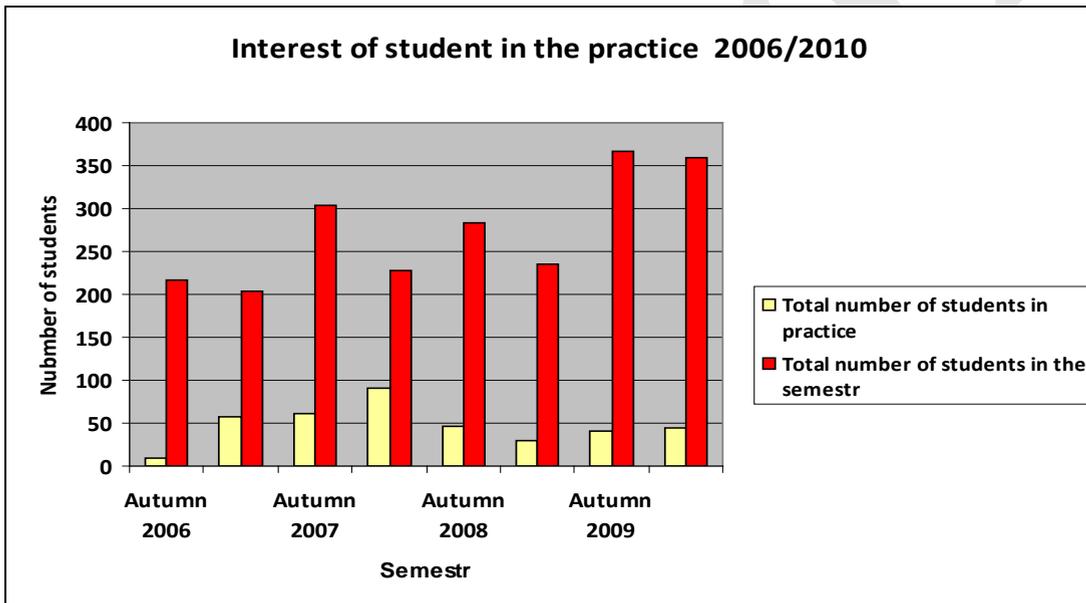

Fig.1:Interest of students in practice

The graph above shows that more than 10% of college students really prepare for work during their study. These are students who choose internship as an optional subject and have agreed on doing it in a specific company. The actual field of specialization at university is connected with the realization of internship. The fields of economics and management are associated with both a strong theoretical background of economics and practically oriented management. This is then reflected in possibilities students of particular disciplines have to ensure the internship and application potential after graduation.

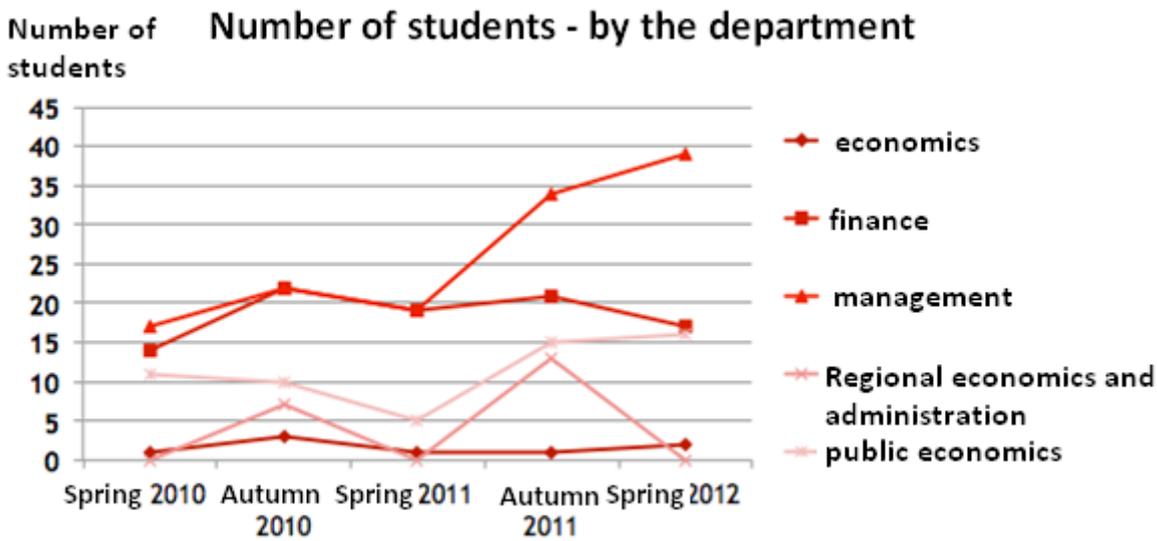

Fig.2: Number of students according the department

Students of disciplines with application potential, i.e. management and finance, are much more represented in the subject of internship. It also significantly associated with greater employability of graduates in these fields. In contrast, students of more theoretical fields, such as economics or public economics, have fewer options because offers of internship in enterprises, government organizations or public authorities are considerably less numerous and their application potential is much more limited. These trends are confirmed at the national level through the monitored indicators of employability of university graduates (Koucký & Bartůšek, 2012).

3.2. Cooperation between universities and the application area – Practice

Within the research of multinational companies in the Czech Republic in 2011, a survey was carried out by Masaryk University on cooperation between the business sector and colleges and universities (Blažek et al., 2011). Enterprises divided by the country of origin, were to identify the intensity of cooperation in the development of knowledge with universities and research institutes. The response range was between 1 to 10 points, where 1 meant no cooperation at all and 10 meant cooperation to a large extent. The question was answered by 331 respondents, which is nearly 99% subsidiaries of multinational companies represented in the file. The average number for each country is shown in the following table and graph.

Table 1. Cooperation intensity divided by the country of origin

Country of origin	Mean	N	Std. Deviation
Australia	3,0000	1	
Belgium	3,0000	12	2,69680
Brazil	5,0000	1	
Czech Republic	6,7143	7	1,70434
Denmark	5,2500	8	3,37004
France	3,8000	10	2,52982
Ireland	2,0000	1	
Italy	3,0000	8	2,77746
Japan	2,0000	9	1,41421
Cyprus	1,0000	2	0,00000
Liechtenstein	4,0000	1	
Luxembourg	3,2308	13	2,52170
Malta	0,0000	2	0,00000
Germany	3,2883	111	2,30961
Netherlands	3,9556	45	2,75479
Panama	1,0000	1	
Poland	3,5000	2	3,53553
Austria	3,5789	38	2,45645
Russia	7,0000	1	
Slovakia	1,5000	6	,83666
Slovenia	9,0000	1	
USA	4,0000	9	2,78388
Spain	3,5833	12	2,46644
Sweden	4,7500	8	2,05287
Switzerland	3,9167	12	2,57464
Great Britain	4,5714	14	2,47182
Total	3,5910	335	2,52827

The research shows that almost 60% of surveyed enterprises rely more on themselves in their innovation activities. Further investigation showed that companies which reported the maximum value of cooperation, i.e. 10, are from the manufacturing industry. A great deal of cooperation, i.e. 7-9 points, was shown by relatively most companies in the section Information and communication activities. It was also found out that the higher the increase in the number of employees in enterprises is, the greater the cooperation is. However, it should be noted

that this is a minimum of enterprises from different sectors without representativeness in the surveyed sample of subsidiaries of multinational companies.

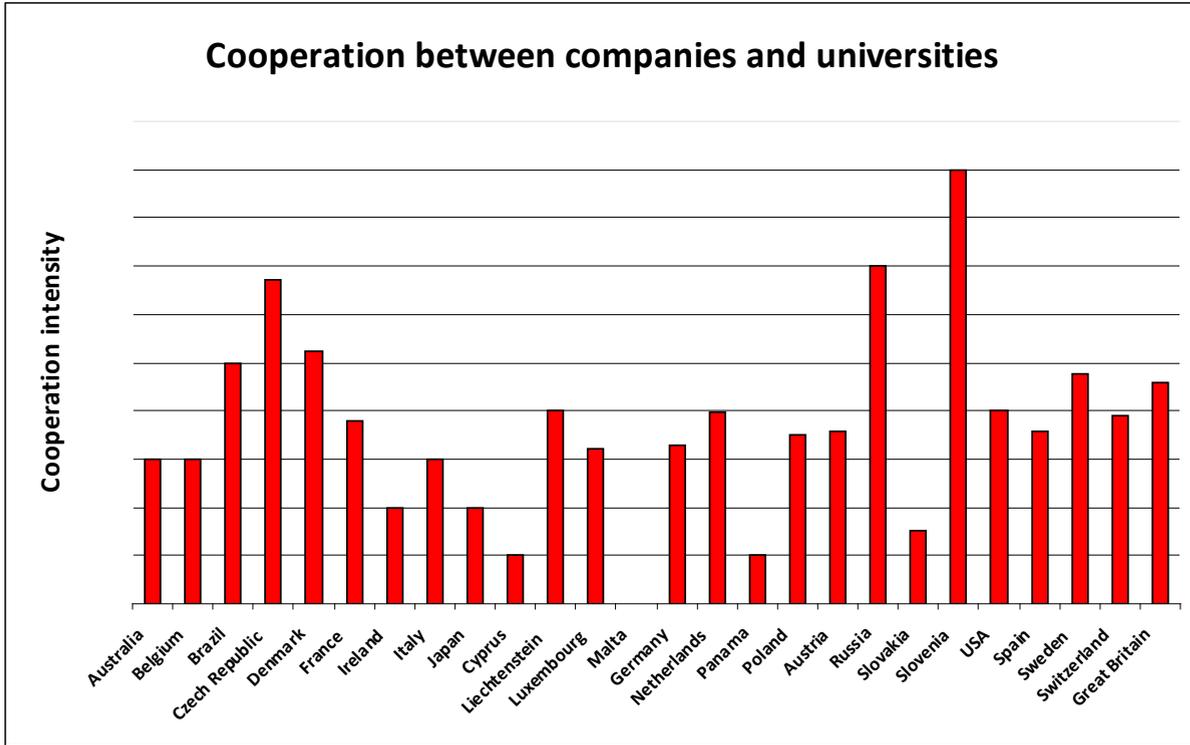

Fig.3: Cooperation between companies and universities 2010

In terms of the share of foreign owner, it shows that companies with an ownership stake of a foreign entity higher than 50% and less than 100% cooperate with external organizations to a lesser extent than companies that are wholly owned by a foreign entity.

Some correlation between the level of gaining knowledge in the context of cooperation with external entities is indicated when companies are analyzed according to their financial performance. It can be said in a very simplified way increasing financial performance means increase in the scope of cooperation with research institutions (Blažek et al., 2011).

The graphs show that the most significant cooperation with a limited proportion of the surveyed branches between the theoretical and the practical sphere, is in companies owned by Slovenian and Russian owners. These are followed by large degree of cooperation carried out by the co-owners from the Czech Republic and Denmark. On the contrary, cooperation between business and research sector does not take place in enterprises owned by owners from Malta, Cyprus and Panama. What is a very interesting finding is a very low cooperation with the nearest foreign neighbor - Slovakia.

4. Resume

Considering the issue, spending on research and development is a very interesting indicator. Except Liechtenstein, where expenditure on research and development is exceptionally high, the percentage of expenditure on research and development in developed countries is around 3%. Countries like Brazil, Cyprus, Panama, Poland and Slovakia are below 1%. These countries can also be characterized by very low cooperation between universities and branches of multinational companies operating in the country. This suggests that the lack of allocated funds measured by a GDP share on research activities is also reflected in the willingness of cooperation with universities.

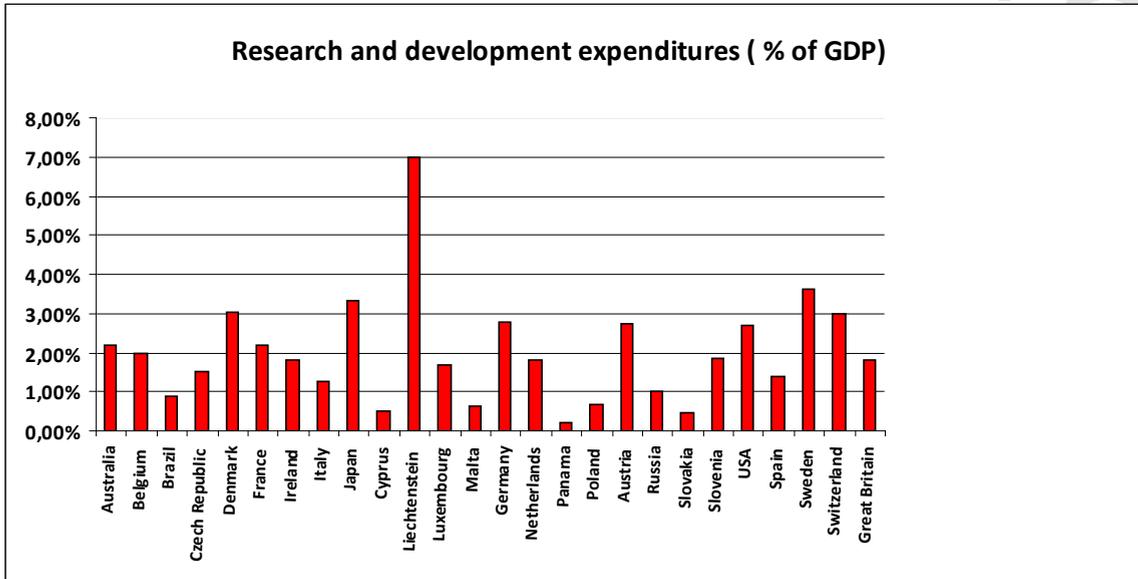

Fig.4: Research and development expenditure 2010 (% of GDP)

Investment in education, enhancing the knowledge and skills of citizens is a competitive advantage that can create new values, flexibility to respond to rapidly changing market needs and generate new ideas. The above mentioned information shows that countries which spend the highest percentage of GDP on research and development are aware of the fact. (Gola, 2012, OECD Factbook, 2011-2012).

5. Discussion

According to the OECD (OECD Factbook 2011-2012), expenditure on research and development is a driving force of national economies. Since 2000, global spending on research and development has been growing. The findings of surveys show that R & D support from the state has an impact on encouraging cooperation between institutions involved in research activities, represented by university, and private firms. The result of the cooperation benefits both parties, consisting in the development of employees who have the appropriate education and qualifications. An inseparable part is the experience that potential employees - university students gain during their studies.

The often criticized purely theoretical knowledge is slowly becoming a thing of the past. It has been shown that universities are trying to introduce courses focusing on the practical application of theoretical knowledge in their syllabi. In connection with the surveys, it is impossible to find out whether the application sphere is aware of the opportunities offered by at least a partial internship of students. A possible example of a successful link between teaching, practice and cooperation, is the establishment of high school Skoda - Auto, which offers degree programs in engineering and business management processes and management (source: www.savs.cz). Students of this type of schools start work having the advantage of domestic and foreign experience. Unfortunately, the research into collaboration of subsidiaries of multinational companies with universities proved that cooperation with Czech universities and research institutes is minimal. With regard to the number of subsidiaries of multinational companies represented in the empirical survey, it can be concluded that the level of cooperation is below average. The branches of multinational companies interviewed stated that the cooperation does not exist at all - 27.8% (total 92 branches) or only to a limited extent, 31.4% (104 branches). This is particularly noticeable among the largest foreign investors - Germany, where there is a limited cooperation with universities. High intensity of cooperation is shown only by 4 branches of multinational companies. It confirms the findings of the Ministry of Education, Youth and Sports of the absence of functional cooperation platform between application sector and universities. It is based only on formal declaration without significant results demonstrating the effectiveness of cooperation. In the near future, cooperation is expected between research and industry-based financing from public and private sources through indirect support (tax relief) and the purchase of scientific research results by the commercial sector through vouchers from (Czech) public research institutions and universities. The question in light of the findings remains how the declared support will be reflected in greater cooperation between universities and the application area with regard to benefits for all stakeholders.

The usage of two level random intercept model specifications in the analysis of achievement in mathematics

Fulya Gökalp^{a*}, Serpil Kiliç^b

^a*Yildiz Technical University, Faculty of Arts and Science 34220, "Istanbul", Turkey*

^b*Yildiz Technical University, Faculty of Arts and Science 34220, "Istanbul", Turkey*

Abstract

Hierarchical models are highly useful tools for clustered and multilevel type of data and coefficients can vary by clusters in these models. In this study, several types of two-level random intercept model specifications are used to compare the mathematics scores of 8th grade students from three different safe and orderly levels of schools, after taking into account of variation both between classes and between students within the same class. The data obtained from Trends in International Mathematics and Science Study (TIMSS) 2011, released shortly, which is a large-scale international database and it shows trends in mathematics and science achievements at both 4th and 8th grades. Class size and weekly spent time on mathematics homework are emphasized in school and student levels, respectively. This study is conducted for Turkey, but it can easily be replicated for other countries enrolled TIMSS.

Keywords: two-level random intercept model, TIMSS 2011, mixed models

1. Introduction

School effectiveness studies mostly related to how the structure of schools influences the achievement of students, or the impact of teachers' characteristics on students' learning performance in addition to students' own attitude. As Kreft and Leeuw states; (1998) Cronbach and Webb (1975), Burstein et al. (1978) and Aitkin and Longford (1986) can be count as classical examples of these studies. The development of multilevel modeling in this area emerged during the 1980s among British researchers (see Creemers & Scheerens, 1989; Mortimore, Sammons, Stoll, Lewis & Ecob 1988a, 1988b; Willms, 1987a) and following these studies, hierarchical linear modeling was embraced in the United States (see Arnold, Kaufman & Sedlacek, 1992; Arnold & Sedlacek, 1995; Bryck & Raudenbush, 1989; Mullis, Jenkins & Johnson, 1994) for some national educational studies (Stemler, 2001).

To see the differences between treatments (which are schools or teachers), the most popular technique is ANCOVA, but this technique is not enough to answer the most important question in school effectiveness research which is 'Why do schools differ?' and many others beyond this question (Kreft & Leeuw, 1998, pg. 5). Also, ANCOVA is required the independence of error terms which is not the case for the most of the educational studies. A group of students in the same school or the same class share the same experiences, so it may not be realistic to assume the independence of observations. Moreover, this inevitable feature of educational studies makes the ordinary least square regression mostly inappropriate (Raudenbush & Bryk, 2002).

Especially in educational studies, researchers look for a method which integrates information about individuals and groups they belong to (classes/schools) and also, dependencies between these observations. The

* Corresponding author. Tel.: +90 212 383 44 39.

E-mail address: fulyagokalp@gmail.com

model handles with dependencies, that educational studies researchers look for, had already been used in other area of statistics, named linear mixed models (Hartley and Rao, 1967) or hierarchical linear model (Lindley and Smith, 1972) as in the Bayesian context (Leeuw and Meijer, 2008). The mentioned multilevel types of models are now internationally accepted tool to analyze the nested data which are mostly encountered in educational studies. The analysis part of this study includes different mixed model specifications and diagnostics.

TIMSS is the well-known international study, mainly mentioned in the next section, used for the application of the two-level random intercept model in this study. TIMSS data set has been used in substantive researches. Schreiber (2002) mentions in his study that there are several educational studies to explain achievement just with one factor such as attitude, beliefs, gender, parent education, employment, homework, school size, etc. Even one factor is crucial in these types of investigations; his study and several other educational studies recently include multilevel analysis with TIMSS data set. A multilevel analysis is applied in the present study and it includes both student and school levels variables which are *school safe and orderly* levels, class size as school level variables and weekly spent time on homework as a student level variable. Schools' *safe and orderly* levels are the main variable and they can be counted as one part of environment at the school level. The importance of the environment is highlighted in the education literature, and it influences behaviour of students and teachers and their consequent learning and teaching capacities (Hughes, 1991). Contrary to the well-known reports (Coleman et. al. 1966, Plowden Committee, 1967) which minimize the school effect, recent works show the researches that believe the importance of school effect on students' achievement is growing (Reynolds et. al. 2000, Hammond, 1999). In this study, it is found that *school safe and orderly* levels are significant in achievement; related results and model diagnostics can be found at the very end of the study.

2. Data

The Trends in International Mathematics and Science Study (TIMSS) is a project of the International Association for the Evaluation of Educational Achievement (IEA) and "it measures trends in mathematics and science achievement at the fourth and eighth grades in participating countries (approximately 60) around the world, while also monitoring curricular implementation and identifying promising instructional practices." (Foy et al., 2013). We conduct analyses for mathematics scores of 8th grade students in Turkey released in TIMSS 2011 database. Since the average scale score of Turkey in mathematics is below the TIMSS scale center point (500), it is desire to build an educational model for mathematics score to give a perspective for educationist and policy makers to improve the education quality in this country.

The average age of students at 8th grade is 14, 6928 students from 240 schools at 8th grade participated in 2011 study, %12 of 8th grade students with achievement is too low for estimation. The part of the TIMSS data, which we use, contains information about the mathematics scores which is our dependent variable, *schools safe and orderly* levels and class size (there is only one class per school) which are our school level explanatory variables, weekly spent time on homework which is our student level explanatory variable. The usage of school safety as a school level variable is highly common in educational studies; Mooij, Smeets and de Wit (2011) put emphasize on school safety in their multilevel study, Everett and Price (1995) conclude the necessity of safe environment in the schools. Along with the school level variables, student level variables are used in educational studies; Cooper, Valentine, Nye and Lindsay (1999), Keith and Cool (1992) use homework as a student level variable in their studies, as well. Class size (Mosteller, 1995) or school size (Haller et al., 1993) is also used in some educational studies, and some of them find it significant on students' achievement.

Safe and orderly school scale is a derived variable based on the agreement of teachers to 5 different statements which are related to the location of schools in a safe neighborhood, the degree of feeling safe, schools' security policies and practices, students behave in an orderly manner, the degree of students' respect to the teachers and Cronbach's alpha reliability coefficient of these items for Turkey is 0.85. Factor loadings depending on principal component analysis of these five items are 0.82, 0.84, 0.82, 0.75 and 0.71, respectively. TIMSS assessments

cover a broad types of topics in mathematics; so TIMSS team apply item response theory (IRT) scaling to describe students achievement for analysis and reporting purposes. Mathematics achievement scores used in this study is the linear transformation of proficiency scores which are obtained by the TIMSS team. Descriptive statistics for the related data set is following:

Table 1. Descriptive statistics for each level of *safe and orderly* schools (treatment) and weekly spent time on homework

Analysis Variable: Mathematics Score				
School Safety Levels	Weekly Spent Time on Homework	N	Mean	Std Dev
1 = Safe and orderly	More than 3 hours	189	452.74	94.90
	Less than 3 hours	2054	482.38	111.15
2=Somewhat safe and orderly	More than 3 hours	264	438.42	98.10
	Less than 3 hours	3091	447.42	107.16
3 = Not safe and orderly	More than 3 hours	88	405.21	89.14
	Less than 3 hours	922	409.96	92.77

3. Data Analyses

Two-level random intercept model is used to compare the mathematics scores of students from three different *safe and orderly* levels of the schools, after taking into account of variation both between classes and between students within the same class. Since TIMSS data are reported for students nested in classes where only one class sampled for selected schools, the data described in two levels which are student (level 1) and school level (level 2). *Safe and orderly* levels of schools and class sizes (centred to make the intercept interpretable) are taken as level 2 variables, while the weekly spent time on homework is taken as level 1 variable.

Different model specifications are implemented for this study. The first model includes the fixed effects of treatment, weekly spent time on homework, class size and the interaction between treatment levels and weekly spent time on homework in addition to a random effect associated with the intercept for each class and a residual associated with each mathematics score (Model 1). "proc mixed" in SAS (Littell et al., 1996) is used as an analyses procedure for each of the model specifications, it can be done in R with lme() function as well as HLM2 procedure in HLM. Following the first step, we test whether we should add class effect as a random effect or not. It is implemented by omitting random statement in the previous model. Different covariance structures for the residuals are tried to decide whether we use homogenous or grouped heterogeneous residual variances for the following models. The selection of variables and interactions are tried as a last step of the study. The data used for the present study is an unbalanced data, which is a common situation in educational studies, iterative numerical procedures are used to estimate in such cases (Raudenbush & Bryk, 2002). Detailed information will be given in hypothesis tests part, following the current section.

4. Model Specifications and Hypothesis Tests

The model of the present study is a combined hierarchical model includes the level 1 and level 2 predictors ($\beta_1, \beta_2, \beta_3$ and β_4), cross-level terms (β_5 and β_6), and the composite error ($u_j + \varepsilon_{ij}$). Since this model includes both fixed and random effects; it is named as linear mixed model (Gill, 2003). Different than the classical regression model, this model allows heterogeneous variance structures of the error terms (Sullivan et al., 1999). Moreover, this model is suitable to count for the dependencies between students in the same class; which is not possible with a classical regression approach. If the dependencies among students within the same class or school are ignored, this would lead to produce spurious 'significant' results (Hox, 2010). We give hypothesis tests in this part of the study, the related test results are placed in the results part.

Model 1: Mathematics scores (predictors) are specified on students $i=1 \dots n$ within j -th class $j=1 \dots J$ as following:

$$\begin{aligned} \text{Score}_{ij} = & \beta_0 + \beta_1 \times \text{SchoolSafety}(1)_j + \beta_2 \times \text{SchoolSafety}(2)_j + \beta_3 \times \text{Homework}(1)_{ij} + \beta_4 \times \text{ClassSize}_j \\ & + \beta_5 \times \text{SchoolSafety}(1)_j \times \text{Homework}(1)_{ij} + \beta_6 \times \text{SchoolSafety}(2)_j \times \text{Homework}(1)_{ij} \\ & + u_j + \varepsilon_{ij} \end{aligned}$$

$$u_j \sim N(0, \sigma_{class}^2)$$

$$\varepsilon_{ij} \sim N(0, \sigma^2)$$

In this model, mathematics score that must be in the lowest level of analysis is the outcome variable, class size, schoolsafety(1) and schoolsafety(2) are level 2 indicator variables, while homework(1) is a level 1 indicator variable. u_j is the random effect which is permitted to vary across classes and ε_{ij} represents residuals which will have different variance structure in the following models. It is taken to be the same for all levels of treatment in model 1.

For model 2, the random effect is omitted to check whether to keep the random class effects or omit them.

Hypothesis 1:

$$H_0 : \sigma_{class}^2 = 0$$

$$H_A : \sigma_{class}^2 > 0$$

To test this hypothesis a likelihood ratio test is used by subtracting -2 REML log-likelihood value of the first model from the corresponding value for our nested model which does not include random effects. Following the model 2, we try to select a covariance structure for residuals by trying heterogeneous residual variances for *safe and orderly*, *somewhat safe and orderly* and *not safe and orderly* schools (Model 3):

safe and orderly: $\varepsilon_{ij} \square N(0, \sigma_{so}^2)$

somewhat safe and orderly: $\varepsilon_{ij} \square N(0, \sigma_{sso}^2)$

not safe and orderly: $\varepsilon_{ij} \square N(0, \sigma_{nso}^2)$

The within-class variance in *not safe and orderly* schools seems to be smaller than the within-class variance in *safe and orderly* schools and *somewhat safe and orderly* schools, so for the next model, we try a common residual variance for these two levels of schools (Model 4). Another REML-based likelihood ratio test is used for the common residual variance structure. (We did not add some steps in between to give the compact information about model selection part.)

safe and orderly/somewhat safe and orderly : $\varepsilon_{ij} \square N(0, \sigma_{so/sso}^2)$

not safe and orderly: $\varepsilon_{ij} \square N(0, \sigma_{nso}^2)$

Hypothesis 2:

$$H_0 : \sigma_{so/sso}^2 = \sigma_{nso}^2 = \sigma^2 \text{ (homogenous variance structure)}$$

$$H_A : \sigma_{so/sso}^2 \neq \sigma_{nso}^2 \text{ (pooled variance structure)}$$

For the next step, we test whether to keep *safe and orderly* school levels and weekly spent time homework interaction with following hypotheses (Model 5):

Hypothesis 3:

$$H_0 : \beta_5 = \beta_6 = 0 \text{ (interaction effects)}$$

$$H_A : \beta_5 \neq 0, \beta_6 \neq 0$$

For the last model (Model 6), we use the same residual variance structure but without interaction effects. The last hypothesis is not about model selection, it is used to test whether the fixed effects associated with school levels are equal to zero in our final model.

Hypothesis 4:

$$H_0 : \beta_1 = \beta_2 = 0 \text{ (fixed effects)}$$

$$H_A : \beta_1 \neq 0, \beta_2 \neq 0$$

It is assumed that the random effects are associated with the class-specific intercept for all models.

5. Results

Since the test statistics for hypothesis 1 is significant ($p < 0.001$), the random effects associated with class-specific intercepts are retained in the model. A grouped residual variance structure is preferred model, the test statistics for hypothesis 2 is significant ($p < 0.001$). After constructing the model with a random intercept associated with each class and grouped variance structure for the residuals, the reduction of non-significant interaction or fixed effects is checked with hypothesis 3 and 4. The treatment by spent time on homework interaction is removed from the model, since the test statistics for hypothesis 3 is not significant ($p = 0.29$). Hypothesis 4 is the last one of this part and the test statistics indicate significance of treatment levels ($p < 0.001$). We can test hypothesis 6 with ML-based likelihood ratio test by fitting model 5 and model 6 using ML estimation and the same hypothesis can be tested with the type III F-test. Related test values can be found the table below:

Table 2. Hypothesis test results

Hypothesis Label	Test	Estimation Method	Models Compared (Nested vs. Reference)	Test Statistic Value(*)	p-Value
1	LRT	REML	2 vs. 1	$\chi^2_{(0;1)} = 80304.3 - 78851 = 1453$	< 0.00
2	LRT	REML	1 vs. 4	$\chi^2(1) = 78851 - 78825.4 = 25.6$	< 0.001
3	Type III F-Test	REML	4(**)	F(2,2433) = 1.21	0.29
4	LRT	ML	5 vs. 6	$\chi^2(2) = 78896.7 - 78862.9 = 33.8$	< 0.001
4(Alternative)	Type III F-Test	REML	6	F(2,232) = 18.21	< 0.001

LRT: Likelihood Ratio Test

(*): 'For nested models, the difference in deviance has a chi-square distribution with degrees of freedom equal to the difference in the number of parameters that are estimated in the two models' (Hox, 2010, pp.16)

(**): F-test for the fixed effects associated with treatment \times homework based on the fit of model 4 is used.

The main effects which are the levels of *safe and orderly* schools are both positive and significant ($p < 0.01$). It is estimable from these results that the mean mathematics score of students in *safe and orderly* schools and *somewhat safe and orderly* schools are 69.68 and 37.17 higher, respectively, than the mean math score of students in *not safety and orderly* schools (Related results are placed at Table 3).

The main effect of weekly spent time on mathematics homework is significant ($p < 0.001$) and has negative effect on mathematics scores of students. It is estimable from these results that the mean math score of students

who spent more than three hours on homework 12.45 lower than students who spent less than three hours for math homework. Even the negative coefficient for *weekly spent time on homework* seems nonsense; it may be caused by students who have problems with mathematics spending more time on homework which is the same situation in the educational study of Leeuw and Meijer (2008). Lastly, class size is not statistically significant ($p=0.678$). Although there are some studies (Mosteller 1995) find class size significant on students' achievements, our result is similar to the one that Woessman (2003) finds non-significance for East Asian countries. Related results can be found at the table below:

Table 3. Solution for fixed effects

Effect	School safe and orderly	Weekly spent time on math	Estimate	Standard Error	DF*	t Value	Pr > t
Intercept			404.13	18.1708	233	22.24	<.0001
SCHOOLSA	Safe and Orderly		69.6786	12.1118	223	5.75	<.0001
SCHOOLSA	Somewhat Safe and Orderly		37.1664	11.4654	222	3.24	0.0014
SCHOOLSA	Not Safe and Orderly		0
(Control Group)							
WEEKLYSP		3 Hours Or More	-12.4525	4.2245	6366	-2.95	0.0032
WEEKLYSP		Less Than 3 Hours	0
(Control Group)							
SIZE			0.1925	0.4636	236	0.42	0.6784

*Degrees of freedom for t statistics are computed by using Satterthwaite method in SAS

In addition to the results defined above, we show the similarity of students within a class with intra-class correlation coefficients which calculated by using the estimated variance components from the last model. While the estimated ICC measures of two groups are quite close to each other, the estimated ICC is lower for the pooled group; since there is more within-class variation in that group.

$$\text{Not Safe and Orderly: } ICC_{class} = \frac{\sigma_{class}^2}{\sigma_{class}^2 + \sigma_{not\ safe\ and\ orderly}^2} = \frac{3089.57}{3089.57 + 6589.78} = 0.32$$

$$\text{Safe and Orderly (1) Somewhat Safe and Orderly (2): } ICC_{class} = \frac{\sigma_{class}^2}{\sigma_{class}^2 + \sigma_{1/2}^2} = \frac{3089.57}{3089.57 + 8517.26} = 0.27$$

After refitting the last model without class size variable, the formula of the predicted mathematics scores of a student i from class j is as following:

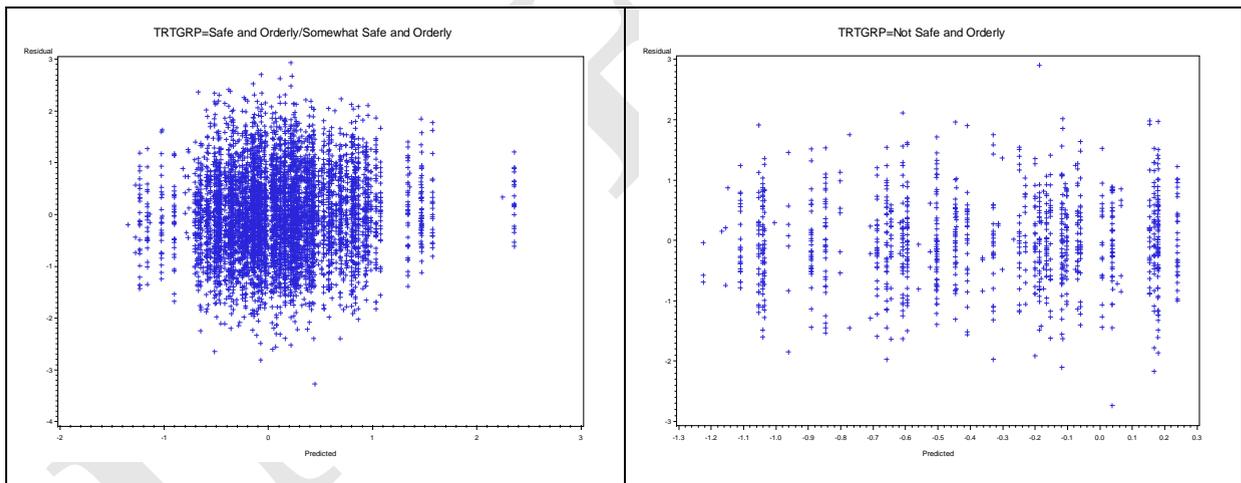

$$Score_{ij} = 404.13 + 68.68 \times SchoolSafety(1)_j + 34.68 \times SchoolSafety(2)_j - 12.47 \times Homework(1)_{ij} + \hat{u}_j$$

The predicted value of u_j (EBLUP) is the random class effect for the j -th class, each class (so do school) has its own model. SAS provides the conditional predicted values for each student under *outpred* option placed in an output data set. Mathematics scores are mostly the same for all students in a particular class. However, it differs for some students because of weekly spent time on homework which is a student-specific variable in the model.

6. Model Diagnostics

The conditional residuals for the last model are saved on a file with *outpred* option in *proc mixed* procedure for the implementation of model diagnostics. Normality assumption is checked for pooled group and not safe and orderly group separately and p-values for the normality tests are 0.01 and 0.50, respectively. Normality assumption is violated for the first group but not for the second one. Checking the plot of the conditional raw residuals vs. predicted values by each level of treatment groups, we do not observe constant variance for not safe and orderly schools (right panel), and we do not see the exact constant variance situation for the pooled group (left panel). Related graphs are followings:

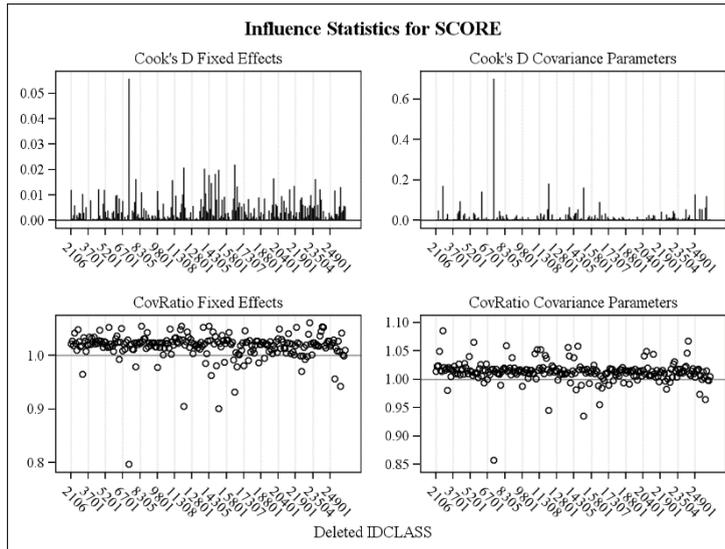

Figure 1. Scatterplots of conditional raw residuals vs. predicted values in safe and orderly/somewhat safe and orderly group (left one), and not safe and orderly group.

We use boxplots of each litter with studentized residuals and observe some outliers, but omitting these students does not make any differences on results; we say they do not influence the final estimates of fixed effects (this paper does not includes them because of the space limits). Figure 2 shows the effect of deleting one class at a time on the Cook's D and CovRatio of fixed effects (left panels) and covariate parameters (right panels). Class 7302 which belongs to the pooled group has a large influence according to these graphs, and the last model is

refitted excluding this class. It makes any differences on fixed effect parameters and a little difference on estimated residual variance for the pooled group. It could be important to state that mixed models are well designed models for the missing data and unbalanced data.

Figure 2. Influence Statistics for Mathematics Score

7. Comments

Since the focus of this study is mostly on the model specifications, particularly the pooled variance structure, we try not to use too many variables; rather we choose four distinctive variables. This study is conducted for mathematics scores of 8th grade students in Turkey released in TIMSS 2011 database, but it can easily be replicated for science scores and for other countries enrolled TIMSS. However, researchers should be careful about countries characteristics, different dynamics of countries may lead to concentrate on different types of models (Delaney, 2000). After checking educational studies in the literature, the exponential increase in the interest on students' achievement in national and international manners is observed. We plan to enlarge the study with more variables and to implement country based-comparison studies.

This study shows a snapshot of achievement at one point in time from a cross-sectional sample of students from Turkey. In addition to this type of studies, the observation of development in a particular country is possible with the comparison of scores from several assessments. This type of studies are needed more complex structures. Related examples and more are found about multilevel analysis in Handbook of Multilevel Analysis (Leeuw and Meijer, 2008), in Linear Mixed Models (West et. al. 2007) which is mostly emphasized on applying software packages and Introducing Multilevel Modeling (Kreft and Leeuw, 2002).

As Keeves (1995, pp.169) states "national development is sustained by an educational system of high quality which provides not only a well-trained work force but also a well-educated citizenry", we aware the importance of education and the value of each work for the development of education.

4th International Conference on New Horizons in Education

The use of a simulation model to assess the problem of enterprise competitiveness

Tleuberdiyeva Gulnara Isabekovna *

Kazakh Economic University named after T.Ryskulov, Jandosov street, 55, Almaty, Kazakhstan

Abstract

At this point in the international community has developed a tendency to use technology to help improve the competitiveness of educational institutions. The purpose of this paper is to determine the role of simulation in the field of modern education as one of the innovative technologies. This article shows the possibility of using simulation in the economic processes on the example of assessing the competitiveness of the insurance company. Also the article covers a review of available software simulation and helps to make reasoned choice of one of the simulation tools.

Keywords: innovative technology, simulation, modeling tools, competitiveness, the flow of events

1. INTRODUCTION

The prospect of development of the education sector as a factor of socio-economic and intellectual potential of society is to improve the quality of education. Techniques used for this purpose, leading ultimately to an increase in the competitiveness of the institution and the specialists prepared by that institution. Improvement of quality of education can be achieved through training and re-training human resource, timely renovation of technology and access to global information resources, as well as using new information technologies. One of the innovative learning technologies is simulation. First of all, the aim is to build a simulation model adequately phenomena, processes, structure of reality.

Completed model will depend on the setting of the problem, as well as the experience and capabilities of the developer. That is, for a research subject many different models can be built. Secondly, in the experiments with the developed models different situations can be reviewed by changing the parameters, and it is possible to select a particular solution. Furthermore, by examining the behavior of a simulation model can be found and new features and patterns that influence the result. Building a simulation model and conduction simulation experiments are active teaching methods, the use of which leads to an increase in the quality of students' knowledge. Testing phase of the model can be compared with the game. In the book Clarin M.V. (1995) "Innovation in the global pedagogy: teaching based on research, games and discussions. (The analysis of foreign

* Corresponding author. Tel.:+7 705 180 50 70
E-mail address: tgi71@mail.ru

experience)", the notion of "game", from psychological point of view, is presented as a model of social interaction, a means of learning attitudes. Simulation models can be created in the form of a training program and in the form of a game. It becomes possible to conduct "what if" experiments, you can analyze the behavior of the model when you change certain conditions. In the transition from the simplest examples of simulation to complex models is recommended to involve groups of students. As a result, students gain practical knowledge and teamwork experience, develop communication skills, become responsible and initiative. The use of simulation techniques forms the students' skills, such as the ability to correctly analyze the problem under study, correctly formulate the statement of the problem, identify the target and set the algorithm to achieve it, the ability to produce the optimal solution and justify it.

2. Research

As an example of the use of simulation in the economic sector consider the formulation of the problem of research objects of the insurance market in the Republic of Kazakhstan, in a formalized manner and choice of simulation software. Analysis of competition leads to the formation of techniques to improve the competitiveness of the object of considered industry. Since the concept of competitiveness is a complex category that affects the strategy and also tactics of the object, researcher should refer to some formalization of objects. For this purpose we make an attempt to structure the characteristics and factors of competitiveness object. At this point it is important to note the granularity of developed model. The desire to build a simulation model close to real object with adequate results of work often leads to redundancy characteristics of the object involved. The high granularity causes the increase of the project cost and complexity of the structure of the simulation model.

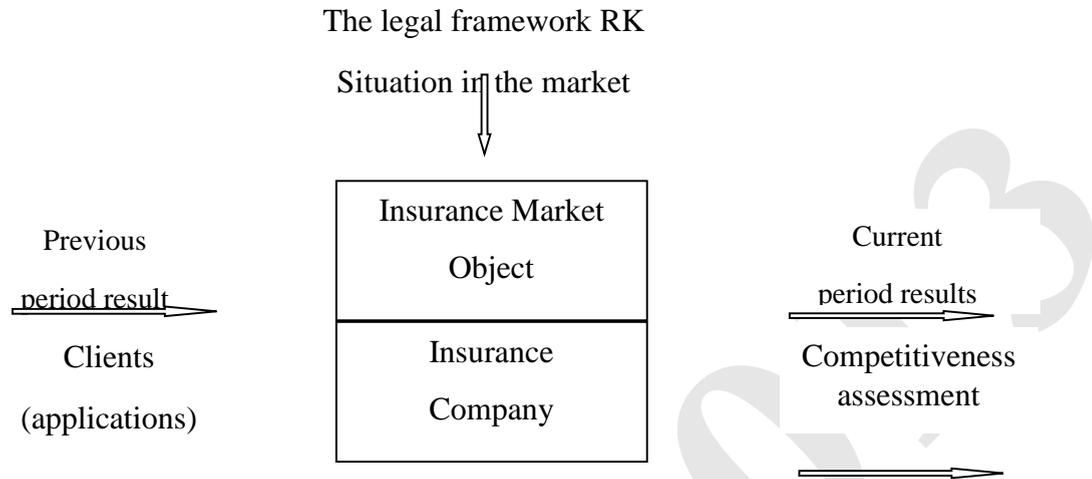

Objects of the market can be described in terms of business management, marketing management activity or motivation of labor, etc. That is, there arises the problem of selecting those aspects of the object that are appropriate for the task of the study. Every economic entity characterized by a certain financial status at any point in its life cycle.

Let $Q_i(x_1, x_2, \dots, x_n)$ - the object of the insurance market, where $i \in \overline{(1, S)}$,

S - the number of objects considered the industry,

x_j - the model parameters, n - number of selected parameters.

As the model parameters we take the main characteristics of the financial condition, such as financial stability, solvency, profitability, liquidity, investment attraction. As the main data base for calculating the coefficients of financial condition we will consider publicly available reports of insurance companies, such as balance sheet and income statement. Then the simplified scheme of informational flow of insurance company can be displayed as follows:

Picture 1. Informational Flow Scheme

Application or a contract of insurance is the main element that forms the financial performance of the organization. The set of applications pending and waiting for their turn, and the insurance company in a formalized representation in the form of a multi-channel unit can be seen as a queuing system. Since the flow of applications for insurance contracts at a specific interval of time in no way depends on where is the considered time interval on the time axis, we can conclude that the flow of applications is stationary. In addition, insurance contracts have the same priority. When considering corporate clients we can talk about grouping conventional insurance contracts. From the previous arguments, we conclude that the flow of applications is homogeneous and non-ordinary. The flow of events has the property of absence of aftereffects, because the number of applications in some period of time does not depend on the number of applications in another interval of time. Customers look to the insurance organization, independently of each other, because each of them is motivated differently. So, we can say that in this case there is a simple flow of events, i.e. a stationary Poisson process. Then, the distribution function can be written as

$$F(t) = 1 - e^{-\lambda t},$$

where λ - the average number of events per unit of time, t - time.

By differentiating, we obtain the distribution density

$$f(t) = \lambda e^{-\lambda t},$$

Lets calculate the expected value

$$M[t] = \int_0^{\infty} t f(t) dt = \lambda \int_0^{\infty} t e^{-\lambda t} dt = \frac{1}{\lambda}$$

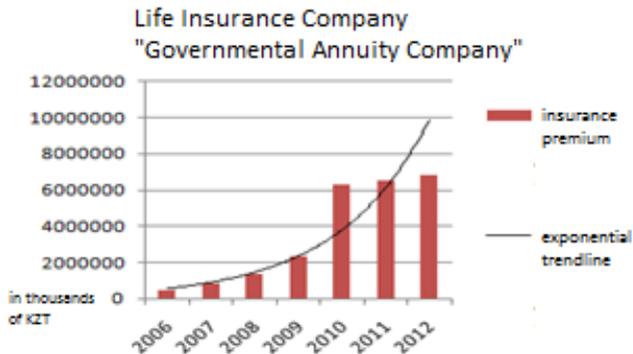

The dispersion is equal to

$$D = M[t^2] - M^2[t] = \frac{1}{\lambda^2}.$$

The probability that k events occur in T time can be found out by Poisson law

$$P_k(T) = \frac{e^{-\lambda T} (\lambda T)^k}{k!}.$$

Each of the accepted application (contract) as a result brings a certain amount in revenues. Income of insurance organization implicitly reflects the number of existing and new contracts in monetary terms, then the data for a certain period of time can be represented as a bar graph and we can draw a trend line (Picture 2).

Picture 2. Trend line according to "Governmental Annuity Company" company data

Simulation includes three main types of modeling based on discrete-event approach, system dynamics and agent-based modeling. There are a large variety of software that implement the task of simulation, for example Plant Simulation (Tecnomatix, eM-Plant), Stella, iThink, Pilgrim, Arena, AnyLogic, product family GPSS (GPSS Cloud, GPSS / H, GPSS / PC, GPSS World , WebGPSS). As modeling tools can use universal mathematical systems with MATLAB SIMULINK library or set of Mathcad and VinSim (Visual Simulation). For the system dynamics are more commonly used tools: iThink, ModelMaker, PowerSim, VenSim. Most modeling tools are suitable for discrete-event approach.

Developers of simulation models usually use special modeling tools. Simulation models allow conducting a large number of experiments in which we can solve optimization problems, and also make possible to choose the most appropriate solution in the resource management, in planning the strategy and tactics of the enterprise. The article "Some aspects of the adequacy of the simulation of discrete-event processes" (2011) Boev V.D. considers various problems, such as determining expected value of production of some number of details for the period of time, the model of the network connection, the model of providing repair services, as well as the solution of inverse problems. Were used software products as GPSS and AnyLogic, and the results do not differs a lot. Thus, it can be concluded that it is possible to apply any of these products. According to the article of Ingolf Stall (2001) GPSS has a half century of development history [2], but is still widespread in the present. But taking to account the fact that the GPSS user interface, models editor are less efficient than modern simulation tools, we decided to use AnyLogic. Using the methods of system dynamics, we can conduct a financial analysis of the market object for competitiveness. The task of assessing the competitiveness is multifactorial, i.e. requires an analysis of the influence of the parameters on the behavior of the modeled system. In AnyLogic implemented a simple experiment, optimization, Monte Carlo simulation, sensitivity analysis, calibration, custom experiment etc. In AnyLogic realized a wide range of tools for the task, and it is possible to use visual aids, such as charts, in a dynamic way. In addition, the AnyLogic you can switch from using discrete-event approach to agent-based modeling, or in one large model combine different approaches. The article of the authors Vlasov S.A., Devyatkov V.V., Devyatkov T.V. (2009) "Universal Modeling Environment for the development of simulation applications," noted the reduction of time and resources on the creation of simulation applications.

3. Conclusion

Simulation modeling is an important and demanded tool for many disciplines, including in the economic sphere. Nowadays a lot of attention is paid to factor in competitiveness across countries, industries, businesses. The task of evaluating the competitiveness is multifactorial, thus, requires analysis of the influence of parameters on the behavior of the modeled system. Using the methods of discrete-event simulation modeling approach, it is possible to conduct a financial analysis of the object for the competitiveness in the market. Simulation business games allow developing management skills, to analyze the quality and the results of experiments. Within the simulation solved the problem of active learning, support of decision making, design and research processes of the real world.

Abstract

The aim of this study is to determine the views of pre-service classroom teachers about nature of technology, the relationship between technology and science, the relationship between technology and society, and social construction of technology. Pre-service classroom teachers have been joined in this research. In order to determine the pre-service teachers' views about the nature of technology "Views on Science-Technology-Society (VOSTS) which was designed by Aikenhead, Fleming and Ryan (1989) instrument was used. Seventeen questions has been selected form VOSTS and adopted to the Turkish. At the end of the research, 4th class pre-service classroom teachers have more realistic views on relationship between technology and science, influence of technology on society than other pre-service classroom teachers. 3rd class pre-service classroom teachers have more realistic views on important of technology for research and development than other pre-service classroom teachers. It has been reached that pre-service teachers have misconceptions about the nature of technology. Although the pre-service teachers have acceptable views about definition of technology, these pre-service classroom teachers have realistic views about influence of society on technology. However, the pre-service teachers have inadequate views about relationship between technology and science, because the pre-service teachers not know the technology advancing as independent from science.

Keywords: Views on nature of technology, Pre-service Classroom Teachers, Misconception, Science, Technology, Society.

1. INTRODUCTION

It has been stated in many sources that '*Individual's understanding of technology and its mutual interaction with science and society*' is one of the aspects of scientific literacy which is one of the most important objectives of modern science education (AAAS, 1993; NRC, 1996; YÖK, 1997; Hurd, 1998; Bybee, 1999; Murphy, 2001). When we look at the acquisitions in Science, Technology, Society and Environment (STSE) learning domains, we see the nature of science and technology (MEB, 2005; MEB, 2006).

Being related with science, encompassing the design, encompassing the production, being multidimensional, being related with values, shaping the society and being shaped by the society exist in the nature of technology. Technology can develop new products by benefiting from the information provided by fields of science. The tools developed by technology can contribute to revealing new scientific information. For instance, tools like

* This study was prepared by Yusuf Zorlu, " Investigation of the preservice science and technology teachers? and preservice classroom teachers? wiews on nature of technology "'s thesis is based on the Master's Degree.

telescopes and microscopes were invented as our knowledge on optics advanced. These tools provided opportunity to discover new celestial bodies, to better understand the structure of living things, and to diagnose and treat diseases (Çepni and Çil, 2009).

Science constitutes humankind's efforts to understand and explain the physical universe (Türkmen, 2006). According to Bertrand Russell, science is the effort to find the laws that bind together the phenomena regarding the world and the universe via observation and observation-based expression. Einstein, on the other hand, defines science as an attempt to make the chaotic diversity of our sense experience correspond to a logically uniform system of thought (Aydm, 2009). The word technology means "a craft that comes from knowledge" in ancient Greece (URL-1). The concept of technology, which has been used to define "systematic behavior" since the 17th century, has fundamentally gained a broader meaning since the 20th century (Çelik, 2006). Technology constitutes the changes that people make in order to live more easily (Kıyıcı, 2007). Technology is composed of the entirety of the changes that people make in the natural environment in line with their aims (Rose ve Dugger, 2003). The relationship between science and technology comes from the fact that science constitutes the studies that are conducted in order to understand the natural world. Technology constitutes the changes that people make in the natural world using their abilities. Science and technology are different from each other, but they exist together. Technology covers much more than the implementation of science. Similarly, science covers much more than the implementation of technology (ITEA, 2000). There is a close relationship between technology and science. Technology can develop new products by benefiting from the information provided by sciences. The tools developed by technology can contribute to revealing new scientific information. For instance, tools like telescopes and microscopes were invented as our knowledge on optics advanced. These tools provided opportunity to discover new celestial bodies, to better understand the structure of living things, and to diagnose and treat diseases (Çepni, 2009). There is a close relationship between society and technology. Technology affects every phase of society. Technological advancements affect society positively or negatively. Technological developments occur in line with the social structure, cultural structure, demands and requirements of society. Characteristics of societies affect technology positively or negatively (Zorlu, 2011). Technology is not independent from the society in which it was born and developed. Social change arises out of the interpersonal changes that are fundamentally affected from the technological change. A technological invention becomes a part of our daily lives every day and even every hour. The world is gradually becoming smaller. We can have all kinds of communication facilities wherever we are thanks to cell phones, fax machines and emails. All kinds of news ranging from various cultural activities to incidents like wars or famine are immediately conveyed to our homes on a regular basis. Internet is used by millions of people around the world. Televisions, telephones and computers will soon become the products of a single technology (Tambini, 2000).

A scientifically literate individual is a person who knows what technology is, how it emerged, how it shapes society and how it is shaped by society. These individuals are impartial and comfortable in the use of technology. They know why technology and its use are important for the country as well as the effects of technology on environment. Scientific and technological literacy mean individuals' developing their skills of questioning, critical thinking, problem solving and decision-making; their becoming the individuals who keep on learning throughout their lives; their constant curiosity towards the world; and their having the required science-related skills, attitudes, values, understandings and information (MEB, 2005).

2. Method

This study is a survey study that aims to depict the views of pre-service classroom teachers on the nature of technology.

2.1. Research Problem

What do pre-service classroom teachers think about the nature of technology in terms of their class levels?

2.2. Population and Sample

The universe of the research is composed of pre-service classroom teachers. The sample of the research is composed of the pre-service classroom teachers who are third-year and fourth-year students at the Faculty of Education in Firat University.

2.3. Data Collection Tool

2.3.1. Survey Views on the Nature of Technology (VOSTS)

Pre-service classroom teachers have been joined in this research. In order to determine the pre-service teachers' views about the nature of technology "Views on Science-Technology-Society (VOSTS) which was designed by Aikenhead, Fleming and Ryan (1989) instrument was used. This survey used changing "Survey Views on the Technology" adapted to the Turkish by Aydın (2009). This Survey Views on the Nature of Technology consists of seventeen questions which are about technology (two questions), the relationship between technology and science (four questions), the relationship between technology and society (eight questions), and the social construction of technology (three questions).

2.4. Data Analysis

Regarding the quantitative data, a descriptive statistics study was conducted in order to depict the participating pre-service teachers' views about class level. The obtained descriptive statistics were compared with the data that was obtained from the survey views on the nature of technology. Then, they were analyzed with the chi-square test.

3. Findings and Interpretation

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in this question that was related to the definition of technology ($p > .05$) (Table 1). It is observed that the pre-service classroom teachers generally have an has merit of view.

Table 1. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 1 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	22,9	51,4	25,7
3.Clasroom P.C.T	20,0	63,8	16,3

$p > .05$

Technology is important for the research and development in the industry. According to the chi-square test, a significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question that asked what research and development in industry generally meant ($X^2= 6.41$; $p=.041$) (Table 2). It is observed that the third-year pre-service classroom teachers embraced a more realistic view than the fourth-year pre-service classroom teachers. It is observed that the fourth-year pre-service classroom teachers embraced an has merit that “Research is exploring new facts, ideas and information. Development is putting them to use by coming up with new and creative ideas”.

Table 2. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 2 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	10,8	64,9	24,3
3.Clasroom P.C.T	23,2	40,2	36,6

$X^2= 6.41$; $p=.041$

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to the relationship between technology and science ($p>.05$) (Table 3). It is observed that the pre-service classroom teachers generally have a realistic point of view.

Table 3. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 3 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	13,9	11,1	75,0
3.Clasroom P.C.T	24,7	20,7	53,7

$p>.05$.

According to the chi-square test, a significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question that was related with the relationship between technological researches and scientific researches ($X^2= 14.64$; $p=.001$) (Table 4). It is observed that the fourth-year pre-service classroom teachers have a more realistic view than the third-year pre-service classroom teachers. It is observed that the fourth-year pre-service classroom teachers embraced a realistic view that “Because science and technology interact and complement each other equally”. It is observed that the third-year pre-service classroom teachers rather embraced an has merit that “Because scientific knowledge is needed to make technological advances”.

Table 4. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 4 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	11,1	19,4	69,4
3.Clasroom P.C.T	34,6	33,3	32,1

$X^2= 14.64$; $p=.001$

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to the fact that technology does not always require scientific discoveries ($p>.05$) (Table 5). Technology can advance with science or on its own. When we look at Question 5 of the survey that was written around this main idea, it is observed that the pre-service teachers generally have a naive point of view.

Table 5. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 5 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	57,1	42,9	0
3.Clasroom P.C.T	56,9	38,7	2,7

$p>.05$.

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to the relationships among the existence of good technology experts in society, providing more science courses in schools for the students in society and the advancement of technology ($p>.05$) (Table 6). It is observed that the pre-service classroom teachers generally have a realistic point of view.

Table 6. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 6 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	11,1	5,6	83,3
3.Clasroom P.C.T	18,2	19,5	62,3

$p>.05$.

Science and technology penetrate into our lives very rapidly. Only individuals who know how to utilize science and technology will be able to advance technology in the future. The use of technology in the future by society depends on the support given to scientists, engineers and technicians. This also depends on how students who will form the societies of the future use science and technology. According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in Question 7 of the survey ($p > .05$) (Table 7). It is observed that the pre-service classroom teachers generally have a realistic point of view.

Table 7. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 7 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	2,8	11,1	86,1
3.Clasroom P.C.T	6,1	25,6	68,3

$p > .05$.

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to the degree to which technology help people make some moral decisions ($p > .05$) (Table 8). It is observed that the third-year pre-service classroom teachers generally have a realistic point of view whereas the fourth-year pre-service classroom teachers generally have an naive point of view.

Table 8. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 8 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	58,8	5,6	35,3
3.Clasroom P.C.T	36,5	10,3	52,7

$p > .05$.

According to chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question that was related with the effect of technology on legal decisions of the individuals in society ($X^2 = 11.94$; $p = .003$) (Table 9). It is observed that the fourth-year pre-service classroom teachers have a more realistic point of view than the third-year pre-service classroom teachers. It is observed that the fourth-year pre-service classroom teachers rather embraced a realistic view that “By developing ways to gather evidence and by testifying about the physical facts of a case”.

Table 9. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 9 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	25,0	5,6	69,4
3.Clasroom P.C.T	58,2	6,3	35

$X^2= 11.94$; $p=.003$

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question that was related with the fact that utilizing technological developments will affect society negatively or positively, and the positive and negative effects of technological developments on society must be balanced ($p>.05$) (Table 10).. It is observed that the pre-service classroom teachers generally have a realistic point of view.

Table 10. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 10 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	13,9	5,6	80,6
3.Clasroom P.C.T	26,3	8,8	65,0

$p>.05$.

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to the fact that technology offers help in resolving our social problems ($p>.05$) (Table 11). It is observed that the pre-service classroom teachers generally have a realistic point of view.

Table 11. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 11 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	10,8	5,4	83,8
3.Clasroom P.C.T	20,3	3,8	75,9

$p>.05$.

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to the fact that the more technology develops in a society, the more that society develops in parallel with this development ($p>.05$) (Table 12). It is observed that the pre-service classroom teachers generally have an has merit of view.

Table 12. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 12 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	8,3	52,8	38,9
3.Clasroom P.C.T	5,1	57,0	38,0

$p>.05$.

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question that was related with the relationship between technological development and our standards of living ($p>.05$) (Table 13). It is observed that the pre-service classroom teachers generally have an has merit of view.

Table 13. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 13 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	13,9	44,4	40,5
3.Clasroom P.C.T	18,8	57,5	23,5

$p>.05$.

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to whether or not the use of a new technological development depends on its functioning, and if so, the degree to which the use of a new technological development depends its functioning ($p>.05$) (Table 14). It is observed that the fourth-year pre-service classroom teachers mostly have a realistic point of view whereas the third-year pre-service teachers have an has merit of view.

Table 14. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 14 of the VOSTS-TR survey in terms of their class levels.

4.Clasroom P.C.T	0	38,9	61,1
3.Clasroom P.C.T	3,7	20,7	75,6

$p > .05$.

According to the chi-square test, no significant difference was found among the views of the pre-service classroom teachers in terms of their class levels in the question related to technological developments and controlling these developments ($p > .05$) (Table 17). It is observed that the pre-service classroom teachers generally have an has merit of view.

Table 17. The Chi-square test results of the answers given by the pre-service classroom teachers to Question 17 of the VOSTS-TR survey in terms of their class levels.

Groups	Naive (%)	Has Merit (%)	Realistic (%)
4.Clasroom P.C.T	0	73,0	27,0
3.Clasroom P.C.T	1,2	57,3	41,5

$p > ,05$.

4. Results

It was observed that the pre-service teachers predominantly thought of computers, Internet or electronic devices when they were asked what technology was. It is observed that there are similar results in related studies that have been conducted in the literature (Ryan ve Aikenhead, 1992; Volk and Dugger, 2005; Yalvaç et al, 2007). It was observed that the pre-service teachers had knowledge on technology, but this knowledge was not at the level of realistic view, that is to say, they had incomplete knowledge. It is observed that the pre-service teachers agreed with the realistic idea that scientific researches will increase technological developments, and technological developments will increase the ability to conduct scientific research while they explained the relationship between science and technology. The fact that technology can advance separately from science was not expressed by any pre-service teacher while they explained the relationship between science and technology. According to the results obtained via the view scale on the nature of technology, it was observed that they stated society had effects on technology. It is observed that the pre-service teachers generally have an naive view on the degree to which technology help people make some moral decisions. It is observed that the pre-service teachers generally have an has meriton the fact that the more technology develops in a society, the more that society develops in parallel with this development. It is observed that the pre-service teachers generally have an has meriton the relationship between technological development and development of our standards of living. It is observed that the pre-service teachers embraced an has merit that the more we know, the better we can solve our problems and gain the strength to become self-sufficient. It is observed that pre-service teachers have a realistic view that if they learn how to use technology, society that knows how to use technology will become more knowledgeable; and furthermore, the society will better understand the technology experts, thereby fulfilling their requirements in a better manner.

4th International Conference on New Horizons in Education

Towards Smart Education: Ambient Intelligence in the Mexican Classrooms

Pedro C. Santana-Mancilla ^{a,*}, Martha Alicia Magaña Echeverría ^b, Juan Carlos Rojas Santos^a, José Alejandro Nieblas Castellanos^a, Alma Patricia Salazar Díaz^c

^a IHCLab, School of Telematics, University of Colima, Mexico

^b School of Pedagogy, University of Colima, Mexico

^c School of Tourism, University of Colima, Mexico

Abstract

The rapid adoption of portable devices, like tablets and smart phones, has allowed students to have access to information directly in the classroom. However, this is not enough. Due to the new trends of interaction with computers and wireless interconnection networks between heterogeneous devices and the growing interest in improving the teaching-learning process, has led to the educational field the application of a discipline known as Ambient Intelligence (AmI) with the purpose of provide intelligence to the ordinary classroom. AmI is a new information paradigm, in which people are immersed in a digital environment that is aware of their presence and context, which also suits their needs. In this research work, we describe a smart classroom, which aims to realize the AmI vision in education. This vision applied in Mexican schools can significantly enhance the educational domain, through personalizing and adapting of the learning environment to enable natural interactions and context aware education in the technologically augmented classroom of the future.

Keywords: Ambient Intelligence; Smart Classroom, Smart Education, Learning Technology.

1. Introduction

The rapid adoption of smart mobile devices and the predominance of laptops used by students, have enabled that school classrooms (especially in advanced degrees) have access to information much faster than previous generations. However, this is not enough.

Some difficulties that face students while studying with computer-supported media are: the resources do not facilitate communication between students, or the exchange of information between them and the professor, the information gathered by students is not always relevant or appropriate to the subject of study presented in class, computers are not able to help with specific exercises made on physical media, such as textbooks, copies and other print materials (Margetis, Zabulis, Koutlemanis, Antona, & Stephanidis, 2012).

With the new trends in natural interaction between the computer and the human, wireless networks between heterogeneous devices and a genuine interest in research to improve learning, has led

* Corresponding author. Tel.: +52-312-316-1059; fax: +52-312-316-1059.
E-mail address: psantana@ucol.mx.

to the application of new technologies in this area to improve the situations described above, as in the case of ambient intelligence (AmI).

The work presented in this paper aims to develop an intelligent classroom, which will use the AmI paradigm to transform the conventional classroom into a context aware environment.

2. Background

For years, the computers miniaturization has allowed their incorporation in our daily lives, a few decades ago it was impossible to think that we would have devices that fit in the palm of a hand with the processing power of a desktop computer, it was not feasible to think in wireless networks of low-power consumption and high-speed, embedded devices that perform thousands of non-invasively functions into our lives. The use of smart mobile devices is so entrenched that there is a new generation of user called digital natives (Bennett, Maton, & Kervin, 2008). Digital natives are used to work with electronic devices and information technologies, most connected to the internet and, in general, for these users are a big part of their daily life. Therefore, new research paradigms as the AmI are growing rapidly (Shadbolt, 2003).

Today, it is difficult to find an area of study that has not been permeated by AmI and do not feel its influence. The systems are being designed so that people do not need prior computer knowledge to be benefited by its use (Augusto & McCullagh, 2007). For example, the graphical interfaces have been augmented with speech recognition, video games have been adapted for use with wireless full-body interaction, wireless communication protocols such as Bluetooth and Zigbee have removed the need for a wired connection.

These devices must be used in conjunction with highly intelligent software to understand the events and the relevant context occurring around the device and from that make rational decisions (Augusto, Nakashima, & Aghajan, 2010), in a digital environment that proactively, but reasoned, supports people in their daily lives (Augusto, 2007).

This set of technologies is aligned to the term "the disappearing computer" (Weiser, 1993):

"The most profound technologies are those that disappear. They weave themselves into the fabric of everyday life until they are indistinguishable from it."

These technological advances bring enormous potential for improving education through more efficient ways, different and innovative (Kinshunk, Sutinen, & Goh, 2003). In addition, academic institutions can use technology to monitor the progress of their students' learning (Cook, Augusto, & Jakkula, 2007).

3. Related work

Next we describe research works that make use of AmI in support of education.

A smart classroom at Northwestern University (Franklin, 1998) use microphones and with the captured information infer the speaker's intentions and thus control the lighting, play videos, flip slides, etc.. The interesting part is that no explicit programming is required to interact with the system; natural actions of users enable appropriate responses in the environment.

The iClass architecture (Ramadan, Hagra, Nawito, Faham, & Eldesouky, 2010) is a classroom with multiple sensors, actuators, processors, and a heterogeneous network. This allows controlling various aspects of the classroom as the air temperature, the opening of shutters, and the intensity of the light in the lamps. All these sensors are hidden from students and teachers so that the user is not aware of the class intelligent infrastructure.

4. Contextual study

Our field work was designed to know the opinions of the actual students of our school, we focus on the services required on a smart classroom on their opinion.

4.1 Methods

We interview 20 randomly-chosen students from different grades from the School of Telematics at the University of Colima.

4.2 Results

Fig. 1 show that 70% of interviewed students unknown what a smart environment is. So we had to explain what is it before continue with the interview.

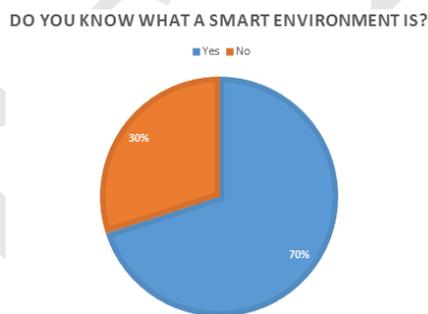

Fig. 1. Answers to question: Do you know what a smart environment is?

Fig. 2 shows that the 20 students interviewed are interested on a smart classroom.

Fig. 2. Answers to question: Would you like that your school has a smart classroom?

Fig. 3 shows the students preference on putting intelligence on the following services of a classroom.

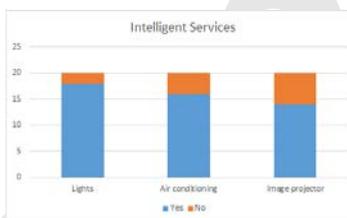

Fig. 3. Answers to question: Desired intelligent services

Finally we ask is they think that a smart classroom will be helpful on their studies, 99% said yes (see Fig. 4).

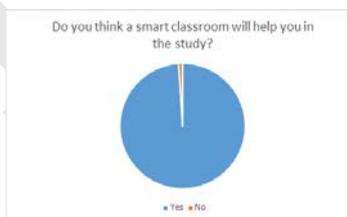

Fig. 4. Answers to question: Do you think a smart classroom will help you in the study?

5. Envisioned system

In order to achieve these issues, we envision that our system needs to address the following aspects:

Support heterogeneous devices. The system must be able to be used in as many devices as possible because there are a very large number of different devices. The idea is that the scope gets to be as broad as possible.

Interface easy to use. The smart environment must have a very small learning curve and be as easy to use as possible.

6. System design

Based on our envisioned system we engaged in the design and development of a prototype of the project, which is described next.

The project consist on two boards (master and slaves) in order to gather and process all the information in the sensor network at the classroom.

The master board is responsible for interacting with the smart classroom, monitoring the temperature, the amount of indoor light and the teacher's presence to turn on the projector, as well a graphic LCD display for monitoring all the components. This card works with a microcontroller Pic18f4550.

The temperature module works with a DHT22 sensor with a temperature range from $-40\text{ }^{\circ}\text{C}$ to $80\text{ }^{\circ}\text{C}$ with a resolution of 0.1. The lighting module has a LDR sensor with high index of lumens and the proximity module uses an ultrasonic sensor.

All modules communicate with the slave boards via the XBee communication module.

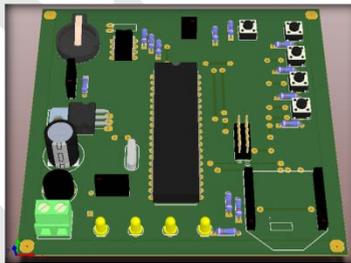

Fig. 5. Master board.

7. Usage scenario

To illustrate the functionality of the system, we present the following scenario of use that describes how the students would interact with the smart classroom:

Sun is shining in all its splendor and it's just a bit too warm to feel comfortable, but as soon as someone walks in the classroom, the fans start spinning and you feel a welcoming breeze. A few minutes later, all that heat leads to storm clouds forming and leaving you in the dark, but suddenly lights go on, automatically, and you start to take notes soon again. Then, your teacher remembers he has a few slides prepared to help you understand that equation you can't master just yet, he approaches the video

projector and connects his laptop. The projector starts doing it's job and lights dim, again, in an automatic way. After this, you can't help but to think "There's no other classroom I'd rather be."

8. Applications

Working on the smart classroom project we realized that creating physical infrastructure was not enough, so we started creating apps to coexist at the intelligent environment.

Augmented reality for secondary education students

We are using mobile augmented reality to allow Mexican secondary education students to access additional educational contents related to their textbooks (see Fig. 6).

Fig. 6. Student with the AR app.

Mexican history through a serious game with physical activation

We are working to create a serious game for children's physical activation. The interaction will be provided through the Kinect.

This game will allow them to learn from the history of Mexico in addition to increasing their physical activity (see Fig. 7).

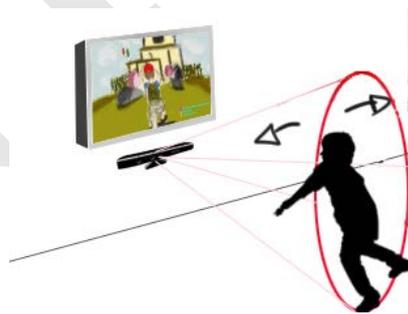

Fig. 8. Serious game.

Natural interactions for learning mathematical concepts

Now we are engaged on developing an app for learning mathematical concepts through the use of natural user interactions. You can find a couple of screenshots of our first prototype.

Fig. 8. MathNUI.

9. Conclusions

This work proposes to improve the learning process by the design of a smart classroom with ambient intelligence. The design process was informed on a contextual study with actual student.

As a general conclusion we can say that the use of smart classroom for education is adequate for the students and the learning process.

4th International Conference on New Horizons in Education

Transfer of scientific research into lifelong learning at the University of Žilina

Mária Rostášová^{a*}, Tatiana Čorejová^b, Alena Chrenková^c

^{abc}University of Žilina, Faculty of Operation and Economics of Transport and Communications, Univerzitná 1, 010 26 Žilina, Slovakia

Abstract

Achieving quality of educational activities within the knowledge transfer from university to business practice is important task for all stakeholders, and especially universities, which mediates the transfer. Educational activity is successful if it fulfils set learning objectives and expectations of interested subjects. The article deals with example of knowledge transfer from the University of Žilina to important company in the Slovak Republic; it describes phases of this activity and through SWOT analysis identifies the main barriers of successful implementation of the project. Following, it contains framework solutions for removing these barriers and highlights the role of participating subjects in improving quality of education and achieving effects that effective knowledge transfer brings.

Keywords: Quality of education, knowledge transfer, lifelong learning.

1. Introduction

The case study presented at the beginning of this paper was prepared as part of the project DIALOGUE. The project aims at bridging the gap between academic research on University Lifelong Learning (ULLL) and the professional practice around adult teaching, learning and guidance within lifelong learning (LLL) provision. By strengthening these links, the project will support the collective production of knowledge and the interactive exchange of information, which reinforces the evolution of LLL and linked benefits for European society. Part of the paper presents case study of educational activity presenting transfer of research results into lifelong learning - "New Trends in Electricity". Within this educational activity, it was a modular structured accredited course that allowed participants to gain new knowledge in the field of generation, transmission and distribution of electricity. The training activity directly followed on solution results of major projects at the Department of Power Electrical Systems, Faculty of Electrical Engineering, University of Žilina (KVES) namely:

- project of Scientific Grant Agency VEGA: Analysis, application and criteria N-1 for Slovak transmission system;
- institutional research project V08-007-00: Research of needed reserve power in the transmission system after disconnecting units of Jaslovské Bohunice nuclear power to meet the criteria N-1.

This research dealt with a very serious problem to remove the effects of loss of one of the electricity generators in nuclear power plant in Jaslovské Bohunice which run the whole energy system in the Slovak

* Mária Rostášová. Tel.: +421-41-513-3109

E-mail address: maria.rostasova@fpedas.uniza.sk

Republic. Information about significant solution results were presented to potential candidates for their use (including the Central Slovakia Power Engineering, Inc.) based on informal contacts, within the participation of practice in the final state exams, at seminars and conferences.

Given the broad range of issue and possible different specialized targeting of the course, students had to be chosen a modular organizational form. Basic training module was compulsory for all trainees. Other follow-up modules aimed at special areas issue of production, transmission and distribution of electricity were chosen by *participants* of course optionally and freely.

1.1. The current state of the problem

The aim of the educational activity was that by the end of the course and selected modules, graduates obtain the current knowledge in the field of generation, transmission and distribution of electricity, as well as from other areas of electricity that were reached by the research on the University of Žilina. Participants acquired an overview of new trends in the field of control of electric power systems, the use of power electronics for control of electric power systems, new knowledge in the field of construction and rearmament of power stations, measurement and evaluation of quality parameters of electricity. In theory and practice they got familiar with the latest simulation programs used in the power industry and obtained complex overview of managing of quality management. Target group were employees of energy companies. The participants were required to have completed high school graduation. (Altus, Pokorný, Novák, Otčenášová, 2011)

Graduate profile had defined that the graduate of course will acquire theoretical knowledge and practical experience in key areas of electricity: an overview of modernization of electricity production, new trends in research and development of new products with use of direct energy conversion and increasing of transmission line capacity. By completing educational activity, graduates are able to apply rules governing operation of power system in the liberalized electricity market. They are familiar with the process of rationalizing energy consumption, are able to monitor and diagnose electricity facilities, to establish a timetable and activities carried out for prevention, to recognize processes of monitoring and protecting the environment and watch global trends in this field. (Altus, Pokorný, Novák, Otčenášová, 2011)

Baseline of individual modules presents lectures including presentation of new information (research results) and theoretical knowledge, amended by an active group discussion of trainees. Each module is revived by practical exercises in specialized laboratories. There is available a teaching text in printed form clearly describing discussed substance. The choice of methods of lectures ensures that educational process is flexible; acceptable to a wide range of participants and that the curriculum is supported by practical training with use of information-communication technologies. The final exam for each module consisted of a test and an interview. Final evaluation of educational program formed summary evaluation of final examinations of all completed modules. The total extent of the educational activity was set for 185 hours of theoretical teaching and 55 hours of practical training.

Material-technical provision of educational activity was on very good level, because the University of Žilina has own educational buildings equipped with the latest computer technologies and didactic techniques. At the outset of each module the students received a study packet containing all materials necessary for the study. (Altus, Pokorný, Novák, Otčenášová, 2011)

Lifelong Learning Institute evaluated the overall quality of this educational activity and thus the knowledge transfer gained by research activities at the University of Žilina into practice. The learning activity could be considered as successful because it achieved the learning objectives and filled expectations of participated subjects. These objectives were based on:

- analysis of educational needs (or the needs of knowledge transfer acquired by research activities of the university) of the target group, based on the findings status meeting their required competency profile job, carried out by the company Central Slovakia Power Engineering, Inc. (SSE),
- determining the development needs of target group of learners from SSE.

In this case, the knowledge transfer from research into lifelong learning was based on the difference between desired and actual competencies of learners. To detect situation in fulfilling competencies served personnel audit in SSE where the trainees were employed and the basis for determining the purpose of education was to review their work.

1.2. Aim of the work

Concerning a complex knowledge and evaluation of educational activity quality, which is also quality of research results transfer, there were following phases of assessment process:

- assessing the quality of educational action at its beginning;
- assessing the quality of educational action during its implementation, including the effective transmission of science and research results in the subject area;
- assessing the quality outcomes of educational action on its output. (Seppälä, Soirero, Coughan, 2008)

1.3. Methodology of the work

In order to meet the aim of the work, there were used analysis and synthesis. Analytical research was based on results of primary research realized through expert interviews with participants of technology transfers and knowledge transfer from the university into business practice.

2. Results of the research

The quality of educational activities at the beginning was identified from six perspectives:

- a) Adequacy of formulation objectives of educational action, i.e. assessment whether the objectives of educational activity were subsequently formulated for the analysis specific development and learning needs of learners; assessed the degree of fulfilment objectives of educational activities in the field of well-defined content and structure themes of educational topics action, which had to meet learning objectives. Indicators for this phase of the process were related to assessments upon which they formulated objectives of the educational activity. In this case, it was the employer's training needs analysis (SSE), which held an employer in relation to the need for practical solutions to current problems - possible outages of generator of Nuclear power plants in Jaslovské Bohunice. The present phase of quality assurance of educational activities was important prerequisite for effectiveness of education, as clearly stated expectations and objectives of educational activity has become a major prerequisite for its successful implementation.
- b) Adequacy of offered content in relation to purpose of education - relevant department at Faculty of Electrical Engineering at the University of Žilina has created an educational project to offer training to this required topic, while alone evaluated whether a given time period, in terms of supply of a wide range of activities offered, can actually carry out educational activity. Teachers themselves could not be at risk of being accused of customers that did not meet promised content and education was not realized in the offered range. The adequacy of offered content was very touching themes of education, because it is difficult to acquire available literature and experience. Therefore, the educational institution has provided references about the conducted educational activities of the focus, provided more detailed outlines of training modules, allowed

SSE insight into the treated material for trainees and provided professional portfolio of lectures of individual training modules.

- c) Adequacy and appropriateness of selected forms of education - Lifelong Learning Institute (the UCV) investigated the suitability and effectiveness of selected forms of education in relation to objectives of the educational activity and individual topics of education. The institute carried out "benchmarking" of proposed forms of course with similar implemented courses, evaluated whether teachers have elaborated timetable for implementation of educational action in terms of time complexity and importance of different topics. From the previous educational activities of a similar nature was evident that conduct educational activities for "practitioners" - participants who are experts on the subject with some degree of knowledge is very difficult.
- d) Adequacy and appropriateness of selection of lecturers - UCV has found that quality of teachers means theoretical knowledge and practical experience and references of lecturers for individual selected topics. Selection was based on set criteria for successfully managing the different topics.
- e) Adequacy and forms of teaching materials - KVES in cooperation with UCV made a comparison whether contents of study materials is in accordance with the structure and objectives of educational action; whether study materials are prepared in accordance with the current level of theory and practice in the field; professionally were assessed the quality and level of their teaching materials, including whether the teaching materials are presented in an appropriate way that will engage participants in learning.
- f) Adequacy and suitability for use of proposed didactic resources - UCV evaluated the suitability of selected didactic resources for the implementation of individual subjects and investigated the rate at which the selected didactic resources represent the desired goals and objectives of education.
- g) Adequacy of schedule completion of the educational activity - UCV and KVES chose the schedule of educational activities very carefully because for learners is assumed (and indeed it was the case) on the one hand time pressure and on the other hand was required by KVES rigorous participation of learners at all educational activity.

Process of educational activity presented second phase of assessment the quality of educational activities. It included knowledge transfer from research to practice. UCV within this activity controlled, whether lecturers presented:

- objectives of educational action of the participants at the beginning of training and educational action expected results (what participants will know after its completion);
- priority sites of topics;
- appropriate expertise;
- possibility of further additions of expertise (books, studies, etc.);
- further knowledge and experience related to the topic of education.

During the training activity, UCV and KVES controlled regular contact with trainees of educational action, ability of trainers to answer questions trainees, whether teachers demonstrated ways of effective use of knowledge presented, whether didactic resources were appropriately used, whether the lecturers combined the use of individual didactic resources by character requirements of topics and whether they used processed teaching materials in their interpretation. This evaluation from UCV and guarantor training for KVES was realized by random classroom visits - several unannounced visits to the educational activity.

In checking output quality of realized educational action, UCV and KVES watched particularly satisfied trainees with fulfilment of set objectives of education event, rate of achieving the desired effects, i.e. rate of impact of relevant educational activity to achieve the desired changes in knowledge, behaviour, values, respectively competence of the subjects of education. In this case, it was about getting feedback by form of communication between learners, their employers (SSE), UCV and KVES, in which assessed immediate

effects of education. To monitoring of subsequent effects of learning, respectively gathering knowledge, for example from managers who manage job trainees in work at the level of changes in their attitudes in this area, changes in behaviour after completing training actions, changes in their performance in the area, occurred only on an informal level. However, evidence of success of educational activity is the fact that educational activity developed into a form of bachelor studies at the request of energy companies. Despite great complexity and lengthy of accreditation procedures, Accreditation Committee in relation to the submission of quality processed accreditation file was friendly for the idea of creating curriculum responsive to the needs of practice.

Effectiveness of funds spent on the educational activity has not been thoroughly studied. Actual costs of educational activities, however, exceeded the amount of price of educational events. Price was an agreement with SSE, which tried to reduce it beside the calculated price.

Case study presents “good practice” in approaches to quality assurance transfer of research results into lifelong learning at the University of Žilina. It presents process approach to measuring quality and effectiveness of learning activities as a knowledge transfer of research into lifelong learning through the establishment of quality requirements for inputs, the quality of their learning and quality, respectively effectiveness of learning outcomes.

Table 1. SWOT analysis on (cooperation between) ULLL research and professional practice, based on the case study (Rostášová, 2012a)

Topic assessed: Educational activities at the University of Žilina based on the interaction between research and practice in lifelong learning.	
Helpful in achieving the objective	Harmful in achieving the objective
Internal factors	
Strengths	Weaknesses
<ul style="list-style-type: none"> - Educational activity was based on the analysis of learning and development needs of the target group of learners. - Undertake an evaluation of quality of educational activities for its entry: adequacy of targets of knowledge transfer into practice, relevance of knowledge transfer into educational activity, appropriateness of education forms, suitable teachers, qualitative teaching materials, adequacy of educational activity schedule. 	<ul style="list-style-type: none"> - Insufficiently monitored subsequent effects of educational activity. - Absence detection of efficiency of funds spent on educational activity. - In some cases the lack of practical experience of teachers – researchers.

Continuation of Table 1

Strengths		Weaknesses	
<ul style="list-style-type: none"> - Undertake an evaluation of quality of realization educational activity: approaching aims of educational activity at the beginning of education, identifying priority sites of topics, bringing appropriate expertise, demonstrating effective ways of using presented knowledge, familiarization with possibilities of further amendments of expertise, providing additional knowledge and experience related to theme of education. - Control of quality of realized educational activity outputs: satisfaction surveys of learners with fulfilment of set objectives of educational action, determining the degree of influence of learning activity to achieve desired changes in knowledge, behaviour, values, respectively competence of learners. - Quality material - technical support of educational activities: suitable teaching facilities, modern computer equipment and didactic technology. 			
External factors			
Opportunities		Threats	
<ul style="list-style-type: none"> - Companies (SSE) interested in knowledge transfer from university research into practice. - High degree of cooperation companies in carrying out quality analysis of educational and developmental needs of potential learners (input) and quality evaluation of immediate effects of education (output). - Existence of recommended standards quality of education and thus transfer of research results into lifelong learning (ESG standards). - Friendliness the Accreditation Board for approval of study program responding to needs of practice. 		<ul style="list-style-type: none"> - Busy time of trainees. - High demands on lecturers from the participants of educational activity. - Existence of competition in the field of education. - Complexity and length of accreditation procedures by the Ministry. - Pressure of companies to reduce prices for educational activities in high quality standards of training activities. 	

3. Discussion

Barriers mentioned in the SWOT analysis can be generalized and used at national level. Further barriers which may occur can be identified following:

- prioritizing education provided by own educational institutions while quality of transfer of the latest research result into practice may not be in satisfying manner;
- absence of integrated procedures/indicators for measuring quality of execution of knowledge transfer from research to practice through lifelong learning. (Rostášová, 2012b)

Reasons of these general barriers:

- insufficiently monitored subsequent effects of the educational activity arise because there is a thorough collection of knowledge (eg, from managers who manage in the workforce trainees work) about the level changes in the attitudes of trainees after completing training in the field, about behavioral changes in the field after completing educational action, about changes in their performance in the field;
- absence detection efficiency of funds spent on educational activities is caused that there is no the detection of adequacy durations of implemented educational activity, determining the amount of money spent in comparison to similar work, the calculation share of costs for training activity in the budget for comparison money spent with the identified effects of education, comparison expended funds to set standards in this area;
- busy time for trainees occurs because alongside education often have to perform the duties;
- high demands on teachers by the participants in educational activities exist because trainees come from experience, and often have their own opinion and specific understanding at presented ways of solving problems from practice; teachers are often "theorists", but with a high degree of scientific knowledge;
- the existence of competition in the field of education - it is a threat that results from a large number of universities and educational institutions in the Slovak Republic, which created a strong competitive environment in which there is a battle for the customer;
- complexity and length of accreditation procedures by the relevant ministry are given the current state of legislation in this area;
- pressure of companies to reduce the price of a learning activity and a requirement for achieving high quality of educational activities is one of the natural braking factor, mainly because in times of crisis, companies aim to reduce costs, and statistics show that very often it is usually just the cost savings in education;
- there is a preference for learning in companies, which the companies provide by their own educational institutions, while the quality of transfer of the latest knowledge of research into practice may not be at a sufficient level – the braking aspect is related again to the economic effects of education in ensuring internal and external educational institution;
- absence of single procedures for measuring the quality of the implementation of knowledge transfer from research to practice through lifelong learning in the Slovak Republic - mentioned braking aspect results from inconsistencies and confusions that exist in the Slovak Republic in the understanding of quality lifelong learning and in underestimating the non-formal education and informal learning. (Rostášová, 2012b)

Solutions to remove barriers can be defined in general terms as follows:

- draw up strategies on a local and national level for quality assurance and efficiency of lifelong learning (including the determination of quality indicators), in which it has been given increased attention to the quality and effectiveness of linking research results to lifelong learning;

- shorten and streamline the accreditation process (quality assessment) and educational programs by legislative amendment ;
- carry out periodic reviews of legislation that deals with quality in lifelong learning by the legislative organs of the state, revised national system of qualifications, establish a specialized unit or workgroup, or advisory body for the quality assurance of lifelong learning in the relevant ministry; in doing so strengthen the cooperation of three ministries - the Ministry of Education, Science, Research and Sport of the Slovak Republic, the Ministry of Economy of the Slovak Republic and the Ministry of Labour, Social Affairs and Family of the Slovak Republic, as all these ministries working together on the employment policy in the Slovak Republic;
- from the national and local levels to support the process of systematic and consistent self-assessment institutions of lifelong learning in the area of quality implementation transfer of research results into practice for lifelong learning;
- carry out at the national level assessment of the quality of lifelong learning organized by centres and institutes of lifelong learning at individual universities independent by external professional institution, to process benchmarking surveys and rankings in terms of the quality of lifelong learning and the transfer of research results into practice;
- create a motivation system for cooperation between researchers and practice, resulting in the achievement of high quality of this link;
- improve the functioning of the existing national network of institutions of lifelong learning and participate in the creation of an international network within which occurs sharing of techniques for 'best practice' in the provision of that quality. (Rostášová, 2012c)

Actors and reason which (could) play a role in carrying out these actions in the Slovak Republic are in Tab. 2.

Table 2. Actors and reasons which (could) play role in carrying out actions in the Slovak Republic (Rostášová, 2012b)

Actors	Reason
Ministry of Education, Science, Research and Sport of the Slovak Republic	<ul style="list-style-type: none"> - shorten and streamline the accreditation process (quality assessment) and educational curricula by legislative amendment; - conduct regular reviews of legislation that deals with quality of lifelong learning, revise national system of qualifications, set up specialized unit, workgroup or advisory body for lifelong learning quality assurance (Jensen, Kralj, McQuillan, Reichert, 2008)
Ministry of Labour, Social Affairs and Family of the Slovak Republic	<ul style="list-style-type: none"> - cooperate with other state legislative authorities in all activities, promoting the quality of the transfer of research results into practice lifelong learning
Ministry of Economy of the Slovak Republic	<ul style="list-style-type: none"> - cooperate with other state legislative authorities in all activities, promoting the quality of the transfer of results; - consider providing financial incentives for companies that are interested in the transfer of research results into practice
Lifelong Learning Providers - Department of Lifelong Learning, continuing and so on	<ul style="list-style-type: none"> - conduct a comprehensive evaluation of effects and quality of educational activity reacting to the need of knowledge transfer research into lifelong learning: assessing quality of educational action on the input, quality assessment of educational action in the process of its implementation, including the effective transfer of science and research results in this area and assessing output quality of educational action on its output;

	<ul style="list-style-type: none"> - create a motivation system for cooperation between scientists and practice with direct effects associated with achievement of quality of links - to be in a position of "switching person"; - initiate and cooperate in national and international network for implementation of quality management in lifelong learning
Lecture of lifelong learning	<ul style="list-style-type: none"> - strive for close connection with practice, acquire practical experience which sometimes absent there
Candidates for lifelong learning, students of some form of lifelong learning	<ul style="list-style-type: none"> - create an active approach to the need of their own lifelong learning and also through acquisition of knowledge related to the results of research activities, educational and scientific-research institutions; - create a personal time management preventing the stress in managing labor, education and private activities
Institutions and initiatives aimed at lifelong learning and quality of education in the EU and the Slovak Republic	<ul style="list-style-type: none"> - support the establishment of initiatives and projects with the issue of quality lifelong learning and support the transfer of research results into practice; - update and improve the database of quality educational programs and quality teachers - specialists
External institution/institutions evaluating the quality of lifelong learning and transfer of research results into practice	<ul style="list-style-type: none"> - carry out at the national level assessment of the quality of lifelong learning organized by centers and institutes of lifelong learning at individual universities by independent external professional institution; - process benchmarking surveys and rankings in terms of the quality of lifelong learning and the transfer of research results into practice
Firms in the position of sponsors of requirements for training employees	<ul style="list-style-type: none"> - cooperate in carrying out the analysis of training needs of their employees; - determine development needs of individual groups of employees in relation to increasing their knowledge and understanding base; - objectively assess the immediate effects of education (mapping level of knowledge and experience in the field), report the results of the educational institution, make suggestions to improve the quality of education to an educational institution; - monitor subsequent effects of education, respectively gather knowledge about changes in attitudes of trainees after completing training in the field, about changes of conduct in the area after completing educational action, about changes in their performance and so on; - share this kind of information and knowledge with training providers
Regional Government	<ul style="list-style-type: none"> - creating, updating, respectively improving of regional information portal, which would include information about the results of research activities, educational and research institutions in the region and throughout the Slovak Republic

4. Conclusion

Case study, the results of SWOT analyses and realized research present "good practice" in approaches to quality assurance transfer of research results into lifelong learning at the University of Žilina. It presents process approach to measuring quality and effectiveness of learning activities as a knowledge transfer of research into lifelong learning through the establishment of quality requirements for inputs, the quality of their learning and quality, respectively effectiveness of learning outcomes.

Translator as researcher: perspectives on training and life-long professional improvement of translators

Senem Öner^{a*}*^aIstanbul Arel University, Faculty of Science and Letters, Istanbul 34537, Turkey*

Abstract

This paper provides a teaching/learning framework to be applied specifically for helping translation students develop translation-oriented research competence. The results of the analysis of the in-class and out-of-class activities designed for observing the development of translation-oriented research competence are discussed with a special focus on the ways of providing students with the insights into the essential requirements of life-long professional improvement as translators.

Keywords: translator training, translation-oriented research competence, life-long professional improvement

1. Introduction

Translation competence and the ways of developing it have been a controversial issue among translation scholars and translator trainers. A consensus on the definition of translation competence has not been reached, however there is an agreement that it consists of sub-competences such as linguistic, cultural, textual, subject, research, and transfer competence (Schäffner & Adab, 2000: ix) or such as communicative and textual competence, cultural competence, subject area competence, instrumental and professional competence, psycho-physiological or attitudinal competence, interpersonal competence and strategic competence (Kelly in Way, 2008: 91). The compartmentalization of translation competence illustrates the complexity of translation and hence the need to handle the challenging requirements of this complexity in translator training programs.

Treatment of translation in all its aspects and helping translation students become competent translators can be said to be the general aim of translator training programs. The realization of such an aim is not easy and requires clearly defining translation competence and its sub-competences, the ways of building and developing them and evaluating the products and performance of the students.

Dynamic nature of the translation industry adds further challenges for translator trainers. The working conditions of translators are changing due to social and technological developments and it is believed that “translation competence can no longer be defined in isolation but must be viewed in relation to the requirements

* Corresponding author. Tel.: +90 212 860 04 80; fax: +90 212 860 04 81.

E-mail address: senemoner@arel.edu.tr

of a rapidly developing information society” (Anderman & Rogers, 2000: 63). Hence the task of the translator trainers is getting complicated as well as that of the translators and reserving room for possible future challenges has become another requirement in translator training.

Taking departure from this requirement, this paper aims at providing a teaching/learning framework to be applied specifically for helping translation students develop research competence. Second part of the paper is focused on the definition and importance of research competence as a sub-competence of translation competence. In the third part, the analysis of the results of the in-class and out-of-class activities designed for observing the development of research competence is presented. The last part is devoted to the discussion on the results of the activities and suggestions concerning the ways of providing students with the insights into the essential requirements of life-long professional improvement.

2. Research Competence in the Context of Translation and Translator Training

Research competence in the context of translation, i.e. translation-oriented research competence is among the sub-competences of translation competence in general. Translation-oriented research competence is the ability to apply the required research knowledge and skills for translation purposes and enables the translator to act like a “competent researcher” who knows “what to research, where to research and how to research by using textual clues, his/her world knowledge and good judgment” (İnce & Bengi-Öner, 2009: 162).

No sub-competence is enough in isolation and the interaction between the sub-competences is crucial. Still, more stress should be laid on translation-oriented research competence which can be thought of as a complementary competence needed to cope with the extremely diversified requirements of translation in today’s and future’s world of communication. This is the link between the increasing importance of this specific competence and the ever changing social, cultural, economic and technological circumstances that directly and/or indirectly affect/change translational processes and the job of translators whose “mindset is an assemblage of everything that is worth communicating from one lingua-culture to another” (Neubert, 2000: 3).

Accordingly, focusing on this specific sub-competence might be significant in helping translation students become aware of the fact that they are required to be able to continuously adapt themselves to changing translation/communication situations and to carry out diversified processes involved therein. For this reason, it seems to be useful also to provide translation students with a core perspective from the very beginning of the training process: a perspective that the only unchangeable rule in the context of translation (activity and profession) is that nothing is unchangeable and that they will have to adapt themselves to change all throughout their careers as translators.

Specialization is the trend in the contemporary global world where “more and more experts are proud that they know more and more about less and less, their speciality is their expertise” as opposed to translators who are “actually supposed to have specialist knowledge about more and more” (3). In another study (Öner, 2013) on the question of specialization in translator training and the translator’s scope of expertise, I described the identity of the translator as a *changeful* one and argued that translator training programs are basically responsible for helping translation students develop a core specialization in fulfilling the changing requirements of various fields and sub-fields of specialization.

This is precisely the point where the problem of specialization in translator training and the special importance of translation-oriented research competence become related. For, this competence might be indispensable for the aim of training translators competent to cope with the challenges to be posed by “endless jungle of areas and processes that crop up in ever-new ways in the job of the translator” (Neubert, 2000: 3).

3. Building and Developing Translation-Oriented Research Competence: A Preliminary Study

In what follows, the results of the in-class and out-of-class activities designed for observing the development of translation-oriented research competence of the students on the basis of the said relationship and the assumed complementary role of translation-oriented research competence are presented and discussed with a focus on the ways of providing translation students with the insights into the essential requirements of life-long professional improvement.

3.1. Profile of the Students and the Method

The framework proposed in this paper is based on a study piloted in the 2013 Spring Semester in a translation course offered to the second-year students at the Department of Translation and Interpreting at İstanbul Arel University. The study involved 15 students enrolled in the class. The mother tongue of all the participating students was Turkish and English was their first foreign language and they had previously taken courses on translation-oriented text analysis, linguistics, comparative syntax, comparative literature, media studies and anthropology of language.

The students were not unfamiliar with translation-oriented research requirements and techniques since they had been basically covered especially in courses on translation-oriented text analysis. However in the study the students were not assumed to have completed the process of developing the competence in question but they are regarded to be in the process of building it.

In order to find out whether the students have been developing translation-oriented research competence and the awareness thereof, two English source texts (ST) were selected to be translated into Turkish for the study which was planned to last for four weeks during which the class met once a week for 150 minutes each. In the first week, an online help manual (ST1) (Adobe.com) was given to the students and the distinctive features of the text were discussed in class. The students were asked to translate the text from English into Turkish and submit the translation in the following week with a report on the translation process. The translation of the text was indeed available on the internet but this information was not provided to the students and the students were expected to find it by themselves. Same procedure was followed for ST2 (“Grace, space, pace.”), an advertising slogan, in the following weeks. Last week of the study was devoted to the general discussion on the two translation activities.

3.2. Selection of the Source Texts, Briefs and Skopos

According to the categorization by Katharina Reiss, there are four text types: informative type for the communication of content, expressive type for the communication of artistically organized content, operative type for the communication of content with a persuasive character and mixed type (Reiss, 2000: 163-164). Viewed according to this categorization, ST1 is an instructive text of operative type and ST2 is a text of mixed type, being both operative and expressive. The source texts were given to the students with briefs. In the brief for ST1, the students were asked to translate the content of the webpage into Turkish to be published on the official website (in Turkish) of Adobe for the general audience who would like to use the Flash Player Program while in the brief for ST2, the students were asked to translate the Jaguar advertising slogan into Turkish to be used by the Jaguar Company in an advertising campaign in Turkey and the students were asked to determine the skopos of each translation on the basis of their analysis of the source texts and the briefs.

3.3. Evaluation Criteria (EC)

The three criteria determined specifically for the evaluation of the students' translation-oriented research competence are as follows:

EC1: Did the student research unknown vocabulary/terms/phrases by using monolingual dictionaries, parallel texts and other relevant sources in addition to bilingual dictionaries?

EC2: Did the student research known vocabulary/terms/phrases if necessary?

EC3: Did the student research the subject matter of the source text in addition to vocabulary/terms/phrases?

3.4. Evaluating the Results of the Activities

The number of the students who submitted both their translations and reports was 10 for ST1 and 10 for ST2. The students who submitted only the translations were excluded from the analysis. The research process reports were written either in Turkish or English and the Turkish ones were translated into English by the researcher. Table 1 and Table 2 below show the results of the analysis of the translations and research process reports.

Table 1. Results of the analysis of the research process reports for ST1

EC	Number of the students who fulfilled the EC	Number of the students who could not fulfil the EC
EC1	7	3
EC2	5	5
EC3	5	5

Table 2. Results of the analysis of the research process reports for ST2

EC	Number of the students who fulfilled the EC	Number of the students who could not fulfil the EC
EC1	9	1
EC2	5	5
EC3	8	2

The results presented in the tables above demonstrate that EC1 was fulfilled by the majority of the students for the two source texts. The evaluation criterion that ranked second in terms of fulfillment is EC3, followed by EC2 that ranked third.

The fulfillment of EC1 by the majority of the students shows that most of the students developed awareness of the importance of using additional sources and not limiting their vocabulary/term research to dictionaries, especially bilingual ones and put this awareness into practice. The following comment of one of the students who fulfilled EC1 with respect to ST1 is a revealing example of this awareness:

“Informative and operative texts function by means of common terms. As our source text was the ‘Help’ section of Adobe Flash Player, I first conducted research on the internet to find out what Flash Player is and what the function of Flash Player is. Then I came across the Turkish translation of the source text, but there were some parts that I did not find appropriate and I tried to make my translation decisions according to the common usages in the parallel texts on information technology.”

As can be seen in the above comment what shaped the decisions of the student concerning terms was the results to be obtained by means of parallel text research. This comment is also an example of the awareness of the need to research the subject matter of the text (function and use, in this context) which corresponds to EC2.

The following comment of another student who fulfilled EC1 with respect to ST2 is another example of the awareness concerning research on unknown vocabulary and the role of parallel texts:

“I found out that the word ‘space’ had been added to the slogan and the slogan consisted of ‘grace’ and ‘pace’ before. Bearing this in mind, I wanted to take a look at the slogans of other automobile brands and I examined the Turkish advertising slogans of other brands. I saw that the slogans were mostly short and effective. I started my translation in the light of all these information.”

EC2 was fulfilled by half of the students and hence was not fulfilled by another half. This shows that the awareness of the need to research known vocabulary in relation to the context and skopos of the translation was not at a desired level. The comments of two students who failed to fulfill EC2 with respect to ST1 are shown below:

Ex.1 *“Generally, the text was very easy. I didn’t have difficulty in translating the menu parts. We could find words that gave the Turkish meaning literally.”*

Ex.2 *“While translating the text, firstly I looked at the meanings of the words. I generally preferred the meanings related to computer because this is a computer program. I did not research the meanings related to other things.”*

The deficiency in research on known vocabulary seems to be resulted in certain translation errors in the translation of the students whose comments are given above. For instance, the student (in Ex. 1) translated //Corporate Solutions// as //İşletme Çözümleri// (Business Solutions) instead of //Kurumsal Çözümler// which has become the standard equivalent for //Corporate Solutions//. The student (in Ex. 2) translated //Was this helpful?// as //Yardımcı oluyor mu?// (“Is it helping”, when translated literally) without making research on the use of this sentence consisting of ‘known’ words in the information technology texts, especially in the help pages of websites. This example strikingly shows how deficient research affects translation and prevents the student from producing an operative text free of ambiguity. The students who made research on this sentence through parallel texts translated this question as either //Bu yararlı oldu mu?// or //Bu bilgi yararlı oldu mu?//.

The comments of two students who fulfilled EC2 with respect to ST1 display, on the other hand, a developed awareness of the need to research known vocabulary and a higher degree of accuracy concerning the translation of terms and field-specific phrases:

Ex.1 *“At first, I translated ‘Sign in’ as //Oturum aç// without thinking on it. However, when I searched it on Google the result was like this: 21.700.000 entries for ‘Oturum aç’, 138.000.000 entries for ‘Giriş’ and 18.800.000 entries for ‘Giriş yap’.*

Ex.2 *“Before translating ‘latest version of Flash Player’, I researched ‘son sürümü’ and ‘en son sürümü’ because computer programs are changing continuously. I found 190.000 entries for ‘son sürümü’ and 249.000 entries for ‘en son sürümü’ and I used ‘en son’.*

The significant point in the above comments is that both students made their translation decisions on the basis of their research on words or phrases they had already known. What is more, these students mentioned in their reports that they had found the existing Turkish translation but they felt the need to check further what they found or what they already knew in order to make their final decision.

As for EC3, the number of the students who fulfilled the criterion was slightly higher than those who did not. This shows that the awareness of the need to research the subject matter of the source text in addition to vocabulary/terms/phrases was close to the desired level as compared to the case related to EC2. The comment of a student who failed to fulfill EC3 with respect to ST1 is shown below:

“In the text there was a box that included an acronym as OS about which I did not have any information. At the end of my research, I found out that it is ‘operating system’ and I translated it as ‘işletim sistemi (operating system)’. I did not use an acronym because we use ‘işletim sistemi’ instead of ‘IS’ in Turkish frequently.’

In fact the translation error that existed in the translation of this student was a common one that appeared in most of the translations of ST1, i.e. most of the students translated the content of the said box into Turkish. However, one of the students who carried out further research on the ‘real operation’ of the Flash Player program found out that the box in question should not be translated into Turkish and should be left as it is because that part of the software did not support the Turkish language. The comment of the student is as follows:

“At first I translated the words in the box into Turkish. But then I tried to install the program and found that the words in the box remained in English. Then I researched the language options of the program and learnt that that part was not supported in Turkish. So I did not translate it into Turkish.’

This comment and the resulting translation decision is a highly important example of the desired research behavior/perspective hence competence in the context of translation. For, in this example, the student decided to do something more than terminology research through dictionaries and/or parallel texts. It should also be noted that this student was also one of those who found the existing Turkish translation on the internet. Despite this fact, rather than stopping the research process at that point, the student tried to install or ‘operate’ the program in order to be completely sure of the appropriateness of the translation decision in terms of achieving the skopos of the translation: to make it possible for the Turkish-speaking target audience to use the program.

The number of the students who fulfilled EC3 in the translation process pertaining to ST2 was high compared to the number of those who fulfilled the same criterion while translating ST1. The following comments of the

students who fulfilled EC3 with respect to ST2 are revealing examples of the awareness of the need to make research on the subject matter, in this case the product in the advertising slogan:

Ex.1 *“When we looked at the slogan we could easily understand the meaning of each word. But the slogan is not only related to the meaning of the words. It’s related to the history of Jaguar.”*

Ex.2 *“Before translating the slogan, I had to decide the way I should use in the translation process. The slogan consisted of only three words. But these were not only words but the summary of Jaguar’s history, culture and features. Firstly, I started to research Jaguar’s history on the internet.”*

Ex.3 *“Before starting to translate the slogan, I watched documentaries about jaguar (as an animal) and wondered whether there were common features between this animal and Jaguar as a car brand.”*

It is understood from the above comments that the students gave priority to researching the history and features of Jaguar (both as an animal and a car) over looking up the words in the dictionary at the beginning of their research process and that the research they conducted on the individual words in the slogan was influenced by the information they gathered from the sources on the history and features of the product. The following comments of two other students also exemplify this process:

Ex.4 *“Although the slogan was short, it was one of the most difficult texts we translated. It is easier to translate long texts but this one was a slogan consisting of three rhyming words. The use of ‘grace’, ‘space’ and ‘pace’ was not coincidence.”*

Ex.5 *“The words in the source text were selected successfully and used effectively. They attract the attention of the target audience. I had to choose that kind of words in order to create the same effect in Turkish. First I thought that this slogan was related to the brand’s history and I researched the history of Jaguar. But I realized that the slogan was not related to the history of Jaguar. And I changed the way I researched. I found that in some motor vehicle magazines, the advertising slogans of luxury cars such as Jaguar were analyzed. In a magazine I found that the original version of this slogan was ‘Grace, Pace.’ The word ‘space’ was added to the slogan afterwards. I did not have difficulty in understanding the meaning of ‘grace’ and ‘pace’. But ‘space’ was the word that I found most difficult and researched most. It was difficult to translate it because although the meaning of the word was very clear, I could not understand its meaning in the slogan. After a very long research, I found out that the word ‘space’ was used for the comfort of the inside of the Jaguar cars and I translated ‘space’ as ‘konfor’.”*

Ex.6 *“I found out that the word grace reflects British style and luxury with XJ models, the word ‘space’ reflects design and also refers to E-type model which was first produced as 2-seat car and then changed to 4-seat, the word ‘pace’ is related to the powerful engines of Jaguars which were built from past to present. Also, the slogan was first used when the Jaguar won an International Car Race.”*

The above comments of the students who fulfilled EC3 with respect to ST2 illustrate that the awareness of the role subject matter research plays in making translation decisions appropriate for the skopos of the translation was close to the desired level. It was observed that rather than the dictionary meanings of the words, the research

on the product details shaped the decisions of the students who strived to produce a Turkish slogan which is at the same time creative, catchy and faithful to the function of the source slogan.

4. Discussion, Conclusions and Limitations

The results of the present study carried out to find out whether the students have been developing translation-oriented research competence and the awareness thereof suggest that majority of the students have developed the competence in question and that this competence was reflected positively on the translation they produced, i.e. the translation product. The results also suggest that asking students to reflect on and report their translation, research and decision-making processes has the potential to contribute to the development of awareness of research competence and its role in terms of helping students explain/justify their translation decisions confidently.

It should be noted that among the participating students, there were also ones who could not produce a translation that achieved the translation skopos even though they fulfilled the evaluation criteria. In those cases the problem stemmed from deficiencies in other sub-competences of the general translation competence such as transfer and/or linguistic competence. This shows that research competence alone is not sufficient for the production of a translation that meets the requirements of the skopos for which the effective interaction of all the sub-competences is needed.

Nevertheless, since the study focused on research competence, the main aim was to try to observe the behavior of the trainee translators who are expected to become competent researchers in the context of translational activity. This was also the reason underlying the selection of the source texts which primarily required due research at lexical level. Even so, the lengthy reports of most of the students especially on the research process of ST2 which consisted of only three words evidence how extensive a research can get depending on text-specific research requirements.

On the basis of the above considerations, it is suggested that more room should be made for in-class and out-of class activities that aim at identifying, building and improving research competence in translation training courses. This would also require a reflection by the translator trainers on the selection of texts and design of activities that would contribute to the achievement of the said aim.

Special focus on translation-oriented research competence might be indispensable especially for preparing the students for the ever increasing number and type of specialization texts and all related translational processes and for the changing nature of translation-related activities in the face of changing social, cultural and technological circumstances. If translator training is considered as a process of enabling students to acquire a wide perspective as to both the existing and future requirements of the translation profession along with helping them develop translation competence, more focus on activities on translation-oriented research competence might help students gain a perspective that they have to improve their research knowledge and skills not only until graduation from the university but all throughout their professional lives and that they need this specific competence in order to become and remain as translators as researchers.

The present study has certain limitations: It involved a limited number of students (second year students) and text/text types. The model provided in this study would be applied to larger and more diversified groups of trainee translators with a higher number of texts and evaluation criteria. Comparative studies can also be conducted with a focus on the level of this specific competence between trainee translators and professional translators which would provide further insights into the ways of identifying the development of and/or building/improving translation-oriented research competence.

4th International Conference on New Horizons in Education

Turkish influence on education in Southeast Europe

Kamil Pikal*

Institute of International Studies, Charles University, U Kříže 10, Praha 5 – Jinonice, 158 00, Czech Republic

Abstract

This paper analyses Turkish presence in the education sectors of Southeast European countries. Turkish influence on education in the region spans from bilateral political negotiations concerning local curricula through vast development aid and scholarship programmes to investments of Turkish companies and NGOs. Despite certain suspicions, mainly among nationalist circles, about hidden agendas of Turkish educational institutions in the region, we can conclude that they contribute to the modernisation of Southeast European education through introducing new ideas and approaches, investing urgently needed capital and opening local institutions to international cooperation.

Keywords: education as foreign policy; Turkey; Southeast Europe

1. Introduction

Since the fall of Iron Curtain in 1989, issues related to education and research have played an important role in relations between Turkey and countries of South East Europe (region consisting of Greece, Bulgaria, Macedonia, Albania, Kosovo, Montenegro, Croatia, Bosnia and Herzegovina, Serbia and Romania; some authors include also Slovenia, Moldova and even Hungary; the region is also called the Balkans). They go far beyond negotiating agreements about student exchanges and scientific cooperation. In fact, they transcend the diplomatic level and form a considerable part of economic, cultural and other direct relations between various state agencies, municipalities and schools.

The frequency of such relations on all levels has significantly increased since 2002, when the Justice and Development Party (*Adalet ve Kalkınma Partisi*, AKP), partly as a result of overall increase of Turkish presence and activities in the region and partly due to government's intention to improve the use of soft power in its foreign policy. Consistently with the concept of 'strategic depth' (*stratejik derinlik*) formulated by Ahmet Davutoğlu (2008), most of educational activities of both state and private Turkish institutions focuses on countries and regions with significant Muslim population, whose cultural ties to Turkey are tighter, such as Albania, Kosovo, Bosnia and Herzegovina. In other countries in the Balkans, Turkish educational policy mainly targets regions inhabited by Turkish and other Muslim minorities, such as Northwest of Macedonia or Sanjak in Serbia.

2. Forms of Turkish influence

Turkey influence educational sectors of Balkanic countries through various channels, engaging a multitude of actors from both, state and private spheres. Despite growing importance of private actors in development of relations between Turkey and the Balkans in the field of education (as well as in other fields), the state still

* Corresponding author. Tel.: +420-251-080-250; fax: +420-251-620-294.
E-mail address: kamilpikal@post.cz

maintains primary position. It is the government who designs parameters of such relations and who dispose with largest budgets for investments.

And it is also the state who has longest practice in doing so. In 1951, Turkey concluded a cultural agreement with Greece with provisions concerning education of Muslim minority of Western Thrace (Pikal, 2009). It was the first time since the fall of Ottoman Empire when Turkish authorities gained direct influence on curricula and staff of schools in any Balkanic country. Since then until late 1990's, all Turkish diplomatic activities in the region regarding education focused on education of local Turkish minorities. Later, the focus on non-Turkish Muslims was added (Öktem, 2012) and since late 2000's we can see growing interest in addressing non-Muslims in the region as well (Remikovic, 2012).

Actors related to the central government usually tend to interact with respective countries' governments and other central authorities but in case of development aid and other forms of direct support of individual educational institutions, they act locally as well. Their activities span from negotiating bilateral cooperation agreement and attempts to influence local curricula to addressed support to various organizations and communities. On the other hand, private and civil society actors usually run smaller projects (i.e. individual private schools) and operate nearly exclusively on the local levels, with exception of big and highly networked organizations, such as Gülen Movement, that have means to operate throughout whole region or even globally.

○ *Diplomacy*

Diplomatic activities of Turkish concerning educational issues generally help to facilitate further cooperation on other levels. In many occasions some steps of other Turkish organizations (state and private as well) must be pre-negotiated with local governments. Typically, this is the case of student exchange programmes that are based on bilateral agreements (Yanik, 2004).

Sometimes, negotiations on ministerial level may facilitate solution of specific issues. This happened for example in Kosovo where talks between Enver Hoxhaj and Hüseyin Çelik, then Kosovan and Turkish Ministers of Education, initiated revision of Kosovan history textbook to 'soften line on Ottoman rule' (Musliu, 2013). However, there was relatively strong opposition against the revision from among nationalistic intellectuals (Hamidi, 2010).

○ *Financial support and technical assistance*

Turkey is increasingly active in the area of development aid, particularly through the Turkish International Cooperation and Development Agency (*Türk İşbirliği ve Koordinasyon Ajansı Başkanlığı*, TİKA). The state agency was founded in 1992 and its activities originally focused on newly independent Central Asian Turkic republics. After the AKP came to power in 2002, TİKA's action radius was considerably enlarged and newly included, among other regions, the Balkans, particularly Albania, Bosnia and Herzegovina, Kosovo and Macedonia (Murphy & Sazak, 2012).

TİKA's activities related to the education are mainly financial and technical support in reconstruction of schools and building new ones, often in regions with significant Muslim population (Petrović & Reljić, 2011). A successful example of a school built with support of TİKA is Mustafa Kemal Atatürk Primary School (*Mustafa Kemal Atatürk İlköğretim Okulu*) opened last year in Gorna Banjica, Macedonia. With its capacity of 1,400 students it is the largest Turkish school in the Balkans (Remikovic, 2012). Another example might be the reconstruction of kindergarten 'Lastovica' in Nikšić, Montenegro (Pobjeda, 2012). Project realized in neighbourhood with overwhelming Montenegrin and Serb majority demonstrates that TİKA does not help only in

predominantly Muslim localities. Other educational activities of TİKA include training of teachers, distribution of textbook and supporting turcologists abroad (Murphy & Sazak, 2012).

Another state institution that operates in certain segments of education in the region is the Presidency of Religious Affairs (*Diyanet İşleri Başkanlığı*, Diyanet). It is a state authority responsible for maintaining religious life in Turkey and originally operated only within republic's borders. But since 1990's the Diyanet is much more open to the world and seeks to play a more important role abroad (Gözaydın, 2008).

Since then the Diyanet has become an important institution influencing spiritual life in the Balkans, including religious education. First, the Diyanet started to provide scholarships to students from the Balkanic and other post-Communist countries to study theology at Turkish universities. Later, the Presidency cooperated in establishing and running such institutes and universities in the region. It opened one institute and three high schools in Bulgaria, one high school in Romania (Korkut, 2010).

In Albania, the Diyanet controlled practically all formal religious educational institutions, including the Beder University and seven medresas (the medresas are now run by Gülenists, see below). Similar situation is in Macedonia and Kosovo. It seems that religious institutions in the region are strong enough to sustain their own educational institutions only in Bosnia and Herzegovina and South Serbian region of Sanjak (with very strong ties to Bosnia) (Öktem, 2010).

The presence of Diyanet is perceived strongly positively by local religious institutions, governments and even by many Western organizations. It is mainly because the Diyanet-run institutions are seen as counterbalance to unwelcome Wahhabi schools and mosques (Erdem, 2008).

○ *Turkish presence in the region: Yunus Emre Institute.*

Apart from diplomatic relations and help in form of material contribution and know-how, there is also a platform for direct addressing the societies of discussed countries. Created in 2007, Yunus Emre Turkish Cultural Centres (*Yunus Emre Türk Kültür Merkezleri*) have spread all over the world including centres in most of Balkanic states. There are even more than one centre in some countries, such as in Kosovo three centres in Prishtina, Prizren and Peja.

The institutes are named after a great Turkish medieval poet Emre Yunus (13th-14th century), following pattern known from many other countries' cultural institutes (such as German Goethe Institutes or Spanish Cervantes Institutes). They promote Turkish culture, language and art through organizing various events, offer Turkish classes and exams for language certificates, including those required by Turkish universities from their foreign applicants (Kaya & Tecmen, 2011). It should be noted that Turkish language classes are on high demand all over the region. For example, a last year commercial research showed Turkish language is the most attractive language in Serbia (Milošević, 2012).

○ *Non-governmental actors*

Private companies and NGOs also participate in Turkey-Balkans relations, including relations in the field of education. They mostly invest in the region by opening private schools. They range from pre-school facilities to universities and some of them are among the top ranked in their countries. Some of them are purely commercial, profit-oriented projects, the others combine

Probably the most successful Turkish organization in the field of education is the Gülen movement, Inspired by thought of Turkish Sufi and preacher Fethullah Gülen (*1941). The religious movement does not have a hierarchical structure and its description as one movement or organization can be questioned. It is rather a network of organizations operating worldwide. Their specific theology highlighting focus on individual spiritual work and integration of old and new might be another factor contributing to their success (Michel, 2005).

Schools organized by various foundations and companies related to the Gülen movement usually have secular curricula with emphasis on foreign languages and sciences. In several countries of the region, notably in Albania, some of these schools are among the most elite educational institutions with enormous tuition fees, with students from the richest families. Notable example of a successful institution in Albania is Epoka University, now one of the country's leading organizations providing tertiary education. In Albania, contrary to common practice, Gülen movement also run most of religious high schools, medresas, where they came with relatively innovative approach, combining secular and religious curricula and educational practice (including co-education). (Öktem, 2012).

3. Conclusion

The way Turkey utilizes educational issues in her foreign policy is sophisticated, efficient and in vast majority of cases beneficent for both parties. It combines activities on more levels where every organization has its specific role. Politicians and diplomats occasionally solve educational problems during their meetings and set basic rules for other organizations. TİKA and Diyanet provide their local partners with financial support and technical assistance, each in their specific area. Yunus Emre Cultural Centres (among other activities) prepare and certify applicants to Turkish universities. Turkish companies and NGOs establish and run schools of all levels in the region.

Recipient countries benefit from whole policies by modernizing their curricula (i.e. in History), welcoming large investments from both state and private Turkish investors. These money are spent on improving material conditions of local schools. Finally, the schools operated by Turkish corporations are often members of various international networks and thus are more open to the world and ready to respond to the recent trends in education.

On the other hand, Turkey benefits as well. Development of soft power can help export, especially in retail goods and increases prestige and so improves position of country in international relations. Strong position on high end education market means that future elites of the country will have positive attitudes towards Turkey and probably will work towards even closer relations with Ankara.

We can conclude that Turkey chose a win-win strategy and most of her Balkanic partners decided to participate in such policy to certain extent. Some problems might come in the future, if the Turkish influence increases so that will be perceived as a threat.

Acknowledgements

I would like to thank my friend and colleague Jozef Bednár for patient reading and reviewing of my paper. I also want to thank the Development Programme of Faculty of Social Sciences, Charles University in Prague for enabling my appearance at the conference. Last but not least, I thank my mom and the rest of my family for patience and moral support.

4th International Conference on New Horizons in Education

Undergraduate teacher training – space for the formation of habit and teacher professionalism

Mariana Sirotová

University of SS. Cyril and Methodius, Faculty of Arts, Department of Pedagogy, nám. J. Herdu 2, 917 01 Trnava, Slovakia

Abstract

Everyone's habit as well as the teacher's habits are adapted to the conditions that have created them and they lead to the behaviour and actions that affect the personal and professional existence of people. Habit thus actually restores the social conditions that have created it. This means that the habit that was created during undergraduate education influences the education of children and the youth that is carried out by teachers themselves in the classrooms. It is therefore vital to examine the undergraduate teacher training that is related to the environment that shapes the habit as well as the process that shapes the teacher as a professional with the necessary knowledge and competencies. The paper offers a comparison of views of university students - teacher trainees and the views of professional teachers on the content, teaching methodology and necessity of teaching pedagogical disciplines for the work of the teacher, especially those disciplines that form both – the habit and the teacher's competencies necessary for the performance of his/her profession.

Keywords: habit; undergraduate teacher training; university student; university teacher

1 Undergraduate teacher training in Slovakia

The teacher's personality plays an important role in the education of children and the youth. His/her personality is developed both during the undergraduate training and also through lifelong learning. Undergraduate education consists of pedagogical-psychological training and professional studies of specific subjects. Pedagogical and psychological preparation is an integral and important part as it creates theoretical and practical bases for the teaching profession. As T. Zařková (2007) states the quality teaching is influenced by the action of the teacher, it primarily depends on his/her activities and teaching methodologies in the process of education. Most of the faculties of education and pedagogy offer disciplines, such as pedagogy, psychology, specific methodologies and didactics and teacher training – pedagogical practice (Šimoník, 2005). Šimoník also adds that the current curricula do not provide the students with sufficient amount of lessons related to pedagogy, psychology, methodologies and didactic and pedagogical practices. Undergraduate teacher education in Slovakia has a long history. Economic and social factors have been forming and influencing teacher education throughout the history and even now undergraduate teacher education is affected by social and political requirements. The society is constantly evolving and changing the perception and status of human existence, work and family life. The scientific and technological progress does not always bring positive but also negative aspects that often lead into increasing socio-pathological behaviour of children and teenagers.

The crisis in the family, negative impacts of the media and social networks, lack of positive models of behaviour, whether in the family or in the wider social environment make us find reflect on the impact of the teacher on pupils' behaviour and actions. In order to be able to educate today's children, the teacher needs to act as a positive model of behaviour, to understand their requirements and to develop pupils' and students'

personalities. However, the future teacher (teacher trainees) must be well prepared and trained for these new roles and tasks. Therefore university undergraduate education must meet two major requirements – to provide good theoretical as well as quality professional training. The theoretical part of the training consists of disciplines such as pedagogy, psychology as well as special subject methodologies and general didactics. This is the bridge between the theoretical and professional part of the education. The professional part comprises mostly applied and practical trainings (communicative training, psycho-social training, etc.), project activities related to school and teaching and teacher trainings. As we have already stated, in this stage, state requirements enter, such as:

- Competences framed by conceptual requirements for the development of education within international and national scales, for example the requirement to teach pupils for lifelong learning. It is not connected only to the reform but also to the development of educational science.
- Competences that ensure teacher professionalism and expert professional activities as they are stated in the theory of the teaching profession. (Kosova et al., 2012)

In Slovakia, similarly as in several other countries of the European Union, undergraduate teacher education is implemented by a parallel model, often referred to as an integrated model. The basis of the model is to combine multiple types of teacher training. During their university training, students –future teachers – study many disciplines such as those on the general base, subjects of their specializations (the so called academic subjects) and subjects that involve pedagogical and psychological training/preparation for the teaching profession. E. Lukáč (In Černotová et al., 2006) states that a student in this model is forced to perform multiple duties from different areas, pedagogical and psychological preparation have only a small number of hours and we gradually give way to the number of hours devoted to real output of the students in practice. Those negatives can be, however, eliminated thanks to the parallel model. Positive features of this model lie mainly in the integration of pedagogical and psychological knowledge and academic subject knowledge.

The second model used in undergraduate teacher education is the subsequent model also referred to as the consecutive model. It requires having completed academic subject education and subsequently pedagogical-psychological training connected to practical training. The subsequent model allows more intensive work with the candidates who expect to gain teaching skills; their education is not divided between pedagogical-psychological education and academic subject education. The consecutive model can be divided into two basic sub-groups. The first one consists of a one-phase consecutive model, which enables the student (after completing his/her professional, in other words academic subject education) to attain pedagogical qualification and immediately after graduation he or she could be employed as a teacher. This model is applied in Slovakia within the process of additional teacher training and the graduates of non-academic subject education attain pedagogical (teaching) qualification. The study is legislated by the Ministry of Education and unlike university undergraduate education here the number of lessons as well as the curriculum is strictly defined. Although courses at pedagogical faculties have similar store of teaching disciplines, they differ mainly in the hours allocated to each subject and teaching practice. Turek (2001) states in his analysis that students at the Faculty of Pedagogy of University of Trnava (Slovakia) attain teaching skills within 874 hours, at the Faculty of Arts of University of Prešov (Slovakia) within 429 hours and at the Faculty of Natural Science of Comenius University in Bratislava (Slovakia) within only 300 hours of study. Although the data were collected twelve years ago, we are afraid that the current situation has not improved. In 2014, Slovak universities are going through a complex accreditation process and here we can see the space for uniting the curricula, scope/extend and quality of undergraduate teacher education. The second sub-group consists of a two-phase subsequent model that comprises first theoretical training – that is usually ended by an exam and followed by the second phase, which is practical training. The practical training part takes place directly at school, where students improve on methodology of academic subjects and develop competencies necessary for teaching. It is not easy to determine which of the two models is more effective. Positive and negative aspects of each of the model should be modified and adapted mostly to the educational system, educational conditions, economy of the society and mentality and culture of the nation. However, curricula unification seems to be the most urgent requirement in order to make undergraduate

teacher education quality and effective so that it prepares professionals with advanced competencies and positive personal characteristics. In Slovak undergraduate teacher education, a major problem appears to be the differentiation into the bachelor's and master's degrees. Although education in the European Union is considered to be national particularity and does not subject to unification, teacher training in Slovakia (under the Bologna Process) has been divided into inconsistent or only formal degrees (unlike some other countries) and does not implement teacher training based on subsequent phases that create teacher professionalism. Bachelor's degree consists mostly of theoretical preparation and master's degree methodology and teaching practice, the gradual teacher development is interrupted:

- by isolating theoretical training in academic subjects from academic subject methodologies,
- by limiting types of practical trainings and by their shortening (mostly from four years into three semesters), i. e. lack of time to develop teaching skills and competencies (kosová et al., 2012).

The Legislative Framework Act. 317/2009 on the teaching staff and professional staff outlining the scope of teacher education in § 7 Qualifications in Paragraph 2 states that the required level of teacher education is at least university master's degree. That means that the graduate of Bachelor's study programme cannot be employed as a qualified teacher and job positions that require bachelor degree in the labour market actually do not exist (such as assistant teacher, or teaching staff for extracurricular activities, Civil Servants, school libraries staff, etc.). To continue and attain Master's degree appears to be equally problematic – the graduate usually ends with specialising on two academic subjects, therefore he or she cannot continue in any other study programme just the same which he or she ended in his bachelor study.

How much effective, therefore, is the principle of the Bologna agreement on credits in undergraduate teacher education in Slovakia? The quality could be improved if we returned to continuous master study programme in which good professional as well as pedagogical-psychological training and contact with school practice was offered. Indeed, the mere historical experience, the current school system and legislation confirm the justness of continuous master education as the quality teachers and quality education in our schools is visible.

2 Undergraduate teacher training as a space for forming the habit

Habit of everyone hence the teacher is adapted to the conditions that have created it, and it leads to the behaviour and actions that affect personal and professional existence of man. Habit thus actually restores the social conditions that have created him. This means that the habit created during undergraduate education influences the education of children and teenagers that is carried out by teachers. It is therefore necessary to deal with undergraduate teacher training and see it as environment that shapes the habit and the process that shapes the teacher as a professional with the required knowledge and advanced competencies. Academic environment of the university on the one hand consists of buildings, libraries, lecture halls and material-technical equipment and on the other hand, interaction of teachers and students form it as well. Personalities entering this process create a climate which affects the emotional experience, the development of critical thinking and creativity, knowledge

structure and competencies of those who are involved.

The university teacher is therefore one of the personalities that greatly affects university students' personalities. There are several definitions on who the teacher is. The one, frequently common is that the teacher is one of the fundamental factors of the educational process, professionally qualified teaching staff, jointly responsible for the preparation, management, organization and results of this process (Prucha, Walterová, Mareš, 2001). An international team of experts OECD characterize the teacher as a person whose professional activities involve mediating knowledge, attitudes and skills that are specified in the formal curriculum programmes for pupils and students studying in educational institutions. Any definition of the teacher agrees that the teacher is a qualified professional, whose role is to educate their pupils or students in order to develop their personalities.

However, we do not find many definitions of university teacher's personality. J. Vašutová (1999) states that the term university teacher involves all the persons related to institutions or in the programmes of university education that involve teaching, professional activities, science and research.

The most significant Slovak professor connected to the area of university pedagogy, R. Štepanovič, states in his works that the university teacher is a basic educational phenomenon whose qualification, activities and social and scientific responsibilities enable him to fulfil his/her duty when carrying out the educational process at universities.

Even in the legal documents of the Slovak Republic we can find characteristics of university teachers' personalities. University teachers are defined in The Higher Education Act no. 131/2002 Coll. as follows: § 75 (2) university teachers except for lecturers are actively involved in research, development, curative and preventive or artistic activities aimed at obtaining new knowledge, development of products or works of art or artistic performances. Furthermore, the paragraph mentions the possibility of university teachers at vocational colleges to replace active research and development activities by watching the current state of science, research, technology and art. The general finding somehow forgets to say that the main and most important activity of university teachers is to educate and train their students. The Act up classifies activities related to the educational process only when naming different positions (professor, associate professor, assistant professor, assistant).

In our Czech neighbours, the Higher Education Act no. 111/1998 Coll. states instead of the term "university teachers" the term "academics" In § 70 academics are characterized as follows:

- Academic staff is formed by employers of the university, who perform educational as well as scientific, research, developmental, artistic or other creative activities.
- Academics are professors, associate professors, assistant professors, assistants, lecturers and scientists, researchers and developers involved in teaching.
- At universities academics serve as teachers.

It is worth mentioning that already in the very first paragraph and the first place pedagogical activities and all other activities, such as scientific research and art are stated (of course not less important for the work of a university teacher).

University teachers accept several roles. J. Vašutová (2002) based on the analysis of mostly American literature offers several teaching roles and categorizes them into several groups:

- Roles of the provider of information and experience – it is a typical and irreplaceable role of the university teacher, through which he or she implements the educational process. The teacher as an expert carries the knowledge of his/her field of science and the knowledge is transmitted onto the student generally verbally or in the form of textbooks. In addition, the teacher mediates knowledge and experience in such disciplines that require practical skills training.
- Advisory and participatory roles – those can be identified in the form of academic advisor, consultant, tutor, facilitator, supervisor and mentor. The common denominator of these roles is to help students to support their learning, individual interests and learning needs. The teacher acts as a consultant, helpful in solving learning problems, leading students in self-study and individual tasks.
- Creative and evolving roles – in which the university teacher acts as a creator of curricular and educational projects, creator of learning materials, study guides and creator of concepts of experiential learning (internships and traineeships). Through the creation of textbooks and university textbooks the

teacher presents his/her ability to write in a professional way. In the selected study programmes, where it is necessary to implement a practice (training) the teacher also accepts the role organizer, from arranging conditions of the training to economic and financial issues.

- Roles of evaluation - can be divided into three positions: the university teacher as a student evaluator, teaching curriculum evaluator and self-assessor. These roles are considered to be extremely demanding and responsible as the teacher has to assess cognitive performance of students and their products/output. They require the teacher to have knowledge of methods and forms of evaluation of learning outcomes and their adequate implementation in the educational process. An essential role is also the one of a self-assessor, which allows the teacher to assess his/her pedagogical activities.
- Managerial roles - in which the teacher acts as an administrator. This role is often underestimated and negatively evaluated by teachers themselves. It involves activities associated with creating records of student assessment in the electronic information systems and archiving students' products.
- Modelling roles- they are of special importance in the higher education. Here, the university teacher acts as a model of teaching profession where he or she especially through his/her teaching depicts the future teaching profession of the studied programme, discusses the problems of the future profession, but also acts as a model of a moral person with an adequate value orientation, life philosophy and wisdom.

All these roles overlap each other and the activities they convey should always be continuously improved. For forming teacher habit, the modelling role is particularly important. The teacher through his/her personality may significantly influence the personality of the student. The role of an information provider is also one of the key roles in affecting the student's personality. Monitoring and evaluation is of no less importance. As E. Smetanová (2012, p. 97) says: " ...the process of monitoring and checking relates also to self-evaluation (the teacher himself/herself may evaluate his/her own performance; similarly, the student may evaluate his/her own results and/or performance, too). We can also evaluate how a lesson was run (the quantity of what was learned; the atmosphere in the classroom in general; personal feelings of the teacher and students, emotional experiences, etc.). Checking and monitoring activities usually attempt to measure individual's success as well as success of the whole team and the educational institution."

Academic environment creates adequate space for forming habits. Educational work of teachers is reflected in the behaviour and actions of their students and teacher trainees can often subconsciously take also ways and methods that are used by their teachers. It is therefore necessary to develop the personality of a university teacher in a complex way - educational and psychological preparedness, professional and scientific training and moral profile.

According to J. Danek (2007) students are part of the school in terms of experiencing the situations that take place in it which significantly influence shaping of the student's value orientation, life goals, behaviour, and thus the formation of his character, necessary features and qualities of his/her personality. However, this process is not feasible in such school environment where the desired properties and values absent. It means that the university teacher must bear those qualities that we want university students to have developed. The teacher influences his/her students not only in the classroom but also outside it, therefore it is essential that every teacher understands the importance of his/her educational impact on students who – after their graduation - will be responsible for the future of our society.

The object of educational activities of the university teacher is his/her student. Students have different personal features, intellect and acquired knowledge as well as their motives to study the chosen field of science, their emotional experience and interests. We consider university students adults. How do we understand the

concept of adulthood of a university student? In older literature we meet with the characteristics of adulthood in relation to physical, psychological and sociological aspects (Štepanovič, R., 1987). Human biology says about physical development during adolescence, between the age of 16 and 21 of an individual. Knowledge of psychology, however, shows that the period of psychological maturity is not equal to the period of physical adulthood. Mental development is not completed together with the physical one but in the higher education the student's personality matures and only in the first grades the student have basic features of psychological adulthood, such as stabilisation in his/her thinking and action, independence, ability to plan activities and life, sense of responsibility, etc. A young person - a university student – strengthens his/her self-esteem, begins to orientate in life and world autonomously although those activities are often accompany with errors that come with the influence of emotions and lack of life experience. This is the time when features and qualities are being developed, religious and political orientation is being created and the perception and status of values are being changed. We can say that students enter university mostly physically mature but they achieve sociological and psychological maturity during university studies. Here the space for educational treatment of the university teacher and academic environment is open. Academic environment is not always the same, it depends on many factors, such as the size of the study group, age of students, form of study but also the curriculum or teaching methods used. Given these facts, we should remember that university teaching has its various specifics which must be respected in their implementation. One of the basic specifics of teaching activities is that the object and its environment is constantly changing and evolving. The role of the university teacher is to perceive the dynamics and changes and respond accordingly using his/her flexibility in teaching. This reality is confirmed by B. Kosová (2006) who states that the world education moves away from understanding teaching as a technological process that can be accurately planned and implemented throughout the years, but it sees it as a complex, variable and creative process of personal teacher-student meetings and the teacher is perceived as an expert during the meetings who facilitates the learning process and an expert to solve school educational situations. To become an expert, the teacher must be mature and mentally healthy.

Education is usually carried out in the process of teaching and learning. J. Pelikán (1995) describes education as purposeful and deliberate creation and influencing of the conditions which enable optimal development of each individual in accordance with individual dispositions and stimulating his/her own effort to become an authentic, internally integrated and socialized personality. Based on this definition university should create such academic environment that would develop the intellect on the one hand and on the other side of the student's personality. The culture of relations, communication and aesthetics of academic environment to a large extent affect the student's nature and his/her habits.

3 Undergraduate teacher training as a process for professional education

B. Kosová (2012) states that the professionalization of the teaching profession in the 20th century has brought about a shift from the orientation of the minimum competence of teachers, i.e. the "transfer" of knowledge to the orientation of the model of wide open teacher professionalism. As we have already mentioned above, the world pedagogy understands teaching as a complex, varied and creative process of personal teacher-students meetings through the curriculum. It means that expert teachers' knowledge is not knowledge of the science, arts, sports, technology etc. The teacher has to be predominantly an expert in facilitating learning and solving any educational situations. This approach implies the following:

- *expert diagnostic of subjects and situations,*
- *decision-making processes and interventions with knowledge of causality for:*

- psycho-didactic transformation of the curriculum and methods of acquisition that facilitate and enhance learning and
- solving educational situations in which the teacher must act as an autonomous subject, (assisting support),
- *interpersonal relationships and strategies to:*
 - help individual development of a certain student,
 - manage a group of students, create appropriate psycho-social environment,
- *professional reflection and self-reflection of the teacher's own way of teaching*

(Vašutová, 2004)

If we are experiencing changes in understanding of the status and roles of the teacher in the educational process, it is necessary to change training and education of teachers. Undergraduate education should be modified and adapted to the demands that are placed on teachers in terms of new understanding of their profession. Undergraduate education in the Slovak Republic is carried out at universities. It represents the first stage in the process of lifelong education and professional development of every teacher. This intense preparation for teaching practice leads to the achievement of theoretical, professional and scientific knowledge of study disciplines and to the acquisition of teaching competencies which beginning teachers gradually improve during their teaching practice. Pedagogical disciplines play important and irreplaceable roles in the teacher trainees' education as they provide theoretical and practical basis for the performance of the teaching profession. As the performance requirements are changing along with the development of the society, it is essential to think over the changes – they should be reflected in curricula of pedagogical disciplines.

In 2004, the Department of Pedagogy, Faculty of Arts at University of SS. Cyril and Methodius in Trnava (Slovakia), carried out a survey of opinions of teacher trainees and of teachers of educational practice. The survey was conducted through a questionnaire that was completed by 118 teacher trainees and 78 teachers of primary and secondary schools. The questionnaire consisted of five parts:

- The first part contained the input data on the purpose of the survey, instructions for filling in the questionnaire and input identifying information about the respondent (gender, age, type of completed university education, length of teaching practice, in case of teacher trainees age, gender, year of study and possibly if they have any teaching practice during their university studies).
- In the second part, the respondents expressed their opinions on the content of pedagogical discipline taught within the curriculum, using an assessment scale (from “excellent”, “very good”, “satisfactory”, “unsatisfactory” to “I cannot judge”).
- In the third part of the questionnaire, the respondents recorded their views on the necessity of the pedagogical discipline in relation to the practical teaching performance. They also used an assessment scale (from “very needed”, “necessary”, “less necessary”, “unnecessary” to “I cannot judge”).
- The fourth part of the questionnaire was devoted to questions related to the methodology of teaching in various pedagogical disciplines. The respondents were offered to express their opinions an assessment scale as in the previous parts and the same list of disciplines representing the curriculum of the teacher training study programme. The fourth part was only part of a questionnaire that was filled out by the respondents in the category of students.
- In the final part, the respondents were allowed to express their free ideas, views or comments.

We divided the questionnaire in order to gain unbiased information. We gained an image of evaluation of individual pedagogical disciplines created by students but also teachers. The respondents expressed their views on 19 basic subjects representing various pedagogical disciplines.

In 2013, due to the inevitable need to reform undergraduate teacher education, we repeated the survey. The survey involved 149 students of bachelor and master degree studies in the study programme Teaching academic subjects and 89 teachers from three grammar schools and two primary schools. The following table shows the comparison of views of the both surveys. The results are differentiated into three selected areas in two categories - students and teachers. We chose five disciplines that gained the highest frequency of responses "excellent" (content and methods of the pedagogical discipline) and "much needed" (the need for the discipline for practical performance).

Table No. 1 – Order of disciplines related to the curriculum – category: teachers

2004	2013
1 - practical teacher training 100%	100% practical teacher training - 1
2 - general didactics 92%	96% special pedagogy (pedagogy of the handicapped) - 2
3 - teaching techniques and methods 76%	80% pedagogical communication - 3
4 - observing 74%	78% teaching techniques and methods - 4
5 - alternative schools and their curricula 73%	72% strategies and methods of developing child's personality - 5

Table No. 1 offers a comparison of the order of preferred disciplines in terms of the curriculum of a discipline from the perspective of teachers of educational practice. It seems that in the past and also in the present teachers consider the most important discipline practical teacher training that enables teacher trainees to develop their teaching competencies. Other positions of preferred disciplines: compared to 2004 when the dominated disciplines were focused on didactic and methodological work of teachers, in 2013 most prominent disciplines were those that help teachers work with students with problem behaviour (aggression, bullying, truancy, drug addiction, etc.) and with the so called integrated students with various handicaps (specific learning disabilities, attention deficit disorder and hyperactivity, etc.). Family crisis and crisis of the society that prefers consuming and materialistic lifestyle is thus reflected in the educational process at school.

Table No. 2- Order of disciplines related to the curriculum – category: students

2004	2013
1 - practical teacher training 30%	46% practical teacher training - 1
2 - observing 26%	32% strategies and methods of developing child's personality - 2
3 - special pedagogy (pedagogy of the handicapped) 25%	29% pedagogical communication - 3
4 - strategies and methods of developing child's personality 24%	21% special pedagogy (pedagogy of the handicapped)- 4
5 - principles of pedagogy 19%	18% general didactics - 5

Similar findings are also found in the student category (Table 2), where the first place is occupied by practical teacher training. This demonstrates the necessity of expanding the number of hours of teaching training in individual grades of study at bachelor and master level of study. We also find an increased interest in disciplines

that help teachers manage symptoms of problem student behaviours and develop the child's personality from the point of view of cognitive site (cognitive structures of the personality) but also the emotional, communication and socialization site.

Table No. 3 – Order of disciplines – importance of the discipline for practical performance (teaching) – category: teachers

2004	2013
1 - practical teacher training 100%	96% practical teacher training - 1
2 - general didactics 92%	89% special pedagogy (pedagogy of the handicapped) - 2
3 -teaching techniques and methods 81%	79% teaching techniques and methods - 3
4 - observing 74%	71% strategies and methods of developing child's personality - 4
5 - alternative schools and their curricula 73%	70% general didactics - 5

Table No. 4 – Order of disciplines – importance of the discipline for practical performance (teaching) – category: students

2004	2013
1 - practical teacher training 53%	64% practical teacher training - 1
2 - observing 42%	53% special pedagogy (pedagogy of the handicapped) - 2
3 - special pedagogy (pedagogy of the handicapped) 38%	40% strategies and methods of developing child's personality - 3
4 - strategies and methods of developing child's personality 37%	38% pedagogical communication - 4
5 - principles of pedagogy 33%	32% general didactics - 5

Tables no. 3 and 4 present a graphical representation of correlation in terms of preferred disciplines that are necessary for teaching – they are differentiated in two categories: teachers and students. It is obvious that dominance is kept by practical teacher training, special pedagogy, general didactics, teaching methods and strategies and methods of developing the child's personality. We thus understand that teachers are interested in not only mechanical transfer of new knowledge to their pupils but also in the complex and comprehensive development of their personalities and appropriate coping with educational problems in the educational process, although the social and financial evaluation of their work in the Slovak Republic is not sufficient.

Table No. 5 – Order of disciplines – methodology of teaching – category: students

2004	2013
1 - practical teacher training 31%	42% strategies and methods of developing child's personality - 1
2 - special pedagogy (pedagogy of the handicapped) 21%	36% practical teacher training - 2
3 - strategies and methods of developing child's personality 19%	22% special pedagogy (pedagogy of the handicapped) - 3
4 - principles of pedagogy 18%	20% principles of pedagogy - 4
5 - general didactics 11%	18% pedagogical communication - 5

Table No. 5 compares the evaluation of students of individual disciplines in terms of methodology of teaching the discipline in undergraduate teacher education. We were interested in the last area mainly in order to verify whether passing the course of university pedagogy has an impact on improving the educational process. Since the disciplines that received the highest score in preference, were taught by the teachers who have completed university pedagogy course, we can assume that passing the course contributes to the development of university teacher's personality, his/her pedagogical and psychological preparation and thus to improve the quality of undergraduate education itself.

Later on we analysed relationships between views and age, sex or length of teaching of respondents. In our research we have found no significant differences. In our survey we did not find any significant differences. This could have been influenced by the small size of the sample of respondents. If we wanted to explore further these relationships, we would need to choose a different group of respondents with deliberate choice by each category (age, sex, length of teaching experience) in order to obtain the most unbiased results. In conclusion we can say that all respondents consistently consider the most important pedagogical disciplines such as practical teacher training, general didactics and methodology of the academic subjects, special pedagogy and general pedagogy. General didactics and methodology of academic subjects are seen as sources of necessary knowledge about the objectives, content and methods of teaching. The most positive perception is practical teacher training during which they can practically apply their knowledge and acquire basic teaching competencies. General pedagogy in our case was represented by a subject Principles of Pedagogy that offers a holistic view of general pedagogy, its basic characteristics and relationships between them. The respondents confirm the necessity of theoretical knowledge - the basis on which they can further develop their studies, but also apply during real teaching. By choosing the theory of education (Methods and Strategies of the Child's Development), the respondents show their interest in the development of their students – not only knowledge but also their complex development. They are aware of the necessity of positive influence of the teacher to their students – this is the way the whole educational process could be more effective and the results better. Our most interesting finding was the inclusion of Special Pedagogy among the five disciplines most needed for teaching. We believe that the increasing importance of this discipline is also done by socio-economic conditions of our society. Parents are required hard work, which causes stress, lack of time and space to raise their children. Children thus could be emotionally disturbed, which is accompanied by behavioural problems and in our primary and secondary school classes increase the number of the so called "troubled children". Another inspiring factor to increase interest in Special Pedagogy is the integration of disabled children into regular classes.

Based on our findings, we have strengthen extend of the study disciplines for teacher trainees in their study plan. As they were represented only as lectures, we have created seminars and workshops to them in order to train model situations in the educational process and strengthen extend of practical teacher training. Opinions of students and teachers are going to be constantly monitored so as the undergraduate teacher education will be more and more professionalised and of better quality.

4th International Conference on New Horizons in Education

Understanding stress in international students of higher education in a Mexican private university

Araiza, M.J.^a & Kutugata, A.^{b*}

^aFACPyA Universidad Autónoma de Nuevo León, Ave. Universidad S/N Cd. Universitaria San Nicolas de los Garza, N.L. 66410, México.

^bIndependent Researcher, Marina 4400-A Col. Valle de las Brisas, Monterrey, N.L. 64790, México

Abstract

This study presents the background of the theoretical models of culture shock and adaptation in international students in higher education. The Stress and Stressors that might be experienced by these students is measured by the Perceived Stress Scale 10-Item version and Focus Groups and Interviews to Faculty and Staff Members of a Mexican Private University. Guidelines and procedures to Counselors are shared as well as the results and data obtained of this Mixed-Method Approach Study.

Keywords: Stress; International Students; Higher Education; Mexican University; Mixed-Method Study;

1. Introduction

Now days, more private universities are trying to achieve a significant quality in their educational processes. One way of doing this is developing international exchange programs with other universities. The private university chosen for this study has an international program department in charge of promoting this exchange programs with foreign universities.

Double degrees in some careers as well as Mexican students have the experience of studying one or two semesters in a prestigious university abroad, has become a very attractive opportunity.

As a result of these programs, this university has received foreign students from the US, Canada, France, Germany, China, Korea, Denmark, Australia, Japan and other countries. According to the data recovered from the International Department of the private Mexican university in 2007 they received 233 students, in 2008; 289 students, in 2009 265 students, and in 2010, 187 in the first semester.

Therefore, the current situation has demanded a need to understand requirements and problems these students might deal in a daily basis. Furthermore, Faculty and Staff members are required to train and adapt their teaching techniques and their interpersonal communication skills, in and out of the classrooms, in order to support and assist their needs, such as any level of stress they might live with.

Nevertheless, the need to have studies and researches in this matter is essential in order to give a service of outstanding quality. This research pretends to give significant information in the study of Stress and Stressors foreign students might experience studying in a Mexican private university.

2.1. Background

Systematic research on overseas students only appeared after the 1950's, when there was a flood of research on their social and psychological problems according to Ward, Bochner, and Furnham cited by Shuo, Jindal-Snape, Topping & Todman (2008).

Considering the limits established in this research the theory that best subscribes the areas considered are the Social skills and culture learning, having its epistemological origins in the social psychology originated by Argyle & Kendon in 1967 (Shuo, et al., 2008). This theory has its conceptual formulation in the lacking of social skills that may cause cross-cultural problems. "The social skills and culture learning perspective began to lay the foundation for the development of the culture learning model" (Shuo, et al., 2008, p.65).

The study of the term culture shock has been acquired from the social psychology as well as from education. On the other hand, the term Culture learning and stress and coping models have become well established as the social identification theories with a high level of prominence, according to Furnham and Bochner cited by Shuo, et al. (2008).

"These three contemporary theories are more comprehensive, considering the different components of response – affect, behavior and cognition (ABC) – when people are exposed to a new culture.... The notion of "culture shock" has been transformed into contact-induced stress accompanied by skills deficits that can be managed and ameliorated, and terms such as adaptation and acculturation have been increasingly used instead" (Shuo, et al., 2008, p. 65). Furnham and Bochner cited by Shuo, et al. "strongly advocated the social skills/cultural learning models, for its theoretical robustness and because it also led to training methods. This approach developed into contemporary culture learning theory" (2008, p. 65).

The term shock is perceived as a stimulus acquire from the reaction caused by the interaction of the new social environment, where new skills are required in order to be able to adapt. This process of adaptation can be influenced by various variables such as a general knowledge of the host culture; the time period in which the student will stayed in these new environment; as well as the level of proficiencies in his o her language communications skills.

Another aspect that differentiates the speed of adaptation is the abilities the student has to connect with other people. This is the number and type of new friends he or she is able to acquire in the host culture, the previous experience the student has abroad as well as the cultural identity will make significance in the adaptation processes.

The concept of shock approaches from stressful life changes such as the "cross-cultural encounters need to be resilient, adapt, and develop coping strategies and tactics" (Shuo, et al., 2008, p.65). The social identification theories focus on the cognitive components of the adaptation process....Two major conceptual approaches are used in social identification. The first is acculturation and the second is social identity theory according to Phinney cited by Shuo, et al. (2008, p.67).

According to Shuo, et al. (2008), there are three models of acculturation: The first one called uni-dimensional where the process of assimilation takes place and the person identifies and copes with the host culture become a new member of it. The bi-dimensional is a leveled model of acculturation and identity. That is, they developed a bicultural identity. And the third called categorical. This model has four acculturation dispositions or strategies of how the person conceptualizes this home and host identities. These are: Integration- The individual perceives himself with a high level of identifications in regards with the host and his own culture, Separation- In this case, the person has a high level of home culture but a low in the host culture identification, Assimilation- On the

contrary, the person has a low level in regards to his own home culture identification but a high in the host culture & Marginalization- In this case, the person perceives himself low in both, his own and the host culture identification.

The concept of Identity is affected by a wide range of factors, such as individual characteristics as age, gender and education level. As a group characteristic we have the permanence of cross-cultural relocation, the degree of motivation for migration, etc. and the broad social context such as the cultural pluralism, the level of prejudice and the degree of discrimination they might feel (Shuo, et al., 2008).

2.2. *Stress in Higher Education*

For college Students living and studying in a foreign country may demand an adjustment in a sociocultural, environmental and physiological way. It is during this process that a psychological stress could be present, such as anxiety, a sense of loss, loneliness, helplessness, and depression (Chen, 1999).

Stress occurs when these individuals perceive harm, threat or challenge exceeding their resources (Lazarus & Folkman, 1991). According to these authors, harm refers to psychological damage that has been done in the past to this person. Threat is an anticipation of a harm that could be imminent in the students mind. Challenge involves difficulties in overcoming difficult situations mobilizing and deploying coping resources.

Stress is a complex multivariate process that includes an input such as a stressors or an event; an output as it would be the person's subjective reaction to the conditions of his ways of living and the mediating activities present in his standards of living that has an impact in the coping with the factors known as stressors (Lazarus, 1990). "From this perspective, international students' appraisal of stress may be defined as the process during which they assess and perceive their interactions with the host cultural environment" (Chen, 1999, p.51). When considering the differences between their own culture and the hosts we have to consider the level of adequate language skills, their own level of academic skills in relation with the native college students; as the social and interaction abilities they possessed.

On the other hand, Ishiyama cited by Chen (1999) believes that the difficulties in verbal and written communication (Spanish in the case of the Mexican private university UDEM as well as English for Asian college students attending the course of Culture of Mexico, course given in English for international students who doesn't have the level of skills acquired to attend the course in Spanish) may cause international students to feel uncomfortable in daily life and may lead to feelings of insecurity.

In this sense, Aubrey cited by Chen (1999) states that stressors fall into two categories: stressors related to the academic and educational environment, and stressors in the sociocultural and personal domain. Furthermore, some of the educational stressors may include performance expectations, system of adjustment and test-taking anxiety.

Considering that the international students are required to attend different courses, they have to adjust to different environments and different levels of demands in order to fulfill the academic requirements. Writing essays in a different language, performing in presentations as well as the daily interactions between peers in the classrooms may have a relevant significance in this sense.

The adjustment process may vary according to the level of skills and abilities of each student. Some may find it relatively easy to adjust once they get to know their teachers and classmates. But in other cases, because of their own skills and expectations this adjustment may have a difficult time to achieve. In terms of test-taking the language in which the tests are written may become a significant obstacle to overcome.

In a general perspective one of the main differences between Mexican college students vs. international students according the Mexican faculty members interview is the level of class participation. Some students (Americans and Canadians) are used to ask and challenge their teachers. But Asians (Korean, Japanese, and Chinese) and some Europeans (German, French, and Turkish) are more prudent with the level of interaction sometimes even becoming silent students when expected to participate.

On the other hand, Asian students as used and accustom to follow instructions and have a high level of respect towards their teachers. In other words, the Asian system carries a strong notion of distance between professor and student to emphasize respect and order (Chen, 1999, p. 54).

Finally, two other stressors can be found and because of their relevance should be address and researched in a profound manner. Financial factors such as scholarships, expenses, costs of tuition and traveling expenses may become strong stressors especially for international students' adjusting to their new environment. As well as the racial prejudice that can still be present in some regions of the world. Color or skin, language, nationality, and even gender may be elements of hard acculturation process for international students in some cultures.

According to Schafer cited by Robotham & Julian (2006) stress can have a positive effect in students allowing them to respond in an effective way during an emergency. As well as taking into consideration that some level of stress will be present in a daily base in the life of college students. In this sense, there has been a lack of longitudinal studies posting the factors that cause them stress according to the student's perceptions of these factors. It's necessary to adopted for such matter a qualitative approach in its methodology in order to have a holistic perception of these matters.

As we stated before, some of the most common stressors experienced by college students include the examinations, time frame in their stay in the host country as well as the financial pressures that a foreign student could encounter.

According to Ross, Niebling, and Heckert, cited by Robotham & Juian (2006) the changes in their sleeping and eating habits, the increase in their new responsibilities and homework considering the language barrier that might have a negative effect in some students as well as the fear to failure in this new experience plus the parental pressure present in some cases cause a significant number of stressors to considered in international college students attending our higher educational universities.

Students respond to stress in varies ways according to Misra, McKean, West & Russo cited by Robotham & Julian (2006) "These responses can be categorized into emotional, cognitive, behavioural and physiological reactions" (p.112). In terms of emotional response we could find some level of fear, anxiety, guilt or depression; where as in the cognitive response there seems to be an increase in the stressful situations.

In relation with the behavioural we can find an abuse of himself or others, irritability to simple and small situations that wouldn't make a difference in these known surroundings and in a physiological response an increase of sweating, headaches, weight loss or gaining for such matter as well as presenting body aches.

It is common for international college students to feel stomach ache after long weekends blaming the food or water taken; as well as having a cold. This has been reported by some faculty members of the private university selected, giving courses to international students. According to Abouserie cited by Robotham & Julian (2006) approximately one in ten students may need professional support to reduce their levels of stress. On the other hand, many individuals would not admit they suffer from stress believing they could be perceived as weak increasing a peer pressure from colleagues becoming a stressor as Scott cited by Robotham & Julian (2006) states.

2.3. *Strategies for Counselors and Faculty Members*

“College counselors often need to modify traditional counseling theories and techniques to meet the particular needs of individual clients.....Becoming competent in multicultural issues, values, and beliefs of diverse clients may aid college counselors when working with a diverse population” (Olivas & Li, 2006, p.217) .

According to Ying and Liese cited by Olivas & Li (2006) in their research “Initial Adjustment of Taiwanese students to the United State” they found out that level of homesickness was the strongest predictor of poor adjustment.

On the other hand, in the study conducted by Mallinckrodt and Leong called “International graduate students, stress, and social support” cited by Olivas and Li (2006) the quality of the relationships between the foreign students and the faculty members, as well as quality of instruction and the continued presence of staff members interested in their own development can turn out to be a protective function to be well-being of the students undergoing their encounter stress. In this sense, it is convenient to take into consideration the eight strategies for positive adjustment to stress proposed by Tseng and Newton (2002) in their study called International students’ strategies for well-being: (1) Know self and others as to understand the similarities and differences between one’s own culture and the host culture. In this way, the transition between cultures will go smoother, (2) Make friends and build relationships as to learn to take advantage of friendship between your own peers. Other foreign students could be of great value in your say in this new country. College students, faculty and staff members of the university can become allies helping overcome difficulties in during your stay, (3) Expand individual worldview as to “...enlarge one’s field of vision as well as to broaden one’s knowledge of the world is a significant way to strengthen individual adjustment capabilities” (Tseng & Newton, 2002, p.595), (4) Ask help and handle problems as to in order to be able to adjust efficiently, it’s adequate to ask for support and help to the staff members of the faculty in the host culture as well seeking for assistance to other peers in the college, this becomes a useful method to deal and solve the problems encountered, (5) Establish cultural and social contacts as to be open to participate in extracurricular activities as well as social events design by the international program department. This will be an excellent opportunity to get to know new acquaintances, (6) Build relationships with advisors and instructors as to the international students should keep an open mind and be flexible in order to build successful relationships with advisors as well as instructors assigned during his stay in the college, (7) Become proficient in the English language as in the case of international students attending the private university, it’s convenient to increase their level of proficiency in Spanish considering that they are attending courses in Spanish relating with Mexicans. Therefore, they have a diverse opportunity to increase their knowledge of the foreign language, and (8) Use the tactic of “Letting go” as to according to some students, the best way to lessen stress and gain well-being was learning to let go of situations they couldn’t resolve. Don’t give too much value to situations that can be left alone.

3. **Purpose and methodology**

3.1. *Purpose*

In order to understand Stress and its’ effects in International Students in Higher Education in a Mexican Private University in a holistic way, it is convenient to approach this study in a Mixed-Methodology.

From a methodological point of view, the majority of previous studies related to stress in higher education college students have focused on a quantitative approach, where participants complete a self-report inventory that claims to measure stress, well being or stressors (Robotham, 2008). Examples of these inventories are:

- The Hassles Assessment Scale for Students in College (Serafino, & Ewing, 1999).

- Student Life Stress Inventory (Gadzella, 1991).
- The College Chronic Life Stress Survey (Towbes, & Cohen, 1996).
- The Student Stress Scale (Insel, & Roth, 1985).
- The Academic Stress Scale (Abouserie, 1994)
- The Perceived Stress Scale (PSS) (Cohen, Kamarck & Mermelstein, 1989)

Using the Perceived Stress Scale (PSS) 10-item version we will be able to measure the stress according to the Student's point of view. In the Quantitative analysis the descriptive statistics will reflect the emotions and situations that might produce some degree of stress as well as the type of stressors present in the student's life in this foreign university.

Using the statistical procedure of one-way analysis of variance (ANOVA) we could establish an analysis of the outcome using SPSS-18 in order to accept or refuse our null hypothesis stated as follows:

Ho - The level of stress is equal for the male international students as for the female international students.

Or on the other hand we could accept or refuse or alternative hypothesis stated as follows:

H1 - The level of stress is significantly different between the male international students vs. the female international students.

Taking into consideration the results obtained in these procedures, we will be able to proceed with the development of the Focus Groups (FG) in order to understand the effects of stress in their daily life in campus as well as the type of stressors perceived by the students in a subjective sense. We will also include two interviews with the academic staff, who are now days teaching courses to foreign students.

According to Green, Caraceli, and Graham cited by Sydenstricker (1997) among the purposes for a mixed-method evaluation design we can find five major highlights of evaluation which are: Triangulation, Complementarity, Development, Initiation, and Expansion.

In this sense, the study taking into consideration the triangulation will increase the chances of controlling some of the threats or multiple causes that might influence our results. In relation to the Complementarity we will use a diverse of instruments such as the PSS, interviews and focus groups in order to add information for the future analysis of data.

Once the PSS is applied we will be able to perform the Focus Groups (FG) developing the Analysis and Report according to this technique (Krueger, 1998); giving us the development as a result of this mixed-method approach. As a result of this, we will have an initiation stimulating new questions to the faculty professors adding more relevant information to this research.

3.2. *Sample*

A group of 62 international students arrived in the semester of autumn of 2011 and a sample of 57 students participated answering the surveys and a group of five from the sample collaborating in the focus group.

The sample was composed as follows: 27 males, 47.37% of the sample & 30 females, 52.63% of the sample.

Total of participants in the sample are 57 students from the following countries: Germany, México, Brazil, UK, France, Hong Kong, Australia, South Korea, China, Finish, USA, Netherlands, Turqui, Japan, Canada, Spain and Switzerland.

3.3. *Instrument and Procedure*

3.3.1. *Quantitative Approach*

“Perceived Stress Scale (PSS) 10-item version is the most widely used psychological instrument for measuring the perception of stress; It is a measure of the degree to which situations in one’s life are appraised as stressful” (Cohen, 2005, p. 1). The items were designed to tap how unpredictable, uncontrollable, and overloaded respondent international students find their lives. The scale also includes a number of direct queries about current levels of experienced stress, in a general perspective, the questions in the PSS ask about the feelings and thoughts during a period of the last month (Cohen, 2005).

The validation of this instrument can be found in the research paper Further Psychometric Support for the 1-Item Version of the Perceived Stress Scale from Roberti, Harrington & Storch (2006). The Cronbach’s alpha reliability for the PSS of 10 items obtained by the authors using SPSS-10 is .89. The Cronbach’s alpha obtained in our research using SPSS-18 is of .82.

The procedure established to apply the PSS, according to the authors, is to apply the instrument during the first two weeks of the arrival of the international students to the foreign university. With the data of this scale we will be able to produce the interview guide questionnaire for our focus group (Morgan, 1998) in relation with the type of items ask in the 4th stage K-Q (Key Questions) of this technique.

3.3.2. *Qualitative Approach*

Focus Groups will be applied following the instruction of Morgan & Scannell (1998) of four steps: Planning, Recruiting, Moderating, and Analyzing and reporting with all the inside criteria that this technique implies in smaller groups for focus groups. The Questions to follow our structure for the FG include the following types: Opening, Introductory, Transition, Key and Ending questions according to Krueger (1998).

The moderating of the FG will include a moderator and two assistant moderators taking into consideration the structure offered by Kruger (1998) in relation with the responsibilities and skills applied in this qualitative approach. Once this process is completed all the data will be included in the corresponding formats added in the appendix along with the transcripts and full report for future use to the reader.

3.4. *Data Analysis and Findings*

3.4.1. *Quantitative Analysis*

Using the SPSS v-18 the results of the ANOVA of each item, as well as the Total Stress Level obtained are revealing a significant difference between genders in relation with the items 2, 3, 8, and 9. As well as the Total level of Stress obtained by summing across all scale items. (See Fig. 1).

Analyzing these results, the sense of not being able to control important issues are more frustrating for the female international students than for the male international students. Therefore, in the item 2 the null hypothesis is rejected and the alternative hypothesis is accepted. In relation to the level of nervous and stress feelings, the female international students felt a higher level than the male international students. So the null hypothesis is rejected and the alternative hypothesis is accepted in relation to the item 3 of the scale used.

As far as the feeling of being “on top of things” the female students’ sense is higher vs. the male students, therefore there is higher level of stress related to the item 8. The null hypothesis is rejected and the alternative hypothesis is accepted. The item 9 is related to the level of anger when the student does not have control of outside issues. The level of female international students is higher vs. the male international students. The null hypothesis is rejected and the alternative hypothesis is accepted.

According to the Perceived Stress Scale used, the Total level of Stress is higher in a significant degree according to the data obtained, there the null hypothesis is rejected and the alternative hypothesis is accepted. In a general sense, we can find in all the rest of the items a relative difference, not as significant as in the items 2, 3, 8, and 9. Only in item 4 the level in the female students is lower than the male students. This item is related to the confidence in the ability to handle personal problems, where the male has a higher level of ability in this sense.

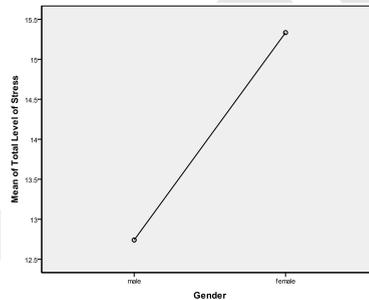

Fig. 1.

But in terms of the Total Level of Stress gained, the level is significant higher for the female students as these affirmations are shown in the means plots showed as follows:

Table 1. The Cronbach's alpha obtained in the research = 0.820

		Sum of Squares	df	Mean Square	F	Sig.
item 1	Between Groups	.044	1	.044	.080	.778

	Within Groups	2103.852	55	38.252		
	Total	2199.368	56			

3.4.2. Qualitative Analysis

The Focus group was active and the students were participative along the session. According to the structure planned the session was prepared before hands with a series of questions, begging with some ice breakers to start the interaction.

Then, the questions were focus on their perception of stress experienced so far in their first two weeks in the city. In this sense, the general perception of the group was that it was more the dangerous the idea spread in their own countries before arriving to Monterrey, Mexico than their own reality lived so far.

Parents and friends were concerned of the news in the media such as newspapers and news broadcast on TV. So far, their impression was overwhelming in terms of the friendliness they have experienced with peers and teacher's staff. When asked about the way they were treated in the classrooms four out of five responded that the professors would extend the deadline of assignments and reports considering they might be traveling around the country. That special treatment was considered "cool" to them.

On the other hand, they all felt a sense of help from peers in relation to instructions not cleared to them, especially with the foreign students learning Spanish in the beginner's levels. But they were all "shock" to have to spend too much time in classes hearing the professors repeat themselves explaining the right way of cite authors in academic papers as well as regular instructions already given in earlier classes.

Three out of five students were "against" the rules in their classes of the professors taking assistant in a daily bases. They mentioned that in their universities in Germany, France and Australia the students could attend to their own discretion considering their own personal agenda and level of commitment to the specific class. In other words, they felt like being back in High School with this action from the professors.

In terms of their perception of stress with this examples and situations explained before, they all agreed they felt a 3.5 level of stress in a scale of 1 through 5. They also felt stressed in relation to their assignments considering they were taking 4 to 6 subject each and having only a week between the instructions and directions given to do this assignments and a week later as a deadline to hand them in for evaluation. Three out of five students mentioned that in their universities they would have instructions hand them to them at the begging of the course and a deadline dated to deliver them in advances given them at least one to two weeks to accomplish their assignments.

They also distinguish the difference between their own professors and the Mexican ones in relation to appointments that could be previously establish with them to check-up advances in their projects and to have recommendations to their own personal topics assigned. They felt in a significant degree, 4 from a scale of 1 to 5, they were wasting their time listening to some Mexican students complained in class in relation to their projects as well as asking the same questions over and over again in terms of the form of their projects and assignments.

As far as their personal safety, they all felt safe in the university and their social life visiting the outsides of the city. They all felt surprised with the level of friendliness from their own peers as well as the staff members of the university. They all felt a high level of support from the staff members of the International program of the exchange students from the university, as well as their own professors in and out of their classrooms.

The stress they felt was stated as far as homework and exams were concerned not knowing if they would be able to understand the written spanish taking into consideration that four out of five we also taking several courses from their own mayors in spanish with Mexican peers.

4. Discussion and implications

4.1. Institutional Procedures to Support International Students

The staff members of the Dept. of International Students are personal trained to deal with the problems concerning the affairs exchange students might go through along their stay in the institution.

As far as their integration with their Mexican peers, all foreign students are part of the integration program consisting of the support and friendship offered by Mexican students volunteers, who as part of their social service program, help new international students with academic support in terms of answering questions related to campus offices and procedures that they have to deal with.

On the other hand, they offered their time and support as well as in their personal interest of getting to know the “cool” places to hang out and have distractions younger’s might be interest in. The Dept. of International Student’s has several programs as housing is concerned. Not only has the private university the possibility to offered housing in their dormitories facilities including their shared or individual bedroom, as well as the complete facilities in the buildings of housing including gym, tennis and football courts, tracking field and cafeterias and restaurants inside the institution; As well as their copy centers, library, social spots, theater, book shop and chapel according to their regular schedules. All students, as well as faculty members, can use the taxi program where a staff of safe drivers with register cars are able to take them into the city and downtown areas having a safe trip round trip.

On the other hand, foreign student might want to rent a studio or department sharing with other international students. They have access to the institution database of renters who are checked by the Dept. of International

Students. This data base also includes Mexican families willing to accommodate foreign students who might need a place to stay and also those who are interested in interacting with natives from this country being able to practice and learn more Spanish in a daily basis. Most of these families have youngsters that can also interact with them. Therefore, this option is one of the most required form the international students arriving each semester.

As far as the faculty members, professors have full access to the support and guidance from the trained professional in relation to possible awkward situations that might need attendance. The profiles of faculty members are professors with teaching experience to foreign students from university level. Each professor has also the support of the director of each department according to the subject and course given. For example, the language department is directed by a foreign experiences academic who is in charge of Mexican and foreign professors teaching to Mexican and foreign students several languages according to the demands of academic needs.

In the case of academic courses taken from different career programs, the faculty members are available to tutoring session previously scheduled by appointments to help those students (Mexican or foreign) who might feel the need of support. Furthermore, most professors would request collaborative assignments integrating foreign students with Mexican students willing to help their peers with the care required in several study sessions in the library and classroom activities.

4.2. Factors of Stress Affecting Learning according to Faculty Members

According to the interviews of three faculty members, the most common factors affecting international students are as follows:

The level of domain of Spanish in order to succeed in classes taught in Spanish. When you have a group of 25 Mexican students you can't stop all the time to attend the special needs of the international students. When this case shows up, we recommend to the foreign student the possibility of taking the course in English until they feel more confident to take the course in Spanish with the rest of the peers.

The need to adapt and respect rules in the class as far as the attendance policies. Most of the foreign students demand free will in terms of their attendance records arguing they have previous plans of traveling during their weekends not being able to dedicate 100% to their courses. The foreign students need to program their social activities according to the time off left after completing their academic needs.

The ability of adapting to a different strategy of teaching in a Mexican private university. The profiles and needs of their Mexican peers might be different to the one they might experience. Therefore, they must take into consideration these differences before having a negative attitude in class.

Finally, the three faculty members acknowledged the need of informing foreign students they must try to adapt their learning skills in relation to the outlines of assignments per week or by terms as the academic programs is structured. The flexibility teachers can have, are limited in numbers of opportunities appeared avoiding the claims of their Mexican peers feeling unfairly treated in class. The balance must be taken care of by the professors in order to have a successful course with Mexicans and foreign students.

5. Future study and limitations

The research team acknowledges the need to study furthermore the perceptions of stress in foreign students in relation to their interaction with the Mexican professors. According to the answers given by students and faculty members, their points of views are opposite to a balance terms of performance requested and needed.

In this sense, a tutorial guidance class must be offered to those foreign students in need of an extra support, as showed in the outcome of the focus group analyzed.

In terms of the instrument applied the research team felt satisfied with the obtained results, taking into consideration the time assigned to this research.

We also have to acknowledged and thank the support and help received by the Department of International Students, Directors of the Language and the Humanity Department, as well as the academic staff members interviewed along this research, and all the international students who participated in surveys and interviews.

Maria de Jesus Araiza Vazquez, PHD Research professor of the Faculty of Accounting & Administration of the “Universidad Autónoma de Nuevo León”, and of the PHD program of the “Escuela de Ciencias de la Educación de la Secretaría de Educación”. Member and coordinator of the REDIE-UANL & member of the REDIIN.

Armando Kutugata Estrada, MEH Independent Researcher and a doctoral Student of the “Escuela de Ciencias de la Educación” de la Secretaría de Educación in his third and final year & member of the REDIIN.

4th International Conference on New Horizons in Education

University preparatory class students' study skills

Phd. Student Özlem Karakiş*

A.İ.B.U.

ABSTRACT

In this study, aiming to identify the university preparatory students' study skills and in which survey method was used, Study Skills Scale developed by Kaner and Kesiktaş (2005) was used and Cronbach Alpha reliability of the scale was found as 0,889 for the current study. In the study, mean, standard deviation and Pearson correlation analysis were used. According to the findings of the study being carried out with 278 students, that students "always" perceive themselves competent in the sub-scale "Doing Homework Effectively and Preparing for Exams (DHEPE)"; "sometimes" in the sub-scales "Studying in a Systematic and Organized Manner (SSOM)", "Problems Faced in Learning (PFL)", "Organizing the Study Environment (OSE)", "Orderliness and Appropriate Classroom Behavior (OACB)" and "never" in the sub-scale "Asking for Help (AH)" were identified. In the study, that there was a high positive relation between the sub-scales "Doing Homework Effectively and Preparing for Exams" and "Studying in a Systematic and Organized Manner"; there was a low negative relation between "Doing Homework Effectively and Preparing for Exams" and "Problems Faced in Learning"; there was a medium positive relation between "Doing Homework Effectively and Preparing for Exams" and "Organizing the Study Environment" and "Orderliness and Appropriate Classroom Behavior"; there was a very low positive relation between "Doing Homework Effectively and Preparing for Exams" and "Asking for Help" were identified. In the study, that there was a low positive relation between the sub-scales "Studying in a Systematic and Organized Manner" and "Problems Faced in Learning", "Organizing the Study Environment", "Asking for Help", "Orderliness and Appropriate Classroom Behavior" were also identified. In the study, that there was a low positive relation between the sub-scales "Problems Faced in Learning" and "Organizing the Study Environment" and "Orderliness and Appropriate Classroom Behavior"; there was not a relation between the sub-scales "Problems Faced in Learning" and "Asking for Help" were identified. In the study, that there was not a relation between the sub-scales "Organizing the Study Environment" and "Asking for Help"; there was a low positive relation between "Organizing the Study Environment" and "Orderliness and Appropriate Classroom Behavior" were identified. In the study, that there was a very low positive relation between the sub-scales "Asking for Help" and "Orderliness and Appropriate Classroom Behavior" was also identified.

Key Words: Study Skills, University Preparatory Class Students

INTRODUCTION

Today's educational systems do not only envisage information upload, they rather emphasize the developing physical, emotional, cognitive and social skills and sustaining this development both in individual and in social terms in line with modern educational approaches. In this context, developing individuals in every field and involving them in a happier, productive and social life more actively are aimed in accordance with the education process (Yeşilyaprak,2010).

Assessment of the educational process with this perspective has required bringing forward various viewpoints regarding study skills. In this context, study skills defined as "effective use of specific methods and techniques in order to realize learning aims" by Uluğ (2011) and Yıldırım, Doğanay and Türkoğlu (2010) in the related literature are also regarded as a structure that includes planned manners of studying in general (Crow,1968), organizing the study environment suitably (Dodge,1994), implementation of effective reading skills (Lewis and Doorlag,1999), providing necessary arrangements to ensure effective listening skills to take place and to identify skills related to note taking (McEvan,1996), ensuring active participation in classes (Smith,2000), perception of basic qualities related to doing homework (Thomas,1993), preparing for exams as needed (Uluğ,2011) and the tasks necessary to undertake in order to achieve success in exams (Yeşilyaprak,2010).

Although study skills include several independent skills that are meaningful on their own, regarding the qualities included in study skills as independent form each other or as alternatives to one another is out of question. In this context, study skills are regarded as complementary skills and it is necessary to approach them as a whole in order to increase success levels (Gettinger and Seibert 2002).

Students' lack of productive study skills or inadequacies to acquire study skills that will lead them to their aims are regarded among the main reasons of academic failure (Harvey,1998). Following this perspective, Yeşilyaprak (2010) stated that lack of correct and effective study skills will never lead to success regardless of the time spent on studying.

In this context, according to Yıldırım, Doğanay and Türkoğlu (2010); students who do not study in line with productive and effective study methods and techniques cannot plan the study process, adapt to the class level and motivate themselves to study and therefore face failure. On the contrary, students with productive and effective study skills are seen as students with higher success levels and more positive attitudes towards school (Türkcan and Öcal, 2003). Kiewra (2002) stated that study skills should be taught to students separately and also remarked that using appropriate and effective strategies would make it easier for teachers to teach students these skills. Crotta (2004) who indicated that teachers should focus on students' internalizing study skills during study skill acquisition also mentioned that this perspective should be taken as a basis to ensure that study skills are transformed into a lifelong habit. Strichart and Mangrum (2002) identified that paying attention to the use of creative activities in developing study skills and effective use of creative skills will be very beneficial along with the activities provided in textbooks.

According to Gettinger and Seibert (2002), teachers should not confine themselves to narration and should also present these skills in their own behaviors as role models during the process of study skills acquisition because when students observe teachers using these skills they will comprehend the importance of these skills better. Polloway and Epstein (1994) stated that the majority of teachers thought study skills could be developed with the help of homework. In this context, Polloway and Epstein (1994) identified in their study that teachers did not provide extra training about study skills other than giving students homework, did not undertake activities that could be beneficial to students regarding study skills, did not

allow the use of auxiliary materials and tools, did not provide peer support, did not check homework regularly and did not encourage students sufficiently. Witzel and Mercer (2003) expressed that if students are given homework to acquire study skills, use of reinforcers during homework checks will support the acquisition of study skills and reinforcers will provide a motivation model for students in this stage. The researchers also mentioned that teachers should regularly follow the literature regarding the use of reinforcers in study skills acquisition. In their research, Wallace, Cox and Skinner (2003) identified that by doing homework piece by piece during study skills acquisition will help teachers and students to act in stages and therefore the activities achieve the goal more successfully.

As a result, it is seen that using different models, providing homework in parts or segments, creative activities, home based activities and teacher-parent-school management and staff interaction are important respectively in development of students' study skills in addition to the methods the students are taught these skills. Study skills acquired in this manner ensure acquisition of productive study habits.

Investigation of the current literature in our country shows that there are several studies that examined the relationships between homework and providing students with study skills (Çolak,2001), between university students' study skill levels and the views of instructors and teachers (Arıkan,1999), between students' study skills and their attitudes towards studying (Küçükahmet,1987), students' study skills (Akçamete, Gürgür, Kış and Kayaoğlu,2002), study skills of primary school 8th graders (Uluğ,1981), high school entrance exams' level of prediction based on parental attitudes in adolescents, exam anxiety and study skills (Azazi Aslan,2005), relationship between study skills orientations of 7th and 8th graders and the students' favorite type of knowledge from among printed teaching materials (Deryakulu,1998), study skills of university students (Bay,Tuğluk and Gençdoğan,2004), study skills of students in inclusion and under risk (Dolunay Kesiktaş, 2006), the effect of study skills on achievement and permanency in 8th grade English class and (Korkmaz,2010), variables that affect teacher candidates' study strategies (Erdamar Koç,2010), study habits of students enrolled in faculty of education and faculty of science biology departments (Temelli and Kurt,2010) and study habits of university students (Sünbül et.al.,2011). The fact that no previous study investigating study habits of university prep class students who take foreign language training exists shows the need for the current research.

METHOD

The study aiming to identify self competence levels of students regarding study skills is a survey. According to Karasar (2007), survey model is a research approach that aims to describe a past or present situation as is.

The study was implemented on 278 students randomly selected from among 560 students enrolled in prep classes of a state university in the Western Black Sea region. Simple random sampling is a type of sampling in which all elements in the universe have equal chance of selection (Karasar,2007).

“Study Skills Scale” which was developed by Kaner and Kesiktaş (2008) was used in the study for student self assessment regarding their study skills. The scale has a total of 55 items and 6 dimensions: Doing Homework Effectively and Preparing for Exams (DHEPE), Studying in a Systematic and Organized Manner (SSOM), Problems Faced in Learning (PFL), Organizing the Study Environment (OSE), Asking for Help (AH) and Orderliness and Appropriate Classroom Behavior (OACB).

The scale is a 3-point Likert type scale (1=never, 2=sometimes, 3=always). Scoring is reversed in some items (DHEPE 2, OSE 1, PFL 1, PFL 2, PFL 3, PFL 4, PFL 5, PFL 6, PFL 7, PFL 8, PFL 9, PFL 10) since they are expressed negatively. The highest score from the scale is 165 (number of items multiplied by three) and the lowest score is 55 (number of items multiplied by one). High scores show that the students assess themselves as competent regarding effective study skills.

Reliability scores of the scales in the current research are found to be: Doing Homework Effectively and Preparing for Exams (DHEPE): 0,832; Studying in a Systematic and Organized Manner (SSOM): 0,767; Problems Faced in Learning (PFL): 0,702; Organizing the Study Environment (OSE): 0,616; Asking for Help (AH): 0,473; Orderliness and Appropriate Classroom Behavior (OACB): 0,632 and the reliability for the whole scale was found to be 0,889.

Distribution of students' perception of competence levels regarding study skills in the sub scales and in general was analyzed with the help of means and standard deviation values. Pearson Correlation analysis was used to examine the relationship among students' perception of competence levels regarding study skills.

The scale in general shows that the highest score is 165 and the lowest score is 55 when perception of competence levels is investigated regarding study skills. High scores point that the students perceive themselves as competent in terms of using effective study skills. 51-59 score range shows that students never perceive themselves to be competent; 92-128 score range points that students sometimes perceive themselves to be competent and 129-165 score range shows that they always perceive themselves to be competent.

FINDINGS, COMMENTS AND SUGGESTIONS

First Sub Problem: What is students' perception of competence levels regarding the study skills in the subscales and the whole scale?

Table-1: Means and Standard Deviation Scores Regarding Study Skills Subscales and the Scale as a Whole

	N	\bar{X}	S
DHEPE	278	43,76	5,48
SSOM	278	18,87	3,69
PFL	278	21,85	3,43
OSE	278	19,48	2,74
AH	278	5,72	1,41
OACB	278	11,73	2,08
GENERAL	278	121,41	13,10

Table-1 shows that students always perceive themselves to be competent (=43,76 (S=5,48)) in “Doing Homework Effectively and Preparing for Exams (DHEPE)” sub dimension in terms of using effective strategies while doing homework and preparing for exams.

Students sometimes perceive themselves to be competent (=18,87 (S=3,69)) in “Studying in a Systematic and Organized Manner (SSOM)” sub dimension in terms of planning the course of study and using systematic study skills for reading tasks.

Students sometimes perceive themselves to be competent (=21,85 (S=3,43)) in “Problems Faced in Learning (PFL)” sub dimension in terms of skills related to hardship levels in tasks such as listening in class and doing homework.

Students sometimes perceive themselves to be competent (=19,48 (S=2,74)) in “Organizing the Study Environment (OSE)” sub dimension in terms of skills related to providing necessary tools and instruments for school and arranging the study environment satisfactorily.

Students never perceive themselves to be competent (=5,72 (S=1,41)) in “Asking for Help (AH)” sub dimension in terms of asking for help from others in situations where they have difficulties during academic work.

Students sometimes perceive themselves to be competent (=11,73 (S=2,08)) in “Orderliness and Appropriate Classroom Behavior (OACB)” sub dimension in terms of skills such as doing homework and refraining from activities that are not related to lessons during class time.

The scale in general shows that students sometimes perceive themselves to be competent (=121,41 (S=13,10)) in terms of effective study skills.

Second Sub Problem: Is there a relationship among the perception levels obtained from the subscales of the study skills scale?

Table-2: Results of Pearson Correlation among Competence Perception Levels Obtained from Study Skills Subscales

		SSO	PFL	OSE	AH	OA
		M				CB
DHEPE	r	,65(*)	,33(*)	,52(*)	,10(*)	,47(*)

	p		,371	,000
AH	r			,11(*)
	p			,030

*p<,05

Investigation of the relationships among perception levels obtained from the subscales of the study skills scale utilizing Table-2 shows that;

There is a positive and meaningful relationship ($r=.65$, $p<,05$) between competence levels in using effective strategies while doing homework and preparing for exams in “Doing Homework Effectively and Preparing for Exams (DHEPE)” sub dimension and in planning the course of study and systematic study skills related to reading tasks in “Studying in a Systematic and Organized Manner (SSOM)” sub dimension.

There is a positive and low level meaningful relationship ($r=.33$, $p<,05$) between competence levels in using effective strategies while doing homework and preparing for exams in “Doing Homework Effectively and Preparing for Exams (DHEPE)” sub dimension and in the hardship levels they face during listening in class and doing homework in “Problems Faced in Learning (PFL)” sub dimension.

There is a positive and medium level meaningful relationship ($r=.52$, $p<,05$) between competence levels in using effective strategies while doing homework and preparing for exams in “Doing Homework Effectively and Preparing for Exams (DHEPE)” sub dimension and providing necessary tools and instruments for school and arranging the study environment satisfactorily in “Organizing the Study Environment (OSE)” sub dimension.

There is a positive and very low level meaningful relationship ($r=.10$, $p<,05$) between competence levels in using effective strategies while doing homework and preparing for exams in “Doing Homework Effectively and Preparing for Exams (DHEPE)” sub dimension and in skills related to asking for help from others in situations where students face difficulties in academic work in “Asking for Help (AH)” sub dimension.

There is a positive and medium level meaningful relationship ($r=.47$, $p<,05$) between competence levels in using effective strategies while doing homework and preparing for exams in “Doing Homework Effectively and Preparing for Exams (DHEPE)” sub dimension and skills such as doing homework regularly and refraining from activities unrelated to school during class in “Orderliness and Appropriate Classroom Behavior (OACB)” sub dimension.

There is a positive and low level meaningful relationship ($r=.27$, $p<,05$) between competence levels in skills such as planning the course of study and systematic study skills in

“Studying in a Systematic and Organized Manner (SSOM)” and in hardship levels regarding listening to class and doing homework in “Problems Faced in Learning (PFL)” sub dimension.

There is a positive and low level meaningful relationship ($r=.34$, $p<.05$) between competence levels in skills such as planning the course of study and systematic study skills in “Studying in a Systematic and Organized Manner (SSOM)” and in providing necessary tools and instruments for school and arranging the study environment satisfactorily in “Organizing the Study Environment (OSE)” sub dimension.

There is a positive and low level meaningful relationship ($r=.24$, $p<.05$) between competence levels in skills such as planning the course of study and systematic study skills in “Studying in a Systematic and Organized Manner (SSOM)” and in skills related to asking for help from others in situations where students face difficulties in academic work in “Asking for Help (AH)” sub dimension.

There is a positive and low level meaningful relationship ($r=.37$, $p<.05$) between competence levels in skills such as planning the course of study and systematic study skills in “Studying in a Systematic and Organized Manner (SSOM)” and skills such as doing homework regularly and refraining from activities unrelated to school during class in “Orderliness and Appropriate Classroom Behavior (OACB)” sub dimension.

There is a positive and low level meaningful relationship ($r=.24$, $p<.05$) between competence levels in hardships regarding listening to class and doing homework in “Problems Faced in Learning (PFL)” sub dimension and providing necessary tools and instruments for school and arranging the study environment satisfactorily in “Organizing the Study Environment (OSE)” sub dimension.

There is no relationship ($r=.00$, $p>.05$) between competence levels in hardships regarding listening to class and doing homework in “Problems Faced in Learning (PFL)” sub dimension and in skills related to asking for help from others in situations where students face difficulties in academic work in “Asking for Help (AH)” sub dimension.

There is a positive and low level meaningful relationship ($r=.26$, $p<.05$) between competence levels in hardships regarding listening to class and doing homework in “Problems Faced in Learning (PFL)” sub dimension and skills such as doing homework regularly and refraining from activities unrelated to school during class in “Orderliness and Appropriate Classroom Behavior (OACB)” sub dimension.

There is no relationship ($r=.02$, $p>.05$) between competence levels in providing necessary tools and instruments for school and arranging the study environment satisfactorily in “Organizing the Study Environment (OSE)” sub dimension and in skills related to asking for help from others in situations where students face difficulties in academic work in “Asking for Help (AH)” sub dimension.

There is a positive and medium level meaningful relationship ($r=.42$, $p<.05$) between competence levels in “Organizing the Study Environment (OSE)” sub dimension and skills such as doing homework regularly and refraining from activities unrelated to school during class in “Orderliness and Appropriate Classroom Behavior (OACB)” sub dimension.

There is a positive and very low level meaningful relationship ($r=.11$, $p<.05$) between competence levels in skills related to asking for help from others in situations where students face difficulties in academic work in “Asking for Help (AH)” sub dimension and skills such as doing homework regularly and refraining from activities unrelated to school during class in “Orderliness and Appropriate Classroom Behavior (OACB)” sub dimension.

According to the findings obtained in the current study, university prep class students always perceive themselves to be competent in skills such as doing homework effectively and preparing for exams; they sometimes perceive themselves to be competent in skills such as studying systematically and in an organized manner, overcoming the difficulties faced during learning, arranging the study environment, doing homework regularly and having appropriate in-class behaviors and students never perceive themselves to be competent in skills such as asking for help from others in situations where they face difficulties in academic work.

Another finding obtained from the study which examines the relationships among competence perception levels found in the sub dimensions of Study Skills Scale shows that the only area where no relationships are found is related to asking for help, problems faced in learning and organizing the study environment. The findings of the current study point to the need to provide students with study skills training. Gettinger and Seibert (2002) stated that students' study systems should be structured in order to increase their academic achievement levels and it is not proper to give the sole responsibility in that area only to the students. According to Babadoğan (2012), acquisition of study skills by students indicates a process that should be undertaken basically under the responsibility of educators. In line with this perspective, it is believed that teachers are as much important as students and parents in the process of studying and they should be as effective. The researcher also states that a study activity that involves only the student is meaningless. Dembo (2001) identifies that teachers who are informed of self learning processes and related study skills will act to teach these skills to students, they will comprehend that effective acquisition of these skills is the most important area to focus and that these skills will provide the students with self control, academic achievement and motivation to learn. Dodge (1994) states that study skills can be learned and that students with study skills have advantages in terms of time.

According to DeBettencourt and Allen (1999), teachers should transfer the information about how study skills work, provide activities related to study skills in the classroom and make an effort in this regard. DeBettencourt and Allen (1999) who state that teachers will contribute to the increase in academic achievement levels with the help of these activities that include teaching students the aims of study skills techniques and methods also mention that providing students with opportunities to present these skills is important. Kiewra (2002) who identifies that study skills should be taught as a separate lesson goes on to say that it is much easier to teach these skills to students with the help of appropriate and affective strategies in line with the aims and content of classes. Crotta (2004) identifies that teacher should give priority to the internalization of these skills by the students and that this perspective should be adopted to provide students with a lifelong habit of using study skills. Strichart and Mangrum (2002) indicate that providing creative activities in the classroom is important for students to acquire study skills and that students may develop in terms of using various tools and instruments and finding per support with the help of creative activities. According to Gettinger and Seibert (2002), teachers should not confine themselves only to narration during teaching study skills and also present these skills in their own behaviors as role models.

Suggestions provided below are believed to be suitable in the light of the current study that investigated the study skills of university prep students.

- The scale in general shows that students sometimes perceive themselves to be competent in using study skills effectively. In this case, awareness should be raised in order to be able to teach students study skills and courses, seminars and similar activities should be provided for teachers.

- Centers should be set up in universities where education specialists who could provide guidance to students in terms of productive study skills and attitudes.
- Educators should not simply transfer knowledge but should be able to ensure student participation in classes by employing various teaching methods and productive study techniques.
- Experimental studies should be implemented in which study skills training activities are tested and effects of study skills on academic achievement are examined.

4th International Conference on New Horizons in Education

University Students' Computer Literacy Readiness Level In Turkey

Fatma Bayrak^{a*}, Halil Yurdugül^b

^a*Hacettepe University, Faculty of Education, 06800, Ankara, Turkey*

^b*Hacettepe University, Faculty of Education 06800, Ankara, Turkey*

Abstract

In the Information Age, also known as the Computer Age or Digital Age, computer literacy is one of the most crucial 21st century skills. In 2011 in Hacettepe University, different faculty students' knowledge and skills about computer were measured to determine that students whose knowledge and skills were not enough. It was also revealed level of students' computer literacy readiness with this measure. 1685 first year students from eight faculties took the achievement test composed of 60 items. For content validity, achievement test was prepared according to ECDL curriculum. Students' test score statistically analyzed and findings were discussed.

Keywords: computer literacy, university students

1. INTRODUCTION

Computer literacy, a dimension of information literacy (Behrens, 1994; Akt, Akkoyunlu, 2008; Curzon, 1998), is essential in Higher Education (Reid, 1997). Since in higher education, courses can be designed as blended. On this respect it is emphasized that computer literacy skills are crucial and must be gained. For helping children to acquire computer literacy and the other 21st century skills, in Turkey curriculum of primary and secondary education were changed. At the same time particularly for computer literacy, some projects were started (cited in Şenel & Seferoğlu, 2009): Mobilization For Computer Literacy Project (Bilgisayar Okur-Yazarlığı Seferberliği, 2008), “Closing the Digital Divide” Project (Dijital Uçurumun Kapatılması, 2009). Therefore it is assumed that students acquire these skills before coming university. On the other hand, some universities has ECDL training programme and give certificate to students for computer literacy. The ECDL certificate proves that its recipient possesses some basic skills in using a computer, such as editing a document with a word processor, preparing a table using a spreadsheet, querying a database, browsing the Web (Calzarossa, Ciancarini, Maresca, Mich & Scarabottolo, 2007).

2. Method

The aim of this study was to investigate first year students’ readiness level of computer literacy according to students’ gender and faculties. Data analysis was made by Kruskal Wallis-H and Mann Whitney - U test processed with SPSS 15 for Windows.

2.1. Participants

1685 first year students (N(male) = 931 and N(female) = 749; Table 1) from eight faculties (Table 2) took the achievement test composed of 60 items.

Table 1. Distributions in terms of gender

Gender	N
Female	931
Male	749
Missing value	5
Total	1685

Table 2. Distributions in terms of faculty

Faculties	N
Faculty of Dentistry	143
Faculty of Pharmacy	44
Faculty of Education	526
Faculty of Economics & Administrative Sciences	238
Faculty of Engineering	380
Faculty of Medicine	286
Kastamonu Faculty of Medicine	32
School of Sport Sciences and Technology	34
Missing value	2
Total	1685

2.2. Instrument

ECDL is a computer literacy certification programme (<http://www.ecdl.org>) and ECDL version 3 syllabus consists of seven modules:

- Module 1. Basic concepts of information technology (XP);
- Module 2. Using the computer and managing files (XP);
- Module 3. Word processing (2003);
- Module 4. Spreadsheets (2003);
- Module 5. Database (2003);
- Module 6. Presentation (2003);
- Module 7. Section 1 - Information (XP/2003)
- Module 7. Section 2 - Communication (XP/2003)

Based on this syllabus 60 multiple choice items were prepared for achievement test. To collect data, the achievement test was applied to undergraduate students beginning of the first year first semester. KR-20, the reliability coefficient, was calculated 0,77 for the achievement test.

3. Findings and Conclusion

3.1. The effect of students' gender on Computer Literacy Readiness Level

For independent sample t test, is a parametric test, primarily the assumption of normality was to be checked by Lilliefors corrected K-S test. Female's test score, $(D(931) = 0,09, p < 0,05)$ and Male's test score $(D(749) = 0,10, p < 0,05)$ were not normally distributed. After doing transformation, the values were not normally distributed. Based on this result, nonparametric test was used for comparing two independent conditions: Mann Whitney Test. There is a statistically significant difference between the two group, $U = 224078,5, z = -12,622, p < 0,05, r = -0,308$ (Table 3). In parallel with this finding, it is said that male students' Computer Literacy Readiness Level is higher than female students' Computer Literacy Readiness Level.

Table 3 Mann Whitney U test results

Gender	N	Mean Rank	Sum of Ranks	U	p
Female	931	706,69	657924,50	224078,5	0,000
Male	749	1006,83	754115,50		

3.2. The effect of students' faculties on Computer Literacy Readiness Level

For one way ANOVA, is a parametric test, primarily the assumption of normality was to be checked by Lilliefors corrected K-S test. According to K-S test; all distributions were not normally distributed (Table 4). Based on this result, nonparametric test was used for comparing the groups: Kruskal Wallis H. It is found that there was a statistically significant difference between the groups ($H(7) = 249,011$, $p = 0.000$), with a mean rank of 878,84 for students from Faculty of Dentistry, 815,85 for students from Faculty of Pharmacy, 651,75 for students from Faculty of Education, 672,27 for students from Faculty of Economics & Administrative Sciences, 938,34 for students from Faculty of Engineering, 1146,94 for students from Faculty of Medicine, 1054,00 for students from Faculty of Kastamonu Faculty of Medicine and 1011,03 for students from School of Sport Sciences and Technology. Comparisons between groups which were statistically significant at $p < 0,05$ are shown in table 5 and table 6.

Table 4 K-S test results of achievement test score according to independent factor

		p
Faculty of Dentistry	D(143) = 0,102	0,001
Faculty of Pharmacy	D(44) = 0,135	0,042
Faculty of Education	D(526) = 0,072	0,000
Faculty of Economics & Administrative Sciences	D(238) = 0,111	0,000
Faculty of Engineering	D(380) = 0,087	0,000
Faculty of Medicine	D(286) = 0,107	0,000
Kastamonu Faculty of Medicine	D(32) = 0,080	0,200*
School of Sport Sciences and Technology	D(34) = 0, 137	0,103*

Table 5. Comparisons between groups which were statistically significant at $p < 0,05$. (According to difference between the mean ranks and critical difference; Siegel and Castellan, 1988; cited in Field; 2009, p. 567)

	Mean Rank	*	Mean Rank
		>	Faculty of Education 651,75
1) Faculty of Dentistry	878,84	>	Faculty of Economics & Administrative Sciences 672,27

8) School of Sport Sciences and Technology	1011,03	>	Faculty of Education	651,75
		>	Faculty of Economics & Administrative Sciences	672,27

* If the first group mean rank is higher than second group mean rank, ">" is used. If the first group mean rank is lower than second group mean rank, "<" is used.

4. Conclusion and Recommendations

Firstly the aim of this study was to determine gender difference in computer literacy. In parallel with findings it is said that male students' computer literacy readiness level is higher than female students' computer literacy readiness level. Therefore, how this difference influence students' achievement should be checked.

Second aim of this study was to investigate first year students' readiness level of computer literacy according to students' faculty. It is found that there is a statistically significant difference between the groups in this study. When examined comparisons between groups which were statistically significant at $p < 0,05$; faculty of education students' computer literacy readiness level were lower than faculty of dentistry, faculty of engineering, faculty of medicine, Kastamonu faculty of medicine and school of sport sciences and technology students'. Computer literacy is essential every students, especially preservice teacher (Korkut & Akkoyunlu, 2008). For this reason, more research is needed to explore the growth process of preservice teachers' computer literacy in the university.

Acknowledgements

For their valuable contribution during test preparation process, we would like to thank Res. Asst. Ahmet AKINCI, Res. Asst. Fatih ÖZDİNÇ, Res. Asst. Gökhan DAĞHAN, Res. Asst. Turgay BAŞ, Res. Asst. Pınar NUHOĞLU KİBAR and Dr. Selay ARKÜN KOCADERE.

Abstract

Corporate Social Responsibility (CSR) involves the marriage of good business principles with the desire to solve social problems, to improve the environment and to empower communities. The shift in the paradigm of managerial studies and the introduction of new trends and concepts in both Public and Business administration fields paved the way for CSR to rise as a topic of research under the limelight of academic studies creating the opportunity to search it as a concept as well as its related research area. CSR invaded the socially motivated business ranging from the smallest and most localized efforts to the largest and ambitious national and international enterprises. These companies shift to incorporate an environmental social welfare based theme and translate it into business plans and products. The field of scholarly investigation about CSR provides the arena for opportunities to challenge and rethink concepts and assumptions from different fields of management and business research.

The importance of the study arises from the institutional reform process in managerial styles and practices, paving the way to address many research gaps in the development of multi strategies to understand the influence of CSR in management practices and applications as the study tends to highlight the importance of CSR activities to maintain competitive advantage for the Egyptian organizations.

Accordingly, on the academic level, this paper aims to shed the light on CSR concept as a crucial development since the turn of this century showing its importance and contribution to the new trends of management studies. In addition, the study aims to bridge the research gap between business practices and public administration views of CSR within the framework of the Egyptian context. On the practical level, the importance of this study arises from the fact that there are few studies in the field of public administration reflecting on the CSR concept's application in Egypt. Moreover the current conceptualization sometimes considers the unique characteristics of the Egyptian society's enterprises seeking to achieve competitive advantage. In addition, studying the concept and its applications from the point of view of activities associated with perceiving the opportunities to create a balance between maintaining competitive advantage and achieving both profit and society welfare as applied in a case study of PEPSICO Egypt.

Keywords: Corporate Social Responsibility CSR; Social Entrepreneurship; Corporate Citizenship; Competitive Advantage.

1. Introduction

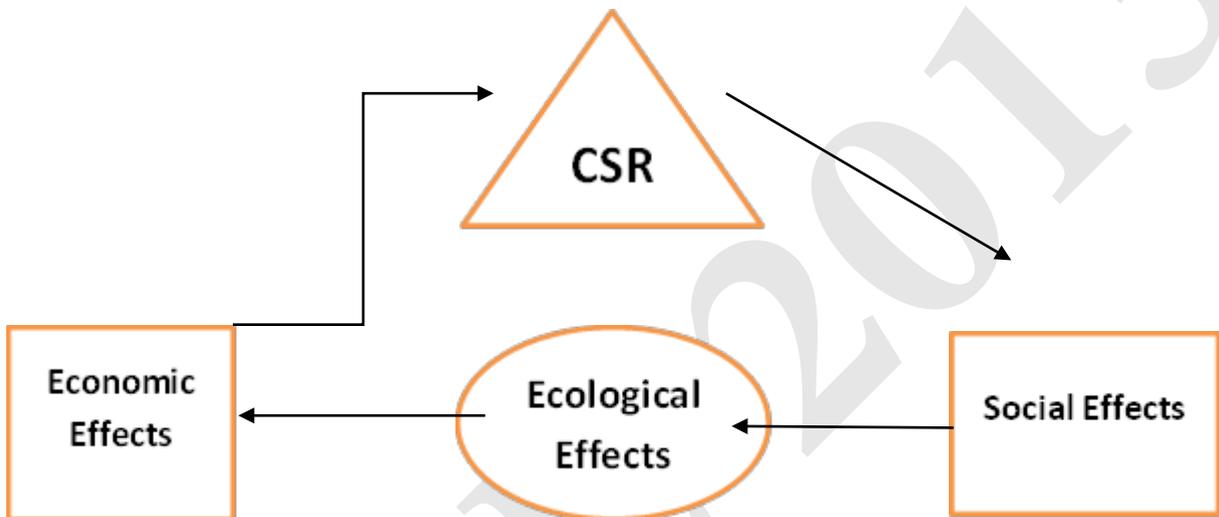

Corporate Social Responsibility CSR invaded the field of business since the year 2000 in a vigorous way. So many corporations worldwide wanted to become more involved in the social welfare of the community and its citizens. The local development goal became crucial for several corporations out of the conviction that the supporting and the focus on the citizen and his human rights will yield profits for both the company and the community served. CSR as a new tendency in the market of both national and multinational corporations is widely used concept. The idea is that in such a competitive global environment of business, the edge of

competition for a company is achieved through both the economical and the social advancement in the market. According to Kotler, achieving CSR through a company in the community is a desire to reach equilibrium between acquiring profit and reinvesting them in the social welfare services of the citizens (Kotler, 7). The implications of social responsibility in the business community entail not only the objective of commercial success but the vision of social involvement and equality. According to Porter, the marriage between good business principles and the desire to solve social problems became crucial in the field of competitive strategy in the market environment. In one of his articles, he advocated the notion that “social responsibility became a priority that is impossible to avoid by the business leaders of any country and any field” (Porter, 4). The idea here is the collaboration between the social environment and the economic needs of any corporation under the umbrella of a clear communication plan conveyed to the community to achieve an integrated competitive strategy. The question here is how can a company maintain a competitive advantage within the market while following the guidelines of the CSR concept within its development plan? Or in other words, what is the nature of the relationship between competitive advantage and CSR concept in the typology of our global business environment? This study tends to review the CSR in terms of its different definitions, history, components, functions, dimensions and approaches. Then it will move to discover the essence of the working relationship between the CSR and the realization of competitive advantage outcome in any organization through highlighting the different strategies used in such process. Secondly the study will practically show how multinational corporations as PEPSICO Egypt can enhance its competitive edge through its CSR activities.

2- Literature Review

CSR: Definitions

The world Business Council for Sustainable development defines CSR as the “engagement of the business environments to contribute to the durable economic development working together with the employees, with their families, the local community and society as a whole to improve their life quality” (Hristea, 2011). The European Commission Forum defines the CSR concept as a phenomenon by which the company is involved in the creation of a better social environment for the citizens of its community in order to gain respect. Both definitions assume the voluntarism of the company in being engaged in such actions, to create a socially added value to the community in which it is working. From this point of view, CSR can be perceived as a “profitable management strategy” as it generates long term credibility between the company and its social environment, affecting accordingly the durability of the company to maintain its competitive advantage (Hristea, 2011). In some research, CSR as a concept is perceived as a bundle of business decisions in the company that would trespass the technical and economic interests of the company to sustain social causes and to fulfil the involvement in the welfare of the community and the citizens (Crisan, 2012). This would wield positive relationships with the society at all its levels covering all possible areas of needs for example as health, education, safety, crime prevention, job creation, environment, poverty and discrimination. As a result, the company here would be entailed to minimize risks and maximize economic and social benefits. The balance here is not easy to achieve. According to Carroll, the idea is to promote development in accordance with parallel social and moral values embedded in the society reflecting on the needs of the people (Carroll, 1991). Many researchers found that some companies would develop internal codes of conduct and management systems that highlight the standards and the guidelines followed by their business leaders in maintaining competitive strategies along the application of CSR approach (Waddock, 2005). According to Hristea, the term of CSR is highly associated with the economic development and prosperity, the improvement of social solidarity and the respect of the environment. The terminology of CSR in this sense would be highly correlated to the ‘triple- bottom- line’ notion advocated in many literatures (Hristea, 2011 and Pendleton, 2004). The integration of the three effects: economic, social and ecological can be seen in the following scheme of the CSR’s Effects on Society:

(Hristea, p.61)

According to Smith, these effects directly and indirectly reflected on the stakeholders involved in the whole system of CSR application. These people are mainly: employees in the company, customers dealing with the company, suppliers, stockholders and the local community within the context of the company activity (Smith, 2011). Then the main responsibility of the company in this sense would be to maximize profits for the stockholders to pay employees fairly, to sell goods and present services to the customers at a fair price to meet suppliers' requirements regarding payment and times delivery, adding to invest in the community to ensure social welfare and an added value to its citizens. Therefore, the above directions and definitions of CSR concept would fall into the broad category of defining the responsibility towards the society.

Our definition in this study will highlight CSR concept as an ultimate decision by the company to ensure the fulfilment of its competitive advantage plan parallel to the achievement of societal needs within the community in which it operates. Therefore, the company in this sense has to jump above itself and create a socially added value to its various stakeholders.

CSR: History

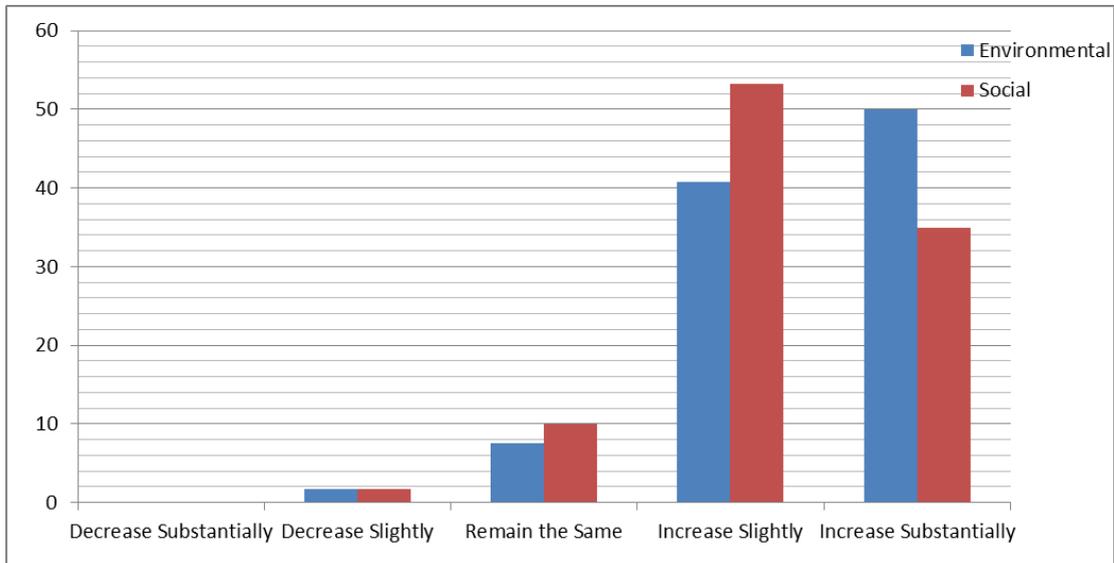

1950's -1960's: According to Bowen, the concept raised from the fact that the actions of the firms affect the life of the population and that business people's responsibility would refer to their obligation to pursue policies in favour to the values of their societies (Rosemaria, 2011). Ethics played an important role in Bowen's literature

that was followed by Peter Drucker who expanded the work in his book “The Practice of Management” focusing on the notion of doing public good as one of the pillars of CSR, as well as the enhancement of stability, strength and harmony (Drucker,2006). Another work by Frederick would reflect in this period that CSR would deal with corporate managers as public trustees and stresses on the idea of balancing the corporate resources to the competing claims (Rosmaria,2011). Later towards the 1960’s, the main focus for Frederick was that firms must widen the scope of their social involvement above their interests using their resources for broad social end (Frederick,2012).

1970’s-1980’s: In 1970, Friedman reinforced the idea of free market rules, laws and ethical boundary of CSR. However, putting financial profit at the tip of the pyramid of priorities for the company requiring long term planning that would yield profit. Therefore this period was tackled by many authors as Friedman Davis and Fitch focusing on the content and the implementation process of CSR that didn’t oppose the financial interest of the business (Rosmaria,2011). In 1980’s business and social interests came closer as the companies realized the presence of their stakeholders and their influence on the business. The new public management arena of study paved the way to CSR concept to prevail subject it realizes the benefits of stakeholders in the society. The term “Public Liability” was used widely to focus on the public aspect of responsibility. In 1982, Donaldson converted the notion of public liability to another terminology involving social contract between business and society (Rosemaria, 2011).

1990’s onwards: The concept of CSR widely prevailing all aspects of business societies but grew under the limelight with the turn of the century. This is mainly because of the growing use of social networks to improve and foster new CSR projects. The human capital investment, the goodwill and reputation of the company were the core of any business development plan. The essence of CSR in year 2000 was “doing good to do well” (Rosmaria,2011), by going beyond maximizing shareholder values to reach better corporate responsibility including social, environmental and governance issues. This idea also was reflected in making companies good citizens to contribute to society’s welfare (Nazari, 2012). The following figure would highlight the changes of CSR activities during the past 5 years, showing that the sustainability of the environment is increasing tremendously. Where it started with 1.7% to increase to 50% and this is due to the worldwide movement towards applying CSR.

Anticipated Change in CSR Activities over the Past 5 Years Percentage of Respondents

Percentage of change
(Harwood, p. 287)

CSR: Components

There are four components that envisage the concept of CSR. First is the philanthropic component which entails serving the community as a good corporate citizen. This means that the company becomes the citizen with all its needs and responsibilities. Secondly, the humanistic and traditional essence of CSR concept as the company in this essence has to perform in a manner consistent with what the society expects regarding the norms and ethics. Thirdly, the legal component of CSR would draw on the notion that the company has to obey the laws of the society. Finally, the profitable component of CSR which is the cornerstone for any company's success plan because in order to serve the society a company has to have a high margin profit to boost its development plans and inject it into the above three components (Carroll, 1991). According to Cunningham, the four stated components of CSR can fall into the trap of conflict of interest. Several questions would pertain about the appropriate responsibility of the government, the overlap between the cost and profit as well as the priority level of the numerous project that the society needs (Cunningham, 2011). So there is always a tradeoff between CSR's components and ultimate profit to the company. Many scholars advocate a Zero-Sum formulation of the concept while pertaining to the social obligations of the business. The Neo-classical school of economics would rely in this sense, that with tougher competition the firms exercise pressure on its stakeholders to fulfill social commitment in order to gain wide acceptance from its opponents (Burke, 1996). The key role played here is by the government in order to ease regulations on firms and corporations giving them the spacious areas to breeze in order to fulfill their social obligations. This would include tax alleviations, less rents on land and corporate tax exemptions.

CSR: Functions

CSR concept entails the following functions required by the company:

1. Protection of the environment.

2. Insurance health and security of the population of the society.
3. The creation of civilized work conditions for employees.
4. Developing a motivational plan for employees.
5. Working on upgrading the standards of living in the community to eliminate inequity and poverty.
6. Ensuring transparency and accountability for projects and actions taken by the company.
7. The application of anti-corruption measures (Hristea, 2011).

The essence of those functions goes parallel to the fundamental values advocated by Koffi Annan, January 1999, in worldwide economic forum from Davos, when he highlighted the force of the collective action to boost CSR towards citizens. He stressed on the universality of human rights as well as the freedom of labor. Moreover he added the elimination of child labor and discrimination of wage pay. Finally the environmental protection was on the top of those values urging several companies to adhere to the responsibility towards the environment using clean technology (Annan, 1999).

CSR: Dimensions

There are 5 dimensions to the concept of CSR: Centrality, specificity, proactivity, voluntarism and visibility. First, centrality refers to how close is the company's objective from achieving the CSR program. It helps to create feedback for the organization to check the consistence of the actions to the mission. Secondly, specificity refers to the ability of the company to gain the benefits of a CSR program in the specific line of their industry. Thirdly, proactivity refers to how behavior is planned and scanned in the absence of crisis conditions. The anticipation of any changes that occur in the environment is crucial in regard to this dimension and is usually achieved through regular SWOT analysis. Fourthly, voluntarism refers to the scope of the decision taken by the company as the business decisions to achieve CSR programs are taken willingly. Finally, visibility refers to company's ability to gain recognition from internal and external stakeholders (Burke, 1996).

Therefore, any company willing to adopt a CSR program has to look and examine those dimensions in order to succeed in the yielding of a socially added value to the community. This value creation would refer to a double faced coin: the economic benefits that a company expects to receive and the surplus in those benefits and profits injected in community service projects. The CSR department in some multinational corporations would include investment in new machinery, new methods of clean technology, brand awareness training and customer services. According to Nazari, companies have to act on the notion of being 'moral agents within the society'. Therefore the above dimensions stated in any CSR program have to fall within the guidelines set by the society. If we look to CSR concept as a social action targeting the satisfaction of social needs, so the underlying principles of CSR dimensions will be as follows:

- The business company is a social institution that has to exercise power responsibility
- The business company has to target the involvement with societal issues and needs related to the internal and external environment.
- Individual managers of the business company have to act as moral agents beyond their profitable self-interest they should force CSR as an obligation (Nazari, 2012).

CSR: Approaches

According to Wood, the basic framework of CSR concept in business prevails with the basic rule that "business and society are interwoven rather than distinct entities" (Wood, 1991). The urge behind this notion comes from the increase in stakeholders' awareness of corporate ethical behavior and social responsibility. Moreover, the increasing issues of image and reputation together with the globalization trend advocated changes in the whole business environment. There are two main fashionable approaches that are used by companies in this sense the Push vs. Pull approach. The Push approach would envision business as sitting in the middle and the pressure actors (societal as well as political) are coming at it from outside. Both are pushing the firm to adopt the CSR program.

Political Pressure **→** **Business Firm** **←** **Societal Pressure**

On the other hand, the Pull approach would see CSR program coming from the business idea and reflecting on both society and external environment with the effects.

Therefore, the Pull approach would rely on voluntary & self-regulation with no outside pressure, whereby the proactive nature of the CSR concept would prevail (Vassileva, 2009). According to Hartmann, there are 3 views to CSR approach. First from the economic theory point of view, a firm's only social responsibility is to increase profits as long as it stays within the legal framework and ensure the sustainability of economic development. Secondly, from the employees' point of view, CSR is positively related to employees seeking a job in the organization as they identify with the cause and perspective of the company. Job satisfaction and involvement increase in this sense and CSR would play the role of non-monetary reward for the employees. Thirdly, from a stakeholder's view, the credibility of CSR program is crucial to reap CSR's strategic benefits. The stakeholder would look to the company's authenticity, communication, motives, community affairs and development (Hartmann, 2011).

CSR: Upholding Competitive Advantage

With the growth of globalization, there is an urgent need to emphasize on the design of new international standards for the management of most business organizations. The competitive advantage trend is considered to be one of the new trends in both Business and Public administration, paving the way for so many institutional reforms in business practices. These reforms include the reorganization and re-regulation of so many business to encompass economic, social and political developments within the environmental context. The concept grew under the limelight since the 80's following the 'factor endowments' and "the comparative advantage" theories and was introduced by Michael Porter in his famous "Diamond Theory". According to the international institute for management and Development, competitive advantage's requirements would include the competencies derived from economic and administrative performance of the government and the good business environment in the country allowing to create a socially added value to the community (Younis, 2009). Along this line of understanding competitive advantage, the major question advocated by many researchers is where does CSR concept stands from achieving competition for the company? Well, CSR as previously noted, helps the company to grow its financial and commercial performance positively while emphasizing competitiveness by creating a socially added value to all stakeholders involved with its programs. There is a strategic intersection between CSR and competitive advantages as two faces of the same coin in business development meeting in the area of creating social welfare for the community. As the implementation of CSR programs in any company would yield social, economic and financial advantages, so the major cornerstone of this intersection will be shown in the resulting positive reputation improvement of the company: "investing in CSR records a plus in image building of reputation, with positive effects in the plan of economic performance" (Hristea, 2011). The second cornerstone of

this relationship is the improvement of the market position and competitiveness of the company. If policies of innovation and differentiation through CSR practices would facilitate the access of new markets, it would also increase the competitive edge of the organization as differentiation strategies is one of Porter's advocating in the study of competitive advantage.

The existence of CSR concept in today's life of business organizations cannot be denied. According to the World Business Council of Business development CSR and competitive advantage go in parallel line yielding positive results in along the organization" (Hristea, 2011). According to Vassileva, the major benefits of applying CSR activities that would go in accordance with the achievement of competitive advantage are listed as follows:

- Image and reputation enhancement
- Financial efficiency
- Staff motivation and loyalty
- Market position support
- Customer satisfaction
- Recognition by stakeholders
- Product brand support
- High quality of goods and services
- Promotion of social commitment
- Providing better social services (Vassileva, 2009)

CSR: Competitive Advantage Strategies

CSR Traditional Enlighten Strategy: It focuses on products and processes and aims at achieving profits by cutting costs and improving efficiency through new innovations. The managerial scope of the strategy would entail the company to make decisions in line with the evolution of demands and change anticipated in the society. Moreover, the managerial decisions involve investment and cost of implementation (Lanoizelee, 2011).

CSR Reputation Strategy: Reputation is the intersection between the company's interest and the public interest and it is the source of competitive strategy in this sense, as reputation would help the company to build the image of competency related to CSR. The company is reintegrated within the society which improves both public interest and its economic performance (Fombrun, 1990)

CSR Ethical Strategy: the demand for virtue in accomplishing business transactions and relating the developmental plans of so many companies is the notion behind this strategy. There is a global demand for green products and cleaner technology as well as the increasing demand for CSR related programs to the society. So many paradoxes aroused around this strategy emphasizing the extent of whether acting by ethics would yield better results in sales or not. Some would argue that this is only feasible for small business enterprises or the shop around street corner, but never applicable to business multinational tycoons. In this sense and according to Vogel, the company's responsibility or irresponsibility was not a modifying factor related to its increase of sales, its attractiveness to its employees or its access to its capital (Vogel, 2005).

CSR: Competitive Advantage in Balance

If CSR behavior becomes a competitive advantage that a company would enjoy its positive results if it applies its programs, opinions would discourage competitors from adopting those programs. The companies in trying to achieve this balance would stress on influencing market expectations on social and environmental quality to gain the interest of CSR stakeholders and to ensure reaching its competitive advantage in the market (Bardelli, 2005). According to Mc Williams, the environment competitive situation in the business market depends on price, degree of product differentiation, the existence of entry barriers and substitutable non CSR products (Lanoizelee, 2011). Both companies and stakeholders will be affected by the above factors. Therefore the strong demand for CSR would yield probable economic advantages whereas the low demand for CSR would result in uncertain

economic advantage. If we build upon Porter's analysis of competitive advantage, we follow the line of competitive edge generated by CSR strategy which would only depend on the added value to the community. This added value would be granted by the economic powerful stakeholders in the company as customers, suppliers and investors. Moreover this value is added by many members of the active civil society who defend the values of development and who look to competitive advantage as being derived from intangible resources such as human capital knowledge (Lanoizelee, 2011). The balance between CSR and competitive advantage is reached evenly when there is a positive relationship between CSR and corporate financial performance CFP. This depends on firms and industry characteristics as well as timing of delivery and the relationship between CSR activities and stakeholders' satisfaction. As Hartman points out "doing good doesn't have to be at the expense of doing well" (Hartman, 2011). The perfection of the balance is a far away dream especially in times of uncertainty, economic unrest and environmental changes. Sometimes, stakeholders themselves as customers would cause an imperfection in the balance when you find a discrepancy between a consumer lifestyle and value on one hand and CSR activities on the other hand. Therefore, CSR programs have to go parallel with the competitive intentions of the company in gaining the credibility, the customer satisfaction and trust, adding to the reputation of the brand or the company as well as the consumer loyalty and which will lead to what we call responsible competitiveness (Hartman, 2011).

CSR: Criticism vs. Praise

The CSR concept falls into the trap of criticism and praise when it comes to the judgment of modern businesses that have to achieve competitive advantage while maintaining socially added value to the society. The controversy arises in the way CSR programs are developed and introduced to the society. Within the ethical route of delivering goods and services some companies adopting CSR programs fail to stick to their promises. Researchers identified six areas of controversies as follows:

- The defense of public image: reflecting on whether CSR program yield positively or negatively to the society
- The attraction of investors; relating to whether CSR program will attract the support of investors or not
- Permission to operate: referring to the risks involved with some operations that put CSR programs at negative opinions of stakeholders
- Good public relations: referring to the maneuvering of CSR programs through social networks that can be sometimes twisting
- Engagement through campaigns: some NGOs work on campaigns and induce companies to work on CSR. When the cause finishes, usually it is not repeated and accordingly it loses its sustainability
- Lobbying against legal regulations: the legal framework is sometimes trespassed by some companies to realize the CSR program and covering up illegalities and in this sense it can yield very negative effects

In order to avoid such controversy, firms should adhere to the business codes of conducts developed by the international organizations supervising CSR programs worldwide as OECD (Ilies, 2012).

Moreover, business firms should accept that the best practices of CSR are not universal and that situational factors direct what's best for each community. One of the main critics of CSR was published in the work of (Henderson, 2004) where he emphasized on the fact that CSR can lead to business disasters as investment in some projects defined as social cause can be unfair in yielding profits. In most cases, a company is attracted to be a global savior leaving behind plans of long term efficiency and competitiveness (Henderson, 2004). Some governments are not also helping with modified regulations and there are worldwide calls to strength and empower those entities for the avocation of CSR (Mattera, 2011).

As the reality regarding CSR and CSI (Corporate Social Irresponsibility) is complex and dynamic, several comparative studies were conducted in this sense. CSI would lead to environmental degradation and pollution of ideas. It would exploit the ethical problems into a sense of irresponsibility towards the society. Looking to the profits of the company adopting CSI, one can find profit is achieved at any cost and in unfair manner (Ilies,

2012). On the other hand, CSR would help to correct market inefficiencies and promote ethics. The HR department in the company through a long range of selection and recruitment is the boosting engine towards better CSR project in the community. Moreover, the adherence to the concept positively would promote good intentions within the financial boundary and would minimize risks (Vallaster, 2012). For them the multiple benefits would be the reduction of costs, motivation of employees within the organization, environmental protection values and ethics in enterprises, better management of human resources and meeting clients' needs and diminishing risks. These multiple benefits can only be perceived if CSR resilience is high in the face of external environment shocks. Actually, some studies argued that CSR is at "cross roads" and it can fade away by 2015 if it doesn't undergo radical changes (Harwood, 2011). These studies were in favor of the reinvention of CSR programs in order to include proactivity of good force and willingness to perform a revolution in the socially added value to the society. Resilience approach to CSR reflects the intensity of its programs to withstand stress, shock or change as a result of competing initiatives" (Harwood, 2011).the changes suggested in the society in order to maximize the benefits of CSR include setting new rules for governments, more involvement of NGOs and trade associations, strict measurement against corruption and more involvement of the local cultural in the society to help with the program.

3- CASE STUDY

According to Ortman, Egypt is one of the first countries that come to mind when one thinks of CSR. More than 80 million populations are striving for better life, social justice and structural reforms. Egypt is a country where entrepreneurial economy plays a vital role (Ortman, 2010). Vast business areas would call for help in education, housing, state owned enterprises, NGOs, small business enterprises, social insurance and health services. Government interference and the distrust due to lack of organized rules and regulations, had stifled major venues of CSR in Egypt and distorted the management of their programs. With the dawn of the January 25th revolution, hopes are that the human agency of business entrepreneurs in Egypt would help to alleviate poverty and enhance justice and social welfare within the society. The Egyptian population now is freer to vote, to create, to solve problems, to be more transparent and accountable for their actions which would improve the environment in which we are living. The road map for the enhancement of CSR projects in Egypt was enhanced by some of the multinational companies in the country. Our case study would present the efforts of one of the most renowned multinational enterprise in Egypt PEPSI CO EGYPT to create a comprehensive CSR strategy to yield better results and boost competitive advantage.

PEPSICO EGYPT

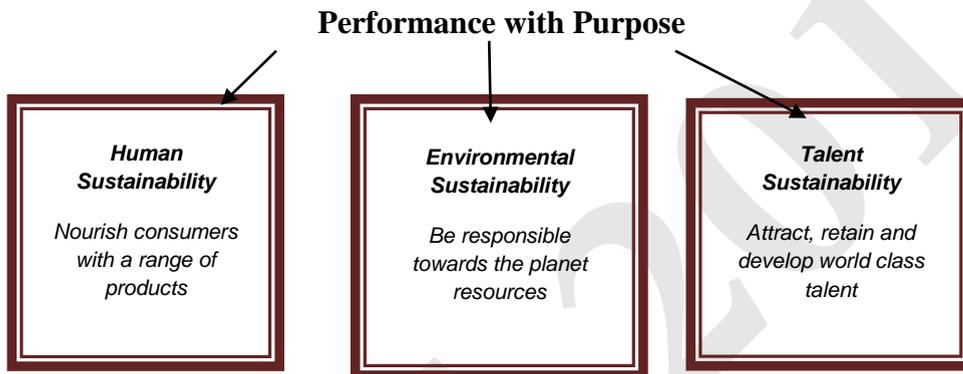

PEPSICO is one of the world largest food and beverage companies, with 2008 annual revenues of more than \$ 43 billion and employs around 198,000 employees worldwide. PEPSI CO has 18 mega brands, each of which delivers retail sale of \$ 1 billion. The brands are enjoyed around the world in more than 200 countries such brands are Pepsi, Mountain Due, Doritos, Chipsy, Aquafina, Frito, Lays snacks, Ruffles and Tropicana Juice, Miranda, 7Up and others as well. For PEPSICO, doing business is not just about making a profit. The company listens to its customers' needs: well treatment of employees, better society services, not harming to the environment and better investment to the human talents. The business of PEPSICO relied on a vibrant society and healthy planet to grow and to meet customers' future needs. The notion of offering better tomorrow than today goes parallel with the responsibility to improve all aspects of the operation process whether socially, economically and environmentally.

PEPSICO EGYPT: CSR Vision

In a world that continues to experience unprecedented economic, environmental and social challenges, PEPSICO Egypt employs corporate social responsibility CSR to help making a difference. The responsibility to improve all aspects of life to create an added social value to the society and to increase the social welfare of its citizens strives

the way to achieve good profit with socially good performance. PEPSICO Egypt is one of a long history of delivering strong financial performance increasing revenues, market share, volume of sales and profits earned per share. This policy is going parallel to the achievement of a competitive advantage among its rivals together with the CSR that is embedded in the management culture of PEPSICO.

The vision of “Performance with Purpose” is the strategy of its corporate Social Responsibility. According to Indra - Nooyi, PEPSICO Chairman and CEO, Performance with purpose is the foundation of every aspect of PEPSICO’s business. The financial achievement as well as the layout of the competitive advantage of the company goes hand in hand with sustainability. The following sections of the case study will review the different aspects of sustainability that PEPSICO invest socially in them in order to achieve its message of delivering good performance.

The commitment of PEPSICO Egypt under the notion of ‘Performance with Purpose’ is to human, environmental and talent sustainability. Human sustainability refers to PEPSICO’s Egypt efforts to nourish consumers with a wide range of products, from treats to healthy eats. Environmental sustainability on the other hand reinforces the commitment of PEPSICO to protect the natural resources of the planet and to reduce any environmental stains on its sides. Finally, the talent sustainability focuses on developing employees in a diverse and inclusive environment to ensure that PEPSICO Egypt is an attractive destination for the world’s best talent.

PEPSICO EGYPTCSR Vision: Human Sustainability

The goal of human sustainability is to make a great progress towards the PEPSICO Egypt’s goal to improve the overall nutritional profile of their portfolio as follows:

- Offering a variety of great tasting food and beverage.
- Reformulate to improve nutritional profile.
- Launch healthier, nutritious food and beverages.
- Act as a responsible company to address global nutrition concerns and encourage healthy life styles through activity.
- The reformulation to improve nutritional profile include removing trans fats, moving to healthier oils, develops and use sugar substitutes, adding whole grains and reduce added sugars.

According to Ms. Sherine Shahine, the CSR, Public Relation , External Communication Manager of PEPSICO Egypt, the slogan that gathers all projects of sustainability is to “**create a better tomorrow for future generations**”, while the objective is to achieve a financial success and to maintain the competitive advantage with a positive imprint on society. Regarding the cornerstone of human sustainability, PEPSICO Egypt is working to develop products that balance cost and nutrition. Moreover, it is trying to solve the global paradox

where more than 1 billion of people are hungry and more than 1 billion are overweight, accordingly they are trying as a team in PEPSICO Egypt to let consumers improve their diet and motivate them to adopt healthier life styles and helping them with the cost. In doing so, PEPSICO Egypt launched a project for renovation of medical units in 10 different governorates that are underserved. The project was launched with the Egyptian cure bank and the Egyptian Ministry of Health.

PEPSICO EGYPT CSR Vision: Human Sustainability: The Egyptian Cure Bank Initiative

PEPSICO Egypt decided to fund the cure bank to improve and renovate the health care in communities near selected PEPSICO EGYPT factories. The Egyptian Cure Bank actually plays an important leadership role in providing medical treatment and improving medical services for underserved children and adults in several governorates. This responsibility arises from endless aspiration to serve the Egyptian people and specifically to improve healthcare in their communities. The plan of work with both the Egyptian Ministry of Health and cure Bank is to renovate the outdated and inadequate status of existing health units and assist in supplementing the training and salaries of medical personnel. These two objectives will be covered through upgrading the medical equipment such as the sonar, X-ray and other important medical devices, adding to providing other essential medical equipment such as surgical utensils and cardiac stents. In addition to enhancing the medical services through providing variety of training courses for doctors and nurses, to be related to supplementing their salaries because of these experienced professional certificates.

PEPSICO EGYPT CSR Vision: Environmental Sustainability

In 2007, PEPSICO Egypt agreed on vigorous companywide methods to help better understand and track the global footprint. The company decided a goal for environmental sustainability to reduce water consumption by 20%, electricity consumption by 20% and fuel consumption by 25% by year 2015. PEPSICO Egypt is considered the first company of its size in their production sector to publicly state long term resource reduction goals. They gained the ISO 14001 for their successful environmental compliance. Therefore, all their individual business in the regions have specific one year and three years conservation goals. These goals go parallel into the performance objectives of their senior leaders just as financial goals. On the contrary, sometimes those socially friendly environmental goals win over financial transactions for PEPSICO Egypt to maintain both the competitive edge and the company's image as Ms. Shahin clarified.

The three major areas of interest of environmental sustainability for PEPSICO Egypt are as follows:

1. Reducing water usage through conservation, reuse and replenishment as PEPSICO Egypt uses inventive techniques, including water recycling for plant maintenance, waste water irrigation and air rising of beverage bottles. The objective is to use proactive working plans to improve water supplies in water scarce communities.
2. Reducing greenhouse gas emissions through energy conservation and use of clean energy sources as PEPSICO Egypt continually improves processes to reduce energy use, through actively engaging in renewable energy projects.
3. Reducing, recycling and reusing packaging and solid waste as PEPSICO Egypt is trying to sustain the Global packaging policy by saving plastic consumption of more than 60 million pounds through manufacturing light weight beverage containers.

The "spillover effect" according to Ms. Shahine, is contagious to other companies in the field which try to apply some related CSR projects for environmental sustainability.

PEPSICO EGYPT CSR Vision: Human Talent Sustainability

PEPSICO Egypt's strength is in its people who continue to deliver exceptional results. PEPSICO is committed to hiring, training and retaining the best people. The accumulation of human capital knowledge in PEPSICO Egypt

is the base of increasing and sustaining the talent for work. The projects that PEPSICO Egypt undergoes to achieve human talent sustainability are: Grass root project and Ambition program.

PEPSICO EGYPT CSR Vision Human Talent Sustainability: Grass Root Project

The aim of the project is the talent scouting inside schools of children to encourage both education and sports. PEPSICO Egypt tried to discover talented football players in 27 governorates in Egypt. It started 2003 and the program will continue until 2017. The pillars of the program stand on providing a career path for such children, through discovering best Egyptian young players and formulating a team in each governorate. Throughout the tournament, PEPSICO Egypt is committed to provide players with the following benefits: Healthy living via healthy meals, transportation and logistical allowances, courts rental, time management workshop, cash prizes for the first three winning teams on the governorate level and on the level of Egypt, mobiles and computer gifts, career advising for those young children and distribution of T-shirts on all participating players covering the 3 stages of school students in Egypt.

The CSR notion behind the Grass Root Project is to help the community within its boundaries and also parallel with giving PEPSI a football competitive edge. The program initiated a set of criteria that ensure good behavioral manners among participants and minimum level of academic performance. The tournament player has to present a proof for a minimum of maintaining academic pass for 3 years and not failing exams during the program. Moreover, a player is required not to engage in any behavioral misconduct during the program course. The socially added value for such children through “Grass Root” program, according to Ms. Shahine, is to promote educational standards, enhancing youth healthy living and empowerment in the community and leveraging the PEPSI talents.

The pillars of CSR intervention lie on the following:

The Grass Root program includes:

- a. Life and educational development pillar to carry out PEPSICO Globe mission towards youth through taking a personal responsibility not only by training and coaching but by implementing and designing a full integrated program for empowering them into their community. The program is a renewed 5 years plan including rotation of different students within their age group.
- b. Mobile computer lab as a rotation mobile lab visits all governorate where tournaments are held twice a year. The objective is to spread computer literacy among all students across all Egypt enlisted in the program. This would encourage e learning and the support of on time access to the program. Moreover, it would help to eradicate problems of technology faced by several schools in poor governorates.
- c. Healthy living enhancement as the program, offers during the trip the service of a mobile clinic facility. This is in order to check health conditions reaching out to all participants who do not usually get proper health care. The mobile clinic is held at the site of every tournament and has several responsibilities as treatment of overall body performance, teeth checkups, eyes, ears, nose and throat checkups as well as pains and injuries.
- d. Youth Empowerment as the program allows for several streams to support workshops along the tournament. These workshops encourage soft skills and future employability. [PEPSICO does this with the cooperation of “Sona’a El Hayah” program of “Ressala” organization. The top ten performers in the tournament receive free gifts and certification at the end of the program to enrich their CVs.
- e. Leveraging the talents of the winners as the Youth ministry and ministry of Health in Egypt honors and rewards the winners with certificates. [PEPSICO Egypt provides the school of the winning team with mobile computer lab and offers free scholarships as wells educational English courses

- programs. The CSR notion here is that the society will be rewarded by those talented people to benefit themselves and their communities to create a role model and a sense of social responsibility.
- f. PEPSICO Egypt volunteer mobilization as the awareness scope is the intervention pillar. It is a cause related project whereby each tournament carries a social, health or environmental cause. So the PEPSICO Egypt volunteers and the players wear T-shirts on which a slogan related to the cause appears. This helped PEPSICO Egypt through many years for fund raising campaigns for many social causes.

PEPSICO EGYPT CSR Vision Human Talent Sustainability: Ambition Program “Tomouh 2007-2012”

The program is designed, in cooperation with the United Nation World Food Program UNWFP”, to support children education, health and welfare in “SOUHAG” governorate in Egypt. The program is designed to empower the youth to provide them with the opportunities they need and deserve to become successful in their lives. The program was initiated 2003 at “the Arab Economic Forum” where Mr. Saad Abdel Latif PEPSICO International, Asia, Middle East and Africa president pledged 1000000 US\$ to promote education in the Arab world. It started mutually in Egypt and Jordan 2007 and aimed to improve school attendance and combat malnutrition among school children in Upper Egypt. PEPSICO Egypt contributed 1.6 million LE. To the program which provided school feeding support to 84 targeted communities based schools in Dar El Salam, Geheina and saqulta districts located in Sohag governorate. This program helped 130000 children and 2600 students. The attendance of the children in those district schools was increased by 90% due to the food distribution during the sessions. The Tomouh program organized trips for students of Sohag governorate to visit PEPSICO Egypt plants of both PEPSI AND CHIPSY and gifts were distributed. Many of those students came to Cairo for their 1st visit. They shared in the manufacturing process as a way of encouragement and they were exposed to the optimum standard used in production. During the program at Sohag governorate, the students attended orientation sessions on the importance of education, nutrition and health. PEPSICO branded bags and caps were distributed at the end of each session to encourage attendance. In June 2011, the “Tomouh” program was sponsored by Chipsy in a new venue for the campaign of “food for education” announcing that Chipsy will cover more than 30 new schools in Sohag and 35 other schools in Upper Egypt through allocating a portion of its sales for 2 months to fund the food for education project. Under an innovative slogan by Chipsy “give them back their childhood, give them back their smiles”, Chipsy launched a big on line donation campaign to give every Egyptian the opportunity to contribute to this valuable cause by simply visiting www.chipsyegypt.com and clicking the yellow box to help needy children to continue their education free of charge. It also launched a video campaign in Fayoum on the 6th of July 2011 and shared it on all channels celebrity figures in Egypt were volunteering in this program to market its components. From a CSR perspective, the indicators for the success of this program were the number of student beneficiaries and their families. An assessment is done every 6 months for the students and monitored as a project every 3 years. The UNESCO accredited the program to develop the children talent and make them upgrade their knowledge. According to Ms. Shahine, PEPSICO Egypt tends and favors to be focused and not to be sporadic. The media helped in the success of PEPSICO Egypt projects especially after the Egyptian revolution January 2011 where there is a change in the media, not centralized and not censored and with more open campaign and strategies. The youth are the decision makers, upgrading the importance of such projects for the community. In an attempt to engage PEPSICO Egypt employees and associates in Tomouh program, the CSR team arranged three school visits in Sohag with the help of 5 volunteers during Ramadan to distribute Ramadan Charity bags on 11th of August, 2011. In September 2012, the CSR team with some of the volunteers from PEPSICO Egypt employees conducted two visits in Bany-Sowaif where they met the kids and spent the day with them. Moreover, there is an attempt from PEPSICO Egypt to engage in Mutual cooperation with some NGOs to extend Tomouh Program to children with disabilities.

PEPSICO EGYPT: CSR Vision and Competitive Strategy Formulation

Working under the umbrella of “Performance for Purpose”, the competitive strategy formulation of CSR in PEPSICO Egypt lies on the following steps:

- 1- Project – Impact Diagnosis:
 - a) Monitoring System
 - b) Assessment of the monitoring tools currently being used
- 2- Recommendations based on research encompasses areas of intervention
- 3- Reporting and evaluation of the project.
- 4- Partnership strategy.
- 5- Communication and public image strategy

The area of researching encompasses the potential stakeholders in the strategy as employees, government, future generations, competitors, business partners, customers, community as shareholders. This allows the pointing out of rooms of intervention following the usual strategic path of what to produce? to whom to produce? Where to produce?

PEPSICO EGYPT: CSR Vision and Competitive Strategy Communication

Regarding communication of the strategy in PEPSICO Egypt, it is usually done through the channels of Public Relations in order to sustain the public image. The focused approach of sustaining CSR through communication lies on the following:

- Talking to the right stakeholders.
- Raising awareness in an innovative and inexpensive way through UNDP ambassadors.
- Attending and organizing events to promote company’s image of CSR.

PEPSICO EGYPT: CSR Vision and Competitive Strategy

CSR strategy in PEPSICO Egypt is a 4 years strategy for developing any project. It focuses on celebrity association and it is a fragmented one encompassing many venues. The strategy focuses on the engagement of employees in CSR community projects and is very responsive to the expectations of both stakeholders and customers’ requests and concerns. Another venue is the communication of their goals, initiative and image building as a company. This communication pattern allows PEPSICO Egypt to tap the markets leader in them and not just the follower. The global initiative report GIR is a tool in this matter whereby stakeholders and customers know about all aspects of the company’s performance. The monitoring and evaluation of the strategy according to Mrs. Shahin is developed through the standards of result based methodology to improve management effectiveness and accountability. It is based on defining outcomes to ensure the success of the strategy ongoing performance monitoring, assessment and integrating lessons learned into future planning and improving accountability based on benchmarking and continuous feedback to improve performance.

The significant achievements according to those monitoring the results in the last 8 years:

- Expansion of healthful product portfolio through innovation
- Improved significantly water, fuels and electricity efficiency
- Saved nearly 5 billion liters of water and 500 million kilowatt hours of energy worldwide in 2007
- Managing more than 13000 children and 2600 students in Suhag governorate on educational and health level through “Tomoooh program”
- Engaging in short term intervention like Floods in Aswan 3 years ago, where there was collaboration between PEPSICO Egypt and “Food Bank” in Egypt to distribute food to the homeless families
- INJAZ program launched to increase “Talent Sustainability”. INJAZ is an already established NGO in the field of education and in collaboration with PEPSICO Egypt, they started to distribute feast clothes

last year and they also have a volunteer group managed by PEPSICO Egypt to teach syllabus and deliver effective education for students in remote poor areas.

- Hand in Hand program in cooperation with Chipsy, aims at recuperating 100 job opportunities for handicapped people through an extension of “Tomoooh program”.
- Launching a campaign of safer roads in Egypt: PEPSICO Egypt bought 3000 cars equipped with the black box of the driver supervision from the head quarter.
- Working on Ramadan “Generosity” Program: with the collaboration of the ‘Food Bank’ in Egypt, they raised from 1 million Short Messages (sms with the word KARAM, which means generosity) from PEPSICO Egypt around 2,140, 000LE to the “Food Bank”.

4- CONCLUSION & RECOMMENDATION

The importance of CSR is to create value for the society through several programs of aid activities, investment in new technology and new products brand awareness facilities, training and customer services. This value creation is the strategic outcome that helps to boost the company’s competitive advantage gaining the positive image reputation and the trust of its stakeholders and thus reflecting on the environment and the community in which it is operating. The idea of relating the business world to the society’s need through CSR projects and the rise of business ethics and value is in vogue and will continue as long as the company succeeds to maintain the sustainability of its competitive edge in the market (Ioannou, 2010). Nowadays leaders of companies committed to CSR must realize that the issue of promoting business ethics is at stake and that they must review and work closely with their investor community in order to achieve strategic positive results of both profitability and commitment. This is achieved by highlighting the short as well as the long term costs and benefits through what many firms call CSR Awareness programs (Ioannou, 2010). This would also include the various stakeholders as investors, buyers, sellers, producers, managers, shareholders, employees, civil society and the government. According to Hristea, the intersection between business ethics and CSR would be realized through balancing economic assets and durable competitive advantage in the market on one hand and managing the social capital emphasizing goodwill and social welfare programs on the other hand (Hristea, 2011). Finally, the study of the relationship between competition and CSR highlights the idea that the business corporate communication plan is a device behind encouraging economic operators to use CSR strategies. A good communication is crucial for the delivery of CSR community services and creates collaborative action for the support of such delivery. The communication with the desired or intended segment of the public would indicate the ‘problem recognition, constraint recognition, level of involvement of the society’, adding to processing the information needed for realizing CSR goal (Byrd, 2009). The relationship in this sense between plans of media communication specially the social one and the achievement of CSR goal will be mutual benefit to both the society and the company.

As recommendations to upholding competitive advantage through endorsing corporate social responsibility:

- There should be laws to regulate CSR activities. In India, there is a law that all companies abide by and execute it within their yearly plan. However in Egypt, it all depends on the cause of the company and while so many international companies located in Egypt execute CSR as a part of their plan, the public and private sectors organizations don’t yet. For public organizations, they have to wait for the approval and allocation of budget for CSR from ministry of finance which seldom happens. Accordingly the companies either public or private cannot change policies alone but they need the government to regulate CSR through set of laws and regulations.
- Avoid the over expectations regarding the return of CSR projects as it is not a magic wand to resolve all the community problems which is faced by corruption, red tape, and the lack of transparency.
- CSR activities should be proactive to mitigate risk and it should be set on the long term to ensure its sustainability and strategic intentions.

- Lots of NGOs work under the framework of the charity concept not as CSR activities. Accordingly, there should be more mobilization of volunteers to encourage CSR activities and there should be more coordination and organization of CSR activities to avoid duplication of CSR activities to enlarge the scope of benefits in the society.

6- AUTHORS PROFILES

Dr. Randa El Bedawy earned her Ph.D. at the Cairo University, Faculty of Economics and Political Science on January 2009 and currently she is the Head of Management Department in the Faculty of Business Administration and International Trade at Misr International University MIU. She got a practical management experience as the Head of Management Department in MIU (October 2009 - Present) and the Director of MIU Quality Assurance Office (February 2007 - January 2010).

Dr. Zeinab Shawky earned her Ph.D. degree from Cairo University, Faculty of Economics and Political Science on May 2009 with an excellent degree. She won the award for the best Ph.D. thesis for the academic year 2009 and got a management training experience in Business Innovation, Strategic Management and Employees Engagement, teaching as a part-timer in MIU (2011-2012) and The Arab Academy for MBA (2010). Currently, she is a full time lecturer at The British University in Egypt BUE.

4th International Conference on New Horizons in Education

Usability level of a university web site

Erhan Şengel*

Uludağ University, Faculty of Education, Department of CEIT, 16490, Bursa, Turkey

Abstract

This study aims to determine the usability level of University web site on the Internet environment respect with “learnability, effectiveness, efficiency and satisfaction”. In the study, which has one-shot case design, while observation method was used to collect data about effectiveness, efficiency and learnability. System Usability Scale with 10 questions was used to collect data about satisfaction. During the procedures, the participants were required to complete 11 tasks, which have been defined by the researcher before. The research results, completed by the participation of 8 University students and secondary school students, show that the tasks’ average completion time is 54,50 seconds and average success score is 80. In addition, almost 85 % of the participants indicated that it was easy to use the web site. All the participants show a positive attitude and belief that this site helps the users about finding information about university. As a result, all participants with a higher success and satisfaction use the University web site. The paper also includes some suggestions for incomplete or completed with difficulty tasks to make it better.

Keywords: human computer interaction, usability, effectiveness, efficiency, satisfaction

1. INTRODUCTION

The usage of information and communication technologies increases according to speed of improvements in the production of the technologies. As well as increase in the kind of devices or technologies, the number of persons using these technologies increases in the community. Meanwhile, governments supports using e-governments applications in order to save time and budget. In the same way, some institutions, universities for example, pay attention to design usable web sites to inform their users. Not only serving to its students, academics and employees, web site of university also gives services to other institutions, and graduates. Therefore, too many people around visit these web sites. Hence the web site of any university should be usable to satisfy the needs of its users. In this case, what does usable mean? And what does usable web site mean?

According to Rubin and Chisnell (2008), any system or product can be accepted as usable if any user can find or achieve what s/he wants without having problems or without requiring any help. How can any system be stated useful? To do this, usability testing that investigates some usability aspects like efficiency, effectiveness, satisfaction, learnability (Nielsen, 2012; Çağiltay, 2011; Sengel, 2013).

In general, there are four kinds of methods could be used to test usability of any product, system or web site. Methods of usability testing can be categorized into model/metrics based, inquiry, inspection and testing. The types of persons attending in model/metrics based and inspection categories include evaluators and/or scales (Zhang, 2007). These types of methods are called as expert-based approach. These types of methods are also

* Corresponding author. Tel.: +90-224-2942180; fax: +90-224-2942199.

E-mail address: erhansenTel@uludaT.edu.tr

called as heuristic evaluation. However, methods in which representative users attend in inquiry and testing are also called as user-based approach methods. These methods are also called as inquiry-based evaluation.

The inquiry-based evaluations (the user-based approaches) are carried out with more than one representative user who tries to accomplish some tasks in an appropriate medium. The most convincing, reliable and valid data could be collected in user-based methods (Akıncı & Çağiltay, 2005; Rubin & Chisnell 2008; Andrews, 2012; Hava, 2012). The most persuasive, reliable and valid data could be collected in usability testing. In usability testing, kind of interaction of user with interface, performance of user, time spent to accomplish the tasks and the satisfaction of users while using the system are some of the qualitative and quantitative data could be collected and be analysed. Almost all aspects of usability, effectiveness, learnability, efficiency, errors and satisfaction, could be measured and analysed in usability testing (Nielsen, 2012; Şengel, 2013).

Usability testing methods are applied in order to evaluate the system with respect to real users' view, to develop more friendly designed systems, and to improve the satisfaction levels of users. During usability testing, different types of problems could be observed. Then with the light of these findings, more usable and more users friendly web sites or programs could be produced (Nielsen, 2012; Rubin & Chisnell, 2008).

Krug (2006) and Nielsen (2012) indicated that the web site of any institution should be obvious and must be understandable to anyone. When one look at the web site for the first time, any users could define relations and their properties without any hesitate. If one is being lost easily in the site or if it takes time to find what user is looking for, s/he may not want to use it again.

In this paper, one scale of a big project that investigates the usability levels of top universities' web pages in Turkey. The purpose of this project is to evaluate the web site of Sakarya University web site according to usability testing criterions with respect to users point, and to find out prospective problems in design of the web pages.

2. METHOD

In this study case study design was used. Usability testing method was used to observe prospective problems as users visit the web site of Sakarya University. In this method, both qualitative and quantitative data could be collected. 11 tasks were introduced to the enthusiastic participants in order to accomplish desired issues related with web site.

2.1. Instruments and context

In this study, 11 tasks were given to participants. Tasks were selected from the results of a study done by Şengel & Öncü (2010). They applied a survey to 445 students to find out how they use web sites of a university. As well as university students, academicians, employees, staffs, and even commercial companies follow the announcements and other activities through web site. Because of this, some of the tasks were related with students, and some were related with staff and some were related with outsiders. Before participants used the site, a survey with four questions was applied to collect demographic properties of users. While each participant using the site individually in a silent place, the interaction done throughout the test were captured by a program called Morae. Morae was preferred to collect data. Because it is easy to install and it requires any computer with cam recorder. In addition, evaluators could easily collect data related with usability aspects and create graphs and tables. As well as creating its own presentation format, it is applicable to transform results to MS Office editing programs easily.

The participants were asked to complete all the tasks. Participants were asked to think aloud while trying to accomplish given task. During the test, the Morae records screen, face of participant and sound at the same time. After participants notified that they completed the given task, a small survey (with three questions) with five-likert type was applied by Morae program in order to endorse the efficiency and effectiveness of the visited site. At the

end of test, a System Usability Scale (SUS) developed by Brook (1996) with 10 questions was applied in order to define satisfaction of users in using web site. It was stated that users were accepted as satisfied with the system if the score of SUS was over 70.

2.2. Participants

Visitors of universities web site is generally students studying at university. But, at the same time different range of users might be a possible user. Because of these reasons, most of the participants (6 participants) were selected from university students studying at Uludag University in different departments. One participant was working as an accountant and one electrical technician. All of them had been using computer and Internet in their daily life's as shown in Table 1.

Table 1. Properties of participants

	Profession	Daily Internet Usage	Weekly computer usage
Participant 1	Student	1-3 hours	11-25 hours
Participant 2	Student	9-12 hours	26+ hours
Participant 3	Electrical technician	<1 hour	0-10 hours
Participant 4	Student	>12 hours	26+ hours
Participant 5	Accountant	1-3 hours	11-25 hours
Participant 6	Student	4-8 hours	26+ hours
Participant 7	Student	4-8 hours	26+ hours
Participant 8	Student	4-8 hours	26+ hours

3. RESULTS

3.1. Efficiency

In this study, efficiency, effectiveness and satisfaction aspects of usability were tested. Efficiency is the measure of the resources that must be spent in order to achieve desired objectives of the system. These resources could be time spent. Table 2 shows the total time spent for each participant to complete the whole test and time spent to find out desired task.

Minimum time spent to complete whole tasks was 653,4 seconds and maximum time was 3294 seconds and average time for full test was approximately 1600 seconds. The long time to complete tasks for participants showed that the web site had a low efficiency level. When each task was investigated separately, the longest time spent was for the Task – 9 (208 sec), then Task – 5 and Task - 11 (each 196 sec). In Task – 9, participants were asked to find a form to apply scientific research project center as if s/he was an academician. During tests, 2 participants find out desired task with difficulty and 6 of them could not completed. One of the reasons for long time was that there were too many button and each were very closed to each other. Related page had to be redesigned.

Table 2. Time spent through out the usability test in seconds

Task Time	Total Time	Tasks										
		T1	T2	T3	T4	T5	T6	T7	T8	T8	T10	T11
Participant 1	1297,2	29,4	111	138	33	173,4	103,8	141	34,2	91,8	86,4	114,6
Participant 2	1365	121,2	123	82,2	21	190,8	119,4	102	49,2	187,2	55,8	175,8
Participant 3	1351,2	27,6	76,2	164,4	62,4	193,2	151,2	162,6	90	115,2	129	46,8
Participant 4	1113	46,2	75	120	19,8	31,8	108	161,4	39,6	157,2	62,4	69,6
Participant 5	2240,4	33	46,2	153,6	29,4	314,4	174	60,6	32,4	330,6	307,2	608,4
Participant 6	1928,4	39,6	151,2	120,6	41,4	110,4	121,8	292,2	127,8	375,6	192	184,8
Participant 7	1757,4	67,8	252,6	87	73,2	326,4	138,6	75	89,4	192,6	238,2	36
Participant 8	1860,6	57,6	59,4	294	121,8	227,4	61,8	90	54	217,2	165,6	334,8
Min	653,4	27,6	46,2	82,2	19,8	31,8	61,8	60,6	32,4	91,8	55,8	36
Max	3294	121,2	252,6	294	121,8	326,4	174	292,2	127,8	375,6	307,2	608,4
Average	1614,6	52,8	111,6	145,2	50,4	196,2	122,4	135,6	64,8	208,2	154,8	196,2

The time required to find out monthly activities was approximately 50, 4 seconds. It was the simplest task to be completed. It was an easy task because the activities were listed in home page. All participants completed the task with ease.

3.2. Effectiveness

Effectiveness is the level of comprehensiveness of the given task. It shows how much a user performs to achieve the purpose. If the task given to a participant is to find contact information any person in any company from a web site, then effectiveness is finding true information. Effectiveness could be measured with different methods. It might be the percentages of succeed persons attended to usability testing. One way to measure effectiveness might be the number of completed task in a specified time interval. Number of errors done till achieving the desired tasks, average accuracy of completed tasks are other types of measurement to be collected in order to find out the level of effectiveness in usability (Çağiltay, 2011; Sengel, 2013).

Fig 1 represents the average error rate for each task. Maximum errors were done in looking for Erasmus web site or any information on that page. They could not completed because, the required information was not planed to announce in the site. However, the information to be found is important for students. For task – 4 (finding monthly activities) was completed without doing any error while participants were searching as they surf.

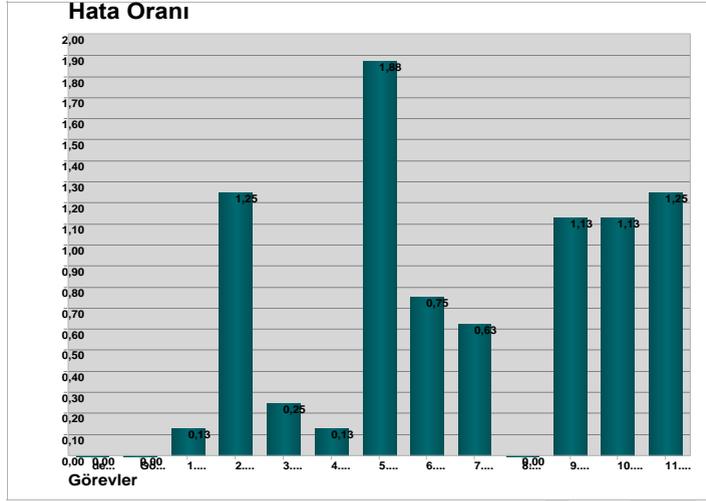

Fig. 1. Error rates

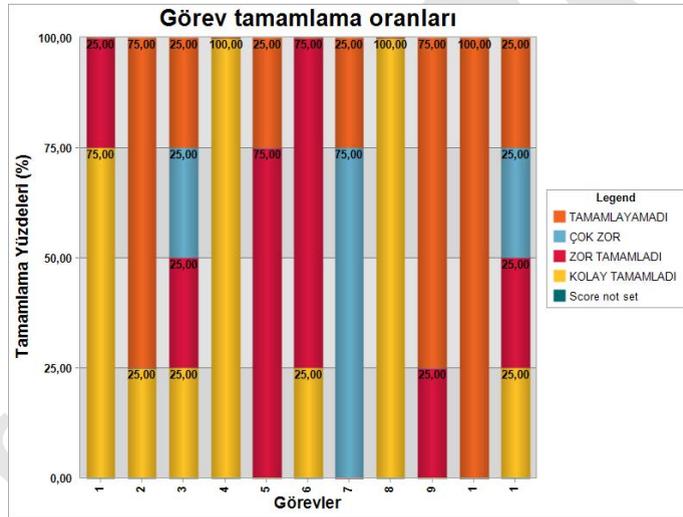

Fig. 2. Success rates

The error rate was high in many tasks from the web site. It shows that the effectiveness of the site was low. This affects the usability of the site. Another method to measure effectiveness of the web site is success rate of task to be completed. As shown in Fig.2, there were some tasks were easily completed (Tasks 4-8). However, some tasks were not completed (Task-10). In this task, the participants were asked to find a phone number to make an appointment to one polyclinics of the university hospital.

In some cases, the task was completed but it was too difficult for participants to accomplish. The reason for this was that links used in the web site were not realized as clickable. Only ones mouse was over clickable

region, shape of mouse turned to clickable. This made users to think about whether the text or figures were clickable or not.

When users were lost ways in the site as trying to complete the given task, they will look at any link to go to the beginning, the home page. But the same problem exists here. There was no written home page link. Link to home page was given to logo of the university

3.3. Satisfaction

In this study, the System Usability Scale, developed by Brook (1996), was used to measure another usability attribute called as satisfaction. SUS composed of 10 questions with both positive and negative statements. It was stated that users were accepted as satisfied with the system if the score of SUS was over 70. If it is between 65- and 70, the system is accepted as medium satisfaction. The SUS score for this study was calculated as 54,06. The satisfaction rate of Sakarya University was found to be lower than average satisfaction.

4. CONCLUSION

The purpose of this project is to evaluate the web site of Sakarya University web site according to usability testing criterions with respect to users point, and to find out prospective problems in design of the web pages. When the results of usability aspect's analyses were investigated, the usability level of the site was found to be low in efficiency, effectiveness and satisfaction criteria.

It is clear that participants had some problems in using the site because of design problems and context problems. Some navigation menus were not identified clearly. Users could not had understood which text was menu and which one was text. In order to increase the usability level of this site rollover property of links and menus should be redesigned. In addition to these, point size of text could be enlarged. Color of text and color of background were almost similar. This made difficult to read text. To increase the readiness level, contrast colors should be used.

When someone is surfing inside a specific web site, s/he might lose her/hisself. In such cases, persons will look after a way to go to starting point or someone to ask. The site contains search box. But, it was not clear that it would be used for searching. "Search" button had to be embedded next to search box as Krug (2006) stated.

There are some topics (e.g., academic calander, daily meal list, and facilities like Erasmus) that are generally preferred by students. These topics had to be achieved without detail searching. Because of this, links to these topics should be placed on main page or main navigation menus.

As stated before, not only students studying in these do use universities' web sites, public and commercial institutions are also searching in these sites. In order to server better, some topics related with their needs (e.g. auctions and procurement) should be included.

Use of the semantics of typography in architectural design education

Selay Yurtkuran^a, Gözde Kırılı^a, Yavuz Taneli^{a*}^a*Uludag University, Faculty of Engineering and Architecture, Department of Architecture, Bursa, Turkey*

Abstract

Visual representation of architectural products and processes has consistently attracted the interest of design researchers and educators. Composing these visual materials into a striking and harmonious presentation is a creative design problem itself. This study describes a Basic Design Studio exercise that explores the boundaries of practice in representing visual material through the semantics of typography. Using only typography, students rephrased a 'transparent' scene of the built environment they themselves photographed. A subsequent analysis revealed that the exercise was effective in transposing the semantics of the selected visual using typography.

Keywords: architectural presentation; typography; architectural education; basic design education

1. Introduction

Architectural design education is based on design studio courses. Design studios require an environment that fosters creativity and experiential learning. The main objective of design studios is to give the students required skills for creative problem solving and critical thinking. Studio participants interact with facilitators as well as other students throughout the design process which improves their communication skills and group working capabilities. Schön (1985) describes the architectural studio as a prototype of 'education for artistry and problem-setting'. The design studio environment is a place for students to learn both about designing and about learning to design (Schön 1985).

Basic Design is a course in which Schön's description of the design studio environment holds. The course broadly encompasses fundamentals of design theory in general, as well as the creativity process in particular. In addition to the wide range of theoretical and methodological issues of design, architectural presentation theory is also covered.

Architectural presentation that engages with visuals of the final product as well as the design process has always been of interest to design researchers and educators. The visuals of the proposed final product are usually structured as models, sketches, 3D computer generated images, hand drawn perspectives, schemas, diagrams, project reports, and computer animated videos. How to compose these visual materials into an eye-catching and harmonious presentation is a creative design problem for the designer.

Most institutions providing architectural education teach architectural presentation techniques in their curriculum in a separate course or as a subject of a related course. These courses usually cover theoretical topics of graphic design basics such as, the concept of layout, typography, and communication fundamentals. The theory based teaching approach may or may not result in students successfully gaining solid presentation skills. Nonetheless, the process of designing a presentation is a very promising and entertaining way for students to

E-mail address: yavuz@uludag.edu.tr

learn how to create and design. Although often omitted in architectural education, typography has great potential as a practical tool for teaching a number of desired presentation and design skills.

Harkins (2010) provides a succinct description of typography as “the art or craft of arranging letters and words.” He elaborates; ‘*typography also allows for the arrangement of letters and words (along with other visual matter) to be reassembled and replicated as few or as many times as is necessitated by the demands of what is to be communicated (the content)*’. (Harkins 2010, p.14)

Although text is a meaningful entity by itself, that meaning can change in the way its pieces are combined and composed. In other words, the meaning of text is dependent on how textual material is structured. The semantic value of text in architectural presentation cannot be underestimated. However, the semantics of the textual material itself; in this case the semantics of letters and the typographic characters usually slips designers’ minds. Letters actually have a subject matter of their own and this assumption might have a dramatic educational potential in terms of understanding the process of design. Cullen (2012) defines typography as a process, and a sophisticated craft, making language visible. Designers form language with type, and consequently words gain life and power. Typography has semantic and aesthetic functions. Type that serves both roles simultaneously can be considered successful (Cullen, 2012, p.12).

The Basic Design Studio considers text and typography as a vital component for representing ideas and the design product itself. Additionally, letters, typographic characters, and typography are potential educational tools in terms of understanding the process of design and creativity. Leeuwen (2006) suggests that typography can be interpreted as a semiotic mode that is systematic, and multimodal. Therefore, typography is not just textual, but possesses ideational and interpersonal meaning (Leeuwen 2006). Emphasizing multimodality, Nørgaard (2009) identifies a restricted focus on word-meaning in literary criticism that ignores the semiotic potential of typography. Thus, the authors suggest that typography and its material can be instrumental in translating and visually rephrasing images such as photos of the built environment and abstract compositions. A design exercise that utilizes the multimodal characteristics of typography is described below.

2. Design Studio Project: ‘Expression of Transparency in a Typographic Poster’

This paper describes a studio project that aims to use typography and text as a tool for translating and rephrasing photographs of the built environment. 71 students participated in the project within the scope of Basic Design 2 class in the spring semester of 2012-2013 academic year. Students were asked to photograph ‘transparent’ scenes of the city, and then to visually rephrase these photos by using only typographic materials in a poster. Student presentations were documented on video as they presented their work and received constructive critique from facilitators and fellow students. Subsequently, these videos were transcribed and discussed by the facilitators.

The “Transparent / Typographic Poster” project was completed in 3-weeks in a design studio medium. The study was carried out as a group work and the groups were formed randomly by the facilitators with the inclusion of 2 or 3 students in each group. In total, 25 groups produced 25 posters. The final work was printed and also submitted on a CD containing the artwork.

2.1. Studio 1

The “Transparent / Typographic Poster” project was carried out as a continuation of, and supplementary to the ‘Transparent Model’ study. Therefore, it would be appropriate to describe this study first.

In the “Transparent Model” study, the groups were asked to form a model of a ‘transparent’ design using the concept of ‘lines in space’. The materials were wires, threads, boards and fabrics. The study was carried out in the studio environment. During the exercise, the instructors who acted as facilitators interacted with the groups

about their ideas. The studies were completed and evaluated during the same day. The evaluation involved exchange of views by all the participants and facilitators, critiquing each other's work.

At the end of the studio, students were asked to prepare a digital presentation for the next studio, explaining the concept of 'transparency'. They were also asked to take 10 photos of the built environment representing the concept of transparency, and bring A3 size printouts to the following studio. These photographs were to be used for the "Transparent / Typographic Poster" project.

2.2. Studio 2

The second studio of the project began with presentations of the concept of 'transparency'. After the completion of group presentations, participants and facilitators discussed the photos in terms of the concept of transparency. Photos that would be used during the next assignment were identified. Key criteria considered during the identification of photos were that they had to provide a link to human life and that they had to be original. Particular attention was given to select dissimilar photos for each one of the groups.

Following the identification of photos, the study was explicated to the participants. Within the scope of the "Transparent / Typographical Poster" project, participants were asked to: (1) draw sketches on the selected photo and simplify the photo using lines, (2) highlight the parts they thought were transparent, (3) place a second layer of sketch paper on the initial sketch, and to envisage how this highlighted new sketch could be expressed with typographical characters. During this expression, each group was asked to find a keyword that suited the transparency they observed in their own photos, and to use this word in their posters once or more than once in an altered color. Group members would agree on the color of this keyword.

After explaining the study, groups were allowed 45 minutes to discuss the design and prepare their first sketches in studio environment. Meanwhile, studio facilitators walked through the groups, listened to their ideas, and provided tips. At the end of the 45-minute period, initial sketches were posted. Class discussions were held, and the sketches were critiqued by the instructors.

Following these critiques, students were allowed to continue working on their designs. They were then instructed to complete their projects by the next studio by using typographical characters of varying nature, which they would cut out from printed materials such as newspapers and magazines.

2.3. Studio 3

The third studio of the "Transparent / Typographical Poster" project focused on evaluations. Photos selected by the groups, initial sketches prepared in the second week, and the final version of the project prepared using the cut and paste method were all posted together, and were subsequently discussed by both the facilitators and participants. The discussions focused on both the strong and weak aspects of the project. Distinctive features of typographic characters that were discussed were weight, expansion, slope, curvature, connectivity, orientation and regularity. Care was taken during evaluations that the latest version of the study involved hints of human life as in the selected photos, and that the typographical characters used were prominent in their color, size, pattern, etc. to give the intended impression.

Participants were asked to turn in a CD containing their initial sketches, the project itself, the selected photos, and a report explaining their project.

3. Student Work

The work of three different student groups are presented and discussed below

Fig. 1. (a) Photo taken by the students; (b) sketch (c) typography work

The photo used for the project is of a multi-story public housing site. The reason for selecting it was that the diffusion of light was hindered because the buildings were very high and close to each other (Figure 1.a).

In their sketch, the participants expressed the contours of the buildings distinctly, and identified solid and void areas (Figure 1.b). Next, they expressed the solid areas with large, dark, dominating typographical characters and the areas receiving sunshine with smaller, yellow and homogenous characters. Following the critiques they received during the initial evaluation, the students prepared an inverse of their first sketch. In this alternative work, the areas that were solid were left blank, the sky was represented by homogeneously distributing small and light-colored typographical characters, and the reflections of the sun on the buildings were expressed with larger, yellow-colored and dense-textured typographical characters (Figure 1.c).

Fig. 2. (a) Photo taken by the students; (b) sketch (c) typography work

The photo used in the project displays the sunshades on the facade of an architectural school of a newly opened university (Figure 2.a). At the sketch phase, participants expressed the sunshades with spread out thin lines considering the transparent nature of the colored design elements, and the non-transparent parts of the mass with dark, thick lines (Figure 2.b). Taking into consideration the critique they received participants expressed light with small yellow typographical characters, and solid areas they had previously expressed with thick lines, with dark, thick typographical characters (Figure 2.c).

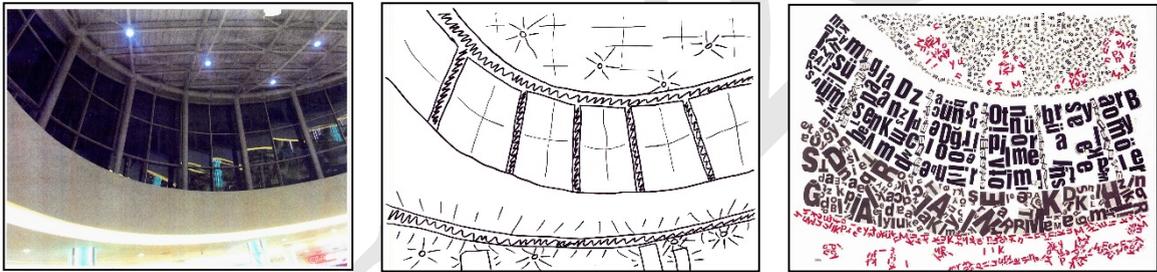

Fig. 3. (a) Photo taken by the students; (b) sketch (c) typography work

The photo used in the project displays the skylight of a shopping mall (Figure 3.a). The reason for selecting this photo was that since it was taken at night, the external lighting and internal lighting created a different impression than the customary impression of transparency.

At the sketch phase, participants traced the contours of indoor spaces and made the light fittings that illuminate the interiors more distinct (Figure 3.b). In the final part of the project, the students expressed the window openings with dark thick typographical characters, and the areas illuminated by artificial lighting equipment with small dense red characters (Figure 3.c).

4. Conclusion

The products of this design exercise reveal that architecture students are able to transpose the semantics of a visual, in this case one of the built environment, by using typography and its multimodal characteristics. Hausmann & Cullars (1998) contend that the design of typography, being artificial and not naturalistic in form,

requires a certain kind of structural perception. It can be further argued that, architecture students are able to read into the logical and predetermined characteristics of typography, utilizing it to convey meaningful ideation.

Type not only carries information, but also elicits emotion (Cullen, 2012, p.12). Using the semantics of typography and its characters in architectural education, students are able to see, read, and visually rephrase their environment not only through colors, materials, texture, size, and shape as they are accustomed to, but also through letters and words.

Acknowledgements

The authors would like to express their gratitude to students who took part in the design exercise.

4th International Conference on New Horizons in Education

Using facebook for learning: a case study on the perception of students in higher education

Teresa Pérez^{*a}, María De Jesús Araiza^a Claudia Doerfer^a^a *Universidad Autónoma de Nuevo León, "Monterrey", México*

Abstract

Facebook is essentially a successful online social network site, in which individuals can share information; the company was founded in 2004 by Mark Zuckerberg, Dustin Moskovitz and Chris Hughes as a way to support the communication of Harvard University. This network was successful used within the Harvard community, and then was quickly spread out to other institutions. Site was opened to the public in 2006. Nine years later, when the company was established and it became into the most popular social network in the world, more and more users are being added every day, coming to already be millions around the world, including students in higher education. This paper shows the results of a study conducted in one a Mexican University, in order to explore the potential benefits that might have this social network in the learning process. Data were obtained by the survey was analyzed and commented upon using the SPSS program with the percentage, frequency, and mean statistical analysis techniques. The results indicated that students will benefit from this interaction tool. The potential benefits of Facebook for students are not only limited to the improvement of learning process used as a communication and a interaction tool, but also as a tool useful to help students in their professional development.

Email address:

In this global world the digital era is very dynamic; students are more immersed in the technologies (i.e. Facebook, twitter, space). Facebook is essentially a successful online social network site, in which individuals can share information. The company was founded in 2004 by Mark Zuckerberg, Dustin Moskovitz and Chri Hughes in Harvard University. At the beginning this social network was successfully used within the Harvard community, but quickly spread to other institutions and finally the site was opened to the general public in 2006. Facebook provides members with a platform to share their stories, pictures, music, and common interests. Users can create individual profiles and can also designate other users as friends, send private messages and join groups. Facebook is used not only for social networking, but also for business and educational objectives. Originally founded in the U.S. Facebook is expanding worldwide and becoming one of the top social networks in the world, reaching over than one billion active users around the world Facebook Inc. (2012), Surveys of undergraduate students in the United States showed that over 90 % of them use Facebook Ellison (et al. 2007); view focuses on the use of Facebook by students, present a detailed the time the students spend on Facebook in a day to educational issues. A social networking site is an online site that presents a platform used by individuals; it focuses on building and reflecting academic's relations in accordance with interests and/or activities of students.

This paper aims to explore the perception of students in University about whether it would be appropriate to use Facebook for the teaching-learning process; and the actual use by teachers for educational purposes]. The reviewed studies have been categorized into three sections: (1) Descriptive statistics – Facebook for educational purposes (2) Pedagogical uses by teachers, (3) Perception of students about Facebook as a learning tool. Facebook also presents opportunities for members to organize themselves into groups in relation professional affiliations, which might include, submission of ads, class schedules, application of tests, submit work, upload presentations, set discussion rooms, chats, and messenger among students.

2 Literature Review

2.1 Facebook

Facebook can have several uses: to maintain contact with a group of students of the same course; to develop a network with others students; to engage in communication with the teacher and with former colleagues, to meet students with similar interests, and share all types of information. The acknowledgement of a student's use of Facebook is of crucial importance for the academic community, as well as for the teacher and students, since this application could have a large impact on teaching-learning dynamics. As stated by Mazer, Murphy and Simonds, (2007); Tuncay & Uzunboylu, (2010) the use of Facebook has a great impact on the motivation of students to turn, effective learning and the climate in the classroom.

2.2 Facebook in higher education

Why we think that Facebook can be learning tool for both teachers and students who are engaged in their studies of higher education?, the answer is that they can create groups based on common interests and have information fast and updated. According to figures provided by Facebook indicating that 30% of users are younger than 30 years, we can conclude that it could be the network of choice among students of universities. Stutzman (2006) said that 90% of the students in their study indicated the use of Facebook. We also think that other means of communication which are email and courses online have become obsolete, but Facebook tool for now is the most widely used, you may need sense to use Facebook as a tool of teaching - learning because students rather than teachers are already actively participating opening groups and sharing online information related to courses that you are taking at the level of higher education. There have been studies about the use of Facebook -[by] teachers. Gross and Shopping (2005) reported that only 1.5% of the population of one faculty at a University where the study was done used Facebook. Maybe, if it motivates teachers to use it, Facebook can become an opportunity for interaction and communication with students.

According to Bugeja (2006), Facebook affects all levels of the academy and academic environments (Villaino 2007); opening wide and exciting new worlds of learning for educators and students Couros (2008). Students can create and join group's base on interests, and can connect to others through a range of channels.. It has also been used for information, knowledge and document sharing trough the built-in applications (Mack et al. 2007; Cho and Lee, 2008). It also has the potential to be used for educational applications (Boon and Sinclair, 2009). Facebook can also become a valuable resource to support students educational communication and collaborations with faculty Roblyer et al., (2010), which can provide that a different model of online tools can be used in educational contexts. Mazman and Usluel (2010) are aimed at designing a structural model explaining how users could use Facebook for educational purposes. They found that the use of Facebook as an educational tool could be explained by the effects of the user, along with the adoption of processes of Facebook. Finally, (McCarthy, 2010) discusses integrating physical and virtual learning environments to improve the experiences of students in first year. With an emphasis on the use of social networks to support learning and teaching in higher education, students were drawn into a university culture of social and academic interaction between peers. We believe that Facebook can positively affect classroom practices and student participation.

2.3. The perception of students about in the learning process

The digital divide is now lower and students use more computing resources for communication either personal as well as for support for education. According to research, Facebook contributes to an easier flow of communication between teachers and students and could enhance learning and this could improve teaching – learning process. For instance Berg et.al, (2007) describes how one university used Facebook as a means to build better relationships with its students and staff. O'Hanlon (2007) describes how educators engage with an inform

students via Facebook, while Sturgeon and Walker (2009) report that some of the most effective faculty members are those who create informal relationships with their students via Facebook. Facebook provides opportunities for students to communication in new ways, but the students believe that the teachers are not updated in the tool. Another area of concern is friending students on Facebook (Lipka, 2007; Young, 2009). The convention seems to be that it is less acceptable for professors to invite students to become friends than the other way around. Students are preoccupied by this situation.

2.4. The aim of the research

The aim of this study was to investigate the Facebook usage of students and also to find out which Facebook tools can be used for of learning. The study attempted to find answers to the following questions.

1. What are the Facebook usage habits of student's hours/day/places?
2. What are the most preferred Facebook tools usage habits of students?
3. If the teacher use Facebook for teaching-learning?
4. Which is la perception of students about in the learning process?

3. Method

3.1 Sampling

The present study used a sample of higher education students enrolled in management 35.9 % (128), counter public 27.5% (98), international business 18.5% and information technologies 15.7 % (56) and of carrier other 2.5% (9) courses at public university located in the North part of the Mexico. The sample was decided by convenience because undergraduate students are the primary users of social networking sites; we intentionally recruited undergraduate students to complete our survey.

3.2 Instruments

The instrument was the implementation of a survey and consisted of two sections. The questions included at the survey were also built from literature review They selected 15 questions that were grouped into two sections: first section, demographic characteristics of students and also length of time spent in Facebook were collected. The second section consisted of items related to perceptions of students about using Facebook for learning. Each item was measured on a five-point Likert Scale (5 - Strongly agree, 4 - Agree, 3 - Not sure, 2 -Disagree, 1 – Strongly disagree). Some of the questions were negatively worded and subsequently recoded so that after being recoded, higher subscale total scores indicated more comfort(less anxiety) with computer technology, and/or more enjoyment and higher perceived usefulness of computer technology.

3.3 Data Analysis

The students were contacted through their personal email accounts and link containing the survey was sent to them. A following e-mail was sent as a reminder five days after the first e-mail to some of the elements surveyed

that hadn't answered. A total of 357 students completed the survey. The study was conducted during March-July 2013. The data was downloaded as an SPSS file and analyzed using SPSS Statistics Version 21. Descriptive statistics were used to interpret the data.

4. Results & Discussion

4.1 Descriptive statistics – Facebook for educational purposes

4.1.1. Demographics

Forty-one percent of the participants were male and the fifty-nine female. The mean age of the participants was 20. The age of participants ranged from 17 to 44, though 91% were between 18 and 23 years old.

4.1.2. Use of electronic devices

According to figure 1, and in order to achieve the proposed aim, first, students are asked about their use of electronic devices for access to the Facebook. Mobile phone (61.3%), laptops (35.0%) or personal computers-home (28.9%) are the more used devices.

Table1. Use of electronic devices

Electronic devices	Frequency	%
Mobile pone	219	61.3
University computer	23	6.4
Home computer	103	28.9
Laptop	125	35
Other	19	5.3
Total	357	100

4.1.3. Using Facebook

Regarding the day of week in which students access Facebook, data revealed one high point (table 2). The day that more used the Facebook was monday (65.5 %) followed by wednesday (48.5%).

Table 2. Use of Facebook per day

Day	Frequency	%
Monday	234	65.5
Tuesday	158	44.3
Wednesday	173	48.5
Thursday	164	45.9
Friday	146	40.9
Saturday	77	21.6
Sunday	110	30.8
Total	357	100

4.1.4 Time spent for educational purposes

In table 3, a rather high percentage (32.8%) of students used Facebook for educational purposes (between 30 min and -1hr).

Table 3. Time spent for educational purposes

	Frequency	Percentage
Valid	8	2.2
1hr. to 2 hrs.	89	24.9
2 hrs to 4 hrs.	50	14
30 min to 1 hour.	117	32.8
4 hrs 8 hrs.	8	2.2
more than 8 hrs.	1	0.3
less than 30 min.	84	23.5
Total	357	100

4.1.5. When do you Access Facebook?

Table 4. Time spent for educational purposes

Valid	Frequency	Percentage
From 06:00 AM to 12:00 PM	70	19.6
12:01 PM to 06:00 PM	134	37.5
06:01 PM to 12:00 AM	170	47.6
12:01 AM to 05:59 AM	16	4.5

The majority of respondents, approximately 47.6%, use Facebook between 06:01 PM to 12:00 AM and use it daily for a relatively short period of time (23.5 used less than 30 min daily and 32.8% between 30 minutes to one hour at the most).

5. Results and discussions

Table 5 below shows in a descriptive way the results we obtained for each of the aspect we try to evaluate. As we have already mentioned above, we are not dealing with a validated methodological construct, but with a

qualitative aspect that came out from our informal discussions with the students (and colleagues) about their experience with using Facebook, deriving in the inclusion of seven questions in the survey. Based on your experience in the use of FACEBOOK, your teacher uses it to support teaching-learning processes.

According to the results obtained, Facebook has not been used specifically for teaching-learning processes. With respect to the question whether it offers students and teachers the possibility of submitting help, 46.5 % responded negatively]. Regarding class scheduling], 51.8% responded that they do not receive such information via Facebook; and with respect to tests, 86.3% of students reported not experiencing an application through social networks. Concerning the submission of information or the uploading of presentations, 53.8% responded negatively, for discussion rooms, chats, or messenger, respondents responded negatively with an 80.7%. Finally, regarding the provision of exclusive groups for education purposes, a 59.1% negative response was obtained. As a conclusion, teachers at a higher education levels are not using Facebook to support teaching-learning processes.

Table 5. The pedagogical use of Facebook by the teacher

FACEBOOK	1	2	3	4	5	lose	total	Mean	SD
Assignment of tasks	169	91	40	34	17	6	357	1.97	1.192
	47.3	25.5	11.2	9.5	4.8	1.7	100.0		
Submission of helps	166	78	47	43	17	6	357	2.05	1.239
	46.5	21.8	13.2	12	4.8	1.7	100		
Class scheduling	185	70	50	30	16	6	357	1.92	1.192
	51.8	19.6	14	8.4	4.5	1.7	100		
Application of tests	308	15	14	2	12	6	357	1.28	.852
	86.3	4.2	3.9	0.6	3.3	1.7	100		
Submit abstracts, upload presentations	192	64	50	28	17	6	357	1.90	1.199
	53.8	17.9	14	7.8	4.8	1.7	100		
Make rooms discussion, chats, messenger	228	31	15	7	10	6	297	1.35	.881
	80.7	8.7	4.2	2	2.7	1.7	100		
Opened exclusive groups for students	211	52	40	29	18	7	357	1.83	1.220
	59.1	14.6	11.2	8.1	5	2	100		

Conversely, sharing certain aspects of faculty's private lives with students may have potential educational value aimed to identify the positive or negative outcomes of student exposure to the more personable image of professors that social networking sites inherently afford (expressions of self-disclosure) to their users. Thus, six questions about the perception of the inclusion of Facebook in the support of teaching-learning processes were included in the survey. Table 6 shows the results descriptively of each one of the aspects that were evaluated [about] the perception of the use of Facebook for teaching - learning in the public University. A 5-point Likert scale was used. where 1 = not supporting, 2 = possibly supporting, 3 = often supporting, 4 = mostly supporting and 5 = always supporting

For the students, Facebook can be used for teaching - learning as portrayed by a 47% response between scales 4 and 5. With respect to the question whether it offers students and teachers the opportunity to participate freely and smoothly in the model of in teaching-learning, 41% answered similarly. 51.30% believe that it may be a tool that encourages the promotion of the exchange of educational content (scales 4 and 5). Finally, 63.60% (4-5 scale) perceive to be allowed that the contents can be seen anytime, anywhere. Paradoxically, although all students sample connect to Facebook only the 59.30% (4-5 scale) thinks it may be a tool that can improve the communication between the students population and expand the network. 59.30% (scale of 4-5) says that if it could be an effective channel of communication between students and teachers. But contrary, about teachers which is not efficient. Perhaps the teacher must be able to develop a personal online at Facebook experience since students know with these details that have been revealed are demeaning it. We think that for this case study, we have to find ways to initiate and manage more efficient, creative and interactive and relevant communication with students. Fortunately, students perceive the use of Facebook as if it can help in teaching-learning method. Therefore, we can conclude that teachers should adapt to this means of communication and be updated to use the tool.

Table 6. Perception of students about if the Facebook can help to process teaching-learning

	1	2	3	4	5	lost	total	Mean	SD
It can be used for the process of teaching - learning	48	95	45	97	66	6	357	3.11	1.36
	0.13	0.27	0.13	0.27	0.19	0.02	1

You can improve the communication with the student population and expand the student network	14	48	65	102	121	7	357	3.77	1.18
	0.04	0.13	0.18	0.29	0.34	0.02	1		
It can be an effective channel of communication between students and teachers?	21	46	75	111	98	6	357	3.62	1.9
	0.27	0.31	0.21	0.14	0.06	0.02	1		

6. Conclusion

This study was intended to find out if students used Facebook, as well as their perception about this and if it could be on the model teaching - learning. First we asked about the general data students and later became questions about perception about its use in the teaching model of learning; the foregoing was since wanted to know its educational identity related to Facebook and your perception if it helps learning. When analyzing the results we found that teachers have a limited use of Facebook since 47% used it less than two hours. And for students, 46.6% use it more than two hours a day. Based on these results, we can say that students showed greater acceptance for the use of Facebook in the teaching-learning model. Concerning questions about the perception of the potential use of Facebook for teaching-learning purposes, results indicate that it could be an effective channel of communication between students and teachers and this can as turn contribute to positive learning outcomes. On the other hand, students find this tool more useful for teachers and can greatly improve the level of communication that is reflected in the interest of students if teachers are trained and use this tool. It is also important to address the limitations of this study, dealing with sample size, was not applied a survey to teachers to get to know your appreciation, limiting generalizability. All results must be interpreted with this in mind. For future research, this survey could be applied to private Universities in the same area to explore the potential benefits that could have this network in the teaching-learning process.

Abstract

The learning management systems (LMSs) are being increasingly used in distance education. However LMSs do not maintain any elements to guide educators to design and develop instruction. The purpose of this study is to design, develop and evaluate a LMS that guide facilitators when designing instructional modules for their online courses based on the Gagne's nine events. Using the revised development process model called "Waterfall Model", the LMS was developed and evaluated. The users of the system found the developed LMS useful. Other instructional models can be integrated to LMS in following studies.

Keywords: distance learning, gagne's nine events, learning management system, internet-based learning

1. INTRODUCTION

Today, the rapid development of technology continues. Technologies have made human life more complex than ever before. However, the opportunities provided by technology and innovations brought about a positive impact on individuals' lives. Traces of the rapid development in technology in the field of education can be observed. Even individuals not having time to attend the face-to-face education due to many reasons including, but not limited to, work, family, distance and health can continue their education using the means provided by the technology (Palloff ve Pratt, 2003). Distance education is the most widely known example of the technology use in education. Distance education provides many advantages. Time and distance flexibility is the chief benefits of distance. Using computers or portable mobile technologies web-based applications of distance education are implemented nowadays.

The rapid development in technology reduced the cost of the equipment used to offer distance education programs. Individuals can easily afford to obtain them. The rapid increase of the use of the internet even using mobile devices has opened a new avenue for distance education. Realizing the benefits of distance education, many universities throughout the world offer associate, undergraduate and graduate degree programs online. Even many universities use distance education tools to support their face-to-face education which is known as blended learning. Therefore individuals can continue their education and can communicate with their classmates and facilitators beyond the classroom walls.

The rapid increase in the number of online courses and students taking them is observed due to the advantages offered by the online education. Many LMSs have been developed for the distance education. LMSs vary according to the tools that they have for online education. Well known LMSs are Moodle, Sakai, Dokeos, ATutor (open-source), Blackboard (commercial). Looking at all the features, almost all LMSs offer similar tools

* Corresponding author. Tel.: +90 372 323 38 70; fax: +90 372 323 86 93.

E-mail address: aligokdemir@yahoo.com

for online students and teachers. With these features, students can have an opportunity to learn at their own pace. Students outside the class can access the course materials and allocate more time to work with them using the advantages of LMSs. Students can access the course, course content, objectives and evaluation criteria in LMSs. Instructors who teach in the traditional education system have experienced difficulties in adjusting to the new system. Online facilitators have faced difficulties primarily on designing, developing and evaluating teaching materials for distance education courses. (McQuiggan, 2007). Although faced challenges are different from the challenges in the traditional educational setting, they vary from discipline to discipline. Many universities prefer to use open-source LMSs. Although many additional properties can be developed and integrated into the open-source LMSs, it requires programming knowledge and skills.

Designing the online course is as difficult as developing new features on the LMSs. Facilitators have faced the challenge of designing course module for their online courses. Facilitators have to know how to design online courses on LMSs in order to design their online courses. The lack of guidance that LMSs have to guide facilitators to design and develop instructional modules leads to the formation of a number of pedagogical problems for the online course design. Especially facilitators coming from different academic background other than education suffer to design sound instructional modules for their online courses. This in turn leads to online course facilitators prepare distance education materials below the expected standards.

In general, web-based distance education was defined as a form of education that through information and communication technologies bring the students, teachers and teaching materials in the same environment (Emir, 2006). There are many advantages of web-based distance education. They eliminate the limit of time and space in education, provide equal opportunity in education, and offer students the opportunity to learn their own learning pace, bring a certain standard to the education, and reduce the cost of education. The LMSs are being increasingly used in distance education. However LMSs do not maintain any elements to guide educators/facilitators to design and develop instruction. The purpose of this study, therefore, is to design, develop and evaluate a learning management system that guide facilitators when designing instructional modules for their online courses based on the Gagne's nine events. For the purposes of this study following research questions were investigated;

1. What are the elements of the design model?
2. What are the opinions of system administrators, facilitators and students about the usefulness of the developed LMS?

2. METHOD

A learning management system that guides facilitators to design online course module was developed in this study. The revised version of the "Waterfall Model" was constructed and used in this study to design the LMS. This model consists of four consecutive phases namely analysis, design, development, and evaluation. The product of each phase was a prerequisite for the entry of the next phase. The basic assumption of the developed model is to guide facilitators to prepare the web-based distance education course modules for their online courses based on Robert Gagne's nine events.

In the analysis phase, general characteristics of users of the system were analyzed. In this context three general user types were determined. These were system administrators, facilitators, and students. Second, a programming language used to develop the system was determined. Finally, software used to prepare a database was selected.

As a result of analysis of individuals who would use the system, the system administrators were chosen among the individuals involved in the information processing unit. These people were required to have technical information in respect to do the basic setup of the host computer, provide and ensure the functioning of the management of the system. The facilitators were selected among lecturers graduated from the undergraduate programs associated with the Mathematics, History, Electronics, Law, Economics, and Medicine. The students studying at the secondary or higher level were comprised of individuals with basic computer skills.

When selecting the programming language, the necessary programming languages were researched and the alternative programming languages were identified. Finally, PHP and ASP were selected as the programming language. PHP was chosen because it is open-source with no cost. In the final stage of the analysis step, MySQL, a freeware database preparation program can be used with PHP programming language, was selected.

Three design were completed namely the design of infrastructure of online education system, the design of the database and the design of the user interface in the design phase. Web-based online education requires a certain internet infrastructure to access individuals and to provide course contents. The system consists of the three main parts, which are the visual part seen by user, the programming language running in the background, and the database storing procedure. The user interface of the program is the space where interaction between users and computers occurs. The user interface of the program should be designed carefully since the users use this space to see images and do course activities. The buttons, links and information on the interface can be easily reached and the users should feel comfortable when they use it. Programming language is the bridge between the users and the computer while maintaining communication between them. Database is the system that allows storing the specific information, organizing and retrieving them to use it again later.

In this system, the system administrator is the person responsible for the execution. The system administrator is responsible for creating and updating an account of the facilitators and the students, adding a new course, assigning the facilitators and the students to the course in the system. The facilitator is responsible for creating the module related to the course content based on guiding Gagne's nine events. More than one course module can be prepared for each content and evaluation questionnaires for each of them. The students are defined as those who access to the system and take the course content in the system. They are registered and assigned to the course by the system administrator. The students should follow the course materials and respond to the evaluation questions to complete the course module.

The developed LMS was designed to guide the facilitators to design and develop course modules based on Gagne's nine events. These events were defined as: (1) Gain attention, (2) Inform learner of objective, (3) Stimulate recall of prior knowledge, (4) Present the material to be learned, (5) Provide guidance for learning, (6) Elicit performance – practice, (7) Provide informative feedback, (8) Assess performance, (9) Enhance retention and transfer. Due to the relational structure of the database, it is simple to make changes among the elements and updates the system information.

Three different designs were made for the three different user groups. The system administrator has the authority to add a new facilitator, add a new course, add a new student and update their information. The facilitator creates the course modules using Gagne's nine events. The evaluation questionnaires are prepared on the user interface, and asked to the students. Students log in the system using the username and password to reach the course materials. Students can study on the course materials and module as much as they want. The system supports all kind of videos, pictures, graph, animations, and plain tests as course materials.

Web-based distance education system was developed in this stage. In this context, the database, the programming code and the user interfaces were primarily created. Firstly, the database was developed in

accordance with the information obtained in the design phase. Secondly, the programming code was written. Finally, the user interfaces were developed.

The web-based distance education system was assessed using “Usability Testing”. The purpose of the evaluation is to make it more useful. In the scope of the evaluation, the tasks of the system administrators, the facilitators and the students were determined while they use the web-based distance education system. The levels of performing these tasks were measured by the usability testing. In addition, Think-aloud method together with usability testing was used to find out the levels to perform the tasks assigned to the system administrators, the facilitators and the students, the users’ choices while performing the tasks, and why these choices were preferred. The test environment was videotaped with sound record. The levels to complete the tasks were measured by using likert scale at the end of the tests. Also under evaluation phase using open-ended questions, opinions of users about the usefulness of the program, the effectiveness of the program, the advantage and disadvantage of the program were collected.

The study population consists of the system administrators, the facilitators, and the students. The sample selection was made separately for each group. The system administrators of the web-based distance education system were selected using convenience sampling method (Yıldırım ve Şimşek, 2006) among those who were experts in the field of educational technology and had at least a PhD degree. In this context, accessible three faculty members each of whom worked in different universities were selected. The facilitators were selected using convenience sampling method among those who graduated from the Faculty of Arts and Sciences, were going on teacher training programs in post-graduate education as well as worked in private schools as teachers. Each facilitator was carefully selected from different universities. Ten students were selected using convenience sampling method randomly from a secondary education institution.

Data were collected through evaluation questionnaires and interviews. The evaluation questionnaires were prepared for three user groups. The interviews were performed using open-ended questions for each of the three groups. The evaluation questionnaires for the system administrators, the facilitators and the students, originally created by Huang (2009), were revised and reorganized as a five-point Likert-type rating scale. The opinions of three experts in the field of Instructional Technologies and Computer Education were received in order to determine the validity of the scope of the surveys. The final changes were made on the surveys based on these opinions. The data collected using these surveys helped to determine the levels of the web-based distance education system being able to use by the system administrators, the levels to perform the tasks of the facilitators required to complete, the levels to perform the tasks of the students required to complete.

Four open-ended questions were created for the each group. The interviews were performed with the system administrators via e-mail, with the facilitators and the students through face-to-face. The interview results were used to find out the usefulness, effectiveness, advantages and disadvantages of the program. In this study, descriptive statistical analysis is used to analyze quantitative data and content analysis is used to analyze qualitative data.

3. FINDINGS AND CONCLUSION

According to the survey results, the system administrator was able to perform easily the tasks specified in the web-based distance education system. The only trouble was experienced in fulfilling the editing process of a course previously uploaded. According to these findings, the developed web-based distance education system ensured that the system administrator easily fulfilled to their tasks. Only the platform that allows users to change the documents previously uploaded was needed to be updated.

The facilitator reported that they easily fulfilled the tasks specified in the developed system. The most of the facilitators answered “Completely Agree” or “Agree” for the question “I am able to perform the tasks specified in the system” The facilitators became successful in the process of preparation of the course module based on Gagne’s nine events. According to these findings, the system was designed for the facilitators to easily fulfill the tasks specified in the system. When looking at the level of the students to perform their tasks, the students became successful to complete the specified tasks. Most of the students answered the question “I can do the tasks specified in the system” as “Completely Agree” or “Agree”. The students logged in the web-based distance education system and completed the specified tasks easily. Therefore it can be said that the systems was designed for students to use it easily.

The opinions of the system administrators, facilitators, and students about the usefulness of the web-based distance education system were obtained by the answers of open-ended questions. All of the system administrators emphasized that the program was easy to use. In the same way, all of the facilitators said the program was simple to use. One of the facilitators stated that “the program is simple, really simple. In the first use one can easily find everything”. Another one stated that “the program is very useful since it clearly explains every step required to do as well as the guidelines of the program is explanatory”. The system is convenient because it is easy to use and supported by examples.

All of the students indicated that the program was easy to use. One of the students said about the usefulness of the program that “Using the program is very simple, easy to use. Everyone can easily use it”. Another student also said similar things “The program is simple, easy to use. A user can easily log in the system. After you log in the system, the course topics are in front of you”. The students found simply, convenient and handy the course contents prepared by following Gagne’s nine events.

The opinions of the system administrators, facilitators, and students about the effectiveness of the web-based distance education system were obtained by the answers of open-ended questions. While evaluating the program, the system administrators found it simple, elegant and simple to use. They stated that “the system can fulfill the specified basic functions but it has some parts required to develop and can be improved in future studies.” All of the facilitators gave a positive opinion on the effectiveness of the developed system. One of the facilitators said “I believe that it will be effective in terms of an instructor so it brings a great convenience” another one said “I think it can be used effectively. The guide of the system is well-prepared so anyone can use it easily” with these words mentioned the effectiveness of the system. Moreover, “the effectiveness of the program in each stage was thought so it looks like a multi-faceted program”.

As general, all of the students found sufficient overall effectiveness of the system. They stated that they can easily reach the course grades. One of the students said that the design of the interface is effective “the interface is simple, easy to use and pretty straightforward. I can easily find the course grades”. This easy and straightforward interface positively affects student achievement. The system administrators, facilitators and students found sufficient to the developed system. It can be concluded that using Gagne’s nine events as a guide to prepare course modules increase the effectiveness of the system.

The users of the system successfully tested the system that guides the facilitators when designing instructional modules for their online courses based on Robert Gagne’s nine events. As a result of the study, the developed system could be used for the development and implementation of instructional module for the web-based distance education courses. In this study, the LMS was designed using revised “Waterfall model”. A different model can be designed to develop similar LMSs in the future. Also other instructional models can be integrated to LMS in following studies.

4th International Conference on New Horizons in Education

Using ontology theory to enhance problem solving skills

Shu-Hsuan Chang^{a*}, Chien-Hung Lin^a, Yi-Ting Mai^b, Ai-Chiao Ku^a^a National Changhua University of Education, Faculty of Department of Industrial Education and Technology, Changhua 500, Taiwan^b Hsiuping University of Science and Technology, Faculty of Department of Information and Networking Technology, Taichung 412, Taiwan

Abstract

It has been proved that using Ontology to construct hierarchical structure for concepts could help understanding conceptual knowledge which is a necessary to problem solving. The study proposes a novel teaching material based on Ontology theory to enhance students' problem solving skill on computer virus. An experimental study is adopted to evaluate the new teaching material. The experiment result shows the proposed teaching material based on Ontology concept outperforms the traditional one. Moreover, the research examined the subjects' attitude with the questionnaire "Technology Acceptance" and found out that over 50% of learners considered the teaching material was easy to learn and useful in clarifying their misconceptions as well as helpful to their problem solving skills.

Keywords: Ontology, Computer Virus, Information Discipline, problem solving.

1. INTRODUCTION

With the popularization of personal computer and internet, Computer Virus, which causes the situations, such as shutting down the Operation System, destroying data or documentation, and stealing private data, has been the biggest threat for computer users.

Generally speaking, users usually rely on the commercial antivirus software to solve the virus problem. However, Cohen (1987) pointed out that all commercial antivirus software could not guarantee against all computer virus. The most important thing is to protect computer system's vulnerabilities which are easily invaded or attacked by computer virus. If the computer is infected with computer virus, users should identify the type of computer virus and their existence, in order to make antivirus protection effectively.

The definition of computer virus was a kind of program which can infect other programs by modifying them, and damage the whole information system. Hung & Feng (2010) investigated the importance of different computer virus topics in ICT textbooks and six dimensions were induced. The six dimensions are the definition of computer virus, the categories of computer virus, the characteristics of computer virus, the spread channel of

* Corresponding author. Tel.: 886-4-7232105 ext. 1751 fax: 886-4-7211227.

E-mail address: shc@cc.ncue.edu.tw

computer virus, the damage by computer virus, and the prevention of computer virus, which are shown in Table 1.

Table 1. The means of the six dimensions of evaluative indicators.

Dimensions	Mean
Definition of computer virus	3.85
Characteristics of computer virus	4.01
Category of computer virus	4.07
Spread of computer virus	4.17
Damage of computer virus	3.81
Prevention of computer virus	4.32

As Table 1 shown, the mean of each dimension were all higher than 3. It implies that ICT teachers considered the six dimensions of computer virus should be integrate into information education textbooks. Moreover, the dimension, prevention of computer virus, get the highest score which means that the information teachers considered prevention of computer virus is the most important issue.

Therefore, how to protect computers from virus' attacking and/or to solve computer virus problems have been recognized as an important capability for a computer engineer.

In order to achieve the aforementioned goals, the study proposes an innovative teaching material with an interactive information network security based on the ontology architecture. Students could master the characteristics of computer virus and their related infectious symptoms through the teaching material. Moreover, they can learn how to apply tools to get rid of computer virus instead of depending on commercial antivirus software. This course supported by the innovative teaching material equips students the practical ability to solve the relevant problems, even when they face brand new computer virus in the future.

Ontology represents knowledge as a set of concepts or terminologies, which describe the high-level abstract knowledge or specific knowledge in the organization (Gruber, 1993). Ontology is a shared concept, formal and explicit representation, which describe some concepts with specifications, including the description of concept, association and attribute. Furthermore, the mail concept of Ontology is used to share and reuse knowledge (Lenci, 2001).

Researches confirmed the high accuracy and stability of using Ontology to construct conceptual knowledge (Yang, Cai, Sun, & Li, 2010). Therefore, this study could apply ontology theory to establish the relationship between concept, terminology and vocabulary of virus/antivirus (Swartout & Tate, 1999).

The article is organized as follows. Firstly, the literature reviews and the competence indicators analysis in Information education are introduced. Then, teaching experiment and settings of environment are described. Finally, conclusions and future study are addressed.

2. METHOD

How to teach an ill-structured learning subject (e.g. how to get rid of computer virus) is a challenge to instructors. There are a lot of ways to make your computer infected with computer virus, and the antivirus solutions are not always consistent. Therefore, most students do not know what and how to do and feel frustrated on learning how to diagnose the computer virus according to the symptom and removal of the viruses that infect computer. Consequently, how to transform the ill-structured learning unit into high-structured one is an issue. The well-structured concepts which are created by ontology are believed to provide students a better understanding and to promote their learning effectiveness. The study proposes a teaching material based on the ontology architecture.

2.1. Construct computer virus database with Ontology structure

This paper builds up a virus instructional material to collect the characteristic data of computer virus, which including 5 categories, infects, characteristics, location, how to infect and how to remove. It is defined as following: "Virus database should contain virus-related reference, e.g. the Original place and initial date which the computer virus was found, author, symptom, infects, damage, likely to cased, and provide how to remove it."

The sample data in virus database were collected from the "computer worm" category of Virus Encyclopedia in Trend Micro corporation via online computer. According to virus newness, major computer virus and the completeness of description for computer virus, computer viruses were collected and used in the ontology knowledge structure of the study. The computer viruses are divided into eight categories by the use of prefix. Table 2 shows the categories.

Table 2. Virus classification based on prefix.

Prefix of computer virus name	Computer virus type
WORM	Computer worm
W2KM, W97M	Macro virus
PE, NE	.com or .exe executable file virus
BKDR	Backdoor
TROJ	Trojans horse
BAT	Batch file virus
VBS, JS, HTML	VBScript, JavaScript, and HTML virus
GENERAL	No specific characteristics

2.2. Experiment instruction

As aforementioned, the participants of the study, 80 sophomore students of two classes in Information Department of higher education in Taiwan, were divided into two groups, the experimental group labeled as “OS group” (teaching material organized by Ontology Structure) and the control group labeled as “Traditional group”(traditional teaching material). This instruction was implemented in a one-semester course, Information Technology Network Security, which aims to cultivate students to understand the concept of computer virus and possess practical skill of antivirus protection. The study evaluates and validate the effectiveness of the teaching material by comparing the learning achievements of these two groups including pencil and paper exam (assess the concept of computer virus) and implementing the proposed antivirus teaching material (practical problem-solving skill).

According to aforementioned, our paper proposes a novel teaching material which can help students to acquire the knowledge of computer virus through Ontology framework. According the logical procedure, students could catch the possible solving directions for the virus problem after classifying the characteristics of computer virus and building their schema for solving virus problems in this course.

2.3. Innovative Interactive Ontology Teaching material

This paper proposes an innovative instruction material for students to learn characteristics of computer virus, such as infects, likely to cause and so on in this course. Students can input the characteristics of computer operation or the disease (characteristics) of computer abnormal to inquire related information, and this course will display information of computer virus and calculate the concept similarity of various viral properties that match the searching criteria. Students could identify the relationship between different computer virus to infer the effective solution from the analysis of concept similarity. Concept similarity is acquired by inputting query, and calculated properties of computer virus accounting for a percentage of the overall results.

In order to enhance student's practical problem solving skills on computer virus, an environment for implementation test, including 60 desktop computers, each of which are installed Microsoft Windows XP SP3 OS, Microsoft Office 2003, and a commercial antivirus software (Avira AntiVir Professional) is arranged. These computers have been infected purposely by computer virus of 2011 computer virus package in advance. After computer booting, there are some characteristics of being infected by computer virus, such as website kidnapping, cannot open the task manager, IE browser is replaced, and so on. The instructors assess students' practical problem solving skills according to "two-way specification", such as inspecting whether the computer is infected, removing the computer virus from this computer and so on.

3. RESULTS

As aforementioned, the participants of the study, 86 sophomore students were divided into two groups, "OS group" (45 students) and "Traditional group" (35 students). This study adopts their scores of a basic course, "Introduction to computer", as pre-test, which is a reference to students' prior knowledge. After teaching "the knowledge of computer virus" for three weeks (three hours per week), the students take examinations of knowledge and implementation, and these two scores are used as post-test.

3.1. *t-test analysis on prior knowledge*

In order to understand the difference of prior knowledge on information literacy between these two groups, t-test is adopted to evaluate the scores of these two groups on the course "Introduction to Computer". The pretest result ($t=1.126$, $p=.263 > .05$) revealed that these two groups had similar levels of prior knowledge on the information literacy before proceeding with the experimental instruction.

This means that there is no significant difference between the learning achievement of "Introduction to Computer" of experiment and control groups. Maybe, there is a reason that students from the department of information have the same educational experience and learning experience, which result in the similar background and basic information network security knowledge. Thus, it can be assumed that there is no significant difference in experimental and control groups of IT security knowledge.

3.2. *t-test analysis on concept clarification*

Regarding the effect of OS upon concept clarification, both groups are treated with three weeks of information network security course, and then take a Paper-based examination for measuring the difference of computer virus knowledge between these two groups. The analytical results, revealing there is no significant difference between these two groups of students in post-test of knowledge of computer virus ($t=1.194$, $p=.236 > .05$).

3.3. t-test analysis on enhancing problem solving skill on computer virus.

Regarding the effect of OS upon enhancing problem solving skill on computer virus, both groups take a implementation test for measuring the difference of problem solving skills on computer virus between these two groups after three weeks instruction. The T-test shows that there are significant differences between these two groups in score ($t= 10.561$, $p=.000<.05$). The mean value of experimental group is higher than the score of control group. The students' practical skill of experimental group is better than control group.

4. CONCLUSIONS

This paper proposes an innovative teaching material applying Ontology architecture to develop a teaching material, which constructs the knowledge Ontology of computer virus and reduces the students' misconception of computer virus. The experiment result shows that students could solve the problems of computer virus infected more accurately and quickly, after studying this teaching material, and this proposed knowledge Ontology computer virus could actually increase the effectiveness and efficiency of this innovative teaching material.

Using the solution focused approach in school counselling

İlkay Başak Adıgüzel^a, Muhammed Göktürk^{*a,b}

^aHacettepe University, Economics and Administrative Faculty, Department of Social Work, Ankara 06410, Türkiye

^bSarıç Handicapped Care Center, Nevşehir, Türkiye

Abstract

Schools are social institutions that great deal of children and young people who different socio-economic, cultural background has come together with the aim of education and training. One of the main functions of school is to help children/young people to improve social behaviours that compatible with their personality and environment by interfering the interaction points with their environment. School counsellors (social worker and expert of psychological counselling and guidance) may not provide sufficient and qualified service because of the fact that they have to work with a lot of student in their employment period. Short-termed and more included work is important for cancellers to enhance their functionality in schools. So, it is considered that the solution focused approach may be useful for counsellors and students. In this study, using of the solution focused approach in school counselling will be discussed.

Keywords: Solution Focused Counselling, Solution Focus Approach, School Counselling;

* Corresponding author: Tel: 00903124393340

E-mail address: basakadiguzel@hacettepe.edu.tr

1. Historical Background of Solution Focused Approach

The solution focused counselling which often referred as “brief counselling” is a type of counselling that focuses on present and future rather than on past experiences. It’s the only thing to deal with any desired solutions about the client’ problem. This approach was brought up by Steve de Shazer who is a social worker and Insoo Kim Berg (de Shazer’s wife) and developed by a team including Eve Lipchik, Jim Derks, Elam Nunnally, Don Norum and Marilyn LaCourt in 1970’s (Macdonald, 2007; Lipchik et al. 2012; Bachhaus, 2011). Many aspects of the approach had been used in psychodynamic theories, behaviour therapies, systems theory and so on. The virtue of the approach is the emphasis of solutions (Hoyt, 2008). The solution focused approach has evolved out of brief therapies which focus on change. And the client is the heart of changing process.

Hoyt (2008) and Macdonald (2007) highlight to respects the clients’ resources, abilities and motivation, and are directed toward building solutions rather than increasing insight about one’s situation. Solution focused approach’s core elements are a non-expert stance; an emphasis on the client’s language; the requirement that the number of sessions is kept to the minimum necessary; the value of making changes slowly; and the recognition that the problem and the solution are not connected (Macdonald, 2007). Besides, it’s important to focus on client’s strengths and having the capability to be self-directed at changing (Lehman et al. 2012).

2. Assumptions of Solution Focused Approach

There are some assumptions which solution focused approach based on. It’s necessary to talk about the solution focused approach’s tenets before explain what the assumptions are. Solution focused approach’s have 3 basic tenets.

The first one is “do not fix it if it’s not broken”. Solution focused approach does not look for underlying issues or see the presenting problem as only the tip of the iceberg (O’Connel, 2003; Connie, 2009). The only thing the helper needs to deal with is the defined problem by the client. The second one is “find out what works and keep doing it” (Sklare, 2013). Counselling process gives chances to the client and the helper to know what works. It’s not the best way to focus on failures or the things not working to solve a problem. It’s important to bring the clients realize there are times that the problems do not exist. Encouraging the clients is important in this case. And the last tenet is “if it’s not working, stop doing it and do something different”. According to de Shazer (1994; cited in Quick, 2008) if a client keeps doing the same thing that is not working which is the exact

definition of problem. So it is important to find different ways to achieve the required amendment. These tenets make the intervention process more clear.

There are some assumptions which based on the tenets as mentioned above. According to Quick (2008), Sklare (2013), Lipchik (2011) These are:

- “Every single client is unique
- The clients have strengths and resources to handle with her/his own problems,
- Nothing is just negative. There are times that the problem does not exist,
- Minimal changes bring major changes,
- Talking about solutions rather than problems pave the way,
- There is always two sides of a situation, it depends on where you look from,
- Solution focused counselling may takes a long time,
- Emotions are a part of the problems as well as the solutions,
- Using the client’s words makes the process more understandable for the client,
- The client’s negative definitions should altered with the positive ones,
- Change is inevitable, there is no resistance,
- The past can’t inalterable, so the client should focus on present and future.”

The solutions focused approach was founded on these assumptions. And it’s approved that acting with these assumptions will create better results in the counselling process.

3. Using the Solution Focused Approach in School Setting

Schools are social institutions that great deal of children and young people who different socio-economic, cultural background has come together with the aim of education and training. One of the main functions of

school is to help children/young people to improve social behaviours that compatible with their personality and environment by interfering the interaction points with their environment.

There is wide range of problem in school settings like school violence, bullying, gang activity, interpersonal conflict, failing at the courses, conflict etc. “These settings can be places of solutions, strengths, and successes at the same time. There are numerous practical ways for school-based mental health professionals (school social workers, psychological counselling and guidance specialists, and school psychologists) to harness the solutions that are already happening in their schools” (Kelly et al., 2008). Using this method facilitates the changing process and improves the students’ problem solving skills.

There are a lot of student at schools. It obstructs the possibilities of paying attention of the whole students. Intervention is limited because of lack of time, crowd of students and the other responsibilities which the helper need to carry out etc. Because of these reasons solution focused model is the best way to change the things that not working in limited time period and reach more students.

Self-determination is a basic right of individuals according to social work discipline. This approach looks out for one’ interests. It is important for children and young people to learn live with own choices. This attitude helps clients to take responsibility about their own life.

This model is especially effective for school counselling because it doesn’t require insight. The other point is the model’ focus to conversations which orientate the students to positive behaviours (Sklare, 2013). It can help to enable children to change things (Milner & Bateman, 2011; Sklare, 2013). Starting where the clients are especially important. It keeps the client in present time. By the way behavioural change and problem solving come true easily.

4. Techniques of Solution Focused Approach While Working With Children and Young People

There are several techniques which helper uses while working with children and young people. “The most well-known and popular solution-focused techniques: scaling questions, the past success question, the preferred future question, the platform question, the exception seeking question, reframing, indirect compliments, the miracle question, summarizing in the words of the client, the what-is-better question, normalizing, the usefulness question, the observation question, the perspective change question, the coping question, the continuation question, the prediction suggestion, leapfrogging, and mutualizing“ (Visser, 2011). Some of these techniques are used in other counselling models too. But this model differs from the others with the way of using these

techniques. The difference is the model' focus on solutions. Every one of them be in used for create positive change, strengthen the clients, improve the clients' problem solving skills and bring the clients to today and future. The thing is not the problems that should deal with but the solutions. And these techniques make easier the problem solving process. Especially the facilitating questions. There are some examples about these questions below:

- scaling question: "Please give yourself a point about your situation between 1-10. What should you do to step up one point?"
- the past success question: "Have you ever been able to solve such a problem before?"
- the preferred future question: "How do you want your situation to become?"
- the platform question: "What has helped to bring you to your current position?"
- the exception seeking question: "How did you make that happen?"
- indirect compliments: "Wow, how did you achieve it?"
- the miracle question: "You went home and fall asleep. A miracle happened when you're sleeping and your problem is solved. But you don't know anything about it. How do you realize that your problem is solved when you wake up the next morning?"
- "the what is better "question: "Think about your situation. What is better now?"
- normalizing: "You are disappointed, I understand. It's normal to be disappointed right now."
- the usefulness question: "What was useful?"
- the observation question: "Could you, between now and our next conversation, which things are a bit better?"
- the perspective change question: "How will other people notice things are better?"
- the coping question: "How did you manage to cope before you gave up?"
- the continuation question: "What happens in your situation that you want to continue to have happen?"

- the prediction suggestion: “Each night, before going to bed, predict whether or not you will succeed in
- the overcoming the urge question: “Pay attention to what you do when you overcome the temptation or urge to fall back”
- the optimism question: “What are the small signs you see that indicate you will succeed in?” (Winbolt, 2011; Visser, 2011; Connie, 2011).

These questions make the process clear to create desired change. Asking the solution focused questions as mentioned above teaches the children and young people to build a healthy life.

5. Conclusion

Solution focused approach was developed by a social worker, so it has been using by social workers effectively for decades. It leads both social worker and client to focus solutions and it takes short-time. Because of these reasons this approach is favourable for some helpers including social workers. The thing of this study to

show it's such a useful approach while working with children and young people. People used to speak problematic way not the positive way. It's important to evoke the children and young people that there are times good behaviours occur. Using these techniques and by motivational intervention desired change can come true.

4th International Conference on New Horizons in Education

Us advanced manufacturing skills gap: innovative education solutions

Gale Tenen Spak, Phd *

New Jersey Institute of Technology, 323 Martin Luther King Boulevard, University Heights, Newark, New Jersey 07102, USA

Abstract

US Manufacturing's future lies in educating new generations for skill-intensive manufacturing jobs involving STEM and computing. The paper covers manufacturing from workforce perspectives; educational and other causes for decline, and two educational innovations, chosen for their potential to facilitate US Manufacturing's growth, and with it the US economy: Massive Open Online Courses ("MOOCs") and Stackable Credentials/Credits. Separately and together each could hold a key to lifelong employability at acceptable wage levels for professionals who fill the US manufacturing workforce gap, revealing the gap, at its heart, to be one in education, which the innovations discussed here, could help alleviate.

Keywords: US manufacturing skill gap, higher education, massive open online course, MOOC, stackable credentials and credits advanced manufacturing workforce, MOOCs, stackable credentials, stackable credits

1. Introduction

Innovations in education are numerous today, but because this paper focuses on the nexus between educational innovations and the US advanced manufacturing workforce, only two will be discussed in detail. Even so, with so many innovations in education occurring rapidly, the potential exists for higher education to tackle not only some of its own real problems, such as affordability, but at the same time to reinforce education's real-world applicability to tackle larger plagues beyond the ivory tower's walls including that of a workforce shortage in one specific industry (Carlson and Blumenstyk, 2012).

2. What is advanced manufacturing?

When Americans think of manufacturing, the usual conjured images are "stuff"--large and small--and "dirty" factory floors where menial and dead-end jobs are performed. The specific "stuff" being made is ever-changing and includes foods, textiles, chemicals, drugs, devices, equipment, machinery, and small and large widgets or gizmos of all sorts. However today, the materials, components and systems by which "stuff" gets produced have changed dramatically and in ways in which the "dirty factory floors" of the past decidedly play no part.

The term, “Advanced Manufacturing,” is used to describe this transformation and refers to “stuff” whose creation requires higher degrees of technical competence, leveraging of new technologies and implementation of processes often entirely computer-based. Better known commercialized examples include precision machining with computerized numerical control interfaces, mechatronics (i.e. combinations of mechanical, electrical and information technology elements), and process technologies (e.g. batch processing of drugs, food, glass). In the *Ensuring Leadership in Advanced Manufacturing* (2011) report to President Barack Obama, future new technologies involve advanced sensing, measurement and process control; advanced materials design (e.g.; metals, coatings, ceramics); information technologies including visualization; energy efficient processing; and nanotechnology. These efforts will one day permit “stuff” to be made on a large scale by robots, artificial intelligence machines, and 3-D printing. The workforce leading the research and development activities clearly are well-educated professionals with bachelors, masters and doctoral degrees from the disciplines of Engineering, Science and Mathematics. The execution of their work is not done on a “dirty factory floor.”

These three academic disciplines represent three-fourths of the academic disciplines in the term, “STEM,” which is an acronym for Science, Technology, Engineering and Math. Indeed, STEM has become a familiar term within American higher education. Educators have heard the clarion calls from a multitude of voices, including President Obama, pressing for a more plentiful STEM-adept citizenry who are needed to meet the challenges of the evolving global economy and most certainly to resuscitate a depleted US manufacturing base. Yet as this call gets answered and the sector blossoms, Schwartz (2013) predicts that there be no equally dramatic boom in the number of workers needed to support it. That is, never again will as many people be needed on factory floors—“dirty or not”—as once was true. Already, the sector has added 500,000 jobs since the recession in the US economy ended and the value of what the nation’s factories produce is close to as high as it once was, but there are still 2,000,000 fewer manufacturing workers today than in 2007. Nearly all of the American manufacturers that survived the lean years did so by remaking themselves into globally competitive companies that depend on high productivity and advanced technologies for their success more than on hordes of assembly line workers. Manufacturing’s future requires fewer people for operations and execution, but each employee will need to possess higher skill and knowledge than ever before. Without deliberate and proactive educational changes, there will not be enough such employees in America to help resuscitate the sector.

Among the multiple of different manufacturing jobs and job categories, there is one category which, relatively speaking and in the conceivable future, continues to afford the largest number of employment opportunities. That category includes jobs requiring skills that align the best with the academic discipline represented by the letter “T” for Technology in the STEM acronym. That is, most small-, mid-, and large-sized manufacturing companies have substantially more jobs in production than engineering. While the large-sized manufacturers will always have pressing needs for more engineers and scientists; the small- and mid-sized companies, which dominate the scene of the American manufacturing base today, are currently facing even more severe shortages of appropriately-educated technologists. Without the human capital or talent of technologists to operate the machines and equipment on which “stuff” is made, manufacturing companies are not able to keep their businesses open. This dilemma is the focus of this paper.

2.1. Status of US manufacturing today

Timmons, Gold and McNelly’s *Facts about US Manufacturing*, 9th Edition (2012), presents the most up-to-date compendium of data on the industry sector, based on the combined expertise of the National Association of

Manufacturers (NAM) with contributions from the Manufacturing Institute and Manufacturers Alliance for Productivity and Innovation. NAM is the preeminent US association of manufacturing companies as well as the nation's largest industrial trade association, representing 11,000 small and large manufacturers in every industrial sector and in all 50 states. The latest publication finds that, "The manufacturing sector in the United States has been in the spotlight more over the past couple of years than at any point in the past half-century [because] it has been one of the lone bright spots in a lengthy economic recovery....No sector creates more economic value or supports more additional jobs than manufacturing." Specifically, they find that for every one person employed in a manufacturing firm, five jobs are created in other sectors (e.g.; supply chain providers). Yet data reveal that the status of the American manufacturing base has fallen on difficult times. According to the edition, among myriad reasons for why are that it is 20% more expensive to manufacture in the US than among the country's major trading partners, excluding the cost of labor, but including the cost to comply with regulations, legal suites, employee benefits, corporate taxes and energy costs; and that this causes manufacturers to move their operations offshore in search of cheaper labor.

The edition's data further reveal that today the US is the third largest exporter of manufactured goods, after the European Union and China, with American goods going to 238 Countries, including 14% to the EuroZone. But warning flags of position decline abound. Two prominent reasons are: (1) the documented low wages paid to the remaining workforce especially in the small and mid-sized firms, which to survive, continue to operate in facilities bearing semblance to the "dirty factory floors" of the past; and (2) the denial of entry into the middle class due to these worker's low wages. A middle class lifestyle was once possible for workers but no longer is for those who lack the required higher "T-related knowledge. Moreover, as these reasons' by-products, youngsters are not being attracted to enter this field, leaving a workforce which is older and less educated versus all other US industry sectors. According to Timmons et al (2012), 82% of manufacturers report a moderate or serious shortage in skilled production workers; 75% say the skill shortage has negatively impacted their ability to expand; and 600,000 jobs in manufacturing are unfilled today because employers can't find workers with the right skills. In various surveys captured by the *America's Skill Gap info-graphic* (2011), few Americans are choosing manufacturing education and careers today. Among 18-24 year olds, 52% have little or no interest in a manufacturing career and 61% would rather pursue a "professional" career. Moreover, 86% of Americans believe tradespeople are important to the nation's economic prosperity and 85% to the standard of living, but only for so long as they themselves are not the ones working those jobs. Then only 1 out of 3 parents agrees to the efficacy of encouraging their own children to work in a trade.

There appears to be little realization that today's manufacturers must have tradespeople and technologists (i.e. the "T" in STEM) who possess different skills including e.g.; computing, and not just highly educated people who have spent significant numbers of years in school acquiring sophisticated knowledge in the three other letters in the STEM acronym. This fact alone prompts new accentuation on a deficiency to be overcome in the American educational system. Traditionally skill gap replenishment occurs in US high schools and vocational schools which issue diplomas; two-year colleges which educate and train and issue both associate degrees and certificates; and four-year colleges which award bachelor's and higher degrees in all STEM areas. In this context, and based on the status of US manufacturing today, high schools and 2-year colleges have not yet succeeded in making significant strides to produce a sufficient supply of technologists, and America's 4-year institutions have not yet committed to according the "T" in the STEM acronym the same status given to the science, engineering and mathematics letters.

3. Two educational innovations for US manufacturing workforce development

This is where innovations in education can and are coming into play. These innovations open the door for new ways for higher level STEM skills to be taught in scalable and engaging ways to youngsters in school and to older workers who require up-skilling to keep and qualify for jobs in advanced manufacturing. The overall number of “T”-adept workers may be smaller than in the past, but the overall importance of educating them for the industry has increased in magnitude as never before to combat the fact that there simply are not enough Americans—young or old—equipped with the required education to help rebuild America’s advanced manufacturing production base. At its heart, this is the situation which provides the nexus to educational innovations and makes them key to any solution attuned to addressing this challenge.

Two educational innovations stand out for their relevance to this problem: (1) Massive Open Online Courses (MOOCs) and (2) Stackable Credentials / Credits, referred to below as “Stackables.” The later has become a focus of US manufacturers and the former of educational innovators. Generally academics approach innovations in the art and skill of pedagogy by beginning with what is already known. But in many ways, MOOCs are not like any structures that are known. MOOCs, for example, are neither like “traditional lecture courses nor traditional distance learning models. The “massive” component changes every aspect” (Heard, 2013).

3.1 MOOCs: What are they?

Wikipedia (2013) defines MOOCs as aggregate classes from multiple organizations offered on a single computer platform. The courses are free (for now) and largely non-credit, but this is changing. The term connotes Open Access (in that learners do not have to be registered at any particular college to enroll), cost nothing and is scalable. Scalability in MOOC terminology means that one teacher is responsible for hundreds of thousands of students. Because of the massiveness of enrollees/course, MOOCs typically have two approaches to instructional design: (1) peer-review, group collaborations through “crowd-sourcing” or (2) online automatic feedback and self-assessments (Kop, 2011). In most cases, MOOC-takers watch short videos which are graded either by computers or by other students. How else would it be possible for one teacher to support a class with so many students?

In its *What You Need to Know about MOOCs (2013)*, The Chronicle of Higher Education editors use multiple sources to compile details of the four predominant higher education US MOOC providers: (1) edX is a non-profit firm started with \$60-million contributed by MIT and Harvard University. So far, it works only with elite US universities (33+) and their faculties and it provides its contractually partnering elite schools with an open source (free) MOOC-supporting platform, placing significant focus on improving the art of pedagogy through “big data analysis” to gain new insights and reveal trends on massive numbers of student learning styles; (2) Coursera is a for-profit venture created by two former Stanford University professors (Ng and Knoller) with venture capital backing. It, too, so far, works only with elite universities (~62) and their faculties, providing, for a charge to partners, a MOOC-supporting proprietary platform while experimenting with a number of additional revenue streams such as charging for licensing, certification / testing and providing hiring managers with lists of promising MOOC-takers; (3) Udacity is a for-profit venture with venture capital funding which was created by another former Stanford University professor (Thrun). It works with computer science academics but does so outside their college contracts. Similar to Coursera’s approach, it is searching for a revenue stream particularly from companies (N=350) which are participating in its “jobs program;” and (4) Udemy is a for-profit company

which works directly both with academic and non-academic experts who develop MOOCs on topics chosen by the expert versus by Udemy. It too provides a proprietary supporting platform which is not free to the student, who pays a fee established by the MOOC expert who then shares it with Udemy. Other MOOC providers, such as the Khan Academy, serve youngsters in pre-college grades.

Even though each MOOC provider has a slightly different financial model, the question of MOOC's overall sustainability as an educational innovation with "legs" may be dependent on whether or not any provider can survive. None has approached profitability yet. Levin (2013) reports that industry insiders believe it may take a 10-year gestation period before revenue streams are sufficient to support funder's investment and entrepreneur's sweat equity. This reality is not deterring venture capitalists from viewing MOOCs as a promising new investment opportunity with Boxall (2012) and Davidson (2013) predicting that MOOCs represent \$100-billion and \$1-trillion opportunities, respectively. Indeed there is reason for this optimism when the number of MOOC enrollments is taken into account.

Keeping track of even reasonably precise numbers of MOOC-takers and their backgrounds is no easy task. According to Dennis (2012) in autumn, 36% of edX's users possessed an undergraduate degree; 2.8%, a master's; and 6% a PhD, with the remaining 30% either in high school or college. By January, he (2013) reports that more than 2 million students signed up with MOOC providers of which 525,000 enrolled for edX courses and 460,000 with Udacity; and in April, Rivard (2013) finds that of Coursera's 200 courses, 3.2 million had registered from 196 countries of which two-thirds live outside the US. Moreover the student experience, as thus far assessed, has been positive. Of the 80% surveyed by edX in Fall 2012, two-thirds said that it was better than taking a similar course in a classroom, only 1% said it was worse. Of special note, however, completion rates are dismal (Dennis, 2012). A survey conducted by Stanford University, when Udacity's founder was still on the faculty teaching his own MOOC class, reveals that only 10% completed it (Marca, 2012); and Parr (2013) reports completion rates of only 7% from students enrolled in 29 different MOOCs. Yet, the trend towards MOOC adoption is proceeding with unparalleled speed among faculty at elite US schools with the later occurring because, at present, only this category has been invited to become part of the major MOOC firms (Rivard, 2013). According to Kolowich, (2013) based on survey results, the motivating factors fueling their support include: (a) an altruistic bent to increase access to higher education worldwide, (b) not wanting to be left behind or being forced into using online techniques, regardless if the emergent technique takes a different form than a MOOC over time, and (c) a desire to increase their personal visibility broadly in academe.

Of course, not all traditional academics are on board and many serious, as yet unanswered, concerns remain. When 2,800 chief academic officers were asked their views of MOOCs from a number of different perspectives, Allen and Babson (2013) find that only 2.6% currently have MOOCs with another 9.4% are in the planning stages; 55.4% report they are still undecided about MOOCs while 32.7% are not planning for MOOCs at all. Also, only a slight majority (57%) of the academic administrators subscribed to the belief that MOOCs hold the potential to attract students to their schools. Even technology-minded educational innovators, who otherwise have shown support, express reservations based on MOOCs use of the rather "tried and true" technology of videos made by participating faculty along with PowerPoint information. This relates to their more serious dismay with MOOCs' inherently limited possibility for meaningful interactions with students (Rivard, March and April, 2013). Closely related to this later point and perhaps the most serious concern of all is MOOC's potential for deepening social class disparities and inequities. The worry here is that over time only students who are able to afford to attend elite universities will enjoy education from on-ground faculty, whereas learners who are

economically less fortunate could receive inferior educational experiences due to being taught through MOOCs which offer constrained and limited chances for meaningful interaction with professors (Xu and Jaggars, 2013, and Rivard, 2013). Another issue is whether the “Open” word in the MOOC label perhaps is misleading. In one sense it is appropriately used in that MOOCs can be taken by students for no cost, but as a paragon for the Open Source movement, “open” is a misnomer. For-profit MOOC companies are creating new software platforms to support not just MOOC courses but hundreds of thousands of students worldwide. These sophisticated platforms are proprietary software. A faculty member and indeed a student engaging with that faculty’s MOOC which is being hosted on one of these platforms does not have the ability to reuse, remix and repurpose any of the content. For any faculty member teaching a subject aligned with the MOOC’s, that person cannot “just take somebody’s lecture notes, add a few paragraphs and distribute them further as part of [his/her] course” (Morozov, 2013). The non-authoring faculty’s ability to do all of this would get closer to what is meant by “openness” in Open Source movement today and is absent from MOOCs.

With so many unknowns about the future of MOOCs, Mittell (2013) finds it helpful to borrow what has turned out to be a lasting metaphor developed by Emanuel “Manny” Farber to understand a different pressing issue of over 50 years ago. Farber was an American painter, film critic and writer who died in 2008 and who had a great influence on later generations of film critics. Once described by Susan Sontag as “the liveliest, smartest, most original film critic this country has ever produced,” in 1962 Farber developed a metaphor to contrast “white elephant art” with “termite art,” and to expound on the virtues of later and the excesses of former. Termite art for him were the B films and under-appreciated auteurs, which he felt were able, termite-like, to burrow into a topic. Of white elephant films, Farber calls them “bloated, pretentious, white elephants [... which] lack the economy of expression found in the greatest works of termite art” (Farber, 1998). Adapting the metaphor to MOOCs, Mittell (2013), an academic (and film critic himself), contends that today’s venture capitalists and entrepreneurial-inclined academics have become so taken with MOOCs because of their “white elephant” aspects. “They’re easy to describe, fit within broader logics of commerce and reform, and since everyone else notices them, [including mass media thought leaders], it’s hard not to talk about them.” Expressing a sentiment likely shared by many academics, Mittell explains that he is always more interested in the termites that change systems through incremental steps and measured reforms; and by analogy, he suggests that educators and thought leaders who are intrigued by, but not yet committed to, MOOCs might delve into the their “termite” aspects. Over time, their analyses could help to transform the general mass media of MOOC hype into a more reasoned and truly transformative 21st century educational innovation.

Despite it all, there are two striking benefits associated with the MOOC movement that could have great moment: can this be one way to make US higher education more affordable, which has become a major plague to the sector today; and, of special interest here, can MOOCs benefit the global economy by helping students and workers become lifelong learners through a new means not yet embraced by traditional educational providers? About the later, those about to enter the workforce and those already in it have begun to realize that they must constantly keep learning if they expect to be able to sustain lifelong employability and earn a family-sustaining income. What better way to stay at the cutting edge than from by attending a free MOOC created by world-renowned professors?

3.2 How MOOCs relate to the manufacturing industry sector

Thus far, MOOCs, as an educational innovation, have not been developed specifically to help ameliorate the decline in the US manufacturing workforce. Yet, *with proactivity and deliberate intent*, this could change. Already, without forethought to such a purpose, this is happening. That is, MOOCs exist today on some of the very topics which advanced manufacturers (and others) say they need their workers to know. These include Algebra and Pre-calculus, Bioelectricity, Calculus, and Electric Circuits. Moreover, due to a different MOOC-related development, these very MOOC classes are now being accepted for academic credit in reputable US colleges.

To wit, recently the American Council of Education (ACE), which represents over 2000 US degree-granting institutions, has endorsed five MOOCs, developed by faculty from top-tier colleges which are among Coursera and Udacity's partners. Included among the endorsed MOOCs are the very ones identified above. ACE's network of colleges permits these colleges to accept ACE's recommendations as transfer credits at their schools. Thus students at these colleges can be granted credit for completing, essentially for free, MOOC courses as part of their degree program. Similarly, Levin (2013) reports the University of Texas system, comprised of 15 Texas colleges, will award credit for some MOOCs from edX starting in autumn 2013. And, according to Rivard (2013), along the same lines, University of Toronto (Canada) has integrated Coursera MOOCs, each of which has sizable video portions, into the curriculum of two established university classes. The MOOCs constitute the "lecture" portion of the Toronto's classes, leaving the Toronto professors with class time to engage their on-the-ground students in lively discussions, exercises, and hands-on experiences. In addition, as reported by Levin (2013) and Rivard (2013), lawmakers both in California and Florida have put forward legislation which would force public colleges and universities under some circumstances to award credit for work done by students in online programs such as MOOCs which were created by entities unaffiliated with their colleges. Time will tell if this particular aspect of the MOOC innovation will work its way through these state's political process, but even if it does succeed there, the idea has been planted nationally. And time also will tell if the MOOC revolution can be used *with deliberate intention* to train the massive numbers of individuals needed to bring the advanced manufacturing workforce base back up to what the industry requires for ever again becoming a key driver of US economic prosperity.

4. Stackable credentials/credits

Identified by the term, "Stackable Credentials," increasingly global industry sectors including US manufacturers are looking to hire individuals with specific and higher level certifiable skills versus high school diplomas or collegiate degrees. While confusion exists concerning the difference between industry-certifications and certificates (and the term is interchangeably used here), one useful rubric is "that certificates are earned through seat time in a classroom [or online]" and industry-based certifications are awarded based on performance on a test, irrespective of where the learning occurs and whether a college offers it (Bosworth and Frugoli, 2013).

According to Austin, Mellow, Roslin and Seltzer (2012), a career-enhancing Stackable Credential is a system with the following six attributes: (1) industry-recognized--industry experts vs educators have verified that the desired learning objectives are being taught; (2) stackable--one credential builds on another sequentially; (3) portable--the achievement is recognized beyond one employer; (4) quality controlled by an outside entity--a employer therefore can have confidence that a certificate-holder really has learned the job's requisite knowledge;

(5) labor market value--the skills taught reflect those in-demand by businesses as validated by reliable metrics such as the number of employer job postings; and (6) are part of a **career** pathway system--there are clear education, training strategies, mechanisms and supports for individual learners *to move from the acquisition of core skills and credentials to higher levels of employment*.

This system is particularly germane for addressing the previously described pressing need by US manufacturers to find workers to fill vacant jobs who possess the knowledge and skills associated with the letter “T” for Technology in the STEM acronym. Today, American workers can become adept in “T” through manufacturing-specific certifications; and, by so doing, are becoming hired. However, because the salaries they earn typically are not high (see above), their automatic entry into the US middle class is no longer ensured as it once was. In light of this, the taxonomy of Austin et al benefits from a refinement which includes a seventh (7th) attribute that uses traditional higher education as the means to enable workers to earn family-sustaining salaries in manufacturing. The new or 7th attribute is acceptance of the credential by US colleges for academic credit in their curricula leading to degrees. According to US Bureau of Labor Standards data (2013), education pays in terms of salary. In a sense, attribute #7 addresses the needs of the employee as an individual learner rather than the needs of the employer for more certified workers. It is an **educational** pathway that focuses on the **individual learner** who can acquire not only industry-certified skills but also the imprimatur of a collegiate degree and, with it, the potential for sophisticated and broader thought processes and understanding of complex problems. That is, today the acquisition of an academic degree relates more directly to the personal and economic best interests of the individual than it automatically does to that of manufacturers, whose needs could be met with employees who stop at the sixth attribute above without continuing their formal education. And because the word, “credits,” increasingly is being appended to the Stackable Credentials term (as in “Stackable Credentials/Credits”), this educational innovation is referred simply as “Stackables” here.

The US manufacturing sector is an industry sector closely associated with Stackables; and, led by NAM, currently has a viable Stackables system (e.g. attributes #1-7) underway to help populate unfilled manufacturing jobs with men and women who at once are earning successively more difficult, credible, and industry-vetted manufacturing certifications and are being afforded the opportunity to go beyond technical skill mastery to acquire academic credits which count towards degrees but are based both on industry-supported training certifications and on actual enrollment in college classes.

As described above, NAM is the preeminent US association of manufacturing companies. Premier among its initiatives stands the *NAM-Endorsed Manufacturing Skills System of Stackables* designed specifically to close the growing skills gap with a system of 52 different nationally portable, industry-recognized credentials which validate both the “book smarts” and the “street smarts” that are needed to be productive and successful particularly in entry level positions in different manufacturing environments. According to Bosworth and Frugoli (2013), indeed NAM’s system represents a blended model of higher education where the manufacturing industry itself takes the lead on defining the standards for competency-based knowledge, and does this in partnership with colleges which, because they are willing to award academic credit for the industry-certified learning, offers students a pathway to acquire an academic degree and eventually higher wages. The NAM System is currently being deployed in community colleges across the country with the first pilots done in Ohio, North Carolina, Texas, and Washington and the stage is being set for the system’s deployment in all 50 states (Austin, 2012).

The system's potential is illustrated at Harper College, a 2-year school in Illinois, where there are 80,000 unfilled manufacturing jobs (Fain, 2012). Harper launched its version of the system in June 2012. In their iteration, students earn successively higher levels of entry-level manufacturing industry-endorsed certificates based on several relevant NAM credentials. More than 50 companies have agreed to hire these students as paid interns as soon as they complete the first level of certification achievable in 4 months and worth 16 Harper College academic credits. Satisfied just with their entry-level internships, some students can see a pathway to progress in their manufacturing careers without further study, but others realize that overtime they can benefit the most from continuing on the concurrent pathway which Harper has created for them which leads both to more advanced certifications and academic degrees. While, as discussed above, manufacturing may be a "tough sell" as a career option to students today, the allure of a paid internship certainly helps. Moreover, derived from different certifications among the 52 in NAM's system, Harper has developed other programs for mechatronics / automation, precision machining, metal fabrication and supply chain management jobs, with each Stackable yielding the appropriate and varying numbers of academic credits. Further layers of the "stack" permit the student to work and concurrently go on in their education. That is, students can earn a manufacturing-oriented 2-year Associate of Applied Science degree or transfer to a four-year college to pursue a Bachelor's degree before or after Associate award. As Soares (2012), a senior fellow at the Center for American Progress observes, this hybrid approach, with both employers and colleges at the table, is a promising way to "bridge the worlds of workplace competencies and postsecondary education".

Roadblocks remain to the emergence of this innovative system in the US including, for example, local versus state versus federal government control of secondary level education and a multitude of stakeholders with sometimes competing agendas whose vested interests often lead to preserving the status quo within the education community (Austin, Mellow, Roslin and Seltzer, 2012). Nevertheless the US Departments of Education and of Labor have begun to take important steps to support stackable credentials and career pathways in general, and, particularly with NAM's strong advocacy, for the US manufacturing workforce base.

5. MOOCs versus stackables: Is one or the other or both necessary to rebuild the US manufacturing workforce?

While there is a relationship as shown between MOOCs and Stackables, both separately and together can help to meet the challenge of a depleted US manufacturing workforce base despite the fact that, as change agents, MOOCs and Stackables represent different "units" of educational innovation. That is, MOOCs are about a specific way in which a topic of learning is delivered to students; and Stackables are about a new career integrated system or pathway. That is, MOOCs method of delivering learning is online using a specific pedagogy appropriate to educating thousands at a time; whereas the Stackables' system is one that requires an effective mechanism for collaboration and coordination among institutions of higher education, industry and government. The Stackables system itself has many layers of which only one is concerned with the way content or learning is delivered and although MOOCs may be one of these ways, there are many others (e.g. on-ground instruction). Put another way, MOOCs may become a significant way for learners to acquire manufacturing-related skills and knowledge in the future regardless of whether or not Stackables become accepted practice. But in contrast, should the Stackables pathway become commonplace in the manufacturing sectors, then MOOCs, while involved, will not be that innovation's prominent or even its most defining characteristic. Finally, right now MOOCs are not deliberately focused on any manufacturing related topic or the industry sector itself although with deliberate intent, they could be; whereas Stackables have had impressive success specifically for

the advanced manufacturing sector. Yet two commonalities cement MOOCs and Stackables together. Each holds relevance unlike anything seen before to ameliorating a major US workforce gap; and each in its own way offers students a new means to obtain academic credit leading ultimately to collegiate degrees and by so doing may lead to a deeper, more symbiotic relationship among employers, colleges, national economies and individual income levels.

6. Conclusion

This paper has sought to reveal that the recognized manufacturing skill gap in the United States, at its heart, is a gap in education, which two educational innovations could help alleviate. As educational innovation after innovation unfolds today, it is entirely possible that at some point and as a cautionary note, the world might witness a value shift. Right now, acquisition of a traditional college degree is at the top rung of career ladder success often equated to higher personal income. In the future, because of innovations such as MOOCs and Stackables, citizens with well-suited and advanced knowledge and skills could emerge who reach the peaks of career achievement by climbing an equally respectable ladder but whose last rung no longer is just the heralded academic degree awarded by the traditional higher education establishment. No doubt traditional and innovative educators would still be required, but how and where they do their work might be changing, especially if the efforts now afoot in the United States to re-create an appropriately skilled and adept workforce for the advanced manufacturing industry sector prove successful.

Values orientation approach to the educational process: The temporal dimension

Marite Kravale- Paulina ^{a*}, Dzintra Iliško ^b, Eridiana Olehnovica ^c

^b Daugavpils University, Parades 1-415, Daugavpils, LV5400, Latvia

^c Daugavpils University, Parades 1-415, Daugavpils, LV5400, Latvia

Abstract

Substantial changes in the Latvian education system have meant a shift from the traditional to the humanistic paradigm. This fundamental transformation notwithstanding, the learner's experience still tends to be undervalued, hence the need to re-examine the value placed on an individual learner in the context of sustainable development. The present article aims to reflect on university students' views about their core life values from a temporal perspective. This qualitative study draws on content analysis of fifty-six essays on the perception of family by bachelor programme students in a regional university of Latvia. Insights from these data are supported by findings from focus group interviews with full-time students taking the courses "Family Pedagogy" and "Social Pedagogy" (N=111). The conclusions highlight the importance of evaluating each learner's knowledge, skills and experience which transforms into self-experience and ultimately enables individuals to set more sustainable aims for their own learning.

Keywords: Sustainability of values; students' view; self-experience; the value approach

1. Theoretical background

The modern-day reality demands flexibility and ability to adjust to the requirements dictated by the market society. It is also essential to understand oneself and to evaluate one's experience in order to become a successful professional. The educational process and its organization at university are always a challenge. Graduates ultimately become key players in the labor market. At tertiary level, the educational process ought to cater for and enhance each learner's abilities, wishes and values. There is an urgent need to re-evaluate the educational process at universities and allow more space for each learner to appraise his or her own unique experience and values. In this regard, Vedin (2011) advocates a challenging subject matter as both didactically and psychologically expedient.

In addition, Vedin (2011) points to a significance of the individualization process at university, that is, the individualization of the educational process to take into account the needs of each learner. Thus, individualization emerges as a way of organizing the teaching and learning process that caters for learners' individual differences in terms of perception, cognitive and mnemonic preferences and character. Moreover, since change is ubiquitous in the modern world, university studies should engage learners in its evaluation in a sense of seeking value and determining the orientation of the latter.

Rohweder and Virtanen's (2009) model of learning for sustainable development confirms the critical importance of shaping the educational process at university in a sustainable way. In this regard, Rohweder and

E-mail address: marite.kravale@du.lv

Virtanen (2009) emphasize three factors: context, mental aspects and activities as well as underscore re-evaluation of values in terms of temporality as fundamental for sustainability.

Comparison of traditional and humanistic approaches allows for evaluating current changes in education. We are witnessing a shift from subordination to interrelatedness, from monologue to dialogue, from coercion to co-existence in interrelatedness, from control to freedom of choice (Vedins, 2011). A key element of the teaching and learning process is learners' experience which can be interpreted as an amalgamation of knowledge, skills and attitudes derived from personal habit, social convention and national tradition that is being passed from generation to generation (Šteinberga, 2011). Yet, what matters most is self-experience – the knowledge, skills and attitudes that an individual acquires throughout his or her lifetime and appraises and internalizes as personally significant values. Questioning is an indicator which suggests that experience is transforming into self-experience (Šteinberga, 2011).

The above-outlined discussion boils down to a conclusion: the teaching and learning process at university should be evaluative in a sense of accepting the learner as a benchmark and nurturing his or her ability to envision and evaluate sustainable futures.

2. Consistency of values across generations

Transmission of values from one generation to another involves young people's willing acceptance of certain values as personally significant. Voluntarily accepted and internalized values allow for self-regulation of the young. Transmission of family values should be seen as a two-way process: firstly, the child's perception of his or her parent's values and, secondly, acceptance, or rejection thereof (Knafo & Schwartz, 2009). Intrinsic motivation to accept parental values is no longer perceived as a threat to young people's autonomy. Soenens and colleagues (2007) emphasize that parents who support their children's perspective, provide more choice options and freedom and allow their offsprings to act upon their personal values can establish more sincere relations in the family.

In 2013, having received a commission from the Ministry of Education and Science, Excolo Latvia Ltd. conducted a study about the possibilities, abilities and attitudes of youth. The said research reveals that youth consider as significant such values as family and career. In a future perspective, they place major importance on balancing the values of work and family, because youth expectations in both spheres are very high (IZM, 2013). Curiously enough, marital life is not mentioned as a significant value; rather, the research participants tend to prioritize informal partnership (IZM, 2013). In the long run, the findings from this study might contribute to the debate about the growth of non-registered families (IZM, 2013).

The present study explores the content of values in the temporal context. In terms of philosophical underpinnings, it draws on psychoanalytical humanism and rests on an assumption that love is among the most significant family values to be considered. Love includes basic elements such as care, responsibility, respect and knowledge (Fromms, 2009). Hence, the teaching and learning process at university should give students opportunities to analyze different problem situations, determine the values that underpin them and appraise these values in terms of orientation and temporality, keeping in mind that love is the supreme value and the very essence of humaneness.

3. Research methodology

3.1. Socio-demographic information about the respondents

The total of one hundred and eleven (N=111) second- and third-year Bachelor program students took part in this study, including 42 males and 69 females. The participants' age ranges from 21 to 25. As an assignment in the study course "Social pedagogy," the students were asked to write an essay about family values. Afterwards, they were encouraged to pinpoint key family values and appraise them in terms of temporality (past, present and

future). Finally, the students were invited to participate in a focus group interview which enabled them to re-examine the content and orientation of their values.

The research was conducted in 2012/2013.

The participants were questioned for personal details such as gender, age, education, professional occupation and family characteristics. They were then invited to write down and rank ten most significant values that dominate their values systems and ten values that they would want to take as cornerstones for building their own families. During subsequent focus group interviews the research participants were encouraged to share their opinion and discuss how they internalize family values as well as which they consider as the most significant values for building their own families and bringing up their own children. The ultimate purpose was to identify consistencies in the transmission of family values.

Thus, the emphases of this study were, first, how Bachelor students formulate the values systems that they live by at present and, secondly, which values they consider as most significant underpinnings for their family life in the future. The focus is on how the values of their parents affect the students' moral development and which values prevail over time.

3.2. Research methods

The study aims to explore how university students view family values and which are the most essential values that prevail over time. The study rests on the following research methods: essay, survey and focus group interviews.

Essay may be defined as a relatively brief piece of creative writing that allows the author to express his or her views and demonstrate a subjective attitude towards an issue of concern. The students were asked to write down their opinions about the values they believe to have inherited from their families. Subsequent analysis of the essays was focused on uncovering the core values which the students have inherited from their families and to pinpoint the values which the students want to build their own families around.

Survey. The students were asked to write down ten basic values on a time line: past, present and future. This allowed for identifying recurrent values and establishing whether the students consider those as important.

Focus group interview. This article draws on data from six focus group interviews about the values that students consider sustainable. The students were interviewed in six groups with average interview duration of one and a half hours. The findings from the focus group interviews are expressed in thesis statements.

3.3. Limitations of the study

The sample size and nature preclude abstract generalization. Making more definitive conclusions warrants extensive further research, such as longitudinal studies or in-depth interviews to gain a more profound understanding of the values transmission processes in the families of young people from self-reported data. In addition, subsequent investigations could not only rely on self-reported data but also make use of some graphic research instruments.

4. Research findings

The data suggest that the students, family experience notwithstanding, name only positive values, such as ability to admire and be proud, ability to find joy in one's life, ability to keep secrets and ability to be diligent. Analysis of the 2553 values named by the students allowed for grouping them in several categories, thereby reducing the number of values to 251. The analysis of values in terms of temporality reveals 89 values inherited from parents, 94 values describing current family values and 68 future-oriented values. The analysis of the

content of values points to the social, cultural and environmental aspects of the latter. The economic aspect was not mentioned in self-reported data gained from the students.

According to Schwartz (1992), the more imbedded an individual's set of values is, the least likely he/she is to experience a conflict between opposing values; the more unstable one's value system, the more possibility for a clash of values.

Key findings from essay and survey data, summarized in Tables 1 and 2, suggest that the students highlight such values as support, diligence, kindness, faith, gratitude, listening, independence and love of work. All these values appear in the contexts of past and present but are conspicuously absent from the research participants' visions of the future. It may be that they are taken for granted, seen as givens in the present but with no relevance to the future. It appears that these values are perceived by the students as meaningful only for appraisals of the present and past experiences.

Another curious tendency in the data pool concerns the values for the future (Table 2), such as culture of work, autonomy, flexibility, future-oriented vision and real rather than virtual society. These values appear to lack the dimensions of past and present. The data evoke reflection about the students' visions of the future and its inherent challenges. For instance, culture of work and flexibility are also acknowledged as values for the present. This may stem from the specifics of the students' perception of time – for them the future does not begin tomorrow but at a more distant point of graduation or taking the first steps in one's profession.

Table 1. Temporality of values: The past and the present

	Values of the past and present	Values of the future
Personal/Cultural aspect	Support, diligence, kindness, hope	x – not mentioned
Social aspect	Sharing with others, ability to listen	
Environmental aspect	Independence, love of work	

The data suggest a number of values that appear relevant only with regards to the future.

Table 2. Temporality of values: The future

	Values of the future	Values of the past and present
Personal/Cultural aspect	Respect of the individual. Culture of work. Freedom of action. Independence	x – not mentioned
Social aspect	Flexibility. Future-oriented thinking. Courage	
Environmental aspect	Real society	

Analysis of the content of values in the temporal perspective suggests there are two distinct values in the survey data, namely, respect of a human being and patriotism. These values are mentioned as existent in the past and as desirable in the future, though not referred to in descriptions of the present state of affairs. This tendency warrants a more profound exploration than was possible during focus group interviews.

Allusions to sustainability imply it is a dominant value in the students' values orientations. In their questionnaires, the students report such values as love, respect, responsibility and health, which, essentially, can be considered fundamental values. These values can be seen as universal and eternal. Through socialization in their families, the students have developed their own attitudes and systems of values. Nevertheless, one cannot disclaim the influence of education on the students' deeper understanding of intergenerational connectedness and responsibility.

Analysis of focus group data confirms the enormity of the parents' role in preserving and transmitting values to their children. Therefore, it is essential that children have both parents, even if their marital status is not formally settled.

Parents are responsible for preservation of certain norms and values. Due to the generation gap, teacher values may differ from those of their learners. Values that are relevant only to the past and present are not reflected in the students' visions of the future, which means that the future is quite vague and can be seen as posing a new challenge.

For the students, sustainable values include flexibility, profound understanding of culture, and hope that the future holds possibilities for real rather than virtual communication.

The students desire to be respected, although, conflictingly enough, they acknowledge having trouble with openness to diversity.

The students wish to see their children as patriots even though they are not positive that they should remain in this country in the long run. In most cases, financial and material factors are being considered as domineering.

5. Conclusion

A proper family is able to create a safe, positive and supportive environment for all its members to develop their potential. Sustainable families can be maintained by reinforcing intergenerational connectedness in value transmission. Healthy and sustainable families transmit to the young generation accepted values, attitudes, behavioral patterns and expectations about parenting, relationships and decision making.

Strong families maintain intergenerational connectedness and support networks. A sustainable family is a critical national resource. Families should offer a safe place where young people could feel comfortable and secure, and find support for facing the challenges of the day.

The study suggests some evidence that internalized family values of young people are not necessarily identical to their parents' personal values. Intergenerational differences between perceived family values and young people's personal values are identified in two aspects: openness to change or modernity (readiness to take risks, gain new experiences and face change) and conservation (tradition, security, order).

In order to transmit values, parents need to build a caring family environment where young people's autonomy is respected. Universities need to educate the young about how to attribute value and choose among alternatives as well as how to translate knowledge and skills into practice.

Thus, the study process at university should engage learners in re-evaluation of values and exploration of their orientation in terms of temporality, because the pursuit of sustainability is not limited to aspiring for personal aims; it also subsumes preservation and transmission of what is socially accepted as valuable to the next generation.

Variation in early growth, canopy temperature, translocation and yield of durum wheat (*triticum turgidum* l. Var. *Durum*) under semi arid conditions

Melle Fellah Sihem^{*a}, Hamenna Bouzerzour^b

^a Dental Surgery Depart. Fac. Medec. Constantine University, Algeria

^b Biology Depart. Fac. Sci. Sétif University, Algeria

Abstract

The investigation was carried on the experimental site of the Field Crop Institute Agricultural Farm located near the town of Sétif (Algeria). The objective was to investigate the differences in developmental rate, heat status and yield between four durum wheat (*Triticum turgidum* L. var. *durum*) genotypes. The experiment was laid down in a randomized complete block design with three replications. Data were collected on canopy temperature, relative growth rate, green flag leaf area duration, assimilates translocation and grain yield. The results indicated that Waha and Boussalam, due to their fast early growth rate, accumulated significantly more above ground biomass at the juvenile, reproductive and grain filling growth phases. They achieved high dry weight of spikes m⁻² at heading and at physiological maturity. Grain yield varied from 194.8 g/m² in MBB to 286.7 g/m² in Waha. The genotypes diverged also for the amount of assimilates transferred to the grain which varied from 26.6 to 39.5% of the final grain yield. These results indicated that selection of faster early growing, short cycle genotypes, bearing smaller leaves should be favoured for the high plateaus of eastern Algeria.

Keywords: *Triticum turgidum* L. var. *durum* - CT- Translocation - early growth rate- yield.

Introduction

The Eastern high plateaus of Algeria have a continental Mediterranean climate with variable rainfall, ranging from 168.7 to 517.3 mm, and 56 to 88% of which falls in the cold period, extending from October to March (Chenaffi *et al.*, 2006). Water remains the main factor limiting cereal crop production even though cold, late spring frost hazard and terminal heat are also frequent (Bouzerzour *et al.*, 1994; Annichiarico *et al.*, 2005; Mekhlouf *et al.*, 2006). Durum wheat is grown on the high plateaus, in a cereal- livestock farming system, in which straw and wheat residue are used as sheep fodder. Grain yield obtained is highly variable and low, compared to what is achieved in the neighboring countries (Annichiarico *et al.*, 2002; Bahlouli *et al.*, 2005). High biomass at anthesis minimizes yield reduction under terminal heat and drought stress (Roseille and Hamblin, 1981; Simane *et al.*, 1993; Fellah *et al.*, 2002). Canopy temperature is an efficient method for a rapid monitoring of whole plant response to water stress. Canopy temperature variation provides clues for crop water status and yield performance under stress (Fischer *et al.*, 1998). Plant ability to remobilize stem reserves and photosynthesis activity of flag leaf, glumes and awns to support grain filling, are adaptive characteristics in high yielding

* Corresponding author.

Email address:

genotypes, under drought stress (Blum *et al.*, 1999). Yield improvement under stress conditions therefore must combine the high yield potential and specific factors, which are able to protect the crop against reductions due to different stresses. The objective of the present investigation was to compare growth pattern and yield formation under semi arid conditions in a set of divergent genotypes of durum wheat (*Triticum turgidum* L.var.durum).

Material and methods *Experimental details and crop husbandry*

The experiment was sown, in mid November, at the Field Crop Institute Experimental Farm, located 5km south of Setif town, on the eastern high plateaus of Algeria (1081m asl., 5°21'E, 36°9'N) during the 2004/05 cropping year. Four durum genotypes (*Triticum turgidum* L. var. durum), namely

Mohamed Ben Bachir (MBB), Waha, Boussalam and Adamillo/Duillio//Semito (ADS) were chosen on the grounds of their suitable agronomic characteristics. They were laid down in a randomized block design with three replicates in plots of 6 m² (5m long x 1.2m wide). Seeding rate was 250 viable seeds m⁻². Before sowing, the trial was fertilized with 100 kg ha⁻¹ of triple super phosphate 46%, and with 100 kg ha⁻¹ of urea 35% were applied at the onset of jointing, Zadoks stage 31, in the month of March 2005 (Zadoks *et al.*, 1974). Weeds were controlled chemically with GranStar [*Methyl Triberunon*], at 12 g ha⁻¹ rate.

Results and discussion *Dry matter accumulation, growth rate, and leaf area*

The amount of rainfall accumulated during the cropping season reached 357.0mm, with 71.9% received in the autumn- winter period. The ambient air temperature rises sharply from March up to the end of the crop cycle, in June, hastening crop growth. May was unusually dry and hot (Figure 1). The analysis of variance of dry matter indicated significant genotype and sampling date effects, suggesting inherent variation among genotypes in growth pattern. Biomass yield varied from a low value of 68.8 g m⁻² measured in MBB at the jointing stage, to a high value of 951.7 g m⁻², measured in Waha at physiological maturity (Table 1). Waha and Boussalam accumulated significantly more above ground biomass at the juvenile, reproductive and grain filling phases, compared to MBB and ADS (Table 1). Waha and Boussalam realized also a high dry weight of the spikes

produced per unit square meter, at heading and physiological maturity. This is suggestive of a better biomass partitioning, while MBB and ADS presented low dry weight of spikes m^{-2} , at both growth stages (Table 1). From emergence to jointing, the relative growth rate in Waha reached $1032.8 \text{ mg g}^{-1} \text{ day}^{-1}$ and varied from 513.4 to $732.0 \text{ mg g}^{-1} \text{ day}^{-1}$ in MBB, ADS and Boussalam. A sharp overall decrease in the RGR was observed in all genotypes, as plants grow older; even though the reduction was more severe in Waha than in Boussalam, MBB and ADS during the reproductive phase (Table 1). ADS, Waha and Boussalam developed a significantly larger leaf area per square meter compared to MBB, but no significant difference existed among genotypes in the assimilation rate (Table 1).

These results indicated that Waha and Boussalam grow faster early in the season, accumulating significantly more biomass at heading and maturity, and achieving a better dry matter partitioning. MBB, ADS were characterized by a slow growth rate, and a relatively low dry matter accumulated at heading and maturity. The slow growth rate in MBB and ADS was explained by the vernalization requirement and photoperiodic sensitivity. MBB and ADS behaved as semi winter type while Waha and Boussalam behaved as spring- type varieties, with no vernalization requirement and moderate or no response to photoperiod. MBB was selected from a local landrace originating from a high altitude area (Laumont and Erroux, 1961), while ADS is an advanced breeding line introduced from Italy (Bahlouli *et al.*, 2005). Both varieties exhibited a prostrate growth habit associated with slow growth rate, early in the season. Waha and Boussalam are Icarda's selections, bearing the earliness characteristic to avoid terminal drought and heat stress of the target mega environment represented by the West Asia and North Africa region (Slafer *et al.*, 1999).

The results of this investigation showed that late material, because of its vernalization and photoperiodic requirements is not able to grow faster and to make the best use of the soil moisture available early in the season, while short cycle genotypes, such as Waha and Boussalam do possess this ability because of their relative insensitivity to vernalization and to photoperiod. They developed a rapid leaf area early in the season, shading the soil surface, restricting water lost by evaporation, maximizing transpiration and improving the transpiration to evapotranspiration ratio. These results are in agreement with Siddique *et al.*, (1991) who mentioned that high above ground biomass could be achieved through faster early growth. Slafer *et al.*, (1999) suggested that increase in aerial biomass could be achieved through a longer cycle (under favourable environments), higher photosynthesis activity per unit leaf area or faster early growth. Simane *et al.*, (1993) and Villagas *et al.*, (2001) explained that genotypes, with the ability to grow faster early in the season, are able to avoid terminal drought and heat stress in Mediterranean environments *Green flag leaf area duration, canopy temperature, translocation and yield*

CT (°C, H+20 d)	31.3	30.0	31.5	31.6	-

- H = Heading stage, Spikes = number of spikes m⁻², TKW= 1000- kernel weight, DHE= number of days from January 1st to heading, d= days.

Waha developed a small flag leaf area of 11.5 cm² while ADS has a larger flag leaf with 16.5 cm². Ten days after heading, the green flag leaf area was reduced by 33.9, 11.7, 14.1 and 14.7% in ADS, MBB, Boussalam and Waha, respectively. The relative reduction in the green flag leaf area reached 70.3, 47.0, 54.3 and 57.3% in the same genotypes, 20 days after heading (Table 2). Flag leaf of ADS senesced a faster linear rate of $-0.5957\text{cm}^2\text{day}^{-1}$. The senescence rate of the other genotypes varied with time, having a quadratic form. Flag leaf area duration varied from 26.5 days in Waha to 29.2 days in MBB (Table 2). Grain yield varied from 194.8 g m⁻² in MBB to 286.7 g m⁻² in Waha. Stem reserves remobilization varied from 26.6 to 39.5% of final grain yield in Waha and MBB which represented the extremes (Table 2). Waha and Boussalam produced significantly higher number of spikes m⁻² compared to MBB and ADS, Waha achieved a high 1000- kernel weight but had a short stem. Both Waha and Boussalam were early to head. MBB and ADS were relatively late to head and taller. No significant differences were noted among genotypes in the crop canopy temperature (Table 2). The rapid change in the green flag leaf area, observed in the present study, was suggestive of strong effect of terminal drought and heat stress on photosynthesis activity. ADS was the most sensitive to photo inhibition, accusing a rapid leaf senescence while MBB was, relatively, the least sensitive. In fact flag leaf blade, glumes and awns are the principal source of photo assimilates imported by the filling grain. Araus *et al.*, (1993) mentioned that an increase in photosynthesis activity, under drought stress, is often observed in genotypes with smaller leaves, which are less sensitive to dehydration. Smaller leaves increase fitness in dry conditions as their decreased surface area to volume ratio inhibits desiccation. When drought is experienced at later developmental stages, selection should then favors genotypes harboring smaller leaves. Waha, Boussalam and MBB were characterized by a small flag leaf area, in comparison to ADS which exhibited a larger flag leaf area. The differences among the tested genotypes in green flag leaf duration were not high enough to explain the observed grain yield differences, but smaller leaves which last longer are best suited to achieve a relatively high yield than larger leaves which senesce rapidly. Waha and Boussalam realized the best grain yield due to their better above ground biomass partitioning and to their post anthesis photosynthesis activity. MBB presented a tolerance to photo inhibition, but this cultivar achieved a low grain yield, because of its low number of culms bearing spikes and low biomass accumulated at heading. Waha presented a relatively high 1000- kernel weight, suggesting that this genotype avoided terminal heat and drought stress. The contribution of the stored reserves laid down in the stem to the filling grain, in Waha was moderate, (26.6%) due probably to a relatively high post- anthesis photosynthesis activity. Boussalam relayed, much more, on the stem reserves to fill grains, and its low 1000-kernel weight seems to indicate that it

did not fully avoid terminal stress. Wardlaw and Moncur, (1995) reported that grain filling, in drought tolerant genotypes, relies on stem reserve remobilization in case where the last photosynthesizing organs senesce rapidly, so the dependence on stored assimilates for grain filling increased as the post anthesis water stress intensity increased. These were the cases of the cultivar MBB and to a lesser extent of ADS. Giunta *et al.*, (1995) reported a contribution of stem reserves remobilization to the grain, varying from 10 to 70%, depending on genotypes and environments. Bingham *et al.*, (2007) reported that the contribution of stored stem reserves varied from 11 to 45% in barley, while Cruz- Aguado *et al.*, (1999) reported a range of 10 to 80% depending on the severity of the stress. The contributions of stem reserves, to the filling grain reported in the present study, were within this range.

Conclusions

In the eastern high plateaus, the crop growth period is restricted, at the beginning of the season, by lack of moisture, and at the end of season, by water deficits and high temperature stress. These stresses leave little scope for lengthening the period of crop growth in order to increase dry matter production and yield. However this can be achieved through increased growth rate early in the season when soil moisture is available and can be utilized. In the present experiment genotypes differed little in the number of days to heading but do in the ability to grow faster early in the season. Waha and Boussalam exploited better the available resources early in the season; they matched a better phenology to the environment. This developmental advantage contributed to their avoidance of terminal heat and drought stress and to the expression of high grain yield. So, approaches to select the appropriate cultivar to the target environment, represented by the Eastern High Plateaus of Algeria, should be based on the synchronization of the crop phenology to match seasonal rainfall distribution pattern, early growth, sizeable stem reserves remobilization, smaller leaves and avoidance of terminal heat and drought stress, as mimicked by Waha and Boussalam cultivars in the present study.

4th International Conference on New Horizons in Education

Vietnamese immigrant women's learning in Taiwanese higher education

Ya-Ling Wu*

Associate Professor, Graduate Institute of Vocational and Technological Education, National Pingtung University of Science & Technology, No.1, Shuefu Road, Neipu, Pingtung 912 Taiwan, R.O.C.

Abstract

According to a sociocultural approach to adult learning, this study aims to explore the learning experiences of Vietnamese immigrant women in Taiwanese higher education. Based on the interviews of 11 married Vietnamese immigrant brides, it was found that all of the immigrant women emphasized the importance of pursuing higher education in Taiwan. With permission from their husbands, these immigrant women participated in higher education to develop the human and cultural capital to fulfill their expected responsibilities both in their homeland and in their host societies and to combat discrimination from Taiwanese. In the Taiwanese-centered higher education, immigrant wives continuously worked hard to prove themselves competent and negotiate their voice and cultural identity. Participating in higher education and even obtaining a Taiwanese master's degree empowered most of these women, gaining self-confidence and a voice in the family and facilitating their settlement into Taiwanese society. For these female immigrants, both their culture and early socialization in Vietnam and sociocultural life experiences in Taiwan affected their learning in their pursuit of Taiwanese higher education.

Keywords: Immigrant women; Higher education; Learning ; Sociocultural contexts

1. Introduction

Since the 1990s, socioeconomically disadvantaged men in wealthier Asian countries have sought spouses overseas, whereas women in less economically developed countries have often move abroad in pursuit of a better life (Bélanger, Lee, & Wang, 2010). For two decades, a rapidly increasing number of immigrant women have arrived in Taiwan from Vietnam through commercially arranged marriages. (Ministry of the Interior, 2013). For female immigrants, participation in learning and higher education in host countries, which is associated with possibilities for empowerment, upward social mobility, and economic advancement through participation in labor market is particularly important for career development (Ghosh, 2000). Therefore, drawing on a sociocultural approach to adult learning, this study aims to understand the learning experiences among Vietnamese immigrant women in Taiwanese higher education.

2. Methods

2.1 Participants

Eleven Vietnamese immigrant women were invited to participate in this study using a snowball sampling. All of them migrated to Taiwan through marrying Taiwanese men and had completed or had been enrolled in a

* Ya-Ling . Tel.: 886-8-7703202; fax: 886-8-7740396.

E-mail address: karin@mail.npust.edu.tw

formal graduate or undergraduate program in a university for at least two years in Taiwan. The informants ranged in ages from 27 to 48 years, with the length of time residing in Taiwan ranging from 5 to 18 years. They started to pursue Taiwanese higher education after they had moved to Taiwan for an average of 6.2 years. In Taiwan, of them, two had been working on bachelor's degrees for two or three years, six had Taiwanese master's degrees, and four had Taiwanese master's degrees and had been working on doctoral degrees. Of the participants, eight had met their husbands through a marriage broker while four had free-selection marriage. Except for Hilary, who was pregnant, all of them had at least one child.

2.2 Data collection and analysis

Data were collected through semi-structured, in-depth interviews. All of the interviews were conducted in Chinese, voice-recorded, and subsequently transcribed. After the transcription, the interview texts were analyzed using within- and cross-case analyses. The process of member checking (Denzin & Lincoln, 2000) was used to guarantee the trustworthiness of the research analysis.

3. Results

3.1 Higher education in Taiwan as Human and Cultural Capital

3.1.1 Embracing the instrumental value of education

All of these women emphasized the importance of pursuing education within the Vietnamese society and within their families. Learning to value education was rooted in these women's early socialization in their homeland. In the Vietnamese society, because of Confucian culture which has emphasized learning, education has been valued as the key to individuals' upward social mobility and economic stability and symbolized their success and achievement in the society. Additionally, in 1970s, most of the people in Vietnam were economically disadvantaged and had to lift themselves out of poverty only through obtaining education. Therefore, the parents of these Vietnamese women usually held strong aspirations for their children to obtain as much education as possible, sometimes at great sacrifices. However, women's education, while encouraged and emphasized, held a lesser value than men's both in terms of its priority and in the economic support women receive to continue their education within the families because of men's central roles as heads of the family in the Vietnamese patriarchal family system. As Carol noted, "Like most of the Vietnamese, my parents always believed that obtaining education was the only way to find the room at the top of the society. Although my parents encouraged the children to study hard, at first they just supported my brothers to continue the pursuit of education because my family was too poor to afford the educational expense of all the children and because my parents preferred sons to daughters like most of the Vietnamese. However, because my brothers quitted studying, my parents just encouraged me to further the university studying. In order to pay my university tuitions, my father even sold the only valuable asset of my family and his vehicle of work, the motorcycle."

3.1.2 Combating Taiwanese discrimination against immigrant women and obtaining better employment

The participants all felt that in the Taiwanese society, they were materialized and stigmatized because of their transnational marriage and national background. "In Taiwan, the media usually portrays immigrant women as illiterate ones from countries with backward economy, victims of domestic violence, social problem makers, and even the 'runaway brides with husbands' money.' Being a marriage immigrant woman from so-called developing country, my motivation to migrate to Taiwan was stereotyped as similar to that of an Asian mail-order bride or an immigrant labour, who people believe, would be willing to pay any price to make money in Taiwan. Some

Taiwanese believed that immigrant women come to Taiwan just for husband's money or for earning money by working on sex trade," Doris said angrily. "Some of my neighbours even forbade their children to play with my daughter. Even the school teacher of my child also looked down on me and thought that I was too illiterate to read the parent-teacher communication note," Flora noted.

Because within Vietnamese families, women received the same encouragement as men to seek employment to support the household economy (Barbieri & Bèlanger, 2009) and because a shortage of income within the Taiwanese family was very stressful for immigrant women, most of the women pursued jobs after migrating to Taiwan. However, most of these women felt marginalized, excluded, and discriminated in the Taiwanese workplaces. Due to social stigmas against marriage immigrants, differences in labour market networks, and the lack of recognition of immigrant women's foreign credentials and work experiences, these highly educated, skilled female immigrants often found low-pay, entry level jobs with poor work environment, discriminatory practices, and exploited benefits, which made it difficult for them to retain the job.

3.1.3 Immediate families' permissions

Because transnational marriages have contributed to the lack of a trusting marital relationship, many Taiwanese husbands tend to force immigrant brides into behaviours within the limited normative expectations and social contacts and disapprove the immigrant brides' furthering new learning lest they get smarter, acquire some "bad habits", and then leave home. However, these women in this study thought that their motivation for enrolling in Taiwanese undergraduate or graduate study primarily originated from their husbands' supports and promise of taking up the household and childcare responsibilities. These participants felt that compared to other Taiwanese men, their husbands appeared less patriarchal and more egalitarian. Most of their husbands respected these immigrant women's decision of furthering learning and expected their wives to be more integrated into Taiwanese society through obtaining advanced education.

3.2 Negotiating their space both in Taiwanese higher education

3.2.1 *Working much harder to prove themselves competent*

All of these women highlighted that they had been studying much harder than their counterparts to keep up with the peers and to prove themselves competent while being enrolling in higher education in Taiwan. Thus, most of them had been proud of winning scholarship. The intensive advanced curriculum in higher education with extensive terminology made it difficult for the participants with basic Chinese proficiency to initially understand the instruction and meet the professors' requirements for assignments. Thus, most of these women in this study felt that as immigrant women, they had to continually prove themselves competent to survive in the Taiwanese higher education institutions.

Except for one, all of these women in this study felt that few of the faculty were sensitive to their particular living experiences and that the delivery of the instruction did not consider their cultural difference that these women students faced. These women had minimal relationships with and supports from the faculty, except for oral encouragement. However, almost all of the participants did not report feeling marginalized and accepted the nationality-blind instruction and interaction as a given in the higher education classroom because they thought that they were competent to manage their learning and they could have some relief and resilience in the margins.

3.2.2 *Negotiating voices and identity*

All of the participants agreed that at first, speaking in class was one of the greatest challenges that they confronted in the Taiwanese undergraduate or graduate classrooms because of their different accent, their early schooling, their unfamiliarity with the Taiwanese classroom cultures, and the lack of understanding the professional instruction. Thus, in the beginning, these women were silent learners. However, as these participants improved their Chinese proficiency, gained knowledge about the atmosphere of Taiwanese higher education class, and acquired more professional learning as well as the Taiwanese media began to praise some of these women's pursuit of higher education in Taiwan, their self-confidence and self-identity improved over time. These participants increasingly realized that silence in class often made individuals ignored and marginalized in the learning process. Because of the power of voice in the demonstration of knowledge and competence, based on their increased self-confidence and self-identity, most of the participants continually drove themselves to negotiate the ideas of voice to improve their visibility in class. Additionally, some of the participants even purposefully took the courses or made the presentation relevant to their cross-border backgrounds and share their experiences in class in order to facilitate the positive visibility of immigrant women and their home country, which in turn would enhance their understanding of their homeland and then enrich their identity. "After getting used to the culture of Taiwanese graduate study, I became more confident. I expected people to understand immigrant women and my homeland more, which was one of my motivations for pursuing Taiwanese higher education. Thus, I attempted to grapple the opportunities to present the reports concerning my transnational immigration experiences or the country of my origin... I also intendedly took the courses in which my background as an immigrant woman could be used as a reference point for discussing.

3.3 **Getting self-empowerment with ongoing settlement into Taiwanese society**

Persevering with completing the higher education programs, winning a scholarship from the universities, or even obtaining Taiwanese master's degrees, which required achieving Chinese proficiency, professional competency, and a certain level of critical thinking, and overcoming difficulties, were significant achievements for these Vietnamese women. In addition, completing the Taiwanese higher education and receiving the academic certificates made it much easier for most of these female immigrants to obtain jobs of better salaries than before, which increased their income and benefitted the family finances. Furthermore, most of the women also had more confidence in their parenting ability as they received more higher education in Taiwan with understanding Taiwanese educational system more and developing professional competency. These achievements contributed to the participants' self-empowerment, including positive feelings of self-worth, self-growth, and economic independence.

Participating in Taiwanese higher education and even obtaining academic degrees also contributed to these immigrant brides' integration and settlement into Taiwanese society. Most of the women gained a strong voice that encouraged their husbands and in-laws to listen to them in family affairs through their contributing more to the family economics and their Taiwanese higher education experiences. As Jessica noted, "After completing the Taiwanese graduate study and getting a better job of more income, the relationship between my mother-in-law and me improves. My husband and mother-in-law often ask for my opinions about family affairs. They even often show off my master's diploma to their friends." Additionally, most of the women had gradually adapted to, understood, appreciated and even identified Taiwanese society and culture more as they participated in Taiwanese higher education even some Taiwanese still had discriminated against marriage immigrant women from south-eastern Asia. Notably, except for Amy, all of the women had never thought about applying for an Taiwanese ID card although they understood the importance of an ID card and they got more integrated into

Taiwanese society. As Doris highlighted,” Even though I like Taiwan very much, but I am still Vietnamese. I have to preserve my original nationality that is my root and pride.”

4. Conclusion

Based on a sociocultural approach to adult learning, this study aims to explore the learning experiences of Vietnamese immigrant women in Taiwanese higher education. Based on the interviews of 11 married Vietnamese immigrant brides, it was found that all of the immigrant women emphasized the importance of pursuing higher education in Taiwan. With permission from their husbands, these immigrant women participated in higher education to develop the human and cultural capital to fulfill their expected responsibilities both in their homeland and in their host societies and to combat discrimination from Taiwanese. In the nationality-blind higher education, immigrant wives continuously worked hard to prove themselves competent and negotiate their voice and cultural identity. Participating in higher education and even obtaining a Taiwanese master’s degree empowered most of these women, gaining self-confidence and a voice in the family and facilitating their settlement into Taiwanese society. For these female immigrants, both their culture and early socialization in Vietnam and sociocultural life experiences in Taiwan affected their learning in their pursuit of Taiwanese higher education.

Views and insights of elementary teacher candidates on sound-based sentence method (case of Pamukkale University)

Ibrahim Halil Yurdakal^{*a}, Fatma Susar Kirmizi^b

^aFaculty of Education, Department of Primary Education, Pamukkale University, Denizli, 20070, Turkey

^bFaculty of Education, Department of Primary Education, Pamukkale University, Denizli, 20070, Turkey

Abstract

This study aims to identify and evaluate elementary teacher candidates' views and insights on sound-based sentence method in teaching basal reading and writing, and their competency related to this method. Participants were 3rd and 4th year 197 students studying elementary education at Pamukkale University. An open-ended survey which was developed by the researchers was used to investigate the teacher candidates' views on sound-based sentence method. While developing the survey, the teacher candidates' opinions were taken into account which was followed by expert opinions. The reliability of the survey was calculated by the help of a percentage of agreement formula. For data analysis, open coding method was employed. The qualitative data gathered through the survey were typed and exposed to content analysis. The data were read by the researchers elaborately and the codes were revealed. Related codes were then grouped under certain themes based on which interpretations were made. To support these interpretations, quotations and the characteristics of quoted participants were provided. The results revealed that the teacher candidates reported to have sufficient theoretical knowledge on sound-based sentence system, but also mentioned that they could encounter various problems in implementation. They also argued that these problems could be overcome by the help of practicum and professional experience while they presumed that other problems would also arise in teaching sounds and finding sample vocabulary during basal reading and writing instruction.

Key Words: Sound-based sentence method, elementary teacher candidates, teaching basal reading and writing, qualitative research.

1. Introduction

Due to information age, individuals need to have broader background knowledge. Accessing information does not seem to be enough, individuals should also read, understand and internalize the information they read. For participating in the society and personal development while falling in step with the information age, their reading and writing competencies should be high (Ontario, 2003). In modern societies, individuals moving up in their field of interest and taking important positions is only possible by having advanced reading and writing skills because they cannot reach the desired level of knowledge without reading. Similarly, without writing, they cannot share that knowledge (Çelenk, 1999).

* Corresponding author.

Email address:

The profile of individuals that the society needs changes in a way to maximize the expectation from the education system. In this decade, an educated person is expected to keep pace with the change, be an entrepreneur, work in collaboration with other effectively, have the skills for developing himself/herself constantly, and know how to learn. From this perspective, “educational systems should extend across the limits of traditional understanding of education and meet the needs of the society with a ‘life long learning’ approach (MEB, 2006a, p. 34). With the changes in modern society, being literate has a greater importance and is also seen as an indicator of contemporary development. As also stated by Çelenk (2005, p. 109), today, being a functional member of the contemporary society, organizing their work and life conditions, being independent and participant, and having a modern world view are only possible by being literate.

Basal reading and writing instruction include all the practices in the process of being literate and reaching a certain level (Yeleğen, 1977). It is not a simple process. Not only because it is complex, but also vitally important that there have been a lot of discussions on the most efficient method to teach basal reading and writing, and the best strategy to apply it (Martin, Lovat, Purnell, 2007, p.4).

In teaching basal reading and writing, the method that would be used is quite important. As for the 2004-2005 academic year, the Ministry of National Education changed the teaching method used in basal reading and writing with the new Turkish teaching curriculum, and preferred sound-based sentence method instead of analysis method. In sound-based sentence method, as can be inferred from the name, the teaching starts with sounds. At first, by constructing students’ preliminary knowledge, teacher makes them feel the sounds. This is followed by combining sounds to form syllables. And then, syllables form words, words form sentences.

There have been various studies addressing the use of sound-based sentence method. Güneş (2005) argued that this method was suitable for the sound structure of Turkish language. Similarly, Turan (2010) reported that elementary teachers found suitable for ‘recognizing letters and sounds’, ‘starting reading and writing earlier’, ‘students learning reading and writing easier’ and ‘enhanced individual learning’.

On the other hand, in their study which was conducted in the province of Giresun, Durukan and Alver (2008) concluded that the in-service training that the teachers take related to sound-based sentence method is not enough. Bilir (2005) also argued that sound-based sentence method slowed up the students’ reading and was not appropriate to their development.

In their study, Tok, Tok and Mazi (2008) stated that this method reduced the time needed to start reading, however, eased down meaningful and speed-reading. Koç (2012) revealed that students having learned reading and writing through sound-based sentence method could not construct meaningful sentences in writing. Similarly, Baydık and Kudret (2012) enhanced the reading fluency, but decreased the reading speed.

The aim of the present study is to identify and evaluate elementary teacher candidates’ views and insights on sound-based sentence method (SBSM) in teaching basal reading and writing, and their competency related to this method. Based on this aim, the study addresses the following questions: (1) What are the views and insights of elementary teacher candidates related to their theoretical knowledge of SBSM? (2) What are the views and insights of elementary teacher candidates related to their practical competency of SBSM? (3) What are the foresights of elementary teacher candidates related to possible problems that they can encounter in the implementation of SBSM?

2.Method

This study employed qualitative research. Qualitative research suggests that researchers examine the subject or subjects under consideration in their natural environment and try to interpret the phenomena from the perspective of the participants (Denzin & Lincoln, 1988, cited in Ekiz, 2009). Consequently, ‘holistic single case design’ which is useful in identifying whether an accepted case

in a field works was used. Thus, the study focused on elementary teacher candidates' views and insights on whether they have the necessary competencies related to sound-based sentence method.

2. 1. Sampling

Convenience sampling was used in this study. Based on this method of sampling, a close and accessible group was selected, which would be practical for the study. For this reason, the results of the study would be valid for his sample. The study was conducted with 3rd and 4th year students studying elementary education at the Education Faculty of Pamukkale University (n:195).

2.2. Data Gathering Tool

In order to identify the views of elementary teacher candidates regarding the sound-based sentence method, an open-ended question survey developed by the researchers were used. While building the survey, teacher candidates' opinions were taken into consideration and a literature review was conducted. The questions were discussed with 4 faculty members who were experts in the field and 5 students to ensure content validity. Based on expert opinions, the final version of the survey was completed. The survey included a form of demographic information and five open-ended questions.

2.3. Data Analysis

To analyze the data gathered through the survey, open coding method was used. The qualitative data gathered through the survey were typed and exposed to content analysis. The data were read by the researchers elaborately and the codes were revealed. Related codes were then grouped under certain themes based on which interpretations were made. By identifying the reliability coefficients of the codes determined by the two researchers, it was aimed to enhance the reliability of the study. The following formula was used for each question: "Reliability=Agreement/Disagreement + Agreement x 100". After calculating this formula for each question, the percentage values for the first question was 84; for the second question 91; for the third question 86; for the fourth question 91; and for the fifth question 86.

Codes under the themes were interpreted by explaining them in relation to each other and supporting quotations were provided. In the quotations, abbreviations were used for the participants. These abbreviations include gender (F/M), year of study (3/4), students' grade in basal reading and writing (A1,B1,C1...). For example, (26, M, 3, C2) refers to a third year male student whose grade is C2.

3.Bulgular

For the first research question of the study, the theme "the elementary teacher candidates' views on their theoretical knowledge of SBSM" was revealed. The codes contributing to this finding are: 1. I think I am theoretically competent in SBSM. 2. I think I am partially theoretically competent in SBSM. 3. I don't think I am theoretically competent in SBSM.

According to the results of the study, the quotations of the theme "the elementary teacher candidates' views on their theoretical knowledge of SBSM" related to the code "Seeing oneself

efficient in SBSM” are as follows. A total of 127 candidate teachers see themselves theoretically efficient in SBSM.

“I am familiar with the topic, highly confident (15, M, B1).” “For me, even though we have not been brought up with SBSM, at university we had the opportunity to familiarize with this issue and apply it (33, F, 3, A1).” “I think, because of the fact that our exam was open-ended and our teacher gave importance to this issue, I have had enough knowledge (34, F, 3, A1).” “I know how to apply the principles of SBSM. I think I will not have difficulty. (37, F, 3, A1)” “I can fully transfer the necessary knowledge to students step by step (56, F, 3, A2).” “I don’t think we have too much missing theoretical knowledge, as our teacher paid the necessary attention to this issue. (62, F, 3, C1)” “Actually, I learned this technique both theoretically and practically in basal reading and writing course. I believe, I will be successful. (84, F, 4, A1)” “I think I am efficient. As we also attended the practicum, I can see where I am in terms of teaching. (97, F, 4, C1)” “If I were to score myself from 1 to 10, I would give myself a score of 8. (114, M, 3, A2)” “I see myself theoretically efficient. The basal reading and writing course I have taken is sufficient. (120, M, 3, B2)” “I see myself as efficient as a teacher to instruct a student. (141, M, 3, A2)”

According to the results of the study, the majority of the teacher candidates think that they have the sufficient knowledge of theoretical structure of SBSM. Teacher candidates, even though they were taught reading and writing analysis, expressed that thanks to the education they took in the undergraduate program they learned the theoretical structure of SBSM at a satisfactory level. Teacher candidates mentioned that conferences and seminars are important in learning the theoretical structure of SBSM and in internalizing what is learned also the learners who were weak in theoretical knowledge mentioned that they would make up for this weakness in time.

According to the results of the study, the quotations of the theme “the elementary teacher candidates’ views on their theoretical knowledge of SBSM” related to the code “Seeing oneself partially efficient in SBSM” are as follows. . A total of 50 candidate teachers see themselves theoretically partially efficient in SBSM.

“I am at a medium level, it could be better. (8, F, 3, C1)” “I have a medium level of knowledge. (17, F, 3, B1)” “I cannot claim that I am fully qualified in terms of theoretical knowledge but I am trying to improve myself. (19, F, 3, A2)” “I don’t see myself quite efficient theoretically. Improvement is needed. (7,F,3, B2)” “according to what I learned in the basal reading and writing course, I believe I am at medium level in terms of theoretical knowledge. (28, F, 3, BA2)” “In terms of theory, I think I am medium or slightly above medium level. (42, B, 3, A1)” “As I see from the period of basal reading and writing, even not quite efficient, I can be accepted as average. (132, M, 3, B1)” “I am as efficient as I practice. I think that I will make up for this in the practicum. (176, F, 3, A2)” “We have not been taught all the letters yet. We know how to teach some letters but not the letters especially the difficult ones in terms of pronunciation. (180, F, 3, A2)”

The teacher candidates who think that they are partially efficient in the theoretical dimension of SBSM know their weakness and are trying to overcome it. They attribute this weakness to the fact that they did not take enough instruction on SBSM in the undergraduate program. They predict that they will encounter problems especially in linking the sounds. The candidates, who mentioned that they will make up for their deficiencies in terms of theoretical knowledge with the help of practicum courses, expressed that they had not been taught some letters and would have trouble in teaching the letters that are difficult in terms of pronunciation.

According to the results of the study, the quotations of the theme “the elementary teacher candidates’ views on their theoretical knowledge of SBSM” related to the code “Seeing oneself inefficient in SBSM” are as follows. A total of 18 candidate teachers see themselves theoretically inefficient in SBSM.

“As we had been taught with sentence technique, it will be difficult to learn with SBSM (44, F, 3, A2)”. “I don’t think that I am efficient enough to teach a student. I need to read more and think about the issue and work harder. (162, M, 3, A2)” “As far as I know from the lessons that I am not efficient as I have not practiced in a school (166, F, 3, A1)” “I don’t see myself efficient in SBSM yet. However, I think that I will overcome this when I become a teacher. (173, M, 4, D1)”

The students who think that they are inefficient the theoretical dimension of SBSM attribute this to the fact that they were taught with the analysis method in order to learn basal reading and writing. However, the candidates mentioned that they will overcome this either with the help of practicum lessons or when they become a teacher.

In order to answer the second research question, the theme “the elementary teacher candidates’ views on their efficiency in applying SBSM” was found out.”

The codes contributing to the arousal of this theme are as follows: 1. feeling incompetent in the implementation of SBSM. 2. feeling competent in the implementation of SBSM. 3. feeling competent depends on various factors

“ The quotations of the theme “the elementary teacher candidates’ views on their efficiency in applying SBSM” related to the code “feeling inefficient and gaining experience in applying SBSM” are as follows. 43 teacher candidates pointed out that they did not feel themselves confident in implementing SBSM, but they will as they gain experience.

“A little experience would make a difference in my practical knowledge. (12,F,3, A2)” “We didn’t expose to an adequate practice. We only made observations. (13,F,3, B2)” “I think I will be beter as I gain experience. (23,F,3,B)” “I feel confident to the extend we covered in our classes. But, practice could be different (27,F,3,A1)” “I don’t think I will have a problem with theory. But, I’m not that sure for practice. I think I will learn it after starting to profession. (94,M,4,B2)”

Teacher candidates argued that they were competent in practice in general, however, practice sessions were necessary as they will gain experience. They perceive SBSM in two aspects one of which they successfully complete during their undergraduate education, but the second, the practical aspect arises when they start the profession.

As for the code “feeling competent in the implementation of SBSM”, 85 teacher candidates perceived themselves as competent:

“I think I’m competent enough to show the necessary care. (15,M,3,B1)” “I feel very confident. (16,F,3,A2)” “I’m active in practice and I think I’ll be successful. (19,F,3,A2)” “I feel competent since we have enough opportunities for practice. (33,F,3,A1)” “I think can implement it since these are all included in real life. (35, F, 3,A2)” “We have seen these methods thoroughly, so I don’t think I will have a problem with implementation. (39, F, 3, B)” “I’m quite competent. I was good at in-class practice. I will be better in real class implementation. (45, F, 3, B1)” “I don’t have a problem with implementation. I can make the class creative and useful for the students. (56,F,3, A2)”

As can be inferred from the above quotations, teacher candidates who took courses embedded with SBSM along with practice perceived themselves as competent. However, the students who took these courses without practice reported to have some problems in implementation. Including practice is not obligatory, but up to the instructor at the faculty. In this sense, it can be argued that including practice would be helpful for students’ implementation of SBSM.

As for the previous code, teacher candidates stated that they were competent, but could also face problems depending on some situations. For this reason, another code was revealed named as “perceiving oneself competent depending on some situations”. 67 teacher candidates said that they were competent although they could encounter problems in some situations. Some quotations for this code are as follows:

“I have adequate knowledge for teaching. However, there would also be some problematic students. I’m not sure how useful it will be for them. (55,F,3,B1)” *“I don’t feel confident in practice. The context and the characteristics of the students would also matter. (132, M, 3, B1)”* *“I know it theoretically. I may have difficulty only in few sounds, which are hard to find in nature (59, F, 3, A2).”* *“I don’t have practical experience on sound-based sentence method. I only watched the presentations in our class. That’s why I don’t feel confident for some situations. (62, F, 3, C1)”* *“In terms of practice, I feel myself competent for making students feel the sounds. However, I can’t be sure for further steps. (64, B, 3, B1)”* *“No problem with practice, but it would be difficult to do every step. (74, F, 4, A1).”* *“I can’t be sure before I start practicum. (88,M,4,B1)”* *“I think there aren’t enough example to create texts. (146,F,3,A)”* *“Teaching letters one by one is easy. However, I can have difficulty in forming syllables and texts just like students would do. (149,F,3,B1)”* *“I think I will manage it by combining technology and creativity in practice.(151,F,3,A2)”* *“Since I don’t have a real classroom experience, I cannot say I am competent or not. (168, F, 4,A2)”*

Most of the teacher candidates answered the survey stated that they were sufficient at the practice aspect of SBSM, however; also emphasized that this would depend on various situations. They argued that students’ cognitive characteristics and ages, physical conditions, present equipment and technological devices would affect their practical competencies. Besides, while applying SBSM, they said that they would not have any problems in making students feel the sounds, but in later stages, some problems could arise in teaching more difficult letters.

The quotations related to the code “Feeling competent in applying SBSM” under the theme of “Views and Insights of Elementary Teacher Candidates on their Competencies related to the Implementation of SBSM” are given below. 67 teacher candidates did not perceive themselves as competent in implementing SBSM:

“I don’t feel competent because we cannot be proficient enough to conduct such lessons with students. (17,B,3,B1)” *“Problems might arise based on the level of the class. (41, B,3, B)”* *“I haven’t conducted any lessons using sound-based sentence method. (63, B, 3, B1)”* *“I think I’m not competent in terms of practice because we don’t have experience. (125,B,3,B1)”*

The participants argued that the reason that they are not competent is because of the lack of practice during their undergraduate courses.

As for the third research question of the study, the theme “comparing SBSM with other methods” and related to this, the codes “being able to make comparison”, “making partial comparison” and “not being able to make comparison” were revealed.

Within the code “being able to make comparison”, the quotation from the students who was able to compare SBSM with other methods are provided. Some of the quotations from the 72 participants who felt themselves competent in making comparisons between SBSM and other basal reading and writing methods are as follows:

“Since I was taught with sentence method, I’m able to make a comparison. I know what the differences are. (183, B, 3, A2)” *“I know the sound-based sentence method in depth, as well as other methods. So, I can make a comparison. (175, B, 4, A1)”* *“I have seen various methods in class, made evaluations on them, that’s why I feel competent.” (156, B, 3, A1)”* *“I feel confident in terms of comparing this method with other methods with their pros and cons. (150, B, 3, A1)”* *“For me, sound-based sentence method is better*

than traditional method. Since I know the characteristics of both, I can make a comparison. (147, B, 3, A1). "I feel myself confident in terms of practical issues, pros, and cons (139, E, 3, A2)" "We are equipped with the necessary information related to each method. So, I wouldn't have a problem in making a comparison in-between. (116, E, 4, B1)" "I can make a detailed discussion and comparison. I have sufficient knowledge. (113, B, 4, B1)"

Based on these quotations, it can be inferred that the participants, due to the courses they took, were able to make comparisons between basal reading and writing methods. 33 participants were able to do this because they were taught with sentence method. One of the participants stated that she could make a detailed comparison. On the other hand, 5 participants reported that they could identify the pros and cons of different methods.

73 participants said that they could make a partial comparison of basal reading and writing instruction methods. Some of the quotations related to this code are presented below:

"I'm aware of the obvious differences and what I should or shouldn't do. (151, B, 3, A2)" "I only know pros and cons to the extent that which is better for which age group. (148, B, 3, B1)" "I cannot make a detailed comparison. (126, E, 3, B1)" "I can make a comparison with the time during which I was taught. I don't know much about other methods. (125, B, 3, B1)" "I can barely distinguish pros and cons. (9, B, 3, B)"

As can be seen, only obvious differences can be compared and teacher candidates have superficial knowledge of these methods to identify their pros and cons. Besides, 7 participants reported that they could only make a comparison between SBSM and sentence method.

Further findings revealed that 17 participants were unable to make a comparison based on their answers. This constituted the code "not being able to make comparison". Some of the quotations related to this code are as follows:

"I can make a partial comparison with sentence method, but not other methods. (152, B, 3, A2)" "Not adequately. (130, B, 3, A2)" "Since it is not the sound-based sentence method that I was taught with, I cannot make a comparison. (122, B, 3, D)" "Even if I do, I think there will be a lot of mistakes. (162, E, 3, A2)"

There seems to be different reasons for not being able to make a comparison between SBSM and other methods. Some also mentioned that even if they made a comparison, it would not be a correct one. However, it should be noted that the number of the students for this code is 17.

4. Discussion and Suggestions

Results of the data gathered from the participants showed that teacher candidates were familiar with the SBSM in theory. Anılan (2013) found that most of the elementary teacher candidates could easily implement SBSM. In another study, Dedeli (2008) reported that fourth year elementary education students were competent in terms of sound-based sentence method. These findings overlap the results of this study. However, according to teacher candidates, their competency in terms of practice was limited. They also argued that they would overcome this by the help of school practicum and after starting the profession. This finding is also supported by Anılan (2011) and Vural (2006). Anılan(2011) argued that although teacher candidates had positive views on sound-based sentence method, they also had some concerns, but were able to implement this method in spite of their lack of experience. Vural (2006) also emphasized the importance of practice in

undergraduate courses as well as practicum and supervision and feedback during practicum. In this sense, school practicum should be extended and reorganized.

Although teacher candidates were taught with sentence method, they were able to adapt to SBSM and compensated their inexperience through conferences and seminars. Teacher candidates reported to have most problems in combining some sound and pronouncing some letters. Besides, some teacher candidates thought that the reason they have difficulty in implementing SBSM was due to their own learning experience with the analysis method. On the other hand, some candidates stated that they were competent in terms of implementation, but classrooms being too crowded and consequently not having enough time for exercises and activities would cause problems in practice. This was also supported by Şahin, İnci, Turan and Apak (2006) which pointed out that classrooms being very crowded limited the opportunities for exercises and activities. Another problem that the teacher candidates presumed was the necessary equipment for sound-based sentence method. In a study with elementary teachers, Karaman (2008) found that “teachers didn’t have any problems in terms of the necessary equipment, and they created most of the tools needed for the method”. The main reason for the differences in the teacher candidates competences of practice seem to be their undergraduate courses. The students who took the basal reading and writing course with embedded practice were more confident, which was also supported by Yıldırım and Demirtaş (2010) in which it was argued that this course should combine theory and practice.

72 participants stated that they could compare SBSM with other teaching basal reading and writing methods while 73 reported that they could do a partial comparison. 17 participants were not able to make a comparison. It can be inferred that teacher candidates are at a moderate or good level in terms of comparing SBSM with other methods.

Based on the findings, the following suggestions were developed: Since the teacher candidates argued that a practical teaching and writing course would be more useful, this course at undergraduate level should be conducted embedding practice.

Basal reading and writing course has 4 credits with 2 hours of theory and 2 hours of practice. School practicum hours should be extended and spread across four years. It was also concluded that in teaching basal reading and writing course, activities and examples for “combining sounds” and “forming syllables and words”.

In materials design classes, teacher candidates should be trained to prepare the necessary tools suitable for SBSM. Universities and academics should organize symposiums, seminars and conferences towards SBSM for teacher candidates. Instructors should not limit themselves to teaching SBSM only. They should also teach other methods used to date and make a comparison in-between.

4th International Conference on New Horizons in Education

Violence and conflict in schools: analysis of proposals based on restorative justice in Brazil

Adam, J.M.^a; Scotuzzi, C.A.S.^{b*}^aUniversidade Estadual Paulista. Avenida 24 A, 1515. Rio Claro-SP.13506-900. Brasil^bUniversidade Estadual Paulista. Avenida 24A, 1515. Rio Claro-SP.13506-900. Brasil

Abstract

This article intends to analyze some of the policies implemented in Brazil with a view to the prevent school violence and the mediation of conflict in the school. Among these policies, the following will be analyzed: the Justice for 21st century project: Instituting Restorative Practices, from Porto Alegre and the Justice and Education project: a partnership for citizenship, from São Paulo. These projects work with the forming of mediators to act in the scope of the school conflicts within the perspective of restorative justice. The analyses herein presented are based on papers published in journals and dissertations on the theme. One of the assumptions of the analysis is that the concern with the lack of security in the schools and with the conflict situations inside them has mobilized different public organs to draw up harder and more restrictive policies as well as a growing influence by the justice related organs to find solutions that initially would be the schools' responsibility to deal with. Based on this, we highlight the phenomenon of the judicialization of social relations and in particular in the case of schools, which would be the passing on to justice organs the function of solving doubts that the various social groups do not consider themselves capable of answering. In this vein, proposals and projects for facing school violence and conflicts has been originated in organs related to the justice system, that even take on the task of preparing educators to work with the issue. The conclusion is that the pedagogical and educational character that is the responsibility of the school institution is passed on to the scope of law. In this manner, the school institution leaves off its role in the education for citizenship and stops analyzing the nature of its conflicts, from the standpoint of a collective effort within the school by involving the different groups that it composes, to seek the best solutions for these conflicts.

Key words: Restorative Justice; school violence; public policies

1. Main text

Introduction

The issue of school conflicts has mobilized educators and other sectors of society due to the feeling of insecurity and perplexity with the situations that the educational institutions have gone through. The most frequent complaints are in relation to the students' attitudes; lack of respect to the school and to the teachers, verbal aggressions and, in some cases, aggressions and very frequently bullying has been pointed out.

With the increase of this type of concern, which is accompanied by the feeling of intolerance to behavior considered violent, alternatives for facing the so-called school violence have been sought. In this vein, since the year 2000, with the start off of the 2000 Manifest launched by UNESCO, the Educators for Peace Program was introduced. In this program six principles are highlighted: respect life, rejection of violence, being generous,

E-mail address: joyce@rc.unesp.br

listen to understand, preserve the planet and rediscover solidarity (Mullet & Amstutz, 2012). These principles, though undoubtedly very important and significant, come into shock with the reality in which millions of people in the world live with, as well as in Brazil. In truth, these principles are not in line with what Sennet (2006) calls the culture of new capitalism, where individualism, lack of respect for the human being and the absence of solidarity are the defining marks.

On the plate of the Educators for Peace Program, and as from the year 2000, the methodology of restorative justice, present in the judicial processes begin to be viewed as an alternative to resolve conflicts within the school, reaching its peak in Brazil at the end of the first decade of 2000.

The analysis presented in this text points out that the school goes from solutions based on psychology to proposals referenced in judicial processes as a way to find solutions for the educational issues, which should be based on educational and pedagogical theories. The concern with the insecurity in the schools and with the situations of conflict within them, have mobilized different public organs to draw up ever harder and more restrictive policies as well as a growing influence of the justice related organs to find solutions that in first place would be the responsibility of the schools to solve. In this context, we highlight the phenomenon of judicialization of social relations and in particular in the case of schools, which would be the passing on to justice organs the function of solving doubts that the various social groups do not consider themselves capable of answering

The critical analysis of some proposals that are being presented in Brazil, that have as a reference restorative justice, does not invalidate some of the principles present therein, but the proposal is to put them in their right place, and point out the limits for this type of approach to the issue called “school violence”.

Restorative Justice: some principles and questioning about its application in school

Based on experience with conflict solving, the Restorative Justice appears as the “new” paradigm, alternative to the Retributive Justice and presumes not only the adoption of conflict mediation practices and techniques, but also a modified view of crime and justice. This proposal has come to be considered adequate not only for issues related to justice but also for other social organizations.

Retributive Justice (our penal system model) operates in a manner that focuses on guilt, generating the equation: *crime-guilt-punishment* to solve the problems of social conflict. The solution of a crime focused on guilt remits to the past- who did it? – and guides all the judicial process that pursues establishing legal guilt and the assigning of corresponding sentences, having a defense lawyer, a prosecutor (who represents the State) and a judge, acting in an impersonal and adversarial process.

On presenting a proposal of principles for discipline based on restorative justice, Mullet & Stutman (2012, pg. 46) pointed out the following principles: the restorative discipline attempts to strengthen the relationships and build a sense of community stimulating an atmosphere of mutual care in the school, because it recognizes that the relationships are the core of community spirit; creates systems that treat bad behavior and the damages in such a way so as to strengthen relationships; it focuses on what is a *violation* of people and relationships and not only disobedience of rules; gives a voice to those who have suffered the *violation*. As can be seen, the term *violation* relates to bad behavior, an aspect that leaves open the relations of power that determine how such rules are established and the severity or not of the broken rules.

Despite focusing on more positive and less punitive aspects, restorative justice has in itself social control component linked to the legal issue. As MacCluskey (2008) reminds us, the language used by the justice system, such as offender and victim derives from criminal justice and the correlated psychological perspectives, therefore making these terms inadequate in when utilized for the school organization. The terms many times used in restorative justice, such as transgressor or perpetrator and victim have meanings linked to contraventions or crimes and transposing these terms to the school atmosphere can lead to mistaken actions and criminalizing actions that would fall into the definition of indiscipline or incivility. The example given by McCluskey (2008) calls attention to this aspect:

In Scotland, for example, the most common reason for school exclusion is 'general and persistent disobedience' (Scottish Executive, 2005a). Pupils are, in fact, rarely excluded for acts of violence and the relationship between pupils who disrupt and those disrupted is complex (McCluskey, 2005, 2007). The borrowing of terms such as 'victim' and 'perpetrator' from criminal justice may then reinforce a discourse that demonizes and criminalizes young people in general. As Waiton (2001, p.141) argued, 'it often appears that the best that young people can hope for ... is to be labeled as victims unable to cope with the pressures of life, rather than as villains who are destroying it'. (MCCLUSKEY, 2008, pág.205)

Another aspect brought up by McCluskey is that restorative justice, on focusing on the fact itself, does not lend to thought about how the offender became an offender, ignoring issues of power, class and gender.

Highlighted for reflection is that the positive aspects brought by restorative justice have already been present in all discussions carried out on the democratic management of education, and aspect very present and discussed as far as theory related to the studies on education that appear to have been reinvented in the perspective of restorative justice. The participation and involvement of the different groups that compose the educational process in decisions, the focus on the interactions that take place in the school, so much so in structural terms as subjective, the collective work and constant dialogue are discussions that have been present for a long time in the educational area, with the advantage of including aspects of power, gender and class relations.

The Brazilian educational legislation, mainly since the Law of Education Guides and Bases (Lei de Diretrizes e Bases da Educação LDB) established the principles of democratic administration of education, which establishes the importance of the participation of all in the educational process. The 7th and 9th articles make this aspect very clear:

Article 7 – the democratic administration has the objective of allowing the school a larger degree of autonomy, in such a way as to guarantee the pluralism of pedagogical ideas and concepts, ensuring the adequate standard of education proffered

Article 9 – In order to improve the achievement of its objectives, the democratic administration in the school will be achieved by a: I the participation of the school professionals in drawing up the pedagogical proposal;

II – participation of the various school community segments – directors, teachers, parents, students and employees in the Consulting and decision processes through the School Council and the Parent Teacher Association -PTA.

Notice that the principle of participation both by those directly involved, such as school professionals and students, as well as other sectors of support in the pedagogical process, such as parents and community, is present in the legislation. Institutions such as the School Council and the PTA have their composition and objectives formally defined in the norms and legislation of the State of São Paulo.

In this manner, the principles of restorative justice can bring techniques that favor the possibilities of dialogue and participation in the school, but the discussion of democracy and participation foreseen even by law were already present in schools. What can be reinforced is that some schools adhere to this technique by bringing in the principles related to human rights and also be related to justice, the sector which meets the concerns about the insecurity that the school and the teachers undergo. In truth, it would be necessary for schools to believe in the democratic process and in the community around it in order to achieve a practice of conflict solving from the inside to the outside of the school.

Analysis of two proposals for solving conflicts in the school implemented in Brazil

Justice and Education Project

The *Justice and Education Project: a partnership to citizenship* is coordinated by the technical-pedagogical team of the Special Projects Directorship of the FDE – Foundation for the Development of Education in the State of São Paulo/Brazil. Its objective is to reduce the episodes of violence in the schools by way of the adoption of the precepts of Restorative Justice that stimulates the involvement of the community in solving conflicts.

According to the documents related to the Project, the implementation of restorative justice occurs through the development of Restorative Circles, as a method to solve conflicts, that are based on spaces open to dialogue and the adoption of negotiated solutions for the understanding between those involved in conflicts (FDE 2010).

These present the justification that the Restorative Circles allow for the participation of students, teachers, school directors, community representatives, and representatives of social and official institutions (such as nongovernmental organizations and Judicial system), in addition to the parties themselves involved in the conflicts, in a deep and organized discussion about what caused the conflict, the consequences, and the possibility of reparation of the damage.

Developed from a partnership signed between the Secretariat of Education and the Justice Courts of the State of São Paulo, with the participation of judges from the Childhood and Youth Courts, the Justice and Education Project: a partnership for citizenship (*Projeto Justiça e Educação: uma parceria para a cidadania*) was implanted in the state Grammar and High school education.

The onset of the Project in the State of São Paulo began with a pilot project of restorative justice in the municipality of São Caetano do Sul (Education Directorship of São Bernardo do Campo), in 2005. The project aims at developing the capacity of solving conflicts in a preventive manner in the schools, avoiding it being sent to the justice department, and of those not related to the school community experience, in the Courts, in Restorative Circles, strengthening the community networks to act in an articulated manner (MELO et.al. 2008). Three schools were pioneers in adhering to the project and, subsequently it was expanded, encompassing the twelve municipal schools of São Caetano do Sul. Educators, parents, students, social workers and Infancy Advisory Board members (Conselheiro Tutelar) were “trained” for the practice of restorative circles, making them facilitators (term suggested in the guidelines of the UN Resolution 2002/2012). One of the parts of the training was a course on the theme that many of the school networks began to attend, rendered in the Escola Paulista de Magistratura,.

The project works on two fronts: In the implantation of institutional and educational changes within the schools and in the Child and Youth courts and in the strengthening of the network of support to these children and youths, involving public and/or private entities in the area of defense and ensuring of rights.

The follow-up of the actions is carried out by a Judge, a technician from the Prevention Department and a specialist from Centro de Criação de Imagem Popular – CECIP (Center of Popular Image Creation).

In 2006 the project was expanded by the SEE, with support from MEC, to the cities of Guarulhos (Education Directorship of Guarulhos – North Region) and São Paulo (Center South Education Directorship – Heliópolis Region) and, in 2008, the municipality of Campinas adhered to the project, naming it *Justice and Education – New perspectives*.

In the cities of São Paulo (Heliópolis), bordering São Caetano do Sul and Guarulhos, in the greater São Paulo, two hundred educators, students and school community members of two Education Directorships of COGESP¹ -SEE, through a partnership with Justice agents, judges, and Child Protection Council members, were

capacitated in approximately 100 hours to implement restorative circles in the school and other spaces (CECIP, 2010).

Five education leaders (director or vice-director, pedagogical coordinator, teacher representative, student representative, and representative of families of the students) were also mobilized further to two Education Supervisors or Technical Pedagogical Assistants (nowadays called Coordinating Teachers of the Pedagogical Workshop), in each one of the Education Directorships, so as to promote the organization and implantation of the restorative circles, as well as allowing the incorporation of the restorative principles in the school pedagogical proposals.

The activities carried out by the educational leaders were: research on the violence in schools and the community; identification of values and discussion on the vision and mission of the school; construction or reconstruction of the norms for coexistence; communication about the project to the community (CECIP, 2010).

The Justice and Education Project is based on work with ethical principles, “empowering” people to assume their role as players capable of operating in the social atmosphere, administrating conflicts and reducing violent manifestations. Dialogue is the main instrument sought after in both projects for the building of agreements between the offenders, victims and community.

Another objective of the Justice and Education Project is the strengthening of the networks of Guarantees of the Rights of Children and Adolescents and the abidance to the programs foreseen by the ECA (Child and Adolescent Statute).

The motto of the Justice and Education Project is “to make Justice more educational and Education with more justice”, by perfecting the Judicial and Educational systems, transforming the punitive character into an educational one, and “substituting the mark of guilt by the awareness of responsibility” (CECIP, 2010, p.11 -12).

The Project still exists nowadays, although the financing for training and technical support to the facilitators of restorative/justice practices and for the educational leaderships was interrupted between January and October 2007. The Project’s actions to develop the restorative practices learned, continued on in the schools and in the community as well as in the Justice Courts. In December 2007, financing was re-established (MELO et al, 2008). Currently, the Project’s actions are in course in some educational directorships, subsidized, however, only by private institutions such as Nextel

A strong presence of the organs linked to the justice system can be seen in this project, reinforcing what we already affirmed previously: the judicial character that permeates it despite its proposals of collective construction of rules, empowerment of the groups involved, etc.

This judicial character is already seen in the regimental structure or the disciplinary code of the schools that are similar to the penal code that we know, insofar as it uses the equation *indiscipline – guilt- punishment* in the application of punishments such as suspensions and compulsory transfer, following the traditional judicial system’s model. Although it has a different methodology and approach from the retributive justice, much closer to the idea of justice currently present in schools, the implementation of the restorative justice would alter very little in the school culture, continuing with the judicial character of the issue in detriment of the pedagogical character.

We know that the appearance of prisons in the XVIII century, even being seen as a reform for being an alternative to the brutal and unjust punishments that were applied at the time, soon became subject to criticism due to the violence and cruelty that the prisons themselves began to produce. According to Howard Zehr (2008, p. 114) “[...] the attractive of the privation of liberty is that it permits the term of the punishment to be measured by the severity of the offense. Prisons constitute a form of dosing the punishment in units of time, offering an appearance of rationality and even of science to the application of pain”.

This apparent rationality or Science has moved the actions of the Government in answering to the demands for security, judicializing the school relationships, with the adoption of penal justice models inside the schools, promoting punishment in levels, “measuring the punishment time to the severity of the offense”, as Zehr affirms.

The network of state school in the São Paulo State, adopt this grading of punishment in its disciplinary system and does the inverse of imprisoning by impeding the student from attending the school atmosphere when submitted to various suspensions which culminate in the compulsory transfer. Students, perpetrators of infractions, who go through the Fundação Casa¹, usually face even stronger rigors in relation to the disciplinary code, when they go back to school.

The book of occurrences (present in almost all state public schools) itself has a policing content in marking the “passage” or involvement of the student in acts of indiscipline. Through the entries in the book the number of “infractions” are counted for the applying punishment. In this manner, three admonishments, normally, will be converted into a few days suspension; various suspensions into successively longer suspensions, until culminating in mandatory transfer.

It seems to be a scaling mechanism of punishments the moves the action more than the acts themselves. It seems to be that the search of a solution for the cases of school indiscipline is focused on the application of constantly more severe punishments in a manner as to “get rid of the problem” progressing to the maximum sentence, which is mandatory transfer.

However, although the principles of Restorative Justice are essentially pedagogical principles, approximating school and justice in the pursuit of solutions to conflicts is a risk that can end up in an even more repressive and more violent school.

Justice for the 21st Century Project: Instituting Restorative Practices, in Porto Alegre.

The *Justice for the 21st Century* Project has the objective of divulging and applying the practices of Restorative Justice (RJ) in the resolution of conflicts in schools, with NGOs, communities and Child and Youth Justice System as a strategy of combatting and prevention of violence in Porto Alegre, State of Rio Grande do Sul/Brazil. Implanted since the year 2005 in the 3rd Court of Childhood and Youth in the capital city of the state, the project Justice for the 21st Century is articulated by the Association of Judges of the State of Rio Grande do Sul.

The work concept of the Justice for the 21st Century Project proposes “emancipating strategies”, irradiating to the service network and to the community in relation to the Public Policies defined by the Child and Adolescent Statute (ECA) through means of individual and institutional partnerships. In three years of the Project (2005-2008), 2,583 individuals participated in 380 restorative procedures carried out in the Child and Youth Court. Another 5,906 participated in training activities promoted by the Project. Further to the Juvenile Court, other institutional facilities such as the penal units of the Foundation for Social-Educational Service of Rio Grande do Sul (former FEBEM), units of open socio-educational measures, shelters, schools and NGOs are also applying these practices in the administration of internal conflict, avoiding their judicialization.

The Project’s initiatives have their main insertion in the network of social service network for adolescents in conflict with the Law from the Justice System, but it establishes partnerships in a manner that expands its scope, producing repercussions in the ambience of other services such as Security, Social Assistance, Education and Health.

It can be seen that this Project was originated with a focus on situations that involve more juridical than educational and pedagogical issues links to the day-to-day educational process. The day-to-day situations in school rarely involve violence that requires judicial intervention, as long as there is an atmosphere of dialogue and democracy in the school.

The thesis developed by the teacher Betina Schuler (2009) points out aspects that can contribute to the reflection points brought up in this study, as it highlights the element of judicial infraction present in the referred project, fact that is present in the teachers’ speech.

One of the teachers, integrant of one of project's pilot schools, during the initiation of the RJ course said that their school was chosen due to the frequent invasions in the school and the violence in the community in which the school was located and that, due to this they implanted a nucleus of the RJ and Juvenile Protagonism with the class representatives, in order to disseminate the RJ values throughout the school and the community, arguing g that there is a greater possibility of barring violence an aggressiveness in the school. This would already be reaping results, as they had lots of fights during recess time (less watched space) and now this had improved. (SCHULER 2009, p.157)

Another important aspect to highlight is the issue, previously discussed in this article, referring to the idea that the proposals presented by restorative justice are new. All the main aspects listed as restorative justice characteristics, such as negotiation, the participation of all the players in the school system, giving value to solidarity and the strengthening of relationships, have always been present in the proposals for the democratic administration of schools. The below speech by one of the teacher's pointed out in Prof. Betina Schuler's thesis demonstrates this idea well:

[...] I even think that the school has Always been aware, because before the coming of this concept of Restorative Justice, in principle the school has always had a restorative attitude, because the school [...] is possibly one of the few institutions that always placed the person who caused the damage and ho suffered damage face to face. Therefore, already in this manner, we the school have this attitude of calling two people together to from there on try to build on something [...] it is a new organization of the norm in society (SCHULER 2009, p.158).

Despite the positive propositions of the principles presented by the restorative justice Project, the fundamental fact is that it is based on a biased view of criminality and contravention, aspects that if taken as the determinant view of day-to-day school relations will bring about a predominance of judicialization of school relationships. Intolerance to undisciplined behavior or rudeness and the consideration that these are liable to judicial punishment can cause a climate of fear and oppression rather than one of cooperation and solidarity.

Conclusions.

Taking into consideration the principles of Restorative Justice, however pointing out its limits for Education, we highlight that the projects that are based on it, such as *Justice and Education: a partnership for citizenship* and *Justice for the 21st Century*, although involving education professional in their implementation, have the justice system as their structure. They are professionals linked to the judiciary system who train the professional mediators as well as having the control of the implementation process of the project.

One of the criticisms to the programs is exactly that the dependence on the judiciary for the training course, which demands in São Paulo 80 hours of studies in order to participate in the project and work with restorative circles in the school. Another criticism is the focus on voluntary work by the people who wish to participate in these projects.

There still are reservations in relation to the Restorative Circle itself, being considered innovative can, according to Schuler, "also be seen as one more way of exercising power, the same as many others, producing certain manners of subjectivism", as it takes "the day-to-day micro-fractions, dividing students in a binary

manner into victims and offenders, classifying behaviors, trying to approximate deviations as much as possible to the norm [...]”(SCHULER, 2009, P. 107).

In the context of Justice, the judicial concepts of guilt are individualistic, based on the idea that the subject, as a free agent, who acts according to his own will, ignoring the social, economic, political and psychological context of the behavior. It is an atomized vision of the individual, based on free-will that brings about the concept of criminality or violence as individual phenomena (ZEHR, 2008; XAVIER, 2001; ADORNO; PASINATO, 2007).

In this manner, the problems of violence are accredited to the individual who, stripped of social competences should adapt to the requirements of a new society.

Another aspect that we wish to highlight is that the option for a partnership between the Secretariats of Education and of Public Security, reveals a manner of thinking and acting about security, focusing on the police and the justice system and triggering the phenomenon of judicialization in the schools (CRHISPINO; CRHISPINO, 2008), a mechanism that incorporates the principles of penal justice in the school atmosphere, excluding the educators from the decision taking roles and the pedagogical treatment that are required by school conflicts.

On attempting to transfer its responsibilities to other institutions and by making the problems that it cannot deal with invisible, the Governments intend to “eliminate” the problems of violence from the schools by giving the Government Policy a considerable proportion of visibility, answering to society’s anxieties and reaffirming its authority in issues of public safety. This political choice seems to correspond to the social anxieties for safety, as, in a society of fear, any form of control and vigilance is seen as a protection factor.

However, even if the application of repressive practices answers to the collective desire for Strong measures to guaranty public safety, the bringing of the judicial apparatus closer to school life, consolidates a climate of fear and of mistrust in the school itself (GONÇALVES; SPÓSITO, 2002).

Therefore, the work based on the principles of Restorative Justice should be thought more of as the development of practices which we call pedagogical or, who knows, come to be called restorative (used by Education for a long time, but perhaps currently a bit forgotten), with a view to the restoration of relationships for the construction of an atmosphere of peaceful coexistence, with the main role being of educational players. Work that is not dependent on external partners because it should be thought of and practiced fundamentally by individuals of all the segments of the school, including, of course, the families and local community.

A construction that occurs through the practice of democratic processes, be it in the formulation of the school rules, be it in the conduction of how these are complied. Practices that give a meaning to the existence of a school and that can act as the conducting wire or reducer of violent situations.

Abstract

In the present, a priority theme of science and research in the field of design and management construction is aimed at transforming the construction sector through the rapid adoption of new processes, such as Integrated Project Delivery (IPD), Integrated Design and Delivery Solution (IDDS) together with Building Information Modelling (BIM) and automation technologies, using people with enhanced skills.

It is necessary to transfer the idea of cooperation among the participants of construction process into the pedagogical process as soon as possible. An educational project focused on the skills development for virtual design and management of construction based 5D technologies, solved to the Civil Engineering Faculty of Technical University of Kosice (Slovakia), dealt with an innovative form and content of teaching in field of design and management of construction projects. This paper describes the main goals, opportunities and results of the mention project, which can develop the professional, communication and managerial skills of students in the joint working teams using the latest digital and automated systems of design.

Keywords: virtual design, construction projects, construction, educational process

1. Introduction

Considering the increasing of construction complexity (constructive, material and technological difficulty) and the pressure of market for quality and efficiency of construction on the one hand and the shortening deadlines for construction process on the other hand, the current methods of project documentation processing and the management of construction planning processes seem to be insufficient. However, the global civil engineering in suffers with mistakes and misunderstanding in communication among the participants of construction project from the very beginning of an investment plan to its realization. This fact seems counterproductive to the very complex efficiency and performance of construction work, including the stage of using.

Accordingly, there is need to monitor the worldwide development towards necessity of structural, technical, technological, qualitative, economic or using requirements and solutions integration in construction projects. The global improvement of the projects cannot be achieved by development of only optimal solution but by complex perception of all parameters of the building projects in all its phases (design, preparation, realization, using) in term of all aspects (quality, safety, environmental suitability, energy efficiency).

2. New concept for design and realization of constructions

The development in fields of engineering support and project tasks directed from a very heterogeneous software environment to integration into more comprehensive tools. The design, construction and commissioning sectors repeatedly analysed as inefficient (Šoltés, Kozlovská, 2011). Actual design tools and delivery solutions for building projects are:

- Unproductive
- Uncommunicative
- Over time and budget

Traditional Design and Delivery tools of construction projects must undergo a fundamental structural change. The studies indicate that the development in support of engineering and project tasks directed from a very heterogeneous software environment to integration into more comprehensive tools. The difficulty of building structures as well as the investors requires more interconnected information environment which is consisted by the base of information and data about whole construction elements and structures.

In the present, there is necessary to focus on close collaboration of individual participants of construction process (investor, architects, civil engineers, structural engineers, MEP systems engineers, constructor, owners,...) which is the main condition ensuring of the effective management of construction projects. This can be fulfilled by using the of 5D (five-dimensional) modelling concept. This can be described as the complex of three essential component parts, interconnected for project's design and construction process. The first component is 3D (three dimensional) project's data allowing the display of building with its relevant information. The second component is time related data (as 4th dimension) and the third component is cost-related data (as 5th dimension) (Popov, Juocevicius, Magilinskas, Ustinovichiuss, Mikalauskas, 2009). The basic principle of using 5D modelling concept is based on the fact that individual information about 3D, 4D and 5D elements are obtained automatically when using 5D BIM technology which represents a potential for new approaches represents. BIM is currently the most common denomination for a new way of approaching the design, construction and maintenance of buildings. It has been defined as "a set of interacting policies, processes and technologies generating a methodology to manage the essential building design and project data in digital format throughout the building's life-cycle"(Bryde, Broquetas, Volm, 2013).

The BIM technology covers geometry, spatial relations, geographic information, quantities and properties of building components (e. g. particular details) of the design construction (IFC Support for Sustainability, 2007). We can easily extract this information and provide it to all participant of construction (limited or unlimited) through the use of BIM technology. The gist of BIM technology therefore is based on the sharing of the correct and same information about construction by all participants of construction (Fig 1). This technology presents an opportunity for more effective logistic of construction process in term of spatial based scheduling of construction, which will increase a predictability of schedule and financial tendency of construction process. On the other hand, the BIM technology can be used throughout the whole life cycle of construction, including the realization of construction and its building-up process, occupation of construction, facility management to the demolition of construction. At the international conference about IDDS (2009, in Espoo – Finland) has been shared the knowledge of research focused to using of BIM as the tool for simulation and visualization of "prototypes" of the buildings, BIM for support of safety in the sites, using of BIM for monitoring of building elements position, using of BIM for generation of designs alternatives and estimation of the building processes costs (Improving Construction and Use through Integrated Design Solution, 2009).

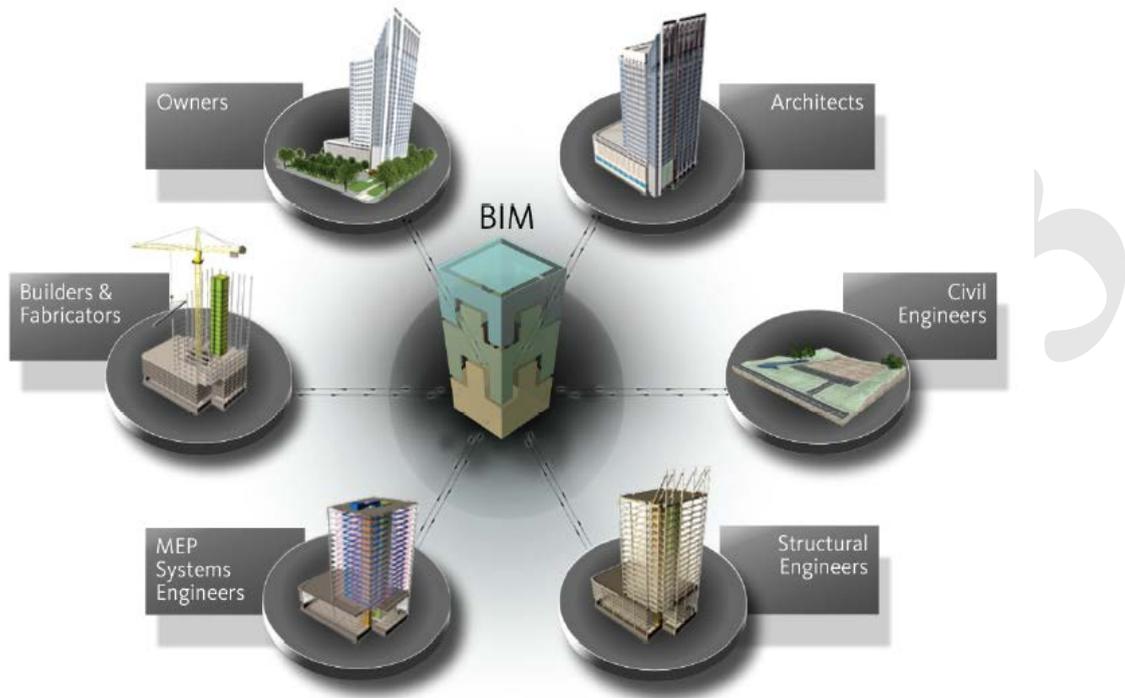

Fig. 1. Integrated environment for design and management of construction projects (autodesk.com)

According that, currently is necessary in the field of education to increase of digital competence of graduated, to develop their logical and critical thinking in the use of digital technologies and management and communication skills and teamwork as well. The educational project which was solved at the Institute of Civil Engineering Technology and Management, Civil Engineering Faculty of Technical University of Košice, Slovakia was focused on these aspects of pedagogical process. Therefore it was necessary to use a software environment for virtual design and management of construction, which is using also for educational purpose at our institute.

3. Software environment for virtual design and management of construction

The software environment for virtual efficiency design and management of constructions, materials and technologies through 5D technologies is breakthrough solution of activities management linked with the integration of constructive, material, technological and economic solution of structures. Substantial increase in quality of construction project management and decrease of construction risks can be achieved by this new technology which also allows a simulation and optimization of this construction solution efficiency. The integration of relatively heterogeneous activities linked with the construction projects is achieved through the unique way which allows improve of construction realization, thereby contributing to increased competitiveness in regional economy, as well as a subregional economy.

The virtual environment offers the increase the quality of design and management for progressive intelligent construction, with a focus on efficiency and return of sources. Virtual environment based on cooperation of

engineering and constructive solutions allow identifying and reducing of the constructive, material, technological and economic risks already in the phase of construction design. 5D technology provides an environment for synchronization of constructive solution with the financial and time aspects of planning and realization of construction projects in accordance with the concept of Integrated Design and Delivery Solution, thereby increasing the quality of construction projects and predictability of construction project development.

The virtual reality is gradually applied in all areas of economic activities. It can be used in the area of research and development of constructions, materials and technologies by the same way as in the design of production processes, workplaces, production systems, planning and management of production. The use of virtual reality allows simulating of proposed constructions for the particular parameters and requirements in the digital environment and its implementation.

The advantages of using virtual reality are for example:

- integrated system solution for digital laboratory,
- virtual research and development – design options, optimized solutions, reducing time and costs for research and development, increase quality of the resulting research solutions in construction,
- virtual prototypes of construction – visual presentation of real system, testing of system parameters in the final phase of development,
- virtual processing – validation of programs, eliminations of collisions, verification of production technology, optimization, etc.,
- virtual design – optimization of production disposition, optimization of material flows, sources optimization of construction production, dynamic verification of design, objective time standards, etc.,
- virtual assembly works – validation of assembly processes, optimization of assembly mix and sequences, optimization of assembly procedures,
- virtual construction – optimization of material and financial flows, minimizing of resource consumption, reduction of construction duration and working capital.

The digital laboratory is an effective tool for linking of experimental research and its digitization with an applied research and educational activities and industrial practices. There are created the conditions for active participation of young researchers, PhD students and postdocs in research fields of excellence research of construction material, intelligent construction elements and intelligent structures, as well as for the education of students of Civil Engineering Faculty.

4. Skills development for virtual design and management of construction based 5D technologies

Our Civil Engineering Faculty, Technical University of Košice provides an education for whole position spectrum of civil engineers who are engaged in design, planning, preparation and realization of building project. In term of status of individual participants of construction, the graduates get into the traditional, but also less traditional working positions, such as: architects, designer of construction, structural engineers, MEP systems engineers, budget manager, contractor, OSH manager, investor, developer, project manager, contractor company manager, etc..

Order to develop the students' professional and communication skills in the common working teams already in very stage of education was created an educational project „Skills development for virtual design and management of construction based 5D technologies“. The students worked as profiling experts involved in solving of mutual problems related to specific construction projects. The project was multi-disciplinary oriented. Therefore the experts who were in design team presented the specialists in various areas of design and

management of construction project. They were identified with the idea of teamwork necessary of all civil engineering professions at the stage of design, based on the latest technologies enabling to prepare the construction project, which predisposes to high quality, cost and economic efficiency of future construction, including the elimination of mistakes from lack of coordination and collaboration of specialists. The solving of project was in the time period 2010 to 2011.

4.1. Results of educational project

One of the project results is the training modules „Virtual Construction Team Working“. Their part is „Construction Work Books“ in Slovak and English language given that the abroad students are at faculty.

The training module „Virtual Construction Team Working“ is using within the architectural, engineering and technology practice for simulation of verification, control and management activities through team collaboration of specialists. These activities associated with the design and management of construction project. The training module also allows its using for simulation of partial solution in lectures and courses dealing with the cost calculation, modelling of construction method, management and maintenance of buildings, OSH, etc.. The modules are created through the equipment of virtual laboratory for the efficiency design and management of constructions, materials and technologies through 5D technologies. The laboratory is equipped by the computers for CAD application, including the software needed for design and management of construction project. There is created an environment that enables the integration of the latest project management, information, digitization and virtual technologies, including the BIM technology.

The manual “Construction Work Book” provides a supported study material for proper use of training modules. This manual should provide the more effectively work with the latest technologies for preparation and realization of construction projects.

The particular education project provided the effective using of knowledge and information base in field of construction projects for solution of design and management tasks and training team teaching for preparation of experts. On the other hand, the education of individual specialists for designs, projecting and management of activities related to building process took place in the individual subjects through the specially focused software environment without marked connection and support of teamwork among the particular students. In the present, it is necessary to emphasize that an idea of collaboration among the participants of construction process is also reflected into the innovative pedagogical process as soon as possible. It included the latest trends in field of design and management of construction together with the BIM technologies which represents a main contribution of whole presented project. The creation of individual part of construction projects by students in the BIM environment based on the team working during the educational process is shown on figure 2.

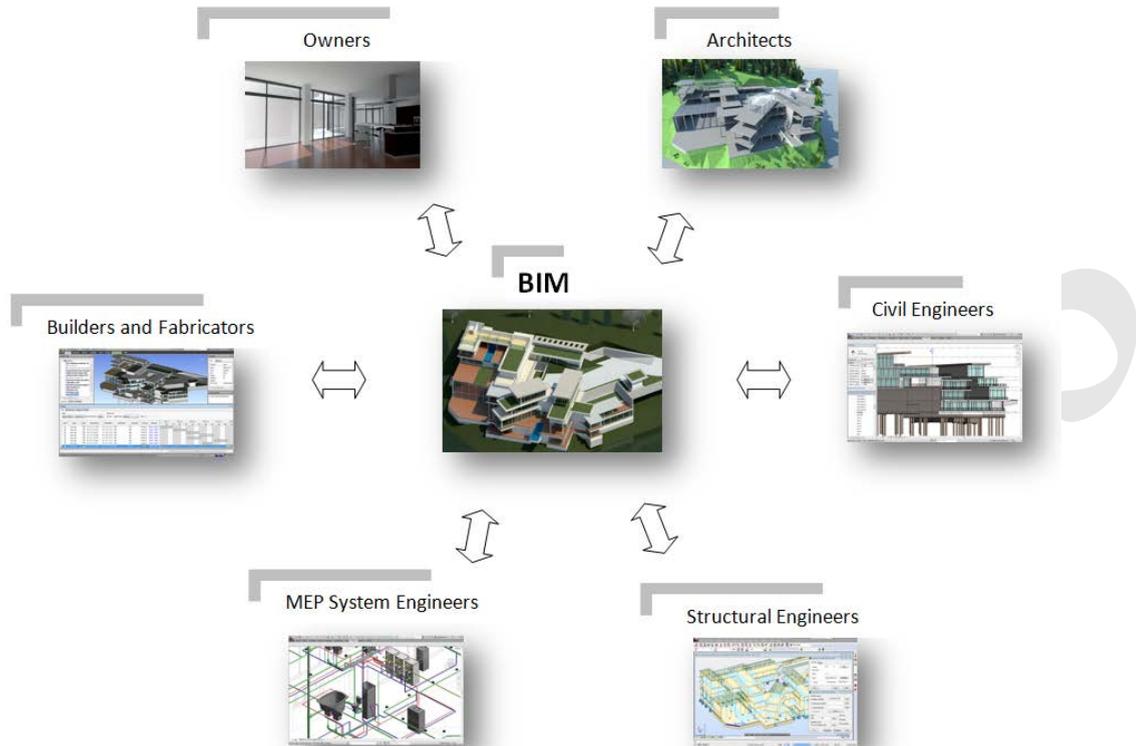

Fig. 2. Design of construction projects in the BIM environment based on team working during the educational process (authors)

The next output of this project is the creation of the database of project solutions of many constructions that are processed by students. This database allows a training of partial solutions associated with particular professions (designers, architects, structural engineers, MEP systems engineers, budget manager, OSH manager, ...) by the “Case Study” within the individual professional courses and lectures.

The outputs of the project can be characterized as follows:

- Main training module, which creates an integrated environment for using of the most modern design, management, information, digitization and virtual technologies in field of preparation and realization of construction project for teaching within the technology practise.
- Additional training module for solving of task within particular specializations by the “Case Study” form,
- Processing of study material for training modules in Slovak and English language for effective using of the most modern technologies for preparation and realization construction projects.
- Database for “storage” of construction projects, for practising the case studies in designing and management construction projects.

We have to be note that main training module can be used also for the designers and engineers from various design and engineers institutions, which presented the contribution of project not only for pedagogical process, but also for practice.

5. Conclusion

Currently, we are witnesses of rapid adaptation of new integrating method of construction processes, innovative automation technologies and more effective work for all participants of building-up process in civil engineering practice. The presented project focused on the skills development for virtual design and management of construction based 5D technologies seeks to develop the professional and communication skills of the students in mutual working teams already in the stage of education process. The students are able to solve the task of current integrated civil engineering industry through applying of adequate computer and graphic techniques of atomizing systems of design whit regard to architectural visualization of construction, its construction design, static and environmental safety and energy intensity. Each of these aspects is applied in real economic and technological environment and reflected the requirements of the latest building practice.

Abstract

In 2009, the Creation Group of Educational Objects in Biochemistry (GCOEB) started to organize virtually practical-laboratory activities in basic Biochemistry for undergraduate students of Pharmacy Course. This occurred through presentation type files (power point) with detailed photos of technical procedures, reagents, equipment and possible results, all associated with challenging questions. These activities are being gradually transformed into virtual versions of the Flash program, mixing photos, cartoons and proposed interactivities. These simulations aim to help the students in the consolidation of the theoretical and practical biochemical knowledge. We believe that these pedagogic tools support the learning of Biochemistry, increase the scientific curiosity, stimulate the presence in the laboratory and never replace it. (www.ufrgs.br/gcoeb/)

Keywords: Educational Objects; Software

1. Introduction

In 2009, some teachers, postgraduate and undergraduate students from the Biochemistry Department of Instituto de Ciências Básicas da Saúde, Universidade Federal do Rio Grande do Sul, constituted the Creation Group of Educational Objects in Biochemistry or, in Portuguese, Grupo de Criação de Objetos Educacionais em Bioquímica (GCOEB). Its activities started when UFRGS-Pharmacy Faculty had its subjects organization modified in 2008. The subject named Biochemistry I was also included in this change. It was transferred from the 4th to 3rd semester and had its class number reduced from 9 to 8 hours, but 2 lab hours were maintained. So, in the first semester of 2009, both subjects, the Old and the New Biochemistry I, were performed simultaneously. In other words, the number of students was doublet. Then, how could we teach our practical classes, if the laboratory had only place for the half?

To maintain the teaching of basic practical Biochemistry concepts we decided to offer different tools to the students. The classical Biochemistry laboratory could be interchanged weekly with the informatics laboratory. Using this strategy, we believed that the students could learn and construct their own knowledge as usual (Eichler and Del Pino, 2006; Behar, 2009).

Practice simulation using power-point files

To organize the virtual classes we built up power-point files aiming to simulate lab activities by using pictures, identifying phrases and technical questions. All power-point files started with the information of page number inside the Biochemistry protocol book and finished with the suggestion to the students to make the report of the simulation results (Salbego and Trindade, 2008). Fig 1 is a file example: Ascending chromatography on paper of amino acids.

In the same way, other simulation practices were created: Protein properties, Protein and Inorganic Phosphate determination in biological samples, Carbohydrate detections, Glucose determination in plasma obtained from fed rats and from rats submitted to a 24- hour fast, Glycogen obtaining from liver and muscle of fed rats and from rats submitted to a 24- hour fast, and enzymes evaluations (pirophosphatase, succinate dehydrogenase and lactate dehydrogenase).

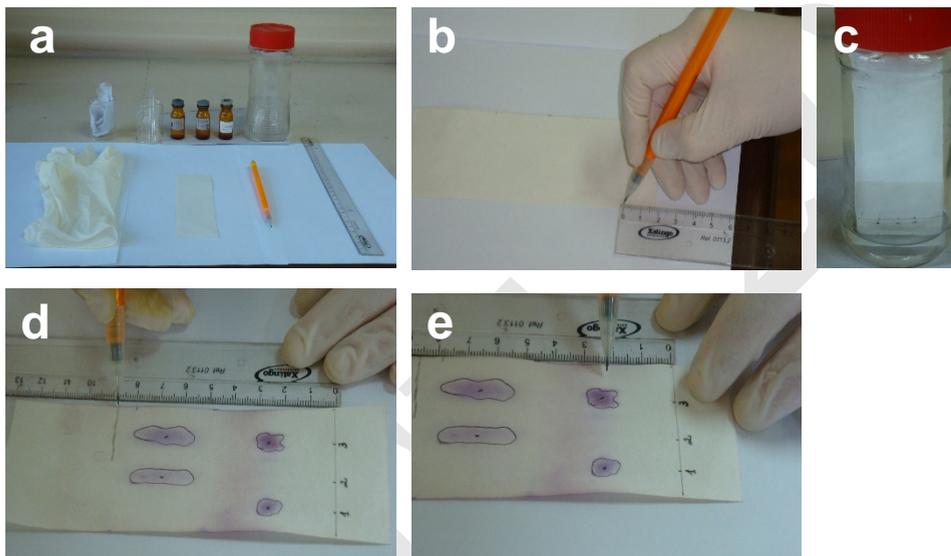

Fig. 1. Ascending chromatography on paper of amino acids. a) Material used in the experiment. b) Demonstration how the chromatography origin was marked. This picture was associated with following questions: What is being used to mark the chromatography origin: pen or pencil? Why? c) Chromatography tank with the migration position marked by the arrow. d) Migration distance of solvent mixture front from the origin marked by pencil. e) Migration distance of the spot center (corresponding to amino acids revealed by ninhydrin) from the origin marked by pencil.

Practice simulation using graphic interface-Flash 8.

In a new stage, we decided to make an improvement in our virtual material adding more interactions to them. Therefore, we again planned the several contents, selected them, edited images and developed them in the graphic interface-Flash8 (Macromedia, 2005; Shupe, 2010). Associated with this development it can be seen: pictures, interactive animated cartoons and challenging questions. These characteristics were introduced in the same virtual object of the Fig.1, but now it is in Flash. In Fig.2, a challenging question is shown: it is suggested to the student that he is supposed to be in the lab, starting the simulation of ascending chromatography. He is challenged to select the group of equipment needed at the first step of the technique. These groups of equipment are assembled in different sets. If the student clicks on Fig 2a, a message will appear indicating that the answer is correct but, if the student clicks on Fig 2b, a message will appear indicating that the answer is wrong. A sentence

appears with both messages explaining that to start the chromatography process, first, it is necessary to transfer solvent mixture into the tank for its saturation (www.bdc.ib.unicamp.br/bdc/visualizarMaterial.php?idMaterial=1136).

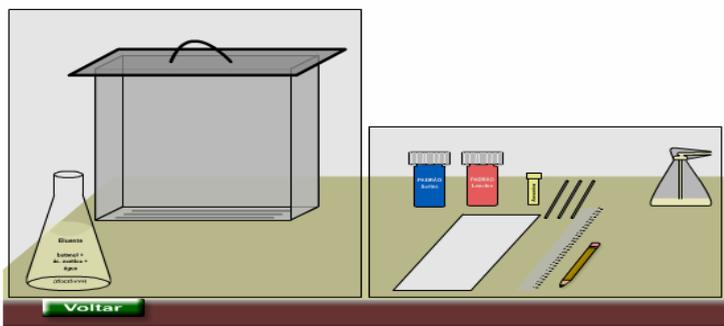

Fig. 2. Interactive animated cartoons in flash-file of “Ascending chromatography on paper of amino acids”.

- a) Chromatographic tank and erlenmeyer with solvent mixture. b) Material used in the experiment: whatman paper, ruler, pencil, standards, sample, glass capillaries and spray bottle

In order to give an upgrade to our learning objects, a scene menu and illustrative films were added to “Determination of serum lactate dehydrogenase (LDH) activity” flash file. This scene is composed of different sets that show the animated reaction, the LDH isoenzyme structures and cell localizations, the metabolic relations, pathologies related to LDH, the method principle of LDH determination and its simulation (Fig.3) (www.bdc.ib.unicamp.br/bdc/visualizarMaterial.php?idMaterial=1165).

Fig. 3. Scene menu in flash-file of “Determination of serum lactate dehydrogenase (LDH) activity”

To make our learning objects more user-friendly, we have introduced some link buttons in the introduction section. We also have inserted multiple information into different interactive sets and some technical and interpretative exercises. These improvements can be seen in “Glucose determination in plasma from fed rats and from rats submitted to 24- hour fast” flash file. Link buttons determine the opening of windows in which the chemical reaction is shown explaining the method principle (Fig.4). In another screen, standards and samples are identified; the absorbance measurement and the standard curve plotting are also animated (www.ufrgs.br/gcoeb/dosagemglicemia/).

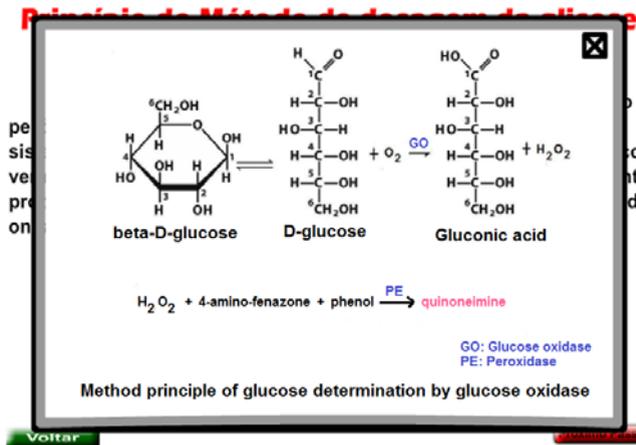

Fig. 4. Interactive animated cartoons in flash-file of “Glucose determination in plasma from fed rats and from rats submitted to 24- hour fast”.

Another stage of our learning objects development occurred when the simulation actions were added through a challenging logic programming. Help buttons, messages of error and of simulation end steps were added. In this way, the learning object “Casein isoelectric point determination” was much more interactive (Fig.5) (www.ufrgs.br/gcoeb/PontoIsoletricoDaCaseina/PontoIsoletricoDaCaseina.swf).

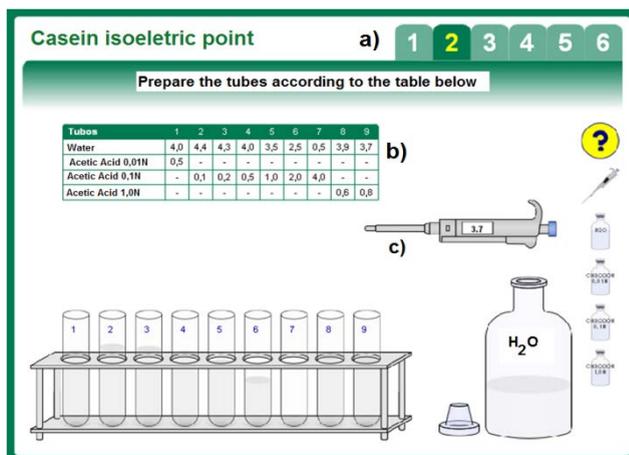

Fig. 5. Interactive animated cartoons in flash-file of “Casein isoelectric point determination”.

- a) several flaps identifying different simulation steps b) table showing the different volumes of reagent to be pipetted; c) micropipette with the possibility to adjust the volume to be transferred from reagent bottles to test tubes.

Evaluation of the learning object: “Ascending chromatography on paper of amino acids”.

This learning object evaluation was performed by the students of Biochemistry I (Pharmacy-UFRGS) of the second semester/2009 (Zanatta et al., 2009) and the first and second semesters/2010/2011. Fig.6 shows that, in general, the students evaluated the LO design and functionality positively, since most of them answered as excellent the questioned aspects. Others LO had similar evaluations for the navigation program, display format and help in learning. (data not shown).

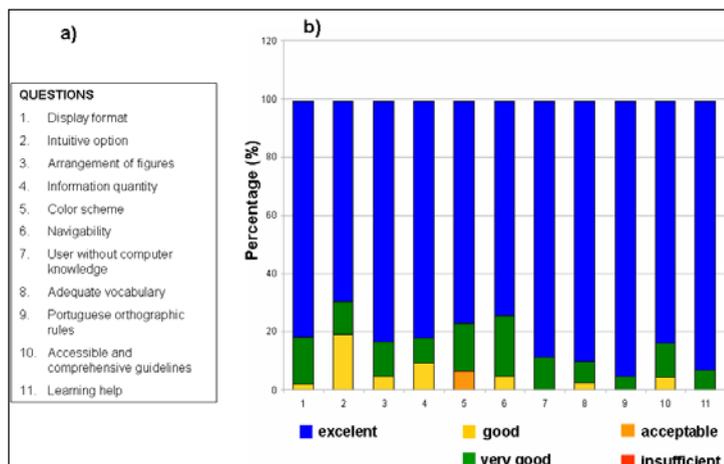

Fig.6. LO evaluation: “Ascending chromatography on paper of amino acids” evaluation.

a) Questions b) Answer percentage

Conclusions

In conclusion, we agree with de Jong et al. (2013) that these pedagogic tools (www.ufrgs.br/gcoeb/) support the Biochemistry learning, the increase of the scientific curiosity and the stimulation of the students' presence in the lab, but they never replace it.

Acknowledgments

We thank Journalist Maria Isabel Tim and Prof. José Cláudio Delpino for the information about LO development. We also thank assistant students Eduardo Zimmer and Lucas Ewald; the technicians Lucia Martini, Norma Silva, Fernanda Timm Souza, Lia Blazina, Luiz Paulo Braga for the help in the lab organization. We are especially grateful to Biochemistry I students of Pharmacy Faculty –UFRGS (2008/2 – 2009 – 2010 – 2011) for accepting this challenge. We thank to Maria Inês Zacher for the English language assistance. We are also grateful to Secretary of Distance Education –UFRGS for the fellowship granted to the P.R.A., I.S.B. and F.P.D. This work was supported in part by Programa de Pós-Graduação em Ciências Biológicas – Bioquímica, ICBS, UFRGS.

4th International Conference on New Horizons in Education

Virtual learning environment moodle used for remedial activities in foreign language teaching

Renata Šimůnková *

Technical University of Liberec, Studentská , Liberec , Czech Republic

Abstract

This paper presents a project financially supported by Student Grant Competition at our university (TUL). When testing language competence at B2 level, mistakes tend to repeat. We therefore recorded them (oral and written), classified them, searched for the causes and designed remedial activities. The aim was to help students to self-improve, and therefore all the designed activities were interactive, available via Internet and supported by forums - video presentation's focus. This paper focuses on lexical mistakes. It discusses "word" and potential problems it represents. Then strategies and exercises leading to the change and improvement of the ways learners approach vocabulary are presented.

Keywords: vocabulary, form, function, mistakes, remedial activities, autonomous learning, peer-learning

1. Introduction

Vocabulary, as one of the language sub-skills is an important part of foreign language learning. The approach to vocabulary, to ways of its teaching and its importance in the teaching/learning process, has been changing in the last twenty years. Generally it can be concluded that its importance has been growing, supported along with others by the influence of Lexical Approach of Michael Lewis. David Nunan comments on the situation in the following way: "These days, then, the consensus of opinion seems to be that the development of a rich vocabulary is an important element in the acquisition of a foreign language. Certainly, contemporary coursebooks are as carefully structured lexically as they are syntactically (Nunan 1991: 57). Although in some methodology books complaints that "vocabulary is neglected in some courses" (Davies and Pearse: 2000) can still be met, the importance of conscious and systematic instruction in the area of vocabulary has generally been accepted and incorporated into syllabi. Despite this positive tendency, students often make "vocabulary mistakes", which suggests that there is still space for improvement. In order to be able to act, teachers first need to know where the problems are.

2. A word

"Since the beginnings of grammatical study in Europe, the concept of a word has been considered to be of central importance" (Trask 1995). As long ago as ancient India (Panini) and Greece (Dionysius Thrax)

* Corresponding author.
Email address:

grammarians wrote about words and even distinguished different parts of speech. The fact that the flow of language both in its written and spoken form can be divided into units called words and their classification into the basic parts of speech is one of the first pieces of “grammatical“ information pupils at Czech schools get. Most people older than seven or eight therefore believe that they know what a word is. But do they really? Linguists feel much less self-assured in this matter and they have not been able to come up a definition of a word which would be approved by all.

This self-obvious approach to words might be one of the sources of the problems learners of English face when learning new words. During their early education they do not learn much about different aspects of words and specific study of words is not usually introduced until they come to university, when it might be too late.

Another source of problems with vocabulary rests in the way students are taught. At lower levels, the presentation and also testing of vocabulary is done mainly by means of translation. The relation between the corresponding words in the two languages is often presented as one-to-one relation. At this stage of learning it is an understandable and often inevitable. Later on, however, more complex work with vocabulary, if possible based on contrastive analysis, is needed. Unfortunately, it is not often provided. In addition to other reasons, one reason is the fact that the textbooks predominantly used are textbooks published by international publishing houses, written by English speaking authors, and aimed for international use. They, therefore, cannot focus on problems specific to learners of a particular language.

3. Vocabulary mistakes

In order to be able to determine insufficiencies and mistakes, one has to know what the required standards are. To know a word basically means to know its form and its use. According to Cook (2001: 72) “words have at least the following aspects:

- form, whether spoken and written;
- grammatical properties, such as grammatical category, ‘arguments’, and idiosyncratic uses;
- lexical properties, such as word combinations and appropriateness;
- meaning, such as general and specific meaning, including components theory and prototype theory.”

Bearing this in mind the most common mistakes students participating in the project made in the area of vocabulary were classified into the following categories:

A) Mistakes in the form a word:

a) mistakes in the pronunciation:

- pronunciation of endings
- stress
- others

b) mistakes in the written form:

- problems with word formation
- others

B) Mistakes in the meaning of a word

- a) using a wrong word
- b) not knowing the word

C) Mistakes in the lexical properties of a word:

- a) wrong collocations

Theoretically, also mistakes in the grammar of words should have been included, but unlike the other areas of mistakes they were rare and therefore are not dealt with in the paper. The categories themselves are not sharply delimited and certain overlaps between them need to be expected, e.g. the use of correct collocations is not just the question of the lexical properties of a word but also of its meaning and partly also its grammar.

Since the main aim of communication, the main means of which is language, is to get a message across, the discussion of mistakes starts and the biggest amount of attention is devoted in this paper to the category of meaning.

4. Mistakes in the meaning of a word

A situation when a student starts to speak about a thing and suddenly stops in the middle of a sentence because he/she does not know the required word in English is commonplace. In such a situation it is probably better to speak of insufficiency rather than of a mistake. Nevertheless the impact on exam results and generally on communication as such can be very negative. Apart from the fact that the transfer of a particular piece of information does not occur, it can discourage the speaker from further communication, which can then indirectly affect the learning process. Students will not learn to speak unless they practice speaking, which means taking an active part in communication as often and as much as possible. As a part of teaching/learning process students should be introduced to and should practise strategies they can use to find a way around unknown words. Such strategies can include e.g. describing the meaning of an unknown word instead of actually using it, starting the idea again and rephrasing it, asking the partner in the conversation for help etc.

A different and more serious situation is the use of a wrong word. In this case students believe that they know the word and that they got it right. It is dangerous for two reasons. The mistake can be of such nature that the listener may not understand the message or may even decode wrong information, which would in both cases result in unsuccessful communication. Or the listener can, despite the mistake made, get the information right, the communication therefore being successful, but the student who made the mistake can solidify his/her wrong assumption.

Can the wrong usage of words be prevented? In order to be able to answer this question, it is first important to see what the words Czech students often get wrong are and whether certain generalizations and common causes can be traced.

The first step is an attempt to classify the mistakes in the meaning of words. The result is as follows:

A) Only partly overlapping meanings of a word in English and Czech

I like going to nature.

I am addicted to my parents.

I visited grammar school in Turnov.

Yesterday I saw on TV and I liked it very much.

In good marriage partners should believe each other.

Did you know that Jana and Jirka are husbands?

B) Completely wrongly used meaning of a word, but the correct word belongs to the same semantic field

In this way of life I manage to spare a lot of money. (save)

There's an area at the airport where you can show aircraft taking off. (view)

C) False friends

- partial: *original, serial*

- complete: *actual, gymnasium, sympathetic*

D) Confusion of words with similar forms, often derived from the same root:

sensible/sensitive, useful/usable, artistic/artificial/ technique/technology, attempt/attend

Category A was by far the most numerous. It will be dealt with in detail later. The second most numerous was category D. The mistakes included in it, however, should not be seen as a systemic problem, but as a part of the natural process of learning because it includes words which usually get special attention in English text books. The same is true about some of the false friends. Other mistakes belonging to categories B and C were individual mistakes of individual students and as such they cannot be systematically prevented.

Mistakes in category A are mainly caused by the fact that students know a word with a certain meaning in English and they see it as corresponding to a certain word in Czech. This corresponding Czech word, however, can have more than one interpretation or meaning and students automatically assume that the English word they originally learned in a different context has all the meanings, too. These mistakes are basically caused by the process of translation between the two languages. Although a lot has been said against the use of translation in

methodologies of foreign language learning, in practice it is often used. It is used by teachers, mainly at lower levels, both for the presentation and testing of new vocabulary and new structures. And it is often used by learners themselves (even at rather high levels). When these students write or even say something in English they first form their ideas in Czech and then translate them into English. This could also have been caused by the frequent use of translation at the earlier stages of learning. Davies (2000:59) warns against the use of translation as a method of presentation of new vocabulary: "it may encourage learners to think in their own language, always translating. It may also encourage learners to feel they have learnt a word or expression permanently once they have been given the translation". When students come across a word for the first time they see it in a certain context and if they are provided with the translation, then it is a translation valid just for this and only for this context. Unless they are systematically trained in the realization that the majority of words have more than one meaning, which is difficult at lower levels and thought of as unnecessary at higher levels, students might easily content themselves with the one to one relation between words in English and Czech. Their motive for doing so in the majority of cases is not ignorance but indolence. It is therefore the responsibility of teachers to repeatedly remind students of the fact that words usually have more than one meaning and that the correspondence between words in English and in Czech is usually valid only in one or several meanings but only exceptionally in all. For this purpose the activities described below might be used. Such concretely targeted practice is useful mainly on higher levels when students' language competence enables them to distinguish the fine shades of meaning.

5. Activities aimed at work with meaning

The activities described and discussed below, which are aimed at the development of students' awareness of and the right use of the interpretations and meanings of words, have been designed for the use with students at B1 to B2 level.

5.1. Work with dictionaries

The first precondition of success is effective work with a dictionary, both bilingual and monolingual. Apart from being perceptive to the form, pronunciation (including the correctly placed stress), grammar, common collocations, etc., students should be alert to the possible problems with meaning. The word addict can serve as an example. Students may meet the word for example in the following context: My best friend became addicted to drugs. They open a bilingual dictionary and find out that addicted means být závislý. This however should not be the only step students take while discovering the meaning of the word. They should also check it in an English-English dictionary. The Cambridge Advanced Learner's Dictionary (2003) offers the following definition: an addict is "a person who cannot stop doing or using something, especially something harmful". Since the main meaning is not being able to stop something harmful, it will usually be used with negative connotation. A logical question students should ask here is Can "být závislý" be used in Czech with neutral or even positive connotation? The answer is YES. One can být závislý on the parents, the partner or help of others. Is be addicted the right solution in these contexts? No. The correct English word is be dependant. Now students are ready to record the new word, but they should record it with a note that it can potentially be confused with be dependant and the explanation of the differences between the two expressions. It is naive to assume that as soon as students meet a word for the first time and they try to store it in their memory, they will remember all the possible meanings of the word. Their attention should, however, be drawn to the potential problems and confusions so that they do not form incorrect connections in their minds.

At the beginning students should be led through this procedure by their teachers. The teacher should record the mistakes students make and be aware of the words which frequently cause problems. In this category of

vocabulary mistakes it is not possible to rely on textbooks because the majority of the textbooks used are designed for international usage.

The next step is to give students pairs of sentences which contain easily confusable words - one word each. Students should discuss the meanings and differences in usage of these words. Once students are able to do this, they can be given several words out of which only a few are potentially difficult and they should be able to find the difficult ones and justify their decisions.

Collecting sentences or contexts in which distinctions between two difficult words are straightforwardly illustrated and then introducing students to them also help a lot. Such sentences and passages might be difficult to find, but once obtained, they become highly valuable.

Shortly after birth babies learn to focus their eyes, and soon instead of seeing they watch. (Lewis 1993: 68)

Work with dictionaries is important as a part of getting the meaning of a word. For the practical language use, however, presentation is not enough. Students need to be involved in practice activities in order to be able to use the words actively and automatically. Below, examples of practice activities are presented.

5.2. Fill-in activities

To facilitate the comprehension and memorization of easily confusable words, first pairs of sentences to which one and then the other word from the confusable pair needs to be filled in are used (see Fig. 1).

Figure 1

<ol style="list-style-type: none"> 1. <i>On one of her novels a famous television _____ have been based. (serial/series)</i> 2. <i>The course consists of a _____ of eight lectures. (serial/series)</i> 3. <i>How long do you have to _____ to become a doctor? (learn/study)</i> 4. <i>In Russian lessons we were forced to _____ long chunks of text by heart (learn/study)</i>
--

As a more advanced form of a gap-filling activity students are given a mixture of sentences from which the easily confusable or difficult words have been deleted and are asked to fill them back in (see Fig. 2)

Figure 2

1. *I like spending my free time outside, going for walks to the woods. So what I like about my home town is the beautiful _____ around it.*
2. *I usually do not have time to read the whole articles in a newspaper but only _____.*
3. *The first _____ I get of a person I meet for the first time is often wrong.*
4. *The prices in the shop do not _____ to the prices shown in the flier.*
5. *Mrs Black relatives initiated an investigation into her death because she died in suspicious _____.*

5.3. Correction of mistakes activities

Another kind of activity developing the comprehension of word meanings is the correction of mistakes. In the sentences in Figure 3, difficult or easily confusable words were intentionally used with wrong meaning and students try to correct them.

Figure 3

1. *My conscience is pure.*
2. *I have been finding a new job for five month.*
3. *Prior to enrolling at the university I studied at gymnasium.*
4. *I can't believe that he's still alive. All he eats and drinks is clear whiskey.*
5. *I do not know what to do with Honza. He still interrupts and it is extremely difficult to make him do anything.*
6. *The watchers rewarded the actors with loud applause.*

7. *Despite I spent there only three month I know the city well.*

6. Mistakes in the form of a word

The biggest problems with pronunciation of English words appear in the areas which are different in English and Czech. One area of potential problems is the pronunciation of endings and their distinction into voiced and unvoiced pronunciation e.g. the difference between [s] and [z] sound in plural or [t] and [d] sound in the regular form of the past simple tense. Since voiced/unvoiced pronunciation of a consonant based on the pronunciation of the previous letter is not found in Czech and moreover there exists voice neutralization which means that at the end of a word, before even the shortest pause, a voiced consonant cannot be pronounced and it has to be replaced by the corresponding voiceless counterpart, e.g. hrad [hrat], tvrz [tvr̩s], led [let] the above mentioned distinction is difficult for Czech learners. The second most common problem is correct word stress since stress in Czech is always on the first syllable or on a preposition. The last area of problems is understandably pronunciation of sounds which do not exist in Czech. This area, however, seems the least serious, because students are usually more or less successful in imitating the original English sounds.

As for the written form, the biggest problems appeared in the area of word formation. In this area three general causes of the problems might be seen. The first could be called “true friends”. These are usually words which are with a similar form used also in Czech. Such words are dangerous for students because since they can easily understand or infer their meaning, they think that they know them and therefore do not pay enough attention to their actual English form, e.g. rivalry/rivalry; recycle/recycle; evocate/evoke, Judes, analyzation, Italish.

Another area which can be distinguished in terms of certain general characteristics is the area represented by words where the derivational change is relatively small, in other words not a clear, typical suffix is added to the root or stem, e.g. complain-complaint, respond-response, refuse-refusal, etc.

7. Conclusion

The study presented here endeavored to determine the most common mistakes in the area of vocabulary Czech learners of English make so that these mistakes can be focused on and dealt with. The question still remains to what extent such results can be generalized. The outcomes from this study were compared with the book by Don Sparling *English or Czenglish?* (1989) which also focuses on mistakes Czech speakers of English make. Only approximately 30% of words listed were common to both sources. Extensive research would be needed to get any reliable conclusions.

It, therefore, stays mainly a responsibility of teachers to familiarize themselves with the most common problems their students face and design activities targeted at these “specific-to-Czech-learners” problem areas. With the development of new technologies and their introduction into education, the use of such activities is not limited to the classroom, but can be made available to students via Internet, offering not only written exercises as textbooks, but also interactive activities, immediate results and feedback, listening material and well as the possibilities to work on and solve problems jointly by means of forums.

4th International Conference on New Horizons in Education

Virtual learning styles: does gender matter?

Maria De Fátima Goulão^{a*}

^a Research Unit on Education and Training, Universidade Aberta, Rua da Escola Politécnica, 147,1269-001,Lisboa, Portugal

Abstract

Online education has its particularities, challenges and ways to face the pedagogical relationship (students/ professor/ context) associated with that. The ubiquity that the virtual space provides allows greater flexibility of time and space. This flexibility can be reflected not only in access to knowledge, but also, in the way of structuring the training and in possibility to means and methodologies best suited to the needs and ways to students reach the knowledge (learning styles). Our results point out to the predominance of type A, called participatory use style in virtual space. We found significant differences between genders.

Keywords: learning; online learning; learning styles; virtual space; gender

1. Introduction

The formal content's learning is a very complex phenomenon. This complexity lies not only with the nature of the content, but also with the system in which such expertise are taught and still, but not least, with factors related to the individual. Each person has a specific and usual stand facing a learning situation. Research in education long since have demonstrated that different people have different forms and rhythms to learn (Kolb, 1984, Kolb & Smith, 1996). These typical ways of perceiving and process new information, are what, in the literature, is known as *learning styles*.

The system in which contents are conveyed also has influence on the learning process. We are witnessing today, an increasing use of ICT, the Internet and Virtual Spaces in the field of education. The features of these systems pose challenges not only to the type of content that can be served, but also to the teacher and student's role. The pedagogy inherent to them requires a redefinition of some of these roles and implies an alert for certain features and forms to address the virtual space. Therefore, it is necessary an adaptation of the classic learning styles for this new reality – Styles of virtual space use (Barros, 2012) to fit the form to transmit information to the styles of each.

1.1. The meaning of learning

Learning is, without a doubt, one of the most complex human phenomena, due to the quantity and diversity of variables and also to the relationships involved. Understand how individuals appropriate the knowledge is a key to educational development.

For a long time this topic has been discussed and demand for answer to this question has gone through various phases. Thought and research's currents that have guided this subject were not always peaceful, having

* Corresponding author. Tel.: +351 966050021

E-mail address: fatimapgoulao@gmail.com

been big differences. According to Illeris (2007) the term learning means *any process that in living organisms leads to permanent capacity change and which is not solely due to biological maturation or ageing* (p.3). Although the learning process is something that occurs inside the individuals, it cannot be considered as a process entirely individual. Rather, the learning process is closely related to the social context where the subject is inserted and come from him or her impulses and needs to learn what is required and conditions how it should be done (Illeris, 2007). In other words, associated with this process are two main concepts - interaction and acquisition. The first concerns the interaction that occurs between the subject and their environment. The second is a process conditioned by internal impulses and influences the interactions established.

The notion of *learning process* began as a process of *acquiring responses*, in which learning was seen as a simple mechanical process where the environment determined the association between stimulus and response. The individual plays, in this process, a passive role and the learning achieved are synonymous with increased right behaviors.

Acquisition of responses' concept was overtaken by the notion of *knowledge acquisition*. The learner begins to gain prominence. This is now seen as an information processor that does not respond directly to the real world, but in the subjective representation of it. The focus is, in this perspective, placed in internal processes, mediators between stimuli and response. The studies undertaken in this direction were synonymous with knowledge acquisition.

The *construction of meaning* is the perspective that aims to explain the learning process (Bourgeois & Nizet, 1999). For these authors, learning is not just a direct link between stimulus and response, but requires the construction of *structures* through reflection and abstraction. This line of thought places emphasis on the construction of meaning in the whole teaching and learning process. Centering on the importance of teacher competences and teaching methodology designed stops, in the constructivist perspective, making sense and emphasis is now placed on the importance of prior knowledge. The capacity of development of the subject, to make significant learning by itself and develop the ability to "learn to learn" is extremely important in this line of thought. The discovery of the person as the center of the learning process and, with it, promoting individual autonomy in this process should be primary tasks in nowadays, because this constantly changing society does not tolerate passive people.

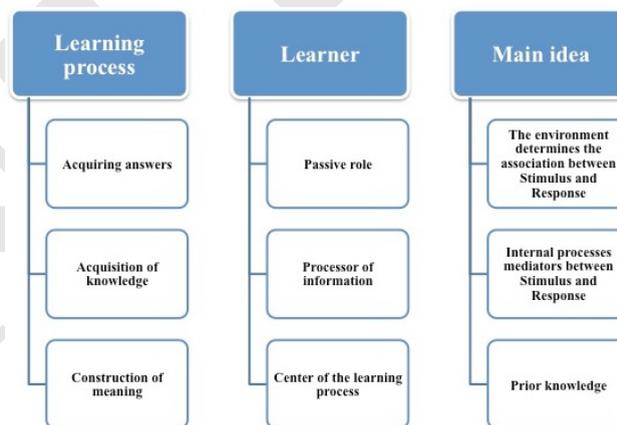

Fig. 1. Summary of the main aspects of the learning process

Briefly, we can say that in a learning process we must take into account the results of this process, what has changed internally by the subject, the way it was processed, the mental processes that took place within the subject and which led to the results. Finally, we have the interaction processes that occur between the individuals, the contents/material and social environment in which they act. The materials or the social environment are directly or indirectly factors conditioning the learning process and finally of learning. That is, learning should be seen from this dual perspective - individual and social, because learning to occur among people has a social character.

1.1.1. The Learning Styles

If need to know how individuals learn is a concern for those who are dedicated to these issues, interpret the differences in each subject during the learning process has also been a phenomenon that made those who are dedicated to it think so much.

The ineffectiveness of education may have its origin in the lack of information on how the individuals perceive, process and retain information.

Nowadays, we know that people have different ways and rhythms to learn. These typical ways of perceiving and processing the new information is what is called *learning styles*. Psychologists, which investigate these individual differences defined the *learning styles* as a tendency to approach cognitive tasks through the use of a preferred strategy or a set of strategies (Kolb, 1984; Kolb & Smith, 1996; Goulão, 2002; Goulão 2008). These are the result of cognitive, emotional, physiological and cultural characteristics which indicate a relatively stable perceives as a learner interacts and responds to the learning environment. In other words, learning styles define the usual manner or characteristic way a learner has to respond to the learning tasks.

Countless experimental studies have shown that students learn better if they used the *correct methods*. We understand that *correct methods*, those that are more according to the learning style of the subjects. In other words, knowing there are different learning styles, by itself, is not the most important. What gives it value is, thereafter, to organize teaching so that all styles are included in a particular learning environment. The learning environment includes the materials, how to teach, the teaching strategies, the materials that support this teaching, the framework in which this activity is happening (Goulão, 2009).

1.1. The Virtual Learning Space

Technological development, as well as the demands of society and the labor market urge to the change of learning environments. The virtual learning environments promote a more active role on the part of students in the construction of their own knowledge (Goulão, 2010). These same environments comprise different formats to support learning that allow a more appropriate choice according to the contents to be transmitted and the learning styles of each.

The research work of Azevedo & Cromley (2004) points to the implications the design of virtual learning environments has for the acquisition of knowledge. It follows, on one hand, the need of teachers being aware of this situation and look to train their students so they regulate their learning. On the other hand, at the environments' designers level so they conceive structures that allow students to proceed to their learning self-regulation.

The school has gained a new dimension and practices that grow in it, as well as the roles assigned to their agents (teachers and learners) also gain a new dimension (Goulão, 2012a).

Associated with virtual learning environments, we find three essential concepts: adaptability, mobility and cooperation. This means that the incorporation of ICT in the educational context, using the virtual spaces, allows a more effective response to the educational challenges by allowing using strategies and tools that best fit to the real needs of their learners. Among them we highlight its learning style. In the mobility concept, we have the flexibility that is experienced in this type of environments and lets you find the information in any area and at any time, freeing learners from the constraints of space and time. Finally, cooperation brings us to the possibility of building networks and knowledge with subjects that do not need to be physically present. Here we have a double advantage. On one hand, to allow responding to individual needs of learners, and secondly, to allow the organization of people in working groups, which lead to the collective construction of knowledge (Barros, Miranda, Goulão, Henriques, & Morais, 2012).

1.2.1. Virtual Learning Styles

Currently, the Internet is a huge repository of information that one can access according to their needs, in turn, bind to aspects of time, context and characteristics.

How you can use this virtual space for learning? As we saw in the discussion about learning styles is its emphasis on the way we work the information as we have mention throughout this section, information is an element that characterizes virtual environments. However, the way this information is available can be very diversified. With that, it is appealing to different individual characteristics and forms of behavior that can be diversified. Will all people look for information in the same way? How the human mind explores the virtual space? Barros (2012) proposes a model that aims to study how people interact with the virtual space and how this can be used for learning. This author defines 4 different ways to use the virtual space - *Styles use the virtual space* that can be identified as follows – Table 1

Table 1. Definition of the Virtual Learning Styles

Style	Definition
Style A <i>Use participatory in virtual space</i>	Using methods and materials that put primacy in contact with groups online, requesting seek situations online. Need to perform group work, participate in discussion forums and give actions to the materials developed.
Style B <i>Use and research in virtual space</i>	Selection and organization of content as form of the user to learn. Learning materials should be facing to construction and syntheses covering the research of a content.
Style C <i>Structuring and planning in virtual space</i>	Develop activities that enhance the applications to develop content and planning activities.
Style D <i>Style of concrete action and production in virtual space</i>	Using the virtual space as a space of action and production

How to predict different styles of use of virtual space to resend different ways to achieve the process of browsing and use of the tool (Miranda, Morais, Goulão & Barros, 2012).

1.2. Purpose of study

The aims of our study were: a) to identify students' profiles that use the virtual space in the online context and, b) to verify if there were differences in those profiles, in terms of gender.

2. Method

2.1. Participants

A total of 100 students participated as volunteers in the survey. 27% are males and 73% are females, had a age range of 18 – 56 years (Av. = 32.1; SD = 11.26).

76% of the participants have been using Internet for more than 5 years and 87% of them use the Internet every day. Our participants use, generally, the Internet at *home* – 59.9% - but also at *University/at Work* – 33.1% - and *in other places* – 7%. They use it *to search for information* (25%), *to communicate* (22%), *with educational purpose* (21.5%), *to work* (16%) and also as *a form of entertainment* (15.7%).

2.2. Instrument

Data collection was made through a questionnaire composed of 3 parts.

Part	Objectives	Questions
I. Identification	Identification of the sample	4 questions
II. Internet usage	Questions to characterize the use made of the Internet	4 questions
III. Virtual Space usage	Identification the users' profile of virtual learning space	40 statements

Table 2. Questionnaire

In Part II of the questionnaire, the question about the number of years of Internet use was asked to indicate only one of the hypotheses. In the remaining questions it was possible choose more than one hypothesis. In Part III we used the questionnaire *Styles Using the Virtual Space* (Barros, 2012). Participants should only indicate the statements that were consistent with their style of using virtual space.

2.3. Procedure

Participants were asked to complete the questionnaire at their own place and online. All responses were anonymous.

2.4. Data analysis

We proceeded to the analysis of participants' responses according to the type of questions. It was the purpose of this research to examine sex differences. To analyze the behavior of the sex variable we used the T test (t-student).

3. Results

3.1. Virtual Space Style: General results

Now, we will do the analysis of the usage profiles of the virtual space. As we saw earlier, theory points to 4 styles using the virtual space. We will see how it behaves in the sample, overall, with respect to this variable. The results obtained are shown in Table 3.

Table 3. Distribution of Internet usage profiles

	Profile of use of the Virtual Space A	Profile of use of the Virtual Space B	Profile of use of the Virtual Space C	Profile of use of the Virtual Space D
N	100	100	100	100
Mean	4.59	3.38	3.01	2.46
Std. Deviation	1.891	1.819	1.850	1.604

As can be seen there is a style that stands out compared to others. We have a predominance of the style A, for the others. The D style is the one with a lower value.

3.2. Virtual Space Style: Results by gender

In this space we will present the results obtained for the study of the usage profiles of the virtual space taking into account the variable gender.

Table 4. Distribution of Internet usage profiles by gender

	Gender	N	Mean	Std. Deviation
Profile of use of the Virtual Space A	Female	73	4.25	1.899
	Male	27	5.52	1.553
Profile of use of the Virtual Space B	Female	73	3.08	1.689
	Male	27	4.19	1.942
Profile of use of the Virtual Space C	Female	73	2.62	1.587
	Male	27	4.07	2.111
Profile of use of the Virtual Space D	Female	73	2.22	1.493
	Male	27	3.11	1.739

As it can be seen, although there are differences in the averages in the two genders, the profile pattern maintains. In other words, the profile of most common use in both genres is A. However, it is noted that, despite the existence of the same standard average score on each profile, depending on the gender have values quite different.

To test if the differences found in the averages are statistically significant, for a significance level of at least 5%, we proceeded to calculate the statistic *T Student*. For this we have the following hypotheses:

H_0 = The average differences, in the different usage profiles of the virtual space, between men and women are not statistically significant.

H_1 = The average differences, in the different usage profiles of the virtual space, between men and women are statistically significant

The results, as well as the level of significance are presented in Table 5.

Table 5. Students T test results and their significance levels

	<i>T</i>	df	Sig.(2-tailed)	Level of significance
Profile of use of the Virtual Space A	-3.114	98	.002	<i>S</i>
Profile of use of the Virtual Space B	-2.782	98	.006	<i>NS</i>
Profile of use of the Virtual Space C	-3.717	98	.000	<i>S</i>
Profile of use of the Virtual Space D	-2.362	98	.013	<i>NS</i>

From the values obtained we can say that there are statistically significant differences in the use of Styles Virtual Space A and C, between men and women, with a confidence level of 98% and 100%, respectively.

To complete our analysis we verify that there is a dependency between the different styles Using Virtual Space and the variable gender. Our study hypotheses were as follows:

H_0 = The use of different styles Using Virtual Space and gender of the participants is independent.

H_1 = Exists dependence between the use of different Styles Using Virtual Space and gender of the participants.

To study this dimension we used the Kruskal-Wallis test, for a significance level of 5%. The results obtained are shown in Table 6.

Table 6. Test results and respective decision

Null Hypothesis	Sig	Decision
The distribution of Profile of use of the Virtual Space A is the same across categories of Gender	.005	<i>Reject the null hypothesis</i>
The distribution of Profile of use of the Virtual Space B is the same across categories of Gender	.053	<i>Accept the null hypothesis</i>
The distribution of Profile of use of the Virtual Space C is the same across categories of Gender	.000	<i>Reject the null hypothesis</i>
The distribution of Profile of use of the Virtual Space D is the same across categories of Gender	.071	<i>Accept the null hypothesis</i>

The results confirm the existence of a relationship of dependence between the Styles using Virtual Space A and C and the gender of the participants. The same is not true with respect to Styles Using Virtual Space B and D.

4. Discussion

As we previously said, the aims of our study were: a) to identify students' profiles that use the virtual space in the online context and, b) to verify if there were differences in those profiles, in terms of gender. The results obtained through our questionnaire allow us to establish the existence of different styles of virtual space usage. Among them we highlight the style A that is defined by *the using methods and materials that put primacy in contact with groups online, requesting seek situations online. Need to perform group work, participate in discussion forums and give actions to the materials developed.*

Regarding the second part of our aim that aimed to verify that there were differences in the use of styles depending on the gender of the subjects we found that, although there is a pattern common to both genders, there is a dependency relationship between Styles of Virtual Space usage A and C and the gender of the participants. In other words, the fact that the individuals chose these two styles are not independent of their being men or women. This relationship is also confirmed by the statistically significant differences between the means of these two styles for the gender of the subjects. Women have a lower average in both styles. These results confirm findings from previous studies that point to significant differences in learning styles (Garland & Martin, 2005; Philbin et al. 2005; Wehrwein, Lujan & Di Carlo, 2007; Goulão, 2012c) and the use of virtual space, by men and women (Lee, 2002; Barrett & Lally, 1999; Yukselturk & Bulut, 2009).

5. Conclusion

Today we live in a society that appeals to competencies that enable individuals to adapt quickly and effectively to new challenges. In this sense, research has shown the importance of encouraging our students to control their learning process. Notes the impact of a pedagogy increasingly personal, social and participatory (McLoughlin & Lee, 2010).

The introduction of ICT in formal education system allows the introduction of new tools in this context and with this new scenarios and new purposes.

These new scenarios allow responding more effectively to the particular characteristics of the subjects, in particular, their learning style. This implies a formal structure of the virtual space in what concerns the type of learning materials, as well as the activities to be provided, which should be diversified in order to meet the different learning styles of students. It must be included diverse strategies to respond to individual differences, the rhythms and styles of learning.

The impact of learning styles in teaching/learning process remains a topical issue. The environments in which this process occurs are constantly changing and how they can maximize to meet the individual characteristics of learners is extremely important in the educational field. The results of our research showed, in general terms, that there are different ways to use and work with the information and resources available on the Internet. In more particular, we have found an accentuation in the use of certain styles depending on the kind of subjects.

To improve the learning process it is necessary to create environments adapted to the needs and characteristics of their users. For a teacher using virtual learning environments, knowledge of the learning style of the students is extremely important (Manochehr, 2006). The virtual space, by definition, makes possible new ways for students to interact with information and, consequently, new ways of learning (Barros, 2012). It is the job of teachers who work in these environments, to help learners to manage these situations. For this purpose, the knowledge of the different styles of the virtual space usage is a precious help to be able to design learning environments that best fit the needs and styles of use of subjects.

Virtual tools: virtual laboratories for experimental science – an experience with VCL tool

José Miguel Molina Jordá^{a,b*}^a*Departamento de Química Inorgánica, Facultad de Ciencias, Universidad de Alicante*^b*Instituto Universitario de Materiales de Alicante, Universidad de Alicante*

Abstract

A fundamental aspect within the configuration of the new European Higher Education Area (EHEA) is that students play an active role in their own learning process. On this educative model of academic formation, the teacher participates as a guide during the teaching-learning process of the student and so he or she must apply constructivist learning models in which new technologies are substantially present. In this regard, the use of tools such as virtual laboratories (which can be found as interactive resources on the web or in digital format from several publishers) can be very effective, for they allow the student to approach real systems and do research on their behaviour with regard to the modification of certain parameters. An experience on the use of the VCL tool on several Chemistry classes will be presented in this contribution. These resources are very useful for the acquisition of several competencies not only when used as teaching materials, but also when integrated as part of the teaching methodology, on an environment of face-to-face or virtual classes, thus reinforcing the teacher-student cooperative work within a constructivist learning context.

Keywords: tutoring; virtual tools; virtual laboratory; cooperative work; teaching material; constructivist learning.

1. Introduction

1.1. Question posed

The EHEA setting poses an important challenge on the academic environment at the university level, since it demands a methodological change on the complex teaching-learning process. This new horizon makes it clear that this process is focused on students and their own role in the learning process, as well as on the acquisition of competences. In this way, students assume a very active role in their training and acquire responsibility towards themselves and their learning process. Only then can one of the biggest challenges of this new teaching-learning paradigm be achieved, which is the students' acceptance that this process must continue through life and it is not to be restricted to their time spent behind the university walls. Within this context, finding tools that can be implemented in the teaching methodology is very useful, so they reinforce that necessary sense of responsibility in the student and provide him or her with the necessary learning autonomy that he or she must develop through life. In this respect, virtual laboratories are very useful, since they can either be used as a tool for support and reinforcement so students make the most of their knowledge, or they can be implemented as a teaching resource in expository class sessions in order to encourage a participatory, constructivist environment. In addition to that, the acquisition of competences in the use of ICT (Information and Communication Technologies), which are of the outmost importance for the students training, is enhanced through the use of virtual laboratories.

1.2. Contextualization of the question posed

In the Prague communiqué (2001), there is a reference to this type of permanent learning pursued by the EHEA, which is based, to a great extent, on the use of ICT: 'Lifelong learning as a key factor in the EHEA, given that, in the future Europe based on a knowledge-driven society and economy, the strategies to learn throughout life will become more necessary in order to confront the challenges of competitiveness and the use of ICT.'

According to J. Salinas (2004): 'The training methodologies relying on ICT lead to new conceptions of the teaching-learning process that enhance the learner's active involvement in the learning process; the attention to the emotional and intellectual skills at different levels; the preparation of young people to take responsibilities in a rapidly and constantly changing world; the students' flexibility to enter a workplace that will demand lifelong learning; and the necessary competencies for this continuous learning process.' These quotes point out the importance of the continuous renovation of knowledge and of the correct use of the technological means available. These new technologies are very diverse and their incorporation into the classroom is subjugated to some criteria, according to Sangrá and González Sanmaned (2004): 'Two core elements are necessary for the integration of ICT to become a functioning reality that provides added value: the first one being a reorganization of the institutions that endows those technologies with the necessary agility to respond to the last demands of the society of information and knowledge, and which allows them to provide the requested support to be able to enhance teachers' work. The second one, the development of teacher training programs which fill the current gaps in the field and ensure that teachers are trained to properly use ICT resources in their classrooms.'

Overall, the advantages of integrating ICT in university teaching are, among others, the following (Díaz (2004), Rosado (2005)):

- Increasing methodological diversity.
- Increasing accessibility and flexibility.
- Promoting the student's leading role.
- Improving the presentation and comprehensiveness of certain types of information.
- Encouraging cooperative work.
- Improving individual work.
- Gaining access to new environments and situations.
- Optimizing resources and costs.

ICT play a key role in the practice of this conception of the learning process focused on the learner, since they can constitute learning experiences related to open problems and tasks that require a critical and reflective thought (Alba Pastor (2005)). These technological tools allow the student to enhance his or her responsibility in the search of materials and documentation beyond class notes, and they provide key support for the student's experimentation of his or her own learning process

ICT, as this paper attempt to demonstrate, offer a wide range of possibilities and are very diverse in nature. In the present work we will focused on one of them, Virtual Laboratories or IT tools that simulate a test laboratory from a virtual learning environment. As we have seen, the cause for Virtual Laboratories basically emerges from the need to create student support systems for their laboratory work with the objective of optimizing the time spent on doing those tasks. Nevertheless, the concept of Virtual Laboratory has been expanded throughout the last two decades (Gámiz Sánchez (2009)):

The doctoral thesis '*Modelo de Referencia de Laboratorios Virtuales y Aplicaciones a Sistemas de Tele-educación*' (Rodrigo (2003)) ('Reference Model of Virtual Laboratories and Applications to Tele-education Systems') gathers most of the historical review related to laboratories. In this regard and to summarise, the following must be noted:

- 1984: the concept of virtual tool appears as an instrument;
- 1992: the term 'virtual laboratory' is coined to refer to a tool used for the development of a simulation laboratory;
- 1994: a study conducted by the Vanderbilt University in USA is presented. In this study, a virtual laboratory is designed, based on simulation, as a support tool to traditional laboratory work, and it concludes with this tool's need to learn the basic abilities and the operation of the equipment, which contributes to optimize students and laboratory personnel's time;
- 1995 – 1996: several works appear. They defined the requirements and necessary components for the success of a virtual laboratory and of any other distance learning system;
- 1997: A review of the rules related to virtual instruments appears in the IMTC conference. This same year, researchers from the Illinois University present a complete electronic instrumentation laboratory available to users through the Internet. This is the first *virtual laboratory with electronic instrument remote control in operation*;
- 1998: A detailed model of a virtual simulation laboratory is described in the IMTC conference and the associated ETIMVIS'98, as well as a teaching laboratory proposal in which students use virtual tools to make their experiments.

- 1999: A detailed explanation on how to set up a virtual laboratory with available commercial elements is described in the IMTC, together with the basic requirements to confront when thinking about designing a virtual laboratory;
- 2000 – present time: Awareness of the importance of virtual laboratories on several teaching fields is increased and diverse virtual laboratories are described in conference articles and magazines, where different methods used in the development of virtual laboratories are described in detail, and possible solutions to improve or implement the performance of virtual laboratories are commented.

2. Methodology

2.1. Contextualization of the question posed

The study of the implementation of the ‘Virtual Chemistry Laboratory’ (VCL) tool within the teaching methodology was carried out during the academic years of 2010–2011 and 2011–2012 with reduced groups (< 15 students) in the following subjects:

- i) ‘Introduction to Materials Science’, a third-year subject from the Chemistry Science Degree of the University of Alicante, with 6 theoretical credits and a practical credit (years 2010 – 2011 and 2011 – 2012);
- ii) ‘Solid-state Chemistry’, a six-credit elective subject from the Nanoscience and Molecular Nanotechnology Master’s Degree of the University of Alicante (year 2010 – 2011).

2.2. Materials

The tool ‘Virtual General Chemistry Laboratory’ (VCL), corresponding to a Prentice Hall’s publication, edited by the Pearson Publishing company on its 3rd edition from 2009 with ISBN: 978-607-442-210-8, has been chosen for this work. This tool is highly versatile as far as its scope of application in a classroom is concerned. This publication provides a VCL installation CD and a paper guide for the execution of each practical session proposed.

Fig.1. (left) ‘Virtual General Chemistry Laboratory’ book cover (ISBN: 978-607-442-210-8); (right) its corresponding CD where the VCL computer program is found for the virtual experiences.

This tool has a package of realistic and complex simulations that encompasses the different experiences that can be carried out in a general chemistry laboratory. In these laboratories, students enter a virtual environment where they are free to make choices and decisions similar to those confronted in an actual laboratory. At the same time, students can experiment the consequences of a good practice or a malpractice in laboratories. Experiments include simulations of qualitative inorganic analyses, fundamental experiments of quantum chemistry, properties of gases, titration experiments, scanning calorimetry, organic synthesis and qualitative organic analysis.

2.3. Instruments

The instrumentation of Virtual Laboratories in the classroom can vary depending on the type of virtual tool we are talking about. Thus, implementing a virtual laboratory tool that is available as a free and toll-free program (free online software) can be relatively easy. However, if it is not a free license program like the one used in this work, the economic factor, so important given the current situation, must be taken into account. The user license for ‘Virtual General Chemistry Laboratory’ (VCL) is acquired when buying the book. If the methodology to be implemented involves using this tool in the classroom in an expository context, this expense is economically viable since each unit costs a little amount of money making it affordable for any institution. Nevertheless, if the aim is to provide a tool for students to be able to work from home, the purchase of so many programs as students

enrolled is not viable. On the other hand, it is more viable to negotiate the purchase of multiple licenses with the publishers (each publisher has its own policy on this regard).

2.4. Procedures

In this study the VCL tool has been exploited in two aspects:

- On the one hand, it has been included as a fundamental element in the explanation of new chemistry concepts in the classroom; to that end the tool has been introduced to the students and it has been used for the execution of several experiences. Afterwards, a debate on the issue has been generated.
- On the other hand, the program has been provided to a small number of students (10 in total), so they could assess from home its utility as reinforcement to the practical sessions of the different subjects and to the concepts seen in class.

In particular, the experiences for which VCL tool has been used are the following:

- a) Experiences carried out in the classroom in the context of expository sessions: i) Thomson's cathode ray tube experiment; ii) Rutherford's scattering experiment; and iii) boiling point elevation.
- b) Experiences carried out by the students: i) counting of protons, neutrons and electrons; ii) specific heat of aluminium; and iii) freezing point depression.

Students were handed out an anonymous survey in order to collect their opinions with regard to this tool. The results are presented in the following report.

3. Results

The use of this tool both by the teacher in the classroom and the students at home has generated the following results explained in detail. Teacher's opinions derive from: i) his experience with the VCL tool inside the classroom, based on his perceptions with respect to the students' response, both in the required time for the understanding of the concepts explained and the opinions obtained from the debate generated around the question posed; and ii) the perception in the students' use of this tool at home based on the resolved tutoring sessions, doubts in class; etc. On the other hand, the students' criteria with respect to this tool, innovative for them while offered by the teacher for free-use at home, have been collected in the form of an anonymous questionnaire.

- **Teacher's opinions**

In general, the use of this tool has been very favourable. The advantages of its use in the classroom are multiple since it is a tool that provides a lot of visual information (hence, direct reception), interactive (it holds both the teacher's and the students' attention for the achievement of the different steps required for the accomplishment of a experience) and produces immediate results, exempts from the circumstantial problems which often arise in an actual laboratory (this makes it perfectly possible for the teacher to plan and schedule the activity in terms of time used in the classroom). However, this tool is not exempt from some disadvantages. Advantages and disadvantages of using VCL detected by the teacher are collected in the following charts:

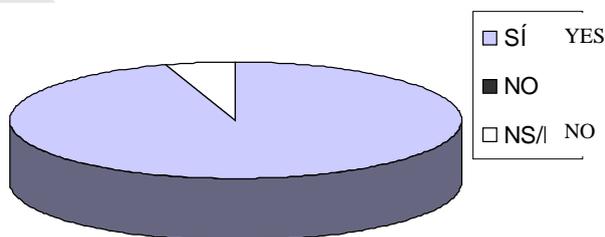

Table 1. Compilation of advantages and disadvantages of using the VCL virtual tool, according to the teacher's opinion, both for its use in the classroom and the use made by the students at home.

Use in the classroom by the teacher	
For the teacher	
Advantages	– possibility of adding laboratory experiences in the classroom – perfect time control of the experiences, since there is no risk of experimental error
Disadvantages	– the activities require extensive planning and a significant investment in time to prepare – it creates a situation of dependence on computer tools
For the students	
Advantages	– better understanding of the topics covered by relating them to experiences – greater ease in relating phenomena and theories
Disadvantages	– lack of interaction with the experience
Use at home by the students	
For the teacher	
Advantages	– it helps to avoid overlapping with the practical sessions of other subjects – it reduces costs and assemblages, being a cheap and efficient alternative to an actual laboratory
Disadvantages	– heavy dependence on computer tools
For the students	
Advantages	– there is no risk involved in experimenting – absolute time flexibility to perform the exercises – it is a self-learning tool
Disadvantages	– misjudgement of the laboratory circumstances

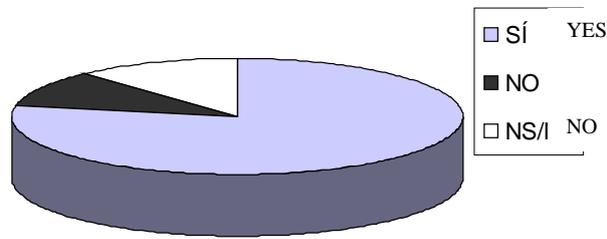

- Students' opinions

Students filled up a simple questionnaire voluntarily and anonymously, in which they were asked questions related to their opinions on the use of the VCL virtual tool. The questions posed and the graphics created according to their answers given are presented below.

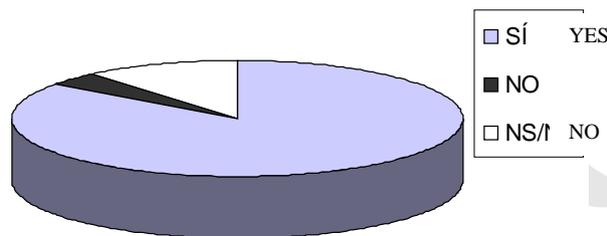

- a) Has the use of the VCL virtual tool contributed to understand the concepts explained?

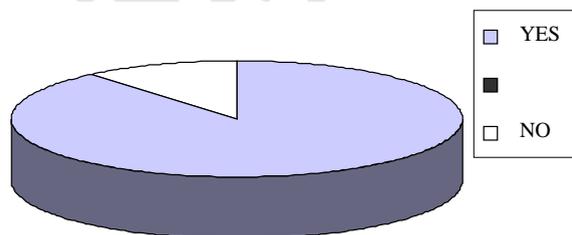

b) Has the use of the VCL virtual tool served to optimize your study and learning time, reducing considerably the time spent on each studied concept?

c) Has the VCL virtual tool helped your self-learning?

d) Do you think that the VCL virtual tool can be useful at an interdisciplinary level for other subjects dealing with the studied concepts?

4. Conclusions

Generally speaking, the use of the VCL virtual tool has produced very positive results, both in its implementation in expository lectures in the classrooms and in the students' use of this tool from home. Nevertheless, while it is true that it is not free of some inconvenient, it provides multiple advantages as it is demonstrated by the results obtained from all the experiences collected by the teacher and from the survey handed out to the students. Any virtual laboratory tool that can be tested positively can be considered an extremely favorable methodological tool in the EHEA context, since it encourages, among other things, students' active participation in a constructivist environment and self-learning. Moreover, it is a perfect complement to the actual laboratory experiences, but never a replacement.

Abstract

Low self-efficacy and academic motivation have been adduced for poor performance of students by teachers and educators. Determination of effective factors on vocational self-efficacy and academic motivation levels of technical and **vocational pre-service teachers** can be useful in order to improve better training programs and academic performance. In this study a group of technical education faculty seniors' vocational self-efficacy and academic motivation levels were studied. The aim of the study was to identify the effective factors on vocational self-efficacy and academic motivation levels of **technical and vocational pre-service teachers**.

Keywords: Pre-service teacher, vocational self-efficacy, academic motivation.

1. Introduction

Low self-efficacy and academic motivation have been adduced for poor performance of students by teachers and educators. It is observed that pre-service teachers as being seniors of technical and vocational education faculty have similar motivational and vocational self-efficacy problems. Self-efficacy determines how people feel, think, motivate themselves and behave (Bandura, 1994, 1997). Self-efficacy is defined as people's beliefs about their capabilities. Such beliefs produce these diverse effects through four major processes. They include cognitive, motivational, affective and selection processes. Students with low self-efficacy believe that cannot be successful and thus are less likely to make any effort. They consider that challenging tasks as treats that are to be avoided. Students with high self-efficacy are more likely to challenge themselves with difficult tasks. They are intrinsically motivated (Bandura, 1993). Motivation is another important issue and studied for years by researchers (McClelland, Atkinson, Clark & Lowell, 1953; Atkinson & Feather, 1964). In this study, motivation is examined within the framework of self-determination theory (Deci, 1975; Deci & Ryan, 1985). According to self-determination theory (Deci & Ryan, 1985), there has been a dialectical relation between people, as innately active organisms, and the social environment. In this theory, humans are assumed to be active, growth-oriented organisms that have an innate desire for stimulation and learning from birth, which is either supported or discouraged within their social environment (Deci & Ryan, 1985; 2000). Within the social environment people attempt to satisfy their three basic needs. These three innate or fundamental psychological needs are competence,

* Corresponding author. Tel.: +90 532 3627778; fax: +90 216 337 89 87.

E-mail address: mhulya@marmara.edu.tr

autonomy and relatedness (Ryan & Deci, 2000). In this theory; at the end of the interaction between these needs and the environment three specific types of motivation are differentiated: firstly; intrinsic motivation, secondly; extrinsic motivation and thirdly; amotivation. From different kinds of definitions, motivation has been conceptualized with regard to inner forces, enduring traits, behavioral responses to stimuli and sets of beliefs and effects (Evans, 2000). Practically, motivation is also known as academic engagement and is identified as the most influential of all the factors that affect student performance (Francis et al., 2004). A child that is academically motivated wants to learn, likes learning-related activities and improves academically (Cunningham, 2003). Many factors influence the development and use of motivation strategies of students (Ellis & Worthington, 1994; McCaslin & Hickey, 2001; Pintrich & De Groot, 1990; Pintrich, & Schunk, 2002; Renchler, 1992; Winne, 2001; Zimmerman, 1990, 1994, 2001). One such factor is the student's perception of themselves as being intrinsically or extrinsically motivated to engage in learning activities within educational environments (Barron & Harackiewicz, 2001; Elliot & Thrash, 2001). Aksan and Koçyiğit (2011) studied with a group of Turkish students and they found that self-efficacy levels of students were very low. From this result, it can be implied that the students also have academic motivation problems. In another study, Turkish teachers and school counselors reported that low academic performance, motivational problems and test anxiety are very common in today's classrooms (Uzbaş, 2009). It is observed that pre-service teachers (seniors of technical education faculty) have also similar problems. Unwillingness, low expectation for the future and low motivation were very common among pre-service technical teachers. A group of seniors expressed themselves that they do not feel ready for the teaching profession. Such kinds of data demonstrate a need to examine pre-service teachers' self-efficacy and motivational problems. The aim of this study is to examine the impacts of demographic factors on pre-service teachers' self-efficacy and academic motivation levels. It may contribute to perform an integrated study with all the possible basic factors which affects self-efficacy and motivation.

2. Method

2.1. Participants

In this work, study group of this research consisted of 404 seniors (pre-service teacher) from Technical Education Faculty of Marmara University, Istanbul, Turkey. Data were gathered within two semesters; 2011-2012, autumn and spring. All group consisted of seniors. Participation was arranged voluntarily, with informed consent in the classroom environment. Students were recruited without regard to gender. Instructions were read aloud by trained proctors before students began responding. Sufficient time was provided for all students to complete each instrument.

Table 1. The demographic characteristics of Participants

		Frequency	Percent	Valid Percent	Cumulative Percent
Gender	Female	233	57,7	57,7	57,7
	Male	171	42,3	42,3	100,0
	Total	404	100,0	100,0	
Age	19-21	68	16,8	16,8	16,8
	22	129	31,9	31,9	48,8
	23-25	177	43,8	43,8	92,6
	26	30	7,4	7,4	100,0
	Total	404	100,0	100,0	
Field	Textile teacher	303	75,0	75,0	75,0
	Computer teacher	101	25,0	25,0	100,0
	Total	404	100,0	100,0	

Average age was 22 (range=19-35, mean=22.93, Std. dev. =1.89, min. =19, max. =35). 43% of the participants were male and 57% were female. 25% were computer pre-service teacher and 75% were computer pre-service teachers as can be seen in Table 1 above.

2.2. Measures

A twelve item questionnaire was used to gather demographic variables. This questionnaire included questions relating to age, gender, and field, academic achievement level, whether he/she was happy from his /her school and whether the school was chosen by himself/herself or not. Academic achievement levels of students' were assessed via a self- determination question. Additionally, a self-efficacy scale for computer teachers', a self-efficacy scale for textile teachers' and an academic motivation scale were used in this study. Totally, test sets consisted of two scales and one questionnaire for each participant.

2.2.1. Teacher Self-Efficacy Scale (TSES)

Pre-service teacher self-efficacy scale assessed via two different Turkish scales in this study. One of them was originally developed for computer education department's seniors (Akkoyunlu, Orhan & Umay, 2005). Second form adapted from this original form for textile education department's seniors by researchers. The scale consists of 12 items. Responses were based on a five-point scale from 1 (never) to 5 (almost always). Students were asked to indicate the degree to which they agreed with the statements, for example, "I feel myself adequate to motivate my uninterested students for courses in classroom". Cronbach's alpha for this sample was 0.79 (N=404, n=12) in this study.

2.2.2. Academic Motivation Scale (AMS)

The AMS (Vallerand et al., 1992; 1993, Ünal-Karagüven, 2012) consists of 28 items and seven subscales. The AMS was developed within the framework of self-determination theory (Deci & Ryan, 1985). The scale is divided into seven subscales, reflecting one subscale of a motivation, three subscales of intrinsic motivation and three subscales of extrinsic motivation. Seven subscales names; Motivation to Know (IMTK), Intrinsic Motivation to Accomplish (IMTA), Intrinsic Motivation to Experience Stimulation (IMES), Extrinsic Motivation External Regulation (EMER), Extrinsic Motivation Introjected Regulation (EMIN), Extrinsic Motivation Identified Regulation (EMID) and Amotivation (AMOT). The items are rated on a seven-point scale, ranging from 1 (does not correspond at all) to 7 (corresponds exactly). Examples for the items; "Because I experience pleasure and satisfaction while learning new things." and "I don't know; I can't understand what I am doing in school". Only five subscales were used in this study, these were; IMTK, IMTA, EMIN, EMID and AMOT. Each subscale consists of four items; thus, subscale scores can range from four to twenty-eight. A high score on a subscale indicates high endorsement of that particular aspect of academic motivation. College version of the AMS was used in this study. Cronbach's alpha was 0.89 (N=404, n=28) for this group.

3. Findings

Table 2 presents, sample sizes, means, standard deviations and inter correlations among variables used in the study. As can be seen in Table 2, all inter correlations among dependent and independent variables are significant and mostly positive. As can be seen in column 7 vocational self-efficacy and academic motivation subscales are positively related. Additionally, as can be seen in Table 2 and column 8, 9, 10 all inter-correlations among five academic motivation subscales are positively significant, except amotivation. Amotivation is negatively correlated with other subscales of academic motivation. All four motivation subscales are significantly and mostly positively correlated with each other.

*** P≤.001, ** P≤.01, * P≤.05

Hierarchical multiple regression was used to predict vocational self-efficacy, intrinsic motivation, extrinsic motivation and amotivation from six of predictor variables. As it can be seen from the Table 3, vocational self-efficacy and academic motivation subscales are dependent variables. The independent variables are gender, age, field, academic achievement level, whether he/she was happy from his /her school and whether the school was chosen by himself/herself or not.

Table 3. Hierarchical regression analysis for vocational self-efficacy and academic motivation

Variables	TSES	IMTK	IMTA	EMID	EMIN	AMOT
	Beta	Beta	Beta	Beta	Beta	Beta
1.Gender	-.119*	-.144*	-.079	-.225***	-.126*	.226***
2.Age	.015	.057	.043	.062	-.015	-.042

*** P≤.001, ** P≤.01, * P≤.05

Table 3 contains the beta weights. Beta weights provide an appropriate criterion since unlike the percentage of variance (R^2), beta weights do not change when the order of predictor blocks changes. The relative importance of variables in each predictor was determined by examining significant beta. The absolute magnitude of beta coefficients indicates the relative strength of five of six variables as predictors of vocational self-efficacy and academic motivation. Table 3 depicts these results. As seen in Table 3, self-efficacy and academic motivation subscales were separately regressed on six predictor variables. All independent variables are important predictors of vocational self-efficacy and academic motivation levels of pre-service teachers except age. Age is not a significant predictor for the dependent variables statistically. These findings show that; being happy from his/her school a substantially important predictor of vocational self-efficacy and academic motivation, even when other predictors are statistically controlled. It explains a significant amount or increment in vocational self-efficacy and academic motivation subscales.

4. Conclusion

Academic motivation, as it relates to learning, is one of the foremost problems in education. It is regarded as an important subject in the field of educational psychology research. Determination of the factors that affect seniors' academic motivation and vocational self-efficacy levels of technical and **vocational pre-service teachers** may lead to preventions for raising seniors' academic achievement and vocational self-efficacy levels. Additionally, this can be useful in order to improve better training programs for education faculties. In this study it was intended to examine the impacts of demographic factors on academic motivation and vocational self-efficacy levels of technical and **vocational pre-service teachers** with a group of Marmara University, Technical Education Faculty seniors.

Inter-correlations among five academic motivation subscales are positively significant, except amotivation. Amotivation is negatively correlated with other subscales of academic motivation as expected. Amotivation as being opposite of other scales shows low motivation. Therefore, it is negatively correlated with other scales. Multiple regression analysis was performed in order to determine the factors that affect academic motivation and vocational self-efficacy levels of technical and **vocational pre-service teachers**. Results of the analysis provided clear support that demographic characteristic affects academic motivation and vocational self-efficacy levels. In terms of motivational theory, the motivational profiles of these students seemed to be well captured within the framework of self-determination theory (Deci & Ryan, 1985) by drawing attention to effective factors for academic motivation of students. This study contributes to the literature on motivation and self-efficacy in education. The study confirmed that students' academic motivation have been affected by some factors. Findings provide support for the view that demographic characteristics affect academic motivation and academic performance. These findings were similar with previous study findings. It was found that; motivation for chemistry lesson was a significant predictor of chemistry achievement (Akbaş & Kan, 2007).

In this study, findings also supported that demographic characteristics affect self-efficacy. To gain a greater understanding of the risk factors involved, subsequent studies of academic motivation and self-efficacy should examine different factors not only demographic characteristics. In order to prevent negative psychological effects of motivational problems on school success motivating factors should be used by teachers and parents. The results were also consistent with previous studies' results (Oliver & Simpson, 1988). It was reported that motivation levels of university students are affected by some demographic factors such as; their reason to choose the school, the probability of finding a job after graduation, order of preferences, future expectations, distinctive power of testing and measurement activities at school and their desire to do master degree, probability of finding

a job, attitude towards the teacher, social circle, level of income, appropriateness of the classrooms, efficiency of the educational material and number of siblings (Celikoz, 2009). Oner (1990) in her study has showed a significant negative interaction in between average scores of mathematics and general academic achievement with test anxiety scores. Yıldırım (2000) researched the effects of loneliness, test anxiety and social support on academic success and showed that the academic success was predicted by loneliness and test anxiety. Moreover, adequate educational materials (e.g., computer) provide a platform for efficient study at home and can motivate students to study. It should be provided motivating materials such as computer in schools for student use.

Consequently, education faculty seniors' academic motivation and vocational self-efficacy levels are affected by demographic characteristics such as; gender, field, being happy from his/her school, preferred the school by himself/herself and academic success. In other words, demographic characteristics are important factors for vocational self-efficacy and academic motivation levels of technical and vocational pre-service teachers. Although, the relative importance of these factors as predictors, at least for the Turkish students, should not be underestimated.

This study had several strengths and limitations. One of its strengths was the sample size of the study. The use of standardized measures and procedures was other strength. Many of the items included in the questionnaire measuring motivation and self-efficacy were objective situations or actions. The weaknesses were typical of many published studies. Replication with different subjects in order to determine the influence of different contexts on academic motivation and self-efficacy is necessary to increase confidence before generalizing to other populations. Replication attempts should involve different populations, longitudinal designs and appropriate control groups.

4th International Conference on New Horizons in Education

Writing as Part of Foreign Language Acquisition

Eva Smetanová*

University of SS. Cyril and Methodius, Faculty of Arts, Department of British and American Studies, nám. J. Herdu 2, 917 01 Trnava, Slovakia

Abstract

Writing can be characterized as a type of language performance with a certain graphical system that is suitable not only for fixing linguistic knowledge of language learners, but also to express their own ideas, attitudes, or beliefs. Writing (as one of the four language skills – listening, speaking, reading and writing) has always been part of foreign language school curriculum and written communication is usually systematically practiced and developed. However, one of the key questions is how to teach students to write in a foreign language. It is vital to understand that writing (not only in a foreign language) has its specific features and aspects and is different from the other skills. Its training and development requires a competent teacher and a prepared learner. The paper deals with various aspects of writing as part of foreign language education.

Keywords: education; foreign language; learner; skill; student; teacher; writing

1. Introduction

The area of foreign languages belongs to the so-called educational priorities of the European Union programmes. To be able to speak English is one of the key competencies of citizens of the European Union and its teaching has become obligatory on both levels of primary and secondary schools in Slovakia. The society therefore places high demands on teaching foreign languages at schools and schools should respond in a flexible way and react immediately. That is why schools present and offer innovative approaches and teaching techniques that respect individuality of every student. The aim of foreign language education is no longer just developing linguistic skills, but also influencing the development of the whole personality of the learner.

1.1. Writing

Writing brings significant effect in teaching a foreign language not only to students but also to teachers who work with them. It helps develop critical thinking, promotes student autonomy and encourages the student's confidence, speech and creativity. The question is, however, how to define creativity and who is considered to be a creative student.

* Corresponding author.
Email address:

We must admit that there is no one right answer. There are various opinions on what creativity is and the term “creative student” is also not clearly defined. Creativity may be the ability to use new or innovative ideas and a creative student may be a student who is resourceful or with a good imagination or the one who can create / produce new things. Petrášová (2011) states that everyone has a certain degree of creativity that could further be developed. On the other hand, writing is often considered a "difficult" and boring activity by students and even teachers sometimes “worry” about it, especially with regard to issues such as: what topic to set, how to lead and bring students to high-quality results, how to evaluate the activity as well as the final product, what extend of writing should be set etc. What is writing as a skill, then? Everything we put on a piece of paper (or a PC screen or a mobile display) becomes writing: from the first half-hearted attempt to write a child's name, through common shopping list, sent e-mail or text message, to a published novel written by a famous writer. As we can see, the reasons for writing are different: it may be the necessity to inform someone about something; a way to express our own feelings, ideas and views; to submit a school task; create a project for our employer; or simply write for pleasure and enjoyment. These aspects are even more significant when writing in a foreign language. To handle them, however, means to move further towards our goal: to master a foreign language in the most natural way, to understand the differences of a foreign (target) language from our mother tongue, to think in a foreign language and to be able to express fluently our opinions. As Raimes (1983, p. 3) claims, “writing helps students learn.” Therefore it is the teacher’s role and task to help students understand the significance of writing in the process of foreign language acquisition. This process is related to mental (the so called cognitive) strategies, such as:

- thinking in the (foreign) language,
- recollecting in the (foreign) language,
- using the (foreign) language.

When thinking about how to teach our students to write in an effective way, it is necessary to be aware of specific features, aspects and differences that writing – unlike other skills – is typical for. It is vital to know what kind of writing we have in mind – whether writing for learning or writing for writing (Harmer, 2004). In writing for learning, mechanical writing is usually dominant, such as copying model words, sentences, text, with the aim to practise spelling, word order, grammar structures etc. However, mechanical writing does not need to be meaningless and the teacher may take advantage of students’ creativity also when performing such tasks. The learner could, for example, divide or integrate the given words in a logical way (according to their meaning) into pre-defined groups; in sentences he or she could change certain part of speech; sentences in a text organise into a logical order; etc.

When writing for writing, we do not consider only the structure of the text, correct punctuation, carefully chosen thoughts, the choice of style, register, or corresponding the title with the content. Here the student mostly shows the will or desire to express himself/herself, get to know himself/herself or the world around. During the writing process, the learner begins to be aware of some techniques and strategies that he/she is using, identifies with them and understands better some facts.

We can thus say that writing is not a mechanical and one-way process and teaching and practising this skill requires a competent teacher and a prepared learner. This is the reason we are trying to avoid the term “creative writing”. We share the opinion of M. Legat (1986) that writing is always an act of creativity. Whereas writing for learning may influence learners’ range of knowledge, writing for writing enables them to show not only their creativity but also critical thinking. It is thus the means of communication and tool for education as well as the form of self-presentation and self-development.

Writing may combine the usage of all the four language skills (writing - of course, reading, speaking and listening). It brings fun and strengthens verbal skills of the student. Writing for writing is about creating poems or stories, short comparisons, concise descriptions, compositions or academic essays, etc. The most important step before the actual writing process is to motivate students and thus involve them in the activity right from the beginning. A dialogue, reading an article, listening to an appropriate text or watching a video may be very stimulating. The next step is the choice of the topic. As Palenčárová (2008) says, in our (Slovak) classrooms it is usually the teacher who sets the topic. She, however, believes that this may suppress the student's individuality and he or she then becomes "dependent" on the teacher – that is why the possibility to choose a topic should be an inseparable part of the writing process. The topic should meet some requirements and therefore should be carefully offered: it should be appropriate to a situation, students' age and language level, their needs, interests, experience – in other words – it should be meaningful and inspiring. If the teacher is afraid that his/her students may choose an inappropriate topic, he or she can offer several ones to be chosen by his/her students. This kind of "responsibility" supports – in a very significant way – student autonomy in the process of his/her own learning.

The students are now motivated, an appropriate topic has been set but they still do not know how their final product should look like. Again, it is the teacher's task to bring and show an example that could be similar in content, length and other aspects and would meet the teacher's expectations. The teacher may spend some time on commenting on the example, highlighting the parts that are required or vice versa, show where weaknesses are and what the students should avoid.

When the students have some idea of the desired product, the teacher can let them create and put their thoughts on a piece of paper. This stage may be interrupted by the teacher's comments and notes, such as: "Could you be more specific to ...?" or "The reader will be interested in this – how did you mean it?" Using the remarks that do not criticise and are not profane or derisive, the teacher may show the "right" way to the student.

Another important step is evaluation. However, the final product does not always be evaluated by the teacher. Peers' comments and assessment may often be more effective feedback and the teacher may – at the same time – learn something about opinions and attitudes of his/her students. The emphasis should be placed especially on friendly and calm atmosphere in which assessment takes place; mockery or insults have no place here. Preparing evaluation criteria in advance is very helpful. The teacher (ideally in co-operation with students) may create those that are most significant and get familiar with them before the actual writing. Therefore everyone knows what to concentrate on during writing. A very practical tool could be a form for evaluators (Comment Form – see Appendix A) – those ones can orientate better in the issue and ask sensible questions. Even grammar mistakes and errors could be less "significant" than the content – in other words, our main interest is not only in the final product itself but we concentrate mostly on the process of writing, ways and techniques that the student uses to achieve his/her goal.

When writing, the student is forced to use various cognitive strategies, such as: repeating, organising thoughts into a logical unit, deciding (how to do something), summarising of what he/she has heard/read, guessing the meaning of words from the context, searching for key words in a text, detailed reading (the so called scanning) or fast reading (skimming), listening with comprehension, mind map creating, using visualisation or association to remember new words and many more. Those strategies support conscious manipulation with a language that is why the importance of writing during foreign language acquisition is irreplaceable.

As Sirotová (2009) says, one of the teacher's task is to form conditions in which students acquire permanent values, such as development of cognitive abilities of students, development of creativity and abilities to learn effectively. Writing definitely belongs to such conditions.

1.2. Research

In order to find out how our students write, what cognitive strategies they use during the process of writing and if the use of the strategies affects the quality of their final products, in 2011 we conducted a survey at University of SS. Cyril and Methodius in Trnava, Slovakia. Our respondents were second-year students of the bachelor degree, the study programme English language and culture in professional communication. After we had studied several sources (Eliášová, 2011; Harmer, 2004; Brown&Hood, 1993), we decided to modify some of the models of writing and created a basic model consisting of three stages: preparatory, processing and final. The following table No. 1 offers examples of cognitive strategies that may be applied in the individual stages:

Table No. 1 Cognitive strategies used within the stages of writing

Stages of writing	Cognitive strategies used by students
<i>Preparatory</i>	planning, revising new language structures, use of linking words, combining language units, revising of forms of writing text and punctuation, selecting ideas
<i>Processing</i>	outline, scheme – note taking, summarising ideas, searching for key information, getting information from a text (read or heard = integrating language skills), translation from/to mother tongue (or any other language = positive transfer), comparison, deduction, applying the learnt form of writing in new situations, revision of the text, selecting ideas
<i>Final</i>	text checking, text presentation, (self)evaluation

The preparatory stage enables the writer to concentrate on the task and select ideas that could be relevant. This is the space for the teacher to motivate his/her students. This stage should not last long in order not to lose the enthusiasm for the topic and ideas related to it.

In the processing stage, the writer concentrates mostly on processing his/her ideas and thoughts. Outline or a scheme could be very helpful. In this stage, revision, correction of the text and editing take place as well as re-writing the text in its final form. The teacher may help, guide and advise.

The final stage, as its name suggests, is the stage in which a draft has changed into its final product. It still can go through checking or final editing (e.g. when writing on PC) until the part in which the author has decided to finish. At the end of this stage, the author may present his/her text. The final stage is also the stage of evaluation – the teacher, a peer or even the author himself/herself may assess the process of writing and the final product. It is essential to highlight that to evaluate the process and the results requires a sensitive approach and pedagogical tact in order not to de-motivate the author when strongly criticised.

Every stage should be time limited according to the difficulty and seriousness of the task, maturity of authors and/or their language level. Time limit may also have a positive effect – writers are gradually getting used to working under stress and it can evoke increasing mind activity (Eliášová, 2011).

The stages could be applied when writing individually or in pairs/groups.

Our students were advised to use the model during a two-semester seminar called *Writing*. After completing the course we tried to find out if they could use the strategies also outside the classroom. We asked the students to write compositions and we monitored their comments on the writing process.

For the quality of the text we did not take into consideration spelling or grammar. We used the ideas of Gavora (1992) who says that a text should have certain properties: communication intention, cohesion and coherence. Communication intention is the aim the author intends to achieve in order to address the reader; cohesion means follow-up of the sentences in the text and coherence is related to thematic linking to the text. These three properties were taken as criteria of evaluation of the products.

The results are as follows:

Cognitive strategies that are present in the process of writing in foreign language education were practised and developed during the seminars on writing. Texts of those students who consciously and intentionally used them also during their composition writing was of much higher quality comparing to the students who did not apply them at all or only minimally. This gives us the answer to our question how development of cognitive strategies relates to the quality of students' writing performance. On the other hand, our research shows that although the strategies were practised deliberately, not all of the students use them in their practical lives; students either have not acquired them to adequate extend or they lack the ability to interconnect subjects and disciplines – to transfer information gained in one seminar onto the work in another one or in their practical lives.

The research shows that the position of teacher is irreplaceable even in the world of modern technologies. Foreign language teachers should encourage their students (regardless to their age or language level) to use various strategies in every stage of writing, they also should motivate, activate, guide their students in order to achieve a gradual automation of the writing processes. The teacher also uses those methods of practising writing that will strengthen their independence in thinking, acting and evaluating and thus learners' independence and autonomy may be formed.

As for the evaluation of written products, we would like to draw attention to the possibility of using this stage as an opportunity for learners to their self-assessment. Evaluation and self-assessment may significantly affect the use of learning strategies. Learners can easily identify their weaknesses but they also can learn about their strengths. This will positively influence their motivation not only towards learning a foreign language but also towards writing activities and may thereby strengthen positive relationship towards expressing their ideas or creating interesting texts.

In conclusion we may say that writing does not need to be a boring and unpleasant activity. When working in a friendly and cooperative learning environment and following certain rules, together with the teacher's humanistic and empathic approach and focusing not merely on the result but mostly on the process and strategies used, this could be a funny and creative part of every lesson no matter how "long" the final work will be. We do believe that learning and teaching a foreign language in our classrooms - whether related to writing or not – will bring much excitement and pleasure to our students and to their teachers so that every lesson could be enjoyable, interesting and fruitful.

4th International Conference on New Horizons in Education

Pedagogical proficiency of a nurse as a contributing factor in patients' education

Gunta Beta[†]*Rīga Stradiņš University, Faculty of Nursing, "Liepaja", Latvia*

Abstract

The notion 'proficiency' is used in different professional areas but less often than 'competence'. Proficiency defines higher level of professional development of a professional member of staff. Besides professional knowledge, the spectrum of proficiency competence is supplemented by experiential, metacognitive knowledge. The difference between a competent and proficient nurse is heterogeneous with a lot of output and input. The study will analyse patients' views on nurses' skills in the process of patients' education.

Keywords: patient; nurse; pedagogical skills

1. INTRODUCTION

When visiting health care facilities, we contact a variety of professional specialists and create an interactive system: Service provider - Patient. A Nurse is the first and the most recognizable professional and communication service provider. In our society a nurse is considered not only a professional who performs a variety of manipulations and educational work but also seen as mediator between a patient and a doctor, a person who might be asked for anything that remains unclear visiting a doctor.

Coming into a new situation, regardless the spectrum of medical institution, into a situation that is associated with health maintenance, a patient feels emotionally unstable. Cognitive concentration, which is influenced by the state of a health disharmony, depending on a severity of the disease or age, fear, confusion, stress, may be impaired. A new situation contributes to the formation of cognitive dissonance (Festinger&Carlsmith, 1959), until a new decision brings internal harmony.

A nurse should be prepared to focus on each individual's unique health condition, listen to the patient and explain the necessary information, thus giving the patient emotional relief and psychological balance in the case of unclear questions. Having competence is essential in both educating and taking care of patients - this can be described as an important interaction process (Wirth, Perkins, 2007). This is crucial to anyone who cooperates with people on a day-to-day basis as the use of competence severally affects the outcome of their actions - whether it shall be positive or negative.

Personal responsibility, ability to act in a principled form, according to the rules of professional conduct, both written and oral competence, interpersonal and teamwork skills, critical thinking and problem solving skills, respect to human dignity, adaptability, ability and willingness to learn- these are components of a professional image of a proficient nurse. Timely, in the correct tone of voice, self-contained, a patient-centered information, as well as responsiveness of a nurse- these are the most efficient criteria for a quality health-care in the point of view of patients. Time that health - care staff, including nurses, spend for each patient, lack of communication

[†]* Corresponding author. Tel. +37126739382; fax: +37163484635.
E- mail address: gunta.beta@rsu.lv

and feedback are the factors that have been marked as insufficient in Eurobarometer research (Eurobarometer Qualitative Study, 2012) and these are factors that are important for each individual coming into a new situation. Studies have shown (Carlsen, Aakvick, 2006, Henderson, 2002, Langewitza, Nüblingb, Weberc, 2006) that most patients prefer to engage in a joint decision-making which is based on the information and which is related to patients' satisfaction. It is absolutely imperative to have a sense of security in a new social environment and a dimensional vision of situations 'Now' and 'Tomorrow' (short version).

The spectrum of patients' educational activities is being affected by both, a nurse and a patient's multifactorial subjective and objective aspects. From the nurse's position: competence of a nurse which includes a critical analysis of the situation, experience, system of values, motivation, processes accompanied by reflection and the patient's feedback. For the patient: decision-making in the context of his/her situation almost always includes internal dissonance that is affected by the following factors:

- Cognitive skills- conceptual awareness of the situation which can be influenced by a health condition in the context of existing knowledge, reflection;
- Communicative skills- a willingness to communicate and cooperate;
- Personal qualities and incentives- ability to engage constructively, subjectivity of the values, expectations.

By assessing factors on time, a nurse can build a positive, result-oriented process of educating patients. There are several possible focuses in the nurse's practical work in patients' education. To help to explain the situation, provide, explicate perspectives, demonstrate empathy, understand patient's behavior by providing a constructive informational integration and explaining future directions and content - by doing the entire have mentioned it is possible to develop individual strategy for overcoming difficulties. Every patient understands the substantiation of situation, theoretical and practical strategy of developing situation differently (Edwards, Elwyn, 2009). Through understanding and motivation which may require a change in attitude while obtaining new or strengthening current information; it is, in fact, possible to take certain actions which would allow the patient to distinguish the value of having a vision of the future in the context of the theory of expectation by taking into consideration the argumentative actions (Fishbein 1980; Southey, 2011) and planned behavior aspects (Ajzen, 1991), along with being aware of the role of personal contribution and the positive outcome.

Educational activity is possible in aspects of health promotion, restoration and maintenance. In health care, communication with a patient is focused on three -function model (Misra-Herbert, 2003):

- Engaging with patients;
- Assessing patient's problems;
- Managing patient's problems.

Targets in patients' education may have different orientation, possibly overlap in content:

- Practically (activities in the particular situation, investigations, medications, exercises, etc)
- Psycho- socially (develop perspectives, enhance understanding of values, motivation)

When educating and advising patients, every factor has a significant role - to provide knowledge with the task of reducing patient's suspense, and to help patients` with decision-making and acquire the necessary skills in the particular situation. Information provided has to be true, impartial, constructive, and very important aspect, forehanded.

In the educating process, the result of the consultation and decision is associated with the patient's priority values, their possible changes in a patient's life; this is a factor which largely determines patient's future behavior. Ethical principles are based on the theoretical aspects of humanistic psychology that states it is essential to respect a person who is given an informative, educational assistance. Tolerance towards patient's judgments, understanding aspects that are important to the patient - these are some aspects of a nurse's work proficiency.

The selected methods how to inform and educate a patient could vary: negotiations, dialogues, visual aids, charts, booklets, etc. In cases when it is needed to present the information in different ways-using written information, booklets, visual aids, charts or other educational resources, a nurse is still responsible for providing the patient with complete, verbal information. Besides psychological context, there are several factors that determine the choices of a nurse which pedagogical method to use to reinforce the information provided:

- Location:
 - Topping the patient's knowledge, skills and attitudes while being in Hospital;
 - Topping the patient's knowledge, skills and attitudes in the communication process while being in the Primary Health Care Practice;
- Forms of interaction (planned/unplanned);
- Range of the length of the communication (short-time, one-time communication, long-time communication, repeated communication);
- Personal and professional values of a nurse, nominating responsibility as a priority. Responsibility for the quality of the educational process, a critical evaluation of the situation, application of relevant pedagogical methods in a context of the professional level.

Not a less important factor in the process of education in acknowledgment of a patient's cooperation, especially, if a long-term treatment is expected. The mission of a nurse is to promote, develop patient's skills, abilities, to help the patient to understand the importance of personal responsibility, not to create an illusion of wardship. Theory of Participation (Ferrer 2002) is based on finding a turn from a patient's inner, subjective opinion to cooperation with the stuff through mental and transpersonal (mind, consciousness, body) understanding.

Besides all the above mentioned preconditions, nurse needs to determine the amount of patient's knowledge that has to be improved, reflections which is a part of a cognitive process, that has to be integrated. If a nurse bases his/her educating and professional performance on reflection as a deliberate inner activity and necessity, then effective patient-nurse interaction is promoted. It promotes the patient's well - being which is one of precondition for successful further cooperation between a nurse and a patient. It increases responsibility of a nurse and helps in professional decision-taking.

Patients absolutely prefer such health-care institutions and staff who give the information in a clear, plain and welcoming manner. Sometimes patient's expectations and the real situation that a patient faces in a primary or secondary health care practice are different.

The Definition of Patients' Education (Healthy People, 2010) states that the given information includes educational resources for patients about their health conditions in order to help them to regain good health, maintain therapies and understand alternative approaches. From this appears that patients' education is individual-centered (at their awareness level), understandable and effective process of providing information. To recognize, define and solve problems, and to work out situational strategy, in a communicative period a nurse can use a variety of theories of delivering the messages and including them in a methodological action.

Working with patients, quality models of cognitive constructivist theory is a priority, where in order to preserve the patient's psychological, physical and emotional balance in the context of current situation, with a help of a nurse, adaptation takes place on the background of accommodation and assimilation. In the beginning it occurs in a cognitive aspect, and, if the situation determines, in a physical aspect, too. Where the knowledge needs to be developed or supplemented repeatedly, activity is already partly based on Kolbs (1939) experience - empirical learning model (Boore, Deeny, 2012) where the particular experience interchanges with a promotion of new concepts that are tested in a practice by using reflexive evaluation.

Choosing relevant method of the action, a nurse has to base her/his decision on the synthesis of critical analysis, psychological competence and sensitivity. Critical thinking is a strategy when thoughts move from the general to ultra-narrow focus by asking questions and choosing arguments (Marquis, Huston 2008), (Paul&Elder, 2004) until a decision is made.

The chosen pedagogical methods, depending on a situation, formulated objectives, identification of common correlations, and on the nurse's experience, can be used together with different micro-level (a nurse and a patient/individual) communication and cognitive theories:

- Argumentation Theory (Mercier, Sperber, 2011; Apsalons, 2012) - (observation, content, reasoned argumentation). Pro-actively used argumentation can facilitate a decision-making but not always gives the best results.

- Cognitive dissonance, improving awareness and internal contradictions, conflicts, collision, resulting in a decision-making and in a change of attitude, behavior (Taylor, Marinou, Fiddler, 2000). Taking into consideration that a positive result is possible by respecting the particular case through five dimensions: motivation, action, and objective, the context of the situation and effect of short-term social factors.
- Developing resumptions (Kenzie, Cameron, 2009) - change of the attitudes that is based on persuasion by considering the potential opportunities and promoting motivation.
- Text Comprehension Theory – (Kintsch, 1998) - verbal, non-verbal information: announcement, assumption that is relevant to the intonation of the speech, semiotics, considering cognitive capacity of the individual and environmental factors.

Depending on the context of a situation, to promote professional, psychological and pedagogical interaction, also taking into consideration the amount of patient's theoretical, practical knowledge and experience, and identifying the patient's learning style, a nurse chooses the most relevant methods of providing information that would facilitate patient's cognitive, emotional and psychomotor areas.

By adequate use of components of pedagogical proficiency which are facilitated by synthesis of the nurse's attitude and their subjective standards, it is possible to create a successful stage for patients' knowledge which is essential for providing further patients' performance and their emotional comfort.

Research object:

To identify nurses' prevailing pedagogical work methods in a context of communication and patients' education; application of which (methods) can positively or negatively affect patients' understanding and complementary forms nurses' proficiency image as a public educator. Getting into the primary or secondary health care institutions, every patient expects to receive an educational support from a nurse. An educated individual, patient in the context of personal case is able to be psychologically and emotionally balanced and take reasoned decisions.

Research aim:

To perform an analysis of the empirical quantitative research, by assessing patients' views on nursing enforced teaching methods, based on the respondents' experiences in primary health care centers, further in the text (PHCC) and in secondary health care centers, further in the text (SHCC).

To compare respondents' answers (urban respondents, rural respondents), taking into consideration their place of living (city, countryside), to find out if there is a difference between the social group views in assessing nurses' job.

Both two social groups of respondents are secondary influenced by different economic conditions. Disappointing economic conditions (rural population) conditionally possible can create more negative, tense evaluation when assessing aspects of professional activity of health care staff – nurses, visiting both PHCC and SHCC.

Overall, between the two groups there is no relation, thus data analysis can be based on the finding whether answers differ or not.

Research question:

What are the working methods with who nurse demonstrate Pedagogical Proficiency in the process of patients' education?

2. Methodology of the research

In a practical part of the study a questionnaire has been used to find out (n- 407) voluntary members of the public / patients' point of view. Assessing questionnaire: Likert's 5-point scale has been predominantly used (1. – Totally agree, 2. – Partly agree 3. - Neutral 4. – Partly disagree 5. – absolutely disagree).

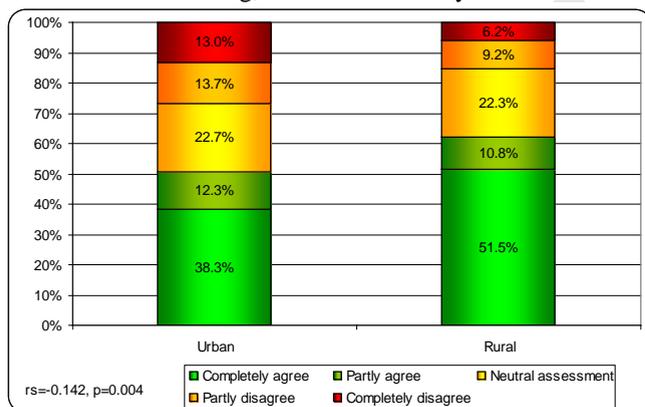

On two questions it was possible to specify several possible answers. Processing data with Microsoft Office Excel and SSPS v.17 software, scores were calculated, descriptive statistics: Frequency (F), percent (%). For evaluation of qualitative difference of patient groups *Pearson's hi-square (χ^2) indicator z-test*, *Fisher's precise test* were used. To determine associations between variables correlation analysis was used. The correlation calculation method was dependent on the variable scale. If one of the variables were on ordinal scale, nonparametric *Spearman's rank correlation coefficient* was used.

3. Research results

There were urban respondents (n= 277) and rural respondents (n= 130) taking part in the survey, comprising total number of respondents (n=407). To build a successful future cooperation with the patient, communication with patients plays an important role in health care (Misra – Herbert, 2003). According to respondents' evaluation using 5-point Likert scale, when addressing patient, a nurse needs to use a basic code of work ethics and always ask about patient's problems (table 1).

Using *Pearson's hi-square (χ^2)*, it was concluded that (p=0.058), which is very close to the limit, dominated by the two answers - strongly agree and strongly disagree (table 1.), and it shows the difference in answers of the urban population (first column) in comparison with of the rural population (second column). The rural population has more positive responses than the urban population whose responses are more negative. Relationship between the two variables is statistically significant, but very weak.

Table1. When meeting, does a nurse always ask me about my current problems

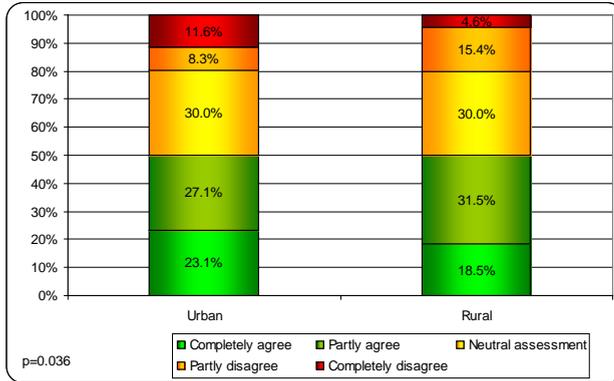

According to Wilkonson's test rating- to find out if nurses are supportive and address the patient first to identify the problems, respondents' rating is (p=0,037), where PHCC nurses are evaluated more positively than SHCC, compared to Spearman's correlation test, it is showing a medium close relationship (rs = -0,142, p=0,004).

In the question (table 2) which assesses if nurses in their professional performance are tolerant and **listen to patients' thoughts and opinions** (Taylor, Marinau, Fiddler, 2000), the main differences are between the two response groups – 'partly disagree' and 'completely disagree'. This is statistically significant by Pearson's hi-square (χ^2) test (p=0,036). Significant responses are partly agree (8.3%) - urban respondents and (15.4%) - rural respondents, and completely disagree (11.6%) - urban respondents and (4.6%) -rural respondents that indicates an overall positive trend in nurses' attitudes to listen to the patient to enable the patient to ventilate their feelings and opinions in order to discuss, recommend solutions of further action. However, it is also very important to pay

attention to that there is no correlation at all between the two groups thus we cannot conclude that one of the group has more positive or negative responses but only that the responses are different.

Table 2. Do nurses listen to patients' thoughts and opinions

To compare responses, parametric Wilkison's test has been used for comparing two sample-dependent ($p = 0.037$), and that shows a statistically significant difference between PHCC and SHCC nurses' work and shows a trend that primary HCC nurses are evaluated more positively than secondary HCC nurses. This is evidenced by Spearman's test results where, with a relatively low correlation coefficient it can be concluded ($r = 0,009$; $p = 0,852^\circ$) that the attitude to PHCC nurses is more positive than to SHCC nurses.

Answering the question if nurses educate patients responsibly, patient's opinions indicate a statistically significant difference according to hi-square test ($p = 0,036$), but the z-test only indicates the importance of neutral rating – rural residents chose the answer option more often than urban residents. According to the Spearman's correlation test, there is no relationship between the variables ($r_s = -0,015$, $p = 0,767^\circ$), therefore no conclusion about tendencies of the answers can be made.

The table 3 reflects potential applied teaching methods in nurses' everyday work to educate patients. Appropriate use of those methods can help the patient to obtain further education that forms the psychological safety in the context of current situation and is able to strengthen the patient's understanding and is based on the aspect of argumentation theory (Mercier, Sperber, 2011; Apsalons, 2012).

Table 3. Frequency of the applied learning methods in primary and secondary health care (n – 407)

Method	Frequency of the applied methods in primary health care		Frequency of the applied methods in secondary health care	
	Frequency	Percentage	Frequency	Percentage
Posters	28	6,9	28	6,9
Mulages	17	4,2	15	3,7
Write information on a sheet of paper	172	42,3	126	31,0
Issued pre-prepared information sheets	104	25,6	111	27,3
Issued a booklet on the disease	85	20,9	77	18,9
A written information about other professionals	52	12,8	53	13
Information about diet	33	8,1	37	9,1
CD demonstration	5	1,2	4	1
Refers to the educational web resources	1	0,2	19	4,9
Refers to Youtube resources	14	3,4	10	2,5
Refers to informative literature resources	29	7,1	26	6,4
Draw a schematic	48	11,8	41	10,1
Invites to the lecture	21	5,2	9	2,2

Table 3 shows which pedagogical methods besides verbal information nurses use too rare, according to the frequency (F) and percent (%). Describing statically, without grouping the respondents by place of residence, the following answers dominate - 'Write information on a sheet of paper' and - 'Issued a booklet on the disease' which having regard to the number of respondents (n = 407), is a small number. Comparing table 2 x 2 results according Fisher's exact test, there are no significant static differences depending on a place of residence. Informational source - 'Issued a booklet on the disease' (p=0.068, r =0,062) p-value is close to the range from 0.05 to 0.1, therefore we can talk about possible trends.

According to Fisher's exact test, there is a statistically significant difference in answer variants 'Youtube' (p=0.034, r=0,028), which is chosen more by city dwellers than those from the countryside. 'Write information on a sheet of paper' option has p-value is above 5% but within the limits of 10%, so it may be possible to talk about trends.

According to the Wilcoxon rank sign test results, there are three pairs of options that has statistically significant differences between primary and secondary HCC - 'Write information on a sheet of paper' (p=0.066, r=0,058), 'Refers to the educational web resources' (p=0.044, r =0,040) and 'Invites to the lecture' (p=0,014). Internet resources as one of the teaching methods of patient often uses SHCC staff, but gives written information and invites to the lecture - PHCC staff.

4. Conclusions

The purpose of the research was to identify nurses' dominant pedagogical working methods in communication and patients' educational aspects that proves nurses' pedagogical proficiency.

Nurses' communication and applied teaching methods were evaluated in two groups of health care facilities: in primary health care centre (PHCC) and secondary health care centre (SHCC). Then the opinion of the respondents were analyzed (n=40) to evaluate nurses' work, considering respondents' place of residence. Having regard to the unevenly developed economy in Latvia, this factor conditionally can provide a variety of estimates. By using difference analysis test, it was determined whether the differences are statistically significant at any particular factor (in this case –a place of residence).

Analyzing the frequency of the applied educational methods in primary and secondary health care ,it's been concluded that nurses' work in patients' education is strongly dominated by verbal educational way which may not always provides the patient's full understanding of the current situation as well as prospects for the future.

According to the author's point of view, identifying the range of methods employed and also analyzing the focus of patients' education in PHCC or SHCC, research results indicate that nurses use relatively little information or alternative methods to enhance education. The result may have both objective and subjective reasons (too high congestion, lack of motivation in the work result, inappropriate workplace for consulting a patient).

Comparing patients' assessments about nurses' additionally used educational methods in primary and secondary health care stage, besides verbal education, there are no sign of very significant differences in answers between the two groups of respondents, only the conclusion that there is a lack of additional pedagogical methods

As a result trends can be observed that are desirable to highlight in the work with the nurses in the training process. Analyzing nurses' communication activities which are focused on the tolerant and empathic treatment of patients which, in its turn, is important to have a positive collaboration in the case re-appointments, it is concluded that there are relatively positive trends according to Likert's scale 5-point evaluation. The test highlights that rural residents' assessment of nursing communication is slightly more positive than urban residents' assessment. It rejects previous assumption that the differences in the economic situation are capable of forming a negative evaluation for nursing activities. However, as a whole between the two groups there is no relation, it is concluded that differences in respondents' answers are not related to place of residence, but with some other internal and external factors.

Comparing patients' evaluation of nurses' work in PHCC and SHCC, we can conclude that nurse's work in PVAC is being evaluated a bit better than in SHCC., The assessment may affected by the communication time, patients' short stay in PHCC, as a result, it scores nurses' attitude in a small period of time.

The study included the evaluation of nurses in the number of dimensions, which proves that patients are more positive about nurses' communication skills and points to the need to develop skills to diversify range of methods for providing information.

The Contribution of Technology Acceptance and Community Feeling to Learner Satisfaction in Distance Education

Hale ILGAZ^{a,†}, Petek AŞKAR^b^aAnkara University, Distance Education Center, "Ankara", Turkey^bTED University, Faculty of Education, "Ankara", Turkey

Abstract

In this study, the contribution of technology acceptance and community feeling to student satisfaction in distance education have been analyzed. Research methodology is designed as descriptive and correlational. The participants were 464 distance education students. As a result, technology acceptance and community feeling have been found in a positive and high correlation with student satisfaction. Technology acceptance contributed more than community feeling, in predicting student satisfaction. Perceived usefulness has been determined as the variable which explained student satisfaction highest by itself among other variables namely, perceived ease of use, affective and action dimensions. Furthermore it was found that there are statistically significant differences between students who were using and not using online environments in community feeling score.

1. Introduction

Recently, distance education has become a greatly demanded option by people. The increasing education demand, time limitations, and geographic obstacles increased the demand of distance education day by day. By the development of information and communication technologies, the problems based on time and place have been overcome and this situation made distance education become qualified in many aspects. Besides the increment of demand devoted to the distance education, empty quotas and the ratio of students who drop out before graduation, release the importance of quality factor in distance education. According to the report which was prepared by Moore (2005) for Sloan-C, affective learning, access, student satisfaction, institutional satisfaction and cost effectiveness form the salient indicators for assessing quality related to retention in distance education. Among these quality indicators, student satisfaction plays a crucial role in distance education. Understanding the student's perception is the first step for composing and performing a successful online learning environment (Sahin & Shelley, 2008). The drop-out rates for students in distance education are higher relatively for those in traditional education (Rovai, 2001a). The students' satisfaction levels are also found being low who drop-out the education program before completing as a result of being not satisfied of needs and

E-mail address: hilgaz@ankara.edu.tr

expectations. The researches, related to information systems, show that the user satisfaction is one of the most important factors of the success oriented to system. There are several factors that influence the student satisfaction in distance education. Some of these are; interaction (Driver, 2002; Kim, Liu & Bonk, 2005; DeBourgh, 1999; Dennen, Darabi & Smith, 2007), communication (Rovai, 2002a; Casey, 2004), demographic properties, design (Hartman, Dziuban & Moskal, 2000; Aşkar, Dönmez, Kızılkaya, Çevik & Gültekin, 2005), evaluation (Maki & Maki, 2003), face to face activities (Brown & Duguid, 1996; Esch, 2003; Stein & Wanstreet, 2003), technical and instructional support (Allen, Bourhis, Burrell & Mabry, 2002; Ham, 2002; Rekkedal & Eriksen, 2004; Dibiasi & Rademacher, 2005), self-efficacy (Lim 2001; Ham, 2002), cognitive styles (Foell & Fritz, 1995; Brenner, 1997), learning styles, isolation. There are many studies which explore the student satisfaction in distance education, reveal its importance and compare it with different environments – hybrid, blended, online- (Allen et al., 2002; Johnson, Aragon, Shaik, & Palma-Rivas, 1999; Rivera, McAlister, & Rice, 2002; Summers, Waigandt, & Whittaker, 2005). The communication between people in a distance learning class and other members of a class which are far away, is provided by electronic media and the quality of this communication is affected depending upon how this electronic media is used. For this reason, as the students' attitudes and the technology usages will affect their satisfactions towards distance education, the researches were performed to analyze student satisfaction within the framework of Technology Acceptance model. Researches show that the perceived usefulness and perceived ease of use are the major components that increase the usage of the sources by students that take part on the internet (Lee, Cheung, & Chen, 2005; Mitchell, Chen, & Macredie, 2005). People, who encounter the online class environment after the ordinary face to face interactions in the traditional class environment, may not take advantage of the interactions efficiently. As a result of the physical distance in distance education, the decreasing sense of community causes the feeling of not involved to the community, isolation and this situation can be resulted with quitting the program. At the environments in which the strong feeling of community is developed, the state of belonging is high and this increases the motivation of students. Also, the interaction has been determined as one of the most important variables in determination of student satisfaction in different researches (Jung, Choi, Lim, & Leem, 2002; Kearsley, 1995; Lu, Huang, Ma, & Luce, 2007; Summers et al., 2005). In this research, contributions of the components -technology acceptance and feeling of community- on the satisfactions of the students who participated to a distance education program were analyzed. Towards this aim, the research was performed after three different scales had been developed.

2. Theoretical Background

2.1. Technology Acceptance and Student Satisfaction

A key purpose of Technology Acceptance Model (TAM) is to provide a basis for tracing the impact of external factors on internal beliefs, attitudes and intentions. TAM, that analyses how the information and communication technologies are accepted and used by individuals, is also quite important in the aspect of the individuals who take online lessons. In a distance education environment, in which the technology is an important tool, individuals' belief of perceived usefulness and ease of use are the main factors that affect the attitudes and behaviors of usage of technology. Usluel, Aşkar and Baş (2008) suggested a structural equation research within the framework of Diffusion of Innovation (Rogers, 2003) theory, to examine the information-communication technologies (ICT) diffusion in universities on the basis of faculty members' ICT usage. Two dimensions of ICT usage are taken into consideration: Instructional and managerial. The findings of the study show that the faculty members mostly use ICT as a means of communication and for searching information about the course through the Internet; and the least, for publishing their lecture notes and the announcements concerning the course assignments, projects-on web. ICT facilities were found to have a strongly positive effect on ICT usage and positive effect on perceived attributes. As a result, it was suggested that ICT usage in classrooms should be more widespread, and faculty members should be supported both technically and

educationally and the process should be institutionalized via the framework of the policies and strategies of universities. Sun, Tsai, Finger, Chen and Yeh (2008) while analyzing factors that affect student satisfaction, they also analyzed effects of perceived usefulness and ease of use. As a result it is founded that the perceived usefulness influenced student satisfaction significantly. An e-learning system provides useful content and helps to prepare students for future career advancement because of being an alternative to working people. Therefore the higher the perceived usefulness of an e-Learning system, the more satisfaction learners have. Besides, perceived ease of use also has a significant impact on e-Learner satisfaction. An e-Learning system's ease of use makes it possible for individuals to devote their attention to learning the course materials instead of spending additional effort learning the instrument. Consequently, a higher learning satisfaction should exist.

2.2. Community Feeling and Student Satisfaction

In non face to face environments individuals can express their feelings by symbols and words instead of physical notation, facial and verbal expressions. Rovai (2002a) determines that in addition to forming a reality sense, the sense of connectedness is also formed between the members of strong community of class. These people have responsibilities and obligations to each other and to the school and also they possess a shared faith that members' educational needs will be met through their commitment to shared learning goals. At the community feeling which is divided into two categories as school and classroom community feeling; classroom community is a feeling in which the members have feeling of belonging, have responsibility to each other and group, and perform the duties and responsibilities to school, behave together for the shared purposes. The school community consists of a community which includes administration, teachers and other people in a more formal frame (Rovai, 2001b).

Rovai (2001b) defined classroom community components, including McMillan and Chavis's (1986) four components of community dimensions. These components are spirit, trust, influence and learning. Spirit shows the acceptance of the membership in the community and develops the feelings of friendship, commitment and satisfaction between the students. Trust is the second one of the class community components. It will be friendly and constructive if the community can be trusted and be given feedback by individuals. When individuals have been accepted by a growing and developing community, they feel more in safe and start to trust to community. The third component, influence is the feeling of closeness and mutual benefit between the individuals. The last component learning is the feeling that community enhances the acquisition of knowledge and understanding, and also the feeling of active information and meaning conformation which supplies the educational needs of the individuals that it consists of.

Because effective learning has important social and cognitive dimensions, it occurs when there is a strong sense of community (Rovai & Wighting, 2005). However physical distance decrease the connectedness between students, it is possible to create and keep a strong feeling of community by information and communication technologies. According to the research results, the community feeling of students has so many positive effects. Strong community feeling have positive outcomes as increasing the flow of information, access to support, collaboration between the members and satisfaction about the group activities (Rovai, 2000). By increasing the numbers and qualities of interactions in distance education programs, the community feeling in online mediums can be improved. In a research, it was founded that there has been a positive and significant effect of creating a social environment and students' social integration into this environments on drop out rates. In distance education programs learning needs can be attractive for adult students but it isn't enough to maintain the program (Ashar & Skenes, 1993). Wegerif (1998) founded that how central collaborative learning was to feelings of success or failure on the course and second how important social factors were to this collaborative learning. According to Brown and Duguid (1996) when enrolled in distance education programs, student participation in institutional life is often limited and may consist of infrequent residencies with little face-to-face

contact with other students, professors, and administrators, thus limiting the true involvement of distance students in institutional life. Consequently, there is a concern among some educators that distance education does not promote community. Rovai and Jordan (2004) aimed to analyze the relationship between traditional, blended and fully online higher education environments and community feeling. Sample of the research was consisted of master students and primary school teachers which of 24 enrolled in traditional, 23 in blended and 21 in online education program. According to the results, blended course has been a higher and significant relationship on connectedness than either the traditional or online courses with a larger effect size.

2.3. Student Satisfaction in Distance Education

Satisfaction can be defined as rank of meeting expectations, emotions and convenience level of an environment or situation. Student satisfaction can be defined as being satisfied from learning-teaching activities and services on students (Sener & Humbert, 2003). When distance education environments analyzed, a lot of factors coming up that affect the satisfaction. Some of these researches were intended to determine these factors:

Aşkar et al. (2005) searched the effects of blended learning on student satisfaction by the frame of usability, instructional design and implementation dimensions. Sample group defined from undergraduate students and the course was delivered as both web-based and face-to-face. Findings of the research showed that interaction was a critical component in online learning environments. Therefore it is founded that blended learning has positive effects on student satisfaction by increasing the interaction.

In 1999 the researchers created two groups, by the purpose of comparing student outcomes in face to face and online learning programs. One of these groups take the instructional design lesson via face to face environment and the other group take the same lesson via fully online environment. At the end of the research it is founded that online learning students' satisfaction scores are higher than face to face learning, at the same time no difference is founded about student outcomes. This research findings confirms that the online learning as effective as traditional face to face learning (Johnson et al., 1999). Allen et al. (2002) found that degree of student satisfaction and courses have a very important role on development of effective distance education implementations. 24 articles were analyzed in this meta-analysis research and no difference was founded between distance education and traditional education on student satisfaction level. This finding shows that students find distance education as satisfactory as traditional education.

In a research which compared satisfaction of students in three different course formats, it is founded that degree of student satisfaction on web based lessons is lower than traditional environment and hybrid learning environment. Researchers binded that to students' young age and underdeveloped computer and web usage skills. Also it is suggested that this information deficiency has a negative effect on student satisfaction (Rivera et al., 2002). Yükseltürk (2007) searched the student satisfaction in a distance education program which is based on synchronous and asynchronous communication methods. The main purpose of the research was defining the relationship between online technologies self-efficacy, online learning readiness, and locus of control, prior knowledge and student satisfaction. 62 students and 8 instructors were participated the study. Quantitative and qualitative data collection methods were used. According to the results, a significant relationship founded between students' perception of online learning readiness and satisfaction. It is defined that the overall satisfaction, satisfaction about course structure and flexibility decrease over the semesters in the program.

Summers et al. (2005) compared the student satisfaction and achievement in traditional face to face environment with online learning environment in statistic lessons in a research. According to the study results students in online learning environment are less satisfied than in traditional learning environment. And this finding considered that there wasn't enough interaction between student and instructor. When students don't get enough feedback in an online course, they feel frustrated and tend to drop out the course (Kearsley, 1995).

Between 1999 and 2001 years, in a research it is investigated that the effects of immediacy behaviors on student achievement and satisfaction in University of Wisconsin. The results of the research showed that immediacy behaviors were positive predictors of student achievement and satisfaction. Also in this research, it is founded that students' attitudes toward course software, the length of a course and prior experiences were significant predictors of satisfaction (Arbaugh, 2001).

2.4. Research Questions

What is the contribution of technology acceptance and community feeling to learner satisfaction in distance education?

- Do technology acceptance and community feeling predict learner satisfaction significantly?
- Do online learning systems acceptance scale dimensions and community feeling scale dimensions predict learner satisfaction significantly?
- Does community feeling show differences whether using online medium or not?

3. Methodology

3.1. Participants

Data collection part of the research has been carried out in two stages. In the first stage, scales which are data collection tools of research are developed. In this stage the participants were consisted of the 731 freshmen of a Ankara University Distance Education Center in Turkey in 2007-2008 terms. The program which the students enrolled in, is a blended distance education program in which an online orientation program, printed course books, online courses, video courses, discussion board, synchronous chat, 48 hours face to face interaction in each term and face to face exams are used together. 731 students have participated to the scale development stage. After the scale development stage, 464 sophomores are participated to the study as research group.

3.2. Design

In this research the descriptive and correlational research model is used. Confirmatory and exploratory factor analyses are used in the stage of development of measurement tools. After the scale development stage; descriptive statistics, multiple regression analysis, multiple stepwise regression analysis, one way ANOVA and canonical correlation analysis are executed to analyze data that are obtained from application.

3.3. Instrumentation

3.3.2. Online Learning Systems Acceptance Scale Development Process

Scale has been designed as 7 point likert scale and analysis has been executed with 574 data. As a result of exploratory factor analysis, the scale has been found being a two factor scale. Factor 1 is named as perceived ease of use and factor 2 is named as perceived usefulness. The Cronbach's α coefficient, which is the reliability coefficient of the scale, was examined and it was founded that $\alpha = 0,89$.

3.3.3. Community Feeling Scale Development Process

A community feeling scale was developed to determine the community feeling of students in distance education based on Rovai, Wighting and Lucking's (2004) studies. Originally, the scale has two forms as school and class.

In this research, the school form was performed by adapting it to the distance education setting and also increasing the number of the items. Scale has been designed as a 7 point likert scale and analysis had been executed with 571 data. The scale has been designed as a two dimension scale- action and affective- by considering the expression types of the items in community feeling scale. The CFA results were; [χ^2 (7, N=571) = 24.76, $p < .000$, RMSEA= 0.067, S-RMR= 0.034, GFI= 0.99, AGFI= 0.96, CFI= 0.99, NNFI= 0.98, IFI= 0.99]. The Cronbach's α coefficient, which is the reliability coefficient of the scale, was examined and it was founded that $\alpha = 0,80$.

3.3.4. Satisfaction Scale Development Process

The satisfaction scale has been developed by the researcher with aim of prediction of student satisfaction in distance education. There were 38 items in the scale for measurement the student satisfaction. The scale has been designed as a 7 point likert scale. As environment of the education program involved both online and face to face education, scale was provided to reflect the properties of this environment. The scale has been designed as a 6 factor scale that are student-student interaction, student-teacher interaction, online courses, technical support, printed materials, and face to face activities. The analysis was executed with 360 data. The values of last version of the scale were [χ^2 (509, N=360) = 1506.29, $p < .000$, RMSEA= 0.074, S-RMR= 0.067, GFI= 0.80, AGFI= 0.77, CFI= 0.98, NNFI= 0.98, IFI= 0.98]. The Cronbach's α coefficient, which is the reliability coefficient of the scale, was examined and it was founded that $\alpha = 0,96$.

4. Analysis

4.1. First Research Problem

A multiple regression analysis was applied in order to determine whether the technology acceptance and community feeling together predict the student satisfaction or not. The results of the analysis are presented in Table 1.

Table 1. Results of multiple regression analysis

Variable	B	Standard Error _B	β	T	p	Binary r	Partial r
Constant	47,538	7,230	-	6,575	,000	-	-
Technology acceptance	2,556	,204	,572	12,503	,000	,712	,620
Community feeling	1,537	,227	,310	6,769	,000	,567	,394
R = 0,763	R ² = 0,583						
F _(2, 250) = 174,565	p = ,000						

Technology acceptance and community feeling scores pointed to having a strong and positively significant relationship together on student satisfaction about distance education (R= 0,763, R²= 0,583, $p < ,01$). Technology acceptance and community feeling explained nearly 58% of the student satisfaction in distance education. Thus the effect size is 1,39 for R²=0,583 according to Cohen f^2 index. This result is an indicator of a large effect size. When the bivariate and partial correlations between the independent and dependent variables were examined, it was observed that there was a positive and high level relationship ($r=0,71$) between the technology acceptance and satisfaction. It was also observed that there is a positive and medium level relationship ($r=0,56$) between the community feeling and satisfaction. It is understood from β coefficients that the contribution of technology

acceptance on learner satisfaction is much more than community feeling. Symbolically, a prediction formula of the model can be presented as follows: Satisfaction= 47,583 + 2,556 * Technology Acceptance + 1,537 * Community Feeling

4.2. The Second Research Problem

A stepwise multiple regression analysis was performed in order to determine whether the dimensions of online learning systems acceptance scale and community feeling scale together predict the student satisfaction or not. Before making the stepwise multiple regression analysis, normality, linearity and homoscedasticity values of the data had been examined and verified for these three assumptions (Tabachnick & Fidel, 2001). The histogram, scattering diagrams and normal distribution curves showed that the dispersion was quite close to the normal. The results of stepwise multiple regression analysis is presented in Table 2.

Table 2. Results of stepwise multiple regression analysis

Variable	B	Standart Error _B	β	T	p	Binary r	Partial r
Constant	47,414	7,298		6,497	0,000		
Perceived usefulness	2,669	0,328	0,425	8,128	0,000	0,673	0,459
Perceived ease of use	2,322	0,568	0,210	4,090	0,000	0,576	0,251
Affective	1,537	0,336	0,220	4,580	0,000	0,538	0,279
Action	1,550	0,430	0,158	3,609	0,000	0,366	0,223

As a result of analysis it was found that the perceived ease of use, perceived usefulness, action and affective dimensions predicted student satisfaction significantly ($p < 0,01$). According to the standard regression coefficient β , the order of importance of independent variables in explaining the student satisfaction is; perceived usefulness, perceived ease of use, affective dimension and action dimension. At first perceived usefulness was joined to the model, and explained 45% of the model alone. Secondly, perceived ease of use was joined to the model with perceived usefulness, and they explained the 51% of the model together. Thirdly, affective dimension was joined to the model; with perceived usefulness and perceived ease of use and they explained the 56% of the model together. Finally, action dimension joined to the model and all of the four variables explained the model altogether at a rate of 58%. These results showed that the dimension of the perceived usefulness was the most powerful factor that predicts satisfaction. Symbolically, a prediction formula of the model can be presented as follows: Satisfaction= 47,414 + 2,669*Perceived usefulness+ 2,322* Perceived ease of use + 1,537*Affective + 1,550*Action

4.3. The Third Research Problem

One way ANOVA analysis was performed in order to determine whether the students' community feeling scores show differences or not with respect to usage condition (users vs non-users) of online environment. The results of the analysis were given in Table 3.

Table 3. Results of ANOVA analysis

Variable	Usage Situation	n	Mean	Standard Deviation	F	p	Levene
Community Feeling	User	253	29,43	6,45	5,312	0,022	0,058
	Nonuser	211	27,95	7,40			

According to the results of ANOVA analysis in which the scores that were obtained from community feeling scale were taken as dependent variables, it was found that there was a significant difference in terms of community feeling ($p=0,022$) and this difference was in favor of the students that are using the online media.

5. Discussion and Conclusion

In this research, relationship between technology acceptance and community feeling together and students' satisfactions towards distance education was found a medium level and significant. Also it was determined that the effect of technology acceptance was much more than effect of community feeling. Sun et al. (2008) defined 7 variables, namely, student computer anxiety, student's attitude towards e-learning, e-learning course flexibility, course quality, perceived usefulness, perceived ease of use and diversity in evaluation, which define the e-learning students' satisfaction in the stepwise multiple regression analysis. These variables explained the 66,1% of the satisfaction. When the duration of computer usage were examined, it has been revealed out that because most of the students had been using computers 3 years or less, they had difficulties in solving the technical problems that they had come across, and for this reason it is thought that the technology acceptance has a higher effect on satisfaction.

Results showed that students who thought that online learning systems are easy for use and useful for their learning, more satisfied about distance education. And also students who could develop community feeling, more satisfied about distance education.

It is seen that the online learning systems acceptance scale sub dimensions and community feeling scale sub dimensions predicted the student satisfaction together significantly. It is determined that perceived usefulness dimension was the variable that explains the 45% variance of the satisfaction alone and it has the highest prediction power. The other dimensions that follow the perceived usefulness in order are; affective, perceived ease of use, and action. It is seen that these 4 dimensions together explained the 58% variance of satisfaction. There have been studies that support perceived usefulness predicts satisfaction more than perceived ease of use (Sun et al., 2008).

The factors affecting the perceived usefulness have been also the subject of a series of research. For example; Aşkar (2005) found in a research that students in undergraduate degree seem more positive about distance education, especially if it is provided by a prestigious university and thought that it will increase the job opportunities. The perceived usefulness is limited by the factors given above but also it can include different factors too. Researching of this subject by both qualitative and quantitative methods may be important in shaping the distance education.

When community feeling analyzed both for using and non-using online environment, a significant difference was observed in favor of learners who were using online environment. In a research which supports the results of this study, additionally it was also determined that online conversation sessions and face to face interactions have a quite large effect on formation of community feeling, but discussion boards, forums have less effect on formation of community feeling (Lord & Lomicka, 2008).

In this situation it can be important integration of Web 2.0 applications to online learning systems which can be provide and increase community feeling. Web 2.0 technologies can increase the involvement of students to online learning environment. Using blogs, podcasts, wikis or social networks can increase interaction and community feeling that may also help developing learner satisfaction. Social software deliver communication between groups, deliver collaborative indexing and collecting information, has new tools for creation of knowledge, enables communication between many students, provides sharing resources, assists personalization of priorities (Owen, Grant, Sayers and Facer, 2006). Web 2.0 technologies can be used effectively in distance education through these features. Especially distance education learners have many choices accessible for their learning process.
