Proceedings Book

SAKARYA UNIVERSITY

Acknowledgement

Dear Guests…

Welcome to the 3rd International Conference of New Horizons in Education-2012.

"The International Conference of New Horizons in Education-2012 (INTE-2012)" is an international educational activity for academics, teachers and educators. It promotes the development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conference activities, the conference proceeding book. This year, INTE-2012 received almost 420 applications. The conference academic advisory board accepted 300 applications.

The International Conference of New Horizons in Education-2012 aims to diffuse the knowledge and researches among academicians and lead to development in educational sciences.

We have lots of participants from 25 different countries. Some of these countries are Brazil, Canada, Czech Republic, China, Kyrgyzstan, Malaysia, Mexico, New Zealand, Portugal, Russian Federation, Saudi Arabia, South Africa, Turkey,United Kingdom and United States

Should you have any enquiries regarding INTE conference, please do not hesitate to contact with us for any additional information you may require.

Finally, we would like to wish you all a pleasant stay in Prague and safe return back home. I hope that INTE-2013 will be a meeting you will pleasantly remember.

We hope we will meet again at the International Conference of New Horizons in Education 2013 in Rome/Italy.

Thank you…

Prof. Dr. Aytekin İŞMAN
General Coordinator, INTE
5 June 2012

General Coordinator

ACADEMICIANS COMING TO TURKEY BETWEEN 1933-1945 OPENED AND THEIR EFFECTS ON TODAY'S MUSIC LIFE

Gulsen G. Erdal

Kocaeli University-State Conservatory, P.O. Box 41300, Turkey

Abstract

Turkey became a homeland for the asylum seekers who were denationalized and declared stateless 'heimatlos' and came to Turkey as refugees from the Nazi Government during the World War II by including them in the country development. During the same period, one of the basic training problems in the agenda of Turkey was 'the University Reform'. Darulfunun, which Abdulhamid II founded in 1900, was insufficient to achieve the objectives of the republic. Ataturk invited Professor of Pedagogy Albert Malche from Geneva University to Turkey to prepare a report.When Prof. Malche, presented the detailed assessment report he prepared after his observations, Ataturk had the report, which included the closure of Darulfunun, the elimination of academicians far from the contemporary science and art, the establishment of a disciplined education system with the academicians imported from abroad and educating academic members, approved and it was carried into practice. Professor Malche communicated with some academicians in order to be assigned in the n Among these scholars who were assigned in the construction of Turkish music institutions by being reformed , Licco Amar, (music lecturer at Ankara State Conservatory), Carl Ebert (director at Ankara State Conservatory and State Theatre), Paul Hindemith (violinist and composer, Founder of Ankara State Conservatory), Eduard Zuckmayer (employed first at Music Teacher Training School, then at Music Department in Gazi Teacher Training Institute) were important musicians.n Those academicians were assigned in all areas.

Keywords: the world war II; Turkish University reforms; Turkish republic music reforms.

1. Ataturk and the Ottoman University (darulfunun) in Turkey before the reform

From 1922 till 1933 the unique university in Turkey was Darulfunun (Science House-Science Gate).It was re-established in the name of Darulfunun-u Osman during the period of Abdulhamıt. Darulfunun had three madrasas related to theology, literature and natural sciences. The government didn't comment on the education and training of the university until 1932, but waited for the developments from the university. However, Darulfunun didn't give any support to the revolutions made in the first 10 years of the Republic. On the contrary, it supported antirevolutionary movements (Ozata, 2005, p.109-112).

1.1 University reform

After the republic was established, the university called 'Darulfunun-u Osman' was named 'Istanbul Darulfununu' with the law numbered 493 in 1933. However, Darulfunun, which didn't meet the expectations in the first years of the Republic, was abolished with the law numbered 2252 in 1933. Two items come fore in Darülfunun's being criticized: The university didn't participate sufficiently in the settlement of the Turkish Revolution, opposed or showed passive resistance to the reforms. There was no scientific study at the university (Zengin,2010,p.117). Along with the reform made in 1933, present concepts such as faculty, dean, rector were adopted and scientific activities were put into an effective audit. The innovations which the university reform brought:Raising new generations who adopted the revolutions of Atatürk, constituting civilized man power to reach the level of contemporary civilization.

- Eradicating fusty thoughts and beliefs from the university.

- Providing a more effective function and scientific study in contrast with Darülfunun, and introducing an effective audit (Zengin,2010,p.117-119)

Upon seeing no contemporary progresses in Darulfunun, Ataturk started the university revolution, which would last two years, in 1931. Proffessor Albert Malche from Switzerland was invited to Turkey and asked to make an investigation into Darulfunun. Malche was in the Pedagogy Department of Gelf University in Switzerland (Ozata, 2005, p.127). Jewish descent Malche, who came from Switzerland, a constant neutral country, was appointed to work in the public reform business in Darülfunun with the Council of Ministers Decree numbered 12032 and dated 12 December 1931 (Simsir, 2010,p.95). On 31 May 1933, the law of İstanbul University was introduced. The law numbered 2252 was enacted on 1 June 1933. (Simsir, 2010, p.101)

In Malche's report, there were 5 sections and 34 items:

- The purpose of Darulfunun, the budget and the organization

- The training staff

- The administrative organization

- The students

- The annual training program of Darulfunun

The purpose of this report was to show how İstanbul Darulfunun could be developed into a higher authority for national culture and modern science. In his report, Malche pointed out that it was necessary to think in a way to reveal the scientific thought and Darulfunun was responsible for managing the scientific mindset (Ozata, 2005,p.137).

Malche's report had three parts:

- The content of the report

- The current structure of Darulfunun

- The innovations to be made

Malche's report revealed the legitimacy of the criticism directed to Darulfunun. Malche emphasized the students' being active and enterprising at the end of his report. (Binbaşıoglu, 2009, p.527). Malche's report was accepted as the university reform program (Yalcın, 2011, p.69). On 31 May 1933, the law numbered 2252, on the university reform, was adopted in the parliament. According to this decree:

Istanbul Darulfunun was eliminated along with all the institutions connected to it, the faculty members and its matrix on 31 July 1933.

- The Board of Education was in charge to found an institution named Istanbul Universiy as of the date of 1 August 1933.

The Resources of the Teaching Staff of the University were specified as follows:

- Those appointed as the staff of Darulfunun

- Foreign scientists brought from abroad

- Those who completed their education and expertise in European universities and returned home (Yalcın, 2011, p.72).

2. Racism coming the fore in Germany and the state of the Jewish descent scientists

The university reform in the newly established Turkish Republic coincided with the Nazi Party's coming into power. As a result of the rising racial understanding, a lot of Jewish descent professors, who were not of the pure race origin, were dismissed. During this period, the scientists who were able to flee from the Nazis to Switzerland established a small "Academic Refugee Colony" (Yalcın, 2011, p.75). Prof. Schawrtz came to Zurich in 1933 resigning from the University of Frankfurt and leaving Germany. In the meantime, scientists began to take refuge in foreign countries in order to save their lives and futures from the danger. An association called "Philanthropic Association of German Scientists Abroad" was founded under the chairmanship of Schawartz. Prof. Malche, informed about the association which wasn't an extension of a political branch or party, told Resit Galip, the Deputy Minister of Education, the developments. Malche was given the authority to contact with the association by Galip (Yalcın, 2011,p. 76).

2.1. The agreement made between the deputy minister of education Resit Galip and the association (Ankara protocol)

Ataturk aimed at the culture of the Turkish Nation being fed with certain values and forging ahead. One of the most important areas of the reform that required to be reviewed was music, which played a crucial role in shaping the society. While Ataturk was contemporizing Turkey, firstly the national culture came out and Turkish enlightenment was fed with neo-nationalist culture (Meydan, 2012,p.137). Turning to the base of the Republican revolutions, the requirement to make institutional and contextual innovations in the field of music, which was foremost of the dynamics of art and basic education shaping the society emerged. Ataturk stated the idea of founding a conservatory in the country in the opening speech of the parliament in 1934 and afterwards it was observed that he frequently referred to the subjects related to art (Sun&Katoğlu, 1993, p.74). Thus, the Ministry of Education asked Cevat Dursunoglu, who was a school inspector in Berlin in 1934, to find an expert for the organization of the conservatory. As a result of the investigations, Dursunoglu invited German Paul Hindemith to Turkey, and after signing the contract on 27 March 1935, Hindemith started his studies. Hindemith was asked to consider our music works nationwide and to prepare his reports in this direction. (Alaner, 2004,p.22)

3. Ataturk and the reflections of the university on musical institutions during the republic period reform

Ataturk aimed at the culture of the Turkish Nation being fed with certain values and forging ahead. One of the most important areas of the reform that required to be reviewed was music, which played a crucial role in shaping the society. While Ataturk was contemporizing Turkey, firstly the national culture came out and Turkish enlightenment was fed with neo-nationalist culture. (Meydan, 2012, p.137). Turning to the base of the Republican revolutions, the requirement to make institutional and contextual innovations in the field of music, which was foremost of the dynamics of art and basic education shaping the society emerged. Ataturk stated the idea of founding a conservatory in the country in the opening speech of the parliament in 1934 and afterwards it was observed that he frequently referred to the subjects related to art. (Sun& Katoğlu, 1993, p.74).

Thus, the Ministry of Education asked Cevat Dursunoglu, who was a school inspector in Berlin in 1934, to find an expert for the organization of the conservatory. As a result of the investigations, Dursunoglu invited German Paul Hindemith to Turkey, and after signing the contract on 27 March 1935, Hindemith started his studies. Hindemith was asked to consider our music works nationwide and to prepare his reports in this direction. (Alaner, 2004, p.22)

4. Jewish Descent Artists And Educators In Turkish Music Institutions

Scientists who came to Turkey couldn't contribute to the university life at once because of language problem, but in the forthcoming process, they gained great importance in meeting the demand for the teaching staff and

structuring a university in western-style. They constituted the scientific bases of various fields in almost all subjects. Within the framework of the university reform, German musicians in the musical institutions in Turkey and their effects on institutional structuring reveal themselves on the bases of present musical institutions.

4.1. Lico Amar

Prof. Amar, a very famous violin teacher, born in Hungary, came to Turkey via Berlin and France in 1934 because of Nazi rule while he was training in Frankfurt. First, he worked as a music professor in Istanbul. When the State Conservatory of Ankara was founded, he moved to Ankara to work as a violin teacher at conservatory and returned to Germany in 1957. World-renowned Turkish violin players such as Suna Kan and Ayla Erduran were Lico Amar's students. (Şimşir,2010,p. 209). Hungarian descent violinist, Lico Amar realised the first performances of the masterpieces of chamber music repertoire, especially all the violin-piano sonatas of Beethoven with Rozsi Venetianer Szabo in Ankara Community Centre, in Ankara State Conservatory Hall, on Ankara Radio, in L'Union Française Hall in İstanbul, in Casa d'Italia Hall in Tepebaşı and in Galatasaray High School Hall.(Ali,????)

4.2. Gilbert Back

Ankara State Conservatory, which started education within the structure of the School of Music Teacher Training (Musıki Muallim Mektebi) in 1935-36 academic year, added theatrical and opera education to its curriculum in addition to musical art branches. Australian Jewish descent Back was one of the first lecturers of Ankara State Conservatory and one of the members of the Presidential Philharmonic Orchestra. He came to Ankara from Vienna in 1937 and survived the Nazi persecution. He trained at conservatory between the years 1937 and 1946. (Şimşir, 2010, p.210) He went to America in 1947.

4.3. Ludwig Czaczkes

Prof. Czaczkes, who taught piano at Ankara State Conservatory between 1938 and 1945, was an Austrian Jew. Upon Austria's joining Germany, he took refuge in Turkey and contributed to the conservatory training between the aforementioned years. (Simsir, 2010,p.213-214).

4.4. George Markowitz

The professor, who taught piano at Ankara State Conservatory, was a German Jew. Upon Austria's joining Germany, he came to Turkey and contributed to the conservatory training in the field of piano art. (Simsir, 2010,p.213-214).

4.5. Ernst Praetorius

Praetorius, who worked as the Musical Director of the German National Theatres in 1933, was about to be promoted to the Directorate of Berlin Philharmonic. When Nazis came to power, he was discharged and was invited by the Turkish Government at the recommendation of Hindemith, and coming to Turkey in October 1935, he became the conductor of the Presidential Philharmonic Orchestra. He was one of the first foreign musicians who came to Ankara (Simsir, 2010, p.217). He came to Turkey before the Republic Day and was assigned to conduct the Presidential Philharmonic Orchestra. He founded Ankara State Conservatory, worked as a musical instrument (bassoon) teacher at conservatory, conducted the student orchestra and made an effort to raise composers and musicians. Praetorius was asked to restructure the Presidential Philharmonic Orchestra (Aydın, 2003,p. 21). After this successful period, which lasted 15 years, upon seeing the destruction of Hitler's Regime, he died at the age of 66 in Ankara leaving memorable marks behind (Yalcın, 2011, p.268).

4.6. Eduard Zuckmayer

In a letter to Dursunoglu, Hindemith explained the future of music education of the country as follows: "My most serious concern is the opening of the new teacher training school which is inarguably interdependent with the beginning of a well-planned firm order. How deeply Turkey is attached to music or whether it is attached or not depends on these young music teachers' next generation." Eduard Zuckmayer, who came to Ankara with Hindemith's proposal and founded the Music Department of Gazi Training Institute and managed it until his death, raised the aforementioned young music teachers and supported and witnessed their selfless efforts (Ali, 2012). In accordance with Hindemith's plans, Zuckmayer, who was put in charge of Gazi Training Institute, which raised music teachers in 1938, was a pianist, a conductor and an effective educator. The future music teachers studied European Music History, learnt to play the piano, violin, cello, viola, contrabass as the main instruments and sang German and French songs in voice training courses there. However, German School had intense effects on several areas of Turkish Music, especially on education music. In recent years, in order for Turkish school music to be able to take its authentic place in the union of European nations, melodies has been formed in Turkish folk series and Turkish folk instruments entered into institutions which especially gave music teacher training (Aydın, 2003, p.21).

5. Paul Hindemith and his Proposals to Save Turkish Music Life

As of 1933, music held an important place in the structuring works carried out in social, scientific and artistic fields. The government, which decided to make reforms on music education as well, needed experts for the establishment and development of symphony, opera, conservatory and theatre and German artists and men of culture who were discharged by Nazi Germany were appealed to (Yalcın, 2011, p.269). The restructuring of music education, which was the basis of the structuring in all these institutions, and opening schools to train music teachers constituted the government's agenda.

Dursunoglu, the school inspector of Berlin, invited Hindemith by command of Ataturk. The contract dated 19 January 1937, included the phrases; " Hindemith will work for the philharmonic orchestra, at Music Teacher Training School under the service of Turkish Republic Ministry of Culture, will occupy himself with training music teachers and will consult the Ministry of Culture on the affairs related to music art". As is evident, Hindemith was asked to consider the music works nationwide and report his studies accordingly. Hindemith devoted an important place to conservatory in his article "Proposals to Save Turkish Music Life" in 1936. He separated the music schools into three groups as free music schools (conservatories), music teacher training schools and theatres (Alaner, 2004, p.23). The first proposals dated 1935 and the two reports submitted in school 1936 and 1937 constituted the bases of Hindemith's reports. Hindemith's reports included the first proposals dated 1935, and the bases of the two reports submitted in 1936 and 1937. These first proposals translated into our language by Oransay consisted of five parts:

- Orchestra: The composer determined the situation of the Presidential Symphony (then called Philharmonic) Orchestra in this part, and he mentioned that the members were trained insufficiently but talented individuals. He touched on issues such as a good orchestra conductor, inadequacy of concert halls, and convenience of broadcasting concerts on the radio. (Birkan, 2002,p.378)

- Music Academy: He pointed out that these schools were far from enthusiasm in terms of ideal. He mentioned about the impossibility of acquisition of that feeling and its reflection on students as long as an official who didn't understand music was in the management of the school although the conditions were not convenient. Therefore, by saying "Management determines the spirit of the school", he emphasized the importance of organisational climate in a sense.

- Public Music Structure: Under this heading, the issues such as the establishment of an opera house, a concert hall, a (music) broadcasting company, a concert organization organ in Ankara, reorganization of music education at schools, folk music's being compiled and treated took place. In this report, Hindemith provided detailed information on what kind of acoustics a concert hall required. Also, mentioning the

bureaucratic obstacles which impeded the development of music, he emphasized the need to repeal the legal regulations brought to musical events managed with public allowances. (Birkan,2002,p.379)

- İzmir, İstanbul: He brought forward proposals by examining the music lives in these two big cities of the period. He pointed out the need to improve the music lives of these two cities. He mentioned about structuring of orchestra and music schools.

- Formation of Turkish Classical Music: He mentioned about the things to be done to constitute Turkish Opera and Contemporary Turkish Classical Music benefiting from Turkish Folk Music. He stated that Turkish composers would find what they looked for in the village music of their countries.

6. Hindemith regulations and its reflections on today's musical institution

The realization level of Hindemith's proposals constituted the basis of the point the current music education has reached. However, the existing proposals keep up-to-date to a certain extent to solve the problems of our present music life. Basic foundations of conservatory regulations in force today existed in Hindemith regulations. Heindemith devoted an important place to conservatory in his article "Proposals to Save Turkish Music Life" in 1936. He separated the music schools into three groups as free music schools (conservatories), music teacher training schools and theatres. The main elements of this regulation could be summarized as follows: The purpose of the conservatory, academic and administrative structuring, instructional periods, students' readiness state required for the exams, the amount of the school fee, conditions of dropping out of the conservatory, study rooms, students' not being able to participate in music studies without administrative permission, courses to be taught, weekly course hours, etc. It was divided into six groups which belonged to the courses put in the program which took place in the regulation. Generally, the first proposals dated 1935, the two reports submitted in school 1936 and 1937 constituted the bases of Hindemith's reports.

- Theory class (composition, instruments, tone knowledge, music history)

- Piano and chamber music with piano accompaniment

- Stringed and wind instruments and their chamber music

- The school orchestra, choir and violin choir

- Vocal training

- Pedagogy class (only for the music teacher training department)

Final exams and graduation exams at the end of the school year and their implementations and the students' exam program also existed in the regulation (Alaner, 2004,p.23) As is seen, all the content of Hinemith's abovementioned report was fully utilized and it constituted the basic foundation of the current structuring. (Alaner, 2004, p.23).

Conclusion

It is obvious that Jewish descent scientists who came to Turkey provided a major contribution to the establishment of a university based on scientific, contemporary and democratic principles. As a result of the studies of these scholars who took charge in the renewal of the musical institutions in the Republic Period, musical institutions of young Turkish Republic were innovated and the bases of the current musical structuring were laid. As of 1933, among German or Australian musicians who served short or long term in Turkey, violinist Lico Amar, Theory expert Gilbert Back, pianist Ludwig Czaczkes, composer Teodor Fuchs, violinist Walter Gerhard, composer Paul Hindemith, composer and violinist Heinrich Jacoby, music educator Max Klein, singing artist Steffi Klein, pianist H.Markowitz, conductor Ernst Praetorius, pianist Frederich Schlösenger,

musicologist Frederich Schönfeld, violinist Adolf Winkler, violinist Walter Wunsch, music educator Eduard Zuckmayer can be counted. The outstanding names in the study were primarily dealt with. A staff of well-known European musicians being met with respect and love in Turkey created a broad response all over the world and caused other musicians to come to Turkey. Among the other names which can be counted are Bela Bartok, Carl Ebert, Hans Kuchenbuch, Paul Lohmann, P.Savarosh, Hermann Ritter von Schmeidel, Otto Matzerath, Hans Hörner, Elvira dev Hidalgo, Max Klein, Frieda Böhm, Johanna Seidler, Alfred Braun, Elizabeth Adler, Hans Rey, Martin Bochhmann, Peter Weiss, Eva Klein Franke,etc (Say,1998,p.279). In this study, the functions of the scholars who survived Nazi Regime have been examined in the contemporary

Özet

Örgün eğitimin sunulamayacağı durumlarda veya farklı lokasyonlarda ki insanlara eğitim verilmesi hedeflendiğinde uzaktan eğitim sistemi öne çıkmaktadır. Son yıllardaki bilişim teknolojisindeki gelişime paralel olarak uzaktan eğitim teknolojileri de gelişmiştir. Bunun için birçok öğrenim yönetim sistemleri (LMS) geliştirilmiştir. Bu kapsamda web tabanlı olarak geliştirilen uzaktan eğitim sistemi yazılımı ile üniversitelerin eğitim-öğretim süreçlerinin tanımlı, şeffaf ve sürekli geliştirilebilir bir çerçeveye taşınması hedeflenmektedir. İstenilen bu çerçeve yazılımının başarımı yazılım kalitesi standartlarına uygun tasarım yapılması ön koşuluyla mümkün hale getirilebilir. Sınıf uyumu (Cohesion)yazılım kalitesinin değerlendirilmesinde son yıllarda oldukça sık kullanılan bir yöntemdir. Bu çalışmada Açık kaynak kodlu öğrenim yönetim sistemlerinde sınıf uyumu, yazılım metrikleri kullanılarak incelenmiştir. Yapılan inceleme sonucunda Açık kaynak kodlu projelerde sınıf uyumluluk haritaları çıkarılarak öz-ilişkisel değerlendirilmeleri yapılmıştır.

Keywords: Öğrenim Yönetim Sistemleri; ÖYS; Sakai; cohesion; yazılım metrikleri;

1. Giriş

Gelişen teknoloji ile birlikte uzaktan eğitimin sunduğu olanaklar, buna paralel olarak da uygulama alanları artmıştır. İnternetle birlikte uzaktan etkileşimli hale gelmiştir. İnternet üzerinden uzaktan eğitim sunumu için geliştirilen bir çok yazılım bulunmaktadır. Bu yazılımlara genel olarak Öğrenim Yönetim Sistemleri "ÖYS" (Learning Management System, LMS) adı verilmektedir. Birinci önceliği ticari kaygı olmayan bir çok kuruluş çok sayıda açık kaynak kodlu öğrenim yönetim sistemi geliştirmiştir. Açık kaynak kodlu projeler ücretsiz olması, çok sayıda gönüllü programcı tarafından geliştirilmesi, çok fazla kişi tarafından test edilmesi kuruma özel modifiye edilebilme özellikleri ile öne çıkmaktadır. Fakat bu özellikler yazılımın, yazılım kalite standartlarına uygun olarak geliştirilmemesi durumunda avantajdan çok dezavantaj da olabilir. Bu dezavantaj yazılım kalite standartlarını uygulayarak aşılabilir.

Farklı yerlerdeki gönüllü geliştiriciler tarafından geliştirilen yazılımların yazılım kalite standartlarına uygun olarak geliştirilmesi zor bir iştir. Aynı ortamda bulunmayan geliştiricilerin ortak bir dil kullanması ve geliştirilen farklı modüllerin uyumunun sağlanması, herhangi bir modülün tekrar geliştirilebilir bir yapıda kodlanması önem arz etmektedir. Bu da yazılımın geliştirilmesi sürecinde sürekli ölçme, değerlendirme ve test etme gibi kavramları karşımıza çıkarmaktadır. Geliştirilen bir yazılımın değerlendirme ve ölçme işlemi yazılım metrikleriyle yapılmaktadır.

Bu çalışmada Açık kaynak kodlu öğrenim yönetim sistemlerinden biri olan Sakai projesinde sınıf uyumu, yazılım metrikleri kullanılarak incelenmiştir. Yapılan inceleme sonucunda Açık kaynak kodlu projelerde sınıf uyumluluk haritaları çıkarılarak öz-ilişkisel değerlendirilmeleri yapılmıştır.

2. Uzaktan Eğitim Ve LMS

Farklı lokasyonlardaki insanlara eğitim verme ihtiyacı uzaktan eğitim uygulamalarını doğurmuştur. Geçmişte mektupla öğrenim şeklinde gerçekleştirilen uzaktan eğitim, teknolojinin de gelişmesiyle birlikte sırasıyla radyo

ve televizyonla kapsamını genişletmiş, bilgisayar ile gelişmiş ve en sonunda internetin kullanılmaya başlanmasıyla etkileşimli hale gelmiştir. 1970 li yıllarda çeşitli veri taşıma cihazları ile taşınan programlar ile offline olarak bilgisayar tabanlı uygulamalar ile uzaktan eğitim sağlanmaya başla. 1990 lı yıllar ile birlikte internetin hayatımıza aktif olarak girmesi ile uzaktan eğitim internet üzerinden sunum imkanına kavuştu (Özkul,2003)

Günümüzde sunulan internet destekli uzaktan eğitimin başlıca avantajlarını sayacak olursak

- Günlük yaşamındaki faaliyetleri aksatmadan, daha uygun maliyet ile eğitim alınmasını sağlar.

- Kişi zaman ve mekândan bağımsız olarak kendisi için en uygun zaman ve mekânda konuyu öğrenebilir. Bu da öğrenim faaliyetinin daha zevkli ve rahat olmasını sağlar.

- İnternet üzerinden referans gösterilen kaynaklara erişim kolay ve kısa sürede sağlanır.

- Gerektiğinde ders içerikleri kısa sürede güncellenebilir.

- Kişinin tüm öğrenim faaliyetleri izlenebilir, analiz edilebilir, eğitimin başarımı raporlanabilir.

- Çok sayıda insana aynı ders içeriğini, aynı sunumla, aynı kalitede ulaştırarak eğitimde standardizasyon sağlanabilir. (Duran vd,2006)

- Bireyler ve/veya gruplar örgün eğitimde ulaşmaları ciddi bir maliyet ve uğraşı gerektiren farklı grup ve bireylere ulaşma imkânını sağlayarak veri paylaşımını gerçekleştirilebilir.

- Teknoloji ve iş dünyasında hızlı gelişmeler olmaktadır. İş dünyasındaki rekabet ortamı, bu gelişmelere ayak uydurmayı, sürekli kendini geliştirmeyi gerektirmektedir. Başarıyı hedefleyen bireyler ve kurumlar çalışma hayatını aksatmadan kendini geliştirmek, yeniliklere ayak uydurmak için uzaktan eğitimden yararlanmak zorundadırlar. (Pantazis ,2002) Çünkü uzaktan eğitim ile hizmet içi eğitimde ve sertifika eğitimlerinde çok sayıda kişiye uygun maliyetle ve zaman mekan kısıtlaması olmadan eğitim sunmak mümkündür.

- Sadece eğitim yaşında olan bireylerin ve kayıtlı öğrenci grubunun değil farklı yaş grupları ve kesimlerdeki insanlarında öğrenme sürecine katılmasını sağlayarak yaşam boyu öğrenmeye olanak sağlar (Altıparmak vd ,2011).

İnternet üzerinden uzaktan eğitim sunumu için geliştirilen bir çok yazılım bulunmaktadır. Bu yazılımlara genel olarak Öğrenim Yönetim Sistemleri "ÖYS" (Learning Management System, LMS) adı verilmektedir. Bu sistemler ders materyali sunumu ve paylaşımı, video konferans ile canlı ders, sınıf oluşturulup yönetilmesi, ödev ve sınav yönetimi ve bunların geribildirimi, öğrenci, öğretmen, not ve ders bilgisi takibi ve raporlama gibi işlevleri sağlarlar (Paulsen,2008).

3. Açık Kaynak Kod ve Sakai

Yazılımcılar yazılımları geliştirirken kullandıkları programlama dilleriyle çalıştırılabilir dosyaları oluşturulur. Eğer istenirse sadece programı çalıştırmak için gerekli çalıştırılabilir dosyaları dağıtılır. Açık kaynaklı yazılımlarda ise kaynak kodu ürünle birlikte dağıtılır. Böylece ürünü kullanan kişi veya kurum kendi ihtiyaçlarına göre programı değiştirebilir, geliştirebilir, dünyanın çeşitli yerlerinden gönüllülerin katılımlarıyla ürünün geliştirilmesi ve yaygınlaşmasına olanak sağlanır. Açık kaynak kodlu yazılımlar insanlığın ortak malıdır. Açık kaynak kodlu yazılımların başlıca avantajları:

- Kullanıcılar tarafından değiştirilebilmesi

- Uyarlanabilir olması,

- Çok fazla kişi tarafından test edilmesi,

- Üretici firma desteğinin mecburi olmaması

- Genellikle ücretsiz veya uygun ücretli olması

Uzaktan eğitimde açık kaynak kodlu yazılımların kullanılması maliyeti önemli ölçüde azaltır. Uzaktan eğitimde kullanılan çok sayıda açık kaynak kodlu yazılım vardır. Bunlardan bir tanesi de sakai'dir.

Sakai, daha çok yüksek öğrenime özelleşmiş ve dünya üzerinde yaygın kullanıma sahip açık kaynak kodlu bir öğrenme yönetim sistemidir. Indiana Üniversitesi, Massachusetts Teknoloji Enstitüsü, Stanford Üniversitesi, Michigan Üniversitesi ve Valencia Polytechnic Üniversitesi önderliğin de oluşturulan "Sakai Foundation" organizasyon yapısı altında akademik, ticari ve bireysel katılımlarla geliştirilen işbirliği ve öğrenme ortamıdır (Collaboration and Learning Environment CLE).

Sakai ücretsiz ve eğitimi destekleyen birçok özelliği ile web tabanlı, platform bağımsız bir uygulamadır. Araştırmacıların ve proje gruplarının kullanımına uygundur. Uygulama, ders yönetim sistemlerinin sahip olduğu birçok ortak özelliğin yanında bilgi\belge dağıtımı, ödev aktarma, çevrimiçi ölçme değerlendirme ve not defteri ve canlı sohbet modüllerini içermektedir.(sakai 2012)

4. Yazılım Kalitesi ve Metrikler

Kullanıcıların veya tüketicinin istek ve gereksinimlerine amaç dersek kısaca "Kalite amaçlara uygunluk derecesi" olarak tanımlanabilir. Kalite sınırları ihtiyaçlara ve teknolojideki gelişmelere paralel olarak sürekli genişler.

Kaliteli yazılımlar; kabul edilebilir seviyede hata ile, öngörülen maliyet ve sürede geliştirilen, gereksinimleri ve beklentileri karşılayabilen ve bakımı ve güncellenmesi kolay yazılımlardır.

Yazılım kalitesi çeşitli kurumlar tarafından tanımlanmış standartların uygulanması, ölçülmesi, değerlendirilmesi ve belgelendirilmesi ile sağlanır.

Değerlendirilebilme ölçülebilme imkânına bağlıdır. Ölçülebilme kalite ile ilgili ölçüm çalışmaları kapsamına girmekte ve çeşitli test ve incelemeleri içermektedir.

Yazılım gözden geçirmeleri sırasında yazılımın neye göre inceleneceği çok önemlidir. Yanlış değerlendirmeler maliyet ve yazılım kalitesindeki düşüş olarak yazılım şirketlerine geri döner. Bu yüzden yazılım gözden geçirmelerinde yazılım metriklerini kullanmak yazılım kalitesi yönetiminde objektif bir bakış açısı sağlar. (Alptekin 2008)

5. Sınıf Uyumu (Cohesion)

Ölçülebilir ve değerlendirilebilir yazılımların geliştirilmesinde sınıf uyumluluğu(cohesion) önemli bir kavramdır. Belli bir işleyişi gerçekleştiren bir sınıfın sahip olduğu metod ve özelliklerin birbirleriyle ilgili ve uyumlu olduğunu ölçen metrik kümelerine sınıf uyumu(cohesion) metrikleri denir.

Yazılım kalitesi literatüründe yüksek uyum sınıflar için zaruri bir özellik olarak görülmektedir. Geliştirilen yazılımın bakım ve devamlılığı sistemin yapıtaşları olan sınıfların uyumluluğu ile doğru orantılıdır.(Kurubaş vd,2010)

Sınıf uyumu metrikleri sınıf uyumunu ölçerek düşük uyumlu sınıfların uyumsuz metod ve özelliklerinin çıkarılarak uyumlu olan başka bir sınıfa eklenmesi veya uyumlu bir sınıf yoksa yeni bir sınıfta yeniden tanımlanması gibi durumlar için geliştiriciye yol gösterir.

Bir sınıfın uyumu yerel metotların yerel değişkenlere olan yakınlığı ile karakterize edilir. S.R Chidamber ve C.F Kemerer, LCOM ölçütünü ilk kez 1991 yılında tanımlamışlardır ve 1993 yılında geliştirmişlerdir. O zamandan bu zamana daha fazla tanım önerilmiştir ve halen bu alan içerisinde araştırmalar yapılmaktadır.

6. Sınıf Uyumunun Test Edilmesi

Sakai projesinin Sınıf uyumu test edilirken Visual JArchitect test programı kullanılmıştır. Visual JArchitec yazılım metriklerini ölçmek için özelleşmiş, gelişmiş bir programdır. Program çok çeşitli grafikler ve çıktılar vermektedir.

Bu çalışmada JArchitec in sınıf uyumunu gösteren sınıf uyum haritaları kullanılmıştır.

Grafikte sınıfların gösterimi:

Fig. 1. Sınıf Gösterimi

Sınıfların birleşmesi ile oluşan paketlerin gösterimi:
Fig. 2. Paket Gösterimi

Uyumu düşük sınıfların gösterimi mavi ile aşağıdaki gibidir.
Fig. 3. Düşük uyumlu sınıf gösterimi
Fig. 4. Test Sonucu

Şekilde her bir sınıfın uyum grafiği çıkarılmış, düşük uyumlu sınıflar mavi ile gösterilmiştir. Görüldüğü gibi yazılımda bazı sınıf kümeleri toplu olarak yüksek uyumlu, bazı kümeler toplu olarak düşük uyumludur. Grafik birbirine yakın sınıfların aynı geliştirici/geliştirici gurubu tarafından yazıldığını düşündürmüştür. Bazı sınıflarının uyumunun yüksek olması uyumu düşük gurupların bir sonraki versiyonda yazılım uyumunu arttırarak geliştirmesi tavsiye edilebilir.

7. Sonuç

Bu çalışmada Açık kaynak kodlu öğrenim yönetim sistemlerinden biri olan Sakai projesinde sınıf uyumu, yazılım metrikleri kullanılarak incelenmiştir. Yapılan inceleme sonucunda Açık kaynak kodlu projelerde sınıf uyumluluk haritaları çıkarılarak öz-ilişkisel değerlendirilmeleri yapılmıştır.

Sakai projesinin bazı modüllerinin Sınıf uyumu gözetilerek tekrar yazılması gerktiği sonucu öıkartılmıştır.

Bu çalışmada sadece Yazılım kalitesi sınıf uyumu ile incelenmiştir. Sonraki çalışmalarda diğer metrikler ilede ölçüm yapılabilir.

[b].Sakarya University, Department of Preschool Education, Faculty of Education, Sakarya, Turkey

Abstract

The aim of this paper is to find out preschool teacher educators' opinions on foreign language education at preschool. The opinions of a preschool teacher educator at a state university and a teacher at a preschool in a private institution were obtained through structured and semi structured interviews. The opinions were then coded and categorized. The emerging categories were the effects of foreign language education on children's mental development, the age to start foreign language education, teachers of foreign language, and ways of teaching foreign language to preschoolers. The participants agreed on the beneficial effects of foreign language education at early ages, methods of teaching, and the qualities of teachers. However, they differed in the appropriate age to start foreign language education.

Keywords: Preschool education, foreign language education, opinions of preschool teacher educators.

1. Main Text

The introduction of foreign language education in preschool educational institutions in Turkey has fuelled discussions on its rationale. Those who have welcomed the development claim that starting foreign language education as early as possible – preferably before the age of seven – enables learners to reach higher levels of language proficiency and improves their awareness of their mother tongue. The opposition front has viewed the change in policy as a threat to children's mastery of their mother tongue as well as to their overall cognitive skills (Celebi 2006; Demircan 2006). In the very centre of the discussions are the best age to start foreign language education, its effects of the mental and linguistic development of children, and the way foreign language education should be given.

Children, their parents, teachers, and teacher educators are the main stakeholders in this policy change, as in other educational policies, a fact that makes their opinions on the issue important. Recent research has looked into opinions of teachers as the implementers of the policy. Equally as important is what opinions teacher educators at universities hold as they educate the teachers in preschool educational institutions.

In her study with 20 English teachers, 34 preschool teachers, and 274 families in Seyhan district, Adana, Kucuk (2006) found that most members of the sample group were in favour of foreign language education in preschool. English teachers believed early it is both beneficial and necessary for children's foreign language development. They said that they used songs, games, art, and drama as principle techniques of teaching, and reported that children developed a positive attitude toward foreign language and tried to use it outside the class. A majority of the English teachers reported that children did not mix their mother tongue Turkish and English. Preschool teachers reported similar support for foreign language education in preschool. 85 percent of the teachers reported a variety of reasons ranging from age factor to the European Union process. Most believed that foreign language education developed the children's linguistic, conceptual, cognitive, social, and emotional development. The greatest support for foreign language education in preschool came from families (93%) who found it necessary to have foreign language education in preschool.

Another study by Aytar and Öğretir (2008) found somewhat similar results in a larger sample in Çankaya, Ankara. Of the 350 parents interviewed for the study, 94% said that foreign language education would have a positive impact on the cognitive and linguistic development of their preschool children. However, 66% acknowledged that foreign language education was not a factor for their choosing that particular institution. Of the 33% percent of the parents who reported that foreign language education at preschool was not as much as it should be and should be incorporated in all the activities. Similarly, a vast majority of the teachers believed that foreign language education is necessary at preschool level because children learn better at an early age and would have an easier life in school in succeeding years. 57% of the teachers believed that 5-6 were optimal ages to learn a foreign language and others thought 3-4 could be even better (35%).

2. Method

This section gives detail about the participants, research instruments, and data analysis methods.

2.1 Participants:

The first participant was a preschool teacher educator at a Turkish state university. The second participant was a teacher of English at a preschool institution. The first participant has been working as an assistant professor in a state university at the preschool teaching department. The second participant has been working in a private school as an English teacher and she is an experienced and only teacher working at all levels of the preschool.

2.2 Data collection:

In this study data were collected through structured interviews. Data from the first participant were obtained through a video interview and a written interview, while those from only the second participant were obtained from a written interview. The video interview from the first participant was transcribed, and then all three data sources were analyzed through pattern-coding, which revealed four categories. The beliefs of the participants as emerged in the four categories were underlined in the original tapescripts and then translated into English. The participants' ideas that are not directly related to the emerging categories were also included but in complementary roles.

3. Findings

The emerging four categories involved the positive effects of foreign language education in children, the age to start language education, the staff to teach language courses, and ways of teaching foreign languages. The participants agreed on the positive outcomes of language study for children, but their opinions differed in when to start it. The first participant had somewhat ambiguous views about it, referring to research studies and current examples from European countries that showed the effects of foreign language learning for children as young as three and then advocating for delaying it until after preschool years. Unlike the first participant who put the optimal age as seven, the second participant believed ages five and six are late enough because children's first language development is almost complete by then. The participants had differing opinions about who should teach language classes. The first participant expressed that either preschool teachers or language teachers should teach it only if they obtain a certificate for the other. That is, preschool teachers can teach language classes if they have a language teaching certificate and vice versa. The second participant firmly voiced her choice of English teachers who can use the language effectively, without mentioning a reservation for lack of preschool teaching certificate. As to the best way of teaching, both participants agreed that teaching should be appropriate for children's level and include game-based activities.

3.1 Foreign language education at preschool and children's mental development:

Children are equipped to learn several languages, and learning a second language contributes to their mental development.

The first participant is of the opinion that children are endowed with the capacity to learn several languages at once and that this process will contribute to children's mental development. The following excerpts reflect this opinion:

"We know that children are cognitively, physiologically, and biologically ready for foreign language learning-teaching after they are born."

"... we know that children can learn not just one but several languages and that this has significant contribution to their mental development."

In the structured interview the first participant added better reasoning skills and mental functioning as the positive outcome of foreign language learning in children. The following excerpt reveals this view:

"Reasoning and problem solving behavior develops more in children who receive a bilingual education. A second language will prove useful for the stimulation and proper processing of mental functions."

The first participant reiterated his opinion in the structured interview, adding that learning foreign languages will contribute to the child's social as well as mental development and improve his problem solving abilities.

"Learning foreign languages develops an individual's mental capacity. It helps improve the individual's social development. It develops the individual's ability to solve problems."

When asked how learning a foreign language would affect children, the first participant explained that it would affect children's mental development positively. In the education process that starts even before birth, he emphasized, learning another language and sometimes several languages will always affect children's intelligence in a positive way. The following excerpt supports this view:

"Language learning starts well before birth. Research confirms that it is in the mother's womb that the child starts hearing his parents' voice, hearing the words (of the language), making sense of them, and after birth he is able to learn several languages ... However, the child loses this ability later."

Referring to previous research studies, the first participant pointed to the child's prolonged presence in the same environment during mental process as the reason for the child to lose his ability to distinguish languages.

The first participant stated in the structured interview that besides its contribution to mental abilities learning a second language early also ensures that the language is learned quickly and effectively. However, mother tongue education should never be neglected. The following excerpt reflects this view:

"Starting foreign language education at early ages will not lead to any negative development for the child if education is given in the first language ... The first language should not be neglected."

The first participant gave examples from European countries such as England, France, and Italy, where these studies were carried out, and concluded that a bilingual education does not harm the development of the mother tongue.

However, the first participant stated in the structured interview that foreign language learning is not healthy in some circumstances, one of which concerns families in foreign countries. Children of these families learn another language at school and outside in addition to the one they use at home. The following excerpt shows this view:

"Parents who work in foreign countries ... send their children to schools in these countries. For this reason these children – willingly or not – learn the foreign language spoken at home and outside in addition to the language used in the home. But it is hard to say that such learning is healthy at all."

The second participant agreed to the first participant's views about the positive effects of foreign language education, and stated that it is important for children's mental development. She also added that learning a foreign language in addition to their mother tongue will keep the children's minds active. The following excerpt reflects her view:

I think learning languages is important for (children's) mental development. The fact that the child is learning a (foreign language) will maintain that his mind is active."

3.2 When to start foreign language education:

The earlier the age of foreign language education, the better.

Referring to research studies, the first participant stated his opinion that children aged three can successfully start learning a foreign language. The following excerpt from the interview reveals his perspective:

"There are a number of research studies into how well children who start schooling at three years of age can learn their mother tongue and foreign languages afterwards."

On the other hand, the first participant provides examples from Italy and France, where foreign language education starts at 8-11 and 7, respectively, but he was observed to be hesitant to pinpoint a certain optimal age for the commencement of foreign language education, mentioning the fact that it is a controversial issue. The following excerpt reveals the participant's indecision:

"But there is a controversy about (the optimal) age (for foreign language learning). I mean ... should we start it at primary school, or should we start it earlier... It requires scientific studies to decide whether we can antedate the foreign language education (that starts at ages seven and eight at present)."

While stating that foreign language education should start as early as possible and giving research studies that showed its effectiveness at the age of three, the first participant claimed in the structured interview that foreign language education should start at primary school because the child should first acquire the syntax of his first language. The following excerpt shows this conviction:

"Foreign language education should be one that should start after the fundamental grammatical structures of the first language are acquired. ... In my opinion, foreign language education should be started in Grade 1."

The first participant maintained that foreign language education should be avoided in preschool years because mother tongue plays a crucial role in a period when the foundations of personality and mental development are laid. Children should understand the world through their mother tongue for healthy mental development. The following excerpt shows this perspective:

"I do not think that foreign language is necessary in preschool institutions because ages 0-6 are a period when children get to know the world and acquire vital behaviour. Especially the foundations of personality development and mental development are laid during this period. Getting to know the world through their mother tongue will positively affect children's mental development."

While the first participant implied that the best age to start foreign language education was seven and above, It could also be inferred from his remarks that foreign language learning should not start later because he denounced the change in Turkish education system that deferred intensive language education until after grade 8.

Unlike the first participant who suggested age seven, or grade 1, as the ideal time for starting foreign language learning, the second participant argued that children can start learning at the age of five. She believed that children were cognitively ready to learn another language readily. The following excerpt shows her stance:

"I think children aged five and six are perceptive enough to learn a foreign language. At these ages children can easily learn a foreign language because they are ready cognitively."

"In early ages children's memory works at full throttle. They can recall what they hear or see for longer periods than an adult can. "

3.3 Who should teach foreign language to preschoolers:

Preschool language teachers should be trained specifically for this age group.

The first participant expressed the view that qualified people should teach foreign language classes, by which he meant that these teachers should have a degree in preschool education as well as a certificate for teaching English.

"I believe that (foreign language education at preschool) should be provided by teachers trained in teaching at preschool and the foreign language and having a language teaching certificate."

The first participant said the opposite is also advisable, that is, teachers with a degree in teaching English can obtain a preschool teaching certificate to be able teach preschoolers. He confirmed his view in the structured interview, but this time he favoured language teachers with preschool certificate over preschool teachers with language certificates. The following excerpt reveals this preference when asked which of the two should teach foreign language classes:

(16) "None. Because a foreign language teacher cannot administer activities appropriate for the children's level since they cannot know children's developmental characteristics. However, if the foreign language teacher is trained in preschool education, it will be healthier."

The first participant expressed his concerns for the present situation where foreign language teachers without preschool teaching certificates are employed rampantly in private preschool institutions. Small as it might be, an educational mistake made at these ages, he argued, may affect the entire life of the child, advocating for the importance of training in preschool teaching. The following excerpt mirrors these concerns:

"This is the greatest danger because mistakes made during preschool education years are mistakes that are difficult to undo. I mean if we fail to lay a sound foundation in preschool years a mistake we make – in the child's mental development, psychomotor development, socio-emotional development – may cause them to acquire wrong behaviour, and it becomes very difficult to correct it in adulthood."

The second participant, on the other hand, clearly expressed the view that foreign language teachers should teach preschool foreign language classes and did not mention vice versa, i.e. preschool teachers teaching language classes. Only the ability to use the language effectively, she argued, is required by the language teachers. The following excerpt reflects this view:

"(Preschool foreign language education) should be provided by foreign language teachers. Teachers who are trained in foreign language education, who can use the language effectively should teach (it)."

3.4 How to teach foreign language to preschoolers:

Game-based activities aimed at introducing children to the new language should be implemented.

The first participant viewed preschool foreign language education as a preparation for primary school years as is done some European countries but also expressed his uncertainty as to how a foreign language education should be. The following excerpt shows his doubts:

"Through what kind of programs, what kind of education should we give (foreign language education? Nobody knows the correct answer to this question. … (in successful programs in Europe) there are preparatory activities for primary education"

The participant spoke highly of Italian and French schools in Turkey that implemented such successful programs, where one or two foreign languages are taught through games. In these games, the participant marked, children are taught new vocabulary items through pictures, improving their phonological skills and increasing their sensitivity to the language.

The second participant emphasized the difference between state and private schools, resulting from the availability and use of technology. The following excerpt shows her views:

"There are great differences between state and private institutions (with respect to foreign language education). Since private schools are technologically better equipped, a wider array of activities can be implemented."

According to the second participant, this array involves audiovisual and game-based activities, stories that develop around specific topics, and other exciting activities. Here is an excerpt that shows how she believes games can be integrated in foreign language classrooms:

The child can be taught plenty of words through game activities. For example, when children first watch a video and then asked to dramatize the events in it, I believe they will learn permanently because they have both seen and applied it.

The first participant pronounced his anxiety about foreign language education across the country, the effects of which were present in preschool education as well. Foreign language education, he argued, is a complete failure that requires overhauling the present system and replacing it with programs that zero in on lifelike activities. The following excerpt expresses this suggestion:

"We should (both start teaching foreign languages at an earlier age and) develop a teaching program that is based on real life situations."

"(We failed) because we could not teach foreign languages through a program based on real life situations. Languages are learned by living them."

4. Discussion

The views of both participants generally converge with research findings. The first line of agreement lies in the positive effects of foreign language education on children. Support for its positive effects mostly comes from bilingualism studies that research children learning the language of the society as a second language, for example, a Turkish child learning English in Britain or the USA. Still, these research findings are applicable to foreign language environments such as studying English in Turkey. In their review of such bilingual programs, Bournot-Trites and Tellowitz (2002) conclude that the general result is positive in all: children have better metalinguistic knowledge that has a positive impact of their mother tongue and they do not fall behind their monolingual peers in the long run. In their study into the effects of the newly introduced foreign language course in the early childhood curriculum, Eichmann and Fori (1977) found that foreign language education has potential beneficial effects such as greater readiness for school work in general, greater creative abilities, higher general intelligence, and superior vocabulary knowledge. Preschool language education is also found to enable preschoolers to be aware of different cultures and languages and develop positive attitudes toward a second

language. (Sığırtmaç and Özbek 2009). However, some research studies (e.g. Chang 1986) concluded that teaching foreign languages along with their mother tongue caused difficulties for preschoolers.

The related literature also confirms what the participants think about the starting point of foreign language learning. "Preschool years are vital years so during this period and especially the first three years of life, the foundations for thinking, language, vision, attitudes, aptitudes, and other characteristics are laid down," says Kotulak (1997). Consequently, it would be a waste not to use a child's natural ability to learn during his or her most vital years, when learning a second language is as easy as learning the first. Long before Kotulak, Bloom (1964) asserted that people develop half their ability to learn in the first few years of their life, nearly one third of it by the age of eight, and the remaining one-fifth during the rest of their lives. Children form their basic learning abilities through sight, sound, taste, touch, smell, and doing (Dryden & Vos, 1997). What children learn during these years lays the foundations of their future learning. Nicholas and Lightbown (2008) claim second language acquisition begins as early as age three and after age seven language acquisition can be viewed as adult language acquisition. They also support the idea that the five year period between ages 2 and 7 are critical in reaching ultimate proficiency; starting foreign language learning later will decrease children's chances of learning the language better. In their study with preschoolers Sığırtmaç and Özbek (2009) found that Turkish children age 4-6 learning English as a foreign language were eager to learn a foreign language and use the words they learn in their daily life, but four year olds were less successful than five and six year olds.

As child language learning up to the age of seven is totally different from language learning in later years, foreign language teachers at preschool institutions should be equipped with the necessary skills to address preschoolers. Foreign language teachers at preschool should know the age-appropriate activities that would provide scaffolding to facilitate the acquisition of language for children's developing minds (Mhathuna 1995). In cases when the teacher is not proficient enough in the foreign language, plenty of tape recordings can be exploited (Dryden and Vos 1997).

Educational literature abounds in examples of methods of teaching to young children, which support the participants' opinions. Dryden and Vos (1997) argue that any method of teaching a foreign language to preschoolers should involve talking to them from the start. Rhymes, songs, games, and counting in a second or third language should be introduced so that they can listen, see, imitate, and practice. Allowing children to learn through imaginative play such as imitating the voices of their popular heroes can help them learn a foreign language without affecting their identity negatively (Orallena 1992).

5. Conclusion

Especially in recent years parents in Turkey have been striving to send their children to schools where their children can have a better foreign language education. In fact, this desire is consistent with much research which confirms that earlier foreign language education will ensure higher proficiency in children together with developed mental abilities. The participants in this study, however, disagreed with the proper age of language learning. The first participant believed that foreign language education should start at the age of seven when children have fully acquired their mother language, whereas the second participant said ages five and six were a good time to start. Despite their disagreement as to the starting point of language education, they both agreed to the beneficial effects of language study and to the ways of teaching to preschoolers. As for who to teach children, the second participant said the answer should be teachers of English, while the first participant was more lenient in that it could be either teachers of English holding a preschool teaching certificate or preschool teachers proficient in the foreign language.

ANALYTICAL THEORY OF MONOTONE COMMODITY STATE DEVELOPMENT WITH INFLEXION

Tomáš R. Zeithamer

University of Economics, Faculty of Informatics and Statistics, Department of Mathematics,

Ekonomická 957, 148 00 Prague 4, Czech Republic

Abstract

A method of modelling commodity depreciation, based on the methodology of theoretical physics, is used to derive a deterministic linear motion equation of the second order to describe the degressive and progressive development of the instantaneous relative depreciation and price of a commodity over time in a model of market structure with perfect competition. The same approach is used to derive a non-linear motion equation of the second order for instantaneous relative depreciation with degressive/progressive development over time.

Keywords: Depreciation, differential equation, econophysics, equation of motion, perfect competition.

1. Introduction

Let us assume that instantaneous commodity depreciation w at every time t throughout the entire lifetime of the commodity is composed of the instantaneous commodity physical depreciation w_{PD} and the instantaneous commodity external depreciation w_{ED}. The law of internal composition of both types of depreciation is designated as Δ, so the instantaneous commodity depreciation w is $w = w_{PD} \Delta w_{ED}$. The law of composition of magnitudes of instantaneous commodity physical and external depreciation is also designated by the symbol Δ, so that $w(t) = w_{PD}(t) \Delta w_{ED}(t)$. In further considerations we presume (in linear approximation) that the law of composition of magnitudes of instantaneous commodity physical and external depreciation is algebraic addition, thus $w(t) = w_{PD}(t) + w_{ED}(t)$, so that the law of internal composition Δ of instantaneous commodity physical and external depreciation is designated „+" and so $w = w_{PD} \Delta w_{ED} = w_{PD} + w_{ED}$. For simplicity, we assume that the law of internal composition Δ, or law of composition of magnitudes Δ respectively, does not change over time for both kinds of depreciation. We further assume in the linear approximation that the instantaneous commodity depreciation w, the instantaneous commodity physical depreciation w_{PD} and the instantaneous commodity external depreciation w_{ED} are continuous real functions at interval $\langle t_0, t_e \rangle$ (t_0 is the initial time of monitoring of the instantaneous commodity state and t_e is the time at which we cease monitoring the instantaneous commodity state i.e. level of the instantaneous commodity depreciation). The instantaneous commodity physical depreciation w_{PD} is defined as the permanent adverse change in the surface or dimensions of bodies of various states, induced by the interaction of functional surfaces or a functional surface and medium which causes wear (Pošta, Veselý, & Dvořák, 2002). The instantaneous commodity external depreciation w_{ED} is defined as a supplement to the instantaneous commodity physical depreciation i.e. the instantaneous commodity external depreciation is the permanent adverse or favorable change in market value of a commodity, which is not caused by instantaneous commodity physical depreciation (damage).

In a market structure with perfect competition[1], the instantaneous commodity relative depreciation RD is defined by the magnitudes of instantaneous commodity relative depreciation in accordance with relation (Drozen, 2008; Zeithamer, 2011 b)

$$RD(t) = \frac{w(t) - w(t_0)}{w(t_0)}, \qquad (1)$$

where $w(t_0) = w_0$ is the magnitude of instantaneous commodity depreciation at the initial time t_0 and $w(t)$ is the magnitude of instantaneous commodity depreciation at time $t (t \geq t_0)$. In addition to instantaneous commodity relative depreciation RD, the instantaneous commodity relative price RP is also defined under the condition of perfect competition by the magnitudes $RP(t)$ at time t in accordance with the relationship (Drozen, 2008; Zeithamer, 2011 b)

$$RP(t) = \frac{p(t_0) - p(t)}{p(t_0)}, \qquad (2)$$

where $p(t_0) = p_0$ is the magnitude of instantaneous commodity price p at the initial time t_0 of monitoring the instantaneous commodity price on a select model market and $p(t)$ is the magnitude of instantaneous commodity price at time $t \geq t_0$.

2. Linear motion equation of commodity state without inflexion

Instantaneous commodity depreciation w is a real composite function of time, i.e. $w(t) = w(p(t))$, where $w(p)$ is the continuous decreasing real function of instantaneous commodity price p and instantaneous commodity price p is a continuous decreasing real function of time t. If we monitor the development of instantaneous commodity depreciation at time interval $\langle t_0, t_e \rangle$, then for the first derivation of functions $w(p)$ and $p(t)$ it holds that $\frac{dw}{dp}(p) < 0$ for $p \in \langle p(t_e), p(t_0) \rangle$ and $\frac{dp}{dt}(t) < 0$ for $t \in \langle t_0, t_e \rangle$. It directly follows from these relationships that for the interval $\langle t_0, t_e \rangle$, $\frac{dw}{dt}(t) = \frac{dw}{dp}(p(t)) \cdot \frac{dp}{dt}(t) > 0$. This means that instantaneous commodity depreciation w is a continuous increasing real function of time t, which corresponds to trends for common commodities over time. Then, instantaneous commodity relative depreciation RD is also a continuous real function at interval $\langle t_0, t_e \rangle$ and $\frac{dRD}{dt}(t) > 0$ for every time $t \in (t_0, t_e)$.

The magnitude of instantaneous commodity relative depreciation RD over time t increases with acceleration and the acceleration of instantaneous commodity relative depreciation increases in direct proportion to the instantaneous speed of change of instantaneous commodity relative depreciation at time t. The motion equation of instantaneous commodity relative depreciation is thus (Zeithamer, 2011 b)

$$\frac{d^2 RD}{dt^2}(t) = B \frac{dRD}{dt}(t), \qquad (3)$$

where B is the constant of proportionality, $B > 0$. In addition, let initial conditions be met where $RD(t_0) = RD_0 > 0, \frac{dRD}{dt}(t_0) = v_0 > 0$, so that the solution of differential equation (3) at interval $\langle t_0, t_e \rangle$ is then

$$RD(t) = RD_0 - \frac{v_0}{B} + \frac{v_0}{B} e^{B(t - t_0)}. \qquad (4)$$

---

[1] In the model of a market structure with perfect competition we assume the following conditions are met: a) in each market there are a large number of buyers and sellers, none of which are strong enough to influence the price or output of a sector; b) all goods are homogeneous; c) there is free entry to and exit from all markets; d) all manufacturers and consumers have perfect information about prices and quantities traded on the market; e) companies attempt to maximize profit and consumers attempt to maximize utility; f) companies have free access to information about technologies (Goodwin, Nelson, Ackerman & Weisskopf, 2009; Nicholson & Snyder, 2008).

From here it directly follows that instantaneous commodity relative depreciation RD is a purely convex function at interval $\langle t_0, t_e \rangle$. This means that the increase in instantaneous commodity relative depreciation at interval $\langle t_0, t_e \rangle$ is progressive.

Instantaneous commodity relative depreciation RD increases with acceleration at time t again and the acceleration of instantaneous commodity relative depreciation increases in direct proportion to the speed of change of relative depreciation at time t while the constant of proportionality is negative. The motion equation of instantaneous commodity relative depreciation is then (Zeithamer, 2011 a; Zeithamer, 2011 b)

$$\frac{d^2 RD}{dt^2}(t) = -B \frac{dRD}{dt}(t) \,, \tag{5}$$

where $(-B)$ is the constant of proportionality, $B > 0$. In addition, let initial conditions be met

where $RD(t_0) = RD_0 > 0$, $\frac{dRD}{dt}(t_0) = v_0 > 0$, so that the solution of the differential equation (5) at interval $\langle t_0, t_e \rangle$ is then

$$RD(t) = RD_0 + \frac{v_0}{B} - \frac{v_0}{B} e^{-B(t-t_0)}. \tag{6}$$

From here it directly follows that instantaneous commodity relative depreciation RD is a purely concave function at interval $\langle t_0, t_e \rangle$. This means that the increase in instantaneous commodity relative depreciation at interval $\langle t_0, t_e \rangle$ is degressive. The progressive increase of instantaneous commodity relative depreciation is characteristic, for example, of certain types of food goods, while degressive increase of relative depreciation may be seen in certain commodities in the automotive industry.

Specific types of commodities are not listed here as the breakdown of all commodities under the condition of perfect competition into individual disjoint classes of commodities is the subject of a separate investigation.

Motion equations (3) and (5) for instantaneous commodity relative depreciation RD yield a deterministic differential equation for instantaneous commodity price p while a commodity is an element of one of the disjoint classes of the set of all commodities. For each commodity class found, it will be necessary to determine the functional relationship between instantaneous commodity depreciation w and the instantaneous commodity price p at interval $\langle t_0, t_e \rangle$. Assume that we have selected a single specific class of commodity from the set of all commodities. For each commodity of this particular class let $w(t) = D\big(p(t_0) - p(t)\big)$, so that, in accordance with equation (1), $RD(t) = \frac{[D(p_0 - p(t)) - w_0]}{w_0}$ at interval $\langle t_0, t_e \rangle$. A constant D ($D > 0$) is given in such units to ensure that the same units are found on both sides of the equation $w(t) = D(p(t_0) - p(t))$. Directly following from deterministic differential equation (3) for instantaneous commodity relative depreciation RD is the deterministic differential equation for instantaneous commodity price p at interval $\langle t_0, t_e \rangle$, which is $\frac{d^2 p}{dt^2}(t) = B \frac{dp}{dt}(t)$ with initial conditions $p(t_0) = p_0 > 0$, $\frac{dp}{dt}(t_0) = r_0 < 0$, where $\frac{dp}{dt}(t) < 0$ for $t \in (t_0, t_e)$. The solution of this differential equation for a purely concave drop in the instantaneous commodity price may be written as $p(t) = p_0 - \frac{r_0}{B}(1 - e^{B(t-t_0)})$. Deterministic differential equation (5) for instantaneous commodity relative depreciation RD yields a deterministic differential equation for instantaneous commodity price p at interval $\langle t_0, t_e \rangle$ which is $\frac{d^2 p}{dt^2}(t) = -B \frac{dp}{dt}(t)$ with initial conditions $p(t_0) = p_0 > 0$, $\frac{dp}{dt}(t_0) = r_0 < 0$, where $\frac{dp}{dt}(t) < 0$ for $t \in (t_0, t_e)$. The solution of this differential equation for a purely convex drop in the instantaneous commodity price may be written as $p(t) = p_0 + \frac{r_0}{B}(1 - e^{-B(t-t_0)})$.

3. Non-linear motion equation of commodity state with inflexion

In this section of our work we again presume the following conditions to be met: (1) the commodity is on one of the markets of the model of market structure with perfect competition at initial time t_0; (2) at time t_0 the

commodity is found in its initial state, which is uniquely determined by the magnitude of instantaneous commodity depreciation $w(t_0) = w_0$.

Let the acceleration of $\frac{d^2RD}{dt^2}$ of the instantaneous commodity relative decreciation be the sum of two components, i.e.

$$\frac{d^2RD}{dt^2} = \left(\frac{d^2RD}{dt^2}\right)_1 + \left(\frac{d^2RD}{dt^2}\right)_2. \qquad (7)$$

The first component of acceleration is a consequence of physical and chemical processes (including also social/psychological processes in physico-chemical approximation), which cause the first component of the instantaneous acceleration to increase in direct proportion to the magnitudes of rate of change of the instantaneous commodity relative depreciation, i.e.

$$\left(\frac{d^2RD}{dt^2}(t)\right)_1 = B\frac{dRD}{dt}(t), \qquad (8)$$

where B is the proportionality constant, $B > 0$ and $t \in \langle t_0, t_e\rangle$. The second component of acceleration results from physical and chemical processes (including also social/psychological processes in physico-chemical approximation), which cause the second component of the instantaneous acceleration to be directly proportional to the product of the magnitude of rate of change of the instantaneous commodity relative depreciation $\frac{dRD}{dt}(t)$ and the magnitude of instantaneous commodity relative depreciation $RD(t)$, while the proportionality constant is negative, thus

$$\left(\frac{d^2RD}{dt^2}(t)\right)_2 = -A\frac{dRD}{dt}(t)RD(t), \qquad (9)$$

where $(-A)$ is the proportionality constant, $A > 0$, $t \in \langle t_0, t_e\rangle$.

By substituting relations (8) and (9) into equation (7), we obtain the following motion equation for the acceleration of instantaneous commodity relative depreciation

$$\frac{d^2RD}{dt^2}(t) = B\frac{dRD}{dt}(t) - A\frac{dRD}{dt}(t)RD(t), \qquad (10)$$

where $A > 0, B > 0, t \in \langle t_0, t_e\rangle$.

One of the subsets of the set of solutions for motion equation (10) is given by

$$RD(t) = \frac{y_2 + y_1 e^{\sqrt{D}(t+C_2)}}{1 + e^{\sqrt{D}(t+C_2)}},$$

where for constants D, y_1, y_2, C_2 it follows that $D = B^2 + 2AC_1$, $y_1 = \frac{B+\sqrt{D}}{A}$, $y_2 = \frac{B-\sqrt{D}}{A}$, $0 < |y_2| < y_1, y_2 < 0$, $-\frac{B^2}{2A} < C_1 < 0$, $C_2 = \frac{1}{\sqrt{D}}\ln\left(\left|\frac{y_2}{y_1}\right|\right) - t_P$. At time $|t_P|$ the value of instantaneous commodity relative depreciation is zero. The given subset of the solutions of motion equation (10) shows the progressive – degressive increase of instantaneous commodity relative depreciation with an inflexion point at time $t = -C_2$ and a limit at $\lim_{t\to+\infty} RD(t) = y_1$.

4. Conclusions

Assuming that the market value of the commodity at time t is fully determined exclusively by the value of the instantaneous commodity price $p(t)$, methodological procedures taken from theoretical physics were used to construct motion equations for instantaneous commodity relative depreciation RD. Motion equations (3) and (5) for the progressive and degressive increase of instantaneous commodity relative depreciation are linear differential equations of the second order with constant coefficients assuming market structures with perfect

competition. Motion equation (10) of instantaneous commodity relative depreciation for the progressive/degressive growth of depreciation is a non-linear differential equation of the second order with constant coefficients. Motion equation (10) was also derived for instantaneous commodity relative depreciation on a market with perfect competition. In the solutions set for motion equation (10), there is the subset of solutions which model progressive/degressive growth of the magnitudes of instantaneous commodity relative depreciation with a single inflexion point.

AN ANALYSIS OF THE RELATIONSHIP BETWEEN THE LIVES OF THE PRIMARY – SECONDARY SCHOOL STUDENTS REGARDING DOMESTIC VIOLENCE AT HOME AND THEIR ACADEMIC SUCCESS

Assistant Professor Munevver Mertoğlu[a], Assistant Professor Oktay Aydın[b]

[a] Istanbul Culture University, CEHAMER, Istanbul-TURKEY

[b] Marmara University, Education Faculty, Göztepe/Istanbul- TURKEY

Abstract

The aim of this research is to analyze the relationship between domestic violence in the lives of 7th and 8th grade students and their academic success at school. This research was conducted at the Azmi Ertugrul Primary School in Pursaklar, Ankara/Turkey. Two questionnares, "Personal Information Form" and "Family Life Scale", developed by the reseacher were used in this study. A total of 137 parents answered the questionnares and the academic success of the students was evaluated based on the 2011 National Exam Results (SBS). As the level of violence of mothers directed against their husbands increases, the level of their children's academic success was found to decrease. This finding suggests that the violent behaviours directed from fathers to mothers may be more socially acceptable and the children are psychologically affected negatively as a result of their mothers' violent behaviors against their fathers more than their fathers' violence against their mothers'.

Key words: domestic violence; academic success; violent behaviours; students, parents

Introduction

Domestic violence has recently become a focus of research in Turkey and is a type of violence that manifestes itself in a group of people referring to themselves as family unit in order to bully, to humaliate, to punish, to show power, to relieve rage and tension from one adult to another adult or adults, from adults to children, from children to adults, or from a child or children to another child or children.

Domestic violence negatively affects not only the victims but also those who witness the violence. Children who witness domestic violence have more physical and psychological problems compared to children who do not experience that type of violence in the home.

Pfutts's (1978) similarly investigated the effects of domestic violence on children's psychology as victims or witnesses. Children witnessing violence at home can also have serious school problems such as poor attentance, low academic achievements, dropping out of school, and difficulty obeying school rules at school (Pfutts1977).

Academic success is defined as the level of the target behaviours that the students are expected to achieve at school (Silah,2003,p:103).The academic success of the students can be measured in many ways such as oral or written exams, group studies, projects, etc. In this study, the results of the National Exam (SBS) the criteria to measure the level of academic succes of the 7th and 8th grade students in primary schools.

Materials and Methods

The aim of this study is to analyze the relationship between the family lives of the 7th and 8th grade students concerning domestic violence and their academic success at school.

In this study, the questions below are asked:

- What is the level of violence that the parents commit against their children?

- What is the level of violence that the parents commit against each other?

- Are there any other reasons that affect the family members's violent behaviours against each other?

- Is there a relationship between dometic violence and the academic success of the students?

Sampling

This research was conducted in Pursaklar-Ankara/Turkey in the Education Year of 2010-2011 and is entitled "A School Project with Effective School Management by Teachers and a Non-violent Communicative Approach". During the Project, the teachers' and managers' attitues towards students, their perception of violence were investigated and the effects of the family violence on the academic success of the students was measured.

The sampling group was comprised of 7th and 8th grade students and 137 parents.

Gathering Data

1. Personal Information Form: this form was used to assess the personal traits of study participants.

2. Domestic Life violence Form: This questionnare was designed to access domestic violence. It has 4 sub-sections and 28 entries. In the questionnare, there are questions about the violent behaviours that the parents of the students encountered during their childhoods; violence committed by the parents against their own children, and violent behaviours of the spouses against each other.

3. National Exam Results (SBS): To evaluate the academic success of the students, the 2010-2011 National exam results for primary schools in Turkey were taken into consideration.

Tools for Gathering Data

The scale for 'Domestic Violence' given to the parents was developed by the researchers.

Analyzing Data

1. Arithmetic mean, standard deviation, and frequency-percentanges tests are used to analyze violence in family life,

2. Pearson product-moment coefficient tests are used to analyze the relationship between the sub-dimensions of domestic violence,

3. Pearson product-moment coefficient tests are used to analyze the relationship between domestic violence and the academic success of the students.

Findings

When I was a child,	No		Sometimes		Yes			Total	
	f	%	f	%	f	%		f	%
My mother used bad words to me and humaliated me.	79	60,3	31	23,7	21	16,0		131	100,0

Table 5: Distribution of Violent Behaviours that the parents of the students encountered during their childhoods.

The results presented in Tables 5 indicate that the parents of the students repeat similar violent behaviours against their children. The most common violent behaviour is 'being angry and shouting', followed by forbidding the child to do the things that he/she likes, saying bad words or insults, corporal punishment, and threats.

I sometimes	No		Sometimes		Yes		Total	
	f	%	f	%	f	%	f	%

The violence coming from the partner	132	,3989	,40082		

According to the data in Table 11, there is no meaningful relationship between the violence coming from the partners and the academic success of their children at school. As most of the participants are the women, it can be assumed that the violent behaviours originate from the husbands.

In the Table 12, it is shown that there is a negative relationship of 0.5 between the violent behavior of the partners committed against each other and the academic success of the students: It is an interesting result because the participants are mostly women and they are the partners who commit violence against their husbands. The data in Tables 11 and Table 12 can be interpreted to mean that while violence coming from the husband has no measureable effect on the children's academic success, violence coming from the wife affects the academic success of the students negatively.

Discussion and Results

The participants joining the survey indicate that the most common violent behavior of their partners is getting angry and shouting at them (x=,9771) followed by saying bad and humiliating words, prohibiting their social

activities, saying threating words, saying that they do not love their partners, and lastly administering corporal punishment.

When the details of the results of violence coming from the partners are analyzed, it is indicated that 71.8 % of the participants express that his/her partner gets angry and shouts at them, 32,6 % of the participants say bad and humiliating words, 26,3 % of the participants are prohibited from social activities by their partners, 15,6 % of the participants are verbally threatened, and 11,8 % of the participants are told that they are not loved by their partners.

Approximately 10,9 % of the participants indicate that they receive corporal punishment from their partners. This result shows that approximately one out of every ten participants are physically beaten by their partners. Given that the survey participants are mostly woman, it can be assumed that mostly women are exposed to physical punishment.

The relationship between the domestic violence and the academic success of the students

The result obtained from the data is not consistent with expectations. Normally, the academic success of the child is expected to decrease if there is domestic violence at home, but the data can be interpreted with the limitations of the group. In other words, the different attributes of the group life, such as love at home, can balance the negative effects of domestic violence on the academic success of the child.

It is a matter of fact that adult males are the ones who commit most of the violence against women more so than women committing violence against men. The data indicate a decrease in children's academic success when their mothers are violent against their fathers. This can be interpreted with the psychological differentiation in the children's values for violence and the threshold of their perception of violence. In this sense, the violence coming from the father seems to be something "normal" but the violent behaviors originating from the mothers against the father can be considered more 'negatively' by their children. As a result, it can be determined that the perception of the violence against women possibly seems to be a socially "acceptable" behavior or has been normalized by society.

Suggestions

Some suggestions based on the survey results are given below;

1. During the academic year, there should be seminars and workshops at regular intervals to educate the parents and increase awareness about the negative impacts of violence and how it affects the students' success at school.

2. To organize some activities to change the cultural that normalizes violence against women.

3. Additional research with a larger sampling group.

4. Employ school counseling services to rehabilitate the students that are victims of violence and try to prevent the violence in which the victims are raised.

5. Encourage cooperation with the other instructions concerning domestic violence.

AN EDUCATIONAL MANAGEMENT INFORMATION SYSTEM TO SUPPORT INSTITUTIONAL PLANNING AT THE UNIVERSITY OF COLIMA

Martha Alicia Magaña Echeverría [a], Pedro C. Santana-Mancilla [b], Victor Manuel De la Rocha Cazares [b]

[a] School of Pedagogy, University of Colima, Mexico

[b] IHCLab, School of Telematics, University of Colima, Mexico

Abstract

This research work present an Education Management Information System designed for the Department of Institutional Planning and Development at the University of Colima, this system allows the gathering of relevant information related to the institutional management indicators with a suitable interface to its users in order to simplify and reduce the time needed for management the University information. Usability testing of our system showed high user satisfaction.

Keywords: Educational planning; EMIS, Educational management, Software engineering.

1. Introduction

Educational planning, which is responsible for establishing the goals and objectives of education, had growth rapidly in Latin America. This is because in the early 90's started the interest in the systematization of indicators that encourage decision making, this information is gathered from an Education Management Information System (EMIS).

There are evidences that the education planning allows a solid structure to expedite the establishment of goals and priorities, facilitates the creation of guidelines for the expansion of the educational system and prevents the neglect or misuse of resources (International Institute for Educational Planning, 2010).

The work presented in this paper aims to develop an EMIS called e-Planea, which will perform the gathering of relevant information related to the institutional management indicators at the University of Colima.

2. Background

Efforts to optimize the quality of data and available information to improve the educational system and support decision-making have occurred for a long time. The EMIS began with the rise of systems programming in the 80's with projects in many countries to compute the annual school census and other administrative routines (Cassidy, 2005).

An EMIS has as a function to collect and analyze management indicators related to the education sector, and aims to support the processes of strategic planning, resource assignation, monitoring, policy formulation and decision making in Institutions of Higher Education (IHE). (International Institute for Educational Planning, 2010).

Currently, the University of Colima also makes the collection of information relevant to the indicators of educational management.

To accomplish this, the University of Colima uses the annual reports as one of its instruments for data collecting and monitoring, this for high schools, colleges, research centers and departments that constitutes it.

This process is performed by the Department of Institutional Planning and Development (DGPDI for its acronym in Spanish) through the distribution between dependencies of files in word processor format to be filled with the required information and then the collection of such files is done through e-mail, which are analyzed manually to formalize the information.

Organize all these files and keep them updated is a big problem. Is a must to take proper coordination between the planning advisors (who are employees of the DGPDI) and the various dependencies and schools (both higher and middle level) with which the University has.

After gathering all this information a review must be conducted in order to make decisions to guide the educational planning. This step is very complex and time consuming due to the enormous amount of data collected in multiple files, which usually have several versions.

Carry out the processes of data collection, management and analysis is becoming a complex task to perform, because is a not systematized process, so it becomes an open problem within our institution. This situation is optimal for the development of an EMIS.

The development of an EMIS will benefit the DGPDI, allowing information visualization quickly and organized, because this department is responsible for the educational planning process of our University.

3. Related work

The EMIS have been widely used in Latin America (eg Colombia, Chile and Mexico) of which have been experiences of successes and failures. Here are some of these cases (Cassidy, 2005).

Colombia (1999 - 2003) The use of information technology enabled them to bring significant financial savings and open 240,000 places in schools, of which 120,000 were the result of efficiency, and did not require hiring more teachers.

Also the website of Mexico City provides geographic information, but it is not easy to use, besides that the help and information are very limited.

Chile in the 80s developed a system that facilitates the presentation and analysis of results allowed the comparison between schools in the municipalities. Provides detailed reports to compare the performance between schools within the community, region or nation. It is also possible to compare schools based on the socio-economic state of the community receiving the service.

Additionally, some states in Mexico have developed and maintained their own systems for educational planning. A particular case is the state of Aguascalientes (Aguascalientes State Government, 2012). This site provides very easy access to a complete set of information for education by status and educational level. Also includes statistics, analysis, and the availability of 6 years of historical data.

4. System development

e-Planea is a cloud web application developed and implemented in a LAMP platform (Dougherty, 2001). As the application resides in the cloud, the users (planning advisors, head of departments and administrators) can access the system from any computer with a web browser and Internet connection.

4.1. Analysis

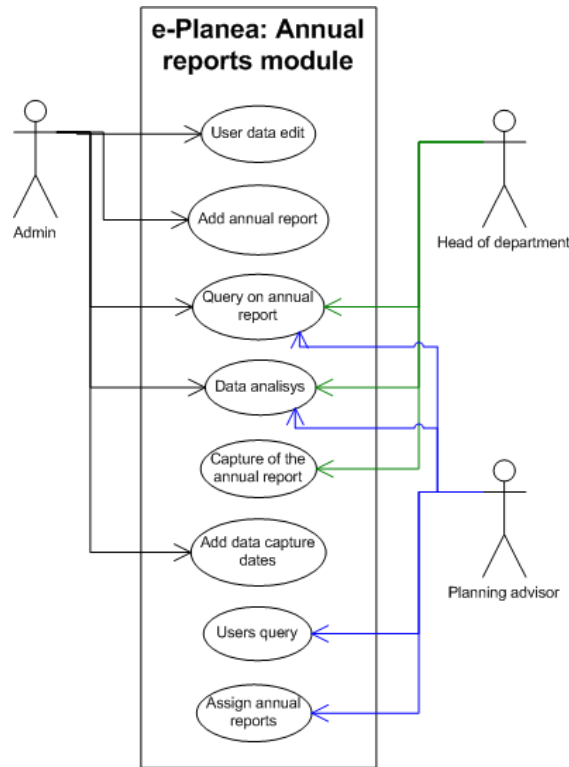
Use cases represent a typical interaction between a user and a computer system (Fowler & Kendall, 1999). Such diagrams are a primary element of software development, and part of the Unified Modeling Language (UML). For the e-Planea platform the actors are the user previously defined: planning advisors, head of departments and administrators. The Fig. 1 shows the use case diagram for the proposed EMIS.


Fig 1. Use-case Diagram

4.2. Software design

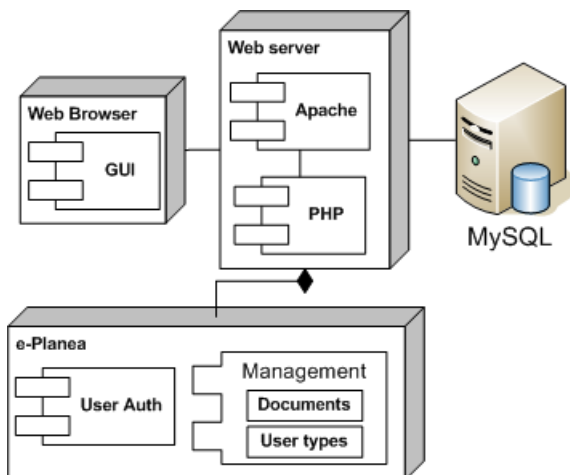
As illustrated in Fig. 2 for the development of the e-Planea platform a cloud web configuration is used, in order to allow Access to the users from a web browser (eg Firefox, Chrome or Safari).


Fig. 2. System architecture

4.3. Implementation

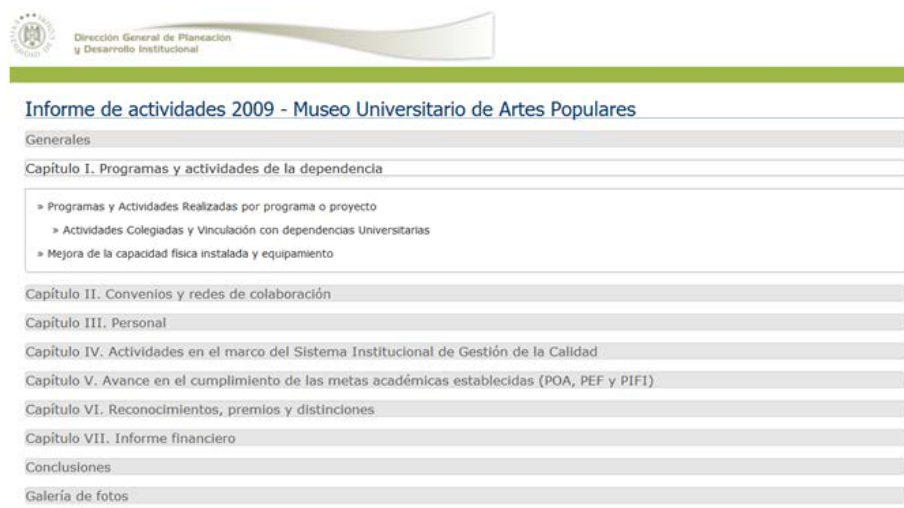
The next step is the software implementation; which should provide a user friendly interface. We develop a fully-functional system, where each user of the application should fill identification requirements in order to login in its personalized interface and use the system (see Fig. 3).


Fig. 3. Home interface.

5. Evaluation

To measure the acceptance of the platform the Technology Acceptance Model (TAM) was used. Developed by (Davis, 1989), because it is a highly effective model tested on predicting the use of the technology. The purpose of TAM is to explain the causes of the acceptation of the technology by the users. Proposes that perceptions of usefulness and ease of use by an individual in an information system are conclusive in determining their intention to use the system. The TAM evaluation was performed with a group of 13 users of type "Planning advisors", which means 100% of the DGPDI's staff of advising. We used this group since they are the direct links between DGPDI and all the departments and schools of the University, besides being who reviews the annual reports and trains the directors in order to use the EMIS. Taking into account the "Strongly agree" and "Totally agree" answers, the TAM generated the following results.

For the perception of ease of use, 100% believe that the system is easy to use, 100% think it is easy to learn, while 85% think that is clear and understandable, and finally by 85% believe that is easy to find information on it (see Fig. 4).
Fig. 4. Results about the perception of the easy to use of the platform.

In the area of the utility perception, of the responders, 85% believe that the system is efficient, 85% said it improved their performance, while 77% said it improved their productivity, and 92% believe that was useful (see Fig. 5).
Fig. 5. Results about the perception of the utility of the platform.

Regarding the attitude towards the use, a positive response was obtained for the system: 92% agree that it seems a good idea it software (see Figure 6).
Fig. 6. Results about the attitude toward the use of the platform.

Finally the answer on the intended use, 100% of the users said they would use the system in their work, use it again and have the intention of use it (see Figure 7).
Fig. 7. Results about the intention of use of the platform.

6. Conclusions

This work presents the creation of an EMIS called e-Planea at the University of Colima, that supports the elaboration of annual reports of the University schools and departments. The features developed are: a) Systematization of annual reports, b) Capture of reports by the heads of the various schools and departments, c) Reviewing of reports by the planning advisors and d) Automatic generation of reports in the required formats.

The evaluation of this platform gave as a result that the platform is useful and allows a greater performance and efficiency, and it is also considered a good idea. Thus, this created good intentions in the users of using it again.

[a]Faculty of Education,Siirt University,Siirt, 56100, TURKEY

[b]Faculty of Education,Siirt University,Siirt, 56100, TURKEY

[c]Faculty of Education,Dicle University,Diyarbakır, 21100, TURKEY

Abstract

The purpose of this research is to determine elementary teacher candidates' environmental approaches (environmental-based or human-based), environmental risk perceptions and environmental behaviours. Furthermore this research intend to determine if there is a significant difference in elementary teacher candidates' environment-centered or human-centered approaches, environmental risk perceptions and environmental behaviours according to the variables of gender and class, or not. The research was carried out with a total of 243 teacher candidates (131male and 112 female) from Elementary Department of Faculty of Education at Siirt University in Turkey. It was used the "*New Environmental Paradigms Scale*", which was first time developed by Dunlap and Van Liere (1978) and revised by Dunlap et.al. (2000) and adapted into Turkish by Furman (1998), to determine the environmental approaches of the teacher candidates, the "*Environmental Risk Perceptions Scale*", which was developed by Slimak and Dietz (2006) and adapted into Turkish by Altunoğlu and Atav (2009), was used to determine the teacher candidates' perceptions of environmental risk and it was used "*Environmental Behaviour Scale*", which was developed by Uzun and Sağlam (2006), to determine their environmental behaviours. At the analysis of data; it was consulted from descriptive statistical techniques and Pearson Moment Correlation coefficient. In our research, it was calculated that the Cronbach alpha reliability coefficient of environmental approaches scale as .65 , the scale of environmental risk perceptions as .93 and the scale of environmental behavior as .85. As a result of this research, it was found that the teachers candidates' environmental-centered approach mean score (M=4.21) is higher than human-centered approach mean score (M=3.35). Moreover, it was found that there is a significant and positive relation between the elementary teacher candidates' human-centered approaches, environmental risk perceptions (r= .41; p<0.01) and environmental behaviours (r= .20; p< 0.01).

Keywords: Environmental paradigms, environmental risk perceptions, environmental behaviors, elementary teacher candidates.

1. Introduction

It requires the individuals to be aware of the environment and environmental problems, in order to understand the features of the environment and its problems, to bring suggestions of solution and to live in peace with nature and the other living. It is presumed that the first creature in our world existed approximately a billion years ago, as the first members of the human family was started to be seen 5 million years ago. Fossils show that "Homo Sapiens" exist in this world only for 40.000 years, and this time covers only a very small period of the of 4-5 billion years of our world's existence time. Humanity has experienced two great cultural changes during this development progress of 40.000 years. First of these was the agricultural revolution , which started 9.000-11.000 years ago and second one is the industrial revolution 250 years ago. Since the first days of its appearance in the nature to our day, humanity continued its life with hunting and salvaging and lived on without causing any serious environmental problems. However the damage of last two centuries caused by humanity to our 5 Billion years old planet has recently reached to such a treating dimension that it can extinct hundreds of plant and animal

species. Global warming, ozone layer depletion, acidic rains, drains of the lakes and rivers and deforestation is only a couple of our problems. In parallel with the cover of the environmental problems and the increase of their efficiency, the political, economical, scientific and artistic concern on environmental problems also increase. As new branches like environment philosophy, environmental ethics, environmental education, environmental psychology, environmental sociology improve, social subjects; ecologic culture, ecologic agriculture, ecologic tourism and ecologic society is being discussed more often by media and science societies. The way of individuals' thinking about the outer world surrounding them is important from the aspect of validating their environmental manners, behaviours and values and for bringing an explanation to their role in this structure (Ponting, 2000). One of the in all societies existing basic research subject is the relation between the humanity and the outer world (nature). Views "If the human is different from or even superior to the nature" (anthropoentrism) or "If the human is an integral part of the nature" (ecocentrism) bear a significant importance in formation of the environmental values and manners (Tuna, 2006). On the other hand, recent studies show that the individuals are aware of and worried about the environmental problems and risks (Riechard and Peterson, 1998; Wals-Daneshmandii and Maclachlan, 2000; 2006; Slimak and Dietz 2006; Gürsoy et. al., 2008). Humans are reacting against to themselves threat posing environmental problems in direction with their perceptions. Lowness of the environmental risk perceptions of the individuals causes to low or misresulting of their endeavour for preserving the society and environment. According to Baldasarre and Katz (1992), environmental risk perceptions of individuals play a significant role in forming and strengthening environmental problems sensitive manners. Additionally environmental problems are waiting upon global solutions in the use of the natural sources, social, financial and political, flora and fauna, climatic, natural and anthropogenic diseases dimensions. The first step to prevent the environmental problems is indicates as, to understand the nature-human interaction, to perceive the contribution of the humanity in formation of the environmental problems, shortly to reach the "environmental conscience" and "environmental sensitivity". Şahin, Cerrah and Saka (2004) have stated that growing environment-sensitive individuals for securing the next generations and more healthy and safe environment became an obligation. Providing this will be possible only with environmental training. In other words, environmental training besides general education seems one of the best ways to make people aware of their responsibilities and to secure their contribution to the solutions for the environmental problems they caused. Being effective significantly in environmental training, in this step revealing teachers' approaches for environment and environmental problems, environmental risk perception and behaviours against the environment is important.

The purpose of this study is to show the environmental approaches (anthropocentric and ecocentric), environmental perceptions and environmental behaviours of teacher candidates. In accordance with this, answers for the following questions we sought:

How are the environmental approaches (anthropocentric and ecocentric), environmental risk perception and environmental behaviours of teacher candidates?

Are there any differences between the environmental approaches (anthropocentric and ecocentric), environmental risk perception and environmental behaviours and gender variability of teacher candidates?

Are there any differences between the environmental approaches (anthropocentric and ecocentric), environmental risk perception and environmental behaviours and class variability of teacher candidates?

How are the environmental approaches (anthropocentric and ecocentric), environmental risk perception and environmental behaviours of teacher candidates and what kind of relation lies between them?

2. Method

2.1. Participants

The study was conducted in the spring of 2009-2010 academic year at Siirt University in Turkey. Participants were 243 teacher candidates who were attending at Elementary Departments in Faculty of Education. Samples of the study is consisted by total 243 teacher candidates divided as 112 female and 131 male with random sample method.

2.2. Data Collection

The data in this study was gathered with a questionnaire, which consists of four parts. Personal fact sheet prepared by the researcher takes place in first part, in second part new environmental paradigm example for identifying the environmental approaches of teacher candidates, in third part environmental risk perception scale and finally in fourth part environmental behaviour scale takes part.

New environmental paradigm scale; the foundation on which the New Environmental Paradigm Scale that gives the opportunity to make a division between ecocentric and anthropocentric approaches based is the fact, that the humans are no different than other elements forming the nature and the humanity is also subject to the laws of the nature. New Environmental Paradigm Scale is consisted by 15 items in 5 point likert scale type. Scale questions consist from two sub-questions group, which measure the ecocentric and anthropocentric approaches. 1st, 3rd, 5th, 7th, 9th, 13th and 15th questions are the ones that measure ecocentric approaches, as 2nd, 4th, 6th, 8th, 10th, 12th, 14th questions measure anthropocentric approaches. High values obtained from the scale show that while there is an increase of environmental conscience in questions measuring anthropocentric approaches, the environmental conscience in questions measuring the ecocentric approaches have not improved sufficiently. This scale was first developed by Dunlap and Liere (1978), revised by Dunlap et. al. (2000), and adapted to Turkish by Furlan (1998). In this study made by us the Cronbach alpha coefficient of reliability of the scale was calculates as 54.

Environmental Risk Perception Scale: This scale was developed by Slimak and Dietz (2006) and adapted to Turkish by Altunoğlu and Atav (2009); it consists of 23 items in 5 points likert type. In study of Altunoğlu and

Atav (2009) it was determined that four factors form the scale and the Cronbach alpha coefficient of reliability of the scale was calculates as 0,89. In our study, the coefficient of reliability was calculated as 93.

Environmental Behaviour Scale: This is a scale, developed by Uzun and Sağlam (2006) and consists of 13 items in 5point likert type. Cronbach alpha coefficient of the scale was indicated as .88. In our study, the Cronbach alpha coefficient of reliability of Environmental Behaviour Scale was found as .85.

2.3. Data Analysis

The analysis of the points obtained from the environmental approaches, environmental risk perceptions and environmental behaviours, arithmetic mean, standard deviation t-test and ANOVA and Pearson Moment Correlation Coefficient was used. The data obtain was analysed in SPSS 16.00 software.

3. Results

Findings of the study that aims to determine the environmental approaches, environmental risk perceptions and environmental behaviours are given below.

Table-1. Arithmetic mean and standard deviation of teacher candidates' environmental approaches, environmental risk perceptions and environmental behaviours

	N	$\overline{X}$	SD
Ecocentric approach	243	4.21	.48
Anthropocentric approach	243	3.35	.90
Environmental risk perceptions	243	4.32	.61
Environmental behaviours	243	3.03	.69

As seen in Table-1, the mean of the teacher candidates' ecocentric approaches = 4.21; mean of the anthropocentric approaches = 4.32 and environmental behaviours = 3.03. Accordingly, it is seen that the mean of teacher candidates' ecocentric approaches are higher than anthropocentric approaches. Additionally, mean of the teacher candidates' environmental risk perceptions are high, while their mean of environmental behaviours is at medium level.

Table-2. t-test results about the ecocentric and anthropocentric approaches, environmental risk perceptions and environmental behaviours that are obtained after examination in regard to gender.

	Gender	N	$\overline{X}$	SS	t	p
	Male	131	4.23	.53		
Ecocentric approach					.607	.544**
	Female	112	4.19	.40		

	Gender	N	$\overline{X}$	SS	t	p
Anthropocentric approach	Male	131	3.30	1.04	-.801	.424**
	Female	112	3.40	.70		
Environmental risk perceptions	Male	131	4.25	.72	-1.78	.076**
	Female	112	4.39	.44		
Environmental behaviours	Male	131	2.93	.78	-2.40	.017*
	Female	112	3.15	.55		

* p< 0.05; **p>0.05

As seen in Table-2, the mean of male teacher candidates' ecocentric approaches ($\overline{X}$=4.23) was higher than female teacher candidates ($\overline{X}$=4.19). The mean of female teacher candidates' anthropocentric approaches ($\overline{X}$=3.40), mean of environmental risk perceptions ($\overline{X}$=4.39) and mean of environmental behaviours ($\overline{X}$=3.15); the mean of male teacher candidates' anthropocentric approaches ($\overline{X}$=3.30), mean of environmental risk perceptions ($\overline{X}$=4.25) and mean of environmental behaviours ($\overline{X}$=2.93). It was determined that the ecocentric and anthropocentric approaches, environmental risk perceptions of the teacher candidates show no meaningful difference in the dimension of gender (p>0.05). In contrary to this, there was a meaningful difference between teacher candidate's environmental behaviours and their gender (p<0.05).

Table-3. Table-2. ANOVA-test results about the ecocentric and anthropocentric approaches, environmental risk perceptions and environmental behaviours that are obtained after examination in regard to teacher candidates' classes where they study.

	Gender	N	$\overline{X}$	SS	F	p
Ecocentric approach	2nd Grade	43	4.17	.53	.717	.489**
	3rd Grade	161	4.24	.46		
	4th Grade	39	4.15	.48		
	Total	243	4.21	.48		
Anthropocentric approach	2nd Grade	43	3.03	.92	3.506	.032*
	3rd Grade	161	3.39	.90		

	4th Grade	39	3.51	.79		
	Total	243	3.35	.90		
	2nd Grade	43	4.30	.52		
	3rd Grade	161	4.31	.66		
Environmental risk perceptions					.185	.831**
	4th Grade	39	4.37	.46		
	Total	243	4.32	.61		
	2nd Grade	43	3.09	.75		
	3rd Grade	161	2.99	.69		
Environmental behaviours					1.077	3.42**
	4th Grade	39	3.15	.63		
	Total	243	3.03	.69		

* p< 0.05; **p>0.05

As it is seen in Table-3, there is no meaningful difference between teacher candidates' ecocentric approaches, environmental risk perceptions and environmental behaviours in regards to their classes, where they study (p>0.05). However the teacher candidates with anthropocentric approach, show a meaningful difference in regards to their classes (p<0.05).

Table-4. Pearson Moment Correlation Coefficient results about the ecocentric and anthropocentric approaches, environmental risk perceptions and environmental behaviours of teacher candidates.

	Ecocentric approach	Anthropocentric approach	Environmental risk perceptions
Anthropocentric approach	.118*		
Environmental risk perceptions	264*	.410*	
Environmental behaviours	.101**	202*	.343*

* p<0.05; **p>0.05

66

As seen in Table-4, it is determined that there is a meaningful low-rate relation in positive direction between the ecocentric and anthropocentric approaches (r=.118, p<0.05), and a meaningful mid-rate relation in positive direction between the environmental risk perceptions and anthropocentric approaches (r=.410, p<0.05) and a meaningful relation low rate relation in positive direction between environmental behaviours and anthropocentric approach of the teacher candidates (r=.202, p<0.05). While a meaningful low-rate relation in positive direction was found between ecocentric approach and environmental risk perceptions (r=.264, p<0.05), a low-rate but meaningless relation was determined between environmental behaviours (r=.101, p>0.05). A mid-rate relation in positive direction was also found between the environmental risk perceptions and environmental behaviours (r=.343, p< 0.01).

4. Conclusion and Discussion

In this study of ours, it was determined that the mean of the teachers candidates' ecocentric approaches was higher than anthropocentric approaches, and the risk perceptions of the teacher candidates was high, while their environmental behaviours was on mid-rate. In similar studies, Sam, Gürsakal and Sam (2010) indicated that the environmental risk perception level of the university students was high and there was a strong relation in positive direction between environmental risk perception and environmental manner. Altunoğlu and Atav (2009) stated that that the environmental awareness level of the secondary education students was high. In this study of ours it was determined that the female teacher candidates' anthropocentric approaches, environmental risk perceptions and environmental behaviour rates were higher than male teacher candidates. Also male teacher candidates' ecocentric approaches were higher than female teacher candidates. In respect of the gender, there was no meaningful difference between the ecocentric and anthropocentric approaches and environmental risk perceptions of the teacher candidates; in contrary to this there was a meaningful difference between the environmental behaviours. Similarly, Sam, Sam and Öngen (2010) indicated in their study, that there was no meaningful difference between ecocentric and anthropocentric approaches and gender, as the study of Silmak and Dietz (2006) shows there was no difference between the environmental risk perceptions and gender. In our study it was determined that there was no meaningful difference between teacher candidates' ecocentric and anthropocentric approaches, environmental risk perception and environmental behaviours in respect of their class variables, where they study. According to the results obtained, while lecturing the teacher candidates about environmental training, considering their environmental approaches, environmental risk perceptions and environmental behaviours will help them to improve a environmental conscience and sensitivity. Thus, it is important to make the students to gain a behaviour change, who is going to be effective on preserving and managing the environment.

AN EVALUATION OF SCHOOL EXPERIENCE COURSES: THE DEVELOPMENT OF OBSERVATION AND REFLECTION COMPETENCES OF PROSPECTIVE TEACHERS

Assist. Prof. Dr. Zehra Altinay[a], Assist. Prof. Dr. Fahriye Altinay[b]

[a]Faculty of Education, Near East University, Nicosia 922022, TRNC

[b]Faculty of Education, Near East University, Nicosia 922022, TRNC

Abstract

Developing observation and reflection competences within school experience process is crucial in order to gain teaching profession. In fact, in merging practical and theoretical knowledge through teaching practice requires in-depth observation and reflection competences. Teaching practicum and school experience courses have aims to develop field knowledge, plan and preparation, teaching methods and techniques, communication, classroom management, evaluation, professionalism by developing observation and reflection competences. Significantly, portfolio is a kind of progress tool to make prospective teachers to report on teaching practicum. In this respect, this study aims to evaluate the development of observation and reflection competences of prospective teachers on school experience courses. The qualitative research design was employed in this study that case study approach was implemented within an inductive process. Self-reports of 65 prospective teachers helped to gather qualitative data that were analyzed based on thematic analysis. This research process yielded how observation and reflection, self-determination competences are significant and are developed through teaching practicum.

Keywords: competence, quality in teaching, observation, reflection, teaching practicum

1. Introduction

Reflection is a key term for the roots of teacher education programs that is gained from school experiences courses. It becomes a bridge to merge cognitive, procedure domains. It is a key activity for teacher development (Zhu, 2011). In this respect, the study of Van Manen (1991) states the levels of reflection that are technical rationality, practical action, critical reflection, reflection on reflection. Therefore, school experiences courses are modes of active learning within the practical process. It is important to be in an action-based approach for the development of teaching skills in higher education based on peer observation and collaborative reflection (Martin, Double, 1998).

As teacher reflection means examining 'one's own interpretations, looking at one's own perspectives from another perspective, and turning a self-critical eye onto one's own authority as interpreter and author's (Husu, Toom, Patrikainen, 2008), it is crucial stressing the importance of reflective practice through school experience courses for establishing deepen reflection for the deconstruction of knowledge.

Learning through reflection and observation are the rationale stances of school experience process in constructing knowledge. Teaching practicum and school experiences are opportunities for professional knowledge based on reflective practice. In this respect, reflection supports professional practice that continuing learning through practices makes the development of observation and reflection skills (Samuels, Betts 2007).

This study aims to reveal the role of synergy among the components of teaching practicum for the development of self-determination, observation and reflection skills throughout the school experience courses. As the teaching practicum covers field knowledge, plan and program, methods of teaching, communication, classroom management, evaluation and professional development activities; self-determination, observation,

reflection skills need to be developed for transferring these skills to the professional life. The following figure summarized the synergy of teaching practicum components and targeted transferrable skills for the work life.

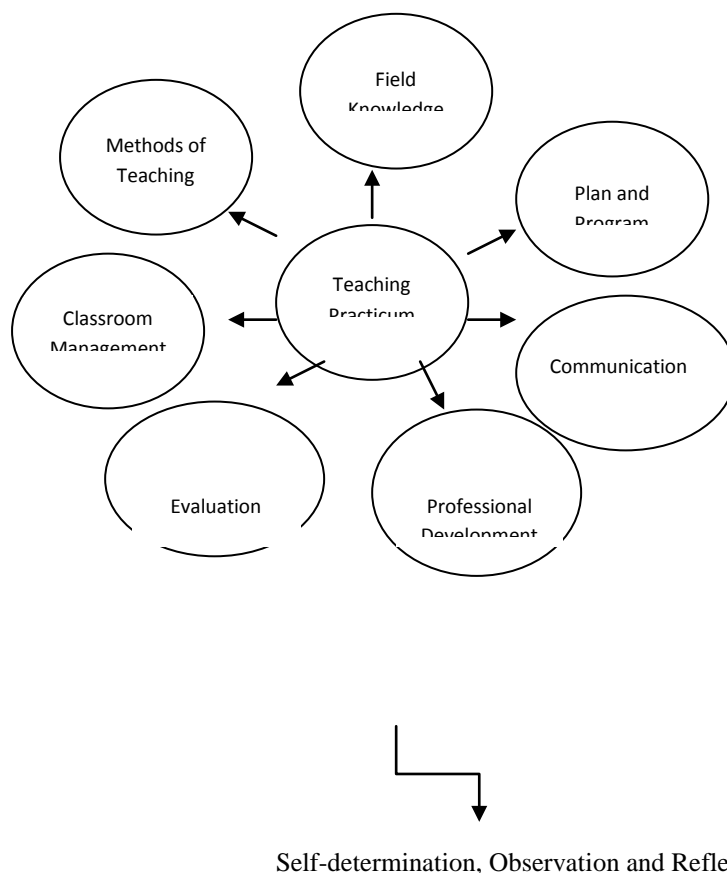
Self-determination, Observation and Reflection Skills


Figure1. Components of Teaching
Practicum

Teaching practicum is significant process for the prospective teachers to gain basic skills to transfer into the work place. Teaching profession is the harmony of field knowledge, plan and program, methods of teaching, communication, classroom management, evaluation and professional development activities which those foster self-determination, observation and reflection skills within knowledge management (Kuter, Gazi A., Aksal A., 2012). In this respect, this study aims to evaluate the perceptions of prospective teachers on the experience of teaching practicum. Regarding the aim of the research, the following research questions need to be answered:

- How do prospective teachers perceive teaching practicum components?

- To what extend, prospective teachers develop self-determination, observation and reflection skills?

2. Method

2.1. Research Design

The study is grounded on the nature of qualitative research. The socially constructed meaning, experiences and perceptions are crucial elements to understand, explain the nature of the problem. As Creswell (2009) points out that qualitative research design is interpretive and inductive process to understand the meanings, perceptions and human experiences; this study focuses on inductive process with evaluating the perceptions of prospective teachers on the teaching practicum experience in school experience courses.

2.2 Research Approach and Participants

Single case study approach was employed in this study to report on the experiences and perceptions of prospective teachers based on detailed documentation. Although the research approach is single case approach as it is the limitation of this study, the detailed documentation, report on inductive process yields valuable examination, exploration (Yin, 1994). Sixty five prospective teachers from Classroom Teacher Education and History Teacher Education programmes in one of the higher education institution became part of the qualitative research who enrol school experience course. The purposive sampling strategy was implemented.

2.3 Data Collection Technique and Analysis

Training was done to prospective teachers that teaching practicum and its components were explained for forty five minutes. Then, self-report was employed to collect in-depth reflections, experiences of prospective teachers. Conceptual analysis was done to set themes based on classification and verification (Altinay, Paraskevas, 2008).

3. Research Findings

The research findings provides experiences and perceptions on develop field knowledge, plan and preparation, teaching methods and techniques, communication, classroom management, evaluation, professionalism within the frame of teaching practicum. As prospective teachers agreed that training session as part of the course has vital process for the teaching profession, they highlighted that teaching practice in schools and during the courses help them develop field knowledge, plan and preparation, teaching methods and techniques, communication, classroom management, evaluation, professionalism. Further to this, prospective teachers underlined that preparing a portfolio for teaching practicum provide developing self-determination, observation and reflection skills.

Field knowledge

Field knowledge is the significant component of teaching practicum. Almost all prospective teachers (N=54) reported that school experience courses foster developing field knowledge. In this respect, prospective teachers (N=59) highlighted the contributions of school experience course to the field knowledge in many ways:

'Teaching practice and school experience course help us enhance field knowledge and be aware of other disciplines'

'School experience course fosters development on field knowledge and help internalize teaching practice'

'School experience course provides confidence of field knowledge to transfer real life experience'

'School experience course is the bridge between theory and practice to do self-evaluation of teaching performance and field knowledge'

Plan and Program

In addition to field knowledge, preparation to the teaching practice, being well prepared to the teaching practicum is the crucial process on teaching profession. Significantly, it is the base line for further steps. Prospective teachers agreed that preparation to the teaching practicum is the prerequisite for the success in teaching profession. Almost all prospective teachers highlighted that plan and program is difficult part of the teaching practicum. However, it is ground for effective instruction.

Teaching Methods and Techniques

The way of teaching and the internalizing principles of teaching methods, techniques are the critical success factors for the teaching profession. Within the teaching practice process, implementing theory into practice can be succeed if prospective teachers can internalize the right choice of the teaching methods and techniques. Almost all prospective teachers reported that school experience course provides in dense experience to evaluate using the appropriate teaching methods and techniques. Significantly, prospective teachers remarked that videotaped simulated instruction within teaching practice and drama, role playing method in micro-teaching help them have in-depth internalization and real life experience about the advantages and disadvantages of contemporary methods and technique for further profession life.

Communication

The personal abilities and skills in teaching profession is the also significant component. According to other components, almost all prospective teachers reported that school experience course enhance their communication, empathy skills. Significantly, all prospective teachers highlighted that communication component is the most developed skill during the school experience course.

Classroom management

For effective teaching and learning process, classroom management is the critical component for teaching profession. When prospective teachers evaluate classroom management, they reported that they gained insights how to manage attention of students, how to arrange classroom atmosphere.

Evaluation

Prospective teachers made reflection on the evaluation that they have learned to summarize the learning of students through exercises and activities at the end of the courses. Most of them stressed the importance of evaluation for transferring knowledge in to new knowledge.

Professional Development

Professional development is the outcome and success of the effective teaching practicum. Almost all participants agreed that school experience course and teaching practicum help them enhance collegial activities and peer support thereby they enhance profession. Prospective teachers stated their perceptions on professional development in many ways:

"It is ongoing activity"

"This course help us experience peer support and development"

"Life long learning is together with professional development"

"Active learning and experiential learning through observation and reflection support professional development"

"Reflection is crucial for professional development"

"School experience courses is the first step for professional development"

"Portfolio is beneficial for learning and development"

"Observing other works provides evidence of development"

"Looking in different angles helps develop professionalism"

"Micro teaching supports professional development"

In this respect, prospective teachers became consciousness on professional development while learning and teaching through school experiences courses.

Self-determination, Observation and Reflection Skills

Reflective portfolio, teaching practicum process helps prospective teachers develop self-determination, observation and reflection skills. As the self-determination, observation and reflection skills are crucial for the outcome of academic programme regarding to European University Association standards, the experience and reflection of the prospective teachers highlighted how this specific course reached out this success.

Self-determination competence of prospective teachers was developed through reflective portfolio and teaching practicum that prospective teachers stated as following:

"I gained to prioritizes actions for observations and reflection"

"I managed huge of knowledge"

"I control myself not be anxiety in teaching practicum"

"We are in knowledge management, this course help me to manage knowledge and my learning"

Further to this, observation skills of prospective teachers are developed that they stated in many ways:

"I learned how to see and look in detail"

"Gaining different views and looking in different angles"

"I learned to compare different activities"

"The way of looking is changed through observation"

In addition, reflection skills of prospective teachers were developed in the teaching practicum. Prospective teachers developed their reflection skills through portfolio and teaching practicum. They reported that they gained knowledge how to be reflective.

4. Conclusion and Recommendations

Reflective practice is a social interchange of experiences from the practices. Student teachers' professional tasks in observations and teaching practices, reflection is a bridge that is a way of expanding social, cultural and political views through way of acting and thinking. Teacher reflection is a key for developing professional knowledge that is supported from observation skills and teaching practices. It is essential to have meaning making process within intellectual and personal growth (Husu, Toom, Patrikainen, 2008; Kleinberg, Stark 1998, Zhu, 2011).

In this research study, it can be seen that prospective teachers developed skills of self-determination, observation and reflection through teaching practicum. They reported that reflective portfolio, teaching practicum support their professional development from school experiences course. In addition, they experience inductive process in order to manage knowledge and they have been the roots of action learning and experiential learning in order to reconstruct knowledge. Further to this, the study remarked that school experience course and real life experience with teaching practicum provide self-determination, observation and reflection skills as they are the transferable skills to the profession. According to the framework of European University Association (EUA) and bologna process, program and courses need to provide transferable skills for the graduates in order to make them well prepared to the work life. Based on this statement, this study confirmed the skills development process of the prospective teachers for the future real life experience regarding the EUA standards. In addition, the reflective portfolio become effective assessment strategy and progress report as part of the internal quality assurance in higher education programme (Aksal A., Gazi A., De Rossi, V., 2012).

In further studies, mixed approach can be conducted in order to evaluate self determination of prospective teachers in knowledge management. Further to this, multi method can be conducted to evaluate deepen perceptions of prospective teachers.

AN IMPLEMENTATION OF DISTANCE EDUCATION PROGRAM FOR TEACHING COMMON NECESSARY COURSES IN FORMAL EDUCATION: KARABUK UNIVERSITY SAMPLE

Gözde Çakır[a], Bengi Yurtsever[b]

[a]Karabuk University, Safranbolu Fethi Toker Fine Arts and Design Faculty, Department of Industrial Design, Karabuk 78600, Turkey

[b]Karabuk University, Safranbolu Fethi Toker Fine Arts and Design Faculty, Department of Architecture, Karabuk 78600, Turkey

Abstract

Increase of student numbers by higher education institution in post-secondary educational institutions causes various problems in the sense of teacher and learner. It is known that the quality of education given in crowded classes by single instructor decreases. It is thought that improving this situation with developing technology and common internet usage is possible. From this point, distance learning program has been applied in the education of compulsory common courses determined by Higher Education Institution throughout Karabük University since fall semester of 2011-2012 academic year. In the process of application it is aimed to discuss experiences of students and instructors, the sufficiency of technological infrastructure of program, advantages and disadvantages of the program with end of term assessment reports for Safranbolu Fethi Toker, Faculty of Fine Arts and Design, Department of Architecture.

Keywords: Distance Education, Undergraduate Education, Technology, Rapid Life, Using Technology in Education

1. Introduction

There have been many changes in Turkish education system recently. The main reason of these changes is thought to be the rate of literacy which is expected to increase and the rate of unemployment which is not expected to increase due to increasing population of the country. With the changes of education and exam in elementary schools and high-schools; similar changes are done in universities as well, this change is rather thought to have the aim of increasing the number of students. While all these changes were done, a system in which the quality is not given much importance but things were determined through quantity has begun to take place in education. It is possible to assert these both for undergraduate and for associate and postgraduate education. The thought of enabling occupation for everyone is naturally favorable. However taking such step without any infrastructure causes insubstantial growth and expansion. In fact it is more important to be an individual who can improve himself in every way and completely comprehended critical thinking and inquisition for this aim. All these actions are regarded important for self-discovery. Providing these to students must be one of the primary aims of education.

Within the scope of this subject it is aimed to determine whether these attainments – critical thinking, inquisition, designing – can be achieved within the frame of distance learning which is a relatively new education system for Turkey and to analyze the issue through the instance of Karabuk University. Evaluation of reciprocal views of students and instructors after one year process has importance at this point.

As it is briefly mentioned above, the number of students accepted in universities has been increasing day by day. Measures taken for this problem and the infrastructure of schools are most of time insufficient. This insufficiency in the infrastructure can be due to specific technological deficiencies, being primarily instructors.

The importance of technology cannot be denied in present period. In recent months when fast developing technology gathers societies together and intercommunal interaction becomes indispensable, reconstruction of education system in harmony with changes experienced have been discussed nearly by all the nations.

The approach of unconditioned truths leaves its palace to more sensible and intuitive approaches; having belief in the necessity of nature integrity, people began to adopt a life style which compatible with all the living species and nature (Yaşar, 2001, 1). In this frame it is important for the students to participate "actively" in the education and produce technology as well as to have the skill of using technology. The way of using technology should be discussed and it must be provided to students sufficiently within the process of education. This usage can be during courses and it is possible to support with various education strategies.

It is thought that participation of such a process, in other words usage of newly developed technologies is quite important for education. However when there is no infrastructure, there would be specific problems soon and then these problems would get bigger. In this sense innovations should be included in the system after inquisition and discussed within the scope of a specific strategy. Cases which are thought to have solved the problem for short term may rather make the situation worse and this in turn may result in unsolvable problems in the future.

In the education system which is called distance learning, students can participate in the education from their houses or from the places where they want or where they are at that moment. Electronic learning (E-learning) or distance learning can be defined as web-based education system which is provided through internet/intranet or a platform on a computer network. Although the greatest difference of e-learning from traditional education seems to be the technology it included, in fact it predicts a radical change. This approach is a student-centered model which motivates students in attaining knowledge and gives them priority. In e-learning, education is conducted with training activities where the student and instructor do not have to be in the same place simultaneously. E-learning occurs in two ways: a. Individual's receiving education on their own from computer. b. a group of students and course instructor synchronously meeting in a class in a live computer environment.

In fact this system is regarded positive for making use of technological opportunities of today, and making use of educational opportunities rapidly within the conditions of daily life. However, it must be questioned whether providing education only as knowledge would be sufficient for an undergraduate student. What kind of an educational environment is expected for an undergraduate student? These are the questions which forms the complications within the system and which are ignored. Through which approach the distance learning can be more efficient?

Output of the process in the case of Karabük University can be evaluated in negative and positive terms. It can be regarded as positive side that such a recent university has been able to adopt such a system and has taken a distinctive place in recent years. Students can program their time thanks to distance learning; create himself a studying environment at home. Moreover it prevents the loss of time in transportation from campus to residential area, students feel free about time. The negative side is the matter of infrastructure/strategy which is generally discussed in this study. Although it is regarded positive for the universities to be open to new ideas, there are many problems when adapting this to education strategy. The process brings along many problems such the problem of instructor, environment, computer etc. Since the system is not comprehensible in the computer environment and students are not interested in computer adequately causes the system to be an environment in which only the instructor talks to himself rather making the process of distance learning a mutual, active one. However as it is mentioned, it is important and is getting important everyday for students to participate in the education process actively and make a process in which students and instructors mutually share and acquire information. This mentioned process is valid not only for distance learning but also for formal education.

In parallel to all these thoughts, students were interviewed in order to mutually evaluate positive/negative sides of distance learning carried out within a year.

2. Distance Learning

Application of distance learning in education started towards the end of 18th century. In the definition made by California Distance Learning Project (CDLP, 2006) it is stated that distance learning is a kind of education system which is carried out through connection with student and educational tools, and it is underlined that the fact that distance learning programs provide education opportunity even for those who are not registered to any educational institution is a case which increase education opportunities provided for students in recent years. Another side of distance learning is that it has to follow developing technology closely by making use of current resources adequately (CDLP, 2006).

According to United States Distance Learning Association (USDLA, 2005) distance learning means providing education to students with the help of tools such as satellite, video, audio, graphic, computer, multimedia technology. USDLA states that student and instructor is geographically far from each other and electronic devices or written or printed materials should be used in this education program. Distance learning is composed of two basic parts, teaching which includes teachers and learning which includes students (USDLA, 2005).

Opportunities provided through developing technology and increase of computer literacy made it possible for web-based distance learning applications to increase. Distance learning which is a kind of student-centered education is an education model which is prepared considering student's inclination towards technology, functional literacy, visual literacy and learning styles.

2.1. Distance Education Application in Turkey

Since there was no widespread usage of internet until the beginning of 1990's in turkey, Open Education University, Open high school and open elementary school used to provide distance education through TRT 4 and books prepared for this aim served as resources for students.

As internet usage became widespread, IDEA (Web-Based Asynchronous Education, http://idea.metu.edu.tr) sustained E-learning studies which are completely carried out on internet environment and asynchronously. Today, E-MBA program organized many intercampus courses, education of foreign language and certificate programs. (E-MBA: an online post-graduate program in which course will totally be given web-based) (Çallı, Bayram, Karaağaç, 2002).

For the course of Informatics which is taken commonly by 1800 students in ITU, students arrive at computer laboratories in the campus and have their exam in virtual exam environment with the questions chosen randomly from question bank which includes 10.000 questions (Çallı, Bayram, Karaağaç, 2002).

Istanbul Bilgi University initiated the first electronic management program which is named Bilgi E-MBA and approved by YÖK. This interactive program provides accomplishments about marketing, entrepreneurship, finance, human resources etc. MBA diploma will be given as a result of the program which can be followed through internet all around the world (www.bilgiemba.net).

2.2. Karabuk University Distance Education Applicaitons

With the developing technology it has become a necessity to remove time and place restriction of higher-education and make the information produced in higher education independent from time and place.

In the process of transition towards information society, scientific and technological studies should be done and recommended in order to make quality education which assists improvement and development of Turkey widespread through e-learning.

In parallel to these necessities, Distance Learning Application and Research Center was founded in Karabuk University in order to conduct plan, program, coordination and applications within the scope of undergraduate, associate and postgraduate distance education program and activities which are carried out in the basis of information and technology technologies of the university.

Karabuk University which aims to increase its success in education with opportunities of interactive media and multimedia presented by the university provides distance education in 5 associate programs, 9 undergraduate and 2 postgraduate programs.

2.3. Application of Distance Education Program for Common Compulsory Courses within Formal Education

Increase of student numbers by higher education institution in post-secondary educational institutions causes various problems in the sense of teacher and learner. It is known that the quality of education given in crowded classes by single instructor decreases. It is thought that improving this situation with developing technology and common internet usage is possible. Considering the age, computer literacy, technology inclination, functional literacy, interests and learning motivations of individuals, distance education program has been applied in the education of common compulsory courses determined by Higher Education Institution throughout Karabük University since fall semester of 2011-2012 academic year.

2.4. Introduction to Distance Education Program

Login of students who completed preparatory education and are to start 1st grade education was defined before the fall semester begins. The student can log in with students number and the password he created. The home page that occurs when system is logged in is shown in Figure 1.

There are videos with lecturing and lecture notes for every course in the system. Students can access these information whenever they want. In addition to these, days and hours were determined in course programs for common compulsory courses of each department. Students who log in at these determined days and hours can access the coordinator of this course on-line, watch the lecture live and ask question to the coordinator (Figure 2). With LMS (Learning Management System) software coordinator can apply quiz, exam or survey to the students and can make assessment.

Log in and log out of students are recorded by the software and their attendance can be monitored in this way.

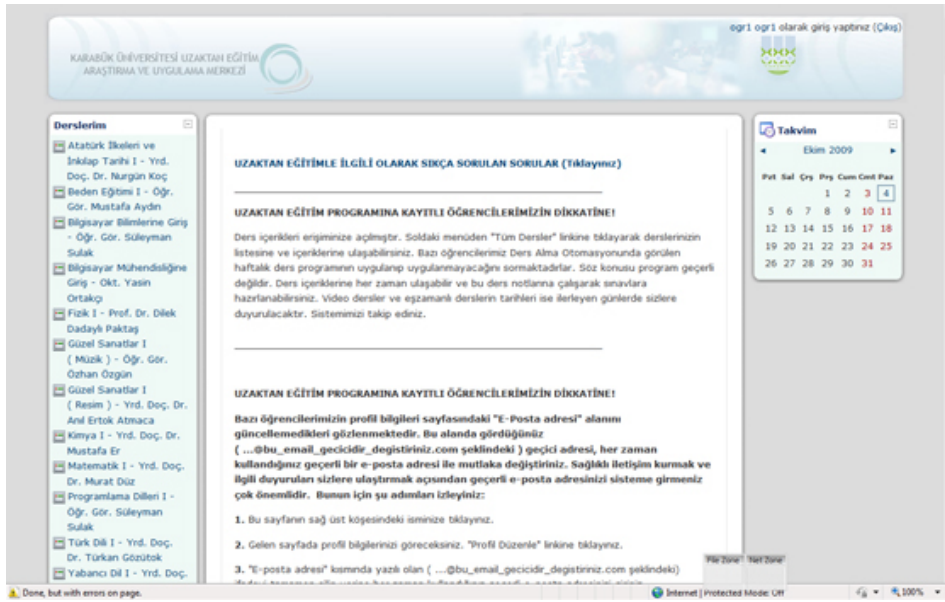
When the student logs in, he can create his own calendar from his personal page and access forum of the courses he receives, introductory video of the courses and course resources (Figure 3, 4).


Figure 1. View of distance education home page

Figure 2. Video page including lecture

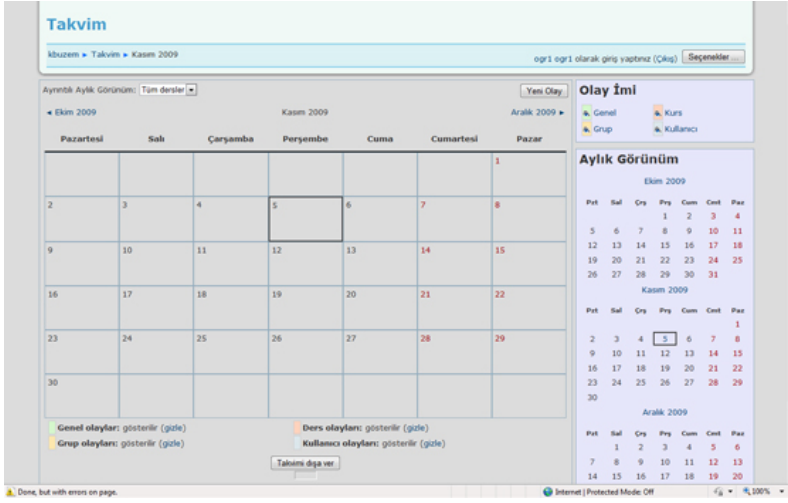
There are two forums for each course in the system. One of them can be defined as the area in which coordinator of the course makes announcements about the course (Figure 5). Students cannot intervene in this area. The second one is the course forum. Coordinator shares his opinions when he expects feedback from students. Students can share their opinions and questions with the coordinator. The interaction between coordinator and students is visible for every student. Students who are active in the system can see other active students and share information (Figure 6).


Figure 3. Calendar page of student
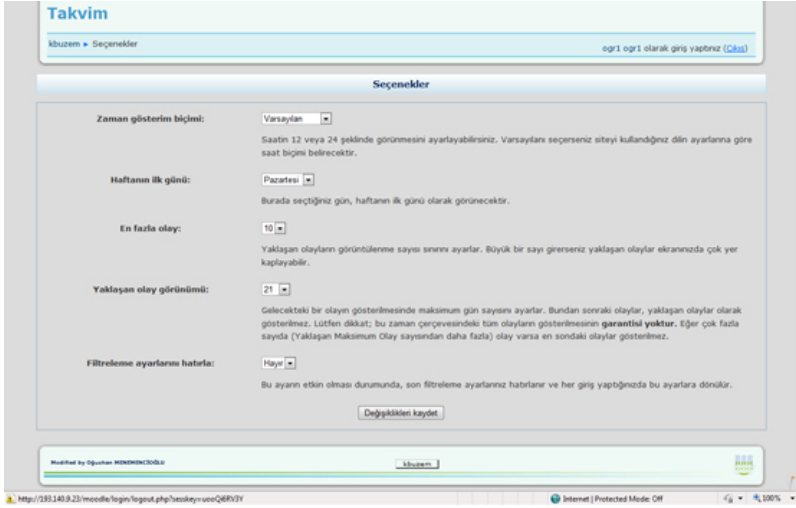

Figure 4. Calendar personalization page of student
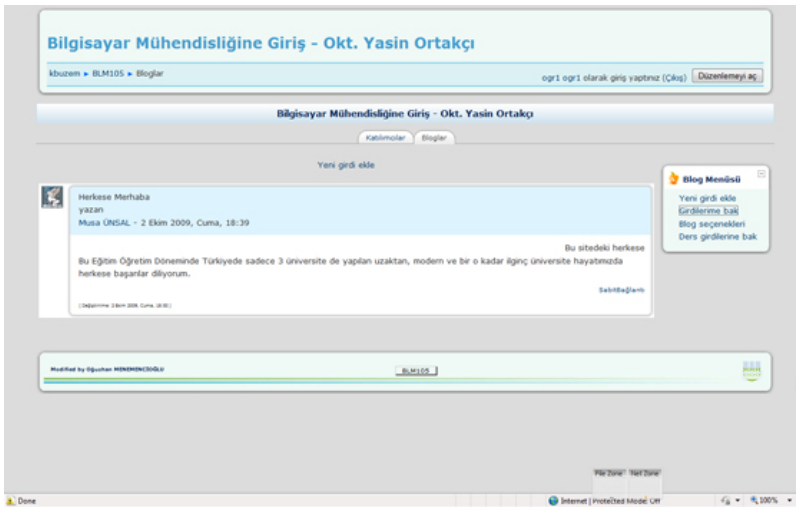

Figure 5. Coordinator forum page
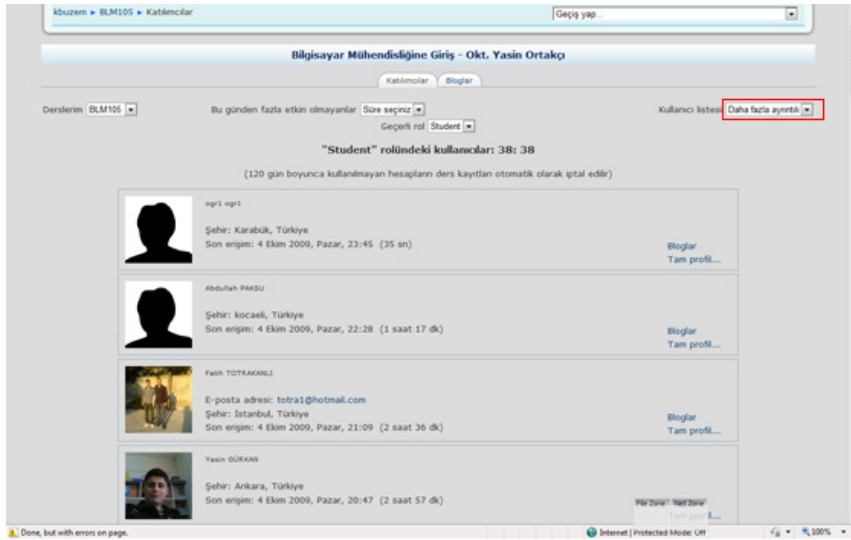

Figure 6. Active student page

2.5. Evaluation of Distance Education Application in Karabuk University, Safranbolu Fethi Toker, Faculty of Fine Arts and Design, Department of Architecture

Architecture is an occupation which is dynamic, open to innovation and constantly modifies. The greatest change is thought to happen in current time. In our day where modernism and latter movements are discussed and technology lives its golden age, it must be questioned that whether current architectural education programs can keep up with the times or not (Lökçe, 2002). With the development of construction technologies, due to improvement of various representation tools, many choices which can be the interface of architecture are provided every passing day simultaneously. Due to the change of way of seeing and thinking; perspective towards art and philosophy, perspective towards life, architecture can fulfill the entire demand of people and society in this plentifulness. This situation makes it possible to carry out every kind of architectural study in interdisciplinary and transdisciplinary basis. Architecture education must be kept up-to-date in line with daily life and conditions of the day in order to create up-to-date environment of architecture education; interrogator, critical student-instructor environment. It is observed that architecture students at first grade gain familiarity with the usage of computer and technology through distance education program applied within the scope of university.

Since common compulsory courses are provide through distance education system, students who have intensive design study in the courses of architectural project and construction can both prevent the loss of time during going to school and back and also continue their project studies after on-line course without changing environment.

3. Conclusion

Within the scope of distance education application, an architecture student at first grade was interviewed, and it was concluded that thanks to the application of distance education program in teaching common compulsory courses students can easily follow the courses since they can access the coordinator of the course face to face; they access the information whenever they want thanks to lecture notes and videos with lecturing; they can determine their learning deficiencies through exams whenever they want. It was determined that problems about the system are rather related with technical/infrastructure basis. Since the system has not been seated very well in the first semester, there have been problems for about one month at the beginning of the term.

Acquisition in the sense of time is especially important for architecture students. In this sense, students who learn to schedule themselves had rather comfortable term in the sense of course intensity. Since the courses

provided with distance education program are not department courses but those with which students are familiar from high-school, there has not been any problem in the sense of conveying information – efficiency.

Technological opportunities of the present day should be certainly evaluated. In this sense distance education is a system which relieves the burden of education system. Yet, it must be discussed whether a proper education environment could be enabled or not.

AN INVESTIGATION OF PROSPECTIVE TEACHERS' REFLECTIVE THINKING TENDENCY

Güliz Gür Şahin[a], Dr. Filiz Tuba Dikkartin Övez[b]

[a]Balıkesir University, Education Faculty of Necatibey, Elementary Teacher Education Department, Balıkesir, 10100, Turkey

[b]Balıkesir University, Education Faculty of Necatibey, Elementary Mathematics Education Department, Balıkesir, 10100, Turkey

Abstract

The basic objective of this study is to examine the reflective thinking tendencies of prospective teachers. The descriptive survey model has been adopted in the study. The universe of the study consists of prospective teachers attending the 4th grade of the Elementary Teacher Education Department at Balıkesir University in the 2011-2012 academic year. Sampling was conducted with a total of 278 prospective teachers in the departments of Elementary Mathematics, Social Sciences, Elementary Teacher Education and Science Education Departments by means of the random sampling method among probability sampling techniques. In line with the objective of the study, for the purpose of determining the reflective thinking tendencies of prospective teachers, the "Reflective Thinking Tendency" scale was utilized. Obtained data, was analyzed through arithmetic mean and standard deviation values, one way analysis of variance (ANOVA), and the Bonferroni test. As a result of the study it was determined that prospective teachers studying at the Elementary Teacher Education Department had the highest and the prospective teachers studying at the Social Sciences Teaching Department had the lowest reflective thinking tendency score means. Furthermore, it was concluded that the reflective thinking tendencies of prospective teachers differed according to the variable of the department they are studying in.

Ketwords; Reflective teaching, prospective teachers, prospective teachers' reflective thinking ability.

1. Introduction

The capacity of thinking in an individual acquires qualification with the individual discovering correct manners of thinking. Accordingly, there is a need for teachers, who can guide students, direct students in utilizing the knowledge they have acquired in an effective manner, and contribute to them in problem solving and being successful both in their school life and daily life. Studies on teachers, who are the most important element of education in the world, and their training, are increasing day by day. One of these is the studies conducted in the field of reflective thinking. Reflective thinking is an essential element of the education process of teachers and students. So much so that, many institutions in the field of education and teacher development in Europe and America have determined reflection as a standard that needs to be complied with by teachers and students. This standard is expressed as; the teacher must contemplate on their practices in a systematic manner and must benefit from the experience they have acquired. They should be able to examine their practice from a critical perspective, consult the views of others, conduct studies with educational quality in order to deepen their knowledge, concretize his/her judgments, and adapt the method of teaching according to new findings and thoughts" (NCTAF, 1996; cited by: Rodgers, 2002). In this context, it would be appropriate to underline the definition of reflection and reflective thinking.

Dewey (1991) defines reflection as "the active, consistent, and careful thought on any belief or form of knowledge in light of reasons that support it and take it to the next conclusion". The concept of reflection has acquired its place in education in the form of "reflective teaching, reflective research, and reflecting on practice". Furthermore, it has become an important building block in the field of teacher training in becoming an effective teacher (Day, 2000). This is because, in the process of reflecting, teachers are able to develop their

personal and professional knowledge. At the same time, together with reflective thinking, teachers are able to guide students in finding realistic solutions to problems and making sound decisions. In this context, reflection and reflective thinking are perceived to be important elements in teacher training.

Şahin (2011) expresses the reflective teacher as a teacher, who "constantly has a hold of control and is constantly open to education in the formation of school culture, directing and restructuring classroom practice processes, controlling and directing behavior and feelings, making inferences on alternative practices and events".

Norton (1997) lists the basic characteristics and behaviors that a reflective thinking teacher needs to have as: "a teacher who constantly evaluates the teaching process, can make effective decisions by reviewing the methods and instruments they use, is broad minded, can produce alternative solutions by considering criticism, is sincere, can take all sorts of short term and long term consequences of decisions made into consideration and organize planning accordingly, pays attention to reflection, is foresighted, and educates his/her students accordingly (cited by. Duban and Yelken. 2010).

In the training of teachers, it is important to determine the extent to which reflective teacher characteristics are acquired at faculties of education. In line with this, the basic purpose of the study is to examine the reflective thinking tendencies of prospective teachers. For this purpose, answers to the following research questions have been sought.

1. What are the reflective thinking tendency levels of prospective teachers?

2. Does the reflective thinking tendency levels of prospective teachers differ according to the variable of the department they are studying in?

2. Methodology

2.1 Model of the Study

The descriptive survey model, which aims to demonstrate the existing circumstance as it is, has been adopted in the study. This model was selected as it attempts to describe the existing case with regards to reflective thinking tendencies of prospective teachers within the framework of the purpose of the study.

2.2. Study group

The universe of the study consists of prospective teachers studying in the 4th year of the Elementary Teacher Education Department at Balıkesir University during the spring semester of the 2011-2012 academic year. A total of 278 prospective teachers consisting of 76 from the Mathematics Teaching Department, 65 from the Social Sciences Teaching Department, 73 from the Elementary Teacher Education Department, and 64 from the Science Teaching Department were included in the study through the random sampling method under probability sampling techniques. A proportion of 35.97% (n=100) of the prospective teachers selected from the said departments as samples were males and 64.03% (n=175) were females.

2.3 Collection and Analysis of Data

In line with the purpose of study, for the purpose of determining the reflective thinking tendencies of prospective teachers, the "Reflective Thinking Tendency" scale developed by Semerci (2007) was used. The scale consists of 35 items, of which 15 are positive and 20 are negative. According to the applied factor analysis as a result of the reliability and validity works of the study, the KMO values were determined as 0.909 and Bartlett value was determined as 6811.461 ($p<0.05$). Furthermore, according to the result of the conducted item

analysis, it was determined that the total item correlations varied between 0.308 and 0.607, test retest correlation is 0.742 (p<0.01), the correlation coefficient between two half points is 0.77 (p<0.01), and the Cronbach Alpha coefficient of the scale is 0.908. (Semerci. 2007: 1351). The themes of the seven factors obtained in the scale prepared as a 5 point likert scale have been determined as constant and purposeful thinking (reliability coefficient 0.794), open-mindedness (reliability coefficient 0.712), inquisitive and effective teaching (reliability coefficient 0.747), teaching responsibility and being scientific (reliability coefficient 0.776), investigative (reliability coefficient 0.742), being visionary and candidness (reliability coefficient 0.668), view towards the profession (reliability coefficient 0.357).

With regards to the data obtained through the implementation of the scale on prospective teachers, the SPSS 17.0 was used to find answers for the questions of the study. For this purpose, arithmetic mean and standard deviation of the data were analyzed through the one way variance analysis (ANOVA) and the Bonferroni test.

3. Findings and Interpretation

3.1. Findings on the Reflective Thinking Tendency levels of prospective teachers

Distribution of arithmetic mean and standard deviation according to the department studied in, with regards to the themes of the seven factors in the scale in accordance with the data obtained from the application of the "Reflective Thinking Tendency" Scale to prospective teachers in the sample under the scope of the first problem of the study, have been provided in Table 1.

Table 1. Average and standard deviation values in relation to the reflective thinking tendency levels of prospective teachers

Subdimensions (Factors)	Departments											
	Elem.. School Teaching			Elem. School Maths Teaching			Social Sciences Teaching			Science Teaching			General		
	n	$\overline{X}$	ss	n	$\overline{X}$	ss	n	$\overline{X}$	ss	n	$\overline{X}$	ss	n	$\overline{X}$	ss
Constant and Purposeful Thinking		4.19	.819		3.82	.658		4.18	.478		4.26	.607		4.11	.677
Open-mindedness		4.65	.482		4.26	.708		4.58	.377		4.45	.629		4.48	.585
Inquisitive and Effective Teaching		4.66	.375		4.25	.751		4.46	.590		4.41	.853		4.45	.676
Teaching Responsibility and Being Scientific	73	4.32	.666	76	3.94	.668	65	2.72	2.048	64	4.30	.615	278	3.85	1.287
Investigative		4.29	.600		3.95	.630		2.76	2.041		4.33	.671		3.86	1.269
Visionary and Candidness		4.46	.514		4.10	.593		2.80	2.095		4.41	.644		3.97	1.289
View Towards Profession		4.39	.759		4.11	.690		2.67	2.034		4.38	.740		3.93	1.342
Total		4.42	.396		4.06	.497		3.45	1.180		4.36	.528		4.09	.790

When Table 1 is examined, it has been determined that prospective elementary teachers have the level of reflective thinking tendency at the rate of 4.42, elementary school prospective mathematics teachers at the rate of 4.06, social sciences teachers at the rate of 3.45, and prospective science teachers at the rate of 4.36. When the answers given within the scope of seven factors in the scale are examined, considering the items measuring the subdimension of the "Constant and Purposeful Thinking", prospective science teachers (X=4.26) mostly prefer the topics of "Valuing students' views, critical thinking in the light of teaching objectives, helping other teachers with teaching, assessing the effectiveness of their own teaching, encouraging debates in the classroom, encouraging students to discover while giving the lesson whereas elementary school prospective mathematics teachers (X=3.82) prefer less. When the items measuring the subdimension of "open-mindedness" are examined, it has been determined that elementary school prospective teachers (X=4.65) are more sensitive to the topics of "Reviewing teaching acquisitions, being open to criticisms regarding teaching practice, looking at the practice in learning-teaching process in a multi directional manner, feeling responsibility in students' individual needs and cognitive behaviors, caring for the educational activities" and that they mostly selected the options of "Completely Agree" whereas elementary school prospective mathematics teachers (X=4.26) prefer less. When the items measuring the subdimension of " Inquisitive and Effective Teaching" are examined, it has been determined that prospective elementary school teachers (X=4.66) are more sensitive to the topics of "Using new materials, introducing the concept maps in the theoretical part of the lesson, valuing students' dreams, giving importance to cooperative learning and having a critical perspective" and that they mostly prefer the options of "Completely Agree" whereas prospective elementary school mathematics teachers (X=4.25) prefer less. When the items measuring the subdimension of "Teaching Responsibility and Being Scientific" are examined, it has been determined that prospective elementary school teachers (X=4.32) are more sensitive to the topics of "Knowing who, what, when, why, and how to teach in education, establishing effective communication with students, presenting suitable teaching materials, paying attention to the expectations of the students, recognizing and explaining a new subject skillfully" and that they mostly prefer the options of "Completely Agree and Partly Agree" but prospective social sciences teachers prefer less (X=2.72).

When the items measuring the subdimension of "researcher" are examined, it has been determined that prospective science teachers (X=4.39) are more sensitive to the topics of "percepting the problems regarding the learning environment and evaluating them in career development, having the spirit of research, evaluating their

teaching objectively, being open for progress," and that they mostly prefer the options of "Completely Agree" whereas prospective social sciences teachers (X=2.76) prefer less. When the items measuring the subdimension of "Visionary and Candidness" are examined, it has been determined that prospective elementary school teachers (X=4.46) mostly give importance to the topics of "Helping the students see beyond the classroom, exchanging views on teaching practice, being open to criticisms, and developing empathy with students" and that they mostly prefer the option of "Completely Agree" whereas prospective social sciences teachers (X=2.80) prefer less. When the items measuring the subdimension of "View Towards Profession" are examined, it was observed that on the subject of behaving more honestly in caring for teaching and self – assessment elementary school prospective teachers had the highest average (X=4.39) but prospective social sciences teachers had the lowest average (X=2.67).

When examined in general, it was determined that the score means of prospective teachers were mostly in the subdimension of "open-mindedness" (X=4.48) and in the subdimension of "Teaching Responsibility and Being Scientific" minimally (X=3.85). In addition, it was determined that reflective thinking scores of prospective teachers were high (144.07).

Findings Concerning the Reflective Thinking Tendencies According to the Variable of Department, in which They Studies.

In order to look for an answer for the second problem of the study one-way variance analysis (ANOVA) was performed to determine the state of difference of reflective thinking tendencies of prospective teachers according to the Variable of Department. The findings obtained are provided in Table 2.

Table 2. The scores of reflective thinking tendencies of prospective teachers according to the variable of department, in which they received education

Department	n	$\overline{X}$	ss	F	p*
Elem. School Teaching	73	4.42	.396		
Elem. School Maths Teaching	76	4.06	.497		
Social Sciences Teaching	65	3.45	1.180	26.34	.000
Science Teaching	64	4.36	.528		
Total	278	4.09	.790		

p*<.05

When Table 2 was examined, it was determined that there was a significant difference between the scores of reflective thinking tendency of prospective teachers according to the variable of department [F(3-275)=26,34, p<.05]. That is, it was found that the scores of reflective thinking tendency of prospective teachers were associated with their departments. In order to specify the source of this difference the homogeneity of the variances were examined and as Leven was (p<.05), Bonferonni test was performed. The data obtained is provided in Table 3.

Table 3. The results of Bonferonni test regarding the significance of differences between the scores of reflective thinking tendency of prospective teachers

Departments		Average Difference (I-J)
(I)	(J)	
Elem. School Teaching	Social Sciences Teaching	.975*
	Elem. School Maths Teaching	.358*
	Science Teaching	.057
Science Teaching	Elem. School Maths Teaching	.617*
	Social Sciences Teaching	-.918*
Elem. School Maths Teaching	Social Sciences Teaching	-.301

*p<.05

According to the results of the Bonferroni test, it is observed that the difference of reflective thinking tendency of prospective teachers is significant in favor of Elementary School Teaching between Elementary School Teaching (X=4.42) and Social Sciences Teaching (X=3.45), Elementary School Teaching and Elementary School Mathematics Teaching (X=4.06), Elementary School Teaching and Science Teaching (X=4.36) and in favor of Science Teaching between Science Teaching and Elementary School Mathematics Teaching, Science Teaching and Social Sciences Teaching, and in favor of Elementary School Mathematics Teaching between Elementary School Mathematics Teaching and Social Sciences Teaching (p<.05).

4. Result and Suggestions

The following results have been obtained in this study aiming to examine the reflective thinking tendencies of prospective teachers.

1. It has been concluded that the score averages of the reflective thinking tendencies of prospective teachers are high. These results obtained demonstrate similarities to the results of some researches performed (Duban, Yelken, 2010; Lee, 2000; Şahin, 2011; Semerci and Kılınç, 2010; Good and Whang, 2002). When seven subdimensions in the scale of reflective thinking tendency were examined, it was determined that the score averages of prospective teachers were mostly in the subdimension of "open-mindedness" and in the

subdimension of "Teaching Responsibility and Being Scientific" minimally. In addition, it was determined that mostly prospective Elementary School teachers had the score averages of the reflective thinking tendencies and prospective Social Sciences teachers had the score averages of the reflective thinking tendencies minimally.

2. It was found that the reflective thinking tendencies the prospective teachers possessed changed according to the variable of department, in which they studied. Also, the results of the study performed by Duban and Yelken (2010) have similar characteristics. It was determined that this difference so as to be in favor of elementary school teaching, science teaching, and elementary school mathematics teaching occurred between the prospective teachers that receive education in elementary school -science, elementary school- elementary school mathematics, elementary school-social sciences and sciences - elementary school mathematics, sciences- social sciences, and elementary school mathematics-social sciences.

In the study it was observed that the reflective thinking tendencies of elementary school and prospective science teachers were high but the average scores of reflective thinking tendencies of prospective social science teachers were below the average. In this sense, in order to remove this difference among the departments teaching practice that may develop the reflective thinking tendencies may be conducted in faculties of education. Studies conducted abroad indicate that training reflective teachers is emphasized relatively in faculties of education. Within this scope the gap regarding this subject may be closed by removing this deficiency in our country, training teaching staff that may teach reflective thinking, and adding reflective thinking and reflective educational courses to faculty of education programs. This research with a quantitative characteristic may be widened and thus, reflective thinking processes of prospective teachers may be examined extensively and to what extent the prospective teachers that are trained in this direction use their skills may be researched when they start to execute their professions.

Abstract

La littérature critique et le nombre considérable de chercheurs qui se penchent sur le problème de l'évaluation des étudiants témoignent de l'intérêt que cette question suscite constamment dans le milieu scolaire et universitaire. Afin de remédier quelque peu à cette situation, le présent article vise à présenter une méthode de notation appelée le système d'aide à la décision qui est basé sur la logique floue. Grâce à sa flexibilité, la logique floue devrait, à notre avis, permettre de perfectionner le processus d'évaluation. Ainsi, dans un premier temps, le texte présente une esquisse de diverses approches du problème d'évaluation. Ensuite, il explique les principes théoriques de la logique floue et le fonctionnement du système d'aide à la décision. Finalement, la partie suivante de l'article comprend la description des trois exemples de l'application du système. Le premier concerne l'évaluation des étudiants de l'École polytechnique de Montréal lors de leurs exposés oraux notés par une équipe de professeurs. Les deux autres constituent la proposition de l'application du système d'aide à la décision lors du briefing technique ainsi que dans l'apprentissage des langues, notamment pendant le cours de l'expression orale.

Mots-clés : logique floue; notation; éducation

Introduction

Selon le syllabus proposé par E. F. Cravley (Cravley E. F., 2005), de l'initiative : Imaginer-Concevoir-Réaliser-Exploiter (ICRE), Conceive-Design-Implement-Operate (CDIO), deux objectifs primordiaux dans la formation contemporaine en ingénierie restent apparemment en contradiction. Tandis que le premier consiste à former les étudiants dans un grand spectre de technologies, le deuxième vise à développer leurs habiletés personnelles et interpersonnelles, et tout cela, afin de réaliser des systèmes complexes d'ingénierie. Les ingénieurs diplômés devraient être en mesure d'Imaginer-Concevoir-Réaliser-Exploiter des systèmes complexes d'ingénierie à valeur ajoutée dans un environnement moderne de travail en équipe.

L'approche ICRE demande, non seulement d'adapter, pour ce nouveau défi, les méthodes d'enseignement adéquates mais aussi les méthodes d'évaluation. Par exemple, dans le chapitre 7 du livre « Rethinking Engineering Education » (Cravley et al, 2007), son auteur P. J. Gray propose que les connaissances acquises par les étudiants soient évaluées avant, pendant et après l'apprentissage. Le résultat de ces évaluations permet aux étudiants de prendre conscience de leur progrès et, donne en même temps aux enseignants, l'information sur la qualité de l'enseignement ainsi que sur les points à améliorer ou à changer. Il existe une variété de méthodes d'évaluation qui dépendent du programme d'enseignement et des méthodes d'apprentissage. On peut citer ici, par exemple : examens écrits et oraux (réponses aux questions), évaluation des performances, évaluation et analyse des résultats, évaluation des cahiers de projet des portfolios et de la rédaction technique des exposés oraux, etc. Par contre, l'évaluation de l'apprentissage des étudiants n'est pas complète si les résultats de cette évaluation ne sont pas utilisés pour améliorer leur apprentissage.

Traditionnellement, l'évaluation est considérée comme un processus indépendant d'apprentissage, effectué à l'extérieur du temps consacré pour l'enseignement. En plus, les étudiants regardent souvent leurs évaluations

avec peur et intimidation. Une nouvelle approche a été présentée par Doris R. Brodeur (Brodeur, D. R. 2006) pendant un CDIO workshop à l'École polytechnique de Montréal, le 13 novembre 2006. Elle est fondée sur six principes de base :

- L'évaluation nécessite une attention concernant les résultats recherchés.
- Divers types d'apprentissage demande différentes méthodes d'évaluation.
- L'enseignement et les évaluations sont jumelés.
- Chaque évaluation est un échantillon seulement.
- Les évaluations sont plus représentatives quand elles sont régulières et continues, pas seulement finales.
- Il y a un compromis entre authenticité et efficacité, les tâches proches de réalité demandent plus de ressources et de temps.

Dans sa présentation, Doris R. Brodeur discute aussi en détails les différentes méthodes d'évaluation.

L'analyse de la littérature critique, dont une brève esquisse vient d'être présentée, permet de remarquer qu'un effort relativement grand est consacré à la réflexion aux méthodes d'évaluation, mais le processus de notation n'éveille pas le même intérêt chez les chercheurs. D'habitude, la notation consiste, d'abord, à accorder les notes en chiffres (parfois, avec un poids) pour chaque tâche accomplie, et ensuite, à calculer la moyenne finale. Prenons comme exemple un étudiant qui a reçu, des trois contrôles consécutifs, les notes suivantes : 2, 2, 20 ce qui donne la moyenne 8. La note moyenne de cet étudiant est-elle comparable au résultat d'un autre étudiant qui a obtenu aux trois épreuves les notes : 8, 8, 8 ce qui donne la même moyenne? Nous visons donc dans le présent article à remédier à cette situation en proposant d'appliquer la logique floue pour l'action d'accorder les notes. À notre avis, la logique floue, grâce à sa flexibilité, devrait permettre de perfectionner ce processus. De plus, le recours à la logique floue rend possible le développement de la stratégie commune de notation pour plusieurs professeurs afin de rendre homogène l'évaluation finale. Le système d'aide à la décision (SAD) Fuzzy Flou, développé à l'École polytechnique de Montréal, permet aussi de réagir comme expert puisqu'il accumule les expertises et les expériences de plusieurs enseignants.

Principes de la logique floue

La logique floue a été développée dans les années soixante par L. A. Zadeh (1965, 1973), professeur de l'Université de Californie à Berkeley. Depuis cette époque, la logique floue a eu beaucoup de succès et elle a été appliquée dans une gamme de domaines très large, c'est-à-dire à partir du design de l'électroménager, en passant par l'automobile, jusqu'au contrôle des systèmes très complexes comme par exemple l'hélicoptère.

Le nom de la « logique floue » éveille souvent un doute, voire un sourire d'incrédulité parce qu'elle fait penser à une imprécision au niveau du calcul ce qui est complètement faux parce que la théorie des ensembles flous s'appuie entièrement sur les rigueurs des mathématiques. Par contre, la logique floue permet de traiter les problèmes de décision qui sont flous et imprécis de sa nature.

Le mérite de la logique floue consiste dans la possibilité d'utiliser un éventail plus large de notions. Tandis que la logique classique ne se limite qu'aux notions « oui » ou « non », la logique floue permet d'utiliser les notions telles que « non », « un peu », « à peu près », « un peu plus », « tout à fait », etc.

Le système d'aide à la décision (SAD) fondé sur la logique floue est composé de quatre éléments, notamment les prémisses, les conclusions, les ensembles des règles et le moteur d'inférence. Cette méthode utilise donc l'information définie sous forme d'un ensemble de règles en forme linguistique qui constitue les liens entre les prémisses et les conclusions.

Dans le SAD Fuzzy Flou, les fonctions d'appartenance des sous-ensembles flous des prémisses, des conclusions ainsi que les observations sont définies sous la forme de trapèzes par un quintuple (m_1, m_2, am, bm, hm), où (Fig.1):

- m1 : valeur modale gauche,

- m2 : valeur modale droite,

- am : écart gauche,

- bm : écart droit

- hm : appartenance maximale de la fonction (1,0).

Cette définition générale de l'ensemble flou permet d'exprimer des observations comme les valeurs exactes (m1=m2, am=bm=0, hm), l'intervalle des valeurs (m1, m2, am=bm=0, hm), la valeur approximative (m1=m2, am, bm, hm) et l'intervalle approximatif (m1, m2, am, bm, hm).

La préparation de l'ensemble de règles est une tâche très importante qui peut être effectuée par un groupe d'experts qui peuvent, dans ce but, puiser aussi dans un savoir général : livres, graphiques, etc. Résultat du travail et de l'analyse des experts, la base de règles peut ensuite être rapidement mise en œuvre et utilisée par le système d'aide à la décision. Au fur et à mesure de l'utilisation du système, la base de règles peut être pourtant facilement modifiée pour répondre aux exigences des utilisateurs.
Figure 1. Définition de la fonction d'appartenance dans le SAD Fuzzy-Flou

Base théorique du système d'aide à la décision Fuzzy Flou (SAD)

Dans cette section, nous présentons la méthode de raisonnement fondée sur la règle d'inférence composée (RIC), une approche basée sur les règles qui émulent le processus de raisonnement.

La règle d'inférence composée peut être écrite sous la forme suivante :

$$U' = (C' x .... x B' x A') \text{ O } R \qquad (1)$$

(1)

où R représente la relation globale qui est un agrégat de toutes les règles (base de connaissance), (A', B',...,C') représentant les entrées (observations) et U' représente la sortie (conclusion). Le symbole O représente l'opérateur de la règle d'inférence composée. Dans le langage courant, on peut lire cette équation de la manière suivante : la conclusion d'une décision U' peut être déduite de la base des règles R à partir des observations (A', B',...,C') à l'aide d'un opérateur de la règle d'inférence composée (RIC). Les résultats obtenus sont en forme floue et, si nécessaire, les trois méthodes de défuzzification sont disponibles dans le SAD Fuzzy Flou : centre de gravité (CDG), moyenne des maximums (MOM) et centre de gravité modifié (CDGM).

Basé sur la formule présentée ci-haut, le système d'aide à la décision appelé FUZZY-FLOU (v1.0) a été développé à l'École Polytechnique de Montréal (Canada) et à l'Université Technique de Silésie à Gliwice (Pologne). Le système fonctionne sous DOS, Windows et UNIX.

La base de connaissance contient un nombre fini de règles linguistiques. Chaque règle contient un nombre fini de prémisses combinées avec l'expression conjonctive «et» et un nombre fini de conclusions indépendants. La description détaillée de SAD Fuzzy-Flou est présentée dans l'article de Balazinski et al. (1993).

Exemples de l'application du système d'aide à la décision dans la notation des étudiants

Exposés oraux

Pour illustrer les avantages de l'utilisation du système dans le processus de notation, nous présenterons trois exemples. Le premier concerne le cours *Méthodologie des projets d'ingénierie et communication*. La spécificité de ce cours consiste dans le fait qu'il a été assuré par plusieurs professeurs dans plusieurs groupes pendant de nombreuses années ce qui a contribué à récolter une grande quantité d'informations et a permis de faire une analyse approfondie du problème ce qui n'est pas nécessairement le cas dans d'autres exemples présentés.

Les exposés finals de ce cours ont été toujours évalués par plusieurs équipes de professeurs, chacune de trois personnes. Après avoir évalué individuellement chaque groupe d'étudiants, les trois enseignants devaient arriver à un consensus pour accorder une note finale à chaque groupe d'étudiants. Nous avons constaté qu'à l'issue de ces discussions, les consensus produisaient toujours un élargissement des premières notes accordées par les professeurs. D'habitude, la note au-dessus de la moyenne a été bonifiée en moyenne de 0,7 points, par contre, la note au-dessous de la moyenne a été diminuée de 0,85 points.

Une autre analyse des premières notes a également relevé la différence relative dans la notation effectuée par les trois professeurs. Ainsi la concordance idéale entre les professeurs (15, 15, 15) a-t-elle amené à bonifier la note finale de 0,5 points, par contre, le manque de concordance (10, 15, 20) a été pénalisé de 0,5 points sur la note finale.

Les résultats de cette analyse ont permis de modéliser la base de données qui reflétait ainsi tout le processus d'accorder les notes finales par plusieurs professeurs pour plusieurs groupes d'étudiants. La création, et par la suite l'application du SAD Fuzzy-Flou a permis d'économiser le temps dans la phase des discussions entre les professeurs et a rendu la notation plus homogène.

La figure 2 présente un exemple d'évaluation complète de la note finale : d'une part pour le cas de concordance entre les professeurs et de l'autre, pour le cas de la non-concordance. L'explication détaillée de cet exemple se trouve dans Balazinski et al. (1996)

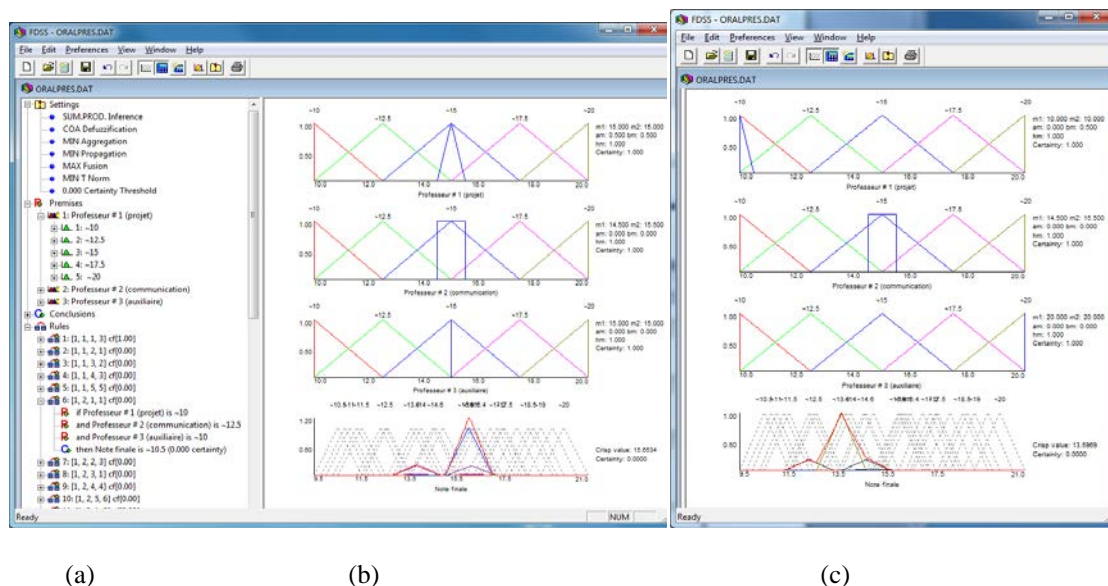
(a)   (b)   (c)


Fig. 2. Écran du logiciel Fuzzy-Flou avec les évaluations complètes de la note finale. (a) structure de la base de connaissance, (b) le cas de la concordance entre les professeurs; (c) le cas de la non-concordance entre les professeurs.

Comme on peut voir dans la figure 2, pour les notes partielles : 15±0,5, de 14,5 à 15,5 et 15, la note finale est 15,65 et pour les notes :10±0,5, de 14,5 à 15,5 et de 20 la note finale est 13,59. Pourtant la note moyenne est

dans les deux cas égale à 15. Dans le premier cas, les étudiants sont bonifiés grâce à la concordance des notes, et dans le deuxième, pénalisés à cause de la disparité des notes attribuées par les professeurs.

Les deux exemples, qui seront décrits par la suite, ne constitue que les cas montrant la facilité relative de l'application du SAD Fuzzy-Flou. Le premier se référera à l'évaluation du briefing technique et le deuxième épuisera un domaine humaniste et fera recours à l'évaluation de l'expression orale dans l'apprentissage des langues étrangères. Dans tous les deux cas, les données ne sont pas disponibles ou elles sont insuffisantes pour effectuer une analyse. Les professeurs, eux-mêmes, peuvent créer la base de donnée fonctionnelle à partir de leurs expériences et leurs connaissances qui peut être, par la suite, modifiée et améliorée au cours des années en fonction des exigence du cours.

Briefing technique

Pendant le briefing technique, il est nécessaire d'évaluer plusieurs compétences qui se divisent en deux groupes : la qualité de la présentation et le contenu technique. Dans le premier, l'évaluation concerne plusieurs aspects tels que la clarté de la présentation, la qualité de langue, la manière de s'exprimer, le contact visuel avec le public, le professionnalisme et ainsi de suite. Par contre, le contenu technique comprend les aspects suivants :

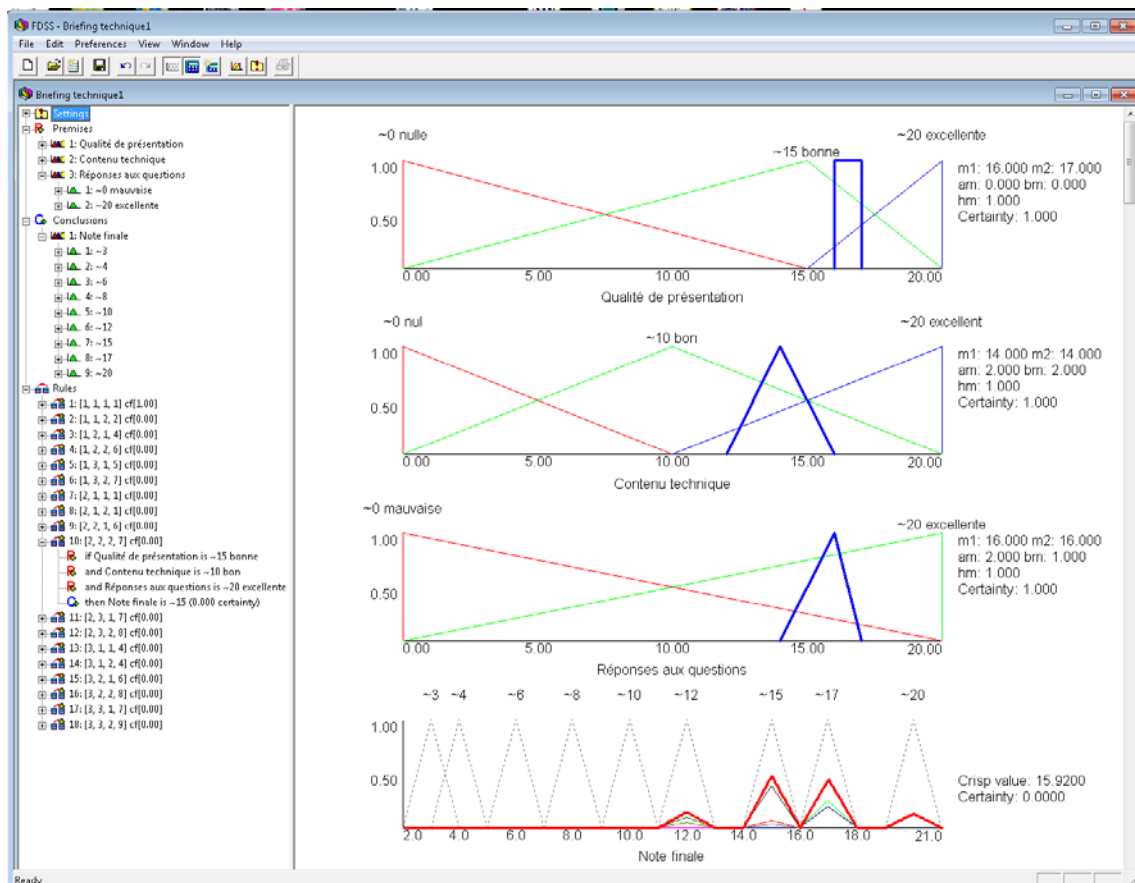
Le contenu technique est-il exacte et important ?

Les points principaux de l'exposé sont-ils suffisamment mis en relief et la cohérence des idées présentées est-elle respectée ?

La présentation graphique est-elle satisfaisante ?

Les solutions alternatives sont-elles proposées ?

Les questions et les réponses sont-elles exactes et cohérentes ?

La figure 3 présente l'exemple décrit pour montrer les principes de la préparation de la base de données. L'écran présente, à droite, deux prémisses avec trois ensembles flous, une prémisse avec deux ensembles flous, une conclusion ainsi que les ensembles de règles linguistiques à gauche. Cette base de connaissance floue peut être facilement transformée, par exemple, par la modification des nombres de prémisses, des ensembles flous, des conclusions et en conséquence, par l'ajustement des règles flous.


(a)	(b)

Fig. 3. Écran du logiciel Fuzzy-Flou avec les évaluations complètes de la note finale. (a) structure de la base de connaissance, (b) évaluation de briefing technique

Comme on peut voir dans la figure 3, l'évaluateur a utilisé pour son évaluation les notions floues. Il a donné respectivement les notes de 16 à 17 (intervalle) pour la qualité de la présentation, 14 ±2 (valeur approximative) pour le contenu technique et 16 −2+1 (aussi valeur approximative) pour réponses aux questions. La note finale est 15,9. La base de connaissance contient 18 règles floues.

Par exemple, la règle floue no 10 est comme suit :

Si Qualité de présentation est **bonne**

et Contenu technique est **bon**

et Réponses aux questions sont **excellentes**

alors la note finale est **15**.

Expression orale dans l'apprentissage des langues étrangères

L'application du système d'aide à la décision basé sur la logique floue paraît efficace aussi dans les domaines humanistes. Prises en compte la spécificité des sciences et la précision des résultats qu'elles exigent, l'évaluation des matières scientifiques pose peut-être moins de problèmes que dans le cas des élèves en littérature, histoire ou bien linguistique.

Le SAD pourrait ainsi constituer un instrument qui faciliterait le travail de l'enseignant en matières humanistes quant à la notation. Il paraît être particulièrement utile dans l'apprentissage des langues, entre autres

dans le perfectionnement de l'une des compétences langagières, notamment de l'expression orale. Durant le cours, mais aussi pendant l'examen qui est toujours à l'oral, le professeur exige que chacun des participants, en s'exprimant le plus correctement possible, prenne parole et donne son avis à propos d'un sujet proposé. Deux éléments sont donc pris en compte : le contenu du propos et la manière dont il est communiqué, c'est-à-dire la maîtrise de la langue étrangère au niveau de la grammaire (dans le sens large : morphologie, phonétique, syntaxe), de la richesse du vocabulaire, de la fluidité, du style, etc. Vu le caractère non calculable de cet exercice, la note ne dépend que de l'expérience du professeur et ne reflète pas toujours les compétences réelles de l'étudiant.

Le problème devient encore plus difficile lorsque le niveau des élèves est très varié. Le professeur de la langue française, par exemple, se pose des questions à savoir : qui sort vainqueur de la confrontation entre un étudiant qui est né en France ou qui y a vécu pendant des années et qui s'exprime avec une fluidité appréciable, mais ne maîtrise pas de règles de grammaire et un autre étudiant qui a appris le français à l'école et parle avec plus de difficultés, mais correctement en utilisant le vocabulaire bien riche et en se déplaçant consciemment entre les registres de langue ? Comment donc noter ces étudiants ? Le SAD pourrait venir en aide au professeur et donner en même temps l'information à l'étudiant quant à ses compétences acquises, mais aussi à propos de ses points faibles. L'enseignant peut, lui-même, préparer la base de données qui lui servira, par la suite, à évaluer chacun de ses étudiants.

À titre d'exemple, nous proposons de préparer quatre prémisses (qui prennent en compte aussi bien le contenu que la qualité de la langue) pour noter les étudiants du cours de l'expression orale : la première se référant à la fluidité de l'expression, la deuxième à la richesse du vocabulaire, la troisième à la structure et au contenu du propos et la dernière concernant la grammaire. Chacune des prémisses opère avec les notions linguistiques telles que « peu fluide, fluide », « pauvre, assez riche, très riche », « incohérent, assez logique, logique », « incorrect, correct », celles-ci peuvent être évidemment modifiées en fonction des besoins et de l'expérience du professeur avec le groupe.

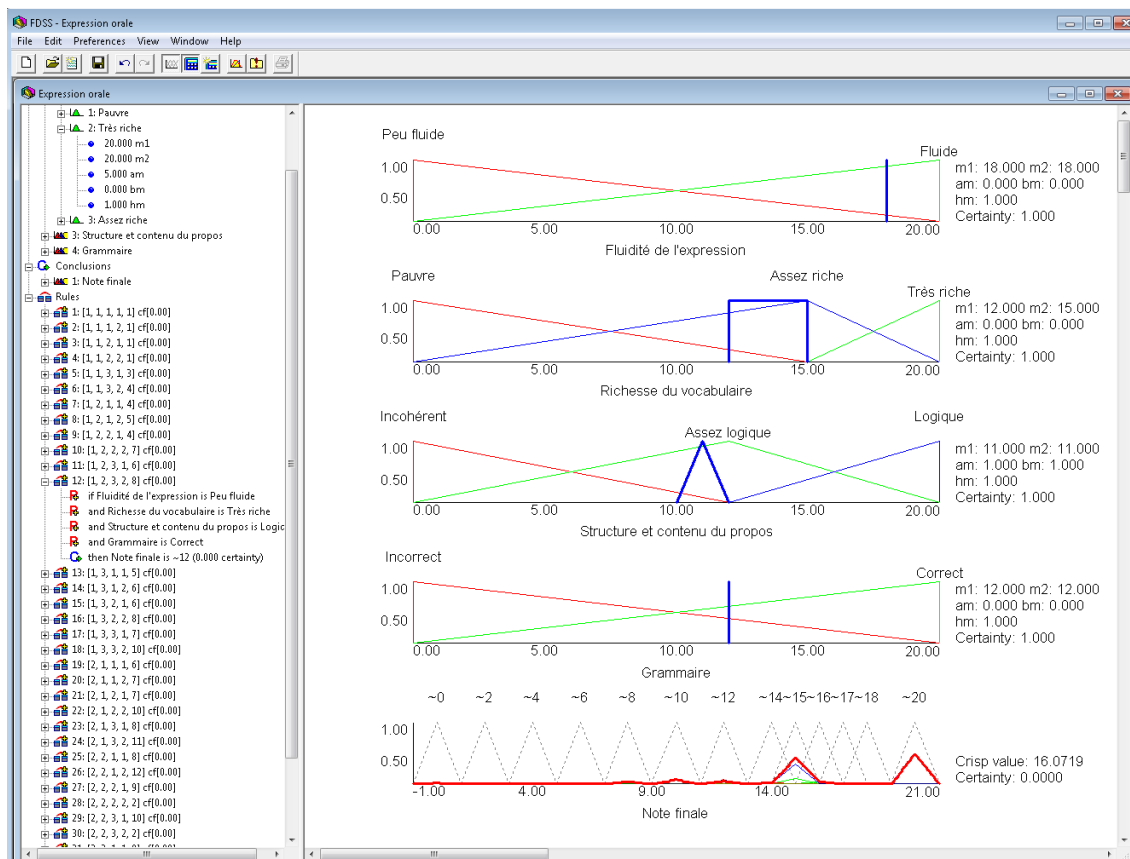
La figure 4 présente l'exemple d'un étudiant qui s'exprime de manière fluide (18), son vocabulaire est assez riche, mais répétitif (de 12 à 15), pourtant la structure du propos peu logique (11±1) et il fait des fautes de grammaire (12). Il recevra comme note finale 16,0719. Le SAD a permis de noter chaque compétence linguistique séparément et de bonifier celle dans laquelle l'élève excellait. Le résultat final calculé par le système reflète peut-être mieux l'état réel des compétences langagières de l'étudiant. L'avantage de cet instrument de notation a consisté aussi dans le fait que l'hésitation du professeur avait pu être exprimée de manière imprécise, par exemple de 9 à 11, ce qui n'a pas empêché que le calcul final soit précis.


Fig. 4. Écran du logiciel Fuzzy-Flou avec les évaluations complètes de la note finale. (a) structure de la base de connaissance, (b) évaluation de l'expression orale

Le processus d'évaluation devient de plus en plus facile parce que le professeur peut se concentrer seulement sur la notation des points précédemment définis et l'évaluation globale (la note finale) sera issue des réflexions antérieures comprises dans la base de données. On évite ainsi de se laisser influencer par les qualités autres que la valeur scientifique de la présentation.

Conclusions

L'utilisation du logiciel Fuzzy Flou pour noter les rapports techniques et les exposés oraux est simple et flexible. De plus, il permet, aux enseignants en cas d'hésitation, d'accorder des notes exactes, approximatives ou floues avant d'obtenir la note finale. Celle-ci est répétitive pour les mêmes entrées de notes et elle dépend de la base des connaissances utilisées. Afin de construire la base de connaissance, on peut se servir de l'analyse des notations des années précédentes ou bien utiliser l'expertise, l'intuition et les connaissances de plusieurs professeurs. Utilisé pour noter plusieurs groupes d'étudiants, le SAD permet d'homogénéiser les notations. L'utilisation du logiciel ne nécessite pas l'utilisation de calculs ainsi que d'autres notions mathématiques.

Abstract

Art education because of Visual Arts Education Program which is given in schools has an important place in our education system for discovering and developing the child's abilities and getting the child in community. This research which is descriptive nature, was done to investigate the views of Art Teachers Teaching Program in Visual Arts, which was placed into effect 2005 - 2006 academic year and now being implemented, achievements in teaching strategies and methods used for and to understand the practical implications of the program.

The state of this study is 71 primary schools selected from the Çanakkale at the academic year in 2009 – 2010 and 74 art teachers who are working in these schools. Quantitative research technique was used to investigate the views of art teachers for the strategies and methods which are used to in teaching in the Elementary Visual Arts Teaching Program' achievements. In order to obtain the data with the purposes of the study, a survey was applied to teachers who teach the visual arts in the primary schools. The data which was gathered from the survey forms and personal information, were analyzed using SPSS (Statistic Program for Social Sciences) package program. As a result, it may be said that strategies and methods which are used in teaching achievements, centered student, allow students to learn by doing and experiencing, make the student to active participants and are based on observation.

Key Words: Visual Arts Education Course Program, Art Teacher, Acquisition, Strategy, Methods

Introduction

Education aims to person discovers himself, aware of his potential and assess it the best way. Visual arts lessons undoubtedly have an important place at the beginning of the lessons which develop his skills, his creativity and critical thinking skills especially during primary educations term.

Visual arts education includes all training efforts which in order to create an aesthetic point of view, improve the ability of individuals to express their thoughts and feelings, and gain the ability to think critically and creatively. When we gain him all of these, he will be a person who useful to society, protective his values, respect others as well as himself produce solutions and undaunted challenges.

1. Problem Statement

Art education is necessary for educating person's creative power and potential, organizing the aesthetic thought and consciousness. Giving the sufficient value and importance, provisioning of hardware to this discipline which positively affects the efficiency of other courses, is necessary and important in education and training system. To be educators who equipped and aware of the seriousness and importance of his work is other necessary and an important point. It is impossible to grow people who are creative, have high self-confident, critical, able to look at problems with multi-faceted and give solutions, at peace with himself without art education.

In order to see its deserved importance of art education, how important and primarily the art, in artistic activities and creativity and it is in the place of human life must teach the society.

All educational activities, which are given in formal and informal education institutions, is carried out within the framework of a program prepared in advance. For this reason, the quality of education largely depends on the implemented program. To take the right decisions that will make the program more effective, depends on research bases of those decisions with scientific studies, and assessment of applications (Erden, 1998). Assessment which is the last step of the program development, is also important seeing the shortcomings of the program, to detect aspects of the program's shortcomings and help the new programs will be developed in this direction. One of the best person to assest the programs is the teachers who implement the program exactly with the students not the experts who prepare the program theoretically.

2. Purpose of the Research

The main purpose of this research is investigate the views of Art Teachers Teaching Program in Visual Arts, (GSDÖP) which was placed into effect 2005 - 2006 academic year and now being implemented, achievements in teaching strategies and methods used for and to understand the practical implications of the program and make recommendations in accordance with the data which were obtained.

3. Model of the Research

Scanning Model from the quantitative research methods is used in this research. Scanning models are approach to aim describing a situation which we still have or in the past the way that. This research aims the investigate the views of Art Teachers Teaching Program in Visual Arts, achievements in teaching strategies and methods used for a questionnaire developed by the researcher.

4. Research Field and Sampling

The population of this study is painting teachers who work in second stage of schools which were selected in center and districts of city Çanakkale in 2009 - 2010 academic years. Simple random sampling method was used for sample selection. In simple random sampling method, each unit, which is in universe, has the same probability to take place in sampling. There are 72 teachers in the universe of the research and all of them were included in the sampling.

5. Collection of Data

For the purposes of the research in order to obtain data, second levels of primary schools, a survey was conducted for teachers who teach the visual arts. This survey is prepared and administered by the researcher. İn the preparation of the survey, studies and literature in different fields were scanned, with the expert advice given its final form. The data which was gathered from the survey forms and personal information, were analyzed using SPSS (Statistic Program for Social Sciences) package program.

Table 2. Statistics on the options which are used in the calculation

	Options	Borders
1	Totally disagree	1.00–1.79

	Disagree	1.80–2.59
2	Disagree	1.80–2.59
3	Not Sure	2.60–3.39
4	Agree	3.40–4.19
5	Totally Agree	4.20–5.00

Results and Comments

This part of the research involves the findings which obtain from results of the implementation of the data collection instrument and interpretation of these findings.

Strategies which are used to achive attaintment of GSDP's by Art Teachers;

Education Strategy of Through Invention
Education Strategy of Through Presentation
Education Strategy of Through Research and Inquiry
Full-Learning Strategy
Other Strategy

Table 3. Views on Strategies Which Are Used to Achive Attaintment

	1		2		3		4		5	
	f	%	f	%	f	%	f	%	f	%
Education Strategy of Through Invention	5	6,90	45	62,50	20	27,8	2	2,80	--	--
Education Strategy of Through Presentation	36	50	8	11,10	20	27,80	4	5,60	4	5,60
Education Strategy of Through Research and Inquiry	28	38,90	15	20,80	28	38,90	1	1,40	---	---
Full-Learning Strategy	2	2,80	2	2,80	4	5,60	64	88,90	---	---
Other Strategy	---	---	2	2,80	3	4,20	---	---	67	93,10

As shown in Table 3, When we look the values of Education Strategy of through Invention in Strategies which are used to achive attaintment of GSDP's by Art Teachers, it is preferred at most second with 62.5%, at least in fourt with 2.8% by teachers. However, in fifth it is never preferred. When we look the values of Education Strategy of Through Presentation at most it is preferred first order with %50 after second order with %27.8 but at least it is preferred fourt and fifth with %5.6. When we look the values of Education Strategy of Through Research and Inquiry, it is preferred at most first and third in with %38.9 but at least it is preferred in fourt with %1.4. When we look the values of Full-Learning Strategy, it is preferred at most fourt with%88.9, but

at least it is preferred in first and second %2.8. When we look the values of Other Strategy, it is preferred at most third and fifth with %93.1, but at least it is never preferred in first and fourt.

Methods which are used to achive attaintment of GSDP's by Art Teachers;

Observation and Analysis Method

From Easy to Difficult Method

Demonstration Method

Working From Model Method

Educational Creative Drama Method

Education Through Art Method

Memory Method

Children's Art Methods

Project Method

Dramatic Method (Dramatization)

Musical Method

Copy Method

Analysis and Connection Method

Museum Education Method

Psychological Method

Table 4. Methods which are used to achive attaintment, to be Preferred Rates

Method Which is Used	Arithmetic Mean ( )
Observation and Analysis Method	12.74
From easy to Difficult Method	11.27
Demonstration Method	11.00
Working From Model Method	10.58
Educational Creative Drama Method	8.57
Education Through Art Method	8.51
Memory Method	8.14
Children's Art Methods	8.01
Project Method	7.22
Dramatic Method (Dramatization)	6.74
Musical Method	6.60
Copy Method	5.93
Analysis and Connection Method	5.50
Museum Education Method	4.71
Psychological Methods	4.55

As shown in Table 4, The first three methods which are used to achive attaintment of GSDP's by Art Teachers are Observation and Analysis Method(= 12.74), From easy to Difficult Method(= 11.27) and Demonstration Method (= 11.00).

At least the preferred methods which are used to achive attaintment by Art Teachers are Psychological Methods (= 4.55), Museum Education Method (= 4.71) and Analysis and Connection Method (= 5.50).

Conclusion

Strategies which are used to achive attaintment of GSDP's by Art Teachers are Education Strategy of Through Invention, Education Strategy of Through Presentation, Education Strategy of Through Research and Inquiry, Full-Learning Strategy, Other Strategy. Methods which are used are Observation and Analysis Method, From easy to Difficult Method, Demonstration Method, Working From Model Method, Educational Creative Drama Method, Education Through Art Method, Memory Method, Children's Art Methods, Project Method, Dramatic Method (Dramatization), Musical Method, Copy Method, Analysis and Connection Method, Museum Education Method, Psychological Method. When we look strategies which are used to achive attaintment of GSDP's by Art Teachers, from the most prefered to the least prefered, Education Strategy of through Presentation which is provided a significant learning, requires an intense interaction between teacher and student, education is advanced step by step, is preferred first with %50, Education Strategy of Through Invention is preferred second with %62.5, Education Strategy of Through Research and Inquiry which is the student becomes aware of the problem, established hypothesis for the solution, collected datas to test hypotheses and reached conclusion by evaluation with it, is preferred third with %38,9, Full-Learning Strategy is preferred fourt with %88.9, Other Strategy is preferred the last with %93.1.

When we look methods which are used to achive attaintment of GSDP's by Art Teachers, with order, Observation and Analysis Method is preferred first, from easy to Difficult Method is preferred second and Demonstration Method is preferred thirt. At least the preferred methods which are used to achive attaintment by Art Teachers are Psychological Methods is prefered in fifteenth is realy regrettable for art education.

Suggestion

Methods which are used to achive attaintment of GSDP's by Art Teachers, serve the purpose. But the important thing is to draw up efficiency to maximize. In Human life, childhood is a period which is imagination is dominated life and the most free in. In parallel to this, people make the best theater acting in their childhood in their lives. Every child is an excellent theater player. There is no role which he can do once after seeing an instance of a role. When person grows, he begins to narrow his limitation. Before these limitations don't start, taken advantage of this feature during the children's education, should be lived, empathized, understood events and facts and portrayed. In children's life, Drama, is an important transfer the game to educational life with in a controlled way. Students' creativity is important to use this method as well as their knowledge. Drama should mainly use for the emergence of intense creativity in the visual arts course and students produce original work.

Students, who represent the future, whose the most important ties with the past is historical artifacts, so museums. The students can learn themselves and other nations culture and art in history courses, just with books but they cannot internalize. Museum education is a method that especially should be used mainly in the visual arts lessons. Creativity is maximize in free environments. In the museums which occurrence of nested with works of art are advanced students' aesthetic capabilities, skills in perception and attention and their creativities are maximize so that must be ensured persons can lived Art culture, grasp the culture of art is a universal language. On the basis of these, museum education which is not given enough attention or not provided enough facility, should be given required importance and frequently used as a technique.

ASSESSING ELEARNING TEACHING QUALITY OF FACULTY MEMBERS IN TEACHERS' COLLEGE AT KING SAUD UNIVERSITY: STUDENTS PERSPECTIVES

Hisham Barakat Hussein

Associate Professor of Mathematics Education, curriculum and instructions dept., Teachers' College, King Saud University, Riyadh 11491, Saudi Arabia. hbisher@hotmail.com

Abstract

This paper examines students' perspectives about assessing Elearning teaching quality for faculty members in teachers' college at King Saud University. The sample of the study includes all enrolled students in Teachers' College during the academic year of 2009-2010, which they were (2282) students. Two questions are stated to be answered: (a) what are the perspectives of students about assessing Elearning teaching quality for faculty members in science, literary and educational departments in the Teachers' College? (b) What are the perspectives of students about assessing Elearning teaching quality for faculty members within each department?. Participants were asked to complete a 5-point Likert scale questionnaire. The results revealed that Educational department has had the highest mean score (3.92), followed by Literary (3.91) and Science (3.79) Departments, respectively. Further, results reveal that within each department, Curriculum and Instructions has had the highest mean with (4.01) in Educational departments; Islamic Studies had the highest mean with (4.09) in literary departments; and Science Department had the highest mean with (4.08) in all scientific departments. Finally, students thought the Elearning Teaching quality of their faculty members in teachers' college at King Saud University was satisfied.

Keywords: Elearning Teaching Quality; Performance of Teaching; and Quality Assessment.

Introduction

The rapid development in all higher education institutions made the Elearning Teaching quality has been recently stressed. Assessing and measuring the efficiency and effectiveness of teaching performance is an ongoing process, so it is a crucial issue in higher education. Assessing performance helps faculty members think about what results and skills that they want their students to acquire. It also validates expectations of learning outcomes and maps such outcomes with the institution's vision, mission, and objectives. Moreover, assessment supports continence communication, feedback, and dialogue about performance of teaching.

Using Educational technology became a core and critical issue in education, In line with the fast advance seen in technology, the use of technological resources in education has come to play an important role in terms of drawing students' attention to the subjects studied in the classroom so that success increases and the knowledge is better internalized. (Can, Sendil, 2010, p46). In addition, using Elearning became a developmental step, Sammour, G.N. (2009) identified Elearning as a strategic resource that can be utilized as an increasing variety of venues such as homes, workplaces, and traditional institutions of learning, education, and training. Elearning systems are becoming technologically sophisticated and complicated, with regard to training management or course management. Their use does not always match well with traditional modes of teaching and learning and much care needs to be taken when considering the use of Elearning in educational institutions. (Sammour, G.N, 2009, p1). Elearning require policies balancing different expectations of participants and considering how the users perceive ethics during online learning. As in the case of face-to-face classes; learners must show respect and tolerance among each other, and conduct civil relations and interaction based on pre-determined rules. (Toprak, Elif ; Ozkanal, Berrin ; Aydin, Sinan, 2010, p78).

Traditionally, the role of students in the learning process is undeniably passive, a situation that leads them to accept knowledge and information provided to them by their respective instructors. Students have thus a limited

set of opportunities to express their ideas and opinions about their learning. As a result, students assessment of teaching (SAT) in higher education became a necessary tool to improve learning and teaching (Bie & Meng 2009). Although students assessment of teaching (SAT) are not generally accepted as being reliable, nor provide meaningful information (Pan, Tan, Ragupathi, Booluck, Roop, & Ip 2009), numerous work has been done on investigating STUDENTS ASSESSMENT OF TEACHING (SAT)in higher education (Seldin 1993; Marsh & Dunkin 1997; Kember & Wong 2000; Brown 2008; Kang 2008; El Hassan 2009; Kember & Leung 2009; & Pan et. al. 2009). That is because measuring the efficiency and effectiveness of teaching plays a vital role in higher education institutions (Chen & Hoshower 2003, Smith 2009).

The Importance of students assessment of teaching (SAT) revealed from many studies as McKeachie (1997), Wachtel (1998), Spencer and Schmelkin (2002), and Stark-Wroblewski, Ahlering, & Brill (2007) assert that research studies have shown that students are best placed to assess various aspects of teaching quality, where their ratings are relatively valid, multidimensional and quite reliable. To achieve that, Kember and Leung (2009) concluded that instruments for assessing the teaching and learning are comparatively inadequate. Therefore, Feldman (1997) believes that instruments of assessing teaching should be multidimensional because teaching and instruction in higher education consist of various components. Designing multidimensional and comprehensive instruments for assessing teaching provides valuable feedback to instructors about their teaching quality (e.g. strengths and weaknesses); help students select courses; facilitate making personnel and administrative decisions (e.g. hiring, contract, renewal, promotion, awards, and tenure) (Marsh & Dunkin 1997; Wachtel 1998; Kember & Wong 2000; Stark-Wroblewski et. al. 2007; Brown 2008; Kang 2008; Bie & Meng 2009; Smith 2009). Moreover, it is crucial for faculty members to understand how to use such feedback so as to address their students' concerns and needs (Pan et. al. 2009).

In the other hand, Olivares (2003, p.240) states that 'there is no empirical evidence to suggest that the widespread implementation of teacher ratings has resulted in more effective teachers or more learned students'. Seldin (1993), Olivares (2003), Kang (2008), Remedios & Lieberman (2008), and Pan et. al. (2009) explains that in spite of the extensive use of SAT, validity, fairness, and accuracy of the measures are not well accepted as being valid, reliable, and subjective because such assessment materials are biased and can be affected by external factors (Olivares 2001; Griffin 2004; & Stark-Wroblewski et. al. 2007), and may ultimately produce results that might be misinterpreted and thus misused (Theall & Franklin 2001).

Any way, if we agree or not about if the students are qualified or not to assessing their teachers teaching quality, at least we could use students assessing as indicator in faculty member assessment. Assessment of teaching effectiveness of faculty members in higher education, as Campbell & Bozeman (2008, p.13) assert, 'is one of the most daunting and arduous tasks confronting administrators, particularly department chairs and deans'. Furthermore, Theall and Franklin (2001, p.45) affirm that 'few issues in higher education are as sensitive, divisive, and political as faculty evaluation and in particular the quality and value of the information provided by students in their evaluations'. Generally, assessments of teaching include instructional skills, delivering and facilitating instructions, evaluating student learning, satisfactions and attitudes toward courses, students' needs, instructor's knowledge, organization and preparation, communication and interaction skills, stimulation, and fairness in grading (D'Appollonia & Abrami 1997; Kang 2008; Bie and Meng 2009; Smith 2009).

Campbell and Bozeman (2008) explains assessments of teaching effectiveness as influenced by students' perspectives and attitudes. students assessment of teaching (SAT) provides students with great opportunities to voice their concerns regarding their education (Bie & Meng 2009). Spencer and Schmelkin (2002) and Greimel-Fuhrmann and Geyer (2003) have found that subjects of their study subjects think that they are qualified to rate their instructors, and that the assessing of the teaching process is important in improving teaching methods. Similarly, in their study on Florida Community College, Campbell and Bozeman (2008) have noticed that the majority of students strongly believe that their assessment has a positive and valuable role, and has thus been considered vitally important. Also, They recommend that students should participate in completing assessment forms to assess their instructors and that the respective instructors should, thereafter, be informed about the results of students' assessment.

Hussein, Hisham (2011) aims to identify the Attitudes of faculty members at Saudi Universities towards using E-learning Management System, The results showed a positive Attitudes of the members of the faculty at Saudi University towards E-learning management system JUSUR. the results showed how their needs for training in using the system and in particular learning content management and file sharing, forums, and Questions Bank. Moreover, results showed no difference in attitudes towards using the system among the faculty members regarding gender or the types of colleges humanitarian, scientific and health.

Guler, Cetin ; Altun, Arif (2010) aims to identify problems and issues teacher trainees experience when designing Learning Objects (LO). The findings indicated that teacher trainees experienced content development related issues (such as, understanding LO paradigm, development software and environments, content packaging and repository) the most. In addition, project management and copyright related issues were emerged, as well. As Becker (2000) puts it well, teachers' beliefs and philosophies affect their use of resources. Therefore, starting the process with prospective teachers and integrating LO design as part of their training curricula, where these issues and problems addressed, would be beneficial in the long term.

Eskil, Murat; Ozgan, Habib ; Balkar, Betuel (2010). Explore the opinions of 9-13 year old students' perspective regarding the interaction with classroom technology (CT) in Science and Technology (S&T) lessons in Kilis city of Turkey. The issues discussed here can provide some ideas for educators to improve their teaching. Two types of students are used from private schools: from schools with high levels of teaching resources (HLTR), and from schools with low levels of teaching resources (LLTR). The students are surveyed in five general areas related to CT. The population of the study is 263 students (4. and 5 class) which belongs to four different primary schools in Kilis city. Subjects (participants) were chosen through random sampling. "Personal Data Form" and "Survey About Students' Opinions on Using CT in S&T Lessons" which were improved by the researchers were used as data collection tools. From this research, Some differences have been found in students' point of view on which it leads support on learning, drawing attention, increasing the research opportunities and the effects of computers on learning according to the school types by using CT in S&T lessons.

Isman, Aytekin; Celikli, Guelsuen Ersoy (2009) aims to find out the self-efficacy level among participant students and analyze their beliefs. This study showed that male students are more confident comparing to female student. Teo, Timothy (2009) Examines the relationship between computer self-efficacy and intended uses of technology of student teachers (N = 1094) at a teacher training institute in Singapore. Results showed that significant relationships exist among Basic Teaching Skills, Technology for Pedagogy, Traditional Use of Technology, and Constructivist Use of Technology. However, Advanced Teaching Skills did not influence Traditional Use of Technology and Constructivist Use of Technology in a significant way. Overall, the results of this study offer some evidence that student teachers' self-efficacy is a significant influence on whether they use technology in a traditionalist or constructivist way.

The Study:

The current study addresses the two major research questions: (1) What are students' perspectives about assessing Elearning quality teaching for faculty members in Teachers' College, including: (a) Science departments, (b) Literary departments, (c) Educational departments? (2) What are perspectives of students about assessing Elearning quality teaching for faculty members among departments within each field in Teachers' College?

In addition, the main purpose of this study is to investigate students' assessment about the Elearning Teaching quality for faculty members in all of the departments in teachers' college at King Saud University (KSU), during the academic year of 2009–2010. The significance of this study stems from the fact that it becomes necessary for each single higher education institution; TCs are no exception, to improve the status quo of its faculty member, develop and expand its curriculum and study plans. This study, to the knowledge of the researchers, is the first in its kind to evaluate the Elearning Teaching quality of the faculty members in (TC).

Descriptive research design was used to obtain thorough information concerning the status quo about the Elearning Teaching quality of faculty members. Sample of the study was (2282) students during the academic year of 2009–2010. Participants were asked to complete a five-point Likert scale questionnaire (Strongly Agree=5, Agree=4, Agree to some Extend=3, Disagree=2, and Strongly Disagree=1).

The questionnaire was adopted from many instruments that examines the students attitudes, perceptions and perspectives, as Al-Karni et al. (2006), Hussein (2011) Construct validity and content validity of the questionnaire was ensured. It was sent to five expert professors who specialized in measurement and evaluation for revision and feedback. Various items of the questionnaire have been modified based on received feedback provided by the expert professors. In its final format, the modified questionnaire compromises 29 items. The researchers verified the reliability coefficient of the questionnaire by conducting pilot study. The sample of the pilot study consisted of (50) students. Cronbach's alpha was (0.94), which is considered to by very high, indicating that the questionnaire is reliable (Harris, 1998).

To successfully achieve the goals of this study, the researchers grouped all departments into three major domains: Scientific, Literary and Educational departments. The number of all courses and classes related to each department during the academic year of 2009 – 2010 were calculated to obtain appropriate results that are expected to reflect students' perspectives about faculty members' Elearning Teaching Quality.

The students were asked to electronically complete a separate evaluation form for each course that they were registered in at the end of semester anonymously. Since two probe statements were used in the questionnaire, any wrong response to either of them, the whole evaluation form was eliminated from the final analysis. The valid calculated and analyzed evaluation forms were (20538) forms of (2282) students for the academic year of 2009 – 2010, which that mean each students complete (9) form to evaluate (9) courses. Statistical treatments were conducted to extract results.

Results and Discussions

Findings about students' perspectives of assessing Elearning quality of teaching for faculty members in Teachers' College at KSU are being displayed in the following tables. In addition, percentile rank of faculty members in each single department compared to the rest of the departments is also shown. For instance, a percentile rank of (75) indicates that performance of the department is higher than (75%) of other departments in both college levels.

The first question of this study addresses to perspectives of students about assessing Elearning quality teaching for faculty members in Teachers' College, including three main domains: Scientific departments, literary departments, and Educational departments. As shown in Table 3, even though differences in mean scores are minor, Educational departments have collectively achieved the highest mean score of (3.92) at the college level. Such a result indicates that students highly assessed faculty members belonging to Educational departments, which surpassed those belonging to Scientific and Literary departments. Moreover, it was noticed from students' grades during the academic year of 2009 – 2010 that there was direct proportion between students' high grades and their high ratings to their instructors in courses presented by Educational departments. In contrast, it is also noticed that the lowest mean and percentile rank were for scientific departments, in which students' grades in courses presented by scientific departments are relatively low.

The second question of the study is related to perspectives of students about assessing Elearning quality teaching for faculty members among departments within each domain in Teachers' College. Results in Table 4 show that the Science department achieved the highest mean score of (4.08) and its percentile rank among the other Scientific departments was (62.5%) at the college level. It was also noticed that students' ratings of Elearning Teaching quality in Science department surpassed their ratings in both Computer Science and Math departments. It was observed from students' grades during the academic year of 2009 – 2010 that there is a direct proportion between students' low grades and their low ratings to their instructors in courses presented by both Computer Science and Math departments, with a slight difference in favor of Computer Science department.

Islamic Studies department achieved the highest mean score of (4.09) and its percentile ranks at college level was (82.85%) among the other Literary departments, and was (92.14%) . There was a direct proportion between students' high grades and their high ratings to their instructors in courses presented by Islamic Studies department. Even though students' rating for their instructors in Arabic Language department was good (3.74), its percentile ranks at college level was very low (21.42%) among the other Literary departments.

In addition, Results showed that the Instructional Technology department achieved the highest mean score of (4.03) and its percentile ranks at college level was (85.71%) among the other Educational departments. Based on students' grades, there was a direct proportion between students' high grades and their high ratings to their instructors in courses presented by Instructional Technology departments. High mean score attained by Instructional Technology department might due to the nature of its courses, which make the students interesting for students as they are technology-based and have many relevant applications to their daily life. In contrast, mean score of Physical Education department was (3.81), where it was ranked as (35.71%) higher than other departments at college level. and (63.35%) .

In general, the overall results of the study raise several questions concerning the objectivity and integrity of students' assessment of teaching. Doubt of students assessment of teaching (sat)is affirmed by the fact that students assessment of teaching (sat)is directly proportional to students' grades in courses they study in each department. further, external factors might increase the lack of validity and reliability of sat. such factors include renewal of the non-Saudi faculty members' contracts, relationships with students, and faculty members' personality. therefore, students assessment of teaching (sat)should not be considered the main criterion for rating the quality of teaching in teachers' college as well as developing teaching and learning processed at KSU. results of this study are consisted with other studies, including Seldin (1993), olivares (2001), olivares (2003), griffin (2004), stark-wroblewski et. al. (2007), kang (2008), Remedios & lieberman (2008), and pan et. al. (2009). these studies conclude that although the students assessment of teaching (sat)was extensively used in higher education institutions, its validity and accuracy as measures of teaching are not fully accepted due to its biases and being influenced by external factors.

In addition, Results of Students Assessment of Teaching might be misinterpreted and misused as Theall & Franklin (2001) stated. Kang (2008) summarizes the most common problems regarding Students Assessment of Teaching (SAT): (1) issues related to the development of instrument quality and its functions; (2) misleading of applied raw scores and its averages, which might lead to inconsistent statistical analyses; and (3) adopting class-average scores, which neglects variability within classes and ignores the peculiarity of students' assessment.

Conclusion:

The Researchers of this study reach a conclusion that students are neither sufficiently qualified nor objective to tackle the task of assessing faculty members. Students lack the ability to rate their instructors' subject knowledge or Elearning quality. Therefore, students usually tend to highly evaluate instructors who give higher grades. An important recommendation of the research is that students assessment of teaching (SAT)should not be considered as a the main criterion for judging the Elearning Teaching quality. Rather, it can be one of the crucial indicators for assessing teaching.

[a]Professor, Department of Early Childhood Special Education, Woosuk University, South Korea

[b]Professor, Department of Psychology, Woosuk University, South Korea

[c]Professor, Department of Nursing, Woosuk University, South Korea

Abstract

The aim of this study was to explore overall developmental status of young children from multicultural families. 290 kindergarten children were involved (147 from multicultural families and 143 from typical Korean families). The result indicated significantly lower levels of performance on overall development of children from multicultural families than children from typical Korean families. It also suggested that delayed language development of children from multicultural families negatively affected their cognitive development, which then influenced higher aggression indirectly through their low self-respect and low self-control. These findings indicated latent atypical development of children from multicultural families.

Keywords: Atypical development; Children; Multicultural families; Rural areas

1. Introduction

During the last decades, Korea has become a multicultural and multi-ethnic society (Hwang, Kim, Lee, Choi, & Lee, 2007; Koo, Park, & Choi, 2009). This can be observed in both urban and rural areas. However, there is a big difference between the two regions: In urban areas, usually a majority of immigrant men have come to find job opportunities, whereas in rural areas, many women have immigrated to marry Korean men (Lee, 2005; Oh, 2007; Yoon, 2005). Moreover, although the absolute number of multicultural families in cities is larger than in rural areas, the social, economic, and psychological influence of multicultural families is greater in rural areas because they form a higher percentage of the population (Koo, 2007). In terms of immigrant women's influx, in 1995, the number of immigrant women was 619 and most were Korean-Chinese (Korean National Statistics Office, 2005). However, according to the Ministry of Justice of the Republic of Korea, by 2011 this had increased to 189,900 from various countries in South East Asia, South America, and the former Soviet Union. This dramatic increase was also reflected in the marriage ratios, that is, 33.9% of all marriage cases in rural areas were interracial marriages in 2010 (Korean National Statistics Office, 2011).

Despite the high ratio of international marriage in rural areas, many young males in those areas appear not yet prepared to adjust to this change. Several studies on this issue have demonstrated that rather than understanding and accepting multicultural families, numerous young males in rural areas just tolerate them as an unavoidable given fact and display depressive emotions on intermarriage (Chu, 2006; Eom, 2008). Additionally, they report their feelings of insecurity about the increasing new cultures and colored races in their environment (Yang & Chung, 2006).

In accordance with this perspective on intermarriage, a considerable number of immigrant women may be at risk. Regarding this, Lee (2005) and Yoon (2003) reported serious problems with intermarriage in rural areas. First, there is a big age gap, averaging between 15 and 17 years in married couples. In some cases, the gap is more than 20 years. Second, without knowing the groom, the women move to Korea and get married through private agencies. More seriously, in this case, most immigrant women do not have enough linguistic ability to

communicate with their husbands in Korean. Third, a high prevalence of economic deprivation has occurred in rural areas and the disadvantaged environment from poverty has negatively affected these women's marriages.

The foremost problem for multicultural families in rural areas in South Korea, however, is related to their children. According to the Ministry of Education, Science and Technology (2008), 1 in 10 children from multicultural families in rural areas leaves primary school. Up to 87% of adolescents give up attending secondary school. Even children in primary schools show a very low level of academic achievement. Moreover, 37% of children from multicultural families have been bullied due to their maladjusted behavior. Related to their social maladjustment, there is other evidence that children in multicultural families easily get involved with school violence and delinquency (Ahn, 2007; Lee, 2007; Oh, 2007). Koo (2009) and Chung and Chung (2010) also showed that the aggressive behavior of children from multicultural families is often reported not only by school teachers but also by kindergarten teachers. Teachers explain that the aggressive behavior is different from that of children from typical Korean families.

To alleviate various problems in multicultural families, the Korean government has implemented several policies and supporting programs. For immigrant mothers, Korean language learning and culture classes were established (Chung, 2008). In addition, for children, after-school programs for coping with schoolwork were provided and mentoring services by school counsellors were established (Hwang, 2008; Jun, Pae, & Kwak, 2008). Nevertheless, there were no significant and positive outcomes (Koo, 2009). For instance, North Jeolla Province, which has the highest number of immigrant women and their children as a percentage of the population, reported that the problems were becoming even worse (Jeonbuk Development Institutes, 2010). These results demonstrate that more effective intervention systems are required based on in-depth understanding of the latent problems.

Therefore, there is a need to figure out the reasons for the non-remarkable results of governmental projects, and to analyze the requirement of immigrant women and their children, as well as to explore when children's problems started and why.

2. Method

To discover fundamental reasons for the maladjustment of young children from multicultural families, a quantitative study was conducted.

2.1. Participants

Initially, 350 kindergarten children were selected in North Jeolla province, South Korea. However, 43 parents did not give permission for this study and 17 children could not be involved in all the tests. The final number of participants was 290: 147 children from multicultural families (75 boys and 72 girls) and 143 children (73 boys and 70 girls) from typical Korean families.

2.2. Measures

2.2.1. Language development test

For measuring language development for children from multicultural families, Joo's (1982) revised version of Peabody Language Development Kits (Blank, Rose, & Berlin, 1978; Dunn, Horton, & Smith, 1981) was used. Joo's (1982) original kits consisted of 80 items in four sub-factors (perceptive, analytic, synthetic, and reasoning skills). Through a pilot study with children from multicultural families, 48 of 80 items were selected across four sub-factors. Cronbach's alphas ranged from .96 to .97.

2.2.2. Cognitive development test

To examine early cognitive development, an intelligence test, Kaufman Assessment Battery for Children (K-ABC) was used. The test was standardized in 1997 by Moon and Byon in Korea. K-ABC differs from most traditional intelligence tests because it has reduced emphasis on verbal abilities and has a significant advance toward non-discriminatory assessment of minority children from multicultural backgrounds (Kaufman & Kaufman, 1983). The test is divided into two domains called mental processing scales and achievement scales. More specifically, mental processing scales contain simultaneous processing, which is related to congenital cognitive development, and sequential processing, which is more involved in acquired cognitive development. However, for mental processing, the two sub-tests are considered as inborn mental abilities. In contrast, achievement scales are strongly related to acquired learning of children.

2.2.3. Social and emotional development test

To investigate the social-emotional development of the children, test scales on self-respect, self-control, and aggressive behavior were used. The self-respect test was the Pictorial Scale Perceived Competence and Social Acceptance (Harter & Pike, 1984). Based on a pilot study, 17 of 24 original items were included and Cronbach's alphas ranged from .84 to .96. Next, the self-control test was a revised version of Eisenberg et al.'s (1996) Self-Control Ability Test by Ahn (1998) in Korea. After a pilot study, it contained eight items with pictures and reported Cronbach's alphas ranging from .81 to .98. Third, aggressive behavior was measured using the developed test (Koo, 2007) based on the Behavior Check List (Achenback & Edelbrock, 1983), the Korean version of Child Behavior Checklist (Moon, Oh, Ha, & Park, 1999), and the Toddler Behavior Checklist (Lazelere, Ambersun, & Martin, 1989). Based on a pilot study, 14 items were used and Cronbach's alphas ranged from .93 to .95.

2.3. Data analysis

For data analysis, first an independent samples t-test was conducted to compare total and subscale scores of language and social-emotional development between children from multicultural families and those from typical Korean families. To explore cognitive development of children from multicultural families, their distributions of intelligence test scores were analyzed against those of children from typical Korean families. Furthermore, to understand cognitive characteristics of children from multicultural families, sub-factors of the intelligence test were compared separately. Finally, to investigate potential causal relationships among developmental domains, structural equation modeling analysis was conducted.

3. Results

3.1. Understanding in language development for children from multicultural families

Regarding language development, the results showed that children from multicultural families had significantly lower levels of language development over the sub-factors (see Table 1): perceptive (t=-4.65, p<.001; M=2.11, SD=.75 < M=2.45, SD=.47); analytic (t=-2.30, p<.05; M=2.16, SD=.64 < M=2.31, SD=.40); synthetic (t=-9.27, p<.001; M=1.64, SD=.73 < M=2.29, SD=.43); and reasoning skills (t=-8.15, p<.001; M=1,69, SD=.74 < M=2.28, SD=.44) when compared with those in typical Korean families. The delay in language development during early childhood is considered an independent impediment. Moreover, it also can be identified as a continuing negative factor over a person's lifetime on cognition and social-emotional development. This demonstrates that language development is a crucial part of general developmental process.

Table.1 Comparison of language and social-emotional development between the two groups

	Children from multicultural families (n=147)	Children from typical Korean families (n=143)	t
	M(SD)	M(SD)

Self-control	2.61(.57)	2.89(.64)	-3.89***
Aggressive behavior	2.70(.54)	1.82(.69)	11.99***

*$p < .05$, ***$p < .001$

3.2. Understanding in social and emotional development for children from multicultural families

To understand social-emotional development in children from multicultural families, the levels of self-respect, self-control, and aggressive behavior were measured, compared with those of children from typical Korean families. As can be shown in Table 1, children from multicultural families showed lower levels of self-respect (t=-4.08, p<.001; M=3.02, SD=.53 < M=3.27, SD=.48) and self-control (t=-3.89, p<.001; M=2.61, SD=.57 < M=2.89, SD=.64), whereas their aggressive behavior (t=11.99, p<.001; M=2.70, SD=.54 > M=1.82, SD=.69) was much higher than that of children from typical Korean families.

3.3. Understanding in cognitive development for children from multicultural families

To analyze cognitive development of children from multicultural families, the distributions of their K-ABC intelligence test scores were compared with those of children from typical Korean families. As can be seen from Fig. 1(a), the overall distribution of children from multicultural families in mental processing scales was similar to the normal distribution of the comparative group. However, in a more detailed analysis, there were differences in some specific intervals.

As the line chart of Fig. 1(a) shows, the percentage of children from multicultural families in the mean interval ranging from 90 to 109 was much lower than that of the children from typical Korean families. Moreover, in the borderline interval ranging from 80 to 89, which indicates cognitive developmental delay, the

result showed a significant percentage difference between the two groups. Only 15.9% of children from typical Korean families were distributed in this borderline interval, whereas 25.2% of children of multicultural families appeared in the same interval. Although there were more children from multicultural families in the borderline interval on mental processing scales, the line chart indicated a normal distribution.
Fig. 1. (a) Comparison of mental processing scales
Fig. 1. (b) Comparison of achievement scales

However, a significant difference appeared on the achievement scales in the overall distribution as well as in specific intervals presented in the line chart in Fig. 1(b). The highest number of children from multicultural families in the achievement scales appeared in the borderline interval ranging from 80 to 89, which indicates cognitive developmental delay, with a positively skewed curve. In contrast, the largest number of children from typical Korean families appeared in the interval ranging from 90 to 109 with a normal distribution.

To reveal a clear view on cognitive development of children from multicultural families, the obtained scores of mental processing scales were separately compared because the sub-factors emphasize different aspects of cognition, such as congenital and acquired function. Thus, the result of simultaneous processing was compared to that of sequential processing. Each obtained score of simultaneous and sequential processing was also compared to that of achievement scales. In addition, the total score of mental processing scales (simultaneous and sequential processing) was compared to that of achievement scales.

As can be seen in Table 2, children from multicultural families achieved significantly lower scores in sequential processing (t=-5.14, p<.001; M=96.43, SD=17.89 < M=104.21, SD=15.93) as well as in achievement scales (t=6.19, p<.001; M=95.53, SD=15.81 < M=104.21, SD=15.93) when compared to simultaneous processing. They also achieved a significantly lower mark in the degree of achievement (t=4.10, p<.001; M=95.53, SD=15.81 < M=100.78, SD=16.30) compared to the total score of mental processing scales.

Table 2. Comparison between cognitive sub-factors for children from multicultural families

Cognitive	Children from multicultural families (n=147)		t
(comparison between sub-factors)	M(SD)	M(SD)	
Sequential vs. Simultaneous	96.43(17.89)	104.21(15.93)	-5.14***
Sequential vs. Achievement	96.43(17.89)	95.53(15.81)	.69
Simultaneous vs. Achievement	104.21(15.93)	95.53(15.81)	6.19***
Mental processing vs. Achievement	100.78(16.30)	95.53(15.81)	4.10***

***$p < .001$

According to the results, it can be assumed that fluid intelligence, which is strongly related to biological factors, does not explain children's cognitive developmental delay. However, achievement, which is more involved in crystallized intelligence, naturally receiving input from the surrounding environment, could be the reason for the delay in cognitive development.

3.4. Structural equation modeling for developmental pathways of children from multicultural families

To understand potential developmental pathways of children from multicultural families, structural equation modeling was analyzed with model fitness indexes. Model fit indicators were RMSEA=0.07, TLI =.91, and CFI= .93, which could imply goodness-of-fit indexes.

Moreover, in the structural equation modeling, standardized β coefficients were tested in the relationship of causal effect between independent and dependent variables for children from multicultural families. As shown in Table 3, language development affected cognitive development (β=8.76, t=5.08, p<001) and also impacted self-respect (β=0.17, t=3.02, p<.01). Moreover, cognitive development had an effect on self-control (β=0.03, t=5.23, p<.001). Through these connected relationships among developmental domains, finally, the extent of self-control (β=-0.51 t=-3.77, p<.001) and self-respect (β=-0.50, t=-2.77, p<.01) influenced aggressive behavior.

The results of indirect and direct causal effects among developmental domains showed that the developmental delays of children from multicultural families in Korean rural areas were articulated with each other (see Fig. 2). The problems usually start with language developmental delay, and this affects the children's cognitive development as well as their self-respect. Cognitive developmental delay also affects the children's self-control. Eventually, failure in self-control and self-respect brings on aggressive behavior. Therefore, any kind of developmental delay may negatively affect other developmental aspects.

Table 3. Hypothesis test with structural equation modeling for children from multicultural families

Independent Variable	Dependent Variable	Standardized β	t
Cognitive	Self-control	0.03	5.23***
Language	Cognitive	8.76	5.08***
Language	Self-respect	0.17	3.02**
Self-control	Aggressive behavior	-0.51	-3.77***
Self-respect	Aggressive behavior	-0.50	-2.77**

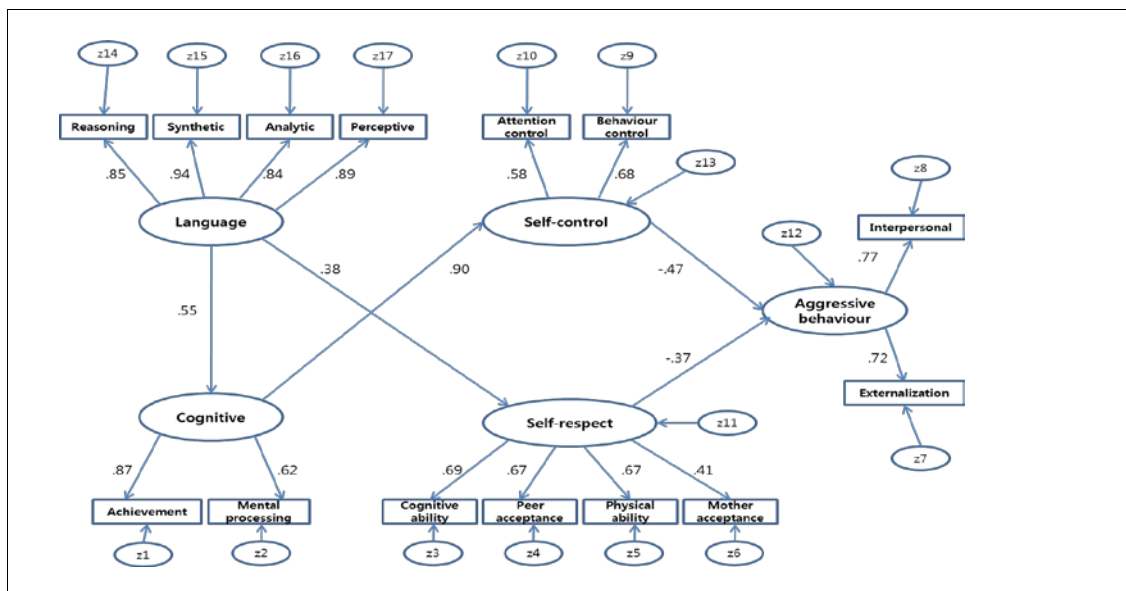
$**p < .01, ***p < .001$


Fig. 2. Structural equation modeling for developmental pathways of children with multicultural families in rural areas

4. Discussion and Conclusion

This study has provided an account of and the reasons for the developmental delay and its potential pathways in children from multicultural families. It is a broadly recognized fact that the early days of life are easily and directly influenced by factors like social, cultural, and family environment, the relationship between parents, parents' social and financial circumstances, and caring attitude of parents (Chung, 2003; Duncan & Brooks-Gunn, 2000; Koo, 2007; McLoyd, 1998). Hence, any problems caused by those factors will seriously affect normal development of young children. More specifically, the problematic behavior of young children from multicultural families found in this study may start from deprivation in their home environment. The negative influential factors from their home environment affect these children's early language, cognition, and social-emotional development. Accordingly, an infant who experiences a negative environment is highly prone to show either atypical development or developmental delay, which also has a negative impact on future growth processes (Koo, 2009; Koreman, Miller, & Sjaastad, 1995). Thus, it can be concluded that the problematic behavior of adolescents from multicultural families is not a temporary issue.

Considering this critical impact of environment on early childhood development, the mother has an important and large role in stimulating her child in the early days (Cho, 2011; Haden, Reese, & Fivush, 1996; Raikes et al., 2006). For the same reason, the conflicts of interracial couples may negatively affect their children's development. Relevant previous research has also emphasized that a lack of caring and stimuli at the beginning of children's lives has a negative effect on their development over the lifetime (Brooks-Gunn, Klebanov, & Liaw, 1995). Furthermore, in most cases, interracial couples are afraid of their future and become more stressed from the fear that conflicts will remain unresolved. These conflicts, however, are not unique to multicultural families in Korea. Instead, they represent a global social problem that is inevitable between interracial husband and wife (McFadden, 2001).

With his longitudinal study, McFadden suggested progressive stages for accepting each other in interracial couples. He indicated that the first stage of acceptance starts with rejection; the next stage is resistance. Through those conflict stages, the husband and wife identify themselves in the family. After that, they can accept and will have respect for each other. Based on this respect, their two different cultures will be transmitted to each other. Finally, the racial difference will be minimized, signalling the universality stage. McFadden also explained that it usually takes 10 years to overcome the rejection and resistance stages. From this point of view, most multicultural families in Korean rural areas could be considered in these stages, which means their conflicts are natural and their chances of surviving the struggle will increase. Therefore, there must be education on the acceptance stages, and the social caring system must focus on interracial couples married for less than 10 years.

In addition, the evidence of this study suggested that children from multicultural families should be systematically observed through screening tests. With respect to this, Shonkoff and Phillips (2000) explained that environmental risks in disadvantaged families and vicious cycles of potential problems can be prevented when the community builds up the social safety net for young children. They also emphasized that the fundamental solution is to identify accurately these children's developmental status. Similarly, Reynolds, Temple, Robertson, and Mann (2001) suggested that screening tests and early intervention can reduce the atypical development of children at environmental risk.

Taken together, the findings of this study imply that children from multicultural families should be involved in early childhood special education. Regarding this, Tjossem (1976) divided children who need special education and are at risk of atypical development into three groups. These are children at biological risk, established risk, and environmental risk. From this perspective, the children from multicultural families could be considered to be at environmental risk in that they have greater possibility of atypical development. The first five years of human life include critical periods that can optimize human development but also negatively affect the entire life. Therefore, for children from multicultural families, implementing immediate interventions through early childhood special education after identifying developmental delay can be the most effective way to prevent further social problems.

AUTHORSHIP AND PLAGIARISM – DISCURSIVE ISSUES AND EDUCATIONAL EFFECTS

Ana Silvia Couto de Abreu

Federal University of São Carlos, Rod. Washington Luis 315, São Carlos 13565905, Brazil

Abstract

New writing and reading practices, due to advances in technological convergence, demand changes on models of construction and circulation of cultural goods. That means new relations of authorship, which bring questions to the logic in the established copyright law, and simultaneously, highlight a trial of strengths between discourses, such as copyright and copyleft, regulation and transgression, author protection and public access to creative work (Fapesp 2010/52454-7). Therefore, this paper focuses on educational challenges, which are a result of these technical and social transformations.

We take as the object of our studies, activities developed during the long distance course *Reading/Writing Processes and Digital Technologies in Education*, on Moodle's a virtual learning environment, in which Brazilian public schools teachers were the course´s target. Based on the theoretical and methodological principles of discourse analysis, we explored the meanings of authorship and plagiarism that circulated during the course's activities, as well as virtual interfaces as potential authorship environments.

As results we highlight two aspects: in order to avoid plagiarism, the importance of placing writing and reading in the perspective of an affiliation process; and, in order to maintain teacher´s autonomy, the importance of comprehending the technical possibilities of a virtual learning environment, so that it can be used according to teaching principles and not as a given object, a neutral technology.

Keywords: authorship; plagiarism; discourse; education; technology.

Introduction

We are experiencing changes in the production and dissemination of culture. The relationship between public/private, producer/consumer and editor/author has been transformed by the new possibilities of technological convergence. The roles of author and reader also suffered changes, thus becoming an overlapping set that is facilitated by the digital space.

This new model brings several polemic arguments, in a search for a discursive hegemony. Thus, the meanings of copyrights instituted by laws, agreements, national and international treaties are in constant change, also in a confrontation between regulation and transgression. This confrontation puts in evidence a power-game between discourses, such as those of copyright and copyleft, just like we discussed in Abreu (2012).

In this context, we bring the question of authorship and plagiarism in the educational scope.

It has become a commonplace to hear teachers complaining about students increase use of the feature of 'copy and paste', when surfing the Internet. There are teachers and schools who have decided to ask for hand written work, in an attempt to force students to read and write, believing that then the students will not copy. Could this be the solution? The problem, in the teacher's point of view, seems to be the lack of appropriate reading. Or could it reside in the student's lack of ethical conduct? Or might there be alternative reasons?

One should remember that this lack of reading and unethical behavior is a manifestation that keep arising, ever stronger, thanks to the Internet and its boundless possibilities of access to information, and therefore it is not caused by the Internet. We call these acts manifestations, as they are revealing a lack, a gap, a failure: it sounds to us identical to a claim for attention.

Therefore, we have as main objectives to understand the current meanings of authorship and plagiarism in the Internet scope, as well as analyzing a virtual learning environment as an area of potential authorship, understanding that the diverse interfaces, whereas technological tools that are apparently closed in its material organization, may present possibilities for openings and new creations. In other words, what is the materialistic weight in the discourse relations?

The vision of plagiarism, in school, as a directive of warning, purely punishment, and with the sole focus on the product, we desire to question. Starting with the assumption that the construction of plagiarism is a process that involves teachers, students, and the school as a whole, as well as methods that form cultural property, its access by society and without doubt the configuration of new media on the Internet. Therefore, plagiarism it is not simply an isolated and individual action. Since we understand that, the thought of plagiarism involves reflecting on authorship, which is evident in Schneider (1990), on treating the *Thieves of Words*. And authorship reminds us of interpretation, thus we put the problem of plagiarism in direct relationship with the practices of reading and writing, which are organized in different forms throughout our society. Speaking specifically on school settings, the relationship between approach/methods used and practices of reading/writing done by the students brings us a special meaning, since is where the specificity of our work in the development of language teachers resides.

Meanings of Authorship and Plagiarism

Authorship and Plagiarism were two key themes developed during the long distance course *Reading/Writing Processes and Digital Technologies in Education*, offered at UFSCar Teacher's Portal, through Moodle platform – Brazilian public schools teachers were its target audience.

UFSCar Teacher's Portal is an institutional program, originally funded by PROEXT/MEC 2003/2004/2005. The Teachers Portal (*http://www.portaldosprofessores.ufscar.br*) is a site that focuses on meeting the formative needs of teachers in different levels and modalities of teaching, and also other fundamental education professionals. In a set of long distance sessions, the portal provides individualized and groups support, to teachers and schools. The teacher-users can, among other things: receive aid for evaluation and construction of instructional materials; ask questions; receive a several number of information (events, contests, public policy, etc.); exchange successful experiences; keep contact with professionals of the university of different areas of knowledge; and participate in virtual communities (REALI, MIZUKAMI, 2009, p.97).

In the sequence we present a few considerations brought by the participating teachers, in which questions about reading, writing, authorship and teacher action arise:

Participating Teacher N:

"I personally do not believe that plagiarism is a display of self-denial on the part of the plagiarist. In fact I believe it is a necessity for self-assertion, thereof a inherit condition of being a student. The student who places himself in a situation of plagiarism does so because he needs to prove himself to the teacher. With intent or even by way of ingenuity, the student tries to take advantage of a resource that does not bring efficiency, but a mistake. In an assessment the student aims at the final grade and not the learning process that the work offers. This assumption conditions the student to seek resources to obtain the desired result (a high grade). Thus, the resource of the assessment becomes a commonplace to the student, because he seeks merely the resulting grade, and not the means by which one creates the need for evaluation. This behavior should and must, in fact, be rejected and condemned by the teachers. The students should be reprimanded, alongside the law, for their undue practice and advised about it. Likewise, the teachers must explain the contradictory focus between teacher and student assessment values. Namely, the teachers should warn students, prior to delivering assessments, about the function of evaluating the knowledge that the student has acquired throughout the course. In summary, it is the sole or main purpose of the evaluation, not a final grade. So that students can change the focus of their production, to focus on understanding the recording of their acquired knowledge, not just the final grade. To facilitate this need of self-assertion, inherent to the student because of his status, be directed to his own

knowledge and not just assignments grades. The teachers must be tough when dealing with plagiarism, so that students do not use the dreaded "little Brazilian way".

Participating Teacher P:

"When thinking of the role of teachers, it is reasonable to treat the subject plagiarist and the explicit theme of plagiarism in the classroom. Often we assume it is paraphrasing, and is actually plagiarizing the original author. Thus, it seems necessary that teachers make clear the limits of paraphrasing, and what plagiarism is, as well as the judicial sanctions. Teachers must emphasize the control over what is produced (gain knowledge), since a number of other students copy, because they know that the teacher does not give feedback, which means that many teachers ask for work but do not read it. Consequently the students perceives little or no difference between writing for themselves and copying – by copying they turn out to avoid time spent in their own writing."

Participating Teacher E:

"We saw that nowadays the teacher's role is in configuring an individual, not just 'deliver' knowledge and bring content to the classroom. The teacher of the information era is responsible for the ethical and moral learning of these subjects, and for making explicit that a copied assignment is bylaw a crime. However, this requirement of ethical commitment should not happen only in the academic life: from earlier grades students must be aware that there is free access to information, but the misappropriation of this information is illegal. The students should be required to have gained these grounds before being placed in front of such critical tasks. Therefore student should be made to build their own opinion and work, instead of putting up with copying the work of others."

Participating Teacher M:

"The digital age certainly gives the reader/writer facility to access information. All this ease brings up a delicate issue: plagiarism, a very common practice, especially among young students. They often fail to produce their own texts and begin to take ownership of unrelated content, without worrying about the authenticity of their productions. This process should be changed with the construction of the subject as an author, and for this to happen reading in school needs to move from the shallow to authentic, as exposed in Chartier (1994, p.155). 'Reading in school is artificial, practiced by the means of texts just made to compel reading, while social reading is authentic, practiced in situations where the reader knows why he needs to read'. By building his texts, the author places in-between lines, his worldviews, his positioning, and his profile as an author."

The participating teachers, because already are working in their field, bring some important issues regarding reading, writing and potential situations of plagiarism. One can understand, from their comments, that there is a relationship between the teacher's methods, the pitch presented to students and how the teacher establishes a dialogue, originated from their texts. We believe that inside the motion of this relationship is where student's authorship starts to develop.

The authorship, in a discursive perspective, is composed by an act of interpretation, a result of a course and a construction of files. Therefore, in the words of Orlandi (2005, p.71):

The [teacher] question is not what text to give, but to be aware of the meanings produced in a variety of texts, for which the pupil perceives the process, rather than only accumulating products. It's not a question of quantity, but the relationship of meanings in the formation (qualitative) of files. (…) What matters is to make the pupil realize that there are relations in the meanings that circulate. There are meanings that are entangled, forming affiliations. To understand, he needs to see these relationships, as we introduce common goals. Hence we seek to change the image that he has about reading, bringing new elements to his reflection, other ways of reading. It is therefore about creating conditions for him to work in order to build files – documental discourses of all kinds – that open his understanding for different possible meanings, even unfulfilled ones.

From a set of affiliations, from a constructed path, the reader/student feels safer to write, to position himself, by taking author's thoughts as arguments, which then can sustain his written text.

With this working method, allowing a construction of networks of meanings, we can prevent the silencing of authorship. According to Paasonen (2007), erasing traces of the past, in a temporal compression, creates a form of amnesia, for which citation practices serve as constraint and means of linking debates and paradigms. According to Orlandi (1997, p.148), while handling the silencing of authorship, this erasing causes effects, because the pupil "rather than unfolding meanings (polysemic process which is the base for the discursive functioning), doubles the meaning (in the sense of 'double' and 'shrink'), shortening the path of meaning."

The process of working with students through different methods of quoting is also essential to avoid that the student, by ignorance, commits plagiarism. The citations, according Orlandi (1997), mark the historicity of language and indicate that the construction of knowledge is a collective act. The erasure of the mention of other means a process of denial, as Orlandi (1997) writes: it denies the trajectory of the senses, denies the identity of others, and denies the identity of the person writing as author.

Terms of Authorship and Technological Possibilities

Our reflection concentrates on virtual learning environments, focusing on the interfaces, considered as potential spaces of authorship. Not only the way these interfaces are configured, but also how much can be appropriated by individuals that are embedded in a learning process, are issues that arise at a time that more and more educational institutions tend to offer long distance courses. For that reason, we propose rethinking the construction of meaning and its dissemination. Given the electronic treatment of the information, which is considered by Auroux (1992) to be one of the techno-linguistic instruments, along with grammar and the dictionary, these instruments are understood as social practices "that have left intact the human linguistic practices" (p.70).

We start from a notion of education in which the individual – situated in history – is at the center of the process, also placing language as the fundamental aspect to be considered, since it is in/through language that the individual constitutes itself (ORLANDI, 2000, p.37). That means to understand how meaning circulates by/through several technological instruments. And with that we end up claiming that material forms are not neutral, but loaded with meaning. We can draw an analogy with the radio and television, following Picanço (2003, p.37) considerations when discussing the risks of reductionism in the educational process, through virtual environments:

the technology (technical / knowledge), which led to radio and television, enabled both the emission and reception of information. However, since the appropriation of these production processes of technology, different settings are being displayed and maintained at the expense of efforts and intentions. It is simplistic to say that the technical devices, in this case the communication and information technologies, are merely tools, like if they have kept only a usability value, and as they embodied false neutrality.

Challenges that distance learning process has are the activities suggested to the student, through platform and other didactic materials, and the work conditions established by the responsible for the course:

According to this model the creation of teaching materials is centralized and its distribution is made in a large scale, through a high work division among the teams of specialized teachers and technicians, not to mention the tutors that make possible to operate the reception. (...) Many experiences of LDE (long distance education) use the media as tools to trigger the distribution of content, which is produced centrally, by experts. This option is marked by a hierarchical model, initiated by a mass education model. This production process has a large division of work, where teams of specialized teachers make the content, technicians produce institutional communication, and tutors facilitate the reception of content to students (PICANÇO, 2003, p.7).

Picanço, while making explicit the risk of a process that has its supply of content vertically transmitted, does not necessarily stop the possibility of subverting the model, then again this is greatly challenging.

With regards to a virtual learning environment, the planning, which implies on reflecting and deciding on which interfaces to work with, is fundamental, in order to provide spaces for case studies, interpretation of charts, portfolios, log book, forums, chats, etc. What matters is the multiplicity of languages that, somehow, will serve the diversity of pupils. In particular, this process has to have an understanding of the concepts underlying the model on the platform, with the perspective of available interfaces and potentially possible work modes.

We understand that there is a game, not always easy, among technical possibilities and methods of using them, generating an appropriation process.

As stated by Chartier (2000,p.67), about the concept of ownership:

allowing etymological links on both dimensions that are present in the concept of ownership: to appropriate is to claim property on something; and, this way, the concept of ownership was used by Michel Foucault to describe all devices that try to control the dissemination and circulation of discourses, establishing over the discourse and through its material forms an ownership. There is a sense of ownership in hermeneutics, which consists of what individuals do with what they receive, and that is a form of invention, creation and production, from the moment they take possession of the texts or objects received. Thus, the concept of ownership can mix the control and the invention, and can articulate the imposition of a sense and the production of new meanings.

It is in the space between control and invention that the teacher operates, building contents on virtual environments. Among the limitations imposed by the own environment, there are possibilities of resistance, reinterpretation, re-meaning, suggesting new techniques of working with interfaces, designing new ways, building new relationships between the team considered as technical, the teachers and the student. But not everything is transparent and regards decisions, as we deal with language and so:

The meaning, writes G. Canguilhem, escapes from any reduction that tries to host it on an organic or mechanical configuration. The so called intelligent machines are the ones that produce relationships among the data supplied to them, but they are not in relation to what the user intends from these relationships. As the meaning is the relationship to, people can play with the meaning, deviate it, simulate it, lie, make a trap" (CANGUILHEM, 1990, pp.16-17, cited by PECHÊUX, 1994,p.62).

It is on these slippery spaces, of games with meanings – whether we like it or not – that we think about the process of attendance and virtual learning. Spaces that have form and content, not totally random, not completely determined, more or less open and administered spaces, which depend on the conditions given for the production of meaning that, according to Orlandi (2000:40), "what is material (the language is subject to misunderstanding and historicity), what is institutional (social formation, in its order) and imaginary mechanism."

The perception of a strong relation between technical and political instruments is taken from Auroux (1998, p.321), for whom the existence of these instruments "is placed not out of society and its place, but within its own scheme, in the construction of a single thread that is techno-social indissoluble. This perception is also viewed by Pêcheux (1990), for whom the instrument in itself cannot be considered independent of a theory or as a simple application of it."

Technology, therefore, is understood as a social practice, since instruments are created not in a vacuum, but full of interests and expectations:

that move into a process acquiring dynamic, intensity, modifications, blocked relations, processes and structures, which can be social, economic and cultural ones. Structures which are active on national and worldwide social spheres. Taking this route will lead them to acquire the presence, power and scope of social techniques such as organization, work, control, management of social systems and the game of social power (IANNI, 1998,p.18).

As these instruments are bringing techno-political questions, they are also theoretical ones, as they inherently relate to economical, social, and cultural aspects. The instruments are not put in place isolated from an ideology.

Orlandi situates it as "ideology is not concealment, but the interpretation of meaning in a certain direction, where this direction is determined by history." (1997:101).

From this position, we bring an analysis of some observed data regarding *forum* and *task* configuration, during the course Reading/Writing and Digital Technologies in Education.

The following considerations are focused on two interfaces of Moodle platform – Task and Forum – used during the course offered by the Teacher's Portal.

The Moodle's task interface, in the way made available for the course, offered the following possibilities of use:

Group Type: offers the following configuration options:

- No groups – there is no division of the students that are participating in the discipline in groups.

- Separate groups – each student of every group only sees the colleague and documents of his own group, as well as the information regarding these participants. The messages and students from other groups are not visible.

- Visible groups – each student can only participate in the activities of his group, but can see the activities and colleagues of other groups.

New Send: the default configuration prevents the student from sending again the same task after it has been evaluated. If that option is triggered, students can continue to send different versions of the task, even after it has been evaluated. This can be useful, if the teacher wants to encourage students to improve their results, or when there is an interactive evaluation process, and successive revisions.

Comment inserted on the sentence: If this option is selected, the original submission will be copied into the comment field during evaluation, making it easier to comment on the text (perhaps using a different color) or to edit the original text.

The choices on how to formulate the tasks, for example, depend on a previous format, which may be under the control of the teacher or not. From these, there are effects related to the possibilities of collective reading and writing, rewriting of texts, more comprehensive view of the course by the participants, among other aspects.

Such decisions may be placed within a teaching methodology, with the intention of being merely efficient, worrying about adjusting itself to the interface possibilities, established by the technical team, following a trim already established, without considering the effects that this model of circulation of the proposed contents can establish, due to its materiality.

The materiality here is argued using the meaning worked by Orlandi (2006). The author works the relationship between language, speech and ideology, from the idea that "the specific materiality of the ideology is the discourse and the specific materiality of the speech is the language". For the author, the materiality is established as speech materiality:

the material form, that is the text, moves with the information's nature, produces effects on the way it works. The nature of the significant (different languages) affects the production of the object, and this object in turn, is the manner of signification of this symbolic gesture. And what is a text? It is a unit of signification in relation to the situation. This characterization can be maintained, but certainly the textually, its material form, its relationship with the memory and production settings differ when its significant materiality differs. (...) The space has meaning, has materiality and is not indifferent in its different ways of meaning (ORLANDI, 2006, p.5).

We have to take into consideration the biased behavior of these instruments, and the constitutive relationship between form and content, understanding that the computerized data is like effects of discursive positioning, as stated by Pêcheux (1994).

We understand that the treatment of the text does not exist only in the digital field, even thou we cannot erase the discursive power of this field acting in a conflicting game with the positions that are sustained by plurivocity of the meaning, in the materiality that fails.The appropriation of knowledge does not happen without clashes. This becomes evident when we make decisions about the subjects that will make up a curriculum, and the content of their digests. It is an ideological fight that is established and translated to "the struggle over the 'way a question is presented', the 'order of the questions', etc., depending on the ideological-discursive effects that this or that presentations assumes and reacts" (PÊCHEUX, 1988, p.223).

Therefore the formulation is understood as political, by way of 'all speech is a political act, because all significance has a direction, divides" (ORLANDI, 2004, p.129). By thinking this question of the division of the meaning, we bring a few considerations from the interface discussion forum.

The forum is an interface, whose asynchronous characteristic brings a potential for higher density in postings, by the student and tutor/teacher. But that depends on how the instrument is appropriated by the individuals involved. Thus, the existence of the forum does not necessarily mean authorship, since authorship implies in positioning oneself in front/next to other people's words, projecting new meaning and taking responsibility for them.

Conclusion

The participation in a forum, as a potential space for authorship, reveals important aspects of the individual's relation to language. At the forum, the individual experiences a search to stabilize meanings, his meanings. Then, in the opacity of language an illusion appears, because it is to have knowledge from language that is ruled by partiality. This partiality is forgotten in order to circulate meaning. We think "I finished, managed to write everything," in a necessary gesture for closing the text posted on a forum, but illusory, since it is "just an illusion that one thinks one can give the 'final word'. Neither the speech has a verifiable beginning: the meaning is (always) in progress" (ORLANDI, 2004, p.11).

Let us not forget that distinctive materiality brings different relationships of the individual with his text production. Thus, in an interface like a forum of a virtual learning environment, we normally have small text files that often seem lost, disconnected from other participant's posts, made at different times. Nevertheless these texts are intersected, sometimes mediated by a professor-tutor who takes over students wording, highlighting the link between the posts.

This move from the professor-tutor, in order to "bring order out of chaos" – as some professor-tutors say – implies in a closing action, which seems to contradict a principle that we hold important: the speech is open. However, we can understand it as a metaphor for the process of signification, which, even though it is open, in movement, is managed (ORLANDI, 2004, p.11), and there is always, by the individual part, an attempt of controlling.

Regarding the gesture of the professor-tutor, with his intervention, he establishes a particular reading; there is an effect of leaving obscure the fact of the participating student makes the possible links in the forum, i.e. he links his wordings to others that make sense to him, from his discursive memory.

The meanings circulate, they have and do not have place, and we try to control them. In response to the comments from the boards of our forums we react: "but that is not what I meant." As if we could control the interpretation, forgetting that what we say is always attached to other's wordings. While in the act of interpretation, this memory of this speech also brings its effects, allowing determined constructions of meaning, and nothing else in its place. We play, then, with the fault, the openings for interpretations and in this the risk of authorship resides.

Abstract

Holec (1981) describes autonomy as, "the ability to take charge of one's learning" (cited in Thanasoulas, 2000). The term autonomy has sparked considerable controversy, inasmuch as linguists and educationalists have failed to reach a consensus as to what autonomy really is. In fact, autonomy in language learning is a desirable goal for philosophical, pedagogical, and practical reasons. But what is oppressed here is the role of teacher. Considering autonomous learning as an unbridled learning is as ludicrous as to assume that an infant can grow up with the help of his/her mother. In the realm of language teaching, teachers scaffold students towards independence using variety strategies in order to help students develop autonomy. Despite such explanations as many practitioners does not consider autonomous learning as synonymous with teacher-less learning, many view the construct of learner autonomy as being synonymous with self-access and especially with technology-based learning. The writer held if being autonomous is to take some charges on the part of students, since the capacity of taking charges of one's own learning in not innate but it must be taught, there would be much need for guidance. As Thanasoulas (2000) declares it would be nothing short of ludicrous to assert that learners come into the learning situation with the knowledge and skills to plan, monitor, and evaluate their learning, or to make decisions on content or objectives. The present paper was an attempt to elucidate the concept of autonomy from philosophical and theoretical perspectives and also to provide some pedagogical implications in order to value the role of teacher, as the primary scaffolder in the educational classroom, in consolidating the autonomy of learners.

Keywords: Autonomy, liberatory autonomy, learning strategies, chaos complexity

Introduction

For many years we have been hearing that autonomy is important. Immanual Kant held that autonomy is the foundation of human dignity and the source of modality, (cited in Hill, 1991, p. 43). Accordingly, autonomy has been heralded as an essential aim of education. Autonomy like many philosophers' favorite words is not the name of one single thing; it means quite different things to different people. However, Hill (1991) claims, "Little progress can be made in debates about autonomy until these different ideas are sorted out." (p. 44).

Learner autonomy in language education is interpreted in various ways, and various terms such as 'learner independence', 'self-direction', and 'independent learning' have been used to refer to similar concepts. It is noteworthy that autonomy as a social process can be interpreted in terms of a point of a departure from education as well as in terms of redistribution of power attending to the construction of knowledge and the roles of the participants in the learning process. In the field of language learning, there is much concern about what techniques can be employed by teachers in order to help those students who are unable to develop skills to learn, to assess and to control their own learning (Ustunlouglu, 2009). A growing number of research studies are focusing on investigating the causes of this failure, with many writers (including Rivers, 1992; Brindley, 1990) offering suggestions for improvement. One area of study is autonomy, defined as the degree of responsibility students take for their own learning, as proposed by Brindley (1990).

2. Literature Review

The concept of learner autonomy has in the last twenty years become influential as a goal in many parts of the world. Accordingly, Palfreyman and Smiths (2003) maintain several arguments may be used in favor of developing autonomy in language learners: for example, that autonomy is a human right; that autonomous learning is more effective than other approaches to learning; and that learners need to take charge of their own learning in order to make the most of available resources, especially outside the classroom (p. 1).

Benson (1997) distinguishes three broad ways of talking about learner autonomy in language education:

● a 'technical' perspective, emphasizing skills or strategies for unsupervised learning: specific kinds of activity or process such as the 'metacognitive', 'cognitive', 'social' and other strategies identified by Oxford (1990);

● a 'psychological' perspective, emphasizing broader attitudes and cognitive abilities which enable the learner to take responsibility for his/her own learning;

● a 'political' perspective, emphasizing empowerment or emancipation of learners by giving them control over their learning. (cited in Palfreyman & Smiths, 2003, p. 3)

As Omaggio (1978) states there seem to be seven main attributes characterizing autonomous learners:

Autonomous learners have insights into their learning styles and strategies;

take an active approach to the learning task at hand;

are willing to take risks, i.e., to communicate in the target language at all costs;

are good guessers;

attend to form as well as to content, that is, place importance on accuracy as well as appropriacy;

develop the target language into a separate reference system and are willing to revise and reject hypotheses and rules that do not apply; and

have a tolerant and outgoing approach to the target language. (cited in Thansoulas, 2000)

Thanasoulas (2000) in his article "What are Learner Autonomy and How Can It Be Fostered?" describes three approaches to knowledge and learning, and debates how each of them is in contact with autonomy:

a) Positivism: This school of philosophy premised upon the assumption that knowledge reflects objective reality. Therefore, if teachers are to be considered the holder of this reality, learning occurs by the transmission of that knowledge from one person to another. Derived from this perspective, we imagine traditional classrooms in which the teachers are considered as the purveyors of knowledge and wielders of power; learners are deemed to have vessels which are going to be filled with the knowledge held by teachers. On the other hand, positivism also lends support to the widespread notion that knowledge is attained by dint of the 'hypothesis-testing' model, and that it is more effectively acquired when 'it is *discovered* rather than *taught*' (ibid.) (my italics). It takes little perspicacity to realize that positivism is incongruent with, and even runs counter to, the development of learner autonomy, as the latter refers to a gradual but radical divorce from conventions and restrictions and is inextricably related to self-direction and self-evaluation.

b) Constructivism is an elusive concept, one of the central tenets of which is that individuals try to give meaning to events and ideas in which they find themselves. In contrast to positivism, constructivism posits the view that, rather than internalizing or discovering objective knowledge (whatever that might mean), individuals reorganize and restructure their experience. In Candy's terms (cited in Thanasoulas, 2000), constructivism 'leads directly to the proposition that knowledge cannot be taught but only learned (that is, constructed)', because

knowledge is something 'built up by the learner'. Apparently, constructivism supports psychological versions of autonomy that appertain to learners' behaviour, attitudes, motivation, and self-concept. As a result, constructivist approaches encourage and promote self-directed learning as a necessary condition for learner autonomy.

c) Finally, critical theory, an approach within the humanities, shares with constructivism the view that knowledge is constructed rather than discovered or learned. Moreover, it argues that knowledge does not reflect reality, but rather comprises 'competing ideological versions of that reality expressing the interests of different social groups' (Benson & Voller, 1997, cited in Thamasoulas, 2000). Within this approach, learning concerns issues of power and ideology and is seen as a process of interaction with social context, which can bring about social change. Certainly, learner autonomy assumes a more social and political character within critical theory. As learners become aware of the social context in which their learning is embedded and the constraints the latter implies, they gradually become independent, dispel myths, disabuse themselves of preconceived ideas, and can be thought of as 'authors of their own worlds.

According to Kuaravadivelu (2003, cited in Kumaravadivelu, 2006, p. 176), in postmethod pedagogy, there are two views of learner autonomy, a narrow view and a broad view. A narrow view seeks to develop in learner a capacity to learn to learn, whereas the broad view goes beyond that to include a capacity to learn to liberate as well. Helping learners learn to learn involves developing in them the ability to take charge of one's own learning. Taking charges, according to Holec (1981, cited in Kumaravadivelu, 2006, p. 176) means to (1) hold responsibility for determining the objectives; (2) to select methods and techniques; (3) for monitoring their progress; and (4) for evaluating what has been acquired. This definition might bring out some misconceptions among many practitioners; among them is the lifeless role of teacher in the class. Little (1991) seems to make a useful statement on what autonomy is NOT: (1) autonomy is not a synonym for self-instruction; in other words, autonomy is not limited to learning without a teacher; (2) in the classroom context, autonomy does not entail an abdication of responsibility on the part of the teacher; it is not a matter of letting the learners get on with things as best they can; (3) autonomy is not something that teachers do to learners; that is, it is not another teaching method; (4) autonomy is not a single, easily described behavior; and (5) autonomy is not a steady state achieved by learners.

Referring to Kumaravadivelu's (2006) broad and narrow concept of autonomy, he elucidates two kinds of autonomy: academic and liberatory. Accordingly:

While the narrow view of learner autonomy treats learning to learn a language as an end in itself, the broad view treats learning to learn a language as a means to an end, the end being learning to liberate. In other words, the former stands for *academic autonomy*, while the latter, for *liberatory autonomy*. If academic autonomy enables learners to be effective learners, liberatory autonomy empowers them to be critical thinkers. (p. 177)

2.1. A critical look at teacher's role

In the literature on language teaching and learning, there are many variations upon the basic idea of autonomy. The underlying assumption is that teachers and students view the processes in which they are mutually engaged from very different perspectives and that this is likely to influence the ways in which they make sense of a notion such as autonomy. From the teachers' perspective, autonomy is primarily concerned with institutional and classroom learning arrangements within established curricula. In other words, from the teachers' perspective, autonomy tends to imply the learner taking control of arrangements whose underlying legitimacy is unquestioned. From the learners' perspective which Benson (2008) views as tangential to, rather than opposed to, the teachers' perspective autonomy is primarily concerned with learning, in a much broader sense, and its relationship to their lives beyond the classroom.

Little (1991) stressed that learner autonomy and teacher autonomy are interdependent, and that teachers wishing to promote greater learner autonomy need to "start with themselves", reflecting on their own beliefs, practices, experiences and expectations of the teaching/learning situation. However, learner autonomy does not imply that the teacher becomes redundant abdicating his/her control over what is transmitting (Thanasoulas,

2000). In fact the teacher's role in maintaining a learning environment in order to enhance the autonomy of learners in the process of learning is critical. The learning environment, also, is taken as a site for democratic practices and this provides another rationale for learner-centered education. Teachers in this model are not viewed as "bank-clerks" who make deposits into empty students. A key concept here is that of the hidden curriculum (the knowledge, values, and beliefs that schools present to students and others), not by what is explicitly being taught, but by the process in which the actual instruction takes place (Loporchio, 2006 cited in Jacobs & Farrell, 2010, p. 18). The point being that if schools and society talk about democracy but classroom practices do not reflect this because they are overly autocratic, students may be less likely to know how to function in a democratic learner-centered setting or even how to insist on this method if they recognize that they are being denied this right (Jacobs & Farrell, 2010). Along the same line, appreciating diversity and democracy are challenge in humanist thinking and acting is the linking of autonomy and humanity. As Hassaskhah (2005) submitted: "that language teaching should be democratic has long become a fact" (p. 54). Autonomy is not isolated individuality but it is the way a person relates to the other. It's the agency of the situatedness of people, as Veugelers (2011) declares. Developing autonomy and humanity is not a natural process, but an interactive process between people under social and political power relationships. Enhancing autonomy and humanity is part of social, cultural and political developments. Like autonomy that can not be separated from humanity, human development can not be separated from social, cultural and political struggle for a world of social justice. From a humanist point of view social change is not possible without strong and critical autonomous people (Veugelers, 2011).

2.2. Autonomy and learning strategy

Emphasizing this continuum, Zimmerman (1998) claim that learners who are able to self-regulate the locus of control throughout the learning experience are strategic learners. Those learners learn through the positive experience of a good performance, through the experience of others, through verbal persuasion, and through a positive physiological state, and eventually develop their self-regulatory skills to the point where they become self-regulated learners and take control of their (Ustunlouglu, 2009). In second language education Learner Autonomy involves second language learners gaining awareness of their own ways of learning such as learning styles and learning strategies, so that they can utilize their strengths and work on their weaknesses (Benson, 2007, cited in Jacobs and Farrell (2010, p. 18). However, according to Jacobs and Farrell (2010), focusing on learner strategies is important in second language education because research has indicated that our students can actually learn how to successfully manipulate their own strategy use. However, focusing on learning styles is more difficult to manipulate because it is within the nature of the learner himself or herself; in other words, learning style is the given (Jacobs and Farrell 2010).

2.3. Autonomy and chaos complexity

Paiva (2006) argue that autonomy is a socio-cognitive system nested in the SLA system. It involves not only the individual's mental states and processes, but also political, social and economic dimensions (cited in Paiva, 2011, pp. 63). It is not a state, but a non-linear process, which undergoes periods of instability, variability and adaptability. It is an essential element in SLA because it triggers the learning process through learners' agency and leads the system beyond the classroom. Paiva (2011) holds, "Autonomous learners take advantage of the linguistic affordances in their environment and act by engaging themselves in second language social practices" (p.63).

Autonomy changes for reasons that are, usually, entirely internal to itself, such as a willingness to learn in a more independent way. In Paiva and Braga (2008), it is argued that 'autonomy, in the perspective of complexity, encompasses properties and conditions for complex emergence, and is inextricably linked to its environment'. (cited in Paiva, 2011, p.63) Likewise, its dynamic structure governs the nature of its interactions with the environment in which it is nested. In this sense, the language learner agent influences, and is influenced by, his/her social practices in a constant movement of organization and reorganization, a process that, paradoxically, possesses a certain degree of freedom and dependency. Murphy (2011) argues, "Despite the lack of a single,

universal theory of autonomy, there is agreement on the educational importance of developing autonomy and that autonomy can take a variety of forms, depending on learning context and learner characteristics." (p. 17)

2.4 How to achieve autonomy

That learners have to follow certain paths to attain autonomy is tantamount to asserting that there has to be a teacher on whom it will be incumbent to show the way. In other words, autonomous learning is by no means "teacher-less learning" (Thanasoulas, 2000). As Sheerin (1997, cited in Thanasoulas, 2000) succinctly puts it, teachers have a crucial role to play in launching learners into self-access and in lending them a regular helping hand to stay afloat. Probably, giving students a "helping hand" may put paid to learner autonomy, and this is mainly because teachers are ill-prepared or reluctant to 'wean students away from teacher dependence. After all, it is not easy for teachers to change their role from purveyor of information to counselor and manager of learning resources. Kumaravadivelu (2006) holds Meaningful (liberatory) autonomy can be promoted in the language classroom by, among other things:

encouraging learners to assume the role of mini-ethnographers to investigate and understand how, for instance, language as ideology served vested interests.

asking them to reflect on their developing identities by writing diaries… related to the social world

helping them in the formation of learning communities where they develop into unified, socially cohesive, mutually supportive groups seeking self-awareness and self improvements.

providing opportunities for them to explore the unlimited possibilities offered by online services and bringing back to the class their own topics for discussions, and their own perspectives on those topics. (p. 178)

Clearly, as Kumaravadivelu (2006) claims such a far-reaching goal cannot be attained by learners working alone; they need the willing cooperation of all others who directly or indirectly shape their educational agenda, particularly that of their teachers.

Thanasoulas (2000) also outlines three ways in order to foster autonomy: (1) self-report, (2) diaries and evaluation sheet and (3) persuasive communication. To him, there are two types of self-report: introspective and retrospective. The main goal of the first, introspective self-report, is help learners become aware of their own strategies, and in the latter, retrospective self-repot, students are asked to think back to retrospect on their learning. It could be argued that self-reports can be a means of raising awareness of learners' strategies and the need for constant evaluation of techniques, goals, and outcomes. The purpose of the second method, diaries and evaluation sheet, according to Thanasoulas (2000) seems to alter learners' beliefs about themselves by showing them that their putative failures or shortcomings can be ascribed to a lack of effective strategies rather than to a lack of potential. It is through the second way, diaries and evaluation sheets, which offer students the possibility to plan, monitor, and evaluate their learning, identifying any problems they run into and suggesting solutions. This approach as Thanasoulas (2000) brings is based on the assumption that when learners are faced with convincing information about a situation, 'they can be led to re-examine existing evaluations they hold.

Nowlan (2008) suggests journal writing and using the internet and technology for having autonomy in language learning. Furthermore, Rao (2003) finds that the use of portfolios works satisfactorily with his students.

As an assessment device, portfolios not only encourage students to participate in the process of evaluation, but also motivate students to improve their English learning in a comprehensive way. In addition, portfolio evaluation takes individual differences into consideration and involves everybody in the assessment process, including students, teachers, and peers. Most importantly, portfolios connect learning, assessment, and instruction and stress improvement, effort, and achievement. With the use of portfolios, students can document the planning, learning, monitoring, and evaluation processes. This can help raise students' awareness of learning strategies, facilitate their learning process, and enhance their self-directed learning. (p. 120)

3. Conclusion

What permeates this article is the belief that in order to help learners to assume greater control over their own learning, it is important that teachers help them to become aware of and identify the strategies that they already use or could potentially use. In other words, autonomous learning is by no means teacher-less learning. The study shows that students do not perceive themselves as sufficiently autonomous, that they are unwilling to take responsibility and that they continue to see the teacher as a dominant figure who is the decision maker in the classroom. Thus, this study highlights the need to integrate learner independence into the language curriculum, with a well-structured focus, delivery, and content.

Autonomy as a socio-cognitive system is not a state but a no-linear process which undergoes variability. Thus, autonomous learners take advantage of the linguistic affordance in their environment and act by engaging themselves in second language social practices. Hence, being autonomous, in initial state, involves being scaffolded by teachers in order to enhance the process of learning. Without this, it would be difficult to implement independent learning in a coherent way and to attract institutional commitment. Meanwhile, teachers, of course, need to experience autonomous learning themselves and need to be committed to self-development. The questions of how teachers can be psychologically prepared and which skills and knowledge are needed for autonomy should be addressed as well. Students need induction sessions and support so that they can become familiar with independent language learning materials, equipment and resources. Thus, designated advisors working at the Self-Access Center will be able to provide students with appropriate approaches.

To sum up, the results indicate that students do not perceive themselves as autonomous enough in language learning and teachers need the ability to move their students towards autonomous learning. Respecting student ideas, sharing decisions in teaching, learning goal setting and leading students towards taking responsibility for their learning rather than prescribing the learning process will all increase student motivation, and thus, foster success.

Özet

Bu programların amacı, Avrupa'nın farklı ülkelerindeki üniversiteler arasında işbirliğini teşvik ederek karşılıklı anlaşmalar yapmalarını sağlar. Bu şekilde, öğrencilerin ve eğitimcilerin birbiri ile değişimleri sağlanarak üniversitelerdeki iyi uygulamaların Avrupa'nın bütününe yayılması ve karşılıklı fikir alışverişi ortamı oluşturulması amaçlanır. Bu kapsamda Erasmus hareketlilik programına katılmak isteyen öğrenci ve eğiticilerin programa başvurabilmeleri ve bu süreç sonunda üniversitelerinin belirlediği başarı ölçütlerine göre uygun olanlarının Erasmus programına yerleştirilmesi işlemleri zor bir süreçtir. Bu nedenle bu süreçleri bilgisayar ortamında tanımlamak, hem bu zahmetli süreçten kurtulmak hem de daha geniş kitleleri bu imkândan faydalandırmak adına iyi bir yöntem olacaktır. Bu çalışmada, Erasmus programına katılmak isteyen adaylar için internet üzerinden online başvurabilecekleri bir web bilgi sistemi geliştirilmesi amaçlanmıştır. Çalışma kapsamında öğrenci ve eğitimciler başvurularını, kendi bölümlerinin yapmış olduğu anlaşmaları tercih ederek online yapabileceklerdir. Geliştirilen sistem, üniversitelerinin başarı ölçütleri çerçevesinde başvuruları değerlendirilerek tercihlerine göre otomatik yerleştirmelerine olanak sağlamaktadır.

Abstract

Erasmus mobility program sare carried out within the scope of European Union lifelong learning process. The purpose of these programs, make mutual agreements by promoting cooperation between universities in different countries of Europe. In this way, it's aimed that spread of good practices at universities to whole of Europe, by exchange of students and educators with each other, and the creation of environment of mutual exchange of ideas. In this context, students and educators who want to participate in the Erasmus mobility program refer to the program and the success of this process, according to the criteria set by the universities at the end of the Erasmus program, placement procedures were in accordance with a difficult process. Therefore, defining these processes in the computer environment would be a good method both for getting rid of these complex processes and as well as giving the broad masses of people the benefit of these advantages. In this study, for candidates wishing to participate in the Erasmus program can apply online via the Internet to develop a web information system. Working within the scope of applications for students and educators, have made their own parts of the agreements is preferred to be able to online. The developed system, criteria for success within the framework of universities in place to automatically allows applications are evaluated according to their preferences.

1. Giriş

Bologna süreci kapsamında Avrupa Birliği(AB) hayat boyu öğrenme Erasmus programı, Avrupa'daki üniversiteler arası karşılıklı fikir alışverişi ve iyi olanı yayma anlayışını amaçlamaktadır (Ulusal Ajans, 2012). Avrupa Birliği Eğitim ve Gençlik Politikası, Avrupalılık bilinci oluşturmak ve Avrupa vatandaşlığı kavramını

her bir Avrupalı bireye kazandırmayı hedeflemiştir (Üre, R., K., 2010; Tanyeri, 2006). Erasmus programı, belirtilen amaçları; üniversiteler arasında ülkelerarası işbirliğini teşvik ederek, öğrencilerin ve eğitimcilerin Avrupa'da karşılıklı değişimini sağlayarak ve programa katılan ülkelerdeki çalışmaların ve alınan derecelerin akademik olarak tanınması ve şeffaflığın gelişmesine katkıda bulunarak gerçekleştirmeye çalışmaktadır (Gümrükçü, 2006; Serbest, 2005). Yapılan bu değişimler vasıtası ile farklı ülkelerden gelen öğrencilerin kültürlerarası iletişimi güçlenmektedir (Sancak, A., 2009).

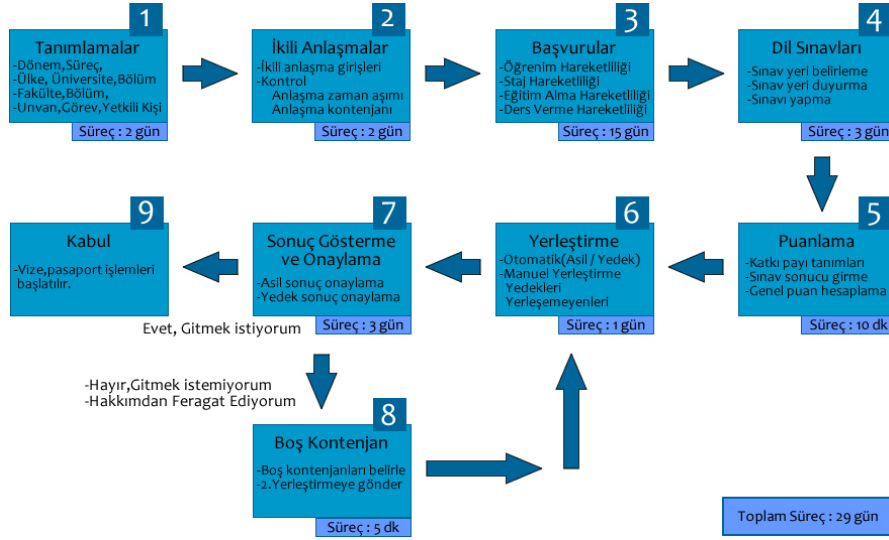
Teknolojinin gelişmesiyle bilgisayarlar artık her alanda kullanılmaktadır. Televizyon, sanat, müzik, yaşam, alışveriş, eğitim vs. gibi tüm alanlarda artık bilgisayar etkin bir şekilde kullanılıyor. İnternetin yaygınlaşmaya başlamasıyla birlikte bilgisayarlar üzerinde yönetilen sistemler internete açılmış ve daha kolay erişim imkânı bulmuşlardır (Erkunt, & Akpınar, 2006). Online bankacılık, online alışveriş siteleri, online kütüphaneler vb. her türlü işlem artık internet üzerinden rahatlıkla tek tuşla yapılabilinmektedir. İnternetin aktif bir şekilde her alanda kullanılması eğitim alanında da yenilikler getirmiştir. Online kütüphaneler ile oturduğumuz yerden dünyadaki tüm kütüphanelerdeki kitapları okuyabiliyor, dergilere abone olabiliyor ve yeni gelen yayınlardan haberdar olabiliyoruz. Bu noktada AB'nin hedeflediği karşılıklı değişim programları da internet üzerinden daha büyük kitlelere ulaşmakta ve bu programlardan milyonlarca kişi haberdar olmaktadır (İşeri, 2005). Fakat Erasmus programından yararlanmak isteyen adaylar, uzun bir süreçle karşılaşmaktadırlar. Başvuru yapma, sınava tabi tutulma, değerlendirilme ve yerleştirilme gibi adımlar sonucu kesin adaylar belirlenir. Tabi burada bu işlemlerin hepsi uzun zaman alan işlerdir. Bu uzun süreçler karşılıklı değişim yapacak üniversiteler için büyük bir sorun haline gelmiştir. Üniversitelerin uluslararası ilişkiler ofisi personeli tarafından yürütülen bu zorlu süreçler programa başvurmak isteyen adayların sayılarının artmasıyla daha da karmaşık ve içinde çıkılmaz hale gelebilir. Bu problemler beraberinde daha çok kişide insanın Erasmus programından yararlanmasını engel teşkil etmektedir. Böylece AB'nin hedeflediği iyi olanı tüm Avrupa'ya yayma hedefi bu tür uzun işlemler yüzünden sekteye uğramaktadır. Bu nedenle bilgi çağında bilgisayarın bize sunduğu hizmetlerden yararlanarak bu uzun süren süreçler kısaltılabilir.

Bu çalışmada, Erasmus programından yararlanmak isteyen adayların kısa sürede doğru sonuca ulaşmaları ve programın önündeki uzun kabul süreçlerini en kısa zamana indirgemek için internet olanaklarını da kullanarak Erasmus online başvuru ve bilgi sistemi geliştirilmiştir.

2. Erasmus Programı Aday Kabul Süreci

Erasmus programının gerçekleştirilebilinmesi için uzun bir evrak ve zaman süreci gereklidir. Erasmus programına katılmak isteyen aday, başvuru formunu doldurarak kendi üniversitesinin erasmus ofisi personeline elden teslim ederek başvurusunu yapmalıdır. Bu şekilde elden başvuru yöntemi, hem uzun süren başvuru süreciyle hem de kısıtlı zaman içerisinde adayın üniversiteye gelmesini gerektirmesiyle başvuracak aday sayısını önemli ölçüde düşürmektedir. Bununla birlikte adayların sadece kendi bölümlerinin anlaşmalarını tercih etmeleri ve anlaşmaların bölümden bölüme değişken olması başvurma işleminin uzun sürmesine neden olmaktadır. Adaya ne kadar çok tercih yapma imkânı sağlanırsa diğer süreçlerde bir o kadar karmaşıklaşacaktır. Elden takip edilen bu işlemlerde hata payı yüksektir. Başvuru alma sürecinden sonra başvuran adayları sınava tabi tutmak için sınav yeri duyurusu, sınav değerlendirmesi ve puan hesabı gibi karmaşık süreçler tüm adaylar için yapılacaktır. Bütün bu işlemler tamamlandığında, adayların tercihleri doğrultusunda başarı sıralaması esasına göre yerleştirme işlemi yapılır. Manuel yapılan işlemler içerisinde en karmaşık süreç yerleştirme sürecidir. Çünkü her adayın tercihleri değerlendirilecek ve anlaşma kontenjanları dâhilinde yerleştirme yapılacaktır. Ayrıca anlaşma kontenjanı önlisans, lisans, yüksek lisans ve doktora öğrencileri için ayrı olması durumunda işlemler daha da karmaşık bir hal alır. İşte tüm bu olumsuz faktörler eğitimde kaliteyi arttıracak erasmus programının gerçekleştirilmesine engel teşkil etmektedir. Bu gibi uzun ve karmaşık süreçler öğrencileri erasmus programına katılmayı teşvik etmemektedir.

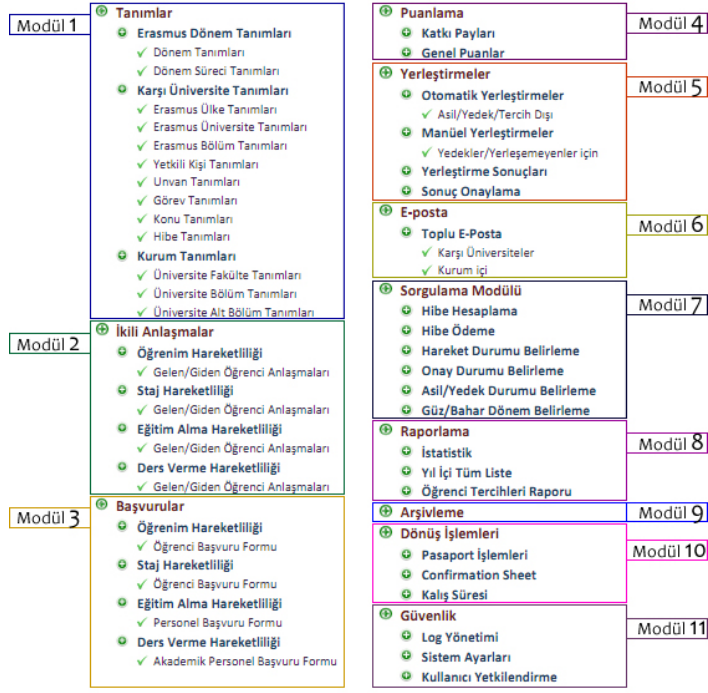
3. Erasmus Online Başvuru ve Bilgi Sisteminde Aday Kabul Süreci

Geliştirilen online bilgi sistemi aday kabul sürecindeki karmaşık süreçlerinin çözümü için tasarlanmıştır. Sakarya Üniversitesi bilgisayar araştırma ve uygulama merkezi bünyesinde geliştirilen sistem şuan aktif olarak kullanılmaktadır. Aday kabul sürecinde önceki yıllarda yapılan elden kabul süreçleri analiz edilerek yaşanılan tüm sorunlar tespit edilmiştir. Özellikle başvurunun bizzat elden yapılmasından dolayı başvuru süreci içerisinde adayların şehir/yurt dışında olması gibi durumlardan ötürü çoğu adayın başvuru yapamadığı tespit edilmiş bu da başvuru sayısı büyük ölçüde azalttığı gözlemlenmiştir. Bunun yanı sıra uzun süren başvurma işlemleri de büyük bir sorun olduğu için bunların çözümü değerlendirilmiştir. Özellikle en karmaşık süreç olan yerleştirme süreci probleminin kesinlikle çözülmesi gerekmektedir. Bu gibi durumları bilgisayar ortamına aktarmak için erasmus ofisi ile uzun süren toplantılar yapılmış ve gerekli çözüm önerileri düşünülmüştür.


Şekil 1. Erasmus Online Başvuru ve Bilgi Sistemi Aday Kabul Süreci

Yapılan analiz çalışmaları sonucunda Şekil 1'de görülen aday kabul süreci ortaya çıkmıştır. Aday geliştirilen sistemle başvurusunu internet üzerinden başvuru zamanı içerisinde istediği yerden istediği zamanda kısa sürede yapabilmektedir. Başvuruların sorunsuz yapılabilmesi için Erasmus programına dâhil olan ülkeler, üniversiteler ve bölümlerin sisteme tanımlanmalıdır. Ayrıca programı yürütecek olan üniversite kendi fakülte bölümlerini ve sistemde olması gereken tüm değişkenleri tanımlamaktadır. İkili anlaşmalar da hangi bölüm ile yapıldığı kontenjanları ve yetkili kişi tanımlamaları yapılarak sisteme girilmektedir. Böylece başvuru süreci için gereken tüm ihtiyaçlar karşılanmıştır. Aday internetten sisteme girerek başvuru yaptığında, karşısına sadece kendi bölümlerinin anlaşmaları gelmekte ve anlaşmalar hakkında tüm detaylı bilgilere erişebilmektedir. Öğrenci, idari ve akademik personel sistem üzerinde kendilerine uyan programa başvurabilmektedirler. Sistem ile öğrenim, staj, eğitim alma ve ders verme hareketlilikleri başvuruları alınabilir. Başvuru süreci sonrası dil sınavı uygulanacaksa adaylar kendi hesaplarına girerek nerede, ne zaman ve hangi dilde sınava gireceklerini öğrenebilirler. Sınav sonuçları sisteme kısa sürede aktarılarak gerekli puanlama katkı payları ölçüsünde hesaplanır. Burada en önemli şey karmaşık bir süreç olan yerleştirme süreci sistem sayesinde dakikalar mertebesinde ve adilce otomatik olarak yapılabilir.

4. Geliştirilen Sistemin Modelleri

Geliştirilen sistem modüller şeklinde tasarlanmıştır. Şekil 1'de verilen aday kabul sürecindeki her adım modüllere bölünerek sistemin entegre çalışmasına olanak sağlamıştır. Sistem 5 farklı kullanıcı profili ve 11 modül ile geliştirilmiştir.


Şekil 2. Erasmus Online Başvuru ve Bilgi Sistemi Modülleri

Şekil 2'de sistemin modülleri aday sürecinin işlem sırasına göre gösterilmiştir. Her modül alanındaki işleri yürütür ve bir sonraki süreçle puzzle parçaları gibi haberleşerek veri transferi sağlar.

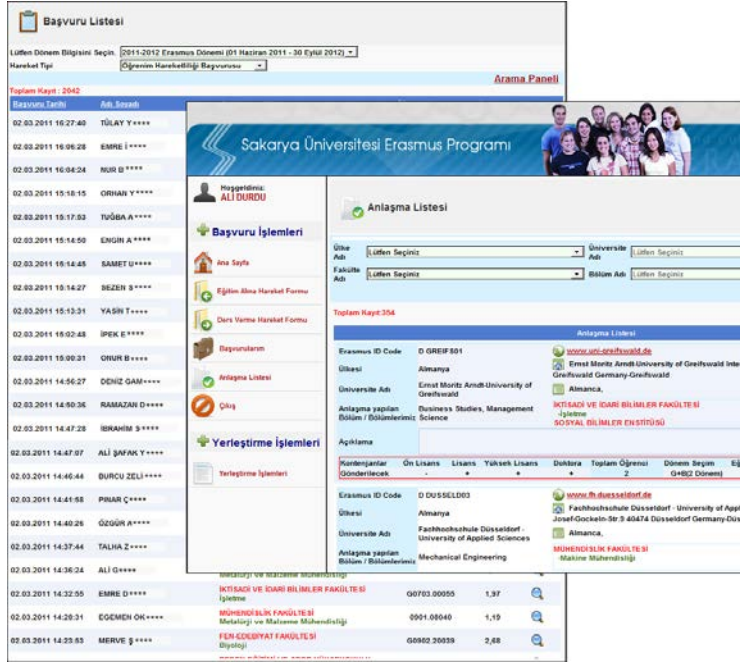
4.1. Tanımlama Modülü

Tanımlama modülüyle, üniversitenin fakülte bölümlerini, erasmus dönemlerini, ikili anlaşma koordinatörlerini, ülkeleri, karşı üniversiteleri, bölümleri, başvuru-yerleştirme-sonuç duyurma ve onay süreçlerinin zaman aralıklarını ve birçok gerekli verileri tüm detayları ile sisteme tanımlanabilir. Sistem tüm üniversitelerin erasmus süreçlerini rahatlıkla yönetebilmeleri için esnek olarak tasarlanmıştır. Örneğin fakülte bölüm tanımları ile sistemi kullanan üniversiteler kendi fakülte bölümlerini tanımlayarak sistemin tüm işlevlerini kullanabileceklerdir.

4.2. İkili Anlaşma Modülü

İkili anlaşma modülü, erasmus hareketlilik programında var olan tüm hareketler için oluşturulabilmektedir. Anlaşmadaki iki tarafında tüm bilgileri detaylı olarak sisteme kaydolmaktadır. Ayrıca gelen öğrenci/personel ve giden öğrenci/personel seçenekleri ile tüm durumlar sisteme tanıtılır.

4.3. Başvuru Modülü

Üniversitedeki tüm idari/akademik personeller ve öğrenciler sisteme güvenli başvuru yöntemi ile sadece kendi bölümlerinin yapmış olduğu anlaşmalara başvurabilirler. Başvurular internet üzerinden zaman ve mekân gözetmeksizin başvuru süresince alınabilir. Sistem kısa sürede başvuru alabildiği için başvuru sayısını büyük oranda etkiler.


Şekil 3. Erasmus Online Başvuru ve Bilgi Sistemi Başvuru Listesi ve Başvuru Ekranı

Şekil 3'de görüldüğü gibi başvuru ekranı ile erasmus adayı bölümündeki tüm anlaşmalara ve detaylarına ulaşabilmekte ayrıca yetkili kullanıcılar admin panelinden başvuran adayların listesini ve adayın başvurusunu inceleyebilmektedir.

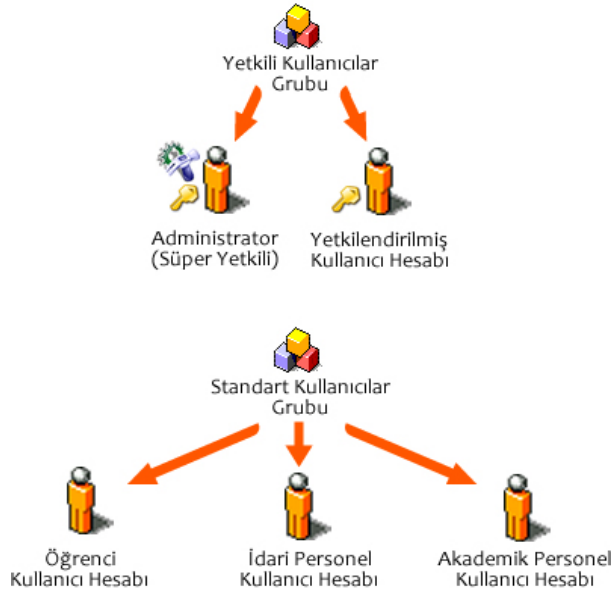
4.4. Yerleştirme Modülü

Yerleştirme modülü otomatik ve manuel olmak üzere iki seçenek sunar. Otomatik yerleştirme ile sistem binlerce başvuruyu beş dakikadan daha az bir sürede değerlendirebilir ve adayları başarı sırasına göre anlaşmaların kontenjanları dâhilinde tercihlerine yerleştirebilir. Asil ve yedekler otomatik olarak oluşur. Manuel yerleştirme ile de yetkili kullanıcı yerleşemeyenleri veya yedekleri boş kontenjanlara yerleştirilebilir.

4.5. Sorgulama Modülü

Güçlü sorgulama seçenekleri ile sistemdeki tüm kayıtlara istenilen alandan anında erişebilinir. Sorgulama ekranı kişinin yaptığı tüm erasmus faaliyetlerini görüntüler ve üzerinde işlem yapılmasına imkân tanır.

4.6. Sistemin Yetkilendirilmesi

Şekil 4'de sistemde tanımlı kullanıcı profilleri verilmiştir. Yetkili kullanıcılar ve standart kullanıcılar olmak üzere iki grup kullanıcı vardır. Yetkili kullanıcılar grubunda administrator kullanıcısı her türlü işlem yapma yetkisine sahiptir. Administrator kullanıcısı tarafından oluşturulan yetkili kullanıcı sadece kendisine verilen yetkiler doğrultusunda işlemler yapabilir.


Şekil 4. Erasmus Online Başvuru ve Bilgi Sistemi Kullanıcı Profilleri

Erasmus sistemine işlem yapacak adaylar; öğrenci, idari personel ve akademik personel olmak üzere üç kullanıcı hesabı ile tanımlanmışlardır. Öğrenci kullanıcı hesabı öğrenim ve staj hareketliliğine, idari personel kullanıcı hesabı sadece eğitim alma, akademik personel kullanıcı hesabı ise eğitim alma ve ders verme hareketliliklerine başvurabilir. Böylece kayıt olacak adayların kullanıcı hesapları yapabilecekleri hareketliliğe göre kısıtlandırılmıştır.

5. Sistemin Başarımına İlişkin Veriler

Erasmus online başvuru ve bilgi sistemi 2006-2007 eğitim öğretim döneminden itibaren Sakarya Üniversitesinde fiilen kullanılmaktadır.
Şekil 5. Yıllara göre Sakarya Üniversitesi Erasmus online başvuru ve bilgi sistemine öğrenim ve staj hareketliliği alanında yapılan başvuru sayıları grafiği

Şekil 5'de verilen grafikte 2005-2006 eğitim öğretim yılında Erasmus online sistemin kullanılmasıyla birlikte önceki sene 8 olan başvuru sayısı aniden 660' yükselmiş ve sonraki yıllar artarak ve son olarak 2042'ye kadar yükselerek sürekli bir artış göstermiştir. Başvuru sayılarının bu şekilde yükselmesinin en önemli sebebi Erasmus

online başvuru sistemiyle internet üzerinden zaman ve mekan kavramı olmadan kısa bir sürede başvuru yapabilme olanağıdır. Başvuracak olan adaylar bulundukları yerden üniversitelerine gelmeden kısa sürede başvuru yapabildikleri için sistem birçok kişiyi başvuru yapmaya teşvik etmiştir.

Tablo 1. Yıllara göre Erasmus online başvuru ve bilgi sistemiyle Sakarya Üniversitesi'nden yurt dışına gönderilen öğrenci ve personel sayıları

Faaliyet	2004 2005	2005 2006	2006 2007	2007 2008	2008 2009	2009 2010	2010 2011	Toplam
Öğrenim Hareketliliği (Öğrenci)	3	30	173	355	334	262	359	1516
Ders Verme Hareketliliği (Akademik Personel)	1	12	123	99	82	27	102	446
Eğitim Alma Hareketliliği (İdari Personel)	0	0	0	19	57	4	26	106
Staj Hareketliliği (Öğrenci)	0	0	0	21	18	10	19	68
Toplam	4	42	296	494	491	303	506	2136

Tablo 1'de Erasmus faaliyetinden yurtdışına giden Sakarya Üniversitesi personel ve öğrencilerine ait yıllar bazında sayısal veriler verilmiştir. 2004/2005 eğitim öğretim yılında başlanan erasmus faaliyetlerinden yararlanan kişi sayısı toplam 4'den 2005-2006 eğitim öğretim yılında sistemin kullanılmaya başlanması ile 42 kişiye çıkmış ve her sene yararlanan kişi sayısında büyük oranda artış gözlenmiştir. 2007/2008 eğitim öğretim yılında 494 kişi ile Sakarya Üniversitesi Türkiye'de en büyük Erasmus bütçesini alan üniversite yaparak birincilik kazanmıştır. Son olarak 2010/2011 eğitim öğretim yılı için 506 kişi yurt dışına gönderilmiştir. Şuana kadar toplam 2136 kişi Erasmus programından yararlanarak yurtdışına gönderilmiştir. Tablo 1'de verilen sayılardaki yurtdışına giden öğrencileri büyük bir kısmı iki dönem(güz+bahar) eğitim almak üzere gönderilmiştir.

Tablo 2. Yıllara göre Erasmus programıyla Sakarya Üniversitesi'ne gelen yabancı uyruklu öğrenci sayıları

Faaliyet	2004 2005	2005 2006	2006 2007	2007 2008	2008 2009	2009 2010	2010 2011	Toplam
Öğrenim Hareketliliği (Öğrenci)	0	1	28	40	65	57	75	266
Staj Hareketliliği (Öğrenci)	0	0	0	0	0	2	0	2
Toplam	0	1	28	40	65	59	75	268

Tablo 2'de Erasmus faaliyetinden Sakarya Üniversitesi'ne gelen yabancı uyruklu öğrencilere ait yıllar bazında sayısal veriler verilmiştir. 2004-2005 eğitim öğretim yılında Sakarya Üniversitesine hiç öğrenci gelmemişken, 2005-2006 yıllarında sistemin kullanılmaya başlanması ile 1 kişiye çıkmış ve her sene gelen öğrenci sayısında büyük oranda artış gözlenmiştir. 2006-2007 yılları arasında erasmus faaliyetlerinden yararlanarak Sakarya Üniversitesine gelen öğrenci sayısında 28 kişi ile yine rekor oranda artış gözlenmiş 2010/2011 eğitim öğretim yılında bu sayı 75'e kadar yükselmiştir. 2011 yılı itibariyle kadar toplam 268 yabancı uyruklu öğrenci Sakarya Üniversitesi'nden eğitim almıştır ve halen almaktadır.
Şekil 5. Yıllara göre Sakarya Üniversitesi'nden Erasmus programıyla yurt dışına giden öğrenci sayılarının pasta grafiği ile gösterimi
Şekil 6. Yıllara göre Sakarya Üniversitesi'nden Erasmus programıyla yurt dışına giden Akademik/İdari personel sayılarının pasta grafiği ile gösterimi

Şekil 5 ve Şekil 6'da verilen Tablo 1'deki verilen sayıların pasta grafiği ile gösterimi ile online başvuru ve bilgi sisteminin Erasmus programına katılan kişi sayısını önemli ölçüde arttırdığının ispatını belirgin bir farkla göstermektedir.

Sonuç

Bu çalışmada, Üniversitelerin Erasmus programına katılmak isteyen öğrenci ver personellerinin başvuru ve yerleştirme süreçlerini internet üzerinden adilce yönetilebilmesi için online sistem geliştirilmiştir. Geliştirilen sistem internetin yaygın kullanıldığı günümüzde özellikle internet üzerinden başvuru alma modülü ile etkili bir şekilde başvuracak aday sayısı önemli ölçüde arttırmaktadır. Sistemin Erasmus programı sürecine kattığı katkıları;

Başvuru alma, yerleştirme, sonuç gösterme ve onaylama süreçlerinin zaman kısıtlarını belirleyebilme

İnternet üzerinden kısa sürede güvenli başvuru yapabilme

Adaylara sınav yerlerinin ve sonuçlarının internet üzerinden kısa sürede duyurulması

Adayların bilgilerine anında erişim

Puanlamaların otomatik olarak yapılması

Yerleştirmelerin otomatik yapılması ve sonuçların internet üzerinden duyurulması

şeklinde özetlenebilir. Verilen sayısal verilerle de sistemin Erasmus programına katılımı büyük oranda arttırdığı gösterilmiştir.

AVRUPA YETERLİLİKLER ÇERÇEVESİ KAPSAMINDA TÜRKİYE YÜKSEKÖĞRETİMDE SPOR EĞİTİMİ

[a]Yrd.Doç.Dr.Fehmi ÇALIK, [a]Yrd.Doç.Dr.Kürşad SERTBAŞ, [a]Yrd.Doç.Dr.Serdar GERİ

Sakarya Üniversitesi Beden Eğitimi ve Spor Yüksekokulu, 54187 Sakarya, Türkiye

Özet

Ülkemizde yükseköğretimin geçirdiği aşamalardan geçmeyen ve bilim dalı olarak ancak son 40 yılda kabul görmeye başlayan Beden Eğitimi ve Spor, çeşitli dönemlerde farklı kuruluşlara bağlı olarak değişik adlar altında çeşitli aşamalar geçirmiştir.

Türk yükseköğretiminde bazı bölümler, anabilim ve bilim dalları bilimsel yeterliliğini kurmakta çok geç kalmıştır. Avrupa'da birçok üniversitede ya bilim dalı olarak ya da diğer bilim dallarındaki öğrencilerin sosyal ihtiyaçlarını karşılamada yükseköğretimde spor ve sanat faaliyetleri diğer bilim dallarıyla eşit olarak gelişme gösterirken, aynı gelişimin Türk yükseköğretiminde olduğu söylenemez.

Bu çalışmanın amacı geçirdiği dönemler itibariyle Türkiye Yükseköğretiminde Beden Eğitimi ve Sporu incelemek; bu inceleme doğrultusunda gelecek yıllardaki misyon ve vizyonu hakkında öngörüler sunmaktır.

Ayrıca, Türkiye Yükseköğretiminde Beden Eğitimi ve Sporun tarihsel gelişimi incelenmiştir.

Sonuç olarak Türk Yükseköğretiminde Beden Eğitim ve Spor Yüksekokullarının gerek Avrupa birliği "Uyum Süreci" gerekse "Bologna Sürecinde" olması gereken yer ile şu anda bulunduğu yer hakkında öneriler sunulmuştur.

Anahtar kelimeler: Beden Eğitimi ve Spor, Bologna Süreci, Yükseköğretim.

Giriş

İnsan vücudunun belirli amaçlar için eğitilme düşüncesi insanlık tarihi kadar eskidir. En ilkel kavimler bile vücutlarını işletmesini bilmişlerdir. İlkçağlarda bir savaş eğitim aracı olan spor ve beden eğitimi, programlı olarak 1800'lü yıllarda eğitim çalışmalarına girerek 1900'lü yıllarda ülkeler arası barış ve propaganda vasıtasına dönüşerek hızla gelişmiştir. Özellikle İkinci Dünya Savaşı'ndan sonra spor bilimindeki gelişmelere paralel olarak antrenman bilimi de gelişmiştir (Sevim, Y. 1992 akt: Güçlü, M.2001).

Türkiye'de beden eğitimi kavramı, kurtuluş savaşı sonrası toplanan birinci maarif şurası 15 Temmuz 1923 yılında "birinci heyeti ilmiye" olarak eğitim tarihimize geçmiştir. Milli Eğitim bakanı İsmail Sefa beyin başkanlığında toplanan bu heyette Selim Sırrı Tarcan da bulunmaktadır. Bu heyetin çabalarında izcilik ve beden eğitimi 5. madde olarak kayda geçmiştir. Aynı yıl meclise gelen bu durum "ferdin bedeni ve fikri kabiliyetleri gibi ahlaki ve içtimai kabiliyetleri de inkişaf ettirilecektir" sözüyle beden eğitimi öğretmeni okulu açılacağı belirtilmiştir. Cumhuriyetin ilanından sonra ülkemizde açılan okullarda izcilik ve beden eğitimi dersinin yürütülmesinde eğitimci ihtiyacı açığa çıkmıştır. Bu açığın giderilmesi için kurulacak olan okullarda Beden eğitimi öğretmenlerini yetiştirmek üzere eğitimci bulma zorunluluğu da doğmuştur. Bu amaçla yurtdışına Vildan Aşır Savaşır, Nizamettin Kırşan ve Suat Hayri Ürgüplü gönderilmiştir.1926 yılında artan bu ihtiyacın kurslarla karşılanması için Çapa öğretmen okulunun yanına bir spor salonu yapılmıştır. Bir yıl sürecek bu kursa katılacak bayan ve erkek adaylar için yurtdışından eğitimci getirilmiştir. Kursun müdürlüğünü Selim Sırrı Tarcan yapmıştır. Bu kurstan başarıyla mezun olanlar orta dereceli okullara atanmış başarılı olamayanlar okullarına gönderilmiştir. Üç yıl bu alanda kabiliyeti olanlara verilen kursun hocalığını daha sonraki dönemlerde

yurtdışında eğitime gönderilen Vildan Aşır Savaşır ve Nizamettin Kırşan da yapar. Bu kurslar 1930 yılına kadar devam etmiştir. 1932-33 öğretim yılında Gazi Eğitim Enstitüsü Beden Eğitimi Bölümü kurulmuştur. Ülkemizde spor eğitimi öğretmen okullarının açıldığı illerde bazen kısa süreli kurslar bazen de tekâmül kurslarıyla yürütülmüştür (Şakar, F. 2011,akt:http://www.saglikllispor.com/spor/1909dan-bu-yana-tarihi-surec-icindebedenegitimi. html).

1970'li yıllarda Gençlik ve Spor Akademileri kurulmuştur. Bu akademiler esas itibariyle antrenör yetiştirmek amacıyla açılmış kurumlardır. 1980 yılından sonra Üniversitelerin Eğitim Fakülteleri bünyelerinde Beden Eğitimi ve Spor Öğretmenliği Bölümleri kurulmuştur. 1990'lardan sonra ise üniversitelerin Beden Eğitimi ve Spor Yüksekokulu bünyelerinde; Beden Eğitimi ve Spor Öğretmenliği, Spor Yöneticiliği, Rekreasyon ve Antrenörlük Eğitimi bölümleri spor eğitimini vermeye devam etmektedir.

Günümüz yükseköğretiminde beden eğitimi ve spor farklı enstitülerde ve anabilim dallarında hizmet vermektedir. Örneğin, bazı üniversitelerde beden eğitimi ve spor sağlık bilimlerine bağlı iken, bazılarında sosyal bilimler ve eğitim bilimleri enstitülerine bağlanmıştır. Bu durum, alanda yeterli sayıda öğretim üyesinin olmaması, hızlı ve plansız gelişimden kaynaklanmaktadır. Bu durumun öğrencilerin sosyal ve sportif ihtiyaçlarını karşılamada yetersiz kaldığı görülmektedir. Ülkemizde son 15 yıl içinde beden eğitimi ve spor yüksekokulları plansız ve altyapıları tamamlanmadan hızla çoğalmıştır. Bu yüksekokulların üniversitelere göre dağılım ve öğretim elemanı sayıları aşağıdaki gibidir (Bkz. Tablo 1-2).

Tablo 1: Beden Eğitimi ve Spor Yüksekokulu Bilgileri

Devlet Üniversitesi - BESYO	45
Özel Üniversite – BESYO	7
Toplam	52

Tablo 1'de görüleceği gibi Türkiye'de Devlet üniversiteleri bünyesinde 45, Özel üniversiteler bünyesinde 7 olmak üzere toplam 52 Beden Eğitimi ve Spor Yüksekokulu bulunmaktadır..

Tablo 2: Beden Eğitimi ve Spor Yüksekokulları Akademik Personel

Personel Ünvanı	n	%
Prof.	61	6,57
Doç.	29	3,1
Yrd. Doç.	286	30,81
Öğrt. Gör.	212	22,84
Araştırma Görevlisi	159	17,13
Okutman	181	19,5
Toplam	928	100

Tablo 2 'de görüleceği gibi, Beden Eğitimi ve Spor Yüksekokulları Akademik Personel sayıları Yrd. Doç. (%30,81) ve Öğrt. Gör. (%22,84) kadrolarında yoğunluk göstermektedir.

Günümüzde hızlı teknolojik gelişmelerle birlikte beden eğitimi ve sporun insan yaşamındaki önemi giderek artmış ve eğitim amaçlarının insana kazandırabileceği önemli bir disiplin durumuna gelmiştir. Çünkü beden eğitimi ve spor bireylerin fiziksel, zihinsel, duygusal ve sosyal gelişmelerini sağlayan bir bilimdir. Beden eğitimi

ve sporun bu işlevini yerine getirebilmesi için nitelikli, araştırıcı ve üretken beden eğitimi ve spor öğretmenlerinin yetiştirilmesi gereği ortaya çıkmıştır (Temel, C., Sunay H. 2002).

Bu çalışmanın amacı geçirdiği dönemler itibariyle Türkiye Yükseköğretiminde Beden Eğitimi ve Sporu, Bologna süreci eğitim yeterlilikleri ve Avrupa biriliği spor eğitim modelini incelemektir. Bu inceleme doğrultusunda gelecek yıllardaki misyon ve vizyonu hakkında öngörüler ortaya koymaktır.

Bologna Süreci ve Avrupa Yeterlilikler Çerçevesi

Avrupa Yükseköğretim alanı yaratmayı hedefleyen Bologna süreci beden eğitimi ve spor alanında da Avrupa'yla entegre olmamızı gerektirmektedir. Bologna Süreci, 2010 yılına kadar Avrupa Yükseköğretim Alanı yaratmayı hedefleyen bir reform sürecidir. Pek çok uluslararası kuruluşun işbirliği ile 47 üye ülke tarafından oluşturulan ve sürdürülen, alışılmışın dışında bir süreçtir. Sürece üyelik hükümetler/devletlerarası herhangi bir anlaşmaya dayanmamaktadır. Bologna Süreci kapsamında yayımlanan bildirilerin yasal bir bağlayıcılığı bulunmamaktadır. Süreç tamamen her ülkenin özgür iradeleri ile katıldıkları bir oluşumdur ve ülkeler Bologna Süreci'nin öngördüğü hedefleri kabul edip etmeme hakkına sahiptirler. Bologna Sürecinin oluşturmayı hedeflediği Avrupa Yükseköğretim Alanı içerisinde yer alan ülke vatandaşları, yükseköğrenim görmek ya da çalışmak amaçları ile Avrupa'da kolayca dolaşabileceklerdir. Avrupa, gerek yükseköğretim ve gerekse iş imkânları açısından dünyanın diğer bölgelerinden kişiler tarafından tercih edilir hale getirilecektir. Avrupa Yükseköğretim Alanında en gerçekleşmesi arzulanmayan şey, üye ülkelerin eğitim sistemlerinin tek tip yükseköğretim sistemi haline getirilmesidir. Avrupa Yükseköğretim Alanı'nda asıl hedeflenen, çeşitlilik ile birlik arasında bir denge kurulmasıdır. Amaç, yükseköğretim sistemlerinin kendilerine özgü farklılıkları korunarak birbirleriyle karşılaştırılabilir olması ve uyumlu hale getirilmesinden ibarettir. Bu şekilde, bir ülkeden ya da yükseköğretim sisteminden bir diğerine geçişin kolaylaşması ve böylece öğrenciler ve öğretim görevlilerin hareketliliği ve istihdamının artırılması planlanmaktadır (http://bologna.yok.gov.tr/?page=yazi&c=1&i=3).

Türkiye Yükseköğretim Yeterlilikler Çerçevesi (TYYÇ), Avrupa Birliği (AB) tarafından 2000 yılında yayınlanan Lizbon Stratejisi hedefleri ve ülkemizin 2001 yılında dahil olduğu, Bologna Süreci hedeflerine yönelik olarak, Bologna Süreci'ne üye ülkelerin yükseköğretim sistemlerinde şeffaflık, tanınma ve hareketliliği artırma amaçlarıyla 2010 yılına kadar oluşturmayı taahhüt ettikleri "yükseköğretim alanında ulusal yeterlilikler çerçevesi geliştirme" konusunda ulusal düzeyde gerçekleştirilen çalışmalar yükseköğretimin tüm iç ve dış paydaşlarıyla paylaşılmaktadır (http://tyyc.yok.gov.tr/).

Yükseköğretim alanında yeterlilik, herhangi bir yükseköğretim derecesini başarı ile tamamlayan bir kişinin neleri bilebileceği, neleri yapabileceği ve nelere yetkin olacağını ifade eder (http://tyyc.yok.gov.tr/).

Ulusal Yeterlilikler Çerçevesi ise, ulusal düzeyde bir eğitim sistemindeki yeterlilikleri ve bunların birbirleriyle ilişkilerini açıklar. Diğer bir deyişle, Ulusal Yeterlilikler Çerçevesi, ulusal ve uluslararası paydaşlarca tanınan ve ilişkilendirilebilen yeterliliklerin belirli bir düzen içerisinde yapılandırıldığı bir sistemdir. Bu sistem aracılığıyla, yükseköğretimde tüm yeterlilikler ve diğer öğrenme kazanımları açıklanabilir ve tutarlı bir şekilde birbiri ile ilişkilendirilebilir (http://tyyc.yok.gov.tr/).

Yeterliliklerin kazanılma derecesi, her ders / modül esnasında ve sonunda uygun ve nesnel yöntemlerle "öğrenme çıktıları" olarak ölçülür (http://tyyc.yok.gov.tr/).

Bu yeterlilik çerçevesinde ülkemizdeki ders sayıları ve kredilerinin sürece uyumlu hale getirilmesinin yeterli olamayacağı öğrenci seçiminden akademik yeterliliğe kadar bütün sistemin uyumlu hale dönüştürülmesi gereği düşünülmektedir. Sadece ders kredi saatlerinin aynı düzeyde olması öğrenme çıktılarının aynı olması, öğrenci, öğretmen ve program üçlüsünde değerlendirilmelidir. Avrupa'daki uygulamalar değerlendirildiğinde Avrupa yeterlilik çerçevesi Yükseköğretimdeki durumu göstermektedir.

Avrupa Yeterlilikler Çerçevesi Üç Ana Unsurdan Oluşur:

1.Öğrenme sonuçlarına dayanan bir takım ortak referans noktaları, 8 seviyelik bir yapı üzerine kurulmuştur. Her seviye; biçim, konum, zaman çizelgesi, öğrenme içeriğinin odak noktası (bilgi, yetenek, yeterlilik), değerlendirme, kalite kontrol düzenlemeleri, öğrencilere yönelik rehberlik ve nitelik kullanıcılarına yönelik rehberlik gibi belirli anahtar kavramlarla belirlenmektedir. Bu seviyeler, araştırmalardan elde edilen sonuçların analiz edilmesi ve Bologna'da Yüksek Öğretim aşamaları ile ilgili varılan mutabakatların ışığında belirlenmiştir.

2.Vatandaşların bireysel ihtiyaçlarına yönelik bir dizi destek araç-gereçleri (yaşam boyu öğrenme – Avrupa Eğitim Pasaportu için entegre bir Avrupa Kredi Transfer ve Biriktirme Sistemi.

3.Farklı seviyelerdeki paydaşlar arasında işbirliği için kılavuzlar sağlayan bir takım ortak ilke ve yöntemler – özellikle kalite güvencesine, geçerliliğe, rehberliğe ve anahtar becerilere odaklanan bir yapıdır (http://www.eseip.eu/index.php?option=com_content&task=view&id=37& Itemid=67).

Spor eğitiminde ulusal yeterlilikleri hazırlarken bu durum göz önüne alınabilir. Bologna sürecinde ve ulusal yeterlilikler çerçevesinin temeli ISCED (International Standard Classification of Education) dayanmaktadır. ISCED, UNESCO (Birleşmiş Milletler Eğitim, Bilim ve Kültür Organizasyonu) tarafından geliştirilen ISCED (International Standard Classification of Education), eğitim istatistiklerinin ve karşılaştırılabilir göstergelerin toplanması, derlenmesi ve bunların gerek ulusal gerek uluslararası düzeyde sunumu için uygun bir araç olarak tasarlanmıştır. ISCED standart kavram, tanım ve sınıflamaları sunmaktadır. İlk kez 1976 yılında yayınlanan ISCED, 1997 yılında revize edilmiş ve günümüze kadar pek çok ülke tarafından eğitim politikaları belirleme ve istatistik verilerinin toplanmasına yardımcı olma gibi amaçlara yönelik olarak kullanılmıştır. 2010 yılında UNESCO, eğitimle ilgili tüm paydaşlarla yeni bir istişare sürecine girmiş ve taslak olarak hazırladığı ISCED 2011 dokümanını paylaşmıştır. Söz konusu dokümanın 2011 yılı başında resmi olarak yayınlanması beklenmektedir. ISCED-1997'de, yapı olarak evrensel olması amacıyla, ülkelerde eğitim sisteminin geliştirilmesi açısından seviyesine bakılmaksızın uygulanabilir olması istenmiştir. Hem bireysel olarak ülkeler, hem de ülkeden ülkeye karşılaştırılabilir eğitim istatistiklerini ve göstergelerini derlemek ve sunmak için bir araç görevi görmesi amacıyla tasarlanmıştır (http://tyyc.yok.gov.tr/?pid=12).

Tablo 3: TYÇÇ, ISCED 97, EUROSTAT&CEDEFOP Eğitim ve Öğretim Alanları

ISCED 97, EUROSTAT&CEDEFOP EĞİTİM VE ÖĞRETİM ALANLARI				
ISCED GENEL ALAN KODU	GENEL ALANLAR	ISCED TEMEL ALAN KODU	EĞİTİM VE ÖĞRETİM TEMEL ALANLARI	EĞİTİM VE ÖĞRETİM ALANLARI

Tablo 3'de görüldüğü gibi, Eğitim Öğretim alanları içerisinde Spor Kişisel Hizmetler alanında yer almaktadır. Avrupa yükseköğretimi spor bilimleri açısından incelendiğinde aşağıda açıklanan modeller karşımıza çıkmaktadır.

AEHESIS Altı Adım Modeli (A6SM)

1. Adım: Profesyonel Alanın Tanımlanması

Bir profesyonel alan, özel sektörde genel olarak endüstri diye adlandırılan belirli servislerin ve eşyaların üretimine uygun aktiviteler dizisidir. Bir profesyonel alan belirli görev ve işlevler bütünü olarak tanımlanabilir ve her alan için bir "işlevsel harita" olarak hazırlanabilir. Burada ortaya çıkan sorulardan bir tanesi "endüstri"nin esasının ve limitlerinin mümkün olduğunca açık bir biçimde tanımlanmasıdır (http://www.eseip.eu).

2. Adım: Standart Meslekler

Bir standart meslek yapılan iş ya da mesleğin türüne göre tanımlanır. Bir meslek, belirli görevler ve sorumlulukların bir insan tarafından yerine getirilmesinin beklenmesidir. Standart bir meslek farklı ülkelerde başka standart mesleklere karşılık gelebilir. Temel görev ve sorumlulukları büyük oranda benzerlik gösteren bir dizi meslek sınıflandırılması gerekir. Farklı alanlar için standart meslekler aşağıdaki gibi belirlenmiştir.

Sağlık ve Fitness

İleri Gym Eğitmeni/ Kişisel Eğitmen

Sağlık ve Egzersiz Eğitmeni / Uzmanı

Halk Sağlığı Danışmanı

Sağlık ve Fitness Yöneticisi

Beden Eğitimi

Mesleğin standardı açısından 3 ana fonksiyonu vardır:

Beden Eğitimi öğretimi, bilgi, beceri ve kavramayı içerir.

Beden Eğitimi öğretimi, sağlıklı yaşam tarzını içerir.

Beden Eğitimi öğretimi, ders dışı spor faaliyetlerini içerir.

Antrenörlük

Bu mesleki alanda 2 temel standart belirlenmiştir.

A) Katılım-Odaklı (Herkes İçin Spor) Antrenörlük

Spora yeni başlayanlar için antrenörlük (Çocuk, Genç, Yetişkin)

Spor geçmişi olan katılımcılar için antrenörlük (Çocuk, Genç, Yetişkin)

B) Performans-Odaklı Sporcular İçin Antrenörlük

Yetenek Seçimi antrenörü

Yüksek Performans sporcusu antrenörü

Spor Yönetimi

Yerel yönetimlerde spor yöneticisi

Spor kulüpleri yöneticisi

Ulusal spor federasyonu yöneticisi

Özel spor işletmeciliği yöneticisi

3. Adım: Etkinlikler

Etkinlikler belli standart mesleklere karşılık gelen görev ve sorumluluklar olarak tanımlanır.

4. Adım: Yeterlilikler

Yeterlilik bilgiye başvurabilme, alanında uzmanlık sahibi olma, sabit ve değişken durumlara uyum sağlayabilme yetenekleri olarak tanımlanabilir.

5. Adım: Öğrenme Sonuçları

Programların sonucunda öğrencilerden beklenen genel ve özel öğrenme çıktılarının tanımlandığı bölümdür.

6. Adım: Müfredat Modeli

Bir eğitim faaliyetinde müfredat, takip edilen bir dizi etkinlik olarak tanımlanabilir ve eğitim amacı, içerik, yöntem, değerlendirme, araç-gereçler, öğretmen eğitimi ve eğitimcileri kapsar (http://www.eseip.eu).

Avrupa birliği spor eğitim sisteminden 6 adım modelinden 5 aşamalı geçiş süreci aşağıda belirtilmiştir:

Yeni Beş Aşamalı Sistem (5PF)

Dört alanın araştırma grupları tarafından bir matris olarak spor eğitimi ile ilgili veri elde etmek için kullanılan altı adım modeli, spor eğitiminde yeni bir müfredat geliştirme modeli ortaya çıkarmıştır. Altı adım modeli, spor eğitim alanlarından dört tanesinde bir çerçeve planı olarak kullanılmıştır.

1.Aşama: Müfredat Kaynağı Tasarımı

Eğer müfredat planlaması sonuçlarının iş gücü ihtiyaçları ile uyumlu olması bekleniyorsa, müfredat gelişim sürecinin en başında kimin – hangi ihtiyaçlarının hedeflenmekte olduğunun net bir biçimde belirlenmesi gerekir. Sistemlerin ve uygulamaların etkili olması için müfredat yapı ve konularının alana hakim profesyoneller ve taraflar ile tartışılması, hedef grupların (müfredatı hazırlayanların, profesyonellerin, karar alıcıların vb) taleplerine uygun olması ve hedef kitle tarafından kolay anlaşılabilecek nitelikte olması gerekir (http://www.eseip.eu).

2.Aşama: Müfredat Kaynağı Belirleme

Eğitim ve istihdamın birbiriyle bağlantılı olmasını ve profesyonel partnerlerin işbirliği hedef kitleye ulaşacak içerikle ilgili daha net tanım ve açıklamalara imkân sağlar. Spor alanı dört temel bölümden oluşmaktadır. Her alan kendi bölgesini, sınırlarını ve aynı zamanda da diğer meslek alanlarıyla olan bağlantılarını belirler. Standart meslekler, hedef kitleye basit ve açık bir biçimde iletilir, profesyonel bağlamda onlardan beklenen temel etkinlik ve görevlerin tanımları iletilir (http://www.eseip.eu).

3. Aşama: Müfredat Amaçlarının Belirlenmesi

Geçmişte müfredat hedefleri akademik eğitime göre uyarlanmaktaydı. Eğer işgücü ihtiyaçları ile ilişki kurulmak isteniyorsa, müfredat tasarlayanlar ve geliştirenler profesyonel yeterlilikleri spor eğitim sisteminin esas amacı olarak mutlaka göz önünde bulundurmalıdırlar (http://www.eseip.eu).

4. Aşama: Müfredat içeriklerinin belirlenmesi

Milli ve bölgesel düzenlemelerin farklılıklarına uygun olarak, müfredat içeriği eğitim kurumlarına esneklik ve uyum kazandıran prensiplere bağlı kalarak hazırlanmıştır. Klasik olarak müfredat, öğrencilerin profesyonel yeterlilikleriyle bağlantılı öğrenme sonuçlarına göre ayarlanmıştır. Öğrenme sonuçlarının tamamını derinlemesine ele almak amacıyla çalışma alanlarına dağıtılmıştır (http://www.eseip.eu).

5.Aşama: Müfredat Sonuçlarının Denetimi

Müfredat sonuçlarını takip etmek amacıyla, "düzenleme" süreci tarafından müfredat geliştirilmesinde denetleyici kontrol özelliği tasarlanmıştır. Bu nedenle her eğitim kurumu taraflarla ilişkilendirilmiş bir kalite kontrol sistemi hazırlar. Bu düzenleme süreci bir onay süreci ile sürdürülebilir. Bu, yenilenmeye ya da spor eğitimi alanındaki topluluğun tamamı tarafından altı başlık tanımlarının onaylanmasına olanak sağlar (http://www.eseip.eu).

TARTIŞMA

Bologna Anlaşmasının ruhuna uygun olarak Avrupa genelde Yükseköğretim kurumlarında geçerli olacak Beden Eğitimi Öğretmenliği müfredatı geliştirilmiştir (Hardman K, Klein G, Patriksson G, Rychteckı A, Costa C. F, 2011).

Türkiye Bologna uyum sürecinde Beden Eğitimi Öğretmenliği programını Avrupa'daki üniversitelerdeki eğitime paralel hale getirmelidir. Avrupa birliği "spor üzerine beyaz kitap" diye adlandırdığı raporunda üç temel noktadan bahseder; birincisi sporun toplumsal rolü ikincisi ekonomik boyutu bir diğeri ise organizasyon boyutudur (Gürten K, 2010). Avrupa Birliği'nde spor tartışmasında bir diğer önemli konu da, 'sporun eğitsel ve toplumsal rolünün güçlendirilmesidir (Balcı V, 2002). Avrupa birliği spor politikası eğitim, halk sağlığı, sosyal ve kültürel, dinlendirme ve eğlendirme faaliyetleri kapsamında gelişmektedir (Atalı L, Sertbaş K, 2003).

Sağlık ve Fitness alanındaki toplu etkinlikler, fiziksel uygunluk, davranışlar, sağlık veya fitness ile ilgili politikalar olmak üzere iki alt bölümden oluşur (PilKington A, 2011). İlgili müfredat planlamaları bu doğrultuda yapılmalıdır. Avrupa birliği sürecinde özellikle sağlık ve fitness alanındaki topluma yönelik etkinliklerin liderlerini yetiştirmede Beden Eğitimi ve Spor Yüksekokullarının ilgili bölümleri etkin hale getirilebilir.

Avrupa konseyi antrenörlük niteliklerinin tanınması için Spor Bilimleri Eğitim ve İstihdam Avrupa Ağı isimli bir alt komite ile çalışmaktadır. Bu komitenin çalışmaları sonucunda Antrenörlük kurslarıyla Avrupa Antrenörlük Eğitimi nitelikleri arasında yakın bir ilişki olduğu tespit edilmiştir. Bu çalışmalar Avrupa antrenörlük konseyi (ECC) uluslar arası federasyonlar, Avrupa Olimpiyat Komitesi, Avrupa Spor Eğitim Bilgi Ağı (ICCE) ile işbirliği içerisindedir (Duffy P, 2011).

Türkiye'de iki tür antrenör yetişmektedir. Birincisi kurslarla yetiştirilen antrenörler, ikincisi yükseköğretim kurumlarının dört yıllık lisans eğitimiyle yetişen antrenörlerdir. Bu yapının Avrupa ile paralel olarak düzeltilmesi gerekmektedir.

Avrupa'da, spor yönetimi müfredat geliştirme çalışmaları, Avrupa Spor Yönetimi Birliği (EASM) ve Avrupa Spor Bilimleri Yükseköğrenim Yapısının Standardizasyonu (AEHESIS) işbirliğiyle gerçekleştirilmiştir (Cingiene V, Puronaho K, 2011). Türkiye'de spor yönetimi eğitiminin standardizasyonu ve yeterlilikleri belirleme sürecinde kalite uygulamaları göz önüne alınarak spor federasyonları ve diğer paydaşlar ile işbirliği içinde hazırlanmalıdır.

Avrupa Birliği Spor Eğitim Bilgi Platformu (ESEIP), Avrupa Spor Yönetimi Birliği (EASM) ve ilgili birçok yapılanma spor eğitiminin, beden eğitimi, antrenörlük, sağlık ve fitness, spor yönetimi alanlarında şekillendiğini araştırmaları ile standart hale getirmişlerdir. TYÇÇ Temel alan yeterlilikleri içerisinde Antrenörlük Eğitimi, Spor Yöneticiliği ve Rekreasyon Bölümleri 81 kodlu kişisel hizmetler alanında tanımlanmaktadır (Bkz Tablo 3).

Ancak ilgili alanlardaki mevcut müfredat ve Avrupa Birliği örnekleri dikkate alındığında bölüm hizmet içeriği ve kapsamı gereği kişisel hizmetlerin yanı sıra, Öğretmen Yetiştirme ve Eğitim Bilimleri (Kod 14), İşletme Yönetim Bilimleri (Kod 34) gibi bölümlere göre temel alan yeterlilikleri tekrar sınıflandırılmalıdır.

Üniversitelerin özel yetenek sınav sistemi ile öğrenci alan Beden Eğitimi ve Spor Yüksekokullarının eğitim-öğretim yeterlilikleri sadece öğrenci ve öğretim çıktıları açısından ele alınmamalı, Akademik Personel yapılanmasının da Avrupa Birliği gibi sistematik bir şekilde ele alınması gerekmektedir.

Sonuç ve Öneriler

Türkiye yükseköğretimin de beden eğitimi ve spor eğitimi, Bologna süreci ve yeterlilikler çerçevesinde yeniden yapılanma içerisindedir. Bu yapılanmada, temel alanların belirlenmesi Bologna sürecinde spor eğitim müfredatı dikkate alınarak tekrar gözden geçirilmelidir.

Bu paralelde üniversitelerin Beden eğitim ve spor yüksekokullarının Bologna uyum sürecini kalite çalışmaları ile birlikte yürütmelerinde yarar vardır.

Bologna uyum süreci kapsamında öğrenci odaklı olarak ele alınan bu sistem, Beden eğitimi ve spor yüksekokullarında görevli akademik personelin akademik yükseltme ve kariyer planlama süreçleri de göz önüne alınarak yapılandırılmalıdır.

Antrenörlük Eğitimi, Spor Yöneticiliği ve Rekreasyon Bölümleri ile ilgili ISCED temel alınarak yapılmış olan TYÇÇ temel alan yeterlilikleri tekrar sınıflandırılmalıdır. Bu sınıflandırmada Avrupa modellerinin temel bölümlerine ilave olarak "Engellilerde Hareket Eğitimi ve Spor Bölümü" de eklenmelidir.

Professora do Instituto de Biologia, Departamento de Imunobiologia, UFF, Niterói, 24000, Brasil

Abstract

The objective of the present article is to discuss the production, socialization and application of two educational films aiming at the improvement of science teaching. The films dealt with the biological concept of life and its origin. In addition to being widely socialized, the films were used in three disciplines: Biology of Knowledge, Special Topics of Biology and Evolution. Besides the discussion of the content, the students' understanding of the film was also evaluated based on a questionnaire containing ten specific questions. The results showed that the students' understanding of the film's content was satisfactory (concepts A and B).

Keywords: Educational film; science teaching, life, origin of life; autopoiesis, evolution.

1. Introdução

A inter-relação entre cinema, educação e ciência foi inaugurada em 1902, com o filme de ficção científica intitulado "Le voyage dans la lune" de Georges Méliés, baseado no romance homônimo de Júlio Verne (Cunha & Giordin, 2009). De lá para cá, o cinema se consolidou como veiculo de comunicação de massa, projetando imagens e criando representações sobre quase todos os temas, incluindo a ciência, os cientistas e suas invenções. É a partir dos referenciais simbólicos construídos pelo cinema que uma boa parte da sociedade vislumbra, concebe e julga os cientistas e o fazer da ciência, seja como uma atividade humana como outra qualquer, contudo diferenciada, seja como uma atividade estereotipada, salvacionista ou nefasta (Oliveira, 2007).

No Brasil, a preocupação com a produção do filme de cunho educativo e científico teve inicio com a criação, em 1936, do Instituto Nacional de Cinema Educativo (INCE). Este Instituto perdurou até 1947 e chegou a produzir 72 filmes educativos nos seus 11 anos de existência (Lima & Miranda Sá, 2008). Desde então, o Brasil não possui um setor ou instância estratégica responsável em produzir, apoiar ou mesmo sistematizar a escassa produção deste gênero de filme.

Considerando o grande potencial do cinema na criação de representações coletivas e mitos urbanos e a lacuna existente na produção de filmes educativos de cunho científico no Brasil, decidimos nos aventurar na produção deste gênero de filme para utilizá-los como material didático no ensino de ciências. Para justificar tal empreendimento, partimos de duas constatações e de duas premissas, quais sejam: (a) o ensino de ciências está em crise e isto pode ser mensurado pelo fraco desempenho dos estudantes brasileiros nos testes do "Programme for International Student Assessment" (PISA) (Academia Brasileira de Ciências, 2008); (b) parte desta crise se deve à alienação dos estudantes frente aos conteúdos científicos que lhes são apresentados de forma monótona e descontextualizada (Bizzo, 2009); (c) "tanto na ciência, como na arte, o que buscamos é um elo com o mundo" (Bachelard, 1989) e (d) este elo pode ser facilitado e fortalecido pelas atividades lúdicas, como o cinema (Duarte, 2006).

Nesta perspectiva, traçamos três grandes objetivos para a realização deste trabalho, quais sejam: (a) produzir filmes educativos de cunho científico, envolvendo os próprios estudantes na criação e produção; (b) socializar os filmes de forma ampla e gratuita e (c) aplicá-los no ensino formal.

2. Metodologia

Ainda que de forma não-linear, a realização de nosso trabalho seguiu as seis etapas enumeradas a seguir: 1ª) Envolvimento dos estudantes e docentes no processo de escolha de conteúdos de aprendizagem desafiadores do ponto vista educacional e lúdico, com vistas à produção dos filmes educativos; 2ª) Produção de roteiro literário e técnico a partir da pesquisa bibliográfica, decodificação e resignificação de conteúdos educacionais; 3ª) Captação de recursos financeiros junto às agencias de fomento e/ou fundações educacionais; 4ª) Construção de cenários, ensaio de elenco e produção de imagens e cenas; 5ª) Produção, divulgação, distribuição e socialização dos filmes em Portal apropriado, como o Vimeo e 6ª) Aplicação dos filmes em espaços educacionais formais e informais.

3. Resultados e Discussão

Partindo de nossa experiência didática com estudantes de biologia, decidimos abordar dois temas inter-relacionados: o conceito biológico de vida e a origem da vida (Andrade & Silva, 2003 a e b). A escolha do primeiro tema se deveu a uma ausência, quase que completa, de material didático específico sobre o conceito biológico de vida. A escolha do segundo – a origem da vida – se deveu a duas razões principais: uma relacionada à riqueza deste tema para o ensino de ciências – uma questão aberta, plena de hipóteses explicativas; a outra relacionada ao tensionamento provocado pelas concepções prévias de matiz religioso no campo laico da educação que, se não forem bem conduzidas pelo professor, se tornam um obstáculo para o livre pensar.

3.1- Envolvimento e participação dos estudantes

A participação voluntária e gratuita de mais de 200 estudantes - universitários e secundaristas - na produção de nossos dois filmes é o melhor indicador do envolvimento do corpo discente. Considerando que 98% destes participantes nunca estiveram na frente de uma câmera e o roteirista e diretor não é um cineasta profissional, nosso trabalho é, assumidamente, amador. Apesar deste amadorismo ter dificultado a realização de algumas cenas, ele nos proporcionou uma maior liberdade na criação, posto que as exigências, cobranças e expectativas eram menores. Há de se ressaltar, no entanto, que isto é válido somente durante o processo de criação. Quando o filme é divulgado pela mídia, as cobranças são maiores e a qualidade do filme (imagens, som e conteúdo) torna-se o fator preponderante para o sucesso ou insucesso do empreendimento – a aceitação do público.

3.2- Filmes produzidos e abordagem reflexiva

O primeiro filme, intitulado "Quem foi que disse: sobre a vida e o viver", com 55 minutos de duração, doravante chamado de Filme 1, foi realizado durante o ano de 2008 e divulgado a partir de 2009. Ele pode ser visto integralmente no Vimeo (http://vimeo.com/28168576). O segundo filme, intitulado "Quem foi que disse: sobre a origem da vida", com 38 minutos de duração, realizado em 2010, doravante chamado de Filme 2, está disponível no Vimeo (http://vimeo.com/28032795).

Considerando que a nossa produção é marcada pela polifonia e pelo convite à reflexão, fizemos da pergunta "quem foi que disse?" nossa marca. Com ela chamamos atenção para a importância do observador. Quem diz? Um observador. Para quem? Para outro observador. Sobre o que? O tema a ser apresentado e discutido. Assim, quem foi que disse deixou de ser parte do título de um filme para se transformar em uma série educativa. Neste contexto, as perguntas e os argumentos produzidos nos diálogos são mais importantes do que as respostas prontas e acabadas.

Assim, na discussão entre religião e ciência, por exemplo, tentamos mostrar que a questão principal não é vencer ou "derrubar" os argumentos religiosos com fatos científicos ou, de outro modo, "subjugar", pelo racionalismo científico, a crença religiosa de uma criação divina. Para nós, o melhor encaminhamento para este debate é mostrar aos estudantes e ao público em geral que os discursos destes dois sistemas de conhecimento, religião e ciência, são diferentes, seja pela forma pela qual eles são construídos, seja pelos critérios de validação de suas proposições (cenas: 43'35" a 47'20" do Filme 1; 34'40'' a 37' do Filme 2).

Com relação aos conteúdos científicos, procuramos ressaltar a importância dos conceitos, contextualizar historicamente as perguntas (Figura 1), ilustrar os experimentos e criar modelos e alegorias para conceitos mais densos, de difícil compreensão como, por exemplo, a auto-catálise de Kauffman (1995) (cenas: 29'30" a 31'55" do Filme 2) e a autopoiesis de Maturana (1970) (cenas: 37'26" a 39'15" do Filme 1; 32' a 34'37" do Filme 2).

Figura 1 – "Louis Pasteur" apontando o microscópio em cena do filme 2

3.3- Divulgação e socialização dos filmes

Várias estratégias foram utilizadas para divulgar e socializar os conteúdos dos dois filmes da série educativa "quem foi que disse?". Assim, foram produzidos e distribuídos cerca de 1000 cópias DVD para os atores, professores e instituições escolares. Seguindo o mesmo objetivo de socialização, os filmes foram postados, na íntegra, no Portal do Vimeo (com cerca de 2000 acessos, ao todo) e vinculados, através de links, às redes sociais, como o facebook e a um blog educacional de mesmo nome (http://quemfoiquedisse.blogspot.com.br/). Para além desta divulgação na internet, nossos filmes foram veiculados na TV Universitária da Universidade Federal Fluminense (http://www.uff.br/uniteve/), no Teatro desta mesma Universidade e em diversos colégios da rede pública do Estado do Rio de Janeiro, Brasil.

3.4- Aplicação dos filmes

Não dispomos dos registros da aplicação de nossos filmes nos diferentes contextos da educação formal ou não-formal no Brasil. É possível fazer, no entanto, um breve relato das experiências de uma comunidade virtual de práticas - a ComPratica - coordenada pelo Professor Charbel El-Hani, da Universidade Federal da Bahia (El-Hani & Greca, 2011) e de algumas experiências realizadas no seio de nossa própria Instituição, a Universidade Federal Fluminense (UFF).

Assim, na comunidade virtual de prática, pensada e criada como uma ferramenta para diminuir a lacuna existente entre a pesquisa e a prática docente na sala de aula, os vídeos da serie educativa "quem foi que disse" foram utilizados como um desafio na preparação de planos de aula (http://www.moodle.ufba.br/mod/forum/discuss.php?d=18531&parent=309057).

Na Universidade Federal Fluminense, o filme "Quem foi que disse: sobre a vida e o viver" (Filme 1) foi apresentado e discutido na disciplina de Evolução pelo Prof. Edson Pereira da Silva (EPS), abrangendo um contingente de 80 estudantes do Curso de Graduação em Biologia e nas disciplinas de Biologia do Conhecimento e Tópicos Especiais em Biologia, ministradas pelo Prof. Luiz Andrade (LA), abrangendo cerca de 200 estudantes do referido Curso.

Na disciplina de Evolução, o filme foi utilizado para suscitar discussões específicas como, por exemplo, as ideias de transformismo e progresso, muito arraigadas nas concepções prévias dos estudantes. Para além destas discussões, o Prof. EPS aplicou um questionário, com questões específicas, para avaliar a compreensão dos estudantes da disciplina de Evolução em relação ao conteúdo do Filme 1. A avaliação e quantificação das respostas dos estudantes, em relação a um gabarito previamente definido, permitiu mensurar o nível de compreensão dos estudantes para as questões formuladas. Na Tabela 1 estão listadas as perguntas. O momento em que a cena correspondente à cada questão aparece no Filme (X' = tempo em minutos e X"= tempo em segundos) e a média de acerto dos estudantes para cada questão. Quando as respostas para estas questões foram analisadas no seu conjunto, os estudantes (41) da turma de 2009 ficaram com média geral 9,19 (conceito A) e os estudantes (39) da turma de 2010 ficaram com média geral 8,74 (conceito B).

Tabela 1. Questionário aplicado aos estudantes de Evolução sobre o conteúdo do Filme 1.

Questões de aprendizagem	Cena correspondente	Nota (média de acertos)
1- Qual a idade estimada da vida na Terra?	7' e 20''	10,0
2- Explique por que a metáfora da árvore é mais adequada para explicar a evolução da vida na Terra do que a idéia de um transformismo das espécies.	7' e 50''	6,9
3- A parte ficcional do filme foi construída em função de uma pergunta: O que é vida? Para além disso, qual é a outra questão fundamental que a ficção encerra?	8' e 35''	7,3
4- Segundo Charbel El-Hani, o termo vida é *"prenhe de significados"*. Quais idéias/discursos/significados é possível identificar na fala das pessoas no ônibus quando elas respondem à questão: o que é vida?	28' e 18''	8,2
5- Por quê o Dr. Martin Makler afirma que "somos *poeira de estrelas"*?	31' e 45''	8,8
6- Qual a diferença entre conceitos classificatórios e comparativos?	33' e 12''	8,1
7- Vírus e a Terra podem ser considerados seres vivos? Explique a sua resposta.	33' e 50''	7,3
8- O que significa dizer que os seres vivos são operacionalmente fechados, contudo, termodinamicamente abertos?	37' e 22''	6,1
9- Qual o problema de se definir vida como uma lista de predicados? Qual a solução para este problema?	39'	6,1
10- Respondam vocês mesmos a pergunta da Aline: "Haverá uma resposta definitiva para o problema do que é vida?" Por que você pensa assim?	46' e 35''	7,3

Para se ter uma idéia do grau de dificuldade das questões formuladas, apresentamos o gabarito que serviu de base para as correções dos relatórios dos estudantes. Questão 1: A idade estimada da vida na Terra é de 3,8 bilhões de anos. Questão 2- A idéia equivocada do transformismo - a transmutação de uma espécie em outra ao longo do tempo – está geralmente associada a outro equivoco, a idéia de um sentido, o fim último do processo evolutivo: o aparecimento da espécie humana. De fato, o processo evolutivo não é linear, mas ramificado e não existe finalismo nem o sentido de progresso e, portanto, não há espécies mais ou menos evoluídas. O processo evolutivo é lento e gradual, de sobrevivência diferencial dos indivíduos que tem alguma vantagem dentro de uma população. Se pudéssemos observar o processo evolutivo no tempo, a perspectiva seria de um grupo diverso se dividindo em dois grupos diversos e esses dois grupos, ainda diversos, se dividindo em mais dois e assim por diante. Destarte, o que melhor descreveria a evolução seria uma árvore. O surgimento de novos ramos (ramificação) seria o surgimento de novas espécies e a quebra de ramos seria a extinção. Questão 3: A linguagem é fundamental para o surgimento da cultura e como mediadora do conhecimento. Questão 4: Senso comum, religião, saber ensinado. Questão 5: Porque todos os átomos pesados que participam da constituição dos seres

vivos tiveram suas origens a partir dos átomos mais leves, Hidrogênio e Hélio, em reações nucleares ocorridas nas estrelas. Questão 6: Os conceitos classificatórios não distinguem ou valorizam as formas intermediárias, são conceitos do tipo "tudo ou nada". Os conceitos comparativos distiguem e valorizam as formas intermediárias, ou seja, o "mais ou menos". Questão 7: Uma lista de predicados (características) não é uma explicação, porque ela não propõe um mecanismo gerativo que, posto a operar, produz a fenomelogia do vivo ou o próprio ser vivo. Para além disto torna-se difícil estabelecer quais predicados são necessários e suficientes para abarcar toda da biodiversidade, presente e passada. A solução seria a proposição de um mecanismo gerativo como, por exemplo, a organização autopoiética proposta por Humberto Maturana (1970/1980; 2002). Questão 8: Um sistema operacionalmente fechado não permite instrução de fora para dentro. Ele é autonômo e, portanto, só obedece a uma lei que lhe é interior. Um sistema termodinâmicamente aberto aceita trocas de matéria e energia com o meio. Assim, os sistemas vivos, enquanto sistemas autonômos, são operacionalmente fechados. No entanto, enquanto sistemas que trocam matéria e energia com o meio, eles são termodinamicamente abertos. Questão 9: Seguindo o modelo da autopoiesis, os virus não são seres vivos porque lhes faltam as dinâmicas moleculares autonômas – produção de moléculas constitutivas da produção de moléculas que se auto produzem e especificam uma fronteira. Quanto à Terra, seguindo o modelo da autopoiesis, ela também não é um sistema vivo porque lhe falta a dinâmica molecular autonôma. No entanto, a questão pode ser rediscutida em outro nível. Se o observador considerar a Terra, não como um organismo, mas como um super-organismo, constituído de sistemas vivos - os organismos - neste caso, poder-se-ia considerar a Terra como um sistema autopoiético de 3ª ordem, apoiando assim a Teoria de Gaia, proposta por James Lovelock e Lynn Magulis (1974). De outra maneira, poder-se-ia também utilizar de conceitos comparativos, como sugerido por Charbel El-Hani (cena: 33'10" do Filme 1), para afirmar que a Terra é "mais ou menos" viva. Questão 10: Não, porque todo e qualquer enunciado da ciência é passível de ser refutado. Para além disto, os diferentes sistemas de conhecimento aceitam diferentes critérios de validação de suas explicações e, finalmente, porque as diferentes culturas produzem diferentes verdades.

Nas disciplinas "Biologia do Conhecimento" e "Tópicos Especiais de Biologia", ambas ministradas pelo Prof. LA, os filmes são utilizados para suscitar discussões em torno dos conceitos de vida, autopoiese, organização biológica, clausura operacional e linguagem. O Filme 2 é utilizado para apresentar e discutir o conteúdo relativo à origem da vida. De uma forma geral, buscamos as concepções prévias dos estudantes para análise e desenvolvimento de estratégias pedagógicas e, na seqüência, os filmes são apresentados pausadamente, ressaltando-se as cenas que exigem maiores explicações ou que vão de encontro às concepções prévias dos estudantes, previamente identificadas e analisadas.

Quanto à aceitabilidade dos dois filmes pelos estudantes e pelo público, podemos afirmar que ela é maior no público mais adulto do que na juventude, acostumada com os filmes de ação. A parte isto, nossos filmes têm sido elogiados por professores do ensino médio e universitário, dentro e fora do Estado do Rio de Janeiro (http://www.moodle.ufba.br/mod/forum/discuss.php?d=18531) e por setores científicos e educacionais, como a FAPERJ (http://www.faperj.br/boletim_interna.phtml?obj_id=7687) e o Instituto Ciência Hoje (http://cienciahoje.uol.com.br/alo-professor/intervalo/2011/12/luz-camera-ciencia).

Fazendo uma análise conjunta de nosso trabalho, acreditamos que tenhamos conseguido atingir os nossos objetivos, quais sejam: produzir, socializar e aplicar filmes educativos de boa qualidade com vistas a melhorar o ensino de ciências.

4. Conclusões e recomendações

O nosso trabalho mostra que é possível produzir material didático interdisciplinar, intercultural e lúdico em ambiente universitário, através da arte cinematográfica. Contando com o apoio institucional, é possível construir cenários e envolver estudantes e docentes nas produções cinematográficas, mesmo que eles sejam amadores. Esta experiência construtivista, vivenciada junto aos nossos colegas docentes e graduandos, desmistifica a exclusividade da linguagem cinematográfica para o uso de poucos iniciados e o próprio uso da técnica, cada vez mais facilitada e socializada pelas novas tecnologias da informação e comunicação. Podemos concluir, também, que o filme educativo é um bom recurso didático para o ensino de ciências, especialmente nas situações em que

ele é utilizado com objetivos pedagógicos claros e, fundamentalmente, quando o seu conteúdo é bem discutido e avaliado.

A título de recomendação, nosso trabalho sinaliza a importância de se produzir mais filmes educativos nacionais, sem abrir mão, no entanto, da supervisão de um docente, posto que todo filme, para além do seu conteúdo científico, estético e poético é, também, portador de mensagens politico-ideológicas que devem ser decodificadas pelos professores e estudantes.

A CHILD IN THE CULTURE OF SILENCE? THE MEANING AND COMMUNICATION IN CHILDREN'S DRAWINGS

Małgorzata Anna Karczmarzyk

University of Gdańsk, ul. Bażyńskiego 4, 80-952 Gdańsk, Poland

Abstract

I assumed that artistic activity performs a role of a drawing-text, by which a child can communicate with the outside world and to overcome the culture of silence which is imposed on him/her by the adults. A six-year-old creator draws things which he/she finds important and shows it through particular signs. Communication and its effect taking form of a drawing given to others constitute a drawing message. A child creates drawings and provides certain sense and meanings for both his/her activity and its visual effect. As a result emerges a new kind of the communication plane between a child and an adult. However, it is not easy to reach an agreement there.

Keywords: children's drawing, voice-drawing, drawing-message, drawing-text, analytical methodology of the meaning of drawings, CDA, drawing as communication, polysemy of drawing

1. Introduction

Why does a child draw? What does he or she want to tell us? Why are the first steps such as drawn words and colorful thinking so important? How can the environment influence the communication in the drawings? And what meanings are important enough to make them comprehensible for parents, teachers and psychologists? Is it possible that drawing can be the voice of the child? How to speak by the drawing language? What kind of potential communication barriers can we encounter in differentiating the meanings? What kind of similarities and differences could occur in constructing and reading the meanings of a drawing-message by children and adults? What kind of pedagogical consequences could the discovery of a net of shared meanings related to a drawing and constructing by different social groups have (Karczmarzyk, 2011)?

These questions are at the core of my research. I assumed that artistic activity performs a role of a drawing-text, by which a child can communicate with the outside world and to overcome the culture of silence which is imposed on him/her by the adults. A six-year-old creator draws things which he/she finds important and shows it through particular signs. Communication and its effect taking form of a drawing given to others constitute a drawing message. A child creates drawings and provides certain sense and meanings for both his/her activity and its visual effect. As a result emerges a new kind of the communication plane between a child and an adult. However, it is not easy to reach an agreement there.

1.1. Meaning and communication

Due to the fact that: semiotics examines all cultural phenomena as if they were sign systems, and assuming a hypothesis that cultural phenomena are indeed sign systems, they are also communication phenomena (Eco, 2003: 35), it is possible to state that all kinds of communication, either verbal or nonverbal, are based on semiotics. Therefore, pictorial communication owns certain forms which according to a semiotic perspective can be called signs, creating a specific text – drawing meant to be read by a receiver. Since in the next part of this article I would like to analyze the significance of drawing and phenomena concerning differentiating and operationalizing of a pictorial message, I would like to start by defining the theory of signs.

A sign is perceived in a twofold manner by different researchers. Employing structuralist theories, we may state that a sign is everything that enables an individual to communicate and express him/herself and that there is

an ideal structure explaining all communication interrelations. This structuralist conception is characterized by determinism; research approach I am employing does not have to lead to determined settlements. Therefore, adopted here is a methodology not based on the superior aim to find an ideal structure in communication, but instead it refers to thinking about values connected with the description of a multitude of communication patterns. My own research belongs then to a poststructuralist trend characterized by the lack of one superior and objective view of knowledge about a subject and having a discursive character. (Nycz R.,1993:54).

For Charles Sanders Peirce the concept of a sign is crucial and determines almost all. His conception sees a sign as a tripartite unity (Peirce, 1997:137)

- representamen (first correlate of a triadic relation),
- object (second correlate of a triadic relation),
- interpretant (third correlate of a triadic relation).

Following Peirce's theory I use his correlates, but I also introduce others terms connected with this area such as: *a drawing-message, a drawing-text or a pictorial text, the semantic content, drawing communication.* Others categories employed in my research include: *drawing code, drawing sign, polysemy of drawing, drawingness.*

For this article, I will define these other categories: drawing-message, drawing – text, pictorial text it is product of child's thinking; what the child thinks and is translated into drawing; drawing communication – it is art - product which is also a communication medium between sender and recipient/ reader of a message; drawing sign – It is an art-product, or more specifically drawing of the child and elements in the drawing; polysemy of drawing – multiplicity of meanings given to the iconic sign by other readers of children's drawing (here: early education expert, psychologist, artist).

2. Research methodology

Owing to the interest in child's drawings together with the network of "ascribed" meanings I am conducting this research in the paradigm defined as "the radical humanism paradigm" (Kostera, 2005). It is based on the assumption of relativity and inter-subjectivity of the reality created by hidden social forces, invisible by an average man.

Due to the fact that I decided on the quality methodology I abandoned making hypothesis and turning to the "naive-investigative" approach. What is also relevant to me is the lack of a poised conceptual network (or to be more precise, creating it while analyzing the material) and using the language of the objects under investigation to describe the observed reality in the most precise way. The main subject of main investigation is description of multiplicity of various meanings given to a single drawing of family related subjects and presenting it as a specific visual communicate which becomes a relevant voice of a child. I use semiotic analysis as defined by Umberto Eco - so called "open work"(Eco, 2003: 35), the methodology of drawings' meaning analysis of my own and Critical Discourse Analysis (Duszak, 2008). All these methods complement each other.

My analysis was composed of a few research procedures based on following methods:

- collecting the research data in the form of drawings made by the six-year-old children with purposely stated subject,
- the nonstandarized interview with the respondents who belong to 3 groups (six-year-old authors of drawings, second – persons known to children and emotionally involved: parents or carers, third - persons not known to a child such as professionals: educators, psychologists, artists),
- qualitative analysis of collected data.

The main subject of my study is the description of the multiplicity of meanings imparted to one picture of a family and presentation it as a special visual message. My aim is, however, not to analyze family relations. Therefore, it is not import for me to examine the character of family bunds, children's feelings or emotions between a child and the interpreter of a drawing. All of those aspects can be analyze with the aid of a

psychological projective test. My research aims at recognizing the communicative and semantic potential of children's artistic works. The semiotic analysis of children's drawings and verbal analysis from different representatives - CDA (interviews with 28 parents, 20 education experts, 7 artists, and 5 psychologists) are to help me to show the meanings and the communication aspects of this process. The own test method extends the possibilities of drawing meaning to read children's drawings. Based on a concept proposed by Ch. S. Peirce's study sets a new, wide field of interpretation for the sign, which is translated to other characters through interpretant. This leads to the total arbitrariness of character connections, and - consequently - infinitive polysemy that arise between the child - the creator of the drawing and readers of a drawing – the adults.

3. What do the children say through their drawings?

The drawings made by the children at the age of six whose the given subject was family were analyzed as carefully as possible, to be more exact, individually. I referred to a singular creation of a child and, to formed in that way, the network of meanings constructed by the child itself as well as by the adults that belong to different social environments. The categories which were formed in the process of coding after an initial analysis of children' drawing and verbal communicates are, among others: stereotypical presentation of sex roles, aesthetizing of a drawing, meanings referring to consumerism, spacial planning (two and three dimensional), applying the references to reality and using the adults' code (for instance media code) which is copied and transferred to its own drawing, impregnated or overseen forms.

A young child when introduced into the culture learns to look at reality not through its own eyes. In consequence, a conventionalized code is formed out of conventional signs: sun, smiles, sky and land stripes and signs derived from popular culture: Coca-Cola, red heart. What is worth highlighting, the signs mentioned above are deciphered in a similar way by various readers, but not unequivocal. There is no arbitration which occurs for example in a mathematical code. On the other hand, unconventionalized code is formed with unconventionalized signs which do not repeat throughout the other children' works and are known to be a singular, individual code of every child. It can be formed as a result of, for example, enriching or simplification of a given conventionalized sign (every little change or adding even a small detail causes its completely unlike connotation and misunderstanding in child-adult communication). This code is created also by all kinds of illegible drawing sings causing the communicative barriers between a sender and a reader of the communicate, for example: erasing, cancellation or correcting the drawing with a rubber.

The conclusion of my research is also the meaningfulness of a child's drawing is connected with conventionalism and enforcing subordinate attitude towards the patterns ordered by authorities.

3.1 How the adults describe children' s drawings?

When it comes to adults the interpretation of children' s works was associated with traditional model of family, schematic meanings, often matching the meaning to inbuilt matrix or scheme (for example the projective method). They applied the aesthetic assessment of artistic creation of a child and referred the meanings to a familiar reality. When the subject of this artistic creation is known by an adult it made the assigning of meanings to a given matrix easier; on the other hand, when the subject was unknown the interpretation caused more difficulties, became chaotic (among educators and psychologists) or abstract (among artists).

The most marginalized drawing signs of a child in the adults' evaluations were: sun, smile, stripes of sun and land. It is problematic that the marginalized signs are the conventionalized signs- that belong to a known code. They are the ones which should be more recognized and understood, but in fact are "transparent". This lack of skills in reading and interpretation of the visual code is connected with inability of reading images - visual literacy. Yet another reason for this marginalization of drawing signs can be related to the inclination to "advertise" a child to a researcher by, for instance, a parent. Other adults, for example educators, psychologists and artists marginalize the chosen drawing signs of the child because they are unable to ascribe them to a chosen

meaning matrix. It causes the creation of interpretation based on an already known sign and subordinating other subjective interpretation of an adult"reader.

3.2 The network of discourses

In the revealing fields of meanings I found the network of interchanging discourses: expert discourse, aesthetic discourse - aesthetic open and closed educative discourse, repudiation discourse, male discourse, child discourse.

Expert discourse belongs to the speakers having power over a child and influencing and controlling it through public institutions. Its characteristic features include often use of impersonal grammatical forms (infinitives, passive voice, elliptical sentences). Speaking knowledge and examples is diverting from a specific child's drawing on a given stage of drawing development.

Aesthetic discourse possesses, on the one hand, features characteristic for expert discourse because it is connected with limiting, ordering and assessing of child's drawing signs. On the other hand, it can also be open to a little bit different meanings belonging to the world of fiction and imagination. Aesthetic open discourse is not an evaluation; rather it is comparing child's drawing to other visual creations. It is used mainly by artists and psychologists who look for the comparisons to what is culturally not available and known (a movie, a pictogram, art made by great artists). Speaking visual language is nothing more than making a child's drawing open to an infinite semiotics and treating it as an open work in which meanings are constantly co-created by "a reader". The next one- educative discourse is often very subjective and based on exclusively positive connotations. It can be prejudiced because it defends child's works from negative opinions of others. It can be also evaluating. Negative terms are associated with subconscious oppression of a child by an adult.

Repudiation discourse is connected with belittling the content of the drawings, infantilsing the meanings by using diminutives that delineate *drawing signs*. This language automatically "decreases" the value of the drawings as art and at the same time it prevents them from treating them "on an equal footing" with the works of adult creators. A child is not autonomous and all controlling, evaluating or supporting actions towards the child, despite naturally its positive outcome, become the power techniques, and it rules every society.

Male discourse is about traditionalism, stereotypical perception of sex roles, aggrandizing the individual who possess power (for example, a father in a patriarchal family). An interlocutor is influenced by attachment to a traditional model of family where it is a father who possesses for instance economic power.

The last but not least, child discourse that can be defined as a specific auto-communicate fulfilling an important role. A child starts to interpret differently what it has drawn and as a result through the dialogue with itself it learns about itself and the world. "Covering*" the drawing signs* into words changes their meanings and ranks *the drawing communicate* higher; it becomes more complete than the verbal one in terms of content and meaning.

4. Summary

Although children "talk" with drawings it initiates the network of meanings that does not help mutual communication. The closest surrounding may seem a space closed for an interpreter due to over-rationalism of the world ruled by universal discourses. Drawing communicate can be marginalized or "read" too schematically by adult readers. There is also no interest of adults in verbal commentary of a child concerning the created drawing. Modern world in which a picture fulfills an important communicative role should be open to a visual communicate which is a child's drawing. It should also be easily absorbed and more appreciated by adults. However, it is not the case. Why?

Possibly it happens because in the visual chaos, from postmodernist modern art to aestheticism and pop culture, an adult man has always been accompanied by constant loss enhanced by manipulating his aesthetics

intuition, artificially enforced patterns, conventions or current fashions. All that is not "nice and pleasant" and is not in accordance with what global *aestheticism* of culture offers "must be rejected and marginalized".

Research described in Polish academic dissertations indicate that a majority of people pays attention to a picture content rejecting as a rule works diverting from realistic performance. What influences also their evaluations is, among others, favoring picture's faithfulness or so called "the art of happiness" associated with aestheticism of contemporary culture and city space. As a consequence, the child's drawing may seem not aesthetic and at the same time less important and meaningful than other artistic creations. As my research show, the majority of adults reads child's drawing schematically ascribing it to educative, psychological or aesthetic matrices. The question remains as to "who" created the regime of the truth mentioned earlier and why adults are unable to free themselves? Why cultural frames can be so stiff that they cannot be weakened even in the relationship context which are supposed to be filled with love and affection?

The inevitable conclusion is that between an iconographic creative communicate of a young creator and its perception by an adult who uses conventions is created the tension. If the interpersonal dialogue is one of the most crucial ways of building healthy relationships it is necessary for a child's *voice- drawing* to be heard and properly understood. For this to happen it is crucial to repeat the effort to notice this tendency to simplify and schematize the way of thinking and the readiness to understanding the communicate sent by children creatively.

A COMPARATIVE RESEARCH ABOUT BASIC TRAINING IN TURKEY AND EU COMMUNITIES

Cevat Celep[a], Nur Gogus[a]

[a]Kocaeli University, Faculty of Education,41380, Turkey

Abstract

In every country, educational systems resist to the change more than other systems. This resistance is a result of the social mission that is associated with schools. When educational institutions which are in charge of transferring the changing values to the new generations, could not realize social changes; they tend to preserve their status quo and they adapt models from institutions which have changed before. These attempts do not fit into 'the unique structure of education' (Ozden, 2010:154). Countries often carry out reforms to realize unique changes and establish the most appropriate system. In Turkey there has been a strong debate in society about the new elementary education and training legislation. Especially the contradictions about early childhood education and vocational training were justified by referring to the European Union educational systems which Turkey aims to be a member of (TBMM, 2012). This study aims to examine new Turkish educational system - namely 4+4+4 in colloquial speech- and basic educational processes of some EU countries' educational systems in a comparative way.

Keywords: Educational system, reform, vocational training, early childhood education, 4+4+4 years education model

1. Introduction

The three dimensions which learning and teaching focused on are; the changes occur in the core of schooling, the changing professional positions of educators (in organization structure, workplace conditions and decision making processes) and the changes occur between the power distribution of school and schools' stakeholders (Elmore, 1990:11).

In every country, educational systems resist to the change more than other systems. This resistance is a result of the social mission that is associated with schools. When educational institutions which are in charge of transferring the changing values to the new generations, could not realize social changes; they tend to preserve their status quo and they adapt models from institutions which have changed before. These attempts do not fit into 'the unique structure of education' (Ozden, 2010:154). Countries often carry out reforms to realize unique changes and establish the most appropriate system.

In Turkey there has been a strong debate in society about the new elementary education and training legislation. Especially the contradictions about early childhood education and vocational training were justified by referring to the European Union educational systems which Turkey aims to be a member of (TBMM, 2012).

It is stated that students in USA, United Kingdom and France, grouped in a segmented structure according to age groups and physical features in the newly regulated Turkish Education Law Proposal. According to this proposal, uninterrupted education has negative effects on vocational education, it makes the village schools nonfunctional by means of unsuitable physical conditions. Also it is emphasized the fact that the students who have just enrolled and older adolescences having a common learning environment could have some negative effects. Therefore Turkish government passed an education law on basic compulsory education which has 3 four-year segments and called as 4+4+4. First two segments (first 8 years) of this structure is compulsory.

Vocational education is the main focus of these adaptations. This reform provisions that after the first four-yeared education, students would be guided to vocational education, the ten years old students are exposed to their initial vocational guidance and during their basic training students are separated to different programs and school types.

Via this legalized proposal, the compulsory education would start a year earlier, that is; the five-year old students are going to enroll primary education in 2012-2013 academic year. A five-year old student who starts school is within the range of 60 months to 72 months. Compulsory education starting age range is reduced to 6-13 years with this regulation in Turkey. Preschool education, which has been the biggest policy priority of the last couple of years, is completely removed from the proposal and compulsory preschool education is not considered within this context.

2. Compulsory Uninterrupted Education and Preschool Education

Education process is a continuing and lifelong process from birth to death which exist also out of school. So why do we need formal education at school? Because individuals need to gain "intellectual knowledge beyond the direct area of their daily life". It has crucial value for children that they could get this knowledge in a systematical way. Furthermore, compulsory education takes part in every countries' education policy in order to eliminate the inequality that appears with the progress of civilization and development of individual variety (Rothbard, 1999).

The earliest thoughts about compulsory primary education was stated in Universal Declaration of Human Rights in 1948, it was important particularly due to the fact that being the first-ever. Afterwards these statements were supported with the European Convention on Human Rights, Protocol 1 (1952), UNESCO (1960), the International Covenant on Economic, the Social and Cultural Rights (1966), the Convention on the Rights of the Child (1989), the European Social Charter (1996) (Tomasevski, 2001). Compulsory education durations in European Union Countries and Turkey appears in the following table (Eurydice, 2012a).

Table.1 Compulsory education durations in European Union Countries and Turkey

	Full-time compulsory education starting age	Full-time compulsory education ending age	Duration of full-time compulsory education (in years)
Germany [1]	6	15-16	9-10
Austria	6	15	9
Belgium	6	15	9
Bulgaria	6	16	10
Denmark	6	16	10
Italy	6	16	10
France	6	16	10
Netherlands	5	18	13
United Kingdom[2]	4-5	16	11-12
Norway	6	16	10
Turkey[3]	6	14	8
Spain	6	16	10
Portugal	6	18	12
Finland	6	15	9

[1] Compulsory education in high schools called as 'Gymnasium' lasts for 9 years, as to the others are 10 yeared schools.

[2] In Northern Ireland starting age is 4. In the other regions of United Kingdom, students start school at 5.

[3] With the last regulation in Turkey compulsory education starting age is reduced to 5, therefore the finishing age changed as 13.

In Europe preschool education is compulsory in Greece, Cyprus, Latvia, Luxembourg, Hungary, Poland, Denmark and Sweden (Eurydice, 2012b: 28). The countries whose pre-primary education implementations are optional, have pre-primary enrollment rates over 90% (World Bank, 2012). It is known that within the range of 36-72 months, male student enrollment rate is 30.23% while female student enrollment is 29.43% (MEB, 2011: 88). Some countries' pre-primary education enrollment ratios are listed in the following table (UNESCO, 2011).
Fig 1. Pre-primary education enrollment ratios in Turkey and some EU Countries

Qualified pre-primary education is an effective education policy alternative to reduce the socio-economical inequalities and to improve learning outcomes. Pre-primary school enrollment rates can be increased by compulsory pre-primary education to improve educational quality and to encourage the progress of education. Non-compulsory pre-primary education results in disparities in terms of preparation to the enrollment processes, on the side of the students from lower socio-economic status.

3. Vocational Education

Educational systems in Europe are divided into the levels as pre-primary, primary, secondary and tertiary education however these levels do not have different curriculums. The earliest guidance to vocational education in Europe is in Germany and Austria although the OECD countries' average is 15. It's known that three states of Germany postpone the guidance age by three years (qtd. ERG, 2012a: 6). The Austrian government aims to integrate all *Realschule* (lower secondary education-middle schools) and *Hauptschule* (lower secondary education- basic training school) under a single structure of curriculum until 2015 (IFES, 2010; qtd. ERG, 2012b). The ratios of vocational and technical programs in upper secondary education are listed in the following table (OECD, 2012b).
Fig 2 The percentage of vocational and technical programs in upper secondary education

In the following section, some countries' basic education systems are examined (Eurydice, 2012b).

3.1. France

Primary school *(École primaire)* and following middle school (*Collège)* are categorized under compulsory education in France. The curriculum has a single structure. In addition to the core subjects elective courses are included in the second level schools known as *Collège.* These courses with elective subject are known as the vocational discovery modules. In the last year of this module, 14-15 year old students are guided to the secondary school levels named as 3rd-guidance cycle. By offering profession and field subjects, voluntary students (on the average age of 14) are guided to the vocational education effectively. After *Collège* education, approximately 15 years old students are guided to general, technical or vocational education.

3.2. United Kingdom

All levels of education levels are the same in three states of United Kingdom, England, Wales and Northern Ireland. Primary and secondary school are categorized under compulsory education and 16 year old students are guided to a different curriculum for the very first time. These education levels are divided into four categories (key stages) and there are elective courses on technical, art, design and foreign language subjects. After completing the compulsory education, students can attend general high schools or sixth form schools with general academic education or they can start their vocational education at the further education colleges.

Scotland differs from the other states in terms of segmentation. The earliest guidance age is 16 after the compulsory education. Types of secondary schools are the same as the other states of United Kingdom.

3.3. Germany

Students are guided to different school types and curriculums starting from the age of 10 except Berlin and Brandenburg. At lower secondary education, including 5th and 10th grades, there are schools named as *Hauptschule, Realschule, Gymnasium* and *Gesamtschule.* Pre-vocational courses take part in the last two years of compulsory education. In comparison to *Hauptschule* and *Realschule*, *Gymnasium* has more elective vocational courses.

Lower secondary education is predominantly of a general nature whereas, apart from Gymnasien, vocational education predominates at upper secondary level. Students graduated from *Hauptschule* usually attend to vocational schools *(Berufsschule)*. *Realschule* provides the opportunity to enter prepatory schools of tertiary education (for example *Fachoberschule*). In this manner, the major part of students go to Vocational Collages (*Fachhochschule*) and Collages (*Hochschulen*). *Gymnasium* is a kind of general lower and upper secondary school. The nine-year *Gymnasiums (Gymnasium in Aufbauform) is* completed by taking maturity examination (*Abitur*) which gives the right to enter the collages. *Gesamtschule* (multi-programmed schools) are formed by integration of *Hauptschule, Realschule* and *Gymnasium. Hauptschule* aims to bring students in general culture and prepare them to a vocational school or upper secondary education. *Realschule* aims to educate students to their career or upper secondary education. *Gymnasium* aims to prepare students to higher education by offering a general education.

3.4. Austria

Compulsory education covers 6 to 15 years old students. There are academic general secondary or general secondary levels in lower secondary education. Students are guided to different curriculums (general, technical and vocational schools) at this level. There are compulsory courses about 'vocational education guidance' for lower secondary level. In some cases, there is an integrated form of compulsory courses and vocational education guidance.

3.5. Finland

7 year-old students attend uninterrupted nine years education in the basic training schools named as *Perusopetus/Grundläggande utbildning* until they become 16. They are guided to vocational or general secondary schools starting from the age of 16. Vocational education guidance is integrated into the first years of curriculum. Students take compulsory vocational courses in the lower secondary level however this compulsory form transforms into an elective form in the upper secondary level.

3.6. Netherlands

Compulsory education covers 5 to 17 years old students. Primary education, lower secondary education and the first two years of upper secondary education are compulsory. Students are guided to VWO or HAVO schools with general education or they can attend to VMBO schools with vocational options. VMBO schools have general programs for the first two years. Students can attend to vocational secondary schools at the age of 16. Vocational guidance is integrated into the whole secondary education curriculum. All of the students take vocational guidance courses during their secondary education.

3.7. Sweden

Like Finland, students are guided to vocational education or general secondary education for the first time after nine-year uninterrupted education. The earliest guidance age is 16. There are seventeen different programs in three-year high school education. Thirteen of these programs include detailed vocational education.

3.8. Czech Republic

Students attend to the uninterrupted nine-year education in basic training schools named as *Základní škola.* This level includes two segments but a single structured program. Students can continue their education on upper secondary schools named as gymnasium or conservatory. However, students are guided to vocational education after completing compulsory education. Students who finish the secondary education after taking *maturitní zkouška* exam, can attend to general, technical, vocational education or conservatory.

3.9. Denmark

Students who are 7-16 year old enroll to compulsory education. From the first year to 9th year of compulsory education there is career education in the curriculum with a multi-dimensional approach. Compulsory basic training schools called as *Folkeskole* has a curriculum that consists of 3 subject blocks. These blocks are on social sciences, fine arts and life sciences. Folkeskole is designed as a single structure and there is no transition between primary school and lower secondary school. Students can take elective courses from the blocks that they attend or can attend the general education.

3.10. Spain

Primary school is composed of six-year education known as 2+2+2. Including lower secondary education, compulsory education lasts for 10 years. This segmentation is being organized according to students' age groups. After completing the two-year first cycle, students can attend only conservatory (*Enseñanzas de régimen especial*) to study dance and music. Students are being chosen in accordance with their competences. The earliest guidance age is 16. Lower secondary education includes four school years is divided into two equal parts. Compulsory secondary education prepares students to vocational education. Students are guided by means of elective courses in preparation phase. In the last two years of compulsory education, there are guidance and vocational guidance activities predominantly.

3.11. Italy

Compulsory education lasts for ten years and serves for 6-16 year old pupils. Students who are fourteen years old are guided to upper secondary education or initial vocational education (FPI). In addition to this there are vocational guidance services. While lower secondary education offers general education, fourteen years old students are guided to different programs in upper secondary education. These schools are Liceo classico (classic high school), Liceo scientifico (science high school), Liceo Linguistico (language school), Liceo Socio-psico-

pedagogio (sociological, psychological and pedagogical high school), Liceo Artistico (art school), Istituto tecnico (technical high school), İstituto professionale (vocational high school) / Istituti d'arte (craft high school) and Fomazione professionale di base (apprenticeship education).

3.12. Turkey

Compulsory education is composed of four-year two cycles and lasts for 8 years. First four years of these cycles correspond to primary education while the next four years stand for middle school. After completing first four-year education, 10 years old students are guided to general, vocational education or schools that require examination results for enrollment. Vocational schools include vocational trade high schools, vocational industrial high schools, girls' vocational school, religious vocational school, multi-program high school and vocational and technical education centers.

The proposal which became law in Turkey, set the earliest age, when education is being interrupted as 10. Some countries' earliest guidance ages are listed in the following table (OECD, 2012a: 57).

Countries	Earliest age when education is being interrupted	Countries	Earliest age when education is being interrupted
Denmark	16	Japan	15
France	15	Mexico	15
Iceland	16	Portugal	15
New Zealand	16	Italy	14
Norway	16	Belgium	12
Sweden	16	Netherlands	12
Spain	16	Switzerland	12
United Kingdom	16	Germany	10
USA	16	Austria	10

Table 2. Earliest age when education is being interrupted in some countries

4. Conclusion

In Europe; there are specific cross-national diversities when it comes to preschool education and vocational guidance activities. These activities alter as to country's level of welfare, geopolitical position, demographic structure etc. The comparisons between countries should be done with regard to these variables. While comparing countries in terms of educational processes, countries' academic achievement in the international tests can be examined instead of doing this comparison only in the context of social welfare. The most effective policy implementations for every nation will arise as a result of such a comparison.

If there is a segmented structure at primary level, Turkey may need an elective guidance system at the end of first four-year cycle. When the existing social and economic disparities and quality differences between schools in Turkey are considered, as opposed to the international trends; such a guidance of a very early age, may increase inequalities. Particularly this may reduce the opportunity to access qualified education by children with disabilities.

Non-compulsory pre-primary education results in undesired lower levels of pre-primary enrollment ratios. It is known that students who do not enroll preschool, differ from their peers in the coming years (Kagitcibasi et. all, 2005).

It is realized that countries which guide students to vocational education at early ages, support these practices with elective courses or similar activities. Countries should consider the negative effects of early vocational

guidance on students. Hence all variable conditions of countries' should be examined and vocational guidance implementations should be organized in this manner.

A CREATIVE STRATEGY FOR SUSTAINABLE DESIGN EDUCATION - A TRIBUTE TO CHARLES AND RAY EAMES

Dr. Martin Racine

Concordia University, 1455 De Maisonneuve Blvd.West, Montréal, H3G 1M8, Québec, Canada

Abstract

This paper describes a project that was assigned to senior level Design students in the Department of Design and Computation Arts at Concordia University, Montreal. The objectives were to transmit advanced conceptual and creative skills while bringing students to integrate fundamental sustainable design principles. The challenge suggested was to create a base for the structure of recuperated chairs designed by Charles and Ray Eames in the 1950's. This project stimulated students to deeply engage in the development of high quality designs and creative concepts while encouraging them to understand the importance of preserving the environment and the cultural heritage related to objects that are much too often discarded after the end of their useful life. This project was inspired by Metacycle, a design research that aims to prolong the lifespan of everyday objects (metacycle.ca).

Key Words: Design Education; Sustainable Design; Design History; Material Culture, Charles and Ray Eames.

1. Introduction

According to the International Council of Societies of Industrial Design (Icsid.org), design is a creative activity whose aim is to establish the multi-faceted qualities of objects, processes, services and their systems in whole life cycles. Therefore, design is the central factor of innovative humanization of technologies and the crucial factor of cultural and economic exchange. In general, designers concentrate their expertise on the creation of furniture and products related to a broad range of domains, including transport; electrical and electronic appliances; lighting; medical devices; sports equipment; etc. Design education is therefore concerned with transmitting both the theoretical and practical knowledge involved in this complex activity.

With the current environmental crisis, the field of design is more than ever challenged by finding solutions and developing products that will have less negative impacts on the ecosystem, which means using less resources, less energy and finding ways to re-use and recycle the materials and the various parts of all the furniture and objects we use after their end of life. For many design schools, the environment issue has become a central preoccupation, as students need to understand that it will be their responsibility to integrate the fundamental principles of sustainability through an ecological perspective, but also from a socio-cultural and economical standpoint.

Since many years, as a design researcher and educator, I have focused my interests towards issues related to sustainable development and I attempt to develop strategies aiming at inducing a fundamental paradigm shift in our society of consumption. Essentially, this means putting less emphasis on the production of new things and paying more attention to notions of maintenance, re-use, repair and durability. While design activities usually concentrate on developing innovative products, this may seem paradoxical and incongruous to focus on the re-use of existing materials and recuperated elements, especially for students who are eager to create novelty. My challenge as an educator is therefore to transmit values of sustainability and making my students realize how creative it can be to re-use and refurbish elements that otherwise would end up in the garbage dumps or landfills. In this paper I describe a project that I have assigned my students, which had the specific objectives of developing advanced design skills, while integrating notions of ecology, and both socio-cultural and economical sustainability.

2. Background Context

Since the late sixties, ecologists have been raising their voices in opposition to the western world's profligate lifestyle. A few designers were among adamant agitators for a reassessment of our wasteful habits and the values that support them. At all scales, the message was the same: progress as measured by unending growth is an untenable paradigm, leading to both depletion of non-renewable resources and the poisoning of the planet through the increased production of toxic pollution. Jane Jacobs argued that architects were destroying the ecology of the built environment through the promotion of urban sprawl [1]. Victor Papanek criticized designers for participating in the suicidal race towards ecological disaster through their contribution to the relentless rise of consumerism [2]. At an even earlier date, Buckminster Fuller demonstrated how wasteful building methods were standing in the way of providing adequate shelter for all[3].

Half a century later, in line with notions of sustainable development established at the Rio World Summit in 1992, a group of ethically responsible designers are proposing changes in our ways of doing things in order to reduce the negative effects of our society's excessive consumption (McDonough and Braungart, 2002, Lewis and Gertsakis, 2001, Charter and Tischner, 2001) . It is along this axis that my group's research efforts have been directed, linking various digital technologies with modern social phenomena in an effort to prolong the life span of manufactured products and thus reduce the deleterious effects of over consumption.

The premise at the root of this research concerns the organic nature of manufactured objects; like living things, objects can change over time. Jonathan Chapman considers that a product's life span is determined in large part by the attachment linking it to its user and that this could be enhanced by the product's ability to evolve and change over time [4]. While this ability is often seen in the area of software design [5] where updates, patches and versioning enable programmes to evolve not only to correct errors but also to meet new needs, some researchers have made attempts at transferring this aptitude to physical objects[6, 7].

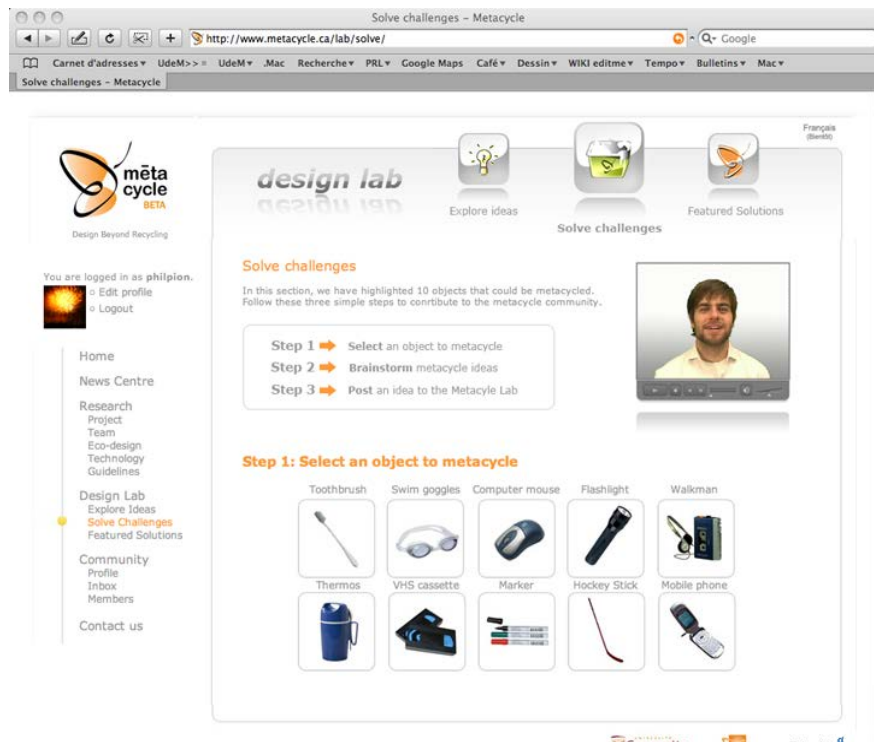
As an educator concerned by environmental issues, the important question to address is "How can I raise the students' awareness regarding sustainable design approaches? In order to reach this objective, I introduce them to my research activities, and put the emphasis on a project entitled Metacycle, a concept aimed at establishing a network of designers applying their creativity to proposing how existing objects could be enhanced and modified in order to take on a second life (Figure 1). Previous work called PRéco [8] established the feasibility of using digital manufacturing technologies and in particular Rapid Prototyping (RP) for repairing products. My research group took this to a second level in META[morphose] by experimenting the application of RP to the up and side grading of products thus enabling them to evolve [9]. Metacycle configures this technique into an operational framework by creating a virtual community of designers linked by their common interest in the creation of new products from old.


Figure 1: Metacycle.ca, a web site where designers are asked to find a second useful life to old objects: swimming goggles, cell phones, computer mice, etc.

More specifically, Metacycle.ca is a web site that aims to optimize the creative potential of designers by reuniting them within a virtual community serving the common objective of prolonging the life span of consumer products. The goal of this project is to develop an interactive framework through which consumers can benefit from unique and innovative updates to products whose usefulness is being put into question. The pooling of a large number of creative minds allows the generation of a new category of unique products that favour increased attachment through personalization. Essentially, the metacycle web site challenges creative minds to find solutions for giving a second life to objects that cannot be recycled, for example toothbrushes, VHS cassettes, hockey sticks, computer mice, swimming goggles, computer screens, markers, Walkmans, cell phone, etc. After having chosen a challenge, additional information pertaining to the size, materials and other characteristics of the object is presented with a reminder of the Metacycle guidelines: "Revitalize Functionality, Maximize Reuse, and Reduce Waste and Energy". After having accepted the Creative Commons terms for the non commercial use of their ideas, users can submit their images, models and/or instruction manuals. This content is automatically uploaded into the Explore Ideas section for others to browse and vote upon. If ever an idea gathers a large amount of positive feedback, the Metacycle team will promote it into the third and final section of the Design Lab labelled Featured Solutions.

3. The Design Challenge

Describing my research activities brings students to understand the importance of recuperation for its environmental benefits. They also realize the creative challenge associated with the objective of extending the life span of old objects. While examining closer all the objects around them that end up being rapidly discarded, they recognize the design efforts that are behind and discover the cultural value of those objects, like as archaeologists examining and preserving precious artefacts. Yet beyond the benefits of recuperation from a strictly environmental point of view, there can also be cultural benefits behind such a strategy. With this in mind, I initiated a project for my senior design studio course aiming to address the global notion of sustainability, from an environmental, socio-cultural and economical perspective. I entitled the assignment "A Tribute to Charles and Ray Eames" as the challenge consisted of creating a base for seats salvaged during the renovation of our

university's amphitheatres, which were recuperated just before their disposal. Those seats were actually chairs without legs and only supported by a steel post, as they were previously bolted on metal structures and fixed to the floor (Figure 2). Inspired by the DSR (*Dining Height Side Chair Rod Base*), a famous chair designed in the early 1950's by two of the most innovative American designers of the 20th century, Ray and Charles Eames, those seats are made in fibreglass, an extremely durable material that otherwise cannot be recycled.

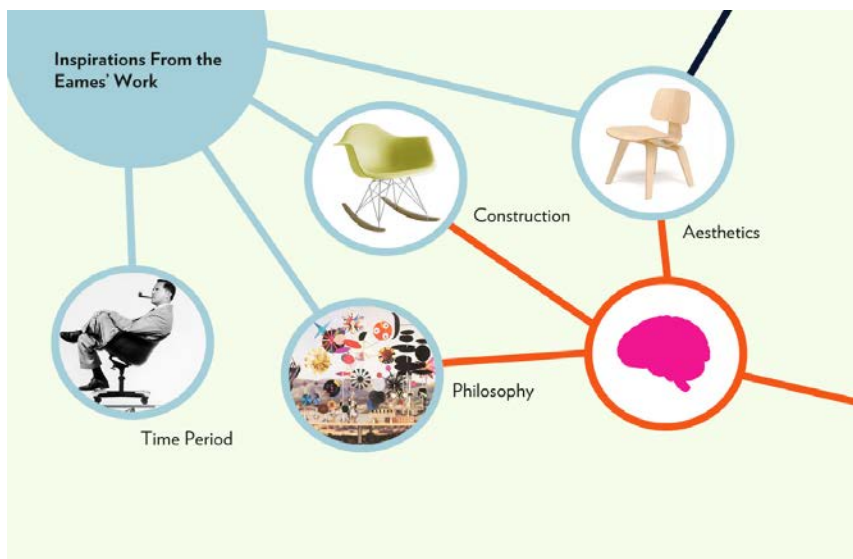
Figure 2. The challenge was to design a base for salvaged seats, recuperated during the renovation of university amphitheatres. The model is inspired by a famous chair designed by Charles and Ray Eames in the 1950's.

Each team of two students was given a fibreglass shell and had to develop a support system (legs, structural system or central post) with the material of their choice (wood, metal, plastic). The base had to be built to scale and attached to the seat without any modification of the original shell. Therefore, students were not allowed to drill holes or to glue any elements on the fibreglass chair in order to preserve the integrity of the original design. They could however use the existing metal structure to which the seats were fixed or attach their base by using the four threaded rods protruding through the shell under the seat. The structure needed to be solid enough to support at least 100kg and be perfectly functional. The project also had to be developed according to sustainability principles, as indicated in my course outline:

"All the projects generated in class must integrate the fundamental notions of sustainability: favouring local materials and production, reducing parts and costs, designing for disassembly, designing for repair and longevity, avoiding the use of toxic materials, glues, paints and finishes. These principles must be integrated in all the aspects of the design process: limiting the printing, using eco-friendly materials for the construction of preliminary maquettes and leaving the studio clean after class".

The first step for this project was to bring students to better discover the original Eames concept and the richness of the designers' vision while giving them the occasion to bring a new life to an icon of modern design (Figure 3). Charles Eames (1907–1978) and Ray Kaiser Eames (1912–1988) are known to having given shape to America's twentieth century. Their lives and work represented the nation's defining movements: the West Coast's coming-of-age, the economy's shift from making goods to producing information, and the global expansion of American culture. The Eameses embraced the era's visionary concept of modern design as an agent of social change, elevating it to a national agenda. Their evolution from furniture designers to cultural ambassadors demonstrated their boundless talents and the overlap of their interests with those of their country. In a rare era of shared objectives, the Eameses partnered with the federal government and the country's top businesses to lead the charge to modernize post-war America.

Figure 3. Here is a sample of the furniture designed by Charles and Ray Eames. Many elements of their work have become icons of 20th century American modern design.

The students were asked to do a complete research about the creative couple, and to study their work in the areas of furniture, architecture, film, art and exhibition design. Following the research phase (Figure 4), students explored conceptual and creative avenues through sketches and preliminary cardboard maquettes, which were presented in class and discussed during the critiques (Figure 5).


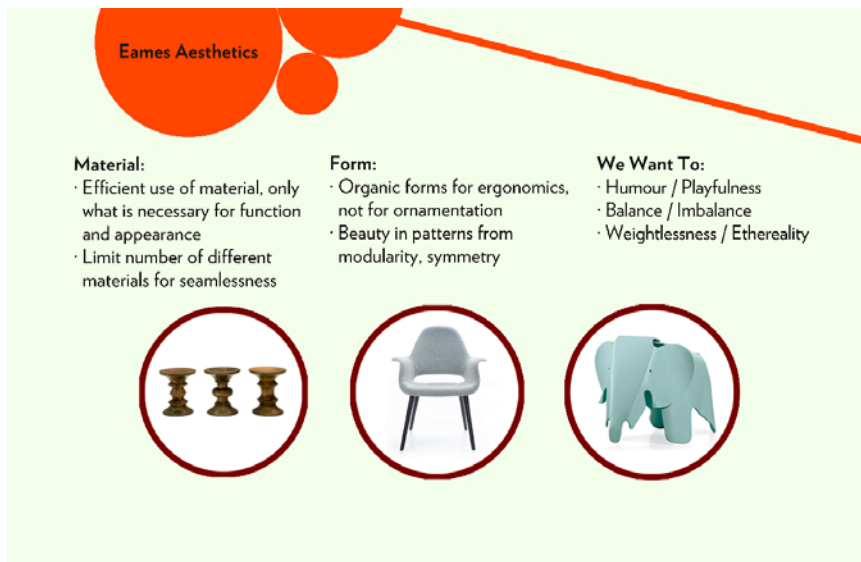


Figure 4: In their presentation, students had to address the historical context, the design philosophy of the famous designers and describe the conceptual framework for their creative intervention. Students: Gabrielle Turcotte and Zachary Kain.
Figure 5: Students prepared sketches to present their brainstorming sessions in the studio. Students: Vivien Leung and Levi Bruce.
Figure 6: Exploration of different concepts through cardboard mock-ups. Different iterations were developed to test the solidity of the structure and evaluate the aesthetic proportions.

4. The results

It has been quite impressive to see the level of commitment and energy the students have spent on this project. What made the experience even more satisfying was to see the level of innovation and creativity that has been expressed through the various solutions. In fact, each of the twelve different concepts developed in class was distinct from the others and every concept focused on a unique structural solution and fabrication method, which led to an extremely rich array of aesthetic and functional approaches (Figure 7).

Figure 7: Images show a sample of the different creative concepts have been developed by the students. (a) Project 1: Rodolfo Martinez and Alexandre Théroux; (b) Project 2: Jeffrey Bush and Alexis Pautasso; (c) Project 3: Vivien Leung and Levi Bruce; (d)Project 4: Kyle Goforth and Dacia Pantelis.

In the four examples presented in Figure 7, we note that the version (a) is based on a braced wooden structure fixed directly to the chair as the version (b) uses the central post to support it, allowing the chair to rotate. The version (c) is also unique, as it is inspired by the Japanese culture, where people sit lower to the ground. The metal structure gives the option of sitting straight or leaning back for additional comfort. The other version presented (d) is a rocking chair, which can turn into a normal chair when the legs are inverted. While developing their concepts, students have learnt to develop essential design skills, while studying the furniture designed by the Eameses, they had the opportunity to understand chair structures and the physical principles applied in furniture and architecture. Because the chairs had to be functional, the students were challenged to use a rigorous process in order to precisely determine the height of the seating position, evaluate the amount of material needed, choose the fabrication method and develop their design according to the technologies that were accessible to them. Throughout this assignment, students were encouraged to exploit the potential of computer assisted design (CAD) and the precision of the computer numerical control (CNC) milling machine. By doing so, they successfully integrated and assimilated abstract theoretical notions and technical knowledge through practical experimentation.

To showcase the projects and to celebrate the unique quality of the projects, I organized an exhibition of the work in the Faculty of Fine Arts' Gallery. This brought a great deal of exposure to the students and contributed to their sense of pride as the expo received many positive comments by the university community.

5. Conclusion

This project proved to be remarkably successful, the challenging assignment stimulated students to understand the Eameses unique vision and to deeply engage in the development of high quality designs, creative concepts and innovative breakthroughs. It also encouraged the students and the community at large who has been exposed to the projects, to be more concerned about the value of the many objects that are discarded without any respect for the environment and consideration for the cultural richness that disappears when things in our surroundings are thrown out. Design, as a creative activity has the potential to add value to what is too often considered useless. In the Department of Design and Computation Arts at Concordia University, we strongly believe that design educators should play a leading role in moving forward towards sustainability, which requires the reconciliation of environmental, but also social equity, cultural heritage and economic demands. Too often this view expresses the idea that the pillars of sustainability are mutually exclusive, they should to the contrary be mutually reinforcing.

A DISCUSSION OF WHAT MAKES A GOOD TEACHER: OPINIONS OF PRE-SERVICE PRIMARY SCHOOL TEACHERS

Assist.Prof. Tuğba Hoşgörür

*Muğla University, Faculty of Education, Muğla, Turkey

Abstract

As being the most important subject of the teaching process, the qualities of teachers naturally influence and shape the quality of learning in schools. Teachers start developing the qualities they need to perform their jobs, during their education at teacher training institutions. This study is designed to determine the conceptions of pre-service primary school teachers at Muğla University about what qualities a good teacher needs to have. It was also aimed to see whether there is an awareness among these prospective teachers about how much they own these qualities which they value. The terminology "good teacher" is used to make the pre-service teachers think again on the qualities not for teachers generally but especially for a good teacher to obtain the most desired qualities. For this purpose, a qualitative research was designed. 90 first grade and 90 fourth grade pre-service teachers were asked two open ended questions. The questions and the number of the sample are the same as Drvodelic and Rajic's (2011) study on Croatian pre-service teachers so that a comparison could be made between two cultures and the results of these two researches will be combined for a further study. Firstly, pre-service teachers were asked to determine five qualities that a good teacher needs to have and rank them by importance and then they were asked to rank the same qualities by regarding their own level of possession. The data was analysed using both a qualitative and a quantitative approach. Qualitative approach was used for thematic coding analysis of the qualities. The data was categorised based on personal and professional qualities. After that, they were analysed through a quantitative method for the frequencies and the rank order. The results showed that, both first year and fourth year pre-service teachers mentioned more personal qualities than professional qualities.

Keywords: teacher qualities; professional teacher qualities; personal teacher qualities; good teacher; pre-service teachers

1. Introduction

Sanders and Rivers (1996) stated in their study that teacher effectiveness is the most important factor affecting student academic gain. And to perform effectively, a teacher should possess an impressive body of knowledge and a considerable amount of qualities (Cohen, Manion & Morrison, 1998, 144). But what is the reference point of these qualities? Teacher qualities are quite popular issues that researchers study about. As Hayes (2006) mentions in his study; opinions vary about the required qualities for a teacher to be successful. There are wide ranges of efforts by different organisations and by different researchers trying to clarify the problem of what qualities and competencies a teacher need to have.

Darling-Hammond (2006) indicates that there should be a coherent system that can provide well-trained teachers in all communities and to do that there should be standards of teacher qualities that all teacher training institutions must follow. For instance, the National Council for the Accreditation of Teacher Education which is recognised by the U.S. Department of Education set some professional standards for the accreditation of teacher training institutions (National Council for the Accreditation of Teacher Education, [NCATE], 2008). These standards include pedagogical content knowledge and skills and pedagogical and professional knowledge and skills that a teacher should possess. The Teacher Education Accreditation Council is another organisation, which is again recognised by the U.S. Department of Education and the Council for Higher Education Accreditation, also determined the standards of qualified teachers for teacher education programs. Subject matter knowledge, pedagogical knowledge, caring and effective teaching skill, learning how to learn, multicultural perspectives and

accuracy and effective use of technology are some of these standards (Teacher Education Accreditation Council, [TEAC], n.d.). In Turkey, the Ministry of National Education made a report and identified the competencies of teachers (Ministry of National Education, [MoNE], 2006). According to the results of this study, six main competencies were determined which are; personal and professional values-professional development, knowing the student, learning and teaching process, monitoring and evaluation of learning and development, school-family and society relationships, knowledge of curriculum and content (MoNE, 2006, 3). Besides MoNE, the Council of Higher Education in Turkey has its own list of teacher qualities for teacher training programmes. They identified four main competencies as; competencies regarding to subject matter and curriculum training, competencies regarding to teaching and learning process, monitoring, assessing and recording students' learning outcomes and other professional competencies (Council of Higher Education, 1998, 15-17). As well as these standards set by the organisations, there are also research efforts considering teacher qualities.

Research conducted by Walker (2008) including pre-service and in-service teachers, states there are twelve qualities of an effective teacher. These traits are; prepared, positive, holds high expectations, creative, fair, displays a personal touch, cultivates a sense of belonging, compassionate, has a sense of humour, respects students, forgiving and admits mistakes. In another study, teacher qualities were divided into four dimensions as; instructional expertise, student assessment, learning environment, and personal qualities of the teacher (Stronge, Ward, Tucker & Hindman, 2007). Cruickshank and Haefele (2001) also define different visions of a good teacher. These are; ideal, analytic, effective, dutiful, competent, expert, reflective, satisfying, diversity-responsive and respective respectively (Cruickshank & Haefele, 2001).

The starting point of this study is the problem of providing quality teachers for all students in the education system. As McArdle (2010) indicates, "…teaching in new times demands new knowledges and new understandings. Key quality indicators can work to shape programs aimed at improving teacher quality." (pp.62-63). Therefore, to be able to obtain an understanding of a "good teacher", pre-service teachers' viewpoints are used as a research base. This study is designed to identify the conceptions of pre-service primary school teachers at Muğla University about what qualities a good teacher needs to have. It was also aimed to see whether there is an awareness among these prospective teachers about how much they own the qualities which they value. The terminology "good teacher" is used to make the pre-service teachers think again on the qualities not for teachers generally but especially for a good teacher, to obtain the most desired qualities. In addition, by comparing the viewpoints of the pre-service teachers in the first grade and in the final grade, this study also provides an insight about; the influence of the teacher training process on the conceptions of pre-service teachers about the qualities of a good teacher. As the respondents pointed out to what degree they own these qualities, this study can also function as an analysis of the effectiveness of education faculties in making the pre-service teachers gain the desired qualities.

2. Methodology

This study uses a qualitative design to research the opinions of pre-service teachers about the qualities of a good teacher. This is the first phase of a study that will be conducted between Croatian and Turkish pre-service primary school teachers. Therefore, the methodological design and the research questions are the same as Drvodelic and Rajic's (2011) study on Croatian pre-service teachers. The data of these two researches are combined for the second phase of the studies which will provide a cultural perspective to teacher qualities issue.

2.1. Sample

The sample of this research is 90 first grade and 90 fourth grade pre-service teachers who are studying at Primary School Teaching department at Muğla University's Faculty of Education. The details of the sample can be found in Table-1. The number of pre-service teachers who participated in this study is % 51.72 of the population. The number of the sample are the same as Drvodelic and Rajic's (2011) study on Croatian pre-service teachers so that a comparison could be made between two researches.

Table 1. Participant overview

	1st grades		4th grades (final year)		Total	
	N	%	N	%	N	%
All Pre-service Teachers	190	100	158	100	348	100
Respondent Pre-service Teachers	90	47,4	90	58.4	180	51.7

2.2. Instrumentation and implementation

To obtain the data for this research, the pre-service teachers were asked two open ended questions. After the data collection tool was prepared, it was shown to two field experts for the comprehensibility of the questions. According to the experts' viewpoints the necessary changes were made in the statements. In the first question, pre-service teachers were asked to write five qualities that make a good teacher and rank them by importance. The most important quality was written at the top of the list and the least important one was written at the bottom of the list. Then pre-service teachers were given some time to think about these qualities they wrote and rank them again with regard to their own level of possession.

2.3. Data analysis

The data was analysed with a qualitative thematic coding analysis. After the data was collected, they were all listed as they were written. Then qualities with similar meanings or synonyms were grouped under the same theme. In addition, the quality list was given to two field experts for the same process. The themes were compared and the data was grouped according to the agreed compromise with the experts. After that, the data was categorised based on personal and professional qualities. Finally, they were analysed through a quantitative way to see how frequently they were mentioned. Only the qualities that were mentioned five times or more were included in the research.

For the second part of the data analysis process, regarding the importance and possession levels of these qualities, each quality was scored from 5 to 1. The most important or the most possessed qualities were given a score of 5 and the least important or the least possessed ones were given a score of 1. The means of the total scores of the qualities were used to be able to rank the data.

3. Findings

After the data was analysed, it was found that pre-service teachers that participated in this research mentioned a total of 32 qualities that a good teacher should possess. The frequencies of these qualities are illustrated in Table 2.

Table 2. Teacher qualities

Quality	Frequency	Quality	Frequency
Patient	86	Inquisitive	13
Tolerant	59	Humanitarian	11
Having wide general knowledge	53	Disciplined	11
Expert on subject matter	43	Having a good diction	10
Just	41	Authoritarian	9
Committed to work	36	Unconditional acceptance	8
Affectionate	31	Friendly	8
Smiley	29	Innovative	7
Professional	27	Responsible	6
Understanding	25	Humorous	6
Respectful	24	Motivated	5
Empathetic	20	Moral	5
Good communicator	18	Self-confident	5
Honest	15	Idealist	5
Democratic	14	Objective	5
Love of Children	14	Continuing self-development	5

According to Table 2, it is seen that patience is the most mentioned teacher quality. When the qualities were categorised into two groups as; personal and professional qualities, the findings indicate that pre-service teachers mentioned 17 personal qualities and 15 professional qualities. The two most mentioned qualities (patience, tolerance) are among personal qualities. The frequencies of personal teacher qualities according to grade levels of pre-service teachers are shown in Table 3.

Table 3. Frequencies of personal teacher qualities

1st year		4th year	
Quality	**Frequency**	**Quality**	**Frequency**
Patient	43	Patient	43
Tolerant	35	Tolerant	24
Affectionate	21	*Democratic*	14
Smiley	19	*Humanitarian*	11
Understanding	16	Good communicator	11
Respectful	13	Respectful	11
Having a good diction	10	Empathetic	11
Empathetic	9	Affectionate	10
Friendly	8	Smiley	10
Good communicator	7	Understanding	9
Honest	7	Honest	8
Love of Children	6	Love of Children	8
		Humorous	6
		Moral	5
		Self-confident	5

Frequencies of personal teacher qualities indicate that first year pre-service teachers mentioned 12 and fourth year pre-service teachers mentioned 15 qualities. Most pre-service teachers in both groups consented to the fact that patience and tolerance are among personal qualities that a good teacher should possess. In addition to 10 common qualities between the two groups, first year pre-service teachers think that having a good diction and being friendly and fourth year pre-service teachers think that being democratic, humanitarian, humorous, moral

and self confident are also important teacher qualities. The frequencies of professional qualities with regard to grade levels of pre-service teachers are given in Table 4.

Table 4. Frequencies of professional teacher qualities

1st year		4th year	
Quality	**Frequency**	**Quality**	**Frequency**
Just	30	Having wide general knowledge	34
Having wide general knowledge	19	Expert on subject matter	33
Professional	14	Committed to work	22
Committed to work	14	Professional	13
Disciplined	11	Just	11
Expert on subject matter	10	*Unconditional acceptance*	8
Authoritarian	9	*Innovative*	7
Inquisitive	7	Inquisitive	6
Objective	5	*Responsible*	6
		Motivated	5
		Idealist	5
		Continuing self-development	5

Table 4 shows that first year pre-service teachers cited 9 and fourth year pre-service teachers cited 12 professional qualities. One third of first year pre-service teachers stated that being just is a quality that a good teacher should possess. However, only one in ten fourth year pre-service teachers think that *just* is an important quality. Most of the fourth year pre-service teachers indicated that having wide general knowledge is a quality that makes a good teacher. In addition, almost the same amount of fourth year pre-service teachers mentioned that a good teacher should also be an expert on their subject matter. And unlike from the six common qualities; first year pre-service teachers referred being disciplined, authoritarian and objective and fourth year pre-service teachers referred being innovative, responsible, motivated, idealist, accepting all the students unconditionally and continuous self development as other professional qualities that a good teacher should possess.

In the study, pre-service teachers were asked to rank the qualities according to their level of importance. They were also asked to rank these qualities by regarding how much they possess them. The results are illustrated in Table 5 and Table 6.

.

Table 5.   Importance and possession levels of personal teacher qualities

Quality	1st year		4th year	
	Level of importance	Level of possession	Level of importance	Level of possession
Patient	1	9	8	12
Good communicator	2	10	9	13
Smiley	3	1	14	7
Empathetic	4	4	11	8
Understanding	5	5	7	11
Honest	6	7	3	1
Respectful	7	6	10	4
Love of Children	8	2	4	5
Tolerant	9	8	12	9
Affectionate	10	3	13	14
Having a good diction	11	11	-	-
Friendly	12	12	-	-
Humanitarian	-	-	1	6
Moral	-	-	2	3
Democratic	-	-	5	2
Self-confident	-	-	6	15
Humorous	-	-	15	10

As shown in Table 5, first year pre-service teachers indicate that being patient, a good communicator and smiley are the three most important personal qualities that a good teacher should possess. On the other hand, fourth year pre-service teachers do not agree the importance level of these qualities. They think that being humanitarian, moral and honest are the three most important qualities. When the results are examined regarding the students own level of possession, it is seen that the most possessed qualities by the first year pre-service teachers are: being smiley, having a love of children and being affectionate. They also pointed out that the least possessed qualities by them are being a good communicator, having a good diction and being friendly. However, fourth year pre-service teachers indicate that the qualities that they the most possessed are being honest, democratic and moral. On the other hand, they think that they mostly do not consider themselves as being a good communicator, affectionate or self-confident.

Table 6.   Importance and possession levels of professional teacher qualities

Quality	1st year		4th year	
	Level of importance	Level of possession	Level of importance	Level of possession
Expert on subject matter	1	7	7	9
Just	2	1	3	3
Professional	3	5	5	10
Having wide general knowledge	4	4	9	11
Committed to work	5	3	2	1
Disciplined	6	2	-	-
Objective	7	6	-	-
Authoritarian	8	8	-	-
Inquisitive	9	9	10	12
Motivated	-	-	1	4
Unconditional acceptance	-	-	4	2
Innovative	-	-	6	8
Idealist	-	-	8	6
Continuing self-development	-	-	11	7
Responsible	-	-	12	5

According to Table 6, being an expert on subject matter, being just and a professional are the most important professional qualities for the first year pre-service teachers. Fourth year pre-service teachers almost agree on the importance of being just but they also mentioned that being motivated and committed to work are more important than being just. When we look at the results about how much they possessed these qualities, first year pre-service teachers think that being just, disciplined and committed to work are the most possessed qualities they have. Nevertheless, they do not mostly find themselves as an expert on subject matter, authoritarian or inquisitive. Fourth year pre-service teachers indicate that the qualities they the most possessed are; committed to

work, unconditional acceptance and just. However, being professional, having wide general knowledge and being inquisitive are the least possessed professional qualities by the fourth year pre-service teachers.

4. Discussion

Teacher qualities are one of the most discussed subjects when the issue is the crucial role of education in shaping the future of societies and the world (Hoşgörür, 2011, 127). Although there is general agreement on some qualities of a good teacher, Stones (1994) points out that the concept of a good teacher has a value laden nature and there is not much consensus about this nature of a good teacher (p. 5). In this study, it was aimed to bring perspective to these discussions about the qualities of a good teacher with the opinions of pre-service teachers.

The most mentioned quality by the pre-service teachers that were involved in this study was patience. About the same number of pre-service teachers indicated patience in Drvodelic and Rajic's (2011) study on Croatian pre-service teachers. This result shows that according to pre-service teachers' viewpoints, in both cultures, patience is an important quality that makes a good teacher. Besides some common qualities that were mentioned by both Turkish and Croatian pre-service teachers, there are also differences in opinions about what makes a good teacher. For instance, being respectful, democratic, having love of children, being humanitarian, having a good diction, being moral and self confident are the personal qualities that were indicated only by Turkish pre-service teachers. In addition, some of the professional qualities mentioned by Turkish respondents are; having wide general knowledge, being an expert on subject matter, being inquisitive, disciplined and unconditionally accepting all the students.

According to the findings of personal teacher qualities regarding respondents' grade levels, it can be said that most of the pre-service teachers in both grades think that patience and tolerance are among the qualities that make a good teacher. Besides patience and tolerance, the most referred qualities by the first year pre-service teachers are mostly related to supportive role of teachers like being affectionate, smiley and understanding. Stronge (2002) also points out the similar traits of effective teachers in his study like; being caring, listening to students, understanding students' concerns and questions. On the other hand, fourth year pre-service teachers direct attention to qualities like; being democratic, humanitarian and moral. First year pre-service teachers do not consider them as important qualities that make a good teacher. This result shows that during their education in teacher training institutions, pre-service teachers observed that accepting democratic principals and being humanitarian are also necessary components of a good teacher.

When the findings about the professional qualities are analysed, it can be said that both groups of pre-service teachers think that a good teacher should have a wide general knowledge, be an expert on their subject matter, be just, professional, committed to work and inquisitive. Walker (2008) also states that an effective teacher should be prepared and fair. Moreover, Stronge (2002) mentions similar characteristics like; being fair, having positive attitudes for the teaching profession, and engaging in reflective practice as essential for teaching. Nevertheless, first year respondents think that being a good teacher also means being disciplined, authoritarian and objective. Mentioning disciplined and authoritarian could be related to their academic self concept. Because they lack teaching experience, they might be thinking that they will have authority problems while doing their jobs so they should be managing the class according to strict rules. On the other hand, fourth year pre-service teachers think that a good teacher should also be accepting all the students unconditionally, be innovative, responsible, motivated, idealist and they should be aware of the importance of continuing self-development. The quality unconditional acceptance is a parallel thought with the personal qualities democratic and humanitarian which they mentioned as personal qualities. It can also be said that teacher training process caused an awareness on the pre service teachers that in the information age teaching profession, the qualities of being innovative, motivated and continuous professional self-development are required.

Pre-service teachers' viewpoints about the importance level of personal teacher qualities are showing differences according to their grade levels. For the first grade pre-service teachers, the most important teacher qualities are mostly related to a teacher's interactions with people like; being patient, a good communicator and

smiley. On the other hand, the most important teacher qualities for the fourth grade pre-service teachers refer to ethical values like; being humanitarian, moral and honest. Hayes (2006) also stresses the importance of social and moral impact of teachers on students while educating them. It can be concluded that pre-service teachers became aware of the importance of these ethical values during their training.

When the findings about the possession levels of personal qualities mentioned by the first year pre-service teachers are analysed, it is seen that the qualities they possessed the most are qualities that are part of an individual's personality. On the other hand they indicated that they are lack of good communication skills and they should progress their diction. They also pointed out that they do not find themselves friendly. This could be because they are at their first year in the department; they have not had much chance to socialise with others around them. Personal qualities that fourth year pre-service teachers possessed the most are mostly parallel to the qualities that they find important. Nevertheless, it is noticed that they could not gain good communication skills during their education. It is also surprising that although they mentioned self-confidence as one of the important qualities, yet they think that they do not possess it. This result shows that teacher training process does not provide opportunities for them to build up their self-confidence.

The findings about importance levels of professional teacher qualities indicate that the most important qualities for the first grade pre-service teachers are mostly knowledge based. On the contrary, fourth grade pre-service teachers think that attitude based professional qualities are more important. This could be the reflection of the thought that to expand knowledge on a profession primarily requires motivation and commitment. The findings about possession levels of professional teacher qualities show that first grade pre-service teachers are aware of the fact that they are not qualified for the profession. Moreover, fourth grade pre-service teachers indicate that they still do not see themselves as competent in their subject matter or as professionals. This result shows that their training could not satisfy their needs about their subject area. Not feeling like a professional could be regarded as expected, as they have not officially started performing their jobs but this result could also be the sign of not being provided adequate teaching experience. Furthermore, fourth grades mentioned that they have low levels of general knowledge and they are not inquisitive. Although personal and professional development of teachers are one of the main competencies identified by the Ministry of National Education in Turkey (MoNE, 2006, 3), it can be said that it is still one of the areas for the teacher training programmes which needs progressing.

Researching the conceptions of pre-service teachers about the qualities of a good teacher gave a chance to compare their opinions with what they were expected to gain with their training. Moreover, learning possession levels of these qualities could help to determine the areas that need improvement. On the other hand, to be able to build a wider understanding of what makes a good teacher, expectations of primary school students from teachers could be identified with further researches.

A GENETIC-FUZZY BASED MATHEMATICAL MODEL TO EVALUATE THE DISTANCE EDUCATION STUDENTS' ACADEMIC PERFORMANCE

Osman Yıldız[a], Abdullah Bal[b], Sevinç Gülseçen[c], Fulya Damla Kentli[a]

[a] Informatics Department, Yildiz Technical University, Istanbul, Turkey

[b] Electronics and Communications Engineering Department, Yildiz Technical University, Istanbul, Turkey

[c] Informatics Department, Istanbul University, Istanbul, Turkey

Abstract

In distance education systems, it is very important to predict academic performance for both instructors and students during the course of the semester. If an instructor can properly assess and predict student performance early at the beginning of the semester, then the instructor can take action and arrange both the course content and the teaching style. This, in turn, contributes greatly to the success of students. In order to make such a prediction, constructing mathematical models is one of the most effective and efficient methods. Among many approaches, fuzzy logic-based models have the most appropriate topology. In this study, fuzzy logic model is used to model data of distance education and predict students' academic performances. In order to increase the success of fuzzy logic model, fuzzy membership functions are optimized by using genetic algorithms. As distance education data, when students enrolled in learning management system, how frequently they log on, and how long they stay online are used. By using this model and data of a 6 week-long study, students' success level at the end of the semester is predicted and the results are compared with the ground truth data.

Keywords: Fuzzy Logic, Genetic Algorithm, Distance Education, Academic Performance Evaluation

1. Introduction

Over the past several years, the use of distance education systems has grown rapidly, since they have more advantages than traditional education; an Internet connection is just enough to access the education system and there is no time restriction to attend the courses. In addition to these advantages, it is relatively cheap compared to traditional education.

Evaluation of student academic performance is one of the most important parts in educational systems. Instructors monitor students' learning processes and analyze their performance based on paper records and observation in traditional education. Distance education systems provide definite opportunities for instructors to observe students' academic performance. In order to establish this task, instructors encounter difficulties in observing academic performance during distance education. Therefore, weblogs stored in Learning Management Systems (LMS) could be helpful for observing and analyzing learners' academic performance, as well as predicting final marks. It is required to monitor and analyze students' activities in distance education systems by suitable scientific research methods. The ability to predict students' performance could be useful for instructors who can take a precaution failure or prevent students from dropping out.

In this study, we have incorporated three types of web logs: recency, frequency, and monetary. Recency is enrollment time of students that shows the number of days after the lectures have been uploaded to LMS. Frequency is defined as how frequently they logged on. How long they stayed online is regarded as Monetary. These data are incorporated into Fuzzy to obtain a prediction model. In order to increase the success of fuzzy logic model, fuzzy membership functions are optimized by genetic algorithms. By this mathematical model, we have tried to predict class grades of the students using only six weeks RFM data.

The rest of the paper is structured as follows: Section 2 Related Works presents the findings of related research literature. In Section 3, we briefly review theory of the Fuzzy Logic and Genetic Algorithm. In Section 4, we present classical fuzzy model and Genetic-Fuzzy Model to evaluate academic performance of students, and the experimental results are discussed. Finally, conclusion and further research are reported in Section 5.

2. Related Works

Several studies focus on the field of analyzing student performance in distance learning. Dimitris and Christos (2006) have employed genetic algorithms and decision trees to estimate academic performance of distance learning students'. Zafra and Ventura (2009) have incorporated multiple instance genetic algorithms to predict whether the students will fail or pass for a certain course. This prediction has been based on students' activities such as quizzes, assignments, and forums. Lykourentzou et al (2009) have performed a student achievement prediction method applied to 10-week introductory level e-learning. Vandamme, et al. (2007) have studied a model by means of neural networks procedure in SAS/Enterprise mining. They have categorized students into three groups as "the low-risk", "medium-risk" and "high-risk" who have a high probability of failing. Kotsiantis, et al. (2004) have conducted a supervised machine learning algorithm in which the training set was comprised of students' key demographic characteristics and their mark on a few written assignments. Ibrahim and Rusli (2007) have used neural network, decision tree and linear regression to estimate students' academic performance. In this work, they have employed demographic profile and students' first semester cumulative grade point averages (CGPA) to predict final CGPA.

In the literature, prediction studies involving Fuzzy Logic method are generally carried out associating with Artificial Neural Network (ANN). Taylan and Karagozoglu (2009) have presented a study that introduces a systematic approach to design of a fuzzy inference system based on a class of neural networks to assess the students' academic performance. The development method used a fuzzy system augmented by neural networks to enhance some of its characteristics like flexibility, speed, and adaptability, which is called the Adaptive Neuro-Fuzzy Inference System (ANFIS). Yusof, et al. (2009) have built an evaluation of student's performance and learning efficiency based on ANFIS, too. In that study, neural network and fuzzy have been used for predicting student's performance based on four criteria which are scores earned, time spent, number of attempts and help needed.

3. Fuzzy Logic and Genetic Algorithm

3.1 Fuzzy Logic

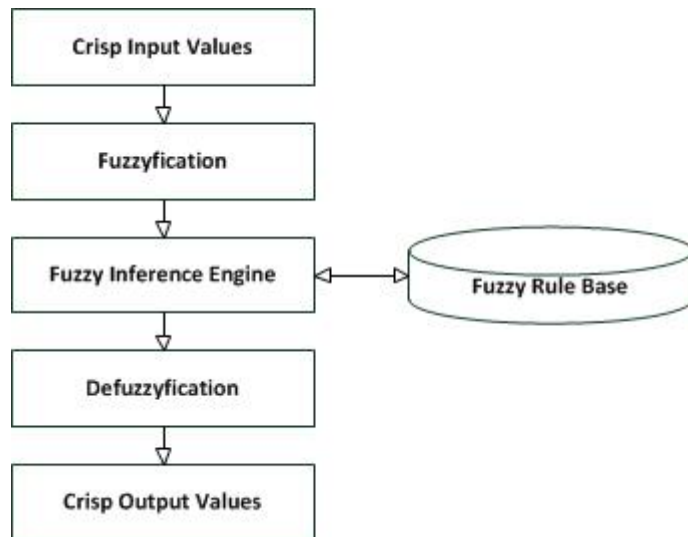
Fuzzy sets and fuzzy logic have been considered an effective tool to deal with uncertainties in terms of vagueness, ignorance, and imprecision (Cho, Cho, & Wang, 1997). While making an operation in a set, a 'b' element is a member of a set or not. On the other hand, when making an operation with fuzzy, 'b' element can be a member of two sets at the same time. Fuzzy Logic is a form of three main stages; fuzzification, rule evaluation and defuzzification. Fuzzification is the first step that transforms the crisp inputs into degrees of match with linguistic values. Rule evaluation is where knowledge derived from experts are formed which is then called fuzzy rules (Yusof, Zin, Yassin, & Samsuri,2009). Defuzzification transposes the fuzzy outputs to crisp values. Figure1 shows the stages of Fuzzy Logic.


Fig. 1 Fuzzy Logic Stages

3.2 Genetic Algorithm

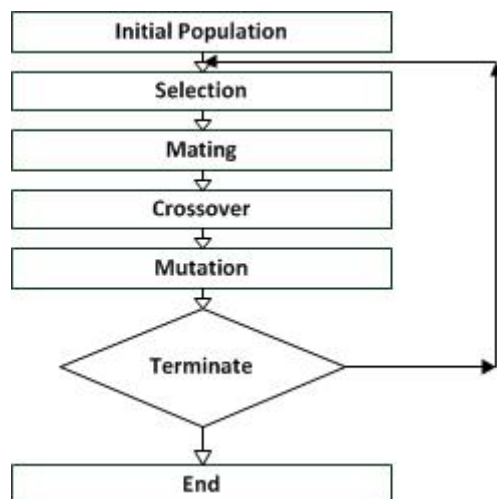
The Genetic Algorithm (GA) is an optimization and search technique based on the principles of genetics and natural selection (Haupt & Haupt, 2004). A GA works on a population of randomly generated input solutions symbolized by chromosomes that are often represented by binary strings. The population improves toward better solutions by applying genetic operators, such as crossover and mutation. In each generation, favorable solutions generate offspring that replace the inferior individuals. Crossover hybridizes the genes of two parent chromosomes in order to exploit the search space and constitutes the main genetic operator in GAs. The mutation is operated to provide the diversity of gene pool. An evaluation or fitness function plays the role to decide for the good or bad solutions (Cordon, Herrera, Hoffmann, & Magdalena, 2001). The major components and the principal structure of GA are shown in Figure 2.


Fig. 2 Principal Structure of GA

4. Method and Results

In this study, the informatics course of the Yildiz Technical University (YTU), Matlab course is delivered in web-based education during 2010/2011 spring semester for Chemistry students.

Moodle (Modular object oriented developmental learning environment), a free learning LMS is utilized for this course. Moodle offers many activities that can be combined with learning material. It logs every activity report for each student that indicates the activities such as operation on course materials, quizzes, and messages for different times and days. This fact enables the authors to collect data only from the tutors involved in this learning process.

The Moodle records for Matlab course have supplied the data for the Fuzzy-RFM model. Matlab course is composed of 12 weeks and leads to an elective course. The total number of registered students is 62, 46 of whom, are selected and the model is formed by entering RFM values for the first six weeks. As the desired output, grade scores of 46 students are selected and introduced to model.

We have first used Classical Fuzzy Model to predict pass grades of the students. Then, we have improved the model by employing Genetic Optimization Algorithm to obtain higher prediction accuracy.

4.1 Classic Fuzzy Model

In this model, Fuzzy Memberships are organized for three input data sets; Recency, Frequency and Monetary. Academic Performance (AP) is used as output value of the model. Input values are determined as low (R1), medium (R2) and high (R3) for Recency, low (F1), medium (F2) and high (F3) for Frequency, low (M1), medium (M2) and high (M3) for Monetary. The output values are determined to be low (AP1), medium (AP2) and high (AP3). Figure 3 shows Classic Fuzzy Model.
Fig. 3 Fuzzy RFM Model.

Input values R, F and M are shown in Figures 4, 5, and 6, respectively.
Fig. 4 Recency Membership Function Plots
Fig. 5 Frequency Membership Function Plots
Fig. 6 Monetary Membership Function Plots

After determining Membership Functions, 27 rules are constructed according to expert opinion. For example, IF R (Recency) is low and F (Frequency) is low and M (Monetary) is low THEN AP (Academic Performance) is low.

The obtained results from classic fuzzy can be evaluated in two stages.

4.1.1 Determining Intervals

Expert opinion is the most vital factor in determining intervals and forming rules while designing the model with RFM data obtained from learning management system of students in distance education. Low, medium and high intervals for each value in RFM variables are formed. For instance, is Recency indicates to how long ago the student visit each course week after the course entered to the system. Firstly, intervals are equally installed. After this installation, the ratio of accuracy of students' academic performance has been found approximately %65. Then, we consult the expert to determine the intervals and the model is reformed. According to the expert, if the student enters the system in 1-7 days, it is high, 7-14 days, medium, and 14-36 days low. On the other hand, trial-error method is used in determining frequency that shows to how often each student stays in each course week. The ratio of accuracy between the alteration intervals according to the expert and prediction of students' academic performance has risen to %74.

4.1.2 Determining Membership Functions

After the determination of intervals in which membership function the model has got high value is determined by 4-type MF. Table 1 presents the results of the model formed before consulting expert opinion that show trimf function gives better result compared to other functions.

Table 1 Accuracy for different type of MF types.

Membership Function	Accuracy (%)
Trimf	65,25
Gauss2mf	64,81
Pimf	64,62
Gbellmf	64,28

Table 2 shows the results of models formed by varied MFs according to intervals formed by experts' opinions. It is observed that Gbellmf function gives better results than others.

Table 2 Accuracy for different type of MF types

Membership Function	Accuracy (%)
Gbellmf	74,40
Gauss2mf	73,40
Pimf	73,29
Trimf	72,90

4.2 Genetic-Fuzzy Model

Fuzzy Logic rules and membership functions are formed according to expert opinion, which is shown as one of the lack of the fuzzy logic. Therefore, fuzzy membership functions' intervals have been optimized by genetic algorithm in this section. Triangular-shaped (trimf) built-in membership function has been used. Figure 7 shows the membership function. There are 3 trimf shaped for all input variables that are R, F, M whose axis of vertex points are a,b,c, respectively. The other points of triangle are on the x-axis. a1 ve a2, b1 and b2, c1 and c2 have indicated the distance from a, b, c.
Fig. 7 Fuzzy Membership Intervals

The genetic algorithm works with chromosomes. The chromosome has 27 variables. The chromosome is written as row vector.

Chromosome=[Ra1, Ra, Ra2, Rb1, Rb, Rb2, Rc1, Rc, Rc2, Ra1, Fa, Fa2, Fb1, Fb, Fb2, Fc1, Fc, Fc2, Ma1, Ma, Ma2, Mb1, Mb, Mb2, Mc1, Mc, Mc2]

The genetic algorithm works with binary encodings. An example of binary encoded chromosome that has 27 variables, each encoded with 7 bits, is

Figure 8 shows the shape of a member.
Fig. 8 Representation of Chromosome of Fuzzy Membership Function

The GA starts with 10 initial populations. After 85 iterations, the algorithm has stopped because costs are the same. Figure 9.(a),10.(a) and 11.(a) show optimization of Recency, Frequency, and Monetary Membership Function, respectively and Figure 9.(b),10.(b), and 11.(b) show optimized intervals of Recency, Frequency, and Monetary Membership Functions.

(a)	(b)
Fig. 10. (a) Optimization of Frequency Membership Function and (b) Optimized Membership Function
Fig. 11. (a) Optimization of Monetary Membership Function and (b) Optimized Membership Function.

After the optimization of intervals of membership functions, accuracy of prediction for distance education students' academic performance has risen to 84.52%.

5. Conclusion

To sum up, a new model, Genetic-Fuzzy Based Mathematical Model, has been formed to predict students' performances in distance education. Academic Performance have been attempted to predict just using 6-weeks data. Fuzzy membership intervals have been determined by genetic algorithm based optimization. Firstly, eight different models have been formed by using varied MF for the intervals formed in consultation with expert opinion. The best ratio of accuracy is 74.40 percent among formed models and it is an acceptable value. Then, using genetic algorithm, the optimal intervals for R, F, M were determined and prediction of students' academic performance has risen to 84.52%. In further studies, the optimization of rules used in the fuzzy logic system will be considered.

A GREEN TOUCH FOR THE FUTURE OF DISTANCE EDUCATION

M.Banu Gündoğan[a], Gülsün Eby[b]

[a]*Instructor, Computer Education and Instructional Technology Department, Middle East Technical University, Ankara, Turkey*

[b]Associate Professor, College of Open Education, Anadolu University, Eskişehir, Turkey

Abstract

This paper aims to draw attention to the sustainability of distance learning in terms of the design process based on learner characteristics and technology usage. Distance learning has become a cyberized system owing its presence to developments in digital technologies. Technological developments solve some immediate problems but also have the risk of leading to even greater ones. To 'sustain' is not only about keeping up, supporting or maintaining continuity but also is about nourishing, cultivation and acknowledgement. 21st century incentives in all fields of human endeavour have replaced sustainability measures in their plans and actions as a necessity for meeting the needs of the present and future generations. Green engineering and design perspectives state the importance of carrying out an inventory of all the materials and energy used in the design process and assessing all the environmental discharges resulting from the product's manufacture, use, and disposal. Being cyberized or virtual does not leave distance education apart; still it is a product designed to serve actual human beings and alike every design, the process has inputs, outputs and unfortunately, produces waste. Unless managed properly, waste is harmful; to avoid possible harms and to be able to respond both to current and future demands and expectations, distance education has to include ecological and sustainable perspectives to its vision. This study outlines the historical background of sustainability, lists the green engineering and green design perspectives from literature and expresses a *green touch* for sustainable distance education within these perspectives.

Keywords: sustainable distance education; future of distance education

1. Introduction

The future is undefined, yet inevitable. Thoughts and actions towards future tend to be hopeful and every organism, including us humans, struggle for permanence and progress rather than to corrupt. There have been numerous incentives in our history which represent this hopeful struggle. The Universal Declaration of Human Rights, adopted in 1948, specifies both individual rights and governmental determinations on promoting social progress and better standards of life for current and future generations. The Bill of Rights for the Planet, declared in 2000, is concerned with the health of the environment where human life takes place and advocated the rights of the planet we live in, the Earth. 21st century initiatives envisioning the future are still based on permanence and progress and the necessity for the wholeness of individual, social, governmental and environmental actions and understandings are underpinned. Education has been one of the common needs of humans. As stated in Article 26 of The Universal Declaration of Human Rights, "Everyone has the right to education… Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit". 21st century education incentives, alike all fields of human endeavour, have to care for meeting the needs of the present and future generations. The new digital age has introduced such technological marvels that were never thought possible before and as John Sener states, "Education is entering the age of cybersymbosis - irretrievably dependent on digital technologies. This is not a fad, a niche, or even a trend; it is education's future" (Sener, 2011).

In terms of education, distance education can be defined as a result of the struggle for permanence and progress. Initially relying on postal services, it was a provision for accessing learning where the source of information and the learners were separated by time and distance. It has now become a cyberized system owing its presence to developments in digital technologies. The contribution of developing technologies together with

the increasing demand due to changing living and working styles have enforced distance learning from being a supplementary solution to a unique system. It is a system; a group of independent but interrelated elements comprise a unified whole to accomplish a predefined goal. The goal is to deliver education to students who are not physically "on site" in a traditional classroom or campus by allowing self-determined, independent and interest-guided learning. It is unique; the learner is real and has real needs, the learning environment is virtual. This system could be successful if it becomes being continuous in space or time, hindering interruptions or disconnections, namely it has to be sustained. To 'sustain' is not only about keeping up, supporting or maintaining continuity but also is about nourishing, cultivation and acknowledgement. Kim (1998) explains the term as "the search for providing the best of all possible worlds for people and the environment both now and into the indefinite future". To provide the best solutions for meeting the needs of the present and future generations, the sustainability provisions have to be an integral part in the design and delivery policies regarding distance education. The following sections present the milestones of sustainability, summarize the green engineering and green design perspectives from literature and express a *green touch* for sustainability, aiming an optimistic contribution to the future of distance education.

2. Milestones of Sustainability

Sustainability definitions have held the Earth - our planet and the Human - our lives as focal points for a long period of time. The concept itself has been a human concern from the earliest civilizations to the present, but has become popular at the post-World War II period when technology had become the determinant of economic growth and innovations like plastics, synthetic chemicals and nuclear energy were changing production and life styles. Popular books such as Silent Spring by Rachel Carson (1962) and The Population Bomb by Paul R. Ehrlich (1968) raised public awareness on the fact that there were environmental costs to be paid for obtaining material benefits and the quality of the environment was linked closely to economic development. Consumption of natural resources and the harm made by technology were major concerns. In 1972, The Limits to Growth Report and the Stockholm Conference on the Human Environment started a wave of governmental regulations for concerns about environmental issues and with the publication of the Brundtland Report in 1987, the society was recommended to act as a whole with the awareness of the fact that current patterns of resource consumption and environmental degradation could not continue as they were. Brundtland Report was the first report to use the term "sustainable development" and defined it as: "Development that meets the needs of the present without compromising the ability of future generations to meet their own needs". The report agreed that technological developments may solve some immediate problems but also stated that these developments had the risk of leading to even greater ones. As to reach a coherent path, the report underlined the fact that sustainable development had to be understood as a process of change in which the exploitation of resources, the direction of investments, the orientation of technological development and institutional change all collate in harmony and enhance both current and future potential to meet human needs and aspirations. Taking these steps further, The Bill of Rights for the Planet, developed and presented by William McDonough Architects for EXPO 2000, aimed to outline priorities which would be taken into consideration by designers, planners, government officials and all involved in the built environment. The aim of setting these principles were declared as follows: "For the development and improvement of humankind, it is imperative to renew a commitment to living as part of the earth by understanding development and growth as processes which can be sustained, not exploited to impractical limits" (McDonough, 2000).

Following these milestones, there has been increasing attention focused on the challenges of sustainability. Hargroves and Smith (2005) have sorted the common sustainability principles from the work and publications by different authorities as follows:

- dealing cautiously with risk, uncertainty and irreversibility,
- ensuring appropriate valuation, appreciation and restoration of nature,
- integration of environmental, social and economic goals in policies and activities,
- equal opportunity and community participation,
- conservation of biodiversity and ecological integrity,
- ensuring inter-generational equity,

- recognizing the global dimension,
- a commitment to best practice,
- no net loss of human or natural capital,
- the principle of continuous improvement and
- need for good governance

Anastas and Zimmerman (2006) state that changes can be made through innovations in science and technology to mutually benefit the environment, the economy, and the global society. They further state that "Most popular constructs of sustainability are in agreement that there are three major aspects- environmental, economic and societal. Inherently, if an action is not advancing each of the three *pillars* of sustainability it could not be viewed as advancing sustainability overall. Therefore, the difficult questions are involved with the short-term versus long-term consequences of actions, regional versus global, and known consequences versus unforeseeable consequences". Green engineering and green design are terms which offer paths to realize the goals of sustainability in practice.

2.1. Green Engineering and Green Design

Green Engineering is the design, discovery, and implementation of engineering solutions for sustainability (Anastas and Zimmerman, 2006) and *Green Design* is intended to develop more environmentally benign products and processes (Hendrickson et.al.,1999). The Principles of Green Engineering presented by Anastas and Zimmerman (2006) represent a reflection of those engineering techniques that are being used to become more sustainable. The authors describe their intention in forming these principles as follows: "While there are significant, creative, and important examples of engineering solutions that are being developed, they are neither comprehensive nor systematic. The 12 Principles should be thought of not as rules, laws or inviolable standards. Instead they are a set of guidelines for thinking in terms of sustainable design criteria that, if followed, can lead to useful advances for a wide range of engineering problems" (Anastas and Zimmerman, 2006). The principles of Green Engineering are as follows:

- Principle 1 - Designers need to strive to ensure that all material and energy inputs and outputs are as inherently non-hazardous as possible.
- Principle 2 - It is better to prevent waste than to treat or clean up waste after it is formed.
- Principle 3 - Separation and purification operations should be a component of the design framework.
- Principle 4 - System components should be designed to maximize mass, energy and temporal efficiency.
- Principle 5 - System components should be output pulled rather than input pushed through the use of energy and materials.
- Principle 6 - Embedded entropy and complexity must be viewed as an investment when making design choices on recycle, reuse or beneficial disposition.
- Principle 7 - Targeted durability, not immortality, should be a design goal.
- Principle 8 - Design for unnecessary capacity or capability should be considered a design flaw. This includes engineering "one size fits all" solutions.
- Principle 9 - Multi-component products should strive for material unification to promote disassembly and value retention - (minimize material diversity).
- Principle 10 - Design of processes and systems must include integration of interconnectivity with available energy and materials flows.
- Principle 11 - Performance metrics include designing for performance in commercial "afterlife".
- Principle 12 - Design should be based on renewable and readily available inputs throughout the life-cycle.

Hendrickson et.al. (1999) outline three general goals for green design in pursuit of a sustainable future: (1) Reducing or minimizing the use of non-renewable resources, (2) Managing renewable resources to insure sustainability and (3) Reducing, with the ultimate goal of eliminating, toxic and otherwise harmful emissions to the environment, including emissions contributing to global warming, and identify the objective of green design as to pursue these goals in the most cost-effective fashion. The authors give special importance to the fact that the application of green design involves a particular framework for considering environmental issues, the application of relevant analysis and synthesis methods, and a challenge to traditional procedures for design and manufacturing. Some Green Design Methods and Tools listed by the authors are as follows:

- Conducting mass balance analysis based on measurements of inflows, inventories, and outflows (including products, wastes and emissions).
- Paying attention to green indices and ranking systems which attempt to summarize various environmental impacts into a simple scale by providing rudimentary guidance in choosing materials, components, or process alternatives that have reduced environmental impacts.
- Designing for disassembly and recycling; making products that can be taken apart easily for subsequent recycling and parts reuse.
- Including risk analysis in design as a means for tracing through the chances of different effects occurring.

- Using material selection and label advisors through which designers can select the most environmentally preferred material among alternatives.
- Integrating full cost accounting methodologies; management information systems that reveal the cost of decisions about materials, products, and manufacturing processes to the company.

The application of green design principles rely heavily on managerial and institutional support since designers are specialists who cannot be expected to be environmental experts capable of estimating the environmental and sustainability implications of their decisions. Especially mass balance analysis and full cost accounting methodologies need to be defined and provided by the management which also means that the institution itself has to plan and act towards sustainability and moreover green design (Hendrickson et.al. 1999). In terms of materials selection, Graedel and Allenby (2002) recommend designers to choose abundant, non-toxic, nature familiar rather than man-made materials which have an existing recycling infrastructure. They also advise to minimize the number of materials used in a product or process and use recycled materials where possible.

Green design principles stress the need to consider the systems effects of design decisions. In designing a new product or service, reducing waste with the ultimate goal of eliminating it, is found important. Life Cycle Assessment, a systematic analysis of the environmental effects of a new product or process, is common to both green design and engineering perspectives. This necessitates defining a system boundary, carrying out an inventory of all the materials and energy used and assessing all the environmental discharges resulting from the product's manufacture, use, and disposal within the defined boundary. Regarding the disposal process, the design choices on recycle, reuse or beneficial disposition becomes important. Within this framework, after completing its intended usage the product or process could be an input in; a closed-loop, which refers to the re-use of the product or service for the same function and an open loop, which refers to the re-use of the product or service in a different function, typically with lower quality requirements (Hendrickson et.al. 1999).

3. The Need for Sustainability in Distance Education

21st Century is the age of digital literacy. Information is located, organized, received, evaluated, and analyzed mostly using digital technology. Technological forces affect culture and human behavior. When introduced in 2001 by Marc Prensky, the term *digital native* defined the ones born into the digital age, and *digital immigrant* referred to ones who adopted technology later in life. These terms aid in understanding the issues of teaching digital literacy; technology has changed the way today's students read, perceive, and process information and today's educators need to find effective teaching methods for the digital natives.

The 21st Century Fluency Project, uses the term *fluency* particularly to emphasize an alteration regarding digital literacy; literacy defines to have knowledge or competence whereas to fluency describes the demonstration of mastery- doing unconsciously and smoothly. The fluencies of a digital citizen are given in Fig. 1 and the project states that these fluencies *are not about technical prowess, they are critical thinking skills, and they are essential to living in this multimedia world*.
Fig.1. Fluencies of a 21st Century digital citizen

- Solution fluency is the ability to think creatively to solve problems in real time by clearly defining the problem, designing an appropriate solution, applying the solution then evaluating the process and the outcome.
- Creative Fluency is the process by which artistic proficiency adds meaning through design, art and storytelling. It regards form in addition to function, and the principles of innovative design combined with a quality functioning product.
- Collaboration fluency is team working proficiency that has reached the unconscious ability to work cooperatively with virtual and real partners in an online environment to create original digital products.
- Media Fluency is firstly, the ability to look analytically at any communication media to interpret the real message, how the chosen media is being used to shape thinking, and evaluate the efficacy of the message and secondly, to create and publish original digital products, matching the media to the intended message by determining the most appropriate and effective media for that message.
- Information fluency is the ability to unconsciously and intuitively interpret information in all forms and formats in order to extract the essential knowledge, authenticate it, and perceive its meaning and significance.

Evidently, current learners of distance education are mostly digital immigrants and in the near future they all will be digital citizens. This is where the importance on envisioning sustainability regarding distance education becomes important. Current distance education planning and solutions need to support present needs but while doing so, have to create a care taking vision for its future generations- the digital citizens. Distance learning has already become a cyberized system but technological developments have the risk of leading to greater problems while solving immediate ones. Thus, there is a need for a supplementary vision; a vision which not only integrates technology but also an overall systems view of the planning process. Distance education is a designed product and service and alike every design, the process has inputs, outputs and unfortunately, produces waste. Unless managed properly, waste is harmful; to avoid possible harms and to be able to respond both to current and future demands and expectations, distance education has to include Green Engineering and Green Design perspectives to its vision.

4. A Green Touch to Distance Education

Sustainable development has been the search for protection and preservation of the environment not only for current generations but for the future ones as well. Sustainable development strategies lead shareholders to be more attentive to the concerns of all stakeholders and thus to convey the expectations of society as well as the environment of the company (Amann et al., 2009). Weybrecht (2010) states that these strategies have created huge competition not only between organizations and firms, but also between countries and societies; the importance of inclusion of sustainability is a publically acknowledged necessity. Green engineering and green design visions offer paths to realize the goals of sustainability in practice. They have resulted from the recognition of the consumption of natural resources and the harm made by technology. The main focus is on cleaning up past pollution and ongoing waste streams (Hendrickson et.al.,1999). Considering the right factors, and building in the right parameters as design criteria, green engineering and green design visions stress the importance of:

- assessing the life cycle of products and processes, including their afterlife period
- using renewable and readily available inputs throughout the life-cycle
- selecting all material and energy inputs and outputs to be as inherently non-hazardous as possible
- choosing materials, components, or process alternatives that have reduced environmental impacts
- designing for disassembly and recycling and
- preventing waste

The contribution of developing communication technologies together with the increasing demand due to changing living and working styles have enforced distance learning from being a supplementary solution to a unique system. It is unique; the learner is real and has real needs, the learning environment is mostly virtual. We have to recognize the fact that in the near future all distance learners will be digital citizens of a world we can't yet even imagine. The distance education system to serve the digital citizens must take into account their fluencies and this is where sustainability becomes significant. Following sections propose definitions and a *green*

touch for sustainable distance education by linking distance education principles, fluencies of digital citizens and green engineering and design perspectives.

4.1. Inputs and Outputs

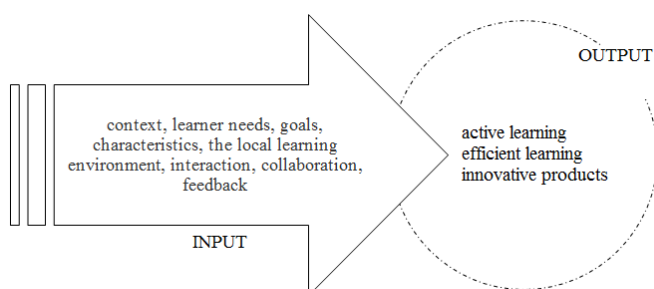
With reference to distance education principles, context, learner needs, goals, characteristics and the local learning environment can be defined as inputs whereas active and effective learning can be defined as outputs in terms of sustainability. The team working and creativity fluencies of digital citizens add interaction and collaboration as an input and generating innovative products as an output. From the instruction part, managing interaction and collaboration necessitates the provision of feedback which also is an input unit. Fig.2 presents the inputs and outputs of a sustainable distance education system as described above.


Fig.2. Inputs and Outputs of Distance Education

4.2. The Energy

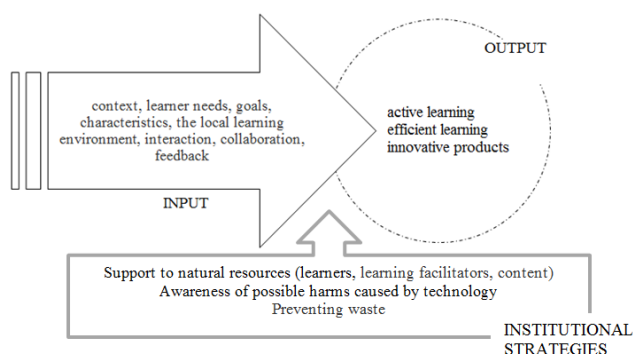
The energy with which inputs would be transformed to outputs are the institutional strategies. It is important for any institution to possess both a technology plan and a human infrastructure to ensure that appropriate technical requirements are established and learners and learning facilitators are supported in their use of these technologies. The natural resources of distance education, namely the learners, facilitators and content have to be used without depleting them. The main focus needs to be on preventing waste. Fig.3 presents the energy component of a sustainable distance education system.


Fig.3. The Energy Component for Sustainable Distance Education

4.3. Designing Learning Materials

Distance education has the ability to provide access to unlimited information via communication technologies, yet has to shape this information so that the learner receives it in coherence with its intended aim. Once designed, the learning materials and environment become real products for which life cycle assessment has

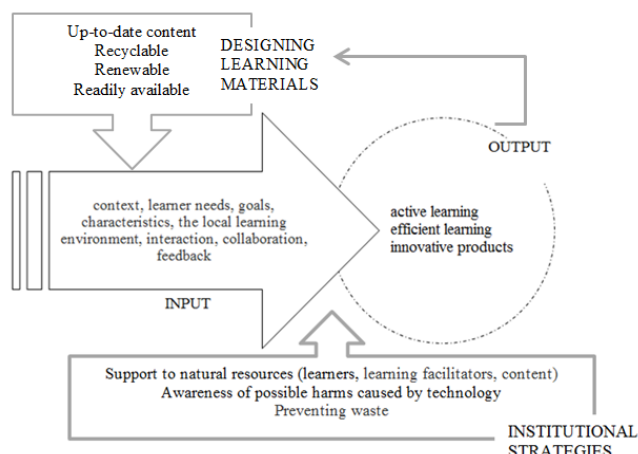
to be conducted. These products need to be designed for disassembly and recycling in order to be renewable and readily available inputs. Fig.4 presents the design process as an input for a sustainable distance education system.


Fig.4. The Design Process for Sustainable Distance Education

4.4. Waste

Waste is anything is unwanted or useless; it is a loss through carelessness, inefficiency, or ignorance. Ignoring environmental effects during the product design and production stages resulted in environmental damage caused by careless consumption of natural resources and the inefficient dumping of hazardous waste. Recognizing this damage, green engineering and design perspectives proposed actions towards cleaning up past pollution and ongoing waste streams. Being mostly cyberized or virtual does not leave distance education apart; still it is a product designed to serve actual human beings and alike every design, the process has inputs, outputs and unfortunately, produces waste. Unless managed properly, waste is harmful; to avoid possible harms and to be able to respond both to current and future demands and expectations, a sustainable distance education design needs to integrate waste prevention.

Every distance education is unique regarding its components and goals, thus the concept of waste has to be redefined in the planning stage of each system. Considering the right factors and building in the right parameters as design criteria, green engineering and green design visions stress the importance of reducing waste with the ultimate goal of eliminating it.

A sustainable distance education at first hand, must be caring, efficient, or aware towards its resources; the learners, facilitators and content information. If not, then dissatisfied learners and/or facilitators, dropouts and out of date information would be wastes. In terms of both hard and software, due to rapid developments, technology itself has the tendency to be waste. Although designers of a distance education system are not expected to be environmental experts capable of estimating the environmental and sustainability implications of their decisions, managerial and institutional support integrating green engineering and design perspectives would provide a reference area at least by forcing product life and after life analysis into the design process. Within this framework, all resources and outputs can be planned as different quality inputs after completing their intended usage.

5. Conclusion

Sustainability is a multi-scale study with many frames of reference and application context ranging from the planet Earth to economic sectors. As all 21st century incentives, current distance education planning and design has to integrate sustainability as a necessity for meeting the needs of the present and future generations. Distance

education has become a cyberized system owing its presence to developments in digital technologies but in terms of sustainability, it can no longer rely on advances in technology or the increasing 'consumer' demand; the inputs, outputs, energy and wastes have to be defined and managed so that the system can be sustained for an indefinite period without damaging its own environment, without depleting resources and has to be renewable. This study defines the inputs as learner characteristics, content, learning materials and environment, outputs as active and efficient learning and energy as the institutional strategies. Understanding the characteristics of learners in the near future, namely the digital natives, is important for the design process. Since every distance education is unique regarding its components and goals, the concept of waste has to be redefined for each system. Green engineering and design principles focusing on efficient use of resources and provisions for reducing waste with the ultimate goal of eliminating it would be a reference for designers in creating sustainable distance education systems for future generations.

Our planet has always offered us colorful resources. Now, in turn, we owe a green touch to our descendants.

A MESSAGE-CENTERED APPROACH TO TEACHING A COLLEGE-LEVEL COURSE IN POPULAR CULTURE

Thomas G. Endres

University of Northern Colorado, Box 155, Greeley, CO 80639, USA

Abstract

Popular Culture, including mediated artifacts from film, television, music, and the internet, are prevalent in most people's lives but often eschewed in academic settings. This essay provides insights into studying and teaching a graduate level course in popular culture through the lens of the communication studies discipline. It provides a message-centered approach that critically examines both mediated and non-mediated artifacts, focusing on the verbal and nonverbal, discursive and nondiscursive symbols that comprise the rhetoric of popular culture. Beginning with background and definitions, the essay then summarizes the course structure including objectives, required readings, and course assignments and their weightings. The focus then moves to examine in greater detail two specialized theories/models taught in the course – Deanna Sellnow's Illusion of Life and Andrew Wood's Omnitopia.   Following this, a description is provided of an online dialogue assigned to discuss media effects. In the dialogue, students compare and contrast the perspectives found in Neil Postman's *Amusing Ourselves to Death* and Steven Johnson's *Everything Bad is Good for You*. The paper concludes with feedback from students and the author's closing thoughts about the value of the course specifically and in studying popular culture in general.

1. Introduction

The movie *The Avengers*, which regales audiences with the adventures of Marvel super heroes such as Captain America, Iron Man, Thor, and the Incredible Hulk, was released in theaters on May 4, 2012. It opened to the biggest box office receipts in movie history, over $200 million USD in one weekend. In less than three weeks, it topped the $1 billion USD mark ($373 million in the United States, and $626 million globally), making it the fastest grossing movie of all time (Bowles, 2012).

I teach a graduate level course in Popular Culture, and a movie such as *The Avengers* is definitely an artifact that could fall under the scope of analysis in the class. That makes some educators cringe. Tell someone you are teaching a graduate level course using traditional and contemporary models of rhetorical analysis for critiquing cultural artifacts, and you will generally receive nods of approval. Tell them that you are analyzing *popular* culture and you may instead get a quizzical expression or perhaps even a sneer. There is something about the term *popular culture* -which generally (and correctly) denotes that you are examining artifacts such as television, music and music videos, video games, comic books/graphic novels, and blockbuster movies – that seems somehow "less than" cultural artifacts found in museums, art houses, and opera theaters.

This essay provides insights into studying and teaching popular culture through the lens of the communication studies discipline. That is, it is a message-centered approach that critically examines the verbal and nonverbal, vocal and nonvocal, discursive and nondiscursive symbols that comprise the rhetoric of popular culture. Starting first with some background and definitions, the essay then summarizes the course structure (e.g. objectives, readings, assignments), and then moves on to more specialized aspects of the course, including an overview of two specialty theories employed – the Illusion of Life and Omnitopia, followed by a description of an online dialogue assigned to discuss media effects. The paper concludes with feedback from students and the author's closing thoughts about the value of the course.

1.1. Definitions

Williams (2005) does an excellent job breaking down the linguistic roots of words/terms such as *culture* and the *masses*, pointing specifically to the degeneration of Latin terms such as *mobile vulgas*. Referring originally, and non-judgmentally, to the shifting and dynamic multitude, we now have such negatively based concepts as *mob* and *vulgar*. It implies that anything pertaining or appealing to the masses must somehow be base, common, or lacking in good taste. Brummett (2011) and Sellnow (2010) identify an elitist culture which lauds theater, opera, classical music and renaissance art; a culture which simultaneously eschews popular genres such as jazz, romantic comedies, and art deco. Fortunately, the gap is being bridged and the distinctions blurred.

Part of that bridge is based on an economic foundation. Cusac and Faulk (2009), looking primarily at formats such as publications, film, television, and sound recordings, determined that, in 2004, the popular culture industry "contributed US $565 billion to the economy, 2.9% of the output in the United States" (p. 459). These numbers precede the launch of products such as the iPad, Nook, and Kindle, which further digitized and revolutionized the aforementioned industries.

In addition to such mass-produced and mediated artifacts, the course also included aspects of popular messages that are less industrialized yet still pervasive in contemporary culture, such as the growing popularity of tattoos or American's fascination with the nostalgic simulacra of mythic locales such as Route 66. All of these artifacts are *texts* worthy of examination. A text, defined by Brummett (2011) is a "set of signs related to each other insofar as their meanings all contribute to the same set of effects or functions;" they are also "the ways in which we experience culture" (p. 29).

Essentially, it is important that we study the messages found within popular culture precisely because it *is* popular. It is what a majority of the people are reading, watching, listening to, and engaging in on a daily basis. In order to better understanding humans and how they communicate, we need to examine the messages they embrace, consume, pay for, dance to, celebrate with, and use for their definitions and construction of self. We need to look at what's popular.

1.2. Brief Course Description

As taught, this is a Master's level course offered as an elective within the Communication M.A. at the University of Northern Colorado in Greeley, Colorado, USA. The section described throughout was offered as an evening course which met once a week. There were twenty students representing a variety of age groups, socioeconomic status, and ethnicities. Though some focus was given to international popular culture (e.g. the influence of the Beatles), given the locale, the focus was primarily on American popular culture.

2. The Course Structure

To set the tone for the course, the syllabus opens with the following quotation, titled "Pop Culture," from the Post World War II American Literature and Culture Database, sponsored by the English Department at the University of California, Berkeley:

> *Popular culture has been defined as everything from "common culture," to "folk culture," to "mass culture." While it has been all those things at various points in history, in Post-War America, popular culture is undeniably associated with commercial culture and all its trappings: movies, television, radio, cyberspace, advertising, toys, nearly any commodity available for purchase, many forms of art, photography, games, and even group "experiences" like collective comet-watching or rave dancing on ecstasy. While humanities and social science departments before the 1950s would rarely have imagined including anything from the previous list in their curricula, it is now widely acknowledged that popular culture can and must be analyzed as an important part of US material, economic, and political culture.*

The course description reads: "This course is designed to examine contemporary Popular Culture through the lens of communication and rhetorical theory. Diverse embodiments of popular culture will be examined, including but not limited to film, television, the internet, music, and Americana." A Blackboard shell was created for the course as a depository for course materials and a site for the online dialogue on media effects discussed later. The banner for the course (see Figure 1) included an assortment of visual images hoping to capture the variety of artifacts to be addressed.

Fig. 1: Blackboard Banner for COMM 561 Popular Culture

Most of the course focused on weekly readings and discussions. Generally, each week a new rhetorical methodology was introduced for critically interpreting cultural artifacts. Among these were popular methods frequently found in rhetorical criticism courses, e.g. Burke's Dramatism, Fisher's Narrative Paradigm, Bormann's Symbolic Convergence Theory, Marxist criticism, Feminist criticism, and media-centered models such as Social Learning Theory, Parasocial Relationship Theory, and Cultivation Theory. Theories were introduced through the required texts, supplementary readings posted online, and class lecture.

In addition, a number of documentaries were viewed throughout the course, including *Confessions of a Superhero*, *Reel Bad Arabs*, *Killing Us Softly 4*, and *Michael Jackson's This Is It*. Two of the course's text authors, Deanna Sellnow and Andrew Wood, Skyped into the class for a virtual guest lecture on their respective theories (discussed later). The class also included one field trip, with an outing to a local theater to see a production of *The Rocky Horror Show*.

2.1. Course Objectives

- Identify and discuss key issues and controversies surrounding the topic of popular culture, such as the debate concerning distinctions between *high* culture and *pop* culture, the impact of television and related media on individual and societal intellect, and the nature of communication messages produced by and about popular culture;

- Understand and apply key rhetorical theories and communication concepts to popular culture phenomena, e.g. narrative/dramatistic approaches, critical power approaches, visual and mediated approaches, and specialized theories such as Illusion of Life and Omnitopia;

- Reflect upon one's own consumption of popular culture and the impact it has one one's communication styles and effectiveness, and share those insights with others;

- Independently research and write a comprehensive analysis of a popular culture phenomenon of one's choosing, interpreting the artifact in light of course concepts and theories, and be able to orally present those findings with like-minded colleagues in a manner consistent with professional academic venues;

- Critique and appraise the works of scholars and peers in light of course content.

2.2. Required Texts/Readings

- Johnson, Steven. (2006, paperback). Everything Bad is Good for You: How Today's Popular Culture is Actually Making Us Smarter. Riverhead Trade.

- Postman, Neil. (2005 printing). Amusing Ourselves to Death: Public Discourse in the Age of Show Business (20th Anniversary Edition). Penguin (Non-classics).

- Sellnow, Deanna D. (2010). The Rhetorical Power of Popular Culture: Considering Mediated Texts. Los Angeles: Sage.

- Wood, Andrew F. (2009). City Ubiquitous: Place, Communication, and the Rise of Omnitopia. Creskill, NJ: Hampton Press, Inc.

- Additionally, approximately 20 journal articles were housed in the Blackboard site as required or recommended readings. Sample resources include The Journal of Popular Culture, Southern Communication Journal, the Quarterly Journal of Speech, Critical Studies in Mass Communication, Communication Monographs, Communication Studies, and Popular Music in Society.

2.3. Assignments/Weights

A **research paper**, in which students wrote a rhetorical/critical analysis on a popular culture topic of their choosing, accounted for a significant portion of the course grade **(25%)**. The papers were 15-20 pages (typed, double-spaced, 1 inch margins, 10-12 pt. serif font, e.g. Times New Roman), not including references or appendices. APA or MLA style was required. A minimum of 15 references were required, with at least five coming from academic Communication journals. As this was a popular culture course, popular press citations were acceptable. No more than half the references could be from online-only resources.

Topics needed to fall under one of the following categories: Film, Radio/Television, Internet, Games, Contemporary History, Art/Visual, Americana. The latter topic included a subdivision focusing on the "American Road" for possible presentation at a conference (discussed later). One of the message-centered methodologies covered in class, e.g. Dramatism, Feminism, Illusion of Life, Omnitopia, needed to be applied as the analytical structure of the paper. 20% of the grade was based on the paper itself (including clarity and organization, depth of analysis, degree of understanding and insight demonstrated re: methodology and interpretation, and writing elements such as grammar and style), while the remaining 5% of the assignment was based on successful completion of a peer review process with fellow students. (Note: after topics were turned in, the categories were reorganized into three cohort groups, which ending up being *Television/Film*, *Audio/Visual Culture*, and *The Road*.)

Students were required to deliver their final paper (**10%** of grade) in a **10-15 minute presentation** emulating a research conference. Like a conference, presenters were seated at a head table. The instructor served as moderator and, following the presentations, a question-and-answer session was held with the audience. Students were expected to deliver their paper extemporaneously; reading from manuscripts was not allowed.

The remainder of the grade was dispersed between **attendance** (**10%**), **class participation** (**10%**), one-page **weekly responses** to assigned readings (**20%**), an **online dialogue** discussed at the end of this essay (**15%**), a two-page **reflection paper** following participation of an off-campus popular culture event of their choosing (**5%**), and an in-class report labeled a "**Pop-up Presentation**" (**5%**). The latter assignment was loosely based on an old VH1 television program called "Pop-up Video" in which a music video aired while historical trivia, insights and "info nuggets" were displayed throughout in little "pop-up" bubbles. In this case, students needed to select a popular culture artifact that was personally meaningful to them and, in a 5 to 15 minute presentation, tell the story using supplementary material (e.g. artifact, song, video) and share history and insights into the phenomenon. The assignment was refreshingly successful, as students shared everything from Beanie Babies and Teenage Mutant Ninja Turtles to rap music and vintage clothing.

3. Specialty Theories/Models

As noted, students generally learned a new message-centered methodology each week. For those in the Communication or Rhetoric discipline, many of the models mentioned earlier will be familiar, e.g. Burke's Dramatism, Fisher's Narrative Paradigm, Bormann's Symbolic Convergence Theory. Space here does not allow explication of the methods. However, two models introduced are significantly worthy and unique to justify additional description here: Deanna Sellnow's Illusion of Life and Andrew Wood's Omnitopia. The author would once again like to thank professors Sellnow and Wood for Skyping into class and providing first-person insight on their theories to the class.

3.1. Sellnow's Illusion of Life

Co-created with husband Tim Sellnow, the Illusion of Life methodology provides a message-centered model for analyzing both the discursive (symbols with fixed associations, e.g. words, lyrics) and nondiscursive (symbols felt as a quality, e.g. sounds, images) of music. Published in a variety of academic journals, Sellnow concisely summarizes the theory in a chapter from her 2010 Popular Culture textbook. The theory expounds upon earlier work by Suzanne Langer, and argues that music functions rhetorically by creating an *illusion of life* for its listeners. In other words, music is not actual life; rather, it is a symbolic representation of "life experiences and feelings influenced by the artist's perspective" (p. 117).

The model provides a framework for analyzing the **virtual experience**, or symbolic lyrics, found in an artist's work. Essentially, the rhetor or critic analyzes whether or not the lyrics are *comic* – which "focus on self-preservation" and "opportunities to beat the odds" – or *tragic* – which focus on "self-consummation, dealing with great moral sacrifices, and coping with fate" (p. 119). Additionally, either comic or tragic lyrics can be situated within a *poetic illusion* – which is backward looking into the past and cannot be altered – or within a *dramatic illusion* – which is "forward-looking into the virtual future" and "offers a sense of uncertain destiny" (p. 119). Thus, a song lyric in which a protagonist looks forward to new and exciting adventures would be described as *comic* and *dramatic*, while a song lyric in which the protagonist laments the loss of a romantic relationship would be *tragic* and *poetic*.

Most message-centered models provide only a framework for analyzing symbolic units, such as the examples above. What makes the Illusion of Life method unique is the additional criteria for analyzing nondiscursive elements in music such as the sound. Referred to as **virtual time**, the method offers a substitute for actual time (which is subdivided into successive movements such as minutes, hours, days, etc.), and identifies instead patterns which are communicated via rhythm, harmony, melody, phrasing, and instrumentation. Distinctions are made between *intensity* patterns and *release* patterns. An intensity pattern, exemplified by a hard rock song, is characterized by fast tempos, harsh and short-held tones, staccato phrasing, and many amplified instruments. In contrast, a release pattern, exemplified by a ballad, consists of a slow tempo, mellow and long-held tones, smooth and connected phrasing, and fewer and generally acoustic instruments. Sellnow provides greater detail in her distinctions, but the brief description above hopefully gives a feel for the methods and demonstrates that one need only be a traditional music consumer, not a trained musician or music professional, in order to hear the difference.

In additional to identifying the variables above, the goal of a critic is to determine whether the messages found in the music being analyzed are **congruent** or **incongruent**. A congruent message, according to Sellnow, occurs when "the emotional messages of the music and the conceptual messages of the lyrics reinforce one another, making the messages communicated poignant (clear) [p. 119]." Conversely, an incongruent message occurs when the emotions conveyed in the music and the conceptual elements of the lyrics contradict. This incongruence tends to alter the meaning of the song compared to simply listening to the music or reading the lyrics separately.

An example of a congruent song would be a *comic* and *dramatic* lyrical message paired with an *intensity* music pattern. Sellnow offers KISS's classic rock anthem, "Rock and Roll All Nite" as an illustration. On the

other side, one would find congruence when combing a *tragic* and *poetic* lyric with a *release* musical pattern. The example offered by Sellnow is Bruce Springsteen's "Streets of Philadelphia," the 1994 Academy Award winning song from the movie *Philadelphia*, focusing on the trauma associated with dying from HIV/AIDS. While congruent music is often effective in creating a particular mood or fostering in-group beliefs, it can sometimes lose rhetorical effectiveness by virtue of being too predictable to adherents and too controversial for outsiders. Sellnow discusses the use of strategic ambiguity and rhetorical ascription as neutralizing methods to temper the polemic nature of a congruent message and make it more palatable to a general audience.

Additionally, the critic can look for incongruity in a musical message, e.g. combining comic lyrics with release patterns or tragic lyrics with intensity patterns. While some might think these combinations chaotic, like the strategies noted above, the dissonance created can actually give the song a twist or a flavor that makes it more acceptable to a broader audience. For example, Sellnow revisits the KISS song "Rock and Roll All Nite;" this time analyzing the ballad-like cover version from Toad the Wet Sprocket. With its slow tempo, harmonic tone, and acoustic instrumentation, this version moves from an abrasive and potentially headache-inducing rock anthem with a call to action to simply a thoughtful and easily consumed musical rumination on the desire to party.

3.2. Wood's Omnitopia

Though many of the course definitions of popular culture focus specifically on mediated texts such as television and the internet, as noted earlier, this graduate seminar sought to identify other aspects of American culture that were not mediated but were still popular, e.g. tattoos. As part of this conversation, we addressed non-mediated artifacts such as locales, roadside attractions, architecture, and increasingly popular home features such as "theater rooms" and "man caves." Andrew Wood's (2009) theory of Omnitopia provided a message-centered lens through which to view such phenomena.

Roughly translated to "all-place," the concept of *omnitopia* "enacts a structural and perceptual enclave whose apparently distinct locales (and locals) convey inhabitants to a singular place (p. 10)." In other words, there exist in culture types of environments that, upon entering, one is cognitively removed from their literal locale and transported to a perceptual, yet strategically incomplete, location that is simultaneously detached from current space yet "everywhere" all at once. Quite simple examples would include a video game arcade at any mall, a McDonalds or Starbucks anyplace on the planet, or a generic conference presentation room found in many hotels. One could be in Denver, Colorado or Prague, Czech Republic – and it is in many ways one and the same space.

Wood discusses these places as *enclaves*; protective and instructive little worlds which have a distinctive identity apart from their surrounding milieu, characterized by "a paradoxical balance of porous borders and rigid rules" (p. 21). Again, space limits preclude an extensive discussion of the perspective. Briefly, Wood's text provides in-depth analysis of three common omnitopia locales: airports, hotels, and shopping malls. In deconstructing their essence, he applies the following five criteria for analysis, all of which relate in varying degrees to the artifact being investigated:

- *Dislocation*: "detaches a site from its surrounding locale" (p. 65). Often, when entering a locale, the external surroundings become immediately irrelevant. We become insulated from the outside, and "here" removes the need or recognition of "there." Casinos, malls, airports, and numerous other structures create such dislocated zones.

- *Conflation*: "merges disparate experiences into a single whole" (p. 68). In this case, multiple message-centered narratives – a "pastiche of functions, referents, and settings (p. 68)" - merge into a single location. Examples include everything from a food court at the mall to Disney's EPCOT Center, where elements of the whole world convene in a unified yet artificial arena.

- *Fragmentation*: "splits a singular environment into multiple perceptions" (p. 70). In contrast to conflation, an omnitopian environment may also fracture the "totality into isolated surface-level images, functions, and interactions" (p. 70). When every occupant in a car is listening to their private music on personal electronic devices, or movie-goers in a multi-plex theater sit in the same building, facing the same direction, but watch different movies on different screens, their locale is fragmented.

- *Mobility*: "orients a place around movement rather than stasis" (p. 73). This is the part of omnitopia in which disparate locales transform into "nodes of the same place" (p. 73). Anyone who has walked from Airport A onto a plane and exits that plane at Airport B – without really feeling like they have gone anywhere – has experienced the movement, flow, and blurred edges of omnitopian mobility.

- *Mutability*: "enables the perceptual change of a place" (p. 76). Within an environment, changes may be purposefully or inadvertently enacted that alter the experience. From adapting a space by moving chairs around to seat a particular group, to setting up velvet ropes to cordon off movie-goers waiting in line to see *The Avengers*, many spaces are mutable. In some cases, the change may actually negate the feeling of being trapped in a singular environment.

Collectively, these five criteria become the basis for a message-centered critique of a popular culture locale. For those wishing to interpret the artifact in even greater detail, Wood concludes his text with three additional variables which help unpack and critically problematize the five-point structures found in the framework above. He addresses the characteristics of *performance* ("recasting of…props and rewriting of preset scripts," p. 156) and *convergence* ("intersection of technology and convergence that allows its practitioners to carry a miniature version of the world with them," p. 175), and concludes with the impact of *reverence* toward the phenomena ("to integrate the value of meaningful places into our sense of selves – not just to pass through them, but also to pass them through us," p. 194).

4. Online Dialogue Regarding Media Effects

The Sellnow and Wood texts discussed above were required readings for class discussion and weekly reading response papers. Two other books, detailed below, were required in class, but there was no time to discuss or integrate them into the weekly regimen. As such, a completely separate online discussion, housed in Blackboard, was assigned. The web dialogue was divided into five two-week blocks. Readings from both books (approximately 80-90 pages) were assigned for each two-week block, and students were required to log into the discussion and contribute at least once to the ongoing conversation. Briefly, zero comments during a two-week block meant an F for that block. The required minimum of one comment earned a D. Two comments, one on each book, were the required minimum for a C for that block. Higher grades were based on a greater quantity of comments and the instructor's evaluation of the caliber of those comments (e.g. more proactive than reactive, thoughtful responses to questions posed by classmates, integration of course and other outside materials, incorporation of personal experience).

4.1. Postman versus Johnson

The two books read were Neil Postman's (2005, 20th Anniversary Edition) classic Amusing Ourselves to Death: Public Discourse in the Age of Show Business and Steven Johnson's (2006) bestseller Everything Bad is Good for You: How Today's Popular Culture is Making Us Smarter. The books give sharply contrasting arguments about the value of mediated popular culture such as television, movies, and the internet. Ironically, both books had red and yellow covers with a drawing on the front of one or two people who had televisions instead of heads. The same picture concept was used as both an indictment and an endorsement of media effects.

Postman's book is a cautionary tale of media consumption. He argues that media, particularly television, is the metaphor that defines and creates our culture. While he claims no bias against the harmless "junk" on television, he expresses concern that media becomes our epistemology – our way of knowing and our standard of

truth-telling. He laments that we have lost our typographic mindset which revered reading and, using the Lincoln-Douglas debates as an example, created an audience who would willingly sit through seven hours of oral debate. With the advent and advances of electricity, telegraphs, telephones, photography, and the like, Postman claims that we entered a peek-a-boo world where, like the child's game, "now this event, now that, pops into view for a moment, then vanishes again" (p. 77). Like the game, it is without much coherence or sense, but is also endlessly entertaining.

With the increasing popularity of television, which puts show business on the screen and entices us with ongoing "Now…This" surprises and topic shifts, Postman concludes that we are abandoning logic and reasoning and replacing it with entertainment and theatrics. Unlike some, who equate television viewing with George Orwell's *1984* and Big Brother concepts, Postman argues that we are more at risk of falling prey to Aldous Huxley's *Brave New World*; a world in which people willingly love the oppressive technologies that take away their capacity to think. Postman observes that:

> *Indeed, he (Huxley) prophesized its coming. He believed that it is far more likely that the Western democracies will dance and dream themselves into oblivion than march into it, single file and manacled. Huxley grasped, as Orwell did not, that it is not necessary to conceal anything from a public insensible to contradiction and narcoticized by technological diversions. (p. 111)*

Quite simply, Postman is concerned that in everything from our religious beliefs to our political affiliations to our educational systems, we are foregoing reasoned treatment and are instead relying on television and other mediated formats to entertain us. We are therefore, in his eyes, amusing ourselves to death.

In contrast, Johnson argues that, thanks to such mediated conventions as televisions and computers, society has actually grown smarter. He bases much of his argument on a theoretical premise called the *Sleeper Curve* (based loosely on Woody Allen's comedy, *Sleeper*, in which a time traveler awakes to find out that future peoples know things not known to previous generations). Johnson argues that "the landscape of popular culture involves the clash of competing forces: the neurological appetites of the brain, the economics of the culture industry, changing technological platforms" (p. 10). This complex interplay between the brain, economics, and new technologies make the peoples of today more intelligent than their forbearers.

Though he extols the Sleeper Curve as the "single most important new force altering the mental development of young people today," he is quick to point out that his argument is about trends and not absolutes. He does not claim that today's television shows and video games are necessarily great works of art; simply that they are more cognitively complex than anything that has proceeded them. In other words, because video games are more complicated, television storylines more multi-threaded, and movie plots more intricate and character-laden, today's consumers are more neurologically engaged.

As evidence, he references the Flynn Effect; a perspective which argues that IQ scores are trending upward. Briefly, philosopher and civil rights activist James Flynn did research to counter allegations (in books such as Arthur Jensen's *The Bell Curve*) which suggested an increasing discrepancy in IQ scores between blacks and whites. What he found was that, regardless of color, the average IQ appeared to have risen by 13.8 points over a 46-year period. It seemed to have gone unnoticed because the IQ exam is geared to have a median score of 100. Every few years the test is recalibrated, allegedly by being made more difficult, in order to reset the median score. According to Johnson, "Some environmental factor (or combination of factors) must be responsible for the increase in the specific forms of intelligence that IQ measures: problem solving, abstract reasoning, pattern recognition, spatial logic (p. 142)." This he attributes to the increasing complexity found in popular culture artifacts.

4.2. Student Reactions

First and foremost, students were supportive of the assignment, but not enthusiastically so. Some were simply not comfortable with, or disciplined enough to engage in, a completely online dialogue. Others simply

tired of the two arguments, especially since they stretched out over a ten-week period. Despite that, it is a dialogue and an assignment worth keeping in class, though perhaps with a few adjustments.

In the end, a majority of the class sided with Postman. A few voiced preference for Johnson overall, but most simply credited him with having some thought-provoking but not entirely convincing ideas. What follows is a sample student comment extracted from the final two-week block of the dialogue, in which students needed to indicate and justify their preference:

In regards to the first page of chapter 10, Postman makes it sound as though educational T.V. is not bad. One thing he said stuck out to me: "'Sesame Street' relieved them [parents] of the responsibility of teaching their pre-school children how to read..." (p. 142). This goes with the theme of "T.V. as the babysitter," which drives me crazy. I watched "Sesame Street" but not as much as my peers because my dad made it his job to sit down with me every night to read to me. And because I wanted to be just like my dad, I wanted to learn how to read. Eventually, my dad had me reading him the bedtime stories and in the morning I would skip to "Power Rangers" over "Sesame Street" because I already knew how to spell, read, and count.

I agree, "... television viewing does not significantly increase learning, is inferior to and less likely than print to cultivate higher-order, inferential thinking" (p. 152). Whenever teachers would put a video on with a follow along worksheet, I would zone out. My generation and the current generations are desensitized to the educational effects of T.V. because we do have unlimited access to it. Besides, our culture dictates T.V. time as leisure time – not intellectual stimulation time.

Overall, I admire what Postman says about educating people about how to use T.V. (and all forms of media). If we made more people aware of how T.V. (and media in general) affects them, then they will be more equipped to utilize media for more than leisurely use. I think people have become slaves to media... as Postman states at the end, people don't need to be worried about the fact they are laughing instead of thinking, but that " they did not know what they were laughing about and why they had stopped thinking" (p. 163).

5. Discussion

All things considered, this was a successful course, and worthy of being taught again. The readings, documentaries, guest speakers, and assignments seem appropriate to the course content. The differential weighting of assignments appropriately reflect the amount of effort expected and value accounted for in the assignment. Though some adjustments could be made to the online dialogue (e.g. condense the number of weeks or number of dialogue blocks, integrate it into a classroom assignment like a debate), the format could be left as is.

Some key elements that seemed most successful were the inclusion of non-mediated artifacts (e.g. tattoos, road) in addition to traditional mediated artifacts, the introduction of new theories/methodologies (i.e. Illusion of Life, Omnitopia) not usually encountered in a communication studies or rhetoric course, the requirement of both a research paper and a concomitant presentation delivered in conference format, and the opportunity to research and share insights into cultural phenomena of personal interest to each student.

This essay provided the author a unique opportunity to reflect upon the course structure, which was certainly of personal benefit. That is not the sole purpose, however, of the paper. The purpose is to share with members of the academic community both a rationale and a framework for those hoping to teach a course, undergraduate or graduate, on *Popular Culture*. The suggestions and ideas throughout are provided freely in the spirit of academic collegiality. Before embarking on such a project, however, it may be of value to hear what the students themselves thought of the course.

5.1. Student Feedback

Students are given a standard course evaluation form to complete, which consists of two clearinghouse questions on a 5-point scale (5 being high) with space for anecdotal comments. On the question, "All things considered, how would you rate the course?" the score was 4.85. On the question, "All things considered, how would you rate the instructor?" the score was also 4.85. Sample open-ended comments include the following:

- This was my first class experience at UNC and it blew my expectations away. The teacher, the material, and the guest lectures all worked together to provide an informative and rewarding experience.

- Very thought provoking. Wish this intense analysis was offered at the undergraduate level.

- Really opened my eyes to the power of pop culture and helped me better put into words thoughts I've had for a long time.

- A new way of considering the world I live in. Dr. Endres always made the time for constructive critique. Breadth and depth of coursework allowed for individual growth and understanding. Books flowed well. Most important, the use of authors via video was excellent addition for understanding.

- The course was one of the most interesting I have ever attended. There was enough material to make it challenging as should be expected in a master's program. It was not too overwhelming and kept me wanting to read more. The instructor was firm and provided a perfect environment for wonderful discussion. I love the idea of bringing Sellnow and Wood into the class.

5.2. Concluding Thoughts

On a professional note, this class was very rewarding, as a number of the students submitted their research papers for consideration at various professional conferences or publications. The five students from "The Road" cohort in class had their papers accepted as a collective panel (chaired by the instructor) at the March, 2012 conference of the *Society for the Interdisciplinary Study of Social Imagery*, held in Colorado Springs, CO. The panel, titled "Rhetorical Perspectives on the Literal and Symbolic Road in Popular Culture" perfectly fit the conference theme of "The Image of the Road in Literature, Media, and Society," and their finished papers were published in the conference proceedings.

The class was rewarding on a personal level as well. Speaking in first person, now, I will admit to being a big fan of popular culture. I've always been a bit hesitant to admit that in an academic setting, however, fearing that my affinity for motorcycle rallies, tattoos, comic books, music and movies does not measure up to the my colleague's interests in ancient or current political speeches. On a similar note, I'm sometimes a bit uncomfortable with popular culture because it sometimes *does* feel shallow when compared to high culture artifacts such as classical music or Renaissance paintings. It is intimidating to be writing this paper for a conference in Prague, which boasts an astronomical clock built in 1410, when I am living in a country whose ruling government wasn't founded until 1776, in a state (Colorado) that didn't exist until 100 years later in 1876. I'm surrounded by more movie theaters than museums, by more tattoo artists than aristocrats, and more comic books than commissioned works. Sometimes, I must admit, I embarrass myself.

But then I return to an observation made in this paper's opening comments. Popular Culture – as manifest in blockbuster movies such as *The Avengers* – is exactly what I should be studying and teaching, because it is what's influencing a majority of consumers worldwide. It is what people are reading about, watching, listening, and dancing to. It is what they are buying and what drives much of the global economy. It is what influences them and their relationships with others. It is the messages they care about.

My next academic paper, which I'll start writing as soon as I finish proof-reading this, is about a super hero action figure named Captain Action. The figure was first released in 1966, then again in 1998, and once again

this summer of 2012. The earlier productions never had more than a three-year lifespan. I will be comparing and contrasting the marketing strategies and use of media in each of the releases (including comic books and, in this new case, social media), as a predictor of the potential success of this latest attempt. Whether you label it "popular" or not, it is communication, and it is culture, and it is worth investigating.

Abstract

In this study, an application has been developed to evaluate the performance of the welder candidates who's using the 3D Welding Simulator. Training of welders with virtual welding simulator for three different welding methods (Electric arc, MIG-MAG and TIG) can be performed close to reality. To keep the information about the experiments on virtual welding simulator and the users who performed the experiments, a Database management and reporting system has been developed. In this software module, welding information, calculated ideal welding parameters and parameters data recorded during welding operation are stored in the database. With this software virtual welding experiments performed by welder candidate can be evaluated, the results can be shown as graphics and scoring, and personal or classroom-based development can be traced.

Keywords: Welder Training, Electric Arc-MIG-TIG Welding Education, Virtual Welding Simulator, Performance Analysis

1.Introduction

Welding method is an economical joining method which is widely used in local and international industrial levels such as shipyard, automotive, steel construction structures, bridges and machine production. Considering the technological concepts such as cost and safety for optimum production, it is required for a good welding training of the welders for their qualifications and efficiency. As well as technological knowledge for training of the welders, various welding applications are done for testing parts in order to develop their hand skills. Despite the importance of having technological knowledge and experience in welding, hand skills and training are the most important parameter in welding joints.

Today software and hardware technologies put forward that perceptions can be lived as realistic, without real world or material. Generally, this technology named Virtual Reality is the sum of three-dimensional (3D) images animated by computers and created with virtual reality devices, and presented to the user in such a way that the user believes and accepts it as "a real world" (Ellis 1991, Astheir 1994, Slater 1994).

In this study, a software including welder training and performance evaluation has been developed for. In main program module that is created by using C# programming language and MS SQL database management system, a database management and reporting system has been developed to keep the information about the experiments on virtual welding simulator and the users who performed the experiments. In this software module, welding information, calculated ideal welding parameters and parameters data recorded during welding operation are stored in the database. With this software virtual welding experiments performed by welder candidate can be evaluated, the results can be shown as graphics and scoring, and personal or classroom-based development can be traced.

The performance analysis of the user is shown through graphical and numerical ways with using artificial intelligence techniques. At the end of analysis, weakness of the user is detected and advises are being displayed on the screen to overcome this weaknesses. According to the basics of computer aided education, fundamentals of welding education and virtual welding simulator education documents are presented in the software.

2.Welding Simulators

With the advances in computer and software technology, concept of computer aided education has entered the world of education and learning in the early 1990s. Researchers are developing simulators to improve education quality and efficiency, shorten training time, decrease the cost of materials and tools used in education. Simulators also has been developed for welders training. These simulators are divided into two categories based on the software and hardware technologies: older and newer generation welding simulators (Oz,2011).

Simulator developed by Wu and his colleagues is an example of the older generation welding simulators (Wu, 1992 & Wu, 1993). In these studies they investigate how welding simulators are affecting the welder education. Their study took two years with 220 students. They found out that studying with welder simulator decrease the education time and costs. Tim investigated how welding simulators which are developed in the USA, Canada and France in last decade, affected the welder education. (Heston, 2008). They determined the benefits of the virtual welder training and advised to use it before the traditional welder education stage. At the same time, modelling of welding and analysis are carried out, such as 3D anaysis of Arc welding simulation with finite element analysis (FEM) (Hamide, 2008) and MIG modelling and simulation (Palani, 2007). Yaşar Top, from Sakarya University graduated his MSc course preparing an MSc thesis on "welder's education program via simulation and training" (Top, 1997) and published an article about the related subject (Top, 1998). In this paper, case study performed on a total of 24 students in two different groups was presented. He observed that the students, first educated in the welding simulator using Arc, MIG, TIG welding methods, obtained better performance during the real welding operation, done better quality welding and reduced the scrap parts.

There are several patents related to welding simulators and virtual welding training (Danison, 1984, Blair, 1978 & aton, 1987). In addition, there are patents for simulation of torch movement (Vasiliev, 1987) and simulation of welding arc (Schow, 1979).

New generation welding simulators are three dimensional simulators which provide interaction between the virtual environment and the user through using today's computer and virtual reality hardware and software technology. Mavrikos and his colleagues(2006) developed three dimensional welding simulator for MIG-MAG welding. In this simulatori the user enters welding parameters such as gas type ,electrode radius, current and gas flow. While creating the welding seam form, welding speed, torch distance and torch angle parameters was used. Porter and his colleagues (2005), used back-propagation algorithm in artificial intelligence to create welding seam form. In 2009, Dongling and his colleagues performed offline welding heat distribution modellings in ANSYS software (Donglin, 2009). Fast and his colleagues developed MIG welding simulator system with using a haptic torch, a head mounted display and a sound system. Welding seam form was determined by using an artificial neural network (Fast, 2004).

3.Virtual Welding Simulator Used In Welder Training

Virtual Welding Simulator as shown in Figure 1-a has been developed for welder training. Virtual welding simulator program is a continuous cycle. Simulator can draw 60 imagess in one second. Before entering a cycle, first, welding stage is created and then dynamic and static objects, observer's camera and indicators are created and added to the welding stage. When the simulator entered in a cycle, input/output engine listens position and orientation device. This device gives the position and the orientation of the torch. Graphics engine of the simulator manages the virtual scene with these data. When torch's electrode close enough to touch the material, graphics engine create weld seam and arc light, etc., and the sound engine produces 3d sound. DirectX library and GPU (Graphics Processor Unit) create 2D/3D image by providing required texture and

synchronization According to the feedback received from the display and other output units, the user determines his/her movements. Throughout a cycle, welding speed, sound and sparkle effects is renewed. Virtual welding simulator interaction software is shown in Figure 1-b.

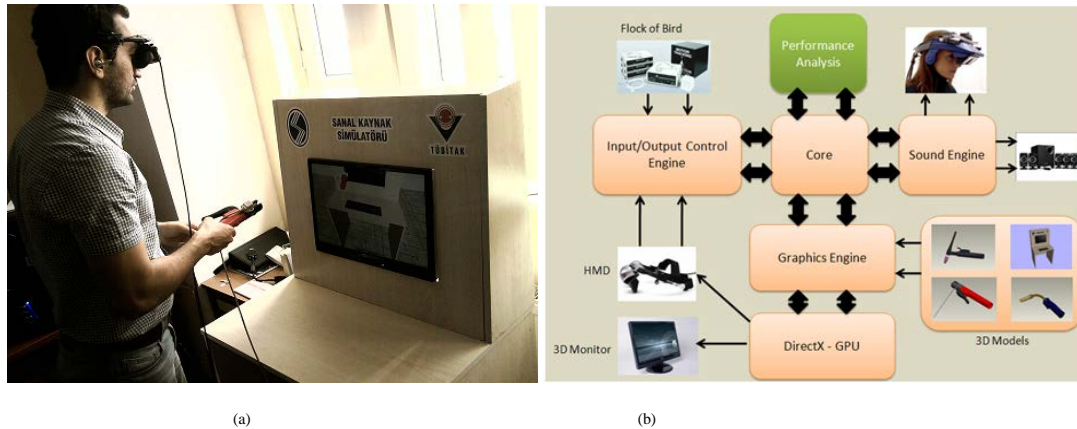
(a)   (b)


Figure 1.The principle of the simulator software (a) Virtual Welding Simulator (b) Software architecture

4.Welder Education with Virtual Welding Simulator

Virtual welding Simulator is developed using C# and C++ programming language, database management system and Microsoft DirectX library. Program is used with a main form. Four buttons exist on the main form. These buttons are; virtual simulator, performance analysis, training documents and exit from the program.

Welding Simulator; allows the user to make welding with simulator.

Performance Analysis; performs the evaluation of the performance and success of virtual welding work.

Training Document; consists of documents containing the information of using the virtual welding simulator, basic welding and so on.

Exit from the program; is used to terminate the program.

4.1.Welding Simulator

Welding simulator module is the main module of the virtual welding simulator software. If the person who will take welder training is using the system for the first time, registers his/her personal information to the database using the Student Registration Form, In the next stage after the student registration process, a form is displayed calculating the ideal parameters using expert systems for the welding application. Parameters related to

the welding type and material that will join with the welding are entered on the form. Depending on these parameters, ideal parameters that will be used on the welding application are calculated with the expert systems module. These parameters are also used to evaluate the student's performance of his/her virtual welding application. Figure 2 shows the form for selecting the ideal welding parameters.

Figure 2. The form for selecting the ideal welding parameters

4.2.Evaluation of Student Virtual Welding Application

Analysis of a student performance in a virtual welding application can be used for another virtual welding experiment performed by the same student. Performance analysis for earlier experimental studies can be traced with the "Performance Analysis" button on the main form. When the "Performance Analysis" button is clicked, the form is displayed in Figure 3. By using this form, user can see student's virtual welding application list and these experiments can be analyzed.

Figure 3. Virtual welding experiment list performed by the selected student

The evaluation of the welding is performed for four basic parameters. Four different graphics are obtained for these four parameters. Horizontal lines in each graph, the black lines show the ideal values, green lines are the acceptable limit, yellow lines are the tolerance limit and the red lines indicate rejection limit. Rejection limit is a limit value determined for scoring. Exceeding this limit value does not mean the welding is failed. After exceeding this limit, no points are given for welding. However, when it retains for a long time in this region, welding fails.

"Line Control" button displays the graph of the line control. Line control graph is used to test whether the welding process is done along the welding line or not. Even if the user has completed a perfect welding process, the welding fails if he/she does not done this process in the welding region. Rate of moving away from the source line is controlled during scoring and after exceeding a certain limit the welding is considered to be failed.

4.3.Scoring

The histogram graph generated for each parameter is used to determine the welding parameter performance. All parameters are evaluated over 100 points in itself and the result score is obtained by taking average of the weights of the parameters.

Each region is subjected to a separate rating during scoring. These regions are also divided into regions with color scale (black, yellow, green and red). The percentage of value in the ideal region is considered as full point in scoring. Points are decreased as 50%, 25%, 0% while going away from this area. General scoring of welding process is obtained from the sum of the average weight of these four parameters.

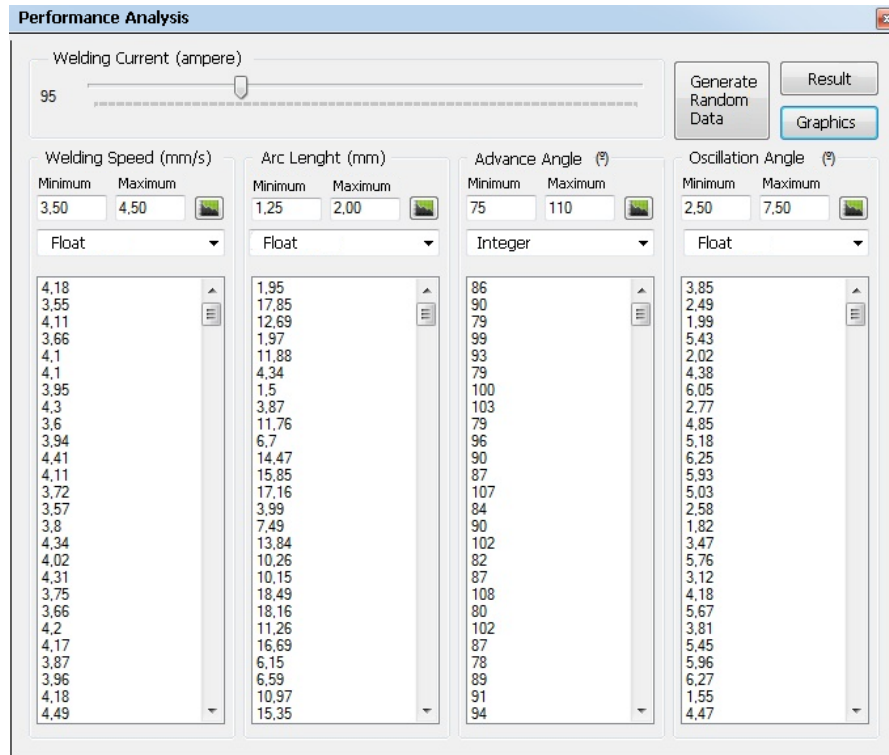
Data obtained from successful welding experiments done for Electric-arc welding in Virtual Welding Simulator is given in Figure 4, the histogram graph is shown in Figure 5, and scoring screen in Figure 6.


Figure 4. Data obtained from a successful electric-arc welding experiment in Virtual Welding Simulator

The parameter values are concentrated around the ideal value (I.V.) in successful welding experiments, this situation is the vice versa in failed welding experiments and are concentrated around the under rejection (U.R.) and above rejection (A.R.) regions. ('A.T'.: Above Tolerance, 'A.A'.:Above Acceptable, 'U.A'. :Under Acceptable, 'U.T.' :Under Tolerance)

5. Results and Discussion

In this study, an application has been developed to evaluate the performance of the welder candidates who's using the 3D Welding Simulator. Training of welders with virtual welding simulator can be performed for three different welding methods including Electric arc, MIG-MAG and TIG. Virtual welding simulator system

consists of three stages including data entry of welding method and workpiece, the creation of the welding seam and evaluation of generated welding. A database management and reporting system has been developed to keep the information about the experiments in virtual welding simulator and the users who performed the experiments, In this software module, welding information, calculated ideal welding parameters, parameter data recorded during welding operation, performance evaluation result of the welding are stored in the database. Personal or classroom-based development can be traced; past or current performance reports can be obtained by using this software. Users performing welding experiments with Virtual Welding Simulator have increased their performance of the welding process over time.

User performance evaluation software module is performed with expert system method using data generated by four different welding expert and trainer. Evaluation can also be done by using Artificial Neural Networks, fuzzy logic classification methods and statistical methods. More flexible usage can be provided by bringing the evaluation and reporting part of the program executable on web environment

A PHYSICAL FITNESS INTERVENTION PROGRAM WITHIN A PHYSICAL EDUCATION CLASS ON SELECTED HEALTH-RELATED FITNESS AMONG SECONDARY SCHOOL STUDENTS

Shabeshan Rengasamy

Department of Science & Mathematics,Faculty of Education,University Of Malaya,Jalan Pantai Baru

Abstract

The aim of the study was to investigate the effect of a physical fitness intervention program within a physical education class on selected health-related fitness components among Malaysian secondary school girls. A quasi experimental design was adopted for the study. Two Schools in a district were randomly selected. In each school, two classes were randomly assigned intact to the experimental group (n=48) and the other was the control group (n=38). Pretest data was collected on cardiovascular endurance, Flexibility and muscular strength. The experimental and the control groups underwent regular physical education classes twice a week for ten weeks. Apart from the regular physical education classes, the experimental group underwent the treatment of four exercises in a form of a circuit immediately after the warm-up session. After ten weeks, posttest data was collected. ANCOVA indicated that there was a main effect in cardiovascular endurance F(1, 83) = 44.69, p<0.05 and for flexibility F(1,83) = 46.80, p<0.05. As for muscular strength, the result was not significant F(1,83) = 3.54, p>0.05. The results indicate that a ten week physical fitness program within a physical education class was effective in enhancing cardiovascular endurance and flexibility among Malaysian secondary school girls.

Key words: health-related fitness, cardiovascular endurance, strength, flexibility, intervention

1. Introduction

Reports abroad indicate that the state of aerobic fitness and other health related fitness among school going children is not very satisfactory (Derri, Aggeloussis, & Petraki, 2004; Gutin et al., 1990, 1994; Hatano et al., 1997; Tomkinson, Olds, & Gublin 2003; US Department of Health & Human Services, [USDHHS]   1996; 2001). Among children ages between 12-21 only half of them participate in vigorous physical activity (PA), and one-fourth of this population reported that did not participate in any physical activity (USDHHS 1996). In view of this, many physical educators are of the opinion that being physically inactive and leading a sedentary lifestyle is one of the reasons for dramatic increase in the prevalence of overweight and obesity, thus attributing to risk factors for cardiovascular diseases (CVD) in adults and even among children (Denke, Sempos, & Grundy, 1993; USDHHS, 2001, 2008; Young & Steinhardt, 1995; Gutin et al., 1999). The American Heart Association (1992) indicated that a sedentary lifestyle is a modifiable risk factor for coronary heart disease (CHD). Conversely, there is evidence that both increased physical activity (PA) and physical fitness are associated with improved risk factors for (CVD) (Caspersen, Nixton, & DuRant, 1998; Despres, Bouchard, & Malina, 1990; Sallis et al., 1997; USDHHS, 1996, 2001, 2008). In view of this problem and to modify the above situation, all school going children should be encouraged and motivated by the teachers to participate in PA through quality physical education programs conducted in schools to educate and enhance health-related fitness components (Levin et.al., 2001; USDHHS 1996; 2001, 2008). These school based physical education programs that are effective would have the potential to increase PA levels and the knowledge of fitness and therefore plays an important role in promoting health-related fitness components and contribute to public health (Wallhead & Buckworth, 2004).

In Malaysia, CVD posed the greatest threat beginning the late 1990s. In 2001 it was reported that 20-30 % of total death in Malaysia was contributed to CVD (Khor, 2001). The findings from National Health Morbidity Survey III (MOH, 2008) indicate the prevalence of physical inactivity to be 43.7% among adults and sedentary

lifestyles among Malaysian children. A study by Lim (2005) indicated that about 44% of the 75 adolescents studied were sedentary. Further, Dan, Mohd Nasir and Zalilah (2011) reported that one third of the respondents between the ages 13-14 years were in the low physical activity level category. Further, the status of Malaysian school going children undergoing regular physical education in schools indicate low mean scores for health-related fitness components (Balakrishnan, 2003; Kasmini et al., 1997; Rengasamy, 2003, 2006 2008; Singh, 2005; Sinnapan, 2006). It is recommended that proper intervention programs with sufficient intensity levels be implemented at the school level (Council for physical Education, [COPEC] 1998; Dan, Mohd Nasir & Zalilah, 2011; USDHHS, 1996; 2001). Intervention programs have indicated enhancement of health-related fitness among school children, however most of the intervention studies were carried outside the physical education classes. (Derri et al., 2004; Faigenbaum & Mediate, 2006; Faigenbaum, Milliken, Loud, & Burak, 2002; Flanagan, et al., 2002; Ignico & Mahon 1995; Singh, 2005).

There is a need to study and understand intervention programs within a physical education class as local research have indicated low health-related fitness components among girls (Balakrishnan, 2003; Rengasamy, 2008 Palanippan, 2007). The lack of published research locally and abroad on intervention programs towards girls within the physical education classes in enhancing health-related fitness components prompted the current study. The purpose of this study was to investigate the effect of a physical fitness intervention program within a physical education class towards selected health-related fitness components among Malaysian secondary school girls.

2. Methodology

2.1. Participants

Two schools in the district of Banting, in the state of Selangor were randomly selected for the study. There were a total of seven Form Four classes in each of the selected school. Two classes in each school were randomly selected and randomly assigned intact for the experimental and the control group. The experimental group consisted of forty eight (n=48) girls, and the control group consisted of thirty eight (n=38) girls respectively and their mean age was 16.1; *SD* 0.42

2.2. Design and Procedure

A quasi-experimental design with a pretest-posttest design was adopted for the study (Gay, 1992). The experimental and the control groups followed their regular physical education conducted for 40 minutes twice a week in addition the experimental group underwent the intervention program.

2.3. Treatment

The present study was conducted for ten weeks. In the present study, a treatment of four exercises in a form of a circuit was utilized to improve health-related fitness as suggested by Morgan and Adamson (1972). Once the experimental group had assembled, they would undergo the warm-up and stretching exercises for about eight minutes and followed by the treatment. As for the control group, they followed their regular physical education classes conducted 40 minutes twice a week. After ten weeks, posttest data were collected and analyzed for between group differences using analysis of covariance (ANCOVA).

2.4. Testing

A common pretest was given using 12-Minute Cooper's Test for cardiovascular endurance with a reliability of 0.95 and the validity coefficients of .65 (Byrd, 1980). The Test was conducted in a 400 meter track in the school field as recommended by Baumgartner and Jackson (1991).

Flexibility was assessed using the Sit and Reach Test using a specially constructed box and this protocol was supported in studies by Faigenbaum et al. (2002), Hatano (1994) and Singh (2005).

The measure of the hand strength was carried out by a hand dynamometer as seen in study by Faigenbaum et al. (2002). The reliability reported is .90 (Bargartner & Jackson). The hand dynamometer was adjusted before the test to check the suitability of the grip to ascertain the right grip size by adjusting the grip lever.

3. Results and Discussion

ANCOVA was utilized in the present study as the design employed was a quasi experimental design with intact sampling method. Data were analyzed for normality using the test for skewness and kurtosis. The data indicated that the groups were approximately distributed. Further, linearity and regression slopes assumption for ANCOVA were met. For the statistical analysis, the level of confidence was set at 0.05. To ascertain the effect of the treatment between the experimental and the control group, ANCOVA was computed using the posttest score as the dependent score and the pretest score as the covariate. Effect size was calculated for each comparison using Cohen's delta to evaluate the size of mean differences. The result of ANCOVA in Table 2 indicates that there was a significant main effect in cardiovascular endurance $F(1,83) = 44.69$, $p < 0.05$,; *Cohen d* = 0.35, and for flexibility $F(1,83) = 46.80$, $p < 0.05$; *Cohen d* = 0.36. There was no significant difference for muscular strength $F(1,83) = 3.54$, $p > 0.05$. Table 1 indicates the adjusted posttest mean scores for the selected health-related fitness components for the experimental and the control groups respectively. The result showed that treatment in the experimental group was effective in enhancing the cardiovascular endurance and flexibility among the experimental subjects.

Table1:Mean, Standard Deviation and Adjusted Posttest Mean Scores for the Health-Related Fitness Components of the Groups

Health-Related Components		Experimental (n=48)			Control (n=38)		
		Pre	Post	Adjusted Mean	Pre	Post	Adjusted Mean
Cardiovascular Endurance(m)	Mean	1344.68	1597.91	1253.94	1253.94	1320.26	1340.86
	SD	181.24	157.08		114.12	185.43

* $P < 0.5$

The present study was aimed at investigating the effect of a ten week physical fitness intervention program within a physical education class towards selected health-related components among secondary school girls. The results indicate that there was a statistically significant difference ($p < 0.05$) towards cardiovascular endurance and in flexibility between the groups when posttest scores were compared (Table 2). As for muscular strength the result was not significant ($p > 0.05$).

The significant differences in cardiovascular endurance in the present study are in agreement with similar studies reported by Singh (2005), Ignico and Mahon (1995), Derri et al. (2004), and Sallis et al. (1997). In the present study, four exercises were carried out during the intervention period which lasted for about four minutes. The intervention and the warm-up sessions were carried out for about twelve to thirteen minutes twice a week increased the intensity levels. This would have probably increased the training volume among the intervention group which contributed to the significant improvement among them.

As for flexibility, the result indicated a statistically significant difference ($p < 0.05$) between the experimental and control group of girls (Table 2). Similar studies implementing intervention programs have reported

significant improvements in flexibility (Derri et al., 2004; Ignico & Mahon, 1995; Faigenbaum & Mediate, 2006).

The significant result in the present study can be attributed to the treatment and exercises in the warm-up, treatment, class activity and the cool down session. The treatment in the present study was carried out twice a week and this would have increased the training volume and indirectly enhanced flexibility.

The between group results for muscular strength between the experimental and the control groups for girls was not significant (Table 2). The result is consistent with a similar finding by Faigenbaum et al. (2002). In contrast to the insignificant result in the present study, other intervention studies on muscular strength have shown vast improvements as reported by Flanagan et al. (2002) and Faigenbaum and Mediate (2006). The insignificant result in the present study can be attributed to the insufficient intensity and the noncompliance of the progressive overload principle.

4. Conclusion

The aim of the study was to investigate the effectiveness of an intervention program towards the enhancement of selected health-related fitness components among Malaysian secondary school girls. It indicated that an intervention program within a physical education class had a positive effect towards cardiovascular endurance and flexibility. Consequently, such intervention programs can be incorporated in the physical education curriculum to have better benefits among the girl

A SOCIO-CULTURAL APPROACH TOWARD EFL TEACHER EDUCATION IN TAIWAN

Yueh-miao Chen

National Chung Cheng University, 168 University Road, Minhsiung, Chiayi, 62147, TAIWAN

Abstract

This is a case study through action research to plan and design a TEFL graduate course of "Writing Development and Instruction," to observe and document the data from students' writing assignments, reflective reports, and collaborative tasks and finally their term papers and portfolios. Through content analysis, the researcher tries to report the content and the issues discussed in the course. The results of the study are presented as: Issue 1: qualifications of being a teacher, Issue 2: professional knowledge and development, Issue 3: learning by doing, the two field trips during the semester, Issue 4: The self and identity.

Keywords: Teacher Education; Writing Instruction; Action Research; EFL Writing; Students' Negotiation

1. Introduction

Students of EFL teaching graduate programs in Taiwan mostly plan to be an English teacher at elementary schools or high schools. With this goal in their mind, do they have clear concepts and self-identity about what a teacher is like? How can they prepare themselves? What basic qualifications do they need to have? What professional features do they need to be nurtured and equipped with? What specific missions do they have to carry out for the society and their unique country, Taiwan?

This paper first portrays the TEFL graduate program at a comprehensive national university in central south Taiwan and the graduate students who planned to be a high school teacher, then, also a brief description of this special and powerful but unrecognized country in Far East in the Pacific Ocean. The study adopts action research and critical/reflective frameworks to examine the processes of orienting graduate students, teachers-to-be, to be qualified and reflective teachers with critical thinking mind.

The results of the study are presented issue by issue as follows: Issue 1: qualifications of being a teacher, Issue 2: professional knowledge and development (life long competence vs. short-term knowledge for exams), Issue 3: learning by doing, the two field trips during the semester, Issue 4: The self and identity (awareness, determination, reliance, self-dependence, and self-control). The issues were well discussed, written and presented by students in class. These issues are also presented and discussed in this paper to show how socio-cultural issues were integrated with the graduate course of "Writing Theory and Instruction." At the end of paper are discussions and conclusion and pedagogical implications.

2. Context of the study: Taiwan, a unique country, and the TEFL program

Taiwan (also called Formosa) is located in west Pacific Ocean in East Asia. For over four hundreds' years since 16th century, it has been colonized under different colonizers such as the Dutch, the Ming, the Ching, Japan, and KMT, a Chinese Nationalist Party. Along with a long process of democratization since 1930s, then under the Japanese governance, Taiwan had come to its direct democracy stage in 1996 with directly electing its president. However, very unfortunately, Taiwan, till today, remains unrecognized, not an official member in the UN but an unresolved territory since WWII.

In 2000 the political power of Taiwan was peacefully transferred to a local Taiwanese party, called Democratic Progressive Party. Since then, Taiwan has come to its new era, a paradigm shift in every way. Taiwan has faced a lot of challenges to restructure the whole country in aspects of politics, education, economics, and culture. In education, there has been an educational reform to implement 9-year executive curriculum and also extend English education down to the elementary schools. On the one hand, the educational reform tries to incorporate Taiwan history and cultures into the curriculum for elementary and high school education, and this trend would further integrate and facilitate a real multicultural society by cultivating different ethnic cultures and nurturing "positive cross-cultural attitudes" (Lambert, 1984, 1987) among the citizens of various ethnic origins and also develop a real Taiwan identity. On the other hand, there is a need to internationalize students by teaching them English from elementary school.

Under the circumstances, English teacher education has been urgently demanded. Responding to the situation, the Ministry of Education has taken various measures such as recruiting potential English teachers by English proficiency exams, then offering intensive courses to train and certify these potential teachers. Besides, MOE also approves more graduate programs to train more teachers through regular academic tracks. This is the background of the TEFL Graduate Program set up in 2004, in the department of foreign languages and literature in a central south university in Taiwan.

3. Methodology

3.1. Settings

This is a graduate course "*Language Acquisition: Writing Development and Instruction,*" offered to graduate students in the TEFL graduate program. It aims to offer an overview of writing theories to graduate students and also orients them to the related pedagogical applications in teaching writing.

The objectives of the course are: First, to get students oriented to the issues of how children develop their writing ability. The complex human act of writing was understood from its fundamental aspects – linguistic, physiological, psychological, and social – and on what is involved in learning to read and write. Second, the writing theories were introduced and discussed, especially the issues about how children learn to write, how second language writing develops. Third, based on the comprehensive understanding about writing development and writing processes, the implications and issues about the kinds of writing instruction learners are most likely to benefit from were illustrated.

The reading and teaching materials had been chosen from several textbooks and supplementary reading articles were also provided from contemporary academic journals. Lectures were kept to the minimum. Students' discussion and presentation on the issues in the reading materials were the major activities in class. Meanwhile, the course offered one session of about 20 minutes for discussion on assigned issues and then writing practicing per week.

The requirements were: 1. Several writing assignments, 2. Six summaries on students selected articles from academic journals, 3. Mid-term proposal for final term project, 4. One final term project for designing an intensive writing teaching program of several weeks for a preferred level of students.

3.2. Participants/student teachers

There were 17 graduate students taking this graduate course of writing development and instruction. Among them, six of them were the second-year students of TEFL program and 11 of them are first-year ones. In gender, six of them are male, while 11 are female. All of them are graduates who previously majored in English or foreign languages at universities. Two of the students are overseas Taiwanese, one from Canada, the other from Belize. Their ages range from 22 – 24.

With previous English majors as undergraduates and learning English at high schools of six years or even earlier private learning, all participants could speak and write English fluently and made presentations in English with PPT. Their English proficiency is about at high intermediate level.

3.3. Method

The present study adopts action research, also named teacher researcher method, and critical/reflective frameworks to examine the processes of orienting graduate students, to become qualified and reflective teachers with critical thinking, professional knowledge, and educational visions.

In educational action research, the teacher is also a researcher observing what is going on in the classroom, identifying the problem encountered, and then planning, acting and designing a study to try to solve problems and improve their teaching. It is a cyclical process of planning, acting, observing, and reflecting for professional development (Lewin, 1946; McNiff, 1995). It is also a reflective, personalized, and contextualized process of research, aiming to cope with difficulties happening in the real world (Wallace, 1991). Hence, the study was conducted in the proceedings of the courses. It adopted multiple approaches to collect data, including students' writing assignments, mid-term reflective reports and final self-evaluation forms, feedback to the professors, and portfolios.

The course also applied critical pedagogy intending to orient graduate students to thinking critically to conceptualize the features of mentors as well as to contextualize themselves about the missions of a teacher in his/her own unique country, about what responsibilities they should shoulder and help construct a normal country. This is a socio-cultural approach to teacher education at national level.

In other words, as a professional in teaching English, they ought not only to absorb the western writing theories and teaching pedagogy but also contextualize their professional knowledge and pedagogies to meet the needs of the special EFL context in Taiwan, in which schooling at high school levels is an exam-driven system. That is to say, these graduate students need to "negotiate" with what they have learned as an agent (Liu, 2008: 86), the academic professional knowledge in the field imported from western theories and pedagogies, transform the knowledge into the context-specific professionals, a socio-cultural approach toward teacher education at professional level for their future teaching practice.

4. Students' Orientations and Negotiations

4.1. Issue of qualifications and basic features of being a good teacher

No matter what career one will develop, one has to identify why to choose, what to achieve, what to learn, and how to learn it. In this study, it is obvious that all students had set their career goal already when they applied and were admitted to the program. Therefore, it could be assumed that all students in this course were aware of their career direction to become an elementary school or high school teacher. Even though the situation is like this, i.e., they know they want to be teachers, can we say that they know clearly what qualifications of being a good teacher? "Not necessary." Surely, they come to learn how to be a teacher, and they need to be conceptualized, and contextualized to be a professional good teacher.

Under the circumstances, in this course, though it covers the issues on "Writing Development and Instruction," it is obvious that the students still need to be conceptualized from an original point, i.e., to ponder over the issues of features or characteristics of good teachers, not just discussing the issues of writing instruction but also thinking over general issues of responsibilities of an educator.

Therefore, students were requested to write an essay in the very beginning, i.e., "Missions of a Teacher." They were directed to think over the qualifications of being a good teacher. In class, students had very thorough discussions on the roles of a real educator. They brainstormed to figure out metaphors for the role of an educator.

Various metaphors were proposed and identified, e.g. a teacher is a lighthouse, a gardener, a spirit designer, a torch holder, a guide to life, a mind engineer. The following is an example:

Joe[2]: "Generally speaking, teachers are expected by our society to be the mentor of students, guiding them in every step of the way and offering their assistances whenever necessary. Teachers are also expected to be a torch holder to enlighten the students by opening their minds to new knowledge. Thus, it can be said that teachers are expected by our society to be like sculptors sculpturing students, with extreme tender and care, into beautiful masterpieces so that they can shine brightly in the future."

Meanwhile, the basic qualifications were further elaborated, too, in their writing assignments. It was found that professional knowledge about the subject and about teaching was identified as most important by the majority of the students, i.e., the cognitive dimension of a teacher is significant for being a good teacher. Besides, students also think that affective dimension of a teacher is important. Thus, features of personality such as patience, kindness, enthusiasm were illustrated one by one. For example:

Joe: "… First of all, teachers need to be knowledgeable and analytical in the field of his teaching. …Secondly, teachers need to have patience, tolerance and sympathy in his virtue. In addition, they should also have very good interpersonal skills. …because they are required to listen, understand …Teachers are also required to be considerate and must try to boost the students' self-esteems without making them feel embarrassed or inferior. Furthermore, they must have a positive attitude towards the students. …Last but not least, teachers must be responsible and have a moral virtue."

In short, the point to let students brainstorm and write about the missions of being a teacher is to help them negotiate with themselves, develop and identify themselves as teachers as well as mentors. Surely the students were encouraged, too, to develop more holistically to become a knowledge producer as well. It is expected that they can develop not only their clear identity as teachers but also their awareness and ambition as mentors for future students. The students are really anticipated to have multiple dimensional developments with various levels of the identities of the self (psychological), the content knowledge (cognitive), a sense of mission as a community and society member (social), and the metacognitive thinking (reflective) for life long self-educator and educator.

4.2. Issue of professional knowledge and development

The graduate course aimed at getting students oriented with the composition theories, research, and practices that form EFL writing instruction. Put it more clearly, the course is part of teacher education program with respect to how writing skill can be taught. For this purpose, the discussion in class started from the psychological underpinning of writing development based on Vygotskian theory of interpersonal and intrapersonal relationship as a writer (Arnold, 1991) to writing teaching approaches of product-based research, process-based research, and contrastive rhetoric, etc.

The students were requested to present the content of the chosen textbooks chapter by chapter to discuss the origin of the theories and practices of instruction. After presentation, students would discuss thoroughly the imported pedagogies to see how they could be used and fit in well in our educational system, which is more exam-constrained at high schools. This process helped the students adapt appropriately the imported theories to local practices, a negotiation and contextualizing process (Liu, 2008), turning students to be an aware agent between western imported pedagogy and local Taiwanese educational settings. The following is an excerpt from a self-report:

Rick: "I think the free writing at the beginning of the course is quite interesting and helpful because I can write freely to express my own ideas and have the opportunity to have a discussion with classmates

---

[2] All names used in this study are pseudonyms.

and professor about the writing concept and writing skills. The presentation of chapters provides me an opportunity to train our abilities to organize the ideas from the papers and to present orally to the public. The opportunity for oral presentation in class not only impresses the ideas but also trains our speaking proficiency."

However, the students were not examined in a written test about the content of the knowledge of this field but encouraged to read widely those related research articles published in academic journals such as *Journal of Second Language Writing, College Communication and Composition* to expand and enrich their knowledge in the disciplines of composition research and second language writing. Therefore, they were instructed how to summarize a research article, and then they need to turn in summaries one after another. In this way, they were nurtured a life long competence to be able to research as a problem solver and self-educator rather than a test taker, only memorizing knowledge for a short time for exams.

In the meantime, since this is a "teacher education course devoted to writing instruction," (Hirvela and Belcher, 2007), what problems are widely encountered in young children's writing development process and what are those writing developing stages should be pinpointed to conceptualize the students. As it is, students were trained to write to express their thoughts and concepts in the essay writing assignments, so-called "writer-centered writing" (Silva, 1992), to develop and be able to write to construct knowledge in a report to meet the expectations of the academic discourse, so-called "reader-based writing" (Silva, 1992). The students need to experience this writing development by themselves from a subjective writer to an objective writer; thus, they can be a good writing instructor. For example:

Cindy: "From this class, I have learned a lot from teacher's lecture or classmates' presentation. Especially, I loved the section of free writing, peer evaluation, and group discussion. Sometimes, at the beginning of the class, teacher asked us to do some free writing and get rid of the limitation of grammar or word usage, and just write down what we want to say. That moment is really comfortable. And I feel my mind is so peaceful and pure. ...In addition, I also love the group discussion through which I was often inspired to come up with some ideas and gained more knowledge than I work by myself. A variety of unexpected outcomes often result from the discussion."

4.3. Issue of learning by doing, field trips, and by reflecting

As John Dewey (1961) advocated "learning by doing," learning is occurring while doing and experiencing. Student teachers can only learn how to teach by practicing teaching. Hence, two field trips were arranged to visit two nearby senior high schools. The first field trip was to visit a nearby private senior high school to observe writing teaching classes. Seventeen students were divided into five groups. Three groups' students were assigned to observe three junior high writing classes, while two groups observed two senior writing classes.

As Vygotsky (1987) advocated that cognition is always socially mediated or influenced by others in social interaction. Hatano and Inagaki (1991) also state that learning, thinking, and knowing arise through collaboration with others. The students went to observe together as a group and they also needed to discuss what they had observed and worked together to write an observing report as a teamwork.

Through observing together and group discussing, the group members discussed and identified their focus to report and worked on the report as a group. In this way, they could have their dialogic interactions. After discussing among one another, they emerged their unique voice and focus in their observing report to present in class, then received feedbacks from the instructor as well as the classmates.

In this trip, the most shocking point for the graduate students were that they noticed that in one senior high school writing classes, the discussing topic even included a political issue of "Is Taiwan part of China?" In a political and ethnical diverse society like Taiwan, most of the time teachers are requested not to refer to any political issues in teaching. Therefore, this finding of authentic political issue was publicly discussed or even debated in a writing class embodied what so-called "authentic principle" (Jack Richard, 1986) for language

teaching, especially language teaching should be socially grounded. As a result, students in a writing class would learn not only about linguistic aspects such as lexical, grammatical usage and text structure but also about independent thinking on concrete issues in real life.

> Gloria: "In addition to discussion section, I especially loved the chance to go to visit practical teaching situation in junior high school. By means of real visiting and observing, I had deep understanding about real teaching situation. Moreover, my view of teaching became broader since we were stimulated by foreign teachers' teaching perspectives and teaching ways. I treasured this chance actually."

Besides the observing trip, there was another trip to a public senior high school for teaching practice. Again, 17 students were divided into five groups to do collaborative teaching. They went trough discussing and negotiating among group members on what to teach and which method they would use to teach. They prepared materials and designed activities and did teaching in a real class for fifty minutes.

The point to have this fieldtrip was to create an environment for students to apply what they had learned into practices. Of five groups, each taught in different ways. One group taught about the structure of a text as "Introduction, body, and conclusion," trying to increase students' awareness about the structure of an essay. The other taught story-telling through drawing and brainstorming to one vocational class. Another taught authentic topic about Christmas story.

In a word, each group had their creativity in topics and methods and collaboration in the team teaching. The key problem they arose was that though all graduate students were fluent in English, however, while facing senior high school students they tended to use about 80% of first language to teach. Actually, they shouldn't have accommodated so largely to the students' habits and should have tried to orient the students to a target language by slowing down or repeating their talk in English. By this, students would gradually get used to listening to English and improve their listening comprehension.

This is a first try in real teaching to real students for these graduate students. The aim is to facilitate their understanding the distance between theories and practices, thus they can be empowered to bring about change in an instructional context. Cindy's report is an example for this issue:

> Cindy: "I think this class impressed me a lot. I learned various valuable experiences which I never experience before, especially the teaching in Tung-Shih Senior high school. I and my group members prepared a lot for this teaching, and we also discussed how to teach students writing and searched for some information and material. I think that the procedure and discussion of preparation for teaching is really helpful for my future career, being an English teacher."

4.4. Issue of missions of a teacher in Taiwan: The self and identity

Since Taiwan is an abnormal nation, there are a lot of weird things among the citizens and in the education, e.g. there are diverse identities because of different ethnic origins and historical memories. A majority of the citizens, about 70-75%, identify themselves as Taiwanese, while 25-30%, identify as Taiwanese as well as Chinese, or even only Chinese (about 1%-2%). Though Taiwan is Taiwan; however, at schools students are still educated with Chinese history, which is a legacy of the Chinese Nationalist Party regime for over five decades and the system is like para-colonizing one, trying hard to brainwash Taiwanese to be Chinese and let Taiwanese forget who they are. However, for decades the two ideologies have been conflicting and competing along with the democratization process. Consequently, the political issues are very controversial and sensitive, seen most of the time as taboos in classroom.

It is until 2000 that a local Taiwanese government was elected then the Taiwanese ideology had a chance to be nurtured and grow and a lot of native Taiwanese got an opportunity to discover and remember who they are. Though it is not an easy job to wash away confusing identities among the citizens, for the democratizing purpose, the aim is to make the country a normal one recognized as a member in the UN. Thus, it seems that

there is no choice but awaken students' critical thinking in terms of self-identity as a Taiwanese to get to know who they are not just as a teacher but as a citizen.

It is obvious that teachers of a normal country can not have a confusing identity getting into a classroom. That's why I used various authentic issues related to this special country to arouse students' pondering on their position about the realistic issues, expecting that these teachers-to-be will have a clear self-identity as a real citizen of this country Taiwan rather than a confusing identity as a fake Chinese and pass wrong self-identity on to next generation. And this wide authentic issues discussion actually was quite welcome by the graduate students. As follows you can see the feedbacks from the students:

> Gloria: "Moreover, preparing presentation increases my critical-thinking ability. ...The last but not least, discussion of recent event brings about influences on me. Current issues which involved politics, culture, life styles and so on let me understand the relative importance between academic knowledge and reality. That is, the use of authentic materials such as political issue and world news arouses students' motivation and interests. Among the discussion period, I obtained broader view and attitude toward every day life. In this class, I acquire both academic knowledge and positive attitude. I also understand how to write meaningful and clear articles. ..."

That is right. The course is trying to orient the student teachers to be good teachers in general, specifically to be writing teachers, too. But, the fundamental issue of who they are as an individual is even more crucial in the situation of Taiwan, for this is a historical legacy all Taiwanese need to face, not mentioning to these teachers-to-be. Therefore, back to the original and basic issue, this course was also trying hard to nurture right concept and correct attitude towards life and get to know the reality in Taiwan.

To be a qualified teacher in Taiwan, I think at least the teachers shouldn't be a naïve in political status and situation of Taiwan and its past history, especially the relationship to its neighbour, China. Therefore, by offering realistic and authentic issues of Taiwan, the aim is to guide and reorient these teachers-to-be to contemplate over the social expectations and the need of this unique motherland of Formosa, currently still caught in a post-colonial framework though the president has been directly elected since 1996. The following are some examples of students' feedback to the issues:

> Shawn: "After admitting Chinese students and recognizing their degrees of education, little by little, there might build up a diplomatic relationship or, to be direct, return to China. After that, there will be one thousand five hundred and twenty-three millions of communists in China. Then our wealth will be evenly divided and more people from China will come to Taiwan to deconstruct our society as the same to what they did to Tibet."…."We are suffering under the overwhelming pressure of China in many different ways ..., and especially, schematizing our country. …."

From the statement of Shawn, it is easy to see that he is worried about the current situation in Taiwan. Obviously that he has the awareness what is going on in Taiwan and what will happen next after some controversial issues are decided, i.e., there will be very serious impact in the future direction for Taiwan. As teachers in Taiwan, they need to have a clear mind seeing the country direction.

This kind of writing activities and discussion aims to initiate their independent thinking ability and push them to think the basic issue of who they are to help them identify with the land they are living on. This process of self-identifying is just like a centric circle with one after one outer circle with a fundamental core. The students were guided to locate their positions in the world and the relationships to all related parties in their life. It is a critical thinking and repositioning process as Rick put it, "… orient us into critical thinking about authentic issues what just happened in our country and are highly related to our life and our near future."

5. Discussion

As presented above, four issues: 1. the natures of being a teacher, 2. the professional knowledge of the second language writing, 3. the practical teaching through reflective and collaborative processes, 4. critical

thinking over the special context of Taiwan were embodied in the proceedings of this graduate course. The major aim is to offer students' professional orientation in terms of reflective and critical thinking of being a teacher as well as a writing teacher.

The students were guided to identify themselves layer by layer, from the core of who they are as a citizen of Taiwan, what their missions are being a teacher in such an unrecognized nation, to the basic requirements and qualification of being a teacher in general, to the fundamental qualifications for being a EFL writing teacher in Taiwan. As we can see it is self-identifying orientation from being a citizen to a mentor to an EFL writing teacher to help students position themselves in this real world. The self-images are like concentric circles from the inner core of being a Taiwanese to outer circle of being a real educator or mentor, then to the external specific EFL writing teacher.

As Samaras and Gismondi (1998) put it, "Socially shared cognition in field work and course work makes a significant difference in enhancing pre-service teachers' sense of what it means to teach in terms of using partnership for cognitive and collegial support, perspective-taking, social negotiation, and ownership." (715)

Similarly, in this course students were situated socially in the real world with a socio-cultural approach to think over their roles or agents as citizens, as teachers, as writing teachers. They were guided to negotiate with themselves about their positions and take their perspectives on the authentic current issues happening in the real context in Taiwan.

The process starts from within the self profoundly towards external roles socially as Shawn has put it, "In this semester, we've done several different writings. From teacher's mission, diet, getting to know Vygotsky, summary writings, to political situations, etc., we came to learn not only how to write different writings, but also experienced as how our students might experience in the future. Then we can base on our knowledge and experience to teach our students writing." In other words, in Taiwan context, teacher educators need to take critical perspective on student teachers' moving upward their concepts from citizens to teachers to mentors. It is a transforming process.

Cognitively the student teachers were conceptualized with professional knowledge in the field of EFL writing, simultaneously, they were put into the fieldwork to teach real students at high schools to push them to negotiate between the theoretical grounds of imported western writing pedagogies and the local context of specific exam-driven educational system and, in the meantime, to reflect critically their role as a teaching agent and the ownership of being an educator. As thus, they were put actually in the situated learning environment to negotiate between theories and realities, too.

Surely, along the process, they were negotiating with the self, the peers, and also the imported western writing theories and pedagogies. They need to contextualize what they have learned from the book in a specific EFL context in Taiwan. Through the negotiating process, they need to question and challenge themselves as a citizen, as an educator, also as a writing instructor in such a unique context in Taiwan and situate and position themselves in the multiple layers of diverse discourses such as in the society, at school, and in the classroom. Eventually they reach to have a sense of ownership as an educating professional in the field of EFL writing teaching in the unique country of Formosa.

In practice, the graduate student teachers need to be aware of the context and question imported theories and writing pedagogy. In the meantime, the student teachers have to play a role of a reflective teacher to relate theory to experience-based knowledge with a critical mind in order to continuously improve their teaching practice, as thus to improve the schools and the educational system and thus strengthen the next generation, and eventually to upgrade the country to be a normal nation in the world.

6. Conclusion

This is a case study through teacher action research to plan and design a TEFL graduate course of "Writing Development and Instruction," to observe various activities in class, to record and document the data through

students' writing assignments, reflective reports, and collaborative works and finally their term papers and portfolios. With the data, the researcher tries to report the content, the forms, the objectives, and the issues discussed in the course. The main purpose of the course is to help the student teachers to raise their self-awareness of being an educator to critically negotiate their role in this unique country, to reflect and challenge themselves as an EFL teacher to negotiate between the imported writing theories and the practices. They were guided through a learning journey not only to broaden their vision in the professional knowledge and concepts but also deepen their insight as an educator in Taiwan.

The final goal is to re-orient and empower the student teachers to construct their subjectivity and ownership with self-awakening and self-reflecting features to be able to continuously challenge the self, the imported theories, and the institutional or social constraints as a liberating and powerful professional with consecutive self-improving power. They were expected to be emancipated to be an active self-relying agent in their life long professional development as an educator as well as unique human.

The significance of this study is to demonstrate how a teacher education graduate course can be designed deliberately to include layers of goal with various teaching activities in class, after class, or in the field trips to achieve the multiple objectives in such a specific context in Taiwan.

Surely, there is limitation of the study, i.e., this is an action research with only qualitative data to support this descriptive paper for pedagogical implications and purposes to show how student teachers were emancipated to think critically their roles and agents in the teaching practices and academic professional development. However, for research purpose, if there were quantitative data to complement the outcomes of this study, the conclusion would be more convincing.

A STRATEGY FOR IMPROVING THE PASS RATE WITHOUT COMPROMISING THE QUALITY OF GRADUATES OF THE MINING ENGINEERING STUDENTS

B Genc and F Cawood

School of Mining Engineering, University of the Witwatersrand, Johannesburg, South Africa

Abstract

The skill shortages of mining engineers are well known and a strategy needed to be developed to address these skill shortages. While trying to do this, the biggest challenge is the improvement of student pass rates without compromising the quality of graduates. By establishing a new Mine Design Laboratory (MDL) for higher learning in Mining Engineering, the School of Mining Engineering at the University of the Witwatersrand (Wits Mining) has showed that having good facilities will have a direct positive impact towards student pass rates. Although the establishment of the laboratory has been a costly exercise, results so far have shown an improved pass rate in most subjects taught in the facility. Through this strategy, Wits Mining has taken an important step that will contribute to addressing the skills shortages in the mining industry. This paper outlines the design and equipment of the laboratory, the facilities incorporated; a comparison with the old laboratory as well as the performance of students.

Keywords: Establishment of a Mine Design Laboratory for Mining Engineering students; Wits Mining facilities; improving student pass rate; addressing the skills shortages in the mining industry

1. Introduction

South Africa is one of the wealthiest countries in the world in terms of mineral resources. It is the largest producer of platinum, and one of the leading producers of gold, diamonds, base metals and coal. The South African mining industry's contribution towards the country's gross domestic product (GDP) varies between 5 to 10 per cent and it currently employs about 500,000 people (DMR, 2010).

To capitalize on these valuable mineral resources, it is vital for the country to have available the necessary technical skills. This need requires the availability of adequate numbers of mining engineers and corresponding skilled personnel. Such skilled staffs, in turn, require the adequate education and training of personnel to meet the needs of the country. However, skilled personnel are currently in short supply. The worldwide shortage of mining engineers is well publicised. Phillips (2005) reported a growing disparity between supply and demand for mining engineers. Stacey, et al. (2008) emphasized the strategic importance of addressing these skill shortages since mining is a long-term business. The shortage of skills should be dealt with as a mining company strategy to ensure the supply of the necessary skills for future mining, since the lack of skills will have significant consequences for design, operations, productivity and safety of mines (Stacey, et al., 2008).

The University of the Witwatersrand (generally known as Wits University) is one of the leading universities in South Africa. Wits enrolled 28,442 students in 2011 and its current undergraduate pass rate is 78% (Wits, 2011). Wits Mining is one of the Schools within the Faculty of Engineering and the Built Environment at Wits University. Wits Mining is the largest Mining Engineering School in the English-speaking world and in February 2012, had 20 full-time academic staff members with 704 registered students (Wits Mining, 2012). Table 1 shows staff-student numbers over the last three years and Table 2 shows the breakdown of student numbers from 1999 to 2012 for the different programmes. Therefore, Wits Mining is in a strong position to make a significant contribution to the provision of qualified mining engineers to the mining industry, and consequently, must ensure that its students are taught the appropriate subject matter at a consistently high level.

Mine design is a key aspect of mining engineering and includes all areas (technical, financial, environmental, health and safety, etc.) involved in the assessment of the profit potential of a mining venture from basic exploration data. The computer skills which are essential in mine design play a vital role in converting basic exploration data into a valuable mining asset. The teaching of modern mining engineering requires facilities to enable students to learn the necessary computer skills. For this reason, Wits Mining saw the need to establish a specialized Mine Design Laboratory (MDL) for the education and training of its mining engineering students. The MDL is a specialised computer laboratory which is specifically equipped with the relevant computer hardware and software for mine design and other mining-related work. The School had two main aims in establishing the MDL:

i.   To provide a facility that would make mining-specific computer software available to the mining engineering students;

ii.   To make available computers at the minimum ratio of one computer per two students, so that academic throughput and pass rates of students could be improved.

Table 1. The staff and students numbers 2009 - 2012 (Wits Mining, 2012)

Year	Full-time academic staff in School	Total students
2009	14	802
2010	19	808
2011	20	695
2012	21	704

Table 2. Total student numbers at Wits Mining (1999-2012) (Wits Mining, 2012)

Year	1st Yr	2nd Yr	3rd Yr	4th Yr	Graduates	Under Grads	GDE	MEng	MSc	PhD	Post Grads	Total UG & PG	MRM Cert
1999	43	25	33	26	27	146	123		66	8	197	343	
2005	103	90	46	29	33	268	144	59	17	10	230	498	
2006	137	91	75	33	25	336	149	48	18	16	231	567	
2007	158	67	90	66	57	381	174	49	17	16	256	637	
2008	153	68	94	52	47	367	206	62	23	14	305	672	54
2009	223	89	79	82	62	473	199	85	31	14	329	802	61
2010	228	85	79	76	79	468	196	68	60	16	340	808	69
2011	233	96	82	62	53	473	137	32	34	19	222	695	46
2012	234	143	80	74		531	102	15	42	14	173	704	59

Although student throughput has always been a problem for engineering disciplines, the change to the National Senior Certificate which gives students access to university studies has had a profound impact at first-year level. The impact of the conversion from the old matriculation certificate to an Outcomes-Based Education (OBE) certificate on Wits Mining is clearly visible in Table 2. The first OBE class arrived at the university in 2009, and the statistics in Table 2 shows:

•   A significantly higher number of first-year students as more students qualified for university admission; and

•   A very high attrition rate in first year, as only 85 of the 223 first-year students progressed to second year in 2010.

The number of first-year students reached 233 in 2011, the highest number in the School's history. As stated in its annual report (Wits Mining, 2010), in line with a major goal in the strategic plan, the ratio of staff to students was reduced from one academic for every 43 students in 2010 to a ratio of one to 34 in 2011.This change was achieved by limiting the number of postgraduate students. The School's ultimate objective is to reduce the present ratio of 34 students per lecturer to the point where it reflects the overall Wits University average of one staff member to about 25 students. The result was a significant reduction, in 2011, of the total number of enrolled students to 695 from 808 in 2010.

The School's four-year B.Sc. degree offers computer-related subjects from the start of the degree program. First-year students are offered a simple introduction to Computer Skills. When they reach their fourth and final year, they are equipped to complete their Mine Design Project. Table 3 shows the number of computer-related courses that have been offered to the undergraduate students using the MDL. The MDL is also used for teaching several of the postgraduate courses that require computers.

Table 3. Wits Mining computer related courses for undergraduate programme

Course Code	Course Name	Description
MINN1001	Computer Skills	1st year course - 1 block
MINN2000	Computer Applications in Mining	2nd year course - Full year course
MINN3003	Technical Valuation	3rd year course - 1 semester
MINN3004	Computerised Mine Design	3rd year course - 1 semester
MINN4005	Financial Valuation	4th year course - 1 semester
MINN4006	Mine Design	4th year course - 1 semester
MINN4009	Surface Mining	4th year course - 1 semester

In addition to the teaching of mining engineering students, Wits Mining provides service teaching to the School of Geosciences at Wits University. Some geology students attend second- and third-year-computer subjects (mining) as well as some of the non-computer related mining subjects. Their numbers differ from year to year, varying between 10 and 37.

2. The Old Mine Design Laboratory

The first MDL was established in the early 1990s with 10 PCs. In 1997, the MDL's capacity increased to 25 PCs, and 25 laptops were added in early 2008 to increase the ratio of available PCs per student. Therefore, in the old MDL in 2010, the School had a total of 50 workstations for 228 first-year students and 108 second-year students. The old MDL could accommodate up to 75 students (3 students per desk). With a first-year class size in excess of 200 students, this lack of workstations was clearly an unacceptable situation and contributed to the student throughput problem. All of the 25 desks were identical; their dimensions being 180x90x70 cm as shown in Figure 1.

Fig 1. Old MDL

Table 4. Subjects taught in old MDL during 2009 and 2010

Subjects	Number of Students	Pass Rate	Average Mark
Computer Skills (2010)	195 (1st year)	50.8%	55.5%
Computer Applications in Mining (2009)	110 (2nd year)	70.9%	50.7%
Technical Valuation (2010)	72 (3rd year)	94.4%	55.4%
Computerised Mine Design (2009)	77 (3rd year)	84.4%	70.8%
Financial Valuation (2010)	61 (4th year)	95.1%	67.4%
Mine Design (2010)	70 (4th year)	100%	59.7%
Surface Mining* (Whittle) (2010)	63 (4th year)	95.2%	66.4%

The old MDL had a floor area of about 200 m^2. It had two large screens in the room to allow projection of the lecturer's PC screen. Wits Mining made use of the old MDL until the end of 2010. Table 4 summarises the computer-related subjects taught in the old MDL during 2009 and 2010.

Over the past five years, Wits Mining's first-year intake increased well above the capacity of the School's computer facilities (refer to Table 2). During 2010, the increased number of students forced Wits Mining to divide the first- and second-year computer courses into three and two classes respectively. The third-year computer course was also divided into two classes. The limited capacity with regard to computer facilities impacted on the performance of students. Table 5 shows the key statistics regarding the School's throughput of

students in 2009 and 2010. The pass rates for first- and second-year students were unacceptable and contributed significantly to the poor throughput rates.

Table 5. Student throughput* (Wits Mining, 2012)

Year	Undergraduate (Target is 25%)	Certificate (Target is 50%)	Postgraduate (Target is 33 – 50%)
2009	11%	29%	21%
2010	17%	52%	29%

*Degrees and certificates awarded, divided by total number of students in all years of study. As an example, the ideal target for the four-year undergraduate programme is 25%. The target of 25% for the four-year undergraduate programme represents the situation where all entrants would graduate in four years. The throughput is calculated as the number of graduates in a year divided by the total headcount for that programme that year. Similarly, the ideal target for the two-year certificate programme is 50%.

Since the School's aim has always been to assign an individual computer to each student to maximize the teaching and learning outcomes in order to achieve the consequent achievement of higher pass/throughput rates. With industry support, Wits Mining has established a new MDL for better education and training of its mining engineering students.

3. The New Mine Design Laboratory

The fourth quadrant of the Chamber of Mines Building, where the Wits Mining is located on the West Campus of the university, was completed early in 2010. On the fourth floor of the new quadrant just over 550 m^2 area was allocated for a new MDL. This space represents more than a 100% increase in area compared with the 200m^2 of the old MDL.

With this space allocation, Wits Mining aimed to establish a new MDL with the maximum number of PCs, bearing in mind the continually increasing number of students. Keeping the objective of assigning an individual computer to each student in mind, a new MDL with 99 PCs/Desks was designed. One of the main reasons behind the establishment of a new MDL is the teaching of computer-related subjects to the mining engineering students. Wits Mining offers computer-related subjects during each year of study. Some courses are one block (about three months) long (e.g. MINN1001), some are a full-year course (MINN2000) and some are half-year courses as can be seen in Table 2. From the third-year onwards, the students are taught core mining software in preparation for their final-year subject and capstone course - Mine Design.

The establishment of the new laboratory was a lengthy and complex task, since different suppliers were involved in completing the desired facility. Several months were spent researching the way forward to establish the lab. This time entailed extensive research into the correct suppliers of furniture, audio-visual facilities, light fittings and network switches.

The current features of the new MDL are:

100 networked PCs

99 PC Desks – to accommodate a maximum of 198 students (maximum of 2 students per desk at first year level)

Specially designed computer desks

Fully integrated presentation capabilities

Full interaction between lecturer and students through an advanced sound system

32 invisible ceiling speakers

Four data projectors with motorized screens

A document camera, which eliminates the need for a white-board

Dimmable lights

Full control over students monitors by the lecturer

Although some lectures were presented in the new MDL from September 2010, it was only officially opened on the 29th of October, 2010. The new MDL became fully operational only from the beginning of 2011.

Fig 2. The new MDL with a group of students presenting a mine design.

3.1. PCs

Every facet of the mining industry today makes use of some form of mining and commercial software. Kapageridis (2005) stated that the use of software is becoming more and more widespread, from exploration, through mine design, to rehabilitation. As Wits Mining's main objective is to prepare its graduates for the mining industry, teaching the use of mining software is a very important part of the curriculum. Wits Mining has strong ties with Gemcom Software (2010) and has historically made use of Gems, Whittle and Surpac mine design and utilization software. Mining software packages usually require significant processing power, and the packages mentioned earlier are no exceptions. Even though Wits Mining offers different levels of computer-related courses, it was necessary to invest in a hardware configuration that would be sufficient for the seamless operation of the mining-related software, and also to complement the School's five-year strategic plan for the PCs to serve Wits Mining for at least five years. Table 6 shows most of the available software in the MDL.

The MDL is now equipped with 100 Dell Precision workstations with Xeon processors, each running a 64-bit Windows 7 operating system, and each with 12Gb of RAM and 22" LCD monitors.

Software	Description
Gems	Gemcom GEMS is a leader in collaborative geology and mine planning solutions (Gemcom

	Software, 2011).
MS Office	Productivity software (Microsoft, 2011).
Microstation	Market-leading software for engineering design (Bentley, 2011).
RocScience	State of the art specialised rock engineering software (RocScience, 2011)
Surfer	Powerful Contouring, Gridding, and 3D Surface Mapping Software (GoldenSoftware, 2011).
Surpac	Surpac is a geology and mine planning software. Efficient, easy and accurate, powerful 3D graphics, workflow automation (Gemcom Software, 2011).
Whittle	Gemcom Whittle is the strategic mine planning software used to determine and optimise the economics of open pit mining projects (Gemcom Software, 2011).
Vuma	A world leading windows-based software packages for mine ventilation, cooling and environment control (Vuma, 2011)
APMOT	Anglo Platinum mine optimization tool (Cyest Analytics)

Table 6. MDL software list

3.1. PC Desks

The final-year Mining Engineering students have to complete a Mine Design Project as their capstone course before graduating. During these projects, the students make use of large mine plans, which require a large working surface with minimum obstruction. In addition, Wits Mining wished to use this large new venue as an examination hall. These two requirements and the desire for the establishment of a multi-purpose venue dictated that the computer monitors be placed under glass covers so that the PC desks could serve all purposes. Figure 3 shows the specially designed PC desk.

Fig 3. Specially designed PC desk

The new MDL has a floor area of about 550 m^2 and It has a reverse L-shape. Special PC desks were designed so that the available floor area could be fully utilized. Accordingly, all 99 desks are identical, with dimensions of 180x90x70 cm. Figure 4 shows the front section of the lab, with lecturer podium in the background and Figure 5 shows the distribution of the PCs in the lab.

Fig 4. PC desks, with lecturer podium in the background
Fig 5. Layout of PC desks in the MDL (Not to scale)

3.3. Networking Equipment

The network speed plays an important role in terms of data transfer. Certain Mine Design Software requires high-speed client-server connectivity. Wits Mining's network speed was upgraded to Gigabit (1000BaseT) speed in 2005. To achieve conformity with our new standard, Wits Mining decided to purchase three additional 96-port 1000BaseT pieces of networking equipment for the fourth quadrant of the building to serve not only the new MDL, but also the remaining PCs in the School.

3.4. Audio and Visual Equipment

Because of the size of the new MDL venue, with 100 PCs and up to 198 students, it was necessary to install a specialized sound system to ensure proper interaction between students and lecturer. This situation was unique as the new MDL was not a conference venue where multiple speakers can interact. Wits Mining wanted to design the sound system so that only the lecturer's microphone is active at all times, and only one student microphone would be activated when the lecturer granted permission. Working closely with sound professionals, a special microphone system was designed. Microphones were attached to each PC desk. To prevent the unauthorized use of the system, a management control panel was designed, allowing control not only of the microphones, but also of 32 invisible ceiling speakers. Figure 6 shows a typical student microphone and the lecturer's control panel. Using the control panel, all the equipment in the venue can be managed. The following functions are available:

- Control of the volumes of the lecturer's and the students' microphones

- Management of the lights - on/off switch as well as dimming of the fluorescent lights

- Control of four data projectors

- Management of motorized screens

- Control of student's screen by means of an on/off switch

Fig 6. A MDL microphone and the control panel

4. New MDL vs. Old MDL

The new MDL became partially operational in September, 2010. The Computerized Mine Design (capstone) course was the first course taught in the new facility in 2010. Since then, all the School's computer-related courses have been scheduled to run in the new lab starting from 2011. Table 7 compares the available features between the old and the new MDL. Table 8 shows the computer-related subjects taught in the new MDL during 2010 and 2011, indicating the numbers of students, course pass rates, and the average mark for each course. While Table 9 compares the pass rates between the old MDL and the new MDL, Table 10 compares the average marks.

Table 7. Feature comparison between old MDL and new MDL

Features	Old MDL	New MDL
Floor area size	200 m^2	550 m^2
Number of PC Desks	25	99
Number of PCs	50	99
Max number of students	75	198

	2	4
Number of projectors	2	4
Control of students monitors	YES	YES
Light control and dimmable lights	YES	YES
Integrated sound system	NO	YES
Document camera	NO	YES
Full-control panel	NO	YES
Ceiling speakers	NO	YES
Motorized screens	NO	YES
Microphone on each PC desk	NO	YES

Table 8. Subjects taught in new MDL during 2010 and 2011

Subjects	Number of Students	Pass Rate	Average Mark
Computer Skills (2011)	196	56.6%	44.8%
Computer Applications in Mining (2011)	96	100%	67.5%
Technical Valuation (2011)	66	90.9%	61.7%
Computerised Mine Design (2010)	83	98.7%	93.8%
Financial Valuation (2011)	66	96.9%	63.7%
Mine Design (2011)	64	98.4%	64.8%
Surface Mining (2011)	67	97%	83.8%

Table 9. Pass rate comparison between old and new MDL

Subjects	Old MDL	New MDL
Computer Skills	50.8%	56.6%
Computer Applications in Mining	70.9%	100%
Technical Valuation	94.4%	90.9%
Computerised Mine Design	84.4%	98.7%
Financial Valuation	95.1%	96.9%
Mine Design	100%	98.4%
Surface Mining	95.2%	97%
Overall Average Pass Rate	84.4%	91.2%

Table 10. Average mark comparison between old and new MDL

Subjects	Old MDL	New MDL
Computer Skills	55.5%	44.8%
Computer Applications in Mining	50.7%	67.5%
Technical Valuation	55.4%	61.7%
Computerised Mine Design	70.8%	93.8%

Financial Valuation	67.4%	63.7%
Mine Design	59.7%	64.8%
Surface Mining	66.4%	83.8%
Overall Average Mark	60.8%	68.6%

The data in Table 9 demonstrates quite clearly the benefits that the new MDL has provided to the students and Wits Mining, as almost all the subjects taught have shown an improvement in the pass rate. Although Table 10 indicated that in two subjects, course average marks reduced, but the overall average mark increased from 60.8% to 68.6%, in effect a 13% increase. However, the very heartening result is that pass rates have improved substantially, even over the short period that the new MDL has been in operation. This pass is a clear demonstration that the throughput problems associated with teaching and learning in large classes can partially be addressed if students and lecturers have access to appropriate facilities.

5. Conclusion

The new MDL has already demonstrated its ability to improve teaching and learning with the much improved pass rates in the new facility. Although the establishment was a costly project, the early results justify the investment in the facility. Through this strategy, Wits Mining has also taken an important step towards addressing the skills shortages in the mining industry. The aims of the School in establishing the new MDL has been achieved – an excellent and comprehensive mine design facility is now in operation; and improved throughput of students in computer-related subjects has already been demonstrated.

A STUDENT-ORIENTED CHECKLIST TO UNDERSTAND THE CREATIVE LEARNING LEVEL OF PRIMARY SCHOOL GRADE II VISUAL ART CLASS FOR SPECIAL EDUCATION METHODS

Assist. Prof. Dr. Tuba Gültekin

Mugla University, Faculty of Education Mugla TURKEY

Abstract

Document analysis method at the level of primary school second grade class should be analyzed and document analysis fit for the level of class should be prepared. Different perception types and merging group students can be present at every class in primary schools. class attitude observed during practice within this period and not observed in restricted period will allow us measure the attitude of students during the activity period. In this respect, analysis and activities should be performed concurrently to carry out fit, attitude analysis for class level of every class, activity performance analysis and to measure the attitudes of class. Within this period, activities can be chosen based on the level of perception of students at different levels in a classroom. So the student can observe to the purpose by means of activities and be aware.

It is aimed to create efficient execution process for performance, project assessment for the control groups performing their activities by means of MEB (national education ministry) guide and reports of the grade 3 students of art education in visual art class for working groups during the period of practice of special education methods.

Keywords: Special education methods, types of perception, analysis forms

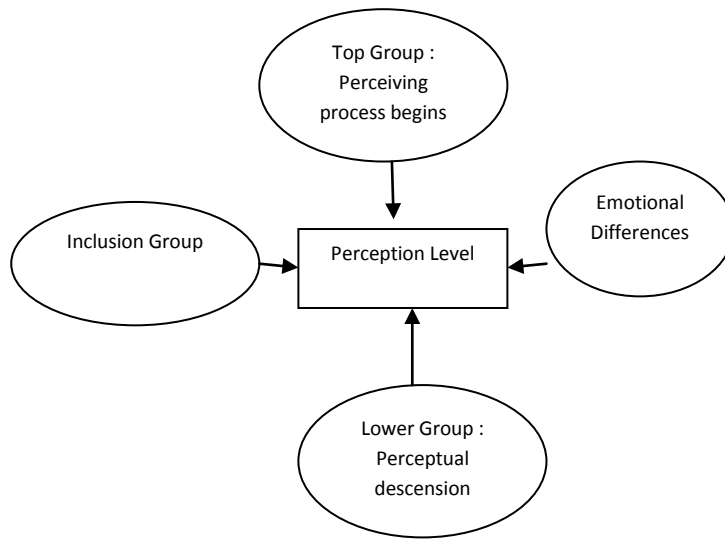
Introduction

The application phase in art education activities, students who take place in the curriculum of artistic branches are considered to be an evaluable or demonstrable result of the development (Day & Hurwitz, 2001; p:111). While the development, performances and works are evaluated, arts are becoming more and more evaluable day by day. In the teaching process, environmental development factors of the child should be taken into consideration as well as the learning process of the child (Hardy,2006, p:50). Accordingly, cultural trials should be performed on children who are at second level of the art education visual applications (Hickman, 2004). Also, students should participate in the activities in art studios where they can evaluate their artistic performances. Self-assessment will help and allow the children to other artworks and artistic performances (Suggs, 1997. p:14). During this process, students make choices about the main statement, aesthetic development process in art education, concepts of creativity and artistic education and art formation subjects. With the ability of criticizing the art, all students must maintain the feeling of art, artistic creation, art history and aesthetic development through their artistic development process (Levi & Smith, 1991; p:1). Besides, students should be encouraged about their works through their art education process and creativity enhancing practices should be made (Wolff & Geahigan, 1997;p:7).

1. Art education and training

Situations that can occur during the activity application process in visual arts class, are ; the age of the class, different age groups, different perception levels among students and inclusive group. Acquisition is also an extent of knowledge, skill and habits. Acquisitions take place within the learning domains. Every age group has different acquisitions. For every age group, environmental factors play roles on their acquisitions and

interpretations, as well as their perception levels (Aytaç, 2002). As Piaget stated, actions of children are parallel to the development of the perception level of each children (Wood, 2003).

Fig.1 . Perception periods of the class


Adapting to the specified topics at grade school second phase level and class levels at application periods are essential to the composition processes of the works. For instance, if overall levels of a 6th grade student is taken into consideration, it is necessary for them to run a more significant construction process and a more efficient learning. After the learning process is complete, better analyzing and researching skills on different types of textures and composition styles must have developed. Even though the concept cannot be reflected as a whole with the color and composition as a result of the abstract connected to the reality at 6th grade, for designing or applying part of the process, it is necessary to have reached a questioning and researching stage for composition, concept and color. This is essential for the 6th grade students. Because when they reach a higher grade, for example 7th or 8th grades, student has to build on the knowledge from last year and give a meaning to the work and structure it and after this process, has to internalize it. Thus, the student will create more criticizing, questioning and meaningful artworks. If class levels are considered at this point, this process sometimes does not occur at 6,7 and 8th grade visual arts classes and art education and applications, due to inhomogeneous class distribution. For instance, if the number of students in a class is 25, this may cause a heterogeneous student distribution due to the number of students whose perception level is lower than their age average. This may cause problems when there are subjects that the whole class should follow at an average level. At this stage, the teacher must know and maintain the average of the class and on which scales it was formed. This attitude will enable the class to learn the targeted goals and behaviors more effectively.

1.1. Child's artistic development and perception

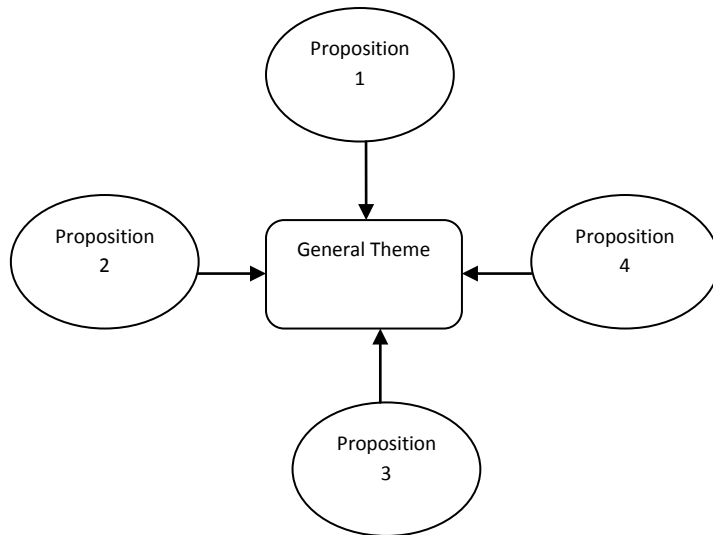
Perception levels are separated as; the top group, the lower group, inclusion group and emotional differences. For perception level is not one of the factors that brought the group together, it is necessary to form 4 different centers. These centers can be formed as ; theme-oriented, concept-oriented, tool-oriented and application oriented. For every stage, different propositions must be developed. Because, each group will base their development on these propositions and will progress at different levels. When the average perception ability of the class is considered, top group will make better analysis and criticisms with a better acknowledgement of the subject, thus will progress to works that include analyzing the relationship between the concept and the subject. This will help that group to start the progress. Especially this group will start building on the previous years' knowledge and support this knowledge with new knowledge and will take on a much more researching role. The other group which is defined as the lower group has difficulties about learning the subject and turn it into a concept. This difficulty will cause a descending in the perception levels. The most distinct characteristic of this group is the difficulty of remembering the previous years' knowledge and adding on it. In order to complete the

learning process, it is necessary to match the previous years' information with the newly learned knowledge. If this process is taking too much time, this means that previous knowledge is not helping to get a result and thus, learning process is not completed. At this point, this group must focus on theme-oriented and tool-oriented studies and associate them with artistic values and art history, and analyze them. During the analysis process, missing knowledge is identified and matched with the new knowledge. This process takes more time considered to the top group's process. However, this is an important period in which the knowledge turns into the meaning and the concept turns into forms. If the inclusion group is taken into the hand, it can be said that there are at least 3 students who can be included in de inclusion group in public schools. Inclusion groups involve students with bigger learning difficulties. Simpler studies must be applied to this type of students. On similar subjects, works that mostly require hand craftsmanship should be preferred. Also, more tangible concepts should be preferred instead of abstract concepts. This group is more of a tool oriented group. They should be encouraged to use the tools more, thus will lead to faster perceiving. Therefore, a tool-oriented group must be formed for these type of students.

Fourth group is the group of students with emotional differences. These students have difficulties of expressing themselves emotionally when considered to the rest of the class. Them not participating in class studies cause deficiencies in the learning process. This causes the incompleteness of the learning process. These type of students will feel much more comfortable with theme-oriented studies by matching the analysis with other information. Composing and structuring the concepts and shapes during the application-oriented period will help them express themselves better. In the study tools and his sense, different perception levels in the class must be identified and directives must be formed accordingly. This formation is important for helping the children to solve the problems in the perception process and to the follow-up of the class.

1.2. Theme oriented studies

In theme oriented studies, for the conveying period, analysis of the artistic thoughts based on the historical criticism must take place. Conveying process must be progressive for the students. Before the elementary level 2nd grade students proceed to the pictorial stage, concepts and subjects must be analyzed. Because at the visual expression level, children have trouble interpreting the themes that they have never seen before. Firstly, the general concepts of the theme are taught. When closer to the result, students must know the concepts which they will base on the expected behaviors and must learn how and where to use them. If we consider the first phase of the class as an introduction, a visual directive of concepts must be passed among the students. At the second phase, concepts must be taught with subgroups and again with a visual directive. When visual directives are combined with verbal lecture and formal expressions, the knowledge will be more permanent. Because at the first stage, students get the knowledge. Then gives a meaning to the knowledge. With the help of the visual directives, students begin to use the knowledge. This process is supported with examples and artistic studies. For the learning process, internalizing the knowledge is essential. In this process, students must be asked to give alternative examples and techniques and to transfer it to the visual works. This process might take time because if students can't understand the concept as a whole, there may be gaps, causing an incomplete compositional and topical at their works. For instance, when the student is asked to use country patterns, they are demonstrated on historical architectural structures and oil paintings. At first student is asked to analyze the graphical shapes on the patterns and then works of various artists are shown to make the student realize how they are using these patterns. This period is very important for the students in theme-oriented study, to internalize the knowledge and use it. In this direction, for the class level to maintain the learning process in theme-oriented studies, initial concepts are given to the child as a virtual directive. At the second phase, each concept and the general subject, art history aesthetics, art history analysis mothed based control scales are formed. In other words ; concept aesthetics, concept analysis and control scale are the 3 main groups of theme-oriented learning.

Fig.2. Theme-oriented learning


As stated in the figure-2, the main target that students must be reached to is at center. In order to make directions to the main center and complete the learning process, center is divided by propositions and each proposition is analyzed within. With this method, brain will internalize the new information by adding it up to the previous years' knowledge. As long as the internalization is complete, a significant visualization, composition and color balance can be formed in the application process. Visual propositions can form directives with questions through the learning process. Below, a sample learning process directives and example questions have formed concepts and subjects. Questions are formed of visual directives that are accepted as directives in the learning process. Lesson and learning process continues with simultaneous questions and visual directives with student participation. As a result of the completion of these processes, learning level should be measured with class-level adapted materials.

Fig.3. Activity formation method

A

- Meaning relations
- Gets results
- Improves the ability to judge

Group activities in visual arts education; is made in 4 groups based on both the theme and application, considering the heterogeneous distribution in class after the method and propositions are defined. This phase based study plan maintains an efficient study method for class studies in 4 groups for student study plan and application.

Center oriented methods given in different stages will lead to more certain results for targeted conceptual or visual shaping processes. In the learning process, students never should pass on to the next phase without achieving a complete learning. Otherwise, students won't internalize the knowledge and will struggle to combine the knowledge, shapes and their own designs. This 4 group, center-oriented approach can be used in any stage of the education to avoid the obstacles that give students a a hard time learning.

In figure-3, there are four sections as ; a, b, c and d. In phase A, firstly the method should be chosen. If the method is chosen based on the class' average level, students will participate more in the analysis and criticisms in the class. After the method is chosen, differences based on age groups or perception levels should be considered. This is an effective method for higher student participation in class activities. Concepts should be separated to 2 groups as abstract and concrete, and the information should flow from abstract to concrete. Thus, students will be able to combine the knowledge with similar previous knowledge. According to these, conveying method should support the learning process of the students. Way of teaching is the conveying of the knowledge and it should be based on the emotional differences among the class. Thus student oriented education can be performed.

In phase B, the topic is based on the age groups and perception differences. In this process, students should be able decide on how to express themselves and use which tools and which visual expressions. By using the art history analysis and art history criticism, students should analyze a sample artwork. Students are conveyed with color, pattern, shape, composition and concepts and learn how to combine them with subtext. This process is

supported with dramatically expression method. Again with the dramatically expression method, students are encouraged to participate in the activity and feel free and creative to express themselves by plays or enactions on the sample artwork.

Phase C is the application phase. In this phase, students use all the knowledge, are able to criticize, analyze, use the tools and emotional expressions. To sum up, this is the phase where the students start to express themselves. Creativity, altered thinking and tool using also begin with this phase. This is a long and very important phase in which students start to improve their creativity. This phase should be a long phase. Analysis and characterization in this phase will lead the student to use the knowledge by signifying it and thus, will lead to a result. When the concept bonds with visual shaping, the creation process will lead the student to characterization and expressions. In characterization phase, emotional identity is used in visual works.

Combination of the emotional identity and application leads to the phase D. In this phase students express themselves much more comfortably and creativity is improved. This leads to meaning associations. After building meaning associations, comes the result phase ; judgment. In judgment phase, students tell which stages they have completed, which concepts they have chosen and which techniques they have used. This improves the judging ability. Application studies improve the ability to get to the result and judging ability by using the knowledge, learning the concepts and topics. The aim is to form a student model who analyzes and criticizes by thinking in different ways with new point of views. During these phases, students should be followed closely and a control scale must be created.

1.3. Applied studies and methods

In art education, art practices, how the students must design their personal identities and the approach of the process must be analyzed. Art Education can reconcile both personal applications and cultural structure of the child (Atkinson, 2002; p:8). In the process of artistic development, children should be introduced to process of arrival periods in all artistic fields (Conant,1964; p:89). In art education programs, the perception of education should take place in a modelized process (Barett, 1979; p:45). In the art education model, aesthetical education and curriculum based aesthetical education, artistic works based on cultural diversity should be used to form an association with the development of the child (Smith, 2006). Students will succeed by associational approach in art history, with aesthetic discipline and recognizing and interpreting their works, and by coming to a result with concepts (Dobbs, 1998, p:5)

1.4. Methods to fellow in-class activity applications

To make applied practices based on a determined artwork. First, lesson materials are prepared. Then, learning and application process is formed based on the art period, artists and their works.

Contrast colors study for 12 year olds (6th grade)

1-Verbal Knowledge : Expression and presentation, question and answer

2- Application (Visual-spatial) : (Sample event : 8 drama) Analyzing artworks

3- Free Activity

THEME : Cubism ; Lesson Plan ;

Phase 1 : Conveying the general information about Cubism. (Center Topic)

Phase 2 : Art History, Aesthetics

Directives :

How did Cubism arise ?

2 Leading figures in Cubism ?

When did Cubism arise ?

Phase 3 : Art History, Analysis

Directives :

Which oil painting is considered to be the starting point of Cubism ?

How did Cubists use the natural images and materials for composing and choosing a topic ?

A puzzle prepared with all the directives is used as an example of the result of theme-oriented process for overall repeating.

The example material used for students in İzmir Yayakent Elementary School Second Level visual arts class about analyzing the artworks, is given below.

1.4.1. Activity evaluation: Sample plan and student control list

| 1 | 2 | 3 | 4 | 5 | 6 |

Name the paintings above.

7. Which period do these paintings belong to ?

8. What was the name of the group that was founded in 1933 and used Cubism technique ?

9. What is their work dated 1937 which tells the Spanish Civil War with Cubism technique ?

10. What is the name of the artist whose still-life painting resembles Braque's Playing Cards ?

VISUAL ARTS CLASS	Tried different application methods and techniques	Analyzes his/her own, his/her classmates and other students works.	Associates the information about the artist with the artist's life, society he/she lived in and time he she lived in	Compares the artworks from different cultures or time periods and shows their differences	Creative Process	
Observation Form						

Class: NAME- SURNAME																		T OP

Table-1 : Student Control List

Conclusion

Control scales will help to follow the student for each and every practice. This is essential for determining the suitable activities and teaching ways for the class. At this level, some factors that will restrains learning and creativity may be encountered. In fact, students go through a certain type of struggles and emotional changes like expressing themselves and studying at elementary school 2nd level while they try to adapt to the new system. Efficient learning methods help form activities suitable to the class's average level by following the students' development and reactions to the topic by evaluations. Activities that are not suitable for the average level of the class don't get good enough reactions and don't help the improvement. Every school year is a learning process. From the start to the end, learning is a united process. Students should add the knew knowledge upon the previous knowledge that they can complete the learning process. Students must build and improve their abstraction and analysis skills with their emotional identities and knowledge, and form their own compositions. Students do this under 2 main topics. First is the conveyance and teaching methods suitable for the class, and the second topic is the control scale which allows the teachers to track the children at each phase and evaluate their development. Thus, which topics to use and how to use them at next phase will be determined.

A UNIFIED EDUCATIONAL PLATFORM OF MULTIMEDIA SUPPORT IN EDUCATION AT MEDICAL FACULTIES OF MEFANET PROJECT

Jaroslav Majernik[a], Daniel Schwarz[b], Martin Komenda[b], Ladislav Dušek[b]

[a] Department of Medical Informatics, Faculty of Medicine, Pavol Jozef Safarik University, Kosice, Slovakia

[b] Institute of Biostatistics and Analyses, Masaryk University, Brno, Czech Republic

Abstract

The paper presents an educational network of medical faculties in Czech Republic and Slovakia. Its activities started within the project Medical faculties educational network in 2007 and the main role is to support modern multimedia information technologies usage in clinical and health care study programs. The network is based on open cooperation among faculties with respect to effective medical teaching and learning. To achieve this goal, an original and uniform platform for educational web portals was developed and it is used, together with central gateway, to offer and share digital educational content. The fundamental principles of this innovative solution are described. Both the authors and the users may utilize a wide range of sophisticated functionalities that make the processes of publication and accessibility more intuitive than ever.

1. Introduction

Multimedia such as pictures, audio, or movies, has become an important tool in the provision of education at many levels. Teaching and learning multimedia materials are offered through the web-based systems and thanks to the recent network technologies the educators use them more trustworthy than ever. Educational potential of multimedia was explored mainly by higher education institutions as traditional leading players in this area (Schwarz, 2010; Allen, 1998). Each stage of multimedia application corresponds to a certain level of computer technology as well as a certain pedagogical approach. The benefits to a learning process result from the flexibility offered by new technologies. However, an initial difficulty to apply such electronic tools into the real praxis comes from apprehensions of educators. It is also difficult to encourage the usage of new technologies when computer resources are restricted by the financial constraints. Fortunately, this becomes an unessential factor because of falling costs of personal computing. On the other hand, the principles of education based on multimedia should motivate educators to use them at least as assisted materials always when convenient. The main advantage of using multimedia in education is to convey information or knowledge quickly and effectively to all students and keep them interested in learning.

A relatively short history proved the multimedia learning materials enhance learner performance even in the form of animated cartoons, engineering laboratory exploration, complex decision-making paradigms or concept development (Remus, 2008; Austin, 2009). Various multimedia technologies were applied to specific disciplines and demonstrated the pedagogical value of multimedia in terms of learning improvement (Stelzer, 2009; Cochrane, 2007; Macura, 2011). The visual presentation of ideas has been proven to be particularly important as it helps the educational process in a critical way (Dalacosta, 2009).

Using multimedia in on-line systems allows teachers to prepare attractive courses that can be easily accessed and organized as real-time two-ways interactions between remote teacher and students, but also more popularly as simpler lecture-on-demand learning models (Chen, 2008; Shi, 2003). The students often use them rather than those two-ways as they can review online materials several times without restrictions. Teachers also fill advantages as they can easily revise individual materials to offer students the most actual information. Other advantages of the web-based systems include increased students' learning efficacy through dynamic media presentation of lectures, abilities to measure students' performance by on-line self-assessment tools or

possibilities to create own courseware and questions. Moreover, education using computer-based instruction appears to be associated with consistent time savings, in some cases students learned with it in more than 70% less time than students in traditional classrooms (Parlangeli, 1999). Research in the multimedia learning field assume that after applying the optimization principles such as cognitive load theory principles and multimedia learning theory principles the web-based learning will be beneficial for both younger and older learners (Pachman, 2012).

The use of multimedia presentations was accepted by physicians in education of students of medicine too. Individual multimedia education outputs can be utilized also for patients' education and counseling (Ihring, 2012; Levett-Jones, 2011; Kodama, 2000; Penhaker, 2011). Here, the successful clinical implementation of multimedia support necessarily depends on high acceptance and appreciation by the physicians in charge. It is because of their everyday clinical practice and/or relevant pressure to realize clinical examinations and interventions. The purpose of this paper is to present an original approach to the collaboration of professionals from different medical faculties and countries.

2. Medical faculties educational network

The very first idea to create the MEdical FAculties educational NETwork (MEFANET, www.mefanet.eu) project has arisen as initiative of cooperation between the Faculty of Medicine at Masaryk University Brno and the 1st Faculty of Medicine at Charles University in Prague in 2006 (Schwarz, 2009). The pilot results of this cooperation that was primarily oriented on sharing of electronic and multimedia educational materials convinced other medical faculties to join this perspective project. Therefore, all seven medical faculties in Czech Republic and all three medical faculties in Slovakia have expressed the interest to be the members of the MEFANET. They were accepted by the MEFANET council and formally joined the network in 2007. Thereafter, the project MEFANET got new dimensions and represents the brand of academic cooperation between individual partners.

The main role of MEFANET is to support improvement in education of medical and health care disciplines using modern information and communication technologies (ICT). It represents an optimal platform to meet experts from different faculties who may join their forces to create qualitative better teaching materials. These materials can be accessible across the network for both the teachers and the students. To do this, several supporting activities have been initiated by the MEFANET. On the other hand, the MEFANET is voluntary network where the independence of the faculties is fully respected and where no restrictions in organization of teaching activities are stated. The activities are supported only by the grants and no expenses are required from individual faculties to cumulate certain central budget. Nowadays, the network covers teachers and medical and health care students at all medical faculties in Czech Republic and Slovakia.

Benefits of this academic cooperation include:

- horizontal cooperation and sharing the results of work from authors of multimedia teaching tools and on-line educational resources,
- unification of methods to create and publish multimedia teaching tools and on-line educational resources, in order to assure availability of these materials to the students of all involved medical faculties,
- putting together human resources and potential to develop complex technological solutions in an effective manner, and to solve possible problems with creation and/or publication of multimedia teaching tools and on-line educational resources,
- more effective usage of acquired financial resources, possibility of inter-university cooperation on awarded grants.

All the activities realized within the project are managed by the coordination council where each medical faculty has its two or three representatives. The council establishes the priorities of MEFANET activities, decides on generally acceptable standards for individual types of outputs, and helps to define and solve common projects. One of the most important outputs of the MEFANET is standardized web publication platform that was accepted and implemented by each participating medical faculty.

3. Web-based portal platform

Electronic pedagogical works that are created at individual faculties are collected and published at faculties' web portals. All faculties decided to operate unified standalone portals rather than one centralized system, hosted for the whole network. However, a central gateway was built to integrate all the information presented on the portal instances into one common place on the web. Thus, the independence of the faculties is ensured and the users are still allowed to find education materials on one place. Interconnection of all these faculties' portals and the central gateway compose the MEFANET e-publishing platform. The list of faculties and their portals is summarized in the table 1.

Unified web portal for multimedia support of education at medical faculties represents universal solution supporting education of medical disciplines. Each portal has its own ISSN code as well as editorial board to make sure the needs and the requirements of particular faculty are fulfilled and no restrictions are given by the MEFANET and/or by other members of the network. Web portals are installed in two language versions. It is Czech and English language combination at medical faculties in the Czech Republic and Slovak and English at medical faculties in Slovakia. Education materials prepared in Czech/Slovak language and materials prepared in English are published independently and there is no equality between the content of these versions. It is fully up to the authors' decision whether they prepare the material in one or in both languages. Each published work may be associated to the particular course/subject taught at the faculty assigning it in the body of education material. This may be used by the users to filter the content of the portal according to the materials intended for specific course/subject.

Table 1. List of medical faculties connected to the MEFANET and their portals.

Faculty	Portal
Faculty of Medicine at Masaryk University in Brno	http://portal.med.muni.cz
1st Faculty of Medicine at Charles University in Prague	http://portal.lf1.cuni.cz
2nd Faculty of Medicine at Charles University in Prague	http://mefanet-motol.cuni.cz

Jessenius Faculty of Medicine in Martin at Comenius University in Bratislava	http://portal.jfmed.uniba.sk
Faculty of Medicine at Pavol Jozef Safarik University in Kosice	http://portal.lf.upjs.sk

3.1 Filter of medical disciplines

To ensure better orientation at the portals a systematic map of medical disciplines was created. Each published work must be assigned to the one of these disciplines so the map categorizes the content of the portals and is also used as the main filter. This is one of three directives that are unchangeable across the faculties and is used to export information to the central gateway. Other two rigid directives include authentication/authorization framework and multidimensional quality assessment. The other features, properties and functionalities of the unified portal platform can be adapted or localized to meet all the needs of particular medical faculty connected to this cooperation. Figure 1 shows the map of specified medical disciplines.

Anaesthesiology and Intensive Care Medicine	Genetics	Nephrology	Physiology and Pathophysiology
Anatomy	Geriatrics	Neurology	Psychiatry, Psychology, Sexology
Biology	Haematology	Neurosurgery	Public Health Care, Social Medicine
Biophysics	Health Care and Nursing	Nuclear Medicine	Radiology and Imaging
Cardiology, Angiology	Histology, Embryology	Obstetrics, Gynaecology	Rehabilitation, Physiotherapy, Occupational Therapy
Dentistry	Immunology, Allergology	Occupational Medicine and Toxicology	
Dermatology	Infectology	Oncology, Radiation Therapy	Respiratory Medicine
Diabetology, Dietetics	Internal Medicine	Ophthalmology and Optometry	Rheumatology
Emergency Medicine	Laboratory Diagnostics	Other	Sports medicine
Endocrinology, Metabolism	Medical Ethics and Law	Otorhinolaryngology	Surgery, Traumatology and Orthopaedics
Epidemiology, Preventive Medicine, Hygiene	Medical Chemistry and Biochemistry	Paediatrics, Neonatology	Urology
Gastroenterology and Hepatology	Medical Informatics and Information Science	Pathology and Forensic Medicine	
General Practice Medicine	Microbiology	Pharmacology	

Fig. 1. Medical disciplines map used to categorize and filter published education materials.

At the beginning of the project the single-level or multilevel list of medical specializations were considered as well as the possibility to adapt an existing scheme from the National library of the Czech republic, which is based on the standard Conspectus method. However, the medical disciplines mapping according to the Conspectus method showed to be inapplicable for MEFANET purposes. Thus, an own medical disciplines map was composed, based on various taxonomies adapted from significant medical publishing organizations. Since first release of the portal it has been reedited several times. The change in this filter has to be approved by MEFANET Coordination Council as it must be applied on all faculties' portals as well as on the MEFANET Central Gateway (http://portal.mefanet.cz).

3.2. Authorization and the users' groups

The access to the faculty portals is not restricted and is opened to everybody. All pages, sections and education contributions published at the portals are accessible for anyone who searches the content of the portals. Therefore, everyone interested can get an overview of educational materials available on the particular medical faculty. The content of the portal is presented as a list of articles described by the title, annotation picture and

short annotation. The educational content of the article is included in attachments and/or hypertext links that contain also information about the group of users who have access to these materials. This is specified solely by the authors of published educational content who can choose one of the user groups to permit/deny access to their materials. Web portals specify several groups of users that are listed in the table 2.

Table 2. Groups of user specified at web portals.

User	Description
non registered user	anonymous and not registered user
registered user	usually anonymous user, who accepts the terms of use within his registration
MEFANET user	user of the MEFANET network, i.e. student or teacher from any Czech or Slovak medical faculty
university member	user, whose affiliation to the university has been verified at the portal via the local information system of that university
faculty member	user of local medical faculty, whose affiliation to that faculty has been verified at the portal via the local information system of the respective university or faculty

Table 3. Roles of users registered at the portals.

Role	Description
dummy	registered user who may access and use education materials according to his/her users group affiliation, dummy is able to create articles and to communicate with redaction
editor	administrator of assigned part of the educational content at the particular faculty, the role allows basic editing of articles but has no rights to publish it, communicates with authors and guides the publication process
guarantee	expert of associated medical discipline, checks the materials to be published and organizes review process to verify quality according to the local rules of the faculty
reviewer	user who reviews particular article and recommends or refuse its publication as reviewed material on the portal and the central gate
master	main administrator of the portal responsible for all functionalities, master also publishes individual articles on the portal

Once the users are registered they may be assigned to the one of the users roles. The basic role is role "dummy" that is added automatically to all newly registered users. This role also allows users to send and article into the redaction of educational portal. Other higher-level roles relate to the management of particular portal instance and are specified according to the list presented in the table 3.

3.3. Structure of published education materials

To make the process of publication easier the portal offers an intuitive article submission form. The authors may use it as one of the features of the main menu under the name Submit contribution. A unified structure was adopted to present all articles in the same way and to be ensured that all compulsory parts are filled in. The submission form consists of three steps in which the author offers information about his/her topic. The field like title, annotation, authors and the text are required in the first step. The second step consists of information that classifies the article to be submitted. The attachments, links and other electronic materials as well as keywords and comments for portal redaction are entered in the last step. Individual parts of published contributions are described in the table 4.

Table 2. Fields of the contributions published at the MEFANET web portals.

Field name	Compulsory	Description
title	Y	the title of the contribution, the length should be 10 or more characters
language	Y	specification of the language of the contribution as well as the language version of the portal in which the contribution will be published
annotation	Y	brief characteristics of the contribution in the size of at least 300 characters
first author	Y	name of the first author, it is also used to filter content of the portal according to the first author
other authors	N	other authors of the contribution separated by commas
participating department	N	information about affiliation of author/authors, the field is also used to filter content of the portal according to the authors' workplaces
text	N	the body of the contribution with more detailed information about the work
medical disciplines	Y	assignment of the contribution to one or more medical disciplines, it is also used to filter content of the portal
courses	N	information about course/courses taught at the faculty in which the contribution can be used, it is also used to filter content of the portal
associated contributions	N	associated contributions already published at the portal, used as links to move on contributions with similar topics
portal category	N	assignment to one of the portal categories (may vary across faculties)
section of portal	N	assignment to one of the portal sections (may vary across faculties)
4-D assessment	N	specification of the type and the level of contribution for review process
attachments	N	files with education content
links	N	hyperlinks to education materials
annotation image	N	picture related to the content of the contribution
creative commons	N	information about copyright
keywords	N	comma separated keywords of the contribution
comments	N	additional information for redaction and editors

After the contribution is send to the redaction it can be published as non-reviewed material (but not send to the central gate) or the review process will be opened. Depending on the author's decision all the attached materials and the links can be offered to the appropriate group of users. The network prefers quality of contribution rather than the quantity and therefore the quality of all published education materials is controlled.

3.4. Quality assessment

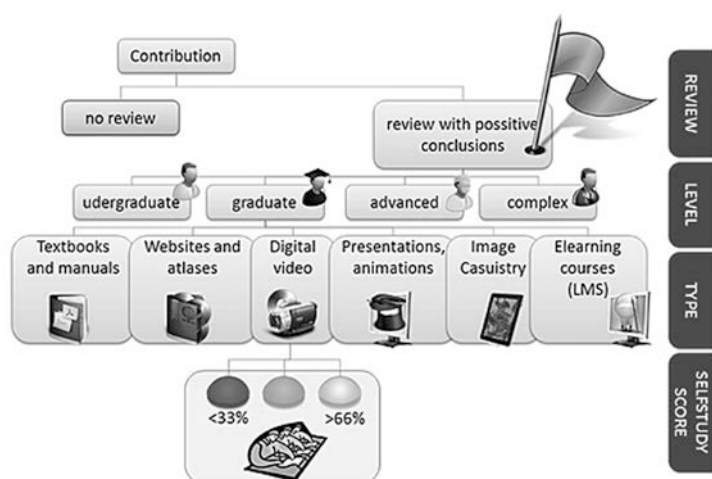
Several control mechanisms were designed and applied within the portal instances to assess the quality of published materials. The current version of quality assessment is based on multidimensional processes as shown on figure 2.


Fig. 2. The principle scheme of four-dimensional quality assessment of the contributions published at the portals of medical faculties in the MEFANET network.

According to the scheme shown on figure 2 the quality assessment methodology consist of four different dimensions. These are labeled as review, level, type and self-study score.

The first dimension of the system is an expert review. This ensures that only the contributions with positive conclusion from reviewers can be published on the central gateway. The contributions with no review can be published only on local portal instances and users are informed about this when using such unreviewed study materials. The review procedure includes both the binary questions as well as the open questions. The structure of the review-form can be localized by modifying an XML template file.

The second dimension is represented by the educational level of the target group (undergraduate, graduate, advanced and/or complex level) of the teaching material, which is a useful piece of information for users as well as for reviewers.

The third dimension specifies a multiple-choice classification according to the types (textbooks and manuals, websites and atlases, digital video, presentations and animations, image casuistry, e-learning courses) of used attachments. Here, the enumerated scale includes static files for web-based learning as well as interactive e-learning courses encapsulated in the learning management systems (LMS).

The last dimension of the quality assessment system represents a self-study scoring mechanisms. This is the users' feedback and shows what the users think about the usability of particular contribution for their self-studies.

There is also an open discussion of users available on the portals. It is located at the end of contributions and using it, the users can response to the presented information. This functionality of the MEFFANET web portals is moderated by the user with the role masters, but it can be disabled if there are no human resources to keep the discussion polite and presentable.

4. Conclusion

This paper presented basic ideas of the MEFANET network and main features of educational web portals which are one of the networks' fundamental outputs. Web portal is designed as e-publishing platform with the aim to share electronic and multimedia materials created across medical faculties. The unified platform is used at ten medical faculties in Czech Republic and Slovakia and involves over 4,000 potential authors (teachers), over 22,000 potential users (students) and many other interested users from all around the world. Local portals are managed independently and do not replace other existing systems established at medical faculties. Information from these portals is exported to the central gateway where all the reviewed educational contributions are summarized. Educational portal platform offers a lot of unique features and functionalities that were developed to meet the needs of all participated medical faculties. The priority is given to the quality of published materials which may be assessed by the well-defined rules. Further development will be oriented on implementation of standards that allow wider cooperation with other teaching institutions as well as with significant international repositories of reusable learning objects.

BASIC DESIGN AND ARCHITECTURAL PROJECT: A CASE STUDY ON THE UNIVERSITY OF KARABÜK

Süheyla Birlik

Karabük University, Department of Architecture, Karabük 78600, Turkey

Abstract

In the artistic activities, 'imagination', taking shape in the human memory and representing freedom, is a guiding light actualizing the ability to be able to create... Architecture combines this infinite imagination with existing information.

Objective of 'Basic Design' course, teaching the alphabet of architecture and predominating visual aspect, is to expose the creativity of architect candidate and continuously improve it.

In this paper, in the experience of the University of Karabük Faculty of Safranbolu Fethi Toker Fine Arts and Design Department of Architecture, will be discussed evaluation on an architectural project of the design principles acquired by the basic design education.

Keywords: basic design; design principles; architectural project; Karabük University

Basic Design

Basic Design was taught for the first time in 1919 at the Bauhaus School which was established by the architect Walter Gropius in Weimar city of Germany (Özer, 1993). The aim of the course was to combine art and craft with mass production. Therefore, knowledge was gained in the workshops by way of learning by doing. At this school, the fragmented creative works were made into a whole by proposing the methods of the new approach to problems; rationalist, geometric, plain, functional, standard products were created.

'Basic Design' course is adopted by many schools of architecture in the world today as well. The plan of the University of Karabük Department of Architecture is located below (Table 1):

Table 1. European Credit Transfer System (ECTS) form of 'Basic Design' course, University of Karabük Department of Architecture

INFORMATION

code	MIM129	title	Basic Design					year/semester	1/1
lecture	2	recite	2	laboratory	0	credit	3	ECTS credit	4
level	bachelor's degree	language	Turkish	type	compulsory	teaching system	formal education	prerequisites	none
objective		to be able to gain the ability of visual perception, analysis, interpretation, and transfer depending on design elements and principles; to be able to reveal creativity							
content		It contains studies related to conceptual explanation of the design elements and their applied works, conceptual explanation of the design principles and their applied works, create a three-dimensional functional abstract composition depending on design element/s and design principle/s to be selected.							
learning outcomes and competences		1.students are informed about design elements and principles. 2.they can bring in three-dimensional to two-dimensional forms. 3.they learn individual study. 4.they question, make abstract analysis and synthesis, produce. 5.they organize and plan. 6.they look for the quality and aesthetic. 7.they use the time efficiently.

Design Principles

Below, the design principles and two-dimensional student works -applied during 'Basic Design' course at the University of Karabük Department of Architecture in 2009-2010 academic year- of these principles are located:

Repetition

. repeatedly use of same or similar elements within a specific order

. spaced-out rhythmic pattern providing continuity and consistency, and creating emphasis

By using the low relief technique in your working area, create a warm-cool contrast arrangement with variable repetition of the unit forms in shape, size, texture and direction you want (Fig. 1).

| Merve Güneş | Gamze Çifçi | Hatice Akosman |

Fig. 1. the repetition works

Rhythm

. systematic, harmonic, aesthetic repetition of visual motion that occurs between similar units

By using the paper cutting technique in your working area, create a rhythmic arrangement with saturation contrast repetition of the unit forms in shape, size, texture and direction you want (Fig. 2).
Gamze Çifçi   Esra Hacılar   Orhan Dağtekin

Fig. 2. the rhythm works

Harmony

. match with each other of the similar parts composing the whole

. coalescence obtained through passages reducing differences between different elements

. conformity that is sensed in all respects-congruence

By using shape, size, direction, interval elements in your working area in the way you want, create an arrangement giving the effect of harmony with adjacent colors (also called analogous colors) in whole of the design (Fig. 3).
Batuhan Kumru   Yeliz Ercan   Burcu Ceren Acar
Fig. 3. the harmony works

Contrast

. dynamic variety provided with elements are not same or similar, are double interactive

. the antithetical harmony in all respects

By using shape, texture, size, direction, interval elements in your working area in the way you prefer, create an arrangement giving the effect of simultaneous contrast in whole of the design (Fig. 4).

Batuhan Kumru   Nalan Yurt   Uğur Kırbıyık
Fig. 4. the contrast works

Gradation

. combining of the two opposite ends by being repeated with proportional gradations within an order

. visual hierarchy-harmonization-measurable echelon

Create a contrast of hue environmental gradation connected to minimum two centers that would provide a meaningful and aesthetic echelon in terms of shape, size, direction, interval in your working area (Fig. 5).

| Deniz Aydemir | Eyyüp Türker | Özgen Genç |
Fig. 5. the gradation works

Dominance

. the most opposite and effective one among the parts constituting the whole-dominant

. variable-attractive center, focal point

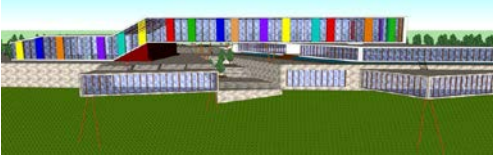
By using the design elements in your working area, create an arrangement that achieved unity through dominance (Fig. 6).

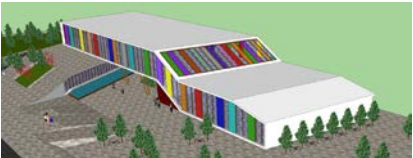
| Zeynep Kübra Çıtlak | Orhan Dağtekin | Gamze Çifçi |
Fig. 6. the dominance works

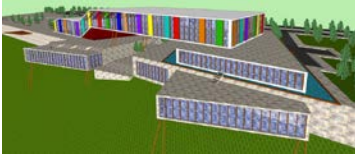
Balance

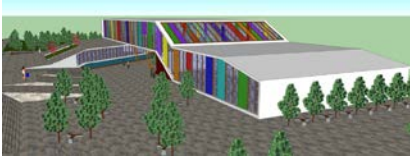
. equivalence of forces which don't create tension, equivalent distribution and harmonic order of items

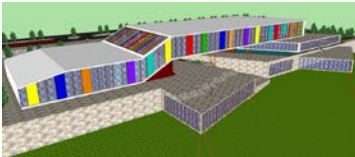
. the relative influence providing unity by bringing closer to each other opposite values

By using the design elements in your working area, create an arrangement giving the effect of asymmetric balance (Fig. 7).
| Emre Sinan Totan | Süleyman Beştaş | Ceren Deniz |










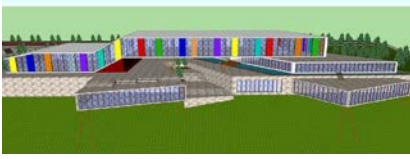


Fig. 7. the balance works

Architectural Project

Below, the evaluation in terms of design principles of the three-dimensional works of a student project titled 'University of Karabük Student Culture Center' has been designed during 'Architectural Project IV' course at the University of Karabük Department of Architecture in 2010-2011 academic year spring term is located (Table 2):

Table 2. Evaluation of the University of Karabük Student Culture Center project in terms of the design principles

REPETITION	linear pattern formed by the repetition of vertical elements	
	similar spatial themes opened outward	

RHYTHM	horizontal continuity created at the beginning and ending connection	
	surface repetitions interdependent	

HARMONY	similar coalescence of spatial arrangements with different functions	

CONTRAST	variety created through the horizontal and vertical lines motion revealed visually and conceptually	
GRADATION	consecutive line up or visual axial organization coming into prominence with its size, shape, position and assuming a symbolic role	
DOMINANCE	unified and differentiated horizontal visual emphasis facilitating the perception of separate parts and establishing superiority over the other areas	
BALANCE	visual unity created through the fragmentation and integration with each other of locational variables harmonic asymmetric distribution in the bright and neutral color areas	

Eyyüp Türker

Conclusion

Basic design education, comprising of stages related to conceptual explanation of the design elements and principles and presentation to the students of samples which has been applied, definition of problems which would create new works, transformation into the analytic compositions of impressions based on the creativity and ability to comment, presentation of the resulting works, proves that the known may change or can be changed. It ensures creation of new concrete products by generating techniques unknown as far as possible, through trial and error or making and destroying, in a creative attitude far from functionality. Therefore, it requires the expansion into the outer world or a workshop atmosphere where diversities are exhibited. It brings in the practice experience, both alone and together. It improves the ability to use time efficiently within a limited time.

However, these workshop activities are performed with only first-year students architectural visions of whom haven't formed yet. In other words, we can observe that information gained through 'Basic Design' course are not always used in architectural projects or these data are not a guiding factor and even, it takes place spontaneously and coincidentally -just as in the above example-; therefore, a bridge can not be built between basic design and architectural project. However, the visuality is the most dominant feature of the architecture and according to contemporary education, the design principles should take place within the design concept in the other semesters as well.

Özet

Bu çalışmanın amacı, gelişen teknoloji ve artan ihtiyaçlar doğrultusunda hayatımızın bir parçası olan çoklu ortam teknolojileri ve bilgisayar destekli eğitimde uygulamalarının incelenmesi üzerinedir. Bu çalışma gerçekleştirilirken çoklu ortam öğrenme kuramları, çoklu ortamların tasarım ilkeleri ve bilgisayar destekli çoklu ortamların neden kullanılması gerektiği ile ilgili bilgiler verilmiştir. Son olarak günümüz çoklu ortam uygulamaları ile ilgili bilgiler verilmiştir.

Anahtar Kelimeler: Bilgisayar destekli eğitim, çoklu ortam, çoklu ortam uygulamaları.

Abstract

In this study, multimedia technologies and computer based education with multimedia which is a part of our daily life due to increasing needs and technology were investigated. Multimedia learning theories, multimedia learning design principles and why we should use computer-based multimedia informations was given. Finally, recent multimedia applications' information was given.

Keywords: Computer based education, multimedia, multimedia applications.

1. Giriş

Çoklu ortam kavramı günümüzde oldukça yaygın olarak kullanılan bir kavram halini almıştır. Özellikle bilişim teknolojilerinin gelişmesiyle beraber çoklu ortamlar oluşturmada bilgisayarlar teknolojilerinden yararlanma oranımız artmaktadır. Özellikle bilgisayar destekli eğitim uygulamalarında çoklu ortam kullanımı oldukça ilgi görmektedir. Çoklu ortam; metin ile birlikte müzik, video, fotoğraflar, grafikler, yüksek çözünürlüklü grafikler veya canlandırmaların bulunduğu bilgisayar programlarından oluşmaktadır (Maddux, Johnson, ve Willis, 2001: 253, Akt: Aldağ ve Sezgin, 2003: 123). Çoklu ortamı (multimedia) oluşturan kelimeler incelendiğinde "çoklu (multi)" kelimesinin birden fazla forma sahip olma, "ortam (media)" kelimesinin ise, bilginin aktarıldığı ortamı ifade ettiği görülmektedir (Marmara Üniversitesi, 2003, Akt: Akkoyunlu ve Yılmaz, 2005: 9-10). Basit bir anlatım ile göze, kulağa, dokunma duyusuna hitap eden çevreler çoklu ortam olarak ifade edilmektedir (Akt: Akkoyunlu ve Yılmaz, 2005: 9-10). Mayer'e (2001) göre çoklu ortam kelimelerin ve resimlerin materyal olarak bir arada kullanılarak sunum yapılmasıdır. Mayer'e göre (2001) yazı, resim, animasyon vb. her biri birer ortamdır ve bunların bir arada kullanılması çoklu ortam kavramını meydana getirmektedir. Ayrıca Mayer (2001), sözel ve görsel öğelerin birlikte kullanılmasının öğretimi daha kalıcı ve verimli kıldığını savunmaktadır ve bu şekilde öğrenmenin gerçekleşmesine Çoklu ortam öğrenme kuramı adını vermiştir. Mayer (2001), Çoklu ortam öğrenme kuramını Pavio'nun (1986) ikili kodlama kuramından yola çıkarak; Baddeley'in Çalışan Bellek Modeli'nden (Model of Working Memory), Sweller'in Bilişsel Yük Kuramı'ndan (Cognitive Load Theory), Wittrock'un Türetimci Kuramı'ndan (Generative Theory) ve Mayer'in Anlamlı Öğrenme Modeli'nden de (Model of Meaningful Learning) yararlanarak Çok Ortamlı Öğrenmede Bilişsel Modeli (Cognitive Model of Multimedia Learning) geliştirmiştir (Akt: Aldağ ve Sezgin, 2003: 127). Nitekim çoklu ortam kavramının başlangıçtaki ve bugünkü tanımları arasında ciddi farklılıklar vardır. Geçmişte

birden fazla teknolojinin birbirlerini destekleyecek biçimde işe koşulması çoklu ortam kullanımı olarak değerlendirilmiştir. Oysa bugün çoklu ortam öğretim, sistemin merkezinde bilgisayarın yer aldığı ve öğretimin birbirini tamamlayan tümleşik kaynaklarla sunularak öğrencinin etken kılındığı eğitsel bir uygulama olarak tanımlanmaktadır (Kuzu, Uysal ve Kılıçer, 2008: 44). Bugün bilgisayar destekli ve internet tabanlı birçok öğrenme içerisinde çoklu ortam barındırmaktadır.

2. BDE'de Çoklu Ortam Tasarımında Nelere Dikkat Edilmeli

Mayer'in (2001) çoklu ortam tasarımına ilişkin tasarım ilkeleri şunlardır;

Çoklu ortam ilkesi (multimedia principle): Öğrenenler, sözcüklerle ilişkili resimlerin birlikte sunulduğu öğrenme ortamlarında, sadece sözcüklerin sunulduğu öğrenme ortamlarına göre daha iyi öğrenmektedirler (Akt: Ocak, 2008: 7).

Uzamsal bitişiklik ilkesi (spatial contiguity principle): Öğrenenler, ilişkili sözcük ve resimlerin birbirine yakın olduğu ortamlarda, uzak olduğu ortamlara göre daha iyi öğrenmektedirler (Akt: Ocak, 2008: 7).

Zamansal bitişiklik ilkesi (temporal contiguity principle): Öğrenenler, birbiriyle ilişkili anlatım ve animasyonların aynı anda sunulduğu ortamlarda, sıra ile sunulduğu ortamlara göre daha iyi öğrenmektedirler (Akt: Ocak, 2008: 7).

Tutarlılık (mantıklılık) ilkesi (coherence principle): Öğrenenler, konu ile ilgisi olmayan sözcük, resim ve seslerin ortamın dışında tutulduğu durumlarda daha iyi öğrenmektedirler (Akt: Ocak, 2008: 7).

Sıraya koyma ilkesi (modality principle): Öğrenenler animasyon ve seslendirilmiş sözcüklerden (anlatım), anlatım ve yazı ile sunulmuş sözcüklere göre daha iyi öğrenmektedirler (Akt: Ocak, 2008: 8).

Gereksizlik ilkesi (redundancy principle): Öğrenenler, animasyon ve anlatımın birlikte sunulduğu ortamlarda, animasyon, anlatım ve yazılı sözcüklerin (on-screen text) birlikte sunulduğu ortamlara göre daha iyi öğrenmektedirler (Akt: Ocak, 2008: 8).

Bireysel farklılıklar ilkesi (individual differences principle): Tasarımın etkisi, daha az bilgiye sahip öğrencilerde, daha çok bilgiye sahip olanlara göre daha yüksek ayrıca, yüksek uzamsal kavramaya sahip olanlarda, düşük uzamsal kavramaya sahip olanlara göre daha fazla olmaktadır (Akt: Ocak, 2008: 8).

Mayer ve Moreno (2002) yaptıkları bir çalışmadı bilgisayar destekli çoklu ortamların potansiyel zengin mesajlar içerdiğini ancak her mesajın etkili olmadığını belirtmişlerdir. Ayrıca gerçekleştirdikleri çalışmada çoklu ortam öğretimsel mesajlarının bilişsel yükü minimize ettiğini belirtmektedirler. Panagiotakopoulos ve Ioannidis (2002) yaptıkları bir çalışmada, çoklu ortam yazılımlarında çocukların öğrenmelerinde bir farklılık yaratmadığını ancak karar verme süreçlerini daha açık ve iyi bir tasarım ile öğrenme motivasyonlarını yüksek tutulabileceğini söylemektedir. Inkpen (1997) gerçekleştirdiği bir çalışmada bireylerin bilgisayarı farklı şekilde kullandıklarını ve bilişsel farklılıklarının olduğunu göz önüne alarak insan bilgisayar etkileşiminin çoklu ortam geliştirmede dikkate alınması gereken bir faktör olduğunu belirtmiştir. Mayer ve Moreno (1998) gerçekleştirdikleri çalışmada çoklu ortamların tasarımında şu adımlara dikkat edilmesi gerektiğini belirtmişlerdir; Birlikte sunma prensibi: Açıklamaları kelime ve resimle sunmak, yalnızca kelimeler ile sunmaktan daha etkilidir. Bitişiklik prensibi: Birbiriyle ilişkili kelimeleri ve resimleri birbirine yakın tasarlamak, birbirine ayrı tasarlamaktan daha etkilidir. Bölünmüş-dikkat prensibi: Bir çoklu ortam açıklaması verirken kelimeleri sesli olarak sunmak, görsel olarak sunmaktan daha etkilidir. Resim tasarımında ise şunlara dikkat edilmelidir; Görsel malzeme çok yoğun ve gereksizce kullanılıp öğrenciyi yormamalı ve dersi anlamadaki bilişsel akışı engellememelidir. Metinleri/sesleri destekleyici ve tamamlayıcı görsel malzeme ayrıntıyla verilmelidir. Metaforik görsel malzemenin seçiminde ve işlevinin tanımlanmasında tasarımcı, öğretmen ve programcılarla birlikte karar verilmelidir (Akpınar, 2005: 115). Ses tasarımında ise şunlara dikkat edilmelidir; Yazılımı hazırlanacak bilgilerin bir kavramsal analizi yapılmalıdır, bu işlemde yapay zeka uygulamacılarının da işe koştuğu "kavram haritaları" çıkarılmalı, kavram ve süreçlerin konuşma gösterimi ile ifadelerinin ne derece kritik olduğuna bakılmalıdır (Akpınar, 2005: 117). Diğer

bilgi gösterim biçimleri ile sözel söylemin birlikte ya da bunların birbirlerinden bağımsız olarak ifade edilip edilmeyeceğine karar verilmelidir. Çünkü farklı öğrenme yöntemlerinde, söylemlerin farklı stratejilerle ilişkilendirilmesi öğrenciden istenebilir veya belli aşamalar geçildikten sonra belli söylemlerin kullanımına izin verilmesi gerekebilir. Dil söylemi, öğretme metodunun ilkeleri ile çatışmayacak ve onlarla uyumlu olacak şekilde işe koşulmalıdır (Akpınar, 2005: 117). Eğer bir gösterim biçiminden diğerine bir geçiş yaptırılacaksa bu geçişin yazılım ortamı içinde ve bilişsel etkinlikte, geçiş bağlarının öyle programlanması gerekir ki sözel söylem ile diğer söylem arasındaki geçiş "yumuşak" (öğrenci bilginin değil sadece temsil biçiminin değiştiğini fark etsin) olmalıdır. Austin (2009) gerçekleştirdiği bir çalışmada çoklu ortamlardaki ekran tasarımının dikkat edilmesi gereken önemli bir prensip olduğunu ve bilişsel farklılıkların dikkate alınması gerektiğini belirtmiştir. Stemler (1997) gerçekleştirdiği bir çalışmada çoklu ortam tasarımında dikkat edilmesi gerekenleri şöyle belirtmiştir; ekran tasarımı, öğrenen kontrol ve rehberliği, geri bildirim kullanımı, öğrenen etkileşimi, ses ve video tasarımı.

Günümüzde bilişim teknolojisinin en çarpıcı gelişmelerinden birisi WWW; normal yazı, grafik, görüntü ve sesin Internet üzerinden iletildiği çoklu ortam ağıdır. Çeşitli ortamlardan, değişik formatlarda alınan malzemeleri bütünleştirme yeteneğine sahip olan Web, eğitmenlerin etkin ve verimli bir ders hazırlamalarına olanak sağlamaktadır (Çetiner, Gencel ve Erten, 1999: 5). Çetiner, Gencel ve Erten'e göre (1999) uzaktan eğitimde çoklu ortam uygulamalarının yararları şunlardır:

Öğrenme zamanının kısalması: Yapılan araştırmalar göstermektedir ki ilgili konunun öğrenilme süresini önemli düzeyde azaltmaktadır.

"Akılda Tutma" seviyesinin artması: Etkileşimli çoklu ortam uygulamaları öğrencinin öğrenme sürecine aktif katılım olanağı vermektedir.

Etkin iletişim imkânı vermesi: E-posta, tartışma listesi ve hatta video konferans sistemi sayesinde eğitmen-öğrenci ve öğrenci-öğrenci iletişimi mekandan bağımsız olarak yüz yüze gerçekleştirilmektedir.

Öğrencilerin etkileşimli eğitimden hoşlanması: Etkileşimli çoklu ortam uygulamaları, bilginin aydınlatıcı ve eğlenceli bir şekilde ifade edilmesine yardım etmektedir (Çetiner, Gencel ve Erten, 1999: 5).

3. BDE'de Çoklu Ortam Uygulamaları ve Neden Bilgisayar Destekli Çoklu Ortam

Bilgisayar destekli eğitimde çoklu ortam uygulamaları oldukça çeşitlidir. Çoklu ortam uygulamaları çevrimdışı olabildiği gibi çevrimiçi de olabilir. Metin, görsel, ses, animasyon, video her biri birer ortamdır ve bunların bir arada kullanılması çoklu ortam anlamına gelmekte olduğu düşünüldüğünde günümüz internet teknolojileri için birer çoklu ortamdır denilebilir. Sosyal paylaşım siteleri, wikiler, web 2.0 araçları sıradan internet kullanıcılarının karşılaştığı çoklu ortamlardır. Bunların dışında LMS, yani öğrenme yönetim sistemleri, uzaktan eğitim, e-öğrenme için özelleşmiş senkron ve asenkron programlar birer çoklu ortamdır. Tüm bunlara ilave olarak bilgisayar oyunları ve sanal dünyalarda etkili çoklu ortamlardır. Son yıllarda özellikle MMORPG, yani, çok oyunculu dev sanal dünyalarda rol yapma oyunları oyuncularına oldukça gelişmiş ve interaktif bir çoklu ortam sağlamaktadır. Yapılan bazı çalışmalar bireylerin bu oyunlar aracılığı ile yüksek oranda motivasyon sağlayıp öğrenmelerini kolaylaştırabileceğini iddia etmektedir. Aldrich (2002), günümüzde 30 yaş altı ve gelecekteki kuşakların bilgisayar oyunları oynayarak büyüdüğünü belirtmektedir ve söz konusu bireylerin bilgisayar ile etkileşime geçtiklerinde nasıl öğreneceklerini bildiklerini, bileceklerini ifade etmektedir (Akt: Anetta, Folta & Klesath, 2010). Özellikle World of Warcraft adlı MMORPG oyununun güçlü ve etkili bir çoklu ortam çevresine sahiptir. Gee, (2005); New Media Consortium & EDUCAUSE Learning Initiative, (2007) e göre World of Warcraft oyunu eğlence amaçlı tasarlanmasına karşın ekonomi, matematik, fen bilimleri, takım olarak çalışabilme, liderlik ve sosyal becerileri geliştirmek amaçlı kullanılabileceğini öngörmektedir (Akt. Anetta, Folta & Klesath, 2010).

Sonuç olarak bilgisayar destekli çoklu ortamlar günümüzde önemli görülen öğrenme ortamları haline gelmişlerdir. 2007 Horizon Project raporunda belirtilen teknoloji ile öğrenmedeki yeni trendler ile; kullanıcıların

oluşturdukları içerikler, sosyal ağlar, mobil cihazlar, sanal dünyalar, ciddi bilgisayar oyunları, çoklu ortam uygulamalarının önemi artmıştır (Anetta, Folta & Klesath, 2010). Günümüz öğrenme ihtiyaçları da dikkate alındığında eğitimde bilgisayar destekli, internet destekli çoklu ortamların kullanılması ihtiyacı kendini göstermektedir.

Özet

Bilgisayar destekli eğitim içerisinde eğitsel oyunlar önemli bir yer tutmakta ve etkinlikleri gün geçtikçe artmaktadır. Bilindiği üzere oyun çocuk gelişimi açısından olmazsa olmaz bir unsurdur. Çocuklar oyunlar sayesinde zihinsel , duyuşsal ve pskomotor gelişim gösterirler. Özellikle Prensky 'nin görüşleri bilgisayar destekli eğitsel oyunlar sayesinde yeni bir eğitim kültürünün oluşacağı yönündedir. Bu nedenle bildirimizde eğitsel oyunları incelemeye çalıştık.

Anahtar Kelimeler: Eğitsel Oyun, Bilgisayar Destekli Eğitim, Educational Games

Abstract

Computer aided education holds an important place in the educational games and activities are increasing day by day. As is known, game is an essential element in terms of child development. Children develope mental, emotional and pskomotor with playing games. Especially the view of Prensky says, computer-assisted educational games will occur a new educational culture. In this paper we therefore tried to examine the educational games. envorment.

Bilgisayar destekli eğitim içerisinde eğitsel oyunlar önemli bir yer tutmakta ve etkinlikleri gün geçtikçe artmaktadır. Bilindiği üzere oyun çocuk gelişimi açısından olmazsa olmaz bir unsurdur. Çocuklar oyunlar sayesinde zihinsel , duyuşsal ve pskomotor gelişim gösterirler.

Oyun (Game): Oyun, katılımcıların belirli kurallara (gerçek dışı) uyarak, belirli hedeflere (meydan okuyucu) ulaşmaya çalıştıkları bir aktivitedir. (Heinich, Molenda ve Russell,1993,Akt. Çeliköz ,1995)

Burdan yola çıkaran bir oyunda bulunması gereken özelliklerin şunlar olduğu sonucuna varabiliriz.

Her oyunda oyunculardan varmaları beklenen bir hedef vardır.

Oyuncular hedefe ulaşırken oyun kurallarını göz önünde bulundururlar

Her oyunda güdüleyici unsurlar bulunur.

Özellikle güdüleyici unsurların varlığı oyunların eğitsel alanda kullanılması bakımından en önemli avantajların başında gelmektedir.Öğrencilerin eğitsel bilgisayar oyunlarını klasik öğrenme biçimlerine tercih etmesibu bakımdan şaşırtıcı değildir. Bilinmektedir ki öğrenme ortamında aktif öğrenme için en önemli gerekliliklerden biri öğrencilerin dikkatinin öğrenme faaliyetine yöneltilmesidir. Bu nedenle eğitsel oyunların kullanımının öğrenme ortamında derse katılımı arttıracağı açıktır.

Bireylerin oyunlara olan ilgisine baktığımızda ise bu ilginin eğitimde kullanım için oldukça avantaj sağlayan bir özellik olduğu göze bakmaktır. Literatürde incelendiğinde; öğrencilerin derslerde eğitsel oyun kullanımına olumlu yaklaştığı ve oyun‐tabanlı öğrenmeyi klasik öğrenme yöntemlerine (kitaptan okumak, öğretmeni dinlemek gibi) tercih ettikleri görülmüştür. (Bakar, Tüzün ve Çağıltay, 2008; Karakuş, İnal ve Çağıltay, 2008)

Şahin ve Yıldırım'a (1999) göre eğitsel oyunlar öğrenenin, öğrenme ortamında sürekli aktif olmasını sağlamaktadır. Bununla birlikte eğitsel oyunlar; öğrenenlerin yaratıcılıklarını, ilkeleri sorgulama ve yeni ilkeler araştırma ve oluşturma yeteneklerini geliştirmektedir (Öztürk, 2007).

Eğitsel oyunların öğrenene sağladığı katkılar genel olarak eğlenerek öğrenme, problem çözme kritik düşünme, kavram öğretimi, strateji geliştirme ve olgunlaşma olarak sıralanabilir.

Teknolojinin gelişmesi ile birlikte eğitsel oyunlar bilgisayar destekli olarak sunulmaya başlanmıştır. Bu sayede bilgisayar öğrenciye rakip olarak ayarlanabilmekte ve her öğrenci kendi seviyesine uygun zorlukta oyunu oynayabilmektedir.Böylece öğrenci kendi hızında öğrenme şansına da sahip olacaktır.

Hayatımızın vazgeçilmezi olan oyunlar, teknolojik gelişmelere bağlı olarak değişim göstermişlerdir. Çocuklar geçmişte oyunlarını sokaklarda oynarken, günümüzde çoğunlukla bilgisayarlarda oynamaya başlamışlardır. Her ne kadar vazgeçilmeyen oyunlar kalsa da çoğunlukla bilgisayarlar üzerinden oynanabilen oyunlar tercih edilmeye başlanmıştır. Bu durumun sonucu olarak film ve müzik endüstrilerine rakip olabilecek elektronik oyun sektörü ortaya çıkmıştır (Yılmaz ve Çağıltay, 2004)

İnal ve Kiraz'a(2008:6) göre ise bilgisayar oyunları bir yandan öğrenme için zengin bir etkileşim ortamı sağlarken diğer yandan öğrencilerin akademik, sosyal ve bilgisayar okuryazarlık becerilerinin gelişmesine katkıda bulunan bir güce de sahiptir. Ayrıca günümüzde internetin de devreye girmesiyle bu eğitsel oyunlar bir ağ üzerinde birden fazla öğrenciyi bir oyunu birlikte tamamlamayı sağlayacak şekilde programlanabilir. Bu da öğrencilerin sosyal öğrenme ile öğrenmesini de teşvik edecektir. Üstelik çevrimiçi oyunlar sayesinde öğrenciler farklı kültürlere sahip insanlarla da iletişim kurmakta, hoşgörü ,empati vb. duyuşsal alan özelliklerini de kazanmaktadırlar.Çevirimiçi oyunlarım bir başka katkısı da toplumsal sorumluluk oluşturabilmek olarak ifade edilebilinir. Bazı eğitsel oyunlar bu yönüyle de öne çıkmaktadırlar.

Quest Atlantis ve Enverimental Detectives oyunları öğrencilerin sosyalleşmesi ve kendilerine verilen görevleri toplumsal sorumluluk ilkeleri dâhilinde yerine getirmeleri açısından önemlidir. Bu açıdan bakıldığında oyunun toplumsal sorumluluk fikrini öğrencilere öğretmeye çalıştığı ve sosyal çevreye ve sorumluluklarına daha

bağlı ve duyarlı insanların yetişmesi amacı ile öğrencilere bu ortamın uygulanmasının amaçlandığı söylenebilir. (İnal ve Kiraz,2008,13)

Garris, Ahlers ve Driskell (2002) ise yaptıkları çalışmada bilgisayar oyunlarının eğitimde kullanılmasını şu nedenlere bağlamaktadırlar.

- Öğretim yöntemlerinin öğrenen merkezli yapıya geçmesi,

- Literatürdeki bazı araştırmaların bilgisayar oyunlarının karmaşık konuların öğretilmesinde etkili bir araç olarak kullanılabileceğini göstermesi,

- Bilgisayar oyunlarının öğrenenlerin ilgi ve motivasyonlarını artırarak eğitsel hedeflerin yakalanmasında yardımcı olması olarak belirtmişlerdir. (Esgin ve diğerleri,2011)

Öğrenen merkezli bir yapıya geçilmiş olması öğrencinin derste aktif olmasını da gerekli hale getirmiştir.Whelan (2005)'a gore öğretmen merkezli öğrenme ortamlarındaki öğrenciler kendilerine öğretilen konuları akıllarında tutmak için çaba sarfederken oyunla öğrenenler yaptıkları üzerinde yetki sahibidir ve dolayısıyla öğrendiklerini akıllarında tutmak için daha çok güdülenmişlerdir.Eğitim materyalinin kalıcılığı bakımından da eğitsel oyunlar olumlu bir etki göstereceklerdir.

Eğitsel oyunlar çeşitli türlerde hazırlanabilmektedirler.Bu türler macera ve rol oynama, ticaret oyunları, pano oyunları, mücadele oyunları, kelime oyunları olarak sıralanabilirler. Carmen Sandiego gibi profesyonel oyunlar bir seri olarak farklı türlerde ve farklı dersler için hazırlanabilirler.Bunun yanında Adobe Flash gibi araçlarla hazırlanan bir derse yönelik çoğunlukla tek bölümden oluşan oyunlar oldukça yaygındır.

Peki özel anlamda eğitsel oyunları genel olarak ise video oyunlarını öğrenciler nezdinde çekici yapan nedir? Bu konuda da literatürde bazı görüşler bulunmaktadır.

Oyunların okullardaki kullanımının artacağını öngören Gee (2003) iyi tasarlanmış bilgisayar ve video oyunlarının gerçek önemini oyunların içindeki sanal dünyalarda insanların kendilerini yeniden yaratması ve hem eğlenme hem de öğrenmenin eş zamanlı olarak elde edilebilmesi olarak göstermektedir. (Bakar, Çağıltay, Tüzün,2009)

Oyun ile gerçek arasındaki fark, oyundan eğlenceli yapar. Bu nedenle bir çok insan bazen günlük hayatın mantıki kurallarını bir tarafa bırakarak yapay ortamlarda bulunmaktan zevk alır. Hemen hemen bütün oyunlar, bilgisayar oyunları da dahil yarışmaya dayalı olarak gerçekleşir ve kazanma-kaybetme unsurlarım içerir. Bu yüzden, eğitsel oyunlar yüksek motivasyona dayalı olarak tasarlanır ve öğrenciler maksadlı aktiviteler içerisinde bir amacı başarmak için ödül ya da puan kazanma işiyle meşgul olurlar (Geisert and Futrell, 1989,Akt. Çeliköz).

Eğitsel oyunların tasarlanmasında kullanılan çeşitli modeller bulunmaktadır. En çok kullanılan modeller şu şekilde sıralanabilirler.

EFM: Eğitsel Oyun Tasarımı İçin Bir Model

FİDGE Modeli

Deneyimsel Oyun Modeli

Oyun Nesnesi Modeli

Dijital Oyun-Tabanlı Öğrenme-Öğretme Modeli

Alanyazın Taramasına Yönelik Sarmal Eğitsel Oyun Tasarımı Modeli

Eğitsel oyunları sınıfta kullanılmasında dikkat edilmesi gereken durumlar da oluşabilmektedir. Öğrenciler bilgisayar oyunlarının eğitimsel amaçlarını bir yana bırakıp sadece eğlenceye odaklanabilebilirler. Bakar ,Tüzün

ve Çağıtay (2008) bu ve benzeri durumların öğretmenin sınıfta bulunmasıyla azaltılabileceğini savunmaktadır. Şüphesiz ki sınıf yönetimi eğitsel oyunlarla işlenen derslerde de dersin amacına ulaşması bakımından kritik bir rol oynamaktadır. Sınıf yönetimi dışındaki nedenlerde de bilgisayar destekli eğitsel oyunlara karşı görüşler öne sürülmektedir.

Kansas (2003) bilgisayar oyunlarının kullanımının; gereksiz zaman harcamaya neden olduğunu, oyunların ve internetin içerdiği güvenilir olmayan ve yanlış bilgilerle öğrencileri doğruyu ve gerçeği bulmaları yönünde olumsuz etkilediğini ve e-öğrenme ve sanal öğrenme ortamlarının gerçekle hiçbir bağlantısı olmadığı yönündeki görüşleriyle dikkat çekmektedir.(Demirbilek ve Yücel, 2006)

Sonuç olarak bakıldığında bilgisayar destekli eğitsel oyunların eğitim açısından oldukça büyük bir fırsat yarattığı görülmektedir. Denilebilir ki education ve entertainment kelimeleri birleştirilerek geleceğin eğitim yönelimlerinden en güçlüsü " edutainment " olucaktır. Eğlenirken öğrenme içerisinde güdülenme , sorumluluk duyma , grup çalışması , eleştirel düşünme gibi pek çok faktörü de beraberinde getirmektedir. Bu konuda özellikler Prensky de eğitsel oyunların yeni bir öğrenme kültürü oluşturabileceğini belirtmektedir.

Prensky'e (2002) göre 21. yüzyılda eğitime damgasını vuracak yenilik ne bilgisayar destekli öğretim ne de uzaktan öğretimdir; eğitimde devrim yaratacak yenilik eğlenceli eğitimi tam anlamıyla sunan eğitsel oyunlar olacaktır. Prensky (2002), öğrenmenin çaba istediği ve bunu sağlamak için de öğrencinin gönüllü öğrenme aktivitesinde bulunması gerektiği görüşündedir. Öğretmenlerin öğrencilerinin öğrenmelerini istiyorlarsa onları derse karşı motive etmeleri ve derse karşı olan ilgilerini artırmaları gerekmektedir. Bilgisayar oyunlarınsa doğası gereği motive edici ve ilgi çekici olduklarını savunmaktadır.(Esgin ve diğerleri,2011:3)

Bu bağlamda oyunların okullardaki kullanımının artacağını öngören Gee (2003) iyi tasarlanmış bilgisayar ve video oyunlarının gerçek önemini oyunların içindeki sanal dünyalarda insanların kendilerini yeniden yaratması ve hem eğlenme hem de öğrenmenin eş zamanlı olarak elde edilebilmesi olarak göstermektedir.(Bakar, Çağıltay, Tüzün, 2009)

BİLGİSAYAR DESTEKLİ EĞİTİMİN PROGRAM GELİŞTİRME İÇİNDEKİ ROLÜ

Kıvılcım Zafer, Özgür Burmabıyık, Fatih Küslü

Sakarya Üniversitesi Eğitim Fakültesi, Hendek, Sakarya,Türkiye

Abstract

Bu makalede, bilgisayar destekli eğitimin program geliştirme içindeki rolünden bahsedilmiştir. Program geliştirme; eğitim programı, öğretim programı, ders programı gibi temel kavramlardan oluşur. Bilgisayar destekli eğitim ise, eğitimde bilgisayarın aktif olarak kullanılmasıdır. Bilgisayar destekli eğitimin program geliştirme içerisine dahil edildiği yeni bir model önerisine makale içinde yer verilmiştir.

Keywords: BDE, Bilgisayar Destekli Eğitim, Program Geliştirme

Program Geliştirmede Temel Kavramlar

Eğitim Programı : Bir görev veya bir mesleğe hazırlamaya veya okuma, yazma, hesaplama gibi temel becerileri geliştirmeye yönelik, kapsamının farklı olmasına bakmaksızın, bireyi amaçlara ulaştıracak ülkenin ve bölgenin ihtiyaçları ile tutarlı tüm etkinliklerdir. (Doğan, 1997: 3)

Öğretim Programı: Okulda ya da okul dışında bireye kazandırılması planlanan bir dersin öğretimiyle ilgili tüm etkinlikleri kapsayan yaşantılar düzeneğidir. (Demirel, 2002: 6)

Ders Programı: Bir ders süresi içinde planlanan hedeflerin bireye nasıl kazandırılacağını gösteren tüm etkinliklerin yer aldığı bir plandır. (Demirel, 2002: 7)

Program Geliştirme: Eğitim programının hedef, içerik, öğrenme-öğretme süreci ve değerlendirme öğeleri arasındaki dinamik ilişkiler bütünüdür. (Demirel, 2002: 5)

Program Tasarımı Yaklaşımları

Konu Merkezli Program Tasarımları

1. Konu Tasarımı :

En eski yaklaşımdır.

Tüm eğitimciler tarafından en iyi bilinendir.

Nedeni, eğitimcilerde bu yaklaşımla yetiştirilmiştir.

2. Disiplin Tasarımı :

II. Dünya Savaşı sonunda çıkmıştır ve 70'li yıllarda öğrenci protestolarına kadar sürmüştür.

Eğitim programı, akademik disiplinler üzerinde yoğunlaşmasına karşın, aslı yine de konu tasarımı ile aynıdır.

Bu yaklaşımda konuların ne şekilde verildiği ve bu bilgilerin nasıl kullanılabileceği önemlidir.

3. Geniş Alanlı Tasarım:

Komu merkezli tasarımın neden olduğu parçalanmayı gidermiştir.

Amacı, konuları mantığa uygun bir şekilde bir araya getirmektir.

Örn: tarih ve coğrafya, Sosyal Bilgiler ismiyle bir araya getirilmiştir.

4. Süreç Tasarımı:

Tüm konular için ortak bir öğrenme yolunu ön plana çıkartır.

"Eleştirici düşünce" bu yaklaşımın en önemli ürünlerindendir.

Ornstein ve Hunkins'e (2003) göre eğitim programını üç anahtar düşünme stratejisinden oluşmuştur. Bu stratejiler; problem çözme, karar verebilme ve kavramadır.

<u>Öğrenen Merkezli Tasarımlar</u>

1. Çocuk Merkezli Tasarımlar:

Bu tasarımın savunucuları, öğrencinin en iyi şekilde öğrenebilmesi için etkin duruma geçirilmesi gerektiğini öne sürmüşlerdir.

Öğrencinin ilgi ve ihtiyaçları ön plandadır.

Sadece, etkin, hedeflere dayalı ve denetim içerisinde kök salan öğrenme, istenilen davranışlara dönüşebilir.

2. Yaşantı Merkezli Tasarımlar:

Çocuk merkezli yaklaşım gibidir.

Farkı, çocukların ihtiyaçları ve ilgileri önceden tasarlanamayacağı fikrinin ön planda olmasıdır.

Bu nedenle, öğretmenler her öğrenciye uygun olanı, uygulama alanında vermelidir.

3. Romantik (Radikal) Tasarımlar:

Savunucuları, okulun işlev ve iş görüsünün tamamen gözden geçirilip değiştirilmesini hatta bazıları ise okulların tamamen kapatılmasını ileri sürmüştür. Çünkü okullar öğrencinin gelişmesini bizzat engellemektedir.

Her öğrencinin kendi doğasında ele alınmasının uygun olacağını öne sürmektedir.

4. Hümanistik Tasarımlar:

Hümanistik psikoloji ön plandadır.

50'li yılların davranışsal psikolojisi ve eğitim programı tasarımlarına tepki olarak ortaya çıkmıştır.

İnsan davranışı basit bir etki-tepki ilişkisinden çok daha karmaşık olduğu ileri sürülmüştür.

Sorun Merkezli Tasarımlar

1. Yaşam Şartları Tasarımı:

Üç ana varsayım üzerine kurulmuştur.

1. Toplumun değişen yaşam ortamına uyum sağlanması ve bu amaca ulaşabilmek için eğitimde yapılması gerekenlerin ortaya konmasıdır.

2. Konular, toplumun yaşamına göre düzenlenecekse öğrencinin içinde bulunduğu çevresi ile programdaki konuların birbirleriyle bağdaştırılması.

3. Öğrenciler, yaşamı bizzat öğrenir ve uygulanırsa sadece toplumu ne şekilde geliştireceklerini öğrenmek ile kalmazlar; toplumun ilerlemesine de katkıda bulunurlar.

  2.   Çekirdek (CORE) Tasarımı:

Konu merkezlidir ve genel eğitim üzerine odaklaşır.

Tasarımlar, öğrenci sisteme girmeden önce yapılır.

Öğrencinin toplumun sorunlarını görmesini ve bu konulara eğilmesini amaç edinir.

Okullarda ayrı ayrı ders konularının öğretilmesine ve toplumsal gelişmenin işlevsel olmayışına bir tepki olarak ortaya çıkmıştır.

  3.   Toplumsal Sorunlar ve Yeniden Kurmacılık Tasarımı:

Bu tasarımcılar, toplumun sosyal, politik, ekonomik gelişmelerinin program tasarımı ile bağlantısı konusu üzerinde ilgilenirler.

Bu yaklaşıma göre zamanın, sürekli olarak toplumu değiştirmeye zorladığı savı ön plândadır.

Eğitim Teknolojisi – Öğretim Teknolojisi – Bireysel Öğretim Teknolojisi Ve Programlı Öğretim

Eğitim Teknoloji: Öğrenme sürecinde her öğrencinin bireysel nitelikleri göz önünde bulundurularak öğretmenin doğrudan karışmasına gerek kalmadan, öğrencinin kendi kendine öğrenmesine olanak veren bir öğrenme sürecidir. (Hızal, 1984 : 262)

Öğretim Teknolojisi:Öğrenme-öğretme ortamının en etkin şekilde düzenlenmesi için gösterilen sistematik ve planlı etkinlikler bütünüdür. (Şahin ve Yıldırım, 1999 : 4)

Bireysel Öğretim Teknolojisi: Tandoğan'a (1982: 23-26) göre, bireysel öğretimi büyük ölçüde öğrencinin çeşitli araçlardan oluşturulmuş bir ortamda kendi kendini yönlendirdiği ve kendi kendine uyguladığı öğrenme deneyimlerinden oluşan bir yöntem olarak tanımlamaktadır. (Akt: Uşun, 2000: 13)

Programlı Öğretim: Öğrenme psikolojisi alanında yapılan araştırmalara dayalı olarak ortaya çıkmış bir öğrenme öğretme tekniğidir. (Hızal, 1984: 162)

Program Hazırlama

Program hazırlama konusunda düşey ve yatay programlama olmak üzere iki yaklaşım vardır. Düşey Programlama Yaklaşımı; Çalışmaların tümü tek bir programcı tarafından yürütülür. Yatay Programlama Yaklaşımı; Çalışmalar bir ekip yaklaşımıyla gerçekleşir.(Uşun, 2000 : 31).

Program hazırlama çalışmaları genellikle; programlanacak konunun belirlenmesi için Hazırlık Aşaması, materyali kullanacak öğrencilerin düzeyine uygun, açık ve anlaşılır olması için Yazma Aşaması ve programın eksik yönlerini bulup saptamak için Deneme Aşaması olmak üzere üç aşama izlenmektedir. (Uşun, 2000 : 31)

Öğretim Araç Gereçleri

Öğrenme öğretme etkinliklerinde yerine getirdikleri işlevler dikkate alınarak üç ana grupta toplanmaktadır. (Büyükkaragöz ve Çivi, 1994) Bu gruplar; Az uyabilen öğretme makineleri, Kısmen uyabilen makineler ve Tamamen uyabilen öğretme makineleri

Programlı Öğretim Modelleri

Doğrusal Program Modeli: Skinner modeli" olarak da bilinir. Şartlanma öğrenme modelinin eğitimde kullanılması yönünde bir girişimdir. (Küçükahmet, 1997: 119). Bu program modelinde, öğrenilmesi istenilen bilgiler madde, çerçeve veya küçük adımlar halinde aşamalı olarak öğrenciye sunulur.

Dallara Ayrılan Program Modeli: "Crowder Modeli" de denilen dallara ayrılan program modelinde öğrenme kuramları ile herhangi bir varsayımdan hareket edilmez. Bu modelde, öğrenmede, her öğrenci aynı yolu izlememektedir.

Atamalı Dallara Ayrılan Program Modeli: Bu program modeline Karma Program Modeli de denilmektedir. Leiris tarafından geliştirilmiştir. Doğrusal program modeli ile dallara ayrılan program modelinin bir arada kullanılabileceği görüşü, karma programların ortaya çıkmasına yol açmıştır. (Uşun, 2000: 30)

Bilgisayar Destekli Öğretim

Bilgisayar destekli öğretim; bilgisayarların öğretimde kullanılmasının en zor fakat umut vaat edenidir. Diğer kullanım biçimlerine göre öğretmenlerin yetiştirilmesi, uygun donanımın belirlenmesi ve ders programlarıyla tutarlı ders yazılımlarının sağlanması gibi yetenek, uzmanlık, çaba, zaman ve para gerektiren karmaşık ve uygulanması oldukça güç bir kullanım biçimidir.

Bilgisayar Destekli Öğretimin Amaçları

Bilgisayar destekli öğretimini amaçları; Öğrenme sürecini hızlandırmak, ucuz ve etkili öğretimi gerçekleştirmek, öğretimde sürekli olarak niteliğin artmasını sağlamak ve bireysel öğretimi gerçekleştirmek gibidir.

Bilgisayar Destekli Öğretim Modelleri

Öğretimsel Model: Temelde programlı öğretime dayanmakta ve bilgisayar sabırlı bir yardımcı gibi kullanılmaktadır.

Hipotezci Model: Öğrenciye hipotez formüle etmede yardımcı olunmakta ve bu model bilginin, öğrencinin yaşantıları yoluyla yaratılması gerektiği düşüncesine dayanmaktadır.

Açıklayıcı Model: Bilgisayar, öğrenci ile gerçek yaşamın gizli modeli ya da benzeşimi olarak, ilerledikçe konuyu keşfederek öğrenmesi esas alınmaktadır.

Arındırılmış Model: Bilgisayar öğrencinin çalışma yükünü azaltma aracı olarak kullanılmakta ve öğrenciye hesaplama, bilgi işlem vb. olanaklar sağlamakta ve onu desteklemektedir.

Program Tasarısı Hazırlama

Hedef

Planlanmış ve düzenlenmiş yaşantılar yoluyla bireyde gözlenmesi kararlaştırılan istendik özelliklerdir (Demirel 2004; Sönmez 1994).

Bilgisayar destekli eğitimde Hedef saptamada istendik davranışların belirleyicileri teknoloji, bilgisayar, konu alanı ve bireydir. Bu belirleyiciler dikkate alınarak saptanan aday hedefler eğitim psikolojisi, eğitim felsefesi, eğitim ekonomisi ve eğitim sosyolojisi süzgeçlerinden geçirilmelidir.

İÇERİK

Eğitim programının içerik boyutunda "ne" öğretelim sorusuna yanıt aranmaktadır. İçeriğin düzenlenmesi sürecinde öğretilecek konular, içeriğin hedeflerle tutarlılığı ve aşamalı olması dikkate alınmaktadır. İçeriğin seçiminde ele alınması gereken temel ilkeler arasında somuttan soyuta, basitten karmaşığa, kolaydan zora, bütünden parçaya ya da parçadan bütüne, günümüzden geçmişe, olaylardan kavrama ve genellemelere, yakın çevreden uzak çevreye doğru bir düzenleme söz konusudur. İçeriğin seçiminde ele alınması gereken ölçütler aşağıdaki gibi belirlenmiştir (Demirel 2004):

Kendi kendine yeterlilik

Anlamlılık

Geçerlilik

İlgililik

Yararlılık

Öğrenebilirlik

Ekonomiklik

- 1. Doğrusal Programlama Yaklaşımı: Birbiri ile ardışık, yakın ilişkili ve zorunlu ya da önkoşul öğrenmelerin düzenlenmesinde kullanılmaktadır. Aşamalılık özelliği taşıyan dersler için kullanılır.

- 2. Sarmal Programlama Yaklaşımı: Konuların yeri geldikçe tekrar öğretilmesi söz konudur. Her konunun kendi içindeki konular arasında bir ardışıklık bulunmaktadır.

- 3. Modüler Programlama Yaklaşımı: Öğrenme üniteleri modüllere ayrılır. Her modül kendi içinde farklı bir programlama yaklaşımıyla düzenlenebilir ve kendi içinde anlamlı bir bütün oluşturur.

- 4. Piramitsel ve Çekirdek Programlama Yaklaşımı: İlk yıllarda geniş tabanlı konuların yer aldığı giderek uzmanlaşmanın küçük birimlerde olduğu ve daraldığı bir yaklaşım tarzıdır.

- 5. Konu Ağı-Proje Merkezli Programlama Yaklaşımı: Öğrencilere konuların ağı bir harita gibi çıkartılıp verilir ve belirli zamanlarda nerelerde olmaları gerektiği söylenir.

- 6. Sorgulama Merkezli Programlama Yaklaşımı: Öğrencilerin sorularına ve gereksinimlerine göre oluşturulur.

Öğrenme-Öğretme Süreci (Eğitim Durumları)

Öğrencilere istenilen davranışların kazandırılmasını sağlayan öğrenme yaşantılarının düzenlenmesi bu aşamada gerçekleşmektedir. Eğitim durumları öğrenci açısından öğrenme yaşantıları düzeneğini, öğretmen açısından öğretmen yaşantıları düzeneği olarak ele alınır. Eğitim durumlarının düzenlenmesinde ele alınan önemli özellikler bulunmaktadır;

Hedefe göre,

Öğrenciye göre,

Ekonomiklik

Diğer yaşantılar ile kaynaşık olmadır (Ertürk 1997; Demirel 2004).

Öğrenme Stratejileri

Öğrenme stratejileri bireyin öğrenme sırasında duyularına gelen uyarıları kısa ve uzun süreli belleğe transfer etmesini ve uzun süreli belleğe kodlamasını sağlayan teknikleri içerir. Öğrencinin güdülenmesini ve öğrenilen davranışların kalıcı olmasını sağlar (Erden ve Akman 1995). Öğrenenler yeni öğrendikleri ile geçmiş yaşantılarında kazandıkları bilgileri bütünleştirmek ve bilgiyi anlamlandırmak için "tekrar, anlamlandırma ve örgütleme" öğrenme stratejilerinden yararlanabilirler.

Sınama Durumları (Değerlendirme)

Değerlendirme ölçme sonuçlarını bir ölçütle vurup yargıya varma sürecidir (Özçelik 1992). Öğrencide gözlemeye karar verdiğimiz doğrudan ve dolaylı davranışları kazanıp kazanmadığını; kazandıysa ne ölçüde kazandığını, kazanmadıysa neden kazanamadığını, kazanabilmesi için eğitim sisteminde neler yapılması gerektiğini belirleme sınama durumunun kapsamı içindedir (Sönmez 1994).

BİLGİSAYAR DESTEKLİ EĞİTİMİN TANIMI

Gökhun Murat GÜVENDİ, Aysar GÜVEN

Sakarya Üniversitesi, BÖTE: ABD YL Öğr.

BDE'ye Genel Bir Bakış

Her çağın kendine özgü gerekleri bulunmaktadır. Yirmi birinci yüzyılın ilk yıllarını geride bıraktığımız bu yıllarda hızla gelişen teknolojiye uyum sağlama çalışmaları halen devam etmektedir. Teknolojinin hızla gelişmesi için ne kadar çaba sarf ediliyorsa, bir o kadar da teknolojik çağa uyum ve teknoloji eğitimi için çaba sarf edilmektedir. Bu durum tüm ülkelerin eğitim sistemlerini derinden etkilemektedir.

Eğitimin alan çeşitliliği, bilgi donanımlı insan ihtiyacını artırmaktadır. Eğitimi daha yaygın, verimli ve kaliteli hale getirmek için teknolojinin imkanlarından fazlasıyla yararlanılmaya başlanmıştır. Bir çok araştırmacı yaptıkları çalışmalarda, bilgisayar destekli öğretim ile geleneksel eğitim karşılaştırıldığında bilgisayar destekli öğretimin başarısının daha yüksek olduğunu bildirmişlerdir. Yirminci yüzyılda eğitime neredeyse damgasını vuran Bilgisayar Destekli Eğitim, artık eğitimin temelini oluşturma yolundadır.

Öğretmen bilgisayar destekli eğitimde konuyu işlerken sahip olduğu donanım ve yazılım olanaklarına, öğreteceği konunun ve öğrencilerin özelliklerine, belirlediği öğretim hedeflerine göre bilgisayarı değişik yer, zaman ve şekillerde kullanabilir.

- Öğretmen konuyu sınıfta geleneksel yöntemlerle işler. Dersi kaçıran, başarısız olan ya da öğrenme ihtiyacında olan öğrencilere konuyu bilgisayar yardımıyla öğrenme fırsatı verebilir. Böylece bilgisayar özel öğretmen görevini üstlenebilir.
- Öğretmen konuyu sınıfta işledikten sonra, alıştırma, uygulama ve değerlendirme çalışmalarını bilgisayar yardımıyla yapabilir.
- Konu bilgisayar yardımıyla öğretilir, öğretmen danışmanlık yapar, öğrenme eksiklerini tartışma yöntemiyle giderebilir, öğrencileri denetleyerek hatalarını düzeltir (Aşkar & Erden, 1986, s. 23).

Eğitimde Teknolojinin Rolü Nedir?

Teknoloji insan oğlunun hayatının her alanında önemli bir yere sahip olmayı başarmıştır. Her alanda olduğu gibi eğitim alanında da büyük yenilik ve değişimlere vesile olmuştur. Uzmanlar bu değişimi anlama geliştirme için yoğun çalışmalar sürdürmektedirler. Eğitimde yapılan bu değişiklikler mali yük getirmesinin yanında bazı mali yükleri de kaldırmıştır. Örneğin okullarda bilgisayar sınıfı kurmak maliyet getirirken çocukların ödevlerini elektronik ortamda hazırlayıp teslim etmeleri maliyet azaltıcı bir uygulamadır.

Eğitimde büyük devrim yapan teknoloji eğitimde görev alacak personel için gereken yeterlilikleri de değiştirmiştir. Teknolojinin kullanıldığı bir eğitim ortamında görev alacak personelin hem teknolojiyi hem de öğrencileri aynı anda yönetmesi gerekmektedir. Bu bakış açısıyla düşünürsek teknoloji öğretmenlerin yüklerini hafifletirken aynı zamanda da ek yükler getirmiştir.

Engler teknolojiyi eğitimin ayrılmaz bir parçası olarak görmektedir. Şöyle der: "eğer eğitim her yönüyle öğretmen, öğrenci, ve çevre arasındaki bir iletişim ağı olarak görülürse, o zaman öğretim teknolojisinin bu ilişkileri tanımlamada önemli bir görevi olduğu anlaşılabilir" (Engler, 1972).

Eğitim teknolojisi öğrenme sürecini geliştirmek için oluşturulan her türlü sistemi, tekniği ve yardımı içerir. Böyle bir yapıda şu 4 özellik önemlidir: öğrencinin ulaşması hedeflenen amaçların tanımlanması; öğrenilecek konunun öğretim ilkelerine göre analiz edilip, öğrenilmeye uygun şekilde yapılandırılması; konunun aktarılabilmesi için uygun medyanın seçilip kullanılması; dersin ve derste kullanılan araçların etkililiğini ve

öğrencilerin başarı durumlarını değerlendirmek için uygun değerlendirme yöntemlerinin kullanılması (Collier et al., 1971, Gentry 2004).

Bilgisayar Destekli Eğitime yol açan olgular nelerdir?

Eğitim isteğinin artması, öğrenci sayısının ve bilgi miktarının çoğalması, öğretilecek içeriğin karmaşıklaşması ve bireysel eğitimin önem kazanması gibi nedenlerle bilgisayarın eğitimde kullanılmaya başlaması, Bilgisayar Destekli Eğitim uygulamalarını başlatmıştır.(ODABAŞI, 2010)

Eğitimin temel öğelerinden biri, öğretme ve öğrenme etkinlikleridir. Eğitim amaçlarının gerçekleşmesinde öğretim ve öğretme süreçlerinin etkililiği ise büyük ölçüde öğretmene ve onun öğretme ortamında kullandığı materyaller (her türlü araç gereçler) ve uygulamış olduğu yöntemlere bağlıdır. İnsan hayatındaki en önemli süreçlerden biri olan eğitim, günümüzün gereksinimlerine yanıt verebilmek için gelişen teknolojinin olanaklarıyla donanmak ve düzenlenmek zorundadır.

Bilgisayarın eğitimde kullanılması bu yolda atılmış gerekli bir adımdır. Eğitimin bireylere daha etkili ve verimli bir şekilde verilebilmesi için çeşitli eğitim materyallerinden yararlanılmaktadır. Günümüzde eğitim kurumlarında geleneksel yöntemlerle ve araç gereçlerle yapılan eğitimin ve öğretimin yerini bilgi teknolojilerinden faydalanılarak oluşturulan çoklu öğrenme ortamına bırakmaktadır. Bu durum eğitim faaliyetlerinde etkili olmakta ve bilgi teknolojileri kullanımının bu alana özellikle bilgisayar aracılığıyla girmesine neden olmaktadır.

Bilgisayarların öğrenme ve öğretme ile ilgili bütün faaliyetlerde kullanılması bilgisayar destekli eğitim olarak tanımlanabilir. Bilgisayar destekli eğitim denildiğinde eğitim öğretim etkinlikleri sırasında eğitimi zenginleştirmek ve kalitesini yükseltmek için öğretmene yardımcı bir araç olarak bilgisayardan yararlanılması anlaşılmaktadır. Bilgisayar destekli eğitimin amacı, eğitimi bireyselleştirmektir. Bilgisayar destekli eğitim, diğer eğitim ortamlarından farklı özelliklere ve farklı değişkenleri kontrol edebilme yeteneğine sahiptir. Ayrıca bilgisayar destekli eğitimde, öğretmen veya öğrencilerin mekândan bağımsız, kişiden bağımsız, zamandan bağımsız olarak bilgisayar teknolojilerini eğitim-öğretim amaçları doğrultusunda kullanmalarını da amaçlamaktadır .

ABD'deki Texas Üniversitesinde Philips tarafından yapılan araştırma sonuçlarına göre insanlar; okuduklarının %10'nunu, görüp işittiklerinin %50'sini,işittiklerinin %20'sini, söylediklerinin %70'ini, gördüklerinin %30'unu, yapıp söylediklerinin %90'ını hatırlamaktadırlar. Zaman faktörü sabit tutularak elde edilen bu oranlar, sınıf içinde çok ortamlı öğretme durumunun düzenlenmesi gerektiğini göstermektedir.

Çoklu ortamlı öğretme durumunun gerçekleşmesi ise bilgisayar destekli eğitim ile mümkün olabilmektedir .Yine yapılan araştırmalara göre, bilgisayar destekli eğitim sayesinde verimlilik %10-%90 arasında artmakta, sınıf ortamına göre ise %60 daha hızlı öğrenme gerçekleşmekte ve hatırlama süresinde ise %25 ile %60 arasında artma olmaktadır .

Eğitim Teknolojisinin Yararları

Eğitim teknolojisinin yararları ile ilgili birçok araştırma yapılmıştır. (Alkan 1997, s.41) Bu konuda yapılan araştırmaların ortaya koyduğu verilere göre, eğitim sistemi için eğitim teknolojisinin genel olarak sisteme ve özel olarak bireye sağlayabileceği yararları; serbesti, birinci kaynaktan bilgi, fırsat eşitliği, çeşitlilik ve kalite, yaratıcılık, kopya edilebilen bir sistem, üretken eğitim ve hızlı öğrenme ve bireysel öğretim şeklinde sıralamıştır. (Rıza 1997, ss.67–79) eğitim teknolojisinin yararlarını dolaylı ve dolaysız olarak iki sınıfa ayırarak ele almıştır.

Rıza'ya göre eğitim teknolojisinin dolaylı yararları şunlardır:

1. Yaratıcılığa sevk eder.

2. Öğretmenin rolünü genişletir.

3. Fırsat eşitliği yaratır.

4. Motivasyon yaratır.

5. Eğitimi bireyselleştirir.

6. Serbest eğitimi sağlar.

7. Birinci kaynaktan bilgiyi sağlar.

8. Kopya edilebilen bir sistem oluşturur.

Eğitim teknolojisinin dolaysız yararları ise aşağıda maddeler halinde sıralanmıştır:

1. Öğrenmeyi kolaylaştırır

2. Aktif öğrenmeyi sağlar.

3. Somut öğrenmeyi gerçekleştirir.

4. Aşamalı öğrenmenin temelini kurar.

5. Düşüncede sürekliliği sağlar.

6. Üretimi artırır.

7. Değişik sınıf ve düzeylerde özel hedefleri gerçekleştirir.

Özbilgin (1991) ise, eğitim teknolojisinin yararlan konusunu eğitimde nitelik geliştirme açısından ele almış ve okullarda öğrencilere belirlenen niteliklerin (hedeflerin) eğitim yoluyla kazandırılmalarında eğitim teknolojisinin işlevinin, "tam öğrenme" yi (belirlenen niteliklerin tümünü) gerçekleştirmek ve eğitim sürecindeki öğrencilerin tümüne istenen nitelikleri kazandırmak olacağını belirtmiştir.

Eğitim-öğretimde teknoloji uygulamaları;

1. Merak, tasarımcılık ve ekip çalışmasını gerçekleştirmek,

2. Öğretmenin rolünün değişmesi,

3. Çıraklık modelinin yeniden ortaya çıkması,

4. Öğrencilerin korku ve çekingenliğini azaltması,

5. Davranış problemlerinin azalması ve konsantrasyonla kendine güvenin geliştirilmesi,

6. Daha fazla bilgiye erişim,

7. Medyanın aşırı yüküne erişmek için daha zengin bilgi ortamı sağlaması,

8. Sınıfın duvarlarını yıkarak ev, şehir ve dünyayı bir araya getirmek gibi kolaylıklar sağlamaktadır (Şimşek, 1999, s.14).

Yukarıdaki açıklamalardan da anlaşılacağı üzere eğitim teknolojisi, eğitim uygulamalarında oldukça önemli yararlar sağlamaktadır. Eğitim teknolojisinin yararları genel bir yaklaşım ile;

1. Genel olarak eğitim bilimleri ve eğitim sistemine,

2. Özel olarak bireye (öğrenciye),

3. Eğitimde insan gücüne (öğretmen, uzman, yönetici v.b.),

4. Öğrenme-öğretme sürecine,

5. Kitle eğitimine getirdiği yararlar şeklinde sınıflandırılabilir.

Bu çerçeve içinde, eğitime teknolojiyi yerleştirmeye karar vermiş olan çeşitli disiplinlerden bir dizi araştırmacının yapması gereken çok çeşitli araştırmalar olduğu söylenebilir. Bunlar yazılımın, donanımın ve uygulayıcı öğretmenlerin sahip olması gereken niteliklerden uygulama yaklaşımına kadar geniş bir yelpazeye yayılan araştırma konularıdır.

Donanım konusunda; bilgisayarın sahip olması gereken hız, bellek gibi temel özelliklerin değerlendirilmesi ilk akla gelen araştırma konuları arasında sayılabilir. Ancak bunlardan daha önemli olarak, farklı özelliklere sahip, hatta farklı kuşaklardan bilgisayarların uyum sorunlarının araştırılmasının gerekliliği vurgulanabilir. Bu arada bilgisayarların girdikleri alanın ihtiyaçlarına göre şekil değiştirebilme potansiyelleri dikkate alınmalı ve eğitim dünyasının donanım üreticilerinden ne istediği sürekli olarak değerlendirilmelidir. Yazılım konusunda yapılması gereken araştırmaları sadece sıralamak bile yeterince zor görünmektedir.

Ekranda kullanılacak renkler yada resimlerin ve yazıların ekrandaki konumları gibi *estetik-ergonomik* sorunların yanı sıra, yazılımların farklı bilgisayarlarda çalışabilmelerini sağlamak gibi *teknik,* yazılım maliyetlerini makul düzeyde tutmak gibi *ekonomik* sorunlardan söz edilebilir. Yazılımların bakımı ve yönetimi başlı başına bir araştırma alanı olarak görülebilir Ama kuşkusuz en önemli problem alanı, yazılımların üretilmesi ve değerlendirilmesinde kullanılabilecek *eğitsel* ilkelerde ortaya çıkmaktadır. Programın eğitim ilkelerinin ne ölçüde geçerli olduğundan, kullanılacak dilin sahip olması gereken özelliklere kadar birçok araştırma konusu, BDE'nin *nasıl daha verimli hale getirebileceğini* araştırmak isteyen araştırmacıları beklemektedir.

Uygulamada görev alacak öğretmenlerin sahip olması gereken niteliklerin nasıl kazandırılacağı da temel problem alanları olarak görülmektedir. Bu anlamda bir dizi soru cevaplandırılmayı beklemektedir. Bu soruların bir bölümü aşağıdaki gibi sıralanabilir: Öğretmen donanımdan ne kadar anlamalı, işletim ve programlama dilleri konusunda ne kadar bilgi sahibi olmalı? Mevcut öğretmenlere bu bilgiler nasıl kazandırılır? Yeni öğretmen adaylarına nasıl bir eğitim programı uygulanmalı ve bu eğitim programlarını uygulamak için gerekli olan araç-gereç ve personel nasıl sağlanmalıdır?

Son olarak, donanım, yazılım ve öğretmenlerden meydana gelen temel kaynakların nasıl örgütleneceği ve zaman içinde nasıl iyileştirileceği gibi sorunları içeren uygulama yaklaşımına değinilebilir. Sınıf içinde mekânsal düzenlemeden, farklı hızlardaki öğrencilerin aynı müfredatı bireysel bir yaklaşımla izlemesinin nasıl sağlanacağına kadar bir dizi sorun henüz çözülememiştir. Ama sadece sınıf içindeki uyulama sorunlarının çözümü yeterli değildir.

Bilgisayarların bakımı gibi veya okullar arasındaki farklılıklara uygun tepkiler geliştirmek gibi *teknik* düzeyde problemlerin yanı sıra, öğretmenlerin motivasyonunu sağlamak gibi *taktik* ve eğitim sisteminin top yekûn şekillenecek imkân ve ihtiyaçlara göre düzenlenmesi gibi "stratejik" sorunlara da çözüm aramak gerekmektedir (Taşçı, 1990, s.102).

Bilgisayarların Öğretim Alanında Kullanımı

Bilgisayarlar okul sistemlerine girerek öğretim alanında da kullanılmaya başlanmıştır. Öğretme-öğrenme etkinliklerini bireysel ihtiyaçlara cevap verecek şekilde düzenlemek, eğitim hizmetlerini daha verimli ve etkili bir biçimde yürütmek ve çağdaş bir öğretme-öğrenme ortamı yaratmak amacıyla diğer araçlar gibi bilgisayarlar da geniş ölçüde kullanılmaktadır. Kullanım şekillerine baktığımızda iki boyut ortaya çıkmaktadır;

1.Bilgisayar için eğitim: Bu kendi içinde üç bölümde incelenebilir:

a.Bilgisayar okur-yazarlığı: Toplumun bütün kurum ve süreçlerini etkileyen bilgisayarla bir arada yaşayabilmek için zorunlu bilgi ve anlayışı kapsar.

b.Yazılım eğitimi: Bireyin kendisi yada başkaları için gerekli yazılımları geliştirme, geliştirilmiş olanları kullanma ve kullanacaklara yardımcı olma gibi yetenek ve becerileri kazandırır.

c.Donanım eğitimi: Bilgisayar donanımlarının tasarımından bakım ve onarımına kadar uzanan akademik ve mesleki yeterlilikleri amaçlar.

2.Eğitim için bilgisayar: Bu da kendi içinde üç bölümde incelenebilir:

a.Bilgisayar denetimli öğretim: Herhangi bir konuda öğrencinin öğrenme süreçlerinin bilgisayarla yönetilmesidir. Her öğrencinin öğretimin amaçladığı davranışları kazanıncaya kadar yapması gerekenleri gösterir ve yaptıklarının kaydını tutar.

b.Bilgisayara dayalı öğretim: Herhangi bir konuda diğer öğretim donanımlarından bağımsız, tek başına yeterli bir öğretici kaynak olarak bilgisayarın eğitimde kullanılmasıdır. Cooper (1988, s.207) BDÖ ve bilgisayar yönetimli öğretimi bilgisayara dayalı öğretimin iki temel fonksiyonu olarak ele almıştır.

c.Bilgisayar destekli öğretim (BDÖ): Öğretim sürecinde bilgisayarın seçenek olarak değil, sistemi tamamlayıcı, sistemi güçlendirici bir öğe olarak kullanılmasıdır. Bilgisayarların öğretimde kullanılması konusunda yapılmış olan uluslar arası düzeydeki çeşitli araştırmalarda (Gleoson, 1981; Taber, 1983) konu; okul sistemi, öğrenci, öğretmen, öğrenme ortamı, geleneksel yöntemle kıyaslama ve araştırma gereksinimi gibi açılardan ele alınmıştır.

Araştırmalarda şu alanlarda daha çok araştırma gereksinimi olduğu üzerinde durulmuştur:

1. Bilgisayar kullanımında öğretmenin rolü,

2. Öğretim uygulamalarında bilgisayarın etkisi,

3. Bilgisayar kullanımının mevcut program içine bütünleşmiş edilmesi (Slaughter ve Brown, 1993hs.10 ve 15).

Gleason (1981, s. 7 -18) ise çeşitli araştırma sonuçlarına göre şu yargılara varmıştır:

1. Bilgisayar öğrencilerin öğretim hedeflerine ulaşmasına yardımcı olmaktadır.

2. Geleneksel öğretimle karşılaştırıldığında; bilgisayar programları, öğrenme zamanında % 20 ile % 40 arasında tasarruf sağlamaktadır.

3. Bilgisayarın öğretim alanında kullanılması, geleneksel öğretime oranla, öğrenci başarısını olumlu yönde etkilemekte ve motivasyonu arttırmaktadır.

4. Bilgisayar destekli öğretimin başarısında eğitsel (ders) yazılımların etkililiği önemli rol oynamaktadır.

Bde'nin İçindeki Tanımlar

Eğitim Nedir?

Bireyin ve toplumun yaşantısını şekillendiren en önemli öğe eğitimdir. Bu nedenden dolayı insanlığın var oluğundan bu yana eğitim üzerinde düşünülmektedir. İnsanlık var olduğundan beri eğitim bir şekilde devam etmektedir. En iyi eğitimin sağlanabilmesi için ise öncelikle eğitimin ne olduğu tanımlanmalıdır. Eğitim sözcüğü sürekli olarak çok farklı anlamlarda kullanılmıştır. Değişik tanımlardan sadece birini benimsemek diğerlerini yok

saymak eğitimin ne olduğunu anlamayı zorlaştıracaktır. Eğitimin tanımını yapan araştırmacılardan bazılarının tanımları aşağıda verilmiştir.

Klasik anlamda eğitim, belli bir konuda, bir bilgi ya da bilim dalında yetiştirme ve geliştirme işidir (Hançerlioğlu, 1992).

Eğitim bireyin zihninde ve davranışlarında kalıcı izli gelişme gösterdiği süreçler bütünüdür (İşman, 2005). Alkan ise eğitimi davranış geliştirme, yetenek geliştirme, bilgi-beceri ve tutum kazanma süreci olarak tanımlamıştır (Alkan, 2005).

Eğitim, bireyin toplumsal yeteneğinin ve en elverişli düzeyde kişisel gelişmesinin elde edilmesi için seçilmiş ve denetimli bir çevreyi içine alan toplumsal bir süreçtir (Tezcan, 1996).

Eğitim, planlı, programlı, belirli bir amaçla belirlenmiş, toplumsal ve bireysel hedeflere doğru yapılan ve yaşam boyu devam eden uygulamalı bir süreçtir (Baytekin, 2004).

Eğitim, bireyin davranışında kendi yaşantısı yoluyla ve kasıtlı olarak istendik değişme meydana getirme sürecidir (Ertürk, 1988).

Eğitim, toplumun genç üyelerinin, var olan kültüre, yetişmiş üyeler tarafından bilinçli, amaçlı ve düzenli bir biçimde hazırlanması sürecidir (Ozankaya, 1984).

28 Eğitim yoluyla kişinin amaçları, bilgileri, davranışları ve ahlak ölçüleri değişmektedir. (Varış, 1988).

Eğitim bir süreçtir. Eğitim bugünden yarına başlayıp bitmez. Zaman ve kapsam bakımından çok geniş ve çok yönlü bir süreçtir (Gültekin, 2005).

Yukarıdaki tanımlardan yola çıkarak eğitimi bireyin yetişmiş üyeler tarafından yönlendirerek toplumun arzu ettiği özelliklere sahip olması, toplumsal ve bireysel hedefleri gerçekleştirebilmesi için yaşam boyu devam eden bilgi-beceri ve tutum kazanma süreci olarak tanımlayabiliriz.

Teknoloji nedir?

Günlük hayatta teknoloji kelimesi çok fazla kullanılmakta ve gerçek anlamının dışında birçok anlamı içinde taşımaktadır. Teknoloji bilimsel bilgi ve gelişmelerin pratik amaçlara uygulanması, bu uygulamanın sonucunda elde edilen metot, süreç ve araçların tümü ve malzeme ve nesnelerin, gereksinimleri karşılamak için her türlü araç olarak kullanımı şeklinde tanımlanabilir. Böyle birkaç tanımı içinde barındırması yüzünden günlük hayatta çok geniş anlamlarda kullanılmaktadır. Teknoloji denildiği zaman birçok kişinin aklına gelişmiş makineler gelmektedir. Ama teknolojinin bundan çok farklı bir anlamı vardır.

Uluslararası Teknoloji Eğitimi Birliği (International Technology Education Association - ITEA) (2007) tarafından teknoloji, algılanan insan ihtiyaçlarını ve isteklerini karşılamak üzere doğal çevrenin değiştirilmesi, yenileştirilmesi ve dönüştürülmesi olarak tanımlanmıştır. İşman teknolojiyi "Teknoloji kelimesi kullanıldığında hemen hemen herkes fiziksel donanım anlamaktadır. Hâlbuki teknolojinin kuramsal boyutu da bulunmaktadır. Teknoloji, fiziksel donanım ve kuramsal boyutları ile birlikte değerlendirilmelidir." şeklinde tanımlamıştır (İşman, 2005).

Teknoloji makine kullanımının yanı sıra sistemler, işlemler, yönetim ve kontrol mekanizmaları yardımıyla, hem insandan hem de eşyalardan kaynaklanan sorunlara, teknik çözüm olasılıklarına ve ekonomik değerlerine uygun çözüm üretebilmek için bir bakış açısıdır (Finn, 1960).

Alkan''a göre teknoloji en genel anlamda kazanılmış yeteneklerin işe koşulmasıyla doğaya egemen olmak için gerekli işlevsel yapılar oluşturma olarak ifade edilebilir (Alkan,2005).

Teknoloji, insanın bilimi kullanarak, doğaya üstünlük kurmak için tasarladığı rasyonel bir disiplindir (Simon, 1983). Teknoloji, kapsadığı makineler, işlemler, yöntemler, süreçler, sistemler, yönetim ve kontrol mekanizmaları gibi çeşitli öğelerin bir araya getirilmesiyle oluşan ve bilim ile uygulama arasında köprü görevi gören bir disiplin olarak tanımlanabilir (Alkan, 1997). Teknoloji, belirlenen hedefleri gerçekleştirmede, gereksinimleri karşılamada ve yaşamı kolaylaştırmayı sağlamada kullanılan bilgileri organize etmek için yapılan pratik uygulamalardır (İşman, 2005).

Tanım olarak teknoloji kavramı "bir mal veya hizmeti üretmenin toplumsallaşmış bilgisidir" (Atabek, 2001).

Teknoloji somut ve deneysel anlamda temel olarak teknik yönden yeterli küçük bir grubun örgütlü bir hiyerarşi yardımıyla bütünün geri kalanı üzerinde denetimi sağlamasıdır (McDermott, 1981).

Eğitim Teknolojisi nedir?

Eğitim teknolojisi kavramı eğitim ve teknoloji kavramlarının kesişim noktasını oluşturmaktadır. Yukarıda ayrı ayrı eğitim ve teknoloji terimlerini inceledik. Bu terimlerden yala çıkarak eğitim teknolojisi kavramını bireylerde istendik davranış değişikliğini en kolay ve en etkili şekilde oluşturabilmek için işe koşulan pratik uygulamalardır şeklinde tanımlayabiliriz. Eğitim teknolojisi kavramı ile ilgili uzmanların tanımları ise şöyledir.

Eğitim teknolojisi; Davranış Bilimlerinin iletişim ve öğrenme ile ilgili verilerine dayalı olarak, eğitimle ilgili ulaşılabilir insan gücünü ve insan gücü dışı kaynaklarını uygun yöntem ve tekniklerle akıllıca ve ustaca kullanıp sonuçları değerlendirerek, bireylere eğitimin özel amaçlarına ulaştırma yollarını inceleyen bilim dalıdır (Çilenti, 1988).

Eğitim teknolojisi, öğrencilerin, kendileri için söz konusu olan eğitimin özel amaçlarına ulaşmalarını sağlayacak yaşantıları saptama ve onlara bu yaşantıları kazandıracak eğitim durumlarını seçip uygulama sürecidir (Çilenti, 1998 akt:İşman, 2005).

Eğitim teknolojisi öğrenmeyle ilgili sorunların analizi ve çözümünde insanları, yöntemleri, düşünceleri, araç-gereçleri ve organizasyonu içeren karmaşık ve tümleşik bir süreçtir (Ergin, 1991). Eğitim teknolojisi, değişik bilimlerin verileri, özel hedef, yöntem, araç ve gereç, ölçme ve değerlendirme gibi eğitimin geniş alanlarında uygulamaya koyan, uygun maddi ve manevi ortamlarda insan gücünün en iyi şekilde kullanılmasını, eğitim sorunlarının çözülmesini, kalitenin yükseltilmesini, verimliliğin arttırılmasını sağlayan bir sistemler bütünüdür (Rıza, 2000).

Eğitim Teknolojisi bireyde istendik davranışları meydana getirmek ve programın belirlediği özel amaçlara ulaşma sürecinde kullanılabilecek araç, gereç ve tekniklerin tümüdür (Çorlu ve diğer, 1991).

Eğitim teknolojisi; öğrenmenin her aşamasında, sorunların çözümlenmesi, tasarımlanması, uygulanması, değerlendirilmesi ve sorunlara çözüm üretilmesi için insan, yöntem, amaç ve örgütlenmeyi içeren karmaşık bir süreçtir (Yurdakul, 1996).

Eğitim teknolojisi eğitim programının bütünü ile ilgilenen, belirlenen hedeflere erişebilmek için gerekli yol ve yöntemlerle birlikte öğretme-öğrenme süreçlerini sistematik biçimde tasarlama, uygulama, değerlendirme ve geliştirmeyi esas alan bir disiplindir (Özkul, 2001).

Genelde eğitime, özelde öğrenme durumuna egemen olabilmek için ilgili bilgi ve becerilerin işe koşulmasıyla öğrenme veya eğitim süreçlerinin işlevsel olarak yapısallaştırılmasıdır (Alkan, 2005).

Öğrenme-öğretme süreçlerinin tasarlanması, uygulanması, değerlendirilmesi ve geliştirilmesi işidir (Alkan, 2005).

National Academy of Engineering's Instructional Technology Committee on Education, eğitim teknolojisini şöyle tanımlar: "eğitim teknolojisi öğretme/öğrenme biliminin sınıf ortamı aracılığıyla gerçek dünya şartlarına uygulanmasıyla elde edilen bilgiler bütünüdür" (Dieuzeide, 1971). 33

Öğretim Teknolojisi

Öğretimin, eğitimin bir alt kavramı olduğu düşüncesinden yola çıkılarak "öğretim teknolojisi" de eğitim teknolojisinin bir parçası olarak ele alınabilir. Bu doğrultuda yapılan bir tanıma göre öğretim teknolojisi; "özel amaçların gerçekleştirilmesinde etkili öğrenme sağlamak için 'iletişim ve öğrenmeyle' ilgili araştırmalardan hareketle, insan gücü ve insan gücü dışı kaynaklar kullanılarak öğretme-öğrenme sürecinin tasarımlanması, yürütülmesi ve değerlendirilmesinde sistematik bir yaklaşım"dır (Ergin, 1995, s.6).

Alkan (1997)'a göre "öğretim teknolojisi", öğretimin eğitimin bir alt kavramı olduğu anlayışına dayalı olarak ve belirli disiplinlerin (fen, yabancı dil, biyoloji vb.) kendine özgü yönlerini dikkate alarak düzenlenmiş teknolojiyle ilgili bir terimdir. Öğretim teknolojisi kavramının tanımını tarihsel bir değişim ve gelişim içerisinde ele alıp inceleyen Şahin ve Yıldırım (1999. s.4) bu kavramı "öğrenme-öğretme ortamının en etkin şekilde düzenlenmesi için gösterilen sistematik ve planlı etkinlikler bütünü" olarak tanımlamışlardır.

Commission on Instructional Technology, öğretim teknolojilerini iki şekilde tanımlamaktadır: "(1) iletişim devrimi ile birlikte şekillenen medyanın, öğretmen, kitap, yazı tahtası ile beraber öğretimsel amaçlar için kullanılmaya başlamasıdır. Belirlenmiş hedefler uyarınca, daha etkili bir öğretim elde etmek için, öğrenme ve iletişim konusundaki araştırmaların ve ayrıca insan kaynakları ve diğer kaynakların beraber kullanılmasıyla tüm öğrenme/öğretme sürecinin sistematik bir yaklaşımlatasarlanması, uygulanması ve değerlendirilmesidir" (Commission on Instructional Technology, 1970, s.19).

Bilim ve Teknoloji

Bilim ve teknoloji arasındaki fark, bilmek ve yapmak arasındaki farka benzetilebilir. Kısa bir ifadeyle Bilim bilme; Teknoloji ise yapma ve geliştirmedir. Eğitim Teknolojisi bireyi geliştirme ve ona öğretme için etkili yöntemler, ortamlar bulmak görevini üstlenmiştir. (VAROL,1997)

Çeşitli seviyelerdeki kullanışlı uygulamaları ve bu uygulamaların vaat ettiklerini incelerken, düşünce ve yorumlar da kötümserlikten sıyrılıp iyimserliğe doğru kayıyor. Engler 1972'de eğitim teknolojilerinin durumunu şöyle anlatıyor: "şu anki öğretim yöntemlerimiz hakkında söylenebilecek en doğru söz eski teknoloji ürünü olduklarıdır. Kitap, tebeşir, öğretmen gibi temel öğretim araçları ve yöntemleri çok uzun zamandan beri kullanılmaktadır. Bugün öğretmenler daha iyi hazırlanmakta, kitaplar daha iyi tasarlanıp daha iyi yazılmakta, ve renkli tebeşirler kullanılmaktadır; ama bu araçların işlevleri ve öğrenci için anlamları yüzyılı aşkın bir süredir hiç değişmeden kalmıştır. Ayrıca bu süre zarfında öğretimin nasıl uygulanacağına ilişkin her hangi bir temel değişiklik de yapılmamıştır. duyacaklardır.

Bilgisayar ve Eğitim

İlkel toplumlarda bireyin eğitimi toplumsal kurallara ve geleneklere bağlı kalmış, ilerleyen yüzyıllarda özellikle bilim ve teknolojide meydana gelen gelişmeler, toplumları etkilemiş ve her alanda olduğu gibi eğitim alanında da değişime zorlamıştır (Gültekin,2004).

Bilgi toplumunun lokomotifi olan "bilgisayar" ve "bilgi" ile toplumsal yaşamın değişmekte olduğunu ve buna dayalı olarak yetiştirilmekte olan insan modelinin değiştiğini görmekteyiz. Yeni insan modelini yetiştirmekte eğitimin görevidir (Numanoğlu, 1999).

Teknoloji, insanoğluna birçok alanda olduğu gibi eğitim alanında da kolaylıklar getirmiştir. Eğitimdeki rolü tartışılmaz bir konuma gelen teknoloji, donanımsal ve kuramsal boyutuyla eğitimin bütün yönlerini etkilemektedir (İşman, Baytekin, Balkan, Horzum ve Kıyıcı, 2002).

Günümüz teknolojileri bilginin ulaşılmasını, yayılmasını ve yeniden üretilerek paylaşılmasını olanaklı hale getirmiştir. Bilgi toplumları, teknolojiyi kullanarak daha güçlü bir hale gelmekte ve hayatı her yönüyle kolaylaştırmaktadırlar. Teknolojinin eğitimde kullanılması da buna bir örnek teşkil etmektedir. Teknoloji sayesinde yaşam boyu eğitim de öncelikli hale gelmektedir. Teknoloji eğitiminin temelinde de bilgisayar eğitimi bulunmaktadır. Bilgisayar eğitimi sonucu bilgisayar okur-yazarı bireyler yetiştirmek amaçlanmaktadır.

Bilgisayar okur-yazarı bireyler bilgiye nasıl ulaşacağını bilir, gerektiğinde ulaştığı bilgiyi kullanır ve yeni bilgiler oluşturur. Zamanımızda bireylerin teknolojik anlamda usta birer okur-yazar olmaları, geleneksel akademik okuma, yazma ve sayısal beceriler kadar gereklidir. Çağdaş ve gelişmiş topluluklarda başarılı bir öğrenci teknolojik araçları ustalıkla kullanır. Eğitim kurumları, toplumsal değişme ve gelişmeleri hem başlatan hem de yönlendiren kurumlardır. Eğitim kurumlarının toplumun gereksinmeleri doğrultusunda, öğrencileri bilgi çağına uygun, bilgi toplumunun özelliklerini göz önünde tutarak geliştirmelidir (Akkoyunlu, 1998).

Niçin BDE?

Bilgisayar destekli eğitim yetişkin öğrencilere sunduğu avantaj nedeni ile kullanılmaktadır. BDE yalnızca mantık çerçevesinde beceri geliştirme, problem çözme ve verilen talimatları takip etmeyi sağlamaz (Askov ve Bixler, 1996), aynı zamanda okuma ve kelime bilgisi, dil, yazma, dinleme gibi alanlarda akademik yeterlilikleri iyileştirmede yardımcı olur (Askov ve Bixler, 1996: Huss, Lane, ve Willets, 1990: Tousignant, 1996, akt. Osei, 2001). Bir çok yetişkin öğrenci BDE'yi sever çünkü öğrenme ilgi çekici ve eğlencelidir (Tousignant, 1996, akt. Osei, 2001).

Yetişkinler gün süresince kendi istedikleri zamanlarda kendi hızlarında, akşamları veya haftasonları bilgisayarları kullanabilirler (Applications of Computer-Aided Instruction in Adult Education and Literacy Report, 1992, s.3).

Eğitmenler ve öğrenciler BDE ile rahat hissederler. Öğrenciler PCler ile büyürler. Çünkü onlar(PCler) son derece sabırlıdır, asla yorulmaz, asla sinirlenmez ya da kızmaz ve öğrencilerin hata yapmasından rahtsızlık duymamasını sağlarlar. Bütün bunlar öğrenciye doğru bir deneyim sağlar, hatalarından dolayı utandırmaz, farklı seçenekler ile çalışmayı mümkün kılar, ileriki hayatlarında değerli olabilecek bilgisayar kullanımındaki yeterliliğini arttırır (Romanenko ve Nikitina, 2011, s.548).

Genel olarak, literatür, BDE (Computer Assisted Instruction)' nin bilgisayar-tabanlı uygulamalar ve İnternet gibi kullanımının geleneksel öğretim eğitim tekniklerine nazaran ortaya daha başarılı sonuçlar çıkardığını göstermektedir. (Dalton ve Hannafin, 1988; Schacter ve Fagnano, 1999; Fletcher, 1990; akt: Cain ve Pitre, 2008)

Davis ve Shade (1994), bugün öğretimde çok verimli bir yöntem olarak kabul edilen bilgisayarların, bireysel öğretim yönteminin uygulanmasına fırsat vermelerinin yanı sıra, öğretim süresinin de kısalmasına yardımcı olduklarını gözlemiştir.

Bilgisayar destekli öğretimdeki öğrenci-bilgisayar etkileşimi eğlenceli olabilir ve öğrenciye somut yaşantılar kazandırabilir. Anında pekiştirme, dönüt sağlayarak dikkat çekici, heyecanlı gösterilerle oyun ortamı oluşturarak öğrencileri güdülemektedir. Bütün bunları geleneksel yöntemle öğretim aracılığıyla yapmak zordur.

Ayrıca B.D.Ö.'nün öğrenmeyi, geleneksel öğretimden daha kısa sürede sağladığına ilişkin birçok araştırma bulgusu vardır ve yapılan çalışmalar, genellikle B.D.Ö.'nün öğrenci başarısını yükselttiğini göstermektedir (Senemoğlu, 2003, s. 437-438).

Yapılan araştırmalar şunu göstermektedir, öğrenilenlerin;

%83'ü görme,

%11'i işitme,

%3,5'i koklama,

%1,5'i dokunma,

%1'i tatma duyusuyla gerçekleştiğini göstermektedir (Halis, 2002)

Bilgisayar Destekli Eğitimin Yararları

Bilgisayar destekli öğretimin birçok yararları vardır. İlgili literatüre göre BDE'in yararları şunlardır (Doğan, 1988; Keser, 1989; Demirel, 1994; Gleason, 1981; Kent, 1983; Bemadatte, 1983; Gregory, 1985; Fiber, 1987; Kennett, 1990; Ely, 1993).

1. Bilgisayar destekli öğretim, öğrencileri sürekli aktif tutar. Öğrenci bilgisayarın üreteceği sorulara yanıt vermesi gerektiği ve ancak konu üzerinde düşünerek bir sonraki adıma geçebileceği için sürekli aktif olmak zorundadır.

2. Her öğrenciye kendi öğrenme hızında bir öğrenim sağlar.

3. Bu yöntemde her öğrenci, öğrendiği konu ile ilgili olarak sorduğu sorulara yanıt alabilir. Sınıfların kalabalık olması, zamanın sınırlı olması ve bireysel farklılıklar nedeniyle öğrencilere soru sorulmayabilir. Bilgisayar destekli öğretimde öğrenci bilgisayarla etkileşim kurarak, istediği anda konu ile ilgili sorular sorarak yanıtlarını alabilmekte ve istediği kadar tekrarlayabilmektedir.

4. Laboratuar ortamında yapılması tehlikeli ve pahalı olan deneyler benzetişim yöntemi ile kolaylıkla yapılabilmektedir.

5. Bilgisayar destekli eğitim ile ilgili konular öğrencilere daha kısa sürede ve sistemli bir şekilde öğretilebilir.

6. Öğrenci, kendisine ait kişisel bir öğrenme ortamında rahatlıkla çalışabilmektedir.

7. Öğretim programı öğrencinin öğrenme ile ilgili gereksinimine göre hazırlanabilir. Öğretim amaçlarının sıralanışı öğrencinin öğrenme davranışlarıyla belirlenir.

8. Öğrenim küçük birimlere indirildiği için, başarı bu birimler üzerinde sıralanarak gerçekleştirilir.

9. Öğrenci kendi çalışmasına rağmen, öğretmen tarafından sürekli denetlenebilir ve gerektiğinde müdahale edilebilir.

10.Bedensel yada zihinsel özürlü öğrenciler, özel olarak düzenlenen bilgisayar destekli öğretim ortamında bireysel öğrenme hızlarına göre ilerleyebilirler (Eggen ve Kauchak).

11.Öğretmeni, dersi tekrar etme, ödev düzeltme vb. görevlerden kurtararak ona öğrencilerle daha yakından ilgilenme ve verimli çalışma zamanı ve olanağı tanır.

Bde'nin Tanımları

Bilgisayar Destekli Eğitimin çeşitli tanımları verilmektedir. Bu tanımlardan ilkine göre Bilgisayar Destekli Eğitim bilgisayar teknolojisinin öğretim sürecindeki uygulamalarının her biridir. Bu uygulamalar bilgi sunmak, özel öğretmenlik yapmak, bir becerinin gelişmesine katkıda bulunmak, benzeşim gerçekleştirmek ve sorun çözücü veri sağlamak olabilir.

Başka bir tanıma göre ise, Bilgisayar Destekli Eğitim, öğrencilerinin bilgisayar sistemine programlanmış olan dersleri etkileşimde programlanmış olan dersleri etkileşimde bulunarak, doğrudan alabilmeleridir. Bu tanımların bir sentezini ise bu ünite için kabul edilecek bir başka tanım vermektedir.

Bu tanıma göre; Bilgisayar Destekli Eğitim, bilgisayarların ders içeriklerin doğrudan sunma, başka yöntemlerle öğrenilenleri tekrar etme, problem çözme, alıştırma yapma ve benzeri etkinliklerde öğrenme-öğretme aracı olarak kullanılmasıyla ilgili uygulamalardır.

Bilgisayar Destekli Eğitimin temelinde uyarı, yanıt ve pekiştirme öğeleri bulunmaktadır. Öğrenciye bilgisayara bağlı terminal veya monitörde uyarıcı olarak bilgi sunulmakta, bu bilgiye ilişkin soruya öğrenci yanıt vermekte, yanıtın niteliğine göre de kendisine pekiştirme sunulmaktadır. Bu etkinliklerin tekrarı belirli konularda öğrenci davranışında değişiklik yapmaktadır. Bu da öğrenmenin oluşması anlamına gelmektedir.

BDE İçin Yurtdışından Uzmanların Yaptığı Tanımlar

Bilgisayar destekli eğitim, eğitim materyallerinin sunumunca bir bilgisayarın kullanıldığı, öğrenimin izlendiği ve bireysel öğrenim ihtiyaçlarına uygun ek eğitsel materyallerin seçilebildiği bir interaktif eğitim tekniğidir. BDE ayrıca bilgisayarı bilgiyi bulmak için bir veri kaynağı gibi kullanan (Computer Supported Learning Resources-CSLR) bilgisayar destekli öğrenme kaynakları içerebilir. CSLR öğrenenler tarafından öğrenme sürecinde kullanılan bir araçtır. (Cain ve Pitre, 2008, s.33-34).

Eğitim kurumlarının geleceğini doğru bir şekilde tahmin etmek imkansızdır. Ama bilgisayarın sorunlarına çözüm olmayacağı açıkça gözlenmektedir. Eğitim yazılımlarındaki kademeli bir geliştirme bilgisayar destekli eğitimi şuan ki durumuna göre gelecekte çok daha yararlı bir eğitim aracı yapabilir. İletişimi desteklemek için bilgisayar ağlarının kapasitesinin artması bir çok öğretmeni televizyon stüdyoları örneği gibi BDEyi geleneksel eğitime tercih etmelerini sağlar. (McDonnell, Turner, 1984, akt. Cingi, 2010)

Gayeski'ye Göre; Bilgisayar destekli öğretim ise öğretmen de dahil, diğer ortamlar aracılığı ile yapılan öğretimin; kendine özgü potansiyelini işe koşmak suretiyle, bilgisayarla desteklenmesidir (Gayeski, 1985, ss. 82-83, Akt. Şimşek, 1995).

Alessi ve Trollip'ye Göre; Bilgisayarın eğitim alanına verdiği destek değişik biçimlerde ifade edilebilmektedir (Alessi ve Trollip, 2001)

Hannafin ve Peck (1989) ise Bilgisayar Destekli Öğretimi, öğretimsel içerik veya etkinliklerin bilgisayar yoluyla öğrenciye aktarılması olarak tanımlamaktadır. Burada bilgisayar, öğretme sürecine öğretmenin yerine geçecek bir seçenek olarak değil, sistemi tamamlayıcı ve güçlendirici bir araç olarak girmektedir

BDE İçin Türkiye'den Uzmanların Yaptığı Tanımlar

Hızal'a Göre; Bilgisayarla öğretim, öğrenilmesi söz konusu içeriğin öğrenciye bilgisayarla sunulmasını esas almaktadır. Bu araçla yapılan öğretme-öğrenme etkinliğinde, bireysel hıza saygı göstererek ilerlenmekte, öğrenme sonucu hakkında hemen geribildirim alınıp, bunun sonucuna göre öğrenci yönetilmektedir (Hızal, 1989, s. 45, akt. Aksin, 2006).

Bilgisayar destekli eğitim bilgisayarın ders içeriklerini doğrudan sunma, öğrenilenlerin tekrar etme, problem çözme, alıGtırmalar yapma vb. etkinliklerde bulunduğu sürecinin önemli bir öğrenme-öğretme aracı olarak kullanılmasıyla ilgili uygulamaları kapsamaktadır (Hızal, 1989).

ODABAŞI'na Göre; Bilgisayar Destekli Eğitimin temelinde uyarı, yanıt ve pekiştirme öğeleri bulunmaktadır.Öğrenciye bilgisayara bağlı terminal veya monitörde uyarıcı olarak bilgi sunulmakta, bu bilgiye ilişkin soruya öğrenci yanıt vermekte, yanıtın niteliğine göre de kendisine pekiştirme sunulmaktadır. Bu

etkinliklerin tekrarı belirli konularda öğrenci davranışında değişiklik yapmaktadır. Bu da öğrenmenin oluşması anlamına gelmektedir. (ODABAŞI, 2010)

YILMAZ'a Göre; Çağdaş eğitim anlayışı, öğretmeni, öğrenmeyi maksimum düzeyde gerçekleştirecek öğretim metodunu seçme ve uygulama zorunluluğu ve sorumluluğu ile karşı karşıya bırakmaktadır (Yılmaz, 2001).

Cingi'ye Göre; Bilgisayar teknolojisinin gelişmesi, eğitim sektöründe derin bir etki yaratmıştır. Bilgisayar destekli eğitim okullarda müfredatın bir parçası haline gelmiştir. Bugün herkesin hayatında yer alan bilgisayar, insanlar için gittikçe vazgeçilmez bir kaynak olmaktadır. (Cingi, 2010)

ÖZDEN'e Göre; Öğretim etkinliklerinin görsel ve işitsel araçlarla desteklenmesi teknolojik gelişmelere ve tabii ki, teknolojinin elde edilebilirliğine bağlı olarak giderek zenginleşmektedir (Özden 2000).

BÜYÜKÖZER'e Göre; Bilgisayarlar klasik eğitim araç ve gereçlerinin yetersiz kaldığı pek çok konuda önemli bir boşluğu doldurmaktadır. Klasik eğitim ortamında gerçekleştirilmesi zor veya olanaksız olan pek çok iş, bilgisayarlarla başarılabilmektedir (Büyüközer, 1990).

GÜROL'a Göre; Bilgisayar Destekli Eğitim kavramı halen bazı kavram karışıklığına neden olmaktadır. Bilgisayar eğitimi, bilgisayarla eğitim, bilgisayardan öğretim, bilgisayarla düşünmeyi öğrenme gibi kavramlar ileriye sürülmüştür. Ancak bu alternatifler Bilgisayar Destekli Eğitim bileşenlerdir (Gürol, M., 1997).

AŞKAR'a Göre; Farklı bilgi, beceri ve tutum düzeyindeki bireylerden oluşan bir sınıfta, bilgisayar aracılığıyla her bireye kendi yeteneğinde gelişmelerine olanak sağlanmakta, çeşitli beklentileri karşılanabilmektedir (Aşkar, 1992).

BAKİ'ye Göre; Öğrencinin karşılıklı etkileşim yoluyla eksiklerini ve performansını tanımasını, dönütler alarak kendi öğrenmesini kontrol altına almasını; grafik, ses, animasyon ve şekiller yardımıyla derse karşı daha ilgili olmasını sağlamak amacıyla eğitim ve öğretim sürecinde, bilgisayardan yararlanma yöntemine Bilgisayar Destekli Öğretim, kısaca BDÖ denir (Baki, 2002).

DEMİREL'e Göre; Bilgisayarların öğrenme - öğretme ve okul yönetimi ile ilgili bütün faaliyetlerde kullanılması "Bilgisayar Destekli Eğitim" olarak tanımlanabilir. Bilgisayar Destekli Eğitim (BDE) denildiğinde eğitim - öğretim etkinlikleri sırasında eğitimi zenginleştirmek ve kalitesini yükseltmek için öğretmene yardımcı bir araç olarak bilgisayarlardan yararlanılması anlaşılmaktadır (Demirel, 2001).

KÖKSAL'a Göre; Bilgisayar destekli eğitim öğrencinin bir bilgisayarın basında öğrencilerin gösterebilecekleri türlü tepkiler göz önünde tutularak hazırlanmış bir ders yazılım ile etkileşim içinde bulunarak, kendi öğrenme hızına göre kullanabildiği öğretim türü, bu soruna ilişkin uygulama ve araştırma alanıdır (Köksal, 1981).

ARSLAN'a Göre; Bilgisayar destekli eğitim denildiğinde eğitim öğretim etkinlikleri sırasında eğitimi zenginleştirmek ve kalitesini yükseltmek için öğretime yardımcı bir araç olarak bilgisayarlardan yararlanılması anlaşılmaktadır (Arslan, 2003).

ALKAN'a Göre; Bilgisayarın eğitimde kullanılma gereksinimi eğitim sisteminin aşırı derecede artması, öğrenci sayısının hızla çoğalması; bilgi miktarının artması ve içeriğin karmaşıklaşması, öğretmen yetersizliği ve bireysel kabiliyet ve farklılıkların önem kazanması gibi nedenlerden doğmaktadır. Bu uygulamanın amacı sadece öğretme - öğrenme sürecinin otomatikleştirilmesi değildir. Öğretme - öğrenme süreçlerinde etkililik, süreklilik ve bütünlük sağlamak temel hedef olup, otomasyon bu faktörlerin sonucudur (Alkan, 2005).

HIZAL'a Göre; Bilgisayar destekli eğitim bilgisayarın ders içeriklerini doğrudan sunma, öğrenilenlerin tekrar etme, problem çözme, alıştırmalar yapma vb. etkinliklerde bulunduğu sürecinin önemli bir öğrenme-öğretme aracı olarak kullanılmasıyla ilgili uygulamaları kapsamaktadır (Hızal, 1989).

KAYA'ya Göre; Diğer bir tanıma göre Bilgisayar Destekli Eğitim, ders içeriğini sunmak için bilgisayarın öğrenciyle doğrudan etkileşime girmesi için kullanılmasıdır (Kaya, 2005).

REİS'e Göre; BDE; her türlü öğretimsel içeriklerin ve faaliyetlerin bilgisayar kullanılmak suretiyle öğrenciye aktarılmasıdır. Farklı amaçlarla olsa dahi, eğitim ortamında bilgisayar kullanımı genelde BDE olarak kabul edilir (Reis, 2004).

ŞAHİN ve YILDIRIM'a Göre; Bilgisayar Destekli Öğretim, öğretim sürecini ve öğrenci motivasyonunu güçlendiren, öğrencinin öğrenme ilkelerinin bilgisayar teknolojisi ile birleşmesinden oluşmuş bir yöntemdir (Şahin ve Yıldırım, 1999).

GÜRAN'a Göre; Eğitimde bilgisayar aracılığı ile konuların öğrencilere tanıtılıp öğretilmesi, bilgilerin ölçülüp değerlendirilmesi olayına bilgisayar destekli eğitim denir (Güran, 1988).

ŞAHİN VE YILDIRIM'A Göre; Bilgisayar Destekli Öğretim, öğretim sürecini ve öğrenci motivasyonunu güçlendiren, öğrencinin öğrenme ilkelerinin bilgisayar teknolojisi ile birleşmesinden oluşmuş bir yöntemdir (Şahin ve Yıldırım, 1999).

GÜVENDİ ve GÜVEN'e Göre; BDÖ, öğrencilerin bireysel hızı dâhilinde bilgisayar başında eğitsel yazılımlar ya da diğer web uygulamaları (forum, mail grupları vs.) ile edinmiş olduğu formal ve informal davranış değişikliği ve ihtiyaçlarını karşıladığı yönetimsel yazılımların(e-okul vs.) bir bütünüdür(2012).

Bilgisayar destekli eğitimin temelinde bilgisayarların yardımcı kaynak olarak kullanılması vardır. Bilgisayarlar, eğitimde verimi, öğrenci motivasyonunu arttırmak, derslerin işlenişini kolaylaştırmak ve öğrencilerin farklı öğrenme biçimlerine uygun eğitim vermeyi kolaylaştırmak için yardımcı bir araç olarak kullanılır.

Bde Ne Değildir?

BDE;

Öğretmenlere ve öğrencilere rapor veya ödev hazırlamaya yarayan kelime işlem programları (Kelime İşlemci- WORD gibi).

Kayıtları düzenlemek, ve saklamak için bir veritabanı programının kullanılması (Veritabanı gibi- ACCESS).

Hesap tablolarının sayısal bilgileri tutmakta, hesaplama yapmakta veya grafik oluşturmada kullanılması (Hesap Tablosu gibi-EXCEL).

Sunum programları yoluyla asetat ya da bilgisayar yoluyla sunum hazırlanması (Sunu Hazırlama Programı gibi-POWERPOINT). değildir.

Bilgisayar Destekli Eğitimle Karıştırılan Bilgisayar Temelli Eğitim Nedir?

Bilgisayar temelli eğitim genel olarak isminde de anlaşıldığı gibi eğitim-öğretim faaliyetlerini bilgisayarın uyguladığı sistemdir. Bu kavram birçok araştırmacı tarafından tanımlanmaya çalışılmıştır. Bu tanımlardan bazıları aşağıdaki gibidir. Bilgisayar temelli eğitimde dersin ve belirlenen hedef ve davranışların öğrencilere temel öğreticisi bilgisayarlardır. Bütün eğitim-öğretim faaliyetleri, hazırlanan bilgisayar programları tarafından gerçekleştirilir. Öğretmen, eğitim-öğretim faaliyetlerinde geri planda kalarak organizasyon işlerini yönetir (İşman, 2005).

Bilgisayar sisteminin öğretimi planlama, öğrenmeleri ölçme, öğrencilerle ilgili verileri kaydetme ve öğrenme verileri üzerinde istatistiksel analizler yapma gibi etkinliklerini yönetmek için kullanılması anlamına gelir (Yalın, 2004).

Öğrenciler, bilgisayar karşısına geçip bütün bilgileri çeşitli etkinlikler yaparak öğrenebilir. Öğretmen, bu faaliyetlerde yardımcı eleman ya da rehber olarak görev alabilir (İşman, 2005). Bilgisayar temelli eğitim çeşitli derslere ait bilgisayar programları ile sağlanır. Bilgisayar temelli eğitime ilişkin etkili bir program, aktif ve yaratıcı süreçlerde öğrencilerin ilgisini çekmeye eğilimlidir. Bu tür programlar aynı zamanda zihinsel ifadelerin gerçek dünyayla bağlantısını kolaylaştırmayı sağlayacak özelliklere sahiptir (Kozma, 1991).

Sonuç

Genel olarak ortaöğretim öğrencilerinin bilgisayara yönelik tutumları olumludur. Bu durumun, diğer derslerin işlenişinde de bir avantaj olarak bilgisayardan yararlanılması öğrencilerin o derse ilgisini arttırabilir. Eğitim-öğretim ortamlarında öğrencilerin çoklu zekâ alanlarının gelişiminde bilgisayardan aktif olarak faydalanılmalıdır. Bilgisayarın derslerde aktif olarak kullanılması öğrencilerin farklı zekâ alanlarına hitap edebilmek için önemlidir.

Öğrenme ürünleri üzerinde, bilgisayar destekli öğretim yönteminin, geleneksel öğretim yöntemine göre öğrencilerin başarı düzeyi ve kalıcılık düzeyleri üzerinde daha olumlu etkilere sahip olması nedeniyle, öğretme-öğrenme süreçlerinde bilgisayar destekli öğretim yöntemine daha fazla yer verilmelidir. Öğretmen adaylarına, üniversite düzeyinde, bilgisayar destekli öğretim uygulamaları yapabilmeleri için, bilgisayar okuryazarlığı, bilgisayar donanımı, web sayfası hazırlama, görsel programlama dersleri okutulmalıdır.

Okullarda, bilgisayar laboratuarında olası arızaları ve sorunları giderecek teknik personel bulundurulmalıdır. Bilgisayar destekli öğretim konusunda öğrenci velileri aydınlatılmalı, öğrenmenin sadece okulla sınırlı kalmaması gerektiği ve uygun yazılımlar ile öğrenmenin okul dışında da gerçekleşebileceği anlatılmalıdır.

BİLGİSAYAR DESTEKLİ EĞİTİMİN TARİHSEL GELİŞİMİ

Zekai Aldır, Recep Altuntaş[*]

Sakarya Üniversitesi Eğitim Bilimleri Enstitüsü Bilgisayar ve Öğretim Teknolojileri Eğitimi, 54300, Hendek / Sakarya

Özet

Bu çalışmanın amacı, bilgisayarların ve bilgisayar destekli eğitimin tarihsel gelişim süreçlerini incelemektir. İlk bilgisayarlardan başlanarak, günümüze kadar olan süreç zamana göre incelenmiştir. Araştırma daha çok bilgisayarların eğitimde kullanılması üzerinedir. Gelişen teknoloji ile bilgisayarlar tüm alanlarda aktif bir şekilde kullanılmaya başlanmıştır. Süreç böyle olunca da bilgisayarların eğitimde kullanılması da kaçınılmaz olmuştur. Bilgisayarlar nesil nesil değişen bir süreçle oluşmuştur. Abaküsle başlayan süreç şu an mikroişlemcilere kadar ilerleyerek bir devrim yaratmıştır. İnsanlığı derinden etkileyen, bilginin kullanımını ve erişimini kolaylaştıran bilgisayarlar çok kısa bir zamanda insanları etkisi altına alarak, onları kendine bağlamıştır. Bu çalışmamızda tüm bu süreci ve özellikle bilgisayarın eğitime girişi, eğitimde kullanılması ve getirdiği yenilikleri inceleceğiz.

Anahtar kelimeler: Bilgisayar Destekli Eğitim, B.D.E, Bilgisayar, Bilgisayar Tarihi ve Gelişimi

Bilgisayar Destekli Eğitimin Tarihsel Gelişimi

Giriş

Bilişim sistem ve teknolojilerinin aktif olarak kullanıldığı günümüze bakıldığında, bilgisayar dünyasının baş döndürücü bir hızla geliştiğini ve değiştiğini gözlemlemekteyiz. Bu hız günden güne daha da hızlanarak devam etmektedir. Her gün yeni bir cihaz ve ürünle karşılaşmaktayız. Daha öncelere bakıldığında bu süreçler daha yavaş ilerliyordu. Peki ne oldu da bilişim ve bilgisayar bu kadar dünyamızın içine girdi. Tüm bu süreçleri inceleyebilmemiz için bilgisayarın tarihçesine ve gelişimine bir göz atmamız gerekmektedir.

Bilgisayar tarihine bakınca bilindiği üzere ilk bilgisayarlar abaküsler olarak kabul edilmektedir. Abaküs ise taşların yan yana dizimden oluşan bir tür nesnedir. Elektrikle çalışmaz ve teknoloji barındırmaz bir yapıya sahiptir. Sadece sınıflandırma mantığı vardır. Zamanla bu altyapı elektronikleşti ve mantık değişmeden daha üst düzey cihazlar oluşturuldu. Bugün bile aynı mantık geçerli. Tek fark daha karışık işlemlerin daha kısa sürede gerçekleştirilebilmesi.

Biz bu çalışmamızda bilgisayarların bu değişim sürecini, özellikle de eğitim içinde bilgisayarın bir destek olarak kullanılmasının eğitime sağladıklarını inceleyeceğiz. Amaç olarak değil araç olarak eğitimde bilgisayar kullanımı nasıl gerçekleştirilir sorusunun üzerinde duracağız.

Bilgisayarların Kısa Tarihçesi

İnsanoğlunun ilk zamanlarda ihtiyaçları çok basit ve azdı. Zaman geçtikçe nüfusun artmasıyla ihtiyaçlar da arttı. İnsan bu ihtiyaçlarını karşılamak için değişik araçlar ve aletler üretmeye başladı. İlk başta insanlar hesap yapmak için parmaklarını kullanırken yetmediği yerde taşları, fasulye, vs.. kullandılar.

Bunlarında yetmediği nokta da, 2000 yıldan fazla zamandır hesaplama aleti olarak bilinen abaküsü icat ettiler. Abaküs, bilgisayarın ilk temel hali olarak bilinmektedir. Teller üzerine dizili boncuklardan oluşan bu hesaplayıcı M.Ö.1000 yılında ilk kez Çinliler tarafından kullanıldığı bilinmektedir.

İnsanoğlu, sayı sayma ve aritmetik işlemleri gerçekleştirme ihtiyacı duyduğundan beri bu ihtiyaçları karşılayacak bir takım cihazları icat etmeye çalışmıştır. Bu icatlar, M.Ö. Abaküs ile başlayıp günümüze gelene kadar hesap makinesi, bilgisayar ile sürdürülmüştür (Yıldız, Gündüz, Baykan ve Uğuz, 2001:1).

Alman Kondrad Zuse 1936 yılında Z1 adında ikili sayı sistemiyle çalışan ilk mekanik bilgisayarı yapmıştır. 1947'de transistorün bulunması ve 1952'de ticari amaçla kullanılması bilgisayar alanında hızlı bir gelişme başlatmıştır. 1955 yılında üç önemli gelişme olmuştur. Bunlar: radyo yerine transistör kullanılması, çekirdek belleğin üretilmesi ve programlama dillerinin gelişmesidir. 1958 yılında bütünleşik devrelerin kullanılmasıyla bilgisayarlar küçülmüş ve kapasiteleri artırılmıştır (Kaya, 2006).

1960'lı yıllarda hafızalama ve kodlama sistemleri üzerine çeşitli çalışmalar yapıldı, IBM bilgisayarları geliştirildi. 1970'li yıllarda kişisel bilgisayar olan PC'ler geliştirildi. Pascal, C dilleri ve disketler geliştirildi. 1980'lerde CD-ROM teknolojisi geliştirildi. Bireysel bilgisayarların hızı ve kapasiteleri gelişmeye başladı. 1990'lı yıllarda Laptop bilgisayarlar geliştirildi. Pentium bilgisayarlar piyasaya sürüldü. Telekonferans çalışmaları yapıldı. 2000 yılları ve sonrasında çok hızlı işlem yapan bilgisayarlar geliştirildi. Günümüzde yapay zekanın kullanılacağı bilgisayarlar geliştirildi (İşman, 2003).

Bilgisayarların Dönüşümleri

Abaküs: bilgisayarın ilk temel hali olarak bilinmektedir. Teller üzerine dizili boncuklardan oluşan bu hesaplayıcı M.Ö.1000 yılında ilk kez Çinliler tarafından kullanıldığı bilinmektedir.

Pascalline:1642 yılında Fransız Blaise Pascal tarafından ilk hesap makinesi sayılabilecek bir icattır. Pascal, bu aleti abaküsten yola çıkarak yapmış ve daha büyük sayıların hesabını yapabilecek hale getirmiştir. Değişik çarkları olan bu makine toplama ve çıkartma yapabiliyordu.

Fark makinesi: 1830 yılında ilk bilgisayarın temel prensibini oluşturan mantıksal işlem birimi, veri depolama birimi, giriş çıkış üniteleri içeren Fark Makinesi bilgisayarın babası olarak da adlandırılan Charles Babbage tarafından icat edildi.

İkili Sayı Sistemi: Günümüz bilgisayarlarının temel mantığını oluşturan ikili sayı sistemi George Boole tarafından 1848 yılında geliştirilmiştir. Bu cebir prensibine göre sayılar ikili sayı sisteminde kullanılırlar. Yani bu sistemde 0 ve 1 sayısından başka sayı yoktur. Bilgisayarda her türlü bilginin işleniş ve saklanış şekli 1 ve 0 sayılarından oluşmaktadır.

Mark I denilen ilk analog sayılacak bilgisayarlar 1890'lı yıllarda Herman Hollerith tarafından geliştirildi. Bu bilgisayarların işleme mantığı kart sistemine dayanıyordu. Bilgisayar verilen kodlara göre kartları delerek bilgiyi saklıyor, tekrar okuyabiliyor ve kullanabiliyordu. İnsan müdahalesi ile işlem gördüğünden yarı otomatikti.

ENIAC: Mark–I den kısa bir süre sonra Pensilvanya Üniversitesinde John Mauchly ile ENIAC (Elektronik sayısal Hesaplayıcı ve Doğrulayıcı) isimli sayısal elektronik bilgisayarı 1946 yılında tamamladı. Yapımında 18,000 adet elektronik tüp kullanılan ENIAC; 150 kwatt gücünde idi ve 50 ton ağırlığıyla 167 m2 yer kaplıyordu. Saniyede 5000 toplama işlemi yapabiliyordu. Mark-I'den 1000 kat daha hızlıydı. Eniac askeri amaçla üretildi ve top mermilerinin menzillerini hesaplamak için kullanıldı.

EDVAC: Aynı yıllarda matematikçi John Von Neumenin görüşleri doğrultusunda EDVAC (Elektronik Soyut Değişken Otomatik Bilgisayar) adli yeni bir bilgisayar ürettiler. Bu bilgisayar ENIAC 'dan on kez daha küçük ve yüz defa daha hızlı çalışabiliyordu. Edvac, komutların diğer veriler gibi bilgisayara dışarıdan girilmesini sağlıyordu. Bu özellik programcılıkta büyük kolaylıklar sağlamıştır.

UNIVAC: EDVAC' dan sonra 1951 yılında UNIVAC isimli bilgisayar yapıldı. UNIVAC, ENIAC bilgisayarlarını yapan kişiler tarafından geliştirildi. UNIVAC ilk defa manyetik teyp kullanarak verileri depolayan bilgisayar idi.

IBM 700 SERISI: 1950'den sonra vakum tüplerinin sık olarak kullanılmaya başlandığı dönemlerdir. Univac ve IBM 700 serisi vakum tüpler kullanılarak yapılan elektronik bilgisayarlardır. Vakum tüplerinin çok enerji harcaması, ısınması bu bilgisayarın sürekli arıza yapmasına sebep oluyordu. Vakum tüplerin boyutlarının da büyük olması baska bir sorundu. Bu yıllarda program yazabilmek için kullanılan bilgisayar donanımının çok iyi bilinmesi gerekiyordu. Program yazmak için makine dili kullanılıyordu.

PHILCO TRANSAC S-200 IBM 1401: 1947 yıllarında transistörün kullanılmaya başladığı yıllardır. Transistörler vakum tüplere göre az enerji harcayan, az yer kaplayan, fazla ısınmayan elektronik devre elemanlarıdır. Transistörlerin kullanılmaya başlanması bilgisayar dünyasına değişik bir renk kattı. Philco Transac S-200 IBM 1401, transistör kullanılarak üretilen ilk bilgisayarlardır.

IBM 360: 1960 'dan dan sonralar entegre devreler üretilmeye başlandı. Entegreler binlerce transistörü içerisinde bulunduran devre elemanları idi. Entegrelerin kullanılması; bilgisayarın boyutlarının küçülmesinin, maliyet azalmasına ve işlem hızının artmasına sebep oldu. Bu yıllarda manyetik diskler üretildi, entegrelerin kullanımı ile merkezi işlem birimleri üretilmeye başladı. IBM 360 entegre devre elemanının kullanıldığı ilk bilgisayarlardır.

INTEL 4004 MIKRO İŞLEMCİSİ: 1970'den sonra entegre devre teknolojisi gelişimine devam etti. Ve entegreler birleştirilerek cipler üretilmeye başlandı. Intel 4004 entegrelerin birleştirilmesiyle hızlanan ilk merkezi işlem birimi sayılabilir.

APPLE: 1977 yılında piyasaya çıkan apple iki üniversite öğrencisi tarafından bir evin garajında üretilmiştir. Apple'de klavye ve monitör bulunmuyordu.

IBM PC: Günümüzde de söz sahibi olan IBM firması ilk kişisel bilgisayarını 1981 yılında piyasaya sürdü. Kısa bir zaman diliminde standart haline gelen IBM PC'lerin 4 yılsonunda bir milyonuncusu satıldı. Artık dünyanın her tarafında IBM uyumlu bilgisayarlar üretilmeye başlandı. Üretimi uzak doğu ülkelerinde daha yaygın olarak yapıldı. Yazılımlar da IBM PC uyumlu olarak yazılmaya başlandı. (Kesici & Kocabaş, 2005)

BİLGİSAYARLARIN GEÇİRDİĞİ EVRELER

Birinci Kuşak (Vakum Tüplü) Bilgisayarlar (1946-1959) İlk programlama dili makine dilinde yazılmaya başlandı ve bilgiler bellekte saklanıyordu.

İkinci Kuşak (Transistörlü) Bilgisayarlar (1959-1964) İlk dönemde kullanılan Vakum Tüplerinin yerine transistörler kullanılmaya başlandı. Bununla beraber daha hızlı ve daha az elektrik harcamaktaydı. ASSEMBLY makine dili kullanılmaktaydı

Üçüncü Kuşak (Entegre Devreli) Bilgisayarlar (1964-1970) Transistörler bir araya getirilerek Entegre Devreler yapıldı. İlk Merkezi İşlem birimi CPU yapıldı.

Dördüncü Kuşak (Mikroişlemcili) Bilgisayarlar (1970-?) İşlem ve kontrol birimlerinin tümünün bir arada bulunduğu chipler geliştirildi.

Beşinci Kuşak (Yapay Zekâlı) Bilgisayarlar (1990-?) Yapay zeka yapma yönünde çalışmalar yapılmaktadır. Bilgisayar teknolojisinde yeni bir araştırma konusu olan yapay zekâ **"kendi kendini denetleyebilen, daha akıllı ve insanlarla tam bir uyum içerisinde olabilen zeki makineler yapmak"** şeklinde tarif edilebilir. (Madran,2006)

Türkiye'ye Bilgisayarın Gelişi

Türkiye'ye ilk bilgisayar 1960 yılında yol yapımında gereken hesaplamaları daha hızlı yapabilmek için Karayolları Genel Müdürlüğü'ne gelmiştir. IBM-650 Veri İşleme Makinesi (Data Processing Machine) adlı bilgisayar 12 yıl kullanılmıştır ve elektrikle çalışan ve elektronik veri işleme kapasitesine sahip 167 m² bir alana sığan ve ağırlığı

30 tonluk ilk bilgisayar ENIAC' tan tam 15 yıl sonra edinilmiştir. İkinci bilgisayar ise akademik amaçlı kullanmak için İstanbul Teknik Üniversitesi'nin Taşkışla binasına geldi. Bu bilgisayar IBM 1620 idi. İ.T.Ü' den sonra ise Orta Doğu Teknik Üniversitesi bilgisayara sahip oldu. Türkiye'deki dördüncü bilgisayar ise Devlet Planlama Teşkilatı'na geldi.(Altınkaya,2004)

Görüldüğü üzere bilgisayarın ülkemizde çok kısa bir tarihi vardır. Henüz 50 yıllık bir geçmişe sahiptir. Durum böyle olunca da halen bile belli kuşağın bilgisayara çok uzak olduğu gözlemlenmektedir. Devlet dairelerindeki memurlardan bile hala bilgisayar kullanamayanlar vardır. Bırakın memurları bilgisayarı çok amatör kullanan öğretmenlerimizin olması eğitim sistemimiz için çok acıdır.

Bilgisayar Destekli Eğitimin Tarihsel Gelişimi

BDE' de bilgisayar teknolojisinin öğretim sürecindeki uygulamalarının her biridir. Bu uygulamalar bilgi sunmak, özel öğretmenlik yapmak,bir becerinin gelişmesinde katkıda bulunmak olabilir. Başka bir tanıma göre ise BDE bilgisayar sistemine programlanmış olan dersleri etkileşimde bulunarak ,doğrudan alabilmesidir.50'li yılların sonlarında ABD'nde gelişmiş bazı üniversitelerde,bilgisayar yönetsel amaçlarla kullanılmaktaydı. 70'li yıllarda maliyeti daha düşük bilgisayarların devreye girmiştir.

Eğitim kurumların özel olarak bilgisayarın kullanımın aşamaları ise şu şekilde sıralanabilir (Özden, 2003):

1950'li yıllarda bilgisayarlar büyük üniversitelerin yönetimsel amaçlı kullanımları ile eğitim kurumlarına girmiştir.

1960'larda bilgisayar temelli öğretim programlarının geliştirilmesi çalışmaları başlatılmıştır. Bu projelerden birisi de PLATO'dur.

1970'li yıllarda daha fazla sayıda okul bilgisayarları idari amaçlı olarak kullanmaya başlamıştır.

1972 yılında TICCIT(Zaman Paylaşımlı ve Etkileşimli Bilgisayar Kontrollü Öğretici Televizyon) sistemi geliştirilmeye başlanmıştır.

1970lerden sonra internetin gelişimi ile kişisel bilgisayardan, ağ sistemlerine ve internete doğru bir yönelim başlamıştır.

Türkiye'nin de 1993 yılında dahil olduğu internet omurgası NFSNET ağ omurgasına ülkelerin hızla katılması ve çok hızlı artan ve bir teknoloji yarışının başlaması ile yeni bir döneme girilmiştir.

1950'li yılların sonlarında Amerika Birleşik Devletleri'nde, Stanford ve Illinois gibi gelişmiş Üniversitelerde, bilgisayar yönetsel amaçlarla kullanılmaktaydı. 1960'lı ve 1970'li yıllarda maliyeti daha düşük bilgisayarların devreye girmesiyle, eğitim uygulamaları ile ilgili projeler de geliştirilmeye başlanmıştır. Bu projelerden en önemlileri IBM 1500, PLATO ve TICCIT sistemleridir.(Odabaşı, 2000)

Florida Eyalet Üniversitesi'nce gerçekleştirilen IBM 1500 projesi ile önceleri üniversite düzeyinde bilgisayar destekli fizik ve istatistik öğretimi, daha sonraları 1960'ların ortasında ise okuma ve matematik becerilerinin yükseltilmesine ilişkin öğretim yapılmıştır.

Bilgisayarın eğitimde kullanılmasına ilişkin ilk geniş kapsamlı proje sayılabilen PLATO ise Illinois Üniversitesince, Control Data Corporation işbirliğiyle gerçekleştirilmiştir. Projenin amacı, üniversitelerde değişik disiplin alanında öğrencilerin bilgisayar destekli öğretim gereksinimini karşılamaktır. Plato sistemi yıllardır başarı ile uygulanmakta ve günümüzde de geçerliliğini korumaktadır. TICCIT sistemi ise, 1977'de Texas ve Brigham üniversitelerince ortaklaşa geliştirilen ve özellikle Matematik ve İngilizce derslerine yer veren bir projedir. Amerika'daki bu projelerin etkisiyle, 1970'li yıllarda İngiltere, Fransa ve Federal Almanya'da bilgisayar destekli öğretim konusunda aşamalar kaydedilmiştir. İngiltere' de 1980 yılında yürürlüğe konulan "Mikro-Elektronik Eğitim Programı; Fransa'da 1983'te "100.000 Bilgisayar" hedefinin belirlenmesi ve bu hedefe kısa sürede varılması üzerine 1985'te "Herkes için İnformatik" programının başlatılması; Federal

Almanya'da 1975'te orta öğretimin üst kademelerine bilgisayar eğitimi verilmesi ve daha sonra alt kademelerine de yaygınlaştırılması bu gelişmelere örnek olarak verilebilir. (Odabaşı, 2000)

Bilgisayar Destekli Eğitimin Ülkemizde Gelişimi

Türkiye'deki gelişmeler ortaöğretim kurumlarına 1100 mikrobilgisayar alınmakla başlamıştır. Daha sonraları ise bilgisayar eğitimi yerine bilgisayarın bir eğitim aracı olarak kullanıldığı bilgisayar destekli eğitim uygulamalarının başlatılması uygun görülmüştür .milli eğitim bakanlığı dünya bankası katılımı ile 53 bilgisayar deneme okuluna 1666 adet bilgisayar alınmıştır ve bu okullarda bilgisayar laboratuarları kurulmuştur. Ayrıca bu okullara denemek üzere Bilim ve Teknik ansiklopedisi İngilizce, matematik, fizik, kimya ve biyoloji konularında ders yazılımları temin edilmiştir. Donanım ve alt yapı çalışmalarına ek olarak 1996 yılı içersinde 256 yeni formatör öğretmeninin eğitimi yapılmıştır.

Türkiye'de ise teknoloji kullanımından 1970lerde 3. Beş Yıllık Kalkınma Planı ile yaygın eğitim için radyo ve televizyon kullanımından bahsedilmiş, ardından 4. Beş Yıllık Kalkınma Planı ile açık yükseköğretim ve yaygın eğitim için ikinci kanal televizyonun açılmasına karar verilmiştir. 1995 yılından sonra ise yeni ileri teknoloji ürünü bilgisayarlar ve internetin kullanımının artması sonucu eğitim sisteminin içerisine de teknoloji hızla girmiştir. 1990'lı yılların sonunda ise MEB'in ortaya koyduğu MLO, ILSIS ve MEBSIS çalışmaları eğitimde teknoloji kullanımında idari süreçlerin yapısını değiştirmeye ve teknolojinin işlerliğinden ziyade sayısına odaklanmaya neden olmuştur (Aksoy, 2003).

1984 yılında Türkiye'de ortaöğretim kurumlarına 1100 mikrobilgisayar alınmış ve bilgisayar eğitimine başlanmıştır. Daha sonraları ise bilgisayar eğitimi yerine bilgisayarın bir eğitim aracı olarak kullanıldığı bilgisayar destekli eğitim uygulamalarının başlatılması uygun görülmüştür. 12-13 Ekim 1987 tarihlerinde İstanbul'da "Türkiye'de Bilgisayar Destekli Eğitim Konferansı" düzenlenmiştir. (Akgün,2011)

Türkiye'de bilgisayar destekli eğitim çalışmaları ilk olarak bu konferansta bilgisayar destekli eğitim konusunda devlet eğitim sektörü temsilcileri ve yabancı uzmanlar görüş alışverişinde bulunmuşlardır. Aynı toplantıda dönemin Başbakanı tarafından belirtilen "Bilgisayar Destekli Eğitimde Bir Milyon Bilgisayar" hedefi Türkiye'de bilgisayar destekli eğitime verilen önemin bir göstergesi olmuştur.

Bilgisayar destekli eğitim konusunda 5-6 Ağustos 1989 tarihlerinde İstanbul'da toplanan "BDE Birinci Danışma Kurulu'nda uygulama modeli, yazılım, öğretmen yetiştirme, donanım ve BDE deneme planlanması konuları tartışılmıştır. 26-27 Haziran 1990 tarihlerinde İstanbul'da toplanan "BDE Projesi Değerlendirme ve Danışma Kurulu II. Toplantısı'nda ise Bakanlığın hedefleri doğrultusunda BDE'ye yapılan ve yapılacak yatırımlar görüşülmüştür.(Akgün, 2011)

Şu an ise okullarda bilgisayarlar aktif bir şekilde kullanılmaktadır. Eğitimde "FATİH" projesinden bahsedilmektedir.

FATİH projesi beş ana bileşenden oluşmaktadır. Bunlar: 1- Donanım ve Yazılım Altyapısının Sağlanması, 2- Eğitsel e-İçeriğin Sağlanması ve Yönetilmesi, 3-Öğretim Programlarında Etkin BT Kullanımı, 4- Öğretmenlerin Hizmet içi Eğitimi, 5- Bilinçli, Güvenli, Yönetilebilir ve Ölçülebilir BT Kullanımının sağlanmasıdır. Fatih Projesi Milli Eğitim Bakanlığı tarafından yürütülmekte olup, Ulaştırma Bakanlığı tarafından desteklenen bir projedir. 3 yılda tamamlanması planlanmaktadır. 1. Yıl ortaöğretim okulları, 2. Yıl ilköğretim ikinci kademe, 3. Yıl ise ilköğretim birinci kademe ve okul öncesi kurumlarının BT donanım ve yazılım altyapısı, e-içerik ihtiyacı, öğretmen kılavuz kitaplarının güncellenmesi, öğretmenler için hizmet içi eğitimler ve bilinçli, güvenli, yönetilebilir BT ve internet kullanımı ihtiyaçlarının tamamlanması hedeflenmektedir (MEB).

Özet:

Günümüz teknolojilerinde meydana gelen gelişmeler eğitim ortamlarında bilgisayarın etkin ve etkili bir şekilde kullanılmasını beraberinde getirmiştir. Kısa zamanda öğrenciyi merkeze alan yaklaşımlar önem kazanmış olup; bilginin akış yönü yapılandırmacı yaklaşım ile beraber öğreticiden-öğrenene olmaktan çıkmıştır. Öğreticinin yeni büründüğü rehberlik rolü daha da önem kazanmıştır. Ayrıca farklı öğrenme stillerine sahip öğrenciler için bilgisayar destekli eğitim ortamlarında farklı öğrenme kuramlarının uygulanmasıyla daha kalıcı öğrenmeler gerçekleştirmek amaçlanmıştır. Bu çalışma ile bilgisayar destekli eğitim tanımı yapılmış, öğrenme kuramları incelenmiştir. Her kuramın bilgisayar destekli eğitim ortamlarında kullanımı ayrıntılı olarak betimlenmiştir.

Anahtar Kelimeler: Bilgisayar destekli eğitim, bde, bilgisayar destekli öğretim, öğrenme kuramları

Öğrenme Kuramları Nedir?

Öğrenme kuramı canlıların nasıl öğrendiğini ortaya çıkarmak için bugüne kadar yapılmış bir çok araştırma sonucunda ortaya çıkarılan sistemli ilkeler bütünüdür. Öğrenme kuramlarının her biri gerek bakış açısı ile gerekse altını çizdikleri çeşitli kavram ve açılımları ile eğitim bilimine katkı sunmuşlar ve sunmaktadırlar (Bozdoğan, 2003, s.12).

Bir diğer tanıma göre öğrenme kuramı, canlıların öğrenmesine ilişkin benimsenmiş, birbiriyle ilişkilendirilmiş ve bütünleştirilmiş denenceler dizisidir. Öğrenme kuramları, eğitim teknolojisini kullanacak olan öğretmenlere ve eğitim uzmanlarına öğrencilerin eğitim teknolojisi ile nasıl öğrenebilecekleri konusundaki bilgilerine derinlik kazandıracak ve verimli bir öğrenme-öğretme için uygun olan koşulları hazırlamada yol gösterici olabilecek niteliktedir (İşman, s. 127, 2008).

Genel Olarak öğrenme kuramları;

1-Davranışçı kuramlar

2-Bilişsel kuramlar

3-Duyuşsal kuramlar

4-Yapılandırmacı kuramlar

5-Nörofizyolojik kuramlar olmak üzere 5 ana grupta incelenir.

Davranışçı Kuramlar Ve Bde'de Uygulanması

Davranışçı öğrenme ilkelerinin birçoğu kapalı laboratuar ortamlarında ve hayvanlar üzerinde gerçekleştirilen deneyler sonucu üretilmişlerdir. Bu çalışmalardan en iyi bilinenleri Pavlov'un Klasik Koşullaması ve Thorndike'in Edimsel Koşullaması'dır (Alkan, 1995, s. 54).

Davranışçı kuramlar;

- Klasik Koşullanma

- Bağ Kuramı

- Edimsel Koşullanma

- Gözlem Yoluyla Öğrenme

- J. B. Watson ve Davranışçılık Kuramı olmak üzere 5'e ayrılır.

Klasik Koşullanma

Klasik Koşullanma yoluyla öğrenme, ilk kez Rus bilim adamı I.Pavlov tarafından ortaya atılmıştır. Pavlov kontrollü bir deneysel ortam oluşturduktan sonra, köpeğe düzenli olarak, yiyecek vermeden hemen önce zil sesi vermiştir. Bu ilişkiyi pek çok kere tekrarladıktan sonra, yiyecek vermediği durumlarda da zil sesini duyduğu zaman, köpeğin salya salgıladığını görmüştür. Diğer bir deyişle köpek zil sesine salya akıtmasını öğrenmiştir(Erden ve Akman,2002,s.133). Pavlov organizmanın başlangıçta nötr olan ve herhangi bir tepkiye yol açmayan bir uyarıcının organizmanın herhangi bir tepkisine neden olan bir uyarıcıyla birlikte verilmesi durumunda nötr olan uyarıcıya organizmanın tepki verebileceğini ileri sürmüştür.

Bağ Kuramı (Bağlaşımcılık)

Thorndike; öğrenmenin temelinin, duyusal uyarıcılar ile harekete geçiriciler arasında kurulan bir bağ olduğunu kabul etmektedir. Alışkanlıkların meydana gelmesini ya da yok olmasını, bu duyusal uyarıcılar ile tepkiler arasındaki bağların güçlenmesine ya da zayıflamasına bağladığından Thorndike'ın kuramı "bağ" psikolojisi ya da "bağlaşımcılık" (connectionism) olarak adlandırılmaktadır (Ülgen, 1995, s.162-165).

Edimsel (Operant Koşullanma)

Edimsel koşullanma klasik koşullanmadan farklı olarak bilinçli ve kasıtlı hareketlerle ilgilidir. Edimsel koşullanma kuramcısı Skinner, öğrenmeyi kapalı kutu içine koyulan fare davranışları ile açıklamıştır. Kapalı kutu içindeki fare rastgele bir yere basmış ve bastığı yerden yemek gelmiştir. Bir süre sonra fare aynı düğmeye direkt olarak basmaya başlamıştır (İşman, 2008, s. 135). Skinner'e göre, tepkisel ve edimsel olmak üzere iki çeşit davranış vardır. Tepkisel davranışa neden olan uyarıcı her zaman bilinirken, edimsel davranışa neden olan uyarıcı çok belirgin değildir. Koşulsuz uyarıcının neden olduğu koşulsuz tepkiler birinci tür davranışa girer. Bunlar refleks türü davranışlardır. Tepkisel davranışlar klasik koşullanma ile öğrenilir. Günlük hayatımızda gösterdiğimiz davranışların büyük bir kısmı ise edimseldir. Edimsel davranışlar, davranışın sonucu ile kontrol edilebilir (Hergenhahn, 1988 Akt. Erden ve Akman, 2002, s.136-137).

J.B. Watson ve Davranışçılık

Watson; yürüme, konuşma, koşma gibi karmaşık becerilerimizin hep uyarıcı-davranım arasında bağ kurma yoluyla öğrenilmiş davranışlar olduğunu ve bütün davranışların klasik koşullanma yoluyla öğretilebileceğini savunmuştur. Hatta düşünmenin bile bu süreç yoluyla analiz edilebileceğini ileri sürmüştür. Watson, "bana bir düzine sağlıklı çocuk verin, gelişigüzel seçtiğim her bir çocuğu kendi seçtiğim herhangi bir alanda doktor, sanatçı, hâkim, uzman yapacağıma garanti ederim. Hatta dilenci ve hırsız bile yaparım, yetenekleri ve becerileri ne olursa olsun" demiştir (Demirel, 2004, s.30).

Watson, öğrenme olayını iki ilke çerçevesinde açıklamıştır. Bu ilkeler frekans ve tazeliktir. Watson'a göre insanların ne düşündükleri ve ne duydukları önemli değil, ne yaptıkları önemlidir. Davranış, çevreye uymak için yapılan bir eylemdir (Kazancı, s.92, 1989 Akt. İşman, 2008, s.139).

Bilişsel Kuramlar Ve Bde'de Uygulanması

Bilişsel kurama göre öğrenme, hem zekânın, hem güdülemenin hem de transferin ürünüdür. Bu kuramı savunanlar öğrenmeyi bir ürün olarak değil de daha çok bir süreç olarak ele almışlardır (Sönmez, 1994 Akt. Yıldız, 2002).

Bilişsel öğrenmeler, zihinsel etkinliklerin ağırlıkta olduğu davranışları kapsar (Yalın, 2002, s.27).Birçok psikolog insan davranışının çok karmaşık bir örüntü olduğunu ve değiştirilmesinin uyarıcı-tepki yaklaşımıyla çoğu zaman olası olmadığını iddia etmiştir. Örneğin bilişsel psikolojinin ilk temsilcilerinden olan Wertheimer (1945) bir davranış örüntüsü, kendisini oluşturan alt davranışlara ya da birimlere ayrıldığında o davranışın bütünsel anlamının ortadan kalkabileceği uyarısında bulunmuştur. Köhler (1925) gibi Gestaltçı psikologlarsa uyarıcı-tepki ilişkisinin organizma tarafından kurulduğunu ve bir davranışın anlaşılması için bu ilişkinin kritik olduğunu kabul etmişlerdir.Bilişsel psikoloji bu yüzden algısal ve bilişsel sistemlerdeki uyarıcılarla çalışan zihinsel süreçler üzerine odaklanmıştır. Bilişselcilerin öğrenmeye asıl katkıları "anlayış" ve "bilişsel süreç" modelleriyle olmuştur.

Bu kuramın temsilcileri Geştalt Okulu psikologları (Max Wertheimer, Wolfgang Kohler, Kurt Koffka ve Kurt Lewin), Gagne, Piaget ve Bruner'dir.

Kohler de Skinner gibi deneylerinin hayvanlar üzerinde yapmıştır. Bu deneyler, şempanzelerin muzlara uzanabilmek için onlara verilen sopaları birleştirerek veya ortamda bulunan kutuları üst üste koyarak problemi çözmeyi öğrendikleri deneylerdir. Kohler, hayvanların ilgili problemlerin çözümünü bir anda keşfettiklerinin gözlemlemiş ve bu bir anlık, tekrarlanabilir ve transfer edilebilir davranışa da "anlayış" demiştir. Kohler'in vurgulamak istediği olgu, bireyin uyarıcı-yanıt bağlarını mekanik olarak tekrarlayarak kurmasından ziyade yeni anlayış ve kavrayışlar oluşturmak için zihninde var olan bilgileri esnek olarak kullanmasıdır (Akpınar, 1999, s.24-25).

Gestalt Yaklaşımı

Bu kuram bilişsel kuramın ilk yaklaşımlarındandır. Bu yaklaşımı, Max Wertheimer, Kurt Koffka, Kurt Lewin ve Wolfgang Kohler adlı bilim adamları kurmuşlardır. Kuram, adını Almanca bir sözcük olan Gestalt'tan (biçim, şekil, form anlamında) almıştır. Kurama göre bütün, parçaların toplamından daha fazladır ve birey, bütünü parçalara ayrıştırarak değil, bütünlük içinde algılar. Örnek: senfoni orkestrasını dinlerken, her bir müzisyenin katkısını analiz ederek değil, bütün olarak dinleyip, anlamaya çalışırız (Demirel, 2002, s. 39).

Lewin ve Alan Kuramı

Alan kuramı (field theory), sosyal psikolojinin önemli isimlerinden biri olan Kurt Lewin tarafından ortaya atılmıştır. Lewin, fiziksel alan kavramını (manyetik alan, çekim alanı, vb.), psikolojiye taşıyarak, birbiriyle karşılıklı bağımlı olan ve dinamik bir sistem oluşturan psişik süreçler bütününü ifade eden psikolojik alan kavramını geliştirmiştir.

Lewin'in çalışmaları Gestalt yönelimlidir. Ancak Gestalt psikologları algı ve öğrenme üzerinde dururken; Lewin, ihtiyaçlar, kişilik ve sosyal faktörler üzerinde durmuştur. Gestalt psikologları davranışı açıklamak amacıyla fizyolojik yapılar üzerinde dururken, Lewin psikolojiyi bir sosyal bilimden daha fazlası olarak görmüştür.

Bilgiyi İşleme Süreci Yaklaşımı

Bu yaklaşımın temsilcileri Nevell, Gagne ve Briggs'tir. Bilgiyi işleme kuramı bireyin bilgiyi toplama, örgütleme, depolama ve hatırlama aşamalarıyla ilgilenir. Bilgiyi işleme kuramına göre öğrenmeye etki eden iki temel unsur vardır. Bunlar bilginin depolandığı bellekler ve bu belleklere bilginin işlenmesini, saklanmasını ve hatırlanmasını sağlayan yürütücü kontrol süreçleridir. Bilginin depolanmasını sağlayan bellekler, işlevlerine ve bilgiyi saklama kapasitelerine göre duyusal, kısa süreli ve uzun süreli olmak üzere üç çeşittir (Erden ve Akman, 2002, s.159-160).

Keşif Yoluyla Öğretim (Buluş Yoluyla Öğretim)

Bilişsel kuramın diğer bir yaklaşımı da keşif yoluyla öğrenmedir. Keşif yoluyla öğrenme yaklaşımının kurucusu Bruner'dir. Bruner'e göre bilişsel gelişimin temel amacı, bireyin içinde yaşadığı topluma ve çevresine uyum içinde yaşamasını sağlamaktır. Belli bir problemle ilgili verileri toplayıp analiz ederek soyutlamalara ulaşmayı sağlayan etkinliğe dayalı, güdüleyici bir yöntemdir.

Bruner'e göre birey, bilişsel gelişim sırasında eylemsel, imgesel ve sembolik olmak üzere 3 farklı şekilde bilgi edinir.

Bruner'e göre konunun temel yapısı basit bir şekil, şema, ilkeler kümesi ya da formülle ifade edilebilir. Bruner'e göre öğrenciler konunun temel yapısını tümevarım yoluyla keşfederler. Tümevarım yaklaşımı sezgisel düşünmeyi gerektirir(Erden ve Akman,2002,s.172-173).

Bruner'e göre öğretmenin rolü paketlenmiş bilgiyi öğrenciye sunmaktan çok, öğrencinin kendi kendine öğrenebileceği ortamı oluşturmaktır. O'na göre bunu sağlamanın yolu da buluş yoluyla öğretimdir. Çünkü bu yaklaşım düşünme, deneme ve bulmayı esas alır. Bunun için de öğretmen öğrencilere kavramları, ilkeleri kendisinin vermesi yerine, öğrencileri deney yapmaya, ilkeleri ve kavramları bulmaya teşvik etmelidir (Taşdemir, 2000 Akt. İşman, 2008). Öğrenciyi belli alanlarda öğretime tabi tutmak, onların belleğine bazı sonuçları yerleştirmek değil, ona bilginin elde edilmesine imkân verecek sürece katılmasını öğretmektir.

Sunuş Yolu ile Öğretim

Sunuş yolu ile öğretim yaklaşımını Ausubel kurdu. Sunuş yolu ile öğretim yaklaşımı, keşif yolu ile öğretime alternatif olarak geliştirilen bir öğretim modelidir. Ausubel' e göre, birey bilgileri keşfetmekten çok, hazır olarak alır. Bu nedenle geliştirdiği model, sunuş yoluyla öğretim olarak adlandırılır.

Sunuş yoluyla öğretme, eğitim durumunda hedef davranışlarla ilgili bilgi, tutum ve becerileri kazandırmak üzere daha önceden hazırlanan bilgilerin dinleyici durumunda olan öğrenci veya öğrenci grubuna aktarılmasıdır (Tan ve Erdoğan, 2002,s.54)

Kuramın BDE'de Uygulanması

"Tanıma" kavramı; BDE'de öğrencilere anlatılacak konu ile ilgili ön bilgiler, temel kavram ve kuramlar anlamlı ve zengin uyarıcılarla öğrencinin hafızasına uyarıcı olarak gönderilerek kullanılabilir. Böylece öğrenci o konu ile ilgili bilgileri tanımaya başlar.

BDE'de "Hatırlama" kavramı; öğrencilere ders materyali olarak dağıtılacak örnek videolarla öğrenilenler istendiği kadar tekrar edilerek, pekiştirilir ve hatırlama kolaylaşır.

"Değişiklik gösterme" kavramı; bireye çevresi hakkında çeşitli sezgiler geliştirmesi için görsel bilgiler sunulur. Bireyin kazandığı etkili sezgiler ile hayatında sosyal ve kültürel değişimler meydana gelir. BDE'de toplumsal hayat ile ilgili çoklu ortam tasarımları yada eğitsel yazılımlar hazırlanıp, öğrenci sezgisi geliştirilebilir.

"Yeniden Kurma" kavramı; Etkili genelleme yapmayı öğrenen birey kendi davranışlarını tanımlamaya başlar, böylece davranışlarını yeniden düzenleyebilir. Öğrenci BDE ders materyali olarak aldığı trafik işaretleri cdsinden gerekli bilgileri aldıktan sonra, trafikte davranışlarını yeniden düzenleyebilir.

Kısa süreli belleğe gönderilen bilgiler tekrar edilmezse unutulur. Bilginin canlı tutulması için BDE'de öğrenciye öğrenilen konu ile ilgili problem verilir ve "tekrar" yapması sağlanır.

BDE programları öğrencilerin gelişim evreleri dikkate alınarak hazırlanmalı, bu evrelere uygun olarak farklı eylem ve semboller hafızaya uyarıcı olarak gönderilmelidir.

BDE programlarında kullanılacak yöntem ve teknikler çeşitli olmalı, öğrencilerin öğrenmelerini kalıcı sağlayacak şekilde imkânlar sunulmalıdır. Konular video, resim, grafik vb. ile birden fazla duyu organını öğrenmeye katacak şekilde çeşitlendirilmelidir.

Duyuşsal Kuramlar Ve Bde'de Uygulanması

Kuram daha çok öğrenmenin benlik ve ahlak gelişimi olan duyuşsal sonuçlarıyla ilgilenir. Bireylerin, etkili öğrenme sonuçları ortaya çıkarmak için kendilerini ahlaki ve toplumsal olarak gerçekleştirmeleri gerekir yani bireylerde benlik tasarımı gerçekleşmelidir. Birey, benlik tasarımını gerçekleştirirken çevresinden, içinde yaşadığı toplumda karşılaştığı olaylardan ve yaşamda edindikleri deneyimlerinden yararlanmaktadır. Çünkü birey içinde yaşadığı çevresi ile sürekli iletişim halindedir. Bunun sonucunda bireyin kendine öz güveni artar. Kendi öz güveni artan birey özsaygısını geliştirir. Özsaygısı gelişmiş olan bireylerin zihinsel sağlığı gelişir. Zihinsel sağlığı gelişmiş birey kendinin eksiklerini ve hatalarını görüp düzeltmeye çalışır. Bunun sunucunda bireyin gelişim evresine uygun olarak öğrenmeler gerçekleşir.

Kuramın BDE'de Uygulanması

BDE'de hazırlanan ders materyalleri, bireylerin gelişim evrelerine uygun olmalıdır.

BDE programları bireylerin içinde yaşadıkları toplumun değer yargılarına uygun hazırlanmalıdır. Birey, toplumun değer yargılarını öğrenirken ken¬di değerine bağlı düşüncelerini de gerçekleştirmelidir

BDE programları öğrencilerin, benlik gelişimine, ahlak gelişimlerine uygun, öğrencilerin kendilerine saygı ve güvenlerini artıracak, zihinsel sağlıklarını destekleyecek deneyimler sunmalıdır.

BDE programları, eğitim alan bireylerin öğrenmede eğitimin ihtiyaç olduğunu ve kendilerine kolaylık sağladığını duyuşsal olarak hissettirecek şekilde planlanmalıdır. Eğer bireyin duyuşsal gelişimleri BDE programlarına olumsuz ise BDE kullanılmasının herhangi bir etkisi olmaz.

BDE programları içerisinde bireyin gelişim evresine uygun olarak video yada multimedya programlar hazırlanabilir. Hazırlanan multimedya programlarıyla öğrencilere yeni bilgiler kazandırılırken öğrencilerin akademik, sosyal, duygusal ve fiziksel gelişimlerini yani bireylerin benlik gelişimleri sağlanabilir.

BDE'de "ahlak gelişimi" kavramı, öğrencilere ahlak gelişimi ile ilgili multimedya programları hazırlanıp sunulmasıyla sağlanabilir. Örneğin öğretmenin bir konu hakkındaki kendi davranışları eğitim yazılımı içersinde öğrencilere sunulabilir.

Öğrencilerin hazırlanan multimedya cdlerinden, sahip oldukları bilgilerden eksik olanlarını öğrenerek, ders saatleri dışında da, günlük yaşamlarında kullanmaları ile BDE'de "ahlak gelişimi" sağlanmış olur.

BDE, öğrencilerin "kendilerine güven duymalarını sağlayabilir. Öğrenci geleneksel eğitim- öğretimde öğrenemediği bilgileri, BDE ile öğretmen rehberliğinde edindiği internet adresleri ya da hazırlanmış eğitim

yazılımları ile daha kolay öğrenebilir, birçok kez tekrar edebilir ve daha önce öğrenemediği konuları öğrenmeye başladıkça zoru başarma duygusu ile kendini iyi hissetmeye başlar. Böylece öğrencilerde "öz saygı" ve "kendine güven duygusu" gelişir ve kendini değerli hissetmeye ve yeteneklerine güvenmeye başlayan öğrencinin "zihinsel sağlık" gelişimine yardımcı olur.

Nörofizyolojik Kuram Ve Bde'de Uygulanması

Nörobilim alanında yapılan çalışmalar ve elde edilen bulgular, öğrenmenin bilişsel ya da duyuşsal öğrenmelerden çok farklı bir şekilde tanımlanması sonucunu doğurmuştur. Buna göre öğrenme, yeni dentritler ya da yeni beyin yapısı oluşturmaktır (Wortock, 2002). Başka bir deyişle insan öğrenmektedir, çünkü beyin kendi nöral devrelerini değiştirebilmektedir (Thomas, 2001).

Beyin gelişimi hakkında ne öğrenildiyse, bu öğrendiklerimiz fareler, maymunlar ve diğer hayvanlar üzerinde yapılan yoğun ve saldırgan deneyleri içeren çalışmalardan alınmıştır. Bu deneyler, araştırmacılara, doğru yoldan çeşitli durumlar altındaki hayvanların fizyolojik olarak karşılaştırılması ya da ölçülmesiyle beyin gelişimlerinin gözlemlemelerine yardımcı olmuştur (Hall, 2007).

Kuramın BDE'de Uygulanması

Nörofizyolojik kuramın öğrenme ile ilgili yedi kavramı bulunmaktadır. Bu kavramlar eş zamanlı faaliyet, öğrenmeyi kolaylaştırmak, anlam yükleme, ilişki kurma, bütünü aynı anda algılama, süreç ve bireysel farklılıktır. (İşman,2008)

1. Eş zamanlı faaliyet: İnsan beyni birçok işlevi eş zamanlı olarak yerine getirebilir. Etkin öğretimde aynı anda yapılması gereken işlemler ahenk içerisinde verilmelidir.

2. Öğrenmeyi kolaylaştırmak: Bilgisayar destekli öğrenmede kullanılan materyaller ve yazılımlar ile biyokimyasal reaksiyonlar ile sinir sisteminde bulunan sinaptik bağların oluşmasını sağladığı için öğrenmeyi kolaylaştırır. Çünkü beyin bilgisayar ile birden fazla duyu organına hitap eder. Beyin her türlü uyarıcıya karşı bir tepki gösterebildiği için renkli, işitsel, hareketli yazılımlar beyinde güçlü miktarda reaksiyona neden olacak ve öğrenmeyi kolaylaştıracaktır.

3. Anlam yükleme: Beyin kendisine ait özgün ve yaratıcı yapılara anlam veren örüntüleri ortaya çıkarmaya ve örüntüler oluşurken onları sezip anlamaya çalışan bir sanatçı ve bilim adamı gibidir. Örüntüleme; bilginin anlamlı organizasyonu ve sınıflandırılmasına işaret eder. Beyin bu örüntüleri algılamak ve yaratmak için donatılmış olup kendisine dayatılan anlamsız örüntüleri de reddeder. Anlamsız örüntüler, öğrenci için bir anlam ifade etmeyen, yalıtılmış bilgi parçacıklarıdır. Bilgiyi bütünleştirmek için görünüşte ilişkisiz birçok bilgi ve faaliyet eğitim ortamına getirilip değerlendirilebilir. Etkili bir öğrenme için anlamlı ve birbiriyle ilişkili olabilecek örüntüler yaratılmalıdır.

4. Eğitim açısından doğurgular: Öğrenenler şu veya bu biçimde her zaman örüntüler, algılar ve anlamlar yaratırlar. Onları durduramayız, ama yönlerini etkileyebiliriz. Hayal kurma, gündüz rüyası, eleştirel düşünme ve problem çözme gibi durumlar birer örüntüleme yoludur. Öğrencinin neyi öğrenmek zorunda olduğunu seçmemize karşın, istenen süreç bilgiyi öğrenciye zorla kabul ettirmekten çok beynin herhangi bir yolla örüntüleri özetlemesine izin vermek olmalıdır. Bunun için zaman harcanması, uygun örüntülemeyi garantilemez, çünkü öğrenci aklı başka bir yerde iken bu işle gerçekten ilgilenmez. Eğitimdeki çoğu sorun anlamsızlığın göz ardı edilmesinden ya da yanlış anlaşılmasından kaynaklanır. Öğrenme sonuçları ve hedefleri açısından eğitimciler ezber ile anlamlı öğrenme arasındaki farkı yeniden değerlendirmelidir. Dolayısıyla tüm öğrencilere, öğretmenlerinin görüşlerinin ötesine geçme konusunda izin verilmelidir. (Tüfekçi,2005)

5. İlişki Kurma: Bilgisayar destekli eğitimde kullanılan materyaller belirli bir sıra ile ve bireyin kişisel hızına göre düzenlendiği için, birey bilgisayar destekli eğitim sayesinde beyninde öğrendikleri arasında ilişki kurabilir.

6. Bütünü aynı anda algılama: Gestaltçıların da ısrarla üstünde durdukları gibi, beyin bütünü algılamaya çalışır. Bir masada oturan insanı, insan beyni tam olarak algılar. Bilgisayar destekli eğitimde ilişkisel olarak insan beynine gönderilen uyarıcıları tam olarak algılayabilmesi için yazılım bir bütün halindedir.

7. Süreç ve bireysel farlılıklar: Bilgisayar destekli eğitimde kullanılan yazılımlar, materyaller bireysel çalışmaya, bireysel hıza ve belirli bir sürece imkân tanır. Bu da insan beynini gereksiz uyaranlarla yormaz, bireysel öğrenmeyi kolaylaştırır.

Yapisalci Kuram Ve Bde'de Uygulanması

Yapısalcı kuramda, bireyin çevresindeki olay ve nesnelerle etkileşimi sonucunda elde ettiği bilgileri, kendisinde varolan eski bilgilerle ilişkilendirerek yeni bilgi olarak yapılandırması amaçlanır (Bodner, 1986;Fosnot, 1996;Limon,200 1;Sherman,2000;Özden, 1999; Akt: Akpınar ve Ergin,2005)

Öğrenmenin Yapısalcı teorisinde öğrenenler şimdiki ve geçmişteki bilgilerine dayanarak aktif bir öğrenme sürecindedirler.(Payne ve diğ., 2009)

(Wink, 2006) yapısalcılığın tanımını epistemolojik ve pedagojik olarak ikiye ayırıyor. Epistemolojik yapısalcılık, Birey ya da gruplar bilgilerini muhtemelen insani olmayan etkileşimlerle kendi tercihleri sonucunda yapılandırırlar, "Doğru", bilgiyi yapan anahtar adımdır. Çok iyi yapılandırılmış bir bilgi bile insan faktörüne muhtaçtır. Bilginin oluşumunda tarih, cinsiyet ve etnik gruplar gibi sosyolojik faktörlerde etkilidir. Pedagojik yapısalcılıkta ise, öğrenen bilginin üretildiği ve elde edildiği yerdedir. Bilgi, onu üreten insanın sınırlarındadır. Bir insanın bilgisi, bilgiyi öğrenme aktivitesine ve onu elde etme süreçlerine bağlıdır. Başka bireylerle etkileşim öğrenenin bilgiyi yapılandırmasında etkilidir. Öğretmen, Öğrenci ve eğitim sistemi, içeriğe ve öğrenmenin temel süreçlerine şekil verir.

Demirel (2011:233)'e göre yapısalcı yaklaşım, "öğretimle ilgili bir kuram değil, bilgi ve öğrenme ile ilgili bir kuramdır. Bu kuram bilgiyi temelden kurmaya dayanır". Bu düşünceye göre öğrenci yeni kazandığı bilgileri eski bilgileri ile karsılaştırarak zihninde yeniden yapılandırır ve böylece etrafındaki dünyayı anlamlandırır. Öğretmen merkezli ve öğrencilerin pasif dinleyiciler oldukları geleneksel öğretim yöntemlerinin aksine bu model, öğrencinin öğrenmede çok aktif olması gerektiğini savunur. Bu teoride, bilginin her bir öğrenen tarafından bireysel olarak yapılandırıldığı, öğrencinin kendisine ulasan bilgileri aynen almadığı ve öğrenmede bireyin ön bilgilerinin, kişisel özelliklerinin ve öğrenme ortamının son derece önemli olduğu vurgulanmaktadır. Genel olarak incelendiğinde yapılandırmacı öğrenme, var olanlarla yeni olan öğrenmeler arasında bağ kurma ve her yeni bilgiyi var olanlarla karsılaştırarak yeniden biçimlendirme sürecidir.

Yapısalcı kuramın temel özelliği, öğrencilerin rolünün tanımlanmasında yatmaktadır. Bu süreçte öğrenci fikir ve algılarını oluştururken onları pasif olarak diğer kaynak veya öğretmenlerden almak yerine, etkin olarak kendisi yapılandırır. Yapılandırma, öğrenenin daha önceki deneyimleri ile şekillenmiş düşünce ve algılarını yeni deneyimleri ile ilişkilendirmeleri ve genişletmede kullanmaları anlamındadır. Bu, zihinsel etkinlikler yoluyla sağlanabileceği gibi bazen de fiziksel etkinlikler yoluyla, yani yaparak ve yaşayarak da sağlanabilir (Harlen, 2000; Akt: Anagün ve Anılan,2005).

Kuramın BDE'de Uygulanması

Öğrenme ortamlarında teknoloji kullanımı ile öğrencilere daha zengin öğrenme ortamları sunulmakta, ilgi uyanmakta, motivasyonlarının artması ve konuya ilişkin eski bilgileri hatırlamalarını sağlamaktadır. Yapısalcı yaklaşımda öğrenci merkeze alındığı ve öğrenme süreçlerinde öğrenci aktif olarak rol aldığı için öğrenci yeni öğrenme ürünlerini ortaya çıkarırken, iletişim kurarken, öğrenme öğretme süreci içerisinde teknolojinin rolü büyüktür. Öğrenme süreçleri içerisinde öğrencilerin anlamalarını kolaylaştırmak için teknoloji kullanılabileceği gibi, öğrenme ürününü meydana getirilirken ve bu ürünün kalıcı hale getirilmesi için teknoloji kullanılabilir.(İşman ve diğ.,2002)

Bilgisayar Destekli Eğitim (BDE), her türlü öğretimsel içeriklerin ve faaliyetlerin bilgisayar kullanılmak suretiyle öğrenciye aktarılması olup eğitimde bilgisayar kullanımı için kullanılan en eski kavramlardan birisidir. Bu yüzden, farklı amaçlarla olsa dahi, eğitim ortamında bilgisayar kullanımı genel olarak BDE olarak kabul edilir. Eğitim kavramı ile eğitim sürecinin alt sistemlerinden birisi olan öğretim kavramının sürekli olarak karıştırılmasından dolayı Bilgisayar Destekli Eğitim (BDE) ile Bilgisayar Destekli Öğretim (BDÖ) kavramları da karıştırılmakta ve çoğu kez birbirinin yerine kullanılmaktadır.(Bodur, 2006)

Bilgisayar teknolojisinin son yıllarda yaygınlaşmasıyla birlikte bu teknolojiden eğitimde daha etkili bir biçimde yararlanmanın yollarının araştırılması gerekliliği ortaya çıkmıştır. Bu bağlamda, öğrenenin önceki bilgilerini temel alarak yeni düşünce veya kavramları yapılandırdığı aktif bir süreç olarak tanımlanan yapılandırmacı öğrenme yaklaşımı ile bilgisayar teknolojisinin birleştirilmesinin eğitim durumlarına önemli katkılar sağlayacaktır. (Özcan ve Asker,2005)

Ramos (1999; Akt. Özcan ve Asker,2005) yapısalcılığın popülaritesinin artması ile bilgisayar teknolojisindeki gelişme ve kullanımındaki yaygınlaşma arasındaki paralelliğe dikkat çekmektedir.

1980'lerden beri Bilgisayar Destekli Eğitimde, Pedagojik yapısalcıları destekleyen yeterli sayıda araç geliştirilmiştir. Mulle Meck gibi Multimedya CD'leri, LOGO gibi çocuklar için programlama dili, E-Slate gibi yeniden kullanabilen parçalar örnek olarak sayılabilir. Son zamanlarda sanal gerçeklik ve geliştirilmiş gerçeklik teknolojileri ile kubaşık öğrenme çevrelerine de giriş yapılmıştır.(Taxén, 2004)

Yapısalcı kuramın öğrenme ile ilgili toplam olarak yedi önemli kavramı bulunmaktadır. Bu kavramlar, yaparak-yaşarak öğrenme, yaratıcılık yeteneğinin geliştirilmesi, bireysel yorum, gerçek yaşantılar, kubaşık öğrenme, öğrenci-merkezli öğretim ve bireysel öğretim yaklaşımlarıdır. (İşman,2008)

1. Yaparak- yaşayarak öğrenme: Öğrenmede yaparak ve yaşayarak kavramları öğrenmenin kilit noktalarıdır. Öğrencinin kalıcı öğrenmeler meydana getirebilmesi için konu ile ilgili bizzat kendisi yapmalı ve yaşamalıdır.(İşman,2008)

2. Yaratıcılık yeteneğinin geliştirilmesi: Düşünebilen her insanın az veya çok yaratıcılık yönü vardır. Bireylerin kendini gerçekleştirmesine çok büyük katkısı olacak bu yönümüzün geliştirilebilmesi için öncelikle yaratıcılığımızı engelleyen faktörlerin ortadan kaldırılması gereklidir. Yapılan çalışmalar, yaratıcılık yönü gelişmiş insanların şu iki hususa özen gösterdiklerini oraya koymuştur: birincisi, soru sorma ortamını geliştirmeleri,ikincisi ise, seçim yapma olanağı sağlayacak çeşitli fikirlere sahip olmadan karara varmamayı öğrenmiş olmalarıdır.

Sonuç olarak, yaratıcılık kişinin konuya ilişkin bilgi ve tecrübesinin yanı sıra, hayal gücü ile de çok yakından ilgili olan bir konudur. Bu nedenle, yaratıcılığı geliştirmek üzere önerilen metotlar tek başlarına yaratıcılığı sağlayamazlar. Bunlar, yaratıcılık yeteneğimizi engelleyen unsurları ortadan kaldırmak için sadece bizlere yardım eden tekniklerdir. Bilgisayar destekli eğitimde kullanılan yapısalcı materyaller ve programlar bireylerin yeni şeyler üretmeye teşvik etmekte ve yaratıcılıklarını geliştirmektedir.

3. Bireysel yorum: Bilgiler ya doğru ya da yanlıştır. Öğrenen, gereksiz ayrıntıları sınavda çıkacak korkusu ile ezberler. Yapılandırmacılıkta ise temel amaç çözümleme, birleşim, değerlendirme gibi üst düzey bilişsel becerileri kullanmak olduğundan öğrenen bilgiyi bireysel olarak yapılandırır ve bilgiye ilişkin yorumunu yapar.

4. Gerçek yaşantılar: Yapılandırmacılıkta öğrenenlerin bilgiyi anlamlı ve kullanışlı yapabildikleri yapılandırmacı öğrenme ortamları teknoloji temellidir. Bu ortamlar; gerçekçi, etkili, işbirlikli ve gönüllü çalışmaları gerektirir. Öğrenenler, teknolojiyi günlük yaşamlarında etkin bir şekilde amacına uygun olarak kullanırlar(Erdem ve Demirel,2002).

5. Kubaşık öğrenme: Bilgisayar destekli öğrenmeyle yapılan projeler öğrencileri işbirliğine dayalı gruplarda öğrenmeye teşvik etmektedir. Öğrenciler bir projenin çeşitli bölümlerini bilgisayarda yapabilmektedir. Zamandan yarı bağımsız ya da bağımsız olarak çalışabilme olanağına da sahiptirler.

6. Öğrenci-merkezli öğretim: Yapısalcı öğretimin savunduğu en önemli ilkelerden biri de öğrenci merkezli eğitimdir. Yapısalcı öğretimde her öğrencinin öğrenme yeteneğine uygun eğitim verilmelidir. Bilgisayar destekli eğitimde öğrenciyi ön plana alan, öğrencinin ihtiyaçlarına uygun ve öğrenme hedeflerine uygun materyaller ve yazılımlar hazırlanabilir.

7. Bireysel öğretim yaklaşımı: Bilgisayar destekli eğitimde bireysel öğretim sunulabilmektedir. Her öğrenci kendi bireysel yeteneği ve öğrenme hızıyla öğrenme imkanına sahiptir. Zamandan ve mekandan bağımsız olarak çalışabilmekte, anlamadığı konuları tekrar tekrar çalışarak öğrenmesini pekiştirebilmektedir.

Özet

Avrupa Birliği, Bologna süreciyle, üye ve aday ülkelerin yükseköğretim kurumlarını yeterlilikler çerçevesinde değerlendirmeyi ve Avrupa yükseköğretiminde ortak bir kalite anlayışını oluşturmayı hedeflemektedir. Bu kapsamda web tabanlı olarak geliştirilen Eğitim Öğretim Bilgi Sistemi (EÖBS) yazılımı ile üniversitelerin eğitim-öğretim süreçlerinin tanımlı, şeffaf ve sürekli geliştirilebilir bir çerçeveye taşınması hedeflenmektedir. EÖBS ders bilgileri modülü sayesinde, Bologna sürecinde program-ders uyumu için uygulanması esas tutulan yöntem ve araçların karmaşık işlemlerini basitleştirerek, süreç yönetimiyle ilgili çalışmaların etkin şekilde yürütebilmesini sağlayacak bir ortam sunulmaktadır.

Anahtar Kelimeler: Eğitim Öğretim Bilgi Sistemi; Bologna Süreci; Ders Bilgileri Modülü; Çerçeve Yazılımı; Avrupa Kredi Transfer Sistemi; Web Tabanlı Bilgi Sistemleri

Abstract

Within the Bologna process, European Union aims to create a common European Higher Education Quality Standards for evaluating the higher education institutions of member and candidate countries by using qualifications framework. By this context developed web based application of Software Framework of Education and Training Information System was aimed for bringing education and training processes into defined, transparent, continuously developable category. Prominent feature of Education and Training Information System is satisfaction of the action titles of Bologna processes.

Keywords: Educational Information System; Bologna Process; Course Information; Software Framework; European Credit Transfer System; Web Based Information System

Giriş

Bilgi sistemleri işletmelerin özellikle örgüt içi iş süreçlerinde bilgi paylaşımının daha hızlı ve yaygın olarak yapılması ve bunun modern toplumlar yararlarına da açılması hedeflerine odaklanmıştır (Srinivasan, 1999; Krajnc, & Hericko, 2003). Bilhassa bilgisayar tabanlı bilgi sistemleri kişi ve kuruluşların verileri toplamak, işlemek, veriler üzerlerinde filtre oluşturmak ve dağıtmak gibi işlemlerin gerçekleştirildiği yazılım ve donanım bileşenleri içeren tamamlayıcı ağlardır (Jessup, & Valacich, 2008, p.416). Günümüzde kurumlar, bilgi sistemleri projelerini ağırlıklı olarak web tabanlı mimariler kullanılarak geliştirme eğilimindedirler (Denning,2007). Web tabanlı bilgi sistemleri mimarileri tasarlanırken kaynak tüketimlerinin makul sınırlar dâhilinde oluşturulması, mimarinin genişletilebilir bir yapıya sahip olması ve tasarlanan yazılım mimarisinin belli standartlar ölçüsünde geliştirilmesi önemlidir (Kelly, & Gibson, 1999 v.b). Tasarlanan sistem mimarisinin geliştirilen her uygulama için geliştiriciler tarafından tekrar tekrar öğrenilmesi, tasarlanması, geliştirilmesi ve bakımının yapılması kaynakların verimsiz kullanılması anlamına gelecektir.

Bologna Süreci kapsamında, Türkiye'de ulusal yükseköğretim sistemlerinin ve kurumlarının uyumlulaştırması çalışmaları hususunda ortak bir planlama, uygulama ve karşılaştırma dili kullanılması için bir dizi yöntem ve araç geliştirilmektedir. Ulusal anlamda; Avrupa Nitelikler Çerçevesi'nin yükseköğretim aşamaları ile uyumlu Ulusal Yeterlilikler Çerçeveleri'nin geliştirilmesi ve belgelendirilmesi bu yöntem ve araçların en önemlilerinden birisidir. Yükseköğretim kurumları içerisinde paydaşların katılımı oluşturulan amaç, hedef ve çıktılar, iç ve dış kalite güvencesi sistemleri ile denetlenmektedir. Ulusal Yeterlilikler Çerçevesi'nde belirtilen yükseköğretim öğrenme çıktılarını sağlayacak öğretim programları geliştirme ve öğrenci iş yüküne dayanan ortak bir kredi toplama, biriktirme ve transfer sistemine geçiş (AKTS - Avrupa Kredi Transfer Sistemi) diğer önemli yöntem ve araçları oluşturmaktadır (Edinsel, 2008, s.8).

Bu kapsamda web tabanlı olarak geliştirilen Eğitim Öğretim Bilgi Sistemi (EÖBS) yazılımı ile üniversitelerin eğitim-öğretim süreçlerinin tanımlı, şeffaf ve sürekli geliştirilebilir bir çerçeveye taşınması hedeflenmektedir. Eğitim Öğretim Bilgi Sistemi (EÖBS) Web Yazılımı ders bilgileri modülü sayesinde, Bologna sürecine program-ders uyumu için uygulanması esas tutulan yöntem ve araçların karmaşık işlemlerini basit hale getirerek, süreç yönetimiyle ilgili çalışmaların etkin ve verimli şekilde yürütebilmesini sağlayacak bir ortam sunulmaktadır.

Bologna Süreci ve Program-Ders İlişkileri

Bologna süreci eylem başlıkları arasında ifade edilen Avrupa Kredi Transfer Sisteminin (European Credit Transfer System, ECTS) uygulanması, kolay anlaşılır ve birbirleriyle karşılaştırılabilir yükseköğretim diploma ve/veya derecelerinin oluşturulması ana hedeflerdir. Sürece dâhil olan ülkelerin ulusal yeterlilikler çerçevelerini tanımlama süreçleri ve bu süreçleri oluşturmada yapılması gereken çalışmalar alt çalışma grupları oluşturularak belirlenmeye devam etmektedir. Ülkelerin, ulusal yeterlilikler çerçevesi (UYÇ) çalışmalarını bu aşamaları takip ederek bir takvim doğrultusunda sürdürmeleri ve en geç 2012 yılına kadar tamamlamaları hedeflenmektedir(Edinsel, 2008, s.33).

Şekil 1. Bologna Süreç İlişki Diyagramı

Şekil 1'de görülen Bologna süreci ilişkilerinden "Program Çıktıları", ve altındaki adımlar doğrudan üniversitelerde yürütülmesi gereken çalışmalar olarak karşımıza çıkmaktadır. Bu kapsamda her program için amaç ve hedef belirleme, yeterliklerin ve öğrenme çıktılarının belirlenmesi, ders planlarının oluşturulması ve her bir ders için işyüklerine bağlı ölçme ve değerlendirme sisteminin uygulanarak ilgili ders için AKTS hesaplamala çalışmaları yapılmaktadır.

Eğitim Öğretim Bilgi Sisteminde Ders Bilgileri Modülü Tasarımı

Çalışmanın bu bölümünde, AKTS'nin uygulanması, program öğrenme çıktılarının ve ders ilişkilerinin kurulması, ders tanımlamalarının yapılması, temel ders bilgilerinin oluşturulması, haftalık ders konu dağılım listelerinin çıkarılması ve derslerle ilgili değerlendirme oranlarının belirlenmesi gibi süreçlerin web tabanlı olarak yönetilmesini sağlayacak yazılım çerçevesi mimarisine sahip bir bilgi sisteminin tasarım aşamaları anlatılmıştır.

Hazırlanan bu yazılım çerçevesi, Şekil-1 de gösterilen Bologna Sürecinin uygulanmasını kapsadığı gibi doğrulama (authentication), yetkilendirme (authorization), işlem kayıtları tutma (logging), hata yakalama (error handling) ve raporlama (error reporting), kullanıcı dostu arayüz (user-friendly interface) sunulması, sağlıklı ve düzenli bir hesap yönetimi (account administration) gibi özellikleri de gerçekleştirmektedir. Doğrulama, yetkilendirme ve raporlamaların yapıldığı modüller üniversitenin diğer bilgi sistemleri ile entegre çalışabilecek şekilde esnek bir mimariye göre çok dilli olarak tasarlanmıştır.

Eğitim Öğretim Bilgi Sistemi, program ve ders bilgileri olmak üzere iki temel süreç üzerine inşa edilmiştir. Düzeye bağlı (önlisans, lisans, yüksek lisans, doktora) bir ağaç yapısı şeklinde programlar ve altında dersler tanımlanmıştır. Ders bilgileri güncelleme çalışmaları, önceden belirlenmiş takvime uygun olarak bir çevrim dâhilinde yapılır. Ders bazlı işlemlerle ilgili modüller üzerinde yapılan bütün veri giriş işlemleri, önceden tanımlanan yetkiler çerçevesinde ilgili birim sorumlularınca yapılır. Yazılım çerçevesinin esnek yapısı sayesinde kullanıcı yetkileri modüler bazlı tanımlanabilirken, aynı zamanda belli bir zaman aralığına bağlı olarak da etkinleştirilebilir.

Yeni Ders Tanımlama Arayüzü

Yeni Ders Tanımlama arayüzü üzerinden bir programın ders listesine eklenecek ders; dersin İngilizce/Türkçe adı, dersin ilgili programda okutulacağı yarıyıl, ortalamaya girip girmeyeceği durumu, dersin zorunlu/seçmeli mi olduğu, dersin saati (uygulama+teorik), dersin kredisi ve dersin kodu gibi tanımlamaları yapılarak oluşturulur. Oluşturulan derslerin ilgili programdan çıkarılması veya bilgilerinin güncellenmesi Şekil-2'de gösterilen aynı arayüz üzerinden yapılır.

Şekil 2. Ders Bilgileri Modülünde Yeni Ders Tanımlama Arayüzü Gösterimi

Temel Ders Bilgisi Güncelleme Arayüzü

Temel Ders Bilgisi Güncelleme arayüzü üzerinden bir programın ders listesine eklenmiş olan dersin; varsa önkoşul dersleri, dersin zorunlu/seçmeli mi olduğu, dersin dili, dersin koordinatörü, dersi verenler, dersin yardımcıları, dersin amacı, dersin öğrenme çıktıları ve dersin içeriği gibi bilgileri güncellenir. Şekil-3'te, Temel Ders Bilgisi Güncelleme arayüzü gösterilmiştir.

Şekil 3. Ders Bilgileri Modülünde Temel Ders Bilgisi Güncelleme Arayüzü Gösterimi

Ders Akışı ve Ders Kaynakları Güncelleme Arayüzü

Ders Akışı ve Ders Kaynakları Güncelleme arayüzü üzerinden bir programın ders listesine eklenmiş olan dersin; 14 haftalık konuları, ön hazırlık çalışmaları, ders notları ve ders kaynakları bilgileri hem metinsel olarak hem de sistem üzerinden ilgili alana dosya yüklemek suretiyle güncellenir. Şekil-4'te, Ders Akışı ve Ders Kaynakları Güncelleme arayüzü gösterilmiştir.

Şekil 4. Ders Bilgileri Modülünde Ders Akışı ve Ders Kaynakları Güncelleme Arayüzü Gösterimi

Dersin Program Öğrenme Çıktılarına Katkısını Güncelleme Arayüzü

Ders Program Öğrenme Çıktılarına Katkısı Güncelleme arayüzü üzerinden bir programın ders listesine eklenmiş olan dersin; mevcut programın öğrenme çıktıları ile ilişkileri kurulur. Buna göre ilgili programın ne kadar öğrenme çıktısı varsa, bu dersin tüm çıktılarla ayrı ayrı ilişki puanlaması yapılır. Şekil-5'te Ders Program Öğrenme Çıktılarına Katkısı Güncelleme arayüzü gösterilmiştir.

Şekil 5. Ders Bilgileri Modülünde Dersin Program Öğrenme Çıktılarına Katkısını Güncelleme Arayüzü Gösterimi

Ders Değerlendirme Sistemi Güncelleme Arayüzü

Ders Değerlendirme Sistemi Güncelleme arayüzü üzerinden bir programın ders listesine eklenmiş olan dersin yıliçi ve yılsonu etkinliklerinin başarı üzerine etkisi oranlanır. Yıl içi çalışmaları kapsamında arasınav, kısa sınav, ödev, devam, uygulama, laboratuvar, proje, atölye, seminer ve arazi çalışması gibi etkinlik seçenekleri vardır. Ders ile ilişkisi kurulacak herbir etkinlik seçeneğine ilişkin sayı ve yüzde oranı değerleri bu arayüz üzerinden girilir. Bundan başka yıl içinin başarıya oranı ve yılsonunun başarıya oranı alanları üzerinden genel değerlendirme ve puanlama tamamlanır. Şekil-6'da gösterilen Ders Değerlendirme Sistemi Güncelleme arayüzü üzerinden aynı zamanda dersin kategori ilişkisi de kurulur. Örneğin bir mühendislik fakültesi programı için Matematik ve Temel Bilimler, Mühendislik Bilimleri, Mühendislik Tasarımı ve Sosyal Bilimler olmak üzere dört ayrı kategori vardır. İlgili dersin bu kategorilere uyum oranı yüzdesel olarak toplamda %100 puanı sağlayacak şekilde dağıtılır.

Şekil 6. Ders Bilgileri Modülünde Ders Değerlendirme Sistemi Güncelleme Arayüzü Gösterimi

Ders AKTS-İşyükü Güncelleme Arayüzü

Avrupa Kredi Transfer Sistemi, AKTS kredisi adı verilen birim ölçüsünün, dersin öğrenimi esnasında yapılan etkinliklerin sayısı ve saat olarak harcanması gereken süre temel alınarak işyükü hesabına dayalı olarak hesaplanması gerektiğini öngörmektedir (Oktik, Ş., 2007). Bu bağlamda Eğitim Öğretim Bilgi Sistemi Web Yazılımının Ders AKTS-İşyükü Güncelleme arayüzü üzerinden bir programın ders listesine eklenmiş olan dersin AKTS-İşyükü değeri hesaplanır. AKTS-İşyükü hesaplaması kapsamında dersin süresi, sınıf dışı ders çalışma süresi, ödevler, sunum/seminer hazırlama, arasınavlar, laboratuvar, proje, atölye, yarıyılsonu sınavı ve arazi çalışması gibi etkinlik seçenekleri sayı ve süre olarak işlenir. Bu seçeneklerinden hesaplamaya dahil edilen etkinliklerin sayı ve süre kümülatif toplamları üzerinden toplam işyükü hesaplanır ve 30 saate bölünüp en yakın tamsayıya yuvarlaması yapılarak dersin AKTS puanı hesaplanır. Hesaplanan bu AKTS değeri program ders planı ve ders bilgilerinin tüm arayüzlerinde aynı anda otomatik olarak güncellenir. Şekil-7'de Ders AKTS-İşyükü Güncelleme arayüzü gösterilmiştir.

Şekil 7. Ders Bilgileri Modülünde Ders AKTS-İşyükü Güncelleme Arayüzü Gösterimi

Sonuçlar

Geliştirilen Eğitim Öğretim Bilgi Sistemi (EÖBS) web yazılımı ile üniversitelerin eğitim-öğretim süreçlerinin tanımlı, şeffaf ve sürekli geliştirilebilir bir çerçeveye taşınması hedeflenmektedir. Eğitim Öğretim Bilgi Sistemi (EÖBS) Web Yazılımı ders bilgileri modülü sayesinde, Bologna sürecine program-ders uyumu için uygulanması esas tutulan yöntem ve araçların karmaşık işlemlerini basit hale getirerek, süreç yönetimiyle ilgili çalışmaların etkin ve verimli şekilde yürütebilmesini sağlayacak bir ortam sunulmaktadır. Geliştirilen sistem, öğretim elemanlarını da Bologna sürecinin içerisine dâhil ederek, bu bilincin tabana yayılmasını sağlarken aynı zamanda sürecin öğrenen ve gelişen üniversiteler misyonunun pekişmesine katkıda bulunmaktadır. Yazılım çerçevesi mimarisinde tasarlanan Eğitim Öğretim Bilgi Sistemi, aynı zamanda bir yazılım çerçevesinin sahip olması gereken nitelikler arasında yer alan diğer bilgi sistemleriyle entegre çalışma, taşınabilir ve geliştirilebilir olma gibi özellikleri de bünyesinde barındırmaktadır.

CASE ABOUT ORIENTATION OF PRIMARY SCHOOL STUDENTS TO OUT-OF-SCHOOL TIME ACTIVITIES

Pınar ARISOY[a], Ömer F. TUTKUN[a]

Sakarya,, Türkiye

Abstract

Purpose of this study is to determine primary school students are mainly orientated out-of-school time activities by whom. Sample of the research consists of 42 schools and 1530 students. Findings of research: 1- Students generally are not orientated out-of-school time activities. They participate in activities which they have selected. 2- There is no significant relationship between gender and orientation of students to out-of-school time activities. 3- There is a significant relationship between school, friend and self orientation of students to out-of school time activities and number of siblings. However there is no significant relationship with family orientation. 4- There is no significant relationship between school, friend and self orientation of students to out-of-school activities and residential area of students. But there is a significant relationship between family orientation and residential area. 5- School orientation to out-of-school activities and economic condition of family has no significant relationship. There is a significant relationship between friend, family orientation, self-orientation and economic condition of family. 6- In orientation of students to out-of-school time activities, there is a significant relationship between educational status of family and school, friend orientation and self-orientation.

Keywords: Leisure time, spare time, primary school, school, student

Introduction

For students who spend most of their time by learning, how they spend their time after school is so important for their personality development. The purpose of school education is to improve all aspects of students but it is succeeded partially through lessons. Personality formation of students is provided through out-of-school activities which are the supplementary of education (Binbaşıoğlu, 1983: 209- 210). Making a habit of evaluating out-of-school time with useful activities and transforming it into an attitude are founded in primary school. For primary school students, evaluating out-of-school time are so important for their personality formation, disorientation to bad habits, protection of physical and mental health and preparation to a better future (Karataş, 2006).

According to research, in our country individuals from all ages and genders spend their spare time at home by doing passive activities which do not need active participation. As a member of the society, children form their recreation habits and attitudes by looking at families and schools which are important units of society. However, researches show that recreation habits of parents and teachers is passive. This situation is an important deficiency for improvement and reconstruction of our society and formation of active individuals (Binarbaşı, 2006; Saygın, 1999; Tuncel, 1999; Yılmaz, 2002).

When out-of-school time is not evaluated correctly, it causes making bad habits and acquiring behaviors like slackness, laxness, laziness, carelessness, irregularity, and hooliganism. (İnan, 1973: 325). Research of Saföz (2008) shows that aggression of students, who do not evaluate out-of-school time correctly, is higher than the others. Milus (1998) finds out that absence and dropout rate is lower, disciplinary problem is absent and future expectation is higher for student who spends their out-of-school time with correct activities.

Society always appraises students according to their achievement of lesson in school. In our country, importance of out-of-school activities for students is ignored because of exam traffics, intensity of lessons. However, researches show that out-of-school time and how productive students spend that time is as important as success in school at character formation of students. But primary school students are not mature enough to decide how they spend their out-of-school time. Therefore, schools and families are the most important factors for programming out-of-school time of students and orientating them out-of-school activities.

Family is the smallest social unit that education starts and child learns socialization. Child's habits of spending his spare time is started to shape by modeling family members at small ages. Therefore, family factor has an important role at students' habits of spending their out-of-school time. In our country, child's selection of action generally depends on the desires of family members and sometimes authoritarian intervention of mother and father (Tezcan, 1976). Families of primary school students, who have a great impact on decision process of out-of-school activities, seem social activities as idleness and orientate students to studying lesson even in their spare time. Studies on this subject show that students do not participate in any activities in their spare time principally because of their busy study schedule. Furthermore, studies show that families are inadequate at orientating to activities (Dikici, 1994; Yavaş Karataş, 2006; Yetiş, 2008).

Schools are the most important institutions for families and students to get spare time evaluation education and acquire awareness about it. Schools are the most suitable places to develop necessary skills for spending spare time (Tezcan, 1994: 78). However, researches made on this subject show that in our country, schools underwhelm on filling students' out-of-school time because of facility and opportunity inadequacies. Furthermore, study results show that school administration and staff members do not show enough interest on this subject (Çakıroğlu, 1998; Dikici, 1994).

In our country, unfortunately family and school orientation for students is inadequate for evaluation of out-of-school time. This situation leads students to social circle. Social circles surrogate family and school in formation of spare time habits and selection of out-of-school time activities of students. In his study Seçgin (1996) reached the finding that students prefer out-of-school time activities, which they will participate, by the impact of their social circle.

In our country major deficiencies, which cover individuals from all ages and all professions, come to light about spending spare time. Families, which children may receive training about spending their spare time, utilize their spare time with passive activities; from primary school to university, schools cannot fulfill vacant hours after the school. Not utilizing out-of-school time is one of the important issues in our country. Therefore, in this study impact of families' unconsciousness and schools' facility deficiencies on this issue is highlighted. The purpose of this study is to provide necessary information for manager, researcher and planners about utilization of out-of-school time effectively by primary school students.

In the light of this information main problem of this research is to determine "primary school students are orientated out-of-school time activities by whom?" In accordance with this main problem, sub problems of this research are alteration of orientation to out-of-school time activities connected with gender, residential area of family, economic status of family, educational background of mother, educational background of father and number of siblings.

Methodology

2.1. Methods

In this research descriptive research method is used. Descriptive research method is a method which makes it possible to define a given situation exactly and carefully.

2.2. Study group

Population of research consists of 26622 fifth grade students of 344 primary schools in Kocaeli province. Sample of this research is assigned at two phases. At first phase, according to the economic level of schools' regions 42 schools, which have low, medium or high level of resources, are determined by using stratified sampling method. At second phase, 1530 students are selected from these schools by using proportional sampling method as the sample of research.

2.3. Data Collection

At this research a questionnaire, which is designed by Tutkun, Arısoy and Okay, is used as a data collection tool for assigning who orientates primary school students to out-of-school time activities. First part of the questionnaire contains personal information. Second part contains 29 cases for assigning students are orientated by whom to out-of-school time activities. These cases are classified as "my family-my friends-my school-myself-I am not interested."

Findings and Suggestions

3.1. "Fifth grade students in primary school are orientated out-of-school time activities mainly by whom?" findings about this main problem.

Average orientation frequencies to out-of-school time activities of fifth grade primary school students, who participate in this study, are given at Table 1.

Table 1 Average orientation frequencies to out-of-school time activities of fifth grade primary school students who participate in this study

	N	Ort.	S.s	Min.	Max.
Frequency of activity with family	1409	6,776	3,356	1,000	28,000
Frequency of activity with friends	1104	4,044	2,956	1,000	22,000
Frequency of activity at school	762	2,451	1,945	1,000	19,000
Frequency of activity by himself	1464	12,449	5,566	1,000	29,000

When analyzing the average frequency rates of doing activities in fifth grade primary school students who participate in study; it is found that average frequency rate of activity with family is $6,776 \pm 3,356$, average frequency rate of activity with friends is $4,044 \pm 2,956$, average frequency rate of activity at school is $2,451 \pm 1,945$ and frequency rate of activity by himself $12,449 \pm 5,566$. According to this, fifth grade primary school students are generally orientated out-of-school activities which are their choices. Students are least orientated by schools to out-of-school time activities.

3.2. Differentiation due to gender variable

Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study due to gender variable seem at Table 2.

Table 2. Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study due to gender variable

	Group	N	Ort	Ss	t	P
Frequency of activity with family	Female	788	6,844	3,397	0,850	0,395
	Male	621	6,691	3,305		
Frequency of activity with friends	Female	617	3,812	2,682	-2,886	0,004
	Male	487	4,339	3,248		
Frequency of activity at school	Female	431	2,387	1,947	-1,036	0,300
	Male	331	2,535	1,942		
Frequency of activity by himself	Female	819	12,512	5,533	0,481	0,630

There is no significant relationship between gender variable and average points of frequency rate of activities which are done with family, at school and by themselves of fifth grade primary school students as a result of t-test (t=0,850; p=0,395>0,05). There is a significant relationship between gender and activities which are done with friends. Males participate in activities with friends more than females.

3.3. Differentiation due to residential area of family variable

Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study due to residential area of family variable seem at Table 3.

Table 3. Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study due to residential area of family variable

	Group	N	Ort	Ss	F	P
Frequency of activity with family	Province	227	6,877	4,054	2,843	0,037
	District	1012	6,755	3,214		
	Town	123	7,228	3,211		
	Village	47	5,574	2,764		
Frequency of activity with friends	Province	169	3,604	2,633	2,057	0,104
	District	800	4,075	2,999		
	Town	100	4,350	3,147		
	Village	35	4,600	2,714		
Frequency of activity at school	Province	125	2,328	1,698	1,244	0,293
	District	530	2,419	1,861		
	Town	81	2,827	2,692		

	Group	N	Ort	Ss		
	Village	26	2,538	1,944		
Frequency of activity by himself	Province	242	12,909	5,338	1,854	0,136
	District	1047	12,475	5,636		

At the orientation of fifth grade primary school students who participate in this study, there is a significant difference between residential area of family and frequency rates of activities done with family (p>0,037). According to this, while residential area of family is getting bigger, orientation of students to out-of-school time activities is increasing.

3.4. Differentiation due to number of siblings variable

Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study due to number of sibling variable is given at Table 4.

Table 4. Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study due to number of sibling variable

	Group	N	Ort	Ss	F	p
Frequency of activity with family	1-2 sibling	830	6,813	3,408	0,859	0,462
	3-4 sibling	456	6,825	3,301		
	5-6 sibling	78	6,205	2,774		
	7 and more sibling	45	6,600	3,852		
Frequency of activity with friends	1-2 sibling	655	3,802	2,762	3,748	0,011
	3-4 sibling	364	4,363	3,253		
	5-6 sibling	55	4,564	2,767		
	7 and more sibling	30	4,533	3,192		
Frequency of activity at school	1-2 sibling	445	2,288	1,592	5,484	0,001
	3-4 sibling	252	2,520	2,046		
	5-6 sibling	41	3,366	3,520		
	7 and more	24	3,208	2,519		
Frequency of activity by himself	1-2 sibling	874	13,100	5,702	10,651	0,000
	3-4 sibling	466	11,592	5,295		
	5-6 sibling	79	11,456	4,851		
	7 and more sibling	45	10,444	4,993		

At the orientation of fifth grade primary school students who participate in this study, there is a significant difference between number of siblings variable and frequency rates of friends' orientation, family orientation and self orientation (p>0,011;0,000; 0,000).

3.5. Differentiation due to economic condition of family

Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study to out-of-school time activities due to economic condition of family variable is given at Table 5.

According to Table 5, there is a significant difference between economic condition of family variable and frequency rates of orientation of fifth grade primary school students to activities by family orientation, friends orientation and self orientation (p>0,010;0,048;0,024). According to this, frequency rates of family orientation, friends' orientation and self orientation of students to the activities is increasing when the economic conditions of family is higher.

Table 5. Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study to out-of-school time activities due to economic condition of family variable

	Group	N	Ort.	Ss	F	P
Frequency of activity with family	Good	641	7,070	3,422	4,663	0,010
	Medium	722	6,547	3,278		
	Low	46	6,283	3,377		
Frequency of activity with friends	Good	502	4,008	2,756	3,055	0,048
	Medium	567	4,002	3,072		
	Low	35	5,257	3,567		
Frequency of activity at school	Good	337	2,415	2,056	0,105	0,901
	Medium	401	2,479	1,859		
	Low	24	2,500	1,818		
Frequency of activity by himself	Good	662	12,687	5,758	3,721	0,024
	Medium	756	12,364	5,377		
	Low	46	10,435	5,472		

3.6. Differentiation due to educational background of mother variable

Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study to out-of-school time activities due to educational background of mother variable is given at Table 6. According to Table 6, there is a significant difference between educational background of mother variable and frequency rates of orientation of fifth grade primary school students to activities by friends' orientation, school orientation and self orientation (p>0,002;0,000;0,000). According to this, frequency rates of activities which are done with friends, at school and by themselves is increasing when the educational background of mother is rising.

Table 6. Differentiation of frequency rates of orientation of fifth grade primary school students who participate in this study to out-of-school time activities due to educational background of mother variable

	Group	N	Ort.	Ss	F	P
Frequency of activity with family	Uneducated	124	6,565	3,153	1,770	0,116

Frequency of activity with friends	Uneducated	40	5,925	3,640	5,674	0,000
	Primary school graduate	359	4,262	2,986		
	Middle school graduate	166	3,982	2,955		
	High school graduate	329	3,809	2,826		
	Üniversity graduate	180	3,544	2,704		
	Other	30	4,867	3,298		

Frequency of activity at school	Uneducated	31	2,968	2,373	2,150	0,058
	Primary school graduate	240	2,608	2,236		
	Middle school graduate	127	2,457	1,708		
	High school graduate	216	2,454	1,902		
	Üniversity graduate	127	2,000	1,458		
	Other	21	2,571	1,748		
Frequency of activity by himself	Uneducated	53	10,038	5,543	6,823	0,000
	Primary school graduate	466	11,955	5,174		
	Middle school graduate	217	12,147	5,701		
	High school graduate	425	12,642	5,457		
	Üniversity graduate	262	13,893	5,964		
	Other	41	11,561	5,710		

There is a significant difference between educational background of father variable and frequency rates of orientation of fifth grade primary school students to activities by friends' orientation, and self orientation (p>0,000;0,000). According to this, frequency rates of activities which are done with friends and by themselves is increasing when the educational background of father is rising.

Suggestions

According to findings which are acquired this research, fifth grade primary school students tend toward out-of-school time activities generally by their choices. However at those ages student are not mature enough to decide activities, which they will participate, without guidance. Schools have least role at orientation of students to activities. Impact of family is also low. Main cause of this is that in our country families do not acquire awareness about utilizing spare time yet. But educating student and family is the responsibility of school. Schools should be places that students spend their out-of-school time easily. Schools should organize seminar to increase awareness of families.

At orientation of students to activities, economic condition and educational background of family are especially important factors. When educational level increases, knowledge level of parents is enhancing on time management and they behave more consciously at orientation of child to activities. When economic level of family increases, financial difficulties like bad straits is decreasing and families allocate more time to their children then they fulfill the needs of their children. Unfortunately, in our country leisure time activities which need active participation are perceived as luxury by society and this luxury is just provided by families who have

good economic condition. This situation reaches a solution if schools turn into places that students utilize their spare time. By doing this, every students have right to spend their spare time like having right to go to school.

When number of children increases at families, attention for each child is decreasing. Therefore, students, who have more siblings, are generally impressed by friends and school.

As a result, family and school are the most important factors at adoption of utilizing spare time habits and attitudes. However, findings of research show that these two factors are inadequate to orientate student out-of-school time activities. One of the causes may be unawareness of families on this subject. In such a case, schools step in. Because by opening schools out-of-school time, there may be places where students spend their out-of school time and conscious level of society may increase through organizing seminar to families.

ÇEVRESEL YAKLAŞIMLARIN TÜRKİYE'DE İÇ MİMARLIK EĞİTİMİNE YANSIMALARI

Derya Adıgüzel

İstanbul Kültür Üniversitesi, İstanbul, Turkey, 34303

Özet

Çevreye duyarlı iç mimarlık pratiğinin gelişimi için ise mesleki eğitimin kazandırdığı bilgi birikimi ve bilinç düzeyi belirleyici olmaktadır. Bu nedenle bu makalenin amacı Türkiye'deki mimarlık eğitiminin çevresel bağlamı üzerine bir durum saptaması yapmaktır. Bunu gerçekleştirebilmek çevresel tasarımın Türkiye'deki iç mimarlık bölümlerinin eğitim programlarına ne ölçüde yansıdığı araştırılmıştır. Araştırmada yöntem olarak müfredatın yapısının ders türleri, ders kredi ağırlıkları ve ders içerikleri üzerinden analiz edilmesi uygun bulunmuştur. Araştırmanın bulgularına göre Türkiye'deki içmimarlık eğitiminde çevresel tasarımın eğitim programının yapısında oldukça sınırlı bir biçimde yer aldığı saptanmıştır.

Anahtar Kelimeler: Sürdürülebilirlik, Çevresel Yaklaşım, İç Mimarlık, İç Mimarlık Eğitimi

Abstract

For environmentally sensitive interior architectural practice, knowledge and consciousness on this subject is important for students who are future interior architects. Therefore the purpose of this article is to make a determination of the current state of environmental design in interior design education in Turkey. The degree to which environmental design is reflected in the curricula of interior design departments was studied. The research was conducted by analyzing the curricula in terms of course types, course content and course-credit ratios. According to the research, it was discovered that environmental design exists in a very limited fashion within the curricula of interior design.

Keywords: Sustainability, Environmental Approaches, Interior Design, Interior Design Education

Giriş

Günümüz toplumlarının en büyük sorunu olarak görülen çevre sorunlarının hızla artması, insanları bu konuda araştırma yapmaya ve çözüm arayışına yönlendirmektedir. Çevresel tahribatı durdurmak için yeşil, ekolojik, eko ön ekli ve son olarak da tüm bu kavramları içerecek ve kapsamını genişletecek şekilde sürdürülebilirlik terimi altında çevresel yaklaşımlar geliştirilmektedir. Çevresel yaklaşımlar aracılığıyla çevre sorunlarını önleyecek uygulamalar, araştırmalar ve çözümler önerilmektedir. Hangi terimle ifade edilirse edilsin temel amaç çevre tahribatını önlemektir. Çevresel yaklaşımlar aracılığıyla tüm disiplinler doğaya olan etkileri bağlamında sorgulanmakta ve bu alanlara dair yeni tanımlar yapılmaktadır. Yapılı çevreyi şekillendiren tüm disiplinlere olduğu gibi iç mimarlığa da bu değişim süreci yansımakta ve iç mimarlara büyük sorumluluk düşmektedir.

Çevresel yaklaşımların iç mimarlık alanında önemi her geçen gün artarken ve farklı boyutlarda ele alınırken, bu tavrın eğitimde de yer almasının gereği anlaşılmaktadır (Ruff ve Olson, 2009). Bu bağlamda eğitim programlarında çevresel yaklaşımların nasıl ele alınabileceği veya alınması gerektiğiyle ilgili çeşitli araştırmalar ön plana çıkmıştır. Gürel (2010) makalesinde, çevresel yaklaşımlar çerçevesinde yürütülen iç mimarlık proje stüdyosunu analiz etmiştir. Proje sürecinde öğrencilerden çevresel tasarım kriterleriyle ürünler şekillendirmeleri beklenmiş, sonuç ürünler ve süreçte karşılaşılan sorunlar irdelenmiştir. Ayrıca farklı seviyedeki öğrencilere, anket çalışması uygulanarak çevreye duyarlı tasarım konusundaki bilgi birikimleri saptanmaya çalışılmıştır. Bir

başka çalışma ise Zuo vd. (2010) tarafından yapılmıştır. Araştırmacılar, iç mimarlık süreçlerinde enerji etkin tasarım amacıyla geliştirilmemiş olan Autodesk VIZ ve Sketchup programlarının, mekan tasarımının ilk evrelerinde geleneksel tasarım yöntemleriyle birleştirilerek pasif aydınlatma girdilerine yönelik olarak kullanılabildiğini, bunun da enerji verimli mekan tasarımına katkısı olduğunu saptamışlardır. Ayrıca çalışmalarında, performansa dayalı tasarım çerçevesinde kurguladıkları iç mimari proje stüdyosunda öğrencilerinin enerji etkin tasarım farkındalığı kazandıklarını belirtmişlerdir.

Yukarıda yer verilen araştırmalarında gösterdiği üzere çevreye duyarlı iç mimarlık ürünlerinin gelişmesi için gelecekteki uygulamaları yapacak bugün eğitim almakta olan iç mimar adaylarının, bu konudaki bilgi ve birikimleri önem taşımaktadır. Bu kapsamda öncelik Türkiye'deki iç mimarlık bölümlerin eğitim programları ve yapısal özellikleri analiz edilmiştir. Analizler doğrultusunda çevresel yaklaşımların iç mimarlık eğitim programlarındaki yeri ortaya konmuştur. Böylelikler öğrencilerin çevresel yaklaşım bilincinin eğitimde gelişmesine yönelik bulguların tartışılması hedeflenmiştir.

Araştırmanın amacı, kapsamı, sınırlılıkları

Makalenin amacı çevresel yaklaşımların Türkiye'deki iç mimarlık bölümlerinin eğitim müfredatına ne ölçüde yansıdığına dair bir durum saptaması yapmaktır. Çevresel yaklaşımların Türkiye'de bulunan iç mimarlık bölümlerinin eğitim programlarına yansımaları, ders türleri, ders listeleri, ders kredi ağırlıkları ve ders içerikleri üzerinden niceliksel yöntemlerle incelenmiştir. Eğitim programlarının zorunlu ve seçmeli dersleri bu bağlamda analiz edilen olgulardır. Bu bağlamda makalede, çevreye duyarlı tasarım anlayışının iç mimarlık eğitimindeki yeri ve öğrencilerin çevresel tasarım bilinç düzeyinin eğitimde geliştirilmesine yönelik öneriler tartışılmaktadır.

Bilindiği gibi iç mimarlık proje stüdyosu, eğitim programında en yüksek kredi ağırlığına sahip derstir. İç mimarlık eğitiminde proje stüdyoları teorik derslerde öğrenilenlerin harmanlandığı ve mesleğin pratiğine yönelik bütüncül bilgileri içinde barındırarak, eğitim programının merkezinde yer alır. Bu nedenle çevresel yaklaşımların proje süreçlerini ve ürünlerini etkilemesi kaçınılmazdır. Ancak, proje dersi yapısı gereği her yıl stüdyonun uygulanma yöntemine ve konusuna bağlı olarak içeriği yenilenmekte ve güncellenmektedir. Birçok girdiyi ve farklı bilgiyi içeren stüdyo sürecinin her öğrencinin farklı şekilde anlamlandırmakta olduğu düşünüldüğünde proje stüdyoları niceliksel yöntemlerle incelenen bu araştırmanın dışında bir alanı nitelemekte olduğu saptanmıştır.

Araştırmanın ikinci sınırlılığı da özellikle dersler ve içerikleri üzerinden yapılan okumanın biçimsel bir değerlendirme olduğudur. Dersin işleniş süreci ve bu süreçteki öğretim görevlisi öğrenci etkileşimi de çok önemli olgulardır. Ancak bir ölçme ve değerlendirme yapmanın güçlüğü, araştırmanın kapsamı dışında bırakılmasına neden olmuştur. İncelenen iç mimarlık[i] bölümleri 2011 Öğrenci Seçme ve Yerleştirme Sistemi Yüksek Öğretim Programları ve Kontenjanları Kılavuzuna göre öğrenci alan okullardır. Çalışmada iç mimarlık bölümlerin eğitim programlarına ait bilgilere internet üzerinden ulaşılmış ve bölüm bilgilerin güncelliği ve eksik bilgiler için iç mimarlık bölüm başkanlarıyla elektronik posta yoluyla iletişim kurulmuştur. Ders listelerinin, kredi ağırlıklarının ve içeriklerinin tümüne eksiksiz olarak ulaşılan iç mimarlık bölümleri çalışma kapsamında analiz edilmiştir. Fakat bu şekilde bilgilerine ulaşılamayan ve yeni bir yapılandırma içinde olduklarından güncel bilgileri eksik olan bölümler araştırmaya dahil edilememiştir[ii].

Türkiye'deki İç Mimarlık Eğitiminin Çevresel Yaklaşım Bağlamında İncelenmesi

Türkiye'deki iç mimarlık eğitiminin çevresel yaklaşım bağlamında incelenmesi iç mimarlık eğitiminde yer alan zorunlu ve seçmeli dersler üzerinden yapılmıştır. İç mimarlıkta çevresel yaklaşımların tartışıldığı konularla doğrudan veya dolaylı olarak ilgili dersler incelenerek konunun hangi boyutlarda ele alındığı ortaya konmuştur. Bu incelemeler derslerin kredi ağırlıkları ve ders içerikleri üzerinden yapılmıştır. Türkiye'de otuz altı iç mimarlık bölümü bulunmaktadır. Bu bölümlerin yirmi dördünün güncel ders kredi ve içerik bilgilerine eksiksiz ulaşılabildiği için araştırma kapsamında incelenebilmiştir[iii].

Çevresel Yaklaşım Üzerine Zorunlu Derslerin İncelenmesi

İç mimarlık bölümlerinin eğitim programında zorunlu dersler içinde doğrudan çevresel yaklaşımla ilgili derslere rastlanmamıştır. Çevresel yaklaşımla dolaylı olarak ilişkili zorunlu dersler belirlenerek, kredi ağırlıkları ve içerikleri incelenmiştir.

Fiziksel çevre kontrolü konularını içeren, enerji, iç mekan çevre kalitesi, su kullanımı konularına ilişkin dersler Yapı Fiziği Dersleri olarak ifade edilerek incelenmiştir. Hammadde kullanımı, yaşam döngüsünde enerji tüketimi ve iç hava kalitesine etkileri açısından Malzeme Derslerinin çevresel yaklaşımla kurgulanıp kurgulanmadığı analiz edilmiştir. Çevre-İnsan İlişkilerine Yönelik Dersler olarak tanımlanan "insan ve çevre, çevresel psikoloji, çevre ve insan ilişkileri" dersleri iç mimarlığın çevre ve insan etkileşimi boyutuyla değerlendirilmiştir. Böylece çevresel yaklaşım konuları zorunlu dersler içinde "Yapı Fiziği Dersleri", "Malzeme Dersleri" ve "Çevre-İnsan İlişkilerine Yönelik Dersler" başlıkları altında incelenmiştir.

Yapı Fiziği Dersleri

Yapı fiziği dersleri iç mekan çevre kalitesine etki eden aydınlatma, sıhhi tesisat, akustik, ısıtma ve havalandırma konularını içerir. Bu konu başlıkları düşünüldüğünde yapı fiziği dersleri enerji ve su gibi doğal kaynakların tüketimi ve iç mekan hava kalitesi açısından önemlidir. Bu bağlamda yapı fiziği derslerinde öğrencilere çevresel tasarım anlayışı kazandırabileceği düşünülerek incelenmiştir. Ders isimleri; bölümlere göre farklılık gösterebildiği için yapı fiziği dersleri belirlenirken ders içerikleri incelenmiştir.

Yapı fiziği ders içerikleri incelenerek, çevresel yaklaşım konuları doğrultusunda şekillenip şekillenmediği saptanmaya çalışılmıştır. İç mimarlık bölümlerinin eğitim programında yapı fiziği derslerinin klasik tasarım yöntemleriyle kurgulandığı, çevresel yaklaşım olarak adlandırılan tasarım süreçleriyle ilişki kurmadığı görülmüştür. Yapı fiziği derslerinde aydınlatma, akustik, tesisat ve ısıtma-havalandırma konularına ait bilgiler aktarılmakta; çevresel tasarım anlayışıyla ortaya çıkan yeni tanımlara yer verilmemektedir. Fakat üç iç mimarlık bölümünün yapı fiziği ders içeriğine çevresel yaklaşımla ilgili konuları dahil ettiği saptanmıştır.

Doğuş Üniversitesi, İç Mimarlık Bölümü, yapı fiziği ders grubunda incelenen Fiziki Çevre dersi geleneksel yapı fiziği konuları dışında "güneş enerjisi ve kullanımı" konusunu da içermektedir.

İstanbul Ticaret Üniversitesi, İç Mimarlık ve Çevre Tasarımı Bölümü, yapı fiziği ders grubunda incelenen Yapı Fiziği ve Fiziki Çevre I dersi içeriğine "alternatif enerji kullanımı ile ilgili bilgiler" de dahil edilmiştir.

İstanbul Teknik Üniversitesi, İç Mimarlık Bölümü, Yapı Fiziği Ders grubu içinde incelenen Fiziksel Çevre Kontrolü I dersi içeriği "Türkiye'de geçerli olan çevresel standartları ve yönetmelikleri" kapsamaktadır.

İç mekan çevre kalitesine yönelik çalışmalar artarken ve bu konunun insan sağlığı üzerindeki önemi farklı kesimler tarafından paylaşılırken, yapı fiziği derslerinin güncel gereksinimler karşısında revize edilmesinin gereği anlaşılmaktadır. Ayrıca, yapı fiziği derslerinin enerji etkin tasarım anlayışı, yenilenebilir enerji kaynaklarının kullanılması ve farklı enerji türlerinin araştırılması konularını içermesi, öğrencilerin çevresel bilgi ve bilinç düzeyini artıracaktır. Diğer yandan toplumlar yakın gelecekte su sıkıntısı nedeniyle önemli sorunlar (Erengezgin, 2006) yaşayacaktır. Bu nedenle çevresel yaklaşımla su kullanımını minimize eden ve kirli suyun arıtılarak yeniden kullanılmasını sağlayan teknolojiler (Hart, 1994 ve Jones, 2008) geliştirilmektedir. Yapı fiziği ders konularının bu kapsamda öğrencilere aktarılması, öğrencilerinin çevre bilincine katkı sağlayacaktır.

Malzeme Dersleri

Çevresel yaklaşımlar düşünüldüğünde en önemli ağırlığı malzeme alanı oluşturmaktadır. Çünkü çevre sorunları karşısında malzemenin, yerel, yaşam döngüsünde az enerji tüketmek ve geri dönüştürülebilmek gibi özellikleri taşıması gerekmektedir. Ayrıca iç mekan bitirme malzemeleri iç mekan hava kalitesini ve yaşam döngüsünde enerji tüketimiyle çevreyi olumsuz etkilemektedir (Kwok and Grondzik, 2007; Wilson, 2000; EPA,

2011a; EPA 2011b). Bu doğrultuda öncelikle iç mimarlık bölümlerinin ders içerikleri incelenerek malzeme konularını kapsayan dersler Malzeme Dersleri olarak nitelendirilmiştir.

İç mimarlık bölümlerinin eğitim programlarında malzeme dersleri, malzemelerin fiziksel ve kimyasal özeliklerini, mekanik etkiler karşısındaki davranışlarını içerecek ve cam, plastik, metal, gibi malzeme türlerini açıklayacak biçimde kurgulanmaktadır. Bu ders içeriklerine çevresel yaklaşımla malzeme alanında tartışılan konuların dahil edilmediği görülmektedir. Yalnızca İstanbul Teknik Üniversitesi İç Mimarlık Bölümü eğitim programında Yapı Bilgisi ve Malzeme II dersinin içeriği "malzemenin üretim, uygulama, bakım ve kullanım aşamalarına ait bilgilerin verilmesi; performans, malzeme özellikleri ve sürdürülebilirlik kriterleri bağlamında en uygun malzeme seçimi, malzeme standartları, malzeme sınıflandırma ve enformasyon sistemlerine" yönelik tasarlanmıştır. Bu derslerin içeriğinden malzemenin çevresel olmasıyla ilgili konuların hangi açılardan ele alındığı anlaşılmamaktadır. Öğrencilere bu konudaki temel bilgilerin verildiği görülmektedir. İç mimari tasarımının odak noktalarından biri olan malzeme konusunda çevresel yaklaşımlarla birlikte yaşanan değişimin bölümlerin eğitim programına gerekli ölçüde yansımadığı, ancak bu konuya ait bir bilincin; bazı bölümlerde öğrencilere aktarıldığı söylenebilir.

Çevre-İnsan İlişkilerine Yönelik Dersler

Çevre sorunlarının çözümünde insan merkezli yaklaşımlar yerine çevre merkezli yaklaşımlar önerilmektedir (Kang and Guerin, 2009). Bu doğrultuda iç mimarlık eğitim programında yer alan çevre-insan etkileşimine yönelik derslerin incelenmesi gerekli görülmüştür. Bölümlerin eğitim programındaki "çevre psikolojisi, çevre ve insan ilişkileri, insan ve çevresel faktörler, çevre ve insan, çevre ve kültür" dersleri bu kapsamda çevre-insan ilişkilerine yönelik dersler şeklinde adlandırılarak incelenmiştir.

Çevre-insan ilişkilerine yönelik dersler çevresel algı ve biliş konularını ve bunların iç mimari tasarıma yansımalarını içermektedir. Bu derslerde insan algısını ve davranışını etkileyen çevre, hem kişisel hem de sosyal açılardan ele alınmaktadır. Çevre-insan ilişkilerine yönelik dersler psikolojiyi temel alarak insan merkezli kurgulanmakta, doğal çevre, yapay çevreye olan etkileri üzerinden ele alınmaktadır. Bu anlayışla çevre sorunları sonucu ortaya çıkan değişimlerle bağlantı kurulamayacağı düşünülmektedir. Fakat çevre-insan ilişkilerine yönelik ders içeriğine çevreyle ilgili yeni tanımlamaların dahil edildiği üç iç mimarlık bölümü bulunmaktadır.

Başkent Üniversitesi, İç Mimarlık ve Çevre Tasarımı Bölümü eğitim programında zorunlu ders olarak bulunan İnsan ve Çevre 1 dersinin içeriğinde geleneksel çevre tanımlamalarının dışında çevre sorunları, çevre konusunda güncel tartışmalar ve sürdürülebilirlik konularına da bulunmaktadır.

Kadir Has Üniversitesi, İç Mimarlık ve Çevre Tasarımı Bölümü eğitim programında zorunlu ders olarak bulunan Çevresel Tasarım ders içeriğinde "tasarımın insan sağlığına etkileri, katılımcı tasarım yöntemleri, sürdürülebilirlik, herkes için tasarım" gibi genel modüller ve çevresel analiz teknikleri yer almaktadır.

Okan Üniversitesi, İç Mimarlık Bölümü eğitim programında zorunlu ders olarak bulunan Tasarımda Çevre Etkeni dersi sosyal, doğal ve yapılı çevre kavramlarını kapsamakta, ayrıca "doğal çevre alanları, sınırlı doğal kaynakların yönetimi ve sürdürülebilir çevre vurgusu da dersin yapı taşlarından" olmaktadır.

Sözü geçen bölümlerin dışındaki iç mimarlık bölümlerinde çevre-insan ilişkilerine yönelik ders içeriklerinde çevreyle ilgili güncel tartışmalara yer verilmektedir. Kuşkusuz, bu dersler insan psikolojisi ve algısı üzerinden farklı bir alan tanımlamakta ve zorunluluk arz etmektedir. Ancak insanın yaşamını daha iyi sürdürebilmesi için doğayı merkez alarak hareket etmesi gerekmektedir. Çevre sorunlarına tüm sistemleri içerecek ve dahil edecek şekilde bütünsel bir anlayışla bakıldığında çözüme ulaşılabileceği öngörülmektedir. Yapılan incelemeler sonucu bu değişimlerin iç mimarlık eğitim programlarında bir farklılaşmaya neden olmadığı, çevre-insan ilişkilerine yönelik ders içeriklerinin insan merkezli kurgulanmaya devam ettiği anlaşılmaktadır.

Çevresel Yaklaşım Üzerine Seçmeli Derslerin İncelenmesi

Seçmeli derslerin içerikleri incelenerek doğrudan çevresel duyarlılık ve bilinç kazandırmaya yönelik "ekoloji, ekolojik tasarım, sürdürülebilirlik, sürdürülebilir tasarım, güneş enerjisi, akıllı bina sistemleri" konularını içeren dersler belirlenmiş ve Çevresel Yaklaşım Odaklı Dersler olarak ifade edilmiştir. Seçmeli derslerin kredileri ve içerikleri incelenerek, doğrudan çevresel tartışma alanlarıyla ilgili dersler saptanarak Tablo 1'de ortaya konmuştur.

Bilgileri incelenen 24 iç mimarlık bölümünün 14'ünde seçmeli dersler türü içinde çevresel yaklaşım odaklı ders bulunmaktadır. Bu da iç mimarlık bölümlerinin %58,33'üne denk gelmektedir. Öte yandan ders isimlerinden de anlaşılabileceği üzere dersler farklı çevresel yaklaşım konularına yöneliktir. Bu derslerin içerikleri çevresel yaklaşımların tartışıldığı konular çerçevesinde analiz edilerek ana başlıklar altında gruplandırılarak incelenmiştir.

Çevreyle İlişkili Kuramsal Dersler

İç mimari tasarım ve uygulamalarının estetik açıdan insan gereksinimlerini karşılarken çevresel yaklaşım özelliklerine de sahip olması beklenmektedir. Sürdürülebilir, ekolojik, ekolojik tasarım ve sürdürülebilir tasarım gibi terimler altında konun kuramsal ve uygulamaya dönük temeli kurulmaya çalışılmaktadır. Böylesi bir anlayışla öğrencilere çevresel yaklaşımların aktarılmasının hedeflendiği dersler, altı iç mimarlık bölümünde bulunmaktadır.

Çevreyle ilişkili kuramsal dersler bölümlerinin çevresel yaklaşım odaklı dersleri içerisinde en yüksek sayıya sahiptir. Böylelikle bölümlerin eğitim programında, seçmeli derslerde çevrenin kurumsal boyutuna yer verildiği söylenebilir. Çevreyle ilişkili kuramsal derslerin içerikleri farklılık göstermekle birlikte, genel kurgu çevresel sorunları ve nedenleri, doğal kaynak kullanımı, ekoloji, ekosistem tanımları ile ekolojik ve sürdürülebilir tasarımın ne olduğunun açıklaması şeklindedir. Derslerde çevresel yaklaşımlar zaman boyutuyla birlikte incelenmekte ve doğal kaynakların gelecek kuşaklara da iletilmesine değinilmektedir.

Çevresel Teknolojiye Yönelik Dersler

Çevresel yaklaşımlarla birlikte teknoloji alanında da değişimler yaşanmaktadır. İç mimarlıkla doğrudan ilişkili, kullanıcı konfor koşullarını, enerji ve su verimliliğini sağlayan akıllı bina teknolojileri bulunmaktadır. Ayrıca, kaynak kullanımıyla ilgili kararların iç mimari tasarım sürecinde daha kolay alınmasına olanak tanıyan bilgisayar simülasyon programları mevcuttur. Bu doğrultuda çevresel yaklaşım odaklı dersler içerisinde çevresel teknoloji konularıyla ilgili dersler tartışılmıştır.

Akılı mekan tasarımına yönelik dersler, çevresel yaklaşım odaklı ders içinde çevreyle ilişkili kuramsal derslerden sonra en yüksek sayıya sahiptir. Çevresel yaklaşımla birlikte tanımı ve uygulama şekli geliştirilen akıllı bina kavramının iç mimarlık eğitim programında yer alması; öğrencilerin çevre bilinç düzeyinin artırılmasında önem taşımaktadır. Ayrıca iç mimarların akıllı bina ve mevcut yapıların akıllı mekanlara dönüştürülmesi uygulamalarında çalışıyor olması bu derslerin gerekliliğini artırmaktadır.

İç mimarlık bölümleri içinde bilgisayar teknolojilerinin çevresel anlayışla kullanımına yönelik olarak yalnızca İstanbul Teknik Üniversitesi'nde Bilgisayar Yardımı ile Yerleşme ve Bina Gölge Analizi dersi bulunmaktadır. Bu dersin içeriği güneşe göre yapının araziye yerleşmesi ve değerlendirmesi şeklindedir. İç mimari tasarımın temsilinde kullanılan bilgisayar programlarının ara yüzlerinden çevresel tasarım amacıyla da yaralanılabilir. Bu da öğrencilerin çevresel bilgi ve bilinç düzeyine katkı sağlamaktadır.

Sonuç olarak az sayıda iç mimarlık bölümünde çevresel yaklaşımla tanımı ve uygulama şekli değişen akıllı bina sistemleri konusunda derslerin olduğu anlaşılmaktadır. Çevresel yaklaşımla geliştirilen güncel bilgisayar teknolojileri konusu iç mimarlık eğitimine henüz yansımamıştır.

Enerji ve Kaynak Kullanımına Yönelik Dersler

Enerji konusu çevresel tasarımın başlıca konularından biridir. Çevresel yaklaşımla geliştirilen yapı teknolojilerin çoğu enerji gereksinimini azaltmaya yöneliktir. İç mimarlık alanında enerji kullanımı malzemenin gömülü enerjisinin dikkate alınması, aydınlatma ve iklimlendirme tasarımda enerji verimli araç ve donatıların seçilmesiyle minimize edilebilir (Jones, 2008; Keonil and Sahachaisaeree, 2010).

İç mimarlık bölümlerinin sadece ikisinde enerji ve kaynak kullanımına yönelik derslerin bulunduğu görülmektedir. Konun önemi düşünüldüğünde bu sayı ve oranlar yetersiz kalmaktadır. Enerji gereksiniminin her geçen gün artığı göz önünde bulundurularak, bu alandaki derslere iç mimarlık eğitim programında daha fazla yer verilmesinin zorunluluk haline geleceği düşünülmektedir.

Çevresel Ekonomiye Yönelik Dersler

Çevre sorunları artıkça ekonomik gelişmeler ve üretim süreçleri; çevre odaklı olarak yeniden değerlendirilmektedir. İç mimarlık alanında mevcut yapının yeniden kullanılmasına imkan vermesiyle çevresel anlamda ekonomik bir yaklaşım sunmaktadır. Ayrıca iç mimari tasarım ve uygulamalarda maliyet analizlerinin çevreyi de kapsayacak biçimde genişletilmesi, çevreye ve ekosisteme zararın azaltılmasını sağlayacaktır. Bu doğrultuda sadece Bilkent Üniversitesi, İç Mimarlık ve Çevre Tasarımı Bölümü'nde Çevresel Yönetim dersi bulunmaktadır.

Çevresel Yönetim dersi iç mimarlığın çevresel ekonomi boyutu çerçevesinde kurgulanmıştır. Ders çevre yönetimi, çevresel kararlarının ekonomik ve örgütsel boyutu ve bina ekonomisi konularını içermektedir. Çevresel Yönetim dersi, bölümün çevresel yaklaşım odaklı ve iç mimarlık bölümleri içinde çevresel ekonomi alanına yönelik tek derstir.

İç mimari tasarım süreçlerinin maliyetine ve iş süreçlerinin hesaplanmasına yönelik olarak eğitim programında bulunan derslerin çevresel ekonomi konularını da içermesinin gereği anlaşılmaktadır. Ancak, incelemelerden de anlaşıldığı üzere çevresel ekonomi konusunu içeren derslere iç mimarlık eğitim programında yeterli ölçüde yer verilmektedir.

Çevresel Yaklaşım Üzerine Zorunlu ve Seçmeli Derslerin Değerlendirmesi

İç mimarlığın temel bilgisine yönelik olan ancak çevresel yaklaşımlar çerçevesinde yeniden tanımlanan konular, iç mimarlık eğitim programında Yapı Fiziği Dersleri, Malzeme Dersleri, Çevre-İnsan İlişkilerine Yönelik Dersler başlıkları altında incelenmiştir. Bu incelemeler öncelikle derslerin kredi ağırlığı, zorunlu dersler içerisindeki oranı ve ders içeriği üzerinde yapılmıştır. Sonrasında; çevresel yaklaşımlarla bu derslerin kurgulandığı iç mimarlık bölümleri aynı yöntemle analiz edilmiştir. Bu veriler doğrultusunda bölümlerin çevresel yaklaşımla kurgulanan zorunlu dersleri ve bu derslerin zorunlu dersler içerisindeki oran dağılımı Tablo 2'de ortaya konmuştur.

Tablo 2. Çevresel Tasarımla Kurgulanan Zorunlu Derslerin Kredi Oranları

Üniversiteler	Yapı Fiziği/ Zorunlu Ders Oranı %	Malzeme/ Zorunlu Ders Oranı %	Çevre-İnsan İlişkilerine Yönelik Dersler/ Zorunlu Ders Oranı %	Toplam %
Başkent Üniversitesi	-	-	1,79	1,76
Doğuş Üniversitesi	3,94	-		
İstanbul Ticaret Üniversitesi	6,28	-	-	6,28
İstanbul Teknik Üniversitesi	4,08	4,08	-	8,16
Kadir Has Üniversitesi	-	-	2,65	2,65
Okan Üniversitesi	-	-	2,27	2,27

Tablo 2'de görüldüğü üzere incelenen 24 iç mimarlık bölümünün sadece altısında zorunlu dersler içinde çevresel yaklaşımla kurgulanan dersler bulunmaktadır. Eğitim programdaki zorunlu derslerde, çevresel yaklaşım konuları az sayıda derslerle kısıtlı kalmaktadır.

Seçmeli derslerin analizine göre Türkiye'deki iç mimarlık bölümlerinin ortalama yarısında doğrudan çevresel tasarımla ilgili, çevresel duyarlılık ve bilinç kazandırmaya yönelik seçmeli dersler bulunmaktadır. Bu dersler çevresel tasarımın farklı konularını içermekte ve çeşitlilik sunmaktadır.

İç mimarlık bölümlerinde en yüksek orana sahip çevreyle ilişkili kuramsal dersler, çevresel yaklaşım konusunun sürecini, tanımını, tartışma alanlarına ait temel bilgilerin verilmesine ilişkindir. Sonrasında ders sayısı açısından, içerikleri akıllı bina sistemleri ve bilgisayar simülasyon programları olan çevresel teknolojiye yönelik dersler gelmektedir. Çevresel tasarım tartışmalarının odağında olan enerji sorunu ve bunların çözümüyle ilgili dersler sadece üç iç mimarlık bölümünde bulunmaktadır. Çevresel ekonomi alanındaki konuları ve tartışmaları içeren tek ders Bilkent Üniversitesi'ndedir. Çevresel yaklaşım odaklı en fazla sayıda ders olan İstanbul Teknik Üniversitesi'nde; çevresel yaklaşımla ilgili tasarım, enerji ve teknoloji alanlarına yönelik dersler bulunmakta ve enerji konulu dersler en yüksek sayıda olmaktadır. Bu dersler çevresel yaklaşımların farklı konularını içermesi açısından çeşitlilik sunmaktadır. Ancak incelenen iç mimarlık bölümlerinin yaklaşık yarısında, seçmeli dersler içinde çevresel yaklaşım konularıyla ilgili derslerin bulunması yetersiz bir değer ifade etmektedir.

Sonuç ve Öneriler

Çevre sorunları karşısında; disiplinlerarası araştırma ve uygulama alanlarını kapsayan çevresel tasarımların, farklı yapılı çevre ölçeklerinde tanımlanması ve tartışılması önem taşımaktadır. Ayrıca, çevresel tasarım anlayışının kentsel bağlamdan başlayarak alt birimlere inecek şekilde bina ve iç mekan tasarımına kadar analiz edilmesi gerekli görülmektedir. Çevreye duyarlı iç mimarlık ürünlerinin gelişmesi içinse, bugün eğitim alan geleceğin iç mimarlarının, bu konuda bilgi birikimi ve bilinci kazanmış olması önem taşımaktadır. Bu bağlamda araştırmada, çevresel tasarımların Türkiye'deki iç mimarlık bölümlerinin eğitim programlarına ne ölçüde yansıdığı, ders türleri, ders kredi ağırlıkları ve ders içerikleri incelenerek analiz edilmiştir.

Öncelikle eğitim programlarının yapısından söz etmemiz gerekir. Bu kapsamda ilk karşılaştığımız konu zorunlu derslerdir. Yapılan araştırmanın sonuçlarına göre Türkiye'deki iç mimarlık bölümlerinin eğitimin programında, zorunlu dersler içinde doğrudan çevresel yaklaşım konularını içeren çok az sayıda ders bulunmaktadır. İncelenen 22 iç mimarlık bölümünün yalnızca yedisinde, çevresel yaklaşımla kurgulanan veya çevresel yaklaşım konularının dahil edildiği iç mimarlığın temel bilgisine ilişkin olan az sayıda zorunlu ders bulunmaktadır. Bu bölümlerinin ortak noktaları hepsinin 2000 yılından sonra kurulmuş olmalarıdır. Bu kapsamda, bölümlerin yeni kurulmuş olmasının eğitim programlarının çevresel tasarım gibi güncel konuları içermeyi kolaylaştırdığı söylenebilir. Ancak, yine de bu bölümlerin dışında çevresel yaklaşım gibi güncel bir konunun eğitim programına yansımadığı çok sayıda yeni kurulmuş iç mimarlık bölümleri bulunmaktadır.

Eğitim müfredatının yapısına ilişkin incelenen ikinci konu ise seçmeli derslerdir. Buna göre Türkiye'deki iç mimarlık bölümlerinin %54,55'inde doğrudan çevresel yaklaşımla ilgili, çevresel duyarlılık ve bilinç kazandırmaya yönelik seçmeli dersler bulunmaktadır. Bu dersler çevresel yaklaşımların farklı konularını içermekte ve çeşitlilik sunmaktadır. Ancak burada ders türünün seçmeli olması, güz veya bahar dönemi ayrımının olması, açılmama olasılığı veya bölümün seçmeli dersler için önerdiği derslerin sayısının fazla olması ve öğrencilerin seçmeme olasılığı gibi çok sayıda soruna işaret edebilir. Bu nedenle, çevresel yaklaşım odaklı derslerin sadece seçmeli dersler içerisinde ve az sayıdaki üniversitede bulunması yetersiz bir değer olmaktadır. Türkiye'deki iç mimarlık programları açısından seçmeli dersler arasında çevresel tasarımın öne çıkan konularıysa çevresel yaklaşımların kuramsal bilgisinin verilmesi ve çevresel teknoloji bağlamında tartışılan akıllı bina teknolojileridir. Çevresel tasarımın kuramsal bilgisi çevreci mekan tasarımı nasıl olur sorusunun cevabı niteliğindedir. Çevresel tasarım konusunda detaylı kuram-eleştiri tartışmasının yapılmadığı, özellikle konunun eleştirel boyutunun geri planda kaldığı anlaşılmaktadır.

İç mimarlık eğitiminde, çevresel tasarım stratejileri ve yöntemleriyle ilgili bilgiler bir şekilde öğrencilere kazandırılmaya çalışılmaktadır. Ancak bunların ideal bir çözüm olarak öğrencilere sunulup sunulmadığının sorgulanması gerekmektedir. Bu tasarım stratejileri ve uygulamalarının değişken yapısı göz önünde bulundurulduğunda öğrencilerin anlama ve yorumlama becerileri arasındaki fark önemli bir etken olarak ortaya çıkmaktadır. Eğitim programlarında, çevresel tasarımın nasıl olacağının yanında eleştirisinin de yapılması, öğrencinin konuyu anlamlandırmasına izin verecek detaylı kuramsal bilginin verilmesi önemli görülmektedir. Sonuçta, çevre sorunlarına çözüm arayışında geliştirilen terimlerin ve teknolojilerin moda ve tüketim nesnesi haline geldiği, çevre sorunlarının öneminin ikinci plana itildiği göz ardı edilmelidir. Bu kapsamda da çevresel tasarımları sorgulayabilecek kuramsal-eleştirel, bilgi ve bilincin öğrencilere verilmesinin gerekli olduğu düşünülmektedir.

COLLABORATIVE LEARNING UNDERSTOOD TROUGH A MICRO-LEVEL ANALYSIS OF BUILDING COMMON PROFESSIONAL KNOWLEDGE IN MENTOR-MENTEE INTERACTIONS

Mihaela Mitescu Lupu

University of Arts "George Enescu" Iasi, Str. Horia 7-9. 700126. Iasi, Romania

Abstract

The analysis proposed in this article is situated at the micro-level of inter-individual formative encounters between a teacher-mentor and a beginning teacher, participants in program for initial teacher education. Findings of this analysis indicate that whilst engaged in collaborative work on the object of their activity – building common professional knowledge as part of the professional identity formation process – the participants come to shape the space of their joint exploration of the tools available and engage in producing their professional culture, by generating between them a space of communication where tools are to be born, transformed, melted into practice, questioned and then transformed again. In return, the conceptual actions performed function as maps for participants' expanding professional agencies. This work has been supported by CNCSIS -UEFISCSU, project number PN II-RU 21/2010.

Keywords: beginning teacher, mentoring, collaborative learning

Introduction

The tendency to consider all collaboration and partnerships unequivocally valuable and commendable for the creation and transposition of teacher knowledge has been challenged over the past decade (Orland-Barak & Tillema, 2006; Baumfield & Butterworth, 2007). Potential characteristics, conditions and principles of collaboration along with models of professional development are beginning to be scrutinized in discourses within current educational research with a more critical intent.

In this article an analysis of collaboration within the space of the collaborative work of one teacher-mentor and one beginning teachers is proposed. The conversational act we'll be focusing on in this analysis is located in a program for initial teacher education arranged as a partnership between a university and schools. The conceptual tools provided by the taxonomic levels of collaboration elaborated by Engeström et al (1997) are employed to form an understanding of the manner in which individual participants engage in interactions and come to shape their collaboration as a space where questioning and transforming the available rules, actions and tools are possible and bound to shape collaborative learning as 'communication' (see Engeström et al., 1997).

The claim in the analysis presented here is that collaboration enacted as an opportunity to communication opens up opportunities for learners to engage with producing their professional knowledge and appropriate increasingly wider horizons of questioning, authoring and positioning in it by means of joint exploration of the motives, tools and rules available in the various sets of professional practice. Findings of this analysis indicate that whilst engaged in collaborative work with the object of their activity – building common professional knowledge as part of the professional identity formation process– the teacher mentor and the novice-teacher come to shape the space of their joint exploration of the tools available and engage in producing their professional culture, by generating between them a space of communication where tools are to be born, transformed, melted into practice, questioned and then transformed again. In return, the conceptual actions performed in the course of working with the tools of their profession function as maps for participants' expanding professional agencies. By means of questioning the tools available and possible actions with them in various contexts of professional practice, participants come to legitimately appropriate them and whilst it, affirm and explore their professional identities. Role-boundary erosion becomes visible as both teacher mentor and

intern-teacher engage in turn taking to question, author and position in the problem spaces they collaboratively work on.

Method

Tools for identifying learning in the discourse of the formative assessment meetings between intern-teacher and teacher-mentor

The conceptual tools for the proposed analysis were located in Stenning et al (2002)'s chains of actions uniting *problematizing*, *authorship* and *positioning* as indicators for participants engaging with the tools and object of activity. *Problematizing* stands for identification of contradictions or questioning the context of activity in its current functioning. Locating a problem presupposes the potential of opening a new problem space or exploring the object currently worked upon from a fresh new perspective. *Authorship* stands for participants positioning in conversational chains, so that their voices are heard; what could be authored is either arguments supporting a claim, explanations or any other expressions exploring alternatives for action relevant to the object worked upon. *Positioning* stands for actions expressing a stance in relation to the object being worked upon; recognizable in "I" statements, positioning becomes the sign of recognizing one's agency in the activity and of identity in the context.

The conceptual tools helping localize the language where collaborative actions set up as communication (Engeström et al, 1997) are present in the teachers' conversation were found in Edwards' notion of *dialogical reasoning* (Edwards, 2005b). Developed from the notions of *dialogic inquiry* (Wells, 1999) and *exploratory talk* (Mercer, 2004), the concept Edwards proposes places emphasis on the public (dialogical) character of reasoning – visible in language in the manner of structuring the lines of questioning, arguing and contradiction - for which internalizing (Vygotsky, 1987) dialogues with others is an essential constitutive dimension. Understood as exploration and dialogue, reasoning –as Edwards argues - escapes the privacy of the individual mind and becomes visible in language as a space where multiple voices engage in disputational, cumulative or exploratory (Mercer, 2004) actions on the activity object. *Disputational talk* is characterised by disagreement and individualized decision making. There are few attempts to pool resources, to offer constructive criticism or make suggestions. *Cumulative talk*, presupposes that speakers build positively but uncritically on what the others have said. Partners use talk to construct common knowledge by accumulation. Cumulative discourse is characterized by repetitions, confirmations and elaborations. *Exploratory talk* is considered that in which partners engage critically but constructively with each other's ideas. Statements and suggestions are offered for joint consideration. These may be challenged and counter-challenged, but challenges are justified and alternative hypotheses are offered. Partners all actively participate and opinions are sought and considered before decisions are jointly made. Compared with the other two types, in exploratory talk knowledge is made more publicly accountable and reasoning is more visible in the talk.

Engaging in dialogue and exploration (as arguing for alternatives of action and response) is considered in this analysis a form of participation confirmatory for both the activity and the engagement of participants with its object and tools. Both sets of conceptual tools proposed are employed in putting forth an understanding the activity of learning to be a teacher as one that is anchored in a context with which develops a reciprocity, visible in the interplay between tools transformation and participants transformation.

Setting up the study

The analysis presented here is part of a larger study aiming at exploring collaborative learning in the context of initial teacher education. The program of teacher education where the conversational episodes between teachers were taken from could be described as a program providing a formative experience that takes the student-teachers to practical school-based activities up to two thirds of its entire duration. For this reason, the program is often referred to in institutionally relevant documents (i.e. course books, mission statement, website,

etc) as 'an internship'. The program consists of a curriculum where the time spent by intern-teachers in school-based activities covers 24 out of the total 36 weeks of the program, while the time spent within the university is spread throughout the whole year and reference to these in the paper will be made through the phrase 'departmental weeks'. The beginning-teachers are gradually introduced in the space of the school during the first four months of the program, when the duration of their presence in the school increases from one day a week in the early stages of the program to full-time school-based activity by the end of the 14th week in the course of the program (early January in the university year). The full-time presence of the beginning-teacher in the school for two-thirds of the program justifies calling their experience an internship for teaching.

Participants in the data proposed for analysis in this article agreed to having me present in their weekly formative assessment sessions with the teacher mentors during the school based periods of the program (from March until end of May). In these sessions I have observed and voice-recorded conversations between the participants. The audio-data were transcribed at a later stage and then analyzed as micro-sequences of activity able to provide relevant information about the way(s) in which collaboration was structured within the formative context of the weekly assessment sessions. The participants in the analyzed episode are Dan – male, 23 years old, who pursued his undergraduate studies at the same university where he also took the post-graduate program in initial teacher education – and his teacher mentor – Dana – who was 26 years old and herself a graduate of the same university in both bachelor and masters degrees.

Collaborative learning objectified in intern-mentor speech interactions

Dan and Dana discuss one of the performance descriptors in relation to which the intern needs to show that he had produced relevant proof of work in the classroom exhibiting his accomplishment of the standard performance imposed by the national authority embodied by an Agency for Training and Development in Schools (ATDS). In the speech events analyzed in this paper, the two participants focus on the beginner's mastery of *pitch* – a metaphor signifying a set of teaching tools (clues, problems, concepts, questions, etc) used to stimulate students' participation in the classroom task at a superior level of comprehensive action and practical approach than the current one. The level of coordination between the pitch technique used and the students' actual needs must be perfect, as too low or too high pitches are equally inefficient, students' refusing to engage at the desired level of comprehensive and practical action, either because they lack the tools to do so (the pitch is too high) or because they trivialize the task by considering too easy (the pitch is too low).

The speech acts proposed for analysis are relevant for the way in which the teacher-mentor and the beginning teacher come to explore deeper theoretical facades of the various aspects of practical, classroom based actions. They start off at exploring a contradiction between what the beginning teacher believed was an appropriate level of difficulty for the year-group he used his *pitching* technique with. This contradiction proves generative enough for the two to engage in pursuing reflective action on two trajectories: one *vertical trajectory* of knowledge arising in the actions of exploring theory into practice and vice versa, and one *horizontal trajectory* of searching for arguments in spaces of action expanding from the confines of the classroom to those of the school and further of the community at large.

This exploratory work becomes visible in the language the two participants employ in their meetings when they problematize (question) the actions or parts of actions, author possible alternatives for building common knowledge and then position in relation to those alternatives.

Learning as participation to a collective discourse of practice

Learning appears as a shared responsibility and a public enterprise, an open space where multiple-voice discourses come into play in decision-making actions. In Excerpt 1 an example of teachers talk is presented; this example is relevant for how the multi-voiced exploratory talk is shaped in participants' discourse:

Excerpt 1 : Mentor [m]-Intern [i] formative assessment session during S1 [3]

```
1      M: Ok (.) ehm (.) pitch we've already talked about that one
2      M: I just put it in there because it happened a few times with year ten (.) but I have to say yest'day wasn-
3      I:                                              [yeah
4      M: an  issue (.) ehm so (.)
5      I:                        [yeah::
6      M:              I don't think this is really necessarily more
7      I:                                      [no no no no it was just with that (.) one or two lessons of Radiation 1
8      M:                                                                        [I think (.) I just tick a radiation topic
9      M: keep it really dumb down
10     I:               [yeah:::
11     M:            [an' I mean  (.) the thing is if you're not sure how far to go  in terms of  keeping it
12      M: down (.)
13     I:       [yeah
14     M: talk to the teacher of the group
15      I:                                    ok
16     M: I mean with year ten I would just say  as low as possible
17     I:                            [ yeah
18      M: and  NAME1   would say to me different for year seven and year twelve obviously NAME2 (.)
19     I:             [yeah I know
20      M:  she sort of said the pitches she approaches a bit like you're doing  (.) so you know
```

   The discourses of absent members of the relevant professional practice is evoked here and come as support and constitutive part of the mentor's argument in exploring reasons why should a certain differentiation strategy work in a certain pedagogical context. Dana employs in her speech the conditional mode of addressing (L6). Using this particular modal form makes Dana's utterance bare the significance of 'as if NAME1 was here and saying this now', thus creating the sense of an agora where multiple members of the professional practice voice knowledge, share meanings and permanently engage in dialogical thinking with absent others, considering the many positions and stances they may take in the matter under scrutiny. This action makes visible the collective enterprise that producing professional knowledge is, an activity in which beginner and mentor are engaged by committing to building common understandings of the pedagogical tools the teachers use in their work with various groups of students.

Participation as exercising agency through engagement in producing professional culture in the course of exploring available conceptual and material tools

   The language in the two teachers' talk shows learning to be an activity in which both teacher mentor and student teacher engage with comparable discursive means crossing stages of identifying problem spaces, authoring alternatives of action and positioning through 'I' statements in relation to the alternatives. In the course of engaging in building common knowledge, role-boundaries are eroded and the learner –teacher dyad appears in many shifting moves with both participants engaged in learning.

   Opened by the assertive positioning of the intern in assessing the efficiency of the pitch used with one year-group, the conversational episode is imbued with examples of exploratory talk between mentor and beginner in which through turn-taking to authoring practice based observations about why the specifications of a scheme of work concerning one particular pitch didn't fit with the year group it was recommended for, the two participants

---

join in a variety of attempts to problematizing available tools (specifications in schemes of work). This turn-taking episode in exploring shared knowledge (explicit in 'we' statements the mentor uses, in the supportive manner of emphasizing shared emotions through paraverbal characteristics of mentor's speech and many confirmations in both intern's and mentor's speech) is conducive of the beginning teacher's use of the common ground created in the conversation through linguistic tools in order to exhibit professional agency through language packed with 'I' statements indicative of position taking about his field observations related to his use of available teaching tools. In Excerpt 2 an example of this sort of teachers' talk is presented.

Excerpt 2: Mentor [M]-Intern [I] formative assessment session during S1

44   I: I saw the bias on my supervision (.) like the higher the lower (.) they just need to know 'bout
45   I: the chain reaction and that's 'bout it
46   M: [yeah yeah
47   I: and it was kind of like right uhm I wish I'd know that
48   M: [an' the thing is they've got that 'cause your room analogy was excellent
49   I: [yeah
50   M: and that was really positive because I've actually I've never heard that analogy before
51   I: [ok
52   M: and I'm gonna use that (.) because it's <u>such an easy</u> way to explain it

Whilst exploring the contradiction between student-teacher's expectations as to what the teaching tools (i.e. textbooks, schemes of work) available in the planning phase of a lesson promise and what they actually cover as teaching information and suggestions needed, the mentor-teacher ends in exploration of a teaching tool (i.e. an analogy) the beginning teacher has successfully used in his practice with a group of pupils. The fact that the new tool becomes one to be included in the mentor's teaching repertoire shows that learning is far from reduced to a one-way enterprise. The novelty of the student-teacher's view on what could work in the classroom challenges mentor's old practices and provokes a widening of her own horizon of thinking about available teaching tools.

Another type of contradiction becomes visible due to the manner in which the two participants author and position themselves in relation to the tools and practices of their profession. The contradiction is at the level of the role played by the teacher-mentor. Traditional mastery-type conceptions of expertise and consequently of the mentoring role are incompatible with the fashion of structuring learning in this dialogical episode between the beginning-teacher and his mentor. Transfer of expertise from a more experienced to a novice member of a professional practice is not the point here, as it is engagement with building common knowledge, an enterprise by which the two embark on producing their professional knowledge. This is the object of their inter-actions.

In this manner of understanding and filling roles during formative sessions the beginner is afforded a more agentic role in the making of his learning trajectory which becomes an exploratory enterprise within the space of acting and thinking like a teacher. Through 'I' statements and using a succession of active verbs at present tense the student-teacher positions himself within the dialogical space used for displaying and exploring expert-like tools for pedagogical reasoning.

Learning as appropriation of expanding horizons for problematizing and exploratory participation to collectively producing professional knowledge

In the following turns in conversation, Dan takes leadership in opening a new problem space and firmly positions in how he feels towards the recommended usage of the pitch. Opened for explorations the problem of explicitly lowering the pitches elicits argumentative work that takes the teacher mentor and the beginner through various routes of reasoning and therefore exposing for exploration new objects and tools.

Whilst the teacher mentor argues for the school having to respond to the requirements of a program providing it with technological support in return of the science curriculum being inclusive of all children in the school, Dan opens a new problem space, expanding his questioning over the epistemological implications of the school's requirements. He positions unequivocally in what he thinks not to be a good assessment policy – that of communicating target grades to the students.   The 'target grades' refer to the school's policy of communicating

to pupils their results in tests and to emphasize the higher level of acquisition and performance they could reach out to. The beginning teacher attempts an exploration of an issue that emphasizes the *vertical dimension of building knowledge* – that of theory growing into practice and practice growing into theoretical tools for action. His language is fractioned and exploratory in both content and structure of phrasing. Many words are attempted, then dropped showing that in the search of what could be the best possible way to express his thoughts, his own thinking is organized in relation to the meanings of the many possible signifiers and possible phrasing. In this search, the idea he's looking for links to what looks like knowledge related to another culture - one that most likely relates to his readings at the university, and is rather research informed - than that of the context of practice which he subjects to reflection. The idea he's authoring is that consequential to the school practices of assessment, young people may not base their motivation for learning on anything other than extrinsic factors and may miss the satisfactions and rewards that learning encapsulates in itself.

A new problem space, wider than that of policies and practices objectified in the school, is identified by the mentor in the requirements of the national body for inspecting, assessing and regulating the activity in schools and institutions providing educational and care services in the country.

The horizon of exploring the implications of classroom teaching are thus expanded to the level of the national school system upon which the governing authority of control and regulation is exercised by a national agency. This does not mean that the explorations end for either the beginner or the mentor once the name of the authority figure has been thrown in the conversation. What follows is a series of disputational episodes in which both participants take the stage to problematise, author and position, creating opportunities for learning . Excerpt 3 presents one of the disputational episodes in the teachers' talk:

Excerpt 3 : Mentor [M]-Intern [I] formative assessment session during S1

```
101  M: .hhh the problem you've got is [name]  (.)[name] insists we show them now where they are
102  I:                      [I don't think tha' givin' them in so much detail as like m- my
103  I: whole six A seven A and so on on the SATs (.) it's a little bit  too much detail
104  M:                    [I think is important tha' job (.) I don't wanna disagree  with you
105  I:                                      [I don't know
106  M:  but I think is really important  because a six C child is different from a six B child
107  I:                   [yeah yeah yeah yeah
```

In dept exploration of the assessment issue brings to light forms of thinking about the classroom practices, policies and pedagogy that present both beginner and mentor as engaged participants *appropriating* the object worked upon (reaching a shared understanding of the assessment policies and of the related practices in the school context) and the conceptual tools employed in the course of the conversation. As such, the debate presents both participants as equally engaged with the shaping of the problem worked upon and of the tools worked with. On one hand, the intern argues the excess of details in assessment reports, the importance of differentiating between the effects of information upon various actors in the learning setting (L 102) and, then, the relevance of the effects generated by labeling children's performance levels . As he completes his argumentation, the intern leaves open the space for authoring new ways for communicating assessment results to children. On the other hand, the mentor positions with a set of arguments placing emphasis on the relevance of correct differentiation between levels of performance, the need for children to become aware of the differences in value of increasingly complex knowledge, drawing attention on the so-called *transit* groups (groups of pupils who's grades are situated in an in-between levels position, presenting difficulties to be located along the lines of a week-medium-high type of hierarchy) and the importance of using suggestive and appropriate terms to name the levels of acquisition. The discourses the two participants bring in the conversation employ different sets of conceptual tools. Familiar with the academic culture of the teacher education program which she completed three years prior, the teacher mentor responds to the arguments the intern states with an understanding of the context of practice located in more than one discourse. In the teacher mentor's conceptual tools the culture of the classroom practice, long term observational experiences of children's progress, the pressure of being accountable both as an individual and as a member of a significant collective – the school - to the national agencies for control and regulation – all play important roles in informing her discourse. As such the histories of the conceptual tools the

two employ in their dispute needs consideration, as different meanings to the same issue (i.e. communicating assessment results to school students) are employed and explored by the two participants in the conversation.

Excerpt 4 is introducing teachers' language making visible a new horizon for exploration, one wider than any of the previous.

Excerpt 4: Mentor [M]-Intern [I] formative assessment session during S1

```
142   I:  [it's not 'bout (.)they don't seem t- see it as self improvement (.) they just seem to see it as (.)I d - know
143   I:  I (.) hitting their target target group grade (.) they don't want to (.) work because they want to
144   M:      [I see what you mean
145   I: work (.) they want to work  because they want to (.) you know they get their target grade they  don't
146   I: want to do anything more(.) that's it (.) we're through now
147   M:  [yeah (.)  that's it that's  for cultural reason in this town (.)fo' town (.)  it's not about
148   M: achievement (.) it's about achievement in social aspects
149   I:          [ok (.) ok
[….]
165   M:  ideally (.)  I think your view (.) if children wanted to learn is better for themselves   it's perfect
166   I:                  [yeah
167   M: but you don't  get in most comprehensive in NAME-county  it's unfortunately not a good county fo'
168   M: that ok so yeah (.) I agree with you that *volumen*tation with the children is got (.) but I think  if we
169   M: could just move away from class competition to  individual ones with  yourself  that's  a tiny step in
170   M: the right direction
171   I:                  [yeah
```

The episode is relevant for the manner in which the speech and thinking of participants are intertwined in the course of being elaborated, as partners take turns in questioning actions on the problem-spaces authored by themselves or by others who become relevant non-present participants to their dialogical, collective reasoning. The discontinuities and multi-voicedness of the collaborative, discursive practices enacted by the two participants are generative of the transformations in the conceptual tools employed in the dialogical action of building common knowledge.

The mentor finds in the community's lack of support for the activity of the school a solid base to state her argument for the importance of developing correct assessment systems along with intrinsic motivations for learning and related type of competitiveness - the one with one's own performance. More than their own histories of learning concur to configuring the horizons of exploration. Both beginner and mentor place important emphasis on the implications that different understandings and employments of the tools available in the various practices of school-teaching and learning bare for their future actions in the classroom. Participants' own projections come into play when tackling the object and the tools worked upon in the course of learning. 'I' and 'we' statements spread throughout the entire episode indicate clear intentions for positioning and exhibiting agency.

Discussion and final considerations

Understanding how collaborative work was structured in the learning situated in teachers' talk meant understanding the nature and functionality of this space, where publicly ruled divisions of labor and structures of power enter the jurisdiction of private decision-making, judgment, engagement, will and responsibility. It was the meeting of these two planes that became visible in the contradictions located in participants' dialogic actions through problematizing entries. Participants' engagement visible in the attempts to author and situate in the myriad of possible contextualized meanings that the exploration of these contradictions made bring to the fore, put light on participants' moves towards inwardly and outwardly engaging with, revising, and developing the repertoire of tools mediating their actions in and with the world. An increasingly informed use of the tools afforded in the space of the activity and progressive engagement of newcomers (student teachers) with the development of existing tools bring along a sense of *legitimate questioning*, indicative of a sense of *legitimate appropriation* of the collective *where to* tools. The dialogical episodes proposed for analysis exhibit a language that is rich in problematizing – authoring – positioning sequences (Stenning et al, 2002) sustaining an image of

learning that emphasizes learners' increasingly informed engagement with the objects and tools of the various sets of practice that make their profession. This progressive sense of ownership of ground for thinking and acting professionally is suggested in language by the many 'I' phrased contradictions, authoring statements and positioning actions performed by both participants in relation to the increasingly wider perspectives for addressing common practical issues. This may be indicative of expanding senses of professional agency.

A beginning-teacher's exploration of a teaching technique (*pitch*) took him and his teacher-mentor across problem spaces for which a direct sense of responsibility, therefore appropriation, isn't required in approaches to teacher learning promoting a best-practice delivery type of curriculum. Striving to understand the interplay of movements and dynamics in the learning activity located in the encounter between the teacher mentor and the beginner, analysis has moved towards the moral-ideological dimension (cf. Engeström, 2010) of the object expansion, as participants engaged with questioning '*who else was responsible*' in the making of the pedagogical tools they employed in their classroom activity. In their dialogical actions, participants pushed the boundaries of their perspectives on the analyzed pedagogical tool (object worked upon) in the direction of instances and spaces of presumed shared responsibility expanding far beyond the confines of the classroom or school. The conversational episode proposed for analysis in this paper exhibits a teacher-mentor's and an beginner's struggle with an object – understanding a pedagogical tool related to their classroom activity – which presented participants in the conversational episode with the opportunity of addressing it from increasingly wider perspectives.

In the findings of this study, learning is reflected in the way participants explore meanings of certain conceptual tools in various contexts of practice. This manner of exploring led participants to broaden the horizon for their quests. Approaching the object worked upon from increasingly wider perspectives led to reshaping the conceptual tools the teacher mentor and her mentee were working with. Explored in language, these continuously reshaped conceptual tools help understanding the interplay of transformations of both the object worked upon in conversation and of the participants working on it.

Configured as participation to the production of professional knowledge, the communication-type of collaborative work between teacher mentor and beginning teacher opens up opportunities for participants to engage with the tools of the professional practice and appropriate increasingly wider horizons of questioning and positioning in relation to them through situated actions alongside others – partners in learning. Accommodating such an idea in the practices and curricular designs of teacher education programs implies reflection and conceptualizations going beyond simply predicating participatory and collaborative requirements. Deeper, contextualized understandings of participation and collaboration seem to be significantly important to tackle, as neither remains inconsequential to how learning is shaped in the work and learning settings. It implies, as Edwards (2005b) suggested that conceptualizations, approaches and assessments of teacher education shift towards an expanding understanding of this activity, going beyond the mere socialization of newcomers to a space of professional activity. Instead, interest in how worlds are being transformed through participants' increasingly informed actions on them is stressed.

COMMUNICATION DESIGN EDUCATION: A NEW TREND IN SCHOOLING

Süreyya Çakır

Sakarya University-Faculty of Fine Arts, P.O. Box 54187, Turkey

Abstract

Today we live in an era of design to which everything is relevant. The goal of this article is to relate current changes in economy and culture to design education. This paper seeks to discuss Communication Design education within neo-liberal enterprise culture in relation with marketization processes with reference to critical approach to education, by giving examples from 'Communication Design Departments' of universities. As a result, this paper suggests a necessity aiming at human-oriented education in order to create a better society than a market-oriented one.

Key words: neoliberal consumer culture; design culture; Communication Design education.

Introduction

In the early 21st century, not only economic, but also political, technological and cultural transformations in relation with neoliberal agenda make it essential to think on education. Neoliberal transformation of economy with global media culture together has caused the transformation of the education system as a response to the new conditions, in which we are faced with the "neoliberal domination of culture and education" (Stevenson, 2010, p.344). Education and reproduction of culture are interrelated since "neoliberal ideologies are seeking to remake common understandings through the reconstruction of education and popular media culture" (Stevenson, 2010, p. 343). With the aim of relating contemporary changes within economy, design culture and design education, this work first will look into the current changes in the economic, social circumstances and relate them to the rise of design culture. In the light of these, then, "communication design education" will be discussed.

1. Neoliberal Economy and Design Culture

Current changes in economic, cultural and technological conditions have shaped the world since the end of twentieth century. Digitalization, globalization and multi-culturalizm are main tendencies of today. In these new circumstances we are faced with

> "the transmutations of technology and capital work together to create a new globalized interconnected world. A technological revolution involving the creation of a computerized network of communication, transportation, and exchange is the presupposition of a globalized economy, along with the extension of a world capitalist market" (Kellner, 2012 b: p. 2).

Modern design in the latter half of the nineteenth century was a "value added" practise that was in relation with industrial capitalism. It had a mediating place connecting production and consumption to make products more competitive in the market place. As Julier says with reference to Dutta, "design was an ethical challenge that harnessed taste and control, produced differentiation of commodities, and the professionalisation of its practice" at that time (Julier, 2009, p.219). After 1980s, with the fundamental changes in economy under globalisation on the base of consumption and, during 1990s, with the emergence of new visual communication technologies, cultural role of contemporary design has changed. Its following history has been " a progression from its mediating place in a linear format linking production and consumption to its dispersed, multilevel distribution and intervention across a number of nodes that make up network economies" (Julier, 2009, p.219).

After 1980s with the implementation of neoliberal policies, rather than production, a consumption based economy has been grounded in many places of the world including Turkey. Consequently, the relations between state and market have changed. Public services including health and education become increasingly market-oriented. A shift from public sector to private causes marketization of public services. The state becomes the servant of the needs and values of the market (Kress, 2008, p.261 & Kress, 2000, p.137). With the marketization of public sectors, the culture of public services come closer to private sector. Such features as competition, performance measurement and ratings become criteria even in public sector. A new public administration model that is related to management emerges in connection with these criteria to achieve 'best value' and to follow continuous progress in the way functions are practised. "This provides opportunities for design consultancies to create money-saving systems. (…) The marketisation of public services also creates a denser landscape of management and indeed, design opportunities" (Julier, 2009, p.223). In the conditions of New Economy, design plays an important role "both for localities and the individual, it (design) carries a symbolic level in the way it points towards broader notions of capital in the New Economy" (Julier, 2009, p. 221).

Today's capitalism is not only globalised but also glocalised and individualized. In changing conditions not only mass production but localised and individualized production and consumption also become significant. In today's multicultural world, glocalisation processes require to consider local properties and markets. And individualized capitalism has to consider persons as consumers. While globalization has a homogenising effect on the one hand, glocalization and individualization encourage diversity and difference. While global capitalism stimulates homogenisation, multicultural consumer capitalism centralizes localities and individuals as consumers. In these new conditions of market oriented and consumer based neo-liberal economy, design and the principles of design become significant. In mass production conditions of the 'nation-state' model of the previous period, the commodity itself was its own ideology and its own advertising. As Foster indicates, our time that refers to a qualitative leap in the history witnesses the "flexible specialization" of post-Fordist production in which "the subjectivizing of the commodity is already apparent in streamlined design" (Foster, 2003, p. 19). The process of the 'subjectivizing of the commodity' causes 'personalization of design'. "Desire is not only registered in products today, it is specified there: a self-interpellation of 'hey, that's me' greets the consumer in catalogues and on-line" (Foster, 2003, p.19-20). In these new conditions, the meaning of design and the role of designer changes:

> "'Design' rests on agency; it takes agency for granted, still as work, but no longer as acquisition but now definitely as 'shaping work' . In this, design proceeds on the basis of a full knowledge of the resources available to the designer and the capacity of the designer to assemble these materials into designs expressing her/his intentions and interests in relation to particular demands" (Kress, 2000, p. 140).

The engine of design becomes 'branding' now. As a result of the growing competition to include more consumers to the market place in the process of diversification and the subjectivization of the commodity, the package becomes almost as important as product (Foster, 2003, p. 19). In the conditions of growing competition, the advantage is attained through 'branding' and 'being fashionable'. "The competition between brands (…) reflects and contributes to their distinctions through providing differentiated rules of engagement. Brands currently articulate fields of their respective practices" (Julier, 2006, p.76). In this case, 'brand value' gains a high symbolic power in the society, which becomes more of an issue any more. Julier finds "the rise of branding as the key focus and driver of much design practice" of today's design and he keeps saying that "the systems of branding inhabit much of the space of design culture, turning information into an "all around- us" architectonic form." (Julier, 2006, p. 75).

These changes and pressures not only coming from economy but also from the technology in connection with digitalization are related to each other. During 1990s technological revolution comes across the world that "centers on computer, information, communication, and multimedia technologies" and changes everything "from the ways that people work to the ways that they communicate with each other and spend their leisure time" (Kellner, 2012 b, p. 1).The improvement of digital technology and high-tech communication systems provide

"an infrastructure for the global economy" (Kellner, 2012 b, p.2). After 1990s the market-oriented neo-liberal economy goes hand in hand with this technological revolution, causing new information and knowledge-based market economy to develop. Kellner states that the synthesis of marketization of economy and digitalization processes create a new form of capitalism that can be called as "technocapitalism", which is marked by the combination of "capital and technology".

> *"The term technocapitalism points to a new configuration of capitalist society in which technical and scientific knowledge, computerization and automation of labour, and information technology and multimedia play a role in the process of production analogous to the function of human labour power, mechanization of the labour process, and machines in an earlier era of capitalism" (Kellner, 2012 b, p.5-6).*

As Foster states, as a result of the improvement in media technologies, media industries become more central in the economy. This is one of the reasons for the inflation of design today (Foster, 2003:21). As he indicates, this might hide a more fundamental development (Foster, 2003, p. 21-22) :

> *"the general mediation of the economy. I mean by this term more than 'the marketing of culture' ; I mean a retooling of the economy around digitizing and computing, in which the product is no longer thought of as an object to be produced so much as a datum to be manipulated –that is, to be designed and redesigned, consumed and reconsumed. This 'mediation' also inflates design, to the point where it can no longer be considered a secondary industry".*

In this case, design becomes the issue of a political economy. As Foster says, 1920s "conflation of the aesthetic and the utilitarian in the commercial" (Foster, 2003, p. 18) is still in effect in this current period but what differs this conflation is the extension of "exchange value" to all signs, forms and objects as "sign exchange value" in the name of design. In today's design not only aesthetic and the utilitarian are conflated but also contained in the commercial and everything seems to be regarded as design (Foster, 2003, p.17). With the development of knowledge economy by the late 1990s and 2000s, design issues become related to 'creative capital' which is significantly important in the production of 'symbolic value of knowledge' as a form of 'sign exchange value'. So today's design as a "knowing practise" is not only a matter of 'profit', but also an important part of the "creative industries" in connection with its power of producing 'sign exchange value' . In the new conditions of economy, we can talk about a growing 'design industry' as an important part of "cultural industries". Design industries are wealth of the economy today. For example, "By 1994, the Netherlands Design Institute was optimistically predicting a growth of the European design market from $9.5b. to $14b. by 2000" (Julier, 2006, p. 72).

Parallel to design industry, a design culture has emerged "with the massification of design production and consumption in the late-twentieth and early twenty-first centuries" (Julier, 2000, p. 72). It has a central role "as commonplace, in creating and articulating value, structuring the circulation of information and forming everyday practices. In either case, it seems apt to regard design culture as a key result and expression of our times" (Julier, 2006: 72). Today's contemporary design is seen by Kress as a kind of metaphor for shaping future (Kress, 2000, p.134).

So, the frames are: the frames of the neoliberal transformation of economy and globalisation of finance capital, changing frames of digital media technologies, the changing frames of transport (commodities, people or information), the changing frames of society (from homogeneously monocultural society to a pluricultural one), changing frames of social and individual communication all have effects on education (Kress, 2000, p.138) in restructuring process. The following part will concentrate on the relation among design education and economic, cultural or technological changes.

2. New Economy, New Labour Demands and Design Education

There are ties between market-oriented enterprise culture based on consumption, design culture and educational field. The need for "an economy based on consumption has an entirely different relation to an 'education system' than one that is based on production" (Kress, 2008: 261). Because "markets are interested in consumption and consumers rather than production, and therefore not interested in the development or the characteristics of a labour-force, local or global." (Kress, 2008:261). Technocapitalism and the logic of neoliberalism itself need a new type of individual and labour. In the previous industrial nation-state model, the state's purpose for the education system was to produce citizens and labor force for its economy, which provided "the means of constructing identities for individuals" (Kress, 2000: 143-144). But a market dominated, post-industrial consumer capitalism needs consumers rather than citizens; that's why it has a different relation with the individual for constructing identities.

> *"The market provides for those who have the means to participate, the possibility of identity making via choice-in-consumption (…) Choice-in-consumption is the expression of the individual' s interest (shaped, of course, in the environment of the society and its market) and becomes the expression of an individual aesthetic (shaped, of course, and met by the aesthetic of the market)" (Kress, 2000:144).*

As Kress states, "Style-as-aesthetics" is the condition of consumer capitalism now, which expands the field of aesthetics from the elite to all practices of everyday life and relates any commodity to any kind of text that are in connection with the consumption of all kinds of commodities. At this point, they all become the issue of design and design principles which overspread "every aspect of the aesthetics of the market" (Kress, 2000:144). In these new economic conditions, design becomes not only the issue of 'creative capital' but also 'creative labor' because "it could signal the transformation or regeneration of localities, but also of the self" (Julier, 2009, p. 223). The demands of the consumer capitalism and the new knowledge economy requires for a new kind of labour force. With the changing role of design in the society and economy, new labour demand is required. As Julier argues, design's new role

> *"fits the labour demands of the New Economy, hence, in turn, the symbolic power of design in representing its potential success. The organisation of the design industry may be viewed as paradigmatic of the kinds of labour arrangements and sensibilities that lie at the heart of the functioning of the New Economy" (Julier, 2009, p. 221).*

Design's role in the New Economy is related to individual's transformation on the base of **'**creativity'. Creativity is "a source of economic advantage but also a way of indicating the symbolic value of knowledge and creative capital at relatively low cost" (Julier, 2009, p.221). So, this property becomes a subject of "marketing" as a "saleable asset", which ties design sector and design education. Design's role here, "alongside other forms of creative labour, is a source of reskilling and employment in postindustrial contexts" (Julier, 2009, p. 221). We can see creativity criteria as an aim in introducing almost all of the Communication Design departments. For example, Communication Design Department of Bahçeşehir University -one of the private universities in Istanbul- states its aim as follows: "Bahçeşehir University's Communication Design Department aims to bring digital technology, creativity, systematic thinking, and theoretical and practical knowledge together to synthesize and create visual communication" (Communication Design, 2012).

This 'creative' designer works in the conditions of New Economy. The requirements of relatively stable, homogen, predictable, secure, less complex conditions of industrial nation-state model founded on mass production and a local economy is being replaced by unstable, mobile, hyper complex, less predictable, the highly fluid arrangements of lifestyle groupings, transnationally and transculturally controlled and ordered market conditions and demands (Kress, 2000, p.138 & Kress, 2008, p. 261). "The demands generated in this new arrangement are diverse and the new curricula consequently have no immediately available, secure basis for broadly integrative principles of coherence" (Kress, 2000, p.138).

There are educational impacts of this shift from stability to instability from homogeneity to diversity. In the conditions of mobility and instability neither knowledge nor values are secure and it is not possible to predict

coming. In this case, "different and distinct (curricular, conceptual, social and ethical) resources are required to deal with each" (Kress, 2008, p. 260). In contrast with the need for stability for the education systems of industrial nations, "the new arrangements seem to demand an education for a period of fluidity, for instability" (Kress, 2000:138). In terms of citizens and labor force, as a result of this social transformation, more flexible selfhood is grounded in the education. As Julier (2009, p. 221) says with reference to McRobbie, "flexible, project-focused, and socially networked worker" is embodied in the designer.

So, these demands of the New Economy explains the designer's integration to the market and business. This integration makes the design education to come closer to the marketing, management and public relations disciplines. This connection is stated by Design and Management Program of The Parsons New School for Design in New York - "a pioneer in art and design education since its founding in 1896" (Parsons, 2012)- as follows: "The BBA in Design and Management program educates students in the entrepreneurial and strategic aspects of design, as well as in design aspects of business" (Design and Management, 2012). The school explains its career pathways below:

> "Students graduate with skills and competencies that prepare them for lifelong personal and professional growth. Design and Management students master the conceptual and technical skills to develop innovative ideas and enable organizations to fulfill their missions and acquire competitive, design-driven advantage. Alumni succeed in a range of capacities: starting their own businesses, managing creative people and projects, marketing new products and services, devising design-driven business strategy, assuming leadership positions" (Career Pathways, 2012).

The connections between the School of Art, Media and Techonology of Parsons New School and the industry in learning process is indicated as follows: "Faculty also take advantage of New York's abundant design resources to create classes that support hands-on learning. These classes often take the form of partnerships with local and global firms including Time Warner, Microsoft, Apple, Electronic Arts, the United Nations, and Human Rights Watch" (Project-based Learning, 2012).

And also the opportunities that Parsons career services' offer for design students illustrate industry based connections of the school: "Parsons Career Services hosts portfolio-review events and puts potential employers and internship sponsors in touch with program participants. In addition, New York-based industry organizations like the Type Directors Club , AIGA, IxDA (Interaction Design Association), and The Art Directors Club, as well as research groups like Eyebeam Art and Technology Center, offer support and networking opportunities" (Networked New York, 2012)

3. The Rise in Communication Design / Visual Communication Design Departments and Related Issues

Consequently, the agenda of capital, expanding communication technologies, changing subjectivities, and the demands of networked society all have caused Communication Design/Visual Communication Design departments to emerge as a reaction or as a solution. In the restructuring of education, the emergence of a new department in response to these changes is expressed well by Bilkent University the first private university in Turkey. Founded in 1998 as one of Turkey's leaders in the field, the Department of Communication and Design of Bilkent University states its aim as follows: "The Department of Communication and Design is a response to the growing need of our increasingly globalized and networked world in which mass communications and visual technologies of various kinds play a fundamental role" (Department of Communication and Design, 2012).

Parallel to design inflation in life, demands on the need the ability to design and thus designers with new skills explain the importance of design education, especially Communication Design education. Sabancı University, one of the private universities in Turkey, Visual Arts and Visual Communication Design Department underlines this necessity for a designer with new skills:

"We live in a world where the role of the artist/designer is being redefined. Todays artists and designers need to be equipped with knowledge and vision which go far beyond the traditionally required skills of draughtsmanship. The individual's need to be conversant with social, scientific and technological evolution that surrounds him or her, and the ability to incorporate this evolution into the creative process, brings the issue of a visual education that has a wider based spectrum than before. The interdisciplinary educational approach embraced by Sabancı University aims to provide an ideal breeding ground for the education of the "new" artist and designer" (Undergraduate Program, 2012)

As a result of all the things discussed above, Design courses in the school programs and Design Departments have arisen rapidly during the last decades. For example, "Design and technology experienced massive expansion in the UK school curriculum in the late 1990s —the Design Council (1999) reported a 63% rise in students opting to study Design and Technology at secondary school" (Julier, 2009, p. 220). With the emergence of design culture and a growth of the design market, the number of design students have increased. For example,

"in the UK, the number of first-year design students increased by thirty five percent, from 14,948 to 20,225, between 1994 and 2001. It is in this decade that we see the emergence of the terms 'creative industries' and 'cultural industries'—of which design forms a significant proportion—and measurements and forecasts of them taking place. According to a 1998 European Commission report, 'cultural employment'—that is work in advertising, design, broadcast, film, internet, music, publishing, and computer games—grew by twenty four percent in Spain (1987–94), while employment in Germany of 'producers and artists' grew by twenty-three percent (1980–94). On the other hand, what is described here is a qualitative change in terms of how design is practiced, circulated, and perceived" (Julier, 2006, p.72).

From late 90s onwards, in Turkey Communication Design Departments or Visual Communication Design Departments have commenced to be established. Most of them are structured in the private universities. Universities are also offering design courses. And some private design education institutions have been opened recently. They are mostly a part of design industry.

In this restructuring of education to the changing demands under the logic of the global market that requires new labour, as Stevenson argues, "what is new is the way in which popular culture and transformations within education more generally are seeking to articulate a neoliberal project through politics, education and media culture " (Stevenson, 2010, p. 343). As Kellner says "the economic and cultural global restructuring going on in the world today is done on the basis of the most advanced sector of the new economy and culture (i.e. information and multimedia technology) penetrating ever more realms of life from entertainment to labour to schooling." Thus, the reconstruction of education on the grounds of "socio-economic, cultural, and the material conditions of everyday life and labour that are changing is a reasonable response to the great transformations now underway" (Kellner, 2012 c, p.13) Imposing neo-liberal, market-oriented agenda on education, schools have been reorganized according to the business model. With the neo-liberal restructuring of education "the language of markets, targets, and tests is (…) increasingly regulating education" (Stevenson, 2010, p. 342) and university is being grounded on a 'client base' with changing relations between work, leisure and pleasure (Kress, 2000, p.137).

There are some advantages of "new enterprise culture that speaks the language of possibility and transformation" (Stevenson, 2010, p. 355). Such kind of language is important to eliminate the boundaries in daily life between high art and popular art and between high culture and popular culture. This is important for the transformation of daily life practices and education compared to the previous period "defined by a conservative set of institutions concerned with the reproduction of a class-ridden industrial society" (Stevenson, 2010, p. 343). Despite these positive transformations, because the logic of market that promotes an entrepreneurial culture increasingly regulates education, market-oriented shifts cause some dangers:

"In this context, the danger is that the rule of money and power will seek to colonize artistic works, education, media and the relative autonomy of culture from the market. As this happens, public spaces that previously were open to experimentation and autonomy become closed. Notions of public culture and

value linked to ideas of service or the promotion of democratic dialogue inevitably become degraded, as
everything becomes linked to the needs of the knowledge economy" (Stevenson, 2010, p. 348).

In these conditions, design education and design curriculum become more integrated into the marketing and management in a consumer society more than before. As advertising and branding become significant in an age of image, design integrates more into the logic of market and consumption culture. In addition to this, turning into the graphic arts with the pressures coming from technology and economy, art becomes interrelated to the design, too. In a design age, in which the aesthetics and the utilitarian are conflated and "subsumed in the commercial" (Foster, 2003, p.17), the Art is losing its critical dimension in the society. Foster states that contemporary design has no resistance as in the past: "It delights in postindustrial technologies, it is happy to sacrifice the semi-autonomy of architecture and art to the manipulations of design" (Foster, 2003, p. 18).

The logic of Art and post-industrial design are quite different. Art dreams to produce other ways of thinking and experiencing, design dreams of persuading to sell other things. This difference is expressed in Parson New School For Design's website: "Communication Design majors examine the social and cultural ramifications of communication. Students learn the art of persuasion by creating compelling messages, narrating them in meaningful ways, and crafting strategies to broadcast them to the world" (Socially Minded Design, 2012). So, the need for the Art's critical look and its unique role in the society that is to "play in illuminating the constantly transforming relationships embedded in hypercomplexity" (Rutenbeck, 2006, p.19) is getting to disappear in today's design culture.

Conclusion

Education should serve democracy and social change for a better society in which humans will be more emancipated than today. In the restructuring of education a democratic and anthropocentric program should be applied. In this process, the demand for new literacies as in the case of Design Education should accompany "with a program of the democratization of education" (Kellner, 2012 c, p.14). Education should be seen as a dialogical and democraticizing process, leading to emancipatory, dialogical and experimental learning to empower students to be independently critical to create a better society. That question is still important in designing our future through education in general and Design education specifically, on the base of human needs : "whether education will be restructured to promote democracy and human needs, or whether education will be transformed primarily to serve the needs of business and the global economy" (Kellner, 2000, p. 247).

COMPREHENSIVE HUMAN DEVELOPMENT THROUGH PHYSICAL AND SPIRITUAL: STUDIES ON THE NOVEL "*TENGGELAMNYA KAPAL VAN DER WIJCK*"

Muhammad Hilmi Jalil[a], Fakhrul Adabi Abdul Kadir[b]

[a]Institut Islam Hadhari, Universiti Kebangsaan Malaysia, 43600 UKM Bangi, Selangor Malaysia

[b] Academy of Islamic Studies, University of Malaya, 50603, Kuala Lumpur, Malaysia

Abstract

This article attempts to explain the form of human development that can be implemented through the medium of writing. In this context, this article tries to identify the human development elements present in Hamka's novel entitled "Tenggelamnya Kapal Van Der Wijck". To identify the elements of human development in the novel, this article will use ten domains of human development elements described by al-Banna. This article concludes that the novel "Tenggelamnya Kapal Van Der Wijck" suitable for reading materials in the process of human development on the reader.

Keywords: Human development; spiritual; physical; literature; Hamka.

Introduction

Every human being must go through the process of human development that will improve quality of life from a low level to a higher level, this process can be done in various ways. One of the most suitable ways for the process of human development is through the literature works that has human development goals.

In the Malay Archipelago, Southeast Asia, Hamka was a religious leader who has written many books with the goal of human development, the total number of books have been produced by Hamka is 118 books. Hamka's literature works covering the subject of religion, philosophy and literature. Literature works produced by Hamka was well received from readers around Southeast Asia like Indonesia, Malaysia, Singapore, Brunei and others, Also Hamka's literature works was reprinted several time. However Hamka's work also received bad criticism and accusations and claimed by some people as weak literature work, some of Hamka's literature works was banned and prohibited to reprint and distribute to mass reader. So this situation is a problem to Hamka's literature works was prompted me to do research on Hamka's literature work with respect to human development (Mohamed Anwar Omar Din, 2004; Abdul Rahman Abdul Aziz, 2007; Noriaki Oshikawa, 1997; Hamka, 2009; Nasir Tamara et al., 1984; A. Teuw, 1966).

I chose novel entitled "*Tenggelamnya Kapal Van Der Wijck*" because the novel is a Hamka's novel that has most popular response from readers around the Malay Archipelago, in addition, this novel was chosen by film producer and it becomes a story in visual form to shown on the viewers.

Theoretical background

Human development

Muhammad al-Buraey (1985) explained that development is a process to provide happiness to human, the happiness and well-being is achieved by balancing the needs of spiritual and the needs of material in humanity.

Since the creation of man is formed from two aspects means physical and spiritual aspects, al-Ghazali (2005) states in the process of human development, both sides of physical and spiritual aspect must be managed properly and correctly so that finally will form a person who have high personality. The desired result from the implementation of human development is can be formed a person that is qualified to be members of society who can perform the duties well, so that they can together develop a community and nation to a better level (Ab Aziz bin Mohd Zin, 2010). So Human development in this paper means the efforts of man to her/his self to change to a better condition and also maintain a good condition.

Human development through writing

A piece of writing is able to form a human, this process will happen to someone when he/she read a piece of writing work (Misran Rokimin, 2001; John F. Savage, 2000), however these writing works can form a reader towards good that lead to human development (Ismail Ibrahim, 1988), or even to damage the human (Shahnon Ahmad, 1994), hence the effort of writing indeed towards human development need to be intensified and multiplied so that the objective of developing the perfect human is achieved. So human development through writing is a process of developing a human by reading a piece of writing such as books, novels, short stories, poetry, magazines, newspapers, comics and so forth. Therefore in this paper, human development through writing is human development efforts being carried through writing a novel.

Methodological framework

This paper will try to identify elements of human development that exists on the main character in the novel "*Tenggelamnya Kapal Van Der Wijck*", the main character named Zainuddin (Hamka, 2010). The elements of human development that will be used to measure the character of Zainuddin are elements of human development presented by al-Banna. Al-Banna present ten comprehensives elements of human development that covers physical and spiritual aspect, so these elements must be present in a person through the process of human development. The Ten elements are first healthy body; second good behavior (*akhlak al-Karimah*); third highly knowledgeable (*'ilm*); four self-reliance; five authentic faith; the sixth implement the properly worship; seventh self-control; eighth effectively manage time; ninth disciplined man, and the tenth people who have contributed to the community (Hasan al-Banna, 1992).

Synopsis of the novel

This novel tells the story of the life of a young man named Zainuddin. Since the nine-month-old Zainuddin has lost his mother's love due to hir mother die and then Zainuddin brought up by his father. Not long after that when Zainuddin still was young, his father died. And then Mak Base takes responsibility to raise Zainuddin until Zainuddin become mature.

After adult Zainuddin want to go to a village in Minangkabau where his father origin, after making resolve Zainuddin began the journey to Minangkabau. After a difficult journey to the sea and the land finally Zainuddin arrived at the Batipuh village in Minangkabau. Zainuddin initially accepted as a nephew of his father's family, but gradually it is being marginalized because Zainuddin considered an outsider, which means not an originally Minangkabau people and dubbed as "Son of Bananas". In this Batipuh village, Zainuddin met the girl who appealed to him called Hayati, and Zainuddin acquainted with Hayati. But the love story between Zainuddin and Hayati blocked by the wall of Minangkabau custom or tradition.

Zainuddin was driven from Batipuh and travel to Padang Panjang to study theology, because in Padang Panjang there are many good an well known schools. After that, Zainuddin suffer because he received news that her lover "Hayati" was married to other people. At the same time Zainuddin got a new that Mak Base was dead. Due to two bad news, Zainuddin's life turned into a weakness. However, Zainuddin finally got up and moved to

Jakarta to develop himself until he became a famous writer in Indonesia and Zainuddin famous with his pen name "Z".

After a prolonged stay in Jakarta, Zainuddin decided to move to Surabaya because of Surabaya closer to his hometown in Mengkasar. In Surabaya, the love story of Zainuddin and Hayati tested again. Unfortunately the love story between Zainuddin and Hayati did not give happiness in the world and the novel ends with the death story of Zainuddin and Hayati (Hamka, 2010).

Findings

Healthy body

Zainuddin character suffered bad health consequences of his failure to accept that her lover was married to someone else, this condition suffered by Zainuddin for several months, however, after his health and his body was successfully recovered and became healthy, Zainuddin regained with his healthy body until Zainuddin became a famous writer in Indonesia.

Good behavior (akhlak al-Karimah)

Zainuddin character through the story in this novel never does anything contrary to the ethics and morals virtue of humanity, even if other people do something bad to him like a broken its promise, Zainuddin character still remains on the path of moral virtue until the end of his life. Moreover Zainuddin always did good behavior to all people that face to him and never did something bad to other people. Fineness of manner exists when Zainuddin was in thick and thin or when Zainuddin was in difficult or happy.

Highly knowledgeable ('ilm)

Zainuddin character is a character that has a high knowledge, since his early life was at the beginning of this novel Zainuddin had traveled far to seek knowledge around Indonesia, Zainuddin character used that knowledge as a capital in his writing works and also with that knowledge Zainuddin create so many book and novel. After that Zainuddin became a very famous writer throughout Indonesia.

Self-reliance

Zainuddin character also found in possession of self-reliance elements, this element significantly applied by Zainuddin character when he create his name as a writer in Indonesia, Zainuddin character use all his energy in terms of mental, physical, spiritual and so on to execute the work as a writer. With persistent efforts, Zainuddin successfully emerged as famous writer in Indonesia. What is more important in the context of self-reliance, Zainuddin character creates his name as a writer with done all the work of writing alone without seeking help from others. With his self-reliance elements Zainuddin successfully develop himself from an indignation people to a famous writer.

Authentic faith

Zainuddin character also has authentic faith element, the faith that held by Zainuddin is Islamic faith. Zainuddin character is always consistent and remains steadfast in his belief, Zainuddin never done something that violates the Islamic faith. In whatever situation, Zainuddin remains firmly with the Islamic faith. Whether in difficult and unlucky condition, Zainuddin still hoping the help of Allah, as well as in the ease and luxury condition, Zainuddin character grateful to the success granted by Allah.

Implement the properly worship

Zainuddin character in this novel, if observed properly the elements of properly worship, it is not featured with the characters that do special worship as contained in the five pillars of Islam, such as reciting the Syahadah, solat, Zakah, the fast and Hajj, this is because the specific worship is not to be a concentrate in the formation of this novel. But the character is always portrayed as a character who is implement properly worship as a general worship through the work of writing, writing work done by Zainuddin character not because to be popular, but the goal is to implement properly religious worship through writings, at the same time to educate and develop community towards the betterment through his writings.

Self-control

Zainuddin character also has self-control element, this elements applied by Zainuddin character in variety conditions either difficult or easy and also healthy or sick. Thus Zainuddin character seem highlighted with self-control element through two forms of self-control, first form exist when Zainuddin faced with life trial, so Zainuddin character always patient and not give up, but always accept the received distress. The second form is used when he faces the convenience and luxury of life, Zainuddin character is not arrogant and always humble moreover Zainuddin character always grateful to Allah for the wealth they possess.

Effectively manage time

Zainuddin character in this novel is not associated with the element of effectively manage time.

Disciplined man

Zainuddin character in this novel is not associated with the element of discipline man.

People who have contributed to the community

Zainuddin character in this novel is a great character in terms of contributing to others. Most significant contribution that given by Zainuddin is contribution to his society through writing efforts. Writing efforts by Zainuddin presented as an outcome that give positive impact on society, Zainuddin's literature works invite people to develop themselves, keep of religion, developing country, development of women status and so forth. Zainuddin character also highlighted as a character who also participate in community activities such as association with the aim to contribute and benefit society.

Conclusion

Can be concluded that through main character in this novel (Zainuddin character), a total of eight human development elements has been highlighted in Zainuddin character, and with these eight elements of human development, Zainuddin character has successfully changed his life from a state of weakness to a better condition. By highlighting all elements of human development in Zainuddin character, it shows that all these elements is important to the process of human development, besides that the readers of this novel can get good lessons from the Zainuddin character, so novel "*Tenggelamnya Kapal Van Der Wijck*" can be categorized as a novel that compatible with human development goals. Author of this novel "Hamka" may be one example or a model who wrote towards human development. Can also be concluded that a novel can be a medium of human development, but the novel must be loaded with the messages of human development so that readers can realize the importance of those messages in life.

COMPUTER MODELLING OF FLEXIBLE CONNECTION WITH FREE HANGING WEIGHT OF THE BODY

Jurgis Maciulevičius[a], Vytas Baranauskas[b]

Kauno kolegija/University of Applied Sciences, Pramonės av.20,Kaunas, 50468, Lithuania

Kauno kolegija/University of Applied Sciences, Pramonės av.22,Kaunas, 50387, Lithuania

Abstract

This paper provides methodology that can be applied for students in classroom and individual work as well as by teachers that prepare and test homework assignments in the case of equilibrium of the flat forces system.

The methodology for preparing self-study assignments, homework activities and tests focused on in one point intersecting forces as well as checking the accuracy of solutions is provided in this article. This methodology integrates the courses of Mechanics and Informational Technologies. Examples of exercises with different external loadings and cases of analyzed are also included in this work.

Keywords: Force ; Equilibrium ; Flexible connection ; Angles ;

1. Scheme And Equations

With the rapid development of Informational Technologies, this tool (IT) is more widely integrated into delivery of the content of different academic subjects. This is the main reason why it is purposeful to have the methodology for immediate acquisition of the assignment scheme, results of calculation and graphical solution entering initial data.

Problem. With the small amount of contact hours and time consuming assignments there are no possibilities to introduce alternative solution models during the lectures.

The aim. To apply the Excel programme and the principles of mechanics in order to develop the methodology for flexible modelling of assignments depending on the curriculum content and aims as well as an individual student's abilities. To provide a student with a possibility to model the assignment independently, starting from the simpler and moving towards more complicated tasks.
Fig.1.1. Task model

Calculation data. In the scheme provided in Fig. 1.1 two joined cables *(AO and BO)* subjected to free hanging weight of the body *G*. Angles, which cables form with x-axis, are as follows, respectively – α_1, α_2.

Reaction forces within the cables, RA and RB are shown in fig.1. 2, and can be computed on the basis of statics argument[1]
Fig.1.2. Calculation scheme

For mathematical description of the task, we use the following statics equilibrium equations in the coordinate axes x and y:

$\Sigma F_x = 0$ *(1)*

$R_B * cós (\alpha_1) - R_A * cós (\alpha_2) = 0$

$\Sigma F_y = 0$ *(2)*

$R_B * sin (\alpha_1) + R_A * sin (\alpha_2) - G = 0$

By solving the system of equations with two unknown variables, we obtain values of reactions R_A and R_B:

$R_A = R_B * cós (\alpha_1) / cós (\alpha_2)$ *(3)*

$R_B = G / (sin (\alpha_1) + cós (\alpha_1) * tg (\alpha_1))$ *(4)*

2. Development Of The Applied Programme

Further solution of the task is performed by applying Eqs. (1– 4) and Excel spreadsheet [2,3,4]

Having used the general sketch for flat system of in one point intersecting forces and the table of initial data, one can create a wide range of tasks, changing the initial data parameters. This task is modelled in computer-aided addresses using an Excel spreadsheet, and all four mathematical equations.

Computer-aided task solution is presented on the Figs. 2.1 (a,b,c,d).

No	G	α_1	α_2	R_B	R_A
Ex	kN	degrees	degrees	kN	kN
Ex1	50	32	64	22,04	42,64

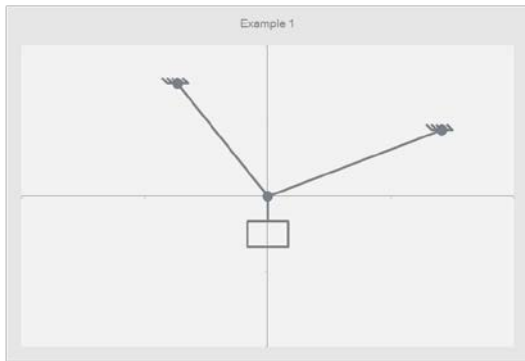
Fig.2.1a. Excel table with initial data and calculation of results


Fig.2.1b. Scheme of 2 cables with weight of the body
Fig.2.1c. Calculation scheme with directions of forces.

Solving the task manually, students have a possibility to verify the correctness of calculation, comparing with the computer solution. Changing initial data in the table in accordance with variation of angles range, one can obtain various variants of solution. Tasks modelling allows preparing assignments for control works of various complexities.

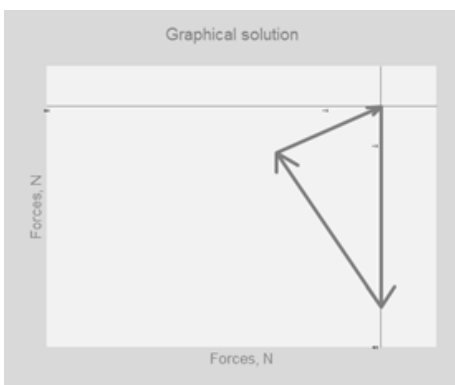
In figure 2.1d a graphical solution of the task is presented on the basis of forces balance condition, which states that in the case of equilibrium the closed triangle of forces must prevail. Solving the task graphically, student must not only accurately depict the known weight of the body G in the scale, but also correctly set directions of all three forces as well.


Fig.2.1d. Graphical solution – triangle of forces

With Excel spreadsheet it is easy to perform analysis of the selected task variables. Analysis has been created by steadily changing increments of 10-points. For the first study, reactions R_A and R_B were analysed, dependence

from weight of the body (by changing the weight of the load range of 10 kN), and other parameters (angles α_1 and α_2) stay stable.

No	G, kN	α1, o	α2, o	RB, kN	RA, kN
1	10	30	60	5,00	8,66
2	20	30	60	10,00	17,32
3	30	30	60	15,00	25,98
4	40	30	60	20,00	34,64
5	50	30	60	25,00	43,30
6	60	30	60	30,00	51,96
7	70	30	60	35,00	60,62
8	80	30	60	40,00	69,28
9	90	30	60	45,00	77,94
10	100	30	60	50,00	86,60

Fig2.2a. Excel table of reactions study R_A and R_B dependence on weight of the body

The results of the calculation, carried out in an excel spreadsheet (Fig.2.2a) show that the increasing weight of body *G* of the two reactions, increases. Diagram graphically shows the dependence of the growth chart in Excel and is presented in figure 2.2b.

Fig.2.2b. Graphical dependence of reactions on weight of the body G

The graph shows that increasing weight of the body of two reactions R_A and R_B increases by a linear dependence.

The second study investigates reactions' R_A and R_B dependence on the angle $α_1$ (angle was changed by a steady interval of 7 degrees), the other parameters -weight of the body *G* and angle $α_2$ remain stable (Figure 2.3a). The results of the calculation and graphical display, performed in excel spreadsheet, show that increasing the angle $α_1$, R_B reaction increases and the R_A - decreases by curvilinear dependence (Figure 2.3b).

No	G, kN	α1, o	α2, o	RB, kN	RA, kN
1	50	85	60	43,59	7,60
2	50	78	60	37,36	15,54

10	50	73	73	26,14	26,14

Fig.2.4a. Excel table of reactions study R_A and R_B dependence from angles α_1 and α_2

The graph 2.4b shows that increasing the angles α_1 and α_2, the reactions of R_A and R_B are decreasing by curvilinear dependence.
Fig.2.4b. Graphical dependence reactions R_A and R_B on agle α_1 and α_2

Conclusions

1. Provided examples prove that this methodology allows flexible modelling of basic/general model, starting from the simplest and moving towards more complicated assignments as well as.

2. Two ways of a task solution are possible:

a) Using values from the table of initial data, to calculate and draw a scheme manually (on paper) and compare it with computer-aided solution.

b) Using different modelling variants, to model correctly the table of data (applying the same scheme) and obtain the same computer-aided solution.

3. Application of IT helps to save time and leads to better quality of tasks of statically determined system of forces.

4. This methodology requires both a student and a teacher to have specific knowledge and skills in the fields of mechanics and informational technologies.

DECISION-MAKING AND COGNITIVE STRUCTURING OF STUDENTS AT UNIVERSITY

Michal Čerešník

Constantine the Philosopher University in Nitra, Faculty of Education, Department of Pedagogy and School Psychology,

Dražovská 4, 949 01 Nitra, Slovakia

Abstract

In our paper, we focus on the relation of decision-making and cognitive structuring of students at university. In the introduction, we concern on various theories of decision-making, especially we concern on the theory of rational decision-making and the psychological theory of decision-making. In the centre of our attention is the theory of Janis and Mann, which is the resource of the research. Very important part of our paper is a section about cognitive structuring which consists of two elementary factors – the need for structure and the ability to achieve cognitive structure. Both processes, decision-making and cognitive structuring are based on information processing. We want to explore relations among the cognitive structuring components and the components of decision-making – self-esteem of decision maker, vigilance, shifting responsibility, procrastination, hypervigilance. The research question was if the ability to work with information is a condition of effective decision-making. In the end of the paper, we present conclusions connected with educational environment.

Keywords: decision-making; cognitive structuring; ability to achieve cognitive structure; need for cognitive structure; self-esteem; shifting responsibility; vigilance; hypervigilance; procrastination

Theories of decision-making

Decision-making process is a term which means a process of choosing one alternative out of more. Montgomery (1983 in Fábry et al., 1992) describes this term as a process of looking for some dominant structure, while one alternative is better than the other ones, at least in one attribute; moreover all its disadvantages are eliminated in different ways. From behavioristic point of view, decision-making process is defined as a process which happens in situations where it is possible to choose out of different stimuli and responses. (Edwards, Tversky in Fábry et al., 1992).

Decision-making process is a process which has its part in an everyday life and in a psychological research too. This process relates to the issue of cognitive styles, categorization (Sarmány-Schuller, 1998) and risk (Sarmány-Schuller, 1979, Sarmány-Schuller, Pavličková, 2005, Fandelová, 1996), coping strategies in Slovakia (Ruisel, Ruiselová, Prokopčáková, 1994). Big attention has been devoted to the procrastination in recent decades (Sarmány-Schuller, 2000; 1999), then to decision-making styles (Sarmány-Schuller, Pilárik, 2005; Pilárik, 2006), faulty decision making (Sarmány-Schuller, Skovayová, 1992) and personality dimensions (Sarmány -Schuller, 2000, Ficková, 1994) associated with decision-making process. Former research data are focused on the operators' decision-making and moral assumptions of optimal decision (Daniel, 1971; Daniel, Droppová, 1979; Zelman, 1979).

There are two dominant fundamental lines in the theory of decision-making – the theory of rational decision-making and the theory of psychological decision-making.

The theory of rational decision-making puts forward two basic questions: "How to decide in a rational way?" and "How to choose the optimal alternative?". This theory is based on studies of Lange and Sadowski. It is based on fundamental arguments that are firmly anchored in rational postulates. They are based on the definition of a

rational man who is able to analyze a situation in which he is, in accordance with the principles of logic. He takes into account all possible alternatives during decision-making process and can choose the best alternative. (according to Kozielecki, 1977; 1981)

The earliest models of how people decide are called a classical decision-making theory. A classical decision-making theory has advantages of an economic perspective in terms of creating and using of mathematical models for human behavior and is associated with terms an economic man and an economic woman. This model assumes a full awareness of possible alternatives and their consequences, sensitivity to slight differences between alternatives and rationality manifested of maximizing the value (according to Sternberg, 2002). We distinguish the following decision-making approaches within the classical decision-making models – approaches by Bayes, Fox, Newell and Simon (Fábry et al., 1992).

Solving of the problem of (un)bounded rationality of a decision maker is in psychology of decision-making dated back to the period of the fifties in the last century and is connected with the name Simon. Simon (1957) states that a person is not in a decision-making process necessarily an irrational one, but he/she reflects in the bounded rationality. Simon (1957) defined a decision-making process as satisfaction, in which we do not concern all alternatives through comparing it, because they maximize our profits and minimize losses. However, we consider the minimum possible number of alternatives in such a way to reach decision which we believe is satisfying for us. Eisenhardt and Zbaracki (1992 in Sarmány-Schuller, 2000) follow these ideas and add that current decision-making situations in various areas are characterized by the number of used criteria, type and use of search information, sources of information, using heuristics, as well as the number of alternatives generated by the heuristics.

Tversky (1972a, 1972b) developed Simon's idea of bounded rationality in the seventies of the twentieth century. He focused on situations in which a large number of alternatives are available for the decision maker and he is not able to consider them all. Tversky (1972a, 1972b) believes that the decision maker will use a method of elimination in this case. He focuses on one aspect occurring at different options and at the same time he creates the minimum criterion for it. He excludes all options which do not meet the criterion. He selects other aspect at the remaining options and he sets a minimum criterion to it and he will continue in elimination. This process finishes when there is only one alternative left.

The theory of rational decision-making is a normative theory, which takes into account rationality, which might be also called an instrumental theory. The principle of the instrumental rationality is the best achievement of the objectives and not the optimal goal itself. According to this theory the role of a decision maker is to choose methods to maximize the target regardless of the impact of its action on other individuals or institutions. Therefore Kozielecki (1977) suggests, along with the instrumental rationality, to take into account an axiological rationality which function is a focus on constructiveness of set targets considering a social environment.

Psychological decision-making theory was developed due to economical and statistical studies. The representatives of this theory are trying to answer the question of a descriptive character: "How do people decide?" Therefore they divert from the normative framework of the theory of rational decision-making which aims at optimizing of the process and results of decision.

The subject of the psychological theory of decision-making is an activity of a decision maker in a decision-making process, but also the structure of roles and personality characteristics of people (eg.: characteristics of the memory or the ability to transform information) in the decision-making process. Tasks placed on a decision maker are diverse, but their common feature is a set of alternatives from which a person selects only one. Each alternative, or a variant of solutions, belongs to a set of possible outcomes, consequences in decision-making process (Kozielecki, 1977).

There are applied so mechanisms in a decision-making process, such as achieving pleasure and avoiding pain. With these theories operate also SEU theories (subjective expected utility) (eg.: Hurwicz, 1953 in Křivohlavý, 1966, Savage, 1954 in Kozielecki, 1977, Edwards 1992, Sheffrin, 1983 in Sarmány-Schuller, 2000), on the base of which a decision maker tries to maximize a positive benefit (pleasure) and to minimize a negative

benefit (pain). The SEU theories therefore work with the concept of a subjective utility. They characterize a decision-making process by a subjective probability. If we know these variables, we should know to predict the optimal decision according to the SEU theory. Therefore, the SEU theories ate based on assumption of and unbounded rationality, the same way as a traditional theory of decision-making. However, people in decision-making process do not always seem fully rational. Traditional examples of utility theories always involve a time factor in itself. Experiments of decision-making realised at children and adults show that subjective utility is lower if the consumption time comes later, or if more time passes till utility time. This phenomenon is known as „gratification delay", it means an ability to resist a momentary pressure and withstand as long as the conditions are more favourable for a decision maker. According to results of such experiments we can assume that there exists a certain hierarchy of values in every person. It means there are also certain scales of subjective utility, which individuals bring to their decisions (Sarmány-Schuller, 2000).

Almost each decision is connected with a risk. The best-known theories that highlight aspects of risk in decision-making theories are those ones by Busemeyer and Townsend, Feather, Janis and Mann.

Busemeyer and Townsend (1993) developed a decision field theory (DFT), which illustrates a decision-making in conditions of uncertainty. DFT incorporated four interlinked factors – probabilistic search, steps and range, approach avoidance balance and time constraints. Elaboration of these criteria represents a shift in the implication of contextual and individual characteristics within the decision- making process.

Feather (1985 in Sarmány-Schuller, 2000) emphasizes the need of the application of dynamic aspects in decision-making process. He developed a model of a dynamic decision-making process concerning on the temporal sequence of decisions which may change the specification of tasks in time. There is changed information that acquires a different quality than in the first step of decision. Finally, implications of decision-making change; they are aimed to future.

Janis and Mann (1977 in Sarmány-Schuller, 2000) focused on the role of conflict in decision-making process. The theory of conflict analyzes the coping patterns used by individuals if he/she faces difficult life or working decisions. The core of the theory is in stress that enters the decision conflict as a major determinant of failure while achieving high quality decisions. The conflict model identifies five main coping patterns within the inducing stress which eventuates from different decisions of a decision maker.

Cognitive structuring

Cognitive structuring defines Neuberg and Newson (1993 in Bar-Tal, Kishon-Rabin, Tabak, 1997) as the creation and use of abstract mental representations, which are simplified by generalizations of previous experience.

The importance of cognitive structuring plays an important role in memory processes and the perception of people (Alba, Hasher, 1983; Allport, 1954; Anderson, 1983; Cantor, Mischel, 1979 in Bar-Tal, Kishon-Rabin, Tabak,1997), stereotypes (Kruglanski, Freund, 1983; Stephan, 1989; Taylor, 1981 in Bar-Tal, Kishon-Rabin, Tabak, 1997), cognitive processes (Kruglanski, Ajzen, 1983 in Bar-Tal, Kishon-Rabin, Tabak, 1997), stress and its coping (Epstein, Meier, 1989; Wheaton in Bar-Tal, Kishon-Rabin, Tabak, 1997), attitudes (Jamieson, Zanna, 1989; Schlegel, DiTecco, 1982 in Bar-Tal, Kishon-Rabin, Tabak, 1997), but especially when experiencing uncertainty and its removal (Bar-Tal, 1993, 1994; Bunder, 1962; Mayseles, Kruglanski, 1987 in Bar-Tal, Kishon-Rabin, Tabak, 1997).

Cognitive structuring assists a person effectively acquire a sense of security. If we define the uncertainty (the removal of which is the fundamental of cognitive structuring) in accordance with Bunder (1962 in Bar-Tal, Kishon-Rabin, Tobacco, 1997; Sarmány - Schuller 2001) as the inability to adequately categorize and structure information, we can find the effectiveness of cognitive structuring in its relative automaticity, speed and undeliberateness (Brewer, 1988; Shiffrin, Schneider, 1977; Taylor, Crocker, 1981 in Bar-Tal, Kishon-Rabin, Tobacco, 1997).

Cognitive structuring helps to develop reassurance in a sense that a person does not perceive inconsistent and irrelevant information.

Bar-Tal, Kishon-Rabin, Tabak (1997) assume that cognitive structuring consists of two components – need for structure and ability to achieve cognitive structure.

A need for structure is defined as the preference of cognitive structuring, which is understood as (1) an opposite towards a piecemeal processing of information and (2) a means leading to a reassurance (Bar-Tal, Kishon-Rabin, Tabak, 1997).

In the past, many authors devoted to the need for cognitive structure (for instance Bunder, Newson, Kruglanski), who, however, used the names such as tolerance for ambiguity, dogmatism, open mind, focus on confidence, the need for cognition, desire for a simple structure, personal need for a structure, the need for cognitive closure, the preference for consistency to describe this term.

We will focus on research findings of some authors mentioned above.

Frenkel-Brunswik (1949 in Bar-Tal, Kishon-Rabin, Tobacco, 1997) notes that people, who do not have a tolerance for ambiguity, prefer the familiar and confidential information, as well as symmetry, closure, permanent regularity. They tend to premature conclusions, black and white vision, simplifying dichotomisation.

Smock (1955 in Bar-Tal, Kishon-Rabin, Tobacco, 1997) adds Frenkel-Brunswik. Intolerance of ambiguity reflects the need of a person to become familiar with his/ her surroundings.

Rokeach (1960 in Bar-Tal, Kishon-Rabin, Tobacco, 1997) defines the difference between open-minded people and closed-minded people. Open-minded people have a system of cognitive beliefs which leads them towards new information. Close-minded people focus on known and predictable events.

Roney, Sorrentino (1987 in Bar-Tal, Kishon-Rabin, Tabak, 1997) point to differences between people oriented on certainty and people oriented on uncertainty. People oriented on certainty use clear and structured categories, they can see a world in black and white, and they can reach the certainty the way that they ignore inconsistency and ambiguity. People oriented on uncertainty dispose with richly developed and low differentiated categories. They cope with inconsistency in a direct way and do not avoid confrontation with it.

On base of above mentioned conclusions, we can generalize differences between people with high and low need for cognitive structure. People with high need for cognitive structure reduce the uncertainty in both non-systematic and heuristic ways and on base of created (Brewer, 1988; Fiske, Pavelchak, 1986 in Bar-Tal, Kishon-Rabin, Tabak, 1997). People with low need for cognitive structure reduce uncertainty in an individual way, in a piecemeal process which is systematic and based on meaningful search for relevant information which evaluates and assimilates to its system (Driscoll, Hamilton, Sorrentino, 1991 in Bar-Tal, Kishon-Rabin, Tabak, 1997). They tend to use piecemeal processes in information processing.

Table 1. Combination of need for cognitive structure and ability to achieve cognitive structure

		Need for cognitive structure	
		Low	High
Ability to achieve cognitive structure	Low	Low level of piecemeal structuring Unintended information processing Dysfunctional impulsivity Low self-efficiency High uncertainty Frequent use of stereotypes Low level of stress	Low level of cognitive structuring Hypervigilance Low self-efficiency High uncertainty Obsessions, compulsions High sensitivity Less frequent use of stereotypes Very high level of stress
	High	High level of piecemeal structuring Intended information processing Vigilance High self-efficiency Low certainty High level of stress	The high level of cognitive structuring Unintended information processing Functional impulsivity High self-efficiency High certainty High level of repression Frequent use of stereotypes Low level of stress

The ability to achieve cognitive structure relates to how the one is able to utilize the process of information processing, which is consistent with its need for cognitive structure. In the case of a high need for structure, it regards to (1) avoidance of information that the one cannot categorized in accordance with existing knowledge and (2) organizing of knowledge the way to be adapted to existing cognitive structure. In the case of a low need for structure, it regards to (3) active and systematic understanding of all available information. In general, the ability to achieve cognitive structure can be defined as the ability to use its categories the same way as analytical information processing in accordance with the tasks that are the man asked.

Need for cognitive structure and ability to achieve cognitive structure are components of cognitive structuring process, which combination we can get four types related to processing of information:

Low need for structure - low ability to achieve cognitive structure (in research is used abbreviation LPNS – LAACS),

Low need for structure – high ability to achieve cognitive structure (LPNS – HAACS),

High need for structure – low ability to achieve cognitive structure (HPNS – LAACS),

High need for structure – high ability to achieve cognitive structure (HPNS – HAACS).

Particular characteristics of mentioned types are displayed in Table 1.

Research

The sample consisted of 75 participants whose average age was 21. They were students of Faculty of Social Sciences and Health Care, Constantine the Philosopher University in Nitra. Their fields of study were social work and psychology. Women dominated in the research group.

We used the following questionnaires for data collecting (in alphabetical order):

AACSS – Ability to Achieve Cognitive Structure Scale

author: Bar-Tal

The questionnaire consists of twenty-four claims that a participant assesses in the 6-point scale. Items of the questionnaire include the following four fields: easy use of cognitive structure, difficulties with use of cognitive structure, easy use of a piecemeal information processing, and difficulties with use of a piecemeal information processing. The output is a single number that characterizes the individual ability to achieve cognitive structure.

MDMQ – Melbourne Decision Making Questionnaire

author: Mann et al.

Twenty-two-item questionnaire designed to identify a decision-making style. It has 5 factors in its extended version:

SED (evaluation of self-esteem as a decision maker in terms of ability of effective decision-making skills),

VIG (vigilance),

SR (shifting responsibility);

PRO (procrastination),

HYP (hypervigilance)

PNSS - Personal Need for Structure Scale

authors: Thopson, Naccarato, Parker

The questionnaire consists of 12 claims which are reviewed by a 6-point scale. Questionnaire items are designed to capture the organization and method of processing information, as well as stereotyped responses, external keys when creating judgments, processing of inconsistent information, efforts to enrich existing knowledge.

We hypothesis that:

H1   high ability to achieve cognitive structure is in relation with high self-esteem in decision-making.

H2   high ability to achieve cognitive structure is in relation with vigilance.

H3   low ability to achieve cognitive structure is in relation with shifting responsibility.

H4   low ability to achieve cognitive structure is in relation with procrastination.

H5   low ability to achieve cognitive structure is in relation with hypervigilance.

To test our hypothesis we used Statistical Program for Social Science 17.0. We used Kruskal-Wallis test to test differences among research groups. As a critical statistical value which indicates the statistical significance, we appointed the standard value of p = 0,05.

The results are presented in tables 2 to 6. All differences are significant at the level of α ≤ 0.001. The only exception is the vigilance in which we did not measured the significant difference among research groups. At this place we explain the abbreviations we used in tables. CS = cognitive structuring, AACS = ability to achieve cognitive structure, PNS = personal need for structure, H = high, L = low, N = count, Min = minimal measured value, Max = maximal measured value, Me = median, AM = average mean, SD = standard deviation, H = result of Kruskal-Wallis test, p = significance.

We allege that we can support all hypothesizes we designated except the hypothesis 2.

Conclusions and discussion

We found that the students with high ability to structure the information have also high self-esteem in decision-making. They do not have the tendency to use ineffective decisional styles in forms as shifting responsibility, procrastination and hypervigilance. On the other hand, we did not find the relation between high ability to structure information and vigilance as effective decisional style.

We can write that the crucial factor which determined decisional style was the ability to achieve cognitive structure. Personal need for structure was the factor which emphasizes the effect of the ability to achieve cognitive structure in case of shifting responsibility and procrastination.

So we cannot support the relation between high ability to process the information and effective deciding. But we can support the relation low ability to process the information and ineffective deciding.

And what are the implications to educational environment? In the present reform of educational system, there is the accent on the humanistic approach. It means the change of the relation educator – educant, curricular transformation and also the aspiration to emphasize non-intellectual factors of education. But the ability to process the information stays the base on which we have to build the education of the students. Information is not only concepts, theories, facts, but also the emotions, attitudes, beliefs, patterns of behavior. Maybe this is the reason why we think about putting back the math into the final exam in secondary school as an inherent part.

The limits of our research are evident. The research sample is small. It is representative for the faculty on which the research was realized, but it is not representative for whole population of students. But the results are clear.

There exists a tendency to decide ineffectively. It means the human has a tendency to deciding delay, to not accept own responsibility for own decisions or has neurotic symptoms because he has the problem to select important information and avoid the unimportant ones. It leads to disbelief to own competences, negative emotions and low self-esteem which was strong influence on own self-image.

If we do not want to learn the students who do not know to decide we have to support their ability to process the information as a part of cognitive effectivity and metacognitive factor.

Table 2. Differences in self-esteem among the groups of cognitive structuring

	groups of CS	N	Min	Max	Me	AM	SD	H	p
self-esteem	LAACS-LPNS	21	4	10	8	7.57	1.66	21.987	<0.001

Modernidade e desconstrução pós-moderna

O projeto educativo no quadro da modernidade

A Modernidade poderá caracterizar-se como um movimento de rejeição do contexto em que o indivíduo aparecia dominado pela tradição e o sentido se encontrava monopolizado por uma autoridade. A rejeição moderna do pré-modernismo foi levada a cabo em nome da razão e da ciência, como instrumentos da emancipação humana, reclamada com base no reconhecimento das categorias antropológicas da liberdade e da dignidade. A sua hipótese fundamental era a atribuição ao indivíduo autónomo da prerrogativa de se constituir como fonte única do sentido e da verdade. No campo epistemológico, a garantia desta atribuição parecia ter sido encontrada com o cogito cartesiano, substancialista, a priori, solipsista e, supostamente, transcendente. Criando-se em seu torno um conjunto de ilusões insularizadoras e desnaturalizadoras, que tipificaram o humanismo tradicional (Carvalho, 1994).

No novo enquadramento, a forma de conceber a história infletiu no sentido antropocentrista, passando, então, a confiar-se nos poderes da razão humana para ir promovendo a sua própria emancipação, mediante os instrumentos que ela possa sacar de si mesma. Um processo otimista de irresistível progresso aperfeiçoador e de libertação de constrangimentos como a dependência (material e espiritual), a injustiça, a violência, a indigência, a fome e a ignorância.

Em si mesmo, o projeto emancipador e ilustrador apontava para valores que tenderam a universalizar-se: a liberdade, a igualdade, a solidariedade e a tolerância. Valores que ainda hoje se podem sustentar como um desiderato universal das sociedades. À educação haveria de confiar-se então uma ingente responsabilidade, pois o uso autónomo da razão, que seria a chave para a libertação de todas as limitações, reclamava-a de modo intrínseco. E daí que se lhe atribua o estatuto de direito universal, pois se lhe reconhece uma função antropológica constitutiva, que se alinharia com o Bildung, precisamente o processo pelo qual o humano adquiriria a competência racional distintiva da sua humanidade.

O conceito envolve a referência a um modelo e a um processo configurador, correspondente ao desenvolvimento que, de dentro para fora, há-de realizar num ser orgânico, a partir de uma situação indeterminada, a forma almejada (Cabanas, 2002). Trata-se de pôr em atividade a enteléquia humana, todas as suas forças e potencialidades, de modo a que estas possam desenvolver-se no seu próprio télos, segundo um jogo harmónico e proporcionado. Com o Bildung aponta-se à emergência da pessoa, cuja dignidade, racionalidade, condição moral e liberdade lhe permitem conceber-se como um fim em si mesma.

A desconstrução pós-moderna

Acabaria, no entanto, por ser contra este paradigma que o pós-modernismo viria a acometer desconstrutivamente. Seja rejeitando a ideia de um sujeito racional soberano e autónomo, seja rejeitando a metanarrativa do progresso, seja rejeitando o Bildung enquanto matriz normativa do programa educacional.

Segundo Eagleton (1998, p.7): "Pós-modernidade é uma linha de pensamento que questiona as noções clássicas de verdade, razão, identidade e objetividade, a ideia de progresso ou emancipação universal, os

sistemas únicos, as grandes narrativas ou os fundamentos definitivos de explicação. Contrariando essas normas do iluminismo, vê o mundo como contingente, gratuito, diverso, instável, imprevisível, um conjunto de culturas ou interpretações desunificadas gerando um certo grau de ceticismo em relação à objetividade da verdade, da história e das normas, bem como em relação às idiossincrasias e à coerência das identidades."

Lembremos também, para a genealogia desta mutação infraestrutural, os contributos dos "mestres da suspeita", segundo a expressão de Foucault (1987), e toda a série de críticas dessacralizadoras, desmistificadoras e desconstrutoras que, se por um lado deram continuidade ao trabalho emancipador moderno, por outro conduziram ao soçobro dos veios axiais do próprio projeto da modernidade. Mas não se pode esquecer que já antes estava em curso um trabalho de sapa de erosão dos seus pilares. A desconstrução conducente ao abate das metanarrativas, registado por Jean-François Lyotard (1989), tinha começado antes e foi preparando a pós-modernidade por diferentes vias.

Tendências pós-modernas e educação

O movimento pós-moderno em educação apresenta-se ambíguo, abrangendo uma pluralidade de aspetos: a conceção de educação, a organização e administração escolar, os métodos de ensino ou a natureza de certas disciplinas (Cooper, 2003). O pós-modernismo tem insistido sobretudo na necessidade de defender a diferença e a diversidade, mostrando uma forte hostilidade pelos processos de cariz universalizador, totalizador ou centralizador.

Lyotard (1989) tipificou a pós-modernidade como uma condição emergente nas sociedades mais desenvolvidas, marcadas pelo consumismo, a capitalização global, o ecletismo, o "anything goes" e a hegemonia da performatividade, em que se afirma o critério técnico-científico da otimização entre custos e benefícios. É neste ambiente que se desenvolve a crítica à modernidade, muito em especial a todo tipo de certezas, sejam elas metafísicas, religiosas ou políticas. Trata-se de uma mudança ideológica que comporta o fim da própria ideologia, a liquidação das crenças, dos ideais e do poder da razão e da moral: o niilismo.

A educação não escapou a este terramoto, registando o fim da crença na própria capacidade da educação para cumprir com o desígnio de perfectibilização dos sujeitos humanos, muito em proveito da procura do encaixe imediatista no mercado de trabalho, isto é, em perfeito alinhamento com a hegemonia performativista. O que expõe a deriva perversa do "fim da ideologia": o eventual ganho em afastamento das lógicas absolutizadoras parece esvair-se na entrega acrítica ao sistema, na generalização da apatia e no triunfo do relativismo, do individualismo rampante, do egoísmo, no quadro da entrega à procura do bem-estar e do divertimento, nos termos do desenvolvimento de mecanismos de uma certa regulação do vazio existencial correlativo.

É o tempo da Razão Cínica, segundo Sloterdijk (1987), em que vai medrando uma falsa consciência ilustrada: ilustrada ou esclarecida porque liberta das justificações tradicionais absolutizadoras; falsa porque inautêntica, pois continua, de facto, a entregar-se aos velhos modelos. Aliás, quando não recai nas velhas lógicas remete-se à vassalagem ao sistema, como acontece ao próprio pós-modernismo demasiadas vezes (Eagleton, 1998).

Segundo Cooper (2003), o relativismo pós-moderno não significa só que o conhecimento é relativo às suas condições contingentes de possibilidade e pode ser de dois tipos: subjetivista, quando relativiza a verdade ao sujeito; linguístico, quando a relativiza ao contexto da linguagem utilizada. Neste quadro, as noções de verdade e conhecimento universal objetivo estão destinadas a ser evacuadas pela sua suposta inutilidade e, sobretudo, pelo facto de constituírem verdadeiros obstáculos epistemológicos. O que representa, no campo da educação, o abatimento de todo horizonte normativo, a recusa dos modelos e dos fins.

Quanto à incredulidade nas metanarrativas, depois de afastado o projeto da teoontologia tradicional, ela incide transversalmente sobre toda a grande narrativa: a da dialética do Espírito; a das hermenêuticas do significado; a da emancipação do sujeito racional ou trabalhador; ou, ainda, a da criação da riqueza. Diferentes relatos, usados com o mesmo propósito: a legitimação dos discursos totalitários, isto é, absolutizadores e

normativos, quase sempre autodenominados "ciências". A partir daqui parece inaceitável a prevalência de qualquer narrativa fundadora, abrindo-se o mundo à pluralidade das narrativas, todas em pé de igualdade. O pós-modernismo desconfia do estabelecimento de hierarquias, pois desconfia que nelas se escondam relações de poder, mas o nivelamento absoluto (!) pode levar-nos a situações absurdas. Por exemplo, no campo da cultura, o pós-modernismo tende a confundir hierarquia com elitismo (Eagleton, 1998).

A hostilidade da pós-modernidade pela pressuposição de um nível de profundidade dos discursos desenvolveu-se no campo artístico onde emergiu a recusa de qualquer ambição por revelar a verdadeira natureza de um suposto real subjacente: o artista pós-moderno não aspira a ser o "senhor" do sentido escondido, nem à mestria da sua revelação, o que significaria admitir que existe "um" sentido, ou seja, significaria ceder à tentação absolutizadora e normativista; o artista pós-moderno devota-se às superfícies e ao pastishe (Keep, Mclaughlin & Parmar, 2011). Neste contexto, a funda(menta)ção da autenticidade é revogada em benefício do relativismo da colagem. No campo da arte e da vida quotidiana vemos emergir um padrão que se afasta dos modelos universais, abraçando a complexidade e a multidimensionalidade, e em que se assume a dissolução das distinções.

Mas o pós-modernismo não só rejeita o indivíduo autónomo e soberano como opta pela ênfase nas experiências anárquicas, coletivas e anónimas, através das quais melhor se podem realizar a diversidade, a colagem e o inefável. Com isto, assistimos à dissolução das distinções clássicas entre sujeito e objeto, o eu e o outro, rejeitando-se todas as tentativas de definir, reificar ou re-apresentar o sujeito humano.

A hostilidade da pós-modernidade face à preocupação com a profundidade resultou de uma descoberta da importância dos contextos, ou jogos de linguagem, para definir o sentido e o significado na sua imanência, daí que tão pouco fosse de admitir as ambições decorrentes da intenção universalizadora para estabelecer regras gerais do juízo ou normas morais *sub specie aeternitatis*. O postulado do plano subjacente ao discurso é desativado pelo facto de o sentido se encontrar tecido no agenciamento do jogo de linguagem em que se efetiva – pertence a uma superfície e não a qualquer tipo de profundidade–, o que dá abertura à ideia da incomensurabilidade dos discursos e culturas, bem como à dos diferendos insolúveis. De modo concomitante, a ideia do sujeito racional autónomo subjacente aos discursos e práticas, autor e agente, elemento unificador do seu sentido, deixa de ser uma referência aceitável, dando passo à ideia de um ser fragmentado, difuso e em contínua mutação. O que significa que no plano da educação acaba de esfumar-se a identidade definidora da personalidade que, na referência coerente a uma constelação de valores se expressa num carácter (Boavida, 2005), ou seja, o próprio elemento axial que articularia o *Bildung*.

Nietzsche e Foucault relativizaram as crenças com as suas genealogias, Heidegger relativizou os edifícios do conhecimento com a sua hermenêutica e Derrida, finalmente, abateu a suposta transcendentalidade do significado com a sua desconstrução: "quando abordagens tão destrutivas se conjugam, é evidente que não existe 'Conhecimento', apenas 'conhecimentos', não existe 'Razão', apenas 'razões', e que estes diversos conhecimentos e razões são 'construídos' e não descobertos. São construídos nas e através das práticas e discursos que apresentam a indelével marca de fatores afinal tão 'demasiado humanos', como a luta pelo poder" (Cooper, 2003, 210). Isto significa que também deve sair de cena o sujeito racional capaz de transcender tais práticas com vista à obtenção de um lampejo objetivo das verdades e das normas.

O reconhecimento da falência da Ilustração moderna está longe de ter produzido uma verdadeira alternativa crítica, pois, quando não se fica pela anomia alienante de qualquer tipo de intervenção, apenas tem dado passo a reações que oscilam entre a recaída nostálgica no apego às certezas perdidas e a obsessão cínica pelos mais pragmáticos interesses egotistas. Destruída a possibilidade de discursos ancorados e assumida que ficava a existência de diferendos irresolúveis, resta à pós-modernidade a celebração da diferença, no quadro de um pensamento assumidamente fraco, dado a exercícios lúdicos e à ironia. O maior ganho talvez tenha sido o desenvolvimento do respeito pelo local e as minorias, procurando conseguir com que se ouçam as vozes das diferenças fora do regime do discurso dominante, nela incluída a mania performativa.

Jean-François Lyotard propôs que se dê testemunho dos diferendos das vozes da diferença e se encontrem os idiomas adequados à sua expressão, sugerindo que a arte e o sentimento poderiam ser os melhores meios para abrir o enigma humano aos interlocutores (Dillon & Standish, 2000). Não só é a arte o melhor meio para abrir a

expressão do diferendo, que não pôde encontrar os termos para se expressar no jogo de linguagem dominante, como será pela arte que se poderá despertar as boas consciências insensíveis ao seu grito surdo.

A seu ver requer-se hoje um trabalho meticuloso e paciente de nada mais do que "apenas educação" (Dillon & Standish, 2000). O que nos leva a questionar se não há aqui um retorno à convocatória moderna da educação com vista ao projeto de emancipação individual e coletiva. O que nos deixa aberta a porta para reconstruir, *mutatis mutandis*, uma nova conceção de *Bildung*.

A filosofia dos limites e os limites do pós-modernismo

A recusa do absoluto pelos pós-modernos significa o reconhecimento dos limites das nossas linguagens e das razões e das práticas que as constituem e nelas se constituem, mas que ao mesmo tempo aponta para os próprios limites da orientação pós-moderna. Por todo o lado se abateram referentes, sem que se tenham reposto os efetivos e, entretanto, progrediu o deserto e a floresta definhou, começando a faltar o ar: assistimos já ao triunfo do hiperconsumismo (Lipovetski, 2007). Alastra o império do efémero na época do vazio, pululam os paradigmas vácuos assentes na fama que tomou o lugar do prestígio, o relativismo anda de mão dadas com a superficialidade, recuaram as éticas para o nível do indolor e da circunstância, e o divertimento casou-se com a procura do prosaico bem-estar, conformado com o sistema. No oceano do fim das ideologias, além de náufragos pouco mais se encontra do que "velozes sem rumo e poderosos sem causa" (Boavida & Sanches, 1997).

Não admira por isso que, após um período de hesitações e passos em falso, de regressos forçados ao passado e fugas para diante, de mais radicalização niilista, se tenha começado a procurar uma reconstrução, desde logo reconsiderando a real valia das abordagens pós-modernas. O questionamento do pós-modernismo pôs a nu uma série de deficiências, que Cooper (2003) elencou de forma precisa. Os pós-modernos espantaram pelo efeito bombástico das suas propostas, mas estas enfermam em muitos casos de sérias limitações: o facto de enveredarem por simples paródias da filosofia "tradicional"[4]; a fraqueza argumentativa que se descobria por trás da opaca linguagem de efeito sensacionalista; e o caráter auto-estupidificante de algumas abordagens.

Uma mitigação do pós-modernismo parece recomendar mais rigor, melhor referenciação histórica, melhor argumentação, maior qualidade nas formulações, de modo a que se veja claramente os seus reais contributos e se evite o resvalamento para o paradoxo e o absurdo. Uma posição moderada poderia ater-se ao critério de uma racionalidade dialógica, remetendo para critérios intersubjetivos abertos à revisão e em que, precisamente, faz sentido admitir para o campo da educação a referência aos valores democráticos e emancipatórios, ainda que, também neste caso, se reconheçam os limites da nossa compreensão do seu sentido.

Subsídios para a reconstrução dos paradigmas educacionais

Desafios im/possíveis da pós-modernidade

Cooper (2003) identificou os principais tipos de respostas dos pós-modernos para o campo educacional, que se podem aglutinar em torno do denominador comum da recusa dos enquadramentos absolutizadores e da afirmação do direito à diferença.

Um grupo muito radical chega a avançar no sentido do fim da crença na educação, muito em particular para realizar o projeto da emancipação. Em certos casos antevê-se mesmo o fim da educação, com o regresso à universidade da vida, em que a busca da emancipação se realizaria pela experiência direta de diferentes formas de viver.

---

[4] Alguns (Buckingham, 2003) assumem explicitamente a paródia como instrumento para lidar com as relações de poder e dizer o indizível, isto é, dar lugar à voz da subversão.

Uma orientação mais otimista propõe uma reestruturação da educação de modo a refletir ao nível curricular a explosão da tradicional confiança na verdade e na objetividade, reconhecendo-se a natureza construída de todo corpo de conhecimentos. Para o plano organizacional prevê-se a descentralização, de modo a poderem afirmar-se as comunidades educativas específicas, definindo o seu próprio estilo, padrões de exigência e estrutura curricular.

Alguns chegam mesmo a avançar a rejeição da iniciação dos jovens nos corpos de conhecimentos estabelecidos, que reputam de totalitários e terroristas, recomendando um ambiente escolar de dissensão e resistência ao conhecimento e normas transmitidas. Esta abordagem, prescindindo de padrões de julgamento, pretende apoiar as decisões na simples adesão estética, um critério muito fraco quando se trata de questões epistemológicas e, eventualmente, éticas.

Uma outra corrente pós-moderna apresenta uma aparente moderação: não rejeita a necessidade de critérios de consensuação acerca da verdade, os conhecimentos e as normas morais, apenas insiste na hostilidade à profundidade e ao "fundacionalismo" da verdade. Impugnam, no entanto, o entendimento do fim da educação como iniciação a formas de conhecimento, supostamente, ancoradas e objetivas ou como correspondendo ao desenvolvimento do indivíduo racional autónomo, subjacente às críticas, aos discursos e às práticas.

As correntes pós-modernas, em geral, tão pouco aceitam a obsessão pela performatividade ou a perspetiva de um discurso científico livre de compromissos ideológicos e normativos. Alguns assumem-se como ironistas, livres de produzir descrições irrestritas de si e do mundo, e sem assumirem ambição alguma para impugnarem qualquer tipo de discursos ou práticas públicas que, embora infundamentadas, sirvam a estabilidade do ambiente democrático das nossas sociedades. Neste caso remetem o uso da sua ironia ao domínio privado, deixando as abordagens pós-modernas para o contexto académico, facto que mostra bem a compactuação com o sistema a que chegaram.

Para onde quer que se olhe, a paisagem pós-moderna não parece fornecer referentes para se estruturar convictamente a educação. Em certos casos, sugerem perplexidades e paradoxos que geram, no mínimo, incredulidade e estupefação e, no limite, bloqueios, anomia, sentimento de deriva e de desespero. É este estado de coisas que tem dado força a uma preocupação crescente de proceder a uma reconstrução da Razão Pedagógica (Gonzálvez, 2010). Um ensejo que se vislumbra mesmo entre os pós-modernos que parecem estar cansados de tanto niilismo.

Relativismo, multiculturalidade e valores humanos

Um dos desafios mais difíceis da pós-modernidade diz respeito ao relativismo, que articulado com a afirmação da diferença motivou o advento do multiculturalismo. O debate sobre o multiculturalismo implica uma análise axiológica que deve começar por enfrentar o facto de, como nota Strawn (2007), o relativismo ser hoje dominante na Academia. Pelo menos os antropólogos, os sociólogos e os filósofos experimentam grandes dificuldades em levar a cabo o seu trabalho fora de abordagens relativistas. Contudo, o direito à diferença, globalmente considerado para uma cultura, não deveria colidir com os direitos fundamentais dos seus membros.

Algumas tendências pós-modernas, prevalecentes nos setores das ciências sociais e humanas, acreditam que a verdade é múltipla e depende do ponto de vista do sujeito ou do contexto em que é formulado, uma vez que não existe uma racionalidade que possa garantir validade universal, apenas racionalidades diferentes em diferentes culturas. Seguindo a análise de Silva (2005), podemos distinguir dois tipos de críticas do relativismo: i) o primeiro é de âmbito geral: os relativistas clamam que não existe nenhuma verdade não relativa, ou seja, a sua perspetiva sobre os "jogos de linguagem" deve ser considerada não-relativa; ii) o segundo tipo de críticas diz respeito às consequências absurdas do relativismo, como nos casos de considerar, por exemplo, que a total equivalência entre práticas culturais, mesmo quando se trata da mutilação genital feminina, cujos relatórios médicos da World Health Organization (2010) mostram à evidência os efeitos nefastos sobre a saúde e a natureza da experiência sexual feminina. Ora, se o multiculturalismo deve ser assumido como princípio para o direito à diferença, não necessariamente nos autoriza a cair no relativismo e muito menos a defender uma

idiossincrasia cultural à custa dos direitos individuais universais, nomeadamente a dignidade humana, a liberdade, a igualdade de condição e a justiça. Temos de evitar que o étnico liquide o ético (Béji, 2006). Nas palavras de Amin Maalouf (2000, p. 88): "há valores que concernem à espécie humana sem exceção. Tais valores merecem ser colocados antes de tudo mais."

Quando passamos para o plano das nossas escolas precisamos também de questionar o sentido e a validade do relativismo, que hoje se apresenta sobre a forma dos avatares do "indiferentismo" e do "tolerantismo" (Gonzálvez, 2010). O "indiferentismo" tende à desativação de todos os instrumentos coativos, das avaliações e do espírito de rigor, o que tem levado a iludir as funções sociais da escola, do ensino e dos diplomas. O "tolerantismo", como tendência para tudo tolerar, que aparece hoje como um novo absoluto, enferma do absurdo de nos fazer aceitar até aquelas perspetivas habitadas pela dominação e o trato vexatório. Ora, no quadro da modernidade, a tolerância entendia-se, precisamente, como limitada pelos valores da dignidade e da justiça, limites que a pós-modernidade veio dissolver com a absolutização da tolerância.

Tal como propôs Herrerías (2009b), devemos chegar a uma conceção metamoderna que transcenda tanto o moderno universalismo da univocidade como o pós-moderno universalismo da equivocidade, se quisermos obter um novo horizonte para a verdade. Para lá das metanarrativas da imposição e do relativismo inoperante, precisamos de aprofundar a via do diálogo genuíno e inquiridor entre todos nós. O novo horizonte da verdade é o do "encontro dialógico", que se refere a uma demanda acerca do que poderia ser uma sociedade mais justa, mais digna, mais livre e mais equitativa.

Da desmobilização do sujeito crítico à sua recuperação crítica

Um dos mais graves problemas da leitura pós-modernista, começa quando se recusa todo o objetivo à educação ou a definição da educação como avançando para a concretização de um objetivo. Usher & Edwards dizem que, "com efeito, o auto-definido objetivo da educação não pode ser realizado na escolaridade. Não há nenhum fim para a incompletude e nenhum fim da completude. A escolarização nem pode ter um 'fim' (objectivo ou propósito) nem pode ela própria ser um 'fim' (*terminus*)" (Usher e Edwards, 1997, 131). Se, certamente, o desejo que nos anima nunca está completo, nem a educação se clausura alguma vez, também é verdade que a educação atinge um dos seus objetivos quando coloca o sujeito na senda dessa dinâmica de procurar respostas à sua incompletude, atribuindo-lhe competências de produzir sentido para a sua existência, ou seja, saídas para a sua inesgotável ânsia de ser. Neste sentido, a educação tem um fim (*terminus*) e tem, aliás, múltiplos e polimorfos fins e finalidades, que podem ser redefinidos de modo renovado, mas que reclamam opções. O pós-modernismo, no entanto, parece, por vezes, querer esquivar o optar.

Usher & Edwards criticam a "novela da autoformação", construída pela Ilustração para definir a educação como processo conducente ao alcançar da autonomia aceitando certos constrangimentos sociais. A seu ver, o verdadeiro sentido da educação está em o educando perceber que "a sua autonomia é indeterminada já que não pode nunca alcançar um fim (, ou seja,) que ele é um sujeito de desejo, de um desejo que nunca pode ser satisfeito" (Usher e Edwards, 1997, 134-135). Sem dúvida somos esta ânsia e, sem dúvida, a nossa autonomia está sempre limitada –por isso se projeta continuamente–, mas somos também sujeitos de razão, que concebem a sua realização no próprio quadro limitado das opções e dos valores. Aliás, não podemos esquivar a condição de, a cada momento, ser o nosso eu, porventura descentrado de qualquer narrativa monológica, com os seus desejos, a sua razão e os seus valores que constitui o centro a partir do qual perspetivamos as alternativas para nos realizarmos, numa contínua emancipação do que nos limita e enclausura. A cada passo, também, é a coerência que nos permite escolher, não lutamos contra a coerência, mas com ela.

Ora, na senda da desconstrução nietzscheana, Bingham apareceu a defender uma pedagogia da *self-reformulation*, a que aparece associado o pressuposto algo absurdo do projeto da não-identidade (Fennel, 2005). A pedagogia da *self-reformulation* ensina a humildade e a abertura experiencial, porém parece fazê-lo para entregar o sujeito à desconstrução de tudo o que possa considerar-se um *self* estável. O seu propósito é o comprometimento com uma não-identidade do *self* ou uma identidade vacilante num contexto de total planura democrática na interação. "Em nome da liberação humana, a pedagogia da *self-reformulation* providencia as

mesmas oportunidades para todos os estudantes. Sob o princípio de que um *self* estável e uma identidade fixa são danosos, os educandos devem acostumar-se a um fluxo em que não pode haver lugar para o que é superior" (Fennel, 2005, 106). A nosso ver, aceitar a abertura a outras formas de ser não pode conduzir-nos à defesa do abandono de toda a identidade que sirva de autoreferente estável. Semelhante radicalização da existência significa perder a própria existência, não ganhá-la. Mais uma vez, o que o abatimento de todo o referente parece legar-nos é a relativização fragmentadora onde nos perdermos. Aliás, em contextos em que se desmobilizou o sujeito crítico que poderia fazer frente ao hiperconsumismo, é patente que o individualismo hedonista e o relativismo apenas nos entregam a planos superficiais e espúrios (Lipovetsky, 2007).

Não deixa de ser curioso o modo como os pós-modernos, ao mesmo tempo que ensaiam uma justa crítica ao conceito mercantilista, consumista e performativista que se instalou na educação, procuram descartar o enquadramento teleológico, por este albergar geralmente a falácia essencialista, mas acabam, no entanto, por recuperar, de algum modo, o desiderato do sujeito crítico. Standish (2003), por exemplo, mostrou como é importante, hoje, transcendermos os esquemas teleológicos enclausuradores da performatividade e do essencialismo de vistas curtas: "o pensamento teleológico torna-se grotesco quando concebe os seres humanos e as suas políticas como perfetíveis –em termos de fins que são em princípio realizáveis" (p. 227). A crítica é importante e acertada quando se pensa nos atuais contextos da educação funcionalizada a performances técnicas e economicistas, ou nas derivas totalitárias do século XX; mas no que diz respeito ao paradigma da modernidade parece esquecer que o conceito moderno de ser humano educado é assintótico: pessoalmente, jamais podemos assumir-nos educativamente acabados, como jamais podemos atribuir à emancipação coletiva uma data de consumação.

O nosso autor pretende esquivar o esquema da perfectibilidade teleológica, voltando-se para o conceito emersoniano de perfecionismo. Uma conceção flexível e aberta, mas que "sugere a aspiração para o melhor de nós mesmos" (Standish, 2003, p. 228). Trata-se de cada um encontrar o seu caminho e não entrar no caminho definido por outros. Contudo, também aqui, seria bom lembrar que o conceito moderno de emancipação pressupõe o pensar por si libertando-se de todas as tutelas, como tão contundentemente mostrou Kant (1784/1985).

A abordagem do autor citado parece, contudo, dispensar a soberania do sujeito racional e pretende antes ater-se à perspetiva de que qualquer ideia que tenhamos de nós próprios, pessoalmente considerando-nos como um todo, é essencialmente provisória, pois a alma é "uma imensidão não possuída e que não pode ser possuída" (Emerson, ap. Standish, 2003, p. 229). De modo que imaginar que podemos constituir-nos pessoalmente adquirindo progressivamente competências apenas nos pode cegar para o facto de a nossa vida ser uma aprendizagem por acercamento infinito à verdade e de que não há nenhum fim para ela, pois cada fim é um novo princípio, cada limiar de profundidade abre sempre outro. O que leva Standish a dizer que "Há uma espécie de blasfémia na abordagem direta dessas profundidades. Há idolatria na busca estreita de fins fixos" (id. Ibid.) Acabando por se decantar por uma proposta que parte do reconhecimento da nossa "incompletude essencial". Proposta que, a nosso ver, deve ser completamente abraçada pela reconstrução educacional que queremos aqui apontar.

A pós-modernidade tem promovido o desenvolvimento de releituras da antinomia fundamental da educação entre essência e existência, mas por vezes tende a uma radicalização existencial. Pela nossa parte, entendemos que a resolução desta antinomia só pode ser provisória e aberta (Reis, 2008), de tal forma que a vida e o ideal se unam de modo criador e dinâmico (Suchodolski 1988). O que nos deixa ver que a tensão se mantém, é preservada, não se anula.

Mas será que a relativização pós-moderna obriga à desmobilização completa do sujeito ativo e crítico, tanto genérica como educacionalmente falando? A resposta de Buckingham, a respeito da cada vez mais indispensável educação para os *media*, é muito clara: "a educação não pode dar-se ao luxo de abandonar o projeto modernista do criticismo cultural" (Buckingham, 2003, p. 325). Na sua opinião, por muito que sejam indispensáveis as formas parodiais, irónicas e lúdicas, por meio das quais o inefável do desejo pode encontrar a sua voz e os discursos totalitários podem ser transgredidos e erodidos, não só é equívoco supor que a ludicidade e a racionalidade se excluem, como temos cada vez mais motivos para encorajar a reflexão e a crítica.

Buscamos um novo paradigma, que deve passar pelo duplo enraizamento natural e relacional da pessoa humana e seja capaz de superar o seu entendimento substancialista, racionalista, monológico e desnaturalizador, por meio de uma conceção que entende a sua complexidade dialógica bio-psico-socio-cultural (Reis, 2009). Devemos encontrar as vias de uma nova ilustração, uma metamodernidade que supere as monologias e os reducionismos e se abra ao jogo da igualdade e da diferença das nossas identidades gramaticalizadas e de uma razão participada (Herrerías, 2009b). O que nos remete para o esforço, pedido por Gonzálvez (2010), de reconstrução de uma Razão Pedagógica crítica, dialógica e intersubjetiva.

DESIGNING INNOVATIVE OPEN SPACES FOR LEARNING: THE CASE OF THE OPEN UNIVERSITY OF CATALUNYA

Eva de Lera[1], Magí Almirall[2], Carles Fernàndez[2], Mercé Gisbert[1]

[1] Universitat Rovira i Virgili, Tarragona, C/ del Escorxador, s/n, 43003 Spain

[2] Universitat Oberta de Catalunya, Barclona, Avda. Tibidabo, 39, 08035 Spain

Abstract

The present paper summarizes the new proposal for the reconceptualization and understanding of the learner experience at the Universitat Oberta de Catalunya (UOC). As an unaivodable effort to go along with our students practices and realities, the UOC is opening a new space within its learning technologies and pedagogical practices, where students will have the freedom to work and integrate the knowledge spread in the Internet, to collaborate and nurture from each other without strict rules, to create new knowledge by using the web tools they usually use, and in general to construct their own learning process according to their own formula. At the present time, we are in the phase of design of the experience, and this paper will describe the design of new learning spaces according to the Activity Theory.

Keywords: Personal Learning Environments, Informal Learning, Social Networks

The Universitat Oberta de Catalunya (UOC)

The UOC is what we call a fully online learning University, an institution where the whole learning system and its services allows students to learn beyond the boundaries of time and space.

In its 15 years of life, the UOC has provided students with a complex open source virtual learning environment, along with a big range of services and learning resources and a profound degree of support offered through a system where faculty, tutors, instructors and staff collaborate together in order to offer an integral and effective learning experience that takes into account all of the students' needs. In some sense, we could say that the philosophy behind UOC has been "*to fully embrace and support the learning experience... and to have it under control*". But precisely this level of control of the learner experience is 'under attack' in the new era of the Internet and the web 2.0, and this is percisely the context in which UOC's new initiative is born, to be discussed more in depth in the upcoming section.

Bridging from the era of VLE to the era of PLE

The concept of PLE

Regarding the concept of PLE, there is not a single accepted definition (Fieder, Valjataga, 179) . Most of the authors go between a concept that focuses on tools (as a set of tools that allow the personalization of the learning process) and a concept where the learner is the main actor or protagonist of such learning process (Fieder, Valjataga, 180). In our case, we understand tools are the instruments to open up learning spaces and learning possibilities but, beyond that group of tools, our objective is to integrate, as part of the pedagogical model, the idea that learning occurs everywhere and in non-ending ways, giving the power to each learner to decide how every piece of knowledge is selected, constructed and integrated into their learning experience. In this sense, the definition provided by Wikipedia fits us best (Wikipedia, 2012): *Personal Learning Environments(PLE)* are systems that help learners take control of and manage their own learning. This includes providing support for

learners to set their own learning goals, manage their learning, both content and process and communicate with others in the process of learning.

Currently, there are a large number of Universities and other educational institutions that have started to implement Personal Learning Environments to different extents: some are just embedding APIs from social networks in their virtual environments, others are using these social networks as an external service and, other institutions are just implementing platforms whose function is to work as a full PLE, such as Elgg, Mahara or Netvibes. More examples about the possibility of plugin connectors for services can be found in Wilson&others paper.

Introducing a new model into an old box

The old box: Teachers, pedagogies and technologies

Introducing all these ideas of freedom, flexibility, openness, student control, etc. into the old container of the University culture, teaching practices, web 1.0 technologies and a huge diversity of students is not a one day task.

Firstly, many teachers are reluctant to change something for which they are comfortable with. Partly with reason, they believe that opening the learning process may lead to a lack of control of what is happening in the virtual classroom. Also, many of them are afraid that learning objectives may not be accomplished if students do not fit the contents, activities and learning resources provided by him or her. As stated by Martindale and Dowdy, current pedagogical practices are still teacher-centric, as the process of education is institution-centric (Martindale, Dowdy, 185)

Secondly, we have the pedagogies or teaching methodologies. In this sense, the UOC has a pedagogical model that guides the pedagogical strategy for all the subjects at the University. The philosophy of the model is very student oriented, meaning that the activity of the student is what configures the learning process. As a model, is very much in tune with most of the web 2.0 ideas, but in the real practice, the way subjects are deployed and the possibilities of the technologies we use are usually a bit far from the nature and objectives of the model.

Thirdly, technology does not always allow the flexibility, the integration and the high level of interoperability that a fully open VLE may demand. In a way, the technology developed and open sourced by UOC allows such integration and interoperability to a specific extent, but the continuous adaptations needed for the non-ending web 2.0. tools to be integrated are not instantaneous and in other cases the APIs are not easily adaptable. On the other hand, there are legal issues related to the use of external resources that are to be integrated in our internal spaces, plus opening our own spaces to the rest of the Internet (or simply other external communities) is also related to legal issues that are not completely clear at the moment. Some of these tensions about the control of VLEs by institutions are broadly described in Fournier&Kop paper in the bibliography

The UOC's student profile. It is not about technology, it is about users !

A model that integrates informal learning as direct material to work with requires a good understanding of how the student deals with information and knowledge in his life beyond the University, in a daily basis. If we want to provide students with the tools they usually use from their own computers, we need to know which tools or components they are using, how exactly they are using them, and also their perceptions on the use of these functionalities in learning.

The framework for the research study of our students will be based in the research work developed by Helene Fournier and Rita Kop, from the National Research Council of Canada (Fournier and Kop, 8). Their work is focused in the background of technology of the users, motivations, frustrations, the way they search and manage information and learning and the element involved in the creation of personalized learning environments. At the moment we are creating the survey based on the mentioned indicators that will be passed to students in a few weeks.

The study does not pretend to be a list of the most used tools or a list of the coolest functionalities or the most visited social networks by students. The objective is to identify trends, certain behaviors, the rationale behind students' elections and the dynamics in students collaboration, sharing, creation and edition of knowledge. It is not about the technology itself and its specific capabilities but about the user patterns in the use of these technologies.

To sum up, we aim to know the ecosystem of our student in terms of new technologies usage, habits, preferences, etc. in order to design educational environments that fit them.

The new trends: what our users show us

At this point of the paper, we need to be concrete and specific about what are exactly these innovations we want to introduce in our educational settings, at least in the first prototype of virtual classroom we are testing, and what are the social changes that justify our decisions. In this sense, we have identified four trends in education that justify a move in our educational models:

The value of informal learning in the Network Society and the intensive use of social networks: Learners have always depended on the support of their peers and peer networks to facilitate learning. In the physical world , these peer networks are experienced as lunchtime discussions, student organizations, communities of practice, brown bag sessions, and study groups. What was lacking until recently was a way to effectively approximate these informal learning opportunities (Martindale, Dowdy, 182).

The value of degrees in the present time: competences is the key term here. Learners are no longer necessarily locked in to a particular course in order to gain a qualification but are able to present their learning to prove they possess such competences (Atwell, Pontydysgu, 3).

Open content and Open Educational Resources (OER): There are a large number of new institutions offering courses and resources for free (most of them subjected to Creative Commons licenses). *Khan Academy*, *Code Year*, *Ted ED* among other claim to have millions of students in total, and prestigious institutions like Stanford, or the MIT have been offering free courses in the last years. More recently, MIT and Harvard have united efforts to create EdX, the new open learning environment for these two institutions.

The global to move from VLE to PLEs: One of the main decisions in this move is how to organize the coexistence between the VLE and the PLE. What is the model of coexistence between them? Parallel lives? PLE becoming the dominant design? A VLE that opens its services to external tools? To be realistic, we plan a medium to long transition from a model like ours where VLE is the dominant platform. Initially, the PLE is going to integrate APIs from external services, according to the research on the student profile. In subsequent stages the VLE would move to a more PLE based platform. A similar example on this decision is the based Netvibes project developed by the Technical University in Sofia, where Netvibes is used as external service linked to the main LMS. We want to remind the following paragraph by Trey Martindale and Michael Dowdy (Martindale, Dowdy, 188).

The 1+1=3 proposal

n this section we will describe the concrete proposal we are carrying out at the Universitat Oberta de Catalunya. We have called it '1+1=3' as a metaphor of the three spaces where learning activity happens, and note that we are not referring only to three virtual spaces but to three spheres or entities where knowledge lives and evolves: the student, the student classmate and the group itself.

The hidden third part

As mentioned, we consider three entities where learning '*happens*': first of all, we have the *student* (let's imagine a concrete student here). The student has learning as an objective, and in order to reach a particular learning objective he has to work in his or her learning process. Secondly, we have *other student, a classmate* (and let's imagine here another concrete student). Both number 1 and number 2 students can benefit from each other, especially if the methodology of learning fosters collaboration and the technology provides tools that make the learning process visible. In a practical way, we can say that PLEs foster these benefits by providing learners with the possibility to create their own personal learning spaces, accessing the learning spaces from their classmates, sharing information, editing new on and working collaboratively with the proper tools, etc. But, in a sense, we can guess there is a third entity in a course. And it is *the group* itself. Every time a particular student shares something with everybody, there is something beyond each specific student that is been feeding: the group. The group is an entity itself, it has its own nature and lifecycle. It's fed by every single student and at the same time can feed everyone, and this is more than a mere philosophical statement; it has practical implications and somehow has to be reflected in the design of a PLE. 1+1=3, exactly points out that there is always one of the three entities that does not receive the proper attention, but it exists: the group.

A practical integration in the model of the UOC

So, how would be our 1+1=3 materialized in a virtual space and implemented?

The response: by giving every student the possibility to create his or her own PLE, to access the PLE of his classmates and to have a concrete space to build the 'PLE of the group', which would be fed by everyone and would fed everybody.

Let's have a look at how a virtual classroom at UOC looks like:

Fig1. The virtual classroom at UOC

This is an example of the learning space that our students use for a specific subject. It is structured into four spaces: space for *communication*, space for subject *planning* and organization, space with learning *resources* and

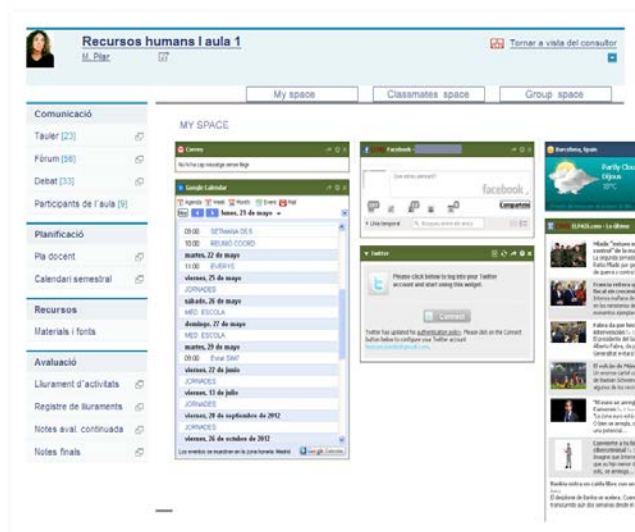
a space for *evaluation*. Each space contains the tools that students need to work with the subject. At the present time, the communication tools allow interaction among the course participants, and the space for resources allows teachers to introduce contents from the Internet via links. Although this VLE offers a large number of tools and services to our students, in the end it is very static and teacher-centred, and the possibilities for students to feed the environment, share new knowledge and create new one are not facilitated by current learning tools. The creation of PLE aims to create these spaces. Our proposal is to work with a system of tabs, where each one of the three entities (1+1=3) is a tab that is conveniently integrated within the current UOC virtual classroom. The following image is just an example of the idea.


Fig 2.. An example of the idea

The image shows the three tabs: '*My space', 'classmates space' and 'group space'*. The image also shows exactly a student who is visiting the tab '*My space'*, where previously he has integrated a set of tools as widgets that are useful to build her own learning process and to share and show teachers and classmates. At UOC, this can be done thanks to the open source interoperable ecosystem developed. The access to the tab '*Classmates space'* would show a list of the classmates and would allow to access the PLE of each one of them. The access to the tab '*Group space'* would show a space where all the learners can put the resources and tools that, under their criteria, make sense for the whole group and allows working the subject from the group point of view. In the next section we will go in depth with the working aspects of the proposal.

The design according to the Activity Theory

What is Activity theory?

The Activity Theory (AT) is a tool that is used as a framework to explore educational innovations and innovative learning spaces, and as a conceptual framework to analyse and design computer-supported collaborative learning and the evaluation of learning technologies (Buchem, Attwell, Torres).

The reason for using this model is that organizes and facilitates the decision making about the main components of learning environments, as in our case, with PLE. The model considers 6 main elements:To sum up: the *subject* of the PLE, who is the learner, the *Object* as the need of learning (or maybe just interest), the *Tools* understood as learning resources, the *Community*, the *Rules and norms* to organize the activity of the Community and the *Division of Labour* as the roles and tasks in the system. For the design of our PLE we refer to each one of these six elements, which provide a structure and a guideline on the main decision we have to make.
All he decisions made reflect the same tensions and key points most of the PLEs show. We have differentiated seven of them: teacher control vs. student control, the community dynamics, interaction and collaboration, the role of the PLE and the teacher role as a mentor or curator. Some examples of the decisions over our PLE are:

As for the *Subject*:

The learner can not decide about learning objectives, since these are part of the formal curriculum

The subject is free to decide its participation in the community / group

The subject can negotiate rules for communication, collaboration and interaction

As for the *Object*,

the PLE can be used for learning something new, producing something new, personal development of new skills, reflective practice (like eportfolios do)

the PLE can be worked from the point of view of learning how to engage in online social networks and improve the capabilities of students to be productive is such environments

As for the *Tools*,

Tools will be customizable to personal preferences, learning needs and look and feel

Tools will foster the development and sharing of Open Educational Resources, as well as mash-ups and mixing in general

As for the Community, is understood as

a way to provide resources and support for learning

a personal hub for networked connections

a way to learn through the interaction and exchange with the classmates

As for the *Rules*,

Rules are decided by the group of students

Learning resources and contents are distributed

Rules regulate the exchange between members

As for the *division of labour*, (this could be divided for each one of the 4 profiles)

Learners own what they create, and are responsible for that

Learners develop and manage their online identity at UOC

The tools

The exact list of tools that are being introduced in our virtual classroom will depend on the previous research study we make with students and the faculty teaching the subject, where we will identify their use of new technologies, patterns, behaviors and specific tools they use in a daily basis. However, taking as a starting point the data we currently have from our students, and also the type of tools we want to promote for our PLE (all of them mentioned in the previous section), we already have a list of potential type of tools (without specifying the specific providers):

Blogging
Microblogging
Social Networks
Social tagging
Collaborative work
Eportfolio
Image sharing
Video sharing
Presentations
Other communication tools
Cloud services – File sharing
Search engines
RSS Feeds
Photo & video edition

Evaluation

The study by Ivanova & Ivanova (Ivanova, Ivanova, 10) proposes an evaluation based on the functionalities provided by the PLE. Students are asked about the utility of all these functions regarding learning, like for example: '*Is the proposed functionality enough for organizing self-learning?* The list of functionalities presented by the study will complement our system of assessment, that also inquires about the relationship between the VLE and the PLE, the comparison between the satisfaction of the same virtual classroom before and now, the aspects related to emotion and engagement among others.

Conclusions and challenges

The paper has presented the new model of virtual classroom that UOC is testing in the next months. This new model is based on the idea of PLEs, and at the moment the University is making decisions about design. The use of the Activity Theory as tool for the creation of the PLE reflects the complexity and the tensions among the elements in the model. The next phase of the project will be to test it with real students from the UOC.

Abstract

The purpose of this study to investigate self-efficacy and attitude of the pre-service elementary mathematics teachers and university students enrolling in mathematics department toward Analytic Geometry with respect to gender, department. There are 336 participants. The self efficacy and attitude toward analytic geometry scale (SAAG-S) developed by Ilgun, Azak ve Takunyaci (2012) was used. In order to analyze data, t-test and ANOVA were conducted and Pearson Correlation Coefficient was found. Results of this study showed that while there is a significant difference between the self-efficacy and attitudes of the pre-service elementary mathematics teachers and university students enrolling in mathematics department toward Analytic Geometry, there is no significant difference between the self-efficacy and attitudes of females and males.

Keywords: Analytic geometry, Analytic thinking, , attitudes,self-efficacy

Introduction

Analytic Geometry which was posed by Rene Descartes in 1637 is one of the branches of the mathematics that concern with the application of algebra in terms of formulas, equations, and their algebraic manipulation. It requires using points, straight lines, and curves (Hogben, 1942).The reasons for existence of Analytic Geometry are that there are differences between Geometry and Analytic Geometry. To be more precise, Baykul (2002) stated that the scope of the geometry includes space, shapes in space, length, angle, area, volume, etc. while analytic geometry provides algebraic explanations and solutions to these problems related to geometry. Geometry does not give opportunity to measure the distances between points, lines and spaces. That's why, analytic geometry come into existence. Additionally, individuals uses information obtained in geometry and algebra course in analytic geometry. Therefore, it is expected that analytic geometry consists of higher order thinking skills.

A great number of researches have been conducted on beliefs, attitudes and perceptions toward mathematics and geometry. However, it is not the same case for analytic geometry. To be more precise, there is not adequate research about this issue. That's why, analytic geometry lesson is chosen as a lesson.

Erüs (2007) investigated whether the instruction based on critical thinking is effective on student achievement in Analytic Geometry lesson. The researcher conducted an experimental study consisting of 62 high school students as participants. The researcher used a scale consisting of 35 items about the chapter called as "Analytic Examining of Lines". It was found that there was a significant difference between the cognitive domain of the experimental and control group in terms of comprehension and application level.

Özerdem (2007) conducted a study to determine the misconceptions regarding analytic geometry. This study included 78 pre-service elementary mathematics teachers. The researchers used both qualitative and quantitative

data analysis tools such as 50 multiple choice questions, 103 open-ended questions, observations obtained in the classroom and student diaries, portfolios and attitudes toward analytic geometry scale. The researcher found that students have difficulties in some of the concepts in analytic geometry. According to Özerdem (2007), the reasons for existences of such difficulties are caused by students' daily life experiences, their prior knowledge, and the similarities between the topics of the Analytic Geometry. In addition, the researcher stated that there is a bias among students. Students think that analytic geometry requires memorization of formulas. At this point, it was indicated that students should learn the meaning of the formulas and the ways how they are derived instead of only memorizing them (Olkun, 2002).

Yemen (2009) investigated the effects of technology based instruction on the achievement of the 8th grade students and on the attitude of 8th grade students toward Analytic Geometry lesson. The researcher conducted pre-test, post-test control group design. "Analytic Geometry Achievement Test "used to obtain the achievement of the students on equation and inequality concepts and "Mathematics Attitude Scale" used to analyze the attitude of the participants toward mathematics. According to the result of this study, achievement of the participants increases by means of technology based instruction. On the other hand, technology based instruction has no effect on the attitude of the students toward mathematics.

The purpose of this study is to obtain attitudes of the undergraduate students who took this lesson towards analytic geometry with respect to the type of their department. In addition to this, another purpose is to see whether there is a difference between the attitudes of two groups of the participants.

There are several reasons for selecting 3th and 4th grade pre-service elementary mathematics teachers and undergraduate students enrolling in mathematics department as participants. First of all, the former ones are future teachers. Their knowledge will eventually affect the knowledge, attitude and perception of the students. Secondly, they took this lesson when they are 3th and 4th grade. Finally, the latter ones took this lesson deeply in their department.

Significance of this study

The result of this study will provide the views and attitudes of pre-service teachers toward Analytic Geometry. Furthermore, this study will provide teachers and teacher educators with insight about the topics that students have difficulty. Thus, by knowing these areas, the teacher educators can give more focus on them. Also, depending on these results, curriculum developers can have a point to improve the curriculum by means of this study. In other words, the lessons they took in the university and in high school can be shaped according to these results in order to meet the needs of them.

Method

In this past are given such information as the research method used in the research, the universe and sample of the research, the development and implementation of measuring tools, collection of data and analysis of the collected data.

Population and Sample

236 university students who are enrolling elementary mathematics education department and mathematics department were chosen as sample of this study. Random sampling method was used. Qualitative data were given in Table 1.

Table 1. Distribution of the Sample

	Gender		Level		
	Female	Male	2	3	4
Education Faculty (Ele. Math.Educ.)	36	80	3	65	48
Art-Science Faculty (Math.Depart.)	28	92	56	52	12
Total	64	172	59	117	60

Process

Data was collected from the university students. Demographic information were collected by the researchers by means of information form in spring term of the 2011-2012 academic year.

Findings and Results

Table 1. The independent sample t-test results about the sores of the participants obtained from the self efficacy and attitude toward analytic geometry scale regarding gender variable

Sub-factors	Variables	N	$\bar{X}$	sd	df	t	p
Attitude toward analytic geometry	Female	64	39.64	10.36	234	-.024	.981
	Male	172	39.67	9.25			
Self efficacy of analytic geometry	Female	64	19.27	4.69	234	1.50	.135
	Male	172	18.33	4.11			
Requirement for achievement	Female	64	23.69	4.23	234	-.965	.336
	Male	172	24.33	3.65			
Total Scores	Female	64	82.73	10.15	234	.617	.538
	Male	172	81.91	8.58			

The t-test scores of the participants which were obtained from the self efficacy and attitude toward analytic geometry scale itself and its sub-factors were given in Table 1 with respect to gender variable. It was found that there is no significant difference between the t test scores of the participants in terms of gender variable (p > .05).

Table 2 The independent sample t-test results about the sores of the participants obtained from the self efficacy and attitude toward analytic geometry scale regarding gender variable

Subscales	Variables	N	$\bar{X}$	sd	df	t	p
Attitude toward	Faculty of Art and Sciences	120	38.13	8.43	234	-2.53	.012**

analytic geometry	Faculty of Education	116	41.25	10.37			
Self efficacy of analytic geometry	Faculty of Art and Sciences	120	17.68	3.72	234	-3.33	.001*
	Faculty of Education	116	19.51	4.64			
Requirement for achievement	Faculty of Art and Sciences	120	24.04	3.59	234	-.159	.874
	Faculty of Education	116	24.12	4.04			
Total Scores	Faculty of Art and Sciences	120	79.64	7.90	234	-4.50	.000*
	Faculty of Education	116	84.72	9.40			

* p<.01,   **p<.05

The t-test scores of the participants which were obtained from the self efficacy and attitude toward analytic geometry scale itself and its sub-factors were given in Table 2 with respect to type of the department. It was found that there is a significant difference between the scores of "Attitude toward analytic geometry" and "Self efficacy of analytic geometry" of the participants in terms of the type of the department in the favour of the those who enrol the faculty of education ,namely pre-service elementary mathematics teachers [$t_{(234)}$= -2.53, p < .01, $t_{(234)}$= -3.33, p < .01,respectively]. It was found that while the mean score of the factor 1 of the participants enrolling Faculty of the Education is ($\overline{X} \pm$ sd; 41.25 $\pm$ 10.37), that of the participants enrolling faculty of Art and Sciences is (38.13 $\pm$ 8.43). This result showed that the mean scores of "Attitude toward analytic geometry" of the former one is higher than that of the latter ones.

It was found that while the mean score of the "Self efficacy of analytic geometry" of the participants enrolling Faculty of the Education is ($\overline{X} \pm$ sd; 19.51 $\pm$ 4.64)), that of the participants enrolling faculty of Art and Sciences is (17.68 $\pm$ 3.72). This result showed that the mean scores of "Self efficacy of analytic geometry" of the former one is higher than that of the latter ones.

Abstract

This study aimed to investigate overall development of preschool children from disadvantaged family backgrounds in South Korea. 1,469 children aged 3 to 6 were involved (971 children from disadvantaged family backgrounds and 498 from ordinary family backgrounds). The result showed that children from disadvantaged family backgrounds scored significantly lower in cognitive, language, social, and motor development than those from ordinary family backgrounds. It also reported potential developmental delay pathways that delayed motor development of children from disadvantaged family backgrounds influenced their language development negatively, mediated by delayed cognitive development, and finally had a negative impact on social development indirectly.

Keywords: Development; Preschool Children; Disadvantaged Family Backgrounds

1. Introduction

Poverty rates have been increasing since the Asian financial crisis in the late 1990s and 1 out of 10 children belongs to low-income families in South Korea (Kim, Cho, Bae, Choi, Hong, & Kim, 2007). The high rates of economic deprivation have triggered numerous family problems such as low-quality parenting, child abuse, violence, and divorce (Lee, 2009; Lee & Kim, 2007). Additionally, these circumstances also promoted an increase in the number of families in multi-culture, single parent, grand-parents and alternative homes (Kim, Lee, Moon, & Kwon, 2007; Koo, 2009).

There is evidence that home environment deprivation caused by family economic hardship in early childhood seems to have a far more negative effect on developmental outcomes than in any other stages of life. The U.S. National Center for Children in Poverty (NCCP, 2003) reported that young children in low-income families are the most vulnerable group in society and they are at increased risk of developmental delays. Similarly, Lee, Lee, and Chung (2003) explained that preschool children from disadvantaged family backgrounds show a higher prevalence of developmental delays than those in ordinary family backgrounds. Furthermore, other relevant research has demonstrated that young children from disadvantaged family backgrounds have a higher risk of developmental problems across cognitive, language, social and motor domains and then these appear to be significantly associated with low academic performance, behavior problems, school dropouts and juvenile delinquency (Brooks-Gunn & Duncan, 1997; Brooks-Gunn, Klebanov, & Liaw, 1995; Duncan & Brooks-Gunn, 2000).

More specifically, cumulative risk factors from disadvantaged family backgrounds are identified such as poor health conditions, inadequate parenting, unbalanced diet, which can influence significantly the central nervous system of children during early childhood (Cravioto, DeLicardie, & Birch, 1966; Freeman, Klein, Townsend, & Lechtig, 1980; Gutman & Nemeroff, 2003). This problem can cause delays in early physical growth in terms of both fine and gross motor development and then, more seriously, can be associated with delays in language and

cognitive development (Chung, 2003; Georgopoulos, 2000; Pulvermüller, Hauk, Nikulin, & Ilmoniemi, 2005). Furthermore, these negative outcomes in their growth have both direct and indirect impacts on social development negatively such as behavioral and emotional problems (Beitchman, Wilson, Brownlie, Walters, Inglis, & Lancee, 1996, Koo, 2009; Rodrigues, Mischel, & Shoda, 1989).

Although the critical impact of disadvantaged environment on early childhood development has been proved, there is a lack of social and political awareness regarding this issue in South Korea. Moreover, there have been few studies on the relationship between environmental risks and children's developmental outcomes as well as on potential delayed-onset pathways among developmental domains for preschool children in disadvantaged family backgrounds. Therefore, in this study, we attempted to examine cognitive, language, social, and motor development of preschool children from disadvantaged family backgrounds, compared with that of those from ordinary family backgrounds. In addition, we sought to investigate potential developmental delay pathways in order to find out the mechanisms and processes related to developmental areas affected by environmental deprivation during the preschool period.

2. Methods

2.1. Participants

First, 1,521 children aged 3 to 6 were recruited in North Jeolla province. However, 52 children refused to participate in all the development tests completely. Hence, 1,469 children (971 children from disadvantaged family backgrounds and 498 children from ordinary family backgrounds) were finally included. The target group was 971 children (boys, n=489, 50.4%; girls, n=482, 49.6%) from disadvantaged family backgrounds. Their family types were as follows: low-income with multicultural home (n=78, 8.0%), single parent home (n=265, 27.3%), grandparents' home (n=55, 5.7%), alternative home (n=32, 3.3%), and parents home (n=541, 55.7%). For the comparative group, 498 children (boys, n=256, 51.4%; girls, n=242, 48.6%) were from ordinary family backgrounds.

2.2. Measurements

To measure cognitive, language, social, and motor development of participants, four standardized measurements were used as below. Trained examiners (inter-scorer reliability ranging from .94 to .99) conducted cognitive, language, and motor development tests with individual children in kindergartens or child care centers. And social development tests were given to participants' teachers to evaluate the children based on observation in daily life. The average test time for individual children was about one and a half hours. Short breaks were provided between tests if necessary.

2.2.1. Cognitive development test

To assess cognitive development, the Korean Version of the Developmental Test of Visual Perception – 2nd edition (K-DTVP-2) (Moon, Yeo, & Cho, 1993) was used, because early visual perception is highly related with cognition (Pylyshyn, 1999). This instrument can be conducted with children from 4 to 8 years and measure two domains: motor-reduced visual perception (MRP, visual processing with minimal motor skill) and visual-motor integration (VMI, coordination of vision with motor skill). The Cronbach's alpha is .83-.95.

2.2.2. Language development test

To evaluate the language development, the Preschool Receptive-Expressive Language Scale (PRES) (Kim, Seong, & Lee, 2003) was administered. PRES was developed and standardized for children from 2 to 6 years in South Korea. This tool is comprised of two categories: receptive and expressive language. The Cronbach's alpha is .95 and test-retest reliability is .78 to .91.

2.2.3. Social development test

To measure social development, the Korean version of Vineland Social Maturity Scale (Kim & Kim, 1995) was given to the participants' teachers. The Vineland Scale is used from birth to 30 years of age and raw scores are changed to a social quotient (SQ). Its Cronbach's alpha is .80.

2.2.4. Motor development test

To measure motor development, the Korean version of Denver Developmental Screening Test II (Shin, Han, Oh, Oh, & Ha, 2002) was used, especially with items of fine and gross motor domains. This test kit can be used during the first six years and consists of four parts (personal-social, language, fine motor-adaptive, and gross motor). Its Cronbach's alpha is .99 and test-retest reliability is .90.

2.3. Data analysis

Collected data were analyzed: First, an independent samples t-test was conducted to examine the difference of total and subscale scores of overall development tests between children from disadvantaged family backgrounds and those from ordinary family backgrounds. Second, structural equation modeling was administered to investigate causal relationships among developmental domains of children from disadvantaged family backgrounds.

3. Results

3.1. Comparison of overall development between the two groups

To investigate the significant difference of overall development between children from disadvantaged family backgrounds and those from ordinary family backgrounds, an independent samples t-test was conducted in cognitive, language, social, and motor development and results are presented in Table 1.

For cognitive development, children from disadvantaged family backgrounds scored significantly lower than those from ordinary family backgrounds on motor-reduced visual perception (t=-9.14, p<.001; M=103.27, SD=16.16 < M=111.86, SD=13.99) and visual-motor integration (t=-9.76, p<.001; M=106.87, SD=21.16 < M=118.43, SD=17.20). Relevant to language development, children from disadvantaged family backgrounds presented significantly lower scores than those from ordinary family backgrounds on receptive language (t=-7.26, p<.001; M=39.28, SD=13.47 < M=44.51, SD=12.26) and expressive language (t=-8.37, p<.001; M=39.29, SD=13.48 < M=44.97, SD=11.66).

Next, in terms of social development, children from disadvantaged family backgrounds (M=104.63, SD=24.37) showed significantly lower outcomes than those from ordinary family backgrounds (M=124.27, SD=20.61) on social quotient (t=-16.22, p<.001). Last, regarding motor development, children from disadvantaged family backgrounds performed significantly lower than those in ordinary family backgrounds on fine motor (t=-2.60, p<.001; M=2.92, SD=.14 < M=2.94, SD=.12) and gross motor skills (t=-3.08, p<.001; M=2.93, SD=.10 < M=2.94, SD=.08).

Table 1. Comparison of overall development between the two groups

	Children from disadvantaged family backgrounds (n=971)	Children from ordinary family backgrounds (n=498)	t
	M(SD)	M(SD)	

Cognitive[a]			
Motor-reduced visual perception (MRP)	103.27(16.16)	111.86(13.99)	-9.14***
Visual-motor integration (VMI)	106.87(21.16)	118.43(17.20)	-9.76***
Language			
Receptive language	39.28(13.47)	44.51(12.26)	-7.26***
Expressive language	39.29(13.48)	44.97(11.66)	-8.37***
Social			
SQ	104.63(24.37)	124.27(20.61)	-16.22***
Motor			
Fine motor	2.92(.14)	2.94(.12)	-2.60***
Gross motor	2.93(.10)	2.94(.08)	-3.08***

***$p < .001$

a For cognitive developmental test, participants were preschool children from disadvantaged family backgrounds (n=734) and those from ordinary family backgrounds (n=374) due to age-relevant ranges.

3.2. Potential developmental delay pathways of children from disadvantaged family backgrounds

To examine the potential developmental delay pathways of young children from disadvantaged family backgrounds, structural equation modeling was analyzed with model fitness. For this analysis, data of 734 children aged 4 to 6 from disadvantaged family backgrounds were included, because three year olds were not given cognitive tests due to age limitation. Model fit indexes showed a goodness-of-fit: the Tucker Lewis index (TLI) =.94 and the comparative fix index (CFI) = .97, which were also used as indicators in Guo and Harris'(2000) study.

As shown in Table 2, standardized β coefficients of the structural equation modeling were calculated in relation to direct, indirect, and total effects between independent and dependent variables across developmental domains. For children from disadvantaged family backgrounds, motor development impacted cognitive development directly (standardized β=.53; <.01) and had both direct and indirect effects on language development (standardized β =.68; p<.001), mediated by cognitive development.

Table 2. Standardized β coefficients of structural equation modelling among developmental domains

Independent Variable	Dependent variable	Direct effect	Indirect effect	Total effect

Motor	Cognitive	.53***		.53**
Motor		.47***	.21***	.68***
	Language			
Cognitive		.40***		.40***
Motor			.36***	.36***
Cognitive	Social	.26**	.13**	.39**
Language		.33***		.33***

**p < .01, ****p* < .001

Moreover, cognitive development affected language development directly (standardized β=.40; *p* <.001) and had both direct and indirect impact on social development (standardized β=.39; *p* <.01). Last, language development influenced social development directly (standardized β=.33; *p* <.001) and motor development had an indirect effect on social development (standardized β=.36; *p* <.001).

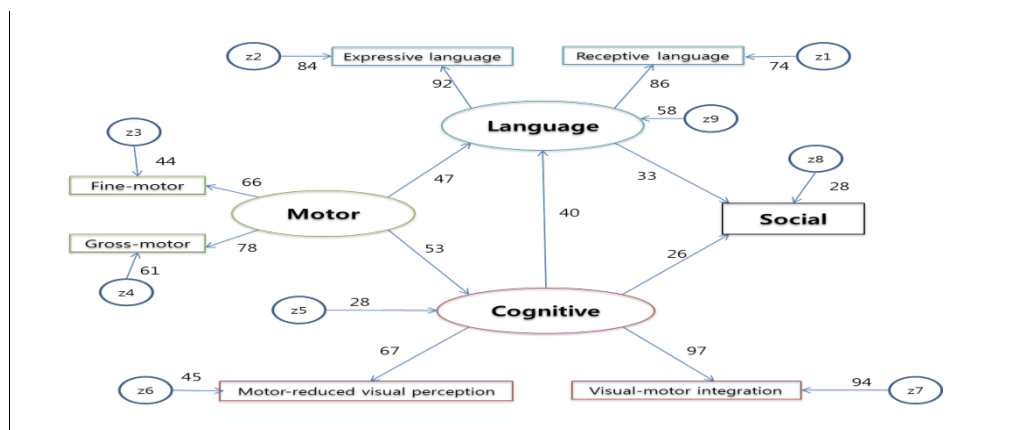
Finally, the structural equation modeling (see Fig. 1) showed that delayed motor development affected language development negatively, mediated by the delay in cognitive development, and finally had a negative impact on social development for children from disadvantaged family backgrounds.


Fig.1. Structural equation modelling for developmental domains of children from disadvantaged family backgrounds

4. Discussion and Conclusion

Although the negative effects of disadvantaged environment during early childhood have been widely known, there is little recognition of the overall status or pathways among developmental domains for preschoolers from disadvantaged family backgrounds in South Korea. In this study, we attempted to investigate effects of exposure to environmental inequities on early childhood development: first by comparing the overall development of preschool children from disadvantaged family backgrounds with their counterparts from ordinary family backgrounds; and then by analyzing structural equation modeling to examine potential pathways among delays in cognitive, language, social and motor development for children from disadvantaged family backgrounds.

Results showed that preschool children from disadvantaged family backgrounds scored significantly lower than their counterparts from ordinary family backgrounds on cognitive, language, social and motor development. It provided evidence that vulnerability to environmental hardship can cause severe developmental delays in all

areas for young children. Moreover, this finding supported the results of NCCP (2003) and Lee et al. (2003) that children from environmental deprivation are the most vulnerable group in society and they are at high risk of developmental delays.

Especially for children from disadvantaged family backgrounds, structural equation modeling indicated that delayed motor development influenced language development negatively, mediated by the delay in cognitive development, and finally exerted a negative impact on social development. This confirmed that a developmental delay in a particular area is not an isolated problem. Instead, it showed the relationships among specific domains of developmental delays for young children from disadvantaged family backgrounds. It also demonstrated that early motor development is an important factor for cognitive and language development, which adds support to the findings of Georgopoulos (2000) and Pulvermuller et al. (2005) that poor motor performance is closely related with delays in language and cognitive development. Moreover, these problems were reported to ultimately cause social behavioral problems. This finding is consistent with Koo's (2009) and Beitchman et al.'s (1996) explanations that developmental delays in language, cognition and motor development are increasingly associated with behavioral and social developmental outcomes.

In summary, the results of this study identified significant links between specific domains of developmental delays, which might explain how environmental deprivation negatively influences the shaping of children's abilities. This finding also highlighted the importance of intervention intended to alleviate the negative impact of environmental inequities and risk factors on young children. Based on the potential pathways of developmental delays for young children from disadvantaged family backgrounds, we may find some effective ways to prevent their atypical problems and further enhance optimal outcomes in their development.

DEVELOPMENT OF SELF EFFICACY AND ATTITUDE TOWARD ANALYTIC GEOMETRY SCALE (SAAG-S)

Münevver İlgün[a], Ayşe Zeynep Azak[a], Mithat Takunyaci[a]

[a]Department of Elementary Mathematics Education,Faculty of Education, Sakarya University, Sakarya/TÜRKİYE

Abstract

The aim of this research is to develop the Analytic Geometry Perception and Attitudes Scale and to examine its validity and reliability analyses. The sample of study consists of 236 university students from Sakarya University. In this study construct and concurrent validities, internal consistency, test-retest reliabilities and item analysis of the scale were examined. As a result of factor analysis for construct validity three factors have emerged which named "attitude toward analytic geometry", "self efficacy of analytic geometry" and "requirement for achievement", consist of 26 items and account for the 44.4 % of the total variance. The internal consistency reliability coefficients were .79 for attitude toward analytic geometry, .81 for self efficacy of analytic geometry and .77 for requirement for achievement. Findings also demonstrated that item-total correlations ranged from .35 to .75. Test-retest reliability coefficient was found .85 for scale. According to these findings the Analytic Geometry Perception and Attitudes Scale can be named as a valid and reliable instrument that could be used in the field of education.

Keywords: Analytic geometry, algı, analytic thinking

Introduction

There have been few studies which address Analytic Geometry lesson in different perspectives. For example, Erus (2007) investigated whether the instruction based on critical thinking is effective on student achievement in Analytic Geometry lesson. The researcher used a scale consisting of 35 items about the chapter called as "Analytic Examining of Lines". The scale was developed by the searcher. According to the results of this study, it was found that there was a significant difference between the cognitive domain of the experimental and control group in terms of comprehension and application level in analytic geometry lesson. However, it is not related to all concepts of Analytic geometry. It does not give general picture of students' attitudes toward Analytic geometry or self efficacy of them.

Yemen (2009) investigated the effects of technology based instruction on the achievement of the 8th grade students and on the attitude of 8th grade students toward Analytic Geometry lesson. The researcher used "Analytic Geometry Achievement Test" and "Attitudes Toward Analytic Geometry Scale". The former one was developed by the researcher. It was related to the concept of inequality. The latter one was developed by Baykul (2000). These instruments do not sufficient to give an opinion about students' self efficacy, attitudes or perceptions. Therefore, an alternative instrument measuring these variables with improved validity is necessary.

Ozerdem (2007) conducted a study to determine the misconceptions regarding analytic geometry. The researcher developed the scale at the light of the aims of the Analytic Geometry I and Analytic Geometry II. There are 14 positive items and 16 negative items in this scale.. After developing the scale, the researcher gave this scale in the beginning of the term and at the end of the term to investigate whether there is a significant difference between the attitudes of pre-service secondary mathematics teachers. The researcher conducted t test analysis and found the p-value as p= .00. That is, according to the results of this study, there is a significant difference between the pre-service secondary mathematics teachers' attitudes obtained in the beginning of the instruction and at the end of the instruction. The comprehensive scale about perceptions, self efficacy and

attitudes toward analytic geometry is needed since this scale includes only the objectives of the Analytic Geometry I.

In conclusion, achievement of the individuals may depend on the perceptions, self efficacy and attitudes toward the lessons they took. Analytic geometry is one of these lessons. Also, the individuals' knowledge obtained in the previous course may affect their attitudes (Ozerdem, 2007). Thus, the purpose of this study is to develop a scale about analytic geometry which reflects university students' perceptions, self-efficacy and attitudes toward analytic geometry.

Method

Descriptive survey method was conducted. Büyüköztürk (2007) stated that the researches which use this method are conducted to get idea of the people about specific topic, attitude of the individuals. Also, it was conducted to represent the events, institutes or objects. In addition, it is used when it is required to reach most people in a short time. The purpose of this study is to develop the scale which can be used to measure perception, self efficacy and attitudes of the university students who take Analytic Geometry.

Population and Sample

236 university students who are enrolling elementary mathematics education department and mathematics department were chosen as sample of this study. Random sampling method was used. Qualitative data were given in Table 1.

Table 1. Distribution of the Sample

	Gender		Level		
	Female	Male	2	3	4
Education Faculty (Ele. Math.Educ.)	36	80	3	65	48
Art-Science Faculty (Math.Depart.)	28	92	56	52	12
Total	64	172	59	117	60

Process

Data was collected from the university students. Demographic information were collected by the researchers by means of information form in spring term of the 2011-2012 academic year.

Before preparation phase of this scale, comprehensive literature research was done. After this, it was tried to establish theoretical structure of this scale. The written forms which were given the university students enrolling in elementary mathematics education and mathematics department were analyzed to get the ideas of them about Analytic Geometry. Then, the opinions of the students about perception and attitudes toward this lesson were converted to the items which can be suitable to this scale. In order to make this scale be comprehensive, it was noticed that there are sufficient items. Thus, 46 items were included in the first form of this scale.

These 46 items were controlled in terms of understandability, suitability by 3 Mathematics educators, 1 Turkish educator who are experts. Five-likert scale was used ("1" strongly disagree, "2" disagree, "3" neutral, "4" agree and "5" as strongly agree). Reliability and validity analysis were conducted.

Exploratory factor analysis and confirmatory factor analysis were conducted to determine structure validity of the scale. Exploratory factor analysis (EFA) is conducted to determine whether the scale is divided into different factors. The items which are loaded in the same factor are given the name. Also, factor analysis is conducted to determine whether the scale has one factor loading (Balcı, 1995). If the factor loading has the high value, the variable can belong to this factor. It can be sufficient if the percentage of the variance is higher than 30% (Büyüköztürk, 2007). Confirmatory factor analysis (CFA) is conducted to determine to what degree the factors which were formed based on theoretical frame are suitable to the real values.

Several conformity indexes used to determine the efficiency of the model which were tested in CFA (Büyüköztürk, 2007). Chi-Square Goodness, Comparative Fit Index(CFI), Normed Fit Index (NFI), Relative Fit Index (RFI), Incremental Fit Index (IFI), Root Mean Square Residuals (RMR), Root Mean Square Error of Approximation (RMSEA) conformity indexes were used. The criteria GFI, CFI, NFI, RFI and IFI >.90, RMSEA and RMR < .05 were used (Hu & Bentler, 1999). SPSS 13 and LISREL 8.7 programs were used for reliability and validity.

Findings and Interpretation

Structure Validity

In order to understand whether the items in the scale are suitable for factor analysis, Kaiser Mayer Olkin = .80 and Barlett's Tests of Sphericity (Ki Square= 4033,3 p<.001) were conducted. According to these tests, the items are appropriate for factor analysis.

Principal component analysis was conducted for factor analysis of the scale. Several criteria were noticed to diminish the items which do not measure the same structure. Firstly, the factor loadings should be .45 or higher than this value. Secondly, items should have one factor with high factor loading. Thirdly, if they have two factors with high factor loading, the difference should be at least .10. Lastly, the value of the variance which are determined by these items should be high (Büyüköztürk, 2007).

The number of maximum factor was analyzed for 46 items. It was determined that the items were loaded in 13 factor. However, the results of the principal component method analysis and oblique rotated factor analysis were restricted to obtain 3-factor structure. The reason for using such rotation, there is a relationship among these three factors (Tabachnick & Fidell, 1996). At the end of these processes, 20 items which have under the value of .45 as a factor loading were deleted. Also, 3-factor structure which explains 44,4% of the total variance was originated .According to the results of these analysis, the factor loadings of these 26 items were given in Table 2.

Table 2. The Factor Loading of Self Efficacy and Attitude Toward Analytic Geometry Scale (Rotated Principal Component Analysis)

Item Number	Common Factor Variance	Factor Loadings		
		1	2	3
Item 12	.552	.691		
Item 13	.561	.685		
Item 19	.475	.674		
Item 17	.542	.658		
Item 20	.436	.638		
Item 16	.498	.629		
Item 22	.384	.597		
Item 15	.501	.580		
Item 4	.326	.575		
Item 21	.356	.534		
Item 46	.342	.532		
Item 7	.296	.485		
Item 11	.264	.474

Item 43	.652		.736
Item 42	.611		.720
Item 41	.637		.696
Item 44	.564		.695
Item 32	.228		.532
Item 40	.455		.530
Level of explanation of Eigen Value Variance			
	% 24.71	% 8.58	% 11.13

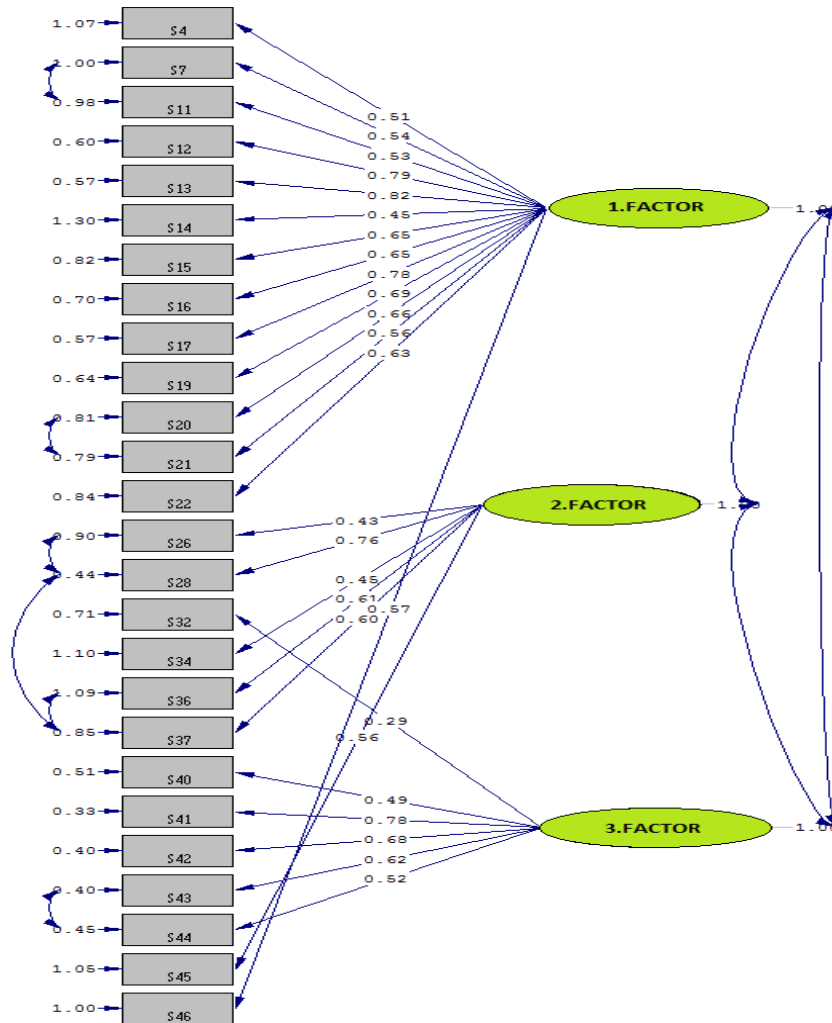
Self Efficacy and Attitude Toward Analytic Geometry Scale has three factors. The first factor "attitude toward analytic geometry", the second factor "self efficacy of analytic geometry" and the third factor "requirement for achievement" explain 24.71%, 8.58%, and 11.13% of the total variance, respectively. According to the results of the principal component analysis, the three factors which have value 1 as an eigenvalue explain 44.4% of the total variance (Table 1).According to test development studies in behavioral science, it is accepted that the ratio of variance is higher than 30% (Büyüköztürk, 2007).

It was found that the correlation value is changing from -.34 to .21 among the subdimensions of Analytic Geometry Scale. (Table 3).

Table 3. Mean and Standard Deviations of Sub-factors of Self Efficacy and Attitude Toward Analytic Geometry Scale and Correlation among Factors

Factor Number			Correlation		
	X	Ss	F1	F2	F3
F1	39.67	9.546	-	-.344**	-.234**
F2	18.58	4.290	-.344**	-	.453**
F3	24.08	3.816	-.234**	.453**	-
Total	82.13	9.021	.708**	.304**	.278**

It was found that Ki-square value is (x^2=567.00, sd=290, p=0.00).Also, the value of fit indexes are RMSEA=.064, NFI=.91, CFI=.93 IFI=.96, RFI=.94, GFI=.87, AGFI=.93 and SRMR=.068.These values showed that the model is consistent. Factor loadings about model were given Figure 1.

Figure1. Path Diagram and Factor Loading about Scale of Self Efficacy and Attitude toward Analytic Geometry


Investigating for Reliability of the Scale

Item Analysis

It was noticed to 27%-lower and upper group comparison and item total correlation value for discrimination of items of Scale of Self Efficacy and Attitude toward Analytic Geometry. Item-total correlation value explains the relation between the scores obtained in items and the total scores (Büyüköztürk, 2007).In other words, it shows that the items in the scale represent the similar things. Thus, positive and high item-total correlation value is expected (Fraenkel & Wallen, 2000).

Revised item-total correlation value was ranged from .35 to .75. Also, t value (sd=128) about the difference between the values of 27%-lower and upper group is ranged from -46.361 (p<.001) to -13.715 (p<.001).The findings were given Table 4.

Table 4. Corrected Item-Total Correlation Value of Scale Self Efficacy and Attitude Toward Analytic Geometry Scale and Unrelated T-Test Results between Lower 27% Group and Upper 27% Group Values.

FACTOR NAME	Item Number	Corrected Item Total Correlation	t (upper%27-lower%27)
	Item4	.541	-32.203
	Item7	.626	-28.212
	Item11	.724	-13.715
	Item12	.442	-25.034
	Item13	.419	-34.849
1. Factor attitude toward analytic geometry	Item14	.350	-45.074
	Item15	.429	-26.789
	Item16	.425	-18.601
	Item17	.467	-35.322
	Item19	.428	-15.934
	Item20	.584	-21.623
	Item21	.513	-29.231
	Item22	.625	-33.573

	Item46	.472	-24.829
2. Factor self efficacy of analytic geometry	Item26	.532	-46.361

	Item36	.492	-36.759
	Item37	.620	-28.314
	Item45	.516	-20.281
3. Factor requirement for achievement	Item32	.644	-41.961
	Item40	.750	-33.731
	Item41	.539	-27.953
	Item42	.475	-19.751
	Item43	.451	-22.453
	Item44	.678	-27.163

Findings about Reliability

The Cronbach alpha value is .80. It was found that internal consistency value for factor "attitude toward analytic geometry" is .79, for factor "self efficacy of analytic geometry" .81 and for factor "requirement for achievement" .77 (Table 5).

Table 5. Cronbach Alpha Coefficients of Self Efficacy and Attitude Toward Analytic Geometry Scale

Factors	r
Factor 1	.79
Factor 2	.81
Factor 3	.77
Total	.80

According to the results of split half analysis, the Spearman Brown coefficient is .78 (Table 6).

Table 6.Split Half Reliability Analysis Results of Self Efficacy and Attitude Toward Analytic Geometry Scale

Split Half Correlation	.74
Equal Split Half Spearman Brown Reliability Coefficient	.86
First Half Cronbach Alfa	.86
Second Half Cronbach Alfa	.71
Guttman Split-Half Reliability Coefficient	.79

After the first administration of the scale, it was administered to 75 university students to determine test-retest reliability coefficient value. Then, it was found that the correlation value between these two administrations is .85.

Answering and Scoring of Self Efficacy and Attitude Toward Analytic Geometry Scale

In the Analytic Geometry Scale which was developed to measure perception and attitude of the students to Analytic Geometry, 5-likert scale was used. That is, "1" is referred as "strongly disagree", "2" is referred as "disagree", "3" is referred as "neutral", "4" is referred as "agree" and "5" is referred as "strongly agree". There are 26 items in this scale. The lowest score can be 26 point; on the other hand, 130 point can be as a highest score. The lowest score can be 14 and the highest score can be 70 for the subfactor "attitude toward analytic geometry", the lowest score 6 and the highest score 30 can be for the factors "self efficacy of analytic geometry." and "requirement of achievement."

While evaluating the scale scores of the students, the scores obtained from sub-factors are divided by the possible score and then this ratio is converted to the percentage. After that, these percentages are ranged from the highest to lowest to determine which area is more dominant.

Discussion

The purpose of this study is to develop the scale which can be used to measure perception, self efficacy and attitudes of the university students who take Analytic Geometry by establishing reliability and validity of the this scale . The sample of this study is sufficient enough. According to the result of this study, it was proved that Self Efficacy and Attitude Toward Analytic Geometry Scale had sufficient reliability and validity value. Conformity and exploratory factor analysis were conducted to determine factor structure of the scale. It was found that this scale has three factor loadings. "attitude toward analytic geometry."," self efficacy of analytic geometry.", and "requirement of achievement" were given as name of these factors. These items have high factor loading in their factor but low factor value in the other factors. That shows the independence of these factors which is very important.

It was seen that item-total correlation value is ranged from .35 to .75. T-test results which were conducted among 27%-lower and upper group showed that there is significant difference among all items and subscale.

It was found that internal consistency value for factor "attitude toward analytic geometry" is .79, for factor "self efficacy of analytic geometry" .81 and for factor "requirement of achievement"   .77.This proves that internal consistency value of the scale is high. Depending on the results of test-retest reliability analysis, the correlation value is .85 between two administrations. That is, the scale measures the same structure.

All findings showed that this scale is valid to determine the self efficacy and attitudes of the students toward Analytic Geometry. If this scale is used for other studies, it will contribute the power of its assessment. However, there is a limitation. To be more precise, this study is restricted to Sakarya University. Thus, it will be necessary to establish reliability and validity for other students in different school, university, etc.

DIALOG AND MEDIATION EDUCATION IN INTERCULTURAL COMMUNICATION

Assoc. Prof. Dr. Bilgehan Gültekin

Ege University, Faculty of Communication, İzmir TURKEY

Abstract

Recent developments in international relations, new perception types in public, international politics and social motion and emphasis on peace culture have made intercultural communication and dialogue concepts key role players. Giving a meaning to intercultural differences within the frame of tolerance and creating a dialogue atmosphere, at the same time requires a social education. The education about this topic to be given both in primary and secondary education institudes or media and universities and social responsibility campaigns will provide new perspecives particularly in the resolvation of the problems arousing due to intercultural differences. Mediation education is based on focusing the communication skills on resolving problems and involves negotioation and conflict resolution education as well. Educating the students as potantial future negotiators starting in primary school will both contribute to the concept of social communication significantly and help build the culture of concensus and living together peacefully concept in social, personal and cultural communications. In this notice titled "Dialogue and Mediation Education in Intercultural Communication" , new education modellings and communication strategies about this topic will be constructed and an intercultural education perspective will be presented.

Keywords: intercultural communication, mediation education, international dialogue management

Introduction

Mediation and dialogue education is one of the building blocks of the social education. In this regard, campaigns that are run through communication and public relations are essential and play a determining and facilitating role. An intercultural dialogue project and education model should be set up in universities, non-governmental organizations and elementary schools. One of the most strategical steps of a dialogue mechanism based on intercultural education; is training and raising international mediators, and building an international mediation mechanism within the intercultural education system. Raising professional mediators for the future is also one of the most important contributions to communal peace. There is a great need for communication pioneers who will conduct the intercultural dialogue and peace project, and help the peace culture to dominate social platforms from elementary school level up until university level. It is a very important mechanism en route to intercultural dialogue, to finding the dialogue and mediation pioneers who are called mediators in literature, at early ages, and involve them in a forward-looking education process

Intercultural consensus strategies in the mediation education

One of the starting points of the mediation training is to form a consensus from differences and create an "Intercultural Consensus Model". It is necessary to create common communicational codes to form a consensus among different cultures and improve the dialogue mechanism, and to develop creative strategies upon these codes in mediation training. ."Rather then supply clear responses to the question of how mediators should balance sovereignty with the demands of justice, the codes merely gesture toward permissive or disapproving attitudes without actually authorizing or restricting. Like traffic signs in a foreign language, the fine print can be indecipherable, but the red or green background gives hints of whether to speed or slow"(Love, Haley,2011,p.114). First task of the intercultural consensus model is to focus on the common griefs of each society.During the mediation training communications code that will be a symbol of respect to each culture's

griefs must be created. The 15 most deterministic features of these communication codes can be summarized as follows;

Universal values of humanity should be used to express these griefs. It should be emphasized that the grief that culture bears, is the mutual grief of humanity.

To express the grief of a culture, most powerful symbols should be picked to emphasize on the sensibility of the situation.

In order to stop these social griefs from happening again, common steps and values that world citizens should possess should be emphasized.

Mutual griefs should be accepted as mental symbols for a shared future.

Cultures should run mutual communication campaigns in order to express their respects to mutual griefs.

Griefs shouldn't be compared and casualties of these griefs should be embraced by different cultures and should be symbolized as mutual losses.

To express these griefs, suitable communication channels should be created and emotions should be expressed in appropriate communication platforms.

Victims of these griefs should be contacted and an intercultural solidarity should be provided.

Instead of using accusatory symbols for these griefs, a teaching communication language should be used to stop the same mistakes from happening.

Grief of a culture, should be accepted as a shame of humanity by other cultures too.

Instead of looking for someone to blame, the process that caused the pain should be analyzed and by learning from that process, a future oriented frame should be created.

In order to reminisce the grief of a culture and to meet at a mutual emotion, momorial days should be organized and respects should be paid.

Names identified with that grief, deceased or alive, should be reminisced and other cultures should pay their respects to these names through different communication methods.

In order to pay respect to common griefs, civil platforms should be structured and these platforms should overtake mission of confrontation, rather than accusations.

With other nations' and people's sincere support and reactions , an intercultural consensus should be maintained.

For mediation training programs run by universities, including the griefs of world nations in the training process will make the mediation process more effective. Emphaty is essential for nations to solve their political disagreements and conflicts."When stories change, the perception of reality changes. Understanding life, relationships, and the human experience is a process, a continuum. In mediation, the parties redefine their stories about the conflict and create a new story that is mutually satisfying"(Weinstein,2001,p.26).Themes such as "Sharing each other's griefs" and "Owning other's grief for a while" are essential for solving disagreements, therefore they should be included in the mediation trainings in universities.

In the scope of this education model, adding a class called "Cultural Griefs and Sharings in the World" to the curriculums of elementary schools, high-schools and universities is a very important step for raising qualified mediators. It is also very important to create a curriculum for this class. Griefs and pains of different cultures should be taught starting from the elementary level until the university. The scope of this class should include; the disasters that these countries have experienced through their histories and effects of these disasters to the

history of the mankind. The struggles that countries went through in the process of democracy and their losses during this period should also be one of the main themes of this class. The struggles that countries went through in the process of democracy and this process' characteristics as a democratic movement is a required information for mediation mechanism.

Because the mediation mechanism and training involves democracy training as well. Therefore, the struggles on the way to the democracy and pains that countries beared should be one of the main topics of "Cultural Griefs and Sharings in the World" class. Turkey, Greece and Portugal's struggles for democracy is a very good example of this in the recent history. These main objectives can be summarized as "The enhancement of conflict resolution skills, prosocial skills orientation, political efficacy, value-oriented attitudes, tolerance toward diversity- multiculturalism, coexistence; cooperation, respect for the other; sense of equality, reconciliation-forgiveness-empathy, enrichment of information about the other, democratic beliefs, good interpersonal relations: The reduction of: aggression,   violence, deliquency, prejudice, stereotype, ethnocentrism" (Nevo,Brem,2002,p.272). One of the most important missions of the mediators is to build a consensus for resolving disagreements and conflicts. The struggles and losses of different cultures on the way to democracy is one of the most critical points of mediation training because in our day, democracy is one of the most important common values. Therefore, the process of democracy and the griefs and losses of all the countries from around the world had to experience in this process should be one of the most important topics of "Cultural Griefs and Sharings in the World" class.

Epidemics, disasters, war casualties, terrorist attacks and etc. should be analyzed in the scope of this class. Teaching the mainlines and a broad summary of the terrorism, natural disasters, dictatorships, wars and hunger in the Middle East, Latin America, Africa, and Europe, should be one of the main objectives of the class. Most important of all, in the scope of the class, students should feel the sensibility and the grief of others. Empathyzing with another person's grief, acknowledging it, raising your voice, giving a hand, and taking initiatives about these subjects should be important topics in the class. Within this scope, each university student writing a letter to emphasize and express their regrets for another culture's grief and sending it to a university student from another culture is an intercultural sign of sensibility and awareness. "The mediator works to create a mutual story that emerges from the different stories"(Haynes,Fong,2004,p.109).

Determining the tools and techniques that can clearly express these awareness with various public relations and communication campaigns is an important part of the mediation training. For instance, the act of terrorism that resulted with the death of 82 people on July 23, 2011 in Norway, is one of the biggest terrorist attacks in the history of Norway. A public relations campaign that all the university students around the world would participate with a letter to Norway with the motto of " We Share Your Pain", would show the support of universities on creating a social awareness. Indian leader Mohandas Ghandi's approach on peace and philosophy has been a guide in the training process of mediation leaders .(Page,2008,pp.44-45).

Mediation training and the art of negotiation in elementary schools

One of the most important phases of the mediation training is the " negotiation training". Mediation is the art of conducting a negotiation and planning the parley. Therefore, starting with the elementary school second grade curriculums, the art of negotiation in mediation training should be examined. In this regard, at 1st and 2nd grade in elementary schools, the art of negotiation should be emphasized for educating future mediators and negotiators. According to Brunswik's "Lens Model of Perception" ; objects are never perceived directly. Brunswik emphasizes the importance of the mediator for perception. (Brunswik,1955,p.237). The first stage of the negotiation training is the interpersonal communication and listening skills classes. One of the most important qualities of mediators is being a good listener. Henceforth, some applications and activities should be added to the elementary level curriculum. Children having the ability to express themselves against different cultural ideas and learning the basics of intercultural communication is a very critical point for mediation

training. ."This clarification of the underlying issues can be described as something like finding the golden nuggets within the complex and emotionally laden stories for each party recounts"(Doherty,Guyler,2008,p.34)

At the point of conveying the elementary students with different point of views; support of the consulates, non-governmental organizations, Ministry of Culture and international institutions should be regarded. Within this frame, an" Intercultural Communication and Sharing" protocol should be signed between the Ministry of Education and ambassies-consulates and education projects should be prepared within this frame. One of the most important topics of this protocol is making "sister school" deals with other countries. It would be an effective step for educating the future of mediators if every elementary school in Turkey could find a sister school in other countries and conduct projects of intercultural communication. To take an initiative for solving an important problem of the sister school is a strategical effort in the mediation mechanism. For instance, when two elementary schools from Turkey and Greece sign a sister school protocol, one of the first steps of the mediation training is each student writing a letter about an important problem of his/her own and trying to find a solution for the problem in the letter he/she received. Such a practice would lead to discovering talented mediators at young ages. For instance, it is a very solid contribution to the mediation training if a Greek student shared a personal family problem with a Turkish student and Turkish student expressing his suggestions through his/her letter, or an elementary school in Greece solving their need of computers through a campaign initiated in Turkey, are very important steps to construct an international consensus idea at early ages.

In this context, another reccomended practice at elementary school level is a 40 minutes briefing every week, about global news and teaching them about different cultures and countries. It is important to keep the children aware of the global news and get their attention on global issues at early ages, with a conveying style that they can adapt to. For instance, telling the children about the presidential election in France with visual support and an intriguing approach would attract the children to global issues at early ages. One of the most famous cartoon characters in France is called Titeuf. Titeuf can also be found with Turkish voiceover, thus by showing the children a Titeuf cartoon and then expressing them in an associating manner such as " Titeuf's country elected their president this week. As a result of the election on May 6, a new president of the France is Francois Hollande" will attract the children. Therefore, it is suggested to gather an "intercultural training commission" which consists of volunteer teachers, in order to raise awareness of the kids. The main objectives of this comission should be as such ;

Developing intercultural training projects for elementary school level children, -Presenting the global news to the kids in a way that they can understand and relate to,-Gathering visual documents that introduce different cultures to students and share them,-Contacting with colleagues in other countries and developing mutual projects, -Teaching cultural differences with a communication language and symbols that students can understand and get interested in, contacting with the experts that can introduce new cultures, -Explaining the universal humanity values and emphasizing on the human rights, -Determining the international institutions that can be contacted to enforce the intercultural communication and cooperating with them, receiving support from non-governmental organizations,-Determining the games that elementary school students can play to learn about intercultural communication and making the kids to participate in them, receiving support from the experts on this subject,-Following international journals and sharing the latest developments, inventions and models with children,-Pioneering various artistic and cultural activities that will empower the intercultural training and dialogue.

Creative strategies for mediation training ın elementary schools

In order to train the elementary school students as future mediators, particularly in 2nd level elementary schools, it is important create various communication scenarios and determine talented students. Therefore, it's suggested to establish a "consensus commision" in every class to help the students resolve the issues among them. This commission is recommended to consist of 5 students and it should pick a mediator for the issues among the students to solve these issues. Main function of the mediator should focus on conduct the negotiations aimed to solve the issue and gathering both parties togehter. The operating mechanism of this comission is based on developing dialogue channels for resolving the issues and substitutions can be made based on the

performance of the students in the commission. In order to run this mechanism properly, job definition of the commission should be explained at the beginning of the school year. By asking the students the 3 major problems that they encounter during the classes, 3 common major problems of the class should be determined. Then the commission should be given 3 weeks to reach a consensus and at the end of these 3 weeks, the commission should announce their solution to the class. Such an activity will result with important attainments on evaluating the mediation skills of the students. Another stage in the application is to give the distinguished students an interpersonal communication training and improving their interpersonal communication skills. Another application similar to this one is to form groups in the classroom and giving them a pre-determined social issue and ask for their creative solutions. This is an important activity for improving the students' problem solving skills.

Children should be made to attend related seminars by the experts of this subject. For instance, one of the most important communication seminars is about listening skills. Practical knowledge about how to be a good listener should be presented. Debates of two opposite minded good listeners, should be presented. Supporters of 2 rival teams would be a good choice for this.

Intercultural communication skills should be supported and improved with various communication applications. It is important to structure these applications in the frame of developing intercultural sensibility. In order to develop intercultural sensibility, an intercultural sensibility model for elementary school students should be developed and this model should be structured with various communication strategies. In order to improve the intercultural sensibility, first thing to do is to share common threats and problems of the world. Global warming is an example of this. Global issues should be thought upon and taken seriously by each citizen of the world. Experts of these subjects should be invited to elementary schools and inform the students about the important issues of the world. This would be the first step to improve the sensibility of the stundets. It is an important attainment for the students to alter their habits towards the solution of these problems. An example of altering these habits for global warming, is to use clockwork table clocks instead of electronical clocks. Organizing a communication campaign on this subject would empower the training project with communication strategies. With the motto of "If you don't want to put your clock back, win your future with table clocks." starting a campaign on "A table clock for every house" in all the elementary schools in Turkey, would provide a common sensibility area.

When raising the intercultural sensibilities, sample activities should be the starting point. Within this frame, when a disaster or an upsetting event happens in a random country, elementary students' awareness should be raised. For instance, showing starvation or an earthquake videos to students without causing any damage to their psychologies should be the first step of the application for intercultural awareness. Following this step, students should be asked to develop an expression style that expresses their emotions towards the children in the country that the natural disaster happened. In this activityin which the children victims' situation is shared, a communication step should be requested to help and aid those children. For instance, students starting an aid campaign or an art exhibition would be examples of sensible communication activities.

Combining the educational projects with with public relations and communication campaigns will make a serious contribution to the intercultural communication perspective. Especially the rapid kinesis in the communication technologies supports the intercultural communication in this aspect. It would be a contributing application, to organize a week in elementary schools, called " Understanding and Learning About Different Cultures" and organizing intercultural activities within this week. One of the most important worldwide applications on this subject is CISV(Children's International Summer Villages). CISV emphasizes on the 8 basic education topics (Global Awareness Education, Intercultural Education, Human RelationsEducation, Personel Devolopment Education, Environmental Education, Development Education, Human Rights Education, International Education) and organizes activities such as summer camps to emphasize on the intercultural dialogue and interaction among elementary students from different cultures (Baraldi, Cortesi,Lervese,2009,pp.29-44).

Diplomacy education

Another sub topic of the mediation training in intercultural training is the diplomacy education. Diplomacy is one of the fields that equires mediation the most. Diplomacy is the most powerful communication force in international relations and diplomacy constitutes the communication aspect of international relations. Therefore, a mediation mechanism should be created to educate the future mediators in diplomacy. Ministry of Foreign Affair and Ministry of Education in all countries should sign a protocol. This protocol will lead to new expansions in mediation training. This diplomacy education should be divided into 3 titles; elementary schools, high-schools and universities, and the persuasive aspect of communication in negotiation process should be strenghtened.

For the diplomacy training for elementary school 1st and 2nd level, "Super Talent" training program is recommended. The project that aims to discover the students that have the interest and talent towards foreign policies and international relations, and training and education these children about mediation for years; support from the foreign representatives of Turkey should be received. Through a protocol organized between the Ministry of Foreign Affairs and Ministry of Education, a mutual education project should be created.First step of this training should determine a pilot school and organize lectures and seminars by experts, in order to determine the children with mediation skills and future diplomats. It is a very important step to form a commission of 9 which consists of ; a foreign policies expert chosen by Ministry of Foreign Affairs, an academic on international relations, 2 teachers that follow international journals and interested in foreign policies and diplomacy, a representative of the ambassies that were involved in the program, an interpersonal communication expert, a retired diplomat and a foreign academic who is an expert on the subject, and to find future mediators through the training program.

The first stage of this training should be discovering the future super talents and mediators. This commission should visit pilot schools and evaluate students potentials. One of the reccomended communication models on this subject is the "call conference model". According to this model, first 2 teachers and the international relations academics should evaluate the students' interest in foreign policies. This team should form teams of 5 students. Number of these groups may vary according to the interest of the students. Criterias on how to evaluate the children, should be pre-determined. These criteria is a scale that tests the children's awareness and interest levels. Students who are interested and aware on global news should be determined. When determining these children, it is suggested to show them visuals about global developments and ask them to comment on those visuals. After dividing the children into groups of 5, each group should be given a topic and asked to brainstorm about it. The highest scoring students should be invited to mediation training within Ministry of Foreign Affairs.

Via representatives of the Ministry of Foreign Affairs in various cities, the Ministry of Foreign Affairs should find a diplomacy school in these cities, give these children special training, organizing international trips and arrange one-to-one lectures with Consuls, arranging internships at Consulates, providing opportunities on foreign languages would be key steps to educate future mediators. After a certain stage of the training, chosen students should be involved in activities that they can take initiatives and evaluated. For instance, children pioneering an aid campaign between schools, interviewing with a top level politician and evaluating this interview, participating in the organization commitee of a political summit, are the examples of activities that students can participate during the training process.

Civil society and mediation training

Another important stage of creating a mediation training and a dialogue mechanism is to get support from the civil society. It is important for non-governmental organizations to take initiatives on educating future mediators. For instance,nongovernmental organizations mediating for more shelters in order to protect the women victims of domestic violence and conduct negotiations to help them is a very important social mission. Non-governmental organizations negotiating with various people and institutions for a domestic violence victim woman who asks for help, is a very good example of social mediation mechanism. In social mediation training that will be run by non-governmental organizations, each non-governmental organization should pre-inform

about their field of activity. For instance, in a mediation training that aims to prevent violence against women, all types of information should be expressed, thus, the information aspect is one of the most important aspects of mediation training. All the technical details should be known in the field that mediation process is involved in. ."They convincingly argue that mediation is,in effect,a form of psychological counselling and that mediators should avail themselves of the wealth of theoretical knowledge and pragmatic wisdom that this field has to offer"(Strasser,Randolph,2004,p.208). To have strong links with significant people and institutions is one of the most important communicational traits of the mediator. During the mediating education it is important to communicate with as much people as possible based on mutual trust. The communication chain that the mediators have is the most important communication power to tackle the problems at particular points and manage the process. "The mediation process contains within it unique potential for transforming conflict interaction and, as a result, changing the mindset of people who are involved in the process"(Robert, Baruch, Folger,2005,p.22).

The management of the meeting traffic needs to be made according to a meeting agenda. Therefore, time management in mediating education is a crucial topic. Meeting results need to be worked out coherently in a coordinated way. Each meeting carried out should be meaningful and support a reasonable step in the solution of the problem. A meaningful and qualified meeting is the planning of the meeting as addressed to a tangible contribution to the solution of the problem or a strong expression of the will. As the NGOs are based on voluntary work, the members should cooperate in the planninng and elaboration of the meetings. Each member has a personal meeting radius. In the mediation mechanism, the personal meeting radius is an area that is made up of the contributions which institutions the mediator communicate made; and a meaningful and visible dimension of the capacity to solve the problems.

Another important phase during the mediating educations by the NGOs is the performances of the mediators in the persuasive communication issue. Therefore the mediator needs to present a convincing model during the dialog. The first stage of setting a convincing model is to take the opinions of the sides and convince them that they have expressed themselves correctly. For that reason each opinion about the solution must be listened and the right communication channel be found for the people to express themselves correctly. "The mediator faces the question of whether people need to tell their story directly to each other or whether it is better to discuss it with the mediator alone, at least as a preliminary step. As much as facilitative mediators want to help parties communicate directly with each other, they also must recognize sometimes people are afraid (often, with good reason)to tell their story in front of the other parties)"(Mayer,2004,p.43)

One of the most crucial characteristics of a mediator is to determine the right communication channel that the sides can express themselves. "Some mediators may make suggestions for settlement, others consciously refrain from doing so. Some mediators are interested in achieving and acceptable the outcome, others may wish to improve interactions between the parties. Some mediators may possess skills to defuse tensions, others may have the resources to "nudge"the parties one way or another".(Bercovitch,2002,p.7).For instance, in the prevention of the violence towards women, it is an important gain a solution to establish a counseling center and and in these 24 hours working centers, to provide every kind of support for women victims of violence immediately through the help of NGOs. Also, it is an important step by the NGOs to sign a protocol with the Family and Social Affairs Ministry and make a cooperation to assign a particular number of people from this platform as "Victim Counselor". The Victim counselors, whose duty is to meet the victims face to face, to determine a map of struggle with them and acompany them till the end of the process, should also determine the communication channels to express themselves. Another duty of the Victim Counselor is, for every victim they met, to provide a law counselor and psychological counselor through the links they have with the NGOs they are member of. As in the example of victim counselor, it is an important step for peace and dialog to bring mediators in the solution of the problems through NGOS.

The social education studies of the NGOs about this subject should be supported with promotions and PR campaigns. The most important factor in social mediation is conducting social meetings with the right people through right communication tools. Mediators should be impartial during this process. "The mediator doesn't take sides. Mediators are not advocates for either party, nor are they counselors or judges. A good mediator will promote and encourage self-advocacy in productive ways"(Butler,2004,p.3). The mediator should have the skill

to create the symbols and plan the activities to activate the public. That is why, each NGO should create the strongest symbol for their stance about the subject to be mediated. In order to strengthen the dialog mechanisms, the mediator should have the training about the power to create public opinion and the techniques for to create public opinion. "Violence Clock" campaign is one of the suggestions as a PR campaign that can be applied towards the public education as well as easy to apply on this subject. In order to provide the sensitivity towards violence, the campaign that everyone who looks at the clock will become a volunteer; for example in İzmir every Friday at 16:00 the volunteers will gather under the clock tower and announce the number of the women exposed to violence and a symbolic bell sound will be played once for every 10 person who is exposed to violence, is being planned. In the campaign, as long as a decrease in the violence is obtained, by taking the clocks one hour forward, a one hour late meeting at the following week, or vice-versa when the opposite occured, every volunteer should aim to have a result in the attempt to fight the violence and this attempt should be expressed by taking the clock one hour forward. Every attendant should be trained as a mediator towards the fight against violence and activate the international public opinion to spread the movement into an international ground.

Conclusion

Mediation training, is a peace project founded upon teaching interpersonal communication skills. In our day and in the future, one of the greatest powers that a sociaety can have is the leadership power gained through resolving conflicts. Especially for the conflicts caused by intercultural miscommunication; mediation training and developing a dialogue mechanism are the most effective peace and communication tools. Mediation training should be planned within universities, elementary schools and non-governmental organizations and should be presented as a model of peace.

Mediation also includes a negotiation process. The negotiations process in intercultural communication, is conducting meetings to resolve an isssue and strenghtening these meetings with the power of persuasion between parties. All the cultures should train mediators for intercultural peace who posess listening skills, taking initiative, crisis management ability, emphaty, sharing griefs and sensibilities and also can be a leader in communication. Mediators also possess the role of effective communication pioneer and should build an intercultural coalition and include important actors in this coalition.

One of the basic goals of mediation training in intercultural communication is to create a peace communication model in order to maintain cultural coalition. Therefore, starting peace education in elementary school and continuing it thorugh university, educating future diplomats as international mediators within a professional training program and improving their skills through training programs in universities are important strategical steps. The support that cultural coalition will receive from nongovernmental organizations will provide a settlement for educating dialogue leaders and mediator training. This social education will provide the mediator who will pioneer the public to an intercultural dialogue coalition, build a dialogue climate for different cultures to live in mutual understanding, tolerance and peace, both today and in the future.

DOES THE ATTAINED LEVEL OF EDUCATION AFFECT THE INCOME SITUATION OF HOUSEHOLDS?

Jana Turčínková[a], Jana Stávková[a]

[a]Department of Marketing and Trade, Faculty of Business and Economics, Mendel University, Zemědělská 1, 613 00 Brno, Czech Republic

Abstract

An increasing number of inhabitants with higher levels of education provide conditions for formation and development of knowledge or information society. In this society, the significance of education is increased and the utilization of scientific findings becomes the key source of the society's competitiveness. However, does the attained education affect the income situation of a household? The paper provides results of an analysis focusing exactly on relationship between attained level of education and the income situation of households in the Czech Republic, mainly those ones living at risk of poverty. The source for the analysis of the effect of achieved level of education on the income situation of households are the results of a survey conducted by EU-SILC (European Union Statistics on Income and Living Conditions) in 2005–2009. The level of education of a household was determined based on the level of education of the household member with the highest income – the head of household. The income situation is determined by mean and median values, differentiation and development between 2005 and 2009, representing the period of economic development but also economic crisis. The results of analysis of households categorized by education level and their risk of poverty clearly show that the most vulnerable group comprises households with primary education or no education. At the same time, when analyzing the mean disposable income per member in households at risk of poverty; it was found that the households with lowest income are rather surprisingly the ones headed by a person with the highest level of education (tertiary). The connection of income inequality and poverty of economically weak households and attained level of education has been proven; however, we can conclude that a higher level of education of the head of a household is no guarantee of a lower risk of poverty and more and more attention should be paid to the applicability of university graduates in practice.

Keywords: EU-SILC, income situation of households, level of education, knowledge society, change;

Introduction

Increasing number of people with higher education provides conditions for formation and development of knowledge society. GDP structure, manifested by growing share of knowledge assets compared with psychical capital is a key feature.

Education not only affects the individual's position in society; it also determines his or her position on the labor market. In addition to personal benefits, it is possible to prove that education of an individual plays an important role in productivity of the whole society. Krueger and Lindahl (2001) consider education as a key driver of economic growth. However, Fields (1980), believes that the level of income inequality in society does not differ significantly, depending on how much individual countries invest in public education. Ram (1989) provides a summary of previously published theoretical and empirical contributions and says that there is no strong support for a direct correlation between increasing levels of education and reduction of income inequality. Nevertheless, Sylwester (2002) suggests that countries that invest more resources in public education (in terms of GDP share) reach lower income inequality in the following years, although this effect can sometimes be delayed, and thus points out that there are other reasons for investment in education than stimulation of economic growth. Similarly, Röbel and Easterly (1993) already earlier assessed such investments and share the

view that in the short term investment in education cannot be directly linked with economic growth, but ultimately it contributes to reduction of income inequality.

Education also has a positive impact on public health, the environment, reduction of crime rate, approach to parenthood, participation in public life, etc. It is therefore desirable that the society sets up a system appreciating and supporting educated people in the form of financial rewards.

As already mentioned, the empirical research findings have mostly pursued a relationship of education level to GDP level. The aim of this paper is to follow the relationship of attained education to the income of individuals, respectively households and their standard of living. Evidence from various sources point out that low-income households are often associated with lower standard of living and welfare of the household and children living there (Duncan, Yeung, Brooks-Gunn, and Smith, 1998). Researches also show that children of all ages living in poverty suffer more health problems than children from affluent families (Newacheck, Hughes, and Stoddard, 1996).

When we want to define who is considered to be poor, we can apply Hallerod and Larsson's definition (2008); they define poor people as those, who, due to insufficient access to economic resources, have an unacceptably low level of consumption of goods and services. Income poverty is measured in accordance with the conventional EU measurement of relative poverty. Those people who live in household with an equivalent of disposable income that is below 60 per cent of the median household income are defined as poor.

Poverty threshold is defined in different countries at different levels. People living below this level are then defined as poor. It is also called subsistence minimum. This definition is closely linked to the income level people require to buy life's basic necessities, such as food, clothing, housing, but also what is necessary for satisfaction of their most important socio-cultural needs. What we must take into account is the fact that the poverty line changes over time and it also varies by region, and the official national poverty line is determined by a country's government (Beyond Economic Growth, 2004).

Methodology

The data set was drawn from a survey EU-SILC (European Union Statistics on Income and Living Conditions), available for years from 2005 to 2009, collected in the Czech Republic on the number of households, as shown in Table 1.

Table 1.

Number of households participating in the survey EU-SILC

Year	2005	2006	2007	2008	2008
Number of households	4351	7483	9675	11294	9911

The Czech national module of the project called "Living Conditions" is performed by the Czech Statistical Office every year in compliance with the Directive of the European Parliament and the Council. The authors did not participate in data collection; they purchased them in a form of a database. The data collection method is unified by the European Union.

The data set provides information on household income, household structure, economic activity, social situation and level of attained education of the head of household. The selected variables for the analysis were:

- The equivalized monthly disposable income of a household per household member. The conversion is performed in accordance with EU methodology, where the head of household is assessed by the coefficient 1, children below 14 years of age are assigned with coefficient 0.3 and other persons are assigned a coefficient of 0.5 (Longford et al., 2010).
- The attained level of education in following four categories:
  - Primary or no education,

- ○ Learned a trade through apprenticeship, lower secondary education, without a leaving certificate,
- ○ Full secondary, vocational or post secondary education,
- ○ Higher (tertiary) education.

The analysis will use income categories of households at risk of poverty. Poverty threshold for an individual country is defined as the percentage of households with income below 60% of the national median income.

The analysis is focused on the number of households in the Czech Republic with the specified attained level of education and their income situation. The income situation is determined by middle values (mean and median), differentiation and development between 2005 and 2009, which included both economic development and economic crisis.

Results

The data set compiled by the above mentioned method gives the results shown in Table 2.

Table 2.

Characteristics of the household income situation categorized by the highest attained level of education of the head of household

The level of education attained by the head of household	2005		2009	
	Number of households (%)	Mean income per an equiv. member (in CZK)	Number of households (%)	Mean income per an equiv. member (in CZK)
Elementary or no education	12.71	8 794	12.40	11 421
Learned a trade through apprenticeship, lower secondary education, without a leaving certificate	45.07	11 096	45.16	14 521
Full secondary, vocational or post secondary education	30.06	13 070	30.27	16 834
Higher (tertiary) education	12.16	17 961	12.17	23 029
Czech Republic	100	12 232	100	15 972

The table shows that the first two categories of education level (elementary and secondary, vocational), do not even reach the national mean income, while their representation in society is more than 57% of households. In the Czech Republic, the development of household income was positive in terms of time and the income increased by 30.6%, the mean income was reached only by the category "learned a trade through apprenticeship" (30.9%) and similarly the category "elementary education" (29.9%), the category "full secondary" achieved a 28.8% increase and the category of "higher education" has the lowest increase of 28.2%). It shows a negative evolution of the dependence of income and education level.

The least numerous category (households with their head with tertiary level of attained education) reached their income 46.68% higher than the mean income in CR in 2005, while in 2009, it was 45.09% higher than the mean income in the country. This finding confirms the lower financial reward of higher attained level of education and confirms the trend of reducing income inequality from this perspective.

The frequencies of households by education categories, respectively their development can not be assessed, as the representation of households in each category corresponds with the educational structure of the Czech Republic.

Advanced economies focus in their social policies on those social groups that live in poverty. This paper, therefore, presents an analysis of income vulnerable households in relation to the attained level of education.

In 2005, the poverty line in the Czech Republic equaled to 6 350 CZK per equivalized household member, in 2009, it was set at 8 314 CZK. Out of it, all households we filtered out with income above the specified values, and Table 3 shows the frequencies of households at risk of poverty, categorized by level of attained education.

Table 3.

Households at risk of poverty, broken down by category of education level

The level of education attained by the head of household	Households at risk of poverty	
	2005	2009
Elementary or no education	13.74	14.72
Learned a trade through apprenticeship, lower secondary education, without a leaving certificate	7.34	5.94
Full secondary, vocational or post secondary education	5.14	4.60
Higher (tertiary) education	1.70	2.16
Czech Republic	6.80	6.16

Positive trend is observed in categories "learned a trade through apprenticeship" and "full secondary education", while a negative trend in the category "elementary education" and, surprisingly, the "higher education" category. This gives rise to further reflection and analysis on the suitability of the distribution of fields of higher education, their availability and usability of graduates in practice. This may also be due to downsizing and mass layoffs in most companies at all levels of management, often engaging employees with a university degrees, for whom it has been difficult to find appropriate new employment then.

Further interesting results can be obtained from a more detailed analysis of the 6.8%, respectively 6.16% of households at risk of poverty, see Table 4.

Table 4.

Income of households at risk of poverty, divided into education categories

The level of education attained by the head of household	2005		2009	
	Number of households (%)	Mean income per an equiv. member (in CZK)	Number of households (%)	Mean income per an equiv. member (in CZK)
Elementary or no education	25.68	5 103	29.62	6 872
Learned a trade through apprenticeship, lower secondary education, without a leaving certificate	48.65	5 001	43.54	6 674
Full secondary, vocational or post secondary education	22.64	4 943	22.59	6 699
Higher (tertiary) education	3.04	4 520	4.25	6 161
Czech Republic	100	4 999	100	6 715

The table shows that the mean income per one equalized member of household at risk of poverty was 4 999 CZK in 2005 in the Republic, and 6 715 CZK in 2009. Interestingly, the lowest income households are headed by a person with the highest level of education. In contrast, households headed by a person with the lowest level of education reach the highest income.

Trying to search for deeper analysis and reasons for this condition, which may be a period of time when the household is in the category at risk of poverty, or setting requirements for social security benefits, willingness to

apply for various social benefits, etc., information on social transfers to households and their share of disposable household income by education categories was presented in Table 5.

Table 5.

Ratios of social transfers in disposable income

The level of education attained by the head of household	2005			2009		
	The ratio of all social transfers in disposable income (%)	The ratio of retirement benefits in disposable income (%)	The ratio of social transfers excluding retirement benefits (%)	The ratio of all social transfers in disposable income (%)	The ratio of retirement benefits in disposable income (%)	The ratio of social transfers excluding retirement benefits (%)
Elementary or no education	64.53	56.66	7.87	65.08	57.89	7.20
Learned a trade through apprenticeship, lower secondary education, without a leaving certificate	35.46	28.39	7.07	34.66	29.12	5.54
Full secondary, vocational or post secondary education	26.68	21.12	5.56	26.94	22.29	4.65
Higher (tertiary) education	16.57	13.93	2.64	17.77	14.80	2.97
Czech Republic	31.51	25.67	5.85	31.34	26.44	4.91

As we can see in Table 5, it is clear that the largest ratio of social transfers to their disposable incomes have households headed by a person with primary education or no education. In both years, social transfers are accounted for about 65% of their disposable income, double the national mean. This trend is increasing in the share of social transfers in disposable income of households in the category of retirement benefits, and slightly decreasing for other social benefits over time.

Conclusions

The analysis of households according to the attained level of education of their heads and their risk of poverty clearly shows that the most vulnerable group comprises households with primary education or no education. The share of vulnerable households in this group (about 14%) is more than twice the ratio of the whole country (approx. 6.5%). Besides that, we experience a negative trend over the time. It is a group that deals with the income situation and faces the consequent possibility of social exclusion, therefore, it needs help from the society (or the system). The category of households headed by a person with "learned a trade through apprenticeship, lower secondary education, without a leaving certificate" experienced a decline in number of households at risk of poverty within the analyzed period. The frequency of households at risk of poverty in these two groups is lower than the national average.

At the same time when analyzing the mean disposable income per member of household at risk of poverty it was found that the households with lowest income are the ones headed by a person with the highest level of education (tertiary). In contrast, households headed by a person with the lowest level of education reach the highest income. But in terms of share of social transfers in disposable income, households headed by a person with elementary or no education are the most often represented (up to 65% of their disposable income), while households with their head of household with tertiary education less than 20%.

The connection of income inequality and poverty of economically weak households and attained level of education has been proven on the basis of our results, including the consequences manifested in the distribution of social transfers. However, we can conclude that higher education level of the head of a household is no guarantee of a lower risk of poverty. On the contrary, more and more attention should be paid to the usability of university graduates in practice. We can conclude that households with head of households with tertiary education level are in a relatively better situation than other categories of households (with lower level of

attained education), unless they lose their job or stable source of income, because they seem to be affected by such problems more than other household types and face perhaps more difficulties finding new appropriate job or fail in application for social benefits and their incomes drop dramatically.

DOMINANT LEARNING STYLES OF PREPARATORY CLASS STUDENTS

Özlem Karakış

English Instructor, Abant Izzet Baysal University, Golkoy Campus, 14100, Bolu, Turkey (*karakis_o@ibu.edu.tr*)

Abstract

The aim of this study is to determine the dominant learning styles of English preparatory class students. The universe of the study, having used survey method, was 584 preparatory class students studying at a state university located in the northwest of Turkey. In order to determine the dominant learning styles of preparatory class students, "Learning Styles Inventory" developed by Kolb (1985) was used. According to the findings of the study; that 50,5 % (n=295) of the students had Assimilator, 26,9' % (n=157) of the students had Converger, 14,2 % (n=83) of the students had Diverger and 8,4 % (n=49) of the students had Accomadator learning style were found. No meaningful difference was found among the dominant styles of students according to their gender.

Key Words: Learning Styles; Preparatory Classes

Introduction

Today, one of the purposes of education and training activities is to provide equal opportunities for students and the work undertaken in this regard centers on students' individual differences. Hence, many of the educational programs aim to identify these differences and to develop activities accordingly, in other words, to provide individualized instruction opportunities such as learning styles.

The main purpose of the studies on the concept of "learning style" first introduced by Rita Dunn in 1960 is to present the fact that individuals learn things differently. Dunn and Dunn (1993) defines "learning style" as a route starting with focusing on new and difficult information that is followed by the process of acquisition and storing the information in memory and that process is different for each individual (Cited in Bahar and Bilgin,2003:42). Learning styles are the characteristic qualities that are present from birth and that affect our behaviors in each moment and dimension of our lives (Boydak,2001:3). "Learning style" is defined as the individually preferred method in learning by Kolb (1984:11). In short, learning style is the route that the individual follows in the perception, processing and utilization of information

Kolb Learning Styles Model: According to Learning Styles Model of David A. Kolb (1976) used in the current study, there are four different learning styles and one of these styles presents the dominant learning style of the individual and the learning preferences related to the preferred style. Kolb's experiential learning theory approaches the learning process differently than those of behavioral and cognitive field theories in that the connection among work, other experiential activities and the creation of knowledge is important. The reason that this approach to learning is called "experiential" is related to the fact that thoughts continuously change according to experiences. No two thoughts are ever the same since experience always intervenes (Kolb, 1984:20–27). Selection of experiences shows which learning style that the individual prefers (Kolb, 1984:68). The learning styles mentioned in the theory are identified based on the thinking and creativity theories: Divergers; Assimilators, Convergers and Accommodators (Kolb,1985: 4–7).

Assimilators (Abstract conceptualizer/Reflective observer): Inductive reasoning skills and the ability to create theoretical models by assimilating integrated explanations with various observations are among the most eminent features of the individuals carrying this learning style. They focus on ideas and abstract concepts and

they do not judge or argue the practical values of the ideas. Principal strengths of assimilators are planning, creating models, diagnosing problems and developing theories (Kolb, 1984:78).

Convergers (Abstract conceptualization/Active experimenter): Problem solving, decision making, logical analysis of thoughts, deductive reasoning and systematic planning skills are the eminent features of the individuals who have this learning style. These individuals prefer to deal with technical matters instead of social and interpersonal activities (Kolb, 1984:77).

Divergers (Concrete experiencer/Reflective observer): Divergers are very successful in looking at concrete cases from various angles. They prefer to observe rather than act and they enjoy focusing on cases where different ideas acre created such as in brain storming. They are patient and careful in the learning process and they can make objective judgments. They consider their won thoughts and ideas while forming thoughts. They also need to develop new learning opportunities express their emotions by being more active in interpersonal activities and develop skills related to tasks that do not require numerical data (Kolb, 1984: 77–78).

Accomodators (Concrete experiencer/Active experimenter): Individuals with this learning style have the ability to learn through their present experiences. They enjoy making new plans and benefiting from new experiences, tend to act according to emotions instead of logical analysis, prefer to ask for personal information in solving problems instead of using technical analysis. The strengths of these individuals are practicality, leadership and risk taking skills (Kolb,1984: 78).

Related literature shows that there is limited number of studies examining university prep level students' dominant learning styles (Çekiç, 1991; Kılıç, 2002; Kırkgöz and Doğanay, 2003). This study designed to identify the dominant learning styles of prep students is believed to contribute to the development of the rearrangement of educational organizations by providing information about learning styles to teachers and program developers. Answers were sought during the study to the questions below:

What are the dominant learning styles of prep class students?

Are there any differences in students' dominant learning styles according to gender?

Method

The universe of the study consists of 584 students from 610 students attending preparatory classes in a state university in Western Black Sea Region of Turkey in 2011-2012 Academic Year.

The data needed for the study was collected through Learning Styles Inventory developed by Kolb in 1976. The reliability of the inventory was tested in 1985. The inventory is composed of 12 items each with four options that request the participant to list the four learning preferences that best describe their learning styles. In the process of knowledge acquisition, the individual is on a continuum from concrete experience to abstract conceptualization and in the knowledge processing he/she is on a continuum from active experimentation to reflective observation. The scores obtained from the test changes between 12 and 48 and integrated scores are between -36 and +36. The positive scores obtained from concrete experience (CE) to abstract conceptualization (AC) on a continuum of CE and AC show that learning is abstract and the negative scores point out that learning is concrete. Similarly, positive scores obtained from active experimentation (AE) and reflective observation (RO) show that learning is positive whereas negative scores point out that learning is negative. The point where the x axis and y axis, displaying AE-RO and CE-AC scores respectively, intersect indicates the dominant learning style for the individual.

The translation and adaptation of the Learning Style Inventory to Turkish and the reliability and validity studies on the inventory were completed by Buket Akkoyunlu and Petek Aşkar tarafından in 1993. According to data obtained from a total 103 adult graduates; 62 females and 41 males between the ages of 22-49, the scores about the four main learning styles were found as follows for Cronbach Alpha Reliability Coefficient calculated by Aşkar and Akkoyunlu (Aşkar and Akkoyunlu,1993:43): Concrete Experience .58, Reflective Observation

.70, Abstract Conceptualization .71, Active Experimentation .65, Abstract-Concrete (AC-CE) .77 , Active-Reflective (AE-RO) .88 (P< .001).

Findings

Table 3.1 displays the data obtained for the question: "What are the dominant learning styles for prep class students?"

Table 3.1   Findings related to the dominant learning styles of prep class students

Learning Styles

	Assimilator	Converger	Diverger	Accomodator	Total
N	295	157	83	49	584
N	50,5	26,9	14,2	8,4	100,0

Table 3.1 shows that 50.5% of the students (n:295) in the framework of the study were found to be assimilators, 26.9% (n:157) to be convergers, 14.2% (n:83) to be divergers and 8.4% (n:49)   to be accommodators.

Table 3.2 displays the data obtained for the question "Are there any differences in students' dominant learning styles according to gender?"

Table 3.2   Relationships between Learning Style and Gender

Gender

Learning Styles		Female	Male	Total
Assimilator	N	145	150	295
	%	49	51	100,0
Converger	N	90	67	157
	%	57	43	100,0
Diverger	N	40	43	83
	%	48	52	100,0
Accomodator	N	27	22	49
	%	55,5	44,5	100,0
Total	N	302	282	584
	%	51,7	48,3	100,0

X^2= 6,057 p=.109

Chi square test employed to identify whether there are statistically meaningful differences between the variables of dominant learning styles and gender shows that there are no statistically meaningful differences at .05 level of significance.

Results, Discussion And Suggestions

1. Data obtained from the study shows that 50.5% of the students (n:295) in the framework of the study is assimilators, 26.9% (n:157) is convergers, 14.2% (n:83) is divergers and 8.4% (n:49) is accommodators.

This finding is fully or partially supported with various research findings in the literature (Aşkar ve Akkoyunlu,1993; Kılıç,2002; Harrelsen, Dunn Leaver ve Martin,2003; Jones, Reichard ve Mokhtari, 2003; Peker,2003; Barmeyer,2004; Güven,2004; Özkan, Sungur ve Tekkaya, 2004; Peker,2005; Karakış,2006; Gürsoy,2008; Tuna,2008; Çiğdem,2010) ve bazıları ile de kısmen (Chi-Ching ve Noi,1993; Mathews,1996; Truluck ve Courtenay,1999; Demirbaş,2001; Kayıntu,2001; Buch ve Bartley,2002; Harris, Dwyer ve Leeming,2003; Özkan,2003; Özsoy, Yağdıran ve Öztürk,2004; Arslan ve Babadoğan,2005; Palas Aktaş,2007; Dincer,2007; Koç,2007; Numanoğlu ve Şen,2007; Peker ve Mirasyedioğlu,2007; Uğur,2007; Erol Çalışır,2008; Demir,2010; Koç, 2010; Şişman Uğur,2010; Yurtseven,2010; Koca,2011; Koçyiğit,2011; Özdemir,2011; Yılmaz,2011).

As a result, we can say that students in the prep classes in the university are mostly in the assimilator style which is in the reflective observation and abstract conceptualization section. In other words, half of the students in the prep class are students who can observe and reflect experiences from different perspectives and can develop concepts that place their experiences in logical theories. The most outstanding features of these students are making logical assumptions going from the general to specific, developing theoretical models by assimilating different observations, planning, diagnosing problems and developing theories. The weak points of these students are the inability to focus on persons of emotions, to apply theories/models and integrate these in logical explanations, not to be action oriented, lack of decision making skills and lack of artistic ability.

2) The findings obtained in the study shows that there are no significant differences in terms of the learning styles of the students in the study and their gender.

This finding is supported by many other research findings in the literature (Truluck ve Courtenay,1999; Erginer,2002; İlhan,2002; Ames,2003; Fer,2003; Hallock, Satava ve LeSage,2003; Jones, Reichard ve Mokhtari,2003; Güneş,2004; Kabadayı,2004; Tekaz,2004; Uzuntiryaki, Bilgin ve Geban,2004; Arslan ve Babadoğan,2005; Sünbül ve Sarı,2005; Özen ve Arsal,2006; Demirbaş ve Demirkan,2007; Numanoğlu ve Şen,2007; Ok,2009; Demir,2010; Subaşı,2010; Yanardöner, 2010; Gündoğan Çögenli,2011; Koçyiğit,2011). The results can be interpreted to support the idea that both male and female students have similar tendencies in terms of learning preferences.

Suggestions below regarding research and implementation are provided in the light of the study that investigates the dominant learning styles of prep students:

The present study was implemented with university prep class students. This characteristic of the universe should be taken into consideration while making generalizations and the generalizations should be undertaken according to this group.

The most common learning style has been found to be assimilator followed by converger, diverger and accommodator. The instructors should plan their classes and select their teaching methods by taking the features of these learning styles into consideration.

ECONOMIC PHENOMENA FROM THE VIEWPOINT OF THE MECHANICS OF MATERIALS

Tomáš R. Zeithamer

University of Economics, Faculty of Informatics and Statistics, Department of Mathematics,

Ekonomická 957, 148 00 Prague 4, Czech Republic

Abstract

The article describes the increasing use of physical and mathematical models to describe and analyze economic processes based upon the analogies found between physical and economic processes during the formation of the Lausanne and Cambridge Schools of Economics. In brief, one of the necessary outcomes of the application of physical-mathematical methods in economics has been the gradual creation of conditions in basic and applied economic research during the course of the twentieth century, which at the turn of the millennium gave rise to econophysics. Contributions of the Czech School of Economics are documented, particularly the analogy between the length of fatigue cracks in metals exposed to periodic loads over time and the fall of market prices for commodities over time.

Keywords: Econophysics, theory of elasticity, statistical mechanics, Lausanne School of Economics, Cambridge School of Economics.The origins of econophysics

The term econophysics was coined as a combination of two scientific fields, economics and physics, with economics being the primary field of study, and physics providing mathematical and theoretical models which can be applied in economics. In its current stage of development, econophysics serves primarily to enhance economic research through methods of theoretical physics research. Methods of theoretical physics research are considered by many economists to be extremely simplistic, and are therefore rejected because they have been developed to describe systems which do not have a great deal of self-correcting elements in comparison with economic systems (either micro or macro-economic). Self-correction is always understood in relation to initial and boundary conditions, thus self-correction may be positive or negative with regard to the initial state. Many economists also reject the application of theoretical physics methods in the research of economic systems because economic processes cannot be repeated under the exact same initial and boundary conditions for a given process, as is possible within a certain degree of accuracy for some cases in physics. Of course, economics is not the only field in which processes cannot be repeated under the exact same conditions. In astrophysics for example, the developmental stages in the life cycle of a single population of stars are not repeated under the exact same conditions. We encounter a similar situation when repeatedly observing the circulation configuration of the Earth's atmosphere. Many other instances may be found of physical processes for which it is not possible to ensure the exact same initial and boundary conditions during the repetition of a certain process. It should be noted at this point that an analysis of the historical development of science reveals similar beginnings of what are today renowned scientific fields such as astrophysics, geophysics, and biophysics, as well as biomathematics, biometrics, biostatistics and others. Today, we are direct participants, both passive and active, in the early stages of the transition from clearly differentiated scientific fields to their gradual synthesis, and the unifying element in this transition is the language of mathematics.

Econophysics in the broader sense

The origins of econophysics can be traced to the 1870s, when methods of theoretical physics and mathematics were first used to describe economic phenomena and processes. The use of these methods however was glossed over by claims of the exclusive economic application of mathematics, gradually giving rise to the term mathematical economics. The use of the methodologies of mathematics and theoretical physics to analyze and describe economic phenomena and processes in the late 1800s is considered econophysics in the broader sense. In a most admirable manner economic phenomena and processes were described using analogies to theoretical physics, including the physical and mathematical significance of the differential of variables[5]. For example, the specific elongation of a body and Hooke's law, analyzed in the elasticity theory of solids, inspired Alfred Marshall to introduce the elasticity of demand (Marshall, 1890).

Biographical research of a number of major economists of this period shows that they were typically first educated in mathematics and/or physics. Giovanni Battista Antonelli (17. 9. 1858 – 12. 5. 1944) began his early studies at the Technical Institute of Leghorn and then continued to study at the University of Pisa where, in 1882, he received a doctorate in mathematics and in 1884 became a professor of mathematics. After this, he completed his engineering studies at the Polytechnic School in Milan, where he was awarded the title of civil engineer. Marie Esprit Léon Walras (16. 12. 1834 – 5. 1. 1910) studied mine engineering at École de Mines in Paris, where he acquired knowledge not only of mathematics and general physics, but also the statics and the dynamics of mine construction (Jaffé, 1965). Alfred Marshall (26. 7. 1842 – 13. 7. 1924) studied mathematics and physics at Cambridge University, where he also taught mathematics (Zemánek, 2006). Vilfredo Pareto (15. 7. 1848 – 19. 8. 1923) studied at the Polytechnic Institute of Turin, where he wrote his dissertation on the theory of elasticity „Principi fondamentali della teoria della elasticitá de corpi solidi in 1869 (Pareto, 1869).

---

[5] In the first approximation the differential of a physical quantity is the change in the value of the physical quantity, expressed in the given units, which is sufficiently small to serve as a mathematical differential, and sufficiently large to be measured with a certain degree of accuracy. The differential of economic quantity is understood in the same manner.

The late nineteenth century is a period in which there was a synthesis of the partial knowledge of economic laws formulated by the previous generation of economists, and increased attempts to describe these laws using the language of physics and mathematics, comprising both the mathematical and physical meaning of the differential of variable quantity; the foundations of econophysics in the broader sense were laid and expanded. Comprehensive works of major economists were written at this time, such as that of Antonelli „*Sulla Teoria Matematica della Economia Politica*" (published by the author in Pisa in 1886, translated into English in 1971 under the title „Mathematical Theory of Political Economy") (Antonelli, 1886). Antonelli essentially uses the theory of vector functions of n real variables to describe an idealized model of a perfect market, the only components of which are buyers with real functions of demand and sellers with real functions of supply. In 1874 the first edition was published of Walras' work „*Élements d´économie politique pure*" (Walras, 1874), translated into English under the title „Elements of Pure Economics, or the theory of social wealth" (the first edition of the English translation was published in 1954 (Walras, 1954)). Walras' background in physics and mathematics is evident in a number of formulations which brilliantly describe analogies between physical and economic processes. For illustration, let us consider his analogy between a perfect competitive market and a machine in which friction is entirely ignored (Part II, Lesson 5, pp. 83–91 first English edition (Walras, 1954), second English edition (Walras, 2003). Likewise, Walras' general equilibrium theory is based on an analogy with the physical concept of mechanical equilibrium. In the first edition of Marshall's „*Principles of Economics*", from 1890, we encounter the „elasticity of demand", a concept founded upon an analogy with specific elongation and Hooke's law. Also in Pareto's two-volume work „*Cours d´économie politique*", published in Lausanne from 1896 – 1897 (Pareto, 1896 – 1897), we can see the influence of the elasticity theory of solid bodies on the description of economic systems (Pareto, 1896).

Econophysics in the broader sense – Czech contributions

The first half of the twentieth century witnessed a deepening integration of economics, mathematics, and physics. At the Czech School of Economics during this time, no reliable sources have yet been found indicating such an interdisciplinary approach or related original work. At the end of the twentieth century however, we do find an economist at the Czech School of Economics whose work represents econophysics in the broader sense. This economist is František Drozen (born 30. 5. 1949), who was inspired by the work of German engineer August Wöhler (22. 6. 1819 – 21.3.1914) (Wöhler, 1855, 1870; Timoshenko, 1983; Schutz, 1996). From 1855 – 1871 August Wöhler examined the causes of fatigue cracks in the wheel shafts of railway cars and the dependence of the number of cyclic loads until axle fracture on stress amplitude. The graphic depiction of Wöhler's findings in the form of Wöhler curves is still used today in the investigation of metal fatigue in various constructions. František Drozen constructed the following analogy between the process of fatigue crack growth in axles and the process of price reduction for goods: the immediate length **m** of a fatigue crack in railway axle at time t corresponds to the immediate price **n** of goods at time t. The period t of monitoring cracks in the axle is the product of the duration of a single cyclic load times the number of load cycles. Thus the differential change in the price of goods d**n** for time interval dt (differential change in time t) is directly proportional to the product of immediate price **n** and the differential change in time dt, just as the differential change d**m** in immediate crack length **m** for differential change in the number of cyclic loads d**N** is directly proportional to the product of immediate crack length **m** and the differential change in numbers of cyclic loads d**N**, where d**N** . T = dt; T is the time interval in seconds expressing the duration of one cyclic load. The market value of goods over time is expressed as a price **n**(t) at any time t. Drozen now makes the assumption that the instantaneous rate of reduction of the market value is directly proportionate to the instantaneous price of the goods (Drozen 2008). Then the deterministic differential equation of price which expresses this assumption is

$$\frac{dn(t)}{dt} = -k \, n(t), \qquad\qquad (1)$$

where $k > 0$ is a proportionality constant, and negative sign is used to indicate that **n** is decreasing. The initial condition is that over time $t = 0$ the market value is **n**$(0) =$ **n**$_0$. It means that the time is measured from the instant of purchase, i.e., when the purchase-sale transaction has been completed. This approach to modeling the process of falling prices for goods can be found in its final form in several of Drozen's works

(Drozen 1993, 1995, 2003, 2008). We know make the generalizing assumption that the instantaneous acceleration of reduction of the market value is directly proportionate to the instantaneous rate of reduction of the market value (Zeithamer 2010). Then the deterministic differential equation of price which expresses this assumption is

$$\frac{d^2 n(t)}{dt^2} = -A\,\frac{dn(t)}{dt}, \qquad\qquad (2)$$

where $A > 0$ is proportionality constant, and negative sign is used to indicate that $\mathbf{n}$, the market value of goods, i.e., a price, is decreasing and the acceleration of reduction of the market value is increasing function of time. The initial conditions now are that over time $t = 0$ the market value is $\mathbf{n}(0) = \mathbf{n_0}$ and $\dfrac{d\mathbf{n}(0)}{dt} = \mathbf{r_0} < 0$. The more detailed approach to modeling the process of falling prices with acceleration can be found in the work as follows (Zeithamer 2010, 2011a, 2011 b).

Econophysics in the strict sense

Let us now briefly mention econophysics in the strict sense of the word, i.e. the approach of physicists to economics based upon statistical mechanics (this subject will be addressed in detail in the work accompanying this article). Given the scope of this article, it is not possible to present the results of econophysics in the broader sense during the course of the 20th century. However, it is important to realize that the findings of econophysics in the broader sense during this period have increasingly focused the attention of theoretical physicists towards economics. This has led to collaboration with economists in researching analogies between economic processes and physical processes addressed by statistical mechanics, and to research in describing macro and microeconomic processes using statistical mechanics methods. Statistical mechanics essentially describes the complicated variability over time of the configuration of a large number of subsystems, which comprise the physical system being monitored and which are governed by certain laws of interaction. The complexity of development over time of the internal structure of physical systems has its origins in the interaction and disorder of subsystems. Expressed economically, this is the interaction and competition of subsystems. Financial markets are sufficiently complicated systems to be assessed both according to their output and their internal structures. A large number of investors present in many various markets create the internal structure of the market through exchanges of stocks, bonds, commodities, and other products. Investment decisions change the prices of the assets being traded, and these prices in turn affect the business decisions of investors, and nearly all commercial transactions are recorded electronically. To facilitate the analogy between the development of internal structures of the market and internal structures of physical systems (with a great number of subsystems), we assume that a trader of a given good has three possibilities: to buy, sell, or not trade (Voit, 2005). This approach enables an analogy between the development of market structures over time and the Ising model (or Potts model). Essentially, the Ising model describes the interaction of the monitored physical subsystem with the entire internal structure of the physical system, and the response of this monitored subsystem to the existing internal structures of nearby subsystems. One of leading proponents of the application of statistical mechanics in economics is German physicist and mathematician Prof. Johannes Voit, who has comprehensively described the results of the application of statistical mechanics in financial markets in his book published in 2001 and in later expanded editions (Voit, 2001, 2003, 2005). Such analogies are the foundation of today's econophysics, econophysics in the strict sense, a new scientific branch of contemporary economics.

Conclusions

From the above it is clear that in addition to mathematics, physics has gradually explicitly and implicitly impacted economics, not only through its specific manner of expression used to describe economic phenomena and processes, but also through its methodology of theoretical research of phenomena and processes. This gradual process of the incorporation of physics into economics began with the founders of the Lausanne and Cambridge Schools of Economics, students of physics and mathematics who later fully devoted themselves to economic research.

Abstract

This study compares, for non-vulnerable and vulnerable children, externalizing and internalizing behaviors in toddlerhood and preschool years across children attending an educational daycare with those of children remaining under the care of their parent. The 66 participant experienced the same type of care from their first year of life to the year prior to kindergarten (daycare, n = 45; parental care, n = 21). Results indicate that, for non-vulnerable children, type of care isn't associated with externalizing and internalizing behaviors. However, for vulnerable children, attending a daycare is associated with a reduction in externalizing behaviors and with higher (but also decreasing) internalizing behaviors between 2 and 4 years of age. On the other hand, parental care is associated with an increase in both externalizing and internalizing behaviors. This study suggests that the effect of childcare type on externalizing and internalizing behaviors from 2 to 4 years old is moderated by a child's vulnerability.

Keywords: educational daycare, risk factors, externalizing behaviors, internalizing behaviors

Introduction

In 1997, the Government of Québec (Canada) created a network of regulated daycares offering an educational program for children from birth to school entry, for a contribution from families of $5 per day ($7 per day since 2004). According to the latest data available, there are 430,900 children aged 0-4 years residing in the province of Québec. Of those, 214,804 children are attending regulated daycares.

For many children, daycares provide the first transition between the family environment and an educational setting. As a result, daycares play a major role in child socialisation by promoting the learning of developmentally appropriate behaviors. Educators are therefore tasked with ensuring that children acquire behaviors that promote adaptation in a group (Lamb, 2004). So, attendance should lessen the manifestation of inappropriate behaviors, whether externalizing (e.g., aggression, destruction, etc.) or internalizing (e.g., anxiety, withdrawal, etc.). This early experience might be more beneficial for vulnerable children, since they appear more likely to proceed along difficult behavioral trajectories (Appleyard, Egeland, van Dulmen, & Sroufe, 2005).

Many have studied the effects of daycare attendance on child development. While cognitive gains are often reported (for a review; Burger, 2010), results are less obvious concerning behavioral outcomes. In fact, researchers still wonder about the effects of daycare attendance on behaviors. This study investigates the effects of early attendance in Québec's educational daycare program on externalizing and internalizing behaviors in vulnerable and non-vulnerable children.

Daycare attendance in children's first years of life and externalizing and internalizing behaviors

The first year of life is a period of swift neurological growth and children who have been inadequately stimulated during that important period of learning appear more likely to develop behavioral difficulties later on (McCain, Mustard, & Shanker, 2007). In this respect, externalizing and internalizing behaviors appear measurable from the age of 2 (Crockenberg & Leerkes, 2006; Miner & Clarke-Stewart, 2008). Beyond this age, there is a general reduction in the manifestation of externalizing and internalizing behaviors of toddlers. Therefore, most preschoolers have integrated societal norms about appropriate or inappropriate behaviors (Campbell, 2002). Following this reduction, researchers indicate stabilization of the behaviors as measured in preschool and kindergarten (Kerr, Lunkenheimer, & Olson, 2007). Before the age of 2, it seems possible to identify risk factors associated with the emergence and maintenance of these behaviors (Mathiesen & Sanson, 2000).

This highlights the importance for children of experiencing a positive and stimulating environment before the influence of risk factors grows too great and, most importantly, before behaviors achieve the stabilization reported from 4 years old and beyond. For those reasons, developmentally appropriate behaviors should be promoted from infancy to ensure the least externalizing and internalizing behaviors; this is expected to be the case for children attending daycare from their first years of life.

Potential effects of daycare attendance on children's externalizing and internalizing behaviors

Several studies have been conducted to examine the relationship between daycare attendance and externalizing behaviors in children, compared with those of children remaining in parental care during the same period. Others, though fewer, have pursued this objective relating to internalizing behaviors.

Regarding externalizing behaviors, some research reported no relation between childcare type and behavioral outcomes (Bacharach & Baumeister, 2003; Bigras et al., 2009; Côté, Borge, Geoffroy, Rutter, & Tremblay, 2008). On the other hand, others have found an increased risk of externalizing behaviors associated with daycare attendance (Hickman, 2006; Loeb, Bridges, Bassok, Fuller, & Rumberger, 2007; Van Beijsterveldt, Hudziak, & Boomsma, 2005). Similar divergent results are obtained regarding internalizing behaviors. Some reported less internalizing behaviors among children attending daycare (Bigras, Lemay, Tremblay, & Brunson, 2009; Hickman, 2006), other observed more internalizing behaviors among those children (Côté, et al., 2008) and few indicated that children attending daycare did not show different internalizing behaviors than those who stayed home (Van Beijsterveldt, et al., 2005).

In short, one of the prominent features of these results is their inconsistency, perhaps because children's vulnerability isn't considered in the previous results reported. Indeed, this variable is associated with more convergent results when examining the relation between type of childcare and child behaviors.

Vulnerability and the effects of daycare attendance on externalizing and internalizing behaviors

Other studies focused on children expose to risk factors in their home (e.g., household income, family structure, education and age of mother), since behavioral trajectories of these children tend to be less favourable (Appleyard, et al., 2005). From a compensatory perspective, attending a daycare may lessen the influence of risk factors to which a child may be exposed on that child's behaviors.

So, it would be expected to observe less externalizing and internalizing behaviors among vulnerable children attending daycares. Research confirms such expectations. For vulnerable children, attending a daycare in infancy is consistently associated with fewer externalizing and internalizing behaviors afterwards compared with children remaining under parental care (Borge, Rutter, Côté, & Tremblay, 2004; Côté, et al., 2008; Peng & Robins, 2010).

Although vulnerable children seem to benefit the most from daycare attendance, they are found to be the least frequent attenders in Québec. Hence, it is important to ensure that such an early experience guarantees low externalizing and internalizing behaviors among vulnerable children. At the same time, it is essential to ensure that non-vulnerable children, who attend these programs in greater proportion, experience equal benefit.

Research objectives

Accordingly, this study compare externalizing and internalizing behaviors at 2 and 4 years-old between children, non-vulnerable and vulnerable, attending an educational daycare and those remaining under parental care from their first year of life.

Method

Subjects

This study completes secondary analysis on the data of the *Jeune enfant et ses milieux de vie project*, a longitudinal study concerned with the development of 150 children experiencing one of three types of care since their first year of life (centers, homes or parental care) (for details; Bigras et al., 2010).

For the current analysis, the 66 healthy participants (35 boys) were recruited between the ages of 5 and 12 months (M = 10.92 months; SD = 1.5 months). They are grouped by having continuously experienced (n = 45) or not experienced (n = 21) daycare since their first year of life. We excluded children who did not remained in the same type of care until their fourth year of life. Based on household income, family structure, and the mother's education and age at the time of the child's birth, the sample also includes 53 non-vulnerable (80.31%) and 13 vulnerable children (19.69%), of whom 6 are in daycare (13%)..

Measures

Externalizing and internalizing behaviors. Parents reported the behaviors of their 2-years-old using the *Child Behavior Checklist 2/3* (CBCL; Achenbach, 1992). This questionnaire quantify the manifestation of behaviors based on items relating to anxiety, social withdrawal, sleep, somatic complaints, aggression and destruction. It consists of 100 statements about children's concrete behaviors. Based on the two months prior to completing the questionnaire, the parent must give a score of 0 (never present), 1 (sometimes) or 2 (often) for each item. Two standardized scores (T-scores) are obtained: externalizing and internalizing behaviors. The scale has good psychometrics proprieties (Achenbach, 1992).

At 4 years old, the revised *CBCL 1.5/5* was used (Achenbach & Rescorla, 2000). Built upon the same procedures and including most of the same statements as the earlier version (with the exception of two items), but showing a different factorial structure, the instrument gives at the end the same two standardized scores. The correlations between the *CBCL2/3* and *CBCL*1.5/5 of 0.73 for the externalizing score and of 0.86 for internalizing score indicate a high consistency between the children's scores on both profiles. Since the factorial structure of the two profiles are different and the normalization of the latest profile of the *CBCL* has been done on a larger and more representative sample, the *CBCL 2/3* have been recoded like the *CBCL 1.5/5* (items 51 and 79 haven't been considered). This procedure is in the *CBCL* manual (Achenbach & Rescorla, 2000). For externalizing and internalizing behaviors, a T-score of 28-59 is in the normal range, 60-63 in the borderline range and 64-100 in the clinical range.

Type of childcare. Parents report their child's childcare experience with a questionnaire consisting of seven questions about the type, continuity and quantity of care experienced.

Child's vulnerability. An index of cumulative risk is calculated based on household income (above or below the low income cut-off), family structure (two-parent or single-parent family), mother's education at the time of the child's birth (less than a high school diploma or an high school diploma or more) and mother's age at the time of the child's birth (20 years and younger or 21 years and older) reported on a questionnaire. This index is used to determine if the child is exposed to no risk (non-vulnerable) or one, two, three or four risks (vulnerable) in his home environment.

Procedures

This quasi-experimental study adopt a 2 X 2 X 2 mixed-design, where child's vulnerability and type of care are between-subject factor and child's age is a within-subject factor. First, the child's vulnerability was obtain during recruitment when a contact by telephone with parents allowed to complete the family's socioeconomic profile, from which the risk index was calculated. The child's type of care, was also identified at recruitment. Finally, the family received a mailing of questionnaires about children's externalizing and internalizing behaviors when children were aged 2 and 4 years old.

Results

Two 2 X 2 X 2 mixed-design analyses of variance (ANOVAs) were undertaken to compared 1) externalizing behaviors and 2) internalizing behaviors of vulnerable and non-vulnerable children in two types of care (daycare and parental care) at two ages (2 and 4 years old). The significance level used in analyzes was set at $p < .05$ for main effects and $p < 0.10$ for interaction effects that are more difficult to detect in our field (McClelland & Judd, 1993).

Descriptive data

Table 2 presents the means and standard deviations. Non-vulnerable children presented behavior scores in the normal range. Vulnerable children presented behavior scores mostly in the normal range, except for vulnerable 2-year-old children in daycare, who obtained internalizing behavior scores in the borderline range. Data met the assumptions of normality and homogeneity of variance.

Table 2. Descriptive statistics of externalizing and internalizing behaviors

	Non-vulnerable (n = 53)		Vulnerable (n = 13)	
	Daycare (n = 39) M (SD)	Parental care (n = 14) M (SD)	Daycare (n = 6) M (SD)	Parental care (n = 7) M (SD)
Externalizing				
2 years old	48.03 (8.09)	47.36 (7.84)	55.17 (7.99)	54.00 (8.62)
4 years old	48.31 (8.68)	45.43 (8.37)	48.33 (13.28)	59.71 (10.47)
Internalizing				
2 years old	48.97 (8.85)	46.93 (8.51)	62.00 (4.82)	47.00 (5.77)
4 years old	48.26 (10.72)	46.86 (8.50)	58.33 (7.55)	53.71 (9.01)

Daycare attendance and externalizing behaviors

A first ANOVA was performed to compare externalizing behaviors between-subjects (non-vulnerable and vulnerable; daycare and parental care) and within-subjects (2 and 4 years old). The results are presented in Table 3, along with effect sizes.

Table 3. ANOVA results for main and interaction effects of child's type of care, vulnerability and age on externalizing behaviors

	df	SS	MS	F	p	η2
Between-subjects						
Type of care (T)	1	54.66	54.66	0.46	0.50	0.64
Vulnerability (V)	1	970.68	970.68	8.25	0.01*	11.35
T X V	1	232.90	232.90	1.98	0.16	2.72
Within-subject						
Age (A)	1	9.41	9.41	0.28	0.60	0.38
A X T	1	131.40	131.40	3.95	0.05*	5.31
A X V	1	0.34	0.34	0.01	0.92	0.01
A X T X V	1	267.84	267.84	8.05	0.01*	10.83

†$p < 0.10$; *$p < 0.05$

The three-way ANOVA for externalizing behaviors yielded a significant interaction between child' age, type of care and vulnerability, $F (1, 62) = 8.05$, $p = 0.01$, explaining 10.83% of the externalizing behaviors variance. This would suggest that the effect of type of care on externalizing behaviors at 2 and 4 years old depend on child's vulnerability. A simple effects analysis for child's vulnerability indicated that the means of externalizing behaviors at 2 and 4 years old were different for vulnerable children, $F (1,11) = 6.96$, $p =.02$, and not for non-vulnerable children, $F (1,51) = 0.77$, $p =.38$ (Figure 1). Specifically, a further simple effects analysis for child's age among vulnerable children indicated that daycare and parental care were associated with the same externalizing behaviors at 2 years old, $F (1,12) = 0.06$, $p = 0.81$. Then attending daycare was associated with a reduction in externalizing behaviors between 2 and 4 years old, while staying under parental care was associated with an increase, $F (1,11) = 6.27$, $p = 0.03$.
Fig 1. a) For non-vulnerable children, T-scores of externalizing behaviors at 2 and 4 years old for children in two types of care; b) For vulnerable children, T-scores of externalizing behaviors at 2 and 4 years old for children in two types of care.

Daycare attendance and internalizing behaviors

A second ANOVA was performed to compare internalizing behaviors between-subjects (non-vulnerable and vulnerable; daycare and parental care) and within-subjects (2 and 4 years old). The results are presented in Table 4, along with effect sizes.

Table 4. ANOVA results for main effects and interaction effects of type of care, vulnerability and age on internalizing behaviors

	df	SS	MS	F	p	η2
Between-subjects						
Type of care (T)	1	654.16	654.16	5.05	0.03*	6.47
Vulnerability (V)	1	1109.06	1109.06	8.57	0.01*	10.97
T X V	1	321.70	321.70	2.48	0.12	3.18
Within-subject						
Age (A)	1	6.27	6.27	0.17	0.68	0.24
A X T	1	149.54	149.54	4.06	0.05*	5.80
A X V	1	18.11	18.11	0.49	0.49	0.70
A X T X V	1	116.53	116.53	3.16	0.08†	4.52

†$p < 0.10$; *$p < 0.05$

The three-way ANOVA for internalizing behaviors yielded a significant interaction between child' age, type of care and vulnerability, $F(1, 62) = 3.16$, $p = 0.08$, explaining 4.52% of the internalizing behaviors variance. This would suggest that the effect of type of care on internalizing behaviors at 2 and 4 years old depended on child's vulnerability. A simple effects analysis for child's vulnerability indicated that the means of internalizing behaviors at 2 and 4 years old were different for vulnerable children, $F(1,11) = 7.24$, $p = .02$, and not for non-vulnerable children, $F(1,51) = 0.05$, $p = .82$ (Figure 2). Particularly, a further simple effects analysis for child's age among vulnerable children indicated that children in daycares started with higher internalizing behaviors at 2 years old compared to children under parental care, $F(1,12) = 25.30$, $p = 0.00$. Then, while children in daycares showed a reduction between 2 and 4 years old, those under parental care showed an increase. So, differences of internalizing behavior were no longer present at 4 years old, $F(1,11) = 1.40$, $p = 0.26$.
Fig 2. a) For non-vulnerable children, T-scores of internalizing behaviors at 2 and 4 years old for children in two types of care; b) For vulnerable children, T-scores of internalizing behaviors at 2 and 4 years old for children in two types of care.

Discussion

This study investigated externalizing and internalizing behaviors of 2- and 4-year-old children, non-vulnerable and vulnerable, attending daycare from their first year of life compare to those of children under parental care. Our results indicate that the effect of type of care on children' externalizing and internalizing behaviors scores from 2- to 4- year-old is moderated by children' vulnerability.

More specifically, significant differences have been found between externalizing and internalizing behaviors of 2- and 4- years-old children attending daycare or staying under parental care only among vulnerable children, which is consistent with previous research (Borge, et al., 2004; Côté, et al., 2008; Peng & Robins, 2010). For externalizing behaviors, at 2 years old, vulnerable children in either daycare or under parental care manifested the same externalizing behaviors. Afterward, externalizing behavior scores decreased in children in daycare and ended in the normal range at 4 years old, while scores for children under parental care increased close to borderline range. For internalizing behaviors, compared to parental care, daycare attendance was associated with significantly higher scores at 2 years old, in the borderline range. But, differences were no longer present at 4 years old because of a decrease in scores of children in daycare and an increased in scores of those under parental care.

As reported by Peng and Robin (2010), daycare attendance could be particularly beneficial for reducing externalizing and internalizing behaviors of vulnerable children. The ecosystemic model of development (Bronfenbrenner, 1979) indicate that behaviors result from interactions between the child and his environment. For example, as a result of certain features of the underprivileged home environment (e.g., parental stress, depression symptoms, etc.), children tend to be more exposed to harsh parenting and inconsistent discipline; they may react to such parenting in such a way that may result in more negative discipline from parents and exacerbation of children's inappropriate behaviors (Dodge, Greenberg, & Malone, 2008). So, for vulnerable children under parental care, we may wonder if manifestation of externalizing and internalizing behaviors will continue to increase—which would be worrisome—as some studies found a certain stability between behaviors measured in preschool and those in kindergarten (Kerr, et al., 2007).

As for vulnerable children attending daycares, this educational experience appears to intervene in that cycle of interactions and act as a compensation environment, probably offering positive socialization opportunities. Indeed, educators should adopt practices that create high-quality physical setting, schedule and interactions (Gouvernement du Québec, 2007). However, our results underline the borderline scores of internalizing behaviors of children in daycare at 2 years old preceding their reduction into normal range at 4 years old. Perhaps educators could be more skilled to detect children' difficulties and organizing a physical setting and a schedule allowing appropriate intervention for externalizing behavior early on and for internalizing behaviors as children get older.

As for the majority of children attending Quebec's daycares that is non-vulnerable, our results indicated no differences between the rates of externalizing and internalizing behaviors from 2 to 4 years old among children attending daycare or staying under parental care. Since one of the key objective of the Québec non-profit daycare network is to foster child socialization by offering a first experience in an educative setting and in a group context, our results are good news for children in daycare, since they don't appear to be more at risk of presenting behavioral problems, a potential detrimental effect that some have reported previously (Loeb, et al., 2007). This positive result may be a particularity Quebec's network of regulated childcare services where settings are publicly subsidies, regulated, monitored, shared a common educational program, etc. which could be associated to high quality services offered in regulated childcare centers and homes. Indeed, countries regulating early childhood education like Sweden tend to offer homogeneous higher quality services (Sheridan & Schuster, 2001). In parallel, previous research have indicated that high quality seem to be associated to lesser rates of externalizing and internalizing behaviors (NICHD Early Child Care Research Network, 1998). Hence, quality of care might help understand our results, although there might be differences between children attending centers and home-based daycares because of their respective quality level (Bigras, et al., 2010).

Since educational practices adopted by educators have not been measured in this study, our hypotheses regarding their association with vulnerable and non-vulnerable children' externalizing and internalizing behavior still need to be verified. Thus, we need further research to understand practices associated to externalizing and, mainly, internalizing behaviors of children attending daycare. In that regards, characteristics of the educational settings, such as its quality and type, appear to be an avenue for exploration in order to better understand features of the educational experiences that might be essential to implement in order to insure normal rates of externalizing and internalizing behaviors among non-vulnerable and vulnerable children attending Quebec's daycare before school entry.

Limitations and conclusion

Even though this study presents new information, it also presents some limitations. First, simple size and effect sizes are small and results should be interpreted with caution. Also, it's important to keep in mind that our study adopted a quasi-experimental design and that omitted variables may have played a role. Some of these variables may be important to consider in future works, such as the type of care (center-based and family-based daycare) and their respective level of quality.

In sum, this study suggests that, on the one hand, daycare attendance is associated with the same normal externalizing and internalizing behaviors scores as parental care from 2 to 4 years of age in non-vulnerable children. On the other hand, for vulnerable children, daycare attendance is associated with a significant reduction in externalizing and internalizing behaviors from 2 to 4 years of age, but internalizing behavior scores still remain higher. Since these are the first results concerning behaviors of young children attending Québec's regulated non-profit educational daycares, further work should explore previous features of the educational experiences that contributed to attain the normal externalizing and internalizing behaviors in this study among 4 years-old children attending daycare so that the socialization goal of the daycare network is fully reached for all children and all types of behaviors.

EDUCATIONAL TECHNOLOGY: A WAY TO ENHANCE STUDENT ACHIEVEMENT AT THE UNIVERSITY OF BAHRAIN

Jaflah AlAmmary[6]

Department of Information Syatems, College of IT, University of Bahrain, Kingdom of Bahrain

Abstract

ET can empower teachers and learners, promote change and foster the development of twenty-first century skills. Improving education quality is a priority for most developing countries in which governments are facing a challenge to identify efficient ways to use their scarce resources and raise the quality of education. Data to support these beliefs are still limited, especially in the Kingdom of Bahrain and the other Gulf countries. Therefore, the current research aims to investigate the current situation regarding using ET at the University of Bahrain from the following aspects: the ET adopted by the university in the teaching and learning processes, obstacles facing the adoption of ET and the effects of ET on student achievement and academic staff teaching effectiveness. The results show that at the University of Bahrain, student learning and achievement have been affected when the teaching and learning processes are enhanced by ET. ET has motivated the students to get more involved in learning activities through which they become more active and more interested in learning. Moreover, the academic staff believe that adopting such technologies can enhance their communication with the students, reduce the teaching pressure caused by the course material preparation and make the lecture material available at the time of the discussion. However, the findings demonstrate some impediments facing both the students and instructors in adopting ET at the University of Bahrain, such as the insufficient ICT infrastructure and computing facilities, lack of sufficient technology budget and IT investment, and technical support.

Keywords: ET, student achievement, teaching effectiveness.

Introduction

Education Technology (ET) is defined as "the study and ethical practice of facilitating learning and improving performance by creating, using and managing appropriate technological processes and resources" (Richey, 2008). ET can be used by all educators who want to incorporate technology in their teaching as well as educational administrators. The emergence of different educational tools and software has motivated may learning organizations to integrate them into the curriculum as they can have a great impact on student learning (Hawkins et al., 1996). Recently, Educational Technologies have been considered as a crucial factor in improving the quality of education and enhancing the level of student educational learning performance (Bialo et al., 1995). ET has demonstrated a significant positive effect on student achievement and the teaching and learning processes as a whole (Bialo et al., 1995).

The University of Bahrain, which is the only national learning organization, pays considerable attention to utilizing state-of-art technologies to facilities their own progress, particularly in the teaching and learning. For instance, ET has become increasingly commonplace in classrooms. All the classrooms are occupied by a data show device and a personnel computer to enable computer-based instructions. An open area lab consisting of more than 200 personnel computers is open to the students for the whole day to study and practice their learning material. In addition, there are four rooms in which a smart board is available for workshops for the students and the academic staff. Moreover, the University of Bahrain has made consistent progress in expanding Internet access in the instructional rooms. The Internet can be accessed by the students everywhere in the university through the Wireless network and the Wi-Fi. The University of Bahrain also established the E-Learning Centre in 2004 to provide high quality educational output that will contribute to producing a highly qualified generation. Moreover, the university has set a strategic plan to investigate new and more updated technology in the education process, such as teleconferencing, a collaborative environment for enhancing student team working,

jalammari@uob.edu.bh.

and social networking. Improving education quality is a priority for most developing countries in which governments are facing the challenge to identify efficient ways to use their scarce resources and raise the quality of education. Data to support these beliefs are still limited, especially in the Kingdom of Bahrain and the other Gulf countries. Therefore, this research aims to investigate the current situation regarding using ET at the University of Bahrain according to the following aspects: the ET adopted by the university in the teaching and learning processes, obstacles facing the adoption of ET and the effects of ET on student achievement and academic staff teaching effectiveness.

Research Background

ET and its Effect on the Teaching and Learning processes

ET has been defined as solutions to instructional problems that involve social as well as machine technologies with concern for improving the effectiveness and efficiency of learning in educational contexts (Cassidy, 1982). Bruce and Levin (1997) perceive ET as a means of media with four different focuses: media for enquiry, media for communication, media for construction, and media for expression. Cox et al. (1999) show that many educators perceive technology as a tool for improving the presentation of material for making lessons more fun for the learners and for making administration more efficient. There is a widespread belief that ET can enhance teaching and learning practices (Higgins, 2003), and create an "ideal" learning environment (Marshall, 2002). Hence, it becomes an integral part of both the teaching and learning process. ET can have the greatest impact on improving student learning and achieving measurable educational objectives (Hawkins et al., 1996). In addition, it can empower teachers and learners, transforming teaching and learning processes from being highly teacher dominated to student centred (Higgins, 2003). This transformation will increase the teaching gain for students and improve the quality of learning. Moreover, ET may provide students with valuable skills that are recommended by the market. Thus, ET creates opportunities for learners to develop their cognitive, critical thinking, information reasoning and communication skills (Chigona and Chigona, 2010). It can also help learners to explore education beyond classrooms by providing access to a wide range of resources and information, promoting scientific inquiry and discovery and allowing students to communicate with experts (Means et al., 1994). Bixler and Askov (1994) stated that effective technology empowers learners and helps them take responsibility for their own learning. Cradler and Bridgforth (1998) communicated the output of a forum wherein 70 US educational decision-makers and practitioners met, discussed and prioritized the benefits and issues related to educational networking. The conclusion was that networking technology is a powerful communications tool, which when utilized can support innovative teaching, encourage active learning, help relieve the professional isolation of teachers and can enable users to become active researchers and learners.

The Effects of ET on Achievement and Performance of Students

Previous studies revealed the positive impact of technology on enhancing the achievement and performance of students and in gaining significant improvement and changes in all areas (Kulik, 1994; Rutz et al., 2003; Sivin-Kachla, 1998; Baker et al., 1994). For instance, Kulik (1994) aggregated 500 individual research studies of computer based instruction students. The results of the aggregation demonstrated that students who used computer-based instruction scored better than those in the control condition without a computer. Students also gained more knowledge in less time because the classes became more enjoyable and interesting after the introduction of computers (Kulik, 1994). Similarly, Sivin-Kachla (1998) found that students studying in a technology rich environment achieved higher marks in all subject areas, gained a positive attitude towards learning, were able to generate new ideas and built self-confidence. The US Department of Education conducted a scientific study in 2001 to assess the impact of technology using two types of student achievement measures – measure assessed reading achievement and assessed mathematics achievement. A significant impact was revealed in the students' scores. Moreover, in a study conducted in Pittsburgh, in which an intelligent tutor – software used to support the curriculum – was used as part of the regular curriculum for ninth-grade algebra

(Koedinger et al., 1999). The results of the study demonstrated that 470 students in the experimental classes outperformed students in compression classes by 15% on a standardized test and 100% on test targeting the curriculum focused objectives (Koedinger et al., 1999). Recent studies conducted by Banerjee et al. (2005) found that by integrating the mathematics curriculum with ET, the mathematics scores of the fourth-grade students in Vadodara, India were increased. In addition, Barrow et al. (2009) analysed the effect of an instructional pre-algebra and algebra program on student's test scores in the US. Rutz et al. (2003) examined the impact of using instructional technology on optimizing the learning styles and process types. They found that using web-based material to supplement the in-class experience can improve student achievement.

Factors that affect the Adoption of ET in Teaching

A number of studies have shown that there are a wide range of factors that influence educators in adopting their teaching with technological tools (Cox et al., 1999). Among these factors are the quality of the ICT resources, incentive to change (Cox et al., 1999), instructor's readiness to adopt and use technology, instructor's confidence, knowledge and ability to evaluate the role of ICT in teaching and learning, technical support, students' acceptance and attitude to the use of IT, effective training and personal development, leadership and the availability of IT resources (Balash et al., 2011, Sherry et al., 2000). Peeraer et al. (2010) identified other factors include access to computers, intensity of computer use, ICT skills and ICT confidence. Means et al. (2001) mentioned that factors, such as lack of technology infrastructure, technical support and high quality digital content, can affect technology implementation in urban schools. Balsh et al. (2011) identified institutional support as one of the important factors to be considered in adopting ET. They discussed institutional support from the lack of policy and planning of using the ET and the lack of a reward system or appreciation reward for using such tools. Muller (2008) considered the instructor's attitude towards computing important and argued that this factor is critical to the effectiveness of integrating ICT into the curriculum. If instructors are not comfortable with technology, then low expectations from technology can be perceived. In addition to the attitude of the instructors, Naimova (2008) identified the attitude of administrators as one of the factors that may affect the adoption of ET. He argued that the lack of support from administrators may hinder the implementation of technology in the classroom (Naimova (2008).

Research Methodology and Data Collection

This research aims to investigate the current situation regarding the use and adoption of ET by the University of Bahrain. To achieve this purpose both survey and experiment were conducted. A random sample of 250 students and 100 academic staff from different colleges and departments were selected for the survey. In addition, an experiment was conducted with the help of 30 students from the Department of Information Systems to investigate the impact of different Educational Technologies on their performance. The students were asked to attend three lectures, which were conducted using the traditional technique (white board), PowerPoint and smart board. At the end of the lecture, the students were requested to complete a short questionnaire indicating their perception concerning the impact of the technology used in the lecture.

Data analysis and results

Demographics

The demographic characteristics of the participants, both students and academic staff, are demonstrated in Table (1) and Table (2), respectively. The results in Table (1) show that the majority of the participating students were junior female (62%, 72%), Bahrainis (94%), and between 17 and 22 years old. Moreover, the results demonstrate that most of the participants were from the College of Business (36%) (The College of Business is considered to be the biggest college in the University of Bahrain in terms of number of students).

Table 1: Selected characteristics of the sample (students)

Table 2: Selected characteristics of the sample (Academic staff)

Demographic information	%	Demographic information	%
Gender		College	
Male	28%	IT	16%
Female	72%	Science	10%
Age		Business	36%
17-22	95%	Engineering	9%
23-28	5%	Other	29%
Nationality		Class level	
Bahraini	94%	Freshman	36%
Non-Bahraini	5%	Junior	62%
		Senior	27%

Demographic information	%	Demographic information	%
Gender		College	
Male	46%	IT	38%
Female	54%	Science	22%
Age		Business	22%
23-35	6%	Engineering	4%
27-35	28%	Other	14%
36-50	38%	Years of experience	
Above 51	28%	Less than 5	18%
Nationality		5 – 10 years	18%
Bahraini	44%	10-15 years	22%
Non-Bahraini	56%	More than 15	42%

The results in Table (2), however, show that the majority of the academic staff that participated in the survey were female (54%), non-Bahrainis (56%), with an age range of between 36 and 50 (38%). In addition, the results show that most of the participants were from the College of Information Technology (38%) with experience of more than 15 years (42%).

Descriptive analysis

The overall ability of students to use ET

The overall ability of the students to use technology at the University of Bahrain was investigated (Table 3). The results in Table (3) show that almost most of the students are able to use ET at the University of Bahrain. Thus, the results show that 46% of the participants are able to use ET without any assistance while 47% are able to use it with minimal assistance.

Students' ability	%
Without assistance.	46%
Need minimal assistance when using technology.	47%
Need a lot of assistance when using technology.	7%
Never use technology.	0%

Table 3: The ability of students to use ET

ET in teaching activities	%
ET is integrated in all of my courses.	44%
ET is integrated in most of my courses.	28%
ET is integrated in some of my courses.	26%
I never integrate ET in my teaching activities.	2%

Table 4: Integrating ET in teaching activities

Integration of ET in teaching activities by academic staff

The frequency of integrating ET in teaching activities by academic staff was demonstrated and the results are demonstrated in Table (4). The results show that 44% of the participants are integrating ET in all of their courses, while only 2% never integrated ET in their courses.

Importance of course requirements being available online

Both students and academic staff were asked regarding their perception concerning the importance of some of the course requirements to be available online. The results are shown in Figure (1). The results in Figure (1) reveal that both students and the academic staff believe that it is very important for lecture notes and students work (assignments and projects) to be available online (77% and 71%, respectively). However, there is a clear contradiction in their perception concerning the importance of the course grades, video archive of lectures, course syllabus, and class discussions
Figure (1): Perception of students and academic staff concerning the importance of course requirements being available online

Perception concerning the barriers for implementing ET at the University of Bahrain

The perception of students and academic staff concerning the barriers for integrating ET in their learning and teaching activities was investigated. The results are shown in Table (5) and Table (6). The results in Table (5) show that all students believe that the major barriers for integrating ET in their learning activities are the insufficient computing facilities (57%) followed by the difficulty of gaining access to the technical recourses in the University of Bahrain labs and classrooms (41%).

Table 5: Student perception concerning the barriers for integrating ET in their learning activities

Barriers	%
Insufficient computing facilities (labs, technology-equipped classrooms).	57%
Gaining access to the technical resources at the University of Bahrain is too difficult or inconvenient.	41%

Lack of assistance when facing technical problems.	40%
I'm not interested in using technology.	21%
Do not perceive any barriers.	9%

However, the results in Table (6) demonstrate that the *insufficient computing facilities* (64%) and *the computing infrastructure* (58%) are the most encountered barriers facing the academic staff in integrating ET in their teaching activities.

Table 6: of academic concerning for ET in their activities

The effect adopting

Perception staff the barriers integrating teaching

of ET –

Barriers	%
Lack of time to integrate ET in teaching activities.	44%
Lack of funding to purchase the equipment and software needed.	32%
Insufficient computing infrastructure (servers, bandwidth, storage capacity).	58%
Insufficient computing facilities (labs, technology-equipped classrooms).	64%
Not enough training offered in the areas that interest you	32%
Not enough assistance with technical problems.	40%
Not interested in using technology.	2%
Do not perceive any barriers.	6%

perspective of students and staff

As most of the students and academic staff at the University of Bahrain perceive the importance of ET, Table (3) and Table (4), the effect of these technologies should be investigated. Therefore, the perception of students and academic staff concerning the effect of ET on the overall performance of the students and instructor was investigated, as shown in Table (7) and Table (8), respectively.

Table 7: The effect of adopting ET – perspective of students

Effects	Disagree	Neutral	Agree
Increase academic achievements (e.g., grades).	18%	36%	46%
Encourages student's collaboration.	24%	33%	43%
Improves student's communication and interpersonal skills (e.g., ability to be a group member).	20%	25%	55%
Motivates the students to get more involved in learning activities.	20%	29%	51%

The results in Table (7) demonstrate that more than half of the participating students believe that ET can improve their communication and interpersonal skills (55%) and motivate them to get more involved in learning activities (51%). In addition, the results in Table (8) demonstrate that the majority of the participating academic staff (> 70%) believe that ET can enhance the instructor's communication skills (74%), increase the competency among other academic staff (74%) and reduce the pressure of the lecture preparation on the instructor (72%).

Table 8: The effect of adopting ET on student performance – perspective of academic staff

Effects	Disagree	Neutral	Agree
Enhance their communication skills.	8%	18%	74%
Increase the competency among other academic staff.	8%	18%	74%
Give the teachers the opportunity to be learning facilitators instead of information providers.	22%	40%	38%
Reduce the pressure of the lecture preparation on the instructor.	14%	14%	72%
Destroy student's social development.	48%	32%	20%

Experiment analysis and results

In section 3, it was mentioned that two of the adopted Educational Technologies in the University of Bahrain were selected: smart board and power point. They were compared with the traditional way of teaching using a whiteboard. The comparison was done to examine the perception of the students on the adoption of such technologies as a teaching tool, the effect of these technologies on their communication skills, performance and understanding, as shown in Table (9), Table (10) and Table (11).

Perception of students concerning the adoption of PowerPoint, smart boards and whiteboard as teaching tools

The results in Table (9) indicate that the smart board is the most enjoyable technology (70%) whereas PowerPoint is the most boring technology to be used (80%). Moreover, the respondents believe that PowerPoint and whiteboard can make the lecture material easy to follow (40%, 40%, respectively) while they require extensive note taking (30% and 70%). In addition, PowerPoint is perceived by the participants to be a teaching technology that does not allow enough participation in the lecture (65%).

Table 9: Perception of students concerning adopting PowerPoint, smart board and whiteboard as teaching tools

Description	Power Point	Smart Board	White board
Enjoyable	20%	70%	10%
Easy to follow.	40%	20%	40%
Boring	80%	10%	10%
Does not allow enough participation.	65%	0%	35%
Required extensive note taking.	30%	0%	70%

Perception of students concerning the effect of using PowerPoint, smart boards and whiteboard on their communication skills

The results in Table (10) demonstrate that students believe that both PowerPoint and whiteboard decrease the communication between the instructor and the students (50%, 40%, respectively) while the smart board increases the interaction among the students (80%) and enhances the ability of students to work in a group (65.5%).

Effect	Power Point	Smart Board	White board
Make the content and delivered materials of the lectures more clear	35%	40%	25%
Helps the students to remember the information easily.	50%	50%	50%
Increases the student's attention by limiting any disruption opportunities.	40%	40%	20%

Table 10: Perception of students concerning the effect of PowerPoint, smart Board and whiteboard on their communication skills

Perception of students concerning the effect of using PowerPoint, smart boards and whiteboard on their performance and understanding

Effect	Power Point	Smart Board	White board
Decreases the communication between the instructor and the students.	50%	10%	40%
Increases the interaction between students.	5%	80%	15%
Enhances the students' ability to work in a group	25%	65.5%	9.5%

The results in Table (11) demonstrate that more than 30% of the participating students believe that smart boards and PowerPoint can make the content and the delivered materials of the lectures more clear by offering images, colours and many other features. Moreover, they can increase the attention of students by limiting any opportunities for disruption (40%, 40%, respectively)

Table 11: Perception of students concerning the effect of PowerPoint, smart board and whiteboard on their performance and understanding

Discussion and conclusion

The current study was conducted to investigate the effect of using ET on the achievement and performance of students at the University of Bahrain. It has been revealed by the results that at the University of Bahrain the learning achievement of students is affected when the teaching and learning processes are enhanced by ET. It motivates the students to become more involved, active and interested in learning. In addition, ET promotes the collaborative communication and interpersonal skills of students, and, consequently, changes their attitude to learning. The experiment has demonstrated that effective technology, such as smart board and PowerPoint are very enjoyable, help in best utilizing the lecture time, limit disruption by students, provide outstanding methods for presenting the lecture materials, and enhance the concentration and engagement of the students.

Most of the academic staff and instructors at University of Bahrain are integrating their teaching with ET due to its easy access and availability. They are mostly using Moodle, LMS (Black board), PowerPoint and some collaborative tools, such as Microsoft Groove and Dropbox, as a teaching assistance technology. The academic staff and instructors realize that adopting such technologies can enhance their communication with the students, reduce the teaching pressure caused by the course material preparation and make the lecture material available at the time of the discussion. The integration with ET will enable them to build teaching competencies, and, therefore, will impact their teaching effectiveness and performance.

Although, the importance of Education Technology has been acknowledged by the University of Bahrain, there are some impediments facing both the students and instructors in adopting ET. The insufficient computing facilities and infrastructure, lack of sufficient technology budget and IT investment, technical support and

excessive budgeting and resources consumption needed for training programmes are among the obstacles facing the university in adopting ET.

The results of the current study have established the positive impact of ET in enhancing the performance of the students and the overall teaching and learning processes that have already been proved by many studies (Rutz et al., 2003, Koedinger, 1999, Baker et al., 1999, Sivin Kachla, 1998). However, educational organizations should be aware that the achievement of their learning effectiveness and desired outcomes will not be achieved just by purchasing updated software and hardware (John and Sutherland, 2005, Peeraer, et al., 2010). Educational Technologies can be found to be less effective and even inefficient teaching supportive tools if adopted without appropriate alignment with the nature of the course, course objectives and learning outcomes, lecture type and material, students learning styles and teaching styles (Balash, et al., 2011, Trucano, 2005). Therefore, before taking a decision to adopt certain ET, the educational organizations need to develop strategic planning in which their vision and mission, together with the teaching and learning processes needs, should be identified and embedded in their strategy (Balash et al., 2011). Moreover, the internal and external environment need to be assessed to identify those factors that assist in achieving their objectives and goals for adopting ET as well as the barriers and obstacles for their achievement.

EDUCATION OF CHILDREN WITH LEARNING DISABILITIES FROM THE SOCIAL AND CULTURAL PERSPECTIVE

Malgorzata Kowalik-Olubinska

University of Wamia and Mazury in Olsztyn, Prawochenskiego Street 13, Olsztyn, Poland

Abstract

This article describes two contradictory discourses on learning disabilities, namely the medical and the socio-cultural one. The former looks for causes of learning difficulties in the learning process itself and analyzes them in categories of developmental deficits, which need to be corrected. The latter approach seeks the causes in the social and cultural context of learners' lives. Thus, in order to help students in their development, it is necessary to change the learning context in such a way that it will correspond to different learning abilities and needs of students. In reference to the socio-cultural discourse, the article presents the guidelines for the education of children who experience learning failure at school.

Keywords: Learning difficulties; Medical discourse; Socio-cultural discourse; Differentiated education; Communities of learners

Introduction

Learning disability is a term that contains a broad range of meanings, avoids an unambiguous definition and lacks precision in making a decision on what exactly constitutes this category of notions. As a result, some researchers will negate the justifiability of using the term in the theory and practice of education or therapy. They claim that learners assigned to a group of individuals with learning difficulties do not differ significantly from the ones who are diagnosed as poor school achievers. Most researchers, however, express the opinion that it is fully justifiable to use the term 'learning difficulties' and demonstrate that students with learning difficulties are essentially different from those whose school achievements are poor as well as from the ones who have other problems in processing information, e.g. children with ADHD (Fletcher, Lyon, Fuchs, Barnes, 2007; Krasowicz-Kupis, 2008; Smith, 2008).

Studies completed over the past decades have shown that learning disabilities are a heterogeneous group of problems, i.e. they comprise difficulties experienced by learners in the acquisition of different school skills. These are the most often difficulties in reading (such as recognizing/deciphering words, reading fluency and understanding), written expression (handwriting, spelling, text formation) and mathematical abilities. Such problems are frequently experienced by the same student and may occur concomitantly with other disorders, such as attention distractibility and social or emotional deficits (Fletcher et al., 2007; Smith, 2008).

Far from negating the fact that some learners have learning disabilities and there are differences between learners in the learning rate and quality of acquired school skills, it seems necessary to analyze the current social discourses on this subject. Two basically opposing approaches to learning difficulties are the medical and the socio-cultural discourses (Reid & Valle, 2004; Dudley-Marling, 2004; McDermott & Varenne, 2010). The former one is rooted in the traditional, positivistic model of education and finds applications in medicine and mainstream psychology. The latter is inspired by the critical thought that is increasingly more pronounced in social sciences and various currents of the contemporary humanities. It finds support in a new branch of science known as *disability studies* (Albrecht, Seelman, & Bury, 2001), which is in opposition to the dominant medical discourse on disabilities.

The purpose of this article is to present both approaches to the interpretation of learning difficulties and their consequences for the practical recognition, diagnosis and assistance of learners. Another objective is to discuss

the main ideas underlying the education of students who experience failures at school, which originate from the socio-cultural perspective of analyzing learning disabilities.

Learning disabilities in the medical and socio-cultural discourses

The process of emergence and formation of the sphere of knowledge that pertains to learning disabilities, which began in the 19th century Europe (cf. Fletcher et al., 2007; Wong, Graham, Hoskyn and Berman, 2008), was closely correlated with the clinical studies conducted by physicians and psychologists. In the 1910s, Gall, an Austrian neurologist, was seeking for causes of language disorders that he had found in some of his patients. He put forth a hypothesis that they were caused by some brain damage, which led to some impairment in expressing thoughts in writing, but did not impair the patients' ability to use spoken language (cf. Hammil, 1993; Fletcher et al., 2007). Thus, the diagnosed disorders were selective in nature. Gall opted for the need to exclude other reasons which could be responsible for language disorders in patients, such as mental retardation or severe hearing impairment. The research may be said to constitute a source of the diagnostic exclusion criteria applied nowadays to identification of learning disabilities.

Studies on the neurological grounds of linguistic, cognitive and reading disorders were continued and developed by Broca, Wernicke, Hinshelwood, Pringle Morgan in Europe, and by Orton and Strauss with his co-workers in the USA. The research undertaken later by Cruickshank, Myklebust, Johnson and Kirk, rather than concentrating on the aetiology of learning difficulties, focused on characteristics of individuals with learning deficits and – depending on the type of diagnosed difficulties - on the potential intervention (Fletcher et al., 2007). In Poland, studies on learning difficulties among schoolchildren have been conducted since the 1950s. The pioneer researcher was Spionek (1965, 1973), who demonstrated that the most frequent primary cause of learning difficulties and school failures was partial disorders in the development and fragmentary retardation, known as micro-defects.

It appears, therefore, that since the earliest days of research and theoretical considerations on the definition and diagnostic criteria of learning disabilities, the biomedical and psychological approaches have been present. This has led to the conceptualization of learning disabilities in the language of medical discourse, which can be relatively easily noticed when one considers the process at the end of which children who demonstrate problems in acquisition of school abilities are classified as belonging to a group labelled 'children with learning disabilities'. This process begins when a teacher finds out an evident discrepancy between the expected and actual school achievements of a pupil. Then, the following questions are asked: What is wrong with this pupil? What characteristics intrinsic to the learner underlie the diagnosed problems? (Dudley-Marling, 2004, p. 488). Consequently, the student becomes a subject of observation carried out at school, and the results are documented, analyzed and used to formulate a preliminary hypothesis regarding the unsatisfactory level of academic performance. In order to confirm or exclude the fact that a given student has learning disabilities, specialist diagnostic tests are given. Finally, an opinion on the type of learning disabilities is proposed as well as further educational and therapeutic measures, which will correspond to the learner's special educational needs.

According to Linton (1998), this process of assigning a student the status of a person with learning disabilities, briefly presented above, is a manifestation of the attachment to epistemology and the tradition of the positivist model of education, based on a privileged position of statistically defined 'normality' and on viewing a difference as pathology. It leads to localizing the problem in the learner (Reid & Valle, 2004). In the discussed discourse, a difference is perceived in just one way – as a deviation from the norm, a pathological condition, a deficit which has to be corrected, compensated for and levelled.

The medical discourse, operational in the school environment, gives the legitimization for the category known as learning disabilities and the consequent educational policy and practice. The more the educators focus on the learner and his problem, the more likely he is to gather negative experiences associated with the assigned status of a person with learning disabilities. This has been evidenced in a study completed by Barga (1996) on how the students with learning difficulties their disabilities in the educational area (from preschool to university). When reminiscing about their schools, such learners dedicate a considerable amount of time to recalling

situations and events in which they most painfully experienced being disliked by other learners and teachers, when they felt excluded, less worthy or stigmatized.

In the socio-cultural discourse, learning difficulties are perceived differently. In the language of this discourse, they are interpreted as an effect of the social construction of reality. A similar attitude to this category of disabilities was initiated by Vygotsky in the early 20th century. Vygotsky's understanding of disability is coherent with the principal thesis of his theory, which assumes that the social context plays the key role in the development of the human mind. Hence, Vygotsky understood disability as a socio-cultural and developmental phenomenon rather than a biological one. It is the social context in which a child grows up that determines to what extent the child will be perceived (and will perceive himself/herself) as 'disabled' (cf. Bodrova and Leong, 2007; Gindis, 1999). Disability cannot be seen and interpreted outside the social and cultural context because it is a product of the social interaction (McDermott & Varenne, 2010), and differences between people in the rate, pace and dynamics of their functioning in various areas and spheres should be taken as a natural thing, as natural diversity of the human population.

Sources of learning, difficulties are therefore to be sought, first of all, in the school and then in the social, cultural and political contexts in which the school functions. As Dudley-Marling puts it (2004, p. 484), learning difficulties can only be understood within the school environment, because their manifestation 'requires an institutional framework, which enables one to assign certain meanings to pupils' behaviour'. Defining learning difficulties as delayed acquisition of certain skills (for example reading or counting) makes sense only when seen in the contexts in which these skills are especially important. Without school and without school education, there would be no learning difficulties (Dudley-Marling, 2004; Krasowicz-Kupis, 2008).

Once the teacher notices that a learner finds it difficult to acquire school abilities, he asks the questions: What goes wrong? What is the psychosocial situation of the learner? Next, the teacher analyses various factors which create the social context of learning in a given class so as to modify the present configuration and minimize or even eliminate learning problems (Dudley-Marling, 2004, p. 488). Thus, instead of focusing on remedying, correcting and compensating for the learner's deficits, educators concentrate on transforming the educational context so that it will correspond to the different abilities and needs of learners. This does not mean that any direct support given to students is abandoned. But what it means is that the teacher should realise that even a small change in the way he communicates with the learner can play a significant role in the modification of the self-image created by the student as a person who is learning (Gutierrez, 1993). It is particularly important to restore the inner motivation for learning, while simultaneously create conditions which help to form a positive self-image by students, to discover own developmental strengths and to reinforce the sense of agency.

Children with learning disabilities in the classroom community

The above heading reflect one of the key ideas in the socio-cultural perspective on the education of children with learning difficulties, such as the intention of building a social context within the school classroom that would help *all* the pupils to learn successfully since the first day at school. From this point of view, the support given to students adequately to their needs is an integral element of the everyday educational practice. It can be called differentiated teaching, understood as a flexible system, in which students are offered many levels or types of learning, organized around the shared teaching goals. By differentiating tasks, it is possible to address the needs of pupils who work on different levels of competences, while the shared goal integrates all pupils and lets them work in small teams and as a whole class (Tomlinson, 1991, 2001).

It seems advisable to diverge from the traditional perception of a school classroom as an area in which a single teacher teaches simultaneously all the pupils. In contrast, a class should be transformed into a community of people who are learning (Brown, 1997; Brown & Campione, 1994; Herrenkhol, Palincsar, DeWater, & Kawasaki, 1999; Palincsar, Brown, & Campione, 1993). What is characteristic of a community of learners is that all the pupils participating in solving a problem and trying to gain an in-depth knowledge bring 'a significant contribution to the mutual understanding of the problem being reached by the learners, despite having different resources of knowledge and competences' (Palincsar et al., 1993, p. 43).

Classrooms are intentionally designed in order to build 'interpreting communities, which allow for many roles and voices, and for active exchange and mutuality, such as seen at research seminars' (Brown, 1997, p. 412). Another key point is to organize learning around essential contents, essential meanings that help learners to think, at the upper threshold of their abilities, about serious scientific problems. One cannot 'think deeply about trivial matters; one cannot think in void' (Brown, 1997, p. 412). Learners must come across something that will challenge them. A challenging problem will give them a chance to conduct research; it will be an opportunity to read, write and think about an interesting, serious issue on a level that is appropriate for the learners' developmental stage. Learners help each other to understand the problem by working in teams, seeking advice of other, more competent persons and presenting the results of their work.

As Reid and Valle (2004, p. 475), claim, creating a community of learners in a classroom is 'a conscious, evolutionary process, which starts on the first day and ends on the last day at school'. The teacher helps to build such a community whenever he creates opportunities to exchange ideas, views and opinions, to run discussions and debates, to plan and undertake shared activities, and whenever he facilitates communication or helps to form bonds within groups. The teacher is a co-participant of educational situations, which enables him to notice and correctly identify signals revealing different educational needs of learners, and helps him to satisfy these needs with a proper organization of the learning environment.

In a classroom community thus created, it becomes possible not only to accomplish the goals of differentiated education but also to introduce various forms of cooperative learning. The positive impact of this form of learning, in cooperation with peer learners, on the children's acquisition of skills and knowledge in different sciences has been confirmed by many researchers (Palincsar & Brown, 1984; Rosenshine & Meister, 1994). The developmental value of learning in cooperation with peers has also been appreciated by authors of therapeutic programmes for children with learning difficulties. As a result, peer tutoring has been included into the system of correctional activities. The success of cooperation learning in the prevention of learning difficulties and improvement of reading and writing skills as well as mathematical abilities of children has been demonstrated in many studies (Fletcher et al., 2007; Topping, 2008).

Let us take the approach of Moll and Whitmore (1993) as an example of the above ideas on such an organization of the classroom environment that helps *all* schoolchildren to learn. These authors, recalling Vygotsky's theory, take a class as a social and cultural system, which is actively created by teachers and students. The life of a class is composed of social relations which occur between particular members of the classroom community (between students as well as between students and teachers), and take advantage of the existing social and cultural resources. In order to name this rich network of interpersonal relations, and to show mutual relations between teachers and children in a school classroom, Moll and Whitemore (1993, p. 20) use the term the "collective" zone of proximal development**.**

According to Moll and Whitemore, the essence of reading and writing lies in the understanding and communicating meanings. This is achieved through shared activities carried out by learners and the teacher, in which a special role is assigned to the adequate, functional and meaningful use of the language. Thus, the main aim of the teacher is to create in the classroom an environment which will encourage learners to accumulate a wealth of educational linguistic experiences. The teacher builds an authentically social context in the classroom, so that the pupils can practise with oral and written language as well as create and transform it while assigning different senses to various texts. The role of the teacher is to mediate this context in a way that allows children, firstly, to discover the functions and purposes of using the language and, secondly, to learn using various forms of linguistic utterances. The teacher, giving support to children's activities (individual or group ones), creates 'collective, interrelated zones of proximal development, which constitutes the indispensable element of the transactional system of education' (Moll & Whitmore, 1993, p. 21).

Conclusion

The adaptation of the the socio-cultural perspective for the analysis of education of children with learning disabilities enables us to propose a thesis that the developmental support of children who experience school

failure should rely more on the classroom context. This does not mean negating the sense of organizing specialist forms of assistance for these children. However, it seems necessary to notice and take advantage of the developmental potential of the classroom community. The individuals who constitute such a community (students and teachers) can use the available mental resources as well as share the knowledge, experience and competences of the whole class, and this should be perceived not only as an important enrichment of the experiences associated with the learning process but also as a form of support of the activities related to the zones of proximal development of all children.

The teacher who respects the above guidelines will intentionally relinquish monitoring the students' behaviour with the aim of capturing and correcting the occurring developmental deficits, which should be corrected, compensated for and levelled. Instead, the teacher acts like a participant of educational situations and tries to read the signals which demonstrate differentiated developmental needs of the learners. The teacher's aim is therefore to satisfy these needs by creating an educational environment which favours the development of tools of the mind (Bodrova & Leong, 2007), necessary for a successful course of the learning process.

Abstract

Modern information and communication technologies have reached immense grow over past decades. This also caused an improvement in the teaching abilities and forced many teachers to reevaluate their traditional forms of education. The primary aim of our starting work is to increase an educational level in the area of infectology. To realize such activity we stated two technological requirements. The first was the ability to distribute live education events to the almost unlimited number of users. The second one presented no technical requirements for users in the sense of the need to have any special and/or commercial equipment. Therefore, we prepare special and scientific sessions that will be periodically organized as live streamed education activities.

Keywords: on-line education; live video streaming; multimedia; infectology; antiinfection treatment

Introduction

Face-to-face forms of education, especially lectures organized in large classes have been considered for a long time as fundamental approach of teaching despite of well-known pedagogical limitations, e.g. large class sizes, repeating lectures, increasing workload. It is because the lectures were thought to be the most cost effective method to introduce new themes and their facts (Bennett, 2008; Foertsch, 2002). However, the usage of modern information and communication technologies (ICT) in higher education has changed this traditional approach of the teachers to the explanation of their scientific topics. Thus, new multimedia educational tools may assist students to understand many complex and difficult concepts related to the science learning (McKinney, 2009; Sloan, 2006; Bednarcikova, 2008). Some authors also argue that students of todays' net generation use digital materials rather than those offered through traditional, usually printed way.

The students expect to have a wide range of learning e-sources with convenient and flexible access and they seldom have the problems to use them in their study. Social media services such as YouTube or Flickr have also significantly influenced the attitude of recent generation to the multimedia. Furthermore, social networks facilitate effective collaboration and communication (Lim, 2012; Schneiderman, 2011; Vybiral, 2011). In this sense, the traditional lectures should be considered as a way of providing a guide to and/or an overview of key concepts and the students should use them in private self-study.

Evaluation of experiences based on using a video-based learning environment revealed that the students consider broadcasted or steamed instruction video as effective for carrying out self-evaluations. The teachers also considered streaming video as useful education tool for all the reflection processes of their students. On the other hand, they also indicated some shortcomings (Leijen, 2009; Reisslein, 2005). Other studies that examined the final grade and satisfaction level differences among students taking specific courses using three different methods: face-to-face in class, satellite broadcasting, and live video-streaming indicated no statistically

significant differences. Such results provide evidence to support distance education (DE) and to use it as a viable, convenient and flexible alternative delivery mode capable of extending learning opportunities (Abdous, 2010).

The ability to adopt different effective teaching methods in education makes teaching processes more demonstrative and more attractive as well. Furthermore, it is also a feature of grand teachers. Methods designed for both teaching and learning usually include explaining, demonstrating, collaborating, modeling, questioning and additional processes. Based on ICT, these methods may be easily realized not only in the presence forms, but even more frequently in distance forms of education with comparable or even better results.

Trends in this expansive area have already influenced all degrees of education including higher education and education of clinical and health care disciplines. Nowadays, the anatomical structures are presented to the students in three dimensional (3D) space, students may examine virtual patients, they are involved into virtual surgery and other clinical interventions, telemedicine tools are used to monitor and/or to evaluate health status of remote patients, real and/or live surgery interventions equipped with audio comments of professionals are distributed directly into the classrooms etc (Williams, 2011; Bargeron, 1999; Cerny, 2011; Macurova, 2010). These technological aspects result in better absorption and understanding of particular topics by students and also in better implementation of new research results into the teaching plans and curriculums. In contrast to the standard DE form, intended only to the students and members of particular faculty and/or study group, we decided to offer access to the newest knowledge from the area of infectology to the pre and post-graduate students at medical faculties, as well as to the clinical professionals and specialists and to the wide range of interested population. Lectures of professionals will be distributed to the audience all around the word using telemedicine tools and internet services. Therefore, the domain of our actual work is DE and dissemination of recent information about infectious diseases, their treatment and prevention.

Distance education

Current trends in education indicate an expansion of DE, and the most of higher education institutions offer certain type of such activities. This is caused by technology innovations but also by budgetary constraints. Because of limited financial sources, the universities often reexamine their curriculums and explore alternatives to find cost-effective ways of delivering education. Here, DE can be considered as default alternative. Regarding used grade of technology, it may be organized as different concepts including distance learning, distributed learning, online learning, e-learning, virtual education, web-based learning, computer-based training, and blended or hybrid learning (Abdous, 2009).

From historical point of view, DE is not a new concept. On the other hand, it is usually referred to the delivery of video (Jesshope, 2001; Simonson, 2003). However, DE based on video transfer can be set as one of the main technological profiles:

- videoconference – interactive two-way video and audio. This is probably the best "simulation" of the real class and the face-to-face form of education. The teaching events are in real-time, communication runs synchronously, but depending on the quality of internet connection, usually the high-speed networks are required.
- instructional television fixed service (ITFS) – broadcasted (satellite, cable and/or terrestrial) as one-way video and two-way audio. It was widely employed at many colleges and universities since the 80's (Fong, 2001), where the distance students were able to make a phone call to the teacher to ask questions and interact with him/her.
- streaming – one-way video and audio. Using streaming technology the live-lecture video (with audio) is broadcasted using network infrastructure and the students may watch it anywhere they are. Archived materials together with web-streaming functionalities can be used to deliver delayed education content to the distance learners through the universities' web sites. The students are usually allowed to interact with the teacher via e-mail and/or web-based discussion boards (asynchronous communication).

Due to the above mentioned facts as well as to the skills and our previous activities, we have been motivated to prepare an innovative approach to the education of clinical and health care disciplines. The targeted groups include pre and post graduate students, clinicians and employers in the health care system, physicians in attestation preparation and wide range of interested people too. Individual lecture sessions are planned to be organized as combination of both the actual knowledge and the recent research results. The live educational meetings, based on streaming technologies will be accessible for any interested person all around the world using internet and only free noncommercial products. All recorded and archived education materials will be shared using our portal of Multimedia support in the education of clinical and health care disciplines with no restrictions that ensures accessibility not only for users from medical faculties. Selected topics will be processed also in the form of printed materials with the aim to reach maximal social impact.

Video streaming technologies

Video streaming technology combines videoconferencing and the internet so that the live or recorded events can be distributed via the web (Robin, 2001). Using this technology to video lectures means that students can view the streams on their own computers wherever it suits them rather than having to take part in a face-to-face lecture (Garrison, 2001). The use of video streaming as a sole teaching strategy essentially remains a non-interactive medium and may therefore have certain disadvantages that are comparable to traditional lectures. Nevertheless, it represents innovative teaching and learning resources with perspectives to be used also in mobile devices.

Thanks to the availability of high-bandwidth network infrastructure the live video streaming enables teachers to deliver high-quality video and audio presentations while enabling students to view, interact, and connect with their teachers and/or classmates. This opposes that video streaming removes interaction and human contact between students and teachers. The real truth is that the advances in methods of data compression and extension of computer networks have significantly increased the ability to interconnect teachers and their students across the world. Teachers and lecturers may perform teaching remotely using live video streaming over the internet even more easily than ever before. All participants, like teachers, students, parents can be involved in collaboration with each other and simplify both the learning and communication processes.

In general, it is possible to specify two main types of video streaming on the internet. These types include true streaming and downloading.

True streaming

True streaming – also called as streaming media or streaming servers, where no waiting to watch event is involved as the media (specialized servers) are able to broadcast live events. An additional advantage of true streaming is that the education content can be broadcasted at different bit rates. Users can start watching live events almost immediately after they start playing it. Time delay, due to the server processing and type of network connection, according to our experiences, moves about 15 seconds. In the case of archived records, the file is also played almost as soon as it is downloaded. Basically, the content is sent to the users as stream so they watch it as it arrives to the computer.

Downloading

Downloading – or so called http streaming. It is a method where the video file (containing video, audio, animations, texts etc.) is usually offered to the users as embedded hyperlink on the web page. Users download entire content/file on their computers as first and then it can be opened and viewed. Depending on size of file it takes some time to be downloaded completely, so the users have to wait for whole file. Although it cannot be used for live events, the advantage is that the user can quickly skip already viewed or for him/her uninteresting parts of lectures, presentations and/or other teaching courses. Combination of streaming and downloading

methods creates something like progressive downloading, where the downloaded file can be played as its individual parts are received. In contrast to true streaming this may result in non-continuous playing.

True streaming in our program

To stream live events using true streaming methods it is necessary to have streaming server, that prepares, encodes and transmits video to the users. There are several file formats that can be used and some of them are offered by RealNetworks (RealMedia), Apple (QuickTime), Adobe (Adobe Flash) or Microsoft (Windows Media).

Considering our previous experiences and our technical equipment we decided to use RealNetworks Helix technology to steam live education events. We prefer to use it as it meets all of our technical requirements. Except of many other advantages it is also because of ability to handle traffic loads and ability to detect users' connection speeds and to supply appropriate files automatically. Thanks to its stability we use it as an effective tool of DE and also as a tool to offer the newest research results to the wide group of remote users.

Helix, similarly to other server solutions, uses tree main component to handle live events. These are encoder, streaming server and decoder.

- Encoder – a source of video signal. It is responsible for digital compression of all captured video and audio data that are sent to the streaming server.
- Streaming server – forwards video data to the remote users. Produces different file formats and streams them on different bit rates.
- Decoder – player, responsible for decoding of received video files and for playing them in the computer of remote user.

Principle scheme of the video streamed communication and interconnection of above mentioned parts of true streaming is shown on figure 1.
Fig. 1. Live video streaming principle.

The advantages of Helix technology include platform independence (Linux, Windows, and Solaris) and support of various codes. The encoder at the transmitting side is represented by RealProducer processing and encoding input video and audio signals. The necessary equipment consists of video camera, microphone, speakers and computer with connection to the internet. Helix server receives data from encoder and distributes streamed content to the remote users. Free RealPlayer is used as decoder at the side of student watching live education event. In this way, the students as consumers of education content do not need to have any special ICT products or equipment to watch live events.

Scientific topics

The primary goal of our activities is focused on creation of systematic approach in organisation of live meetings. This should cover not only a few individual lectures with completely different topics and streamed randomly as unorganized sections. Therefore, we specified one area of medicine to offer students the most actual information about it as a pilot conceptual solution delivered in periodically repeated terms. The selected specific topics will cover branch of infectology as it concerns not only clinicians but also a large group of patients and healthy people as well.

The bacterial resistance against antibiotics, convenient anti-infectious treatment and nosocomial infections are only a few of themes that every one of us should be informed about. These are the one of the major problems of European Commission (EC) in the area of public health. It is also the priority of national government as the consumption of antibiotics is one of the greatest in European Union. European Surrveillance Antibiotic Consumption (ESAC) rated Slovak republic on the sixth place in consumption of antibiotics. Furthermore, there are hospitalized 80 million patients per year in EU and 5 percents of them get nosocomial infection. Approximately 40 thousand of such patients die of it. This is the reason why EC emphasises the need to increase awareness of population using education activities with the aim to improve situation and to solve these problems.

In that sense, we try to address live lectures to the wider group of undergraduate students, PhD students, physicians in continuous education and to the public as well. They will be able to watch presentations for example about the most frequent infections, their transmission mechanisms, rational usage of anti-infective drugs or about the resistance of microorganisms against anti-infective medicine and many other that are covered by main topics as are summarized in the table 1. Using realization of above mentioned activities we also plane to minimize antimicrobial resistance to improve management of patients with nosocomial infections.

Table 1. List of prepared sessions and their main topics. Targeted groups are S – students of medicine, C – clinicians, H – health care employees, P – general public.

Session	Main topic title	Pt	Target group
I	Physiological bacterial settlement, most frequent bacterial infection	4	S, C, P
II	Rare bacterial infections	4	S, C, P
III	Mechanisms of infections transmission in community and in hospital	5	S, C
IV	Antibacterial pharmaceutics used in community	4	S, C
V	Antibacterial pharmaceutics used in hospital	4	S, C
VI	Antimycotics, antivirotics and antiparasitics	4	S, C
VII	Respiratory infections	4	S, C
VIII	Urinary tract infection, neuroinfections, gastrointestinal infections and skin infections	4	S, C
IX	How and when to use antibiotics	4	S, C, P
X	Sepsis	4	S, C
XI	Nosocomial infections and resistence on antiinfective pharmaceutics in hospital	4	S, C
XII	Preventions against nosocomial infections	5	S, C
XIII	Antivirotic treatment of the most frequent infections	5	S, C
XIV	Recommendations in treatment of micotic infections	4	S, C
XV	Selected topics and panel discussion		S, C

Individual live video streams will be broadcasted as free to join events, so not only the students of our faculty will be able to watch it. Anyhow, we have arranged that the active teams of participants will be composed of physicians and professionals with skills in education of clinical disciplines. Information about regularly organized sessions are announced at the faculty webpage as well as at the webpages of other education institutions, scientific societies, and health chambers and on webpages of Ministry of Health and Ministry of education. The streams will be archived and shared together with additional education material.

Conclusion

Learning science is a complicated system affected by too many input and output factors that should be beard in mind while searching for optimal and the most effective results. We suppose the combination of traditional teaching methods with new technological innovations satisfies teachers as well as students and may offer optimal learning experience for clinical medicine subjects. We decided to use streaming media technologies as it is a cost effective solution for multiple users to access audio and video content on the web in near real-time. It also allows to present education content to the global audience without the need for expensive broadcast equipment or facilities.

Using of streaming and software videoconferencing tools that we use at the faculty and also their advantages motivated us to utilise them in more intensive ways. Therefore, we realize live streaming of education events to improve quality of education and to offer an access to the newest scientific, clinical and specialized research knowledge. Activities are based on methodologies enabling to share lectures, seminars and conferences anywhere and without the need of having specialized equipment at the side of participants. In contrast to our previously streamed courses, the individual infectology oriented sessions will be archived now. An asynchronous collaboration will be offered to the user through the ability to annotate archived events. The substantial educational materials will be published also in printed versions to satisfy user not familiar with multimedia technologies.

EDUCATION OF OLDER PEOPLE IN THE FIELD OF INFORMATION TECHNOLOGY ON THE EXAMPLE OF POLISH UNIVERSITIES OF THE THIRD AGE

Łukasz Tomczyk[8]

University of Silesia, ul. Grażyńskiego 52, Katowice 40-126, Poland

Abstract

The paper presents the specifics of education of older people in the area of information technology in relation to educational solutions in Poland. Today the most popular exemplification of the life-long learning idea for people in so called "golden age" are the Universities of the Third Age which serve not only as the places for leisure animation but also allow seniors, in a professional manner, to gain various competencies. The paper points out to the main objectives fulfilled by such units in the area of minimizing digital exclusion in reference to the phenomena like: demographic changes, information society development and improving the IT education methodics.

Keywords: older perople, education, new media, information society in Poland, life long learning, University of the Third Age

Demographic change in Poland

Ageing and old age have recently become even more noticeable and not only within the medical, pharmacological or economical sciences. This state results from increasing demographic changes that create significant changes in the developed countries' populations, consisting in the age structure transformation. Studying common analyses available in the old and new media one can notice that the term „old Europe" refers not only to its historical, cultural heritage but is also connected with the ongoing process of ageing of the societies. Demographic changes, in turn, determine changes in such sectors like: culture, education, medical care, economy.

In the coming years Poland and Europe need to prepare for the effects of quickened process of population's ageing. This phenomenon is connected with crossing the barrier of 60-65 years by the numerous people being the post-war population boom (P. Szukalski, 2008, p.21). The ageing process in Poland of the last 25 years and within the next quarter-century should be treated as a steady phenomenon, yet characterized, in short time units, by a variable dynamics related to replacing given age groups by the next generations. Regardless of assumed senior age limit and terminology determinations the increase in number of this subpopulation will be quicker than it is now. That tendency will be particularly visible in 2010-2030 in comparison to the rate of change observed in this matter during the last two decades of the previous century when the number of Poles in postproductive age increased by little over ¼, while in 2005-2030 it is assumed to grow by little over ¾. Changes in the proportion of people in "golden age" will create a different, comparing to the present one, socio-economical situation of the country especially in the areas like: job market, goods and services demand (entertainment, recreation, education, rehabilitation, care services for the oldest living in one-person households). The demands for various services signalized by the oldest part of society will be determined not only due to the demographic changes but the needs of the people from this group will become a similarly important factor. The growing number of the subjects with higher education and the change of attitude towards ageing and old age will also be influencing the functioning of older people in the society (J. Kowaleski, 2006, pp. 229-230). In the light of presented demographic premises, among the popular and valuable services for the "golden age" group, widely understood education sector connected also with the animation of free time occurs to be a prospective and

[8] Corresponding author. Tel.: 0048 503 738 988.
E-mail address: tomczyk_lukasz@prokonto.pl.

growing domain. Therefore, further analysis and improving that offer is beneficial not only by reason of the personal benefits among those who receive such services but also by reason of economic benefits.

New media and seniors

In each period of human history a different type of transferring and acquiring information dominated – apart from the universal face-to-face communication. In order to adjust to certain conditions people who wanted to participate in communication process had to gain skills necessary to use media, that is to learn communication code (speech and writing), familiarize with technical possibilities of devices (telegraph, telephone, radio, television) and, today, gain competences in IT area.

The difficulty in adaptation of seniors to new, indirectly and directly computerized space is being expressed, among others, in the percentage usage of various types of microelectronic devices among the general of the population. Old media like radio, newspapers, television are the natural tool for gaining information while PC with the Internet connection, multifunctional mobile or other mobile media are used occasionally, mainly by people aware of the facilities the new media offer. Determined by the new technologies, the development of the civilization requires from its members, in even greater degree, certain competencies in using daily necessities - PCs connected to the global network among them.

New media have irreversibly transformed the functioning of certain individuals as well as social groups. This obvious statement gains new quality meaning when we consider the positive and the negative effects that process has on psycho-social functioning of certain age groups within the computerized society. One of the common computerization's negative effects is the digital exclusion that is noticeable especially among the oldest age groups .

In the subsection "Using New Information and Communication Technologies" in the report "Social Diagnosis 2011" we can read that older people (especially of the age 65+) are still the less effective group of the electronic media users. This state begins to change slowly due to several things like: popularization of life-long learning idea, generation replacement, generating actions aiming at reducing digital exclusion supported mostly by EU funds.

Table 1. Information society in Poland

Group		Computer	Internet	Mobile phone	Non users	Uses 3 technology
TOTAL		60,6	60,0	85,1	13,3	55,0
SEX	MALE	62,3	62,0	87,1	11,1	56,6
	FEMALE	59,1	58,1	83,2	15,2	53,5
AGE	16-24	93,2	93,1	97,2	0,5	86,6
	25-34	86,4	85,9	97,8	1,4	81,1
	35-44	75,8	75,7	96,4	2,5	70,0
	45-59	50,8	49,9	86,2	11,1	43,9
	60-64	30,3	29,2	76,0	22,2	25,2
	65 and more	11,4	10,6	48,7	50,1	8,9

Source: (Batorski, 2011, s.309)

Modern civilization places each individual in a very complex situation as it imposes permanent changes in almost every sphere of their life. Products of information engineering, that were used occasionally only few years ago, are now commonly available and used in private as well as in professional life. Many researchers notices that the low rate of electronic media use in the age group of 65+ is connected with constant difficulties in adjusting to the conditions of the society characterized by ongoing changes often determined by the technology

itself. Understanding the specifics of the problem of those complicated relations between new media and seniors will never be fully explicable if the specific characteristics of that group is not considered.

Polish Universities of the Third Age and education of seniors

The first University of the Third Age was founded in 1972 in Toulouse by French lawyer and sociologist Pierre Vellas. The main idea which accompanied the originator of this innovative movement was to enable older people to lead an active life and break the stereotypes of old age through participation in activities taking place in the institutionalized space. The program of the forerunner outpost focused on making attempts towards improving life conditions through educating on keeping or gaining psychological comfort after retiring (which deprives of one of the main form of activity that is professional work). At the beginning the classes were held during summer holiday season but thanks to the students the schedule was changed to a form looking more like a traditional academic year (Trafiałek, 2005, p.79).

U3A students are the people who have usually finished their professional carrier. They are mostly retired or pensioners in the age between 50 and 85. The biggest group consists of the students between 60 and 79, in some U3As being 90% of all students. Women are a vast majority – their percentage share varies from 72% in Cracow to 92% in Wrocław and Poznań. As for the education level the most students posses secondary education (47%-70%), then academic (24%-53%) and there are small percentage of people with primary or vocational education. The duration of being a U3A student is not limited in most of the universities. There are students who participate in the structures from their very beginning as the open formula of the universities and program that changes every year allow that. Each person that in a certain time, set by U3A board, enrolls and takes part in the classes becomes the U3A student (Hrapkiewicz, 2006, p.59)

Apart from the essence of studying in the places addressed to the oldest part of society, the characteristic of students who, along with their acquired worldly wisdom and through a basic need of belonging, get a further opportunity to study needs to be enhanced. Taking the role of the U3A student is specific as not all older people can make use of it or find themselves in that role. In order to use the opportunity to study in such institution older person should have a proper level of cognitive functions . By attending lectures and recreational classes student stimulates his nerve system, what makes him sustaining his psychophysical condition. While listening to the lectures an individual needs to focus his attention which results in improving his concentration span. Thanks to recreational activities he improves his observation skills.

The U3A students acquire knowledge and skills through the following forms of education:

- open lectures on various subjects, available to all students,
- theme lectures within the specific groups of interests (e.g. psychology, arts, medicine),
- exercise sections, workshops (e.g. IT, painting, gymnastics),
- organized trips (visiting interesting places and objects),
- occasional events, not recurrent (e.g. St. Andrew's Day, pro-health actions financed from the external sources – projects).

The forms of gaining knowledge are in many cases coincident with the traditional models of academic education, however their organization reminds rather more of inter-faculty interdisciplinary studies, popular in many academic centers than traditional stationary or non-stationary form. The older person has a possibility to choose the subjects according to his interests, which in his opinion serve the development of his own human capital, the improvement of intellectual and physical efficiency or to deepen his social relations.

Apart from different methodological assumptions education in U3A units differ significantly from stationary, non-stationary and distance education because in most cases, after completing several years of education, seniors do not get any formal confirmation of their competencies. However, students do not require that as acquiring knowledge on this stage of education is for them a value in itself, that does not require any legal systematization. But here as well exceptions occur because within the internal projects there is a possibility to conduct selected groups of classes in way that allows getting international certificates e.g. in the area of PC usage - ECDL

(European Computer Driving License) or certificates confirming foreign languages competencies (TELC, TOEFL, FCE, CAE).

Specifics of Education of Older People in the Area of IT

On the basis of analysis of functioning people in the „golden age" in regard to developmental psychology the following indications are worth considering during educational activities in the area of electronic media:

exercises for seniors should enable a free action not limited by time pressure,

the classes should be conducted in a calm manner – reducing additional impulses that disturb information flow,

one needs to accept the speed of fulfilling tasks and activities,

it is necessary to repeat the issues several times in a simple, uncomplicated way,

the presented material – theoretical or practical – needs to be completed and referred to daily life problems that students are close to,

exercises conducted during classes should be preserved in a form of points in the seniors' own notes,

introduction and completing the didactic material should be extended by the available literature addressed to this group and by scripts provided by the teacher,

during the exercises teacher needs to accept students' problems with visual-motor coordination and stimulate this area through implementation of attractive applications,

according to J. Trempała's (developmental psychologist) concept, learning new competencies should start as early as possible as the ability to assimilate new skills decreases with age,

people showing higher activity and high life aspirations are more predisposed to gain new competencies therefore the possibilities of information technology should be presented particularly to this group,

social, economic, cultural, technical changes cause some people in the age of over 60, in spite of their psychological condition, adjust to the dominating trends and their functioning differs from their peers from several years ago (Tomczyk, 2010a, p.39-46).

In addition, while conducting the analysis of older people's education in the IT area it is worth to consider the most often occurring barriers that reside in the students such as:

fear of damaging the electronic medium – most often resulting from the low awareness of usage and value of the equipment. Despite common availability and even lower prices of computers, most people are afraid they can make a serious damage and will have to take certain financial consequences;

fear resulting from not knowing the equipment's properties and its potential usage possibilities that can determine higher life quality of its users. It is quite common that adults – as they get older – show even lower interest in technical novelties. Those fears are also connected with excessive fear of unknown. Due to the lack of knowledge on computer usage the potential user - seeing its apparent complexity – assumes it is difficult to handle it. It is thus necessary to break the barriers in thinking about technical devices;

not understanding of instructions and messages appearing during working – those situations are caused by too short practice which makes it impossible to acquire certain group of habits typical for certain software. This

fact is also connected with preparing popular applications for mass users who, using new media, require an user-friendly software;

difficult vocabulary overload, information slang used by the teacher or found in literature of the subject discourages students from further study or hinders acquiring proper skills. The vast amount of specialist terminology and necessity to move in a new, foreign space makes students not always able to understand the commands or sense of presented knowledge properly;

inadequate expectations regarding computer's and Internet's possibilities – the ideas about incredible functions of microelectronic devices strengthen by literature and movies occur less and less rarely among seniors;

language barriers – specialist software or Internet websites on specific subjects are written usually in English which makes it impossible to use certain areas of information technology and knowledge stored in cyberspace;

inadequate use of software context help – noticed usually in case of users with poor advance level;

fear of being ridiculed and embarrassed in front of the group. It is one of the most frequent problems causing even resignation of potential new technologies' users from taking part in the organized trainings. The situation occurs when a person in "golden age" has no support from the close ones or is even discouraged from taking up education and when the course participants don't know each other well and their skills vary in level;

lack of faith in one's own abilities resulting from former failures (Wierzbicka, 2008, p.58).

Conclusion

Exclusion from society caused by a different factors like: disability, economic status, skills, knowledge, age, sex, origin accompanies humans from the beginning of a humankind. In the face of common computerization of all spheres of our lives it is important for each aware individual to have the competencies in the area of popular digital devices use. Today's technique has imposed creating the new type of society which pushes people not interested in its tools and deprived (whether it depends on them or not) of possibilities to discover the properties of new information and communication devices on the margin. Polish seniors, due to their potential lying in their number (6 million people), are a considerable client of all kinds of services provided also via the Internet. Unfortunately, due to the low percentage of the new media users, the development of dedicated services (e.g. shops, community portals, banking) in this age group develops, comparing to other groups, very slowly (Tomczyk, 2010b, p.441-450).

Internet, in comparison to other media, is relatively young and created by and for „young". Comparisons in the extent of use, intensity and proficiency reveal more significant disadvantage towards generation 50+ than towards the "young" group. As a result, the discourse regarding older internauts is dominated by considering the problems, limited competencies or lack of skills or psychophysical limitations. It is a fact that in some aspects of electronic media use the older users are less efficient (e.g. they type more slowly, have problems with "taming" the mice) and perform some actions generally more slowly. Yet, their use of the Internet is much different than that of the young generation. Older people use the net rather alone, they do not look for new friendships as it serves them usually to sustain the relations with their close ones. Tools like communicator or e-mail strengthen the already existing relations. For generation 50+ technology does not determine the ways of communication because it is transferring contacts from the real world (Krzyżanowska, Danielewicz, 2010, pp. 48-49). Change of approach to digital exclusion is very much needed today. The exemplification of the positive approach to older people involved involuntarily in the information society processes should be seen in the institutional and educational solutions. Creating education centers for seniors has been taken over by the Universities of the Third Age or specialized NGOs, training companies, but there is, however, lack of methodical solutions that would improve the process of effective education of older people.

Abstract

This study aim was to assess the effect of an E-learning program on the quality of life (QoL) of patients with coronary heart disease. A quasi-experimental design was applied to 65 intervention patients and 61 control patients with recently diagnosed CHD in Palestine, at Jenin Hospital. An E-learning program was designed by the researchers and implemented for patients in the intervention group. The effect of utilization of the E-learning program was evaluated through a post-test assessment. The results revealed that the intervention group patients had better QoL related to physical function and bodily pain at the post-intervention phase. At the follow-up phase, their QoL was higher in almost all domains compared to control group.

Keywords: Coronary Heart Disease; Quality of Life; E-Learning.

Introduction

Worldwide, heart disease is considered as a leading cause of death, and constitutes a major part of expenditure on health (Abdulle, Nagelkerke, Abouchacra & Obineche, 2008; Lloyd-Jones, Adams & Brown, 2010). The risk of developing coronary heart disease (CHD) depends on several determinants; some are associated with lifestyle operating from early childhood on (Assmann, Cullen & Schulte, 2002).

QoL measure is well suited for patients with CHD because many interventions are directed toward improving quality of life rather than just extending survival(Dougherty, 1998). One of the major goals to consider of cardiac rehabilitation is the changes in quality of life.(Shephard & Franklin, 2001; Muller-Nordhorn , 2004). Coronary artery bypass graft patients experience an average improvement in health related quality of life (HRQoL) after surgery(Lie et al., 2010) .Exercise-based cardiac rehabilitation studies revealed significantly fewer cardiac events and hospital readmissions, reduced total mortality and increased HRQoL (Thompson et al., 2003).

Patient education is one of the most important strategies in prevention, control CVD.(Farahani, 2008). Cardiac patient education is an essential component of nursing care aimed at assisting those patients to take care of themselves(Fredericks, Beanlands, Spalding & Da Silva, 2010) .Nurses have a public health role to advise, help and support patients to make lifestyle changes. Nurses are able to provide expert advice and support in either a consultation or rehabilitation setting using a holistic approach to care. Smoking cessation, relaxation techniques and stress management can be undertaken with the patient and his/her carers in a relaxed, informal way (Riley, 2003;Coster & Norman, 2009).

With the advent of E-Learning, new paradigms for teaching and learning about complex issues are emerging. A wide range of opportunities are being developed and implemented in the vocational, academic, and continuing education and training arenas to support life-long learning.(Thompson & Randall 2001; Wheeler, Byrne &Andrea, 2003; Britt, 2004).Self-management interventions in patients with CHD showed a positive effect, although not always significant, on the reduction of numbers of hospitalization, decrease in mortality and increasing Quality of Life. (Ditewiga, Bloka, Haversa & van Veenendaal, 2010; Yu, Thompson & Lee,

2006).The political situation in the Palestinian territories may make the continuity of care for chronic diseases a real problem. The use of the internet as a new technology for education of those patients and for keeping continuing contact with them and responding to their queries might help them in management and prevention of further complications. Therefore, this study is testing the effectiveness of E-learning for coronary heart disease patients (CHD) education.

Aim of the study

The aim of this study was to assess the effect of an E-learning program on the quality of life of patients with CHD and on their compliance to medication. It was hypothesized that CHD patients exposed to the E-learning program will have more positive quality of life indices compared to coronary heart disease patients on standard management.

Subjects and Methods

This quasi-experimental intervention study involved comparisons of a study and a control group, with pre-post assessment. It was conducted on CHD admitted to Jenin Hospital in Palestine. The inclusion criteria were being 18 years or older with recently diagnosed CHD , and having basic computer skills (either the patient or a family member).Patients with other chronic diseases as hyperthyroidism, nephrotic syndrome, liver disease, diabetes, and mental problems were excluded. The   sample size was calculated to estimate a difference between the mean±SD score of QOL of patients in the control group (X_1=50.0±10.0) and the expected mean in the intervention group after the intervention (X_2=75.0±10.0), with a 95% level of confidence(α error = 5%), and a study power of 80% (β error=10%). Using the equation for the difference between two means (Schlesselman, 1982) the required sample size was 63 subjects per group. After adjustment for a dropout rate of 5%, the sample size would be 67 patients per group. A consecutive sampling technique was used to recruit patients. Those fulfilling the inclusion and exclusion criteria were randomly assigned to either the intervention or the control groups.

An interview questionnaire form was developed by the researcher .The tool involved a section for the socio-demographic data, medical history, and lifestyle habits. The Chinese version of SF-36 Health Survey (Liu, 2001) was used as a measurement tool for QoL of patients in this study. It was translated into Arabic using the translation-re-translation process to guarantee its original validity. The tool examines eight QoL domains, namely physical function, role physical, role emotion, social functioning, bodily pain, mental health, vitality, and general health. The reliability of the eight subscales has been estimated using both internal consistency and test-retest methods with high reliability statistics.(Failde, Ramos & Fernandez-Palacin, 2000; Kiebzak,2002;MaKee,2009). For scoring, the raw scores obtained on each SF-36 domain are transformed to a 0 to 100 scale, with higher scores indicating higher levels of QoL.The tool was pilot-tested and finalized. The reliability of the QOL scale turned to be high with Cronbach alpha coefficient 0.87.

After finalization of the study tools, recruitment of the patients was started in August 2009. The nature of the program was explained to each patient. Patients were assigned to either the intervention or the control group. Based on the analysis of the data obtained from the assessment, the researcher was able to identify the information needs of the patients. The E-learning program was then designed to fulfill these needs. The site uniform address locator is itc.birzeit.edu.

Patients in the intervention group were individually met by the researcher before discharge. The researcher explained to each patient the aim of the study .This was followed by a demonstration of the program site which included instructions on its use. The instructional booklet was then handed to them to help in proper utilization of the program. Patients were encouraged to enter the site through a specific user name and password. Also they were encouraged to post any questions to the researcher regarding their health condition for follow-up through the site Blog. For the first three months, the number of hits was 1298, and in the follow-up phase (3 months), the number of hits increased to 1667. This indicates that the patients trusted the information on the site as well as

they needed continuous care and encouragement outside the hospital. Patients in the control group received the standard care provided at the hospital. The effect of utilization of the E-learning program was evaluated through a post-test assessment using the same pre-test tools. This was done after 3 and 6 months of the E-learning program implementation.

Ethical Considerations

Before launching the study, ethical approval was obtained from the Scientific Research Ethics Committee of Ain Shams University. In addition, a written informed consent was obtained from each participant. Patients sharing in the study were reassured about the anonymity and confidentiality of any obtained information. They were also informed about their right to withdraw from the study at any time.

Statistical analysis

Data entry and statistical analysis were done using SPSS 14.0 statistical software package. Quantitative continuous data were compared using Student t-test in case of comparisons between two groups and ANOVA for more than two groups. Qualitative categorical variables were compared using chi-square test. Whenever the expected values in one or more of the cells in a 2x2 tables was less than 5, Fisher exact test was used instead. Statistical significance was considered at p-value <0.05.

Results

Only two patients (3.0%) in the study group and five (7.5%) in the control group did not continue the study. Table 1 shows that patients in the study and control groups had almost the same mean age (55.3 ± 5.2 and 56.1 ± 5.6, respectively). The study group had more males (87.7%) and less unmarried (3.1%) patients and these were the only differences of statistical significance between the two groups. Meanwhile, the two groups had similar residence, education, job status, and computer skills.

Patients in the two groups were also similar regarding their medical history and special habits (Table 2). Hypertension was slightly more prevalent in the study group. Both groups had similar history or previous cardiac interventions. A family history of atherosclerosis was reported by 55.4% of the patients in the study group, compared to 67.2% in the control group; the majority of the patients in the two groups were current smokers, 80.0% and 82.0%, respectively. Regarding physical activity, only less than one-third were having daily exercise at least 30 minutes 3 or more times per week.

Table 2. Medical history and special habits of patients in the study and control groups

	Group				X2	p-value

The comparison of the quality of life (QoL) of patients in the study and control groups (Table 3) at the pre-intervention phase revealed similar distribution with the highest domains reported in relation to physical and social functioning and emotional role. At the other extreme, none of the patients in either group had high QoL related to vitality. The only statistically significant difference was in physical functioning, which was higher in the study group (87.7%) compared to the control group (62.3%), p=0.001. In total, 21.5% of the study group patients and 16.4% of those in the control group had high QoL. At the post-intervention phase in the study and control groups revealed two statistically significant differences. These were related to physical function (p=0.005) and bodily pain (p<0.001). In both these differences, the percentages were higher in the study group patients. Moreover, they had higher QoL related to physical role and social functioning, but the differences were only of borderline significance, p=0.06 and p=0.08, respectively. Concerning QoL at the follow-up phase, the table indicates statistically significant differences in almost all domains. The only exceptions were in the physical function, vitality, and role emotional domains. In total, 83.1% of patients in the study had high QoL, compared to 63.9% of those in the control group (p=0.01).

(*) Statistically significant at p<0.05

Figure 1 illustrates the changes in QoL scores throughout the study phases. It indicates increasing trends in both groups, which were statistically significant (p<0.001). However, as evident from the figure, the increases were higher among patients in the study group.

Changes in
Figure 1. QoL of patients in

the study and control groups throughout the study phase

Discussion

In the fast changing modern society, e-health care systems are currently the best possible way to achieve enhanced service efficiency and quality(Chang & Chang ,2008). The current study hypothesized that CHD patients exposed to the E-learning program will have more positive quality of life indices compared to coronary heart disease patients on standard management. The study findings point to significant improvements in the QOL of patients in both groups, but it was higher in the intervention group, which leads to acceptance of the study hypothesis. The two groups of patients involved in the study were similar in most of their socio-demographic characteristics. This similarity is essential to ensure that any changes obtained after the intervention would not be attributed to differences in these characteristics. Patients had also similar medical history. Therefore, their heart condition, with the related risk factors, was quite similar. Additionally, the history of smoking was alike in both groups. Therefore, smoking is considered a major risk factor in the present study samples, which should be targeted in any health education intervention as a proved modifiable risk factor in ischemic heart disease(Dalal et al., 2010) .

Furthermore, the baseline assessment of physical activity demonstrated a similarity between the two groups. In both, only a minority of the patients reported carrying out physical exercise at a level presumed to be of benefit for improving their risk factors, i.e. exercising at least 30 minutes per day, 3 or more times per week. This lack of physical activity is another proven modifiable risk factor identified at the baseline, and addressed in the educational intervention. In this regard, it has been shown that unsuccessful behavior change related to physical limitations had a negative impact on the prognosis of ischemic heart disease patients.(Peterson et al., 2010). Moreover, patients' exertional tolerance improves significantly with exercise training.(Giallauria, Galizia & Lucci, 2008).However, exercise must be maintained for long-term to sustain the improvements (Herdy , Marcchi & Vila, 2008).

Quality of life (QoL) is an important outcome indicator in chronic diseases. It has been measured among patients in the study and control groups of the present study before implementation of the intervention. The results showed low levels of QoL in many of the domains especially those related to vitality, physical role, and general health. Meanwhile, QoL in the physical functioning domain was high in both groups, especially among the study group patients. This difference must be taken into account in the interpretation of the post-intervention QoL. The QoL findings indicate that ischemic heart disease has a more significant impact on psycho-social aspects, compared to physical aspects. Meanwhile, the high QoL in the physical functioning might be explained by that the majority of the present study patients had undergone some type of cardiac surgery or intervention. This has been shown to be associated with improvements in the QoL of such patients postoperatively (Hunt , Hendrata & Myles, 2000).

At the post-intervention phase, few differences of significance were noticed in the comparison of patients in the study and control groups of the current study. These differences were related to systolic blood pressure, as well as QoL related to physical function and bodily pain. In all these differences, the improvements were more prominent among patients in the study group.

Assessment at the follow-up phase revealed further differences between the study and control groups of the present study. These were related to improvement of systolic blood pressure, which were significantly better among study group patients.

In agreement with these foregoing findings, a systematic review comparing home-based educational program with usual care reported a statistically significant reduction in systolic blood pressure at follow-up in the home-based group (Jolly, Taylor, Lip & Stevens, 2006).

Overall, patients in the study group of the current study had higher QoL compared to control group patients in the follow-up phase. These improvements were observed in almost all the domains of QoL. Such

improvements reflect the positive impact of e-learning on patients' lifestyles, which would have affected the improvements in some of the physical parameters such as blood pressure. The findings are in agreement with Mårtensson et al., (2005) who demonstrated a significant improvement in the intervention-group at 3 months follow-up regarding role function due to physical limitations as well as a tendency toward improved vitality and social functioning. Similar results were reported by Dunagan et al., (2005) regarding QoL after 6 months of follow-up.

On the other hand, other studies showed no differences in QoL scores between baseline and follow-up in both the control as well as the intervention groups (Del Sincad , 2007; Balk et al., 2008) .The discrepancies among various studies regarding improvement of QoL might be related to differences in the measuring tools, as well as the types of interventions and the periods of follow-up.

An important issue to be considered in any educational or training program is the compliance to such program. In the present study, it was difficult to measure the compliance of the study group patients to the instructions and information provided to them through e-learning. This is considered a limitation of the present study that must be taken into consideration in the interpretation of its results and its implications. However, this limitation has been previously noticed in similar home-based programs. Thus, Jolly et al. (2007).emphasized that it is difficult to make a comparable measure of adherence to a home-based program as adherence to a centre-based program is usually defined by the number of sessions attended. Accepting a visit from a rehabilitation nurse at home requires less commitment from the patient and gives no measure of the amount of physical activity undertaken. Therefore, in such situations, researchers rely on patient self-report, which could be another limitation due to participants' as well as interviewer's bias (Arthur , Smith , Kodis & McKelvie, 2002).

The study findings support the hypothesis that e-learning can be an effective measure to improve the QOL of CHD patients. This approach has the advantage of being flexible in delivery and offers a variety of options compared with face-to-face groups; health professionals function mainly as facilitators in this approach.(Lindsay , Smith ,Bellaby & Baker, 2009) Moreover, on the Internet, participants can feel more comfortable talking about their condition, which may help them to develop supportive relationships (Onnela , Saramaki & Hyvonen , 2007). The findings suggest that nurses could begin to think about presenting their educational content using multiple modalities to enhance patients' knowledge and performance of behaviours (Fredericks , Beanlands , Spalding & Da Silva , 2010).

Conclusion and recommendations

This intervention study demonstrates that an E-learning program does have a positive effect on patients with CHD in terms of improved QOL. The success of the study confirms the value of E-Learning program information provided to patients with CHD and the significant role nurses can play in patient education, and their contributions to promoting the recovery and preventive process of CHD patients. However, interpretation of the findings must take into account the study limitation of possible contamination or co-intervention bias as some of the patients in the control group may have had access to the E-learning site or other similar sites, which led to improvements among them. Nonetheless, these bias if occurred would lead to lower differences between the two groups rather than exaggeration of the effect of the intervention.

The study recommends that cardiac units and clinics should include E-learning educational material related to CHD in Arabic language. The E-learning solution can be applied for the education of patients with related illnesses like Post CABG, bronchial asthma, diabetes, etc. Meanwhile, patient's satisfaction with the proposed program was not addressed in this study; this issue warrants future study for improvement of the program.

Abstract

The performance in Mathematics and Sciences of a large proportion of Moroccan students in middle and high schools has been ranked recently below expectations. The Center of Information Technology Innovation (CITI) for human development at Al Akhawayn University in Ifrane (AUI) is investigating how IT-based education could improve both motivation and performance of students in middle and high schools. To demonstrate the positive effect of these ICT resources on the scholastic performance of middle school students, CITI experimented the project in two pilot middle schools. The two schools belong to two different socio-economics environments; one is located in Ifrane (small city) and the other in Fez (large city). In each school, two groups, of 20 students each, have been selected randomly at the beginning of the academic year for the three middle school levels. For each level, one of the groups is the experimental group and the other is the control group. In each the three levels in each middle school, both groups were taught the Biology and Geology course by the same teacher.

For each academic level, we developed electronic content matching the intended learning objectives of the Biology and Geology course to be taught using information and communication technologies to the experimental groups in both cities. The control groups in each level learn the same course material from the same instructor using the traditional (non ICT) means. It should be noted that each middle has been equipped with an ICT enabled classroom where experimental groups where taught the Biology and Geology course. For each level, both groups were evaluated using the same tests.

Having designed and run the experiment described above for one semester, we conducted statistical analysis to compare the performance of the experimental and control groups for each level in each middle school. The analysis revealed that the experimental group outperformed the control group for the three levels in the Fez middle school with a 85% confidence. In Ifrane middle school, the performance of the experimental group was superior for the third level but was found to be similar to the control group for the first and second levels with the same confidence level.

Main text

Introduction and Background

Information and communication technologies (ICTs) are a large field that includes radio and television, as well as newer digital technologies such as computers and the Internet. The latter is a potentially powerful tool for educational change and reform. When used appropriately, different ICTs are meant to foster access to education, strengthen the relevance of education to the increasingly digital workplace, and raise educational quality by teaching and learning into an engaging, active process connected to real life (ICT in Education, 2004).

During the last decade, studies showed that Moroccan students did not perform well in middle high school in mathematics and science and therefore couldn't make it to higher education (Millis, I.VS et al, 2005). Based on these facts, a research grant was allocated by the Korean International Cooperation agency (KOICA) (3) to the Center for Information Technology Innovation (CITI) for Human development at Al Akhawayn University in Ifrane to overcome the mentioned weaknesses by the improvement in the use of Information and Communication Technology that is still very low in the technological usage at the national level.

The project was conducted in 3 phases. Building the IT platform and preparing the middle school instructors to IT environment were the main parts of first phase. The second phase focused on developing IT material to be used in middle school mathematics, physics, biology and geology. The material was developed by the prepared middle school instructors then validated by middle school pedagogic inspectors. After an evaluation of the delivered contents by AUI faculty, the latter was given to CITI technicians for IT implementation. The IT developed material such us power point presentation, simulation and others was presented and then reviewed for improvement by the project members and then added to the platform system. The third phase was about the implementation of the developed material in the applied classroom setting.

Initial results of the project show that the experience gained has allowed accumulating sets of techniques and capabilities that have accelerated progress in supporting development of course materials (Kevin Smith et al, 2008)

This paper covers the approach adapted and results obtained in improving motivation and performance of students in biology and geology courses in middle school.

Structure and Methodology

Hardware

Thanks to KOICA grant, studio and multimedia classrooms were equipped at AUI for the development of the project content. Another two equipped multimedia classrooms established in the two pilot middle school for the implementation of the developed content. The installed AUI studio would be used for recording real classes with instructors from the middle school partners (Collège Al arz in Ifrane and Collège Kassim Amin in Fès). The multimedia classrooms in the partner schools were equipped with computers, server, tables and chairs, a projector, and a screen, a printer , a scanner, air conditioning and wireless connections. The Ministry of Education assured an ADSL connection to each school.

Human resources

The two delegations of Fès and Ifrane have assigned 18 teachers and 6 pedagogic inspectors to work with the KOICA project. Teams consisting of 3 teachers and 1 pedagogic inspector were in charge for the courses content development and to present model courses to be filmed for each the 3 different scientific area: mathematics, physical science and life science.

Workshops were organized on regular basis (weekends) at AUI to train school teachers on the use of the development tools and the e-learning platform. AUI faculty from related disciplines accompanied the development of the project along with CITI engineers and technicians.

Development of digital content

After series of workshops, best practices from IT-based education literatures were identified such us power point presentation, simulations, interactive evaluation…Teams consisting of teachers, pedagogic inspectors prepared the content using Microsoft Word format for the three years programs in the middle. CITI engineers

and technician along with AUI faculty revised the content and then converted it to adequate format. The IT developed material is returned to the teachers for validation and then the AUI team placed it through a distance education platform.

Course offerings

To study the material using the developed ICT materials each middle school has selected randomly a pilot class of twenty students and another class with the same size to be used as a control. The latter class and in parallel will use the same material using traditional methods. The two classes are taught by the same instructor in the same discipline. For the three disciplines we had 120 students using the ICT resources and 120 students using the traditional methodology.

Both traditional and IT resources classes were evaluated the same tests that include subject area exams, polls and survey. The obtained grades are used as variable to quantify the impact of IT-based education.

Results and interpretation

We took into consideration the learning curve of the human resources involved in the experiment and made appropriate adjustments to digital contents developed before collecting and analyzing data and drawing conclusions. For each student involved in the experiment, we computed his grade point average in the biology and geology course. For instance, the data collected of the experimental group in Grade 1 in Fes middle school, consist of 20 data points each one representing the grade point average of a student in the course under study from that group.

Having collected data, we tested the experimental hypothesis of our experiment. The data analysis that we conducted consists of a simple comparison, for each grade in each middle school, of the performance of the experimental and control groups using t-tests (Montgomery, D.C, 2007) and the results are given below.

The data analysis consists of comparing the mean of the experimental and control groups in each grade in each middle school. The null hypothesis states that the means for both groups are the same and the alternate hypothesis states that the mean of the experimental group is higher than the mean of the control group. The T-test was conducted at an 85% confidence level. We made a decision based on the p-value of the test as follows; tests, whose p-value is less than 15%, reject the null hypothesis which means that the experimental group outperforms the control group for the discipline tested. The results of this analysis are summarized in Table 1 for the middle school in Fes and Table 2 for the middle school in Ifrane.

Table 1. Results of the 85% confidence level one sided T-test comparing the performance of the experimental and control groups in the biology and geology course for the three grades, in Fes Middle School

Fes Middle School	First grade	Second Grade	Third Grade
P-value	0.013	0.013	0.031
Test result	Reject	Reject	Reject

The results summarized in Table 1 which concern Fes Middle school indicate that using ICT had a positive impact in enhancing student's learning and their performance in the biology and geology course in the three grades.

Table 2. Results of the 85% confidence level one sided T-test comparing the performance of the experimental and control groups in the biology and geology course for the three grades in Ifrane Middle School

Ifrane Middle School	First grade	Second Grade	Third Grade
P-value	0.499	0.26	0.091
Test result	No	No	Reject

The results of the comparison did not show a similar success of the use of ICT in Ifrane. At the same 85% confidence level, we noted a positive impact only for the third grade. The positive impact could not be confirmed for the first and second grades in Ifrane. The obtained results concerning the use of IT tools in life science are consistent with the work of Berrado et al (A. Berrado, 2009).

Conclusion

There is a positive impact of ICT based education in biology and geology in Moroccan middle school; In general it was confirmed that the impact was not consistent across middle school representing different socio-economic environment.

EĞİTİMDE YORUMLAMACI YÖNTEM BAĞLAMINDA SCHLEİERMACHER ÖRNEĞİ

Doç. Dr. Mehmet Faik YILMAZ

Yıldız Teknik Üniversitesi Eğitim Fakültesi Sınıf Öğretmenliği Anabilim Dalı başkanı

Özet

Eğitim tarihi boyunca çok farklı yöntemler kullanılagelmiştir. Bu yöntemlerden bir bölümü uzun soluklu olmuş, yüzyıllar boyunca kullanılmış, bazıları ise dönemsel önem taşımışlar; bir kısmı da -karabatak gibi- tarih sahnesine bir çıkıp bir kaybolmuşlardır. Yorumlamacı yöntem olarak da adlandırılan hermenötik yöntem, bilim tarihi boyunca çok işlevsel dönemler geçirdiği gibi, adından fazla söz edilmediği adeta unutulmaya yüz tuttuğu dönemler de geçirmiştir.

Adını, eski Yunan tanrıları ile insanlar arasında elçilik yaptığına inanılan Hermes'ten alan hermenötik, İlk Çağ Yunan felsefe ve edebiyatında çok işlevsel bir dönem geçirmiş, dini ve profan metinlerin yorumlanmasında çok aktif bir rol üstlenmiştir.

Bin yıllık Ortaçağ boyunca adından fazla söz edilmeyen yorumlamacı yöntem, Yeniçağda Rönesans ve Reformla birlikte Kutsal Metinlerin yeniden yorumlanmasında adeta lokomotif görevi yapmıştır.

XVIII. y.y.'da Doğa bilimlerinin *açıklama* yöntemini kullanarak adeta bilimi tekeline alması ve Sosyal bilimlerin geri plana düşmesiyle XIX. y.y.'ın sonuna kadar yorumlamacı yöntem yine bir kenara bırakılmış adından hiç söz edilmemişti.

Wilhelm Dilthey, Beşeri Bilimler Hermeneutik / *Geisteswissenschaftlicen Hermeneutik* denilen bilim dalının en önemli teorisyeni olarak, Doğa bilimlerinin *açıklama* yöntemine karşılık *anlama* yöntemini ortaya atmasıyla hermenötik tekrar tarih sahnesine çıkmıştır.

Bu tebliğde eğitimde yorumlamacı yöntemin uygulanmasına ışık tutması bağlamında, Dilthey'in dilinden Schleiermacher'in eğitimci yönü, onun ders işleyişi ele alınacaktır.

Anahtar Kelimeler: Eğitim, yorumlamacı yöntem, hermenötik, Dilthey, Schleiermacher.

Giriş

"Eğitimde Yorumlamacı Yöntem Bağlamında Schleiermacher Örneği" isimli bildiriye başlamadan önce Schleiermacher'n hayatı, fikirleri ve düşünce dünyasıyla ilgili bilgi vermek yerinde olacaktır.

Tam adı Friedrich Ernst Daniel Schleiermacher olan XIX. yy'ın ünlü düşünürü, 21 Kasım 1768 tarihinde Polonya'nın Breslau şehrinde doğmuş, 12 Şubat 1834'de Berlin, Prusya'da ölmüştür. Alman ilahiyatçısı olan filozof, aynı zamanda klasik filoloji uzmanıdır. Modern Protestan ilahiyatının temellerini atmış; *Der christliche Glaube* / Hıristiyan İnancı adlı eserinde Hıristiyan dogmalarının sistematik bir yorumunu yapmıştır.

Schleiermacher'in 19. yüzyıl boyunca etkili olan ilahiyat görüşleri, mutlak doğrudan ayrılıp insani kültüre dayalı bir din yarattığı gerekçesiyle yaklaşık 1925-55 arasında, Karl Barth ve Emil Brunner'in önderlik ettiği *"Tanrı Sözü"* grubunun şiddetli eleştirisine uğramış, yakın zamanlarda ise katkılarının önemi daha iyi anlaşılmaya başlamıştır (Yılmaz, 2003, 104).

Schleiermacher'e göre hermenötik, bir başkasının söylediğini doğru anlama sanatıdır. Bu da anladığı kişiyle anladığı şeyi aktardığı üçüncü şahıs arasında bir bağ oluşturmaktır (Berger, 1999, 14; Schleiermacher, 1977, 11).

Kendisinden önce gelen teorisyenlerin aksine, o, problemi başkasını anlama konusunda ortaya atmış; onu gerçeklikten daha çok niyette, araştırmadan ziyade sezgiyle, bilginin umumi bir problematiği haline getirmiştir. Gerçekten, onun tahlilleri umumiyetle Kitabı Mukaddes'ten ya da klasik Antikite'den alınmış örneklere dayanmaktadır; öyle ki, onun girişimi her şeye rağmen biraz teolojik kalmaktadır (Freund, 1997, 30).

Başlangıçta hermenötik teknikler, genellikle dini bir metindeki bazı pasajların kapalı ya da tutarsız görüldüğünde karşılaşılan belirgin anlama güçlüklerinin ya da başarısızlıklarının üstesinden gelmek için, geliştirilmişti. Schleiermacher, bir metinde kapalılık ya da tutarsızlık görmememizin, yorumumuzun doğruluğunun bir teminatı olmadığını düşündü. Anlama, potansiyel olarak yanlışa hep açıktır. Bildik sözcüklerin, tarihsel bir metinde ortaya çıktıkları zaman, bildiğimiz ya da düşündüğümüz anlamı taşıdıklarını kabul ederek, hiçbir yere varamayız. Linge'in de öne sürdüğü gibi, yanlış anlama, sözcük anlamlarında, dünya görüşlerinde, vs., yazarı yorumcudan ayıran zaman dilimi içinde vuku bulan değişmelerden dolayı, doğal olarak ortaya çıkabilir. Araya giren tarihsel değişmeler, sonuçları tesirsiz hale getirilmedikçe, anlamayı kaçınılmaz olarak güçleştirecek bir tuzak meydana getirir. Hermenötik ilkelere, şu halde, sadece güçlüklerle karşılaştığımız zaman değil, fakat anlama çabası içinde olduğumuz her seferinde başvurulur (West, 1998, 121).

Schleiermacher'in kendinden önceki transandantal felsefenin ve romantik akımın mirasına dayanarak, yorumsamacı yaklaşımın oluşumuna yaptığı temel katkı, geçerli yorum olasılığının koşullarını sorgulamak ve yeni bir anlama kavramı geliştirmek olmuştur. Schleiermacher için edebi metin bir yandan yazarın tüm yapıtının bütününe yani bağlı olduğu yazarın tümüne ait iken (metnin nesnel etkenleri), bir yandan da bu metnin özgün anlamı yazarın yaratma anındaki öznelliğine (metnin öznel etkenleri) bağlıdır. Ona göre anlama, daima önceden bilinen bir başvuruyu içerdiğinden dairesel ve eytişimsel (diyalektik) bir akış içerisinde işleyen yaratıcı bir yeniden formüllendirme ve yeniden yapılandırmadır. Onun anlamı bu şekilde ele alış tarzı, daha sonra yorumsamacı yaklaşımın temel kavramlarından olacak olan 'yorumsama dairesini / *hermeneutische zirkel* öncelemektedir. Yorumu ise gramatik ve psikolojik olmak üzere ikiye ayıran ve bunların kendine özgü yasalarını saptamaya çalışan Schleiermacher'in ilgisi henüz bir metnin anlaşılması ve yorumlanması noktasındadır ama yorumsamacı düşüncenin tüm gelişimi boyunca etkili olacak olan anlamanın gerçek nesnesinin deşifre edilip anlaşılmayı bekleyen bir metin olduğunu ileri sürmüştür. (Göka, 1993, 86; Göka, Topçuoğlu, Aktay, 1996, 28-29.)

Schleiermacher'in hermenötik daire yaklaşımı kısaca üç adımda özetlenebilir: (1) Anlama varmak için nasıl bir sözcüğü yazarın yapıtının bağlamı içine oturtmak gerekiyorsa, her metni de yazarın tüm yapıtlarının içine oturtmak gereklidir. (2) Aynı biçimde, yazarın eserlerini söz konusu edebi türlerin içine, giderek edebiyatın tümü içine oturtmalıdır ki bu işin nesnel yönü olmaktadır. (3) Öte yandan aynı metni, yaratma sürecinin bir anının ifadesi olması açısından yazarın manevi yaşamının içinde belirlemelidir. İşte Schleiermacher'e göre, ancak böylelikle, işin öznel ve nesnel boyutlarını içeren bir daire devrini tamamladığında yani 'hermenötik daire' oluştuğunda anlama varılabilir (Kasaboğlu, 1992, 61).

Yeniçağdan İtibaren Yorumcu Yöntemin Gelişimi

Yorum ve onun kural koyması, Rönesans'tan bu yana yeni bir boyut kazanmış ve bu nedenle de klasik, Hıristiyan Ortaçağın dil, yaşam koşulları ve milliyet anlayışı tamamen değiştirilmişti. Bundan dolayı yorum, önceleri Roma'daki Kutsal Kitabı yorumlama görevinden daha farklı bir alana kayarak, gramatik, nesnel ve tarihsel araştırmalar yoluyla başka bir ruhsal hayatı yorumlamada kullanılır oldu. Bu yeni filoloji, çok yönlü bilim *(polymati)* ve eleştiri çok defa sadece bilgilerle ve bilgi kırıntılarıyla çalışmaya mecbur oluyordu. Böylece bu bilimler yeni bir tarza bürünmek, yaratıcı ve yapıcı olmak zorundaydılar. Bu nedenle filoloji, hermenötik ve eleştirel bilim anlayışı daha yüksek bir mertebeye çıktı. Son dört yüz yılda çok kapsamlı bir hermenötik literatür ortaya çıkarılmıştır. Klasik ve kutsal metinler, elde edilmesi gereken güçlerdi, bu nedenle hermenötik iki farklı akım oluşturmaktadır. Klasik ve filolojik kural koyma, eleştiri sanatı *(ars critica)* olarak nitelendirildi. *Scioppius, Clerius* ve *Valerius*'un henüz tamamlanmamış eserleri bu dönemde kendini gösterdi. Bu eserler ilk bölümlerinde hermenötik sanat öğretisini verdiler. Sayısız yazı ve konuşmacı yorumlama *(de interpretatione)* hakkında yazıyor ve konuşuyordu. Ama nihai planda hermenötiğin yapılanması, Kutsal Kitap yorumu sayesinde oldu. Bu

eserlerin en önemlisi, belki de temel olma özelliğini taşıyanı *F l a c i u s* ' un 1567'de yayınlanan Anahtar *(Clavis)* adlı eseri idi (Dilthey, 1924, 317).

Flacius'la birlikte o zamana kadar keşfedilip zirveye ulaşan yorumlama kuralları bir öğreti yapısına kavuşturulmuştu. Şöyle ki, postulatın bir aracı olarak, sanatsal usulün bu kurallarla genel geçerliği yakalaması gerekiyordu. Hermenötiği yöneten bu kuralcı bakış açısı, *Flacius*'u XVI. y.y.'da yapılan tartışmalarla bilinçlendirdi. O iki cephede savaşmak zorundaydı. Bunlardan biri restore edilmiş Katolikliğin otoriteleriydi. Onların iddiası Kutsal Kitapta kapalılık olmadığıydı. *Flacius* bunlara karşı gelirken özellikle *Calvin*'in yorumlarından çok şey öğrendi. *Calvin*'in bu yorumları yorumlamadan daha çok onun temellerine geri dönmüştü. O zamanki bir *lüterci* için en önemli görev, daha yeni formüle edilmiş olan geleneksel Katolik öğretisini çürütmekti. Kutsal Kitap yorumunu belirleyen Katolik gelenek ise, Protestan Kutsal Kitap yorumlama prensibine karşı yürüttüğü mücadeleyi sadece, Kutsal Kitaptan genel geçer, yeterli yorumlama çıkarılamayacağı anlayışı üzerine kurmuştu. *Flacius*'un eserlerinin yayınlanmasından bir süre sonra *Trieste Konsili*'nin Katolik temsilcisi *Bellarmin,* 1581 yılında Kutsal Kitabın bizzat kendisini yorumlaması fikrine şiddetle karşı çıktığı tartışma yazısında, geleneğin gerekliliğini ispatlamaya çalışmıştır. Bu tartışmalar bağlamında *Flacius*, yorumlama kurallarını hermenötiğin genel geçer kurallarına yükseltmeye teşebbüs etmiştir. Bu çabaların sonuca ulaşması için daha önce hiçbir hermenötik çalışmada kullanılmayan araçlar ve kurallar geliştirilmiştir. Eğer yorumcu, metinde bir zorlukla karşılaşırsa o zaman onu aşmak için yükseltici bir tarzda bir araca ihtiyaç duyar. Bu da yaşayan Hıristiyan dindarlığı bağlamında oluşturulan kutsal yazımlardır. Biz bunu dogmatik düşünce tarzından, kendi düşünme tarzımıza tercüme ederiz. Böylece bu dindarlığın tecrübesi olan hermenötik değer, sadece tekil olayların prensibidir. Buna göre her bir yorumlama metodunda yorumun kendisi nesnel bağlamdan çıkan bir faktördür. Ama bu **dini** yorumlama prensibinin yanında bir de **akli** yorumlama prensibi vardır. Bundan sonra da **gramatik** yorumlama gelir. Ama *Flacius* bunun yanında yorumlamanın **psikolojik** ya da **teknik** prensibinin eserin bazı bölümlerinin, tamamının kompozisyonuna ve amacına göre yorumlanması gerektiğinin önemini kaydeder. Ve o ilk etapta bu teknik yorumlama için retoriğin metodik anlayışından, edebi bir ürünün iç bağlamı üzerine onun kompozisyonunu ve en etkili unsurunu kullanarak yararlanır. Bu arada *Aristocu Retoriğin* yeniden düzenlenmesi çalışmaları *Melanchthon* tarafından yapılmıştı. *Flacius,* ilk önce metodik olarak bu araçla metnin tek anlamlılığını tespit etmek için, metnin bazı kısımlarının ya da unsurlarının içerdiği kontekst (siyak-sibak), hedefler, oran ve eşitliğe göre değerlendirilmesi gerektiğinin bilincindeydi. Bundan dolayı da o, hermenötik değeri, bizzat metot öğretisinin bakış açısına ekler. "Hani bir bütünün parçaları, bu bütünle ve diğer parçalarla olan ilişkisinde kendi anlayışlarını barındırırlar ya işte onun gibi". O bir nesnenin içsel formundan yola çıkarak üslubuna ve etki unsurlarına kadar gider ve bundan da *Pavlusçu* ve *Johannesçi* üslubun ince ruhlu karakteristiklerini geliştirir. Bu, retorik anlayışın sınırları çerçevesinde büyük bir adımdı. *Melanchthon* ve *Flacius*'a göre her yazı, kurallara göre yazılır ve kurallara göre anlaşılır. Bu tıpkı mantıksal bir otomat gibidir, yazı bu mantıkla üslup, şekil ve konuşma figürlerine bürünürülür (Dilthey, 1924, 318).

Flacius'un eserinin eksiklikleri, çok daha sonra kaleme alınan Baumgarten'in hermenötiğinde giderilmiştir. Aynı zamanda Baumgarten, bu eserde ikinci bir büyük teolojik - hermenötik hareketi gerçekleştirir. Baumgarten'in bir Halle kütüphanesinden yararlanarak verdiği bilgiler üzerine, Hollandalı yorumcuların yanı sıra İngiliz özgür düşünürleri ve Eski Ahit'i bir etnolojik eser olmaktan çıkarıp Alman görüş alanı çerçevesinde açıklayanlar ortaya çıkmaya başladı. Semler ve Michaelis onunla iletişime girerek, onun çalışmalarına katıldılar. Michaelis; dil, tarih, tabiat ve hukukun tekdüze tarihsel bakışını Eski Ahit'in yorumuna uyguladı. Büyük Christian Baur'un selefi olan Semler, Yeni Ahit'e ait metnin tekdüzeliğini yıkarak yerinde bir çalışma başlattı; bununla her bir Kutsal Kitabı kendi lokal karakterine göre anlamaya çalıştı. Sonra bu Kutsal Kitapları bir birine bağlayıp yeni bir birliktelik oluşturdu. Bu birliktelikte, canlı tarih yazımlarında en eski Hıristiyan ve Yahudi çatışmasını düzene koydu. Teolojik hermenötiğin ön hazırlığında kesin bir kararlılıkla tüm bilimi iki kısma ayırdı: Dil kullanımından ve tarihsel durumlardan oluşan yorumlama. Böylece yorumlama dogmadan kurtarılmış, gramatik ve tarihsel okul kurulmuş oldu. Ernesti'nin dikkatli ve ince dehası klasik metinleri yorumlayanlar için yeni bir hermenötik oluşturdu (Dilthey, 1924, 319).

Yorumcu Yönteme Schleiermacher'in Katkıları

Onun okumalarından Schleiermacher kendi hermenötiğini geliştirdi. Bu gelişmeler de kesin sınırlar çerçevesinde oluştu. Bu yorumcuların elinde kompozisyonlar ve düşünceler her metnin kendi zamanının şartlarına göre lokal ve zamana bağlı tasavvurlar çerçevesinde oluşturuldu. Bu pragmatik tarih anlayışına göre dini ve ahlaki yönden eşit şekilde nitelendirilen insan tabiatı, yalnızca dışarıdan lokal ve zamana bağlı olarak sınırlandırıldı. İnsan tabiatı tarihsel değildir.

O zamana kadar klasik hermenötikle İncil hermenötiği birlikte hareket ediyordu. Bu iki uygulamanın genel olarak anlaşılması gerekmiyor muydu? Wolfçu Meier 1757'de Genel Bir Yorumlama Sanatının Denemesi ile bu adımı attı. Kendi biliminin kavramlarını elinden geldiğince genelleştirmeye çalıştı: Her yorumlamada takip edilebilecek işaretlerden kurallar geliştirilmeliydi. Ama bu kitap, bir kez daha bu mimari ve simetri bakış açısına göre yeni bir bilimin oluşturulamayacağını gösteriyordu. Bundan ancak hiç kimsenin giremeyeceği kör pencereler oluşturulabilirdi. Çok etkili bir hermenötik ancak filolojik yorumun ustalığını, gerçek felsefi kabiliyetle birleştirmiş olan bir kafa yapısında oluşabilirdi. Schleiermacher işte böyle biriydi (Dilthey, 1924, 320).

Schleiermacher şu şartlar altında çalıştı: Winckelmann'ın sanat eserlerini yorumlaması, Herder'in bilişsel olarak çağların ve toplumların ruhunu anlayabilmesi, Heyne, Friedrich August Wolf ve onun talebelerinin filolojik çalışmalara yeni bir estetik bakış açısı getirmesi ki; bunların içerisinde Heindorf, Schleiermacher'le sıkı bir ilişkiye girerek Eflatuncu araştırmalar içerisinde bulunmuştur. Bütün bu şartlar Schleiermacher'i Alman Transandantal Felsefesinin tecrübesiyle bağlıyordu. Bilinçaltında verilen bir yaratıcı kabiliyete geri dönme fikri ve bu birlikteliğin etkisi kendisi farkında olmadan içimizdeki dünyanın bütün formunu meydana çıkarıyor; işte bu iki anın birleşmesinden de, özel bir yorumlama sanatı ve bilimsel hermenötiğin temellendirilmesi ortaya çıkıyordu.

Hermenötik o zamana kadar en azından bir kurallar binasıydı, onun kısımları ve kendi kuralları genel geçer bir yorumlamanın hedefiyle birbirine bağlıydı. Hermenötiğin yorumlamada birlikte etki ettiği yorumu gramatik, tarihsel, estetik-retorik ve nesnel olarak kısımlara ayıran fonksiyonları vardı. Hermenötik yüzyıllar boyunca filolojik ustalıktan çıkan kuralların bu fonksiyonlarının neye göre etki etmesi gerektiğini bilince çıkardı.Şimdi Schleiermacher anlamayı analiz etmek için tekrar bu kurallara geri döndü. Böylece bizzat bu hareketin amacını anlayabilmek için bu anlayıştan genel geçer yorumlamanın imkânını, araçlarını, sınırlarını ve kurallarını çıkardı. Ama o, taklit etme, kurma ve planlama olarak tanımladığı anlamayı, yalnızca metodun edebi ürünle canlı bir ilişki içinde olursa analiz edilebileceğini dile getiriyordu. Bu yaratıcı metodun canlı bakış açısından etkili bir eser ortaya çıkar, böylece o başka bir metodun anlaşılması için gerekli olan koşulu tanımış olur. Nasıl bir eserin yazım şeklinden onun tamamı anlaşılıyorsa, onun amacından da yazarın ruh hali anlaşılır(Dilthey, 1924, 324).

Böylece problemin çözümü için yeni bir tarihsel-psikolojik bakış açısı gerekiyordu. Bu bağlamdan yola çıkarak, Antik Yunan yorumlama ve retoriğinin arasında belirli bir edebi ürün çeşidinin sanat öğretisi olarak hermenötiğin oluşmasının, ilişkisini takip ederek burada neyin kastedildiğini bulmaya çalıştık. Ama bu iki usulün anlayışları sonuçta hep tarihsel ve mantıksal olarak kaldı. Bu görüşün içinde gerçekleştiği kategoriler, sürekli yapıp etmeler, mantıksal bağlam, mantıksal düzen ve sonra da bu mantıksal ürünlerin üslup, konuşma figürleri ve resimlerle giydirilmesiydiler. Şimdi edebi bir ürünün anlaşılması için çok yeni kavramlar kullanılıyor. Bütünlük ve yaratıcılık içeren bu kabiliyet kendi etkisinin ve yaratıcılığının farkında olmadan bir eserde ilk önce ortaya atılan fikirleri kabul eder ve onlara şekil verir. Bu fikirleri karşılama ve kendiliğinden oluşturma ondan ayrılmaz bir parçadır. Burada bireysellik tepeden tırnağa, her bir kelimeye kadar etkisini gösterir. Edebi eserin iç ve dış şekli onun en yüksek ifadesidir. Şimdi bu eserin karşısında bitmek tükenmek bilmeyen bir ihtiyaç durur: Başkalarının bakış açısından dolayı kendi bireyselliğinin sınırlandırılmasının gerekliliği. Anlama ve yorumlama bizzat hayatın içinde sürekli faal ve etkindirler, hayati önem taşıyan eserlerin sanatsal içerikli yorumunda ve bizzat yazarların zihninde oluşumlarını tamamlarlar. Bu Schleiermacher'in zihninde farklı bir biçimde oluşan yeni bir bakış açısıydı.

Ama genel bir hermenötiğin bu büyük atılımı için başka bir şart daha vardı. Bu tarihsel-psikolojik bakış açısı, Schleiermacher ve arkadaşları tarafından filolojik yorumlama sanatı ile geliştirilmiştir. Schiller, Wilhelm von

Humboldt ve Schlegel kardeşlerdeki bu Alman Ruhu, şiirsel bir edebi ürün olmaktan çıkıp tarihsel dünyanın anlaşılmasına dönmüştür. Bu güçlü bir hareketti; Böckh, Dissen, Welcker, Hegel, Ranke ve Savigny bu harekete tabi oldular. Friedrich Schlegel filolojik sanatta Schleiermacher'in öncüsü oldu. Schlegel'in Yunan şiiri, Goethe ve Boccaccio üzerine yapmış olduğu parlak çalışmalarında kullandığı kavramlar, eserin iç üslubuna, yazarının gelişim tarihine ve edebiyatın bütün alanlarına ışık tutuyordu. Böyle derinlemesine yapılanmış filolojik sanatın tekil başarısının arkasında bilimsel bir kritik yatıyordu. Eleştiri sanatı (Ars critica) bu üretilmiş edebi yeteneklerin teorisi üzerine kurulmuş olmalıydı. Schleiermacher'in "Hermenötik ve Kritik (Hermeneutik und Kritik)" adlı eserinde bu plana kısaca temas ettiği gibi (Dilthey, 1924, 324).

Schlegel tarafından da Eflatun tercümesinin planı başlatılmış oldu. Bununla yeni yorumlamanın tekniği kuruldu ve ilk önce Böckh ve Dissen bunu Pindar üzerine uyguladılar. Eflatun'un felsefe sanatçısı olarak anlaşılmış olması gerekiyordu. Bu yorumun hedefi, Eflatuncu felsefi karakterle ve Eflatuncu eserlerin sanatsal şekli arasındaki bütünlüğün sağlanmasıdır. Felsefe o zaman henüz canlıdır, konuşma ile birleşir, yazınsal oluşumu yalnızca zihinde yer etmesi ve hatırlanması için gereklidir. Onun sanatsal formda bir diyalog olması gerekir. Felsefenin kendini üretmeye devam edebilmesi için canlı düşünce bağlantısına ihtiyacı vardır. Aynı zamanda sıkı bir bütünlük arz eden bu Eflatuncu düşünceye göre her diyalog, olayın öncesini kapsamalı, sonrasını hazırlamalı ve felsefenin çeşitli bölümlerini oluşturmaya devam etmelidir. Diyalogun bu ilişkisi takip edilirse, o zaman kaynak eserlerin bağlantısı oluşur, bu da Eflatun'un en içsel niyetini ortaya çıkarır. Schleiermacher'e göre sanatsal olarak oluşturulan bağlantıdan sonra ancak Eflatun anlaşılabilir. Bununla ilişkili olarak onun eserlerinin kronolojik sıralamasında bu bağlantı çökebilir ya da daha önemsizleşebilir. Böckh o meşhur eleştirisinde (Rezension) Eflatun için filoloji bilimi alanında oluşturulmuş bir başyapıt olduğunu söylemiştir.

İlk defa Schleiermacher'in dehasında böyle bir filolojik ustalıkla, felsefi bir yetenek bir araya gelmişti. Gerçi bunda hermenötik problemin çözülmesi ve bütün metinler için yeterli bir araç sunan transandantal felsefenin rolü de büyüktü. Böylece genel bir bilim ve yorumlama sanatı öğretisi olarak hermenötik ortaya çıktı.

1804 sonbaharında, Schleiermacher, Ernestici yorum okumalarından hermenötiğin ilk taslağını geliştirdi, bununla Halle üniversitesindeki yorumlama derslerini başlatmak istemişti. Bizim elimizde böyle oluşturulmuş bir hermenötiğin sadece çok etkisiz bir şekli vardı. Buna gerekli etkinliği, Halle döneminden Schleiermacher'in talebesi olan Böckh, felsefi ansiklopedi hakkındaki derslerinin o harika kısmında kazandırmıştır (Dilthey, 1924, 332).

Schleiermacher'in hermenötiğinden, başka bir gelişmeye bağlı olarak, benim için gerekli görünen bazı cümleleri buraya alıyorum. Bütün edebi eserlerin yorumlaması, yalnızca anlamanın sanatsal olarak oluşturulmuş metoduyla yapılabilir. Bu yaşamanın bütün yönlerine kadar uzanır, konuşma ve yazının her türünü içerir. Buna göre anlamanın analizi yorumlamada kural koyma için temel durumundadır. Ama bu ancak edebi ürünlerin analiz edilmesiyle ilişkilendirilebilir. Yorumun araç ve sınırlarını belirleyen, anlama ve ürün verme arasındaki ilişkiyle ancak kuralların bağlantısı oluşturulabilir.

Genel geçer yorumun oluşması imkânı, ancak anlamanın doğasından üretilebilir. Yorumcunun ve eserin yazarının kişiliği kıyaslanamaz iki olgu olarak karşı karşıya gelmezler. Genel insan tabiatının temelinde bu iki olgu bulunmaktadır. Bundan dolayı da insanın kolektifliği ancak konuşma ve anlama ile mümkündür. Burada Schleiermacher'in formüle edilmiş ifadeleri psikolojik olarak tekrar açıklanabilir. Sonuçta bütün farklılıklar, kişilerin birbirinden kalitatif farklılıkları değil, aksine yalnızca onların ruhsal durumlarından kaynaklanan temel farklılıklarına bağlıdır. Ama şimdi yorumcu kendi yaşamsallığını tarihsel bir ortama deneyerek yerleştirdiği takdirde buradan o anki ruhsal durumları vurgulamayı ve kuvvetlendirmeyi, diğerlerini geri bırakmayı ve böylece yabancı hayatların bir taklidini kendi içine katmayı başarabilir.

Bu metodun mantıksal tarafı göz önüne alındığında; o zaman yalnızca göreceli, belirlenmiş bazı işaretlerden mevcut gramatik, mantıksal ve tarihsel bilimin değişmez katılımı altında bir bağlam göze çarpar. Bizim mantıksal terminolojimizde ifade ettiğimiz, anlamanın bu mantıksal tarafı, böylece tümevarımın birlikte etki etmesinde, genel hakikatlerin özel durumlara uygulanmasında ve karşılaştırmalı metotta bulunur. Yapılacak olan

son görev, özel formların tespiti, burada zikredilen mantıksal operasyonlar ve onların bağlantılarının kabul edilmesidir.

İşte burada bütün yorumlama sanatlarındaki başlıca zorluk kendini hissettirir. Her bir kelimeden ve onların bağlantılarından bir eserin tamamının anlaşılması gerekir, fakat parçanın tam anlaşılması bütünün anlaşılmasına bağlıdır. Bu döngü, tek bir eserin yazarının gelişimi ve ruh haliyle olan ilişkisinde tekrarlanır ve aynı zamanda bu eserin edebi türüyle olan ilişkisinde geri döner. Bu zorluğu, Schleiermacher pratik olarak en güzel şekilde "Eflatun'un Devlet'ine Giriş" adlı eserinde çözümlemiştir. Kendi yorumlama ders notlarında ben aynı metodun başka örneklerine rastladım. [O derse bölümün özetiyle başladı, bu özet üstünkörü bir okumayla kıyaslanabilirdi. Bu giriş, ana hatlarıyla bütün bağlamı içine aldı. Zorluklara ışık tuttu. Kompozisyon hakkında bilgi verilen her yerde durdu ve düşündü. Bundan sonra asıl yorumlama başladı.] Burada teorik olarak bütün yorumlamaların sınırı ile karşılaşırız, belli bir dereceye kadar işlevini yerine getirir: Böylece her şeyi anlamak, her zaman göreceli olarak kalır ve hiç bir zaman sona erdirilemez.

Schleiermacher'den önce yapıldığı gibi, yorumlama metodunun gramatik, tarihsel, estetik ve nesnel yorum olarak kısımlara ayrılmasını o kabul etmemiştir. Eğer yorumlama başlamış ve her bir türe aynı etkiyi yapabilecekse, o zaman bu taksimat yalnızca gramatik, tarihsel, nesnel ve estetik bilmenin olmasına işaret eder. Ama bizzat yorumlama metodu yalnızca iki kısma ayrılabilir, bu kısımlar dil işaretlerinin içerdiği şeylerden zihinsel bir yaratıcılığın anlaşılmasıdır. Gramatik yorumlama, metinde bağlamdan bağlama gider ve metnin bütününde en yüksek derecede bağlantı kurulmasına kadar devam eder. Psikolojik yorumlama, yaratıcı içsel sürecin oluşmasıyla başlar ve eserin iç ve dış formuyla ileriye doğru gider, buradan da eserin bütünlüğünün yazarının gelişimine ve ruh halini kaydetmeye kadar varır (Dilthey, 1924, 336).

Şimdi Schleiermacher'in yorumlama sanatını ustaca geliştirdiği noktaya ulaşıldı. Onun öğretisinde iç ve dış form temeldir, özellikle de edebi ürünlerin genel teorisi derin anlam taşır. Organon'un edebiyat tarihinde önemli bir yeri olduğu gibi.

Hermenötik metodun ulaşmak istediği en son hedef, yazarı kendisinden daha iyi anlamaya çalışmaktır. Bir cümle düşünün ki, öğretisinin tutarlılığı bilinçsiz bir yaratmadan oluşmuştur.

Şimdi sonuca gelmiş bulunuyoruz. Anlama, yalnızca dil anıtları karşısında genel geçerliğe ulaşmış bir yorumla mümkün olabilir. Eğer hermenötik de filolojik yorumlama metodunun ve doğruluk sebeplerinin bilincinde olursa; böyle bir disiplinin pratik yararı canlı bir egzersizle karşılaştırıldığında, Friedrich August Wolf'un haklı eleştirisinde olduğu gibi, yüksek derecede bir etkide bulunamaz. Ama bu pratik yararın ötesinde yorumlamanın bana göre kendi görevi, ikinci hatta en önemli görevi olarak, romantik keyfiliğin ve şüpheci öznelliğin devamlı baskısı karşısında, yorumun genel geçerliğini tarih çerçevesinde teorik olarak temellendirilmesi görünüyor. Çünkü tarihin bütün güvenilirliği buna dayanır. Yorumlama öğretisi, bilgi kuramı (Erkenntnistheorie) bağlamında ve beşeri bilimlerin mantık ve metot öğretisi olarak kabul edildiğinde o zaman bu öğreti felsefe ve tarihsel bilim arasında önemli bir bağlayıcı olur. Yani beşeri bilimlerin asıl tamamlayıcısı ve temellendirici unsuru olur (Dilthey, 1924, 317).

Özet

Bilgi toplumu olma, bilgi ve üretimin hızlı paylaşımı, tarım toplumundan bu yana üretim fazlası veren ve bunları depolama veya pazarlamaya çabalayan insanoğlunun daha da acımasız rekabet koşulları ile yaşantısını devam ettirme gereğini ortaya çıkarmıştır. Zaman içinde ortaya çıkan bu rekabet ortamı klasik yönetim yaklaşımlarını da etkilemiş, hiyerarşik bürokrasi ve otoriteye dayalı yönetim anlayışı, yerini insanların çıkarlarının birleştirildiği, farklılıklar arasında orta yolun bulunduğu, hak ve sorumlulukların hayata geçirildiği mekanizmalar, süreçler ve kurumlara bırakmıştır. Bu gelişmeler ile şekillenen günümüz felsefesi, geleneksel eğitim anlayışını etkilemiş ve çağdaş eğitim sürecini bir yarışmaya dönüştürmüştür.

Bu çalışmada daha rekabetçi bir ortamın yaşandığı günümüz dünyası yapısına uygun olarak eğitim denetimi alanında "koçluk" kavramı açıklanmaya çalışılacaktır. Bu amaçla koçluk yaklaşımı, koçluk türleri, koçluğun yararları ve yönetim teorilerinde koçluk yaklaşımları üzerinde durulacaktır.

Eğitimde denetimin gereği önemlidir. Günümüzde denetim, kontrol etmekten öte geliştirme odaklı bir işlev içinde görülmektedir (Aydın, 2008: 3). Eğitim kurumlarının bu yapıya uygun denetimi, denetimde yeni bir yaklaşımı; "Koçluk" kavramını gündeme getirmiştir.

Günümüzde eğitim sistemi yapısı ve buna bağlı olarak müfettişlerden beklenen roller değişmektedir. Alışıldık klasik yönetim tarzı olan hiyerarşiye uyma, emir verme ve kontrol etme yerine esnek örgütlenme, sürekli değişim, risk alma, motive etme ve geliştirme gibi davranışları içeren "koçluk" yaklaşımı önem kazanmaktadır.

Yönetim alanına "koçluk" kavramının girmesi ile eğitim sistemleri içerisinde de "Denetimde Koçluk" uygulamaları başlamıştır. Eğitim denetçilerinin koçluk yaklaşımını benimsemeleri ve uygulamaları, kendi gelişimlerini, öğretmenlerin daha verimli olmalarını ve okul örgütlerinin daha etkin bir yapıya kavuşmalarını sağlayacaktır.

Anahtar Kelimeler: Koçluk, eğitim denetimi, yönetim teorileri

Abstract

Being information society, sharing information and production rapidly have revealed the need of human being who has given production surplus since the agricultural society and has strived for storing or marketing them to continue his life with even harsher competitive conditions. The competitive environment which has occurred in time has also affected the classic management approaches, the management approach which based on hierarchical bureaucracy and authority has given its place to the mechanisms, processes and institutions where the interests of people has been combined, where the common way has been found between differences, where the rights and responsibilities have been put into action. Today's philosophy is shaped by these developments has affected the traditional education approach and has turned the modern educational process into a competition.

In this study, "coaching" concept in the field of educational supervision will be tried to explain according to the structure of the contemporary world that is experiencing a more competitive environment. For this purpose, coaching approach, coaching types, benefits of coaching and coaching approaches in management theories will be focused.

Requirement of supervision in education is important. Today supervision is seen in a function-oriented development than controlling (Aydın, 2008: 3). Supervising the educational institutions appropriate this structure has brought up a new approach in supervision; "coaching" concept.

Today the structure of the education system and depending on this the roles expected from inspectors has changed. "Coaching" approach including behaviors such as motivating and development, flexible organization, continuous change, risk taking instead of traditional management style such as comply the hierarchy, giving orders and controlling becomes important.

"Coaching Supervision" applications have started in education systems with the entrance of "coaching" concept into management area. Education supervisors adopt and implement the coaching approach will provide their own development, teachers to be more efficient, school organizations leading to a more effective structure.

Key Words: Coaching, education supervision, management theories

Giriş

İnsanoğlu, yeryüzünde yaşadığı ilk günden başlayarak hem eğitilen hem de eğiten varlık olmuştur. Başka bir değişle insanlar, öncelikle çevresindeki insanlara ve diğer varlıklara bakarak onlardan birtakım yaşam becerilerini öğrenmişler, daha sonra da bunların en işlevsel olanlarını, yakın çevrelerinden başlayarak toplumun diğer bireylerine öğretme yoluna gitmişlerdir. Bu da tüm insanlık tarihi boyunca sürekli bir gelişme göstermiştir. Günümüz uygarlığı bu eğitsel süreçlerin bir toplamı olarak ortaya çıkmıştır (Başar, 2011: 25).

Her insanın en az bir amacı, kendine özgü oluşturulmuş değerleri, inançları ve geçmiş yaşantıları sonucunda oluşturulmuş olduğu tutumları vardır. Bütün bunlar sayesinde yaşamı anlar, yorumlar ve yeni değerler katar. Yaşamdan beklentileri vardır. Birçok filozofun dediği gibi, her insanın bir felsefesi vardır. Felsefe bir yaşam biçimi, geleceğe bakış açısı, bir dünya görüşüdür (Ergün, 2011: 69).

Bu anlamda günümüz uygarlığını vardığı noktaya getiren eğitim süreci ile felsefenin iç içe olması kaçınılmaz bir gerçektir. İnsanoğlunun yaşantısı birçok alanda sürekli olarak bir gelişim ve değişim göstermektedir. Bilimsel gelişmeler ve felsefe birbirini sürekli etkilemektedir. İlkel toplumlardan, tarım toplumuna, sanayi devrimine derken günümüz toplumları artık bilgi çağını yaşamaktadır. Bilgi çağının ihtiyaç duyduğu insan tipini ise formal bir şekilde eğitim veren günümüz eğitim kurumları yetiştirmeye çalışmaktadır.

Bilgi toplumu olmanın, bilginin ve üretimin hızlı paylaşımı, tarım toplumundan bu yana üretim fazlası veren ve bunları depolama veya pazarlama yoluna giden insanoğlunun daha da acımasız rekabet koşulları ile yaşantısını devam ettirme gereğini ortaya çıkarmıştır. Zaman içinde ortaya çıkan bu rekabet ortamı klasik yönetim anlayışlarını da etkilemiş, yapısında bulunan hiyerarşik bürokrasi ve otoriteye dayalı yönetim anlayışı, yerini insanların çıkarlarının birleştirildiği, farklılıklar arasında orta yolun bulunduğu, hak ve sorumlulukların hayata geçirildiği mekanizmalar, süreçler ve kurumlara bırakmıştır. Bu gelişmeler ile şekillenen günümüz felsefesi, geleneksel eğitim anlayışını da etkilemiş, çağdaş eğitim sürecinin de yarışmalı bir hale gelmesine sebep olmuştur.

1.1. Araştırmanın Önemi ve Gerekçesi

Dünyadaki bu gelişmeler Türkiye eğitim sistemi ve uygulamalarını da etkilenmiştir. Bakanlar kurulunun 25.08.2011 tarih, 2011 / 652 sayılı ve "Milli Eğitim Bakanlığının Teşkilat ve Görevleri Hakkında Kanun Hükmünde Kararname" adlı kararnamesi ile "Teftiş Kurulu Başkanlığı" şeklindeki ilgili birim adı "Rehberlik ve

Denetim Başkanlığı" biçiminde değiştirilmiştir. Aynı şekilde birim denetimini gerçekleştiren kişilerin görev adları hiyerarşik yapıya uygun olarak korunmuştur. İlgili kararnamenin "Personele Dair Geçiş Hükümleri" başlığı altında "Bakanlık Teftiş Kurulu Başkanlığı Başmüfettiş, Müfettiş ve Müfettiş Yardımcısı kadrolarında bulunanlar, Rehberlik ve Denetim Başkanlığında ilgisine göre Millî Eğitim Baş denetçisi, Denetçisi ve Denetçi Yardımcısı kadrolarına başka bir işleme gerek kalmaksızın bulundukları kadro dereceleriyle atanmış sayılır." şeklinde düzenlenmiştir.

18. Milli Eğitim Şûrası Kararlarının "İlköğretim ve ortaöğretimin güçlendirilmesi, ortaöğretime erişimin sağlanması" başlığı altında yer alan 36. Maddede "Eğitim çalışanlarına branşında rehberlik ve denetim esas alınmalı" şeklinde vurgu yapılmıştır.

"Milli Eğitim Bakanlığı İlköğretim Kurumları Standartları Uygulama Yönergesi" içerisindeki 4. Bölüm – 19. Madde / c bendinde de Milli Eğitim Bakanlığı adına denetim görevini gerçekleştiren bu kişilerin yeni görevlerinin içeriğini oluşturan anlayışta "rehberlik" görevinin öne çıkarıldığı görülmektedir.

Bu şekilde yapılan son düzenleme ve önerilerin, ilgili alan yazınında yer alan "Koçluk" kavramı ile örtüşüyor olması, eğitim denetiminde koçluk yaklaşımının bir model olarak ele alındığı bu araştırmanın önem ve gerekçesini oluşturmaktadır.

1.2. Araştırmanın Amacı

Bu çalışmanın amacı; daha rekabetçi bir ortama sahip günümüz şartlarına uygun insan tipini yetiştiren eğitim kurumlarının denetiminde görev alan eğitim denetçilerinin rollerine bir model olacak şekilde "koçluk" yaklaşımının açıklanmasıdır. Ortaya konacak eğitim denetiminde koçluk yaklaşımı ile daha verimli bir eğitim – öğretim ortamı oluşumuna katkıda bulunulması hedeflenmiştir. Bu amaçla şu sorulara yanıt aranmıştır:

1. Yönetim kuramlarındaki gelişmeler ve denetim anlayışlarına yansımaları nelerdir?

2. Koçluk kavramı, türleri ve yararları nedir?

3. Eğitim denetiminde, koçluğa dayalı denetim yaklaşımının yeri nedir?

1.3. Yöntem

Bu çalışmada hâli hazırda yayımlanmış materyallerin çözümsel değerlendirilmesi yapılmıştır. Önceden konu ile ilgili yapılmış çalışmalar taranmış, konu ile ilgili taşıdıkları önem göz önünde bulundurularak amaca uygun biçimde bir bütün haline getirilmiş ve okuyucuları durumdan haberdar etmek için özetlenmiştir. Çalışma bu yönüyle genel tarama modelinde, belge ve metin çözümlemesine dayalı nitel bir araştırmadır.

2. Bulgular

Eğitim denetçilerinin rolleri içerisinde yer alan "koçluk" kavramı ile ilgili yapılan taramalar neticesinde şu bulgulara ulaşılmıştır.

2.1. Yönetim Teorileri ve Denetim Yaklaşımları

"Bilimsel yönetim", "Yönetsel kuram" ve "Bürokrasi modeli" biçimindeki yaklaşımların yer aldığı klasik örgüt kuramları, yönetsel

açıdan süreç ya da fonksiyonel yaklaşıma dayanır. Süreç ya da fonksiyonel yaklaşım, deneysel ampirik okul ile yönetim süreci okulun yönetimine ilişkin görüş, düşünce ve ilkelerini yansıtır. Frederick W. Taylor'un öncülük ettiği, "Bilimsel Yönetim", önce A.B.D' de ortaya çıkmış, daha sonra da Avrupa'da "Taylorizm" ya da "Rasyonalizasyon" adı altında hızla yayılmıştır (Gürsel, 2008: 29).

Bilimsel işletmecilik akımının okul yönetimine girmesi, okul yöneticisinin bir verim uzmanı olarak kabul edilmesine yol açmıştır. Okullar fabrika, öğrenciler ham madde olarak kabul edilmiş, okulların sosyal ve psikolojik yanları ihmal edilmiştir.

Kuruculuğunu Henri Fayol'un yaptığı yönetim süreci yaklaşımında ise, insanları motive etmek için disiplin ve ceza öngörülmekte, örgütsel verimlilik için ortaya konulan kurallara uyulması istenmiş, yönetilenden çok yöneticiye güvenilmiştir.

Bürokrasi modelinin kurucusu olan Max Weber de, örgüt hiyerarşisinde yer alan pozisyonların yetki ve sorumluluklarının belirlenmesi, mevkilere uzman kişilerin yerleştirilmesi, kurallar ve yönetmelikler konulması gibi konular üzerinde durmuştur. Ancak bu tip yaklaşımlar, yetki devri, sorumluluk dağılımı, işbirliği, çatışma, merkezden ve yerinden yönetim kalıp ve derecelerini belirlemede yetersiz kalmıştır.

Klasik yönetim düşüncesi; kişisel çıkarlar peşinde koşan, menfaatçi, tembel, karar ve yargılama kabiliyeti zayıf olan akılcı – ekonomik insan modeli varsayımına dayanır. Özellikle, bilimsel yönetimde "insan" bir robot gibi görülüp standartlaştırılmıştır. Kişilerin birbirinden farkı

yoktur. İnsanlar rasyonel davranırlar. İnsanların yönetiminde kişi ve grupların akılcı davranışları önemlidir. Grup üyeleri, üstlerinin rehberliği olmadan pozisyonlarının getirdiği ilişkileri yürütemez. Ekonomik ödüllendirme ve prim esasına dayalı bir motivasyon sistemi uygulanır.

Klasik yönetim anlayışlarının gelişmeye başladığı dönemlerde "koç" kavramı kano yarışlarına katılan takımları eğiten kişileri (çeşitli spor dallarında çalışan koçlar) ifade etmek için kullanılmıştır. Klasik yönetim anlayışında, özellikle bilimsel işletme yaklaşımında, koçluk anlayışından söz etmek mümkün değildir. Yetkilendirmeyi esas alan koçluk yaklaşımı ile bilimsel işletmecilik yaklaşımı birbirinden tamamen farklı durumdadır. (Evered ve Selman, 1989).

Klasik yönetim teorileri kısa bir süre sonra eleştiriler almaya başlamıştır. Taylor'un bilimsel işletmecilik ilkeleri işçi ve yönetici kuruluşlarının çeşitli eleştirilerine uğramıştır (Bursalıoğlu, 2005: 27). İşletmelerde klasik yönetim yaklaşımlarının yetersiz kalması ve çeşitli örgütsel sorunların artması sonucunda, 1920'li yıllarda neo – klasik yönetim teorisi (insan ilişkileri yaklaşımı) ortaya çıkmıştır. Bu yaklaşım esas itibariyle klasik yönetim düşünce sisteminin kavram ve ilkelerine dayanmaktadır. Klasik yaklaşımının arka plana attığı insan öğesini, inceleme ve araştırmalarında ön plana çıkarmıştır. Neo - Klasik Yönetim Düşüncesi, insanı sosyal ve psikolojik varlık olarak değerlendirmiştir. Ayrıca doğal grupların biçimsel gruplardan daha etkili olduğunu ve grup davranışlarının üretimi doğrudan doğruya olumlu ya da olumsuz şekilde etkilediğini ileri sürmüştür.

Klasik Yönetim Düşüncesinin dayandığı "akılcı ekonomik insan" modeli, yerini "sosyal insan" modeline bırakmıştır. İnsanın sosyal ve psikolojik bir varlık olarak kabul edilmesi, örgütün insanların çalıştığı, yaşadığı ve birbirleriyle ilişkide olduğu bir sosyal birime dönüştürülmesi sonucunu getirmiştir. Bu nedenle insan davranışlarının, örgüt yapı ve işleyişini etkileyeceği kabul edilerek, örgütte bulunan insanların kendi güdüleri, inançları, ihtiyaçları, tutum ve değerlerinin olduğunu düşünen bu anlayış, onların birer araç olarak görülmesinin mümkün olmadığını ileri sürmüştür (Çetin, 2003: 37).

İnsan ilişkileri yaklaşımının ele aldığı başlıca konular, insan davranışı, kişiler arası ilişkiler, grupların oluşumu, grup davranışları, biçimsel ve biçimsel olmayan örgüt, algı, tutumlar, motivasyon, liderlik, örgütlerde değişim ve gelişme, birey ve örgüt bütünleşmesi olmuştur (Şahin, 2004: 530-531).

Neo - Klasik Yönetim Düşüncesinin aldatıcı bir demokrasi havası yaratması, işletmelerde kararlara katılmanın sahte bir biçimde uygulanması nedeniyle eleştirilmiştir. Fakat kararlara katılma, iş genişletme, merkezcil olmayan yönetim, kişiye yönelik denetleme, aşağıdan yukarıya haberleşme vb. gibi önlemlerle daha etkili ve verimli çalışma ortamı yaratılmaya çalışılmıştır. Teori ve uygulama açısından, yöneticiye insanlarla olan ilişkilerine yol gösterici, çalışanlarıyla iletişim kurma becerisini geliştirici bir bilgi topluluğu sağlamıştır. Yönetimin insan ilişkilerine dayanan "sosyal bir süreç" olduğunu davranış bilimlerinin de katkısıyla göstermiştir (Baransel, 1979: 223 – 227).

Neo - Klasik Yönetim Düşüncesinin hâkim olduğu 1950'li yıllardan bu yana işletmelerde koçluk yaklaşımı görülmektedir. Bu dönemde koçluk yaklaşımı ile ilgili yazılmış makalelerde, çalışanların iş becerilerini iyileştirmek amacıyla nezaretçilerin koçluk becerilerini geliştirme eğitimlerinin öneminin altı çizilmiştir. "Koçluk" yaklaşımı, usta – çırak ilişkisinin bir şekli, astların gelişimine ilişkin sorumluluklardan biri olarak algılanmıştır (Arat, 2007: 131).

Bir yönetim alanı olarak "koçluk" yaklaşımının öne çıkması Myles Mace' ın çalışmalarıyla gerçekleşmiştir. "Koçluk" yaklaşımı oldukça değerli ve sonradan kazanılabilen bir yönetim becerisi olarak ele alınmıştır (Maher ve Pomerantz, 2003).

Yönetim düşüncesinin değişmesinin temelinde, insan düşüncesinin ve toplumsal yaşamın gelişimi vardır. Davranışsal Yönetim Kuramları, bilimsel gelişmelere bağlı olarak ikinci dünya savaşı yıllarından itibaren yerini Sistem Yaklaşımı ve Durumsallık Yaklaşımına bırakmaya başlamıştır (Genç, 2004).

Sistem yaklaşımında insanlar, gruplar, yöneticiler örgütsel sistemin bir parçasıdır ve davranışlarında bu sistemi etkileyen faktörleri ve bu faktörlerdeki değişimleri titiz bir şekilde izlemek, örgütsel başarıyı sağlayacak tutumları göstermek zorundadırlar. Bunun için örgüt içinde oluşturulacak alt sistem ve organların görevlerini iyi belirlemek gerekmektedir (Eren, 2008: 55).

Sistem yaklaşımının yöneticilere bulunduğu katkılar şöyledir (Koçel, 2003: 242-243):

- Yönetici görevini dar bir şekilde, sadece kendi fonksiyonu açısından yorumlamaktan kurtularak, kendi sisteminin bağlı olduğu diğer alt – sistemleri ve çevre koşullarını da dikkate almak zorunda kalmıştır.

- Yöneticiye kendi sisteminin amaçlarını daha geniş bir sistemin amaçları ile ilişkilendirmek fırsatını vermiştir.

- Yönetici, organizasyon yapısını alt – sistemlerin amaçları ile uyumlu bir şekilde kurmak olanağına kavuşmuştur.

- Yönetici, alt – sistemleri değerlendirirken bu sistemlerin esas sisteme yaptıkları katkıyı belirleme olanağına kavuşmuştur.

Sistem yaklaşımı sayesinde yönetici için daha kapsamlı araçlar ortaya çıkmıştır. Sistem düşüncesine uygun yöneticiler, örgüt amaçları için çalışırken teknik yön ve çalışanlar arasında uyumu en iyi şekilde ortaya koymaya çalışmışlardır. Yönetici, örgüt amaçları için işleri yürütmekten çok işleri koordine eden bir yaklaşıma yönelmiştir.

Sistem düşüncesi bireyleri, ekipleri ve organizasyonları; dünyayı alt sistemlerden oluşan bir bütün olarak görmektedir. Bu bütün içinde koçlar çalışanının tüm süreçleri görmesini sağlar (Ceylan, 2002: 13-15). Bir yönetim sistemi olarak ele alınan koçluk, örgütün amaçlarını, çalışanların performanslarını – yeteneklerini ve alt sistemleri geliştirilen bir yapıdadır.

Sistem yaklaşımının yönetim bilimine sunduğu kavramlardan birisi olan entropy, (Gürsel, 2008: 37) sistemin bozulması veya ölmesi demektir. Örgütler, entropyi önleyecek mekanizmalar geliştirirler. Çalışanlar koçlarını iş başında devamlı izlemektedir. İşgörenler, koçun

onlara nasıl görevler verdiğini, grupla nasıl iletişim kurduğunu, zamanı nasıl yönettiğini, sürekli öğrenme ve kendini geliştirme konusunda neler yaptığını gözlemektedir. Bu yüzden bazı astlar koçun davranışlarını kendilerine uydurmaya çalışabilir. Astlar arasında koça benzeyen doğal liderler oluşması negatif entropye neden olabilir. Bu nedenle koç, iyi bir yönetici ve iyi bir iş arkadaşı olmalı ve astların benimsemesini istediği standartlar koymalıdır.

Örgütsel davranış konusunda geliştirilen yaklaşımlardan bir diğeri de durumsallık yaklaşımıdır. Klasik, neo – klasik, insan kaynakları yaklaşımı örgütsel sorunlara çözüm getirecek tek bir model üzerinde durmuş ve çalışmışlardır. Hazırladıkları modellerin her örgüt için ve tüm koşullarda geçerli olduğunu iddia etmişlerdir. Ancak değişik düşünürler tarafından ve farklı örgütsel koşullarda yapılan araştırmalar her örgüte uygulanabilecek genel ve evrensel modellerin bulunmadığını ortaya koymuştur (Eren, 2008: 55).

Durumsallık yaklaşımına göre her insan ve her durum farklıdır; dolayısıyla en iyi örgüt yapısı yoktur. Genellikle teknoloji ve çevre faktörlerinin organizasyona etkileri üzerinde durulmaktadır. En iyi yönetim tarzı insana, teknolojiye ve çevreye göre değişiklik göstermektedir (Şahin, 2004: 536). Örgütlerin değişik zaman, durum ve koşullarda karşılaştıkları yönetsel sorunların her defasında aynı genel yönetim ilkeleri ile çözümlenmesi imkânsızdır (Doğan, 1998: 191).

Durumsallık Yaklaşımı, değişik durum ve koşullarda başarılı olmanın anahtarını değişik kavram, teknik ve davranışlarda aramaktadır (Gürsel, 2008: 36). Durumsallık yaklaşımı ile günümüz dış çevre koşullarını

düşünecek olursak, değişimin her alanda kaçınılmaz olduğunu görürüz. 80'li yıllarda yönetim dünyasına giren koçluk kavramı, değişimle meydana gelen işletme yapısındaki farklılıklarda artık başarıya giden bir yol olarak görülmektedir. İşletmelerde yerleşik hale gelen değişim kültürünü yönetmek, güven oluşturmak, değerlerine sahip çıkmak, iş birliği ve uzmanlaşmayı sağlamak, yeni kuşaklara destek olmak için işletmeler artık koçlara ihtiyaç duymaktadır.

2.2. Denetim Alanındaki Gelişmeler

Denetim, kamu ve kurum yararına insan davranışlarını kontrol etme sürecidir. Önceden kararlaştırılmış amaçların gerçekleşme derecesini bulmak üzere her kurumda denetim yapılır (Taymaz, 2010: 3). Bu yönetsel uygulamalar doğrultusunda denetim, örgütsel eylemlerin kabul edilen amaçlar doğrultusunda, saptanan ilke ve kurallara uygun olup olmadığının anlaşılması süreci olarak düşünülebilir (Aydın, 2007: 11).

Klasik yönetim kuramları, denetimin, teknik yanına ağırlık veren klasik denetim anlayışına yakındır. Verim, emretme ve kontrol öğelerinin önemliliği, işi yapandan çok yapılan işin gözetilmesi, denetimin kontrol öğesine ağırlık verilmesi, zorlayıcı olması bu yönetim ve denetim anlayışının genel özelliklerini oluşturur (Başar, 2000: 5).

Dönemin yönetim felsefesine uygun olarak yapılan klasik eğitim denetimi tanımlarına baktığımızda denetim ile hedeflenin esasen yapılan işlerin, örgütün amaçlarına uygunluğu ile ilgili olup olmadığı görmek söz konusudur. Bu tanımların yüklediği anlam ve içerik dâhilinde eğitim sistemimizin denetim anlayışı şekillenmiş ve tamamen yapılan işlerin kontrolü anlamında denetim süreçleri gerçekleştirilmiştir.

Eğitimde denetim anlayışı, yönetime ilişkin yaklaşım ve kuramlara uygun bir değişim ve gelişim göstermiştir. Yönetim kuramının ortaya koyduğu ilkelere, varsayımlara ve yaklaşımlara göre, denetime bakış açıları da zaman içinde farklılaşmıştır.

Eğitim denetimi uygulamalarına bakıldığında, başlangıçtan günümüze denetim anlayışında bazı değişimlerin olduğu görülmektedir. Ancak, geçmişteki denetim uygulamalarına yön veren anlayışların izleri, bugünkü uygulamalarda hala görülmektedir (Aydın, 2007: 12).

Örgütler, kuruluş ilkelerine uygun denetim sistemlerini de oluşturmuşlardır. Dolayısıyla, denetim ilkelerinde birlik sağlansa bile, süreçlerde değişikliğin yaşanması doğal bir olgudur. Bunun sonucu olarak da denetim uygulamaları zaman içinde farklılık göstermiştir. Oliva ve Pawlas (2004) tarafından denetim ile ilgili olarak ortaya konan tarihsel gelişim, Tablo 1'de gösterildiği şekilde gerçekleşmiştir (Aydın, 2008: 11);

Tablo 1. Eğitim denetiminin tarihsel gelişimi

Dönem	Denetleme Şekli	Amaç	Sorumlular
1620 – 1850	Kontrol	Kurallara uygunluğun sağlanması, yetersizliklerin	Aileler, yurttaş komiteleri,

		aranması	seçmenler
1850 – 1910	Kontrol, öğretimin iyileştirilmesi	Kurallara uygunluğun sağlanması, öğretmenlere yardım	Superintendent (Yöneticiler), okul müdürleri
1910 – 1930	Bilimsel, bürokratik	Öğretimin ve etkililiğin arttırılması	Denetici okul müdürleri, okul müdürleri, özel merkez bürosu deneticileri, superintendent
1930 – 1950	İnsan ilişkileri, demokratik	Öğretimin iyileştirilmesi	Merkez bürosu denetmenleri, Okul müdürleri
1950 – 1970	Bürokratik, bilimsel, klinik, insan ilişkileri, insan kaynakları, demokratik	Öğretimin iyileştirilmesi	Okul müdürleri, merkezi bürosu denetmenleri, okuldaki denetçiler
1975 – 1985	Bilimsel, klinik, insan ilişkileri, insan kaynakları, işbirlikçi, koç, akran, mentor, sanatsal, yorumsamacı	Öğretimin iyileştirilmesi, öğretmen doyumunun arttırılması, öğrencilerin sınıf olayları anlayışının genişletilmesi	Okul müdürleri, merkezi bürosu denetmenleri, okuldaki denetçiler, meslektaş, koç, mentor
1985 – …	Bilimsel, klinik, insan ilişkileri, insan kaynakları, işbirlikçi, akran, koç, mentor, sanatsal, yorumsamacı, kültürel olarak yanıt veren, ekolojik	Öğretimin iyileştirilmesi, öğretmen doyumunun arttırılması, öğrencilerin sınıf olaylarının anlayışının genişletilmesi, öğrenen toplumun yaratılması, sınıfta kültürel ve dilsel örneklerin analizi	Okuldaki denetçiler, meslektaş, koç, mentor, okul müdürü, merkez bürosu denetmenleri

Denetim sisteminin yapısı ile ilgili gelişmelerin geçmişten günümüze kadar olan gelişiminin anlatıldığı Tablo 1 incelendiğinde, kontrol anlayışlı bir yapıdan daha çok rehberlik ve koçluk anlamında bir yapıya dönüştüğü görülmektedir.

Denetimde önceleri, "okul müfettişi" olarak atanmış meslekten olmayan kişilere okul ziyareti, araç gereçlerin kontrolü, öğrencilerin bilgilerini ölçme gibi sorumluluklar verilmiştir. Daha sonraları denetmenin bir uzman olması ve öğretmenlere yardım etmesi gerektiği düşüncesi gelişmeye başlamıştır.

İşletmelerin açık sistem anlayışıyla yönetimi ve durumsallık anlayışına dayalı örgütsel yapılanma, günümüzdeki yönetim uygulamalarının temelini oluşturmuştur. Böylece daha esnek ve "önce insan" anlayışı ile yönetilen örgütler doğmaya başlamıştır. Bu gelişmelere paralel olarak sistem ve durumsallık yaklaşımının geliştiği 1980'li yıllara kadar yönetim literatüründe koçluk yaklaşımı yönetim geliştirme amacıyla kullanılan bir eğitim tekniği olarak görüldüğünden işletmelerde sadece bu yönde uygulamalara ağırlık verilmiştir (Evered ve Selman, 1989). Günümüzde koçluk yaklaşımı yalnız bir eğitim tekniği olmaktan çıkarak işletmelerin verimliliğini, çalışanların ve ekiplerin maksimum etkinliğini, performanslarını artıran yeni bir yönetim stili haline gelmiştir.

2.3. Koçluk

"Koç" kavramının İngilizce karşılığı olan "coach" kelimesinin en temel anlamı, "yolcuları, uzun bir yolculukta, yol üzerinde taşıyan büyük motorlu taşıt biçimindedir (Collins Cobuild English Language Dictionary, 1992: 259). Tarihte ilk kullanımı, Macaristan'ın Kocs köyünde yapılan ve adını oradan alan yaylı araba olarak ortaya çıkmıştır (Wikipedia, 2011). Günümüzde de İngiltere'de şehirlerarası yolcu otobüsleri "coach" olarak anılmaktadır. Aynı sözlükte "coach" kavramı kişi anlamında kullanıldığında; "birisine koçluk yapmak, özellikle bir sınava hazırlama amaçlı olarak o kişiye özel bir eğitim vermek" anlamına geldiği görülür.

"Koçluk" kavramı, ilgili alan yazını incelendiğinde değerli bir kişinin bulunduğu noktadan başka bir noktaya ulaşmasını sağlayacak bir araç, bir hizmettir. 1980'li yıllarda iş yaşamında ortaya çıkmış ve 1990'ların başından itibaren yönetim alanında bir kişiye belli bir amaç doğrultusunda, iş ile ilgili öğrenme anlamında müdahale yapmak olarak şekillenmiştir (Arabacı, 2010: 233). Bu anlayış ile çalışanların daha etkin olmaları amaçlanmaktadır.

2.3.1. Koçluk Türleri

Literatür taraması yapıldığında "Koçluk" kavramı ile ilgili birçok yaklaşıma ulaşılabilmektedir. Bunların başlıcaları şu şekilde sıralanabilir:

Koçluk: Geleneksel koçluk; büyüme modeli, amaç belirleme, planlama ve basite indirgenmiş kişilik profili gibi modası geçmiş modeller üzerine kurulmuştur. Gelişim ve ölçülebilir davranış yetenekleri gibi konularda

yetersiz kalmaktadır. "Bir durum her şeye uyar" yaklaşımı ile gelişme odaklı olmayan bir süreci içerir (Arabacı, 2010: 235).

Kariyer Koçluğu (Career Coaching): Kariyer koçluğu, bireyin kendi yaşamları için gerçekten ne yapmak istediklerini belirlemelerini ve bunu başarmak için de stratejiler geliştirmelerini sağlar. Kariyer koçu, çalışanın özel hayatı ile iş hayatı arasındaki dengeyi sağlamasında yardım eder. Bir kariyer koçu bireylerin; kendilerini tam olarak keşfetme ve anlama fırsatıdır, beklentilerine açıklık kazandırır ve onları tanımalarını sağlar, amaçlarına erişmek için stratejiler oluşturmalarını ve geliştirmelerini sağlar (Palankök, 2004: 46).

Yaşam Koçluğu (Life Coaching): Yaşam koçluğu tüm dünyada oldukça rağbet gören bir iş haline gelmiştir. Bireyler pek çok şekilde iş yaşamı gelişimi ve yaşam arasındaki dengeyi kurma yolları arar. Kariyer koçlarına benzer olarak, bireyler kişisel gelişim yollarını keşfetmek ve kendilerinin farkına varmak amacıyla yaşam koçlarına başvururlar. Yaşam koçluğunda en yüksek seviyede verim almak için aşağıdaki noktalara dikkat edilmelidir (Aydın, 2007: 125):

Birey yaşam koçuna ve yaşam koçluğu ilişkisine güvenmelidir. Eğer bireyin yaşam koçluğu kavramına inancı tam değilse olumlu ve kalıcı sonuçlara ulaşması imkânsızdır.

Dürüstlük çok önemlidir. Koçluk süreci bireyi hedefe ulaştırmada yardımcı ve yönlendirici bir süreçtir. Bu bakımdan doğru tanımlanmalıdır. Tanımlanırken de birey hem kendine hem de koça karşı dürüst olmalıdır.

İstekli olmak. Birey istemedikçe koç hiçbir yardımda bulunamaz. İstekli olmak koçluk sürecinin etkinliği için en önemli faktördür.

Seanslardan önce hazırlık yapılmalıdır. Koçluk toplantılarından önce birey neleri başardığını, ihtiyaçlarının neler olduğunu kendisi ile neler keşfettiğini, kazanımlarını ve hedefe ulaşmak için neler yapması gerektiğini analiz etmelidir. Böylece sürecin etkinliğini de gözlemlemiş olur.

Yönetici Koçluğu (Executive Coaching): Yönetici koçları, üst düzey yöneticilere koçluk etmekte uzmandır. Bir örgütte yetki ve gücü elinde bulunduranlarla ilgilenirler. Üst düzey yönetici koçları bu dünyaya aşinadır ve uyumludur. Bu koçlar, kendileri koçluk eğitimi almış, dolayısı ile üst düzey yöneticilerin zorluklarını bilen kişilerdir. Yönetici, bu süreçte kendisini yeni ve objektif bir bakış açısıyla değerlendirir. Daha iyi olabileceği yönleri fark eder, sorunlarını çözer. Kendisine daha güvenli, mutlu ve başarılı bir ortam yaratır (Barutçugil, 2011).

Performans Koçluğu: Performans koçluğu, kişi odaklı bir yönetim şeklidir. Koçun danışanla yüzü yüze iletişim halinde olup, ona destek olmasını ve onu teşvik etmesini gerektirir. Koçun sürekli bir rolden bir diğer role geçmesini gerektiren aktif bir süreçtir. Koçun pasif bir gözlemci değil, aktif bir katılımcı olması gerekir. Performans koçluğu, koçun görev verme ve iş çıktılarını kontrol etmekten çok, soru sorma, dinleme ve yardım becerilerine dayanır. Genelde kurumun kendi içinde yarattığı koçlarla uygulanan bu metot, çalışanların verimini artırmak amacıyla kurum bünyesinde kullanılmaktadır. Bu konuda özel eğitim almış şirket koçları ister astlarına, isterse diğer bölümlerdeki çalışanlara koçluk yapabilir. Kurum bunu sistematik bir biçimde uygulamaya koyar, kişilere özgü gelişme planları hazırlanır ve uygulanır. Bu iki tarafın da (çalışanlar ve kurum içinden gelen koçlar) kazandığı bir süreçtir (Aydoğdu, 2004: 58).

Takım Koçluğu (Team Coaching): Takım koçluğu birey odaklı olarak gerçekleştirilen koçluk yaklaşımlarından uygulama açısından bazı farklılıklar gösterir. Takım koçluğu bireysel koçluk uygulamasına göre daha geniş bir bakış açısıyla ele alınması gereken bir süreçtir. Bu süreçte takımı oluşturan her bireyi doğru tanımak ve amaca ulaşırken takımın her üyesinin projenin hangi alanında en yüksek verimi sağlayacağını analiz etmek gerekir. Takım koçluğunda bir arada tutabilme ve bireylerin ortak hareket etmelerini sağlama önemli rol oynamaktadır. Takımın ihtiyaç duyduğu sinerjiyi yakalamalarına imkân verilmelidir. Bireysel olarak performans eksikliği duyulan konular açıklanır ve takımın her bir üyesi diğerine çözüm sağlamada yardımcı olur. Koç ise bu konuda yönlendirici lider rolünü üstlenerek ilk olarak bireylerin takım olarak problem çözme yeteneğinin ortaya çıkarılmasını sağlar. Böylece takım üyeleri içinde bulundukları ortamda kendilerini rahat hissedecek ve yaratıcı yönlerini sunmaya başlayacaklardır. Ancak takım koçluğu periyodik olarak kontrol ve gözlem gerektirir, çünkü

insanların toplulukta yer aldıklarında gösterdikleri değişken özellikler bireysel olarak gösterdiklerinden daha fazladır (Aydın, 2007: 127).

Bilişsel Koçluk (Cognitive Coaching): Bilişsel koçluk, bireyin bilişsel farkındalığını arttırmak, bilişsel stratejiler geliştirme konusunda yardım etmeyi amaçlar. Bu yaklaşımda uzman olan bilişsel koçun çeşitli etkinlik ve stratejilerle öğretimi söz konusudur. Bilişsel koçluk üç temel esas üzerine oturtulmuştur: 1- Herkes değişme yeteneğine sahiptir. 2- Öğretim Performansı, geliştirme ve düzenleme becerilerini motive eden karar verme becerilerine dayalıdır. 3- Öğretmenler birbirlerinin bilişsel süreçlerini, kararlarını ve öğretimsel davranışlarını artırma kabiliyetine sahiptir (Costa, 2011).

Eğitim Koçluğu (Educational Coaching): Eğitim koçluğu öğrencinin eğitimiyle devamlı ilgilenen ve onu başarıya götüren, uzman koçlarla uygulanan yeni bir eğitim sistemi olarak tanımlanabilir. Öğrenci koçluğu da denilen eğitim koçluğu öğrenciyi ezbercilikten kurtararak yüzleşmeyi öğrenmelerine yardımcı olur. Koç, bireysel ya da takım çalışmasıyla okul, sınav stresi, sosyal aktivite, aile iletişimi, mesleki yönelme, zaman yönetimi vb. konularda öğrenci ihtiyaçlarına destek sağlamaktadır (Gynnild, 2007: 2-3).

2.3.2. Koçluğun Yararları

Koçluk etkili olarak sağlandığında öğretmenlerin becerilerini geliştiren ve iş performansını iyileştiren bir sistemdir. Belki de koçluğu en önemli kılan yanı, ileride büyük sorunlara neden olabilecek küçük sorunların zamanında önlenebilmesidir. Koçluk, danışmanlık ile karıştırılan bir kavramdır. Danışmanlık, bireylere kişisel sorunlarını çözmede yardım etme süreci iken koçluk, bireyin iş performansının iyileştirilmesine odaklanır. Bu anlamda koçluk bir yönetsel sorumluluktur (Aydın, 2008: 227).

Koçluğun örgüt açısından yararları, şu şekilde sıralanabilir (Cantimer, 2008: 16);

• Koçluk örgütsel ve biçimsel yapı içinde kişiler arası yazılı ve sözlü iletişimi daha verimli hale getirir.

• Danışanın performansının ve verimliliğinin arttırılması ile örgütün üretkenliği, verimliliği ve yaratıcılığı artar.

• Örgüt içindeki sorunlar su yüzüne çıkar, bu sorunlar için çözüm yolları geliştirilebilir.

- Örgüt zaman ve personel yönetimi konusunda esneklik kazanır.

Tipik eğitim ve gelişim yaklaşımlarından ayrı olarak, koçluk, devamlı bir öğrenme süreci sağlar ve insanları günümüz ve gelecekteki ihtiyaçlara göre geliştirir. Koçluk, anahtar kaynak olan insanın gelişimini sağlayarak örgüt için uzun dönemde verimlilik kazanmasına imkân tanıyan etkili bir yatırımdır.

Bir koçun gündeminde tek konu vardır; Koçluk yaptığı kişinin başarısı. Koçluk, insanlara kişisel ve profesyonel açıdan gelişme konusunda yardımcı olur. Bu gelişme örgütün de başarısının gelişmesi anlamını taşır. Profesyonel koçlar örgütte yer aldığı sürece, performans yönetimi çalışan ve yöneticilerin yararına işleyen bir uyum ve işbirliği süreci konumuna gelir. Dolayısıyla, koçluk alan kurumlarda pek çok faktörün değiştiğini ve yenilikçi bir yapı kazandığını söylemek mümkündür.

2.4. Denetimde Koçluk Yaklaşımı

Günümüzde eğitim sistemindeki yapıda ve buna bağlı olarak denetmenlerden beklenen roller değişmektedir. Alışıldık klasik yönetim tarzı olan hiyerarşiye uyma, emir verme ve kontrol etme gibi davranış biçimleri yerine esnek örgütlenme, bireyleri geliştirme, motive etme ve kendilerini yaptıkları işe ait hissederek performanslarını en üst noktaya taşımalarını hedefleyen "koçluk" uygulaması önem kazanmaktadır. Koçluk kişinin deneyimli bir yönlendiricinin yol göstericiliğinde, güçlü ve eksik yanlarını keşfetmesine, yetkinliklerini geliştirip yanlışları düzeltmesine dayalı, kendini koşullarını sorgulayan, çözümlerini üreten, kendi kendini yeniden yapılandıran, eylemli bir öğrenme modelidir (Aras Çakar, 2011; Çınar, 2010).

Bilgi çağı ve dünyada daha yoğun bir rekabet ortamının oluşması ihtiyaç duyulan insan sermayesinin bu rekabet ortamı ile mücadele edebilecek, varlığını koruyabilecek bir nitelikte yetiştirilmesi gerekliliğini ortaya koymuştur. Yapılan tahminlere göre, 2020 yılına kadar birçok ülkede imalat mallarının üretimi en az iki katına çıkarken,

imalat sanayindeki istihdamın toplam iş gücünün yüzde 10 – 15'i kadar daralacağı yönündedir (Ekinci, 2011: 168).

Eğitimde denetimin gerekliliğini vurgulayan bir diğer unsur da denetimin bu gün artık kontrol etmekten öte geliştirme odaklı bir işlev içinde görülmesidir (Aydın, 2008: 3). Toplumun en önemli kurumlarından olan eğitim kurumunun da yetiştireceği insan modellerinin de bu yapıya uygun şekilde işleyişlerinin denetlenmesi süreci, denetimde yeni bir yapılanmayı; "Koçluk" kavramını gündeme getirmiştir. Günümüzde eğitim sistemindeki yapıda ve buna bağlı olarak müfettişlerden beklenen roller değişmektedir. Alışıldık klasik yönetim tarzı olan hiyerarşiye uyma, emir verme ve kontrol etme gibi davranış biçimleri yerine esnek örgütlenme, sürekli değişim, risk alma, motive etme ve geliştirme gibi davranışları içeren "koçluk" uygulaması önem kazanmaktadır.

Ünal'a (2006) göre öğrenen organizasyon geliştirmek için denetçi rollerinden bir tanesi liderliktir. Lider denetçiler, mentorlük ve koçluk uygulamalarıyla organizasyonu öğrenen topluma dönüştürmede katalizör olarak hizmet ederler. Yönetim alanına "koçluk" kavramının girmesi ile eğitim sistemleri içerisinde de "Denetimde Koçluk" uygulamaları başlamıştır.

Başarılı bir koç denetçinin sahip olması gereken nitelikler şu şekilde sıralanabilir (Aras Çakar, 2011; Öztürk 2007: 32-33):

Başarılı bir koçun içgüdüleri olmalıdır.

Değişime inanmalı, inandırmalı, başkalarının değişimi için çalışırken sorunlu davranışlarını göz ardı etmeyip kendini de değiştirmeye istekli olmalıdır. Yani denetçi de gerektiğin de kendi davranışlarını değiştirebilmelidir.

Kargaşa ve huzursuzlukların önüne geçmek, ilişkileri onarmak amaçlarından biridir. Dolayısıyla ilişkileri değerlendirme ve onarmaya yönelik buluşmalara düzenlenmelidir.

Sorunları çözmek için hazırlanan bireysel denetim raporu kişiye özel olmalıdır.

Denetim esnasında koç-denetçi, aktif dinlemeyi bilmeli yani karşısındakinin sözlerini kendi ifadeleriyle tekrarlayarak hem daha iyi kavramalı, açıklığa kavuşturmalı hem de hatalarını düzeltmelidir.

Koç herhangi bir olay sonrasında ya da program içerisinde karşısındaki kişinin neler öğrendiğini çeşitli sorularla araştırılmalıdır. Örneğin kişinin neler hissettiğini, ne kadar başarılı olduğunu düşündüğünü, başkalarının nasıl tepki verdiğini sorarak geri besleme almalıdır.

Kolaydan zora giderek kişinin deneme yanılma yöntemi ile ilerleyebileceğini akılda tutmalıdır. Birden fazla sorunlu davranışı olan kişinin ilk sırada değiştirilmesi en kolay olan davranışlarına odaklanmasına yardım etmelidir.

Küçük hedefler belirleyerek nihai hedefe doğru yaklaşmalıdır. Örneğin nihai hedef, daha güvenilir ve sosyal bir kişi olmaksa ilgili küçük hedefler, bir karar almadan önce başkalarının fikrini almak, daha fazla insanla yemek yemeyi teklif etmek, bir ilişkinin gidişatına dair notlar tutmak olabilir.

Koç-denetçi daha fazla olumlu geri beslemeyi teşvik etmelidir. Olumsuz noktalara saplanmamalı ve öğretmenlerin ve yöneticilerin başarılarını da dile getirmeli ve daha çok bu yönde geri besleme sağlamalıdır.

Koçluğun temelinde yaratıcı olmak ve çeşitli pratik çözümler aramak yatmaktadır. Bu amaçla yapılan gerekli davranış değişikliği için başka insanların bu davranıştan nasıl etkilendiğini iyice kavramalıdır. Ayrıca değişim sabır gerektirir, aylar sürer, inanç gerektirir, başlangıçta küçük çabalar küçük sonuçlara yol açarken uzun vade de hem çabaların arttığı hem de sonuçların büyüdüğü gözlenir. Değişim sürecinde ilerlemelerin yanı sıra geri düşmeler de mümkündür ve tolere edilmelidir.

Koç denetçi egosunu yenmeli, kontrol altına almalı ve bunu öğretmenlere de aşılamalıdır. Böylece insanlar, korkusuzca iletişime açık hale gelir. Hata yaptığında ve üstünden farklı düşündüğünde küçük düşmeyeceğini ve gülünç kabul edilmeyeceğini bilir ve rahat hisseder.

Diğer meslek geliştirme hizmetlerinin aksine, denetici koçluğu farklı biçimde aşağıdaki şekilde karakterize edilebilir (Henderson, 2011):

- İlişkiler otoriter olmak yerine, daha işbirlikçi ve eşitlikçidir.
- Odaklanılan, problemlerin analizi değil, hedeflere ulaşım sürecidir.
- Vurgu, ortak hedef belirlemedir.
- İstemcilerin, klinik olarak anlamlı bir ruh sağlığı sorununa sahip olmadığı kabul edilir.
- Koçların, ileri seviyede belirli bir baskın uzmanlığa ihtiyacı yoktur.

Başarılı denetçi / koç, saygılı ve uzman, çalışan davranışlarını her zaman gözleyebilen, her bir çalışanın farklılıklarını tanımlayabilen ve

açık, informal yollarla zamanında tüm gelişmelerin farkında olandır. Koçun odak noktası, personelin yeteneklerini geliştirmesine yardım etmektir. Denetçiler için, geleneksel personel eğitimlerine ilave olarak koç; süreci gizlice takip etmek, tecrübeli personeli gözlemek, bir konferansta sunum yapmak, diğer kurumları ziyaret etmek, kütüphane ve internet kaynaklarını kullanma yoluyla öğrenmenin kolaylaşmasına yol gösterir.

Koç, kişiye saygı göstererek onaylamalıdır. Saygı göstermekte bir başlangıç noktası, kişiyi basit bir uygulayıcı olarak görmekten çok, yardım etmeye zaman yaratmak için istekliliktir. Onaylamanın diğer bölümü, üretimdeki düşüş için bir açıklama gibi, kişinin problem hakkındaki görüşünü dinlemeye istekliliktir. Koçlar tarafından ihtiyaç duyulan dört önemli beceri: gözlem, çözümleme, görüşme ve geri bildirimdir (Hopkins ve Austin, 2004).

3. Sonuç

Günümüz yönetim anlayışına uygun olarak eğitim denetçilerimiz, çalışanların gelişimini sağlayıcı liderlik rolleri ortaya çıkmıştır. Bu anlamda "Denetim Koçu", öğretmenlerin mesleki gelişimlerini ileriye götürürken etkili bir öğrenme öğretme ortamının oluşumuna katkıda bulunur. Okulda olumlu bir öğrenme iklimi oluşturarak, çalışanların sürekli öğrenmeleri konusunda destektirler. Eğitim denetçilerine, Şişman'ın (2004: 72) aşağıda belirtilen öğretimsel liderlik becerilerinin kendi yapılarına uyarlanmış şekilde kazandırılması, "Denetimde Koçluk" rolü bakımından faydalı olacaktır:

- Okulu, öğrenciler ve yetişkinler için bir öğrenme merkezi haline getirmeye öncülük ederler,

- Bütün öğrenciler ve yetişkinlere ve yetişkinlere ilişkin olarak akademik ve sosyal boyutlarda yüksek beklentiler oluştururlar,

- Öngörülen akademik standartlara uygun olarak öğretimin içeriğini oluşturur ve öğretimi gerçekleştirirler,

- Öğrenci ve yetişkinler için "sürekli öğrenme" anlayışına dayalı bir okul kültürü oluştururlar,

- Öğretimi iyileştirmek için mevcut durumu teşhis ve değerlendirmede çeşitli araçlar kullanırlar,

- Öğrenci ve okulun başarısını artırmak için okul toplumunun etkin bir üyesi olarak sorumluluk üstlenirler.

Günümüz insanı daha etkili bir eğitim alma çabasına içerisindedir. Yönetim alanında koçluk kavramının ortaya çıkması, eğitim denetimini gerçekleştiren klasik denetim sistemini etkilemiştir. Gelişmeler neticesinde ülkemiz eğitim denetimi yapısında bazı yasal düzenlemeler yapılmış ve denetçi rollerinde koçluk yaklaşımına uygun tanımlamalar gerçekleştirmiştir. Eğitim denetçilerinin koçluk yaklaşımına uygun bir biçimde rollerini benimsemeleri ve uygulamaları, hem kendi gelişimleri, hem öğretmenlerin daha verimli olmaları, hem de okul örgütlerinin daha etkin bir yapıya kavuşmalarını sağlayabilecektir.

ENCOUNTERED DISCIPLINARY PROBLEMS IN ELEMENTARY SCHOOLS OF A LOW SOCIOECONOMICALLY STATUS DISTRICT

Abstract

The purpose of this research is to determine the most frequently encountered disciplinary problems, reveal disciplinary punishment frequency due to students' these disciplinary problems, and present the relationship between families and their undisciplined students in the elementary schools to be situated in a low socioeconomically status district. The sample of this study consists of 554 teachers composing of 308 women and 246 men who worked 2010-2011 academic year in 55 elementary schools to be situated in a low socioeconomically status district of Istanbul. According to the results of the research, it is seen that disciplinary problems decrease when family interest increases, senior teachers and male teachers encounter with less disciplinary problems in comparison with junior teachers and female teachers, there are similar disciplinary problems of both first and second stages, besides dress and bad language problems are incorporated into them. It is seen that contrary to expectations, walking around in the classroom, making noise, interrupting and talking without permission problems have appeared above the average as class levels rise in upper classes.

Keywords: Discipline, family, teacher, student, education

1. Introduction

Discipline is one of the most important parts of education, thus new generation knows, and learns their responsibilities; their bounds for social peace; where and how to behave with their own free will. Schools should always revise, renew and educate themselves because discipline is a process to be always continued due to security reasons and educational objectives (Garman& Walker, 2010).

Discipline states all kinds of measures providing a common unity to live in safety (Sarıtaş, 2003; Sadık, 2006). It is necessary to show consistent and decisive behaviors in order to prevent negative behaviors (Erdoğan, 2010). According to Frau and others (1993), the main reason of discipline's negative connotation is that teachers and school management are only interested in its punishment dimension and most References sanctions are related with imposing punishments. The aim of discipline is not to force students to obey the rules imprudently but to help them control themselves, and gain them educatory, regular, proper behaviors, and perfection and bring them up. Necessary freedom should be acknowledged individuals to gain their own identity and make them compatible and successful; and an adoring supervision environment should be provided for individuals to be able to find the true path, and learn social rules (Cited by: Gökhan, 2007). We shouldn't forget that successful discipline's main aim is to reinforce positive behaviors and prevent possible undisciplined behaviors before they emerge.

2. The Role of Teacher in Discipline

Teacher is one of the most important factors in discipline; teachers should pay attention to students' psychological and physical health in classroom discipline (Aydın, 2006). School management, family, environment, briefly each individual in society should be aware of the importance level of discipline separately and completely and it's supposed to be helped teachers so that they can perform their duties successfully (Brown & Beckett, 2006; Özdemir & Yalın & Sezgin, 2004; İlgar, 2007).

Teachers should provide in-class discipline in order to reach their goals in educational activities. Teachers should follow students' development, abilities, and capabilities well; establish a good communication with their parents; and recognize them closely (Sirkeci, 2010).

Recent searches have indicated that there is a meaningful relation between school discipline and academic success. If disciplinary rules aren't applied consistently, disciplinary problems may increase, and incite nuisances, so students can be encouraged to make aforementioned behaviors and applications concerned with discipline may damage students' relation with school (Cameron & Sheppard, 2006). The purpose of disciplinary rules is to endear school to students and have students apprehend why the rules are necessary.

3. Possible Unwanted Behaviors in School/Class Environment

The criterion of unwanted or terminal behaviors is features of treater, behavior, other people, and environment; enacted and unenacted rules of society; and individual judgments. Every kind of behavior, which hampers educational efforts in the schools, is called "unwanted behavior". Their negative effects are variable. From this point of view, they are ranged from "nondestructive" to "too destructive". Some of unwanted behaviors take most effect on the person who performs these behaviors, but they also badly affect teachers, class and lesson. Moreover, some unwanted behaviors harm school and family seriously. Unwanted behaviors in class spoil classroom organization and actions; block reaching goals; and especially cause waste of time. Teachers often encounter with disciplinary problems. Certainly, teachers may sometimes cause them by themselves, too, but these problems may have more complicated reasons; we can add them the problems arisen from society, family or school management (Edwards, 2007; Başar, 2008).

On the one hand discipline should prevent unwanted attitudes and behaviors, but on the other hand it should create a necessary environment where students will develop in every respect (Özmen & Tonbul, 2010). There isn't a ready receipt for each disciplinary problem. Besides, every situation must be evaluated in terms of student's age and conditions. Consequently, management of unwanted behaviors is complexified more. The priority which behavior management strategy is chosen to change negative behavior; and carries out successful socialization must specify how students behave in classroom environment and the reasons why they behave so. Because removing unwanted behaviors and preventing their emergence won't be possible unless potential factors, which cause these negative behaviors, are removed (Başar, 2008; Özyürek, 2001; Weber, 1986; Brophy, 1988; Sadık, 2006).

In reality, there are so many reasons of unwanted behaviors and they are generally complicated and one within the other situations. Primary reasons of unwanted behaviors of students are viewed as schools, teachers and families. Classes may be too crowded, curriculum may not be suitable for students, assignments may not arouse interest, teachers may always complain and be devoid of sense of humor, families may not be interested in their children's education or children may bring their familial problems into classes in the schools. All of these factors cause unwanted behaviors of students to display (Baron, 1992. Cited by: Dağlı & Baysal, 2010).

4. Coping with Undisciplinary and Unwanted Behaviors

It is known that only punishment isn't an effective way to dissuade people from a behavior. It is monitored that if students' unwanted or unacceptable behaviors are only tried to be removed with punishment, these

students who are prone to violence do their best not to be arrested and to be escape from punishment; when they are punished they try to revenge themselves on school angrily. Also, if we try to stop students forcibly we convey a message to them that "If you're strong, you're obeyed." and "He who has strength is the ruler.", so we reinforce these kinds of beliefs (Pişkin & Öğülmüş & Boysan, 2011). If punishment doesn't change the behavior in a desired way; on the contrary, if it supports negative behavior, the first thing to be done is to help students avoid behaviors of their own free will which necessitates punishment at all costs.

Studies have indicated that motivational techniques, punishment and rewarding carried out in classes and in the schools aren't enough. While school/class rules are being determined social relations should be strengthened, classroom size should absolutely be reduced, a good communication environment should be established, guidance and counseling service in the schools should be improved, you should be merciful and patient to correct unwanted behaviors, parents should be informed in order to apply the rules more easily and school should be aligned with family more (Gökhan, 2007). It is useful to take headmasters', supervisors', and families' opinions together with students while rules are being determined. In addition to them, the features of school and environment, school administration's preferred subjects, and students' requirements should be considered (Çiftçi, 2008).

Family and school who try to create terminal behavior changes want to raise a good person who obeys the rules of society. Therefore, a certain order is necessary for it. This order is based on affection, and if it aims for child's future, a healthy society's base can be established. Loved and respected child loves and respects others and constitute base of the order during early development years (Yavuzer, 1997).

5. The Importance of Family-School Cooperation in Discipline

Making contact with families can be a good opportunity to inform them about problems and train them confinedly. Conversations with families show school's sensibility about students' negative behaviors and enable information exchange between family and school about the event's dimension realization (Pişkin & Öğülmüş & Boysan, 2011).

Although families have a great effect and importance on school discipline, they are less focal point in the studies related with discipline in comparison to students and teachers. Shaw and Scott (1991) have studied on the relation between discipline practices in families and children's problematical behaviors. The results have shown that there is a relation between sense of discipline at home and children's problematical behaviors.

It has been found that students who are rarely controlled by their families show less problematical behaviors (Gottfredson, 1986).

Students who have close relations with their families' teacher are prone to show more constructive behaviors. When families feel good things about their children's teachers and school, children incline to show expected appropriate school behaviors (Celep, 2004).

One of cyclical and controlled important variables of student behaviors is family. Education begins with family. Basic behaviors of personality structure considerably are acquired in the family. It is too difficult to change them later. Lazy-hardworking, truthful-liar, shy-sociable, selfish-generous and similar situations' acquisition begin with family, develop, and mostly strengthen. It's difficult to change them for school, hence family plays a very important role in child's socialization and first core of child's unwanted behaviors' resources is formed within the family (Başar, 2008).

Firstly society and family should be made safe in order to make safe school. Safe school is the school where everybody has a positive communication with each other, and it's open to personal development. In other words, it's a place where student and personnel live in peace, any groups don't act superior to others, everybody respects each other, and there is a positive interaction among teachers, students, managers, personnel and visitors (Bucher & Manning, 2005). Experiences gained from family and group of friends will affect school life of student (Tarcan, 2007).

Differences of families in discipline and education understanding shape children's interest towards educational life. While some parents are interested in their children's education more closely, some others never come to school until their children are graduated from school (Çelik, 2009).

Discipline based on using of force within the families includes depriving children of their fundamental right; applying corporal punishment; threatening; mocking; not exhibiting love; paying no attention to child; separating them from their brothers or sisters. These practices have a strong influence on children (Sadık, 2006). According to researches, children of helicopter families cause more problems in the schools because these kinds of children have difficulties in controlling by themselves and showing expected behaviors at school (Quesada, 1983). Low socioeconomic level of family may cause student's unwanted behaviors to show (Burden, 1995; Türnüklü & Galton 2001; Dağlı & Baysal, 2010). Especially, children in crowded families having insufficient financial income aren't fed enough; also they are worked by their families as financial contribution to income. This situation alienates children from school. For these reasons, teachers and school administrators express that families are responsible for students' unwanted behaviors (Porter, 2007; Edwards, 2007; Dağlı & Baysal, 2010).

Social norms deeply affect family members' behaviors and relations, namely that social norms are always together with family life (Huntington, 2010) and therefore school rules will be the arbiter in the relation of students with their families.

Parents' support should be planned well for disciplinary effort, and family education programmes should be arranged. Parents may be insufficient about discipline. Instead of criticizing parents because of this situation, schools should educate them. Teachers as a domain expert in disciplinary practices should create solutions relying on academic data; they should persuade parents of reasons (Cemaloğlu, 2007).

It is necessary to establish communication channels between school and house as from the first days of school. Children who must obey some definite rules accept other rules easily outdoor. Therefore, making in contact with parents are quietly crucial to apply the rules. Some parents may think that rules are silly and unnecessary. It is useful to speak with them about these subjects (Yüksel, 2011).

Cooperation with parents should be established as from first days of school, and parents should be informed about parents-students communication and interaction out of school education. While participation of families is being provided into school disciplinary practices, the most important considered subject is families' subjectivity to their children. School administrators and teachers should cope with this situation (Cemaloğlu, 2007).

We can give that information about being searched on population with its family, teacher, student and general environment in studying area: Parents' financial income is usually at the minimum of subsistence or lower. Most of parents are the families emigrated from different parts of Anatolia because of economic problems. Some students live in heavy living conditions (in the basement, in the dampish rooms, with a crowded family in a very small house etc.)Parents can't join into parents' meeting adequately. Schools don't have enough infrastructures for a healthy education. Most schools even don't have a garden where students will be able to spend their time at breaks. Classroom sizes are too crowded. Different teachers apply different rules in classrooms. First appointed inexperienced teachers or paid teachers instead of senior teachers work in these schools. Schoolteachers constantly change, so teachers and students can't be attuned to each other completely.

6. Purpose of the Research

The purpose of this research is to determine the most frequently encountered disciplinary problems, reveal disciplinary punishment frequency due to students' these disciplinary problems, and present the relationship between families and their undisciplined students in the primary schools to be situated in a low socioeconomically status district. So it is sought answers to the following questions:

6.1. Problem statement:

What are the most encountered disciplinary problems in the primary schools of Istanbul Province Bağcılar District? Is there a meaningful difference among gender of teachers, class level of students, and level of parental interest towards children with disciplinary problems?

6.2. Sub-Problems

1. In the primary schools;

a. What are the most frequently encountered disciplinary problems?

b. What are the disciplinary problems causing punishment too often?

c. Is there a meaningful relation between disciplinary problems and seniority of teachers?

d. Is there a meaningful relation between disciplinary problems and parental interest?

7. Method

7.1. Pattern

This research is a descriptive study in the relational pattern which aims to determine most frequently encountered disciplinary problems of primary school teachers in the schools/ classes, undisciplined students' perceptions about their families, students' punishment frequency when disciplinary problems have been encountered.

7.2. Population and Sample

The sample of this study consists of 554 official teachers composing of 308 women and 246 men who were chosen from 55 elementary schools of the Ministry of National Education to be situated in a low socioeconomically status district of Istanbul in 2010-2011 academic year.

7.3. Data Collection Tool

As a data collection tool, a likert scale involving 32 disciplinary problems which include the probable encountered disciplinary problems in the schools/classrooms by teachers; specify punishment frequency of students related with these problems; determine degree of relation causing difficulties between family and student has been made and applied to teachers. SPSS packaged software is used for analysis of data. 8. Findings

Respondents who participate in this research are 55,6%women and 44,4% men. It has been seen that only 20% respondents have ten-years or more experience in teaching. 54,3% respondents are the teachers who teach 6th, 7th and 6th grade students, and others are classroom teachers for smaller ones. It is conceivable as the reasons why senior teachers are in the limited number that the population of the research is at a low socioeconomically status district; appointment procedure has based on seniority; and senior teachers have preferred high socioeconomically districts because they may think of dealing with their jobs more comfortably.

8.1. Most Frequently Encountered Problems in Classes

Table 1 – Problems

1.2.3. Classes			4.5. Classes			6.7.8. Classes		
Problems	X	sd	Problems	X	sd	Sorunlar	X	sd
Wandering in class	3,14	1,04	Interrupting	3,53	1,04	Interrupting	3,89	3,05
Making nose	3,12	1,07	Making nose	3,46	1,15	Speaking without permission	3,74	2,53
Speaking without permission	2,90	1,12	Wandering in class	3,38	1,08	Making noise	3,59	1,11
Interrupting	2,87	1,15	Speaking without permission	3,37	1,14	Wandering in class	3,52	1,11
Not doing homework	2,73	0,79	Not doing homework	3,35	1,09	Not doing homework	3,30	1,25
Lack of materials	2,71	0,79	Lack of materials	3,10	1,09	Littering	3,29	0,91
Not participating in the lesson	2,67	1,11	Not participating in the lesson	3,08	0,94	Appearance	3,24	1,12
Irresponsibility	2,64	1,01	Toilet cleaning	3,01	0,91	Lack of materials	3,19	1,10
Littering	2,61	1,00	Littering	2,98	0,89	Not participating in the lesson	3,19	0,94
n=103			n=150			n =301		

According to the chart, the most frequently encountered (X>2,50) classroom management problems are similar in almost all classes of primary school such as interrupting, speaking without permission, not doing homework, wandering in the class, littering, lack of materials, not participating in the lesson adequately. It has been seen in the chart that appearance problem has been added to the problems at 6th, 7th, and 8th grades. The varying problem at 1st, 2nd, and 3rd grades is "not to fulfill responsibilities". It seems that when it has been regarded the smallness of classes, this situation may be acceptable; however, lack of parental interest may be a reason of this condition. Lack of classroom materials, not doing homework, and appearance problem encountered at upper classes may result from lack of parental interest, too. It is thought that some problems can be solved when parental interest increases. It is seen that the problems, which are anticipated, to decrease while class level is increasing are on the rise on the contrary.

8.1.1. Most frequently punished problems

Table 2 – Most frequently punished problems

1.2.3. Classes	X	sd	4.5. Classes	X	sd	6.7.8. Classes	X	sd
Making noise	2,81	0,96	Making noise	2,89	1,08	Making noise	2,73	1,09
Not doing homework	2,55	1,00	Speaking without permission	2,74	1,03	Speaking without permission	2,69	1,09
Irresponsibility	2,54	0,89	Not doing homework	2,65	1,00	Using rude words	2,63	1,16
Speaking without permission	2,48	1,00	Irresponsibility	2,64	1,18	Not doing homework	2,61	1,01
N=103			N=150			N=301		

Teachers frequently punish the students who don't do their homework; speak without permission; and don't fulfill their responsibilities. "Using rude words" behavior is one of the most frequently punished behaviors at 6th, 7th and 8th grades.

Table 3 – Disciplinary action

	Punishment		Parental interest		Seniority	
	r	p	r	p	r	p
Disciplinary Action	,439**	,00	-,236**	,00	-,155**	,00

When viewed the chart, it is seen that there is a meaningful relation (P<.05) between crime and punishment. It is found that there is a negative and meaningful (P<.05) relation among parental interest, seniority and disciplinary problems. While parental interest is decreasing the problems in classes, less classroom management problems happen in the classes of senior teachers. It is thought that this situation is arisen from improvement in classroom management skills of senior teachers year after year, so classroom management problems increase more and more in the low socioeconomically areas in which senior teachers don't prefer working much.

Table 4 – Disciplinary reaction differences between genders

	Gender	n	X	sd	sem	F	t	df	p
Disciplinary Action	Woman	308	88,00	23,94	1,36	5,39	0,98	552	0,02
	Man	246	86,11	20,84	1,33				
Punishment	Woman	308	76,32	23,34	1,33	4,48	2,17	552	0,04
	Man	246	72,19	20,75	1,32				
Parental Interest	Woman	308	77,33	23,05	1,31	0,80	0,11	552	0,37
	Man	246	77,13	21,42	1,37				

According to the chart, female teachers have more difficulty in classroom management than male teachers (p<.05), and they punish students more often. The gender of teachers doesn't cause a meaningful difference in terms of parental interest towards their children (p>.05). This situation is interpretable that male teachers create a more deferent factor, especially for upper classes.

Table 5 – Parental interest

ANOVA								Subset for α= 0.05		
Parental Interest						Class	N	1	2	3
	Sum of Sq	df	X square	F	P	6.7.8.	301	73,26		
Between Groups	13919,62	2	6959,81	14,65	,00	4.5.	150		78,90	
Within Groups	261632,98	551	474,83			1.2.3.	103			86,45

Table 5 – Parental interest

ANOVA								Subset for α= 0.05		
Parental Interest						Class	N	1	2	3
	Sum of Sq	df	X square	F	P	6.7.8.	301	73,26		
Between Groups	13919,62	2	6959,81	14,65	,00	4.5.	150		78,90	
Within Groups	261632,98	551	474,83			1.2.3.	103			86,45
Total	275552,61	553								

According to the chart, parental interest towards student is decreasing while student is moving up an upper class (p<.05). When children just start school, families are more enthusiastic and interested, but when children are grown up, parental interest decreases, hence responsibility of teacher and school is on the increase. Parental interest may be decrease because subjects widen more and enter into details; and families can't help children in their lesson any more. Families may show avoidance behavior because they don't support their own children with private teaching institutions or a private teacher in the low socioeconomically areas or some families may plan their children to run anywhere in order to be contributed family budget, so both children and families can't allocate enough time for lessons and school.

9. Conclusion

According to the research findings, there are disciplinary problems related with classroom management in almost all levels, they are similar and the most frequently encountered ones are these: interrupting, speaking without permission, not doing homework, wandering in class, littering, lack of materials, not participating in the lesson. While class-level is rising, problems are accreting, too, contrary to what is anticipated. Appearance and using rude words are some examples of classroom management problems when class-level rises.

Parental interest has classroom management problems decreased, but advancement in class-level induces difficulty in subjects, and lessons, so parental interest has decreased. The students who have a low financial income are less successful than other students, and consequently these students get lower points from the exams being required superb performance. This situation induces loss of motivation in both students and teachers, and so some teachers and students may not be follow lessons any more. Immigration, absence, nonhomogeneous classes, etc. hinder increase of academic success. At the same time, all of these conditions have negative effects on classroom management.

Experienced teachers have classroom management problems decreased, but these teachers would rather work at more equipped schools in every respect, and these schools are generally in high socioeconomically status districts. While senior teachers are working in high socioeconomically district, junior ones are working in low socioeconomically status district, because seniority is an important element in teacher appointments, so classroom management problems are going to continue.

In conclusion, if it isn't taken any precautions, it is considered that classroom management problems in low socioeconomically districts are going to continue increasingly even in basic cases such as speaking without permission, littering, etc.

ENGELLİLERİN KARİYER GELİŞİMİNİ VE ÇALIŞMA YAŞAMİNA KATİLİMİNİ ARTTİRACAK BİR MODEL ÖNERİSİ

Hakan Arslan [a], Gülşen Altıntaş [b]

[a] Öğr Gör Dr. Hakan Arslan, Celal Bayar Üniversitesi, Manisa, Türkiye

[b] Öğr. Gör.Gülşen Altıntaş, Celal Bayar Üniversitesi Eğitim Fakültesi, Manisa, Türkiye

Özet

Engellilerin iş yaşamına katılma düzeyi oldukça düşüktür. Zaten dezavantajlı konumda olan engellilerin bu durumu engellilere toplumun bir parçası haline gelme konusunda daha büyük bir dezavantaj oluşturmaktadır. Oysa ki çalışma, kişinin yaşamını biyolojik olarak idame ettirmesinin ötesinde, kişisel doyumunun ve toplumun bir parçası olmasının ana kaynaklarından biridir. Bu nedenle sağlıklı insanlar kadar engellilerin de bir işe sahip olmaları yaşamsal önem taşımaktadır.

Engellilerin çalışma sürecine katılmalarını sağlamak adına faaliyet gösterecek bir uzman grubu bu büyük problemi çözme konusunda avantaj yaratacaktır. Bu uzman grubunun iki temel görevi olmalıdır: Birincisi engelliye ilişkin bilgileri tek elde toplayarak bütünsel bir değerlendirme yapabilecek; bilgi eksiği olmaksızın kurumlarla ilişkiye geçebilecek ve engelli için en doğru kararın verilebilmesinde bir tür "koçluk" görevi üstlenebilecektir. İkincisi ise engellilerin istihdamında en temel problem olarak tespit edilen "önyargılar"ı kırmak üzere genel olarak engelliliği ve özel olarak haklarını savunduğu engelliyi tanıtmaktır. Bu sayede engellilik hakkında farkındalık yaratma gibi sosyal bir sorumluluğu yerine getirirken öte yandan bir engellinin daha işe yerleşip kendi yaşamını kurmasına katkı sunacaktır.

Anahtar Kelimeler: Engellilik, Engellilerin Çalışma Yaşamına Katılımı

Abstract

The participation level of disabled people into work life is very low. The situation of disabled people who are already in disadvantaged position makes a bigger disadvantage to the disabled people becoming a part of community. Yet working is one of the main resources of personal satisfaction and becoming a part of community beyond sustaining his life as biological. For this reason it carries a vital importance that disabled people have a job like healthy people.

An expert group which will operate for the participation of disabled people into working process will create an advantage in the solution of this big problem. There should be two main functions of this expert group: The first one; they should collect relevant information of the disabled people in one hand and should make a holistic assessment. They should contact with institutions without the lack of information and should give the right decision for the disabled people. They should assume a kind of "coaching" task. Second one; they should break the prejudices that are detected as the basic problem in the employment of people with disabilities. In general they should introduce disability and in particular they should introduce the disabled whose rights they defends. Thus they will actualize a social responsibility as creating awareness about disability and they will ensure taking a job of one more disability and establishing his own life.

Key words: Disability, participation of disabilities into working life

1. Giriş

Yapılan pek çok araştırma engellilerin iş yaşamına katılma düzeyinin oldukça zayıf olduğunu göstermektedir. Thornton ve Lunt (1994) engelliler arasındaki işsizlik oranının tespitinde, kullanılan engellilik tanımları ve

ölçütlerine bağlı olarak bazı farklılıklar gözlendiğini ancak buna rağmen, bunların hepsinde de engelli işsizliğinin engelli olmayanlarla karşılaştırıldığında en az üç kat fazla olduğunu iddia etmektedirler.

DİE ve ÖİB tarafından 2002'de yürütülen Türkiye Özürlüler Araştırmasında da (2009) engelli nüfusun % 78,29'unun işgücüne hiç katılmadığı hatta kadın engellilerde bu oranın % 93,29'a ulaştığı ortaya çıkmıştır. 2010'da yine TÜİK tarafından gerçekleştirilen "Özürlülerin Sorun ve Beklentileri" araştırmasında da engellilerin % 86'sının herhangi bir işte çalışmadığı saptanmıştır.

Çalışma, kişinin yaşamını biyolojik olarak idame ettirmesinin ötesinde, kişisel doyumunun ve toplumun bir parçası olmasının ana kaynaklarından biridir. Bu nedenle sağlıklı insanlar kadar engellilerin de bir işe sahip olmaları yaşamsal önem taşımaktadır.

Sağlıklı bireylerin meslek edinmeleri ve bir işe yerleşmelerinin önünde de engeller bulunmasına rağmen, bu durum engelliler için daha büyük bir sorun teşkil etmektedir. İşverenlerin engellileri işe alması genellikle ya hukuki zorunluluktan ya da özel bir sebepten kaynaklanmaktadır. Bilgisizlik ve önyargılar ise engellilerin çalışma ortamına kabulünü güçleştiren başlıca nedenler arasında sayılabilir.

Bunun yanı sıra engellilerin istihdamının önündeki en büyük sorunlardan biri de engelliler ile işveren arasındaki bağı kurabilecek, aynı zamanda da Sağlık Kuruluşları, Rehabilitasyon Merkezleri, Yerel Yönetimler ve İŞKUR ile koordinasyon sağlayabilecek bir kurumun bulunmayışıdır.

Bu çalışmanın temel amacı mesleki beceri edinmemiş / edinememiş engellileri meslek öğrenebilecekleri kurumlara, programlara ve eğitimlere; hüner sahibi olanları da doğru iş yerlerine yönlendirebilecek sonrasında uzun süreli takip işlerini yürütebilecek bir kurumun hayata geçirilmesini önermektedir. Bu kurumun en önemli görevlerinden biri işveren ve yöneticileri engellilerin çalışması hakkındaki önyargılarını gözden geçirmelerini sağlamak ve engellilerin çalışma potansiyelleri hakkında bilgilendirerek, engellilerin önündeki toplumsal engellerden birini kaldırmaya katkı sağlamak olacaktır.

2. Engellilik ve Engellilik Türleri

Engelli birey, sahip olduğu fiziksel veya zihinsel bir yetersizliğin onun eğitimi, istihdamı, ulaşımı vb. gibi temel bir yaşam etkinliği açısından dezavantajlı duruma getirdiği kişidir (Akkaya, 2002).

Engelli bireyler özel eğitim kapsamında yer almaktadırlar. Özel eğitime muhtaç olan bu gruplar Culatta ve Tompkins (1999) tarafından şu şekilde sınıflandırılmışlardır:

• Zihinsel geriliğe sahip bireyler

• Öğrenme güçlüğü olan bireyler

• Duygusal ya da davranış sorunları (uyum sorunları) olan bireyler

• Fiziksel engelli bireyler

• Diğer sağlık sorunları olan bireyler

• İletişim bozuklukları (konuşma ve dil bozuklukları) olan bireyler

• İşitme engelliler

• Görme engelliler

• Ağır ya da birden çok engele sahip bireyler

• Üstün yetenekli bireyler

2. Özürlüler Şurası Komisyon Raporlarında da özel eğitimin görme, işitme, dil ve konuşma, zihinsel, ortopedik, süreğen hastalık ve ruhsal ve duygusal bozukluğu olanlar olmak üzere geniş bir grubu kapsadığı belirtilmektedir.

Bu engel gruplarının tümünü olmasa da öne çıkanlarını ele alıp temel özelliklerini tanıtmak gerekmektedir. Ancak bu noktaya gelmeden önce Başbakanlık Özürlüler İdaresi Başkanlığı ve Devlet Planlama Teşkilatı işbirliği ile Devlet istatistik Enstitüsü tarafından 2002 yılında gerçekleştirilen Türkiye Özürlüler Araştırması'nın (2009) verilerinden söz edilmelidir. Bu araştırmaya göre Türkiye toplam nüfusunun % 12,29'u engellidir. Bu oranın önemli bir kısmını (% 9,70) süreğen hastalığı olanlar oluştururken kalan kısım (% 2, 58) görme, işitme, ortopedik, dil ve konuşma ve zihinsel engellilerdir. Tablo 1, engellilerin toplam nüfus içindeki yerini cinsiyet değişkenini de gözönünde bulundurarak vermektedir.

Toplam engelli nüfus (%)			Ortopedik, görme, işitme, dil ve konuşma ve zihinsel engelli nüfus (%)			Süreğen hastalığa sahip olan nüfus (%)		
Toplam	Erkek	Kadın	Toplam	Erkek	Kadın	Toplam	Erkek	Kadın
12.29	11.10	13.45	2.58	3.05	2.12	9.70	8.50	11.33

Tablo 1: Toplam engellilerin toplam nüfus içindeki payı

Tablo 2 ise toplam nüfus içerinde engel türlerinin hangi oranda olduğunu göstermektedir. Tabloya göre en yüksek oranı ortopedik engelliler oluştururken, en düşük orana işitme engelliler sahiptir.

	Ortopedik Engelli (%)	Görme Engelli (%)	İşitme engelli (%)	Dil ve konuşma Engelli (%)	Zihinsel Engelli (%)
Türkiye	1.25	0.60	0.37	0.38	0.48

Tablo 2: Engellilik türlerinin nüfus içindeki payı

Bu noktada engellilik türlerini genel hatlarıyla tanıtıcı bilgiler sunmak yerinde olacaktır. Bu sayede engellilerin genel olarak sosyal hayata ve özel olarak da çalışma yaşamına katılma potansiyelleri hakkında farkındalık yaratmaya katkı sağlanması umulmaktadır.

İlk kategori "ortopedik engelliler"dir. Bu engel türü 2002 Türkiye Özürlüler Araştırmasında kas ve iskelet sisteminde yetersizlik, eksiklik ve fonksiyon kaybı olarak tanımlanmıştır. Yine bu kaynakta el, kol, ayak, bacak, parmak ve omurgalarında kısalık, eksiklik, fazlalık, yokluk, hareket kısıtlılığı, şekil bozukluğu, kas güçsüzlüğü, kemik hastalığı olanlar, felçliler, Serebral Palsi, spastikler ve spina bifida olanlar bu gruba dâhil edilmişlerdir.

Ortopedik engeller yetersizliğin derecesine göre (hafif, orta ve ağır derecede yetersizlikler) ya da yetersizliğin bulunduğu yere göre (sinir sistemiyle, kas-iskelet sistemiyle ya da sağlıkla ilgili yetersizlikler) sınıflandırılabilir.

Hafif ortopedik yetersizlik içinde bulunanlar günlük yaşamlarını sürdürmek için herhangi bir desteğe veya alete ihtiyaç duymazlar ve bireysel gereksinimlerini bağımsız olarak karşılayabilirler. Orta derecede ortopedik yetersizliği olan kişiler az da olsa destek ve bireysel gereksinimlerini karşılamak üzere yardımcı aletlere (baston, koltuk değneği ya da yürüme cihazı gibi) ihtiyaç duymaktadırlar. Ağır derecede yetersizlik çekenler ise tekerlekli sandalyeye ve desteğe bağımlıdırlar.

İkinci grup olarak "görme engelliler" sayılabilir. Birincil duyularımız arasında yer alan görme duyusunun yetersizliği az görme, kısmi görme, işlevsel körlük ya da total görme kaybı kategorilerini kapsamaktadır (Özsüer, 2011b).

Yapılan araştırmalar görme yetersizliğine sahip olanların zihinsel olarak yaşıtlarından belirgin bir farklılık taşımadıklarını göstermektedir. Ancak bu engel grubunun kavramsal gelişiminde ya da bilişsel yeteneklerinde gecikme gözlenebilir. Bunun yanısıra soyut düşünme gerektiren beceri alanlarında da başarı oranları düşük olabilir (MEGEP, 2008). Görme yetersizliğinden kaynaklanan eksikliklerini diğer duyu organları yardımıyla

kapatmaya çalışırlar. Dikkat yoğunlaştırma ve ince ayrıntıları farketme yetenekleri gelişmiştir. Sosyal faaliyetler ve müziğe ilgileri fazladır (MEB, Görme Engelli Bireyler).

Görme engelliler psikomotor beceriler ve dil becerileri açısından diğer insanlardan farklı gelişim özelliklerine sahip değillerdir. Bununla birlikte engel derecesine göre hareket etme ve diğer motor becerileri daha güç kazanabilir. Dil yeteneği ve gelişiminde ise en önemli kanal işitme olduğundan dil kullanma isteği diğerlerine göre daha fazladır ve bu kişiler sözel anlatıma oldukça düşkündürler.

Duygusal-sosyal gelişim açısından ise bazı uyum sorunları ortaya çıkabilmektedir. Özellikle iletişimin en önemli faktörleri arasında yer alan göz teması kurulamaması kişinin içedönük ve etrafına karşı ilgisiz olmasına neden olabilmektedir. Yine anne-baba ve çevredekilerin bu yetersizlik içinde bulunan çocuğu aşırı koruyucu ya da dışlayıcı, ihmal edici veya ona acıyan bir şekilde yaklaşmaları bu kişilerde sosyal çevreye uyumu zorlaştırmaktadır.

Tüm bu özelliklerden hareketle, görme engeli içinde bulunan çocuklar (kişiler) eğitimle desteklendiklerinde engellerine rağmen başarılı olabilmektedirler (Yavuz ve Akagündüz, 2004).

Üçüncü grup "işitme engelliler"dir. İşitme kaybı çeşitli temel etkenler dikkate alınarak sınıflandırılabilmektedir. "Yeri"ne göre iletişimsel işitme kaybı, duyusal-sinirsel işitme kaybı, karışık tip işitme kaybı ve merkezi işitsel işlev bozukluğu olarak dört tipte incelenebilen bu yetersizlik, derecesine göre sınıflandırıldığında çok ağır, ağır, orta ağır, orta, hafif, çok hafif, normal işitme kayıpları olarak yedi türde ele alınabilmektedir. Bunların yanısıra nedenler üzerinden de bir sınıflandırma yapılabilmektedir: kalıtımsal nedenlere dayalı, doğum öncesi ve doğum anı nedenlere bağlı ve doğum sonrası nedenlerle oluşan işitme kayıpları (Vural, 2011).

Tablo 3 işitme kayıplarını dereceleri açısından ele almaktadır.

Sınıflama	İşitme Kaybı Derecesi	İşitmeye Etkisi
Normal İşitme	0-15 dB	İşitmeye etkisi yoktur.
Çok Hafif Derecede	16-25 dB	Gürültülü ortamlarda kısık sesleri anlamada zorluk çeker.
Hafif Derecede	26-40 dB	Sadece hafif konuşmayı anlamda sorun olabilir. Sessiz ortamlarda bile kısık sesleri anlamada zorluk çeker.
Orta Derecede	41-55 dB	Normal konuşma sesini anlamada sorun olabilir. Karşılıklı konuşmalarda sadece yakın mesafeden anlayabilir.
Orta Ağır Derecede	56-70 dB	Yüksek sesle ve anlaşılır biçimde konuşanları anlayabilir.
Ağır Derecede	71-90 dB	Yüksek sesle konuşulduğunda bile duyamaz ve bazı kelimeleri ayırt edemez.
Çok Ağır Derecede	91-dB ve yukarısı	Karşılıklı konuşmaları duyamaz. Konuşma anlaşılır değildir ve geliştirilemeyebilir.

Kaynak: Turnbull, Turnbull ve Wehmeyer, 2007'den aktaran Vural, 2011.

İşitme yetersizliği içinde bulunan çocuklar yaşıtlarına göre bazı farklılıklara sahiptirler. Örneğin psikomotor özellikler bakımından işitme kanalı ve sinirlerdeki hasarlara bağlı olarak denge problemi başgösterebilir. Bu kişiler geri geri yürüme, ip üstünden atlama, denge tahtasında ileri geri yürüme gibi becerilerde zorlanabilirler. Ebeveynlerin koruyucu tutumları da bu çocukların gelişmesini engelleyici etkiye sahip olmaktadır (URL, 1).

Bilişsel gelişim sürecinde de dil önemli bir yer tutar. İşitme engelli çocukların dil becerilerindeki, kavram gelişimlerindeki yetersizlik ve işitsel girdinin az olması bilişsel gelişim sürecini de olumsuz olarak etkiler. Bu durum çocuğun eğitim ve yaşantı eksikliğinden kaynaklanmaktadır. Çocuk düşüncelerini ifade etmede ve başkalarının düşüncelerini anlamada engellerle karşılaşır. Buna rağmen işitme engelli çocuklar normal işiten

akranlarından bilişsel becerilerde çok fazla geri kalmış değillerdir. Erken tanılandıklarında ve erken eğitime alındıklarında birçok çocuk engeline rağmen, akranlarını yalnızca birkaç yıl geriden takip eder (URL, 1).

Sosyal ve duygusal gelişim açısından incelendiğinde işitme engelli çocuklar ihtiyaçlarını sözel olarak ifade etmede yetersiz kalırlar. Aileleri ve arkadaşları onların duygu ve düşüncelerini anlamakta zorlanırlar. Bu durumda çocuklar kendini kötü hisseder, kendine kızar ve kendine olan güvenleri gelişmez. Topluma uyum sağlamada zorluk çekerler, kendilerini soyutlanmış hissederler (URL, 1). Ancak işitme yetersizliğine sahip olan kişilerde ortaya çıkabilecek bu tür sosyal ve duygusal sorunlar tek başına büyük bir sorun teşkil etmez. Asıl sorun bunun iletişim eksikliğine sebep olmasıdır. Bu becerinin gelişmesi ise aile ve çocuk arasındaki ilişkiye bağlıdır (Vural, 2011).

Dil ve konuşma becerisi ise işitme engellinin karşı karşıya kaldığı en büyük problem olarak görülebilir. Çünkü bu tür bir yetersizlik kişilerin tüm gelişim ve uyumunu aksatma gücüne sahiptir. Çocukta dil kazanımı birbirine bağlı aşamalardan meydana gelir.Buna göre; sesleri duymayan ve sözel uyaranları algılayamayan çocuğun dil kazanımı tam olarak gerçekleşemez. Dil kazanımının tam olarak gerçekleşememesinin bir diğer sebebi de ailenin çocuğa yeterli sözel tepkiyi vermemesidir. Çocuğun engelli olduğunu duyan ailenin çocukla sözel iletişimi azalır. Çocuğun sözel tepkilerinin az olması ailenin çocukla iletişimine etki eden bir faktördür. İşitme engelli çocuklarda okuma yazma gibi dilin kullanımını gerektiren becerileri kazanmada da problemler görülür (URL, 1).

Sonuç olarak işitme yetersizliğinin bireyin performansını bir bütün olarak etkileme derecesi kaybın tipi veya derecesine bağlı olduğu kadar kaybın oluştuğu yaş, çocuğun zeka düzeyi, ailenin ve toplumun işitme engeliyle başa çıkma yeteneği, çocuğun dil ve eğitimsel deneyimleri gibi birçok faktöre de bağlıdır (Meyen, 1996) denilebilir.

"Dil ve konuşma bozukluğu" bulunanlar da dördüncü grup sayılabilir. Dil ve konuşma bozuklukları Milli Eğitim Özel Eğitim Yönetmeliğinde, konuşmanın akışında, ritminde, tizliğinde, vurgularında, ses birimlerinin çıkarılışında, eklenlenişinde, artikülasyonunda, anlamında bozukluk bulunması şeklinde tanımlanmaktadır.

Dil ve Konuşma bozukluklarını 1. Konuşma bozuklukları (söyleyiş/artikülasyon bozuklukları, ses bozuklukları, konuşma akışındaki bozukluklar); 2. Dil bozuklukları ve 3. Diğer dil ve konuşma bozuklukları şeklinde üç türde incelemek mümkündür (URL, 2).

Son olarak ise "zihinsel engelliler" ele alınabilir. AAIDD zihinsel engelliliği zihinsel işlevler ve gündelik sosyal ve pratik becerileri kapsayan uyumsal davranışların her ikisinde görülen anlamlı sınırlılıklar olarak karakterize etmektedir. Bu yetersizlik 18 yaşından önce başlar (Kirk, Gallagher ve Anastasiow, 2003; Luckassan, 2002; Snell, 1993).

Türkiye'de 2006'da yayınlanan ve sonrasında 2009 ve 2010 yıllarında düzenlemeler geçiren Özel Eğitim Hizmetleri Yönetmeliğinde de AAIDD'nin yaklaşımına paralel olarak zihinsel engellilik zihinsel işlevlerin yanısıra kavramsal, sosyal ve pratik becerilerdeki sınırlılığa vurgu yapılmakta ve engel ya da gerilik kavramları yerine yetersizlik kavramının kullanılması önerilmektedir.

Zihinsel yetersizliği olan bireyler eğitsel ya da psikolojik olarak sınıflandırılabilirler. Eğitsel sınıflandırma türüne göre bu bireyler "eğitilebilir", "öğretilebilir", "ağır ve çok ağır" olmak üzere üç başlıkta değerlendirilebilmektedir. Psikolojik sınıflandırma ise bireylerin zeka testlerinden aldıkları puanlara bakılarak yapılmaktadır. Buna göre IQ düzeyi 50-70 arasında olanlar "hafif düzey"; 35-50 arasında olanlar "orta düzey"; 20-35 arasında olanlar "ağır düzey"; 20'nin altında olanlar ise "çok ağır düzey" zihinsel engelli sayılmaktadır.

Çok ağır düzeyde zihinsel yetersizliğe sahip olanların genellikle birden fazla engele sahip oldukları, genellikle hareket edemedikleri, bütünüyle bakıma ihtiyaç duydukları söylenebilir. Özel Eğitim Hizmetleri Yönetmeliğine göre bu grup, zihinsel yetersizliği yanında başka yetersizlikleri bulunması nedeniyle öz bakım, günlük yaşam ve temel akademik becerileri kazanamaması nedeniyle yaşam boyu bakım ve gözetime ihtiyacı olan bireyleri kapsamaktadır.

Ağır düzeyde zihinsel yetersizliğe sahip olanlar temel (özbakım) becerilerini belli ölçüde kazanabilmelerine rağmen genellikle bakıma muhtaçtırlar. Yetişkinliklerinde yakın bir denetimle basit işler yapmaları mümkündür (Özsüer, 2011a). Özel Eğitim Hizmetleri Yönetmeliğinde bu kategori öz bakım becerilerinin öğretimi de dâhil olmak üzere yaşam boyu süren, yaşamın her alanında tutarlı ve yoğun özel eğitim ve destek eğitim hizmetine ihtiyacı olan bireyleri tanımlamaktadır.

Orta düzeyde zihinsel yetersizlik çekenler, eğitsel sınıflandırma içinde "öğretilebilir" kategorisinde olanlardır. Bu grup akademik olarak ilköğretim ikinci sınıf düzeyinden ileri gitmekte zorlanır ancak basit mesleki eğitimlerden yararlanabilir ve belli bir denetimle kişisel bakımlarını yapabilme becerisi kazanabilir. Toplumsal kuralları öğrenmede yaşadığı sıkıntılar yaşıtları ve çevresiyle ilişkilerini bozabilir (Özsüer, 2011a). Özel Eğitim Hizmetleri Yönetmeliğine göre bu kategori, zihinsel işlevler ile kavramsal, sosyal ve pratik uyum becerilerindeki sınırlılık nedeniyle temel akademik, günlük yaşam ve iş becerilerinin kazanılmasında özel eğitim ile destek eğitim hizmetlerine yoğun şekilde ihtiyaç duyan bireyleri içermektedir.

Hafif düzey zihinsel yetersizlik içinde olanlar ise "eğitilebilir" olarak değerlendirilmektedir. Özel Eğitim Hizmetleri Yönetmeliği bu kategori için "sosyal ve pratik uyum becerilerinde hafif düzeydeki yetersizliği nedeniyle özel eğitim ile destek eğitim hizmetlerine sınırlı düzeyde ihtiyaç duyan birey"leri kapsar şeklinde tanım yapmaktadır. Kişilerin hafif düzey engelli kategorisinde olduklarının belirlenebilmesi için çoğu zaman okul çağlarına kadar beklemek gerekmektedir. Bu tür yetersizliklere sahip olanlarda psikomotor beceriler çoğunlukla normaldir. İletişim, özbakım, ev yaşamı, sosyal etkileşim, toplum içinde yaşayabilme, kendini yönlendirme, sağlık ve emniyeti gözetebilme, akademik beceriler, boş vakitlerini değerlendirebilme, iş becerileri gibi özellikler de yaşıtlarına çok yakın değerde gözlenir (Özsüer, 2011a).

Tüm bu engellilik türleriyle ilgili yukarıdaki özet bilgiler gözönünde tutularak, bu yetersizliklere maruz kalan kişilerin (bazıları için ağır ve çok ağır olanları hariç) önemli bir kısmının sosyal hayatını belli dezavantajlarla olsa da "normal" olanlara yakın bir şekilde sürdürebilmelerinin mümkün olduğu söylenebilir. Ancak toplumda engellilere yönelik varolan önyargılar ve bilinçsizlik bu kişilerin yaşamlarını olması gerekenden daha fazla zorlaştırmaktadır. Engellilerin içine doğdukları aile ve küçük çevrelerinin dışına çıkarak hayata karışmaları ve sosyalleşmelerinin temel olarak iyi ayağı vardır. Bunlardan birincisi eğitim süreçleri iken ikincisi de iş hayatıdır.

3. Türkiye'de Engellilerin eğitimi ve İstihdamı

Çalışmak, para kazanmaktan çok daha büyük anlamlara sahiptir. Üretim içerisinde bulunmak; maddi ihtiyaçlarını karşılamak gibi ekonomik, üretmenin hazzını yaşamak gibi psikolojik ve toplumun aktif bir parçası olmak gibi sosyal faydalar içermektedir.

4857 sayılın İş Kanunun 30. Maddesi "Özürlü, Eski Hükümlü ve Terör Mağduru Çalıştırma Zorunluluğu" başlığını taşımaktadır. Bu maddeye göre;

"işverenler, elli veya daha fazla işçi çalıştırdıkları özel sektör işyerlerinde yüzde üç özürlü, kamu işyerlerinde ise yüzde dört özürlü ve yüzde iki eski hükümlü işçiyi meslek, beden ve ruhi durumlarına uygun işlerde çalıştırmakla yükümlüdürler."

"Çalıştırmakla yükümlü oldukları işçileri Türk İş Kurumu aracılığıyla sağlayacak" olan işletmelere kanunca verilen teşvikler de şu şekilde belirtilmiştir:

"Özel sektör işverenlerince bu madde kapsamında çalıştırılan 17/7/1964 tarihli ve 506 sayılı Sosyal Sigortalar Kanununa tabi özürlü sigortalılar ile 1/7/2005 tarihli ve 5378 sayılı Kanunun 14 üncü maddesinde belirtilen korumalı işyerlerinde çalıştırılan özürlü sigortalıların, aynı Kanunun 72nci ve 73üncü maddelerinde sayılan ve 78inci maddesiyle belirlenen prime esas kazanç alt sınırı üzerinden hesaplanan sigorta primine ait işveren hisselerinin tamamı, kontenjan fazlası özürlü çalıştıran, yükümlü olmadıkları halde özürlü çalıştıran işverenlerin bu şekilde çalıştırdıkları her bir özürlü için prime esas kazanç alt sınırı üzerinden hesaplanan sigorta primine ait işveren hisselerinin yüzde ellisi Hazinece karşılanır."

4857 Sayılı Kanunun 101. Maddesinde ise çalıştırma zorunluluğu olduğu halde yükümlülüğünü yerine getirmeyen işletmelere ne tür bir ceza uygulanacağı düzenlenmiştir. Buna göre;

"(kanunun 30. Maddesindeki) hükümlere aykırı olarak özürlü ve eski hükümlü çalıştırmayan işveren veya işveren vekiline çalıştırmadığı her özürlü ve eski hükümlü ve çalıştırmadığı her ay için binyediyüz Türk Lirası idari para cezası verilir. Kamu kuruluşları da bu para cezasından hiçbir şekilde muaf tutulamaz."

Buna karşın (giderek azalmakla birlikte) engelli istihdam etmek yerine ceza ödemeyi göze alan kuruluşların sayısı oldukça fazladır. Bu tür bir tercihin altında pekçok sebep bulunmaktadır. Engellilerin iş yapabilmesi konusundaki önyargılar ve engellilerin özelliklerinden haberdar olunmaması nedeniyle hangi görevin verileceğine ilişkin bilgi eksikliğinin başı çektiği bu davranışların altında engellilerin yeterince eğitim (özellikle de mesleki eğitim) almamış olması gibi somut nedenler de bulunabilmektedir.

Türkiye Özürlüler Araştırmasının (2002) sonuçları engellilerin eğitsel açıdan oldukça zayıf kaldıklarını gözler önüne sermektedir. Bu araştırmaya göre engelli nüfusun içerisinde 6 ve daha yukarı yaşta bulunup da (görme, işitme, dil ve konuşma, ortopedik ve zihinsel engelliler içinde) okuma yazma bilmeyenlerin oranı % 36, 33'tür. [10]

Eğitim durumları bitirilen okul açısından incelendiğindeyse [11], engelli nüfusun (görme, işitme, dil ve konuşma, ortopedik ve zihinsel engelliler) % 40,97'sinin ilkokul mezunu olduğu; % 5,64'ünün ortaokul ve dengi meslek okulunu bitirdiği; lise ve dengi meslek okullarını tamamlayanların % 6,90'a tekabül ettiği ve ancak % 2,42'sinin üniversite okuyabildiği tespit edilmiştir.

Bu veriler, engellilerin eğitim almasında herhangi bir yasal kısıtlama olmamasına rağmen bu en temel kamu hizmetine ulaşabilme ve yeterince yararlanabilme konusunda sıkıntılar yaşandığını göstermektedir.

Eğitim imkânlarını engelliler adına genişletmek ve özellikle de mesleki eğitime yönelmek büyük önem taşımaktadır. Kaynaştırma eğitimi, engellilerin eğitilmesi konusunda akla gelen ilk yollardan biri olmaktadır.

Kaynaştırma eğitimi genel olarak, özel eğitime ihtiyacı olan bireylerin akranları ile birlikte eğitim ve öğretimlerini bütün kademelerde sürdürme esasına dayanan destek hizmetlerin sağlandığı özel eğitim uygulamaları şeklinde tanımlanabilmektedir. Özel Eğitim Yönetmeliğinin 23/1 maddesinde de kaynaştırma yoluyla eğitim;

"…özel eğitime ihtiyacı olan bireylerin eğitimlerini, destek eğitim hizmetleri de sağlanarak yetersizliği olmayan akranları ile birlikte resmî ve özel; okul öncesi, ilköğretim, orta öğretim ve yaygın eğitim kurumlarında sürdürmeleri esasına dayanan özel eğitim uygulamaları"

olarak ifade edilmektedir. Bu eğitim anlayışında amaç çocuğu normal hale getirmek değil, onun ilgi ve yeteneklerini en iyi şekilde kullanmasını ve toplum içinde yaşayabilmesini sağlamaktır. Temel ilkeleri ise aşağıdaki gibi sıralanabilir:

1- Özel Eğitime ihtiyacı olan bireyin akranlarıyla aynı kurumda eğitim görme hakkı vardır.

2- Kaynaştırma, özel ve genel eğitimin ayrılmaz bir parçasıdır.

---

[10] Bu oran süreğen hastalığı olanlar için % 24, 81 iken; toplam nüfus içerindeki oran ise 1/12'dir. Kır ve kent açısından da bir ayrım sözkonusudur. Kırsal alanlarda yaşayan engellilerin (görme, işitme, dil ve konuşma, ortopedik ve zihinsel engelliler) % 43,44'ü okuma yazma bilmiyorken; kentsel alanda bu oran aynı engel grubu için %29,58'e düşmektedir. Bu engel grubu için cinsiyetler arası bir farklılık gözlemek de mümkündür. Erkeklerde %28,14 olan okuma yazma bilemem oranı kadınlarda %48,01'e çıkmaktadır. Aynı şekilde bölgeler arası farklılık da tespit edilebilir. Güneydoğu Anadolu'da %52,53 olan bu oran Marmara'da % 26,62 görülmektedir.

[11] Tamamlanmamış eğitim durumlarının incelendiği bu aşamada 25 yaş üstü engelli nüfus gözönünde bulundurulmuştur.

3- Hizmetler yetersizliğe göre değil, eğitim ihtiyaçlarına göre planlanır.

4- Karar verme süreci Aile – Okul – Eğitsel Tanılama sürecine göre gerçekleşir.

5- Kaynaştırmaya erken başlamak esastır.

6- Kaynaştırmada bireysel farklılıklar esastır.

7- Duyu kalıntılarından yararlanmak esastır.

8- Gönüllülük, sevgi, sabır, gayret gerekmektedir.

9- Eğitim normal insanlarla ve doğal ortamlarda verilmelidir.

10- Eğitim, bireyi toplumun bir parçası haline getirmeyi amaçlar.

Kaynaştırma eğitimi sadece özel eğitime ihtiyacı olan bireylere fayda sağlamaz, çok yönlü yararları vardır; normal çocuklara, ailelere ve öğretmenlere de katkı yapar. Kaynaştırma eğitimi sayesinde normal çocukların, engelli bireyi kabul etme, hoşgörü, yardımlaşma, demokrasi anlayışları gelişir; ayrıca bireysel farklılıklara saygı gösterme; kendi yetersizliklerini görme, bunları kabul etme ve giderme becerileri edinirler.

Ailelere yönelik yararlara bakıldığında, ailelerin çocuklardan beklentileri ve çocukların gerçek kapasiteleri hakkında daha gerçekçi bir ilişki kurulma ihtimalini güçlendirdiği görülmektedir. Bunun yanısıra çocuğun ilgi ve ihtiyaçlarının farkına varıp onlara yardım etme konusunda yeni bakış açıları edinirler. Okula bakış açıları değişir. Aile içi çatışmalar azalır ve aile sağlığında artış gerçekleşir.

Kaynaştırma eğitimi öğretmenlerde şartsız kabul, sabır ve hoşgörü gelişmesine büyük katkı sağlar. Ayrıca öğretmenlerin öğretim becerilerini geliştirir, farklılıkları tanımasını ve saygı duymasını sağlar ve deneyimlerini arttırmalarına yardım eder. Elbette ki en büyük fayda özel eğitime ihtiyaç duyan bireyler için gerçekleşecektir. Bu yararlar kısaca şu şekilde sıralanabilir:

1- Kendine güven, takdir edilme, işe yarama, cesaret, sorumluluk gibi sosyal değerleri gelişir.

2- Olumsuz davranış yerine olumlu davranışları artacaktır.

3- Normal öğrencilerle birlikte çalışmaları daha büyük başarılar için kendilerinde istek ve cesaret uyandırır.

4- Bu öğrenciler normal öğrencilerden bazı davranışları öğreneceklerdir.

Kısaca kaynaştırma eğitimi toplumdaki tüm kesimlerin bireysel farklılıkları tanıyıp empati geliştirebilmesi adına büyük bir fırsattır. Yeterli ve doğru bir şekilde ve ideal haliyle uygulandığında sınıftaki her öğrencinin değerli olduğu bir ortam oluşmasına katkıda bulunduğu gibi bu değer duygusunun bireye yerleşmesini ve kalan yaşamında karşılaşacağı başka durumlara transfer edebilmesini de sağlar. Buradaki başka durumlar tüm yaşam anlarını içerebilmekle birlikte özellikle çalışma hayatı özel bir öneme sahiptir.

Yukarıda bazı engel gruplarının kısa tanıtımlarından da anlaşılabildiği gibi her engel grubu için farklı engel düzeyleri bulunmaktadır (en basit sınıflandırma şekliyle ağır, orta ve hafif düzey gibi). Aynı zamanda her engel grubu için yapılabilecekler ve yapılamayacaklar listesi de oldukça farklılık gösterir. Bu farklılığı aynı engel grubuna dâhil olan farklı bireyler için de söylemek mümkündür. Aynı engel grubu içerisinde bulunan ve aynı düzeyde engelli olan kişilerin de iş yapabilme, öğrenebilme, sosyal ilişki kurabilme vs. gibi özellikleri birbirinden farklılık gösterir.

Ancak bu konuda bazı genellemeler yapmak da mümkündür. Örneğin orta düzeyde bir zihinsel engelli, kişisel bakımını belli düzeyde yapabilir ve basit meslekleri öğrenebilir. Hafif düzeyde bir zihinsel engelli ise çoğu zaman normal düzeye yakın psikomotor becerilere sahip olduğu için iş becerisi açısından oldukça yeterlidir. Burada bahsedilen yeterliliği engelli olmayanlarla karşılaştırmaksa doğru değildir. Bir engelliyi sahip olduğu dezavantajla ilişkisi ölçüsünde değerlendirmek gerekir.

Çalışma, kişinin yaşamını idame ettirmesinin ötesinde, kişisel doyumunun ve toplumun bir parçası olmasının ana kaynaklarından biridir. Bu nedenle sağlıklı insanlar kadar engellilerin de bir işe sahip olmaları yaşamsal önem taşımaktadır. Ancak daha önce de ifade edildiği üzere genel olarak toplumda, özel olarak da işverenlerde engellilere ve engellilerin istihdam edilmesi fikrine yönelik bazı önyargılar bulunmaktadır. Bu önyargıları tespit etmek üzere Amerika'da gerçekleştirilmiş bir araştırmada çıkan sonuçlar şu şekilde sıralanabilir (Seyyar, 2001):

Sık sık mazeret izni alırlar ve sürekli hastalanırlar

Verimli ve iyi çalışamazlar

Alıngan ve kırılgan olurlar, çabuk kızarlar

Kariyer yapmaları zordur

Diğer çalışanlar rahatsız edip verimlerini düşürürler

Daha çok iş kazalarına maruz kalırlar

Halkla ilişkiler açısından olumsuz manzara oluştururlar

İşyerlerinde özel düzenlemeler yapılması masraflıdır

İşten atmak ve cezai yaptırımlar uygulamak daha zordur

Emek piyasasında yeterince sağlıklı işsiz bulunmaktadır

Bunun yanısıra yine Amerika'da yapılan bir başka araştırma ise engelliler hakkındaki önyargıları ortadan kaldırabilecek sonuçlara ulaşmıştır (Seyyar, 2001):

Engelliler işyerlerinde "sağlıklı" işçilerden daha iyi davranışlar gösterirler

İşi bırakma ihtimalleri daha azdır

Sorumlu ve kesintisiz olarak çalışmaktadırlar

Daha az iş kazalarına sebep olmaktadırlar

İşlerini daha çabuk kavramaktadırlar

Daha fazla iş bilincine sahiptirler

Daha güvenilirdirler

İşlerine zamanında gelmektedirler

Diğer işçiler kadar verimli çalışmaktadırlar

Halkla daha iyi diyalog kurmaktadırlar

İkinci araştırma, engellilerin istihdamıyla ilgili önyargıların gerçekte ne ölçüde asılsız olduğunu gözler önüne sermektedir. Bu tür araştırmaların bulgularından yola çıkarak engellilerin toplumsal hayata daha güçlü ve yoğun bir biçimde katılmalarını amaçlayan aktif politikaların hayata geçirilmesi gerekmektedir. Yukarıda ifade edilen kaynaştırma eğitimi bu politikaların en önemli ayaklarından birini oluştururken ikinci adımında ise engelli istihdamını özendiren ve belli ölçüde de zorlayan (kota rejimi gibi) politikalar yer almaktadır. Birleşmiş Milletler tarafından 2006 yılında kabul edilen ve Türkiye tarafından da 2007'de imzalanan Engelli Hakları Sözleşmesi, engellilerin haklarını tanımlamakta ve bu bağlamda çalışma yaşamını da kapsayacak şekilde yaşam kalitesini arttırmanın koşullarını belirlemektedir. Birinci maddede amacı;

"engellilerin tüm insan hak ve temel özgürlüklerinden tam ve eşit şekilde yararlanmasını teşvik etmek, korumak ve sağlamak ve doğuştan sahip oldukları onura saygıyı güçlendirmek"

olarak açıklanan bu sözleşmenin 27. maddesi ise doğrudan çalışma ve istihdam konusunu ele almaktadır. Bu maddede engelliliğe dayalı ayrımcılık kesin bir dille yasaklanırken engellilerin çalışma yaşamı içinde desteklenmesi savunulmaktadır. Seyyar (2008) engellilerin için istihdam politikalarının belirlenmesinde bu belgenin temel ilkeler içerdiğini söylemektedir.

Özellikle hafif ve orta düzeye engeli olanların istihdamına yönelik olarak yasalarda da yer alan kota oranının arttırılması ya da en azından etkin bir şekilde kullanılması konusunda hassasiyet gösterilmesi sorunun boyutlarının büyümesini engelleyebilecektir. Ancak ağır derecede engelli, çoklu engelli ya da zihinsel engelli olmaları dolayısıyla istihdamı çok daha zor olanlar için daha özel politikalar geliştirilmesi gerekmiştir. Bu amaçla 2006 tarihinde "Korumalı İşyerleri Hakkında Yönetmelik" çıkarılmıştır. Bu yönetmeliğin amacı birinci maddede belirtilmektedir:

"(1) Bu Yönetmeliğin amacı, normal işgücü piyasasına kazandırılmaları güç olan özürlüler için açılacak olan gerekli teknik donanımı devletçe sağlanacak olan işyerlerinin korumalı işyeri statüsü kazanması, işleyişi ve denetlenmesine ilişkin usul ve esasları düzenlemektir.

(2) Bu Yönetmelik, normal işgücü piyasasına kazandırılmaları güç olan özürlüler için mesleki rehabilitasyon ve istihdam oluşturmak amacıyla gerçek ve tüzel kişilerce açılan ve açılacak olan işyerlerini kapsar"

Yönetmelikte korumalı işyeri;

"normal işgücü piyasasına kazandırılmaları güç olan özürlüler için mesleki rehabilitasyon ve istihdam oluşturmak amacıyla, Devlet tarafından ilgili mevzuatta teknik donanımın sağlandığı ve mali yönden desteklendiği, çalışma ortamının özel olarak düzenlendiği işyeri" (3. Madde)

olarak tanımlanmaktadır. Çalışan sayısının, işletme büyük şehir belediye sınırları içindeyse 30; dışındaysa 15'den az olmaması kaydıyla yüzde 75'inin engelli olması şart olan (madde 4) korumalı işyerlerine ilişkin yönetmeliğin 17. maddesi ise korumalı bir işyerinde istihdam edilecek olan kişilerin temel özellikleri hakkında bilgi vermektedir:

"a) En az %40 oranında zihinsel, ruhsal-duyusal ve davranışsal özürlü olmak veya diğer özür gruplarından ise %60 ve üzeri özürlü olmak,

b) Kuruma kayıtlı olmak,

c) 15 yaşını bitirmiş olmak gerekir"

Korumalı işyerlerine örnek olarak "Down Cafe"lerden söz edilebilir (URL 4; URL 5; URL 6; URL 7; URL 8; URL 9).

Bu başlık altında bahsedilen şekliyle engellilerin meslek hayatına kazandırılmasında temel olarak iki sistem göze çarpmaktadır. Bunlar pozitif ayrımcılık anlamına gelebilecek şekilde "kota rejimi" ve BM gibi uluslar arası kuruluşlarca belirlenen ilkeler doğrultusunda ayrımcılığı önlemeye yönelik "kanunlaştırma hareketleri"dir. Bunlara ek olarak iki politikayı bir araya getirmeye çalışan (Kayacı, 2007) "korumalı istihdam" yaklaşımı ve son olarak da "seçilmiş iş" anlayışı ortaya konabilir. Seçilmiş iş yaklaşımı da belirli işlerin yalnızca engelliler için ayrılmasını içeren bir modeldir. Santral memurluğunun görme engelliler için ayrılması buna örnek olabilir (Kayacı, 2007).

4. Aracı Bir Uzmanın Gerekliliği

Yukarıdaki başlıkta da sözü edildiği üzere engellilerin çalışma hayatında başarılı olamayacağına yönelik önyargılar oldukça güçlü ancak bir o kadar da asılsızdır. Fakat toplum(lar)da engellilere yönelik önyargıların

hâkimiyeti devam etmektedir. Böyle olduğu içindir ki iş kapılarının engellilere açılmasında büyük zorluklar yaşanmaktadır. Engelliyi işe kabul edecek kişilerin (işveren gibi) engellilik, engel türleri, engellilerin yapabileceği işler ve kapasiteleri gibi konularda detaylı bilgi sahibi olmalarını beklemek gerçekçi değildir. Bu nedenle de işverenle engelli arasında bağlantı kurması gereken ve bunu profesyonel bir meslek olarak yapan kişilere ihtiyaç vardır.

Bu profesyonel meslek sahipleri (bundan sonra "uzmanlar" denilecektir) devlet tarafından desteklenecek bir kurumda örgütleneceklerdir. Özel Eğitim ve Rehabilitasyon merkezlerinde olduğu gibi verdikleri hizmet karşılığında devletten bütçe alacaklardır.

Bu kurumlarda çalışan her uzmanın ilgilendiği engelli sayısı 30-50 arasında olacaktır. Uzman, listesine aldığı bu kişilerin en başta yaşadıkları hayattan zevk almalarına ve sosyal uyumlarına katkı sağlayacak şekilde, onların (eğer ihtiyaç varsa) meslek öğrenmesi için uygun eğitimlere yönlendirilmesinde, iş bulmasında, işyerindeki çalışmaya ilişkin veya sosyal sorunlarının çözümünde aracı rolü üstlenir.

Uzman; ne psikolojik danışman, ne doktor, ne tam olarak sosyal hizmet uzmanı, ne de işverendir. Bu anlamda uzman, engellinin önündeki "engelleri" temizleyip doğru zamanda doğru kurumlarla bağlantı kurmasını sağlayan ve özellikle işvereni engellinin yapabilirlikleri hakkında bilgilendiren ve "ikna" eden kişidir.

Uzmanın engelli adına bağlantı kuracağı kurumlar sağlık ve rehabilitasyon merkezleri, İŞKUR, Yerel Yönetimler ve İşverenlerdir.
Şekil 1: Uzmanın İlişki Kuracağı Kurumlar

Uzmanın asıl görevi, çalışma etkinliklerinin kişiyi toplumun parçası haline getirmede büyük faydası olduğundan hareketle, engellinin bir işe yerleştirilmesi ve çalışma hayatının yolunda gitmesine katkı sağlamaktır. Bu nedenle, doğaldır ki ilk olarak işe yerleştirilmeyi bekleyen engelliye ait raporları incelemek, eğer gerekiyorsa yeni tetkikler yapılması için onu gerekli sağlık kuruluşlarına yönlendirmek durumundadır. Bu şekilde kişinin engel türünü ve derecesini belirledikten sonra kişinin almış olduğu eğitim ve mesleki formasyonu üzerinde bilgi toplamak gerekmektedir. Bu aşamada kişinin herhangi bir meslek dalında yeterli birikime sahip olmadığı ortaya çıkarsa İŞKUR, Mesleki Rehabilitasyon Merkezleri ya da başka kurumlarca organize edilen meslek kurslarına yönlendirmek gerekecektir. Engelli ve ailesiyle birlikte ve ek olarak bir PDR uzmanının uygulayacağı testlerin

sonuçlarının da yol göstericiliğinde bir kariyer planlaması yapmak mümkün olacaktır.[12] Bu sürecin tamamlanması ve engellinin bir mesleğin gerekliliklerini yerine getirebilir hale gelmesinin ardından Uzman, çevredeki işyerlerini ziyaret ederek engellinin yapabilecekleri hakkında işvereni bilgilendirecektir. Bu aşama, süreçteki en önemli aşamadır. Çünkü engelli bireyin tanınması ve mesleki kurslara yönlendirilmesi için özel olarak onunla ilgilenen bir kişinin yardımı gerekmezken, işverenin bir engelliyi işe alması için çoğu zaman onu ikna edecek birilerine/birşeylere ihtiyacı vardır.

Uzman, işvereni sadece yasal mevzuatta yer alan zorunluluklar ve teşvikler hakkında bilgilendirmeyecek; bundan daha önemli olarak engel, engellilik, engellilerin yapabilirlikleri ve başarıları hakkında örnekler vererek bir farkındalık yaratmaya, önyargıları ortadan kaldırmaya çalışacaktır. Özel olarak da, işe yerleşmesine katkıda bulunduğu engelliyi tanıtacaktır. Uzmanın yapacağı işin en önemli boyutu da bu noktada ortaya çıkacak ve bir tutum değişimini / olumlu tutum oluşumunu desteklemektir. Petty ve Cacioppo tarafından ortaya atılmış olan "ayrıntılandırma olasılığı kuramı" engellilerle ilgili tutum değişimini açıklamakta kullanılabilmektedir. Petty ve Cacioppo (1986'dan aktaran ÖİB) tutumların merkezi ya da çevresel yollar izlenerek oluştuğunu ileri sürmektedirler. İnsanlar tutum objesi hakkında kendilerine ayrıntılı bilgiler ulaşmışsa ve bu bilgileri ayrıntılı olarak inceleyebilirse yüksek bir bilişsel işlemle tutumlarını oluşturabilirler/değiştirebilirler. Buna imkân yoksa yani yeterli bilgi verilmezse ya da buna zaman ayıramazlarsa tutumlarının oluşması için çevresel yollar izlerler. Bu bağlamda "uzman"ın engelliler hakkında işvereni ayrıntılı bir şekilde bilgilendirmesi daha gerçekçi tutumlar oluşturması için merkezi bir yol olacak ve büyük fayda sağlayacaktır. Bilgilendirmenin engellilerle ilgili olumsuz tutum, inanç ve yargıları azaltmasına ilişkin pek çok araştırma da bulunmaktadır (ÖİB Araştırması). Bununla birlikte engellinin performansının, uzman tarafından süreç içerisinde takip edilmesi ve uzmanın olası problemlerde devreye girerek sorun çözümünde rol ve inisiyatif alması da işverenin engelli istihdamına olumlu bakışını güçlendirecektir.

5. Sonuç

Engelliler istihdam sürecinde büyük sorunlarla karşılaşmaktadırlar. Eğitim eksiklikleri, mesleksiz ve dolayısıyla vasıfsız olmaları bir yana; iş yapabilme kapasitelerine yönelik önyargılar nedeniyle ya hiç istihdam edilmemekte ya da düşük ücretli işlerde değerlendirilmektedirler. İstihdam fırsatı bulanların çoğu ise işin ve işyerinin kendi özelliklerine uygun olmaması, gereksinimlerine cevap vermemesi ve gerek iş arkadaşları gerekse amirleri tarafından gösterilen olumsuz davranışlar neticesinde ayrımcılığa maruz kalmaktadırlar. Dolayısıyla engelliler iş hayatının öncesinde, sonrasında ve iş hayatı süresince çok boyutlu problemlerle karşı karşıyadırlar.

Uzmanın iki temel görevi vardır: Birincisi engelliye ilişkin bilgileri tek elde toplayarak bütünsel bir değerlendirme yapabilecek; bilgi eksiği olmaksızın kurumlarla ilişkiye geçebilecek ve engelli için en doğru kararın verilebilmesinde bir tür "koçluk" görevi üstlenebilecektir. İkincisi ise engellilerin istihdamında en temel problem olarak tespit edilen "önyargılar"ı kırmak üzere genel olarak engelliliği ve özel olarak haklarını savunduğu engelliyi tanıtmaktır. Bu sayede engellilik hakkında farkındalık yaratma gibi sosyal bir sorumluluğu yerine getirirken öte yandan bir engellinin daha işe yerleşip kendi yaşamını kurmasına katkı sunacaktır.

Sonuç olarak engellilerin toplum içinde aktif bireyler olarak yeralması toplumsal bütünlük duygusunu güçlendirecektir. Toplumu toplum yapan temel etken, içinde bulunan birey ve grupların birbiriyle kurmuş oldukları etkileşimlerdir. Engelliler toplumda bilinçli veya bilinçsiz olarak en fazla ayrımcılığa, dışlanmaya tabi tutulan gruplardır. Toplumun engelli ve engelli olmayan tüm kesimlerinin eğitim ve çalışma süreçlerinde birlikte olması, sosyal temas kurması olumsuz tutumları ortadan kaldırmanın birincil yoludur. Özellikle çalışma süreçlerinde bu temasın kurulmasını sağlayacak, buna yardımcı olacak uzmanların yer alması da önem taşımaktadır.

---

[12] Bu aşamaya kadar olan kısmı mesleki rehabilitasyon merkezleri de gerçekleştirmektedir. Sözkonusu merkezler rehabilitasyon hizmetini bir bütün halinde vermektedirler. Bu süreçte, tıp doktorları, psikologlar, pedagoglar ve mesleki eğitim uzmanları görev almaktadırlar. Merkeze kabul edilen engelli öncelikle tıbbi muayeneden geçirilmekte ve engelinin türü ve derecesi belirlenmektedir. Daha sonra yapılan fiziksel ve zihinsel testlere ve mevcut iş kapasitesi ve yeteneğine göre eğitim alması sağlanmaktadır.

ENGINEERING EDUCATION TECHNIQUE BASED ON PROFESSIONAL ACTIVITY IMITATION

Sysoev Alexander Alekseevich, Sysoev Alexey Alexandrovich, Petrov Valerii Ivanovich, Poteshin Sergey Stanislavovich. [13]

National Research Nuclear University "MEPHI", Kashirskoe sh., 31, Moscow, 115409, Russia

Abstract

A new technology for the training of engineers is offered, named as of Professional Activity Imitation Education Technique (PAIET). This technology is being tested at the National Research Nuclear University (NRNU MEPI) for many years. Its basis is establishment of training equivalent of professional activities of specialist after graduation. In order to ensure the rapid reproduction of skills and functions of engineering activities by students, they are included in the "habitat" and they participate in the implementation of real projects. In the process of scientific and devise work, as well as learning sessions, they gain experience and skills of real engineering activities.

Keywords: Engineering Education, Education Technology, Students.

Main text

The traditional (informational) education technique, which is used in a higher education, is in contradiction with the needs of the economic development of the country. The main reason is that the technique not only ignores the basic laws of intellectual development of personality, but also contradicts them. Essentially, in a traditional technique, one goal - the development of professional abilities to productive activity - is replaced by another - the successful implementation of the academic plan and obtaining good grades for tests and examinations. And the task of developing students' creative abilities is not specifically raised. The existing technique was developed more than 4 centuries ago by John Amos Comenius [1], and was based on "class and lessons" educational principle. Expert and experimental evaluations of a person's ability to produce knowledge shows that creative abilities of the person are not very high. However, according to the authoritative American psychologist Abraham Maslow, creativity - is a creative orientation, innate characteristic of all but lost by a majority under the influence of the environment [3]. In this respect, the traditional system of education plays a negative role.

This principle was used as a base for the development of Professional Activity Imitation Education Technique (PAIET), which is being experimentally tested in the Moscow Engineering Physics Institute at the Department of "Molecular Physics" for 20 years, specializing in "Applied Ion Physics" [5]. Its essence lies in the implementation of the learning process as a training equivalent of professional activities of specialist. The key principles of PAIET are based on the following. At the beginning of the 4th, and in some cases 3rd year, students are given a complex task to create a new analytical tool, the development of which includes all the main stages of professional activity of experts outside the university. This task is implemented as part of a through project, which includes interrelated semester course projects with access to the practice and to the diploma work. List of academic disciplines is formed, based on the professional needs of the projected activities of a specialist. In each of all disciplines practical tasks are allocated, which are components of a complex problem. I.e. implementation of self-consistent tasks, related to the engineering, calculations, preparation of models, essays, modeling, and construction occurs. Students are actively involved in participation in scientific conferences, competitions for young scientists, publications of scientific papers. The maximum support for the complex of arising problems is placed on general scientific disciplines that were already mastered. The shift in emphasis of studied disciplines from goals for taking tests/exams to achievement of results in practical activity takes place. Students participate

E-mail address: aasysoyev1@mephi.ru.

in the activity of real professional environment, which suggests their continued work in the scientific laboratory. The main objective here is mastering of methodology of creative activity with the help of subjects of the environment, the intensification of information exchange and transfer of professional skills to students from teachers, specialists, and from senior to junior students. The use of psychological tools in the implementation of the emotional state of students to enhance the intellectual professional activity. Individual and the group work are organically combined.

Establishment of educational analog of projected professional environment is an important step in implementing new technology. This assumes constant scientific, project and engineering work of students in the science laboratory. According to LS Vygotsky [6], personality reproduces abilities and functions of subjects of the environment. The main objective of the teacher is activation of the students' work in mastering of advanced methods of intellectual activity. Professional activity imitation model eliminates the principal disadvantages of the information model: 1) it gradually eliminates stereotype of mental activity of the student "learned - passed" ... "learned - passed", which was created on junior courses, 2) eliminates transfer of students to the following semester, or course, with gaps in knowledge in any discipline or its subthemes. That is, consider not only the positive (for tests and exams) grades, 3) initiates formation of students' needs in professional activities and motivations to creative work, to lay down the foundations for the development of creative abilities.

Special seminars, professional activity games, students' work directly in the research laboratory under the direction of any of employees or senior student are used as elements of the professional environment. Students learn techniques of modeling and engineering design, using modern computer means and software products in the laboratory. Mastering occurs by means of work on separate parts of a through project. In the technique used, the process of knowledge development by students has the following additional features. Certain disciplines are mastered by non-traditional approaches: students are assigned 1) to give lectures, 2) to regularly prepare sections of the course with a mandatory summary. For lecturing whole material of the course is divided between students (3-5 people) and they present it alternately during the lecture hours. The role of the teacher in this case is to control the correctness of presentation of the material, to discuss the results, to add to the topics that were not reflected by students, and to formulate problems that enhance students' understanding of the material. During mastering the subject (with a mandatory preparation of summary) the method of group discussions in class is used in accordance with the academic schedule. Defense of course projects, essays, analytical reviews, results of lecturing and group discussions of materials of mastered disciplines are used as a semester control for subjects listed in the academic plan. If the teacher drew the conclusion that someone did not master the material, then discussion is repeated with that student.

Psychological tools for support of learning process play an important role in described educational technique. Great attention is paid to the formation of motivations, establishing their connection with the situational needs of the students (through awards, appointments to positions with payment, etc.). Psychological means are a key tool for improvement of students' motivation to actively participate in creative activities. Generation of something new is an emotional process, and the student does not have skills of "swinging" the emotional sphere. Of course, teaching methods of psycho-intellectual generation [8] is one of the main objectives of the teacher.

Use of the described technique offers following positive results:

- The effectiveness of specialists' training increases dramatically.
- The time required for graduate to adapt to the professional environment decreases greatly.
- The ability of graduates for productive creative activity develops more intensively.
- All diploma projects are unique and their results are published in scientific journals.

Over the past 6 years, students who studied according to PAIET received 8 diplomas of 1st and 2nd degree in competitions of young scientists. Two students were awarded with trips to international mass spectrometry conferences. Eleven articles were published in scientific journals with their participation.

Abstract

Engineering education literature shares a consensual vision of the importance of soft skills for every workplace. However, undergraduates may not be aware of soft skills importance for their future employment and professional development. This research examines how undergraduates rate their current proficiency in a range of soft skills, and how do they perceive its importance for future employment. It also explores relations between proficiency in soft skills and self-efficacy, a variable strongly associated with competent performance, and learning styles, in order to identify practical implications for the design of more effective skills development programs.

Keywords: engineering education; soft skills; learning styles; self-efficacy

Introduction

One of the crucial areas of research in engineering education is, according to "The Research Agenda for the New Discipline of Engineering Education" (2006) the knowledge and skills that future engineers must learn in the classroom and develop during professional practice. Today's engineering graduates have an abundance of technical knowledge, but most lack the interpersonal and social skills required by modern job settings, such as effective communication and teamwork. In recent years, industries, professional organizations (e.g. ABET - Accreditation Board for Engineering and Technology), and international organizations (e.g. European Commission), have all noted the weakness in soft skills proficiency among recent engineer graduates. In line with this, there is a consensus in engineering education literature that highlights the urgency to help undergraduates acquire a broad range of soft skills that facilitate employment transition and professional career development. But what about undergraduate students? Are they aware of soft skills importance for engineering profession?

Several studies have already tried to understand undergraduates perceptions of soft skills importance for work context (Nabi & Bagley, 1999; Passow, 2012). With the present study we wanted to know in which soft skills are engineering undergraduates less efficient, and find out their preferred learning styles and self-efficacy.

Soft skills are transferable behaviors that can be used within a wide range of functions, activities and contexts. They are essential to the labor market, specifically in the highly competitive scenarios, and in engineering professional contexts is increasingly important to master them together with the hard and technical skills (King, 2012).

Self-efficacy, according to Albert Bandura (1999), is a mechanism of personal agency consisting of individual's beliefs regarding performance capabilities in a particular domain. In this sense, self-efficacy can be defined as being a prospective competence-based variable that predicts action (Bandura, 1997). More specifically, perceived self-efficacy represents an optimistic sense of personal competence accounting for motivation and performance in multiple life domains (Scholz, Gutiérrez-Doña, Sud, & Schwarzer, 2002). In fact, previous studies have consistently found a significant and positive correlation between perceived self-efficacy and successful performance (Beeftink, Van Eerde, Rutte, & Bertrand, 2012; Hughes, Galbraith, & White, 2011; Schunk & Gunn, 1986).

More than ever, higher education engineering courses are asked to prepare efficient, autonomous and competent future engineers (Holvikivi, 2007), in order to respond to labor market demands for high qualified professionals. There is a general acceptance that the manner in which individuals prefer to approach a task or learning situation – learning style preference – has an impact on academic achievement and professional performance. The Index of Learning Styles (ILS; Felder & Soloman) has been widely used in engineering education research (Litzinger, Lee, Wise, & Felder, 2007), and studies reported that the majority of engineering students are predominantly visual, sensing, inductive, and active learners (Carrizosa & Sheppard, 2000; Felder & Silverman, 1988; Kuri, Silva, & Pereira, 2006).

Method

Sample

A sample of 337 undergraduate engineering students of four Portuguese public universities participated in the study, including 292 males and 45 females. The ages of participants ranged from 18 to 38 years (Mean=22.19, SD=3.045). Forty seven percent of the participants frequented the Bologna's 1st cycle studies (N=154), and 53 percent the 2nd cycle studies (N=173). Nine percent of the participants (N=30) were working-students.

Instruments

A list of 29 soft skills was designed based on literature and on findings of several studies (e.g. Dijkgraaf et al., 2009; Spkins, Silburn, & Birchall, 2006). Using a 5 point Likert scale (1 minimum importance, 5 maximum importance), participants were asked to self-evaluate their proficiency in the skills at the present moment (Proficiency - P), and to rate the importance of the same skills in future employment (Importance - I).

Self-efficacy was assessed using the translated Portuguese version of General Perceived Self-Efficacy scale (GSE) by Schwarzer and Jerusalem (1995; Nunes, Schwarzer, & Jerusalem, 1999). Participants are instructed to estimate their ability with respect to several situations (for example, "*If I am in trouble, I can usually think of a solution*"). The scale consists of ten statements and participants have to respond to each one according to a 4-point Likert scale, in a range from 1 (*not at all true*) to 4 (*exactly true*). High reliability, stability, and construct validity of the GSE scale was found in several studies (Leganger, Kraft, & Røysamb, 2000; Schwarzer & Born, 1997; Schwarzer, Mueller, & Greenglass, 1999).

Felder and Solomon developed the Index of Learning Styles (ILS) specifically for engineering education. The ILS classifies students learning preferences in four dichotomic dimensions (Felder, 1996; Felder & Spurlin, 2005):

- Sensing/Intuitive. Sensing learners are oriented toward facts and procedures, concrete and practical information. Intuitive learners are more oriented toward theories and meanings, conceptual and innovative ideas.
- Visual/Verbal. Visual learners prefer visual representations of material whilst verbal learners prefer written and spoken words.
- Active/Reflective. Active students learn by doing and working with others. Reflective learners learn through thinking and prefer to do it alone.
- Sequential/Global. Sequential students learn in small incremental steps, orderly and linearly. Global learners have an holistic view of things and learn in large steps.

The ILS has 4 scales, corresponding to the four pairs of learning styles, with 11 items each. In all items, respondents have to chose one of two possible answers (e.g. "*I understand something better after if:(a) try it out; (b) think it through*").

Procedure

An assessment protocol was composed by soft skills rating, GSE and ILS. The protocol was distributed in classroom to undergraduates of electrical and electronic engineering, with subfields in computers, electronics and telecommunications.

Results

Four research questions were addressed in the study: (1) how do undergraduates rate their proficiency in a range of soft skills, at the present moment; (2) how do they rate the importance of soft skills for future employment; (3) in which soft skills do undergraduates indicate gaps; and (4) how does graduates' perceptions relate to self-efficacy and preferred learning styles. Results were also analyzed considering study cycle.

Histograms of the ratings for skills showed that the rating were not normally distributed. The participants predominantly used the upper end of the scale. As skills have been measured on a ordinal scale and do not meet the distributional assumptions of parametric statistics, nonparametric tests were used to analyze data (Cohen, 2001; Howell, 1997).

Proficiency, importance and skills' gaps

Table 1 shows undergraduates' mean rates for skills current proficiency and importance for future work, and also presents the skills' gaps. Mean ratings for all skills were above the middle of a five-point scale. Regarding skills' proficiency, higher ratings were found for "responsibility"(M=4.16; SD=.836), "continuous learning" (M=4.12; SD=.694), and "listening" (M=4.11; SD=.773). Lower rating were found for "time management" (M=3.37; SD=.965), and "creativity and innovation" (M=3.50; SD=.858).

Table 1. Skills' mean rates for current proficiency and importance for future work

Skill	Proficiency (P)		Importance (I)		Skill gap

* p <.05

Regarding skills' importance, undergraduates indicated higher importance to "meeting deadlines" (M=4.59; SD=.658), "responsibility" (M=4.45; SD=.811), "time management" (M=4.43; SD=.721), "teamwork" (M=4.42; SD=.664) and "work organization" (M=4.33; SD=.858). The median of 5.00 was found for all of these skills. Undergraduates indicated lower importance to "intercultural relation", "persuasion" and "systemic vision". In general, the mean importance ratings ranged from 3.83 (intercultural relation) to 4.59 (meeting deadlines), and these results show that undergraduates consider soft skills as having high importance for professional practice.

As noted in previous studies (e.g. Nabi & Bagley, 1999), undergraduates rated the importance of soft skills more highly than their proficiency in the same skills. Wilcoxon signed-rank test was used to medians analysis. Significant differences were found between ratings of all skills, except for "intercultural relation" and "information sharing". That is, undergraduates ratings revealed gaps in 27 of the 29 analyzed skills. The most evident gap was found for "time management" (Z=-12.313, p≅0), however 8 skills obtained mean differences superior to 0.50, to know: "work organization", "creativity and innovation", "oral communication", "meeting deadlines", "foreign languages", "teamwork", "autonomy", and "pressure tolerance".

Mann-Whitney test was used to analyze possible differences between 1st cycle and 2nd cycle undergraduates. Significant differences were found regarding proficiency on "flexibility" ($M_{1st\_cycle}=3.88$, $M_{2nd\_cycle}=4.06$, $U=11300.000$, $p=.012$), "foreign languages" ($M_{1st\_cycle}=3.55$, $M_{2nd\_cycle}=3.77$, $U=11463.500$, $p=.026$), and "proactivity and initiative" ($M_{1st\_cycle}=3.64$, $M_{2nd\_cycle}=3.83$, $U=11537.500$, $p=.042$). According to these results, 2nd cycle undergraduates rated higher than 1st cycle undergraduates in the previous skills. Concerning skills' importance, significant differences were found again between study cycles, with higher ratings of 1st cycle undergraduates in "intercultural relation" ($M_{1st\_cycle}=3.92$, $M_{2nd\_cycle}=3.73$, $U=11781.500$, $p=.045$) and "creativity and innovation" ($M_{1st\_cycle}=4.33$, $M_{2nd\_cycle}=4.15$, $U=11633.500$, $p=.049$).

Self-efficacy and learning styles

Undergraduates showed preferences for active, sensing, markedly visual, and sequential learning styles, as has been referred by literature (e.g. Kolmos & Holgaard, 2008). They also reveal high self-efficacy levels. Table 2 shows the results for the total sample and study cycle groups.

Table 2. Self-efficacy and learning styles

Variable	Total sample (n=337)		1st cycle (n=154)		2nd cycle (n=173)	
	Mean (SD)	Median (IR)	Mean (SD)	Median (IR)	Mean (SD)	Median (IR)
GSE	30.85 (4.03)	31.00 (6.00)	30.99 (3.77)	31.00 (5.00)	30.72 (4.33)	30.00 (5.00)
Active	6.71 (2.19)	7.00 (3.00)	6.44 (2.39)	7.00 (3.00)	6.94 (1.98)	7.00 (2.00)
Reflective	4.27 (2.20)	4.00 (3.00)	4.54 (2.41)	4.00 (3.00)	4.05 (1.98)	4.00 (2.00)
Sensorial	6.87 (2.06)	7.00 (2.00)	7.03 (2.04)	7.00 (3.00)	6.77 (2.07)	7.00 (3.00)
Intuitive	4.05 (2.06)	4.00 (2.00)	3.91 (2.04)	3.00 (3.00)	4.16 (2.07)	4.00 (2.00)
Visual	8.39 (2.03)	9.00 (3.00)	8.33 (2.00)	9.00 (3.00)	8.55 (1.98)	9.00 (3.00)
Verbal	2.54 (2.03)	2.00 (3.00)	2.61 (2.02)	2.00 (3.00)	2.41 (1.99)	2.00 (3.00)
Sequential	6.25 (2.01)	6.00 (3.00)	6.53 (2.06)	7.00 (3.00)	6.05 (2.11)	6.00 (3.00)
Global	4.70 (2.09)	5.00 (3.00)	4.41 (2.06)	4.00 (3.00)	4.91 (2.10)	5.00 (3.00)

Notes: SD=standard deviation; IR=interquartile range

Significant differences were found between groups in learning styles preferences for sequential-global dimension. On one hand, 1st cycle undergraduates showed higher preference for the sequential style in comparison with 2nd cycle undergraduates ($M_{sequencial[1st]}$=6.53, $M_{sequencial[2nd]}$=6.05, U=11529.500, p=.034). On the other hand, 2nd cycle undergraduates showed higher preference for global style ($M_{global[1st]}$=4.41; $M_{global[2nd]}$=4.91; U=11427.000, p=.025).

A correlation analysis was performed to determine the relation between soft skills and self-efficacy, and between soft skills and learning styles. Table 3 shows Spearman correlation coefficients between variables.

*Correlation is significant at the 0.05 level; **Correlation is significant at the 0.01 level

Undergraduates with higher self-efficacy tended to rate themselves higher in soft skills' ability, except for "listening" (r_s =-.019, p=.727).

We found significant positive correlations between active style and "teamwork" (r_s=.254, p=.000), "information sharing" (r_s=.165, p=.002) and "adaptation to change" (r_s=-.141, p=.009), and a significant negative correlation with "attention to detail" (r_s=-.128, p=.019). These results show that active undergraduates, that prefer learning by doing, tended to rate higher than more reflective undergraduates in their ability to work in teams, share information and adapt to change.

Sensing style showed negative significant correlations with "oral communication"(r_s=-.159, p=.003), "foreign languages" (r_s=-.114, p=.037), "argumentation" (r_s=-.176, p=.001), "autonomy" (r_s=-.135, p=.013), "goal orientation" (r_s=-.134, p=.014), "tolerance to pressure" (r_s=-.141, p=.009), "problem solving" (r_s=-.165, p=.002), "creativity and innovation" (r_s=-.289, p=.000), "adaptation to change" (r_s=-.121, p=.026) and "leadership" (r_s=-.166, p=.002). On the other hand, we found positive significant correlations between intuitive style and the same previous skills.

Results showed a positive significant correlation between visual style and "teamwork" (r_s=.138, p=.011), and negative significant correlation with "listening" (r_s=-.110, p=.044). Verbal style showed only one negative significant correlation with "teamwork" (r_s=-.138, p=.011).

At last, positive significant correlations were found between sequential style and "work organization" (r_s=.151, p=.006), "persuasion" (r_s=.161, p=.003), "continuous learning" (r_s=.116, p=.033). Negative significant correlations were found between global style and the same previous skills.

Discussion

Individuals need to become actively involved in the management of their own careers as early as possible rather than relying solely on external sources. Through assessment methodologies, undergraduates can promote awareness of the importance of soft skills for their future employment, and look for personal strategies to overcome possible skills deficiency. In line with is, curriculum development must focus on utilizing appropriate pedagogic techniques which enhance learning and develop soft skills, in order to prepare undergraduates for employment.

Although not exhaustive, the soft skills list used in the present study is applicable to multiple engineering work settings. Findings suggest that undergraduates identified deficiencies in the quality of skills they considered important for future work. Correlations between perceived ability in soft skills and learning styles preferences could have implications for curriculum design, despite the correlation coefficients founded in this study were relatively low. Specific training could be designed and delivered to respond to major skills' gaps, using learning styles based methodologies. For example, enhancing teamwork skills using active and visual learning strategies, and work organization skills using sequential learning strategies. Furthermore, by soft skills development, self-efficacy is promoted, and it is fundamental to competent performance.

Results should be interpreted paying attention that the sample consisted of only 337 undergraduates from four Portuguese universities, and that self-report methodology also limits the generalization of the current findings. The results must be viewed as indicative only. Further research, with employers and graduates, is required to refine the tested list of soft skills and to evaluate the most effective learning strategies for their development.

ENSEÑANZA INTRODUCTORIA DE ECONOMIA PARA NO ECONOMISTAS: UN CONTENIDO PANORAMICO CLAVE

Rosalía S. Lastra B., Ma. Guadalupe Galván, Luis Jesús Ibarra M. [15]

Universidad de Guanajuato, Cd. de Guanajuato, CP 36,250, México

Abstract

This article condenses some of the learning experience gained through the teaching of the subject Economics and Education, in a graduate program to form educational researchers (also tested in others, with similar results), which comes from different areas of knowledge, from social to exact ones, passing by the naturals. It is claimed that the content setting- panoramic and direct-, overcomes the usual resistance in these students to recognize that the knowledge provided by the Economy is essential for an integrated approach to all social phenomenon and, in particular, establish that causes are not always which violate the external social, this objectified the way it assumes the economic structure, usually confronted with sustainable development. In return, the traditional method of such teaching re-focuses in a mayor psychological sense, according in what the group inquires about the representations that support the educational phenomenon.

The suggested content, approachable in 6 sessions of 4 hours (unlimited adult participants), it begins by identifying the correct use of key concepts, followed by a brief history of the great dilemmas of economics, its writers and the object of study, together, allow any review of the general postulates of the three contemporary political-economic dominated systems. Along the way, interspersed explanations of the meanings for Mexico, cases are emerging whose analysis should benefit the interdisciplinary approaching pursuit of a holistic vision.

Economy, education, environment, *consumption and responsible production*

1. Introduction

The essence of economics, it is stated, it is pertinent to impart to students of any postgraduate in social sciences, it began to take shape after 1990, when it had to adjust an economics course to typically-bent-for mathematical formalizations Master of Education and subsequently administrative areas. This was the first mismatch to be corrected, it comes from adult students who entered to be users of the economy, not economists, even that at some point in their training took courses in mathematics, the memory of them is this asymptote to almost nothing, which makes the imposition of such a profile is inappropriate. The combination "profile of entry-time-topics" turned into a constant tension during the first courses, until we identified two circumstances:

The diverse professional origin of the assistants which, in the same group serves architects, engineers, lawyers, nurses, artists, teachers- predominating this last ones -, among others, to be a challenge, it became an advantage, because the complexity of the relationship between economy-education is consistent with the construction of explanations from disciplinary approach of each participant. Then, the next task became to structure a robust definition of the subject matter of economy.

During the first session is usually identified 2 precognitions:

• That "economy'' is a matter for mathematicians, being conducive to demonstrate that this is only descriptive and prognostic stage, but most useful is the discipline that addresses the ways in which human groups decide to resolve their material existence.

• The economy is the one '' to blame'' for the precarious situation of education, the nation and the planet, which makes appropriate for the immediate approach to avoid such disqualification, using brief examples of

how the culture of each human group and its practices the political scope, determine crucial economic distortions.

After the detection of resistance, a brief survey is made of the dominant representations in the group about what is education as a service, and for the purpose it serves or could serve.

At the end of the session the reading is promoted of the book designed for this purpose, winner of the first contest of the University of Guanajuato on didactic material, being also relevant to point along the short contemporary readings sessions on the topics that will be addressed as well the support in the dictionary of Economics preference.

2. Explanation of objectives

To reflect on a panoramic way on sense of the basic concepts of conventional economics, the purpose is that the student make it on their own, professional and personal, resizing is courses on welfare, economic growth and social development.

The specific objectives are: a) Support the precise handling and fluid core economic concepts, b) Understand the potentiality that economy offers to explain more fully the social surrounding and organizational environment on behalf of sustainability, understood as the ability of nature to be restored before the human action determinates that collapse in its nodes.

2.1. Purpose of the study of economics

It begins by explaining that there is not only one definition of economics, because in every treatise they will find the focus on some of its parts. What does exist is a single object of study, to be known: production --> distribution --> consumption, of goods and services for the satisfaction of "necessity and wishes".

It is clarified that the economy, either as discipline or as part of social reality, is limited to the scope of the form of how human groups "decide" to satisficed their materialities, with goods (that are tangible, with high inputs) and services (that are intangible, with less content of inputs). The intention is to allow compliance on a "optimal'' way the production, distribution and consumption. However, is warned that economy is not more than a reservoir where such practices are deposited, socially and culturally justified, so the "mistakes" about what is optimal or the bad decisions to select, are the personal responsibility, That use to happen in social prejudice aggregate by types of actors.

The next aspect of substance, is with precision identify the distinction between the physiologic derivation of the necessities and the psychological derivation of the wishes to achieve establish a mental structure of critical order between goods and services priority over the superfluous useful most of it in times of scare resources. Such activity has to prefigure personal responses to what common characteristic have the "goods" that now make up the majority consumption in Mexico or another country? Known that are soft drinks, alcohol, cigarettes, chips, canned goods and packaged, plastics, cosmetics, chemicals, toys and high energy consuming devices, etc.., Is subjected to wide scrutiny of whether it is edifying or destructive products the person and the planet, coming to trial if the current historical exploration is increasing human traits or decomposition.

The reaction of certain students begin to be dramatic when it states that this type of consumption, besides of damage the health of one who is willing to spend on what he gets ill of, goes against the public health sector budget, by the over demand that generate who consumes. This section requires skillful management of impersonal reminding almost always, the sensation of that it could have gone further, or that the reflection was cut by over-reaction of a participant, which is a risk that must be take, if we really want to help to reflect on the positive transformation of lifestyles.

In any case, the final statement is that "who demanding, commands," but if is made wrong ... the economy and the environment are those who receive the effect of such "habits." The purposeful corollary consequent is that if in the family "good" habits were form there would be no advertising, even as pertinacious it was, to induce to markets through negative paths, the time is suitable to exemplify the behaviour of those that with his purchase support organic products or use alternative energy. There is not left explanation that the marketing is a technic "for sale to the highest bidder", being more part of psychology than the economy, being more used to distort the rational election of the unwary and insecure-they prefer to deal by appearances than by essences, that provide objective information on the product concerned.

Then the conceptual strengthening the responsibility for what is deemed as a necessity and desire is personal, taking care to be clear that all economic good (subject to purchase-sale) is replaced, and that everyone must find the source of their beliefs in fixed behaviour patterns from childhood in the family, the development context, the influence for exposure to the media or in the present circumstances.

In function of the stinging observed, is it desirable to raise two debates derivatives: a) the reason of why economists often decide to legalize the drug, pointing out that loneliness and social dissatisfaction of those who purchase has more to do with the fractured families and values, with the bidders, which would disappear if the buy stops and, b) the case of imported products of the people without nationalist ruthlessly, who expects orders from outside to decide what to use, eat or see, putting on the side products of their own culture, valued as "ghetto" or out of fashion. Such cases make the student to ponder about their positive economic axiology, transcending to identify the consequences of their choice, at which point you can start looking for alternatives and solutions, personal or joint, and not keep looking "guilty ones" in government, businessmen, Chinese or Americans. In other words, we look that each one switch its sight from outside to inside.

At the end of the session, a basic method is presented to give an order to the cause and effects of social phenomenon of similar nature, that could help to reduce the saying that "everything has to do with everything" if this is certainly true, it is not the expected state of a social scientific, whose duty whose work resides in applying observational acuity to identify generalizations and special cases to explain the social order, obtaining ordered mental structures, lends their self to systematic analysis, in this case, exercising the discretion on whether it satisfies the essential belonging to the subject matter of economics, without denying the multi-factorial and multi-real causality, but determining what explains the most or actives the dynamics studied. The method reconstructs the phenomenon analyzed in four determinates instances: social, cultural, political and economic. Is warned that the ignorance of the cause (s), moves away the probability of producing the right solution or the phenomenon control. Then, how to know if the observe phenomenon is the study object of economics? First, divide the reality in 4 social instances: society, politic, cultural and politic; second, diagnose if the cause is in the economy object; if "yes", go ahead, but if "not" search another science for help to solve.

2.2. Key Concepts

In the second session will address the following concepts that stabilize the channel of communication to raise further issues of greater substance.

Resource

The instruction is directed to admit that resource is all element available for a productive use, requesting the identification of countries that possess exiguous material conditions, but with very proactive human resources, who come to determine the existence of the capital resources, assisted by historical joint, as are the cases of Japan and the Netherlands, in contrast, sets out cases of countries economically "poor" but favoured by nature with physical resources and plenty of human resources, but not able to the creation of capital resources. Consequently, the general content is discussed between a generalization about resources essence in

the production: Materials, are conditional; Humans are determinants; the Capital ones are the result of the interaction.

Because there are habitants on the planet that having the resources, do not see them, or prefer to wait for the gift of government, and others who, without have them, attempt them with technological developments and lots of coordinated work, being their imagination the limit and the interest to please the physical environment for (without discuss by the moment whether the production of profitability is done with care or not the environment and society, in example, the viability of life in long term), is concluded that those who do not apply their daily effort in such way, is often guilty of natural disasters, reason why are often called underdeveloped countries.

The discussion can also be detonated from sayings such the ones of theories of determinism of the physical environment, which claim that leisure is inherent to the natural rich and, on the contrary, the creation of technology is the result of natural precautious conditions or less fitted, to face extinction.

Inputs

They describe the resources already transformed to integrate some good or service. This concept helps to understand , now a days the vanguard lines of production are not explainable nationally, but by analyzing the integration of transnational corporations, reinforced since the 40's by the most technologically advanced countries, called outsourced (specialized in high-tech services) in the form of economies of scale or mass production. This led to a new international division of labour in which, countries with organizations capable of made direct foreign investment, act upon the world as their field of interest, with high independence of the existence of borders, forming it in groups of countries, in the current international basic division of labour, as know:

Develop countries (third sector)

Industrialized countries (endogenous or exogenous)

Manufacturing countries (importing inputs)

Primary-exporting countries (inputs suppliers)

Autarkic countries

The conjecture is formulated the main result of such division, led by the capitalist countries "developed", Is that dictated the financial and commercial rules through international agencies designed a way to redeploy its old industry to "selected" countries. These desires reach the stage of industrialized, even at the expense of their own territory to inherit a development model based on the guidance of exogenous structures. To open the dialogue, students are asked to arguments about whether they believe that the current way that global economy grows is already anachronistic, for standardizing and contaminant, entering the analysis tool denominated "globalization" application that helps the owners to stop the persistent decline in the rate of profit, taking advantage the countries willing to blur their culture, lower payment for work and open their finances abroad. In this point, it is good to raised at least a couple of commonly accepted of what is conceived by poverty, in order to contrast them with the "has to be" accepting extra economic points of view.

-Goods and services

Goods are conceptualized as tangible satisfactions and services as intangible satisfactions, one of their characteristics is that their consumption is simultaneous to their production, to be the case of educational services. Is explained that depending on the approach required, there are alternative types like: a) those that studied the use of income (goods are divided in "superior, normal and inferior), and b) welfare sensation (essential, desirable, pleasant).

The economic type by excellence is the first, which supports the knowledge of what each one believes it is more important to consume. The predilection to each product is tested by increasing the income, the vote is exercised of the buy in such product in such product, making the loss to the counterparty that is replaced, judged inferior (the normal is unchanged) the reading of connoted reports is suggested, that relating renowned products which are best positioned in the taste of different human groups, concluding that it is superfluous for widespread consumption in Mexico, even in times of crisis, which partly explains the form taken economic structure and situation of chronic insufficiency of income (debt).

- Market

The <u>third session</u> starts by defining that a market is the space (each time less physical, by electronic and catalog sales), in which suppliers and demanders attend, making actions of sale and purchase of goods and services, according to the tastes and bearing the preferences of each individual will determine. Thus, given the prices and quantities, it happens that the market is empty at the point of equilibrium, which implies the inexistence of wasted resources, since all that is offered is purchased-or imbalances emerging surplus or shortage someone has to pay. This can happen because of calculation errors or because there are infra-marginal buyers (who are willing to pay just below the equilibrium price) and supra-marginal (who are willing to pay above the equilibrium price).

As a result of observation of such situations, sets forth the laws of supply (when prices are high, production rises) and demand (when prices are high, the demand is low) that, either because they met or not, become practical as positive or normative claims of economic theories as target image to the scientist it shows the basic logical operation of the neoclassical graphical formalization for their predominance in the way that present economists usually communicate their ideas and analytical results.

Economic problems - crisis

Using the defragmentation, recalls that "problem" has the connotation of something negative and that the object of study of economics is the production-distribution-consumption of goods and services, whether in the real market (of product) or in the nominal market (of money), therefore, any interruption or obstacle in such order, constitutes in a economic problem, having to determine the stage, for its attention, if it worsens in time, space or amplitude, is denominated "crisis". Students are requested, cases of situations that began as an isolated problem and became the crisis.

3. Brief History of Political Economy

Through an image showing the genealogy of ideas of great thinkers who have left their mark on the approach to the subject of the economics study, it deals with social and historical circumstances that have mutated the unity of what is valued in different times and contexts: the slaves in the Slavery, land under Feudalism, and today, the capital (nominal, machinery, equipment and infrastructure) in the Capitalism. This helps to explain later, for example, that the Liberal Doctrine made possible the development of the political ideology that structures the capitalist system. So, is generalized in the books of Political Economy, the vague theoretical-philosophical of the economy is found through history and in the books of Economic Political, applications in making decisions guided by the requirements before mentioned in form of plans and public programs that seek to identify the effects, for example, fiscal policy (taxes), monetary (or banking), tariffs (or trade), etc.

If time is ripe, some graphic effects are shown in the key added markets such as labour, or any goods or services, as oil and telecommunications, raising awareness to study that the decisions of politicians (unfortunately not always knowledgeable about the discipline of economics or with the expert advisers are those who really impact the social spectrum. The conclusion may emerge by the awareness of the importance of exercising with great responsibility as a voter participation in elections, always preferable to abstention and the reprehensible indifference.

4. Tree Biggest Dilemmas of the Economy

Everything seen before the becomes more meaningful in the <u>fourth session</u>, to introduce three of the big dilemmas addressed by economists, with the aim of revealing the laws mechanisms or processes through which, goods and services acquire value (which is subjective) and its price is formed (which is objective, supply and demand).

4.1. The first dilemma is requested to speculate on for whom produce comes first? The tree big contemporary answers are named that humanity has given, to know:

Capitalist system: it favours the operation of market forces to produce first for those who have purchasing power (effective demand), refuting public intervention. To deepening its understanding, we recommend some reading of the liberal work of its founder, Adam Smith, who studied at essentially the supply side (cost and production function), being out of time of economic repression which involved Feudalism, stating that selfishness is the oil that makes it work in an "almost miraculous" way the economic machine (automatic adjustment of markets, in which no intervention from anyone, moves the capital from industries less profitable to more profitable), setting an individualistic conception of society, the central assumption is that everyone in the pursuit of enrichment, should look at the needs of those with money and satisfy it, thus ends up serving one another, even though it was not part of the original intention.

The contemporary extension of Liberalism, is the Neoliberalism, that studies with greater emphasis the demand side, every time that the consumer develops .is no longer "collector of goods", that is to say, for momentary attraction to become a skilled "hunter of prices "that treats markets as well thought only buy products from the best quality and best prices, admitting some government intervention, particularly as a referee " impartial " of the economic activity.

The solicitation subsequent to the students, is to identify what type of consumer it is, because if you buy at any price, any quality (laziness to go look), the off error's interpretations is that, it is indolent, sparking inflationary processes (up general price level), be the conduct of the applicant the opportunity. Demonstrated that everything is replaceable, it's sufficient to test that high prices should be stop using them for download.

Arguments are requested on the social consequences of the holders of money are those that define the shape of the markets and on the possible meaning that countries like France and Spain, which began its modern history in this position, are strengthening a twist towards socialism.

Social systems: the government directs production to the collective needs, and its intervention that defines the shape of the market: what is produced, how, such what type, amount and method of distributing wealth. K. Marx was the synthesizer of these postulates, led to a higher stage still theoretical, denominated *Communism*, in which the government has to disappear.

Mixed economy or Welfare State: involves the undifferentiated mixing (in no case there are pure states) between the two above requirements: public and private co-exist (there is social security and private hospitals too, also schools, businesses, possession of land, etc.). Today is the most supported system by the experience of countries such as northern Europe. At this point we tested the idea that none of the previous systems in good or bad *per se*, but in terms of the quality of governance and the closure that achieves consensus with the public to realign its forces.

The analysis of this dilemma ends by asking the students to value and express the three systems and that express advantages and disadvantages of each, particularly the way that is observed is been linked with the environment, and conclude on which one can respect more. If there is resistance to commit to an answer, is subjected to scrutiny the idea that values are prevailing in each place and time that direct the production, by the logic of relevance to the act which is challenged in any of them.

4.2. Second dilemma: at the <u>fifth session</u> students are asked, about the appropriateness they observed of the way that income is distributed, and for the particular case of the underdeveloped Capitalist System. In this dilemma, also known as distributive conflict, combines the relationship between:

a) The evaluative or subjective approach (typically practiced in developing countries), has a sense of collective consensus that under implicit qualities "substantial" differentiated earnings are given being the workers typical business and intellectual benefit.

b) The technical approach or objectivist (typically practiced in developed countries), resulting quantification favours productive action. For better understanding, provides the comparison of situations in which the investment exceeds the amount of the labour force and in the other way, to see consequences as, for example, who must pay the job training to technological changes?: The market resolved, as will tend to pay the employer if the labour is scarce, but it will work, it overflows.

Once more both forms are subject to scrutiny from students, who appreciate advantages or not of, coming to identify where performance is taken into consideration or the other and, in particular, in the midst of higher education of Mexico, in the case facing the productivism with experience value.

The concepts reviewed simultaneously, useful of their constant appearance in economic information sources are: joint and interdependent demand, marginal analysis, production of function, law of diminishing returns, economies of scale, automation and labour flexibility in the technological effect.

4.3. Third dilemma: in the <u>sixth and final session</u>, students are encouraged to identify cases of economic crisis, returning to those where there is conflict of interests in a single agent, given its multiple economic, as workers, consumers, savers, investor, and so on. This is useful to introduce the understanding of parallelism that must exist, given the currency regulations, including the market for goods -services and money market (and its price, which is the interest rate), focusing on the detection of possible crisis through the Quantity Equation of Money and the process of money creation (nodes of possible economic crisis: money--> merchandise--> money increased; each obstruction to the flow "money -products", so-called *crisis* of first, second and third stage. Verifying the performance of self-assessment exercises in the book recommended, the course closes with the presentation of *basic analytical method* through which it can quickly set and clear a context analysis to identify when to be used instrumental economical to approach to social desired phenomena having to search in some other discipline. Then, a basic analytical method is: check whether the observed phenomenon is the subject of study of economics; if yes, determine the cause (is it in production, distribution, consumption); described critical effects breakdown and, finally, pose alternative solutions consistent with the cause (choose the one that complies with effectiveness, efficiency and effectiveness).

Thus, noting that without the support of other disciplines, as exact and social, the diagnostic of dilemma becomes a mere abstraction or fatuous exercise of measurement (which justifies jokes about the economist spends half his life predicting what will happen, and the other explaining why it was not) and finally, depending on the availability of time, outlines the parties that the economy is conventionally divided, namely, in microeconomics, macroeconomics and international economics.

Conclusions

The configuration of this extra-condensed content, which began as the search for instruction in the essential understanding of economic thought to professionals who, without intending to become experts, need to become familiar with basic milestones, eventually hooking up with the analysis of large challenges facing humanity by thoughtlessness on the issues raised.

Then, this content is expected to contribute to the teaching of economics for students of introductory courses, very brief but ambitious, suitable for college, but also for non-university who wish to incorporate a basic understanding of economics as extracurricular. The matching contribution is difficult to set solid foundations still

maintain that the economy is the primary responsibility for achieving sustainable development management, being jointly responsible for direct, culture, politics and socio-historical practice, preceded by their values and judgments relevance of the action.

Certainly, the relativity of economic "laws" by which the ideological frame Neoliberalism and justify the production of "whatever" in pursuit of profitability that exploits appearances, enter recurring crisis abuses of natural resources and pollution of the environment, paradoxically, makes it increasingly scarce and therefore expensive, leading to the initial purpose otherwise. But this is not just the responsibility of Capitalism, for Socialism and Mixed Economy also upload their culpable ecocide. The fundamental problem lies in the historic walk of humanity, with individuals and conglomerates little awareness of the importance of caring for Mother Earth, living the life of everyone, in every decision and action of production and consumption.

In the interest of course, depending on the style of each guide, it should approach cases upgradeable ignore the catastrophic effects of the trinomial cultural political economy, is the involvement of a doctor or biologist to explain the effect of school or mother instead of feeding milk to give children junk food or soda, blocking their learning (synapses) but making it tedious and diabetic, excessive intake of sugars or supported by a physicist or chemist to explain the carcinogenic effect of long-lasting lipsticks containing lead, with damage to the air by the peroxide in the dyes hair, aerosols and plastic products in general, and what about cigarettes, alcohol and all kinds of non-biodegradable waste to water, batteries and consuming excess energy. Everyone, from their base discipline, has to make the diagnosis of cases and solutions that help reverse the tragedy of the commons, in which, each in its smallness, think that their actions do not impact, without thinking that the action collectively in the same direction as consumption is generated by the catastrophe to which it is leading the planet. This is not to stop using, but consumed with transcendental consciousness and, therefore, the producer will not convert their production other than in an ethical sense.

The reader may have already inferred that before closing the introduction should be made explicit two limiting situations: 1) the approach of almost all the issues discussed, given to complete courses of Economy, which is not to say that the findings imply that the profiled debate is over, and 2) the recursive tension during sessions, practices and customs as playing is deeply rooted collective thoughtless, makes the students react in defense of those who, though notoriously harmful and unnecessary, they have them and drop them clinging seems impossible, consisting this a real opportunity to transform that part of social action. Regardless of achieving such high claims, inevitably attends a meaningful practice of building interdisciplinary analysis.

Given that ecology, rather than a subject, is a way of life, it requires the continued support of resolute meditation in schools of all levels and of all types, that's where they have to recreate the high-power strategies to transform necrotic practices. Then, to help positively transform lifestyles, each teacher has to take up the mission that way, having proved that the support in the Economy is a timely and appropriate primer, as urgent reintroduce all know, even the way introductory suggested here.

Abstract

In this paper we focus on planning, environmental education in the National Parks in the conditions of Slovak Republic. As a very consequential and primary role would be realized not only National Parks, but also other protected areas in Slovak Republic to support environmental consciousness and improve environmental edification appears implementation of expertly processed Conception of environmental education and training of the protected area or National Park. This strategic document will account all the constitutive legislative documents of national and international significance relevant in Slovakia. This constitutive document today in several protected areas in Slovakia absent. Suggestion of Conception should be based on assessment of environmental consciousness and needs of the aggrieved groups population living around the National Park, but also other public. Also that have to account objectives of relevant Management plan of a protected area and to assist to their fulfillment.

Keywords: environmental education, National Park, protected area, conception of environmental education, Slovak Republic;

Introduction

The current system of protected areas of Slovak Republic according to the Act No. 543/2002 Coll. About Nature and Landscape Protection consists of 9 National Parks, 14 protected landscape areas and 1 094 small - scale protected areas, 1 protected landscape element, 172 protected areas, 388 nature reserves, 219 national nature reserves, 254 natural monuments, 60 national natural monuments. Total area of specially protected areas of nature which is in the protection level from 2nd to 5th is 1 222 839 hectares, what represents 24, 94 % from land of Slovakia (Klinda, Lieskovská et al., 2010).

Environmental education in National Parks globally in Slovakia

National Parks as areas to ensure preservation of the original nature of the Slovak Republic have also informative and educative function about natural values. A particularity of environmental education is mostly that it is happens in concrete environment. Uses specific conditions of this environment for its protection, but also to influence the public with its values, aiming at increasing its environmental consciousness. In this meaning environmental consciousness can be understand like the ability of an individual to realize and perceive phenomena and problems of the environment. In context of his own set of values orientation, personal experience also knowledge of wider sequences, but even is expressing in willingness optionally correct their behavior in behalf of conservation biodiversity of nature and ecological stability of landscape. In protected areas environmental education have to take

in consideration targets of protected areas as well as global environmental problems. It should effectively use as natural heritage of protected areas for a direct contact with nature. Another task is to bring nature near to people as something esthetically pleasurable, what inevitably needs protection. Environmental education of the protected area have to be organized by the visitors and target groups,   to whom are adjusted methods and language. To participants are presented concepts of implementation new attitudes into their daily lives and therefor there will be the change in their behavior. Important document in the environmental education in the Slovak Republic is the Conception of environmental education, which must be worked out in line with Management plan of a protected area. This task is clearly formulated also in Aarhur Convention, which says, that the management of protected areas and public authorities should promote environmental education and environmental consciousness. Management of protected areas and public authorities should assist and advise to the public in environmental matters. The recommended procedure for management of protected areas is to take on long-term concept to assist and advise to the public. This will encourage people in their efforts to connecting to decision-making process and help them develop their skills and knowledge, which simplify them alll. Good application of the conception should lead the public to greater interest. Working out Conception of environmental education brings necessity of material and technical assecuration in the form of development or purchase of tools for individual program offers as well as necessary equipment.

Environmental education is also non-violent and suitable form of promotion (contacts with citizens in communities, students in school) and through leaflets and promotional materials. Editorial and publication activities are the main source of information for various age groups or target groups. Also promotion of the National Park through exhibitions, permanent exhibitions for example in information centers is an important source of information for the public. One of the important role of the National Park is its active involvement to the process of environmental education in the region where is the National Park is situated, but also outside it, and encouraging the finding of new and to deepening old partnerships with other institutions in the region and outside it. The National Park should work out a shool program, which results from the Conception of environment education and it elaborating individual topics correspond with the content of curriculum and emphasize the importance of National Park´s propagation and system of protection of nature (for example with its topics like National Parks, forest, flora, fauna, water, human influence, adventure-experiences). Very important is the form of a presentation prepared topics, where as necessary selected a process of presentation in school field or in areas of the Management National Park and in providing adequate time setting to providing from the school especially in place in National Park´s area. To these topics are in - process practical activities depending up target group and conditions accordingly pupils and students start working more effective with given topic. Environmental education should be performed according to the local competency individual workplaces of National Park, where will be chosen lecturers for environmental education. In addition to the protection of unique natural ecosystems, plants and animals would be in the National Parks should primarily bring near to public, to people living in the region, visitors, owners and other their value. Without their involvement, understanding and active cooperation is threatened concrete target of the National Park and that is its protection (Tvevad, 2004; Hass, Ondrová, Švajda, 2008).

Impressed visitors requires developing interesting programs allowing interested not only learn a lot about the National Park, but mainly to get a lot of experience and the know and support them in changing their thinking and subsequent actions, that will be in behalf of nature. It is necessary focus on lifelong learning ensuring obtain certain environmental knowledge, which can affect the society-wide action aimed at every social and   age group in society. An important aspect is our understanding of nature. Nature is not only individual objects, trees or natural heritage, which we protect. It is a complex system of mutual relations, is an inseparbl part of our physical and mental existence (Demo et al., 2007).

Feelingful of nature and living out the experiences that offer National Parks to visitors and support holistic understanding of nature (complicated and complex interconnected relationship between nature and people). This built perception of the National Park is a very powerful tool for converting values and visitor behaviour, which in themselves by fulfilling their emotional needs, deepen their love of nature (Kyöstilä et al., 2001).

The environmental education (EE) in National Park, we should focus on:

Environmental education (EE) at schools – to schools should be distributed offer list where will be offer with themes and forms of environmental education activities. Based on the offer letters to contact the representatives of the school staff and arrange a schedule and form. Education of children and youth can be implement by primary and secondary education. By primary education is systematically influence the formation of personality of student impact through knowledge, skills, but also effect of creating his attitudes and lifestyle. Is creating conditions for lifelong learning for each individual. Secondary education by children and youth can be achieved by the action of the general public, including parents and other family and contribute to increase the level of environmental consciousness throughout the population (Švecová, Sásiková, 2008).

(EE) at non school settings – through after-school clubs, where one can attend the Circle of Nature´s Protection or Circle of Hiking, for instance once a week which can aim at using unconventional forms of nature´s protection. There is very necessary to work out the content of activities in cooperation with the after-school clubs.

(EE) aimed at visitors – there is a need to work out the offer list for group excursions aimed at various themes about protection of nature and National Park. Promote them in public places (hotels, cottages), where usually move big groups of people and such a form and this way speak to and give the opportunity to this target group hear about the National Park and its activities.

Other supporting activities include:

The organization of events aimed at promoting conservation and its importance – such as events and excursion on the occasion on the European Day of National Parks, Rangers Day, Days of nature protection etc., it is appropriate to organized entertainment – educational event to promote the work of personal connected with competitions and games.

Organization of voluntary jobs – like cleaning and garbage collection in the National Park, animal transfer (transfer of amphibians), repair of cultural monuments in the National Park.

Organization of competitions – for children and youth of different ages aim to the level knowledge of competing about the National Park and biodiversity in park and its promotion in local media.

Using information centers – for environmental education and raising environmental edification during the high tourist season.

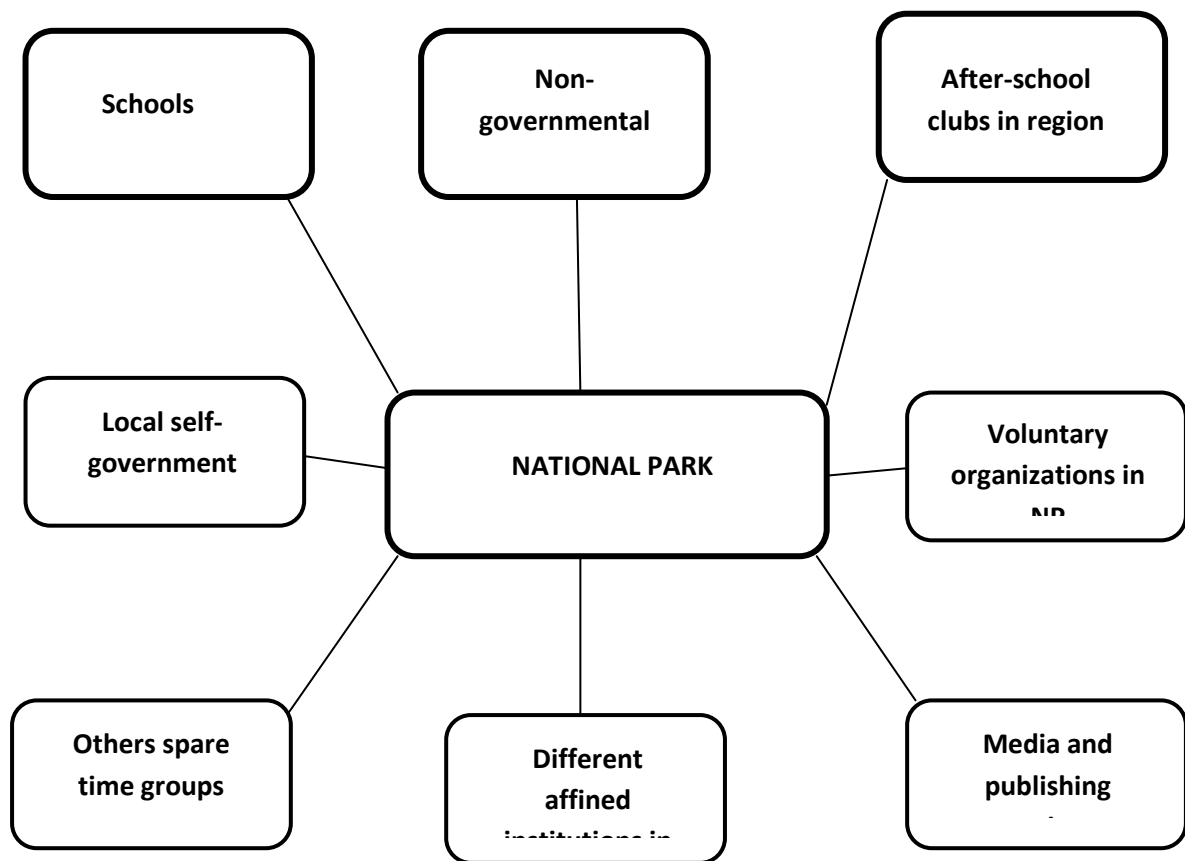
Building nature trails - with a focus on the physically disabled people, reconstruction and updating of existing nature trails, construction of educational sites, green way and infokiosks. In consequence of insistency of the changes caused by anthropogenic activities is necessary to implement environmental education in all of the socio - educational and training levels. In the family, at school, in various institutions, in the media (Fazekašová, Manko et al., 2007). Very important is creating of partnerships that help improve the quality of environmental education of national park. Also that it is assistance in the area of acquiring new abilities and skills of employees and last but not least is here making room for assistance in he area of financing individual activities and functions within Environmental education, which is not always able to finance management of the National Park independently. Environmental education and activities as well as their implementation is an area of not only creating partnerships with local schools, but also other organizations functioning in the region, where is the national park (a hunting association, hiking clubs, etc.). Partnerships are supposal not only implementation of common projects, but above to increase duty and capacity of management of the national park.


Fig. 1 Schema eventualy cooperation of National Park and important partners with (EE).

Methodology

Important part about creating of any strategy document are the input data. This condition seems to be very significant in the design and subsequent facture of the Conception of Environmental Education. As a highly adequate tool for obtaining input information such as identification of all the strengths and weaknesses as well as the opportunities and threats in this area in the national park help a lot by the SWOT analysis method, which aim is detailed knowledge of conditions. To interpretation the real state of environmental consciousness and edification in the region in which the national park, is appropriate to use exploratory method through research tool, which will be a questionnaire. This survey will help us suggest the measures and activities that will solve concrete inadequacies in environmental consciousness and edification ascertained by questionnaire survey and to which we will also focus on developing the conception of environmental education. This will lead to strengthen and upgrading the environmental edification and consciousness of the general public. Consequently is necessary to work up a suggestion of potential partners and their salutation, which will be able to participate in the implementation of the Conception of Environmental Education and fulfilling its goals through various activities, movements and common projects.

Conclusions

National parks are places where is realize important functions of ecosystems, which are result of various spectrum natural, semi-natural, but anthropogenic ecosystems which through their products and parallel processes allows to fulfill human needs (De Groote, 1992). In developing countries, poverty and low educational level in the area of environmental education main drive power of exploitation resources and destruction of nature. Citizens of developed countries of the world where education is accessible to all and its level is relatively

high, leaving their ecological and environmental feeling at the expense of its comfort (McKeown, 2002). It is very important that institutions such as national parks and protecting areas strive to development the internal feelingful of nature as such because, where else is it possible authentic nature feelingful the as fully as in herself? It is therefore very important that giving out to renewal of relations between man and nature, what will help environmental education in the national parks, whether theoretical or experiential.

ENVIRONMENT IN MY POINT OF VIEW: ANALYSIS OF THE PERCEPTIONS OF ENVIRONMENT OF THE CHILDREN ATTENDING TO KINDERGARTEN THROUGH THE PICTURES THEY DRAW

Yunus Günindi [16]

Aksaray University,Campus, P.O. Box:68100, Aksaray

Abstract

The aim of this study is to examine the perceptions of environment of the children attending to kindergarten through the pictures they draw. 183 children in the group of 60-72 months attended the study. The data of the study, which was carried out using scanning model of descriptive research methods, was collected through draw-and-tell technique, and during the collection of the data, the children attending the study were asked to draw a picture related to environment and to explain the picture they draw. Their explanations of the pictures were recorded on the activity paper by the researcher. When the data obtained from the study were analyzed, it was found out that the children mostly included people, various plants and animals, mountains and especially elements such as sun and clouds. When the drawings are examined, it can be observed that they include environmental problems that they can observe in their immediate surroundings.

Key words: Kindergarten, Environment Drawings, Clean Environment, Dirty Environment, Children's Environment Perceptions

Introduction

Here introduce the paper, and put a nomenclature if necessary, in a box with the same font size as the rest of the paper. The paragraphs continue from here and are only separated by headings, subheadings, images and formulae. The section headings are arranged by numbers, bold and 10 pt. Here follows further instructions for authors.

Structure

"Environment is a system that is composed of the living creatures of the world and the air, water, soil and natural resources in the atmosphere where these creatures live". Environment includes the physical, chemical and biological elements that help creatures live and progress. All living and non-living creatures that the environment includes are in an interaction with each other (Yağlıkara, 2006). People try to take advantage of all opportunities in the nature while they continue to live their lives. In previous communities, human population was not very high and the opportunities of the nature were sufficient. Together with the increase in the world population and civilization, as production have not progressed in harmony with consumption and production has neglected the principle of "protecting the nature", natural processes of natural resources, natural order and the creatures in the nature. As a consequence, various environmental problems have appeared (Zabunoğlu, 1982). In this century, most significant environmental problems include rapid population increase, global warming, unconscious consumption of natural resources, increasing environmental pollution, increasing consumption in industrialized countries, extinction of species, hunger and drought (Redclift, 1984; Brown, 1991; Brundtland, 1987; MacNeill, Winsemius & Yakushiji, 1991; Goodland, 1995).

These environmental problems have come to the point of threatening the world and the future of all living creatures. Human beings, who are affected by these problems, have discussed them in national and international platforms in order to find a solution and prevent possible future problems. Handling the understanding of education for environment has revealed the need for education on how to gain environmental awareness. The

radical solution in environmental education is that, individuals must become conscious and aware of the environmental issues, and must be able to demonstrate the attitudes and behaviors related to this awareness. Individuals must also have the skills of taking advantage of the environment without harming it, participating in the decisions related to the environment, following and evaluating the consequences (Geray, 1997). It is accepted that understanding and preventing environmental problems, that education plays a great role in making individuals conscious of the environment that they live in, and that people demonstrate a more conscious and sensitive attitude towards environmental problems thanks to education (Flogaiti, 2006).

According to Basil (2000), knowledge on the environment and the attitude towards the environment starts to be shaped in the pre-school period. Wilson (1996) also states that similarly, environmental education offered in the early ages helps the children develop positive attitudes towards the environment in the following stages of their lives. When the studies on pre-school education in Turkey are considered, it is seen that research on environmental awareness in pre-school education are very few (Yağlıkara, 2006). In this period, considering the few number of studies on environmental education, the aim of this study is to determine the environment perceptions of pre-school children.

Studies on environmental education in Turkey and in the world generally focus on environmental knowledge, environmental literacy, attitude towards the environment; the thoughts of the children on the environment, how they perceive and make sense of the environment are seen as subjects that have not been sufficiently studied. It can be understood that generally interview method is used in order to determine the environment perceptions of the children and asking the children to draw pictures is not a way that is preferred. However, asking little children to draw pictures and analyzing these pictures is an effective method to determine their perceptions and discover their inner worlds (Falk, 1981; White and Gunstone, 1992). During the process of drawing pictures, the child synthesizes his thoughts and feelings on the issue with his observations, and expresses them through colors, shapes and lines (Malchiodi, 2005). Children reflect the way they perceive the world by combining their daily observations with their own thoughts. Drawing pictures is both an enjoyable activity and an expression technique for the children (Hayes, Symington and Martin, 1994; Johnson, 1993). While children do not like to answer questions in questionnaires or interviews, they draw pictures easily and voluntarily without getting bored when they are asked to (Lewis and Greene, 1983). Besides, drawings are also an alternative way for children who cannot express themselves verbally (Chambers, 1983; Rennie and Jarvis, 1995).When the pictures drawn by the children are analyzed well, they give the researchers detailed information on the knowledge they have and on their development (Yavuzer, 1997).

For these reasons, pictures drawn by children give the researchers more than written or verbal texts do. The drawings of the children related to environmental issues will provide valuable data for the researchers regarding the environment perceptions of the children, their knowledge on environmental issues and their attitudes towards the environment (Barraza, 1999).

There are a few studies in which the drawings of the children related to environment are analyzed. Thus, this study has been carried out in order to examine the environment perceptions of the pre-school children through the pictures they draw. The results of the study are significant as they will contribute to the information of environmental education and environmental awareness and it will be an example in determining the ideas of the pre-school children in Turkey on environment.

2. Methodology

This research, which aims to determine the environment perceptions of kindergarten children, is a descriptive research carried out using scanning model. Scanning model is an approach that "aims to describe a situation that existed in the past or still exists as the way it is" (Karasar, 2000). Interpretative content analysis of qualitative research methods was used in the collection, analysis and interpretation of the data. The work group of the research consists of total 183 children in the age group of 6 attending to different kindergartens in the city of Aksaray.

2.1. Measurement Tool

Draw-and-tell technique was used in order to determine the environment perceptions of the children (Brackett-Milburn, 1999; Shepardson, 2005). This technique involves the drawings of the children and the explanations of these drawings. Draw-and-tell technique is a diagnostic method that is used in order to understand how children construct thoughts and concepts (McWhirter, Collins, Bryant, Wetton and Bishop, 2000). The children were asked to draw a picture of what comes to their mind when they hear the word environment and explain their drawings. While the researcher took the papers from the children, he recorded the explanations of the children on the papers he had arranged beforehand, according to the codes place on each paper.

2.2. Implementation

The study was carried out in the spring semester of 2011-2012 academic year. After the necessary permission was taken, the researcher went to the pre-school institutions that will take part in the study and informed the teachers and the managers about the study. Then, an implementation plan was made with the school managers and when and how to implement the measurement tool was determined. The measurement tool was implemented by the researcher within one lesson.

2.3. Analysis of the Data

Visual and written elements comprising the environment drawings of the children constitute the data of the study. The data was analyzed using the interpretative content analysis of the qualitative analysis methods (Ball and Smith, 1992; Banks, 2001). Interpretative content analysis includes the determination and identification of the themes, subjects and phenomena in the visual and written elements obtained from the study (Giarelli and Tulman, 2003).

The codes and themes that were obtained for the validity and reliability of the data obtained from the study were revised by the researcher. Besides, they were analyzed by different researchers specialized in science education and pre-school education using the same processes. The reliability formula suggested by Miles and Huberman (1994) was used for measuring the reliability of the research.

Reliability = Agreement / (Agreement + Disagreement)

The reliability of the research was calculated 92%. Results over 70% in the calculation of reliability are considered reliable for the research (Miles and Huberman, 1994). The result obtained here was accepted as reliable for the research. The data obtained from the study was reported with descriptive analysis, percentage and frequency analysis.

3. Findings

The research was planned for the purpose of determining the environment perceptions of children attending kindergarten. The data collected for this purpose were analyzed, and the findings are presented in Table 1.

Table 1. Elements that Children Participating the Study Include in Their Drawings

Codes	60-72 Months	
	f	%
Environment		
Dirty	34	18.6

Clean	149	81.4
Total	183	100
PEOPLE	116	63.4

Recycling	1	.5
Balloon	2	1.1

Park	3	1.6
NATURAL EVENTS		
Rainbow	14	7.7
Rain	32	17.5
Lightning	1	.5

A total of 51 codes were collected as a result of the analysis of the data obtained from the study. The children generally included people; various plant types such as trees, flowers and grass; abiotic elements such as sun and clouds and houses in their drawings.

The elements that the children participating in the study and the frequency of these elements are given in Table 1. A great majority of the children drew a clean environment (81.4%) and 18.6% drew a dirty environment. 71.6% of the children included the sun, 63.4% included people, 60.7% included house, 55.2% included cloud, 39.3 % included grass, 38.8 % included flowers, 34.4% included trees. Whereas the most common animal in the drawings is bird (12.6%), butterfly (8.2%) and dog (5.5%) drawings were also performed. In the environment drawings, natural events such as rain (17.5%), rainbow (7.7 %) and lightning (0.5%) were also drawn.

3.1. Clean Environment Perception: Figure 1 is given as an example of a drawing including clean environment perception, and Figure 2 is given as an example of a drawing that includes elements that support this perception.

Figure 1. *An Example of Drawing Clean Environment*

In the drawings that are included in this theme, the children drew the environment as clean and green. These drawings generally include trees, grass, flowers, sun, mountains, cloud and river. The fact that sun, tree, river and grass are common shows that children associate the environment with green areas, clean water and a bright sunny day. Besides, smiling flowers and various animals are also included in the drawings in this theme. It is seen that the children draw elements such as white smoke, people having a picnic, recycling bin, balloon and park as a support to clean environment.

In Figure 1, clean environment is described with trees, grass, a blue sky with white clouds. In Figure 2, happy people having a picnic next to the river on a sunny day were drawn in order to support the description of a clean environment.

Dirty Environment Perception: Figure 3 is given as an example of a drawing including dirty environment perception, and Figure 4 is given as an example of a drawing including elements that support this perception.

The children drew rubbish thrown away in the environment, a black sky, unhappy people, flowers with a sad face, sick animals and included environmental problems such as air pollution and soil pollution. Moreover, it is seen that the children drew smoke, rubbish, rubbish bin and black raindrops in order to support the dirty environment.

Figure 4. *An Example of Elements that Support Drawing a Dirty Environment*

In Figure 3, dirty environment is described with rubbish that is not thrown into the rubbish bin and a rubbish bin that is not cleaned. When the paper of the child who drew the outside of the house in the colors of the rainbow is examined, it is seen that the people who live in the house clean their own house but they do not clean their environment, although their house is clean, they are affected by the smell coming from outside. In Figure 4, black raindrops, black clouds, an unhappy person, a faded flower and an ambulance that came to save the person in this dirty environment were drawn in order to support the description of dirty environment. When the records of the interviews made with the children are examined, it is understood that they say the black raindrops are acid rain. It is seen that children handle air, water and soil pollution from different perspectives.

4. Discussion and Suggestions

The environment is the atmosphere that people and other living creatures continue to interact through their whole life. Generations that are raised with an environmental awareness both will help arrange the existing environment and will make an effort to leave a cleaner and habitable environment for the following generations. In this study, the aim is to determine the environment perceptions of the children and the pictures about the environment that the children drew were used. While the children include animals that they often see in their immediate surroundings such as birds, butterflies, dogs, cats, spiders, rabbits, sheep, tortoise, ladybug, fish, bee, caterpillar, they drew grass, trees, fruits and flowers as plants. The results obtained are similar to the results of previous studies. The results of the studies of Keinath (2004) and Alerby (2000) demonstrate that the children include biotic and abiotic factors that they can observe in their immediate surroundings.

When the percentages of the figures included in the pictures are considered, it can be said the students frequently include people. This result shows that children regard people as a part of the environment. However, this case differs from the results of the previous research. In the results of the studies about the definitions of children related to the environment, they include living and non-living elements and these studies also show that children do not associate people with the environment and they do not regard people as a part of the environment (Littledyke, 2004; Loughland, Reid and Petocz 2002; Shepardson et al., 2007; Yardımcı and Kılıç, 2010). The findings obtained from the study show that the views of the children focus on a clean environment. At the same time, there are also drawings of a dirty environment. These results differ from the results of the study by Alerby (2000). Alerby collected the drawings of the students under categories of clean, dirty, both clean and dirty and activities in order to keep the environment clean. However, it can be said that this difference might have occurred because the age level of Alerby's work group was high.

Although the codes obtained from the study are high in number, limitations in the types of plants and animals, and few types of environmental problems that have been drawn makes one think that the children have

limited experience with the environment. If children who will have experiences with the environment and gain environmental awareness in the pre-school period are reinforced in their future education periods, individuals who can protect the environment, who can take measure against any environmental threat and who have the will to continue the measures that have been taken are raised. When it is thought that the solution of environmental problems is not possible through human effort, the children need to become aware of the environment and its problems. The studies have shown that field trips and studies carried out in the nature make it easier for the children to understand the relationships between living and non-living creatures in the environment and their effects on the nature (Ballantyne and Packer, 2002; Manzanal, Barreiro and Jimenez, 1999). However, environmental education which must be performed in the nature is carried out in classrooms, which are artificial. Taking the children far from the nature worry the educators who perform environmental education (Miller, 2007, Sobel, 2008; Louv, 2005). As the children get further away from the nature, their physiological and psychological senses decrease gradually, which restricts the experiences they will gain through nature (Louv, 2005). Curiosity, imagination, creativity, observation skills and communication skills of the children who interact with the nature and gain positive experiences will develop (Crain, 2001; Moore and Wong, 1997; Palmer, 1993). It is suggested that activities which will enable the school subjects to be covered outside the classroom, in the nature should be included in the programs so that these skills and environment perceptions of the children can be developed.

The pictures that the children draw can be used to determine the knowledge they have on a certain topic, their misunderstandings of a certain concept and their interest. Although evaluation of the drawings of the children is an effective method, there are very few studies on this issue. From this perspective, it is suggested that in the future studies, the drawings should be used more frequently on issues related to environment with different purposes. The pictures drawn by the children can also be used for the thoughts and perceptions of the children regarding environmental problems, the reasons of environmental problems and the ways of solution that they think of. Despite the fact that the thoughts of a limited number of students are determined, the data that was obtained is significant due to the fact that there is a very limited number of studies that aim to determine the environment perceptions of the children through the pictures they draw. It is suggested that similar studies should be repeated with different samples and the results should be compared. Though the drawings of the children are an effective method, there are certain constraints. In order to decrease these constraints, it is suggested that the drawings should be supported with interviews with the children.

EXPLORING MINDS: ALTERNATIVE CONCEPTIONS IN SCIENCE

Mahima Chhabraa, Bharati Bavejaa

Department of Education, University of Delhi, Chhatra Marg, Delhi — 110007, India

Abstract

This exploratory study has focused on two major dimensions- students' conceptions and teachers' conceptions. First part explored alternate conceptions that are possibly present in the area of Newtonian Mechanics among a group of first year Master of Science (M.Sc.) students majoring in Physics. The plausible conclusion from the study strongly point towards presence of misconceptions amongst students. Second part explored whether university teachers are cognizant of students' alternate conceptions and if so, what kind of techniques do they suggest or employ to attend to them. The data collected through interviews did not show any evidence of teachers' awareness about students' alternate conceptions. The major conclusions derived from the present study strongly substantiate the fundamental need for teachers to understand the mental world of their learners and shift to 'student centered' classroom processes as against commonly practiced 'teacher centered' ones.

Keywords: Alternate conceptions; misconceptions; teachers' conceptions; learning

Introduction

Students don't understand everything in the class." This is a commonly discussed topic amongst science teachers.

Despite repeated instruction and explanation students still write wrong answers, which is a serious cause of concern.

Thinking deeply on this issue is likely to lead us to a very basic yet crucial question i.e. "What do students understand" or "how do students conceptualize?" From a constructivist standpoint, knowledge is 'constructed' and it is an interpretive process, wherein the prior experiences of he learner play a decisive role in what is constructed. The purpose of constructing knowledge is to organize and deal with our experiences. That is, we make working hypothesis which fits both our previous knowledge and new experiences. We continue to use them till we get a satisfactory picture; otherwise they are either modified or discarded. These constructs/hypotheses are called concepts, ideas, theories (Bettencourt, 1993). Thus, every student makes sense of the world in his/her own unique personal way. At times, these personal constructs differ from the well-negotiated, most viable scientific constructs of the time and this discrepancy may be called as misconception or preconception or alternate conception or mental model. There is lot of empirical evidence to suggest the existence of alternate conceptions among learners which clearly show that students may not always understand the same thing which is taught (Beatty, 1994; Galili and Lavrik, 1998; Sharma and Sharma, 2007; Bhadrapurkar, 2008; Rohtagi 2008). Further, these alternate conceptions may present some challenges to learning. For example, a study by Muller and Sharma, (2007) shows that these preconceptions are well fitted in a learner's cognitive structure, and are very stable. Therefore, they pose a challenge to learning of new knowledge. For instance, they give learners a false sense of knowing therefore mental effort invested in learning is limited. Hence, there is a strong need for teachers to explore their students' minds, to understand what they understand of what is taught in the class. In this whole process, teachers' own conceptions play a key role. What teaching, learning and knowledge means to teachers would influence the way they deal with students' conceptions (Bencze, Bowen and Alsop, 2006; Mulhall and Gunstone, 2008). Hence both the areas of research-students' conceptions and teachers' conceptions are very vital from the perspective of teaching and learning. In this study we have made an attempt to explore students' mental models in Physics at tertiary level and at the same time to unravel teachers' conception about learning and learner's alternative conceptions.

Research Questions

2. Do college/tertiary level students of Science (Physics) have misconceptions in the area of Newtonian Mechanics?

3. What does 'learning' mean to university teachers?

4. Are they (teachers) aware of student's alternate conceptions?

5. Do these teachers have any teaching strategies to deal with students' alternate conceptions?

Methodology

This study was conducted in an engineering institute situated in Delhi, India, where, apart from Bachelors (B.Tech.), Masters (M.Tech.) and PhD in technology; Master's courses in Science (M.Sc.) (Physics, Chemistry, and Mathematics) are also offered.

To address the first research question i.e. to explore misconceptions among students, M. Sc. (Physics - Ist year) students were selected as the sample group. They were 47 in number and had completed their Bachelor's degree in Science from institutes across India, (thus a heterogeneous group based on their educational and social backgrounds). However, all of them had done at least one course in Newtonian Mechanics at Bachelor's level.

In order to explore students' misconceptions, questionnaire was constructed as a research tool. It was in structured multiple-choice-question (MCQ) form in which each question had 4 options. These questions were conceptual in nature and apart from choosing one answer out of the four; students were required to compulsorily provide reason for their choice of an answer.

The initial draft of the questionnaire was given to three experts including their subject teacher (teaching Classical Mechanics) for validation. Final draft was made after incorporating the suggested changes. This was presented to students as part of their internal assessment task, and therefore students were informed beforehand about the test. After the data was collected, its content analysis was done in consultation with their subject teacher.

To address remaining three research questions of the study i.e. teachers' understanding of students' alternate conceptions; their strategies to deal with it; and their views about learning, a sample of seven teachers was selected with teaching experience ranging from 1 - 20+ years. Almost all of them had the experience of teaching B. Tech, M. Tech and M.Sc. classes. It was a convenient sample. Semi-structured interviews were carried out to explore teachers' conceptions and hence, answer to our research questions (II), (III) and (IV). The data collected was transcribed and content analysed.

Data Summary and Analysis

For Research Question I.

The first research question pertained to students' misconceptions for which questionnaire as a tool was used. Questions were based on concept of force and its role is determining the motion of the particle in different geometries. For this section, one of the questions based on the concept of impulse (i.e. force experienced by a body/particle for a very short duration of time) is discussed in detail and further, observations are discussed for rest of the questions.

Q. Despite a very strong wind, a badminton player manages to hit a shuttle with her racquet so that the shuttle passes over the net and lands in her opponent's court.

Consider the following forces:

A downward force of gravity(Fg)

A force by the "hit"(Fh)

A force exerted by the air(Fa)

Which of the above forces is (are) acting on the shuttle after it has left contact with the racquet and before it touches the ground?

1 only.

1 and 2.

1 and 3.

1, 2, and 3.

The data obtained for this question is tabulated below. 91% students attempted this question. 'Row 2' of the table comprises the responses of students who provided a reason for their choice. On the other hand, 'Row 3 ' of the tables includes the responses of the students who did not provide any reason for their choice.

Table 1.

	a	b	c	d
Answers with Reason	3	3	22	10
Answers without Reason	-	2	1	2

Those who chose 'a' as the right option either neglected Fh and Fa after the hit or considered that both Fh and Fa balanced each other. Thus, in effect only Fg acted after the journey. The one who chose 'b' recognized Fg to be acting throughout the journey and Fh to be acting only when shuttle is in contact with the racquet. Those who chose option'd' considered Fh>Fa, and one of them mentioned that forward motion of the shuttle was because of difference between Fh and Fa and downward motion of the shuttle was because of Fg. Most of those who chose 'c' as the option recognized that Fh is an impulse or contact force and acts for a moment but provided varied effects of that impulse. One of them said Fh gave the initial impulse that changed the direction of the shuttle; another one said that after contact, the energy is transferred to the shuttle and yet another participant explained that after shuttle has left the contact, it still remains under the effect of 'hit', but Fg and Fa affects the motion during its flight.

Analysis

From the above data, one point, which comes out very clearly is that many learners considered Fh to be acting even after the contact between shuttle and racquet breaks. Actually, force due to gravity and air acts continuously throughout the journey, whereas force due to hit is a contact force, which acts only for the instant when shuttle is in contact with the racquet. Thus in the above case , only force due to gravity and force due to air acts on the shuttle after it has left contact with the racquet and before it touches the ground.

Similarly, other questions were analyzed and following points were observed:

The participants did not understand under what conditions centrifugal force comes into the play. It was evident when they used expressions of centrifugal force even in the inertial frame of reference for an object under uniform rotational motion.

Many learners considered velocity and acceleration to be in the same direction in a uniform rotational motion (it was evident from their diagrams), whereas they are actually perpendicular to each other. Most probably they have carried this concept from rectilinear motion where, indeed both the velocity and acceleration are in the same direction.

Many learners showed confusion with the meaning of words "ascending" and "descending". It was evident from the figures they drew to explain their answers.

All the other research questions pertained to teachers for which interviews were conducted. In the following section thematic analysis of the interview is presented .To maintain the anonymity teachers have been referred to as T1, T2... .T7.

For Research questions II, III and IV What learning means to you?

Ali teachers (except T2) were of the opinion that learning involves active participation from both teachers and students. Teacher (T2) felt that self motivation of student is the only governing factor for learning, therefore, onus of learning is on the student; teachers can only show the path but it has to be treaded by the student. For one of the teachers (T4), true/actual learning is to understand the content to such an extent that one can play with it. For another one, reflection on the already done steps while solving a problem and ability to correct them is learning. The aspect of learning as mutual gain/sharing of knowledge is pointed out by both T6 and T1; they also talked about learning as a continuous ongoing process. The focus on culture as the source, which guides the content of learning, also came up along with the statement/belief that there can be many ways of teaching, which can be equally effective, and different people learn differently. One of the teachers (T7) emphasized punctuality and other virtues, which one learns through observation, as part of teaching-learning process. An important aspect of teaching as pointed by one of them was, guiding through a problem (not giving clear-cut answers but giving cues) to facilitate learning. He further points out that teaching plays a part in setting the initial interest level of the students. Therefore, if one does not teach well, students would get disinterested in the subject and will not work towards it.

For most of them, the way to test/assess learning is mainly through numerical questions, quizzes and conceptual questions and discussion (only at times). One of them (T6) also talks of constraints present in the educational system (specific to their institute) such as limited time, many courses to complete (which are quite rigorous in their approach), co-curricular activities , frequent tests, and so on; which proves to be overly stressful for many students. Thus, he does not consider grades/marks achieved as correct indicator of learning.

Analysis

Learning is understood as an ongoing process by a few in which both students and teacher gain mutually. A point, which clearly comes out, is that it is difficult to draw a line between teaching and learning; rather it is considered as an inter-related and inter-dependent and thus an interactive process.

T2 focuses on self-motivation and interest of the student as governing factors for learning. Therefore teacher is considered only to be a guide or a facilitator who can show the path but learner has to walk on it on his/her own. Hence, learning is taken to be a personal process of knowledge construction, which is highly dependent on or governed by self-motivation and interest of the student. This view is reflective of constructivist approach.

T4's stance is reflective of learning as 'Cognitive Information Processing' where he is talking about meaningful associations when he says '...the student has to go beyond the definitions and get into the meaning or message contained in the situation'. On one hand it reflects gestalt i.e. having a holistic view in which, understanding the meaning, ability to apply, inter and extrapolate are all considered essential/necessary components of learning. On the other, it is reflective of few concepts as given by Norman. When he (teacher) says that learning a law would also mean that student should be able to apply it (i.e. solve problems using it) which indicates the use of memory (to retrieve

essential information) and performance (i.e. being able to solve problem). In addition, when he mentions that students

should be able to decide in a given problem, which laws have to be applied, it indicates fine-tuning. Thus it is quite similar to the way Norman viewed learning as a deliberate act of study of specific material so that it can be "retrieved at will and can be used with skill" (Norman, 1982, p. 3).

T5 cited many examples from his life exhibiting varied views on learning. Firstly, he equated learning to the process of discovery. Here the concept of Discovery Learning as suggested by Bruner is quite evidently seen. According to the teacher, doing research, which is an organized process (not haphazard) is discovering something which was pre-existing and this discovery in turn is 'learning'. Similarly Bruner has pointed out that discovery is "all forms of obtaining knowledge for oneself by the use of one's own mind", i.e. one has to transform/reassemble the data in such way that one goes beyond it to gain new additional insights. It is not a haphazard activity but a planned endeavour of finding regularities and relationships in the environment. This actually is the process of research.

Secondly, he acknowledges that learning is both context and culture driven .Thus one's culture determines and interacts 'what to be learnt' i.e. the content of learning which in turn helps one to survive and flourish in that culture. E.g., "a school child may know 5x3 =15, but a farmer would rather know how much fodder a cow eats."

His third life instance (experience with a professor from Presidency College, Kolkata, India) was indicative of learning being facilitated by locating the subject in an overall structure of the discipline. It is much like the concept of Advance Organizers suggested by Ausubel. They are relevant and inclusive introductory material, provided in advance of learning material that serves to bridge the gap between what the learner already knows and what he needs to know before he can meaningfully learn the task at hand. Further, emphasis was given on learning through solving real life problems of physics in a class through brainstorming and discussions. Here teacher was also an equal and active participant. This is very similar to learning through group problem solving where the participants are constructing knowledge together. Teaching and learning is seen as a conjoined process.

He further emphasizes on learning as internalization of knowledge by student. He believes that learning would only happen when students themselves solve each step of the problem (after it is solved/derived in the class).

He lastly suggests that learning is dependent on teaching to a great extent in the sense that it guides the motivation level of a student. This makes teaching an inspirational process which acts as a trigger for learning.

T7's stance also exhibits many manifestations of learning. Firstly, he points at 'reflective abstraction' as a process of learning. He gives importance to learning through observation and then reflection. He further asserts that learning the content of subject is not enough but values such as punctuality are also important. He emphasizes self-learning as an ongoing process. Secondly, he suggests that learning is to connect new information with the existing cognitive structures, when he says, "If they don't understand I have to get down in level a bit". Thirdly when he says that "... (when students ask a question in class) sometimes I may just answer the question, sometimes I might pose a question back at them and tell them to work a bit harder as they are near the answer"; it quite clearly reflects Vygotsky's concept of Zone of Proximal Development (ZPD) where learning is leading the learner from actual to potential level of performance; from assisted to unassisted level of functioning.

Assumption about teaching learning as an intuitive process with which we are endowed is clearly evident.

Do all students learn the same way?

Most teachers acknowledge that not all students understand everything that is taught in the class. Some of them also realize that not all students understand the same way. A few teachers view learning as a concept, which is taken to be a linear, hierarchical structure in which different students can reach different levels. One of the teachers holds difference in capability (intelligence) of students as the cause for it. Few teachers assume the variation in backgrounds of students as the reason behind it. One of them does believe that initially they might understand variously because of different backgrounds but after the completion of course, their background is homogenized and they can therefore think in similar way. For most of them the only indicator available in the present set up to test students' understanding is exams, quizzes etc.

Can it lead to misconceptions?

Most of them agreed that there might be misconceptions (though not in a technical sense). Only one of them (T3) said that he has never noticed it, however partial understanding can take place but not contrary to what is being taught

in the class. According to T1, while teaching, he makes sure that everyone understands in his class. T6 preferred to call it a confusion (for a short period of time) rather than misconception. Two teachers tried to give reasons which could lead to misconceptions such as - teacher's lack of comprehension of the content, lack of attention paid to the limitation of each law (in science) which may lead to its extrapolation in different situations (where the law might not be applicable); unnecessary simplification (or dilution) of complex concepts. One of the teachers acknowledges that students make their understanding in a given context and they are comfortable with it which makes them resistant to change. However, all of them view construction and continuation of misconceptions as a short-term phenomenon, which is likely to cease once the students are able to understand or apply the same logic as the teacher does (i.e. somewhere leading to homogeneity).

How to deal with it?

Some of the ways/techniques adopted (or can be adopted) as suggested by the teachers were:

Repeated explanation;

Recapitulation of underlying concepts in content covered in previous classes;

Provide real life examples or practical use of concepts;

Unwinding their present learning by questioning

Giving day to day examples (analogies)

Solving lots of problems in the class

Giving references where problems are solved

Giving lots of application based questions so that students can check their logic while solving them.

Elaborate most things in the class (do not presume students would know certain things).

Show applicability of concepts in varied situations.

Clarifying or stressing the limitations of laws

Not diluting the complexity, rather giving them limited but right information. (For details, interested students can take the help of teacher).

Giving conceptual questions in quizzes

Whenever students ask doubts (if time permit), trying to get into a discussion to get an idea of their level of understanding.

Analysis

From interviews, we could ascertain that none of the teacher had come across any literature about alternative frameworks per say.

From the data few points, which can be clearly inferred, are:

The distortion of concept per se is not easily cognised by teachers. They only assume either incomplete or complete understanding of the concept - i.e. different levels of understanding of the concept among students rather than varied interpretation of the same.

Further, for teachers, teaching learning process seems to be subject centred rather than student oriented. The focus is much more on transferring concept to the students where they are expected to follow pre-determined set of logics

and thoughts. The underlying assumption is that student's mind is like clean slates where newer concepts (if explained effectively) can be understood exactly the same way. The capacity within a student to place same concept in their subjective context is not recognised by most teachers except for one. Thus, the teachers seem to be unaware to the process involved in concept formation in a student's mind. Hence, a student might have idiosyncratic construction is unimaginable by the teachers.

The teacher student ratio is extremely high, thus one to one or personal interaction with the students is not possible. In such a scenario the only workable method of feedback and evaluation are semester exams, quizzes, or the doubts/questions students ask. These help the teacher to know whether students have understood or not, in case the student has not understood or not performed up to the mark then the usual reason cited is lack of interest and motivation on the part of the student. The other approach teachers usually take up is that of explaining the concept again. This might prove useful in clarifying certain points; however it does not challenge (or create a state of disequilibrium in) the conceptual framework which has already shaped up in student's mind.

Also, the onus of clarification of any concept is completely put on students. It is assumed to be student's responsibility to take care of any conceptual problem arising in the subject matter and clarify with the teacher. Such an assumption implies that students have to or they can recognise/discover on their own when they have developed any misconception. Now the vital point, which is missed, is that students (or anyone else) are actually unaware of their misconceptions because their interpretation of concept fits their (personal) conceptual framework. Further, the high student teacher ratio and inflexible system act as structural barriers, which impede any effort to accept or understand the novel way in which a student might understand a concept. Thus misconceptions, far from being clarified, are generally not recognised by the teachers (in the same sense as done in literature).

Approaches/ techniques to deal with misconceptions seem to be varied and effective but they are only used for those students who come to teachers with their doubts or sometime those who have got very low grades.

Discussion and Conclusion

This research attempted firstly to locate misconceptions at tertiary level among a sample of master level students in Physics. Data quite evidently show that learners did carry misconceptions within the area of Newtonian Mechanics like-1) Force of a hit continues to act even after the two bodies leave contact; 2) Centrifugal force acts in an inertial frame of reference; and 3) In a uniform rotational motion direction of acceleration and velocity is same.

Simultaneously the other related aspect of research was to explore if university teachers are cognizant about students' alternate conceptions and this in turn is closely related to their conception about learning. Amongst the given participant teachers, notions of learning were varied and most of them seemed inclined towards constructivist ideas. In spite of the inclination, no evidence was found of their awareness about alternate conceptions. Most of them took it either as a temporary state of confusion or misunderstanding. Consequently, most of the strategies they suggested to deal with misconceptions did not aim towards conceptual change. More importantly, teachers made students responsible for locating and acknowledging their misconceptions, hence their (teachers) role in attending to alternate conceptions starts when student himself/herself comes to them with doubts. The most crucial point missed by them is that learners (or anyone else) have stable cognitive structures, which fit into each other coherently, thus they would remain unaware of their alternate conceptions until they get into a situation, which challenges their conceptions. Hence, it is imperative for teachers to explore how their students learn and conceptualise to make the whole process of teaching and learning more meaningful.

The implication of our research puts forth a huge and challenging task before teachers (keeping in mind the huge numbers we deal with in our classrooms) which involves peeping into every learner's mind, to unravel their preconceptions before teaching any concept. Further, while acknowledging these concepts, enabling learners to explore their own mental models and compare them with those of others and find if there are any inconsistencies and if so why. Thus, in the process, nurturing learners' metacognitive ability. To do so, teachers themselves need to reflect on their own epistemological beliefs about their subject (science in this case), teaching and learning. They need to understand the pluralism in the process of knowledge construction which is in consonance with the nature of science. Science is viewed as socially negotiated way of understanding the events and phenomena that comprise the experienced universe. Science cannot be thought of as a body of absolute, unchangeable truth rather tentative and

theory laden. This argument is supported by Kuhn's(1996) concept/model of paradigm shift where he says that the way reality (or science) is viewed in one paradigm will change as the paradigm shifts. Thus theories and laws (in science) are actually viable models which evolve through the process of consensus building and negotiation. As our experiences change so do the models. Thus what is essential is to build viable models in science, i.e. as coherent model of the experiential world as possible (Tobin & Tippins, 1993). In this regard alternate conceptions become very important as they may lead to paradigm shifts (Kuhn, 1996) through which science progresses. Thus, it is very important to locate them, acknowledge them and put them to debate so that a well-analysed clarity of the concept could be developed. Therefore, this area of research becomes all the more meaningful and relevant. Hence this study gives a very vital reason for 'why' there is a need for teachers to understand the mental world of their learners as well as their own; 'why' there is a need to make classroom processes student- centred rather than commonly practiced teacher -centred and for a teacher creating those learning environments that are in consonance with the learners' cognitive needs is one of the major challenge!

EVALUATING THE FITNESS OF LECTURING WITH POWERPOINT PRESENTATIONS FOR ACCOUNTING EDUCATION- RESEARCH AT SAKARYA UNIVERSITY

A. Vecdi Can[a], Nevran Karaca[b], Nermin Akyel[c], S. Dogus Demirci[d]

[a,b,d] Department of Business, Faculty of Management, [c] Geyve Vocational School

Sakarya University, 54187 SAKARYA / TURKEY

Abstract

In the study, it was aimed to evaluate the effectiveness of the lecturing via powerpoint presentations in accounting education. The questionnaire study prepared with this purpose was applied to the students at the Departments of Economics and Finance within the Faculty of Economics and Administrative Sciences and at the Departments of Business Administration and Tourism within the Faculty of Business Administration at Sakarya University. By means of the questionnaire applied, the traditional lecturing method and lecturing with PowerPoint presentations were comparatively evaluated in terms of efficiency and achievement factors. The results of the study were also evaluated according to students' departments, grades and genders. The questionnaire data was analyzed with Kruskal-Wallis Test, Independent Sample T test, Analysis of Variance (ANOVA) and Tukey test and as a result of the analyses, it was determined that there was a significant difference between the teaching methods and the grades students got in accounting education. Moreover it was determined that there is not a significant difference between the students' thoughts about Powerpoint presentations and traditional method in terms of their genders and class.

Keywords: Teaching methods, PowerPoint, Traditional Education, Accounting Education

1. Introduction and Literature Review

The developments in science and technology underlie active learning that occurred as a reaction to the traditional teaching method, in which a student is considered a simple receiver, under the influence of the changes and developments experienced in the world. Computer, an indispensable element of everyday life, has become a must in terms of the education & instruction system. In order for courses to be more efficient in auditory and visual senses and in order to achieve permanent, effective and fluent teaching, the computer technologies began to be utilized. The need to back up education & instruction with visual aids brought forward a lesson environment that was enriched with PowerPoint presentations in modern classrooms which had a technological infrastructure. PowerPoint presentations were brought to the classroom environment at every stage of education & instruction from the elementary education to graduate education and the lessons gained an interactive structure.

The rapid increase in information and in the number of students brought about some problems and the entry of new technologies that played an important role in the development of the education process and quality into the education institutions became inevitable (Akdağ & Tok, 2008). With the use of technological tools particularly such as Projector, PowerPoint, Video and the Internet in education in the recent years, visual education has become popular. A computer-aided presentation, defined as PowerPoint, is a method of display that supports lecturing (Suguhara & Boland, 2006). PowerPoint presentations are a dynamic communication tool in oral and visual senses and in terms of reading & writing. According to some studies made, individuals learn the conveyed information more effectively as a result of the supporting of information with visual elements besides lecturing (Levasseur & Sawyer, 2006).

Some studies on the efficiency of PowerPoint presentations in education reveal that students display a positive attitude towards the course which is lectured by means of PowerPoint presentations (Susskind, 2008; Susskind, 2005; Nouri & Shahid, 2005; Bartsch & Cobern, 2003; Szabo & Hastings, 2000; Lowry, 1999). In

addition, the studies which were carried out to determine the efficiency of PowerPoint presentations contain evidence of the fact that the PowerPoint presentations which have been prepared to be in order and comprehensive facilitate remembering the subjects (Wecker, 2012; James et al., 2006; Susskind, 2005; Şengün & Turan, 2004; Szabo & Hastings, 2000; Chanlin, 2000; Lowry, 1999), facilitate learning (Kahraman et al., 2011; Tang & Austin, 2009; Apperson et al., 2008; Susskind, 2005; Beets & Lobingier, 2001; Szabo & Hastings, 2000), make the relationships among concepts more comprehensible (Şengün & Turan, 2004), enhance motivation by making the lessons more interesting (Kahraman et al., 2011; Tang & Austin, 2009; Şengün & Turan, 2004; Szabo & Hastings, 2000), facilitate note taking by students in the lesson (James et al., 2006; Susskind, 2005) and enhance the achievement levels of students (Gürbüz et al., 2010; Akdağ & Tok, 2008).

On the other hand, some studies on the efficiency of PowerPoint presentations reveal that PowerPoint presentations do not create any difference in education as compared to the traditional techniques and that the presentations which have not been well-prepared even hinder learning (Kahraman et al., 2011). As a result of some studies, it was detected that there was no significant relationship at acceptable level between the course presentations performed with PowerPoint and the achievements of students in exams (Selimoğlu et al., 2009; Craig & Amernic, 2006; Susskind, 2005; Susskind, 2008; Szabo & Hastings, 2000; Harknett & Cobane, 1997). In some studies, however, it was expressed that PowerPoint presentations did not have any significant contribution to a student's development (Mantei, 2000) and that the bullets used in presentations even kept people away from thinking and made them learn by rote. Moreover, Butler & Mautz (1996) and Nouri and Shahid (2005) determined that PowerPoint presentations were influential on the short-term memory, but they had no impact on the long-term memory. In their research, Szabo & Hastings (2000) concluded that there was no difference in the exam results of the students in the classroom where the course was lectured with PowerPoint and in the classroom where the course was lectured on the blackboard.

Some studies made suggest that PowerPoint presentations are inadequate for effective teaching, but that the course presentations should be backed up by graphs, images and various animations (Gelişli, 2009; Savoy et al., 2009; Apperson et al., 2008). Bartsch & Cobern (2003) stated that the presentations containing animations, images and effects concerning the subject provided advantages by ensuring permanent learning of the things learned and that irrelevant sounds, interesting but irrelevant writings and irrelevant images provided disadvantages by reducing the comprehension capability. In their study, Selimoğlu et al. (2009) put forward that the courses lectured with presentations would enhance the achievement of students in the event that a favorable environment was provided and that the students had positive attitudes towards PowerPoint presentations. In his study, Kask (2000) highlighted the relationship of the success of lecturing with PowerPoint presentations with the physical conditions of classrooms, and with his research, he observed that a student's performance decreased by 50% in the courses lectured with PowerPoint in large classrooms like a lecture theater.

Some remarkable results occurred as a consequence of the studies performed to find out for which courses and subjects PowerPoint presentations were fit. As a result of their research, Savoy et al. (2009) determined that lecturing technique preferences varied by the expectations from the course. In the event that the course contained complex graphs, animations and figures, the students stated that lecturing with a PowerPoint presentation would provide advantages. On the other hand, it was revealed that the students preferred the traditional course method to PowerPoint presentations in the event that the course contained numerical information. As a result of their research, Şengün & Turan (2004) detected that there were considerable students' views on the fact that PowerPoint presentations would be more suitable for the field of physical geography within geographical subjects. With their research, Duman & Atar (2004) expressed that PowerPoint presentations enhanced the academic achievement of students and motivation with respect to the teaching of abstract subjects like climatology in the course of geography. Szabo & Hastings (2000) suggested that PowerPoint presentations were more beneficial in the teaching of specific subjects, but not in a course in general. Saguhara and Boland (2006) stressed that in the event that many subjects lectured orally were presented with visual and auditory means of media which were prepared with an accurate content, they had positive impacts on students, encouraged participation in the lesson and were positive in terms of students.

A limited number of studies have been made in order to detect the impact of the use of technology on accounting education and the results of these studies provide some clues for the impact of lecturing with

PowerPoint presentations on accounting education. In their study, Burke et al. (2009) examined the effect of the education provided with PPT in different courses on the understanding by students. In the research, the courses of accounting, law, economics, finance, management and informatics systems, and management and marketing were selected; it was examined how effective the courses lectured with PPT were in these selected courses; and it was concluded that the impact of lecturing the accounting courses with PPT was very small. In their study which they made by applying a questionnaire to 189 undergraduate students in Japan, Sugahara & Boland (2006) examined the academic performance of those students who received the accounting courses lectured with PowerPoint. As a result of the study, they concluded that the use of multimedia technologies in accounting courses had no effect on the academic achievements of students and even that the students were able to learn less. At the same time, in the study by Ijiri (1983), he concluded that the accounting courses lectured in a computer-oriented fashion put one off the idea of practicing by using pencil and paper and hindered their development in accounting. Ijiri (1983) considered the information technologies used thoughtlessly in the accounting classroom and insisted that computers could not replace a blackboard in accounting education as they drove students to laziness. In their research on the accounting students at Hiroshima Shudo University, Saguhara & Boland (2006) expressed that the presentation with PowerPoint in the accounting course had negative impacts on the students.

Besides the studies concerned which put forward that PowerPoint presentations were not fit in accounting education, there are also studies alleging that they were fit. In the studies by Apperson et al. (2008), Albrecht & Sach (2000) and Perry & Perry (1998), they concluded that lecturing the accounting course with multimedia presentations like PowerPoint enhanced students' interest in and motivation for the course. Nouri & Shahid (2005) explored the impacts of PowerPoint presentations on the students who received the accounting course in terms of attitude and memory. In the study, it was emphasized that properly designed presentations which were prepared with a well-arranged content would contribute to the course, enhance efficiency in note taking and facilitate the course and it was stated that PowerPoint presentations might have a positive effect on temporary memory but they had no impact on permanent memory. There are few studies which were carried out in Turkey with respect to the efficiency of PowerPoint presentations in accounting education. The results of these studies are summarized below.

To determine the views of university students about the effectiveness of accounting courses lectured both in the classical fashion and with PowerPoint presentations, Fidan (2012) applied a questionnaire to the students who studied at the Departments of Business Administration, Economics and Public Administration within the Faculty of Economics and Administrative Sciences at Bilecik University and who received the course of Accounting Procedures. According to the results of the questionnaires, it was detected that the students who were lectured in the classical fashion had more positive opinions about the course of accounting than the students who were lectured with PowerPoint in terms of perception and judgment. Furthermore, it was determined that for accounting courses, the students generally preferred the application of techniques in which technology and the classical method were used together. In their fieldwork in the Faculty of Economics and Administrative Sciences at Karadeniz Technical University in order to determine whether there were differences in achievement, interest, perception and judgment between the students who received the accounting courses with PowerPoint presentations and in the classical fashion, Çankaya & Dinç (2009) determined that the students who were lectured with PowerPoint presentations were more successful than the students who were lectured in the classical fashion in terms of academic performance. In addition, when an examination was made in terms of students' perception of the accounting courses, it was revealed that the students who were lectured with PowerPoint presentations found the course more attractive, more enjoyable and more relaxing and thought it became more beneficial, whereas the students who were lectured in the classical fashion found the course more monotonous, more boring and more tiresome than the other group. In her study, Hatunoğlu (2006) aimed to determine students' evaluations of the current situation of the accounting education provided at the university and of the level which it should reach in terms of course presentation. With the questionnaire prepared to this end, she intended to reveal the effects of the use of information technology in accounting education on the quality of presentations. The questionnaire study was applied to the students who studied at the Departments of Business Administration and Economics in the Faculty of Economics and Administrative Sciences and in the Faculty of Business Administration at 23 state and 7 foundation universities in Turkey. The majority of the students

(98.3%) stated that the use of tools of information technology in the presentation of accounting courses would facilitate the understanding of courses.

In this study, it was intended to determine students' perception of the use of PowerPoint presentations in accounting education and it was investigated whether the achievements of those who received the accounting course with PowerPoint presentations differed as compared to the achievements of those who received the course with the traditional lecturing method because despite the availability of many studies on the use of education technologies in education, there are very few studies that investigate the contribution of the use of technology in accounting education by the students studying accounting at the universities in Turkey to education. Nevertheless, it is necessary to explore the most efficient methods of allowing the student to comprehend the accounting course, one of the courses in which students have difficulty in comprehending in the field of social sciences, and to enhance efficiency in accounting education. In this study, it was aimed to determine whether the projection apparatus, which was considered an efficient instructional tool, could be used as a tool in making accounting courses efficient/in enhancing efficiency.

2. Research

a) Scope of the Research: The population of the research comprises the students at the Departments of Economics and Finance within the Faculty of Economics and Administrative Sciences and the students who studied at the Departments of Business Administration and Tourism within the Faculty of Business Administration at Sakarya University and received the courses of General Accounting, Cost Accounting and Accounting Procedures. The distribution and grades of the students who participated in the research by department are presented in Table 1.

Table 1: Distribution and Grades of the Students who participated in the Research by Department

Department/Grade	Freshman	Sophomore	Junior	Senior	Total
Economics	43	50	49	54	196
Finance	0	60	50	50	160
Tourism	70	56	60	0	186
Business Administration	62	63	115	56	296
Total	175	229	274	160	840

b) Hypotheses and Method of the Research: The research encompasses students' evaluations of the use of PowerPoint presentations and the traditional lecturing method in accounting courses. Nine hypotheses were developed depending on the purpose of the research. H_1: The grades for General Accounting vary by the type of being lectured. H_2: The grades for Accounting Procedures vary by the type of being lectured. H_3: The grades for Cost Accounting vary by the type of being lectured. H_4: The levels of preferences for using PowerPoint presentations vary by department. H_5: The preferences for using the traditional method vary by department. H_6: The preferences for using PowerPoint presentations vary by gender. H_7: The preferences for using PowerPoint presentations vary by class. H_8: The preferences for using the traditional method vary by gender. H_9: The preferences for using the traditional method vary by class.

c) Data Collection and Analysis: The data was collected by means of the questionnaire form developed by the researchers. The questionnaire form developed so as to collect the data consists of three parts. The first part includes questions containing demographic information on the gender, age, department and grade of the respondents. The second part contains 19 expressions in order to determine students' views on lecturing with PowerPoint presentations and 13 expressions in order to determine the views on the traditional lecturing method. These questions that constitute the second part of the questionnaire form were prepared in 5-point Likert type (1: Strongly Disagree; 2: Disagree; 3: Neither Agree Nor Disagree; 4: Agree; 5: Strongly Agree). In the third part, questions were posed with respect to whether the students received the courses of general accounting, accounting procedures and cost accounting with PowerPoint presentations, with a blackboard and through the use of a blackboard and PowerPoint presentations together. In this part, the achievement grades of the students from the courses of general accounting, accounting procedures and cost accounting were also asked. SPSS 17.0 statistical package program was used to evaluate the research data.

d) Testing the Hypotheses

H_1: **The grades for general accounting vary by the type of being lectured:** The Kruskal-Wallis Test was used to detect whether the letter grades that the students received from the course of general accounting varied by the type of being lectured. The test results are shown in Table 2. H_1 is accepted, for the statistical value of the Chi-Square test is 98.483 and sig=0.000<0.05. That is, there is a difference between the grades for general accounting in terms of letter grades. When the column of mean rank was considered, it was seen that the most successful groups were those lectured with a blackboard, those lectured with PowerPoint presentations and a blackboard together and those lectured with PowerPoint presentations, respectively.

Table 2: The Analysis Of Relation Between The Teaching Method And Students' Success In Basic Accounting Education

Lecturing Method	N	Mean Rank	Chi-Square	98.483
Use of PowerPoint presentations only	137	234.32	df	2
Use of the traditional method	431	462.82	Asymp. Sig.	.000
Use of PowerPoint presentations together with a blackboard	255	421.57		
Total	823			

H_2: **The grades for Accounting Procedures vary by the type of being lectured:** The Kruskal-Wallis Test was used to detect whether the letter grades that the students received from the course of accounting procedures varied by the type of being lectured. The test results are demonstrated in Table 3. H_2 is accepted because the statistical value of the Chi-Square test is 172.695 and sig=0.000<0.05. That is, there is a difference between the grades for accounting procedures in terms of letter grades. When we considered the column of mean rank, it was seen that the most successful groups were those lectured with a blackboard, those lectured with PowerPoint presentations and a blackboard together and those lectured with PowerPoint presentations, respectively.

Table 3: The Analysis Of Relation Between The Teaching Method And Students' Success In Inventory Balance Sheet Education

Lecturing Method	N	Mean Rank	Chi-Square	172.695

Use of PowerPoint presentations only	107	255.93	df	2
Use of the traditional method	396	559.62	Asymp. Sig.	.000
Use of PowerPoint presentations together with a blackboard	215	408.87		
Total	718			

H₃: The grades for cost accounting vary by the type of being lectured: The Kruskal-Wallis Test was used to detect whether the letter grades that the students received from the course of cost accounting varied by the type of being lectured. The test results are shown in Table 4. H_3 is accepted, for the statistical value of the Chi-Square test is 6.646 and sig=0.036<0.05. That is, there is a difference between the grades for cost accounting in terms of letter grades. When we considered the column of mean rank, it was seen that the most successful groups were those lectured with a blackboard, those lectured with PowerPoint presentations and a blackboard together and those lectured with PowerPoint presentations, respectively.

Table 4: The Analysis of Relation Between The Teaching Method And Students' Success In Cost Accounting Education

Lecturing Method	N	Mean Rank	Chi-Square	6.646
Use of PowerPoint presentations only	57	104.80	df	2
Use of the traditional method	109	134.25	Asymp. Sig.	.036
Use of PowerPoint presentations together with a blackboard	84	128.19		
Total	250			

H₄: The levels of preferences for using PowerPoint presentations vary by department: An Anova test will be made to test this hypothesis. Before the Anova test, it is necessary to perform the Levene's test to measure the homogeneity of the deviations. According to the result of the Levene's test statistic, the statistical value is 0.912 and the sig. value is 0.435. As sig=0.435>0.05, H_4 is accepted. Considering this, it might be stated that the variances are homogeneous. The fulfilment of the condition of equality of the variances indicates that the analysis can be carried on. The results of the Anova test regarding the preference for using PowerPoint presentations are shown in Table 8.

Table 8: The Analysis Of Students' Thoughts About Using Powerpoint Presentations In Accounting Education According To Their Departments

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	16,918	3	5,639	5,457	.001
Within Groups	860,862	833	1,033		
Total	877,780	836			

When the data in the table is considered, the F score is 5,457. As sig=0.001<0.05, H_4 is accepted. This result proves that the preferences for using PowerPoint presentations vary by department. The Tukey's test was made so as to determine between which departments there was a difference and the test results are provided in Table 9.

According to the Tukey's test, it is seen that there is a difference in the preferences for using PowerPoint presentations between the Department of Finance and the Department of Business Administration. When the discrepancy between means is examined it can be said that the students who study Public Finance agree on the positive items more than the students who study Business Administration

Table 9: The Discriminant Analysis Of Students' Thoughts About Using Powerpoint Presentations In Accounting Education According To Their Departments

(I) Question 3 department	(J) Question 3 department	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Economics	Finance	-,19827	,10831	,260	-,4771	,0806
	Tourism	,00475	,10406	1,000	-,2631	,2726
	Business Administration	,19767	,09368	,151	-,0435	,4388
Finance	Economics	,19827	,10831	,260	-,0806	,4771
	Tourism	,20301	,10961	,250	-,0792	,4852
	Business Administration	,39593*	,09981	,000	,1390	,6529
Tourism	Economics	-,00475	,10406	1,000	-,2726	,2631
	Finance	-,20301	,10961	,250	-,4852	,0792
	Business Administration	,19292	,09518	,179	-,0521	,4379
Business Administration	Economics	-,19767	,09368	,151	-,4388	,0435
	Finance	-,39593*	,09981	,000	-,6529	-,1390
	Tourism	-,19292	,09518	,179	-,4379	,0521
*. The mean difference is significant at the level of 0.05.						

H_5: *The preferences for using the traditional method vary by department:* An Anova test will be made to test this hypothesis. Before the Anova test, it is necessary to perform the Levene's test to measure the homogeneity of the deviations. According to the result of the Levene's test statistic, the statistical value is 1,206 and the sig. value is 0.306. H_5 is rejected as sig=0.306>0.05. Considering this, it might be stated that the variances are equal. The fulfilment of the condition of equality of the variances indicates that the analysis can be carried on. The results of the Anova test regarding the preference for using the traditional method are

demonstrated in Table 11. When the data in the table is considered, H₅ is rejected because the F score is 1.1377 and sig=0.248>0.05. This result proves that the preferences for using the traditional method did not vary by department.

Table 11: The Analysis of Students' Thoughts About Treditional Teaching Method In Accounting Education According To Their Departments

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	3,455	3	1,152	1,377	,248
Within Groups	695,718	832	,836		
Total	699,173	835			

H₆: The preferences for using PowerPoint presentations vary by gender/ H₇: The preferences for using PowerPoint presentations vary by class/ H₈: The preferences for using the traditional method vary by gender/ H₉: The preferences for using the traditional method vary by class: The "independent t test" was used to detect whether the preferences for using PowerPoint presentations and the preferences for using the traditional method in accounting courses varied by gender, while an ANOVA test was used to determine whether they varied by class. The test results are given altogether in Tables 12 and 13.

Table 12: Independent Sample t test and Anova Analysis on the Preference for Using PowerPoint Presentations and Traditional Method

Hypotheses	F/t value	Sig.	Accept / Reject
H₆: The preferences for using PowerPoint presentations vary by gender.	-1.065 (t test)	0.287	REJECT
H₇: The preferences for using PowerPoint presentations vary by class.	1.576 (ANOVA)	0.179	REJECT
H₈: The preferences for using the traditional method vary by gender.	1.308 (t test)	0.191	REJECT
H₉: The preferences for using the traditional method vary by class.	1.003 (ANOVA)	0.405	REJECT

Lastly, the students' choices of Powerpoint presentations or traditional teaching method were compared in the study. Cronbach Alpha value was calculated in order to test the reliability of the items in the questionnaire which was about the students' preferences about powerpoint presentations or traditional teaching method used while lecturing. Cronbach Alpha value was found as 0,794. The result showed that the answers of the items were coherent. When the means of the items students answer is examined it is seen that students agree on the positive items about traditional teaching method more.

Table 14: The Results of The Mean And Standart Deviation Of The Students' Thoughts About Accounting Education According To Teaching Method

Item Statistics			
	Mean	Std. Deviation	N
S.6 A course presentation with PowerPoint provides a better comprehension of the subjects.	3,14	1,332	834
S.23 Lecturing the courses with traditional lecturing provides a better comprehension of the subjects.	3,58	1,160	834

S.7 A course presentation with PowerPoint enables the instructor and the student to communicate more effectively.	2,81	1,327	834
S.24 Lecturing the courses with traditional lecturing enables the instructor and the student to communicate more effectively.	3,66	1,187	834
S.9 A course presentation with PowerPoint provides active participation of the student in the course.	2,49	1,263	834
S.25 Lecturing the courses with traditional lecturing provides active participation of the student in the course.	3,62	1,135	834
S. 10 A course presentation with PowerPoint facilitates note taking by students.	3,12	1,347	834
S.26 Lecturing the courses with traditional lecturing facilitates note taking by students.	3,43	1,220	834
S11 A course presentation with PowerPoint increases the interest of the student in the course.	2,95	1,266	834
S.27 Lecturing the courses with traditional lecturing increases the interest of students in the course.	3,47	1,164	834
S.13 A course presentation with PowerPoint enables the student to consider different dimensions of a subject.	3,04	1,222	834
S.28 Lecturing the courses with traditional lecturing enables the student to consider different dimensions of a subject.	3,45	1,544	834
S.14 A course presentation with PowerPoint enables the subjects to be remembered easily.	3,12	1,255	834
S.29 Lecturing the courses with traditional lecturing enables the subjects to be remembered easily.	3,50	1,118	834
S.15 A course presentation with PowerPoint helps the student to form a relationship between the concepts.	3,18	1,231	834
S.30 Lecturing the courses with traditional lecturing helps the student form a relationship between the concepts.	3,47	1,128	834
S.16 A course presentation with PowerPoint enhances the quality of education.	3,24	1,239	834

S.31 Lecturing the courses with traditional lecturing enhances the quality of education.	3,35	1,137	834
S.17 A course presentation with PowerPoint facilitates learning.	3,22	1,333	834
S.32 Lecturing the courses with traditional lecturing facilitates learning.	3,41	1,123	834

3. Conslusion of Research

In this study, the aim is to evaluate the effectiveness of lecturing via powerpoint presentations in accounting education. Varieties of questions are asked to the students who got accounting education by means of a questionnaire prepared to evaluate this. It is tried to determine whether there is a significant difference between the success of the students lectured with Powerpoint presentations and traditional method by using this questionnaire. The results are also evaluated according to the students' departments, class and genders. These results below are reached after the analysis of the data.

According to the answers of the participants, it is seen that the students grades they took from accounting course within the study, differentiate depending on the teaching style. In the result of the study, the students who were taught via blackboard are the most successful. The students who were taught both with a blackboard and powerpoint presentations are less successful and the students who were taught with just powerpoint presentations are the less successful. This result shows that most of the students become more successful when they are taught with traditional method.

It is seen that there is a difference in the prefences of using powerpoint between Public Finance Department and Business Department. It is thought that the difference is because of the lecturers different teaching methods and different classroom environments in those departments.

It is seeen that the prefences of using tradional method don't differentiate according to departments,grades, and gender. Thus, it can be said that students point of view about tradional teaching method is the same regardless of departments grades and gender.

It is seen that the prefence of using powerpoint differentrate according to departments. However it doesn't differenciate according to grades and gender. Therefore, it can be said that students point of view about using powerpoint presentatioon is the same regardless of grade and gender.

As seen in the results of the study, there is no difference between the point of view of the students who learned accounting towards lecturing via powerpoint presentations or lecturing with a tradional method. However, it is seen that the students taught with a tradional method are more successful in accounting. It is thought that the difference is because of the lecturers different teaching methods and different classroom environments.

Accounting in university is called a difficult course for both lecturers in terms of teaching and the students who haven't learng anything about the course before.It is thought that the problems which emerge from the current teaching methods, can be solved via new technology. Moreover it is thought that it is possible to change the students attitude towards the course ,success and attendance ,thanks to new technology. Lecturers having information about teaching methods along with learning styles and using them while lecturing is benefical for the quality of education and increases the students success.

EVALUATION OF AN E-LEARNING SCENARIO FOR BIOMEDICAL ENGINEERS

Kožuško Jan[17], Kuß Julia, Abdel-Haq Anja, Weichelt Claudia, Dietrich Hans, Hebestadt Susanne, Rudolph Inge, Morgenstern Ute

[a]Institute for Biomedical Engineering, Technische Universität Dresden, Germany

Abstract

The new co-operative blended learning concept is being developed under leadership of the TU Dresden team with collaborative partners in Saxony. In the new e-learning system TheraGnosos - Biomedical Engineering, a new framework and feedback scenario have been developed. This has been compared with the previous version of e-learning software Labyrinthos - Medical Terminology, in which immediate feedback was implemented. 20 students studied for exam, using the old version, and 28 could use the new one. The average exam result in the first group was 2.26, and in the second group 1.72. In control exam in another subject, there was no significant improvement of score. The new developed feedback scenario might influence the learning effect, measured by exam score.

Keywords: e-learning, feedback scenario; biomedical engineering

Introduction

Rapid development of electronic media in last decade provides new opportunities in education of biomedical engineering specialists. E-learning offers are an important part of university and lifelong learning courses. They allow students to train individually without supervision. Essential for high quality e-learning offers are didactically well prepared e-learning content, opportunities to repeat and learn the new information in a sustainable manner as well as an attractive design and intuitive usability of the e-learning program. High quality scenarios might reduce learning time up to 30 % [1].

Reorganizing and structuring curricula due to Bologna process required concentrating of teaching stuff. This leads together with introducing of school leaving exam already in 12th class (one year earlier) to a situation in which the higher number of students has to be served with more comprehensive knowledge within relatively short time.

There is a long tradition of e-learning at the Institute of Biomedical Engineering on the Technische Universität Dresden since 2001. The first program "Labyrinthos" dealing with medical terminology was developed using authoring tool IDEA 3.24 [2] under Windows NT. It had a simple navigation and interactive exercises with immediate feedback. A few program components were developed later: Medical imaging and visualization tutorial, ventilation mechanics for students of medicine (in co-operation with the Clinic for Anesthesiology and Intensive Care in Dresden University of Technology) and bio-cryotechnology for mechanical engineers (in cooperation with the Faculty of Mechanical Engineering, Leibniz University in Hannover).

Within the current project "Interactive e-learning software in biomedical engineering for blended learning on universities in Saxony as a part of a cooperative internet-based masters program – Blended Learning BMT" we have developed an appropriate framework and e-learning scenario, respecting the various aspects for high quality e-learning offers. In addition to issues on navigation and user profile functions like favorites, learning track or

possibility to create custom notes on individual pages, we have dealt with feedback in exercises and tests to motivate students and to enhance the learning process.

Feedback scenarios can be sorted into the following categories: immediate and delayed feedback, and intrinsic and extrinsic feedback. In intrinsic feedback, user receives information about possible consequences of his answer. For example: What happens to patient, if the therapeutic device was not set appropriately. While using extrinsic feedback, user is only informed whether the answer is correct or not. Selection of an appropriate e-learning scenario plays an important role for motivating students.

E-learning software system TheraGnosos

System design

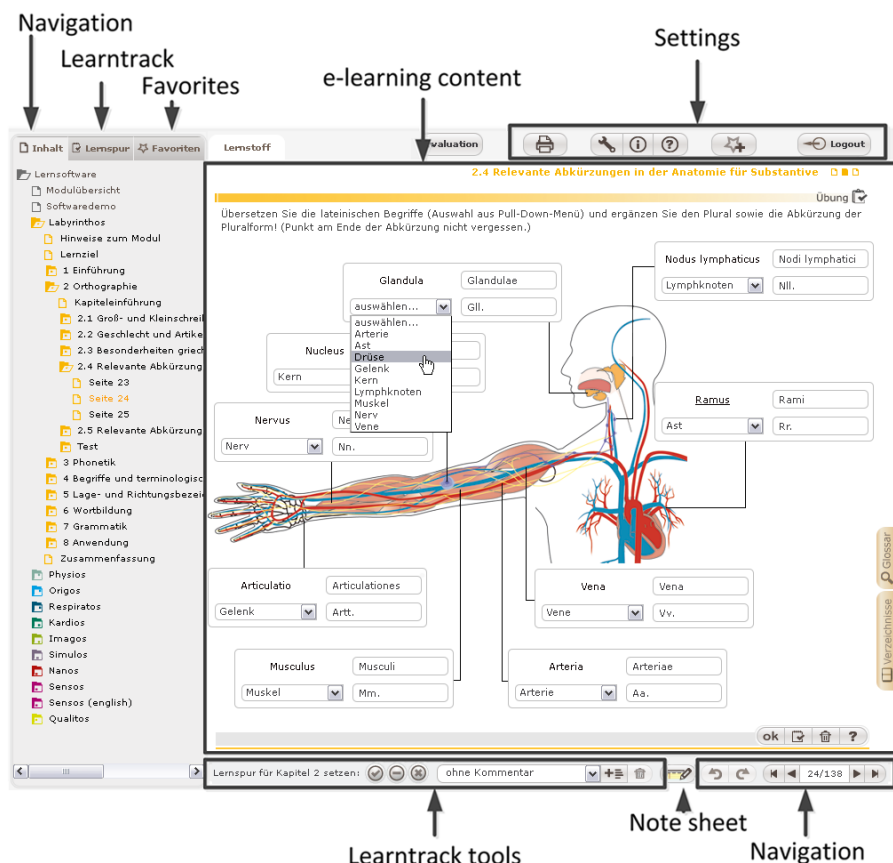
All the functions in an e-learning system have to be usable and accessible. To achieve this, we put the focus on usability from the beginning on. Using the creative technique named 'pen and paper method', the user interface design concept was developed. Especially for ensuring an optimized workflow, this method has proved, because it makes usability-tests possible in an early stage. It allows going through all user scenarios without programming a prototype. Furthermore part of the interactive e-learning software for example exercises are tested with another usability testing technique called 'thinking out loud'. Concluding the whole System is tested by questionnaire, so that perfecting the usability is still in process.

Our e-learning program framework consists of two layers: a basic matter layer of essential information, interactive exercises, tests and animations; and an extended learning layer, that includes text and tables for further reading (Figure 1). In order to support the individual user settings, a saving learning track and the evaluation of the software, we developed our own user management system using PHP and MySQL. Individual user accounts allow detailed user tracking enabling evaluation of e-learning components. Furthermore, the students may use feedback form to communicate their impressions on the e-learning system.

The e-learning framework has been developed using the authoring tool IDEA for an interactive content creation based on HTML/JavaScript [3]. This Integrated Development Environment (IDE) allows building event driven pages with interactive exercises with an automated feedback. The content is structured in XML metadata files and can be exported into the SCORM-compliant format. The IDEA environment has been selected due to extended positive experience and solid individual user support from the IDE provider. It allows producing complex interactive content with rather low initial developer training. In comparison to standard learning management systems [4], our framework developed using IDEA allows higher variety of exercises and their layout. Using the IDE is a trade-off between WYSIWYG editors with only a low range of functions and complex IDEs like Adobe/Macromedia or Click2Learn Toolbook [5, 6]. The development times are comparable with the state of the art [7].

Fig. 1. Design of the e-learning system TheraGnosos (completed exercise with free text and pull-down choice)

With the reference to figure 1, the user interface consists of the main field with e-learning content, which includes mandatory part with learning stuff and optionally a second page with additional information. The navigation zone in the left part enables the user to jump directly on a desired page, check the own learning track and save favourite pages. The glossary, references and lists of symbols and abbreviations can be opened using corresponding tabs in the right edge of the e-learning content field. They appear as a sub-window within the e-learning content field. User might set the status for each chapter, so that she/he can see her/his overall learning progress.

Modules of the e-learning software


Ten modules of the e-learning software TheraGnosos are being developed:

- Biomedical Engineering - Overview (Origos)
- Anatomy and Physiology (Physios)
- Pulmonary diagnostics and mechanical ventilation (Respiratos)
- ECG and pacemaker (Kardios)
- Imaging and Visualization (Imagos)
- Modeling and Simulation (Simulos)
- Cellular transport and Nanotechnology (Nanos)
- Biosensors and biohybrid technology (Sensos)
- Quality assurance (Qualitos).
- The course "Medical Terminology" (Labyrinthos) was implemented as a prototype module.

Previous feedback scenario

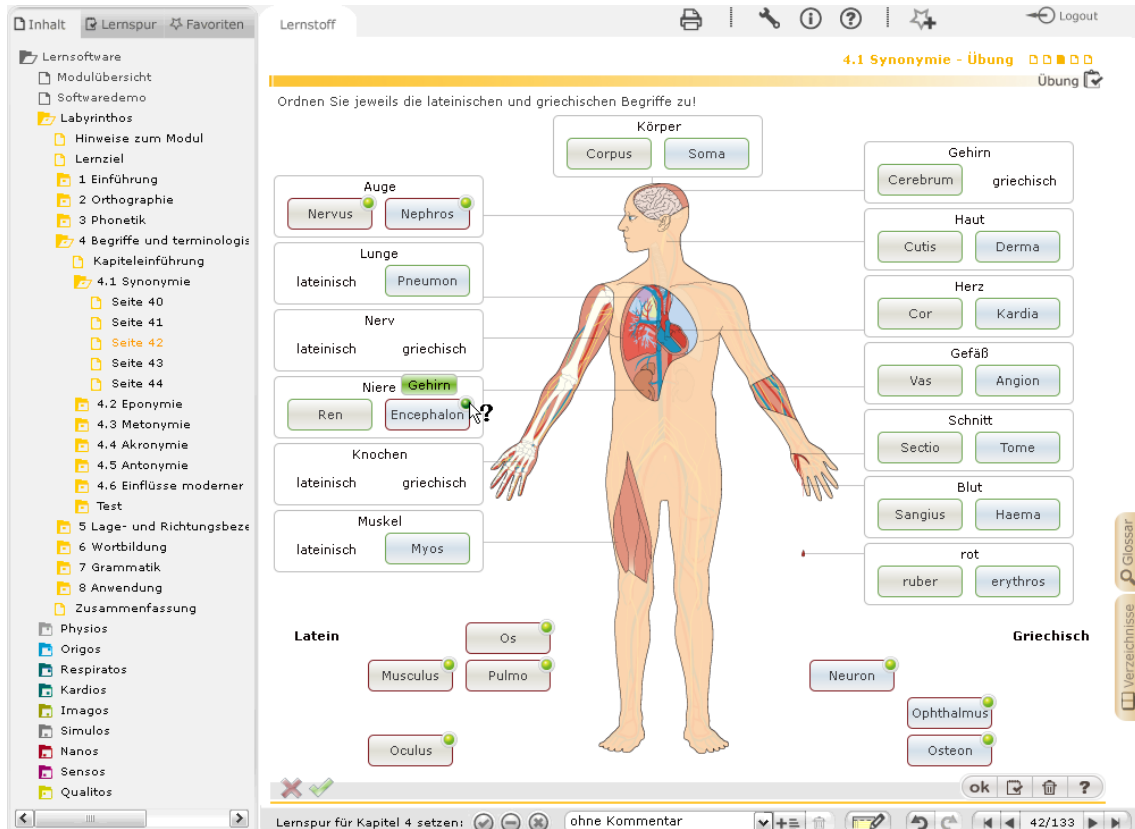
In the first version of Labyrinthos theoretical content and exercises were separated. The most theoretical content was trained only once in exercises, no intentional didactical repetition was provided. If you left the exercise, it was reset. There was an immediate extrinsic feedback implemented, which means each answer in an exercise was evaluated immediately and "right" / "false" indicator was displayed. Referring to figure 2, the student had to drag greek prefixes on their latin equivalents. Immediately after dropping the panel with greek prefix, the panel either disappeared, and correct answer was indicated, or false answer was indicated and the panel flied back to its original position. Student could finish the exercise using trial&error method and was not motivated to think over his/her answers seriously. Thereby, the information of the choice of the right answer will only be stored in the short-term memory. We hypothesise, that the learning effect is quite low in such a case.

Moreover, the student got only the information false or right. While dealing with exercises to fill in single words or to check multiple choice boxes, the student got no hint for the right solution. It was only possible to try

on until getting the right answer feedback. So the student is lost in trying and will soon be demotivated.

Fig. 2. Exercise in previous version with continuous immediate feedback: while putting a box to a false place (mouse pointer) the feedback text "Das ist leider falsch!" (That is unfortunately wrong!) appears at the display.

In the System TheraGnosos, most exercises from the previous version of Labyrinthos were implemented. The exercises are integrated into the theory. The functions of the exercises can be: activate attention, motivate, reactivate existing knowledge, repeat and train new stuff. The new information is directly repeated and trained in multiple exercises in which the learning content is combined in different ways. That will lead to a real learning situation with storing the new information into the medium-term and long-term memory. The main types of exercises include: Multiple-Choice Questions, Single-Choice Questions (Button, Pull-down-Choice), Drag & Drop exercises, Free-Text writing, and the combinations thereof. The new feedback scenario was adopted: Users have to complete the exercise first. After finishing, they press the OK button to evaluate the exercise. The right answers are highlighted with a green border, false answers with a red border and a green point (cheat sheet). Referring to figure 3, the user drags the panels with latine and greek words to corresponding German labels and elements in the picture. After pressing OK button, the user gets the right and false answers. Nevertheless, she/he does not see the correct solution of false answered questions immediately. The user can decide if she/he want to retry another answer or to press the green point (cheat sheet) in order to display the correct solution of particular question only. It is also possible to display the correct solution of the whole exercise or to reset the exercise completely. When leaving the page, the individual working state is saved. This enables the user to search the right answer in the theory or to look later again at her/his results in that exercise. Additionally, writing individual remarks at the note sheets, or adding comments to the learning track can support the learning process. All these aspects together provide a higher level of flexibility in the learning process, so that different learning types are considered.

Fig. 3. New e-learning scenario with delayed extrinsic feedback: a Drag & Drop exercise after pressing button "ok", right


answers: green border, false answers: red border, green point (cheat sheet): click to see the right answer in a full colored green box

Evaluation procedure and results

There were 48 students of specialization biomedical engineering envolved into the evaluation. 20 students in the first group (2011) used the previous version of e-learning software Labyrinthos for exam preparation. The second group used the new system TheraGnosos with the innovated e-learning scenario described in section 2.4. Both groups absolved a 60 minutes written exam. The exam on Medical Terminology included multiple choice questions and open questions. , The students who used the new system achieved better score than the students using the old version of the system. To eliminate possible error caused by selection of more skilled students for the second group and less skilled in the first one, we have compared exam results in one control subject (basics of electrical engineering) for the same students. There was no score improvement in this exam, see table 1.

Table 1. Exam results in Medical Terminology and for comparison in basics of electrical engineering for the same students.

Exam	2011 (N = 20)	2012 (N = 28)
Medical Terminology	2.26±0.90	1.72±0.37
Basics of Electrical Engineering (verification exam)	2.34±0.87	2.61±0.80

Users had to fill in a questionnaire containing 39 questions on usability, functionality, content and their subjective impression of the e-learning system. Summary of evaluation of the pilot module Medical Terminology – Labyrinthos is provided in table 2. The most interesting subjective impression of users was the following: "I do not need to study especially for the exam, if I use this e-learning software for pre-exam training."

Table 2. Evaluation and assessment of the e-learning module Medical Terminology by pilot participants.

Exam	Value	Min .. Max
Average netto learning time	11.5 h	5.5 – 19.5 h
Content comprehensibility	2.2	2 – very good … 4 – bad
Simulations	2.3	2 – very good … 4 – fair
Level of interactive exercises	2.8	2 – too easy … 3 – adequate … 4 – too complicated
Number of interactive exercises	3.1	2 – too high … 3 – adequate … 4 – too low
Level of tests	2.8	2 – too easy … 3 – adequate … 4 – too complicated
Navigation in e-learning Software	2.5	2 – very good … 4 - fair

Discussion and conclusion

The findings of this study provided information how the innovated e-learning scenario influences learning effect of an e-learning system. Higher variability of exercises, repeating the same stuff in different situations, enhanced navigation, user specific functions, as well as the selective delayed extrinsic feedback lead to improving the exam score in the studied course. As there was no score improvement in control exam in another course, we assume, the results were not influenced by selection effect and both group consisted of comparable skilled students.

Even in such a specific field like Biomedical Engineering, it is possible and desirable to use e-learning, especially because of improved learning effect and efficient work of tutoring personal. Further development of presented e-learning scenarios as well as designing intrinsic scenarios is intended. This should be preferred, however, even changing the feedback timing and selectivity might substantially contribute to better learner performance.

The developed scenario has proved its worth. The prototype was tested successfully. Further modules are being implemented according to the designed scenario. Our experience confirms that complementary e-learning offers to face-to-face teaching attract students for independent study and contributes to better understanding of the subject matter.

Abstract

A program should act based on the reality of the society which it is formed for. It is impossible for a program to be successful unless it leads the social changes, make its citizens be social individuals and provide the society with the equality of educational opportunity. Within this study, it was aimed at evaluating secondary education programs in accordance with the thoughts of the teachers about the level of the importance of socialising, social changes and the equality of educational opportunity which are the social bases of the program as well as their views about the realization level of these elements in the current programs. This research covered 175 teachers working in 13 secondary schools. A measurement tool developed by the researchers themselves was used for collecting data. As a result of the findings from the analysis, it was found that teachers regard programs enabling the equality of educational opportunity, social changes and socializing as significant. In the research, it was identified that teachers thought these social bases weren't realized adequately. As a result, it can be said that social bases of programs are very important, however, there are some problems in their applications.

Key words: *Socializing, equality of educational opportunity, social changes, program*

1. Introduction

Programs have social bases as well as their philosophical, psychological and economic bases. A program should act based on the reality of the society which it is formed for. The idea of approaching a program not just considering it as a matter of education but by understanding its place in the society is based on Durkheim (Young, 1999). Durkheim (cited by Doğan, 2010) mentions that education is the effects of physical and social surroundings on humans. Moreover, Durkheim takes education as a social event. According to him, every society conditions education system as a setting. Every education system responds to the needs of the society and it is the expression of the society. In addition, society is the purpose and aim of the education system. Society is one of the causes that identifies the structure of an education system.

According to Young (1999), who has some significant views on the importance of the social bases of a program, program is a way to question how learning and knowledge is related especially with educational aims and the idea of educating people as social. In addition, Olivia (2009) states that in the process of the development of education programs, some necessities of the society such as politic, social, economic, educational, environmental, health and defense should be considered.

On the other hand, Carl draws attention to the bases of programs with the question "What is a program?''. According to him, program was used as a constricted and special tool in order to cover topics and content taught in schools. Later this definition was broadened to include educational aims, teaching methods, procedures and classroom organizations. Although these definitions made program and school experiences be better understood, they made people ignore and hide the significant politic and social role that programs take in cultural, politic social and practical relationships of the society. Last attempts draw attention to ''reconstruction theory'' in order to understand in what ways programs affect existing economic, cultural and politic examples of the society. An

American philosopher Walter Feinberg (1983, s:155;cited by:Carr,1998) underlines this point in his book titled "understanding education" as:

''Talking about education as a social constitution is to realize the continuation of a social identity for generations and the prior role to last the permanence of generations. In this context, education has two functions. The first function is the constitution of the abilities in response to social necessities. The second one is the reconstruction of the understanding and consciousness providing a basis of the social life. At the most basic level, works on education contain analysis of the process. In the course of time, a society reconstructs itself so that it can stay as the generation belonging to the society that is the same as the former and next ones.'' (cited by: Carr, 1998)

As it can be seen above, program is accepted as a ''social event'' and a close relationship is established between the society and the program. We can evaluate program in the context of social bases under three main titles:

- Socializing and program
- Social change and program
- Equality of educational opportunity and program

1.1.Socializing and program

Socializing is the adjustment of an individiual to his society, being integrated or identified with the society. (Celkan,1996). Socializing can be defined as adopting the cultural traits of the society the individual lives in. Passing on cultural values is one of the basic functions of education systems in every society. Every society wants its citizens to acquire the culture it owns through education. In this sense, the duty of education is to provide social integrity and continuity by making new generations get the culture of the society. Materialistic and spiritual cultural elements, values, beliefs and norms of a society can be transfered to new generations by means of programs (Demirel, 2004). Through programs, an individual learns how to establish relationships with other individuals in his own society, how to behave within the society and the expectations of the society from him (Eskicumalı, 2002).

1.2.Social problems- change and program

Social change can be defined as, 'change in social structure, social network constituting it and social institutions that determine these relations (Tezcan, 1994). Social change is the sum of changes that occur in social and cultural structure, social relationships, social institutions and integration, conflict and balance of the society.

The power of programs in social change has been argued for a long time. On the other hand, social bases have become more important nowadays. According to Ornstein and Hunkins (1988), another reason why social bases are so significant in the works of program is that society has never changed in every aspect so fast. Today, society is changing very fast and there are some difficulties in dealing with these changes, adapting these changes to the modern day and preparing them for the future. Unfortunately, in the process of this social change, programs lag behind this change.

Ornstein and Hunkins (2004) mention that some factors such as knowledge explosion, increase in the diversity of philosophical views which are related with the nature of knowledge, some changes in the behaviours of teachers and students, changes in attitudes and values, increase in the demands of some social segments, changes in the nature of workforce, changes in the quality of work life and obsolescence of the products affect changes in educational process tangibly and cause basic elements of education programs not to be determined in an exact and static way.

According to Alvin Toffler (1996), societies that have changed from primitive societies into agriculture, industry and lastly, knowledge society have entered the ''future shock'' process. In this process of change, education systems, relatedly programs take huge responsibilities to make people overcome this shock.

Reymond Williams supports in his impressive book called ''Long Revolution'' that we live in the middle of an era of social change that started in the second half of the 18th century and is still going on at full steam. According to him, we all see a long revolution throughout. This is a real revolution that changes the shape of the institutions, widening and deepening with the acts of millions of people, opposed constantly and distinctly under the effects of accustomed ideas, patterns and a certain reaction (cited by:Carr, 1998). Williams advocates that this long revolution has changed our politic, economic amd cultural life experiences considerably.

Briefly, humanity is in the process of social change. In this process, programs should be the pioneer of social changes. Moreover, how social changes will affect programs should be taken into consideration.

1.3.Equality of educational opportunity

Equality of educational opportunity is to have opportunity of benefitting from education existing in a society in accordance with every person's own attention, demands and abilities. According to this dimension, nobody can be deprived of the right of education. Tezcan (1981) explains the types of equality of opportunity as providing everyone with equal education, entitling every individual to minimum right of education in a certain level, making people have educational opportunity that enables every individual to make the most of his own ability and potential and allocating economic sources to education at maximum level.

Providing equality of educational opportunity is under the responsibility of states, accordingly programs. In modern and democratic socities, education is considered as a basic right, however, equality of opportunity keeps on being one of the most important problems of the whole world.

As a result, in the process of development of education programs, especially while determining aims, dimensions related with social reality (social need, expectation, change, etc) besides philosophical, economic, psychological bases should also be taken into consideration since an education program reflects a society and helps the society to be formed. A program can't be away from society or social structure (Büyükkaragöz, 1998; Demirel, 2004; Ertürk, 1997). Secondary school is the period when individuals start to be involved in social life actively. At this level, programs should provide equality of educational opportunity, make individuals socialize and consider psychological traits of individuals as well as social reality. This research was also done with the aim of evaluation of secondary education programs in the context of social foundations.

2.The Aim of the Research

The aim of this research is to evaluate secondary education programs in the context of social foundations. In accordance with this general aim, it was tried to ascertain teachers' thoughts about the importance and realization level of ''socialism'', ''social change'' and ''equality of educational opportunity'' which are components of social bases affecting programs.

3.Method and Application

3.1.Sampling

The research covered 13 secondary schools that can be defined as upper, lower and mid and 175 teachers working in these schools which are located in the centre of Şehitkamil district of Gaziantep province. Data of the teachers taking place in the sampling can be seen in the table above.

Table 1 Frequency and Percentage Levels Related with Sampling

		f	%
	Women	59	33,7
Gender	Men	116	66,3
	Total	175	100
	1-5 year	14	8,0
Work experience	6-10 year	34	19,4
	11-15 year	71	40,6
	15 and more	56	32,0
	Total	175	100,0

3.2. Data Collecting Tool

A data collecting tool, which was developed by the researchers, has been used to gather data. In that process, an item pool related to the social basis of the program has been formed. Content validity has been meant to be provided by presenting these items to lecturers in educational sciences with the viewpoint of experts. They are also presented to lecturers in Turkish Teaching Department to determine the level of suitability and comprehension in terms of language. After this process, it is determined that 32 items must take place in evaluation scheme. It has been designed as a two-dimensional measurement tool.

Table 2 Sample items of evaluation device

(5) very important	(4) important	(3) Partly important	(2) unimportant	(1) not important at all	Programs should	(5) highly sufficient	(4) sufficient	(3) average	(2) insufficient	(1) not sufficient at all
					provide individuals to adopt the culture of the society					
					develop students in the way of their abilities					
					prepare students for social change					

On the left hand side of the tool, the level of importance of propositions is shown, and on the right hand side of it, the level of actuation of these propositions with existing applications is shown.

After these processes, the measurement tool has been applied to the sample group. Exploratory Factor Analysis (EFA) is applied in order to determine the validity of the data collecting tool. As a result of the analysis, it is found that the value of Kaiser-Meyer-Oklin's test (KMO) is 0,93 and the one of Barlett Sphericity test is 2525,581 ($p<.001$, df=231). It is also specified that the anti-image value of the device ranges from, 846 to, 931.according to these findings, it can be uttered that data is appropriate to the factor analysis.

After it is determined that data is appropriate to the factor analysis, 32 devices are studied to see the number of maximum factors by using straight-line method and it is confirmed that devices concentrate on five (5) factors. However, in the process of developing the measurement tool, the results of rotation factor analysis and principal components technique are limited to three (3) factors as it is intended to reach a three-factor (3) structure. As a result of this process, a three-factor structure, which explains 63,125 % of the total variation, is reached. In the measurement tool, six (6) of the devices are eliminated since two of which have similar load value and four (4) of which are not supported hypothetically to the factors they exist. After these processes, there remains 22 factors total in three factors. The first factor is 'socializing', the second one is 'social change and issues', and the third factor is 'equality in educational chance and opportunities'. There remain 7 devices total in the first factor. In the second one, there remains 8 devices total, and in the third factor, there remains 7 devices total. The load of device factors varies as ,536-,815 for the first factor; ,457-,776 for the second one, and ,665-,801 for the third one. The common item variation of the items in the measurement tool ranges from ,470 to ,742. Correlation of the items is meaningful, and it varies between ,436 and ,644.Pearson product-moment correlation coefficient has been calculated in order to determine the relation among factors in the measurement tool. Data gathered here is presented in Table 3

Table 3 Correlation values among factors

	Socializing	Equ.in edu.	Soc.chang	General

	Opp.	e	
Socializing	1	,668**	,715**	,873**
Equality in educational opportunities and chances	,668**	1	,768**	,899**
Social change and importance	,715**	,768**	1	,928**
General	,873**	,899**	,928**	1

As it can be seen in Table 3, there is a positively and statistically meaningful relation among factors (subscales). The highest correlation is between 'Equality in educational opportunities and chances' and 'Social change'. This finding supports the structure validity and it demonstrates that dimensions in the measurement form a meaningful unity with one another. After the processes above, the reliability co-efficient of the measurement is calculated.

Table 4 The reliability co-efficient of the measurement

Dimensions	Internal Consistency (Cronbach Alpha)	Splitting the test half (Split Half)
Socializing	,86	,77
Social change	,90	,84
Equality in educational opportunities and chances	,91	,84
General	,87	,83

The findings in the table demonstrate the measurement tool is sufficiently reliable. According to the findings above, it can be uttered that the measurement tool is sufficiently valid and reliable.

3.3. Data Analysis

Data gathered via the measurement tool has been analyzed in the program SPSS 17.00. Means and standard deviations of each item in the subscales have been calculated. For interpretation of the arithmetic mean, interpretations below have been used.

Table 5 Values used for the interpretation of means

Score interval	Graduation (level of importance) →	Interpretation ←	Graduation - (actuation)

1.00 - 1.80	Not important at all	Very low	Not sufficient at all
1.81 - 2.60	Unimportant	Low	Insufficient
2.61 - 3.40	Partly important	Average	Partly sufficient
3.41 - 4.20	Important	High	Sufficient
4.21 - 5.00	Very important	Very high	Very sufficient

4. Findings

In the research, it is firstly searched for the viewpoints of teachers about the importance of socializing, which is one of the social basis of programs, and the level of actuation of this dimension in existing programs. The findings gathered here is below.

Table 6 the importance of socializing and values related to the levels of its actuation

Items	Importance			Actuation		
	m	S.D.	Interpretation	m	S.D.	Interpretation
-providing the individual to adopt the culture of the society.	4,47	,741	V. important	2,98	,887	Partly
-being based on the realities of the society	4,39	,726	V. important	2,72	,868	Partly
-enabling the values of the society (patriotism, etc) for individuals.	4,48	,822	V. important	2,88	,929	Partly
-making an effort to educate students as individuals adapted to their environment.	4,50	,685	V. important	2,68	,851	Partly
-aiming the student development on social and cultural issues with students' own traditions.	4,33	,747	V. important	2,76	,882	Partly
-giving students the chance of having good relationships with themselves and their environment	4,42	,775	V. important	2,65	,849	Partly
-considering our history as a functional tool to plan the future.	4,25	,869	V. important	2,79	,942	Partly
General	4,41	,574	V. important	2,78	,620	Partly

   When the findings in Table 6 are analyzed, it is seen that teachers think it is *very important* for a program to enable students to adopt the culture of the society, to be based on the realities of it, to enable the values of the society for individuals, to aim the social development with students' own traditions, and to make an effort to educate students as individuals adapted to their environment. In the same table, it is seen that teachers think necessities related to the actuation of the programs in terms of socializing are *partly-average leve*l in existing programs.As a result, it is seen that actuation does not occur in existing applications and programs do not manage to provide socialization although they are considered to be very important in terms of providing socialization.

   In the research, it is also searched for teachers' viewpoints related to actuation and social change, which is in the basis of programs. The findings are presented in Table 7.

Table 7 Values of the importance of social change and level of actuation

	Importance			Actuation		
	m	SD	Interpretation	m	SD	Interpretation
-preparing students for social change	4,34	,814	V.Important	2,69	,887	Partly
-meeting the demands of changing conditions and necessities of social life	4,42	,722	V.Important	2,65	,958	Partly
-including the issues the society cares about	4,22	,738	V. Important	2,61	,882	Partly
-educating the individuals the society needs	4,42	,790	V. Important	2,56	,893	Insufficient
-pioneering the social novelty	4,38	,770	V. Important	2,56	,979	Insufficient
-meeting the demands of the society	4,35	,809	V. Important	2,56	,887	Insufficient
-paying attention to social issues	4,43	,715	V. Important	2,49	,981	Insufficient
-preparing students for the complex problems in life	4,32	,772	V. Important	2,48	,889	Insufficient
General	4,36	,601	V. Important	2,58	,73	Insufficient

In Table 7, it is seen that teachers consider programs as very important in terms of paying attention to social issues, meeting the demands of changing conditions and necessities of social life, pioneering the social novelty, meeting the demands of the society, preparing students for social change, including the issues of the society. However, it is seen that existing programs provides social change poorly when findings are analyzed related to the provision of social change despite its value.

As a result, it can be uttered that teachers consider programs as very important, but they think social change is insufficient in existing conditions.

Finally, in the research, it is searched how important the equality in educational opportunities and chances is and how much it actualize in the existing conditions. The findings gathered are displayed in Table 8.

Table 8 Values related to the importance of equality in educational opportunities and chances and the level of actuation

Items	Importance			Actuation		
	m	SD	Interpretation	m	SD	Interpretation
-paying attention to the problems of disabled and blue ribbon students	4,48	,709	V.Important	2,41	,978	Insufficient
-contribution to the reduction of social and economic inequality	4,37	,873	V.Important	2,52	1,03	Insufficient
-foreseeing the equality in educational opportunities and chances	4,49	,757	V.Important	2,56	1,00	Insufficient
-preparing teaching opportunities for everyone under equal conditions	4,50	,733	V.Important	2,57	,990	Insufficient
-unauthorization to religious, ethnic and political differences	4,62	,673	V.Important	2,71	1,04	Partly
-considering the individual privacy, which is accepted as the bill of rights	4,54	,700	V.Important	2,73	,966	Partly
-improving students in the way of their abilities	4,61	,659	V.Important	2,38	1,00	Insufficient
General	4,51	,596	V.Important	2,55	,780	Insufficient

In the table, when the findings about the importance of programs in terms of equality in educational opportunities and chances are studied, it is specified that teachers give importance to the program's paying attention to the problems of disabled and blue ribbon students, contribution to the reduction of social and economic inequality, preparing teaching opportunities for everyone under equal conditions, unauthorization of discrimination, considering the individual privacy, and improving students in the way of their abilities. In this factor, like other factors, the equality in educational opportunities and chances is important. Yet, it is insufficient in existing applications.

For teachers, the level of importance and actuation of socializing, social change, and equality in educational opportunities and chances, which are the social basis of the program, can be observed in the bar chart below.

Graph 1 the importance of the social basis of the program and its levels of actuation

As it can be seen from the graph, teachers consider programs as very important for socializing, social change and equality in educational opportunities and chances; however, these bases are not sufficiently achieved in existing applications.

5. Discussion

This study is carried out in order to evaluate the secondary education programs in terms of social basis. In this study, it is aimed to determine how important it is for programs to provide socialization, social change, and equality in educational opportunities and chances, and in which levels it actualizes in existing conditions.

It is seen that, although teachers working in secondary education think that it is very important for programs to actualize socializing, they think that it is partly actualized with existing applications. When the problems in Turkish secondary education institutions are considered, the importance of the issue is understood better.

It is stated by some pedagogues that problems arise since the educational system and the cultural structure of the society do not match. As a result of this, according to Yahya Kemal Kaya, , the educated, whose origins are in society, try to blame it by judging 'This society will never get better', which is the fault of alienation from the society. The community is narrow-minded for them. It is possible to see this clash between the intellectuals and the community in the famous novel called "Yaban" by Yakup Kadri Karaosmanoğlu. Likewise, in his study called "Kültür değişmeleri", Mümtaz Turhan empirically depicts a secondary school teacher who collaborates with the values of the society and how successful s/he becomes and the one who does not and how unsuccessful s/he becomes.

In addition to this, Ziya Gökalp is a good example related to the topic with his observation he made many years ago. According to him, 'There is a specific situation for Turkey, which makes it different from other countries. In other countries, the people of good character and ethics are the ones who have studied further. However, in Turkey, the ones who harm the nation are the ones who have studied further. From this statement, it can be concluded that schools in Turkey corrupt the people whom they educate.'

As it is understood from this example, the inability of education to provide socialization causes many problems. One way to overcome these problems is that cultural technicians should analyze the culture and include some options from the central culture in the program.

In the existing system, it cannot be uttered that high schools are good at that as they digress their main mission, which is to enable academic information, and they are in the pursuit of being successful in university entrance exams. Besides, it is doubtful whether vocational high schools fully accomplish their goals. It is true that all the high schools, regardless of which, are not able to fulfill their duties in terms of making the students sociable.

One of the most important functions of programs is to pioneer the social change. Another conclusion from the study is that teachers point out it is insufficient in practice although they think it is important for programs to

pioneer the social change. In Turkish society, knowing the problems detected can make it possible and necessary to raise manpower, which can solve them. For instance, the existing conditions, and their reasons for problems in Turkey such as migration, diseases, strikes, lockouts, divorce, vendetta, terrorism,etc, and the results of these ones should be analyzed and a solution to them should be found and applied. It is the man to carry out these studies, to find a way of solution and suggest them and apply them. Thus, the system of education is supposed to raise these people in quantity and quality. Therefore, the system of education should determine targets related to the solution of its problems, content, education and evaluation. If it does not do it, it can cause the social system to destruct as well as itself.

In the study, programs have also been evaluated in terms of equality in educational opportunities and chances. Concerning this dimension, it is concluded that teachers think it is very important for programs to provide equality in educational opportunities and chances, but it is insufficient in application.

6. Conclusion and Proposals

As a result of this study, it is understood that programs are very important in terms of i) providing socialization, ii) pioneering the social change and iii) providing equality in educational opportunities and chances. It is fundamental for sharers affected directly or indirectly in preparation of programs to give importance to this issue. Every system has to collaborate with the realities of the society for which it is designed. Otherwise, the system, which is not based on that reality or collaborate with it, will probably have to perish. In short, ignoring the living conditions of the society, and socio-economic situation, and social dynamics largely affects the actuation of programs.

In this study, the importance of social basis of programs and levels of their actuation has been analyzed. Yet, factors affecting the actuation have not been studied. In other studies related to this one, it can be studied what factors affect the actuation of the social basis. That study can be carried out in a larger scale.

Abstract

This examination aimed to examine relationships between happiness and psychological need satisfaction and investigated whether psychological need satisfaction significantly predicts happiness. Participants were 192 Sakarya University students, between 17-45 age ranges (54.7% female, 44.3% male). Needs Satisfaction Scale and Oxford Happiness Questionnaire were used as measurement instruments. Multiple regression analysis indicated that happiness is significantly predicted by psychological need satisfaction among university students. Need for competence is the best predictor of happiness and need for autonomy and need for relatedness follow it, respectively. Findings show that predictor variables account for 54% of total variance of happiness. Happiness and psychological need satisfaction and its sub-dimensions. autonomy, competence and relatedness, are also significantly associated in a positive way (p<.01). Finally, psychological need satisfaction and happiness do not significantly differ in terms of gender. Consequently, these results suggest that increments of basic psychological need satisfactions for autonomy, competence and relatedness of university students contribute to happiness levels.

Keywords: Happiness; psychological need satisfaction

1. Introduction

A human being has physiological, sociological and psychological needs, and evolves as satisfying these needs. Throughout the historical process, human needs have always protected their current value and importance in the basic concepts of psychology. After the initial discussion about human needs, which started with McDougall in 1908 and continued with Freud, Murray and Hull, Maslow made the 'concept of need' popular and functional in the area of psychology (Özer, 2009; Türkdoğan, 2010; İlhan, 2009). Maslow's hierarchy of needs model in the 1970s and 1980s, however, has been found insufficient to verify the significant estimates in research about needs, and the model has started to lose popularity since that period. In recent years, both because the theory of Maslow left some situations unexplained, and because research about positive psychology has been gaining weight, new and different approaches to the needs model have been focused (Sheldon & Bettencourt, 2002). One of these, developed by Deci and Ryan (1985a, 2000), is the theory of basic needs. This falls within the theory of self-determination, and is known in widespread use as psychological need satisfaction. This research is also based on the theory of psychological needs, self-determination.

According to the theory of self-determination, there are three basic psychological needs, known as autonomy, competence and relatedness. The need for autonomy requires the individual to act in respect to their own feelings and choices, and behave like the initiator of their own actions (Gagne & Deci, 2005; Deci & Ryan, 1985a, 1985b; Deci & Ryan, 2000). In this context, the individual has the choice of their behavior and responsibility and stands behind their own behavior.. The need for competence requires the effort to succeed toward to changing

tasks and the ability to attain the desired outcomes despite challenges. This need also includes the desire to influence the environment, and while individuals with this desire try to influence the environment and cope with environmental conditions, they want to feel competent at the same time (Baard, Deci & Ryan, 2004; Deci & Ryan, 1985a). Finally, the need for relatedness is defined as an individual's desire to be related to other people and the social environment. Need for relatedness also reflects a sense of belonging to the environment, and establishing close and meaningful relationships (Deci & Ryan, 2000; Baumeister & Leary, 1995; Kowal & Fortier, 1999; Reis, Sheldon, Gable, Roscoe & Ryan, 2000).

According to the theory of self-determination, the three needs of autonomy, competence, and relatedness, as well as guiding the human behavior, have an important role in protecting or enhancing mental health. In recent years, many studies have noted that psychological needs have a significant role in life satisfaction or level of happiness (Sheldon & Bettencourt, 2002; Vansteenkiste, Ryan & Deci, 2008), since these unsatisfied needs bring with them psychological dissatisfaction which causes physical and psychological distress (Ryan, Sheldon, Kasser & Deci, 1996; Morsünbül, 2012). On the other hand, satisfying these needs allows individuals to choose their own behaviors, to be functional by taking their own responsibility, to be active in reaching the predetermined goals, and to have a sense of belonging by reinforcing social relations, which eventually increases the individual's level of well-being and happiness (Deci & Ryan, 2008).

Research on happiness carried out by Diener (1984), defined as frequent positive feelings, infrequent negative feelings and high life satisfaction, demonstrated that happy individuals are more successful at interpersonal relationships, as well as feeling good and experiencing positive feelings (Diener & Seligman, 2002). In this manner, determination of how and on what level satisfaction of psychological needs influences happiness will contribute to studies aiming to promote happiness, and to protect and enhance psychological health. Although there are several studies about the relationship between psychological needs and happiness in the USA and other countries (e.g., Ryan & Deci 2000, 2001; Reis et al., 2000; Sheldon & Elliot, 1999; Sheldon, Ryan & Reis, 1996; Ryan, 2009) these studies are limited in Turkey. Determining the level of happiness affected by satisfaction of psychological needs in Turkish culture will make a useful contribution to the existing literature. The study will also contribute to cultural and cross-cultural comparisons.

2. Method

This study was performed using relational screening models. The aim was to examine the relationship between happiness and satisfaction of psychological needs, and to ascertain at which level satisfaction of psychological needs predicts happiness. For the purpose of the study, happiness was treated as a predicted variable, and satisfaction of psychological needs was treated as a predictor variable.

2.1. Participants

Participants of the study are 192 university students continuing their education in academic year 2011-2012. When classified by gender, 105 of participants are female (54.7%), 85 of them are male (44.3%), and 2 subjects withheld their genders. Participants of the study are in the 17-45 age range, with the mean of 20.55 and standard deviation of 2.57.

2.2. Measures

2.2.1. Needs Satisfaction Scale (NSS)

Needs Satisfaction Scale (NSS) was developed by Deci and Ryan (1991) and adapted to Turkish by Bacanlı and Cihangir-Çankaya (2003). This Likert-type scale has 21 items and three sub-dimensions: autonomy,

competence and relatedness. As a result of the psychometric evaluations at the time of Turkish adaptation of the scale, it was reported that the internal consistency coefficient is .71 for autonomy, .60 for competence and .74 for relatedness, and .83 for the whole scale. Validity of the three factor-structure of the scale was investigated by the "confirmatory factor analysis" method. After the analysis, consistency indexes of the derived model were reported as RMSEA: 0.07, GFI: 0.86, AGFI: 0.82, CFI: 0.82, NNFI: 0.80 and the three factor-structure was confirmed as in the original of the scale.

2.2.2. Oxford Happiness Questionnaire (OHQ)

This scale, which was developed to measure happiness by Hills and Argyle (2002), was adapted to Turkish by Doğan and Sapmaz (2012). Results from confirmatory factor analysis also show that one factor-structure of scale stays the same in Turkish university students sample as in the original. Criterion-related validity analysis indicates significant relationships between OHQ and other measurement instruments evaluating happiness and optimism. In reliability analysis, Cronbach Alpha coefficient for internal consistency of OHQ was found to be .91, and reliability coefficient assessed using split-half reliability was found to be .86. Composite reliability of scale was determined as .91.

2.3. Analysis

For the purpose of the study, to examine the relationships between happiness and satisfaction of psychological needs, Pearson Product-Moment Correlation Analysis was used. Multiple Regression Analysis was used in order to determine the prediction level of satisfaction of psychological needs to happiness. The study also includes the descriptive statistics such as mean and standard deviations. Statistical significance level in this study was p<.05 and data was analyzed using Statistical Package for the Social Sciences (SPSS) 15.0.

3. Results

In the results section, descriptive statistics of dependent (happiness) and independent (satisfaction of psychological needs) variables are first demonstrated. After that, correlational values between variables, and finally multiple regression analysis results are presented.

Table 1. Descriptive statistics of dependent and independent variables

Variables	Min	Max	X	Ss
Happiness	46.00	165.00	121.22	20.03
Need for Autonomy	12.00	35.00	26.01	4.79
Need for Competence	13.00	30.00	20.84	3.62
Need for Relatedness	20.00	40.00	31.00	4.30
Psychological Need Satisfaction (Total)	50.85	101.00	77.87	10.32

n=192

Table 1 shows the means and standard deviations of happiness and psychological need satisfaction sub-dimensions which are need for autonomy, need for competence and need for relatedness. Mean of happiness scores, measured by Oxford Happiness Questionnaire (OHQ), was found as =121.22 (Ss=20.03). When scores from the Need Satisfaction Scale were examined, it was found that need for autonomy mean score is =26.01 (Ss=4.79), need for competence mean score is =20.84 (Ss=3.62), need for relatedness mean score is =31.01 (Ss=4.30). Total mean scores of psychological need satisfaction is =77.87 (Ss=10.32). It can also be seen in Table 1 that the lowest score taken from OHQ is 46, the highest score is 165. For the psychological need satisfaction, the highest scores of the need for autonomy, competence and relatedness are 35, 30 and 40; on the contrary the lowest scores are 12, 13 and 20, respectively. When total mean scores from the Need Satisfaction Scale were examined, it was found that the lowest score was 50.85 and the highest score was 101.00.

Whether psychological need satisfaction and happiness differs in terms of gender or not was also examined. According to the results, there is no significant difference, in terms of gender, between the need for autonomy ($t_{(188)}=1.031$, p=.304), the need for competence ($t_{(188)}=.325$, p=.745), the need for relatedness ($t_{(188)}=.167$, p=.868) and total psychological need satisfaction ($t_{(188)}=.660$, p=.510). Similarly, there is not a significant difference between happiness ($t_{(188)}=-.026$, p=.980) scores in terms of gender.

Table 2. Correlation coefficients of happiness and psychological need satisfaction

	1	2	3	4	5
1. Happiness	1	.61**	.60**	.57**	.73**
2. Need for Autonomy		1	.50**	.54**	.87**
3. Need for Competence			1	.39**	.75**
4. Need for Relatedness				1	.81**
5.Psychological Need Satisfaction (Total)					1

**p< .01, n=192

It was found that there are positive significant relationships (p<.01) between happiness and psychological need satisfaction and its sub-dimensions which are the need for autonomy, the need for competence, and the need for relatedness (see Table 2). Similarly, there is a positive significant relationship (p<.01) between total scores of psychological need satisfaction and its sub-dimensions; autonomy, competence, relatedness. There are also positive significant relationships between each sub-dimension of psychological need satisfaction (autonomy-competence, autonomy-relatedness, relatedness-competence). Correlation coefficients of research variables are presented in detail (see Table 2).

Table 3. Multiple regression analysis of happiness prediction

	B	SEB	Beta	t	p
Need for Autonomy	1.21	.26	.29	4.58	.000*
Need for Competence	1.91	.32	.35	5.97	.000*
Need for Relatedness	1.28	.28	.28	4.60	.000*

R=0.74, R^2=0.54, F=73.64, p<.01

*p< .01

Findings of Multiple Regression Analysis, conducted to assess how psychological need satisfaction sub-dimensions autonomy, competence, and relatedness predict happiness; can be seen in Table 3. According to the findings, psychological need satisfaction sub-dimensions significantly predict happiness of university students (R=0.79, R^2=0.54, F=73.64, p<.01). When the relationships between predictor variables (need for autonomy, competence, relatedness) and predicted variable happiness are examined one by one, it was found that the need for competence most significantly and positively predicts happiness (β = .35; p<.01). Following the need for competence, the need for autonomy (β = .29; p<.01) and the need for relatedness (β = .28; p<.01) predict happiness significantly and in a positive way, respectively. According the analysis results, all predictor variables account for 54% of the total variance of happiness.

4. Discussion and Conclusion

In the present study, the aim was to examine the relationships between psychological needs and happiness. Findings showed that there are significant and positive relationships between psychological needs and happiness. According to the theory of self-determination, it was concluded that three psychological needs, autonomy, competence and relatedness, significantly and positively predict happiness.

Findings of the study show congruence with literature on psychological needs and happiness. For instance, Sheldon and Niemiec (2006) found that satisfaction of each of the needs for autonomy, competence and relatedness significantly predicts subjective well-being and happiness (Sheldon and Niemiec, 2006). Another study by Reis et al. (2000), showed that level of perceived satisfaction of the psychological needs within the theory of self-determination significantly predicts the perceived subjective well-being during the day. Cihangir-Çankaya (2009) demonstrated, in their study with Turkish university students, that an individual's perceived autonomy support from their family and friends influences satisfaction of basic psychological needs; and satisfaction of basic psychological needs also positively influences subjective well-being (Cihangir-Çankaya, 2009). The findings of these research studies support the results of this present study. It was concluded that each of the needs for autonomy, competence and relatedness significantly predicts happiness in Turkish culture. According to the results of this study conducted with Turkish university students, on the other hand, it is interesting that the need for competence is the most significant predictor of happiness, and the need for autonomy and relatedness follow it, respectively. This is the reason why many studies (e.g. Ryan, Deci, Grolnick

& LaGuardia, 2006; Gagne, Ryan & Bargmann 2003; Morsünbül, 2012) within the theory of self-determination emphasize the need for autonomy. Other studies also underline the importance of balance in satisfaction of psychological needs. For instance, in a study by Sheldon and Niemiec (2006), balance of need satisfaction, which means the satisfaction of the needs for autonomy, competence and relatedness in the same average levels, significantly predicts the subjective well-being and happiness as a fourth variable (Sheldon & Niemiec, 2006). In this study, it can be also said that balance of need satisfaction has an important mediating role on the level of happiness, when the prediction levels of each need are examined. Results of another study, conducted by İlhan and Özbay (2010) to examine which level life goals and need satisfaction predict subjective well-being in Turkish culture, supports this idea. Findings of the study by İlhan and Özbay (2010) indicate that psychological need satisfaction is the most predictive variable of subjective well-being. In other words, as the satisfaction level of university students for basic psychological needs such as autonomy, competence and relatedness increases, subjective well-being levels also increase.

It is important to support the findings of this study with other studies conducted by similar and different subject groups, especially in Turkish culture. Furthermore, based on the findings, individual or group counseling programs aiming to increase happiness and include psychological needs one by one or together could be designed, and efficiency studies may have utility in literature. Similar studies with different age, education and socio-cultural sample groups and comparisons between these studies could also be carried out. Although satisfaction of psychological needs indicates happiness, subjective well-being and life satisfaction in many cultures, distinctive and changing influences of individual and cultural factors should always be taken into consideration (Deci & Ryan, 2008).

EXPERIENCING CULTURE IN A NURSERY SCHOOL. AN EMPIRICAL STUDY

Beata Adrjan[18]

University of Warmia and Mazury

Faculty of Social Science

Early Education Department

Olsztyn, Poland

Abstract

Culture carries a broad range of meanings. In this article, culture is shown as an inherent component of education. In other words, the article deals with cultural entanglements of education. Cultural experiences of preschool children are discussed to illustrate the subject. The observations described by the author show the culture of indifference, fear, violence and exclusion. The conclusions make us reflect on what kind of world we offer to the youngest people, a world composed of childhood experiences in an educational institution, and to ask ourselves how these cultural experiences will affect the future of young people.

Keywords: school and preschool culture, socialization experiences, cultural experience, cultural entanglements of education

Introduction

It would be naive to claim that a school, a pre-school or any other educational institution is just to teach and educate. In all institutions, people interact with one another and consequently modify their personalities. Thus, what matters in every school is not only teaching and education, but also social reproduction, selection and normalization of behaviour patterns (Tillmann, 2006). Increasingly more often, the pedagogical literature raises the question of culture. School cultural contexts are discussed, for example, with respect to language (Bernstein, 1990),violence (Bourdieu, 2006), power (Foucault, 2009), knowledge (Klus-Stańska, 2000) and other areas. All these discussions show how culture in education shapes people. The present article tries to describe the culture that children experience in a pre-school.

The cultural context of education.

In my presentation, I use the term 'cultural entanglements of education' in order to show the whole network of meanings and associations permanently involved in education. I do not claim to provide here a complete and exhaustive presentation of these relations, but I would like to shed some light on several of the approaches described by some researchers.

The oldest understanding of the relation of culture to the society was given by functionalists. It is both the most classical and the most traditional approach. With respect to school, culture is understood as a superior value. School is to prepare students to participate in culture (Durkheim, 2000), but it also assigns notions and a whole network of meanings that students will use in the future as a tool for understanding the world. Dorota Klus-Stańska calls it a monologue of one version of culture: under one and the only valid convention, school teaches children by superimposing on them certain meanings (Klus-Stańska 2000). Zygmunt Bauman suggests

[18] E-mail: beata.adrjan@gmail.com

that functionalism sees culture as a concept made to fit the idea of 'the manufacture of order'. In this sense, culture reflects a system where everything has a role to play (Bauman, 2000). In functionalism, culture is superior to education, and education is to transmit and preserve culture in the shape in which it exists in the society. School is therefore an institution which preserves, maintains and ensures the stability of culture (cf. Illich 1976).

Certain criticism of functionalism has generated an alternative understanding of culture and its relationship with education. Post-functionalist approaches have been critical towards the relation between culture and education. An example of such a critical attitude is the theory of cultural reproduction developed by Pierre Bourdieu. In this concept, school is an institution where culture is reproduced, and where it is decided how the school culture should be imposed and implemented (Bourdieu, 2006). Such imposition of uniform culture was referred to by Pierre Bourdieu as 'symbolic violence'. The power exercised by school primarily consists in the imposition of notions which function as the only valid ones (Bourdieu, 2006).

Bourdieu's concept is in line with the idea of understanding culture through the language, a concept authored by Bernstein (1990). In this theory, the language is a basic tool for transmission of culture, which helps us to encode the reality. The language is, or actually becomes through educational practice, an instrument applied to control individuals, who are socialized in such a way as to internalize the institutionalized social order (Bielecka-Prus, 2010). The categories which we produce owing to codes impose an order over the world and are passed on to the next generations (transmission). Codes are a medium of culture transmission, which establish the interpretation and creation of linguistic acts in a socially determined communication context (Bielecka-Prus, 2010). "Where a child is sensitive to an elaborated code, the school experience for such a child is one of symbolic and social development; for the child limited to a **restricted code** the school experience is one of **symbolic and social change**" (Bernstein, 1980).

A completely different entanglement is presented by Bruner, who perceives education as an intimate relationship embedded in culture, which establishes the school educational context (Brzezińska, introduction to Bruner 2010). Bruner understands culture in categories of exchange: "Life in culture is, then, an interplay between the versions of the world that people form under its institutional sway and the versions of it that are products of their individual histories" (Bruner, 2010). Bruner notices the existing cultural methods of interpreting natural and social worlds. However, he perceives education as a chance to alter interpretations because - as he claims - "in the contemporary world change is the norm" (Bruner, 2010).

In another approach to school culture, different from the above ones, culture is searched for as a product of a specific educational institution. Thus, rather than speaking about the school culture, one has to discuss cultures of schools (cf. Bauman, 1966). The culture of an educational institution becomes its property, i.e. "properties, a way of life or characteristics of different sets of individuals", as cultures can be understood in post-modernist times (Burszta 1998). Thus, organizational culture (cf. Konecki, 1985) is the personality of an institution or a company, seen as an immanent property generated by school. By principle, research and work on organizational culture can be performed in line with one of the three approaches to culture: as a set of notions, a set of abstract constructs or a variable that explains what happens in an organization or company. The theory of management assumes that organizational culture is the key to quality. Organizational culture, being a community of thoughts, feelings and actions, creates a perfect form of an organization and ensures high quality of a final product (Hofsteede, Hofsteede, 2007).

Socialization experiences as experiencing culture in education

Considerations on cultural entanglements in education could be multiplied by referring to other numerous approaches and interpretations. For the purpose of this article, having discussed the main directions in the understanding of the education and culture relationship, I must limit such a broad scope of ideas to a certain class of understanding. In order to 'see' culture in education and to show exemplifications of culture, I have chosen

the category of experiencing culture in an educational institution such as a nursery school. This method of studying culture corresponds to Edgar Schein's concept of organizational culture or to ethnographic studies, where people's actions are observed in order to draw conclusions on culture (Eller, 2010). Nursery school teachers' actions will represent a class of people's behaviour in my presentation. Experiencing these actions by children will be a socializing activity, which will evidence the culture of the preschool. I refer the cultural experience to the socialization process, which is generally understood as (...) an intentional and unintentional impact of the environment on a child (Nowicka, 2010). I see socialization as a process and culture as a tool (socialization through culture) as well as a product (socialization for culture). Culture, as worded by Nowicka, is always the context for socialization behaviour (Nowicka, 2010), whereas enculturation or socialization is a process of learning culture (Eller, 2010).

Experiencing indifference.

In the observed nursery school, the children frequently experienced indifference on behalf of adults. The research often captured such actions of the teachers that demonstrated lack of response to the children's behaviour. The teachers either failed to notice or chose to ignore what the children were doing. These could be harmless activities considering the children's safety or attainment of the nursery school's goals. But they can also be dangerous or harmful actions, or example when the children were aggressive, that is they were physically or verbally abusive. Some of the observed situations happened when the teacher was busy doing other things, most often making phone calls, talking to a colleague, preparing materials for school activities or talking to a parent.

Experiencing fear

In the analyzed preschool, it was not a sporadic observation to see a teacher threatening a child. An example is the situation which occurred while the children were sitting in a circle and having a talk. The teacher asked one of the children (Maciej) to stop talking. Maciej was unresponsive to the teacher's request. A boy sitting next to Maciej could not bear the teacher's helplessness so he stopped Maciej's mouth with his hand. At that point, Maciej bit the boy's hand. The teacher said that what Maciej had done was unacceptable and that right after breakfast she would take him to a dentist to have all his teeth taken out. Whatever else could the omnipotent teacher do? She drew an image of a dentist as someone who causes pain and suffering, and she showed her power to the child using such means of terror as the threat that he would lose all his teeth. The child, for whom what matters is only now and here, and who lacks distance to time and adults, is certain that the teacher's threat is realistic, just like other things she has done to other children before.

Another observed situation was even more dangerous because it proved that such practices had taken place in that nursery school before. When one of the girls keeps waving her arms, the teachers tells her: *Shall I bind your arms? You know I can do it*. In what she says, the teacher refers to the previous experiences, either with this child or other ones, who may have had their arms tied up.

On several occasions, it was observed that the teacher told some of the boys that they would not go on a trip to a castle because they had been pushing other children, or that they would not receive presents from Santa Claus because of their misbehavior, but the teacher would get them (after all, adults also receive presents). The teacher uses her power and forces the children to behave as desired under the threat of punishment. The punishment here is not being allowed to take part in a school ballroom party or to play with new, attractive toys. The teacher threatens the children and makes them behave as she wants.

Experiencing violence

Shouting seems to be very common in the preschool; it happens every day. Most often, the teacher shouts at children to keep them quiet. On other occasions, she shouts and humiliates them, using derogative names and

especially comparing children to younger age categories (toddlers). The worst insult is to be called 'an infant'. Depreciating younger persons is a cultural pattern that appears to be nurtured in nursery schools.

In another observed situation, the teacher even hit a girl for taking her time while changing clothes before going to sleep. The teacher quickly noticed that she was being watched and afterwards excused herself to the observer saying: *I have told her three times to hurry up*.

On many occasions, the teachers in the analyzed nursery school encouraged the children to use physical force. The teachers repeatedly said: *You should have hit him back. If he got spanked by other kids a few times, he might behave better.* Thus, violence becomes a valid way of dealing with difficult situations, and it is not just violence demonstrated by adults. It is also encouraging children to resort to violence.

Experiencing isolation

The teachers observed in the nursery school often separated a group of children from other kids. Most often it was punishment for not listening to the teacher or for breaching the rules which governed the preschool culture. A child or children are most often isolated by being excluded from the activities that the other children are engaged in. While the others are having a good time, the children who are punished must sit next to a wall unit, at a table or on a carpet behind the teacher. Another practice, similar in its sense, is the exclusion of a child from an activity by taking away an item that is necessary to participate in a game (e.g. building blocks, a sack, etc.).

The most controversial way of isolating a child during preschool games was observed when the teacher decided that Szymon had breached the rules so badly that he had to be punished by being moved to another group, obviously a younger one, because in the preschool culture such transfer was humiliating. The child felt deeply hurt; when he came back to the classroom, the teacher commented on the situation by saying: *I have run out of patience with you. Next time you will go and have a midday nap with the youngest group of toddlers*. When the teacher had left the classroom, the boy began screaming and kicking a wastepaper basket. His reaction showed the tragedy of a child, who protested against the harm the teacher had inflicted on him.

Another teacher's reaction to the breaching of preschool rules was the exclusion of guilty children. It was rather astonishing to notice that one of the children (Mieszko) was quite often subjected to exclusion. The softest form of exclusion was to make him carry out some preschool activities alone, after all the other children had finished a given task. Thus, the boy had to wait until the others finished and then was allowed to do the same thing himself. The teacher, for example, told him: *You will brush your teeth alone, after all the others leave the bathroom*. On many occasions, the boy seemed to have been excluded for no reason, but when he asked the teacher to let the children play, the children were 'rewarded' by the teacher who let them play as a whole group, except the boy who had asked for permission: *The children can play, but you cannot!* Another time, the boy tried to engage himself in the preschool life by helping the teacher set up beds for a midday nap. When rebuked by the teacher: *You're disturbing me!* he sat down unhappy on the floor. When he was the first to get dressed in the cloakroom, as he wanted to get ready for a walk as quickly as possible, the teacher punished him by sending him to the end of the queue and saying: *Whoever said you would be the first in the queue. Quickly, go to the end of the queue!* It was also noticed that this child, so often excluded by adults, continued to experience the exclusion on behalf of his peers. When the children evaluated constructions they had made from building blocks, Mieszko asked the others if they liked his construction. None of the children answered his questions.

Conclusions

Childhood is a very special time. It is the time when children enter new roles and face new situations, such as education, first in a preschool and them at school. The first stage of pedagogical work is the very beginning of instilling culture (Kłoskowska, introduction to Bourdieu, 2006).The questions arise: what does this first step in the educational system look like? What kind of culture do the youngest schoolchildren experience?

The socialization experiences observed in the analyzed preschool introduce the children into the culture of indifference, violence, fear and isolation. The cultural entanglements of education show the culture which imposes the meanings, interpretations and behaviour demonstrated by the teachers, who quite often breach the standards of decency ... .

As Katarzyna Gawlicz puts it: "Culture generated through everyday practice in preschools remains an integral part of culture dominating in Poland" (Gawlicz, 2009). How do such practices change children's personalities? "Experience goes beyond what has happened to people (...); experience also pertains to the events people have faced and how they have tried to deal with these events" (Bauman, 2000). What world do we, the adults, create and what cultural patterns do we provide the children with for their future lives? In the light of the observations presented here, it appears that we endow children with a culture of indifference rather than a culture of being there, a culture of fear and not security, a culture of violence and not protection, and a culture of isolation instead of a culture of interaction ....

How the children will face the above experiences is what we are bound to discover soon ...

EXPLORING PUPILS' HISTORICAL KNOWLEDGE WITHIN THE JUNIOR HIGH SOCIAL STUDIES COURSE

Charles Adabo Oppong

Department of Arts & Social Sciences Education

University of Cape Coast, Ghana

Abstract

Traditionally, the centerpiece of social studies, particularly at the junior high school level, has been history. This is, as it should be, because an understanding of our history is critical to being an informed and active citizen. However, the extent to which pupils are exposed to the nitty-gritty (logical dimensions) of the history subject at that level within the social studies course where history has been encapsulated is not known in literature. This paper, therefore, explores pupils' historical knowledge within the junior high social studies course. The research entailed a qualitative case study, using focus group discussions with pupils in form three of the University of Cape Coast Junior High School. Discussions were transcribed into written texts for analysis. Thematic analysis was used for the analysis of the data as it dealt with naturally occurring events. Commonalities and distinctions regarding the discussion of the key themes have been presented.

Key words: concept of history, sources of history, historical evidence, continuity and change, cause and effect, ethical dimensions in history.

1. Introduction

The junior high school social studies programme provides a coordinated, systematic study drawing upon such disciplines as economics, geography, history, law, political science, psychology, religion, and sociology, as well as appropriate content from other humanities disciplines. Traditionally, the centerpiece of social studies, particularly at the junior high school level, has been history. Indeed, history got encapsulated into the social studies programme during the 1980s and the 1990s, when history in schools was gathered into a generic social studies framework, a trend which had its origins back in the 1960s and 1970s. It was during these earlier decades that the social studies approach to teaching humanities had begun to dominate the primary and lower secondary school curriculum in many jurisdictions. At that time, the 'new social studies', originally based on the work of Fentoni (1991), was seen as inclusive, progressive and relevant. School history, on the other hand, was regarded by some leading Australian educators as elitist, backward-looking (always stuck in the past) and irrelevant (having little or no relationship to students' lives, experiences and the contemporary world). However, during this time, history continued to enjoy its place at that level of education in the social studies curriculum.

It is understood that teaching social studies in the basic schools is an essential part of the framework of an overall social studies programme. Knowledge, skills, and attitudes necessary for informed and thoughtful participation in society require a systematically developed programme focusing on concepts from history and the social studies. A report by the National Council of Social Studies (1988) indicates that, social studies provides a sense of history, a sense of existence in the past as well as the present, a feeling of being in history. Even though young children find the concept of time difficult, they need to understand how the present has come about and to develop an appreciation for the heritage of this country. Huck and Kuhn (1968) posit that even though children

have difficulty with time concepts, they can develop an appreciation for their historical heritage through factual presentation of history, biographies of famous people, and historical fiction.

Drew (2000), on her part, also indicates that social studies helps pupils to learn about historical events such as the issues that led to some revolutions like the American revolution, the French and Indian War, Colonial taxation and world wars. Other topical issues may include the Declaration of Independence, Bill of Rights and Constitution Development as part of the standard content of social studies. She added that eighth grade students are taught to make connections between historical events and current trends. Crossover curriculum topics are innumerable. For instance, students can relate Reconstruction-era amendments to the Civil Rights movement of the 1960s in America, the 1948 riots to current demonstrations in Ghana, and current events that relate to racism or human rights activism. Early Irish and German immigration movements connect to current discussions about immigration in the U.S., and the development of the women's suffrage movement can be connected to current discussions about affirmative action.

Specifically, pupils in early grades learn to locate themselves in time and space through their social studies course. They gain experience with sequencing to establish a sense of order and time, and begin to understand the historical concepts that give meaning to the events that they study. The use of stories about the past can help children to develop their understanding of ethical and moral issues as they learn about important events and developments. They begin to recognize that stories can be told in different ways, and that individuals may hold divergent views about events in the past. They learn to offer explanations for why views differ, and thus develop the ability to defend interpretations based on evidence from multiple sources. There is also the understanding of the linkages between human decisions and consequences. The foundation is, therefore, laid for the further development of historical knowledge, skills, and values at a high level.

2. The Theme and Context of the Study

Whether the potentials of social studies influence history, as reported in the literature is yet to be established empirically. The social studies curriculum for junior high school level organises pupils' learning around a set of fundamental concepts: systems and structures; interactions and interdependence; environment; change and continuity; culture; and power and governance. History offers different perspectives on these concepts. In history, for example, students may consider historical evidence, cause and effect, change and continuity over a relatively short period that covers only a few years in the story of a country or person. So does the social studies course ensure that the teaching of such historical concepts to follow the academic discipline of the subject.

It must also be noted that the designers of the social studies curriculum clearly identify the primary purpose of the subject, and indicate that the curriculum is not designed nor intended to teach discrete social sciences disciplines such as history, geography, and economics (Trinidad and Tobago Ministry of Education [MOE], 2008). This does not mean, however, that history concepts are totally absent from the social studies curriculum. At the lower secondary school level, for example, basic concepts such as identity, resistance, and change form part of the content of social studies (MOE, 2008). Still, key history concepts such as historical evidence, causation, and historical explanation cannot be adequately explored in a social studies curriculum that must also include a wide array of concepts in economics, government and politics, geography, and international relations. This is due largely to the fact that history is not part of the prescribed basic school curriculum; and while some students may obtain a knowledge of history from educational films and selected television programmes, the only exposure a student is likely to get to the subject might be oblique references to history in a social studies curriculum (Joseph, 2011).

Given the structure of social studies and the treatment of history as one of several components of the subject, it is very difficult to determine what students actually take away from social studies as historical knowledge that are later built upon (Joseph, 2011). The understanding of this issue and its relationships is a quite demanding cognitive task. Therefore, the crucial impact of the social studies course on pupils' historical knowledge is of immense significance. Therefore, such an impact needs to be established. Consequently, this paper presents a study that explores pupils' historical knowledge within the junior high social studies course. Contextually, in

examining the theme, the researcher employs the framework provided by Seixas (2009). Seixas (2009) presents an interesting framework for history education, where he highlights six concepts for developing historical thinking. These concepts have been adopted to guide the study: the concept of history, sources of history, historical evidence, cause and effect, and ethical dimensions in history. These concepts would be explored to find out whether pupils have been exposed to them, during their study in the social studies curriculum.

3. Methodology

In this study, the researcher adopted an interpretive phenomenological methodology using a case study approach. This approach helped me to understand the meanings and essence of an experience and how participants make sense of these (Grbich, 2007). The intention and adoption of this approach was to gain insight into the views of respondents and to describe their knowledge and understandings to a certain phenomenon (Fraenkel & Wallen, 2006). Being a qualitative study, the procedure of the qualitative technique was used in collecting and analysing appropriate evidence during the investigation. Specifically, the research entailed a qualitative case study using focus group discussions with pupils in Form Three of the University of Cape Coast Junior High School. The use of Form Three pupils was informed by the fact that they had studied the course for three years which put them in a position as it were to know what the course entailed and what they drived from it. Discussions were transcribed into written text for analysis. Thematic analysis was used for the analysis of the data as it dealt with naturally occurring events and it provided thick descriptions and information that led to answers. Commonalities and distinctions regarding the discussion of the key themes are presented.

4. Discussion of Results

The discussion of the results is done within the framework provided by Seixas (2009) as stated in the context of the study. These are the concept of history, sources of history, historical evidence, cause and effect, and ethical dimensions in history. In doing this, the researcher adopts the style of discussing the results according to the themes in the framework.

4.1. The Concept of History/Understanding History Concepts

Four focus group discussions were conducted to probe deeper into pupils' knowledge of key concepts in history. Findings from the first thematic strand in the framework revealed that pupils have a fair idea about what history was. That is, most pupils demonstrated some degree of understanding of what the history concept was. Two of such responses were that "history is like things that happened in the past", "it is the past events that took place during the days of our ancestors". Another respondent puts it this way: "History is the record of an important past event". These responses clearly show that the pupils understand what history is in their social studies course. The responses made by the pupils also appear that pupils operate at a lower cognitive level with regard to what history is. If these pupils view history mostly as the compilation of records of the past, then they are operating at what Hallam (1970) describes as the concrete operational level of thinking. According to Hallam, such pupils possess the ability to give organized answers, yet very often their responses are limited to what is immediately apparent in the text. In a similar view, LaCapra (1989) simply tells that if history is regarded as a story about the past and goes no further in its efforts is, at best, dull and forgettable, at worst, reckless and irresponsible because it ignores the duties of the true historian. "The point of historical inquiry, for LaCapra, is to arrive at 'meaningful guides to thought and practice' in the present for the sake of the future" (p. 29). It is necessary, therefore, that teachers guide students beyond this threshold to the point where they could move from past records to engage in deeper probing about what history is.

Indeed pupils' understanding limits history to everything that took place in the past as within the purview of history. Participants were, therefore, asked "what qualifies an event to be regarded as a historical event or as having historical significance? In the minds of the participants, there were differing views on this subject. One echoed that "when that particular event has not changed in our time." However, a majority of the participants

shared the view that an event qualifies as a significant point in history when that particular event has an impact on the lives of people. One such response was " ...when that event manages to change the lives of people present at the time of the event." This response, therefore, puts pupils' understanding of historical significance within the perspective of the horizontalists or idealists historians who view historical events from the point of their practical effects on the people living during the time of the event. Though acceptable, it is important to point out that such an explanation could also be equally valid, using the lenses of the vertical perspectivists who see historical events in the light of their effects on the people living presently. In either case, it can be said that pupils have fair understanding of what history was and what qualifies an events to be regarded as historically important. Based on these findings, one could assume that students' understanding of history is likely to improve with greater exposure to the subject at a higher level.

4.2. Sources of History

Information gathered from the focus groups showed that pupils' knowledge about the sources of history in the social studies course is not appreciable as all the participants answered an emphatic "No". According to the views expressed by participants, it was clear that they had no knowledge about the sources of history indicating that pupils are not taught the specific sources through which history could be reconstructed in the social studies course. However, when prompting questions were put forward by way of explaining what historical sources are and some examples, participants acknowledged that indeed they have heard about some sources like archeaology, oral tradition, ethnography, among others, but do not know what they are. It, therefore, appears that the fundamental issues in historical studies such as the sources of history which pupils ought to have been exposed to before any 'proper' content issues are exposed to them are not taught. One possible assumption for this finding may be that the social studies syllabus does not cater for such a topic (sources of history) to be taught at that level. Granted that this is the case, it can also be argued that such a topic could be taught not necessarily being captured in the syllabus bearing in mind that teachers could add certain things they consider as important that could enhance the understanding of certain topics in the syllabus, a decision which would fall within the domain of the informal curriculum. The onus is, therefore, on social studies curriculum designers and teachers to incorporate this thematic strand into the social studies syllabus if indeed they continue to tout social studies as an integrated subject for which history is part. Teachers, on the other hand, could also clarify this conceptual misunderstanding by instruction. This would help expose pupils to historical sources at an earlier level where teachers have adequate time to properly introduce students to the subject of history. Wineburg (2007) supports the view that the development of historical thinking requires what he refers to as an orientation to the past informed by disciplinary canons of evidence (logical requirement) and rules of argument of the subject. Lévesque (2008) is perhaps correct in concluding that students may well need powerful conceptual and procedural historical-thinking tools and ideas now more than ever. However, this cannot be achieved if learners are not exposed to the rudiments of the subject of which the sources of writing history form a critical part. But this can only be achieved by careful history instruction and engagement over a period of time starting from the basic level. Once this is done, pupils' knowledge of history is likely to improve. But given the complexity of this particular historical concept as not captured in the social studies syllabus, one needs to be sympathetic with pupils who are generally not taught such a topic at that school level.

4.3 Historical Evidence

On this particular theme, participants were asked whether historical evidence ought to be questioned. In the focus groups, discussants were unanimous in their views. They all agreed that, historical evidence should be questioned as they believe that historical evidence, as subjective as it could be, should be questioned, and that the historian, like a detective, uses a number of clues to unlock the mystery of the past (Joseph, 2011). Sampled views of the discussants include the following: "Any one could make up something and just come put it there as something that had happened in the past. But if they are questioned we will find out the detailed aspect of that event and you will then know if it really happened", "because some historical facts or narrations may not be true" and "...once you were not there you have to question historical evidence."

Given this understanding on the part of the participants, one can reasonably assume that the pupils are aware of the element of subjectivity in historical writing and explanation as embedded in the relativists' philosophy and espoused by Burston and Green (1967) that history cannot be an objective account of the past. Reasons ascribed include the fact that historians are influenced by a myriad of factors such as age, circumstance, personality, nationality and a host of others when reconstructing the past. Respondents' hesitation to state categorically that historical facts were really true suggests that there is need to question the past. The mere mention of an alleged incident in a book does not guarantee its authenticity. It is for this reason that Muslims have, since the earliest days of Islam, developed the system of isnad in terms of which the narrator or the documenting author had to state each and every successive source through whom the report had been handed down to him or her, on the basis of which its authenticity could then be determined. No author, whatsoever eminent and learned, confers the benefit of authenticity upon the material he or she includes into his book merely by virtue of his personality. Therefore, even a historian like Ibn Jarir at-Tabari, whose history is meticulously recorded with complete chains of narration, makes no claim of authenticity for the material documented in his book.

Pupils' understanding would, therefore, be somewhat postmodern, deconstructionist approach, questioning the validity of certain historical sources. Deconstructionists generally challenge what they consider as the old modernist principles of historical truth and methodological objectivity (Munslow, 1997). In the candid opinion of the researcher, if pupils at that level have realised the essence to question historical evidence then it is possible that learners are likely to engage their teachers at any level in their schooling in interrogating historical facts, a strategy recognised as 'doing history', granted that they would pursue history at higher levels. Should this be the case, the boring nature of history instruction could be reduced which the subject has been criticised of. Since pupils are aware of this element of subjectivity in history, teachers need to adopt the right approach and attitude when teaching. This they could do by exercising caution in the selection of history textbooks. Indeed, chosen books should be those with academic integrity and not those that contain deliberate distortion of facts.

4.4. Cause and Effect

Cause and effect is one of the strands in the framework and the researcher essentially dwelt on the following issues: whether history is caused by a complex mix of factors or a single factor; whether human beings determine the cause of history; whether historical events have effects. The study of cause and effect - which requires a strong grasp of historical chronology - constitutes one of the basic approaches to the discipline of history. The underlying principle is one adapted from physics: for every action there is an equivalent reaction; every cause results in an effect. In historical terms, every event has a cause, and is itself the cause of subsequent events, which may, therefore, be considered its effect(s), or consequences. Findings of the focus group discussions show mixed responses to the question of causation. While pupils demonstrated an understanding of multiple causation in history, they continued to offer single-factor explanations for events in history. For example, when asked to explain what causes an event to happen, students gave responses like: "Historical events are caused by so many factors like the 1948 riots in Ghana", "They are caused by multiple or different factors". This means that pupils believe that historical events are caused by a multiple of factors, and that they are multifaceted in nature. However, when asked whether human beings determine the cause of history, they all agreed that indeed human beings are responsible for historical happenings and nothing else. This also implies that pupils do not consider natural happenings as cause in history. Therefore, holding fast to their response that human beings determine the course of history, pupils generally failed to consider other possible factors such as social and political events, technology, or even natural forces, as other possible explanations for events of the past. This suggests a lack of clear understanding on the part of pupils of what constitutes historical causal explanation. Based on the responses, it appears that students believe that an event is caused by one single factor, rather than by a mix of different factors (Joseph, 2011). It may be that the topics that pupils are exposed to in their social studies course are probably limited to the activities of men at that level of their schooling.

Concerning the effects of historical events, discussants were unanimous in their views that historical events had both positive and negative effects on society as well as humans. One participant's illustration is used to sum up their views. "The colonisation of Ghana has impacted on the country positively and negatively. It

brought the introduction of formal education which is a good thing. At the same time, it brought separation in society". This means that pupils understand that historical events or happenings do affect societies, and that such effects could be positive or negative. Reasonably, teachers might have been examining historical events in terms of their merits and demerits within a given epoch. This point leads the discussion to the ethical dimension in history whether making judgment in history is an ideal thing to do.

4.5. Ethical Dimensions in History

A lot of issues were explored within this theme as ethical matters have gained prominence in recent times. Participants were first asked whether they make judgment about historical actors. Unanimously, they all indicated that there is the need to make judgment about the actions of the past in the past. As echoed by one participant "we make judgment about them because how they behaved may affect others today". Another expressed his view as "...because the judgment make us aware of past mistakes committed by people". This implies that pupils see the need to judge historical figures with the thinking that their mistakes would not be repeated. This response led to a follow-up question that in making judgment do they use the standards of today or make it within the context of that historical epoch. There were mixed responses for this question. Some intimated that they used today's standards and reasons ascribed included the fact that "...because we do not know their standards [past standards] emphasis added" or "their standards did not help them". This clearly tells us that because of ignorance of the past pupils tend to use their own standards in judging the past. They also think that had their standard being perfect, it would have guided them properly. Others, on the other hand, indicated that they make judgments within the historical context in which those activities were performed. One such response is that "Because everything that they did depended on the circumstances that prevailed at the time. For instance they might have not been educated to understand the effects of their actions so you cannot use today's standards in judging them". Pupils have the believe that each epoch in history has its own standard, and there is nothing like trans-epochal standards that could be used in judging historical actors across historical periods.

Notwithstanding the differing positions of the participants, one thing stands out, which is the need to make judgment in history. Their positions could best be described as the views shared by moralists and anti-moralists historians who have been arguing about making judgments in history. In either case, the responses show that pupils are aware of the ethical issues in history within the social studies course. This new pursuit of the ethical aspects of historical enquiry operates on the premise that all historical works, whether they are consciously structured so by their actors or not, possess ideological and psychological underpinnings that we may not know. The ethical turn calls for a conscious and willing acknowledgment of this theme by learners, much as the linguistic turn sought an open awareness of the primary importance of language as a matrix that structures reality (Thomas, 2005). Such an understanding, according to historians, can sensitize an individual to the universality of the human experience as well as to the peculiarities that distinguish cultures and societies from one another (Daniels, 1981). With such knowledge, pupils are more likely to show tolerance and appreciation of others bearing in mind differences in standards, norms and values. They are also better equipped to coexist with those who think and live differently in a multiracial and multicultural society (Joseph, 2011). Ferretti, MacArthur, and Okolo (2001) also support the view that certain skills pupils obtain from history ethics are essential for active and engaged civic participation. The use of stories about the past can, therefore, help children to develop their understanding of ethical and moral issues as they learn about important events and developments. They begin to recognize that stories can be told in different ways, and that individuals may hold divergent views about events in the past. They learn to offer explanations for why views differ, and thus develop the ability to defend interpretations based on evidence from multiple sources.

5. Conclusion

It must be pointed out that the only thematic issue participants acknowledged they had no knowledge of was the sources of history which happens to be an important ingredient in understanding and reconstructing the past. So such a gap in pupils' historical knowledge is worrying and must be addressed. This also suggests a lack of

clear understanding on the part of pupils of what constitutes historical sources. But this is not surprising as these pupils are not adequately exposed to historical concepts at that level where social studies is often taught as an alternative to history. On this point, I share the view of Joseph (2011) who suggests that the preferred seamless approach to address such a lacuna in the literature would be to introduce history to pupils as early as the primary level a call that needs political backing. This study is also a pioneer in its nature; for that reason, more studies are recommended with large number of students and schools in nationwide population.

FORENSIC ACCOUNTING TRAINING: A PROPOSAL FOR TURKEY

Nermin Akyel[a][19]

[a,] Department of Accounting and Tax Applications, Vocational School of Geyve Sakarya University, 54700 Geyve / SAKARYA / TURKEY

Abstract

In time of globalization and developments in many fields and increased diversity in business administration, reliability of financial activities has become significantly important. These developments have pushed up the white-collar crimes such as fraud with the implicit approval of both employees and senior management. Therefore, especially in the USA, Canada and England, a new area of expertise has emerged: "Forensic Accounting". The forensic accounting activities, which have not sufficiently been discussed in Turkey, aim at giving expert witness litigation support in the field of accounting. In this study, forensic accounting will be analyzed and a training model will be proposed.

Keywords: Forensic Accounting, Litigation Support Services, Expert Witnessing, Fraud Examination, Forensic Accounting Training

Introduction

As a result of developments and diversity in business administration activities, accounting data have an important place in institutional management. Thus, the information has to be reliable in order to enable the financial activity results to help in the administrative decision making process and related parties. In parallel to aforementioned developments, the number of fraudulent conducts attempted by the accountants - with the implicit approval of both employees and senior management - has dramatically increased. This increase has affected not only the financial statements of the companies and their activity results but also the economies of the countries. Therefore, it has been inevitable to make new regulations, to set new standards and applications and to create new accounting fields as a result of the pressure from outside of the company and the international organizations. Accordingly, accounting control and several occupational groups such as internal auditing, independent auditing and certified councillorship have gained importance within the field of accounting in Turkey just as in many other countries.

Nowadays fraudulent conducts are gradually increasing, however detection and prevention such conducts have become more difficult than it was before. Likewise, the commercial transactions have become more complex and thus the disagreements between the individuals and institutions have increased. In this respect, both sides have started litigate more often. Consequently, experts on accounting have become more important for lawyers and courts need the support of experts on accounting more than it was before. When we examine the applications outside of Turkey, "forensic accounting" draws our attention. When we take "forensic accounting" into consideration –as a requirement of globalization and standardization- it is commonly supposed that it can be applied in Turkey.

Forensic Accounting

The fraudulent conducts in accounting records affect not only company owners and investors but they also affect employees, credit institutions, government and audition companies. Accounting records, notebooks, invoices and balance sheets etc. can be manipulated by malicious experts. Numbers and sales can be decreased or increased according to the demand of managers. Only an accountant auditor can say which points should be taken into consideration on the subject. The support of accounting specialist is needed in controversial forensic

---

issues. AICPA (American Institute of Certified Public Accountants) describes this support as "the professional support which no lawyer can give to another" (Pazarceviren, 2005: 2).

The need for reliable information has made accurate financial statements and accounting knowledge important as well as fraud examination. In the USA, a new occupation which involves finding out accounting frauds has emerged: "forensic accounting". However it has not been legally described in our country yet. In dictionaries the word of "forensic" means "judicial" or "to be accepted as a standard at a judicial cases" (Bozkurt, 2000: 56). Thus the term "forensic accounting" refers to accountants working in the field of law. Forensic accountants help decision making process combining their accounting, auditing and investigating skills at forensic issues.

The increase of international companies as results of globalization and technological advancements requires a more comprehensive fraud examination and specialist on accounting fraud. Forensic accountants have the necessary legal permission and education to realize this. The most important feature of forensic accounting is that forensic accountants are more knowledgeable with accounting fraud than any other occupation (Caliyurt, 2007: 185).

The term "forensic accounting" usually refers to CPA, Certified Public Accountants who carry out "analysis, inspection, investigation, audition and questioning" process in order to reach to truth and to obtain an expert witness opinion. Fraud examination and litigation support consulting include the services of certified public accountants (Crumbley, 1995: 25). Forensic accountant is the person who assists lawyers informed about accounting and law courts for applying accounting to law and debatable issues (Telpner and Mostek, 2003:1).

Forensic Accountants focus on the prevention and detection of fraud, the investigation of occupational and financial statement fraud and related law courts Forensic accounting can be described as "carrying out applications and relationships in the viewpoint of low while applying financial issues to the business problems (Peterson and Reider, 2001: 25).

Accounting As An Occupation And Forensic Accounting

If we try to make a very brief and definite comment on the difference between an accountant and a forensic accountant, we can say "accountants look over numbers, whereas forensic accountants look beyond numbers" (**www.investigation.com**) or "other accountants look over financial statements while forensic accountants penetrate into events" (www.bus.lsu.edu).

The forensic accountants who were educated so as to find out the reality reading beyond numbers have begun the use their accounting skills and knowledge while trying to identify and solve legal issues (www.forensicaccounting.com(a)). They should have the ability to apply their accounting knowledge to legal interrogation. A certified public accountants is a civil person who will question the written report, help at dismissals, approve an expert witness, start fraud investigation and help with crime research (www.forensicaccounting.com(b))

Both forensic accounting and financial accounting are significant disciplines. They are very helpful in the viewpoint of institutional partners, investors, capital markets within the management and integrity of the company. Both occupational groups will have reached their goals if they are supported by informational cooperation putting their fields' complexity into consideration (Ronallo, 2005:116)

The Need For A Forensic Accountant

In the emergence of forensic accounting -as a combination of auditing and investigation skills and as an expertising field of accounting- the reasons below have been influential (Bozkurt, 2000: 56-57):

Individual or institutional litigations have gradually increased as a result of more complex commercial transactions.

In the society, the relationship between the individuals, the institutions and the state have started to cause problems.

Accounting fraud has been increasing day by day and fraud detection and prevention have become harder.

Management failures has been gradually increasing,

Lawyers and courts need expert reviews more than ever.

The ones who may require a forensic accountant can be grouped as lawyer, the police, insurance companies, state representatives, juristic institutions connected with the state, banks, courts and business world (Pazarceviren, 2005: 2-3).

The increase of hackers and cyber crimes in parallel with technological advancement, has attached more importance on forensic accountants due to the need for security and for the skills required to conduct forensic investigation.

Required Skills For A Forensic Accountant

Forensic accountants must behave as detectives. In a recent survey, forensic accounting was correlated with Sherlock Holmes and it was emphasized that there is much for forensic accountants to learn from him while collecting data and analysing them (Crumbley and et al, 2004:1). So, a good forensic accountant must be a good detective as well. Forensic accountants are people who look beyond numbers and do not accept the visible amounts in financial statements. He must examine and investigate cases very meticulously and be able to apply their accounting knowledge to legal investigation.

Forensic accounting has been changing the public opinion on accounting. In general accountants are supposed to be deprived of original ideas. Moreover the people think that they wear glasses and spend their times in tiny rooms among dusty accounting notebooks. The distinctive feature of forensic accountants from the accountants is their experience on accounting and they are becoming more important in western countries (Ozkol, 2005: 73).

Crumbley and Apostolou listed the skills a forensic accountant must have as follows:

A strong accounting background

A thorough knowledge of auditing procedures

An understanding of risk assessment

An understanding of the legal environment

An understanding of internal controls

Knowledge of fraud detection techniques

Good communication skills (Crumbley and Apostolou; 2002).

Bozkurt and Hunter listed the personal skills of a forensic accountant as fallows (Bozkurt, 2000: 60; Hunter, 1995: 14):

To be curious: A forensic accountant must be curious about and interested in the developments in his occupation. He must exert effort to bring out the truth.

To be tough: A forensic accountant should not give up when he face with difficulties, he must be insistent on what he defends.

Creativy: A forensic accountant must be as creative as possible besides obeying the general principles and standards.

Perception: A forensic accountant must investigate each event in detail. He must have a good perception of business administration and a strong reasoning ability. He must be clear, analytic and logical in his decisions.

Reliability: A forensic accountant must know how to listen to people carefully and also must be good at written and oral communication; he must set up healthy social relationships.

Depending on nature of forensic examination, some forensic accountants work in the public sector such as police departments (FBI or IRS) while the others work in the private sector such as banks, insurance companies (www.forensic-accounting-information.com).

Success of forensic accounting investigation depends on determining which evidence will be considered as valid or invalid.

Working Areas Of Forensic Accountants

Forensic accounting is rapidly developing in the USA and other countries. Although problems are getting bigger and more complex, available opportunities are also getting more. Forensic accounting is the activity field of skillful and successful auditors who face with theorical and practical problems (Golden and Pilkington, 2006: 546). They serve in very different sector and in a vast area. The basic target of the research carried out by The USA Department of Justice and SEC (Standards Executive Committee) is the leaders of companies.

Fraud/material misstatement cases are occasionally very complex so they need to be handled by experts. A forensic accountant's working area includes many specific areas. When we generally handle these issues it will be more understandable why forensic accounting expertise is needed. The issues of forensic accountant deals with are as follows:

Partnership and shareholder cases,

Business together with state,

The construction sector,

Individual injury cases/ automobile accidents,

Stopping of work/ other compensation demands from insurance companies,

Fraud examination corporation/ employees,

Financial conflicts regarding divorces,

Work assessment,

Cases regarding the financial losses of companies,

Occupational negligence,

Mediation and fortification,

Environmental problems,

Cyber crimes,

Issues about intellectual capital.

Types Of Forensic Accounting

Forensic accounting has three different application fields: litigation support consulting, expert witnessing and fraud examination

Litigation Support Consulting

It is described as professional support given to lawyers by non-lawyers during a case (www.bus.lsu.edu/accounting/faculty/lcrumbley/forensic.html) or giving an accounting support to a continuing case. The forensic accountant undertakes the functions below (Özkol, 2005: 74; www.forensicaccounting.com/cphome.html):

To collect the necessary documents to support or refute a claim,

To revise the related documents to make an early examination of the case and the determine lacking points,

To help questioning the witnesses and to list the questions regarding financial prooves,

To assist in financial issues revising the statements and joining witness questioning for preparing the supplemental questions,

To examine the opposite part's expert's report, to report its strong and weak points,

To assist in meeting held to reach a consensus,

To listen to the opposing part's testimony and to be present at the trial to be helpful in cross questioning.

Expert Witnessing

The new tendency in litigation -especially in the USA and Canada- is charging much more experts with regarding the case investigated. Before the trial, to determine their opinions about the case, experts must be more interested in and closes to it. For being accepted as an expert, the courts demand various expertising abilities besides official education and accreditation.

The need for expert witnessing generally emerges in issues requiring accounting expertise. A forensic accountant can be hired to reach economic realities, to prepare tax analysis, to refute the testimony of the opposing part, to determine the issues to be investigated, to help commenting on documents, to give support in obtaining information from other witnesses.

The duties of forensic accountants in their expert witnessing activities can be listed as below (Bozkurt, 2000: 58; Ozkol, 2005: 75):

Making necessary research regarding the case, collecting various data,

Reaching an opinion utilizing these data,

Reaching this opinion in such a way to enlighten and inform the judge and lawyers at courts.

Expert testimonies have become more efficient during litigation period and giving expert testimony is the final step for a forensic accountant at the trial period (Lawrence, 1998: 1115). Forensic accounting is almost independent from the legal system but legal standards are very important at describing it. The duty of a forensic accountant as an expert witness is "to enable both opinions and realities to be revealed" (Lawrence, 1998: 1115). Therefore, during the determination period, some individuals are chosen depending on their "skills at issues which require witness opinion".

Fraud Examination (Investigative Accounting)

The advancement of technology, the accounting knowledge of management, the globalization of economy and the creation of large complex business organizations with hundreds of transactions can create a situation in fraud detection where extensive research is necessary. Occupational fraud and abuse lead to losses of billions. Illegal conducts "characterized by deceit, concealment, violation of trust and not dependent upon the application of threat of physical force or violence" are defined as white-collar crime (WCC). Association of Certified Fraud Examiners (ACFE) referred to this type of crime as "occupational fraud and abuse" and defined it as the using of one's occupation to personally enrich one's life by the deliberate misuse or misapplication of an employer's resources or assets. This type of crime has reached epidemic proportions that amount to an estimated $600 billion per year in the USA alone (Christensen and et al, 2005). In order, fraud auditing is an important tool to eliminate these problems.

Material misstatement by a joint-stock company does have not only financial results but also gives harm to its reputation. Some of the most obvious corporate examples of WCC include Enron, Pharmalat, WorldCom and Tyco International.

Types of fraud in corporations can be listed as follows (Bozkurt, 2000: 59):

White collar crimes,

Financial misstatement by top management to mislead the authorities,

Fraud related to investments,

Commercial bribe and commissions,

Fraud in banking transactions,

Fraud in electronic fund transfers,

Fraud related to credit cards,

Fraud related to computers,

Fraud done via the internet.

Types of fraud listed above are so various that it seems impossible for a non-expert accountant to detect and prevent them (Ozkol, 2005: 75). They can only be solved by people who are experts and have occupational knowledge on the subject.

Characteristic A Forensic Accountant Must Possess

A forensic accountant is the person "who does not appropriate the visible values at once and looks beyond their background, who is sceptical about the documents, who prepares the expert witnessing testimony, who

interferes when some people seem to lie and who reveals the truth with all its aspects interviewing with individuals in detail (Crumbley, 1995: 23). As it can clearly be understood from the description that forensic accountants are different than independent accountants and auditors must have extensive knowledge on some issues. Besides possessing these characteristic skills they must have knowledge at the issues below (Bozkurt, 2000: 59).

An extensive accounting knowledge,

Investigation and examination techniques,

Law,

Auditing,

Business administration,

Psychology,

Criminology,

Computer studies,

Statistic.

In addition to different auditing roles of forensic accountants and the independent auditors, the training and certification for these positions vary. The training and certification of forensic accountants gives them much stronger background for fraud detection than that of the traditional auditor.

Forensic Accounting Training: A Proposal For Turkey

The second cycle (master's degree) program of Florida Atlantic University comprises nine forensic accounting courses. In order to be a certified forensic accountant in the USA one has to pass through different steps. These steps can be listed as below (Bozkurt, 2000: 60-61):

To have a bachelor's degree,

Two years of professional experience,

To pass the exams applied by "Association of Certified Fraud Examiners" in the USA.

Many professional forensic accountants have an occupational certificate as a CFE (Certified Fraud Examiner) or a CPA (Certified Public Accountant). The CFE examination can be taken any time during the year with four sections being offered as follows (Christensen and at al, 2005):

Section : Fraudulent Financial Transactions

Section : Legal Elements of Fraud

Section : Fraud Investigation

Section : Criminology and Ethics

ACFE, professional organization with 25.000 members, is accepted as the most important organization in the world. It is dedicated to offer extensive assistance on forensic accounting and fraud auditing, to arrange training courses and seminars and to create publications. Its examination has the four main sections below (Pazarceviren, 2005):

Financial transaction

Investigation

Legal issues

Criminology

In order to be successful in the examination a bachelor's degree is not sufficient. Therefore, an extra training regarding the four issues above must be included in the education system.

It is possible to include them in the university programs in various ways:

Including the courses in routine bachelor's degree curriculum

Forming a different postgraduate program

Forming a course program

The possible topics of a forensic accounting education -depending on the studies of Rezaee and Burton- can be ordered as follows (Rezaee and Burton, 1997):

Investigation and Law

Statute and regulations for bribery and criminal fraud

Knowledge of the legal system

Legal elements of fraud

Trial and cross-examination

Litigation and counseling techniques

Expert testimony and expert witness techniques

Corporate governance and compliance with applicable laws and regulations

Bribery and corruption investigation including resolution of allegation of misconduct

Fraud and Fraud Auditing

Theory of fraud examination and prevention

Fundamentals of fraud

Rules of evidence and reporting standards for forensic accounting

Fraud auditing methodology

Professional standards on forensic accounting

Document collection and analysis

Types of fraud (e.g. bankruptcy, computer, management, employees)

Professional interview skills and legal aspects of interviews

Financial Reporting Process

Financial fraud and accountants' responsibilities

Internal control evaluation and statistical sampling

Techniques in locating hidden assets

Financial reporting process and analysis including analytical review procedures

Effective report writing

Ethics

Conflicts of interest investigating techniques

Principles of ethics and corporate code of conduct

Environmental and personal red flags

CONCLUSION

As a result of globalization and developments in many fields, new arrangements in accounting are required for modernization. This paper introduces "Forensic Accounting" which is existed in some states, especially in the USA and Canada and aims to evaluate the subject from the perspective of Turkey.

Nowadays, arguments and claims on disputable issues such as accounting records and financial statements and legal conflicts must be well-founded. In Turkey, the applicability of forensic accounting must be studied examining if current witnessing system can meet the demands or not. Necessary studies must be initiated by the leadership of TURMOB and if it seems feasible, legal arrangements must be done. It will be an asset for Turkey to initiate necessary rehabilitation in education system to meet the requirements of this occupational group.

FROM PAST TO PRESENT: TREND ANALYSIS OF COOPERATIVE LEARNING STUDIES

Elif Akdemir[20], Ali Arslan

Bülent Ecevit University, Zonguldak 67300, Turkey

Abstract

The descriptive analysis of 2037 papers which used cooperative learning as a key word in the Education Resources Information Center' digital library between 1966 and 2010 was conducted in this paper based on several criteria. Results of the study indicated that the first paper on cooperative learning was appeared in 1988 and researchers' interest on cooperative learning increased in following years. Robyn Gillies appears to be the one who has the highest number of research studies on cooperative learning and most of the studies conducted in foreign countries using educational technologies with students who are in high school or other upper levels.

Keywords: Cooperative learning, ERIC, trend analysis, educational technology

Introduction

Cooperative learning is a learning where small number of students in a group cooperate to support each other's' learning to complete a task (Siegel, 2005). The roots of the cooperative learning come from many theories: the social interdependence theory, the cognitive developmental theory, the behavioral learning theory and the cognitive elaboration theory (Slavin, 1995; Johnson & Johnson, 1999; Kauchak & Eggen, 2003; Jacobs, 1990; Johnson, Johnson & Smith, 1998).

Any group work to be considered as a cooperative learning should contain following properties (Açıkgöz, 2003; Johnson & Johnson, 1999; Stahl, 1994; Kagan, 1994):

Positive Interdependence: Students should be aware of the fact that they have a common goal and they can achieve this goal by not only learning the instructional materials but also by helping their pears to learn the instructional materials (Johnson & Johnson, 1999).

Individual Accountability: Each student in the group should know that everyone is responsible in the group to complete the task and all students should take responsibilities to achieve the goal (Stahl, 1994). In another word, students should feel responsibility to support other students in the group to achieve group's final goal (Cohen, 1986).

Heterogeneous Groups: Constructing the groups, students should be selected based on various criteria to make the distribution of the groups heterogeneous. Allowing students to select pears in the group may lead to the construction of homogenous groups (Stahl, 1994).

Interpersonal and small group skills: Before the cooperative learning, assuming that students have interpersonal skills can be a mistake (Cohen, 1986; Johnson & Johnson 1999). In order to have effective cooperation, initially students should be furnished with interpersonal skills and then motivated to use them. Unless students gain interpersonal skills, they can not learn the subject to be taught in an expected level (Johnson & Johnson, 1999).

Face To Face Promotive Interaction: Students in the groups should gather often while supporting and encouraging each other's works (Açıkgöz, 2003).

E-mail address: akdemirelif@gmail.com

Group Process: Effective group work depends on the fact that whether students think on the process of the group work. The group process is a process that students judge the activities of each other and make decision on whether to continue or not (Johnson & Johnson, 1999).

Equal Opportunity for Success: Each student should contribute the group work while increasing their past achievements. In this way, students with low, medium and high achievement try to complete their task while increasing their grades (Slavin, 1995). Each group member's contribution is valuable. Each student in the group should have equal opportunity to contribute the group work (Cohen, 1986).

Different factors exist in cooperative learning which increases the achievement. There are social factors: cooperation, support, encouragement and feedback that students provide each other; cognitive factors: learning new topics and sharing information and other factors: task sharing, reward mechanism and rolls where students actively contribute and the teacher acts as a mentor (Knight & Bohlmeyer, 1990).

Many techniques are used in cooperative learning. Well known techniques are Student Teams Achievement Divisions (Slavin, 1991), Team Game Tournament (Slavin, 1991), Co-op co-op (Kagan, 1985), Cooperative Integrated Reading and Composition (Slavin, 1990), Team Assisted Individualization (Slavin, 1990), Group Investigation (Sharan & Sharan, 1989/1990), Jigsaw (Slavin, 1995).

Although popularity of cooperative learning is increasing, there was not found any study in the literature investigating the trends of research studies on cooperative learning to guide researches. Such trend analysis would have the potential to guide curriculum developers to reach studies and researchers working on cooperative learning easily and to identify current trends.

This study was conducted to answer following research questions:

Who are the top ten researchers conducting studies on cooperative learning?

What are the top ten descriptors used with cooperative learning?

What are the top ten journals which have published articles on cooperative learning?

What is study participants' grade levels based on the frequency appeared on research which used cooperative learning as a descriptor?

What are the target audiences of studies on cooperative learning?

Method

In this descriptive study, the descriptive analysis of 2037 studies used cooperative learning as a key word and were conducted between 1966 and 2010 and listed in the ERIC database was done in this study to identify the trend on cooperative learning. The content analysis was used to analyze the data.

Findings
