Figure 1 presents the frequency of studies found at the ERIC database from the past to the present. The first paper appeared in 1988 on cooperative learning. Also it was observed that the number of research increased in following years which indicated that the interest of researchers increased in following years on cooperative learning.

Figure 1. Publishing frequency of papers on cooperative learning
Table 1 presents the top ten researchers who conducted research on cooperative learning. Robyn Gillies conducted the highest number of research with eleven papers found on the ERIC database on cooperative learning. It was also found that researchers on this topic have three paper published in 2010.

Table 1. Researchers conducting studies on cooperative learning

Researchers Conducting Studies On Cooperative Learning And Their Publishing Frequencies	
1966-2010	**2010 Only**
o Gillies, Robyn(11)	o Yang, Stephen(3)
o Valcke, Martin(9)	o Valcke, Martin(3)

o Jarvela, Sanna(8)	o Warwick, Paul(3)
o Fischer, Frank(8)	o Thurston, Allen(3)
o Weinberger, Armin(7)	o Mercer, Neil(3)
o Dimitriadis, Yannis(7)	o Topping, Keith(3)
o Mandl, Heinz(6)	o Van Keer, Hilde(3)
o Schellens, Tammy(6)	o Kershner, Ruth(3)
o Yang, Stephen(6)	o Christie, Donald(3)

Top ten descriptors used with collaborative learning on research papers based on the frequency of their appearance are presented at the Table-2. Teaching method, foreign countries and educational technology are found to be the first three descriptors used with cooperative learning. These findings indicate that studies on cooperative learning are dominantly conducted in foreign countries and educational technologies are used in studies.

Table 2. Other descriptors used with cooperative learning

Conclusion

Cooperative learning takes its place in applications whose popularity is increasing and which requires individuals to work together to reach information. This paper reviewed studies conducted to review research papers published on cooperative learning until today. Following results were found;

- The first paper on cooperative learning was appeared in 1988 and researchers' interest is increasing every day,
- Robyn Gillies conducted the most research on cooperative learning,
- Majority of studies are conducted in foreign countries using educational technologies and
- High school and other upper levels have been selected as a study participant for studies conducted on cooperative learning.

The trend analysis of studies published in peer reviewed journals and used cooperative learning as a descriptor and enlisted at the ERIC (Education Resources Information Center) data base between 1966 and 2010 was conducted. Results of this study have the potential to guide especially novice researchers preparing to conduct research on cooperative learning in the near future to find researchers and research journals and target audiences of such research. Curriculum developers can also use this research to identify the researchers and research journals popular on cooperative learning.

Abstract

A few years ago, children with special needs like blindness or deafness, were seen as strangers and different inside of classroom environment. Most of the teachers have serious difficulties to deal with cases like this. Nowadays this situation has changed: the society is more able to analyse questions concerning to children with special needs. The other, so called normal children, are more prepared and able to communicate with this colleagues. So school classrooms are no longer unfriendly spaces for these children, but, in spite of this help from the school community, colleagues, teachers and staff, there still exists some problems. They are related, especially in teaching and learning process from teacher's point of view, to the few didactical materials present in schools. Only the will of community is not enough to promote learning, so the existence of materials that could help to promote activities is very welcome. In this article the first author has face the problem of having in the classroom this special children. So he had tried to solve this issue by adapting some games to teach mathematics and other themes, like the alphabet. In this communication we want to present some of the games related to mathematics learning. Apart from the presentation of the games we will show some conclusions after the use of this didactical games in school environment.

GENELLENEBILIRLIK KURAMININ DOLDURMA KAVRAM HARITASI DEĞERLENDIRME ÇALIŞMASINA UYGULANMASI

Gülden KAYA[22]**, Selahattin GELBAL**. **Neşe GÜLER*****

ÖZ

Bu çalışmada genellenebilirlik kuramı iki farklı teknikle hazırlanmış doldurma kavram haritası değerlendirmesine uygulanmıştır.

Araştırmada kullanılan veriler ilişkiler yaratılarak (C tekniği) ve ilişki kümesinden seçilerek (S tekniği) oluşturulan, madde konulu iki farklı doldurma kavram haritasının, 2010-2011 öğretim yıllarında Sakarya Üniversitesi Fen Bilgisi Eğitimi Bölümü 3. Sınıf'ta okuyan 64'ü (%70,6) kız 26'sı (%29,4) erkek toplam 90 öğrenciye uygulanması ile elde edilmiştir.

Uygulamalar için 90 kişiden oluşan grup rastgele olarak 2'ye ayrılmıştır. 44 kişiden oluşan gruba S tekniği ile hazırlanmış kavram haritası ve 46 kişiden gruba C tekniği ile hazırlanmış kavram haritası uygulanmıştır

Analizlerde C ve S uygulamalarının genellenebilirlik kuramına göre ana ve ortak etkiler için varyans değerleri kestirilmiş, puanların güvenirliği için G ve Φ (Phi) katsayıları hesaplanmıştır. C ve S tekniği ile elde edilen doldurma kavram haritası değerlendirmesinde karar çalışması tek boyut altında yer alan madde sayısının arttırılıp azaltılmasına göre yapılmıştır.

Bu araştırmanın sonucunda C ve S teknikleri ile uygulanan doldurma kavram haritası değerlendirilmesinde yer alan 10 maddeye tümüyle çaprazlanmış O x M modeli uygulanarak yapılan G çalışması sonucunda tek boyut için kestirilen varyans ve toplam varyansı açıklama oranlarına göre; öğrenci (O) ana etkisi için kestirilen varyans bileşeninin tüm uygulamalar için toplam varyansın büyük bir oranını açıkladığı görülmüştür. Tüm uygulamalar için madde (M) ana etkisi için kestirilen varyans bileşeni büyüklüğü diğer ana etkiler içinde ikinci sırada yer aldığı görülmektedir.

Araştırmadan elde edilen bulgulara göre C tekniğini uygulamasından S tekniği uygulamasına göre daha yüksek güvenirlik (0,90) elde edilmiştir.

Karar çalışması sonucunda doldurma kavram haritası C ve S uygulamaları değerlendirmesinde daha yüksek genellenebilirlik ve güvenirliğe ulaşmak için madde sayısını arttırmanın uygun olacağı sonucuna varılmıştır.

Araştırma ile farklı tekniklerle uygulanmış doldurma kavram haritası değerlendirmesinde yüksek güvenirlik için madde sayısı arttırılmış C uygulamasını kullanmanın uygun olacağı sonucuna varılmıştır.

Anahtar Sözcükler

Doldurma Kavram Haritası, C Tekniği, S Tekniği, Genellenebilirlik Kuramı

Application of Generalizability Theory to Fill-in Concept Map Assessment

Gülden KAYA [*] , **Selahattin GELBAL****, Neşe GÜLER*****

ABSTRACT

In this study, Generalizability Theory was applied to the assessment of fill-in concept maps which were prepared with two different techniques.

The data of this study were collected by using fill-in concept maps which are prepared with two different techniques; construct-a-map with created linking phrases (C) and construct-a-map with selected linking phrases(S).

Fill-in concept maps applied to 90 students who were studied in Sakarya University in the department of science education in 2010-2011 spring semester.

For the applications students were randomly assigned to two groups. Group which took S technique has 44 students and other group with C technique has 46 students.

In the analyze of the data; variance values, generalizability and dependability coefficient of C and S applications were calculated. Based on the information from G studies, for C and S techniques, the effects of increasing the number of items in a series of D studies were examined.

In the result of this study by using O x M (all facet crossed with each other) design, variance component patterns in all applications were similar: variance created by students was the largest proportion of the total variance. Items were the second largest source of error and mapping techniques were the smallest source of error.

According to all results C application had bigger generalizability coefficient (0,90) than S application.

In the result of D study, to have bigger generalizability and dependability coefficient for C and S techniques, it is better to increase number of items.

With this study, it was seen that for the assessment of fill-in concept maps which were prepared with two different techniques it is better to use C techniques with more items to have higher generalizability coefficient.

Key Words

Fill-in Concept Map, C Technique, S Technique, Generalizability Theory

1. GİRİŞ

Geleneksel eğitim yaklaşımlarının yetersiz kaldığı durumlarda yapılandırmacı ve çoklu zekâ gibi eğitim yaklaşımlarının ön plana çıktığı görülmüştür. Bu yaklaşımlarla eğitim sürecinde, öğretmen merkezli anlayışla öğrencinin davranışını değiştirme yerine; öğrenci merkezli anlayışla öğrencinin zihinsel becerilerini geliştirmeye ve bilgiyi yapılandırmaya ağırlık verilmektedir (Güneş, 2005).

Ausebel (1968)'e göre anlamlı öğrenme kartopunun yuvarlanarak büyümesi gibi bilgilerin gelişigüzel bir araya gelerek rastgele birikmesiyle değil; yeni öğrenilen daha az kapsamlı kavramların, zihinde 'önceden' edinilerek var olan "daha az" kapsamlı kavramlarla ve yine zihinde daha önceden edinilerek yer alan "daha kapsamlı", "daha genel" kavramların altına bu sıra dâhilinde bilinçli olarak belirli bir düzen ve hiyerarşi içerisinde sıkı bir şekilde bağlanmasıyla oluşur.

Ausebel' in teorisine bağlı olarak kavram haritaları bireylerin önceden edindikleri bilgilerle yeni öğrendikleri arasında köprü oluşturan, bireylerin zihinlerinde kavramları nasıl ilişkilendirdiğini gösteren şemalar olarak tanımlanmaktadır (Novak ve Gowin, 1984).

Kavram haritalarının ortaya çıkışında Ausubel'in "bilişsel öğrenmeye dair asimilasyon kuramı" çok önemli bir rol oynamıştır (Novak, 1990). Ausubel'in (1968) "Eğer tüm eğitim psikolojisini bir tek ilkeye indirgeyecek olursak: Anlamlı öğrenmede en önemli etken; öğrenenin hali hazırda ne bildiğidir. Bunun ne anlama geldiğini araştırın ve buna uygun şekilde öğretin." şeklinde ifade ettiği ilkeye dayanarak Novak ve arkadaşları yaptıkları çalışmada öğrencilerin ne bildiklerini ve anlamalarının zaman içinde nasıl değiştiğini araştırırken bir yandan da bir araç geliştirmişler, buna önce 'bilişsel haritalar' daha sonra da 'kavram haritaları' yöntemi adını vermişlerdir.

Kavram haritaları, "bilgiyi organize eden ve sunan araçlardır." Bilgi yapıları, kavramlar ve önermelerden oluşan anlamlı öğrenmeyi temsil eder. Kavram haritalarındaki karakteristikler:

1. Kavramlar hiyerarşi göstermelidir, en genel kavramdan, özele doğru gitmelidir.

2. Çapraz bağlar kavramların ilişkilerini göstermelidir.

3. Özel örnekler kavramların anlamını tanımlamak için kullanılmalıdır (Novak, 1993).

Diğer araştırmacılar, kavram haritalarının hiyerarşik olması görüşüne katılmamaktadırlar. Jonassen ve diğerleri (1997), hiyerarşinin yapısal olarak tek model olmadığını belirtmektedir. Kavramlar arasındaki ilişki birçok şekilde olabilir.

Bir kavram haritası kavramların birbirleriyle ilişkisini gösteren iki boyutlu bir şemadır. Bu bağlamda bir kavram haritası; *oval şema* içinde yazılmış kavramlar, *dikdörtgen kutular* içine yazılmış kavramlara verilen örnekler ve bu kavramlar ile örnekler arasındaki ilişkileri gösteren *oklardan* oluşur.

Bilginin zihinde somut ve görsel olarak düzenlenmesini sağlayan kavram haritaları tüm bir öğretim yılı, tek bir ünite ya da bir ders içinde önemli kavramlar arası ilişkileri şematize etmede etkili bir yol olmasından dolayı diğer alanlarda olduğu gibi fen öğretiminde de anlamlı öğrenmeyi sağlamada önemli yöntemlerden birisidir. Bu özelliğinden dolayı fen bilimleri eğitiminde bir öğretim tekniği olarak kullanılan kavram haritaları öğrencilerin düşünme, analiz etme, problem çözme gibi yaratıcı yeteneklerini geliştirerek kavramları daha iyi anlamasını sağlar (Novak, Gowin ve Johansen, 1983). Fen bilimlerinde kavram haritasını kullanılması gerekliliğinden yola çıkarak yapılan bu çalışmada kullanılan kavram haritaları Fen ve Teknoloji dersinin 'Madde' konusunu kapsamaktadır.

Kavram haritaları yapılarına göre farklılaşırlar. En çok bilinen kavram haritası türü olan hiyerarşik kavram haritaları kendi içerisinde boyutlar içerir. Kavram haritasının hiyerarşik olup olmaması konuyla ilişkilidir. Eğer konu hiyerarşik bir yapıya sahip değilse kavram haritasının da hiyerarşik bir yapıya sahip olmasına gerek yoktur. Kavram haritalarında görülen yapısal değişikliklerden biri de; kavramların öğrenciye verilmesi ya da öğrencinin kendisi tarafından belirlenmesi şeklindedir. Bu şekilde yapılandırılan kavram haritaları 'oluşturma kavram

haritası' (construct map) olarak adlandırılır. Kavram haritaları kavramlar arasında olan ilişkilerin verilmesi ya da verilmemesine göre de değişiklik gösterebilir. Bunlar; bağlantı sözcükleri verilmeden yapılması istenen kavram haritaları, bir diğer deyişle ilişkiler yaratılarak oluşturulan kavram haritaları (C 'created' tekniği), ve bağlantı sözcükleri verilerek yapılması istenen kavram haritaları, bir diğer deyişle ilişki kümesinden seçilerek oluşturulan kavram haritaları (S 'selected' tekniği) olarak adlandırılır. Bir diğer yapısal değişiklik; öğrencilerin verilen kavramları, kavram haritasında bırakılmış olan boşlukları doldurmak için kullanması şeklinde olabilir. Bu şekilde yapılandırılan kavram haritaları 'doldurma kavram haritası' (fill-in map) olarak adlandırılır.

Doldurma kavram haritaları uzmanlarca çizilmiş kavram haritalarından bazı ya da tüm, kavram ya da bağlantı sözcüklerinin çıkarılmasıyla oluşturulur. Doldurma kavram haritaları öğrencilerin bu boşluklara dolduracakları kavramları seçmeleri ya da üretmelerine göre ikiye ayrılır. Öğrencilerden kavram haritalarındaki bu boşlukları üreterek doldurmaları isteniyorsa bu tür kavram haritalarına üret ve doldur (create and fill-in) kavram haritaları, verilen kavram ya da bağlantı sözcükleri kümesinde seçerek doldurmaları isteniyorsa 'seç ve doldur kavram haritaları' (select and fill-in) denir (Schau et al., 1997). Doldurma kavram haritaları ölçme aracı olarak ilk olarak Surber tarafından 1984'te kullanılmıştır. Naveh-Benjamin, Lin ve McKeachie (1995) doldurma yaklaşımını sınıflandırılmamış ilişkileri içeren hiyerarşik kavram haritalarında kullanmışlardır. Bu çalışmada üret ve doldur (create and fill-in) ve seç doldur (select and fill-in) türünde oluşturulması istenen 2 farklı doldurma kavram haritası kullanılmıştır. Çalışma içerisinde bu haritalar kısaca C ve S tekniği ile hazırlanmış doldurma kavram haritaları olarak isimlendirilmiştir.

Yapılarına göre farklılık gösteren kavram haritaları puanlama yöntemlerine göre de farklılaşır. Novak ve Gowin (1984), birkaç kriter üzerinde puanlamayı önerir, bunlar: sayı ve anlamlılık olarak kavramlar arası bağlantılar, haritada kavramlar arası hiyerarşik yapının gösterilme derecesi, değişik kavram hiyerarşisi arasında bağlantının var oluşu ve uygun örneklerin sağlanmasıdır. Bu kriterler sadece hiyerarşik kavram haritalarında uygulanır. Sadece bazı kavram haritaları hiyerarşiktir ve hiç hiyerarşik yapı yoksa hiyerarşi için yapılan puanlama dikkate alınmadan diğer puanlamalar yapılarak işlemler yürütülebilir. Bazı puanlama yöntemleri, bağlanmış kavram çiftlerini sayar. Bu bağlar hiyerarşik, çoklu ya da çapraz olabilir. Puanlar bağların sayısına göre verilir (Shavelson, 1993). Diğer bir yöntemin odağında, kavram haritalarındaki önermeler yer alır. Bu yöntemde önermelerin üç parçası puanlanır. Bunlar; kavramlar arasındaki ilişki, etiket, kavramlar arasındaki hiyerarşik ya da nedensel ilişkileri ifade eden okun yönü. Bunun yanında kavram haritaları dereceli puanlama anahtarı (rubrik) kullanılarak da puanlanabilir. Dereceli puanlama anahtarı, performansı tanımlayan ölçütleri içeren puanlama rehberidir. Herhangi bir çalışmanın puanlanması için geliştirilmiş ölçütleri içeren bir araçtır (MEB, 2005). Doldurma (fill map) şeklinde hazırlanmış olan kavram haritaları doğru yanıtlara 2, kısmen doğru yanıtlara 1 boş ve yanlış yanıtlara 0 verilerek puanlanabilir. Kısmen doğru yanıtlar doldurma kavram haritası hazırlanacak olan konunun uzmanları tarafından belirlenir. İki kavram arasında ilişkinin var olduğunu bilen ancak aradaki bağlantı sözcüğünü yazamamış olan öğrencinin bu cevabı kısmen doğru olarak kabul edilir. Bu çalışmada kullanılan doldurma kavram haritaları doğru yanıtla 2, kısmen doğru yanıtlara 1 ve boş ve / veya yanlış yanıtlara 0 verilerek puanlanmıştır.

Kavram haritaları üzerine yapılan araştırmalarla kavram haritalarının iç tutarlık güvenirliği, kararlığı, uyum geçerliği, yordama geçerliği, farklı puanlama yöntemlerinin denkliği ve farklı kavram haritalarının denkliği konularına ışık tutulmuştur. Bu çalışmalar uygun olmayan seçenekleri elemede yardımcı olacak olan; farklı kavram haritaları konuları, yanıtlama formatı ve puanlama cetvelinin teknik özellikleri hakkında önemli bilgileri bize sunmuştur. Buna rağmen kavram haritası değerlendirmesinde değişkenlik kaynakları o kadar fazladır ki klasik test kuramı (KTK) bu değişkenlerle etkili olarak başa çıkamaz.

Başarısı ölçülmek istenen adayın kavram haritasından elde ettiği başarı puanını tüm adayların her türlü değişen durum altında- konu, cevaplama yöntemi, puanlama sistemi- kavram haritasından elde ettiği puanlar evreninden bir örnek olarak görecek olursak kavram haritası değerlendirmesi Genellenebilirlik Kuramı çerçevesinde yapılabilir.

Genellenebilirlik (G) kuramı ölçme sonuçlarının güvenirliğinin belirlenmesini, güvenilir gözlemlerin tasarımını, araştırılmasını ve kavramsallaştırılmasını sağlayan istatistiksel bir kuramdır. Genellenebilirlik (G) kuramının temeli varyans analizi (ANOVA) üzerine kurulmuştur. Varyans analiziyle toplam varyans desendeki

bağımsız değişkenlere bölünür. Böylece ölçme sonuçları farklı varyans kaynaklarına ayrılarak bireylerin ya da objelerin gözlenen puanlarının evren puanlarına (gerçek puanlarına) genellenebilmesi sağlanır.

G kuramı KTK'nı geçersiz kılmamakla birlikte karşılaştırıldıklarında aralarında bazı faklılıklar bulunur (Shavelson ve Webb, 1991). G kuramı KTK'ndan öncelikle hata kaynaklarını ele alışı bakımından ayrılır (Cronbach ve ark. , 1995). Bu kuram, hata terimini birçok hata kaynağına ayırmakla birlikte birçok değişkenlik kaynağından gelen hataların (puanlayıcı, madde, zaman vb.) birlikte değerlendirilmesine (hata kaynaklarının birbirleriyle ortak etkileşimlerine) olanak tanır (Shavelson ve Webb 1991). Böylece G kuramıyla KTK'ında olduğu gibi farklı hata kaynaklarına göre farklı güvenirlik katsayıları hesaplamak yerine tek bir güvenirlik katsayısı hesaplanabilir. Bunun yanı sıra Genellenebilirlik Kuramında Klasik Test Kuramından farklı olarak bağıl ve mutlak değerlendirmeler arasında bir ayrım söz konusudur. Bu nedenle güvenirlik hesaplanırken hata varyansları arasında bağıl ve mutlak hatalara göre farklılık vardır (Brennan, 2001). Bir diğer farklılık güvenirlik hesaplanırken Klasik test kuramına göre güvenirliğin hangi amaç için kullanılacağı göz önüne alınması ve hesaplanmasında buna uygun bir yol seçilmesi gerekirken (Baykul, 2000) genellenebilirlik kuramının güvenirlik yöntemlerinin tümünü içine almasıdır (Eason, 1989).

Genellenebilirlik kuramıyla en etkili ve daha yüksek güvenirlik elde etmek için karar çalışması (K çalışması) yapılabilmesi G kuramını klasik test kuramından ayıran başka bir gelişmedir. Genellenebilirlik kuramı ile K çalışması yapılarak sonraki çalışmalar için oluşturulan senaryolarla gelecek çalışmalar için bilgiler elde edilebilir.

Genellenebilirlik kuramında öğrencinin bir performansın ölçülmesinde yer alan görevde gösterdiği performansı, puanlayıcı ve görev gibi olası tüm değişkenlik kaynaklarının bir arada bulunduğu karmaşık bir evrendeki performansından çekilen bir örneklemi olarak görülür.

Tüm açıklamalara dayanarak Genellenebilirlik kuramı performansın ölçülmesinde güvenirliğin kestirilmesine uygun bir kuramdır denilebilir.

Genellenebilirlik kuramı, klasik test kuramının sadece yeniden yorumlanması olmayıp, aynı zamanda güvenirlik ile geçerlik arasındaki yerleşe gelmiş farkın, güvenilir ölçmeler düzenleyerek nasıl ortadan kaldırılabileceğini de ortaya koymaktadır. Genel anlamıyla yapı geçerliği, ölçülmek istenilen bir yapının yani bireylerde var olduğu kabul edilen bir özelliğin, ölçme sonucunda ortaya konulma derecesi olarak yorumlanabilir (Baykul, 2000). Oysa klasik kurama göre güvenirlik, paralel ölçmeler sonucunda gerçek puana ilişkin doğru tahminde bulunmanın bir derecesidir. G kuramında yer alan "evren" kavramı; tüm gözlem koşulları ve değişkenlik kaynaklarını kapsamaktadır ki bu da klasik kuramdaki geçerlikte yer alan "yapı" kavramını tanımlamaktadır. G kuramı, bu örtük yapıya (kabul edilebilir gözlemlerin evreni) ilişkin kestirimlerin doğru olarak elde edilmesini sağlarsa, güvenilir sonuçlara ulaşılabileceğini ifade eder. Böylelikle G kuramı, güvenirlik ile geçerlik arasındaki geleneksel ayrımı ortadan kaldırır.

Genellenebilirlik kuramına göre evrende bir ya da birden çok varyans kaynağı bulunmaktadır. Bu varyans kaynakları genellenebilirlik kuramında değişkenlik kaynağı (facet) olarak adlandırılır (Brennan 2001). G kuramında kullanılan bir kavram olan "değişkenlik kaynağı" (facet) deneysel desenlerin literatüründeki faktör kavramına benzer.

Bir değişkenlik kaynağının tesadüfi olarak mı yoksa sabit olarak mı ele alınacağı tamamıyla araştırmacının kararına bağlıdır. Eğer araştırmacı, örneklemin ötesinde genelleme evrenine genelleme yapmak istiyorsa, bu durumda değişkenlik kaynağı tesadüfi olarak ele alınacaktır. Diğer taraftan, eğer araştırmacı örneklemin ötesinde bir genellemeye gitmek istemiyorsa, o zamanda değişkenlik kaynağı sabit olarak düşünülecektir. Değişkenlik kaynağının tesadüfi ya da sabit olarak ele alınması güvenirliğin kestirimini etkilemektedir.

Genellenebilirlik kuramına göre değişkenlik kaynakları çapraz (crossed) ya da yuvalanmış (nested) şekilde olabilir (Rentz 1987). Bir değişkenlik kaynağının koşulları başka bir değişkenlik kaynağının koşullarıyla örtüştüğü duruma çapraz (crossed) denilmektedir (Shavelson ve Webb 1991). Çapraz olarak tasarlanmış bir desende değişkenlik kaynakları arasında "x" işareti kullanılır. Değişkenlik kaynaklarının diğer değişkenlik kaynaklarıyla örtüşmediği yani çaprazlanmadığı durumlar da söz konusudur. Bir değişkenlik kaynağının

koşulları diğer değişkenin bazı koşullarıyla örtüşüyorsa değişkenlik kaynakları yuvalanmış (nested) olarak tasarlanmalıdır. Yuvalanmış olarak tasarlanmış bir desende değişkenler arasında ":" işareti kullanılır (Shavelson ve Webb, 1991).

Değişkenlik kaynaklarının düzeyleri koşullar (conditions) olarak adlandırılır. Örneğin, bir başarı testinde maddeler değişkenlik kaynağı olarak adlandırılırken testte bulunan her bir madde de bu değişkenlik kaynağının koşulu olarak düşünülebilir (Wang 2005). Gözlemlerin yapıldığı eldeki örneklemin yerine geçebilecek olası gözlemlerin tümüne "kabul edilebilir gözlemlerin evreni (the universe of admissible observation)" denir. "Genelleme evreni (the universe of generalization)" ise araştırmacının genellemek istediği koşulların setidir. Pek çok ölçme durumunda bireyler, ölçmenin amacıdır (the object of measurement).

Evren puanı amaçlanan değişkenlik kaynakları için kabul edilebilir gözlemlerin evreninden elde edilecek puanların ortalaması olarak bulunan, ölçme puanı olarak tanımlanır. Evren puanları varyansı, klasik test kuramında yer alan gerçek puan varyansına benzer. Klasik test kuramından farklı olarak, G kuramında iki ayrı hata varyansı bulunur. Bu farklılık, G kuramında iki ayrı anlamda karar vermenin mümkün olmasından kaynaklanmaktadır. G kuramında hem göreceli hem de mutlak hata varyansı bulunmaktadır. G kuramındaki göreceli hata varyansı klasik kuramdaki hata varyansı gibi düşünülebilir (Shavelson ve Webb, 1991).

G Kuramında, güvenirliğin araştırılmasında iki aşamadan söz etmek mümkündür (Goodwin, 2001). Bunlardan ilki Genellenebilirlik çalışması (G-çalışması) ve ikincisi Karar çalışması (K-çalışması)dır.

G çalışmasının amacı, ölçmenin birden çok kullanımını kestirmek ve bu sayede varyans kaynakları ile ilgili mümkün olan en çok bilgiyi sağlamaktır. G çalışması, mümkün olan en çok değişkenlik kaynağını içerecek biçimde tasarlanmalıdır. Yani G çalışması, kabul edilebilir gözlemlerin evrenini mümkün olan en geniş şekilde tanımlar (Shavelson ve Webb, 1991).

K çalışması ise, G çalışmasından elde edilen bilgiyi belli bir amaç doğrultusunda sosyal bilimlerdeki ölçmelerde mümkün olan en iyi deseni oluşturmak için kullanır (Shavelson ve Webb, 1991). K-çalışması, karar vermek üzere belirli bir amaç için veri toplanan çalışmadır. Yapılan bir K çalışmasında, incelenen bireyleri tanımlamak için veri toplanabilir. K-çalışması sürecinde araştırmacı, farklı senaryolar kullanarak daha yüksek güvenirlik ve daha düşük hataların olduğu durumlar elde etmeye çalışır. Örneğin; "Daha fazla sayıda puanlayıcı kullandığımda ne olur?", "Görev sayısını azaltırsam ölçme aracımın güvenirliğinde kaybım çok fazla olur mu?" vb. sorularının cevabı K-çalışması yapılarak araştırılır. Sonuç olarak, tek bir G-çalışmasından elde edilen aynı varyans kestirimlerine dayalı pek çok K-çalışması düzenlenebilir.

Bir çalışmanın desenine bakarak o çalışmayı sadece G çalışması veya K çalışması olarak sınıflamak ise mümkün değildir (Crocker ve Algina 1986). Farklı puanlayıcılar tarafından puanlanan bir testin güvenirliğini kestirmek bir G çalışması iken, bu testi puanlamak için uygun olan puanlayıcı sayısının belirlenmesi bir K çalışmasıdır.

Genellenebilirlik kuramı çerçevesinde, hangi modelin uygun olduğu daima uygulama amacına yani araştırmacının ölçme sonuçlarını nasıl kullanacağına bağlıdır. Eğer bir öğrencinin bir sınavdan geçmesi veya kalması sınavı alan diğer öğrencilerin o sınavdaki performanslarına bağlı ise araştırmacı göreceli model kullanmalı; eğer öğrencinin sınavdan geçmesi veya kalması diğer öğrencilerin o sınavdaki performanslarından bağımsız olarak sadece kendi performansına bağlı ise araştırmacı mutlak model kullanmalıdır.

G kuramı sosyal bilimlerdeki ölçmelerde hataya sebep olan varyans kaynaklarına odaklanmasına rağmen, genellenebilirlik (G) katsayısı adında bir güvenirlik katsayısı da sağlamaktadır. G katsayısı, bir bireyin gözlenen puanından o bireyin evren puanının ne derece doğru genellendiğinin bir göstergesidir. Klasik test kuramındaki güvenirlik katsayısı gibi, genellenebilirlik katsayısı bireylerin puanlarındaki çeşitliliğin oranını yansıtır (Güler, 2008).

Genellenebilirlik katsayısı (G-katsayısı), klasik test kuramındaki gerçek varyansın gözlenen varyansa oranı olan, güvenirlik katsayısıyla benzerlik gösterir. Özellikle (1) değişkenlik kaynağının maddeler olduğu, (2) K çalışmasındaki düzeylerin testte yer alan maddelerin sayısına eşit olduğu ve (3) sadece göreceli modelin

kullanıldığı durumda, tek değişkenlik kaynaklı (maddeler) çaprazlanmış desenlerdeki G-katsayısı, klasik test kuramındaki Cronbach alfa'ya eşit olmaktadır.

G-katsayısı, göreceli modellerde kullanılır ve gerçek varyansın, gerçek varyans ile göreceli varyansın toplamına bölünmesiyle hesaplanır. Güvenirlik indeksi (Phi-katsayısı) ise mutlak modeller için kullanılmaktadır. Güvenirlik indeksi gerçek varyansın, gerçek varyans ile mutlak varyansın toplamına bölünmesiyle elde edilir. Diğer bir deyişle, bu iki katsayı hatanın nasıl ele alındığına bağlı olarak değişmektedir.

Bu çalışma ile Fen ve Teknoloji dersinin "Madde" konusunu ölçen iki farklı doldurma kavram haritası tekniğinin genellenebilirlik kuramı ile elde edilen parametreleri araştırılmıştır. Bu amaca dayalı olarak G çalışması ile C ve S tekniği ile yapılandırılmış doldurma kavram haritaları uygulamalarından elde edilen sonuçların varyansları ve toplam varyansları açıklama yüzdeleri, K çalışması ile madde sayılarının arttırılması ve azaltılmasıyla G ve Phi katsayılarındaki değişim araştırılmıştır.

Bu araştırmayla klasik test yöntemiyle değerlendirmesi zor olan kavram haritası tekniklerinin genellenebilirlik kuramı ile değerlendirilebileceğinin ortaya çıkarılabileceği düşünülmektedir. Genellenebilirlik kuramının gücü, elverişliliği ve esnekliğine dayanarak kavram haritası değerlendirilmesinde klasik test kuramına göre tercih edilebilir olduğunu göstereceği ve bu nedenle önemli olduğu düşünülmektedir.

Araştırma 2010-2011 öğretim yılında Sakarya Üniversitesi Fen Bilgisi Eğitimi Bölümü 3. Sınıf öğrencileri ve Fen ve Teknoloji dersi 'Madde' konusu ile sınırlıdır.

2. YÖNTEM

2.1. Araştırmanın türü

Bu araştırmada madde konulu iki farklı kavram haritası tekniğinin genellenebilirlik kuramı kullanarak parametrelerinin elde edilerek incelendiğinden bu yönüyle çalışma betimsel bir araştırma niteliğindedir.

2.2. Çalışma grubu

Bu araştırmanın çalışma grubunu 2010-2011 öğretim yıllarında Sakarya Üniversitesi Fen Bilgisi Eğitimi Bölümü 3. Sınıf'ta okuyan 64'ü (%70,6) kız 26'sı (%29,4) erkek toplam 90 öğrenci oluşturmuştur. Öğrenciler öğretim yöntem ve teknikleri dersi kapsamında kavram haritası hazırlamayı aynı öğretim üyesi tarafından öğrenmişlerdir.

2.3. Verilerin elde edilmesi ve veri toplama araçları

Araştırmanın problemini yanıtlamak için gerekli olan veriler biri S tekniği diğeri C tekniği ile hazırlanmış olmak üzere iki farklı doldurma kavram haritası ile toplanmıştır.

Uygulamalar için 90 kişiden oluşan grup rastgele olarak 2'ye ayrılmıştır. 44 kişiden oluşan gruba S tekniği ile hazırlanmış doldurma kavram haritası ve 46 kişiden gruba C tekniği ile hazırlanmış doldurma kavram haritası uygulanmıştır.

2.4. Verilerin analizi

Bu çalışmada elde edilen veriler çalışmanın problemine cevap verecek şekilde genellenebilirlik kuramının analizleri kullanılarak çözümlenmiştir.

Uygulamalar sonucunda genellenebilirlik kuramına göre ana ve ortak etkiler için varyans değerlerinin kestirilmesinde, puanların güvenirliği için G ve Φ (Phi) katsayılarının hesaplanmasında ve K çalışmalarında EduG programı kullanılmıştır.

C ve S tekniği ile elde edilen doldurma kavram haritası değerlendirilmesinde karar çalışmaları tek boyut altında yer alan 10 madde sayısına göre yapılmıştır.

3. BULGULAR

Farklı teknikle hazırlanmış kavram haritalarının uygulama sırasına göre öğrencilerin 10 maddeye verdikleri cevaplardan elde edilen puanların betimsel istatistikleri Tablo 1'de verilmiştir.

Tablo 1. Farklı teknikle hazırlanmış kavram haritalarında yer alan 10 maddeye öğrencilerin verdikleri cevaplardan elde edilen puanların betimsel istatistikleri

İstatistikler	C	S
N	46	44
Ortalama	11,96	15,43
Ortanca	12,50	16,50
Tepe değer	5	17
Std. Sapma	5,337	4,145
Çarpıklık	-0,31	-1,320
Basıklık	-1,354	1,899

Tablo 1'de görüldüğü gibi, 10 maddeden 0 - 2 puan ölçeği üzerinden aldıkları puanlara ilişkin ortalamalar C uygulaması için 11,96 ; S uygulaması için ise 15,43'tür. Her iki harita tekniğine ilişkin ortanca aritmetik ortalamadan büyüktür ve harita tekniğine ait puanlar sola çarpık dağılım göstermektedir. Bu durum, her iki harita tekniği için çarpıklık katsayısının negatif çıkmasıyla da görülebilmektedir. Basıklık katsayılarına bakıldığında, C uygulamasından elde edilen basıklık katsayısı 0'dan küçük bir değer olup puanlar normalden daha basık, S uygulamasından elde edilen basıklık katsayısı 0'dan büyük bir değer olup puanlar normalden daha sivri dağılım göstermektedirler.

C uygulaması olarak adlandırılan tek boyutta toplanan doldurma kavram haritası değerlendirilmesinin G çalışması ile elde edilen varyanslarını ve varyans yüzdelerini hesaplamak amacıyla, 10 maddeye çaprazlanmış O x M modeli uygulanmıştır. Değerlendirmenin uygulandığı 46 öğrenci (Öğrenci) ve 10 maddeden (madde) oluşan orjinal verilerle tek değişkenli modelle yapılan G çalışması için; kestirilen varyans bileşenleri ve toplam varyansı açıklama yüzdeleri O ve M ana etkileri ile OM ortak etkileri Tablo 2'de verilmiştir.

Tablo 2. C Uygulamasına ait Kavram Haritası Değerlendirilmesinin G Çalışması ile Kestirilen Varyanslarını ve Toplam Varyansı Açıklama Oranları

Varyans kaynağı	Sd	Kareler toplamı	Kareler ortalaması	Varyans	%
O	45	128.191	2.848	0.255	41.0
M	9	32.826	3.647	0.073	11.7
OM	405	119.373	0.294	0.294	47.3
Toplam	459	280.391			100%

Tablo 2'de verilen tek değişkenli G çalışması sonucunda C uygulaması değerlendirmesinin tek boyutu için kestirilen varyans ve toplam varyansı açıklama oranları incelendiğinde, öğrenci (O) ana etkisi için kestirilen varyans bileşeninin (0,255) toplam varyansın % 41,0'ini açıkladığı görülmektedir.

Madde (M) ana etkisi için tek değişkenli modelle yapılan G çalışmasından kestirilen varyans bileşeni (0,073) toplam varyansın % 11,7'sini açıklamaktadır. Madde ana etkisinin varyans bileşeni büyüklüğünün, öğrenci ana etkisine göre daha düşük olduğu görülmektedir.

Öğrenci x Madde (OM) ortak etkisi (0,294) toplam varyansın % 47,3'ünü açıklamaktadır.

C uygulaması olarak adlandırılan doldurma kavram haritası değerlendirilmesinin tek boyutunda yer alan 10 madde sayısının beş arttırılıp azaltılması senaryosuna göre yapılan K çalışması sonucunda G (genellenebilirlik) ve Phi 'Φ' (güvenirlik) katsayılarına ilişkin değerler Tablo 3'te verilmiştir.

Tablo 3. Doldurma Kavram Haritası Değerlendirmesi C Uygulamasına İlişkin K Çalışması ile Madde ve Sayıları Senaryosuna Göre G ve Phi Katsayıları

Madde sayısı	5	10	15	20	25
G	0.81	0.90	0.93	0.95	0.96
Φ	0.78	0.87	0.91	0.93	0.95

Tablo 3'te görüldüğü gibi, doldurma kavram haritası değerlendirmesinin tek boyutu altında yer alan uygulamadaki 10 madde sayısına G katsayısı 0.90 ve Φ katsayısı da 0.87 olarak kestirilmiştir. Buradan görüleceği gibi, uygulamadaki durumda değerlendirmeden elde edilen puanların G katsayısı Φ katsayısından daha yüksektir. Madde sayısının beş azaltılması (5) durumunda kestirilen G katsayısı 0.81 ve Φ katsayısı 0.78, madde sayısının beş arttırılması (15) durumunda ise G katsayısı 0.93 ve Φ katsayısı 0.91 olarak hesaplanmıştır.

Tablo 3'te uygulamadaki madde sayılarının azalması durumunda G ve Φ katsayılarının giderek azaldığı, arttırılması durumunda ise G ve Φ katsayılarının giderek arttığı açıkça görülmektedir. Tüm madde sayılarına göre, G katsayısı Φ katsayısından daha yüksek değerlere sahiptir.

Benzer şekilde S uygulaması olarak adlandırılan tek boyutta toplanan doldurma kavram haritası değerlendirilmesinin G çalışması ile elde edilen varyanslarını ve varyans yüzdelerini hesaplamak amacıyla, 10 maddeye çaprazlanmış O x M modeli uygulanmıştır. Değerlendirmenin uygulandığı 44 öğrenci (birey), 10 maddeden (madde) oluşan orjinal verilerle tek değişkenli modelle yapılan G çalışması için; kestirilen varyans bileşenleri ve toplam varyansı açıklama yüzdeleri O ve M ana etkileri ile OM ortak etkisi Tablo 4'te verilmiştir.

Tablo 4. S Uygulaması Kavram Haritası Değerlendirilmesinin G Çalışması ile Kestirilen Varyanslarını ve Toplam Varyansı Açıklama Oranları

Varyans kaynağı	Sd	Kareler toplamı	Kareler ortalaması	Varyans	%
O	43	73.879	1.718	0.146	31.2
M	9	27.793	3.088	0.064	13.8
OM	387	99.508	0.257	0.257	55.0
Toplam	439	201.180		0.146	100%

Tablo 4'te verilen G çalışması sonucunda S uygulaması değerlendirmesinin tek boyutu için kestirilen varyans ve toplam varyansı açıklama oranları incelendiğinde, öğrenci (O) ana etkisi için kestirilen varyans bileşeninin (0,146) toplam varyansın % 31,2'sini açıkladığı görülmektedir.

Madde (M) ana etkisi için tek değişkenli modelle yapılan G çalışmasından kestirilen varyans bileşeni (0,064) toplam varyansın % 13,8'ini açıklamaktadır..

Öğrenci x madde (OM) ortak etkisi (0,257) toplam varyansın % 55'ini açıklamaktadır.

SS uygulaması olarak adlandırılan doldurma kavram haritası değerlendirilmesinin tek boyutunda yer alan 10 madde sayısının beş arttırılıp azaltılması senaryosuna göre yapılan K çalışması sonucunda G (genellenebilirlik) ve Phi 'Φ' (güvenirlik) katsayılarına ilişkin değerler Tablo 5'te verilmiştir.

Tablo 5. Doldurma Kavram Haritası Değerlendirmesi S Uygulamasına İlişkin K Çalışması ile Madde Sayıları Senaryosuna Göre G ve Phi Katsayıları

Madde sayısı	5	10	15	20	25
G	0.74	0.85	0.89	0.92	0.93
Φ	0.69	0.82	0.87	0.90	0.92

Tablo 5'te görüldüğü gibi, doldurma kavram haritası değerlendirmesinin tek boyutu altında yer alan uygulamadaki 10 madde sayısına göre elde edilen G katsayısı 0.85 ve Φ katsayısı da 0.82 olarak kestirilmiştir.. Madde sayısının beş azaltılması (5) durumunda kestirilen G katsayısı 0,74 ve Φ katsayısı 0.69, madde sayısının beş arttırılması (15) durumunda ise G katsayısı 0.89 ve Φ katsayısı 0.87 olarak hesaplanmıştır.

4. SONUÇ VE ÖNERİLER.

C ve S teknikleri ile uygulanan doldurma kavram haritası değerlendirilmesinde yer alan 10 maddeye çaprazlanmış O x M modeli uygulanarak yapılan G çalışması sonucunda tek boyut için kestirilen varyans ve toplam varyansı açıklama oranları aşağıda açıklanmıştır.

Her iki teknik için de Öğrenci (O) ana etkisi için kestirilen varyans bileşeninin tüm uygulamalar için toplam varyansın büyük bir oranını açıkladığı görülmüştür. Uygulamaların tümünde tek değişkenli modelle bireyler için kestirilen varyans bileşeni, toplam varyans içinde yüksek bir paya sahip varyans bileşeni olmuştur. Genellenebilirlik çalışmalarında, birey ana etkisi evren puanı varyansı olarak değerlendirilir ve ölçülen özellik açısından bireyler arası farklılaşmayı ifade eder (Shavelson ve Webb, 1991; Brennan 2001). Bireyler için kestirilen varyansın toplam varyans içindeki oranının en büyük olması istenilen bir durumdur. Buna göre, yapılan değerlendirmenin, elde edilen boyutta bireyler arası farklılıkları ortaya çıkarılabildiği sonucuna varılmıştır. Bu sonuca dayanarak kavram haritası ile yapılacak değerlendirmelerde bireyler arası farklılıkların ortaya çıkarılması istendiğinde C ve S tekniği ile hazırlanmış kavram haritaları uygulanabilir.

Benzer şekilde madde (M) ana etkisi için kestirilen varyans bileşeni büyüklüğü her iki uygulama için diğer ana etki olan öğrenci ana etkisine göre daha düşük olduğu gözlenmiştir. Buna göre, doldurma kavram haritası uygulamasında yer alan maddelerin güçlük düzeylerinin birbirine yakın olmadığı, bir maddenin diğerinden daha zor olduğu sonucuna varılmıştır. Buna göre farklı tekniklerde bulunan maddelerin güçlük düzeylerinin farklı olduğu sonucuna varılmıştır.

Öğrenci x Madde (OM) ortak etkisi her iki uygulama içinde varyans yüzdesi en büyük olan etkidir. Bu durum, bu ölçme için belli bireylerin bağıl durumlarının bir maddeden diğerine çok farklılaştığını göstermektedir. Ayrıca artık etki olarak adlandırılan bu varyans tesadüfi hataların büyük olabileceğinin bir göstergesi olabilir

C ve S tekniği ile elde edilen doldurma kavram haritası değerlendirmesinde tek boyut altında yer alan 10 madde sayısına göre elde edilen genellenebilirlik (G katsayısı) ve güvenirlik (ϕ katsayısı) her iki teknik içinde birbirlerine çok yakın ve oldukça yüksek değerler olarak elde edilmiştir. Bu değerler sırasıyla C tekniği için 0,90 - 0,87 ve S tekniği için 0,85 - 0,82'dir. Elde edilen sonuçlara göre tek boyut altında yer alan 10 madde sayısına göre C tekniği daha yüksek güvenirlik vermektedir. Ayrıca Yapılan K çalışmasında madde sayısının arttırılmasıyla G ve Φ katsayılarında da artış gözlenmiştir. Ancak bu artış C tekniği için 25 maddeyle G katsayısı için en fazla 0,06 S tekniği için 0,08'dir. Madde sayılarını arttırmanın, G ve Φ katsayılarında elde edilen bu

kadar küçük artmalara sebep olmasından dolayı emek ve zaman açısından fazlaca ekonomik olmadığı yorumu yapılabilir.

Yapılan analizler sonucunda her iki uygulamanın değerlendirmesinde daha yüksek genellenebilirlik ve güvenirliğe ulaşmak için madde sayısını arttırmak uygun olabilir.

Araştırmadan elde edilen bulgulara göre önce C tekniğinden daha yüksek güvenirlik (0,90) elde edilmiştir. Ayrıca diğer uygulamaya göre daha yüksek güvenirlik veren C uygulamasına yapılan karar çalışması sonucunda madde sayısını arttırarak daha yüksek güvenirlik elde edilebileceği vurgulanmıştır. Bu sonuçlara dayanarak farklı tekniklerle uygulanmış doldurma kavram haritası değerlendirmesinde yüksek güvenirlik için madde sayısı arttırılmış C uygulamasını kullanmak uygun olabilir.

Bu çalışma sadece Fen ve Teknoloji dersi 'madde' konusu düşünülerek yapılmıştır. Daha genelleyici sonuçlara ulaşabilmek amacıyla, farklı derslerde ve farklı konularda doldurma kavram haritalarının güvenilir ve geçerli sonuçlar verip vermediği araştırılabilir.

Bu çalışmada doldurma kavram haritası değerlendirilmesinin güvenirliği genellenebilirlik kuramının O x M modeli ile analiz edilmiştir. Benzer çalışmalar genellenebilirlik kuramının farklı modelleri ve farklı değişkenlik kaynakları ele alınarak yapılabilir.

GENERATIONS OF DISTANCE EDUCATION: TECHNOLOGIES, PEDAGOGIES, AND ORGANIZATIONS

Kumiko Aoki[23]

Open Universtiy of Japan, 2-11 Wakaba, Mihama-ku, Chiba, 261-8586 Japan

Abstract

Distance education has often been discussed in terms of generations as its forms and methods have been evolved over years. Most often, generations of distance education has been discussed in terms of the dominant technologies it utilizes in teaching and learning. There has been another attempt to classify distance education into generations in terms of its dominant pedagogy. This paper proposes the discussion of distance education in terms of its organizational structure, and proposes a new organizational structure for distance education in which a division of labor can be observed across institutions.

Keywords: distance educaiton; ICT, educational technologies, pedagogies, educational organizations, generations

Introduction

The term "distance education" may sound somewhat outdated nowadays as in today's technologies of education, its "distance" nature no longer matters as much as before. What matters more nowadays is "flexibility" and "distributed" aspect of teaching and learning using technologies. However, still "distance education" exists as a field of research and practice and many educational scholars and practitioners identify themselves as those in the field of "distance education."

There have been numerous attempts to classify distance education in the past. Most of them classify distance education in terms of dominant technologies used. Distance education and technologies are considered inseparable as in order to reach students at a distance, one must use certain tools or technologies to do so. While technologies of instruction have been examined closely, the organizational transformation those technologies necessitate tends to be overlooked. In changing the mode of instruction or the educational model of distance education, an institution must also rearrange or transform its organizational structure to enable and effectuate such changes. Actually many distance education institutions fail to transform themselves to adapt to the changes and stay behind in adopting new technologies and methods of teaching and learning.

Generations of Distance Education

Technological Perspective

The history of distance education tells us the evolving use of technologies. Bates(2005) as well as Peters (1994) mentioned that distance education had gone through three stages. The first generation of distance education refers to those which mainly utilize written and printed texts and postal services for delivering such texts in the forms of books, newspapers, and manuals. It is so-called print-based correspondence education. In this stage, the interaction between teachers and students was usually limited to correspondence, meaning hand-

[23] Corresponding author. Tel.: +81 43 298 3250; fax: +81 43 298 3250.
E-mail address: kaoki@ouj.ac.jp

written texts that were sent via postal mail. It is difficult to gauge the extent of student learning in this mode as student evaluation is usually summative and left at the end of the course.

The second generation is characterized by the use of radio and television as instructional media in addition to print materials. This generation is often referred to as the "industrial mode" of distance education with highly specialized division of labor in producing and delivering instructional materials and the potential to educate thousands of students at once. Many open universities in the world including British Open University, Anadolu University's Open Educational Faculty in Turkey, Korea National Open University and the Open University of Japan also started as this second generation institutions. When those institutions were started, broadcasting media such as television and radio were selected as the mediums of instruction as they could easily reach mass audience and it matched the mission of open universities to expand educational opportunities. All of those institutions began as national initiatives and the respective national government was heavily involved. In the case of the Open University of Japan (OUJ), it was given a television and radio station by the government for the purpose of providing lifelong learning opportunities to the citizens.

The third generation of distance education utilizes information and communication technologies (ICT) to provide interaction in addition to content delivery. There are two aspects of interactivity in the use of ICT: the interactivity between the learner and the content as seen in interactive multimedia learning materials in CD-ROM as well as on the Web and the interactivity between teachers and students and among students. The latter interactivity makes the fourth generation of distance education, in my opinion. The third generation of distance education allows personalization of content depending upon learners' learning preferences.

Taylor (2001)suggested five generations of distance education: First, the Correspondence Model based on print technology; Second, the Multi-media Model based on print, audio and video technologies; Third, the Tele-learning Model, based on applications of telecommunications technologies to provide opportunities for synchronous communication; Fourth, the Flexible Learning Model based on online delivery via the Internet; and Fifth, Intelligent Flexible Learning Model based on the interactive nature of the Internet. As this model was originally suggested before social media and Web 2.0 came into scenes, it is understandable that this model does not include the emerging generation of distance education, which utilizes Web 2.0 extensively.

Pedagogical Perspective

Criticizing those classifications based on technologies, Anderson and Dron (2010) suggests three generations of distance education in terms of its dominant pedagogy: the cognitive-behaviorist pedagogy, the social-constructivist pedagogy, and the connectivist pedagogy of distance education. According to Anderson and Dron, the first generation, the cognitive-behaviorist pedagogy, is characterized by the thinking that learning means some behavioral changes instigated by learning stimuli, and was the dominant thinking in computer-assisted instruction and instructional systems designs. The second generation of distance education pedagogy, the social-constructivist pedagogy, was originated in the work of Vygotsky and Dewey, and focuses more on learning instead of teaching. In this pedagogy, human interaction (student-teacher and student-student) is emphasized, which makes it costly for an institution to adopt. The third generation, the connectivist pedagogy of distance education, is built around networked connections and based on the learners' ability to actively participate in networked communities of their choice.

As Anderson and Dron state that, "Connectivism is built on an assumption of a constructivist model of learning, with the learner at the centre, connecting and constructing knowledge in a context that includes not only external networks and groups but also his or her own histories and predilections," the connectivisit pedagogy does not seem significantly different from the social-constructivist pedagogy, but it may be significantly different from other paradigms of teaching and learning in terms of the degree of control an institution has over students' learning. In the previous paradigms of distance education, the role of institutions in designing and evaluating students' learning is quite large while in the connectivist model where learners rely upon existing networked communities to develop their own net presence, the role educational institutions play in individual learning may be reduced to credentialing what students have learned.

Organizational Perspective

So far the evolution of distance education has been classified into generations in terms of its dominant technology and its dominant pedagogy. Here it is suggested that distance education can be classified into three organizational models. The first organizational model of distance education is the "supplementary model," where distance education is supplementary or complementary to traditional education, which targeted those who were excluded from traditional education for some reasons and needed some "access and equity" in their lives (Terry Evans, 2008). As the distance education programs are supplemental to on-campus programs, the institutional investment in offering the distance educational programs is minimal and usually managed by a special office called "extension programs," "external study," "independent study," etc. It also has been called "independent study," "self-directed learning," and "non-traditional and open education" (Saba, 2011).

After the introduction of the Internet in distance education, many existing educational institutions have taken this supplementary model as its core and started to offer dual mode (online and off-line) of teaching and learning. In many such institutions, a division specialized in helping schools and departments offer distance education classes and courses has been established and schools and departments have started to expand their student base beyond on-campus students.

The second generation of distance education is the industrial model discussed earlier. The industrial model has been associated with mass education where hundreds or thousands of students learn in the same program using the same content and the same method. In order to enable this, the institution has to have a division of labors within the institution; hence, it becomes the "industrial" model of production and delivery of courses. Those institutions who utilize educational broadcasting such as radio, television, telecommunications satellites and cable television must organize themselves into this model as it is labor intensive to produce such educational broadcasting programs and it requires different skillsets and expertise to do so. The drawbacks of this organizational model are: difficulty of responding to changing needs of learners, inflexibility of adopting new methods and content, and large organizational overhead.

The third and emerging model of distance education is the "ad hoc model," in which institutions may play one part in the whole process of learners' learning in various ways. In this model, the beauty of utilizing technologies should be realized in providing individualized learning programs and structures responsive to individual learners' needs instead of one size-fits-all system. However, in order to achieve this, it becomes too costly for one institution to offer all the diverse programs and systems depending on diverse learners' needs. Hence, an institution may offer services covering some part of the whole learning process of a learner.

For example, one institution may offer learning content while another institution may offer tutorials and student support. Yet, some other institution may offer evaluation of learning and credentialing of what students have learned. It's a division of labor across institutions to meet the demands of learners being arranged by an ad hoc institution based on learning goals students want to achieve. This third organizational model is still emerging, and has not yet been seen beyond experimental bases. As discussed above, there are many different models (whether it is termed as "generations" or not) of distance education and it is usually the case that evolving from one generation to another, or transforming itself from one model into another requires tremendous institutional efforts. It is so much easier to start anew rather than transforming one institution into that of a different generation or model.

Conclusions

In today's world, distance education has been becoming more complex and multi-faceted as time has gone by with added features and technologies. Educational institutions which have been created before the times of technological availability of today have to restructure themselves in order to benefit from those technological advances. With those technologies, now it is possible to achieve the ideal learning environment for a learner, that is customizable according to the individual learner's needs and preferences. For that end, educational institutions

have to reconsider the meaning of their own existence to equip learners' with the skills needed today and in the foreseeable future.

Abstract

This work presents an open source web environment to learn GPSS language in Modeling and Simulation courses. With this environment, students build their models by selecting entities and configuring them instead of programming GPSS codes from scratch. Teachers can also create models so that students can apply, analyze and interpret results. Thus, it includes a simulation engine that stores snapshots of models as they are executed, and allows students to navigate through these snapshots. The environment may be combined with existing learning management systems.

Keywords: Modeling and Simulation; GPSS; interactive learning

Introduction

Programming discrete simulation models can be successfully accomplished using general purpose programming languages, such as Java or C++, or specialized languages like General Purpose Simulation System (GPSS) or Simula. While the former are known by any programmer, the latter introduce entities and processes in a higher abstraction level as well as a set of analysis tools to obtain data from simulated models. Thus, simulation languages greatly facilitate the development and execution of simulations of complex real-world systems. Most general purpose programming languages are designed around a set of instructions that control the execution of an algorithm: sequences, iterations and conditions are organized in objects, routines and subroutines. According to this simplification of programming languages, learning to build programs requires understanding what basic routines do and how they can be combined to deliver a recipe for the computer to execute.

The behavior of a system as it evolves over time is usually studied by developing a simulation *model*. This model usually takes the form of a set of assumptions concerning the operation of the system and, once developed and validated, it can be used to investigate a wide variety of "What if?" questions about the real-world system. Each simulation language generally possesses an orientation to real-world situations, which may be classified as event-oriented or process-oriented. Simulation languages exist to make it easier to build models for analysis and to answer those *what-if* questions. Understanding the output of a simulation after it was executed is as important

as programming the model. To learn an event-driven simulation approach, a few major concepts need to be incorporated: entities, events, queue theory, simulation times, etc. Thus, learning a simulation language requires understanding the syntax and semantics of the language to manage those new concepts. Unlike general programming languages, simulation languages are not built around basic or atomic instructions. Instead, they are based on high level sentences representing entities with abstract attributes and specific behavior. The combination of these sentences describes several system components and their interactions. Simulation languages are so powerful because they allow programmers to create complex models with very few lines of code, run those models and finally retrieve information – general data and statistics – that explains the behavior of the system. In the academia, GPSS (General Purpose Simulation System) is a widely used alternative for modeling and simulation used for teaching discrete systems. GPSS is processes-oriented and defines the structure of models based on a set of language commands. Each command describes processes, with attributes and subroutines inside, which affect the model being represented. The language supplies lots of entities for the programmer and more than 50 commands to deal with them: create, use, release and query their status. There exists a small set of available tools and integrated development environments (IDE) for GPSS dialects. Most of them offer a place to write the model and to run it and they display reports regarding the simulation execution results. Code assistance and visual aids for the user during the programming stage are rarely seen here. Besides, deep analysis tools of how the simulation – and its entities – progressed and changed are quite unusual too. All of these tools are tremendously useful once programmers know GPSS well, but they are not suitable for newcomers that need to learn everything from the ground up. Consequently, students spend most class time learning how to specify and combine entities in a particular language instead of focusing on acquiring important simulation skills, such as mapping real systems into abstract models, identifying input and output variables and so on.

In this work, a web-based interactive learning environment (ILE) for GPSS is presented. The ILE was built upon an intuitive graphic user interface (GUI), based on dialogues and visual aids and a simulation engine improved for learning purposes. As with most web applications, no installation process is involved since the whole application can be exposed through a web server. In addition, the application architecture –split into several layers based on the client-server model– enables the ILE to be plugged into other web systems, in particular Learning Management Systems (LMS) such as Moodle (Moodle, 2012) Sakai Project (Sakai Proyect, 2012) and LRN (LRN, 2012). Models created on the client side of the ILE can be sent to the simulation engine on the server for its execution. The engine handles everything related to code parsing, interpretation, simulation running and report generation, keeping the client lightweight. Last but not least, for each simulation run, the server registers all changes as different simulations' snapshots which are kept in persistent media. Thus, students can fetch *snapshots* of their simulations and analyze in deep detail how the whole model –or even a particular model entity– progressed during execution time. The following section shortly reviews some previous modeling and simulation related publications as well as current GPSS implementations. Next, in the *Methodology* section, some issues related to GPSS learning are explained and the most important aspects of this work are introduced. Then, the application is presented and its implications related to those issues are described, followed by a section with some important notes about the development and its advantages. Finally, suggestions for future work have been included in order to offer a wider point of view of the project.

Related work

Simulation teaching in general and GPSS learning in particular are topics that have already been discussed over the last decades. Zikic and Radenkovic (Zikic, A. M.; Radenkovic, L. J, 1996) discussed GPSS learning problems. After some years of observation, they have summarized in four points the reasons why it takes so long for students to accept an entirely new approach to programming:

- - Students acquired programming skills based in Pascal or C, which employ strict and explicit typing for variables/objects;
- - GPSS does not have explicit declaration or strict typing of variables and objects;
- - Pascal and C propose a very structured and organized approach for programming;
- - GPSS syntax is of assembler type, with labels and transfer statements, which completely clashes with structured programming;

In their work, the authors introduce a new simulation language, based on GPSS concepts but oriented to a structured programming layout. This language, named ISDS, has different syntax rules and semantics compared to traditional GPSS dialects, and introduces some important changes such as explicit declaration, types and routine code organization. Even though the base concept seems correct, the authors suggested that it could delay the learning process in a second stage: the students would eventually have to use GPSS or some other commercially available system. Thus, once they have learned ISDS, they would still need to learn GPSS or another simulation language.

There exist few active implementations of GPSS language, among which MinutmanSoftware's version, named GPSSw (Minuteman Software, 2012), excels other developments as the most widely used one. GPSSw is a desktop application, and quite fast for developing and running simulations under MS Windows. To code models, GPSSw users have at their disposal a plain text area to write GPSS sentences. The application allows the creation of the simulation as well as to start its execution by inserting a *START* command. Simulations are usually run in a few seconds; the results are displayed in a text report which summarizes the most important aspects of the previously run model. GPSSw also offers some debugging tools such as pause and resume points during runtime, and some live examination tools for most GPSS entities (facilities, storages, transaction chains, etc...). GPSSw is also very useful to generate screening, optimization or user defined experiments. Wolverine Software Corporation (Wolverine Software, 2012) has also developed a GPSS implementation, which shares some common points with GPSSw. It is also a MS Windows application which lets users run models over the simulation engine and outputs a simulation report similar to that of GPSSw. However, models have to be compiled first, which results in a MS Windows executable program representing the simulation ready to be run. Compiling source files allows users to define external so-called ampervariables (routines) in C++ programming language, which will be compiled altogether with the model file(s). Even though the compilation process adds an extra step, it proves very useful for users to enable the extension of the simulation engine, either to connect the model to external data sources or to generate different output files. WebGPSS is another application that implements GPSS dialect. Models are created by defining and connecting block diagrams. This facilitates learning since engineering students are used to representing models with diagrams and charts. Models are created in a client desktop application and sent to a server for execution. The term *web* is owing to the fact that the server process could be run in a remote computer and thus be accessed. Both server and client are executable programs included in the package.

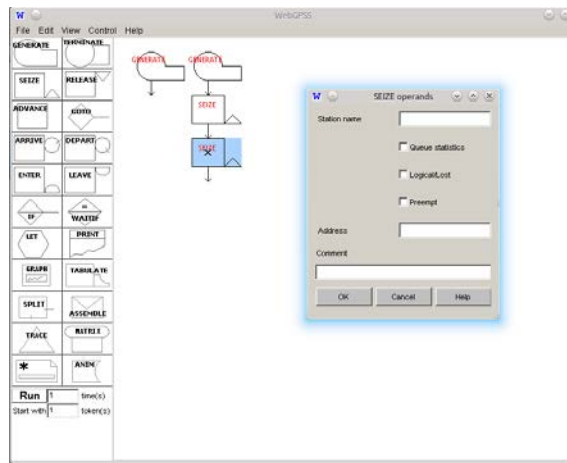
As learning tools, all GPSS dialects presented above share some common aspects that students and teachers need to deal with. As mentioned before, no current GPSS implementation includes either code assistance or syntax highlighting. On one side, WebGPSS implements a drawing-based alternative in which the user chooses blocks from figures and arranges them in a connected network. On the other side, GPSSw includes a plain text editor and GPSS/H has no editor at all. All GPSS alternatives require some installation process and all of them are also MS Windows dependent. Even though all alternatives can be run in Unix-based platforms using an MS Windows layer like Wine or Crossover, there is of course some performance drop. Besides, and more important, although some developers include a limited or trial version, there exist neither open source nor free alternatives available. In education environments, only WebGPSS includes some visual aid for the user. However, all mentioned versions are intended for users that already handle GPSS syntax, semantics and entities usage. In addition, there is no possible integration with existing web LME's.


Fig. 1: WebGPSS IDE displays dialogues and graphs

Desporovic et all implemented a GPSS/FON (another less used GPSS dialect) based environment, which they called FONWebGPSS. The purpose of their work is to combine a GPSS implementation with Moodle. With this purpose in mind, teachers prepared case studies and problems related to the area of discrete event simulation, and students used GPSS/FON via Moodle to write and run the models. Simulation execution results are also integrated into Moodle, mixing standard GPSS reports with statistics charts created ad-hoc. Although the simulation engine was not adapted for teaching purposes, this work exposes the need to transform simulation learning via web environments, and to integrate simulation tools in existing LMS. In a different approach, Fonseca et all designed a framework with a Java-based desktop application to build GPSS models from graphics. The framework lacks, on purpose, the implementation of the simulation engine. The main idea of their work is to let students complete the engine by programming themselves the behavior of GPSS entities. This would help students understand how the engine works and would motivate them to write their own simulation engine. In addition to the *empty shell*, JGPSS also includes a regular GPSS engine and statistics generator. Note that in that work the authors considered the importance of understanding a simulation engine by accessing its core implementation and modifying its source code in a language they feel comfortable with.

Methodology

Between 2005 and 2011, during the development of Simulation and Modeling courses in Computer Science School at the National University of La Plata, students mainly used Minuteman Software's version of GPSS. During that period, some common obstacles that most students came across when starting with GPSS were identified:

Unlike general purpose programming languages, GPSS has many sentences and only two sentence categories: blocks and commands

Each sentence may require a different amount of parameters; some of them are mandatory and some are optional, some refer to other entities and some expect numeric expressions only

Although GPSS blocks are semantically different from GPSS commands –and that difference is key to understanding the simulation model– they are displayed in the same way, in the same place and they might even be syntactically mixed

- Some blocks are used for general flow control, while others are used specifically to deal with a single entity
- There is no code assistance or highlighting. One of the obstacles that arises from this is that it is hard to remember which entities have already been defined –especially in large models– and how they must be referenced
- When the simulation ends, the system displays a report which resumes in few statistics what happened during the execution of the model. Thus it is not easy to know what really happened: when entities were created or destroyed, how the system clock advanced or which entities were interacting
- The code organization and the language itself are very different from other programming languages that students had learned before (i.e. C++, Pascal or Java)

This paper proposes an interactive learning environment (ILE) to improve GPSS learning which tackles all previous issues in the very first stages of simulation courses. The bottom concept of the ILE is quite simple: instead of programming models by writing code from scratch, students can build their models by selecting and configuring entities and sentences. To that end, the GUI has been designed to explain some commonly confusing aspects of GPSS from the beginning and to allow students to focus solely on core simulation concepts and entities. The application presented here is suitable during the simulation development stage and also after the simulation has been executed, in the results analysis stage. In the next two sections, most elements introduced in both stages (development and analysis) are expounded.

Aids during development time

During the stage of development, students need to focus on their model and the flux of entities through it. They should not be distracted by issues of one particular programming language. To that aim, a first visual element introduced is the use of dialogues to insert blocks and commands, instead of writing code. Many efforts have been put into dialogue boxes, including a set of small but useful visual elements that avoid dispersion and most common mistakes.

- Dialogue boxes show all possible parameters for each sentence (block or command)
- Parameters include hints for the user to get a clue of what they are for
- Mandatory fields are clearly distinguished from optional data
- Since some sentences require the use of previously created entities, many dialogues display a list of optional entities to choose from
- Listed entities are just the ones having the correct type required for the sentence which narrows the possibilities to cause a mistake, mixing sentences with entities of incorrect type

In addition to dialogue boxes design, the ILE displays available blocks and commands grouped by their main function or by the entity they deal with. For example, since ENTER and LEAVE blocks are used to access and free *storage* units, they are shown in the same group; similarly, given that SEIZE, RELEASE, PREEMPT and RETURN blocks exist for *facilities* manipulation, they are shown in another group. Grouping blocks helps students make associations between blocks and entities and among related blocks too. Block groups are also separated from command groups, which reinforces the idea that, even though they look similar, they are not. Once confirmed, dialogues create GPSS sentences and entities in an inner representation and they are displayed in a GPSSW-like dialect. Code is rendered highlighting keywords and parameters, and again sentences have been split into two code zones: commands above and blocks below. In addition to GPSS code representation, blocks are presented as a list, and commands as a queue, which is the actual internal representation of the simulation engine. Among other features, blocks and commands can be moved up/down, dragged and dropped from the list (or queue respectively) and removed. Code parts can be intuitively organized, although blocks and

commands can never be mixed. The GPSS model, created in the web client application, can be sent to a server for its execution, which contains a GPSS interpreter and a modified simulation engine that runs the simulation.

Simulation execution analysis

GPSS is designed for the sub-area of discrete simulation systems, which basically means that each simulation is controlled by a finite simulation clock that changes discretely. For each clock change (*tick*) the system being simulated updates its status, cascading to all entities in order to be ready for the upcoming clock change. This behavior affects both permanent entities (facilities, storages, chains) and temporary entities (transactions). Hence, a simulation run can be decomposed as a sequence of clock changes and entity updates associated with those changes. Each component of that sequence represents a *snapshot* of the simulation in a precise clock time. This concept leads to a different way of interpreting a simulation run, based on the analysis of entity changes during running time. Even though this might not be very useful for real simulation analysis, it clearly helps students understand how the simulation advanced and what *really* happened in each advance: how the clock moved forward, which entities existed in each *clock time*, what they were like and how they interacted with each other. It is of particular interest that this model also helps to understand the transaction scheduling system inside the system chains, which is a particularly problematic topic. The previous concepts were implemented by making major changes to the GPSS interpreter and the simulation engine to enable them to take full snapshots of the simulation during runtime. Snapshots are taken each time the system clock changes and they are queued in an in-memory data structure as the simulation runs. It must be considered that snapshots are quite heavy in memory and CPU terms, since they represent the whole simulation graph, composed by all model entities and its relationships. Once taken, each snapshot is persisted in a relational database system (RDBMS) for further analysis. Persistence is also a heavy task that involves saving all entities to a relational database and it is handled by a concurrent thread that maps objects to tables and stores them in the DB in disk.

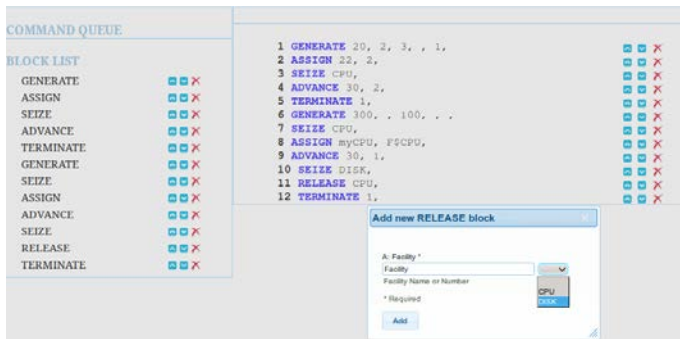
When the simulation is sent to be run in the server, it only takes few seconds until the execution ends but it could actually take a while to be fully stored by the persistence thread. To make that clear for the user, the system GUI has been designed to display a brief simulation report in the final stage and to show the user the persistence process as it advances. Once all snapshots have been persisted, the GUI enables the user to access snapshots, sorted by its system clock. Then, the student can browse snapshots, and inspect the status of self created entities as well as system default entities and data structures. Each entity can also be selected individually, which results in a specific report for the entity itself displaying it status in each system clock and other entities being affected. Again, these entities can also be selected, allowing the user to recursively navigate through entities and simulation snapshots.


Fig. 2: GPSS ILE: dialogues display entities lists and field hints
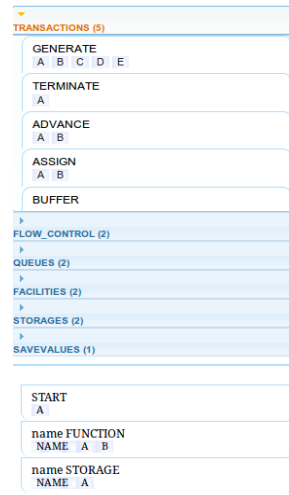

Fig. 3: Block and commands grouped by function or entity

Results

The application has been organized into a multi-layer architecture mainly composed by a thin client on one side and GPSS interpreter with the simulation engine and the RDBMS on the other side. Both parts of the application are completely independent one from the other. For them to work together, a MVC application has been developed to acts as a bridge between them, transforming requests from the client to messages to the interpreter and vice versa. The high decoupling level also allow application parts to be easily embedded into other environments. The client side was built using only HTML, Javascript and Cascading Style Sheets (CSS), and works as an independent pluggable module. The GPSS interpreter and engine is a common open source Java and MySQL application. It has been adapted to the Maven2 standard, which makes it really easy to download, extend and compile. Even though it is not likely that GPSS students will try to modify or extend something they still do not understand at first, accessing the source code of the simulation engine is a powerful way to understand how GPSS entities really behave inside, by reading it in a well known language. Similarly, having snapshots that compose a simulation stored in a database gives the students an opportunity to write their own SQL queries and to research much deeper about the entities than any front-end could offer. The application can also load and execute *preexisting models*; teachers can create their own models and leave them available for students to understand particular issues, review any class subjects or prepare quizzes and activities. Once models are created by the teacher, students will see an icon to load them in one click. After a model is loaded, users have full access to it just as if they had written it block by block and command by command. They are able to modify it too or even to extend it, which proves very suitable for some activities of interpretation and system improvement or optimization. In the meantime, as they analyze the model, the system will have sent it to be run in the background and at the end it will output the same kind of results as any model created by hand.
Fig. 4: Drag and Drop over the block list

Social implications in education were also considered in this work. An open source application results in a helpful teaching tool and the ability to plug it into other systems represents a great opportunity for teachers and students. In third world countries, license fees are hard to afford. Commercial applications and trial versions are not a real solution, although they mitigate limitations. Platform dependent applications make it even harder for non Windows users. By using a web application, students can use it in any computer, tablet or even mobile phone: all they need is an operative system with a web browser. No installation process is required. Last but not least, colleges can naturally host their own GPPS full stack: client, web application and interpreter. This allows them to count with a full repository of new learning objects: GPSS models ready to be run, modified or extended, and already executed GPSS models to deeply analyze and understand them from the ground up.

Conclusion

A web application for GPSS learning has been presented here. The application is targeted to students in their very first encounter with modeling and simulation subjects, in special with a programming language like GPSS. The main purpose of this work is to shorten simulation learning times by eliminating the need for students to deal with specific issues of a particular simulation language and letting them focus solely on important modeling and simulation concepts such as abstraction, resources, statistics and experimentation. To that end, the application focuses on two key stages of modeling and simulation learning: model building and simulation run. The former is tackled by providing the students with an interactive GUI that helps them build the model by selecting and configuring sentences, organizing code parts, and laying GPSS elements out making key aspects clear from the beginning. The latter is faced under the premise that a simulation run is too complex to be understood from a single text report with some statistics results, especially when students are still learning what a simulation is or should be. The solution presented proposes a *navigable report*, where the students can surf from their simulation entities and access the state of each one in all simulation clock changes. This way, they can understand how entities are affected by other entities and how the simulation system deals with the execution of temporary entities created on the fly. Another important aspect of this work is that it has been released as open source software. This license has two main implications in this context. First, and as with any other open source software, anyone can download, use and extend the applications as needed; of particular interest is the possibility of integrate it with other LME's or with any web application. Secondly, students can be encouraged to study the software as it is, to improve it and extend it, either on their own or as a class exercise.

Future work

There is much work to do to improve this environment. Many but not all GPSS entities have been implemented, so a first improvement would be the inclusion of more entities and their associated sentences. Dialogue boxes can also be improved by including visual clues for students to make associations between GPSS entities and real-world objects: if the student is creating a FACILITY, the GUI would show something that *works* as a facility, like a toll barrier or a computer processor. Reports can also be extended to include new entities and to allow students to compare different snapshots side-by-side, highlighting changes in existing entities as well as entities created on one side only. The ILE still lacks a view for the professor, to create models and organize activities and class members. Even though the latter can be accomplished by most existing LMS, model creation, testing and publication must be improved to encourage teachers to add new models for their

students. Integration with existing LMS must also become better. As any web application, the GPSS ILE in its current state can be embedded into any web page using, for example, an iframe. However, it would be very helpful to integrate it with existing LMS via installable plug-ins/extensions. This would demand many efforts, since each addition must be customized by hand, but would encourage system administrators to offer the tools to its users.

GRADUATE STUDENT MIDDLE SCHOOL MATHEMATICS TEACHERS' COMMUNICATION ABILITIES IN THE LANGUAGE OF MATHEMATICS

Tangül Kabael

Faculty of Education, Anadolu University, Eskisehir, 26470, Turkey

Abstract

It was aimed to investigate graduate student middle school mathematics teachers' communication abilities in the language of mathematics. The study was designed qualitatively with fourteen middle school mathematics teachers who were graduate students in mathematics education program. Data of the study was collected through an open-ended test including ten questions with several items. Responses of the test were analyzed by coding qualitatively.

Keywords: The language of mathematics, communication in mathematics, mathematical literacy

Introduction

Mathematics can be defined that it is a language; in fact it is a universal language. However, the language of mathematics differs from other natural languages since there are no native speakers of mathematics language and it requires a natural language to communicate. Additionally, mathematics has its own vocabulary. Therefore, it has a syntactical and rhetorical structure. According to Jamison (2000), the language of mathematics has a nearly universally accepted logical and rhetorical structure, and it has been presented following a format of definition-theorem-proof. Moreover, each of three main elements which are definition, theorem, and proof has a definite rhetorical structure.

The importance of the mathematics language in learning is indisputable. Students should gain the mathematics language skills and mathematics concepts simultaneously to communicate in this language. Thus, mathematics teachers are responsible to provide the mathematics language skills apart from the mathematics concepts. Jamison aimed to show how making the syntactical and rhetorical structure of mathematical language clear to students can increase their understanding of mathematical concepts. Then, he concluded if the rules of the language of mathematics are made explicit, students will learn them and use them as tools to understand abstract mathematical concepts. Owens (2006) questioned the reason why students become reluctant once they reached higher grades while they were eager to learn mathematics at the beginning of the school. Owens emphasized that teachers need to know where in the curriculum to introduce the vocabulary words and how to make connections with the students' knowledge to support the use of appropriate mathematical vocabulary in the classroom. Owens considered that every classroom needs a mathematical dictionary, and he constructed a mathematical dictionary that can be used in the primary and middle grade levels.

It is a fact that mathematics teachers generally focus on only mathematical concepts because they expect students to learn mathematics language skills through exposure, they rarely focus on mathematical language knowledge and skills. Gray (2004) worked on why teachers rarely focus on the language while teaching mathematics. According to Gray, the reason is that teachers are either unaware of how to teach the language of mathematics or they may not believe that they are capable of successfully implementing language instruction in their mathematics classrooms. According to Gray, Bandura's self-efficacy theory is a possible explanation for why teachers rarely focus on mathematical language (Bandura, 1997). Bandura's theory emphasizes that teacher's self-appraisal may shape her/ his choices to teach. Gray explained this idea that if teacher does not believe that she can teach a mathematics topic successfully, she will not choose this topic to teach and she will probably not be able to. Gray designed a measurement instrument called Language of Mathematics Teacher Efficacy Scale (LoMTES), to measure teacher' self-efficacy about this issue.

Increasing the importance given mathematical literacy has emerged as one of the results of international examinations like PISA or TIMMS, it is seen that most countries give special importance to communication in the language of mathematics, which is one of the elements of mathematical literacy. In this regard, National Council of Teachers of Mathematics (NCTM) gives importance to students' communicating in mathematical language beginning from the early ages. Communication standards for school mathematics are as follows:

Instructional programs from prekindergarten through grade 12 should enable all students to-

- organize and consolidate their mathematical thinking through communication;
- communicate their mathematical thinking coherently and clearly to peers, teachers, and others;
- analyze and evaluate the mathematical thinking and strategies of others;
- use the language of mathematics to express mathematical ideas precisely.

(2000, p.60)

Structure of mathematics

As it is mentioned above, mathematics is a language like any other language, so it can be got in semiotic perspective. That is mathematics has own words (symbols), semantic and syntactical rules (Cathcart, 2003). Cathcart states that symbols convey meaning and associated rules. Kenney (2005) emphasized distinction between mathematical content and process. As cited in Kenney (2005), first model of the language of mathematics proposed by the Balanced Assessment Program at the Harvard Graduate School of Education. Kenney states that this model suggests thinking about mathematical nouns, or objects and arrangements and mathematical verbs may be regarded as following four actions:

Modelling and formulating,

Transforming and manipulating

Inferring

Communicating.

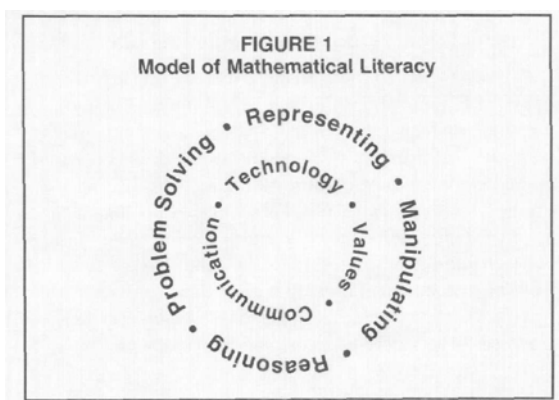
When we consider these actions as elements of mathematical literacy, we have seen that generating a model for mathematical literacy has received a great deal of attention in literature. Pugalee (1999) indicated necessity of definition and a model of mathematical literacy and he studied on a model. According to Pugalee, a model of mathematical literacy must first embody the NCTM's processes through which students obtain and use their mathematical knowledge. The five processes through which students obtain and use their mathematical knowledge were valuing mathematics, becoming confident in one's ability to do math, becoming problem solvers, communicating mathematically, and reasoning mathematically in NCTM standards in 1989. Furthermore, Pugalee adds that as a second, a model of mathematical literacy should demonstrate the intricate interrelationships between various essential processes in development of mathematical literacy and specify 'enablers' facilitate development of the five processes. Pugalee presented a model for mathematical literacy by considering these three standards he indicated as in Figure 1.


Figure 1. Model of mathematical literacy (Pugalee, 1999, p.20)

On the other hand, as Kenney emphasized, distinction of mathematical processes and content is essential for conceptual knowledge and communication in the language of mathematics. , Tall (2004) claims that symbols that we use for calculation and manipulation are begins with actions as pointing and counting. By using symbols, actions are encapsulated as concepts. Tall states that encapsulation of actions as objects allow us to switch from process to do mathematics to concepts to think about. Gray and Tall (1994) call this switching by the term 'procept'. Tall claims that symbols act dually as process and concept. For instance, a symbol like 1+3 acts as the process of addition or the concept of sum. From Piaget's perspective, when actions on fundamental mental objects are routinized, they are conceptualized as processes. Then, these processes are considered as mental objects at higher levels. We used some aspects of these frameworks in this study.

Purpose of the study

We aimed to investigate middle school mathematics teachers' communication abilities in the language of mathematics in this study. The research questions that were considered are the following:

How are communication abilities of middle school mathematics teachers who were graduate students in mathematics?

How are reasoning abilities of middle school mathematics teachers who were graduate students in mathematics?

What are conceptual levels of middle school mathematics teachers who were graduate students in number concept?

Methodology

The study was designed qualitatively with fourteen middle school mathematics teachers who were graduate students in mathematics education program. We should also note that we can call participants by junior mathematics teachers, since the most experienced of them had seven years experienced. Data of the study was collected through an open-ended test including ten questions with several items.

The test was prepared to asses participants' abilities of reasoning, communication and conceptual level. For instance, some simple sets of numbers were given with common-properties representation in two questions and

asked to read with comprehension and the meaning of the given representation to assess participants' reading and conceptual level in number concept. Similarly, a proposition and a number set were given in natural language and required to write in the language of mathematics to assess their writing abilities. Moreover, with some given prepositions in natural language, it is aimed to assess participants' reasoning abilities, structural knowledge of mathematics language that is knowledge of syntactical and semantic rules. For instance, two propositions were given in the language of mathematics and required negations of them. In another question, following mathematical expression was given and asked to evaluate if it was convenient.

$$\text{If } \{x \in \mathbb{R} | 5 < x \leq 8\} \text{ then } x > 7$$

Findings

Results of the study indicated that junior middle school mathematics teachers did not have communication abilities in the language of mathematics as expected from a mathematics teacher. It was seen that eight participants out of fourteen had ability of reading with comprehension. In the aspect of writing a mathematical sentence, given in natural language, in the language of mathematics, only seven of fourteen participants were completely successful. Almost all of the participants, except only one, able to write the given set of numbers in the common property notation, while only seven of them could write the preposition given in the natural language in the language of mathematics. Moreover, these seven participants successful about writing were also able to read with comprehension. Furthermore, we saw that only five participants demonstrated that their conceptual levels in the number concept were object level. That is, remaining nine participants were not able to take a set of numbers as a mental object. They expressed the elements of the following number set by reading word by word.

$$\{x \in \mathbb{R} | 5 < x \leq 7\}$$

These participants who gave such an expression explained the elements of the set as an answer of the item in which the meaning of this notation was required. Another important thing was that five participants who demonstrated object conceptual level were also successful about reading with comprehension and writing in the language of mathematics.

Another crucial result obtained from the study was that most participants had weak reasoning ability and weak structural knowledge of mathematics. For instance, answers of the item in which the following conditional sentence was given to be asked to evaluate if it was convenient can be taken as examples of this result.

$$\text{If } \{x \in \mathbb{R} | 5 < x \leq 8\} \text{ then } x > 7$$

Except three participants, all of them evaluate this conditional sentence with the value of x that satisfy the conditional sentence. Therefore, they changed one of the equalities in the sentence. We saw that they were not aware that connective of "if…..then" connects propositions, but hypothesis part of the given conditional sentence was not a proposition. Moreover, also four participants reading with comprehension were not able to evaluate this conditional sentence successfully by reading with comprehension.

In the aspect of reasoning ability, it was seen that junior middle school mathematics teachers had weak abilities. Furthermore, participants who had strong reasoning abilities also demonstrated abilities of reading with comprehension and successful writing in the language of mathematics. One of the questions that we assessed

participants' reasoning abilities included two compound propositions that can be seen in the following. Negations of them were asked in this question.

"$For\ all\ \varepsilon > 0\ there\ exist\ at\ least\ one\ \delta > 0\ such\ that\ |x - a| < \delta\ implies\ |f(x) - L| < \varepsilon$"

"$For\ all\ x < 10, f(x) < 0$"

It was seen that any participant could obtain negation of the first compound proposition successfully. Most of the participants negated the first proposition word by word by memory. They negated each quantifiers, symbols and words, while some of others exchanged hypothesis for conclusion to negate it. It was obvious that any of them check the meaning of expressions that they obtained. One of wrong negation can be seen as an example in the following:

$$[\forall\varepsilon > 0, there\ exist\ \exists\delta > 0\ \ni\ |x - a| < \delta\ implies\ |f(x) - L| < \varepsilon]'$$

$$\exists\varepsilon \leq 0\ there\ exist\ \forall\delta < 0\ \ni\ |x - a| \geq \delta\ implies\ |f(x) - L| \geq \varepsilon$$

On the other hand, seven participants out of fourteen were able to obtain correct negation of the second proposition. It was seen that these seven participants expressed the proposition in the language of mathematics first and then negated it. But, this result did not mean that they were able to negate this proposition successfully, since the proposition did not have connective and one can obtain correct result by negating word by word by memory. The student whose negation is seen in above gave following correct answer to the second compound proposition. When her responses for negating were considered, it was thought that she might negate by memory without giving meaning as in the first proposition.

$$(\forall x < 10, f(x) < 0)'$$

$$\exists x \geq 10, f(x) \geq 0$$

Following expressions are examples for the participants who exchanged hypothesis for conclusion and negate word by word to negated it.

$$f(x) > 0, \forall x > 10$$

$$f(x)' > 0, \forall x' > 10$$

Conclusion

We concluded junior middle school mathematics teachers had weak abilities of reading with comprehension and writing in the language of mathematics. Moreover, their reasoning ability and knowledge of logical structure were not sufficient to support middle school students' mathematical literacy. For instance, mathematics teachers who were responsible for developing middle school students' mathematical reasoning ability did not evaluate the

meaning of the mathematical sentence that they wrote.   Consequently our findings indicated necessity of some developments in mathematics teacher training programs in the context of mathematical literacy.

Abstract

Educational technology has emerged as a new field of education because the main means of having access to information has become technology. Thus, basic curriculums in all over the world have been in the process of restructuring; Classical teaching materials have been replaces by technological equipments (Smart boards, tablet PCs, mobile phones etc.) and new materials are designed for these technological tools (Course presentations, notes for distance education, educational software etc.). With the design of teaching materials for technological tools, graphical designs have become one of the most important ways of presenting information. Therefore, instructors should be knowledgeable about graphical design elements such as color of the background, the font used, the size of writing, the density of the text and the relationships among background color and font contrast etc. In this paper, the main focus is the elements to be considered in color selection and harmony which are among the principles of graphic design while designing computer based instruction materials.

Keywords: Computer based instruction; Computer assisted language learning; Educational software; Educational technology; Ggraphical design

Introduction

Graphic design started with the drawings on cave walls by primitive human beings. The designs drawn on cave walls by first people were the visual reflections of verbal language. Hence, graphic design is one of the ways of a person's expressing himself/herself. Therefore, the choices made by an individual while forming the design include elements of his/her inner world; and like fashion, they change depending on some factors such as the education taken, the environment resided (city, country), upbringing (oppressed, free), gender, politics of the era, technological and scientific developments, peace or war atmosphere etc. In case of graphic design suggestions are not made not to restrict the creativity of the person, only factors to be considered and situations to be avoided can be mentioned (Fiell, 2005).Yet, the design has some basic components and the greatest care should be taken while making educational designs as it is very difficult to correct them.

Principles of design

Graphic design is viewed to be a discipline in the field of visual arts. However, it has many sub-concepts. The components of design can be subsumed under two categories. These are principles and elements. The basic principles are balance, rhythm, proportion, and unity. Elements are line, shape, texture, white space, mass, value and color (Fidan, 2012). The present study only focuses on the element of color.

Features of color and its use in design

Color is one of the cornerstones of a design. Sometimes, color can lay the basis of creative thinking and all the design is built on color (Wong, 1997, Fidan 2009):

Colors existing together with the light can create various effects on people. There are three dimensions of color: Length (type of the color), width (shade of the color), and depth (intensity of the color).

- The type of color is the terms used to describe the color such as yellow, red, blue, purple, green, orange etc.

- The shade of color is its lightness or darkness. When a color is enriched with white color, it becomes lighter, and when black is added, it becomes darker.

- The density of color is related to brightness. The colors with high density are bright colors.

The most important one among these three dimensions is the shade value of color. The element which describes a visual image best is the shades it contains.

Effects induced by color on people

In addition to reflecting the sensitivity of the designer, the choice of the colors in the design of educational software should be in compliance with the color preferences of the target group. Therefore, it is of great importance to know the effects of colors on people. Some of the effects induced by colors on people are personal and some are generalisable. For instance, warm colors' becoming stimulating and cold colors' being soothing can be considered to be the generalisable effects of colors.

Generalisable effects of colors

Green and blue colors are known to be cold, red and yellow colors are regarded to be warm colors. By bringing cold and warm colors, new colors can be obtained. For instance, a cold color, blue, can be mixed with a warm color, red, then we get a color of blue close to purple. This new color is a bit warmer than blue. In this way, we can have less cold color.

Grays called to be neutral colors can be cold or warm depending on the mixture ratios in their pigments.

While warm colors stimulate and cheer watchers, cold colors soothe and relax them. The reason why restaurants are painted with warm colors is to stimulate visitors to eat fast and in the similar manner, hospitals are painted with cold colors to calm the people who are panicked. Excessive use of cold colors may result in the emergence of gloomy and depressing atmosphere. In the same token, excessive use of warm colors may lead people to aggression.

On graphical surfaces, warm colors seem as if they would leave the surface and they seem in the front. Yellow is the color which is seen at the forefront of all the colors. Cold colors on the other hand give the impression of distance.

Psychological effects of colors

When the psychological effects of color are considered, it is usually accepted that green means jealousy; blue is the symbol of loyalty and sincerity; red represents activity and courage; brown and purple are the symbol of monotony and boredom; white represents submission; black symbolizes pessimism. In addition to these, some researchers argue that red increases blood pressure and pulse beating.

Cultural effects of colors

When the colors are considered from a cultural perspective, they have various connotations. For instance, in oriental culture, the golden yellow is considered to be a sacred color; yet, in some westerns cultures it is the symbol of cowardliness and treason. Red stands for passion. Orange represents science, civilization, energy and power, purple close to blue is the symbol of spirituality and purple close to red is the symbol of courage.

Blue which is a passive and cold color symbolizes both distance and formality and honesty and loyalty. It connotates authority and power. It is cooling and associated with sky, ice and water.

Green is the symbol of freshness and fertility. It symbolizes environment and nature and it is relaxing and soothing. White represents honesty and innocence; black is the symbol of sorrow, gloom, grief and dead. Moreover, it connotates extreme passion and elegance.

Female and male colors

There are two important concepts to be considered while selecting not only the color of the surface but also the color of the letters of the writing on the surface. These are female and male colors.

Female colors: light color on dark surface. For example; white writing on blue surface

Male colors: dark color on light surface. For example; blue writing on white surface

However, there are no certain formulas showing how to operationalize these concepts in a design. A graphic designer should consider following four elements in color selection:

1- Cultural connotation of a color,

2- Color preference of the target culture,

3- Character of the product,

4- Type of approach to design

Things to be considered in color use

The designer should know how colors are perceived by the eye, their wavelength characteristics and their effects on the health of eye. For instance, yellow color is first perceived as purple and the process through which the color is perceived to be yellow is tiring for the eye. Long-time focusing on yellow color may lead to visual disorders. Therefore, yellow should not be selected as the color of surface or front color while designing products requiring long-time reading. Moreover, the designer should be knowledgeable about the effects of visual disorders on the perception of colors by people. For example, he/she should know what color blindness is

and what effects it induces; learn how to use red and green colors on the same surface or to create a contrast appropriately so that undesired outcomes can be avoided.

The use of colors in computer assisted language learning software

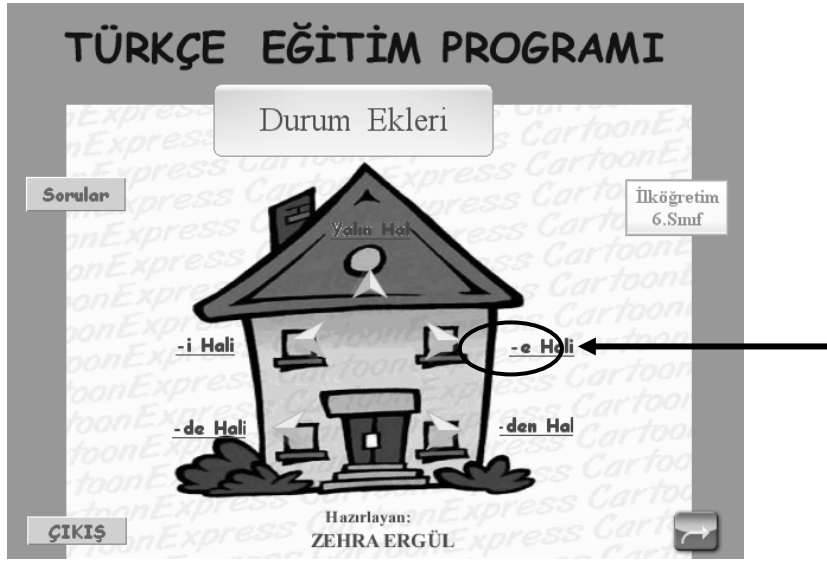
In most of the educational software programs, pictures, figures, tables etc. are used in teaching of subjects, yet, in language teaching, particularly in teaching of grammar, most powerful elements to enhance teaching are colors. Suffixes and prefixes, tense suffixes, changes and differences in verb inflections can only be emphasized through colors. Look at the following example to teach some suffixes in Turkish (Figure 1):


Fig. 1. Educational software sample to teach some suffixes in Turkish

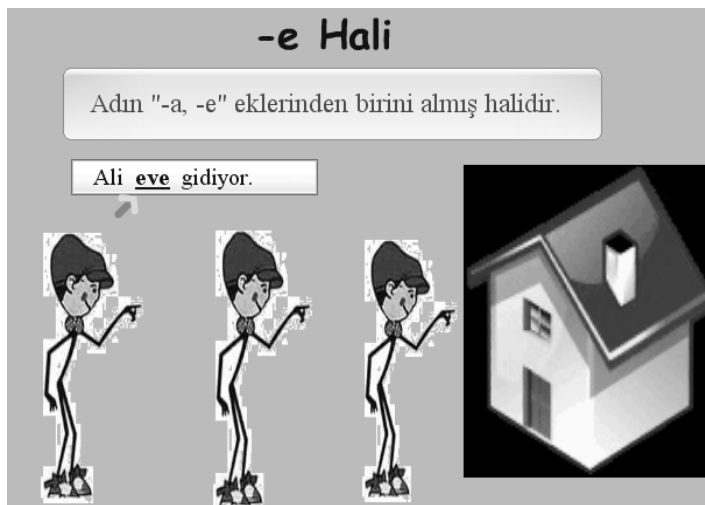
In figure, you can see the subject selection screen of the educational software programs developed by Turkish language pre-service teachers to teach some suffixes in Turkish. In this screen, you can click on the subject you want to learn and then you are directed to the relevant screen (Figure 2).


Fig. 2. Subject teaching screen (-e suffix added to word "ev")

In figure 2, there is a hero in this software program: "Ali". The subject is taught through the activities Ali carries out. As an object "Ev" (house) is selected. Some suffixes are taught by using the interactions between Ali and "Ev". In the sentence "Ali eve gidiyor", the purpose is to teach –e suffix. The subject is taught with a sentence. In the example, for better presentation, -e suffix can be shown in a different color or at least it can be underlined or written in bold. In subject teaching, while presenting the word ev(e) in the sample sentence, -e suffix can be zoomed. Moreover, a color inside the house (for example, blue) may be selected, and Ali's hat, the title of the subject and –e suffix in the title and –e suffix in the sample sentence can be in blue, in this way subject teaching can be consolidated.

In figure 3, the sample sentence is "Ali evde" and here the purpose is to teach –de suffix. In the subject selection screen, Ali's entrance to the house should be shown through an animation and in this screen, the subject should be taught by showing that Ali is in the house. To teach better, the door of the house can be yellow and –de suffix can also be written in yellow. Moreover, the teaching can be consolidated by making the color of the room where Ali is yellow, subject selection button (-de) in subject selection screen can be in yellow, subject title (figure 3) can be in yellow.

Fig. 3. Subject Teaching Screen (Suffix showing the state of being inside the house)

As a result, every element used in the design (character, surface color, font color, button design, subject title, sample and explanation) should be designed in such a way that each should complete each other and contribute to the teaching of subject.

Conclusion

When the fact that educational technologies are developing fast and all the educational settings will be presented in digital environments in the future is considered, it seems to be clear that the people who will design educational software programs should be knowledgeable about the basic principles of education and main principles of graphic design. In this paper, we focused on one of the most important elements of design, color, and some samples were given here to show how color can be used to make language teaching more effective. It should be noted that "Design is not a magic, many trails are made until the correct design is found (Atasay, 2012)". Therefore, it should be underlined that for good design, much time should be spent on the material. But it is worth doing because in the digital environment, the information can be reached by millions of people.

GRAPHICAL UNDERSTANDING IN MATHEMATICS EDUCATION: DERIVATIVE FUNCTIONS AND STUDENTS' DIFFICULTIES

Nevin ORHUN

Anadolu University Science Faculty Mathematics Department

Abstract

Effective teaching is one of the most important factors to improve students' achievement. Therefore, many researchers in mathematics education are looking for several ways to improve the quality of learning. The purpose of this paper is to investigate an overview of specific difficulties based on the graph of derived function, another words, how students find the connections between the graph of derived function and the some properties of the original function.

The subjects were 102 high school students in grade 11. The study was conducted during the fall semester in two calculus classes. The data of the research has been collected from 5 diagnostic the graph of derived function involved the chance in slope, decreasing, increasing, a local maximum, a local minimum, the point of inflection.

The questionnaires were designed to assess how well the students had learned procedures the connections between the graph of derived function and the some properties of original function. Each student was asked explain how you arrived at your answers. While working on the answers of the students, not only the accuracy of the students' answers was examined but also the methods were being analysed even if they were incorrect.

The results indicated that the students find it difficult to make connections between the graph of derived function and the original function. Usually, they were to interpret the graph of derived function as the graph of function. The students did not use the mathematical language to describe the graph of derived function

Effective teaching in calculus course should be informal, intuitive and conceptually based on graphs and functions in order to improve the quality of learning and develop the understanding of calculus concepts.

Keywords: Function, Derivative Function, Graph of Derived Function, Effective Teaching

1.Introduction

Derivative function is a new function which is formed from given function. The subject of derivation forms important chapter of analysis in university level as much as high school level. Additionally, the subject of derivation is mathematically cryptic subject. When conceptual structures, logical structure, abstract and symbolic character of derivation combine with deficiencies in conditions of education, complications in learning arise.

To gain theoretical thinking character of derivation encloses discussion activities graphically as researches, solutions of problems. Graphical discussion of derivation is needed thinking skill. Due to the usage of derivation concept in many disciplines, to know difficulties of students met in this level is important. These difficulties in understanding on this main subject were a studying topic for many researchers who are working on mathematics education.

Graph of derivative function was analysed. In this research graph of derivative function was analysed. Just because of the use of derivative function in various disciplines, the students have to be aware of these difficulties that they face in this level.

Visualisation in mathematics education, i.e. in other words, graphical interpretation became important increasingly. Until years of eighties, mathematics education was made operationally. At subsequently years, many mathematics

educators emphasized meanings of derivation in various disciplines and suggested a new method that used graphical operations (Decker, 1985, tall, 1997, Asial et al 1997).

Tall and Vinner (1981) defined some difficulties that students faced while they were using graphical methods in order to solve a function. In similar study, before giving the graph of derivative function Ferrini-Mundy and Graham (1994) investigated finding the equation of function given graphically and then defined difficulties.

Usage of graph in the subject of derivation have the students be concentrated on this subject of derivation and simplified examination of concerned problem solutions (Tall, 1986) To establish relationship between the graph and algebraic operations provides gaining power of knowledge which is obtained by the students (Dreyfus and Halevi, 1990).

Heid (1988) investigated that the college students' difficulties on understanding the subject of derivation, the mistakes made by students and effects of computer usage on this subject. In addition to this subject, to simplify understanding the derivation conceptually, Heid indicated the importance of computer usage and drawing graph. Mathematics is not a discipline demerged different subjects, operations and rules, it is a consecutive discipline abided to basic principles and concepts. When the basic concepts of analysis of derivation have not been understood by students thoroughly, the students will be ignorant of applications, formulas and their meanings. Thus, learning abided memorization of rule and definition gets difficult and doesn't contain real life applications (Orhun, 2012).

In similar study, Orton (1983) showed that many students in mathematics department have many basic errors in the subject of derivation and derivation can not be understood conceptually.

The students understand the subject of derivation algebraically. One another purpose of this research is to understand and to deepen the epistemology of subject of derivation.

By means of the strategies developed, learning of the students will be increased.

In this research graph of derivative function was analysed. Just because of the use of derivative function in various disciplines, the students have to be aware of these difficulties that they face in this level.

Visualisation in mathematics education, i.e. in other words, graphical interpretation became important increasingly. Until years of eighties, mathematics education was made operationally. At subsequent years, many mathematics educators emphasized meanings of derivation in various disciplines and suggested a new method that used graphical operations (Decker, 1985, tall, 1997, Asial et al 1997).

Tall and Vinner (1981) defined some difficulties that students faced while they were using graphical methods in order to solve a function. In similar study, before giving the graph of derivative function Ferrini-Mundy and Graham (1994) investigated finding the equation of function given graphically and then defined difficulties.

Usage of graph in the subject of derivation have the students be concentrated on this subject of derivation and simplified examination of concerned problem solutions (Tall, 1986) To establish relationship between the graph and algebraic operations provides gaining power of knowledge which is obtained by the students (Dreyfus and Halevi, 1990).

Heid (1988) investigated that the college students' difficulties on understanding the subject of derivation, the mistakes made by students and effects of computer usage on this subject. In addition to this subject, to simplify understanding the derivation conceptually, Heid indicated the importance of computer usage and drawing graph. Mathematics is not a discipline demerged different subjects, operations and rules, it is a consecutive discipline

abided to basic principles and concepts. When the basic concepts of analysis of derivation have not been understood by students throughly, the students haven't learned from applications of formulas and their meanings. Thus, learning abided memorization of rule and definition gets difficult and doesn't contain real life applications (Orhun, 2012).

In similar study, Orton (1983) showed that many students in mathematics department have many basic errors in the subject of derivation and derivation can not be understood conceptually.

The students understand the subject of derivation algebraically. One another purpose of this research is to understand and to deepen the epistemology of subject of derivation.

By means of the strategies developed, learning of the students will be increased.

2.Method

The subjects were 102 high school students in grade 12. The study was conducted during the fall semester in two calculus classes. The data of the research have been collected from 5 diagnostic the graph of derived function involved the chance in slope, decreasing, increasing, a local maximum, a local minimum, the point of inflection.

The questionnaires were designed to assess how well the students had learned procedures the connections between the graph of derived function and the some properties of original function. Each student was asked to explain how they did find the answer. The results that taken from the students' attempts were analysed. While working on the answers of the students, not only the accuracy of the students' answers was examined but also the methods were being analysed even if they were incorrect.

3.Findings

The results indicated that the students find it difficult to make connections between the graph of derived function and the original function. Usually, they interpreted the graph of derived function as the graph of function. The students did not use the mathematical language to describe the graph of derived function

It was determined that conceptual and practical errors which arised from this study, resulted from skill to understand basic principles, skill to think on the graph, skill to argue from graph and lack of relation in relationships which problems contained.

The questions that were asked to the students have been exemplified below.

Research Question 1.

The derived function graph is given in figure 1.

Find the generally the equation of function y=f(x).
Figure 1.Graph of derived function

The aim of this question is to build relation between derivative function and degrees of original function. Almost every single student knows that algebraically the degree lessens one in operation of derivation. Contrarily, the students have difficulties finding the degree of original function on the given graph of derivation.

The answers were as follows:

Generally given answers were to form symmetric line for graph of function unless making declaration (42%).
Figure 2. Graphs of derived function and original function

Another answer is derivative function is a linear function, base function can not be found (10%).

The equation of derivation must be given. In this position the equation of function could be everything (15%).

Research Question 2

The derived function graph is given in figure 3. Find the points of local maximum and local minimum of original function.
Figure 3. Graph of derived function

The aim of this question is to apply the definitions of points of local maximums and local minimums on derivative function. However the majority of the students (72%) answered this question that there is a local maximum at the point of $x=2$ and there isn't any local point of minimum. Here, derivation of graphically representation of derivative function could be converted to properties of function. This graph was generally perceived as the graph of function.

Research Question 3

The derived function graph is given in figure 4. . Find increasing and decreasing intervals of the original function.
Figure 4. Graph of derived function

The aim of this question is to specify on which intervals derivative function takes positive or negative values and to apply the condition of occurring to decrease and to increase of original function. The answer of majority of students to this question (53%) is that function is descending at any point. The other answer (39%) is that due to derivative function is increasing, main function is decreasing.

Research Question 4

The derived function graph is given in figure 5. Is there any inflection point of function at the point of x=1 Explain.
Figure 5. Graph of derivative function

.The answer of majority of students to this question (67%) is that there is inflection point, or there isn't inflection point. There is no explaining.

4.Conclusions and Suggestions

According to results produced, the students were not succesful in analysing derivative function. This case could be the result of traditional teaching method.

The derivation concept is derivative operation for students. The students haven't interpreted the graph of derivative function.

The graphs convey many concepts and collect much information. Then, the graphical interpretation and construction include the understanding connection among various mathematical topics. All of them, first approximation to calculus is not only theoretically, compounding with real life, giving place to numerical and graphical discussion.

HOW THE SCHOOLING ENVIRONMENT SHAPES THE CONSCIOUSNESS OF SCHOLARS TOWARDS PEACE AND WAR

Juliet Joseph[25]

University of Johanensburg, Corner Kingsway and University Roads Auckland Park, Johannesburg, 1709, South Africa

Abstract

People are at war with themselves. Bullying has become the norm and fights continue on the playground; students show hostility towards their teachers and the world is at war, as people go on rampages, killing learners at schools. This study will discuss why classrooms should be considered spaces in which children can learn, understand and comprehend what peace and love is as opposed to war. Humans are taught from a young age to compete with their siblings and fight for survival, which creates a sense of clear winners and losers. The level of learner consciousness of respect for life and being at peace with themselves and those around them should be enhanced through teachings about life principles and through mindful training.

Children spend most of their lives at school and in the classroom. If the school environment can make children more aware and conscious of what it means to be giving and accepting through teaching about mindful learning which encourages justice, peace, kindness, courage and goodness, then perhaps the world will be a better place, as opposed to accepting it when children bully, fight, tease, compete and undermine each other's potential. Children already display dictatorial behaviour from a young age because of the examples adults have set, as children tend to imitate figures of authority. Teachers should take the lead in ensuring social justice and peace.

We teach children to take from the world as opposed to give to it, through subjects such as mathematics and accounting; accumulate, expand, make money at any expense. The playground and school environment promote the idea that scholars consider themselves only, damaging the environment, fighting for survival and the needs of human beings only. Littering, ganging up on the helpless, oppressing those less popular, going with the crowd and being tough, heartless bullies have become acceptable within the schooling system. If this is what we are teaching our children to become, will they be the leaders that we want them to be? The paper will touch on mindful learning as a means of creating a conducive peaceful schooling environment for learners.

INTRODUCTION

"We can't solve problems by using the same kind of thinking we used when we created them."

—Albert Einstein

"A mindful nation is about recognising that we are all connected: we are in this together. At present we feel divided and scared, and have been made to believe that independence means we are totally on our own. But our experiences – as individuals and as a country – tell a different story. We know that when we join together, and care about each other, our freedom actually increases. Real independence emerges when we know how to support each other. The Declaration of Independence was a communal act."

We are conditioned to operate in a mode that is acceptable to society. From a young age we adapt to social norms and become programmed to think and behave in a certain manner. A typical example is that children should not question why the Earth moves around the Sun, it is a given because it has been proved. Routine has become so entrenched in our psyche and social constructions that we don't realise that there might be another means of doing things which has not yet been discovered (Morris, 2009; 180). Not only does this prevent us from being more creative, it also hampers the discovery of new ideas which can make a positive impact on the world.

This type of routine mode is passed on from generation to generation, as children live similar lives to their parents and the symptoms of forgetfulness, fatigue and their emotionality remains. The outcomes include emotional elements such as fear, anxiety, bullying at school, classroom wars, psychological and mental problems which get carried on from childhood to adulthood (Hooker and Fodor, 2008; 83). Perhaps that explains why we continue to have deadly wars, economic decline and environmental damage. The schooling system is an instrument which ensures that we remain within the status quo. School environments should be places of hope, peace and love, but instead they have become spaces where dictators in the making are bred; a place where scholars learn to start civil wars through their bullying, ganging up on the weak and displaying dictatorial behaviour towards teachers. This behaviour starts at school and ends with the creation of the likes of Adolf Hitler, Robert Mugabe and the militia.

The schooling environment is characterised to be multicultural and diversified. Due to the dynamic nature of the schooling environment, it is imperative that schools remain receptive to new ideas, approaches and attitudes. The current schooling system promotes academic distinction, overconsumption, stressed out teachers and reinforces creativity with the goal of promoting competition trough detrimental arms races, economic growth and war. Current education in schools focuses on different disciplines as opposed to reinforcing values such as respect, justice, compassion, tolerance and empathy (McInnis, 2007; 5)

This will be a quantitative study on the nature of peace within schools that practise mindfulness and how this practice contributes to shaping the consciousness of scholars towards peace and war. This calls for a strong and sustained case which will contribute to diminish a low-level consciousness and awareness to peace within the young. Secondly, conflicts such as bullying and ganging up on the weak in the school environment will be examined and it will look at whether mindfulness can positively impact on eradicating this phenomenon.

Banai said (2005–2007; 2–5) that he does not have faith in the current schooling system as learners are spoon-fed by their teachers; as they consume information without thinking about it or being mindful about the knowledge. Banai does however believe that children's "innocence, the excitement, the love, the authentic self-expression, the aliveness and high level of inner energy, the sensitivity to pick up what is happening to another and to be responsive to it in a simple manner – are due to the strong sense of Being." This is one good reason for further studies to be conducted on the matter. Based on previous research, mindful learning can have an immensely positive impact on children. He also concludes that mindfulness can increase quality of life, reinforce humanness and restore a balance of goodwill in the cold world and end conflicts by transforming individuals.

Between 1970 and 1990 alone, African states endured ratios of 50 per cent of states having coup d'états, 33 per cent attempted coups and 50 per cent reported plots. These figures are high (Ayoob, 1991; 3) and has been demonstrated in states such as Sierra Leone; Rwanda, Libya and Ethiopia, due to intrastate wars, genocide and military regimes and poverty (Cheru, 2002). There is a growing urgency for new methods of ensuring that peace within continents becomes reinforced in the minds of the young from an early age. Mindful learning and peace education encourage greater consciousness for oneself and one's environment which allows for learners to be more conscious of their thoughts and actions.

Hence, mindful learning plays an important role in creating greater awareness about oneself and ones conscious thoughts and actions, which plays an important role in behaviour and the relations between scholars, teachers and the broader community. Schools have started to view mindful learning as a strategic resource in shaping behaviours, attitudes and interactions among their learners and teachers, valuing its outcomes as can be seen in a reduced anxiety, conflict and attention disorders (Suttee, 2007; 1).

Mindful learning teaches children to become more present in the moment than they have been, in a non-judgemental way. People therefore become more aware of their environment and themselves and accept the moment in a more indulgent manner and let go of the specific experience in order to focus on the next experience (Kabat-Zinn, 2003; 145). This type of learning results in environments which have led to peaceful classrooms and schools. The relative influence of mindful learning within the schooling environment will allow for learners and teachers to be more aware of their actions, more productive, less reactive, less aggressive, more compassionate and ultimately more peaceful.

MAIN PROBLEM AND RESEARCH OBJECTIVE

As scholars of today will eventually become the leaders of the world, this can turn out to be detrimental for the future of human existence and the maintenance of peace and the prevention of war. There was a need to investigate to what extent the schooling environment; system and curriculum instil in learners values that promote a peaceful world. Teachers, school boards, teaching and learning methods are set in their ways and fail to cultivate a sustainable culture of innovation which focuses on human rights and social justice.

The basic principle is that all education stakeholders must participate in a process which can ensure that learners have a respect for life and peace. The study will focus on how schools, through mindful learning and their teaching methods can ensure that students become more peaceful. The study will discuss mindfulness and peace education to explore and make a significant contribution to the existing literature.

The study will seek to answer the following key research questions:
- Have schools been successful in fostering peace within the consciousness of learners?
- What is the result of schools practising mindful learning in ensuring peace and in creating a more peaceful world?

Primary objective

The primary objective of this study was to investigate peace within schools practicing mindful learning.

Secondary objectives

The following secondary objectives were identified in order to achieve the primary objective:

* To conduct a literature review which will assist in identifying what mindfulness entails and what its learning methods are

* To review current empirical research on the topic

* To summarise, draw conclusions and provide recommendations based on the empirical results.

Literature review

Mindful learning teaches children to become more present in the moment, in a non-judgemental way. People therefore become more aware of themselves and their environment, and accept the moment in a lenient manner and let go of the specific experience in order to focus on the next experience (Kabat-Zinn, 2003; 145). This type

of learning is conducive for a peaceful environment, school and classroom. The relative influence of mindful learning within the schooling environment allows for learners and teachers to be more aware of their actions, to be less reactive, less aggressive, more compassionate and ultimately more peaceful.

The study believes that the way in which we think and behave has an effect on our brain which impacts on our health and wellbeing. Mindfulness has contributed to reduce stress and pain through Mindfulness-Based-Stress-Reduction (MBSR) by Jon Kabat-Zinn. Buddhist meditation and mindfulness have been documented for their contribution in decreasing psychological suffering (Ostafin et al, 2006). Smith (1975), Grossman, Nieman, Schmidt & Walach (2003) concluded that mindfulness has been used to treat mental and psychological disorders such as stress, anxiety, cancer, Aids, ADDH and aggression more specifically. Kabat-Zinn (1982) said that mindful meditation impacts on individual thoughts and actions. This aims to prevent negative thoughts in order to prevent negative experiences (Hayes and Stosahl, 2004). Flaxman and Flook (unknown) illustrate that current research on mindfulness focuses on the effects of the brain, effects on the body, metal effects and how participants practicing mindfulness behave toward people and the environment.

This burgeoning field has concluded that mindfulness creates greater concentration and sensory stimulation, while compassion meditation activated the part of the brain that prompts emotional cues thus leading to more empathy, awareness and compassion (Flaxman & Flook, unknown). There are a number of intertwined facets of mindfulness which must be more aligned.

The bulk of the literature on mindfulness has had notable success and has focused on the effects on children and there remains a gap in the investigation of its effects on young learners. The research that has been conducted with children and adolescents has concluded positive outcomes such as to reduce anxiety and promote higher grades as a result of greater attention.

There remains great interest in the study of education and mindfulness. Studies that have been conducted within education settings revealed greater social skills and greater attention, as well as greater connectivity to environments. This raises questions about the powerful effects that mindfulness within the schooling system can indeed lead to calmer and attentive learners, better academic results and more awareness and greater connectedness among learners that promotes respect for oneself and harmony with everything. (Flaxman and Flook, unknown). The literature demonstrates that mindful learning can create more peaceful minds, peaceful children, peaceful schools and communities and ultimately a peaceful globe. There is however not enough evidence based on adequate control groups and big sample groups to conclude that the findings are universal (Baer, 2003).

Singh, Lancioni, Joy, Winton, Sawaawi, Wahler, et al (2007), Eifert, McKay and Forsyth (2006), Birnbaum (2005) and Barbieri (1997) conclude in their journal articles that mindfulness contributes to reducing aggression in its participants. McLeod and Reynolds (2010) in their book *Peaceful pedagogy: Teaching human rights through the curriculum* illustrates how peace building can become a part of the schooling curriculum. In their study they conduct a case study on five schools. The model that McLeod and Reynolds (2010) present is based on peace education and focuses on the interpersonal level (individual) and intrapersonal level (schools, teams, groups, communities). The model promotes peace building within classrooms, schools and the community. Their perspective is that peace education focuses on transformation, caring, inviting emotions, being value laden, building intercultural peace and an understanding within a global context.

McLeod and Reynolds (2012) in their book demonstrate that schools can become agents of peace building although much work is still needed by all involved. They also believe that the school body, teachers, textbooks, course material and the subjects offered can all contribute to instilling peace building into the minds and actions of learners. The model promotes the implementation of human rights principles such as social justice, peace and harmony into the curriculum through teaching and learning.

Morris (2009) in his book *Teaching happiness and wellbeing in schools: learning to ride elephants* provides a model based on personal experiences in the classroom through a curriculum based on happiness and wellbeing. This perspective equips students with skills that are necessary for them as a rider to ride the elephant which is a

metaphor for the world and become not only riders but excellent riders in their experiences with the world. This model is similar to Kabat-Zinn as it teaches children to be more aware, intervene through action and to reflect and it is based on peace within and outside the individual. He also gives reference to the importance of learning methods, teachers, principals, students and the body of knowledge taught within the school environment.

Morris (2009: 199) said that the teaching of the wellbeing of all can transform education so as to create more attentive and aware, mindful, compassionate and peaceful individuals from an early age. This is one way that we can prevent the world from going into greater turmoil in the future. Mindfulness research suggests that the study has had positive effects on reducing psychological pain. Eisler (Mclnnis, 3–4) calls this the Dominator System which promotes values around competition, dominance and wins only, and further suggests that children should be given the freedom to explore past survival methods that have worked, tolerance and not inflicting any pain, and being in harmony with nature as we are all interconnected in some way or another.

Marshall and Rosenburg (2003) in their book *Life Enriching Education* illustrates that children should be taught to create a future that ensures equality and respect for everything to ensure human survival in a peaceful manner as opposed to aggression, intolerance and inequality, in a non-judgemental way, a sense of caring for another person out of kindness and love as opposed to duty or expectation.

The term "secular ethics" entails basic human wisdoms such as compassion, kindness, love and empathy. Eisler (2000) demonstrates that there is a need for this to be instituted into the learning of children as they will require this in the environmental, social and economic problems that might transpire in the future. She also said that this will allow for leaders who look for sustainable peace, harmony with the environment and ensuring social justice throughout the globe (Mclnnis, 2007; 5). Reardon (1997) concludes that the teacher is the pinnacle of education development; they are to nurture elements of peace, justice and tolerance. The literature illustrates that teachers who promote peace and tolerance are true ambassadors of peace and display this type of behaviour verbally and non-verbally, ensuring that children enact their behaviour (McInnis, 2007; 7).

Hooker and Fodor (2008; 83) and The Prevention Research Centre in Pennsylvania State University conclude that there is not much research based on mindfulness and children, even though younger children are considered to have higher consciousness levels than adults as they live in the present moment, are non-judgmental and are attentive. If research can be done in the early stages of these children's lives, it could be cultivated even more.

Baer (2003) points out those adults enjoy learning about mindfulness. Based on the fact that children often imitate adults, they too will enjoy learning this practice. Based on probability, children will benefit in the same manner as adults – this has already been depicted in some schools practicing mindful learning. Children will become more aware and remember better therefore they will get better grades due to their learning (Fontana & Slack, 1997). Children will also become less aggressive and more aware of themselves, (Fontana and Slack, 1997) and their environment, creating greater understanding, harmony and connectivity to everything, creating a respect for life, human dignity, and social justice. It will also make them more responsive, which are all characteristics which go against wars, conflicts and injustices.

Gunaratana (1991) illustrates a number of myths held by children on meditation such as that it is for saints or holy men, and children often learn of it in descriptive ways using humour, such as comics and cartoons. However, children respond differently and Hooker and Fodor (2008; 83) said that although some children might become anxious, they should accept their experience and will move on. This might take a few sessions, but they should continue trying. Hooker and Fodor (2008; 84) study how mindfulness can be introduced to children through their environment, their body, mindfulness meditation and through practise.

Jacobi (2012) concludes in her article *Do bad grades and violent video games lead to violent kids?* that in a study done in the Netherlands, it was illustrated that boys who played violent video games had lower academic results and were more aggressive than those who did not. The researchers don't imply that the two go hand in hand, but they did conclude that there is a correlation between violent TV games, aggression and violence in learners. The study does however remain open for future investigation on whether this aggression could remain a part of the participant into adult life.

RESEARCH DESIGN AND METHODOLOGY

Firstly, the study conducted a quantitative study on the nature of peace within schools that practise mindfulness and how this practice contributes to shaping the consciousness of scholars towards peace and war. This calls for a strong and sustained case which will contribute to diminish a low level consciousness and awareness of peace in youths. Secondly, conflicts such as bullying and ganging up on the weak in the school environment were examined and whether mindfulness can positively impact on eradicating this phenomenon.

A desktop research study was used. This aim of this study was to investigate how mindful learning contributes to the consciousness and actions of learners and how schools that practise this contribute to peace and war. Primary and secondary sources were used to conduct desk research, such as library sources, internet sources and documents reports, websites and papers.

FINDING AND CONCLUSIONS

The study examined how schools that practise mindfulness impacted on the consciousness levels of their learners towards peace and war. Future research would be in controlled groups that have bigger sample sizes.

Beigel et al (2009) demonstrates that better controlled studies are needed to reveal the shortcomings of the study and more research based on previous findings must be replicated before generalisation can be made.

Findings

Ohio State University and the University of Amsterdam observed more than 800 adolescent boys in the Netherlands. Boys were divided into three groups. The results concluded that boys with lower grades believed that the video games were real and they related to the video game characters (Jacobi: 2012; 1).
A study which involved Grade1–3 children over the 12-week period where yoga and breathing exercises showed improvements in concentration, social interactions, reduced anxiety in those who participated in comparison to those who did not (Williams, Zylowska: 2008; 4–5).
A study that combined MBSR and Tai Chi for middle school children over five weeks resulted in better sleeping patterns, greater awareness and connection to the environment and a calmer group (Flaxman & Flook, 4–6).
A pilot study on Mindful Learning was conducted with preschool and elementary schools children over an eight-week period which impacted on their self-regulatory abilities. The study revealed that mindful learning benefited children within the school environment (Flaxman & Flook, 4–6).
Nylicek and Kuijpers (2008) concluded in their study that MBSR reduced stress, increased living quality and had positive effect overall, In adolescents, mindful learning decreased depression and somatic complaints

(Flaxman & Flook, 9).

Toluca Lake elementary school in Los Angeles practices mindful meditation methods once a week for 10 to 12 weeks. This has resulted in increased attention and concentration levels, positive thoughts, more responsive students, less reactive students, better grades amongst students, less conflict on the playground and in the classroom (Suttie: 2007; 1).

The Garrison Institute in New York in a study promoting mindful meditation in education concluded that children become more focused, less distracted, calmer, less stressed and more responsive as opposed to reactive.

The Mindful study at Standford concluded that there has been increased control in attention and less negative thoughts within participants (Brown: 2007; 2).

The Mindful Awareness Research Centre concluded in their study based on the effects of school children that the children became more calm, peaceful and managed to deal with stressful situation (Brown: 2007; 2).

In Welby Elementary School in South Jordan Utah, a fifth-grade teacher has been practising mindfulness in her classroom and has reported that the attitude of students are positive, there is greater peace in the classroom, the students are happier, they are more attentive and concentrate better (Kabat-Zin, 1997; 2–3).

Conclusion

It was found that schools produced more attentive, aware, awake and conscious learners. The aggression levels of learners have decreased and students became calmer and receptive as opposed to reactive. Students also became more conscious of themselves, of others and the environment. The respondents also became positive towards the importance of individual action and the impact that this can have on peace and the environment. This means that they have a positive attitude towards everything, that they respect everything, and that their consciousness goes against social injustices.

Recommendations and Implications

Based on the results of schools who are already practising mindful learning, it seems that mindfulness can be used as incubation hubs for contributing to greater levels of consciousness towards peace and harmony, which will ensure better performance due to better learning, concentration and creativity and greater awareness of their

thoughts and actions. Students will be in harmony with everything due to less anxiety and aggression, which will ensure more peaceful children and schools and, ultimately, a peaceful globe.

ICT INTEGRATION INTO CHEMISTRY-PHYSICS CLASSES IN MIDDLE SCHOOLS THROUGH A PARTICIPATORY PILOT PROJECT APPROACH

Abdelkrim Ouardaoui[a,*], Ahmed Legrouri[a], Hassane Darhmaoui[a], Khalid Loudiyi[a]

a School of Science and Engineering, Al Akhawayn University, Ifrane 53000, Morocco

Abstract

Information and Communication Technology (ICT) based education was examined, through an integrated project, to experimentally determine how such technology could influence the motivation and performance of students in science (Chemistry-Physics, Mathematics, and Life-Earth sciences) in Morocco. The experiment was deliberately run at middle school level (age 12-14) as it constitutes the best stage in student life to influence their choice for the field of study. Two schools were selected based on their location and environment; one in a semi-rural area of Ifrane, and the other in the large city of Fes. The present study focuses more on the physical sciences (Chemistry-Physics), as they are taught together by the same teacher and represent a structural template of what was carried out within the framework of the pilot project.

The project was the first of its kind in Morocco since it permitted decent usage of ICT in classroom sittings and allowed integral participation of middle school teachers in the elaboration of ICT pedagogical teaching resources using Arabic as teaching language. Control (standard) and experimental (ICT-based) classes were both taught by the same teachers and all the experiments were carried out in close collaboration between the authors and the teachers, with assistance from ICT engineers and technicians.

Quantitative evaluation of the experimental data based on general balanced 3-stage nested design, together with qualitative assessment show a positive impact on the performance and motivation of students as well as their teachers.

The project established successful practice guidelines and has set a promising roadmap for extending it at a larger scale to the rest of the country.

As expected, this project encountered obstacles and limitations. Lessons learnt as well as suggestions are presented in this paper

Keywords: Morocco; ICT education; Chemistry; CITI project; Participatory approach

INTRODUCTION AND BACKGROUND

The application of ICT-based education in science has been the focus of several studies [1-13]. This interest stems from efforts to improve education in terms of effectiveness and efficiency through the use of ICT.

In general the education of science and technology in Morocco is confronting challenges at times the country needs more quality engineers to satisfy its exponential industrial development[10]. In fact, the level in science courses of the majorities of Moroccan students in middle and high schools has been described as below expectations and consequently a decent percentage of Moroccan pupils do not reach higher education [11]. In order to address these issues, the CITI [14] had conducted a three year project sponsored by the Korean International Cooperation Agency (KOICA) [15], with the goal of developing competency and useful IT-based instructional materials for Moroccan Junior High level mathematics and science instruction as a foundation for the larger project that would improve and assist primary and secondary education in Morocco. More details about the background, the constraints, the structure of the project, its human and physical resources, the

development of the e-learning environment and digital resources can be consulted in [12]. In this paper, the focus is on the approach used and the analysis of the results achieved in improving motivation and performance of pupils as well as teachers in Chemistry-Physics education. We also shed some light on the obstacles encountered and the lessons learned from this project. The originality of this study is not so much in the introduction of ICT in education, which has been tried and/or is in use in many countries, but in its research-based operation methodology and its participatory approach. Thus, making teachers directly involved in content development and facilitating their acceptance of the technology. However a resistance or rejection to change in pedagogy with little or no participation by the teaching body can be observed if this ICT approach is imposed from above. In addition, the introduction of technology in educational institutions without providing any structure for maintaining the equipment or training users (pupils and teachers) in how to make effective use of the equipment for educational content development, presentations, studying and learning may result in failure.

METHODOLOGY

Experiment Strategy

The project involves three implementation stages: development of the pedagogical tool, testing, and evaluation. The two pilot institutions in this experiment are Al Arz Middle School in Ifrane (a small town in the Middle Atlas mountains of Morocco) and Kassim Amine Middle School in Fez (an imperial city located at 60 km north of ifrane). Most of the students in these schools are from low income families, and are therefore less exposed to computer technology. Three Chemistry-Physics teachers together with one pedagogical inspector from the same discipline, in each of the two pilot middle schools, contributed to this project. Each teacher was responsible for the experiment in one middle school grade. Before the start of the experiment, the teachers and the inspectors (who jointly constitute the pedagogical teams) were requested to design scenarios of lessons integrating ITC in the Moroccan curriculum. The technical team, composed of ten engineers and technicians at CITI, was responsible for digitizing modules proposed by the pedagogical team, managing the project platform and installing and maintaining the computer equipment in the multimedia rooms, as well as recording typical distinctive class lectures and presentations. Joomla was chosen as the platform for managing the digital content (Content Management System, CMS). The choice of Joomla was based on its easiness to configure and to personalize, in addition, Joomla is one of the rare platform that provide support for Arabic language (Joomla won the best Open Content Source Management System award in 2006). This platform includes functionalities necessary for teaching with digital resources, permitting therefore the addition of modules such as quizzes, interactive tests, text and video courses, whiteboards, agendas, forums, blogs, surveys, RSS news feed, games, chat, television and radio streaming, etc.. Users of this platform can as well create their own templates by arranging the menus offered to suit their own interests.

Digital courses were organized by class level and by subject matter. With each course containing several elements, such as: lecture notes in PowerPoint format, introduction and summary of lectures, videos, quizzes, interactive exams, simulations, educational games and virtual laboratories.

Registered users were given access to personal agenda allowing them to organize their work. They were as well able to share files, post events, create blogs, and contribute to a whiteboard in order to exchange ideas online. Forums allowed for virtual meetings, exchange and offered significant teacher-teacher, teacher-student, and student-student interactivities [14].

Furthermore, teachers who use the platforms can upload lectures and participate in the development and diversification of the content. Readers of all uploaded educational material have the possibility of introducing their comments.

Preparation for the Experiment

The entire pedagogical team benefited from appropriate training sessions and workshops. Teachers and inspectors from the participating middle schools took part in training course organized by CITI. The training, spanning 24 hours over the space of 6 weeks, targeted the basic tools: Word, Excel, PowerPoint, Internet exploration, e-mail, and use of the digital platform of the project. The center also organized approximately ten pedagogical workshops on ICT integration in teaching for all participants to the project. These workshops allowed different actors to share and discuss their experiences thus allowing an effective and improved execution of subjects contents.

Resources' Development

For each discipline and in each pilot middle school, the three teachers in charge of the experimental class were responsible for designing the scientific and pedagogical content, integrating ICT according to a plan drawn up by CITI and advised/approved by an academic inspector. This design was based on the official Moroccan education program. The chosen model is constructivism and the development methods for different pedagogical scenarios were based on the experimental process and/or the problem situation. Worth mentioning that in physics and chemistry, we recommend that the teacher opts, whenever possible, practical (manual) experiments/exercises to computer simulation.

Digitization of Scientific and Pedagogical Content

The technical team from CITI was responsible for the digitization of different content (implementation of flash animations, interactive exercises, film sequences, virtual experiences, photos, power point presentations,...) proposed by the pedagogical team and its insertion into the platform. The team's technical work was closely followed by CITI coordinator, as well as the proper pedagogical team. The digital products created by them were also evaluated from a scientific and pedagogical perspective.

Internal and External Validation of Multimedia Outputs

Once the digital pedagogical resources were produced by the "content experts" and the CITI computer technicians, regular discipline-specific meetings were scheduled in order to internally validate the coherence of the products and their adherence to pedagogical objectives set out by the actual national programs.

Within the framework of the collaboration between Al Akhawayn University in Ifrane (AUI) and the Ministry of National Education, and with the aim of better judging the technical quality and pedagogical orientation of the elaborated resources, an external audit was set through by a team from the Ministry of National Education representing the National Centre for Pedagogical Innovation and Experimentation (CNIPE). This team as well as ICT Education experts reviewed the content of this educational digital products

After having formulated various comments on the different aspects of the products, notably at the pedagogical, ergonomic and multimedia levels, the main team submitted an evaluation report followed by recommendations for improvement.

Experimental Model

To investigate the impact of ICT-based education on the scholastic performance in the two middle school students in Chemistry-Physics, we designed a three stage nested experiment. More detailed explanations about this design can be found in our previous work [12].

For each middle school level, two groups (A and B) of twenty students each (one student for each computer in the multimedia room) were randomly chosen (with the usual distribution except that, in ordinary classes, the class size is forty). In parallel, the chemistry-physics teacher was also randomly assigned to teach one level in each middle school.

Group A (the experimental class) followed the course of study with the aid of ICT in the multimedia class. Group B (the control class) followed the same course of study with the same teacher but in an ordinary classroom and without the aid of ICT (See Figure 1). The two groups underwent identical evaluations each trimester. A statistical analysis of the results of the two classes, A and B, would permit a quantitative evaluation of the impact of integration of ICT.

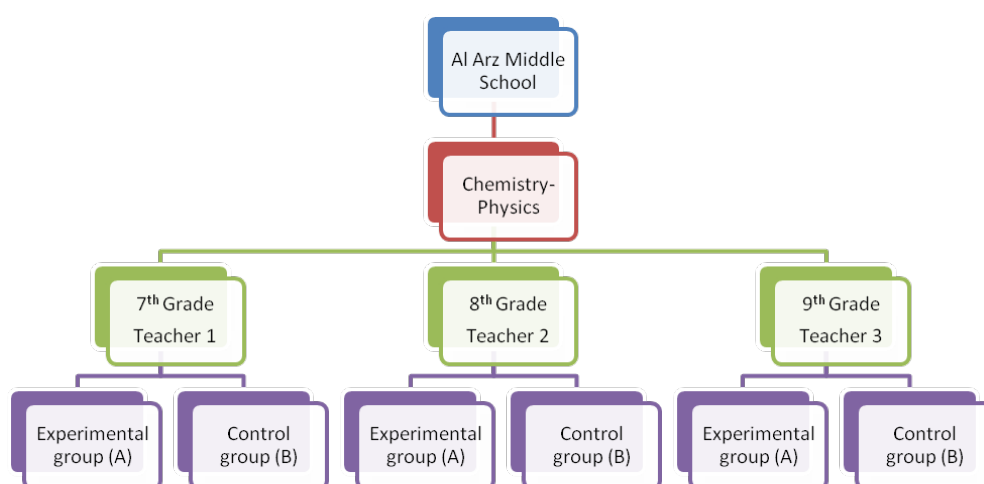
For all three middle school levels, the performance of the experimental and control groups in each discipline in both schools was assessed using the same examinations.


Figure 1: Experimentation flowchart for one middle school. Both experimental and control groups are taught by the same teacher. Both classes of the same level were assessed using the same examinations.

3. RESULTS AND DISCUSSIONS

By comparing the class averages for both the experimental and the control groups, in each grade of each middle school (Figure 2), we noticed the outperformance of the experimental group as compared to the control group.
Figure 2: Class averages of the experimental and control groups in both schools.

For more accurate statistical evaluation, we conducted a T-test as described in our previous work [12]. The null hypothesis of the T-test states that the means for both groups are the same and the alternate hypothesis states

that the mean of the experimental group is higher than the mean of the control group. Our T-test was conducted at an 85% confidence level and our decision was based on the p-value of the test as follows: tests with p-values less than 15% reject the null hypothesis, meaning the experimental group outperforms the control group. Results of this first analysis are summarized in Table 1.

	Kassim Amine Middle School			Al Arz Middle School		
Level	7th	8th	9th	7th	8th	9th
P-value	0.632	0.102	0.098	0.014	0.182	0.027
Test results	No	Reject	Reject	Reject	No	Reject

Table 1: Results of 85% confidence level one sided T-test comparing experimental and control groups' performance for the three considered grade levels

Our analysis indicates positive impact of using ICT on student's learning and performance in Chemistry-Physics for the 8th and 9th grades in Kassim Amine middle school and 7th and 9th grades in Ifrane middle school. Overall, this represents a successful rate of about 67% in both schools. In parallel to the quantitative analysis, we conducted a surveys and classroom observations in order to measure qualitative impact of using ICT in classes. One of the noticeable results is the high motivation for the use of ICT tools in the teaching and learning of chemistry and physics.

4. CONCLUSION

This study shows positive impact of ICT-based education in chemistry-physics education in middle schools. We noticed that our T-test analysis, even though with a 67% success rate, was not consistent across all levels in the two pilot middle schools except for the 9th grade. Knowing that proper pedagogical usage of ICT tools is a deterministic factor in classroom performance, we believe that the observed discrepancies are probably due to this factor. We believe, therefore, that teachers need to be accompanied towards efficient integration of ICT in their daily teaching practices.

Some aspects and learned lessons from the conduction of this project could be summarized as follows:

A rigorous planning of the project (definition of objectives, means, resources and actions) allowed the project to advance, not as a predefined product, but rather as a continuous act of regular questioning of adaptation to context and constraints.

The coherency of needs and the delivered training programs for teachers are vital for the successful implementation of any ICT based project in science education.

The creation of a climate of confidence that limited to some extent the degree of resistance to changes.

Psychological motivation and material incentives for different actors in the project are of crucial importance to carry out similar studies.

İLKÖĞRETİM OKULLARİNDA EĞİTİM TEKNOLOJİLERİNİN KULLANILMASININ YÖNETİMİ: YÖNETİCİ VE ÖĞRETMEN GÖRÜŞLERİ

Yard.Doç.Dr. Vural HOŞGÖRÜR

Muğla Üniversitesi

Eğitim Fakültesi Eğitim Bilimleri Bölümü

Özet

Bilgi çağı olarak tanımlanan günümüz koşullarında kişisel gelişim için gerekli olan tüm bilgiler bilişim teknolojileri yolu ile kolayca erişilebilir hale gelmiştir. Bu durum eğitim sistemlerini temelden etkilemiş, bireylerin öğrenme gereksinmelerinin artması, okullarda öğretme-öğrenme sürecinin verimliliğini yükseltmeye dönük çalışmaların da artmasına neden olmuştur. Okulda yöneticiler bilgi ve eğitim teknolojileri kullanımında öğretmen ve öğrenci arasındaki bağlantıyı gerçekleştirip yönetecek bilgi ve yeteneğe sahip olma rolü üstlenmiştir.

Bu araştırmada ilköğretim okulu yönetici ve öğretmenlerinin eğitim teknolojilerinin okulda kullanılması ile ilgili yönetim etkinliklerinin gerekliliğine ilişkin görüşleri betimlenmeye ve yorumlanmaya çalışılmıştır. Bu genel çerçeve içerisinde probleme dayalı alt problemlere de yanıt aranmıştır. Bunun için araştırmacı tarafından hazırlanan bir veri toplama aracı ile ilköğretim okulu yöneticilerinin ve öğretmenlerin görüşlerine başvurulmuştur. Araştırmanın çalışma evrenini Ankara İli Yenimahalle İlçesindeki ilköğretim okullarında görev yapan 85 müdür ve bu okullarda görev yapan 3308 öğretmen oluşturmuştur. Öğretmen sayısının fazla olması nedeni ile çalışmaya katılacak öğretmenler ilçe merkezinde görev yapan öğretmenlerin arasından random olarak seçilmiştir. Okul yöneticilerinin tamamına ulaşılmaya çalışılmış ancak 79 okul yöneticisinden veri toplanabilmiştir. Buna göre çalışmanın örneklemini 79 okul müdürü ve 66 öğretmen oluşturmuştur. Araştırma da araştırmacı tarafından geliştirilip geçerlik ve güvenilirliği (.88) test edilmiş veri toplama aracı kullanılmıştır. Toplanan veriler frekans, yüzde, aritmetik ortalamalarına göre betimlenmiş, karşılaştırmalar t-testi ve tek yönlü varyans analizi (anova) kullanılarak analiz edilmiştir.

Araştırma bulgularına göre; ilköğretim okulu yöneticilerinin eğitim teknolojilerinin okulda kullanılması ile ilgili yönetim etkinliklerinin gerekliliğine ilişkin olarak öğretmenler yöneticilere göre daha olumlu görüş sahibidirler. Yönetici görüşleri ile öğretmenlerin görüşleri arasında anlamlı farklılıklar tespit edilmiştir. Yönetim yeterlikleri çalışma süreleri bakımından değerlendirildiğinde öğretmen ve yönetici görüşleri arasında anlamlı bir fark tespit edilmemiştir.

MANAGEMENT OF THE USE OF EDUCATIONAL TECHNOLOGIES IN PRIMARY SCHOOLS: OPINIONS OF SCHOOL PRINCIPALS AND TEACHERS

Yard.Doç.Dr. Vural HOŞGÖRÜR

Muğla Üniversitesi

Eğitim Fakültesi Eğitim Bilimleri Bölümü

Abstract

In the information age, people have an easy access to all the information they need for personal development by means of information technologies. This situation has influenced the educational systems from its roots and; an increase on learning needs of individuals caused an increase on the efforts for the effectiveness of learning-teaching process. School principals have the role of having the knowledge and talent to make the connection between teachers and students and manage it, for the use of informatics and educational technologies.

In this study, it was aimed to determine the opinions of primary school principals and teachers about the necessity of managerial activities for the effective use of educational technologies. To determine the opinions of school principals and teachers and a data collecting device was developed by the researcher. The population of this research is 85 school principals and 3308 teachers who work in Ankara Yenimahalle district. As, the population of teachers is too large, the sample was randomly selected from the total number. 79 school principals 66 teachers replied the survey. The collected data was analysed by using frequency, percentage, mean and for the comparisons t-test and one way Anova was used. According to the findings of this research, teachers give more importance to the necessity of managerial activities in the effective use of educational technologies in primary schools than the school principals. Significant differences were found between the opinions of school principals and teachers. When the managerial competencies were analysed according to the length of service, no significant differences were found between the respondents.

Keywords: school principal, educational technologies, technology leadership

Giriş

Teknoloji ve iletişimde yaşanan hızlı gelişme eğitim ve öğretim sürecini de etkilemektedir. Okullarda eğitim öğretim hizmetleri artık internete bağlı bilgisayarlar, projeksiyonlar, elektronik tahtalar kullanılarak verilmeye başlanmıştır. Okul yöneticileri öğretim ve öğrenimde teknolojinin verimli kullanılması için yeni roller üstlenmiş ve sorumluluklarında değişiklikler meydana gelmiştir (Akbaba-Altun & Gürer, 2008). Bu yeni rol ve sorumluluklar okullara eğitim teknolojilerinin alınması, güncellenmesi, uzman personel istihdamı, öğretmenlerin eğitilmesi gibi konularda yoğunlaşmaktadır (Brooks-Young, 2002).

Okul müdürlerinden beklenen, okulda eğitim teknolojisi ile ilgili örgütsel kararları alması, politikalar üretmesi ve eğitim teknolojisinin etkili kullanımını kolaylaştıran işleri gerçekleştirmesidir. Esasen bir eğitim kurumunda yapılacak tüm değişim ve gelişim çalışmalarının başarısı temelde o kurumdaki yönetim anlayışına bağlıdır (Wildman & Niles, 1987). Alanda yapılan çalışmalar incelendiğinde, bu çalışmanın okul müdürlerinin bilgi ve desteğinin, öğretim sürecinde teknolojiyi bir araç olarak kullanan öğretmenlerin desteklenmesinde ve cesaretlendirilmesinde, teknolojinin bütün sınıflara entegre edilmesinde anahtar role sahip olduğunu vurguladığı görülmüştür. (Turan, 2002; Kozloski, 2007; Weber, 2006; Can, 2008; Sincar, 2009; Hacıfazlıoğlu, Karadeniz ve Dalgıç, 2011.). Teknolojinin okula uyarlanmasında pedagojik konular, yetersiz profesyonel gelişim, yetersiz teknoloji liderliği gibi sorunlar önemli olmaktadır (Flanagan & Jacobsen, 2003). Bu sorunları başarılı bir şekilde çözen okul yöneticisi; öğrencilerine daha iyi bir eğitim-öğretim ortamı hazırlayabilmekte, okulda öğrenci devamsızlığını azaltmakta, öğrencilerin akademik başarılarını artırmakta ve daha etkili bir yönetim gerçekleşmektirebilmektedir. (Kearsley ve Lynch, 1994). Çelik (1999) ve Sergiovanni (1984)'ye göre, okul yöneticisi okulun vizyonunu, misyonunu ve amaçlarını belirlemeye rehberlik etmeli, bunları gerçekleştirmek için bütün okul çalışanlarını ve diğer kaynakları bu doğrultuda yönlendirmelidir. Yönetici okulda eğitim teknolojilerinin etkili bir şekilde kullanılmasını sağlamak, diğer bir deyişle teknoloji liderliği yapmak durumundadır (Kearsley, 1994; Turan, 2002.).

Problem

Çalışmanın problemi İlköğretim Okullarında Eğitim Teknolojilerinin Kullanılması EtkinliklerininYönetimidir.

Amaç

Bu araştırmanın amacı, okulda eğitim teknolojileri kullanımı yönetim etkinliklerinin gerekliliğine ilişkin olarak ilköğretim okulu yöneticilerinin ve öğretmenlerinin görüşlerini belirlemektir. Bu genel amaç çerçevesinde aşağıdaki sorulara yanıt aranmıştır.

İlköğretim okulu yöneticilerinin ve öğretmenlerinin okulda eğitim teknolojilerinin kullanımı yönetim

etkinliklerinin gerekliliğine ilişkin görüşleri nelerdir?

İlköğretim okullarında eğitim teknolojilerinin kullanılmasında yönetim etkinlikleri gerekliliğine ilişkin

yönetici ve öğretmen

görüşleri arasında anlamlı bir fark var mıdır?

İlköğretim okullarında eğitim teknolojilerinin kullanılmasında yönetim etkinlikleri gerekliliğine ilişkin

çalışma yılları bakımından yönetici görüşleri arasında anlamlı bir fark var mıdır?

İlköğretim okullarında eğitim teknolojilerinin kullanılmasında yönetim etkinlikleri gerekliliğine ilişkin

çalışma yılları bakımından öğretmen görüşleri arasında anlamlı bir fark var mıdır?

Yöntem

Araştırma tarama modelinde, betimsel bir çalışmadır. Bu çalışmada, ilköğretim okulu yönetici ve öğretmenlerinin okulda eğitim teknolojilerinin kullanılması yönetim etkinliklerinin gerekliliğine ilişkin görüşlerinin betimlenmesine çalışılmıştır. Bunun için "okulda eğitim teknolojileri kullanımı yönetim etkinlikleri" konusunda araştırma maddeleri tespit edilmiş, bu maddelerin yönetim etkinlikleri bakımından gerekliliğini tespit için yönetici ve öğretmen görüşlerine başvurulmuştur. Veriler araştırmacı tarafından geliştirilen beşli likert tipi bir veri toplama aracı ile toplanılmıştır.

Evren ve Örneklem

Araştırmanın çalışma evrenini 2009 – 2010 eğitim öğretim yılında Ankara İli Yenimahalle İlçesindeki ilköğretim okulu yöneticileri (müdür) ve öğretmenleri oluşturmuştur. Yenimahalle İlçesinde 85 ilköğretim okulu bulunmakta olup, bu okullarda 3308 öğretmen, 163 müdür yardımcısı 85 müdür olmak üzere toplam 3556 kişi görev yapmaktadır. Çalışmaya katılacak öğretmenler sayı bakımından çok olduğu için öğretmen grubu ilçe merkezindeki okullarda görev yapan öğretmenler arasından okul müdürlerinin sayısına yakın sayıda (66 öğretmen) random olarak seçilmiştir. Okul yöneticilerinin tamamına ulaşılmaya çalışılmış ancak 79 okul yöneticisinden veri toplanabilmiştir.

Verilerin Toplanması ve Analizi

Araştırma verilerinin elde edilmesi için, alan yazın incelenmiş, konusunda uzman olan öğretim elemanlarının ve alanda görev yapan konu ile ilgili öğretmen ve yöneticilerin görüşleri alınmış, ulaşılan bilgiler ışığında bir veri toplama aracı geliştirilmiştir. Veri toplama aracının kapsam ve yapı geçerliliğini sağlamak için elde edilen geri bildirimler doğrultusunda her bir soru gözden geçirilip, araştırma konusunu net olarak ifade eden cümleler haline getirilmiştir. Araştırmanın verileri geçerlik ve güvenilirliği de test edilen bu veri toplama aracı ile toplanılmıştır. Veri toplama aracı kişisel bilgileri içeren 3, çalışma konusunu içeren 12 cümle olmak üzere toplam 15 maddeden oluşmuştur. Veri toplama aracının güvenirlik katsayısı "Cronbach Alpha" 0.88 olarak tespit edilmiştir.

ilköğretim okulu yönetici ve öğretmenlerinin okulda eğitim teknolojilerinin kullanılması yönetim etkinliklerinin gerekliliğine ilişkin görüşlerinin betimlenmesi ve görüşlerin arasındaki farkların belirlenmesi amacıyla yönetici ve öğretmenlerce yanıtlanan veri toplama aracından elde edilen veriler "SPSS (Statistical Package For Social Sciences) for Windows" paket programına yüklenmiş verilerin çözümlenmesi için t-testi; frekans (f), yüzde (%), aritmetik ortalama ($\bar{x}$) kullanılmış ve varyans analizi yapılmıştır.

Araştırmada 5'li Likert tipi bir ölçek kullanılmıştır. Veri toplama aracında yer alan her cümle Kesinlikle Katılıyorum 5, Katılıyorum 4, Fikrim yok 3, Katılmıyorum 2, Kesinlikle Katılmıyorum seçeneğine de 1 puan verilerek değerlendirilmeye alınmıştır. Ölçekte yer alan aralıkların eşit olduğu düşüncesinden hareket ederek seçeneklere ait sınırlar aşağıdaki gibi belirlenmiştir.

Tablo: 1 Dereceli Ölçek

Puanlar	Değişkenler	Puan Sınırları
1	Kesinlikle Katılmıyorum	1.00-1.80
2	Katılmıyorum	1.81-2.60
3	Fikrim Yok	2.61-3.40
4	Katılıyorum	3.41-4.20
5	Kesinlikle Katılıyorum	4.21-5.00

Kişisel Bilgilere İlişkin Bulgular

ilköğretim okullarında görev yapan ve kendilerine veri toplama aracı uygulanan yönetici ve öğretmenlere ilişkin kişisel bilgi bulguları aşağıda belirtilmiştir. Araştırmaya katılanların 53'ü (%36.6) kadın, 92'si (%63.4) erkek dir. Katılımcıların %54.5'i (79) yönetici, %45.5'i (66) öğretmenlerden oluşmaktadır. Yöneticilerin 70'ini (%88.6), erkek yöneticiler, 9'unu da (%11.4) kadın yöneticiler oluşturmaktadır. Öğretmenlerin 22'sini (%33.3) erkek, 44'ünü (66.7) kadın öğretmenler oluşturmaktadır. Yöneticilerin 6'sı (%7.6), 1 – 5 yıl, 20'si (%25.3), 6 – 10 yıl, 53 'ü (%67.1), 11 yıl ve üstü çalışanlardan oluşmaktadır. Öğretmenlerin 17'si (%25.8) 1 – 5 yıl, 10'u (%15.2), 6 – 10 yıl, 39'u (%59.0), 11 yıl ve üstü, çalışanlardan oluşmaktadır .

İlköğretim Okulunda Eğitim Teknolojilerinin Kullanımı Etkinliklerinin Yönetimi Konusunda Yönetici ve Öğretmen Görüşlerine İlişkin Analizler

Tablo: 2 Yönetici ve Öğretmen Görüşlerine İlişkin Genel t-testi

Görev	N	($\bar{x}$)	(Ss)	t	(Sd)	Sig.
Yönetici	70	50.74	6.58	1.98	140	.002*
Öğretmen	66	54.07	5.83			

p<0.05*

İlköğretim kurumlarında eğitim teknolojilerinin kullanılması etkinliklerinin yönetimine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark tespit edilmiştir (t $_{(140)=}$ 1.98 , p<0.05). Öğretmenler eğitim teknolojilerinin kullanılması yönetim etkinliklerinin gerekliliği konusunda ($\bar{x}$ =54.07), yöneticilere gore ($\bar{x}$ =50.74) daha yüksek düzeyde görüş sahibidirler. Öğretmenlerin test edilen yönetim etkinliklerinde yöneticilere göre daha duyarlı oldukları söylenebilir.

Tablo: 3 Yönetici ve Öğretmen Görüşlerinin Maddelere Göre t-testi

$p<0.05*$

"Öğrencilerin ihtiyaçlarını desteklemek için teknoloji ile zenginleştirilmiş öğretim teknolojilerini uygulamayı sağlayacak uygun öğrenme ortamları tasarlama gerekliliği" (Mad:1) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ .512 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde Öğretmenlerin görüşleri ($\bar{x}_{=}$4.59), yöneticilerin görüşlerine göre ($\bar{x}$ =4.23) daha yüksektir.

"Teknoloji kullanımında işbirliği, ittifak ve ortaklık gibi durumların yaratılmasına olanak sağlama gerekliliği" (Mad:2) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark tespit edilmemiştir. (t $_{(140)=}$1.92 , p>0.05). Söz konusu yönetim etkinliğinin gerekliliğinde hem öğretmenler ($\bar{x}$ =4.39) hem de yöneticiler ($\bar{x}$ =4.14) benzer düzeyde görüş sahibidirler.

"Öğrencilerin konuyu ne kadar öğrendiğini ölçmek için teknolojiyi değişik ölçme tekniklerine uygulayarak kullanmaları için öğretmenlerin yönlendirme gerekliliği " (Mad: 3) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ 3.23 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde Öğretmenlerin görüşleri ($\bar{x}$ =4.32), yöneticilerin görüşlerine ($\bar{x}$ =4.02) göre daha yüksektir.

"Okulun teknoloji kaynaklarını ve olanaklarını öğretimi gerçekleştirmek amacı ile kullandırma gerekliliği" (Mad:4) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark tespit edilmemiştir. (t $_{(140)=}$ .593 , p>0.05). Söz konusu yönetim etkinliğinin gerekliliğinde hem öğretmenler ($\bar{x}_{=}$4.28) hem de yöneticiler ($\bar{x}$ =4.17) benzer düzeyde görüş sahibidirler.

" Teknoloji araçlarının etkili kullanımına model olma gerekliliği" (Mad: 5) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ .224 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde öğretmenlerin görüşleri ($\bar{x}_{=}$4.32), yöneticilerin görüşlerine ($\bar{x}$ =4.02) göre daha yüksektir.

"Bilgi ve iletişim teknolojilerini de kullanarak elde ettiği değerlendirme sonuçlarını veliler, öğretmenler ve diğer eğitimcilerle paylaşma gerekliliği" (Mad: 6) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ 2.18 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde Öğretmenlerin görüşleri ($\bar{x}$ =4.64), yöneticilerin görüşleri ($\bar{x}$ =4.28) göre daha yüksektir.

" Teknolojinin entegrasyonu ve ortamı teşvik etmek için ortak vizyon geliştirme gerekliliği" (Mad: 7) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ 37.78 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde öğretmenlerin görüşleri ($\overline{x}$ $_=$ 4.85), yöneticilerin   görüşlerine ($\overline{x}$ =4.64) göre daha yüksektir.

" Teknoloji kullanımı ile ilgili iş ve işlemlerin yönetimine aktif olarak katılma gerekliliği" (Mad: 8) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ .414 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde öğretmenlerin görüşleri   ($\overline{x}$ =4.45), yöneticilerin görüşlerine ($\overline{x}$ =4.11) göre daha yüksektir.

" Araç- gereç ve teknolojinin kullanıldığı öğrenme ortamlarında sağlık ve güvenliğe ilişkin önlemler aldırma gerekliliği" (Mad 9) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark tespit edilmemiştir. (t $_{(140)=}$ 3.23 , p>0.05).). Söz konusu yönetim etkinliğinin gerekliliğinde   hem öğretmenler *($\overline{x}$ =4.48)* hem de yöneticiler ($\overline{x}$ =4.59) benzer görüş sahibidirler.

" Okulda teknoloji kullanımını yönetecek bilgi stratejileri kullanma gerekliliği" (Mad: 10) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ 7.43 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde öğretmenlerin görüşleri ($\overline{x}$ $_=$4.31), yöneticilerin görüşlerine ($\overline{x}$ =4.00) göre daha yüksektir. Bu madde yöneticilerin gerekliliğine en az önem verdikleri maddedir. Yöneticilerin bilgi stratejilerini kullanma gerekliliğine inanmalarına karşın, bu maddeye en az önem vermelerinin nedeni, bu konuda yeterli bilgiye sahip olmayışlarından kaynaklanıyor olabilir.

" Ders kazanımlarını hedefleyen teknoloji destekli deneyimlere olanak sağlama gerekliliği"(Mad: 11) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ .328 , p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde öğretmenlerin görüşleri ($\overline{x}$ $_=$4.59), yöneticilerin   görüşlerine ($\overline{x}$ =4.25) göre daha yüksektir. Bu maddeye okul müdürlerinin öğretmenlerden daha az önem göstermesi okulun olanakları ile bağlantılı düşünülebilir. Öğretmenler ders kazanımlarının gerçekleştirilmesi için teknoloji destekli deneyimlerden azami oranda fayda sağlamayı beklerken, yöneticiler bu istekleri ancak okul olanakları ile sınırlı bir şekilde gerçekleştirebilmektedirler.

" Öğrenme yeterlikleri bağlamında teknoloji kaynaklarının planlanmasını yapma gerekliliği"(Mad: 12) yönetim etkinliğine ilişkin olarak yönetici ve öğretmen görüşleri arasında anlamlı bir fark gözlenmiştir (t $_{(140)=}$ 3.26 ,p<0.05). Söz konusu yönetim etkinliğinin gerekliliğinde öğretmenlerin görüşleri ($\overline{x}$ =4.60), yöneticilerin görüşlerine ($\overline{x}$ =4.32) göre daha yüksektir. Yöneticiler teknoloji kaynaklarının planlamasını yapma gerekliliğine öğretmenler kadar önem vermemektedirler

Tablo 4:Yönetici ve öğretmen görüşlerinin aritmetik ortalamalara göre önem sırası

Mad No	Yöneticiler	Önem Sırası	Öğretmenler	Önem Sırası
1	4.23	6	4.59	6
2	4.14	8	4.39	9
3	4.02	11	4.32	10
4	4.17	7	4.28	12
5	4.06	10	4.42	8
6	4.28	4	4.64	2
7	4.64	1	4.85	1
8	4.11	9	4.45	7
9	4.48	2	4.59	4
10	4.00	12	4.31	11
11	4.25	5	4.59	5
12	4.32	3	4.60	3

Ayrıca, tablo 4 de görüldüğü üzere yöneticiler ($\overline{x}$=4.64) ve öğretmenler ($\overline{x}$=4.85) "Teknolojinin entegrasyonu ve ortamı teşvik etmek için vizyon geliştirme gerekliliği" maddesine (Mad:**7**) birlikte en yüksek değeri vermişlerdir. Yöneticilerin ve öğretmenlerin bu madde ile ilgili görüşleri arasında anlamlı bir fark da tespit edilmiştir. Öğretmenler bu maddede yöneticilere göre daha yüksek görüşe sahiptirler.

Bununla birlikte, yöneticiler ($\overline{x}$=4.00) "Okulda teknoloji kullanımını yönetecek bilgi stratejileri kullanma gerekliliği" maddesine (Mad:10) en düşük değeri verirken, öğretmenler ($\overline{x}$=4.28) "Okulun teknoloji kaynaklarını ve olanaklarını öğretimi gerçekleştirmek amacı ile kullandırma gerekliliği" maddesine (Mad:4) en düşük değeri vermişlerdir.

 Okul yöneticileri eğitim teknolojisi kullanımındaki diğer yönetim etkinlikleri yanında "teknoloji kullanımının yönetiminde bilgi stratejileri kullanımı gerekliliğine" (Mad:10) daha az değer vermişlerdir. Öğretmenlerin 4. maddeye daha az önem vermeleri ise, eğitim teknolojisi olanaklarının okulda zaten eğitim öğretim için kullanılıyor olmasından kaynaklanıyor olabilir. Öğretmenler bu etkinliği daha az değerli bir yönetim etkinliği olarak görmektedirler.

İlköğretim okullarında eğitim teknolojilerinin kullanılmasının yönetiminde çalışma sürelerine göre yönetici ve öğretmen görüşlerinin analizi

Tablo: 5 Yöneticilerin çalışma sürelerine göre betimsel istatistik tablosu

Çalışma	N	$\overline{x}$	(Ss)
1 – 5 yıl	6	48.50	4.18
6 – 10 yıl	20	50.78	7.05
11 yıl ve üstü	53	50.98	6.68
Toplam	79	50.74	6.58

Tablo: 6   Yöneticilerin çalışma sürelerine ilişkin varyans analizi (one-way anova) tablosu

	Serbestlik Derecesi				Anlamlılık Düzeyi
Gruplararası	2	33,233	16,616		
Gruplariçi	76	3309,639	44,129	,377	,668
Genel	78	3342,872			

p<0.05*

Yöneticilerin görüşleri çalışma sürelerine göre, anlamlı farklılık göstermemektedir ($F_{(2;76)}$= .377, p<0.05). Bu durum, çalışma süreleri farklı olan yöneticilerin, eğitim teknolojilerinin yönetimi konusunda benzer şekilde görüş sahibi olduklarını göstermektedir.

Tablo: 7 Öğretmenlerin çalışma sürelerine göre betimsel istatistik tablosu

Çalışma Süresi	N	$\bar{x}$	(Ss)
1 – 5 yıl	17	55.50	4.35
6 – 10 yıl	10	52.72	9.82
11 yıl ve üstü	39	53.79	5.22
Toplam	66	54.07	5.83

Tablo: 8 Öğretmenlerin çalışma sürelerine gore varyans analizi (one-way anova) tablosu

	Serbestlik Derecesi				Anlamlılık Düzeyi
Gruplararası	2	50,695	25,347		
Gruplariçi	63	2091,915	34,294	.739	.482
Genel	65	2142,609			

p<0.05*

Öğretmenlerin görüşleri çalışma sürelerine göre, anlamlı farklılık göstermemektedir (F(2;63) = .739, p>0.05). Bu durum, çalışma süreleri farklı olan öğretmenlerin , eğitim teknolojilerinin yönetimi konusunda benzer şekilde görüş sahibi olduklarını göstermektedir.

Sonuç

Araştırmada, ilköğretim okulu yöneticileri ve öğretmenlerin okulda eğitim teknolojilerinin kullanımı etkinliklerinin yönetimi konusundaki düşünceleri öğrenilmiştir. Elde edilen verilere göre genel olarak hem okul yöneticileri, hemde öğretmenlerin okulda teknoloji kullanımının yönetimi konusunda olumlu düşüncelere sahip oldukları görülmüştür. Bununla birlikte, sınıflarda gerçekleştirdikleri eğitim - öğretim etkinliklerinde eğitim teknolojilerini bizzat kullandıkları için öğretmenlerin eğitim teknolojilerinin okulda kullanımı yönetim etkinlikleri ile daha yakından ilgilendikleri söylenebilir. Bu çalışmanın problemini oluşturan okulda eğitim teknolojilerinin kullanımı kunusundaki yönetim etkinliklerinin gerekliliği hakkındaki öğretmen görüşleri okul müdürlerinin görüşlerine göre daha yüksektir.

Okul müdürleri okulda eğitim teknolojileri kullanımı konusundaki yönetim etkinliklerinin gerekliliği bakımından olumlu görüşlere sahip olmakla birlikte; Teknoloji kullanımında işbirliği, ittifak ve ortaklık gibi durumların yaratılmasına olanak sağlama- Öğrencilerin konuyu ne kadar öğrendiğini ölçmek için teknolojiyi değişik ölçme tekniklerine uygulayarak kullanmaları için öğretmenlerin yönlendirme- Okulun teknoloji kaynaklarını ve olanaklarını öğretimi gerçekleştirmek amacı ile kullandırma- Teknoloji araçlarının etkili kullanımına model olma- Teknoloji kullanımı ile ilgili iş ve işlemlerin yönetimine aktif olarak katılma- Okulda teknoloji kullanımını yönetecek bilgi stratejileri kullanma gibi yönetim etkinlikleri konusunda okul müdürlerinin biraz daha fazla sorumluluk geliştirmeleri beklenebilir. İlköğretim okulu yöneticilerinin teknoloji yönetimi konusundaki eksikliklerini, değişen çağa ve koşullara kendilerini yeterince uyarlayamamış olmalarına da bağlamak mümkündür.

Brockmeier, Sermon ve Hope (2005) tarafından yapılan araştırmada okul müdürlerinin eğitim teknolojileri konusunda bilgi sahibi olma, öğretme-öğrenme sürecinde teknolojilerin nasıl kullanılabileceğini anlama, teknoloji kullanımını destekleyen kullanıcı, işbirlikçi ve kolaylaştırıcı rollerinde sıkıntı yaşadıkları sonucuna ulaşılmıştır.

Yöneticilerin ve öğretmenlerin çalışma sürelerine göre ayrı ayrı olarak yapılan analizlerde hem yöneticilerin hemde öğretmenlerin okulda eğitim teknolojilerinin kullanılmasının yönetimine ilişkin görüşleri arasında anlamlı fark tespit edilmemiştir. Değişik çalışma sürelerine sahip olan yöneticiler ve değişik çalışma sürelerine sahip olan öğretmenler benzer görüşlere sahiptirler.

Öneriler

Araştırma konusuna dayalı olarak geliştirilen öneriler şunlardır.

Teknoloji kullanımında işbirliği, ittifak ve ortaklık gibi durumların yaratılmasına olanak sağlama,

Öğrencilerin konuyu ne kadar öğrendiğini ölçmek için teknolojiyi değişik ölçme tekniklerine uygulayarak kullanmaları için öğretmenleri yönlendirme,

Okulun teknoloji kaynaklarını ve olanaklarını öğretimi gerçekleştirmek amacı ile kullandırma,

Teknoloji araçlarının etkili kullanımına model olma,

Teknoloji kullanımı ile ilgili iş ve işlemlerin yönetimine aktif olarak katılma,

Okulda teknoloji kullanımını yönetecek bilgi stratejileri kullanma,

gibi yönetim etkinlikleri konusunda okul müdürlerine hizmet içi eğitim düzenlenebilir.

Eğitim kurumlarında eğitim teknolojilerinin yönetimi konusunda okul müdürlerinin sorumlulukları net olarak belirlenebilir.

Okulda teknoloji liderliği kriterleri oluşturulabilir.

Eğitim teknolojileri etkinliklerinin yönetimi konusunda daha ileri araştırmalar yapılabilir.

İLKÖĞRETİM OKULLARINDA ÖĞRETMENLERİN TAKIM ALGISI

[26]Çiğdem AYANOĞLU, [27]Yrd. Doç. Dr. Mehmet Ali HAMEDOĞLU

ÖZET

İlköğretim okullarında öğretmenlerin takım algısı düzeylerini ve takım algısı düzeylerinin çeşitli değişkenlere göre inceleyen bu araştırma, 2011-2012 öğretim yılında Sakarya ili Sapanca ilçesinde bulunan 10 resmi ilköğretim okulundan elde edilen veriler yardımıyla yapılmıştır. Araştırmanın evrenini Sakarya ili Sapanca ilçesi sınırları içinde yer alan Milli Eğitim Bakanlığına bağlı ilköğretim okullarında görev yapan 242 öğretmen oluşturmaktadır. Araştırmada örneklem belirleme yoluna gidilmemiş, evrenin tümüne ulaşılmaya çalışılmıştır.

Araştırma sonucunda;. Öğretmenlerin okullarında kurulan takımlarda takım ruhu içinde çalış(a)madıkları, kadın öğretmenlerin takım algılarının erkek öğretmenlere göre daha yüksek olduğu, bulundukları okulda daha uzun süre görev yapan öğretmenlerin daha yüksek bir takım algısı olduğu tespit edilmiştir.

Anahtar kelimeler: Takım Çalışması, Takım Algısı, Öğretmen.

GİRİŞ

Okulların, önceden belirlenmiş amaçlarına ulaşması; bu amaçları kendi amaçları olarak benimseyen, bu amaçları gerçekleştirme doğrultusunda diğer çalışanlarla işbirliğini geliştiren, okulun başarısının, ancak tüm çalışanlar üzerlerine düşeni bir takım ruhu ile ve tam olarak yaptıklarında ortaya çıkabileceğini bilen çalışanlarla olasıdır (Demirtaş, 2005: 42).

Takım kelimesi literatüre girmeden önce, 1930'lu yıllardan itibaren Neo-klasik okulun üzerinde durduğu ve bugüne kadar üzerinde birçok araştırmalar yapılan organizasyonlarda gruplar, grup davranışları, grup oluşturma gibi konular takım çalışmasının başlangıcı sayılabilir (Kayalar, 2002: 271). Ancak zamanla bu iki kavramın farklı olduğu düşüncesi yaygınlaşmıştır. Bunun sebebini Çetin (1998: 1-2), takım kurmanın temelindeki düşünce bir grubun performansının, grubun yapısına ve işleyişine uygun olarak arttırılması isteği olduğu ve takımların çoğu zaman diğer gruplardan ve bireylerden daha fazla performans gösterdiğini belirterek ifade etmiştir. Yine Maddux (1999: 5-6)'ın grupların en büyük başarılarını takım denilen verimli yapılara dönüştürdüklerinde ortaya çıkardıklarını belirtmesi ile grup ve takım kavramlarının birbirinden farklı olduğu anlaşılmaktadır.

Takım, ortaklaştıkları amacı tümleşik olarak, elbirliği ile en üst etkililikte gerçekleştirmeye çalışan birbirlerine bağlı ve birlikte hareket eden iki ya da daha fazla kişiden oluşan insan grubudur (Başaran, 2004: 292; Balcı, 2005: 177; Eren, 2007:463; Dengiz, 2000: 30).

Balcı (2002: 98) ve Sümter (2003: 7) takımların en az iki üyeden oluştuğunu, üyelerin birbiriyle sürekli etkileşim içinde olduğunu, kendilerini ve birbirlerini takımın üyesi olarak algıladıklarını, takımın ortak değerlerini paylaştıklarını, birlik içinde olduklarına inandıkları ve birlikte hareket ettiklerini, aynı amacı benimsediklerini ve sürekli yeni amaçlar belirlediklerini, sinerji yarattıklarını, yaratıcı olduklarını, motivasyonun yüksek olduğunu, hızlı karar alma yeteneğine sahip olduklarını, açık bir iletişimin, karşılıklı güvenin ve bir takım kültürünün mevcut olduğunu, bir yap-boz'un parçaları gibi birbirini tahrip etmeden yerine oturan ve birleştirildiğinde bütün bir deseni meydana getiren bir yapıya sahip olması gerektiğini belirtmektedirler.

Takımlarla Çalışmanın Önemi

1990'lı yılların başından itibaren ekonomik ve sosyal çevrenin uğradığı değişim, işletmelerin yapısında ve yönetim stratejilerinde de önemli değişikliklere yol açmıştır. Bu değişiklikler içerisinde yer alan takım çalışması uygulamaları işletmelerin temel gereksinimleri arasında yer almaya başlamıştır. Bugün başarılı olan birçok işletme söz birliği etmişçesine, rekabet üstünlüğünü sağlamak için takım çalışması uygulamalarının gerekliliği üzerinde vurgu yapmaktadır. Tüm bu gelişmeler, takımların uygulamada hızla yaygınlaşmasına ve yönetim tarafından desteklenmesi kaçınılmaz bir felsefe ve uygulama olarak ortaya çıkmasına neden olmuştur (Özler ve Koparan, 2006).

Takım çalışmasında temel nokta; bir kişinin yaptığı faaliyetlerin, verdiği kararların diğerlerini de etkileyeceğinin bilincinde olması ve toplam aklın, bireysel akıldan daha büyük olduğu gerçeğidir (Polat, 2000). "Hiçbirimiz, hepimiz kadar akıllı değiliz" cümlesi aslında takım çalışması ile birlikte ortaya çıkan vizyonun ne kadar önemli olduğunu açık bir şekilde ifade etmektedir (Blanchard, 1996: 22-23).

Bir kişi bir işi tek başına yaptığında daha fazla zaman ve emek harcadığı halde, takım içerisinde daha az zamanda çok fazla işler yapılabilmektedir. Takım çalışmaları ile bireysel iş performansı takım performansına çevrilerek sinerji oluşmaktadır (Brestrich, 2000: 111). Takım çalışmasının sihirli kelimesi sinerjidir (Karslı, 2004: 63).

Örgütlerde takımlar birçok amaçla kurulurlar. Bu amaçlar arasında; değişimi başlatma, değişime karşı direnci kırma, sorunlara çözüm bulma, çalışma ilişkilerini geliştirme, amaçlara dönük sonuçlar elde etme, örgütü yenileştirme, çalışanlar için işi daha anlamlı hale getirme, katılımcı ve paylaşımcı bir örgüt kültürü yaratma, kaliteli hizmet sunma, yeni stratejiler geliştirme vb. sayılabilir (Elma, 2004: 197).

Etkili Takımların Oluşması

Örgütün etkililiğini artırmak ve örgütsel amaçlara daha çabuk ve sağlıklı kavuşabilmek için bütünlük gösteren her iş için bir takım oluşturulmalıdır (Başaran, 2004: 195-196). Takım oluşturmanın en genel amacı; birbirleriyle dayanışma içinde olan, destekleyen ve birbirlerine güvenen bir takım oluşturulup, verilen bir işi tamamlamak, aynı zamanda da bu işi yaparken üyelerin değer farklılıklarına, davranış biçimlerine ve becerilerine saygılı olmaktır (Özkalp ve Kırel, 2001: 438).

Takımlar bir anda oluşuveren topluluklar değildirler. Bir araya gelmiş bir grup yabancının oluşturduğu kümeden birlik içinde hareket eden, iyi koordine edilmiş bir grup oluşturmak biraz zaman alır ve grup üyeleri arasında büyük miktarda etkileşim gerektirir (Eren, 2007: 467).

Takım yapılanma süreci bir işbirliğini ifade eder. Takım üyelerinin birlikte çalışma fikri önemlidir. Sinerjik bir takım olarak, biz bu takıma neler katabiliriz ve bu katkılarımızla neler yaratabiliriz düşüncesi önem kazanmaktadır. Yapılandırma süreci boyunca takım etkiliğinin değerlendirilmesi ve alınacak kararlarla gelecekteki bu etkinliğin arttırılması ve devam ettirilmesinde nelere ihtiyaç duyulduğunun belirlenmesi gibi konularda katılımcılık beklenir (Keçecioğlu, 2000: 17). Bu nedenle takım oluşum sürecinde takım olacak tüm bireylerin bazı sorulara cevap vermesi beklenmektedir.

Margerision' a (2001:19) göre yeni oluşturulan takımlarda "Biz kimiz?", "Biz şimdi neredeyiz?", "Nereye gidiyoruz?", "Oraya nasıl ulaşacağız?", "Bizden ne yapmamız bekleniyor?", "Amacımıza ulaşmak için desteği nereden alacağız?", "Ne kadar etkiliyiz?", "Sonuçta ne elde edeceğiz?" sorularının cevaplarını tüm üyelerin çok iyi bilmesi ve anlaması gerekir (Akt. Çetin, 2001: 32). Takım üyelerinin bu soruları cevaplandırmalarından sonra takım oluşum süreci başlar ve gelişir.

Örgütlerde takım çalışmasının tercih edilmesinin temel amacı; işletme stratejileri doğrultusunda yüksek performans sağlamaktır. Ancak bugüne kadar gerçekleştirilen birçok araştırma sonucunda takım çalışmasının başarıyla uygulanmasının kolay olmadığı, birçok hataların yapıldığı veya takım çalışmasıyla beraber ortaya çıkan sinerjik güçten yeterince faydalanılamadığı görülmüştür (Yedievli ve Ersen, 1997: 29-30). Her şeyden

önce takım olmanın, takım haline gelmenin bazı koşullarını yerine getirmek gerekmektedir (Ataman, 2002: 89). Bu nedenle etkili bir takım çalışması için bir takımın bazı temel özellikleri taşıması gerekmektedir. Bu özellikler; açık hedefler, üst düzeyde bir motivasyon, sağlıklı iletişimin oluşturulması, yetenekli üyeler, ortak sorumluluğun paylaşılması, paylaşılan amaç ve vizyona sahip olmak, takıma ait olma duygusu, takımsal yetkilendirme, faydalı bir çatışma alanı oluşturma, verimli toplantılar yapma, yaratıcılık ve yenilik, uygun çalışma yöntemleri, karşılıklı güven, işbirliği, etkin liderlik, takıma bağlılık, düzenli aralıklarla gözden geçirme ve değerlendirme, ödüllendirme, bireysel gelişime destek vermek ve diğer takımlarla sağlam bağlar şeklinde ifade edilebilir.

Eğitimde Takım Çalışması

İnsanları gelecek için hazırlayan eğitim kurumlarının takım çalışmasına doğru yönlendirilmesi zamanın ve çalışma şartlarının bir ihtiyacı olarak ortaya çıkmaktadır. Eğitim örgütlerinde takım çalışması verimliliği en üst düzeye çıkarabilmede gerekli ihtiyaç olarak görülmelidir. Yöneticiler kendilerinin de desteğiyle akademik ve destek personelden oluşan, çeşitli fonksiyonları yerine getirecek biçimde takım çalışmasına gidip takımlar oluşturmalıdırlar (Cafoğlu, 1996: 65-72; Çetin, 2001: 35).

Takım çalışmasının bütün personeli içine alacak şekilde başlatılması öğretim, yardımcı ve yönetici personel arasındaki duvarları ortadan kaldırıp daha iyi bir çalışma ortamının kurulmasını sağlayacaktır. Problem çözme ve karar verme sistemlerinin organizasyondaki bütün seviyelerde takım çalışması ile birlikte uygulanması eğitim kurumlarının başarısı için önemli adımları oluşturacaktır (Cafoğlu, 1996: 66).

Okul, aynı eğitim amaçlarını gerçekleştirmeyi paylaşan eğitim işgörenlerinin oluşturduğu bir örgüttür. Öğrencilerin eğitiminde, her işgörenin, başka işgörenlerin yardımını araması doğaldır. Eğitim hizmeti bir bakıma imeceyle yapılan çalışmanın ürünüdür. Çünkü öğrencilerin eğitimi bir insanın bilgi ve becerisiyle yapılamayacak kadar ağırdır (Başaran, 2008: 310). Okullar bu açıdan değerlendirildiğinde yapılan işin doğası eşgüdümü ve işbirliğini zorunlu kılmaktadır. Bu nedenle takım çalışması okullar için oldukça önemlidir (Demirtaş, 2005: 43-44).

Örgütlerde takım ve kurul sözcükleri birbirlerinin yerine kullanılabilir (Cooper, 2000'den akt. Şekerci ve Aypay, 2009: 141). İlköğretim okullarındaki zümre öğretmenler kurulu, şube öğretmenler kurulu, öğrenci davranışlarını değerlendirme kurulu okuldaki eğitim etkinliklerinin yürütülmesine dair kararların alındığı takım çalışmalarıdır.

Bu çalışmada zümre öğretmenler, şube öğretmenler, okul gelişim yönetim, okul aile birliği ve öğrenci davranışlarını değerlendirme takımları üzerinde durulacaktır.

- **Zümre Öğretmenler Takımı**

Zümre öğretmenler kurulu, 1, 2, 3, 4 ve 5 inci sınıflarda aynı sınıfı okutan sınıf öğretmenleri ve varsa branş öğretmenlerinden, 6, 7 ve 8 inci sınıflarda branş öğretmenlerinden oluşur. Dersin özelliğine göre etkinlik örnekleri ve materyaller hazırlanarak ortak bir anlayış oluşturulur (MEB, 2003).

- **Şube Öğretmenler Takımı**

Şube öğretmenler kurulu, 4, 5, 6, 7 ve 8 inci sınıflarda aynı şubede ders okutan öğretmenler ile okul rehber öğretmeninden oluşur. Kurulda; şubedeki öğrencilerin kişilik, beslenme, sağlık, sosyal ilişkilerin yanı sıra öğrencilerin başarıları ile ailenin ekonomik durumu değerlendirilerek alınacak önlemler görüşülür ve alınan genel karar, uygulanmak üzere şube öğretmenler kurulu karar defterine yazılır (MEB, 2003).

- **Okul Aile Birliği Takımı**

Okul Aile Birliği, okul ile aile arasında bütünleşmeyi gerçekleştirmek, veli ile okul arasında iletişimi ve iş birliğini sağlamak, eğitim ve öğretimi geliştirici faaliyetleri desteklemek, okulun ve maddi imkânlardan yoksun öğrencilerin eğitim ve öğretimle ilgili zorunlu ihtiyaçlarını karşılamak üzere okullar bünyesinde tüzel kişiliği haiz olmayan birliklerdir (MEB, 2012).

- **Okul Gelişimi Yönetim Takımı**

İlköğretim okullarında; paylaşımcı ve iş birliğine dayalı yönetim anlayışıyla eğitim-öğretimin niteliğini ve öğrenci başarısını artırmak, okulun fizikî ve insan kaynaklarını geliştirmek, öğrenci merkezli eğitim yapmak, eğitimde planlı ve sürekli gelişim sağlamak amacıyla "Okul Gelişim Yönetim Ekibi (Takımı)" kurulur (MEB, 2003). Okul Gelişim Yönetim Ekibi (Takımı), okul toplumunu temsilen oluşturulan ve planlı okul gelişimini yöneten ve yürüten ekiptir. Okul gelişim planı okulun etkili bir kurum hâline getirilmesi için önemli bir araçtır (MEB, 2007: 9-10).

- **Öğrenci Davranışlarını Değerlendirme Takımı**

İlköğretim okullarında öğrencilerin ilgi, istek, yetenek ve ihtiyaçlarını belirleyerek olumlu davranışlar kazanmaları ve olumsuz davranışların önlenmesi için Öğrenci Davranışlarını Değerlendirme Takımı oluşturulur (MEB, 2003).

Problem Cümlesi

Sakarya ili Sapanca ilçesinde ilköğretim okullarında görev yapan öğretmenlerin takım algısı düzeyleri nedir?

Alt Problemler

Bu araştırmada yukarıda belirtilen probleme cevap bulmak için, aşağıdaki alt problemlere cevap aranacaktır:

1.İlköğretim okullarında görev yapan öğretmenlerin zümre öğretmenler, şube öğretmenler, okul aile birliği, okul gelişim yönetim ve öğrenci davranışlarını değerlendirme takım algıları ne düzeydedir?

2. İlköğretim okullarında görev yapan öğretmenlerin takım algısı öğretmenlerin;

a) Cinsiyetlerine, b) okuldaki çalışma sürelerine göre anlamlı bir farklılık göstermekte midir?

Araştırmanın Amacı

Bu araştırmanın amacı eğitim sistemimizin temel basamağı olan ilköğretim okullarındaki öğretmenlerin takım algılarını ortaya koymak, takım algılarının öğretmenlerin kişilik ve mesleki özelliklerine göre farklılık gösterip göstermediğini belirleyerek, takım çalışmasında karşılaşılan güçlükleri saptamak, sorunlara ilişkin çözüm önerileri belirlemek ve takım çalışmasının okulların etkiliğindeki önemini vurgulamaktır.

Bu araştırma sonucunda elde edilecek bulgular ilköğretim kurumlarında görev yapan öğretmenlerin takım algısı düzeylerini ortaya koyması ve öğretmenlerin takım çalışmalarındaki eksikliklerinin, çalışmalar sırasında karşılaşılan güçlüklerin belirlenmesi ve bu doğrultuda çözüm önerilerinin belirtilerek okullarda yapılacak takım çalışmalarının etkiliğinin artırılması açısından öğretmenlerin görüşlerinin belirlenmesi önemlidir. Böylece Milli Eğitim Bakanlığı bünyesindeki okullarda ve diğer eğitim kurumlarında takım çalışmasına yönelik bir okul kültürü oluşturulması açısından öğretmenlere ve okul yönetimine yol göstereceği umulmaktadır.

Sınırlılıklar

Araştırma, Sakarya ili, Sapanca ilçesinde 2011-2012 öğretim yılında ilköğretim okullarında görev yapan öğretmenlerin görüşleri ile sınırlıdır.

Araştırma, okullarda kurulan takımlardan zümre öğretmenler, şube öğretmenler, okul aile birliği, okul gelişim yönetim ve öğrenci davranışlarını değerlendirme takımları ile sınırlıdır.

YÖNTEM

Araştırma tarama modelindedir. Araştırmanın evrenini, 2011-2012 öğretim yılında Sakarya ili Sapanca ilçesinde bulunan ilköğretim okullarında görev yapan öğretmenler oluşturmaktadır. Araştırmada örneklem belirleme yoluna gidilmemiş, evrenin tamamına ulaşılmaya çalışılmıştır. Araştırmanın verilerini toplamada kullanılan ölçek iki bölümden oluşmuştur. Birinci bölümde öğretmenler hakkındaki bazı bilgileri elde etmek amacıyla "Kişisel Bilgi Formu", ikinci bölümde öğretmenlerin takım algılarını tespit etmek amacıyla "Takım Algısı Ölçeği" veri toplama aracı olarak kullanılmıştır. Ölçek aracılığıyla elde edilen verilerin istatistiksel çözümlemesinde SPSS 15.0 paket programından yararlanılmıştır. Değerlendirmelerde anlamlılık düzeyi .05 olarak alınmıştır.

BULGULAR VE YORUM

Araştırmaya katılan ilköğretim okullarında görev yapan öğretmenlerin okullarında oluşturdukları zümre öğretmenler, şube öğretmenler, okul aile birliği, okul gelişim yönetim ve öğrenci davranışlarını değerlendirme takımlarındaki takım çalışması durumları saptanmaya çalışılmıştır. Bu yolla, öğretmenlerin bulundukları takımlarda aynı amaca yönelik bir takımın üyeleri olmaları açısından her bir takım ayrı ayrı ele alınmıştır. Bu alt probleme yanıt bulmak amacıyla, ilköğretim okulu öğretmenlerinin ölçme aracındaki sorulara verdikleri yanıtlar aritmetik ortalama ($\overline{X}$) ve standart sapma (Ss) hesaplarıyla analiz edilmiş ve sonuçlar Tablo 2'de verilmiştir.

Tablo 1. İlköğretim Okulu Öğretmenlerinin Takım Çalışmasına

İlişkin Algılarına Yönelik Aritmetik Ortalamalar ve Standart Sapmalar

Takımlar	N	X	s.s.
Zümre Öğretmenler Takımı	208	2,05	0,81
Okul Aile Birliği Takımı	208	2,00	0,86
Şube Öğretmenler Takımı	131	2,07	0,76
Okul Gelişim Yönetim Takımı	40	2,03	0,73
Öğrenci Davranışlarını değerlendirme Takımı	37	1,49	1,12

Tablo 1'de, araştırmaya katılan öğretmenlerin okullarında kurulan takımlardaki takım çalışmasına ilişkin algılarına yönelik veriler görülmektedir. Buna göre, zümre öğretmenler, şube öğretmenler, okul aile birliği ve okul gelişim yönetim takımında yer alan öğretmenler takım çalışmasını "nadiren" gerçekleştirdiklerini, öğrenci davranışlarını değerlendirme takımında ise öğretmenlerin takım çalışmasını "asla" gerçekleştirmekleri görülmektedir.

Tablo 2. İlköğretim Okulu Öğretmenlerinin Takım Çalışmasına

İlişkin Algılarına Yönelik Frekans ve Yüzdeler

	N/%	Haberi yok	Düşük	Orta	Yüksek	Toplam
Zümre Öğretmenler Takımı	N	.00	63	72	73	208
	%	.00	30.3	34.6	35.1	100
Okul Aile Birliği Takımı	N	.00	77	55	76	208
	%	.00	37	26.4	36.5	100
Şube Öğretmenler Takımı	N	.00	33	56	42	131
	%	.00	25.2	42.7	32.1	100
Okul Gelişim Yönetim Takımı	N	.00	10	19	11	40
	%	.00	25	47.5	27.5	100
Öğrenci Davranışlarını Değerlendirme Takımı	N	10	7	12	8	37
	%	27	18.9	32.4	21.6	100

Tablo 2'de, araştırmaya katılan öğretmenlerin okullarında kurulan takımlardaki takım çalışmasına ilişkin algılarının frekans ve yüzde değerleri görülmektedir. Zümre Öğretmenler takımında öğretmenlerin 63'ünün (%30.3), okul aile birliği takımında 77'sinin (%37), şube öğretmenler takımında 33'ünün (%25.2), okul gelişim yönetim takımında 10'unun (%25) ve öğrenci davranışlarını değerlendirme takımında ise 7'sinin (%18.9) takım algılarının düşük olduğu görülmektedir, bir başka ifadeyle öğretmenler bulundukları takımlarda bir takım ruhuyla hareket etmemektedirler.

Araştırma kapsamına alınan öğretmenlerin takım çalışmasına ilişkin algılarının cinsiyete göre bir farklılık gösterip göstermediğini belirlemek amacıyla t-testi yapılmış ve sonuçlar Tablo 4'te verilmiştir.

Tablo 3. Öğretmenlerin Takım Çalışmasına İlişkin Algılarının Cinsiyet Değişkenine

Göre Farklılık Gösterip Göstermediğine İlişkin t-Testi Sonuçları

Takımlar	Cinsiyet	N	X	s.s.	Ort. S.H.	F	t	sd	p
Zümre Öğretmenler Takımı	Kadın	116	2,20	0,78	0,07	,05	3,06	206	,00
	Erkek	92	1,86	0,81	0,08				
Okul Aile Birliği Takımı	Kadın	116	2,03	0,87	0,08	,22	,57	206	,56
	Erkek	92	1,96	0,85	0,09				
Şube Öğretmenler Takımı	Kadın	68	2,24	0,76	0,09	1,51	2,68	129	,00
	Erkek	63	1,89	0,72	0,09				
Okul Gelişim Yönetim Takımı	Kadın	15	2,00	0,85	0,22	1,68	-,65	38	,87
	Erkek	25	2,04	0,68	0,14				
Öğrenci Davranışlarını Değerlendirme Takımı	Kadın	18	2,06	0,94	0,22	1,03		-,18	,85
	Erkek	19	2,11	0,74	0,17				

*p<.05

Tablo 3'te görüldüğü gibi zümre ve şube öğretmenler takımında yer alan öğretmenlerin takım algılarına ilişkin görüşleri cinsiyet değişkenine göre anlamlı bir farklılık (t=3.06, t=2.68 p<.05) göstermektedir. Kadın öğretmenlerin erkek öğretmenlere göre takım algıları daha yüksektir.

Okul aile birliği, okul gelişim yönetim ve öğrenci davranışlarını değerlendirme takımlarında yer alan öğretmenlerin takım algılarına ilişkin görüşleri cinsiyet değişkenine göre anlamlı bir farklılık (t=.57, t=.87, T=.85 p>.05) göstermemektedir. Kadın ve erkek öğretmenlerin takım algılarına ilişkin görüşlerinin benzer olduğu söylenebilir.

Araştırma kapsamına alınan öğretmenlerin takım çalışmasına ilişkin algılarının öğretmenlerin mesleki kıdemlerine göre bir farklılık gösterip göstermediğini belirlemek amacıyla yapılan analiz sonuçları Tablo 5'te verilmiştir.

Tablo 4. Öğretmenlerin Takım Çalışmasına İlişkin Algılarının Bulundukları Okuldaki Görev Süresi Değişkenine Göre Varyans Analizi Sonuçları

ANOVA						LSD			
Varyansın KAynağı		Kareler Tp.	sd	Kareler Ort.	F	(I) O.Ç.S.	(J) O.Ç.S.	Ort.Farkı (I-J)	p
Okul Aile Birliği Takımı	Gr. Arası	8,45	2	4,22		1-5 Yıl	6-10 Yıl	,07	,60
							11 Yıl ve+	-,49	,00
	Grup İçi	144,54	205	,70	5,99	6-10 Yıl	1-5 Yıl	-,07	,60
							11 Yıl ve+	-,56	,00
	Toplam	152,99	207			11 Yıl ve+	1-5 Yıl	,49	,00
							6-10 Yıl	,56	,00

*p<.05

Öğretmenlerin bulundukları okuldaki görev süreleri bakımından yalnızca takım okul aile birliği takımındaki katılımcıların takım algıları arasında anlamlı fark bulunmuştur (F=5.99, p<.05). Farklılığın hangi çalışma sürelerinde çalışan öğretmenlerin görüşleri arasında olduğunu belirlemek amacıyla yapılan LSD testi sonuçlarına göre görev süresi arttıkça takım algılarının arttığı söylenebilir..

SONUÇ VE TARTIŞMA

İlköğretim okullarında zümre öğretmenler, şube öğretmenler, okul aile birliği ve okul gelişim yönetim takımlarında "nadiren" takım çalışmasının gerçekleştiği bulunmuştur. Öğrenci davranışlarını değerlendirme takımında ise takım çalışmasının "asla" gerçekleşmediği tespit edilmiştir.

İlköğretim okullarında öğretmenlerin takım algılarının düşük olduğu bulunmuştur, bir başka ifadeyle öğretmenler okullarında kurulan takımlarda takım ruhu içinde çalışmamaktadırlar.

Araştırma bulgularındaki ortalamalara göre zümre öğretmenler ve şube öğretmenler takımında kadın öğretmenlerin takım algılarının erkek öğretmenlere göre daha yüksek olduğu bulunmuştur. Okul aile birliği, okul gelişim yönetim ve öğrenci davranışlarını değerlendirme takımlarında öğretmenlerin takım algılarının cinsiyetlerine göre bir farklılık göstermediği bulunmuştur.

İlköğretim okullarında öğretmenlerin okullarında kurulan takımlarda takım çalışması uygulamasını algılama biçimlerine mesleki kıdemlerinin etki etmediği bulunmuştur.

İlköğretim okullarında öğretmenlerin okullarında kurulan takımlardan zümre öğretmenler, şube öğretmenler, okul gelişim yönetim ve öğrenci davranışlarını değerlendirme takım çalışması uygulamasını algılama biçimlerine bulundukları okulda çalışma süresinin etki etmediği bulunmuştur, dolayısıyla araştırma kapsamındaki okullarda uzun süre görev yapmış veya yapmamış öğretmenlerin bu takımlardaki çalışmalar hakkındaki görüşlerinin ortak olduğu tespit edilmiştir. Ancak okul aile birliği takımında öğretmenlerin bulundukları okulda çalışma sürelerinin onların takım algılarına etki ettiği bulunmuştur. Bulundukları okulda daha fazla görev yapan öğretmenlerden daha yüksek bir takım algısı olduğu tespit edilmiştir. Bu durum okulda daha kısa süre çalışan öğretmenlerin okul aile birliği çalışmalarında çevre ile iletişimlerini kurmada zamana ihtiyacı olmaları gerektiğinden

kaynaklanabilir. Ayrıca bu durum, bir yandan uzun süre çalışan öğretmenlerde oluşan bağlılık duygusunun oluşması ile ilişkilendirilebilirken diğer yandan bağlılığın çalışanları o okulda daha uzun süre çalışmaya yönlendirdiği şeklinde değerlendirilebilir.

[b]Balıkesir University, Education Faculty of Necatibey, Elementary Teacher Education Department,Balıkesir, 10100, Turkey

Abstract

This study aims to investigate the elementary school students' perceptions of future technology through their pictorial representations. The study carried out with fifth-grade elementary school students was applied to a class of 18 students. The 5th graders of Çağış Primary School in Balıkesir constituted the research context. The participant children were given pastel painting sets and asked to paint pictures related to future technology. Before this, they were given information about life in the future or using technology. Images collected from children participating in the study were analyzed using content analysis method. According to the analyses, it was determined that the children focused on more than one future technology topic in their paintings. A great majority of the students used "transportation" and important portion of students used "nature" as future technology themes in their paintings. The rest of the students used "Instruments-Devices" as future technology themes in their pictures.

Keywords: Future technology, pictorial representation, images, art education;

Introduction

We are witnessing a century, where information and communication are developing rapidly and technologic products are constantly being renewed. In the 21st century, life is becoming more convenient with the impact of intensely developing technologic products; however, the qualifications we require in order to access this convenience are increasing. The basic function of mass communication is to provide solutions for reality based problems while entertaining, to educate, and to assist certain values settling in society. The dazzling developments in IT Technology constantly demonstrate changes for the sustaining of pursuits of humans such as establishing communication, addressing daily needs, correspondence, and forms of work. In the society of today, while young children are becoming acquainted with the computer and using technology effectively, the previous generation is making efforts and taking lessons to overcome this task and a large majority of them can refer to the new generation, which is very acquainted with technology, as being detached from and irrelevant to their roots.

Many social benefits, which technology helps in arising, are balanced day by day with social problems arising from their use. These are problems ranging from the individual being under pressure, the multi-dimensional destruction of nature to the consumption of the world's limited sources. It is undeniable that technology is an integral part of our social world and has become a fundamental element of our daily activities. The need for any type of machine in performing almost all types of works in the social domain is one of the apparent characteristics of modern life. We use machines for travelling, communicating, producing goods, rendering services, and even entertaining each other. It can be said that technology, which facilitates our lives,

[28] Burcu Sezginsoy Şeker. Tel.: +90-507-768-4296
E-mail address: sezginsoy@balikesir.edu.tr

makes the world smaller, and thus, creates more free time and makes us free and at the same time makes us easily traceable (Turan & Esenoğlu, 2006: 72-74).

In the society of today, children become acquainted with technology, particularly computers, at very early ages. The children and youth of today, who intensely use the computer and internet for assignments and extracurricular activities and entertainment both at home and school, are among the actors that take part the most in the portion requiring communication and interaction of technology in general and computers and internet specifically.When observed in this respect, children are the most prominent factors that use technology in a well manner and shall take it further (Canbek & Sağıroğlu, 2007: 33).

Children of the new generation are born and grow together with computers, the internet, mobile phones, cameras, and other products of the digital world. These children, which are referred to as "digital natives" by Prensky (2001), perceive the world in a different manner, think multi-dimensionally, make decisions faster, and transform technological products to the center of their lives. Computer games, e-mails, the internet, mobile phones, and mobile phone messages have become an integral part of the lives of these students. Studying the perspective of these digital natives, who are each a strong user and consumer of technology of today, is of significance in terms of directing this interest of theirs in a correct manner. In this context, the conducted study was formed in line with paintings of students concerning technology of the future. As a technique pictorial representation, in which they can express schemas envisaged in the minds of students, their emotions and thoughts better, was consulted.

Art and art education is of undeniable significance. The child, who is illiterate and cannot completely express him/herself, reflects him/herself and his/her inner world through his/her first doodles. This unconscious shapes and scribbles are replaced with conscious shapes with art education (Şişginoğlu, 2007). Humans are born with the competence of making sense of and interpreting the world, in which they live in. When this competence is supported under suitable conditions and environments, each individual interprets and expresses the world and itself in various manners. Just like each individual living in society, children too have the need to express themselves. In teaching settings, one of the most effective means for students expressing themselves is pictorial representation (Acer & İlhan, 2011). In addition to pictures being criteria useful for introducing the child to us in psycho-pedagogic terms, it is also of great significance in that it is an instrument of expression useful for reflecting the child's intelligence, personality, intermediate surrounding characteristics, and inner world (Yavuzer, 2007: 12). With the pictures they have sketched, students are able to express their emotions and thoughts through lines, forms, and colors and are able to demonstrate their thoughts on the future in a more comfortable manner.

When the literature is examined, it can be observed that studies addressing children's paintings demonstrate diversity. Image of scientists (Türkmen, 2008), image of mathematicians (Picker & Berry, 2000), perception of the concept of health (Rijey & Van Rooy, 2007), environmental issues (Sadık, Çakan & Artut, 2011), perception of technology (Erişti & Kurt, 2011), perceptions of the internet (Esgi & Çevik, 2010), perception of popular culture (Erişti, 2010) and perception of the European Union (Belet & Türkkan, 2007) are among subjects discussed in studies conducted with primary school students.

The overall objective of this study is to examine the perception of future technology of students in the fifth year of primary school through paintings they have painted. Based on this overall objective, answers to the questions of "What are the opinions of primary school students on the concept of technology?" and "How do primary school students reflect their perception of future technology in their paintings?" have been sought in this study.

Method

This study is a qualitative study examining the form of future technology perception of children in the 11-12 year old age group through paintings they have painted. The universe of the study consists of 18 students studying in Class A of the 5th Grade at the primary school in the Çağış Village in the province of Balıkesir during the 2011-2012 academic year. Data was collected in the spring semester of the 2011-2012 academic year. Primarily, brain storming was carried out under the guidance of the researchers with the students concerning the use of future technology. Open ended questions were directed at the students and then they were requested to

express their emotions and thoughts on future technology through paintings. The students painted their paintings with pastel paint on paper handed out by the researchers for one period. Each student wrote their name, surname, and a brief description of their painting on the back of the paining paper. Whilst the students were painting, the researchers and class teacher remained in the classroom.

The overall objective of this study is to examine the perception of future technology of students in the fifth year of primary school through paintings they have painted. Based on this overall objective, in the study the answers to the following questions have been sought:

1. What are the opinions of primary school students on the concept of technology?
2. How do primary school students reflect their perception of future technology in their paintings?

Analysis and Interpretation of Data

Data obtained from the pictorial expression of students and their discussed opinions have been analyzed and interpreted through descriptive analysis. In the analysis stage of the data, paintings painted by the students and their answers to open ended questions have been analyzed by researchers. As a result of these analyses, the themes appearing in the expressions of students based on the concept of technology have been gathered under the three titles of "benefits, characteristics, and definition of technology." Afterwards, these main themes have been separated into sub-themes. These are 1. Benefits of Technology; a) Making life easier, b) Usefulness, c) Problem solving, 2. Characteristics of technology; a) Entertaining, b) Pleasing, c) Sustainable; 3. Definition of technology; a) Invention, b)Power, c)Instrument.

The themes of opinions developed by students with regards to future technology are present in the following figure in the form of main themes and sub-themes.

1. Change of Nature; a) Magic Seeds, b) Growing Food, c) Ever-lasting Drinks, d) Clean Environment, e) Polluted World; 2. Future Architecture; a) Rising Homes, b) Homes with Geometric Shapes, 3. Transportation; a) Flying cars, b) Flying People, c) Flying Homes, d) Walking homes, e) Space Vehicles; 4. Instruments-devices; a) Walking ball, b) Magic Pen, c) Living Television, d) Change Controller, e) Robots, f) Cloning Machine.

Table 1. Opinions of Students on the Concept of Technology (N=18)

Themes	Sub Themes	Opinion No	Frequency
Benefits of Technology	Making life easier	17,16,15,14,13,10,8,7,4, 3,2,1,6,18	14
	Usefulness	15	1
	Problem Solving	7	1
Characteristics of Technology	Entertaining	15	1
	Pleasing	10,8,18	3
	Sustainability	8	1
Definition of Technology	Invention	14,13,11	3
	Power	12	1
	Instrument	9,8,5,4,2,1	6

As it can be observed in Table 1, answers to the question of "In your opinion, what is technology?" directed to the participants, is in three different categories. Accordingly, there are a total of 16 opinions expressing the benefits of technology. A total of 5 opinions on the characteristics of technology and 10 opinions emphasizing its definition have been discussed. Among all participants, 14 expressed the concept of technology as "making life easier", 6 participants expressed technology as an "instrument." Below there are samples of student opinions on technology.

Opinion 7: In my opinion, technology produces solutions making life easier and finds solutions to some causes.
Opinion 8: In my opinion, technology is an instrument required to make our lives easier. Technology is a very nice thing and is something that never finishes and increases as the years pass.
Opinion 12: Technology means power to me.
Opinion 13: Inventions in the future are called technology.

Table 2. The Perception of Future Technology in the Paintings of Students (N=18)

Themes	Sub Themes	Painting No	Frequency
Change of Nature	Magic Seeds	1	1
	Growing Food	5,18	2
	Ever-lasting Drinks	7,18	2
	Clean Environment	13,16	2

	Polluted World	9	1
Future Architecture	Rising Homes	3,8	2
	Homes with Geometric Shapes	13,17,11,5	3
Transportation	Flying cars	6,10,	2
	Space Vehicles	11,12	2
	People	18,10,6	3
	Walking homes	10,16,17	3
	Flying Homes	8,10	2
Instruments-Devices	Walking ball	13	1
	Magic Pen	14	1
	Living Television	15	1
	Robots	10,8	2
	Change Controller	4	1
	Cloning Machine	2	1

As it can be observed in Table 2, the paintings painted as a response to the question of "In your opinion, how should future technology be?" directed to the students have been grouped in 4 categories. These themes have been discussed under the titles of the change of nature, future architecture, transportation, and instruments-devices. In 8 of the student paintings there are pictorial expressions of changes in the future resulting from the change of nature, and in 5 of them the architectural change of the future was dealt with. In 12 paintings on transportation of the future there are different figures and the total of pictorial expressions with technological instruments of the future have been determined as 7.

Finding and Interpretation

Change of Nature

Fig.1. (a) painting no 18; (b) painting no 5

Painting No 18:
It is a painting expressing that roles in life changed in the future. In the painting it can be seen that humans travel by flying and they have wings as parts of their bodies. With regards to this painting, the student has used the following expression:
"In my opinion, in future technology, humans fly in the sky. I imagined it like this. Flowers and fruits are larger and we eat them and they never finish. I would really like to live in such a world."

Painting No 5:
In the painting in the sub theme titled growing fruits there are samples of bean and tomato figures in relation to the change of nature in the future. At the same time, the "tomato house" figure in this painting also reflects the creative ideas of the individual regarding future architecture. The student has used the following expressions with regards to this painting:
"In my painting there is a tree of beans, house of tomatoes, and a glove made from a broom.
Tree of beans: The beans on it are edible and medicine can be made from them.
House of Tomato: It has windows in the form of waves.
Gloves made from a broom: when sweeping, it will be like as if you had a hand."

Future Architecture
Fig. 2. (a) painting no 13; (b) painting no 3

Painting No 13:
These homes, which were depicted by the student with triangles and various geometric shapes under the future architecture style, were expressed to be "smart homes" by the students. Another striking figure in this painting is a transportation vehicle called the "walking ball", which is believed to be a part of transportation in the future. The student has expressed his/her opinions regarding the painting in the following manner:
"As time and technology advances, humans build their homes in different forms. These homes must definitely address all our needs. They should be smart. They should be able to do whatever we wish. People shall stand on something like a wheel so they do not have to walk. The wheel shall take them around. The shapes of trees are different and people have wanted to make the environment more beautiful. They want to live in a different and more fun place."

Painting No 3:
In this painting, the architecture of the future has been depicted based on "nature." Homes at heights enabling humans to reach the sky have been imagined. The student has expressed his/her opinions regarding the painting in the following manner:
"In this painting there are homes made of beans. These homes reach out to the sky. The tallest one has a leaf garden, rectangular windows, and small leaf stairs. The houses are entered by climbing these stairs. Let's use green paint more. Because I like the color green. I made the leaves colorful, because I imagined it to be like that."

Transportation

Fig. 3. (a) painting no 10; (b) painting no 17

Painting No 10:

In this painting with dominant airplane, car, house, and human figures, the theme of "transportation" has been determined as the main theme. It can be seen that in a majority of student paintings, there is the theme of "transportation". This demonstrates that students perceive the concept of future technology as flying objects. The student has expressed his/her opinions regarding the painting in the following manner:

"For me, in the future there are walking homes, tall trees, homes on trees, and colorful trees. There is a child, who has put on wings and is flying around. I painted a flying car and robot dog. Those things, which I have painted, are entertaining and comforting everyone and making them happy. In brief, it makes our lives easier"

Painting No 17:

As in painting 10, in painting 17, it can be observed that under the main theme of "Transportation", the sub theme of "walking homes" have been depicted. In this painting, the student personifies the home and has indicated this with a happy facial expression. The birds in the painting are reinforcing this. At the same time, this walking home has been discussed as the concept of "nature" and has been depicted as presenting its products to humans and is glad to do this. The student has expressed his/her opinions regarding the painting in the following manner:

"In this painting, by using geometric shapes for the year 2200 I have painted a house with a triangular top, that produces fruits, has flowers and birds, and those butterflies carry humans."

Instrument - Devices

Fig. 4. (a) painting no 2; (b) painting no 4

Painting No 2:

In the painting numbered 2 above, in the middle column of the painting paper, which the student has divided into three, the student has depicted a cloning machine and in the columns to the sides, the student has depicted that it is possible to be at different places at the same time after the cloning procedure. Thus, by stating that technology could make human life easier in the future, the student has attempted to explain that there shall not be a case of 'timelessness'. The student has expressed his/her opinions regarding the painting in the following manner:

"In the year 2100 there is cloning. Someone has cloned himself and these clones are going everywhere. That man is resting at home. In other words, this cloning machine handles all our work. In the 1st painting, the clone is going to work and in the 3rd painting it is going out dining with the girlfriend of its owner."

Painting No 4:

In this painting, a "controller" designed for the future is striking. With this controller, humans in the future are able to return to their past state whenever they desire and return back to their previous state. At the same time, a house that has been depicted with geometric shapes has been formed by considering a human face. Again, this can be an example of homes being personified.

The student has expressed his/her opinions regarding the painting in the following manner:

"I painted this painting because people are playing games and they want to show themselves sometimes as giants and sometimes as dwarfs. But in the year 2100, they are able to make themselves giants or dwarfs with a single controller. And they are able to go to one of their past states. If they wish, they are able to pass from their babyhood to their childhood. In the year 2100 the sun shall come alive and clouds shall have geometric shapes. The stump and leaves of trees are in the shape of triangles. There is a home and the bottom floor of this house is normal and its top floor is in the form of a human."

Conclusion and Suggestions

Students expressed their views on the concept of technology as the benefits of technology, the qualities of technology, and its definition in their written expressions; however, they associated the concept of technology with concepts such as computers, phones, projectors, radios, cell phones, and internet in their verbal expressions prior to their written expressions.

During the interviews conducted with the students before the painting session, in addition to the concepts they reflected in their drawings in the brainstorming activity regarding the technology of the future they also expressed themselves in the following creative activities: Robots working instead of humans so humans do not get tired, a device used for storing the information in the memory without ever having to attend school, houses in the shape of a body of water to avoid water shortage in the future, roller coasters like in amusement parks and special vehicles fitted for them. GPRS in the shape of spectacles, folding pocket-sized houses and computers, a teleportation device, changing the color of the paper to the requested color at one touch with an electronic pencil during painting, a device that creates an abundance of food and water in an arid region when it is in contact with the soil, appearing bars of chocolate when the word chocolate is written on paper with an electronic pen. Above all, greater emphasis given by the students is a machine they designed depending on the concept of "time." The reasons for requiring such a device in the future are stated as follows: 1. Immortality of humans 2. Return to childhood period whenever they wish 3. Repair mistakes 4.Having the power to see the future whenever they wish 5. Changing the current conditions (for example: To experience the summer time instead of winter time).

Despite the wide-variety of students' verbal expressions in the research, due to the limited time and the space of the drawing paper, they have been able to reflect their imaginations on the papers to a small extent. In students' expressions of future technology the reflection of visual media and internet used for games and learning purposes as well as their level of preparedness on their drawing papers is inevitable. Considering that this research is performed in a village primary education school, the traces of versatile and creative thinking of new generation students in their views on technology are observed. In addition, in the examples regarding future technology the element that draws attention deals with the positive functions of technology as a means of obtaining things that are requested as well as providing entertainment and amenities. Students have never mentioned the abuse of technology in the future or its adverse effects.

Abstract

Educational process of individuals with visual impairment differs significantly from education of the intact students due to differences in perception. In the course of teaching, a number of internal as well as external factors influencing the quality of the educational process have to be taken into account and that is why the education can be improved in many ways and in many fields. In this paper, we attempt at approaching the possibility of making educational process more effective by using a new type of 3D maps for students with visual impairment.

Keywords:

Education; students with visual impairment; 3D maps; quality of education.

Main text

Defining the issue of development of people with visual impairment:

Schools years are regarded as a period of preparation for the future. Special attention is paid to acquisition of skills, development of abilities and adoption of knowledge. Development of an individual with visual impairment is, during this period, heavily influenced by teachers and parents with emphasis on skills and performance. Satisfactory results confirm the quality of the individual and thus confirm positive qualities of parents, acceptable development of the individual and reduction of negative impact of the impairment. In relation to general development, self-evaluation and self-confidence are also deemed as strengthening (Finková, Ludíková Růžičková, 2007).

People with visual impairment whose intellect is not affected are able to devise a certain strategy in approaching reality which can help them cope with the handicap. They are, however, not capable of handling particular difficult situations that they are not familiar with.

.

In the course of personal development of a student with visual impairment, fundamental psychical needs play a momentous role, especially in their developmental transportation. This includes a need of stimulation and learning, physical activity, safety, positive identity and self-realization and the need for an open future (Finková, Ludíková, Růžičková, 2007).

Personality is created in the entire period of a man´s development and is affected by external as well as internal factors. Subsequently, personality is also conditioned by biological factors – genetic makeup of the individual, and, to a certain extent, physical appearance of the individual. Another aspect of the highest importance in personality formation is the so-called social factor – how a man develops in contact with other people (at first, family, gradually also other people). What also counts is what an individual hands over to another person, intentionally or unintentionally.

Health disorder has undoubtedly a strong impact on formation of one's personality. It depends on a number of circumstances, e.g. whether the person is handicapped since birth or early infancy or whether the disorder occurred during life. (Votava, 2005)

Visual impairment is a type of sensory defect, which means that the volume of impulses from the environment towards the person is reduced due to the sensory defect and that can also affect the activities of the person with visual impairment and his/her living through experience. (Vágnerová, 1995).

The very task of a person's sight, to reflect the surrounding world, is enormously significant. A person is formed as an "optical being". Visual sensations and perceptions provide a wide range of finely differentiated data from various spheres. The eye is able to distinguish approximately eight categories of signs: colour, shape, size, movement, standstill, distance, direction, area, which thus allows for an adequate reflection of real three-dimensional relations. Sight offers us the most genuine perception of an object. It is then quite obvious that damage to one´s eyesight, whether complete or partial, can cause serious and often irreplaceable losses in the field of sensory perception. Consequences of visual impairment on development and psychical manifestation of people with various intensities of visual disorders have qualitative as well as quantitative character.

Quantitative changes occur, above all, in the field of sensory cognition; visual sensations and perceptions drop out to a certain extent or completely, which results in a limited amount of images, limited formation of mental images, etc.

Qualitative oddities of people with visual impairment are demonstrated in almost every area of psychical activities: changes in the system of interaction of analyzers, types of perceptions, development of specific oddities in the process of forming pictures and notions, disruption of reciprocal sensory and conceptual relation in thinking activities, changes in emotional sphere and in features of one's personality (Litvak, 1979).

Visual impairment influences an individual in all directions, let alone education. The issue of educating students with visual impairment is outlined by Ludíková (1989, p. 20) who defines a notion typhlo-pedagogy, which characterizes the field as follows: "Typhlo-pedagogy, or theory of teaching students with visual impairment, is one of the disciplines of typhlopedia and examines general laws of teaching process or students with visual impairment, deals with the substance of teaching these students, related objectives, contents, specialities of the teaching process, teaching principles, methods, organizational forms and means, which can be applied in teaching students with heavy visual impairment". In this type of teaching process, it is also necessary to include knowledge and findings from other branches, e.g. medical science (ophthalmology, neurology, psychology), teaching science (pedagogy), technical sciences (optics, IT, including software provisions, acoustics, etc.), which contribute, in an effective way, to incorporating an individual into the educational process (Finková, Růžičková, Stejskalová, 2011).

Within the Czech Republic, educating students with visual impairment is anchored through legislation in educational documents not only from the point of view of organization but also from the point of view of implementing "supportive measures", which play a significant role in the process of education and development and directly affect the quality of education of students with visual impairment. Special aids for teaching visually

impaired students aiming, among others, at increasing and enhancing effectiveness of education can be also considered among these supportive measures.

This paper endeavours to indicate to the option of applying special tools - 3D maps, which have been created and tested through co-operation with students with visual impairment. Applicability of these maps is evident, above all, in lessons of geography and spatial orientation but also in other subjects, due to the possibilities of implementing intra-disciplinary relations. As an example, engaging these maps is welcomed in lessons of civics.

Geography is a rather difficult subject for students with visual impairment, especially then for students with a total loss of eyesight. It follows knowledge from the first years of the primary school and develops findings from various scientific fields, e.g. agricultural, industrial, origin of the Earth, planetary system, geographical hypsography, individual spheres, population, political arrangement, etc. Students can also work with a text book or teachers who quite frequently prepare individual materials for particular students, such as work sheets or embossed visualizations. There can be at disposal an embossed globe, various types of embossed maps (usually in thermo vacuum print), including legend in the Braille font, issued individually or as a book of maps. Information is, more often than not, conveyed orally and students can make notes in a standard way. In order to achieve individual work with the map, it is, at first, necessary to introduce the map to the students one-by-one so that, gradually, all students are able to use the map on their own.

Foundations for creation of the maps:

3D maps resulted from a needs analysis of people with visual impairment, which claimed that there is a shortage of suitable didactic materials for teaching geography, in the first place, and further teaching of spatial orientation and independent movement of people with visual impairment. At present, teachers of visually impaired students in the Czech Republic have actually only two options of "showing" perception of geo-area. Compressed foils and plastic embossed maps (thermo vacuum foils, thermo active foaming substances) are applied; or teachers even produce such maps themselves by, usually, layering individual surfaces on top of each other. Another example of innovative approach can be, e.g. adjusting plastic embossed maps by means of marking linear elements or labelling maps with tags in Braille font inscriptions. These tools are, understandably, highly demanding on production and difficult availability further complicates teaching in the given area.

In our research and the following creation, we focussed on maps, which are especially unusual for the material applied. Our maps are made of a material on the basis of plaster and their production allows for forming an even higher embossment compared with standard maps. On top of that, these maps are designed in bright colours so that they can be used by all students with various severity of their visual impairment. At the same time and as a matter of fact, creation of these modern 3D maps respected all general principles of producing tactile maps.

The process was divided into three basic phases:

Creating a pattern book of surfaces,

Creating three basic types of maps,

Creating a multi-media map.
Pct. 1 (authors´ archive)
Pattern book of a key of signs for tactile map for 3D print.
Marks A1 up to F16 are only rough extimates for better orientation in noted-down results and for demostration. Unmarked parts of the pattern book and test results were described word-by-word.

The pattern book was tested by both students with lost vision and purblind students. Testing was conducted in primary and secondary schools for students with visual impairment. People with lost vision tested the surface of the samples, whereas purblind students found most important the colour contrast. Some samples and colours were evaluated as perfect, others were ruled out. Surfaces and colour shades evaluated as prime-quality were later applied in creating concrete maps. Our surface pattern book was tested by altogether 40 students of primary and secondary schools.

Test results – pattern book of surfaces and colours:

The following facts arose from testing the key of signs:
- Necessity to intensify the colours selected; ideal colour combination was chosen as orange and green, the most striking was labelled pink,
- Necessity to not use these lines together within one map: dot-and-dash line, broken dotted line and dashed line; they were often misinterpreted,
- Necessity to not use, at the same time, structures under the label D1, C2 and D3; C4 and C5 and also C4 and D3,
- Arrows can be only used in a format F5, in a format F7 only as a line (not clear where the arrows points),
- Signs F11 and F13 are unrecognizable, differences between F12 and F14 are easier to perceive,
- Suitable are simple and double linear signs and simple dot-and-dash lines (without labelling at the picture); on the contrary, dotted lines, lines with hatching and patterned lines are not suitable,
- As for dotted signs, simple geometrical shapes are suitable (circle, square, triangle), especially F1 up to F4, and also F12 up to F14.

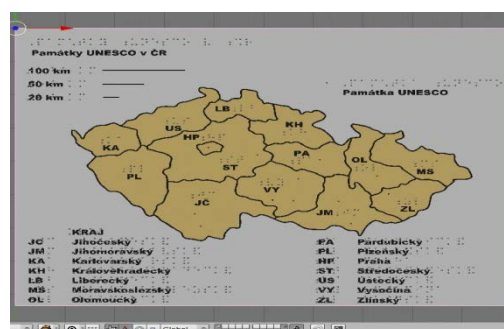
In relation to the above-stated test results assessing the sample book of sign legends, satisfactory surfaces and colour combinations were further applied in devising all archetypes of tactile maps of a modern design created by means of 3D-print technologies, Finková in (Voženílek a kol, 2010).

Pct. 2 (authors´ archive) tactile maps

– European countries and hypsography of Europe.

Pct. 3 (authors´ archive) Thematic tactile map.

- Unemployment in the Czech Republic.

Pct. 4 Map of the area in front of the Olomouc train station (authors' archive).


Pct.5 (authors' archive) Multi-media map – PC model

Research outcomes:

Our maps were evaluated from the point of view of various parameters, our main focus, was, however, on convenient arrangement of legends and distinctness of hypsography differences. Further on, we examined individual significant parameters in particular maps. Further below we present selected results of testing the map "Hypsography in Europe", which we regard as highly important because they allowed us to specify even more parameters in other maps, e.g. map of unemployment in the Czech Republic (Pct. No. 3) or multi-media map (Pct. No. 5).

Test results of a tactile map – Hypsography in Europe:

At first, we focused our testing on the map of hypsography in Europe, whereas the map of European countries was an auxiliary map, within the pilot testing, due to its simpler spatial orientation. Spatial orientation on the map of European countries was only tested in the following phase of the research.
Pct. 6 Convenient arrangement of the legend of the map of hypsography in Europe.

The legend was by 78 % respondents evaluated as well arranged, 14 % students regarded it as poorly arranged and 8 % students voiced only certain objections.

Pct. 7 Ability to recognize altitude degrees according to the legend.

Altogether 75 % respondents were able to distinguish latitude degrees according to the legend (left upper corner of the map). Further, 8 % respondents found it difficult and 17 % students were not able to distinguish them at all. Complications occurred when knowledge obtained from the map were to be transformed into real work with a map. In one case even, a student stated that differences in individual altitude degrees were not sufficient.
Pct. 8 Finding the highest point on the map.

Majority of respondents, i.e. 81 %, managed to find the highest point on the map without difficulties; sometimes a longer period of time was required. The remaining 19 % respondents were not able to find the highest point on the map at all.
Pct. 9 Recognition of sea areas.

Out of the total number of respondents, 81% were able to recognize the sea, 8 % partially (only some seas) and the remaining 11 % were not able to identify the sea at all. The problem lies, most probably, in the fact that the sea was not marked in any special contrasting way compared with other altitude degrees. The sea was, later on and subsequent the test results, completed with hatching for clearer distinguishing.
Pct. 10 Finding individual countries.

Only 50 % of the respondents were able to find European countries in the map of hypsography in Europe without using the accompanying map (the map of European counties). Some students (altogether 12 %) found their approximate position, 38 % respondents, however, were not capable of finding the countries at all. The problems occurred especially due to the fact that some respondents did not know where to look for the countries; they did not even know their approximate position in Europe. That is why our team produced an additional map with borders of individual European countries and both maps were presented to the students at the same time, to allow better orientation.
Pct. 11 Overall satisfaction with the map.

In the final and global evaluation of the map, 48 % of the respondents stated that the map suits their needs, 46 % expressed certain objections and 6 % did not find it suitable at all. Following the map testing, it was mentioned that respondents had not been used to working with such type of maps before. Usually, educational institutions work with maps produced of thermo foils. Working with a map produced by means of a new technology is significantly different. If this map was used regularly, success of work would be higher and subsequently, satisfaction of respondents would also increase.

Conclusion:

The issue of educational quality of students with visual impairment is unquestionably multi-dimensional. Many aspects have to be taken into account. Within our research, we aimed at applying new types of 3D maps as a suitable teaching tool for students with visual impairment. Creating, testing and consequent adjustments of these revolutionary maps brought about a number of intriguing results, which can be easily applied in real teaching. Schools and students that took part in our testing showed their sincere interest in acquiring and using these maps. For the future, we consider the option of expanding these types of maps into individual schools all over the Czech Republic.

INFLUENCE OF SOCIO-DEMOGRAPHIC CHARACTERISTICS TO ATTRACTIVENESS AND SUCCESS OF INITIAL VOCATIONAL EDUCATION AND TRAINING IN LATVIA

Jurijs Lavendels[a], Vjaceslavs Sitikovs[a, 30], Marina Uhanova[a]

[a]Faculty of Computer Science, Institute of Applied Computer Systems, Riga Technical University (LATVIA)

Abstract

The ongoing project "Detailed Methodological Approach to understanding the VET educational system in 7 European countries (7EU-VET)" tries to improve understanding of what particular factors influence on VET system attractiveness and success. The project tries to answer to questions what's new in human perception of VET systems and how they see the future job opportunities, career development and mobility; how effective and successful are advising and informing systems? For these reasons the project implemented empirical study among VET schools' pupil which results are intended for decision makers, experts and VET managers. Results derived from research made in Latvian institutions of initial VET are presented.

Keywords: vocational education and training, Livelong Learning Programme, survey, socio-demographic characteristics

SHORT DESCRIPTION OF THE PROJECT

Developing the attractiveness of vocational education and the quality of vocational education and training (VET) system is one of the goals of Lisbon strategy. The ongoing project "Detailed Methodological Approach to understanding the VET educational system in 7 European countries (7EU-VET)", implemented with the support of the Lifelong Learning Programme (Transversal KA-1) of the European Union, tries to improve understanding of what particular factors influence on VET system attractiveness and success.

The 7EU-VET project builds upon common European strategies, frameworks and tools that have been developed and supports them with the research action among seven European countries – Slovenia, Austria, Germany, Greece, Latvia, Lithuania and UK (7EU-VET, 2010a). The project addresses the following scientific and research objectives (7EU-VET, 2010b): a) are educational and training systems flexible enough to correspondingly respond to different and changing needs; b) how efficient and successful are the systems of advising and informing; c) what are the perceptions of young people of VET systems and how they see their future possibilities for career building and mobility? One of the instruments envisaged to find an answer to mentioned above questions is wide survey in each participating country among initial VET (IVET) schools' pupils (7EU-VET, 2010c). Research results are intended for decision makers, experts, VET managers and secondary school pupil who plan to enroll into VET. Presented paper contains results derived from research made in Latvian institutions of initial VET. Preliminary results of survey in Latvia presented in (Lavendels, 2012) elaborated further in this paper.

SAMPLING AND QUESTIONNAIRE

To be statistically valuable sample list for Latvia contains all IVET schools existing at the moment. The target group of survey is 17-18 years old pupil.

[30] Corresponding author. Tel.: +371-670-895-83; fax: +371-670-890-94.
E-mail address: vss@latnet.lv

Selection of classes participating in the survey was made on the base of school size. If there were more that 2 classes with pupils' age 17/18 in school that is smaller than 600 pupils, then 2 classes were selected occasionally. If there were just 2 or 1 such class then all of them participated in survey. If there were more that 4 classes with pupils age 17/18 in school over 600 pupils then 4 classes were selected. If there are just 4 or less such classes then all of them participated in survey. However if there were in selected classes pupil with other age they also were invited to take part in the survey.

The questionnaire consists of core part, which is the same for all participating countries and nationally-dependent part reflecting particularities of national educational systems. In the questionnaire there were closed, partial open and open-ended questions. Majority of them were closed-type and require from participant only selection of the most appropriate answer from proposed. Essential number of questions was content dependant (specializing) and these questions were asked to answer only in the case of particular selection on previous question(s).

RESPONSE RATE AND SOME SOCIO-BIOGRAPHIC CHARACTERISTICS

Survey was made in May-June 2011 when 82 IVET schools were invited to participate in the survey from which 179 classes have to participate according to sampling described in section 2.

Really in survey participated 72 schools (88% of invited), 169 classes (94% of supposed), 3038 pupils (80% of supposed). In participating classes 3775 pupils are registered, 3105 of them (82%) were presented during survey. 67 pupils from presented (2%) decline to fill questionnaire, so 3038 filled questionnaires (80% of sampled population) were collected and handled. Distributions of ages of participants were as follows: 16 years old - 7%, 17 years – 30%, 18 years - 37%, 19 years and more – 26%. After filtering of 17-18 years old 1888 questionnaires were considered.

Pupils enrolled to approximately 200 VET programs were presented in the survey, from them 54% boys and respectively 46% girls that approximately corresponds to ratio of population enrolled to IVET in Latvia at all (60% of boys and 40% of girls). Majority of respondents (83%) are enrolled into programmes combining both vocational and secondary education giving ability for further education in high schools or universities, from them 49% represents industry-oriented programmes while 51% - service-oriented. Regarding place of living – 37% of IVET student live in big cities or their suburbs, 31% in towns or small villages while 32% - in country villages or farms.

SOME OBSERVATIONS

The following issues are considered: a) transition to VET; b) level of satisfaction of programme and school; c) characteristics of study behavior and acquired knowledge; d) future career aspirations and self-assessment; e) acquired skills and abilities. These issues are considered taking in mind such characteristics of pupil as gender, programme enrolled, pupils' and their parents' country of origin and pupils' place of living. Analyze was made in intention to find what are the strongest and what are the weakest factors influencing on decision making, present attitude, future plans etc. Majority of questions analyzed propose to rank given expression using a scale from 1="Not at all" to 5="Very".

Transition to VET

The research objective was to find which factors are most important for enrolment into current VET. More than half of surveyed pupils in Latvia stated that it was quite or very important for them that the programme offered good job prospects (53%), essential number of pupil (39%) considers that occupation(s) related to selected programme appeals to them, more than each third selected their programme because it was the most appropriate within a reasonable distance from their home (36%) whereas almost each third thinks that reputation

of selected programme is attractive (32%). A smaller proportion of pupils indicated the importance of the following aspects: friends who have chosen to undertake the same programme (22%), parents suggested enrolling in this programme (20%) and previous examination grades which prevented the pupils being able to enroll on more preferable programme (11%). The weakest factor influencing pupils' decision on programme selection is former teachers' encouragement to enroll on this programme (just 7%).

The examination of certain socio-demographic characteristics shows that parents' suggestion is more important for girls than for boys (23% vs. 18%) as well as reputation of programme (34% vs. 29%).

Friends' advices have more influence to pupils born in other than Latvia EU countries (66%) rather than for born in non-EU countries (42%) whereas just 21% of born in Latvia have mentioned this factor as quite or very important for selection of enrolled programme.

Influencing of parents to pupils' decisions is the most strong in case when both parents were born in other than Latvia EU country (29% of pupil has mentioned that parents opinion was quite or very important in selection of enrolled programme) whereas the weakest dependence on parents is when both of parents were born in Latvia (18%). The same is related to influencing of friends advices – for 38% of pupils who's both parents were born in other than Latvia EU country friends' advices are quite or very important comparing to 19% of pupils who's both parents were born in Latvia.

It is predictable that distance from home to school is more important to pupils from towns or small cities (40%) than for pupils from big cities or their suburbs (32%).

In addition to important aspects we were interested in the information sources pupils use when deciding on a certain programme.

The most important information sources for pupils when choosing their programme were parents and family members (29%), online information and other public media, e.g. newspapers (27%), followed by informative days, fairs and open days at schools (26%) whereas aptitude test offered by an educational establishment (14%), previous internship or work placement (13%) and teachers (12%) were less important in Latvia. The least important information source when choosing the current programme was the job centre. Here, only a bit more than 8% of the pupils states that this was quite or very important for them when choosing the programme.

Review of information sources influencing on decision for current programme strengthen consideration that parents have more impact on girls than on boys (33% vs. 26%). Moreover for female pupils are more important than for male such sources like informative days, fairs, open days in school as well as online information and other public media, e.g. newspapers (about 33% vs. 22%). Regarding last set of information sources is necessary to point also that they were more important of pupils enrolled in programmes related to service than for pupils enrolled for programme related to industry (30% vs. about 22%). Despite of the fact that job centers are the less important source of information in general (just about 8% of respondents considered them as quite or very important) for pupils born in other than Latvia EC countries it was second by importance source of information – 39% considered it as quite of very important.

The pupils were also asked whether they considered any alternative programme when they were selecting their current programme: 37% of the pupils have considered one alternative programme, 21% considered two other alternative programmes and 8,5% considered three or more alternative programmes whereas 33% did not consider any alternative programme at all when they were deciding for the current one. Pupils born in Latvia less often stated that they didn't considered any alternative programme (33%) than pupils born in other EU country (39%) while more than a half of pupils born in non-EU countries (53%) have no alternatives considering programme to enroll. Also pupils from country villages or farms more often didn't consider any alternatives than pupils from any other place of living (38% vs. about 31%).

Level of satisfaction of programme and school

The research objective was to find which factors the most influence to satisfaction of present programme and school. The majority of pupils indicated that the programme provides useful practical experience for entering the workforce (61%) and prepares them well for further education and training (57%). It is quite unexpected that more than half of the pupils (56%) believe that their programme prepares them for a job that is important for society.

Exactly half of pupils ensures that their programme offers them a broad perspective for a professional career, a bit less (48%) that the programme is recognized within society as having a good reputation, while 42% consider that the programme prepares them for starting their own business or becoming self-employed. The least accepted (39%) is that the programme ensures employment in the job market.

Female pupils' evaluations of enrolled programme are sufficiently higher than male pupils' (differences from 5 to 9 percents) in almost all proposed for consideration aspects except of employment in the job market where their visions coincide. Pupils from service sector appreciate their programme more than from industry sector absolutely by all aspects (differences from 7 till 9 percents).

Pupils were also asked how satisfied they are with their school facilities, teachers, computer equipment and with their programme in general. More than 60% of all pupils in Latvia are all in all satisfied with the programme. The satisfaction with the programme is higher for female pupils (67% vs. 57%) and for pupils with service-oriented programmes rather than for industry-oriented (65% vs. 58%).

Nearly 40% states that most of the attended classes are interesting; meanwhile female pupils agree with it in a greater extend than male (44% vs. 37%).

More than half of the pupils agree with the statement that most of their teachers are usually well prepared when teaching their subjects (58%). Female pupils agree to a greater extent to this statement than male (62% vs. 55%) as well as pupils living in country villages or farms greater than pupils from towns or small cities and big cities or their suburbs (62% vs. 59% and 53% respectively).

Half of the pupils agree that most of their teachers are usually interested in helping them to learn; meanwhile female pupils feel it stronger than male (55% vs. 46%). Even more differences depend on country of pupil's origin. The whole 72% of pupils born in non-EU countries agree with the statement that most of their teachers are usually interested in helping them to learn, whereas so think just half of pupils born in Latvia (50%) and only 13% of pupils born in other than Latvia EU countries. Also the same figures are for perception that schools offer enough learning and training material (73% of non-EU vs. 50% of Latvia-born vs. 22% of other EU country born). To the perception of this aspect influences also place of pupil's living. Pupils from countryside are more satisfied with learning and training materials (53%) than pupils from big cities and their suburbs (45%).

It is necessary to stress also that pupils from countryside agree to a greater extent to the statement that most of their teachers are usually interested in helping them to learn (53%) comparing with big cities' and their suburbs' pupils (47%).

To the perception that schools offer enough learning and training material in addition to pupils' country of origin influence also countries of parents' origin. Pupils from families where both parents were born in other than Latvia EU country agree to a much greater extent to this statement than pupils from families where both parents were born in non-EU countries (69% vs. 39%). However with the statement that schools' facilities are well maintained in a lesser extend agree children of Latvia-born parents (42%) whereas in a higher extend again agree children of non-EU countries' parents (73%). There is also difference in such perception between pupils from country villages and farms (48% are satisfied with schools' facilities maintenance) comparing to 42% of such consideration by pupils from the rest of a country. Agreement with this statement for female pupils is higher than for male (47% vs. 41%). Female pupils also agree on a higher extend that computers at schools are up to date (49% vs. 40%); however regarding the statement that "The number of computers available at school is

adequate for the needs of pupils" both female and male pupils were solid (43% of both female and male pupils agree with it).

As the main aim of the project is to understand factors influencing on pupils' decision regarding educational path it is quite important evaluate availability at school of information on careers and training. Overall about 45% of respondents agree that such information is easily accessible at schools.

Characteristics of study behavior and acquired knowledge

The research objective was to find which factors the most reflect to progress of pupils learning and skills. Nearly two thirds (64%) of the pupils in Latvia agree that they are interested in practical subjects. Almost two thirds (58%) stated that it is important for them to fully understand what they have to do/learn. More than a half (52%) agrees that they want to make a good impression on potential employers by achieving good grades. For the most important goals there are not big differences between girls and boys considerations with the exception of understanding what to do/learn - this goal is slightly more important for female than for male pupils (65% vs. 53%). More than each third pupil (38%) strives for the highest possible marks and for female pupils it is more important than for male (43% vs. 33%). Very close figures to that is also for desire to make a good impression on their teachers by achieving good grades (36%) without big difference between female and male pupils. Almost one third (32%) confesses that want to keep up with their fellow pupils when female pupils do it more often than male (35% vs. 30%).

Despite female pupils enjoy learning more than male (31% vs. 21%) the overall rate of pupils who like to learn is very low (just one of four). Even worse is the situation with general subject. Also despite female pupils are a bit more interested in general subjects (e.g. maths, foreign language) than male (25% vs. 20%) this factor is the least important for VET students – actually a bit more than one of five pupils (22%) expresses some interest in general subject.

In an additional question the pupils were asked how they rate the proportion of practical training within their current programme. In Latvia most of the pupils rate the proportion of practical training as good (59%) or average (27%), when good rates came more from female than male pupils (64% vs. 55%), whereas amount of practical training was estimate as average otherwise – 29% of male and only 24% of female pupils. Meanwhile just 6% percent state the amount as fair and only 3% rate the proportion of practical training as poor without big differences in female and male opinions. Just 6% of pupils evaluate the amount of practical training as excellent with total coincide of male and female considerations.

Evaluation of the appropriateness of the practical training highly depends on the country of pupils' origin: majority (60%) of pupils born in Latvia consider the amount of practical training as good and each forth (26%) as average whereas more than a half (56%) of pupils born in other EU country rate it just as average and each forth (26%) as fair while only small 4% consider it as good. The percentage of pupils born in non-EU countries that rated the amount of practical training as average or good are close (30% and 38% respectively) whereas percentage of pupils rated such amount as excellent is much more for pupils from non-EU countries (19%) rather than born in Latvia (6%) or other EU country (9%).

We were also interested in the activities of pupils outside the programme. Do they hold down a paid job which is not part of the programme? More than a half of the pupils (58%) hold another job during the last year outside their programme. However just each fifth of them declares that he/she works regularly, while another four answer that they worked for payment, but only during the holidays. While 66% of the male pupils hold down a paid job fewer female pupils worked for payment outside the programme (48%). It concerns both to regular work (14% male vs. 9% female) and working only during the holidays (52% male vs. 39% female pupils). Non-working pupils are more between service-related (47%) than on industry-related programmes (32%). Meanwhile non-working pupils of parents born in other than Latvia EU countries are much less (23%) than in any other cases (from 42% till 48%). However majority of children whose parents born in other than Latvia EU countries have just occasional work during holidays (69%) while children of Latvia-born parents

more often have regular work (till 17%) comparing to abroad-born parents' children (just 5% in the case when both parents were born in non-EU country).

At the same time 40% of working pupils do not see any similarity of what they are doing outside the programme to those pupils undertake during their programme, almost 41% sees few of similarity while only 19% of working pupils consider that most of the task in outside work are similar to those their undertake during their programme. It is interesting that partially similarity is more often for industry-related programmes (47% vs. 36% in service sector) while more often working pupils in service sector are occupied with absolutely different tasks than in their programme (45% vs. 31% in industry sector).

Future career aspirations and self-assessment

Another goal of the research study was to measure the pupils' perceptions about their life goals and their future possibilities for employment, career building, and mobility. In Latvia, the most important aspect with regard to personal and professional life goals are "having a job that makes one happy" and "making and maintaining relationships with others (e.g. family and friends)" – about 70% each. A bit lesser important with almost equal scores are gaining job security (67%), having a good relationship with colleagues (67%) and receiving a high income (66%).

Absolutely all considered aspects are more important for women than for man. For instance, obtaining solid occupational proficiencies (63% vs. 56%), having a job that makes one happy (74% vs. 66%) and having a good relationship with colleagues (69% vs. 64%). Also absolutely all considered aspects are more important for service-sector programme's pupils rather than for industry-sector's. For instance, last two described aspects – "having a job that makes one happy" (73% vs. 65%) and "having a good relationship with colleagues" (71% vs. 63%). The same is related also to making and maintaining relationships with others (e.g. family and friends) – it is quite or very important to 73% of pupils from service-related programmes comparing to 67% from industry-related.

Country of pupil's origin influences essentially pupils attitude to having a good relationship with colleagues – just one of three pupils born in other than Latvia EU country decides that it is quite or very important, while so consider two of three pupils born in Latvia and even 81% of pupils born in non-EU country. Almost the same proportion are in consideration of advancing to a high level of status in society – 41% of pupils born in other than Latvia EU country, 59% of Latvia-born and even 94% of non-EU country-born consider that it is quite or very important.

Desire of "undertaking interesting tasks in the workplace" slightly depends on place of pupil's living – for inhabitancies of big cities or their suburbs it is more important (63%) than for pupils from towns or small cities (58%) and pupils from country villages or farms (56%).

When pupils were asked about the sector in which they would like to work in, the answer option "service sector (e.g. nursing, policing, hairdressing)" was quoted the most with 44% following with 36% voting for trade (e.g. banking, financing, business). Other considered sectors are far away from two leaders.

For male pupils the sector of trade is the most quoted (33%), however female pupils' willingness to work there is even stronger – 40%. For male pupils after trade (33%) and service (30%) third the most popular sector is industry (e.g. producing industry, steel, motor, oil). While 26% of the male pupils quoted that they would like to work in this sector only 4% of the female pupils stated that they strive towards working in the industry sector - this sector is the least popular between female pupils. Almost the same attitude is for agriculture, forestry and fishery – 18% of male pupils desire to work there (forth by popularity between male) whereas just 5% of female pupils have the same opinion (second from the end by popularity for female). For female pupils after service (60%) and trade (40%) third the most popular sector is public administration (e.g. local government, education) with 12%; however here isn't sufficient difference with male choice (14%). Opposite than attitudes for industry

are perception of non-governmental organizations (e.g. charities, not-for-profit organizations) – with 10% this sector is fourth by popularity for female and with just 5% the least by popularity between male pupils.

With regard to the service sector, pupils who are born in Latvia more often chose this sector (45%) rather than born in a non-EU country (32%), while just 14% of pupils born in other than Latvia EU country select this sector as preferable. Pupils from big cities or their suburbs more often than pupils from towns or small cities and even more often than pupils from country villages or farms strive towards trade (42% vs. 36% vs. 29% respectively). The same is concerning the sector of public administration (15%-13%-9%) whereas for agriculture, forestry and fishery the situation is opposite – just 7% of big cities inhabitancies are thinking to be involved in this sector, while 10% of pupils from towns or small cities and whole 20% of pupils from country villages or farms are going to be occupied there.

We also asked the pupils whether they consider continuing schooling or participating in further education after they have finished their current vocational programme. In Latvia, most pupils have a positive attitude towards further education - only 10% state that they do not consider continuing schooling or participating in further education. In total, 39% of the pupils strive towards continuing their education while 33% are still not sure. Though, amounts of doubtful are almost equal between boys and girls, female pupils are much more intended to continue education (46%) rather than male pupils (33%). Also pupils from service sector are more aiming for further education than from industry sector (43% vs. 30%). Desire to continue education more often express pupils from big cities or their suburbs (48%) than pupils from towns or small cities (38%) and pupils from country villages or farms (30%).

We also were interested what qualification pupils would choose if they continue learning. Another programme related to what pupils are doing currently was the option that was quoted the most by the pupils who want to continue their education (30%). It was followed by a higher level of vocational programme (29%) and another programme not related to what pupils are doing currently (20%) while academic programmes at universities or universities of applied science are the least planned (10%).

The preferences for the different pathways differ between male and female pupils. While male pupils more often consider another programme related to what they are doing currently (33% vs. 27%) female pupils are the most interested in higher level of vocational programme (that not sufficiently differs from male opinion - 31% vs. 28 %) and in another programme not related to what they are doing currently (23% vs. 17%). Pupils from industry sector more often than from service sectors desire to perfect themselves in already chosen area (33% vs. 24%) whereas pupils born in other than Latvia EU country or non-EU country more often (56% and 41% respectively) than pupils born in Latvia (just 12%) prefer more specialized programme.

The pupils were also supposed to report their opinion about what further education will enable to them. With 74% the statement "to enhance my career options" received the highest agreement in Latvia. It is followed by "to gain a good qualification/education" (71%), "to earn a high income later in life" (69%) and "to become an expert in my field" (68%). With the statement that further education enables them to fulfill their parent's expectations agree more male pupils than female (43% vs.32%), however for the rest of considered factors female pupils agree with more extend than male, e.g. "to gain good qualification/education" (75% vs. 67%), "to enhance career options" (78% vs. 70%), "to experience pupil's exchange programme" (44% vs. 35%). However the most essential difference is regarding professional interest – 58% of female pupils consider that further education enables them to follow their professional interest while just 44% of male have the same opinion.

Except of fulfilling of parent's expectations where industry sector students agree more than service (43% vs.37%) whole the rest of considered aspects of further education are more appreciated by service sector students. For instance, "becomes an expert in my field" (71% vs.65%), "gain a good qualification/ education" (72% vs. 65%), "experience a pupil exchange programme" (44% vs. 36%) and "enhance my career options" (78% vs. 68%). The highest difference in service and industry sectors students' opinions is regarding ability of further education to follow pupil's professional interest. Here 56% of service sector's students consider it as further education enabler wile the same opinion has just 44% of industry sector's students. A higher proportion of pupils who were born in Latvia agree with the statement that further education enables them to gain a good

qualification/education (71%) compared to pupils who were born in another EU country (68%) and even more compared to pupils who were born in a non-EU country (just 25%). Almost the same proportion is regarding opinion that further education enables to enhance pupil's career options (75% vs. 46% vs. 35%). While fulfilling of parent's expectations is more important to pupils with parents both born in other than Latvia EU country, pupils with parents both born in Latvia much lesser agree to this statement (52% vs. 36%). All aspects of further education are slightly more important for inhabitancies of big cities or their suburbs than for pupils living in towns, small cities, country villages or farms. Especially it concerns to following pupil's professional interests (57% vs. 48%) and ability to postpone starting of full-time work (49% vs. about 40%).

Pupils in the vocational education system may also benefit from the personal development prospects abroad. We asked pupils whether they have ever participated in an international exchange programme.

The majority of pupils in Latvia (84%) have never participated in an exchange programme for pupils – 79% of female and whole 89% of male pupils. Only 16% of the pupils stated that they have taken part in an exchange programme either in their vocational (8%) or general (8%) school. For vocational schools there is not big difference between girls and boys, however females being general schools' pupils more often participated in such endeavors than male (11% vs. 5%).

When asking those pupils who are not interested to participate in international exchange programme about the reasons, aspects which were quoted the most are that they would not benefit from this experience (19%), that they are not familiar with exchange programmes (21%) and most often that they don't want to leave home (22%). Despite of the fact that just 9% of pupils consider that organizing of international exchange is too laborious, it is interesting that male pupils are thinking such more often than female (11% vs.5%) as well as industry sector students more often than service sector (11% vs. 5%).

Acquired skills and abilities

In addition to their acquired knowledge pupils were asked about their acquired skills and abilities. Therefore pupils were asked to assess their current level of several soft skills relevant for the work sphere.

Being able to work as a team member received the highest rating. Here 62% of the pupils in Latvia assessed themselves as being skilled in this ability. Next places with almost the same rates took the ability to approach and engage with others with confidence (e.g. networking) and the ability to quickly familiarize oneself with new occupational tasks (58% and 57 % respectively). The aspect pupils assessed themselves least skilled is the ability to perform well under pressure (40%). The gender and the sector in which the pupils are undertaking their programme also have an influence on the skills' assessment. Female pupils assessed themselves higher by all of proposed soft skills than male, e.g. "manage occupational tasks independently" (51% vs. 46%), "approach and engage with others with confidence" (61% vs. 55%) while the highest difference is in assessment of ability to work as a team member (66% of female vs. 58% of male pupils consider that they obtain this skill). Pupils from service sector estimate themselves higher than from industry sector also by all of proposed to consideration soft skills. Foremost it concerns to ability of networking (63% vs. 53%), working as a team member (67% vs. 59%) and quick familiarization with new tasks related to job occupations (61% vs. 53%).

Ability to manage occupational tasks independently more often stated pupils born in Latvia (49%) than born in non-EU country (26%) while pupils born in other that Latvia EU country estimated it even lesser (22%). The same tendency is for ability to work as a team member – 62% of pupils born in Latvia feel themselves as skilled enough for this while the same opinion have only 45% of pupils born in non-EU-country and just 28% of born in other that Latvia EU country. It is interesting that self-assessment of ability to manage occupational tasks independently depends on the country of parents' origin – just 21% of pupils whose both parents were born in non-EU country feel themselves able to do this comparing to about 51% of pupils in any other cases. As smaller is the size of municipality were pupils are living as lesser is pupils' self-assessment, e.g. 62% of pupils from big cities or their suburbs stated that they are able to approach and engage with others with confidence, while only 57% of pupils from towns or small cities agree with it and the same opinion have just 53% of pupils from

country villages or farms. Almost the same distribution is regarding ability quickly familiarize with new tasks related to job occupations (61%-56%-53%) and ability to communicate ideas und suggestions to others clearly (55%-52%-48%).

In addition to the self-assessment the pupils were also asked to what extend their current programme strengthens these abilities. About 41% of the pupils stated that their programme is quite or very able to prepare them to develop these skills and abilities (24% quite, 17% very). More than half of pupils (57%) stated that their programme prepares them fairly or slightly and only 1.4% think that their current education does not help them advance in these skills and abilities. It is difference of programme's assessment by boys and girls. Male pupils more often assess that current programme fairly develops desired soft skills than female (46% vs. 40%) and in turn female pupils more often consider that the programme does it quite or very good (47% vs. 37%). Service-oriented students more often than industry-oriented consider that their current programme develops necessary soft skills very well (21% vs.16%).

Pupils who were born in Latvia more often stated that the programme prepares them fairly or quite good (67%) than did pupils who were born in other EU country (45%). In contrast the percentage of pupils born in Latvia that have stated that their programme prepares them slightly is much lesser than for pupils that were born in other EU country (14% vs. 46%). Percentage of pupils who consider that their current programmes do not develop their soft skills at all is much higher between born in non-EU countries (15%) comparing to born in other than Latvia EU countries (9%) and born in Latvia (just 1%).

In addition to soft skills also language skills are relevant for the work sphere. Therefore we asked all of the pupils in which of the selected world languages (English, French, Spanish and German) they have acquired at least basic knowledge. About 87% of the pupils stated that they have acquired at least basic knowledge in English. Nearly 20% have some basic knowledge in German while French and Spanish are not widely used in Latvia (just less than 5% and 4% respectively have mentioned that they acquired basic knowledge in these languages). Male pupils stated less often that they acquired at least a basic knowledge in German than female pupils (15% vs. 27%) as well as industry-related students comparing to service-related (15% vs. 26%) while for other languages there are not neither gender-related nor sector-related differences. Pupils that were born in Latvia more often stated that they acquired at least a basic knowledge in English (88%) than pupils born in other EU country (70%) or in non-EU country (49%). For Spanish and French we find a reversed picture. More often pupils that were born in a non-EU country stated that they have certain competencies in these languages (51% and 30% respectively) than pupils that were born in Latvia (just 4% for each language). Pupils from big cities or their suburbs are more familiar with German than pupils from towns, small cities, country villages or farms (27% vs. about 17%).

Conclusions

The results show that pupils' path of transition to VET, level of satisfactions of programme and school, characteristics of study behavior, acquired knowledge, future career aspirations, self-assessment, acquired skills and abilities obviously depend on pupils' gender, programme enrolled, pupils' and their parents' country of origin and pupils' place of living. However to complete the picture is necessary evaluate also influence of such factors as pupils' school achievement and grades, level of parents' education and families' socio-economic conditions.

results' description are developed by Caroline Dahmen and Cornelia Neuert (Darmstadt Technical University, Institute of Sociology).

INFORMATION, KNOWLEDGE, AND WISDOM: TRANSFORMING EDUCATION

Elaine P. Maimon, Ph.D. [31]

Governors State University, 1 University Parkway University Park, IL 60484-0975

Abstract

In the twenty-first century, we are experiencing a paradigm shift in learning environments because of an underlying change in epistemology. Never in the history of the planet has information been more readily available. With the click of a key we can find answers to just about any question. When the questions are factual, based on common knowledge, we can be relatively confident about the answers.

Keywords: Information, Knowledge, wisdom, transforming education

Main Text

I am going to use an example from U.S. history—one that I believe has global implications. Let's imagine the day that President Abraham Lincoln was shot. By the way, you can find that date, in case you have forgotten it, in about five seconds on Google. The date is April 15, 1865. At the moment of Lincoln's death, who became the seventeenth president of the United States? Andrew Johnson. Was he impeached? Yes. What does "impeached" mean? That he was indicted by the U.S. House of Representatives and put on trial by the U. S. Senate. Was he convicted and removed from office? No. He was tried by the Senate in the spring of 1868 and acquitted by one vote.

Even though the impeachment of the United States' seventeenth president may be relatively unfamiliar information for world-wide audiences, the facts are indisputable and readily available through a thirty-second search on Google. In the digital age, **information** is at our finger-tips.

While information is easy to obtain, knowledge and wisdom are not. I would define **knowledge** as the ability to assess and then integrate information into a meaningful whole. **Wisdom** is the capacity to apply knowledge effectively to new situations. Knowledge about the U.S. seventeenth president would include an understanding of the challenges when he took office on the day of Abraham Lincoln's assassination at the end of a bloody Civil War. What was Johnson doing to overcome wartime bitterness and hatred and reconcile the North and the South? What were the positions of the Republicans and Democrats on civil rights for the emancipated slaves? What were the reasons for Johnson's impeachment? What motivated the majority of House members to impeach Johnson and the majority of Senate members to acquit him? Knowledge would, in short, assess factual accounts, think critically about information, accurately reconstruct a long-ago historical environment, make sound judgments about what happened and what did not, and finally integrate what is known into meaning and understanding. Wisdom goes even further. How do these long-ago circumstances in the United States apply to the aftermath of civil wars in other nations in other times? How does the aftermath of the American Civil War apply to the Truth and Reconciliation Commission in South Africa? How might we define political courage in highly partisan situations? Should questions involving slavery, freedom, and human dignity be evaluated within

a context of history and culture or within a framework of universality? Wisdom would apply concepts from one set of circumstances to very different contexts, define the underlying issues, consider ethical and moral implications, make judgments, and engage in problem-solving.

Access to information on the internet is growing rapidly. Moreover, information organized into coherent courses, is now readily available. Harvard, the Massachusetts Institute of Technology (MIT), Stanford, the University of Michigan, the University of Pennsylvania, and Princeton are already offering free on-line courses taught by their best professors. Yale and Carnegie Mellon will soon join the group. If star professors from elite universities are right now, as we speak, transmitting information via the internet free of charge, it is essential that college classrooms around the world go beyond the dissemination of information and focus on the goals of creating knowledge and helping students to attain wisdom.

Here is how NY Times columnist David Brooks explains the situation in an opinion piece, "The Campus Tsunami," (May 3, 2012):

The most important and paradoxical fact shaping the future of online learning is this: A brain is not a computer. We are not blank hard drives waiting to be filled with data. People learn from people they love and remember the things that arouse emotion. If you think about how learning actually happens, you can discern many different processes. There is absorbing information. There is reflecting upon information as you reread it and think about it. There is scrambling information as you test it in discussion or try to mesh it with contradictory information. Finally there is synthesis, as you try to organize what you have learned into an argument or a paper.

David Brooks concedes the role of communicating information to the internet. He then challenges colleges and universities to redesign instruction to focus on learning--what we are calling the creation of knowledge and the attainment of wisdom:

In an online world, colleges have to think hard about how they are going to take communication, which comes over the Web, and turn it into learning, which is a complex social and emotional process.

How do we create the complex learning environments that will transform the communication of information into knowledge and wisdom?

Here are my suggestions:

Construct meaningful connections between the Web and the classroom

The design of courses and academic programs should be determined by the nature of the subject matter, the needs of the student population, and the instructional goals.

For example, at Governors State University, our Bachelor of Science in Nursing (BSN) is delivered entirely on line. Prerequisite to the BSN is a rigorous, hands-on, hospital-based registered-nurse program (RN), offered by our partner community colleges. Students come to the BSN after deep experience in the emotional circumstances of working with mentors and patients in real settings. Their first two years of instruction have provided opportunities to integrate and apply the information they learned. The come to the online BSN, with strong, recent practice in integration and application. The on-line BSN provides a wider informational context for further connections. In addition, the flexibility of the online delivery of BSN courses helps the registered nurses connect learning with a highly variable and labor-intensive work situation. Our online program is student-centered—making it possible for working nurses to continue their education free of the tyranny of the clock, the calendar, and the car.

In contrast, the program GSU is planning for first-year undergraduate students will heavily emphasize human interactions, guiding students from the acquisition of information to the construction of knowledge, and maybe even to the beginnings of wisdom. Students will be organized into thematic cohorts, with each student taking at least three classes with the same group of students. Creating these intellectual families will encourage stimulating interactions and friendships. Classroom work will be highly participatory.

But even those classes that depend mainly on face-to-face interaction will make use of online tools. Learning a new language can be substantially assisted by Web courses, but students should also have opportunities to communicate in the new language in person with others, preferably with native speakers.

In addition, the Web can connect students, not only in foreign language, but in the full variety of disciplines to classrooms across the globe. Such interactions will work best when facilitated by an enlightened teacher.

Many instructors are "flipping" their courses, with lecture material available on the web, leaving classroom time for discussion and other interactions.

Replace the sage on the stage with the guide on the side

Close to a century ago, the American philosopher John Dewey (1859-1952) argued for the effectiveness of learning by doing. Yet, throughout the twentieth century, education continued to emphasize the sage on the stage. In fact, what we are doing now—this keynote address-- is an example of the sage on the stage. It's indisputable that learning can take place in a setting like this one. At least I hope so. But even assisted by PowerPoint technology, this keynote involves a relatively passive audience and an active lecturer. By the way, I hope that we can have a much more interactive question/answer/discussion period. But even then, we will for the most part be exchanging information. In truth, I would wager that the most intensive learning—integration, application, constructing knowledge, and acquiring wisdom--will take place in informal, engaged conversations in lounges, restaurants, and bars. The participation of the keynote speakers in the full conference and our availability for follow-up conversation will enable the sage on the stage to function as a guide on the side.

As the guide on the side, encourage writing across the curriculum

When students write, they learn. In her classic 1977 article, "Writing as a Mode of Learning," Janet Emig argues that writing is more than a way of demonstrating what has been learned. Writing itself is a mode of learning, promoting integration and application, the construction of knowledge and wisdom. My own work, as one of the founders of the movement called writing across the curriculum, has demonstrated again and again the power of infusing writing into all courses.

In U. S. universities, the first-year composition course can serve as a foundation for writing across the university curriculum—and throughout life. In the decades that I have been teaching and publishing within this movement, I have witnessed a radical shift in U.S. higher education from unreasonable expectations for students to learn to write either before they come to college, or failing that, to learn to write effectively, once and for all, in one course—freshman composition. In 2012, U.S. university professors have a more nuanced understanding of the complexities of writing and understand that it takes a campus to teach a writer. Many see that reasonable goals for the first-year course include experiences that other faculty members can build on, as they integrate writing appropriately in their courses:

Here are suggested learning goals for a first-year composition course:
o Understanding and selecting writing processes—generating, drafting, revising—recursive, variable, complex
o Understanding the variability of contexts—a field guide description of a snake is different from a poem about a snake (situation, audience, purpose, and disciplinary context)
o Understanding the writing situation: purpose, audience, context, roadblocks to communication
o Practicing peer review—how to read and comment intelligently about classmates' writing
o Learning how to make judgments about research materials, in books and on line
o Learning how to use technology in the writing process
o Practicing effective communication, visually and verbally
o Using resources: on-line sites, dictionary, thesaurus, handbooks, and writing guides.
o Finding ways to make excellence reference-able.

What can faculty in other disciplines do to reinforce writing through writing intensive courses?

Integrate writing into learning process
o Write at beginning of class
o Write in response to questions
o Write summary at end of class

- o Assign e-mail commentary and questions about the course
- o Assign major writing projects in draft stages
- o Use peer review
- o Vow that you will never again be the first human being on the planet to read another person's writing.
- o Help students learn to read their own writing.
- o Assign an acknowledgments page
- o Stop essay exams five minutes early to allow time for students to edit and proofread

Infuse civic learning, ethical reasoning, visual literacy, problem-solving, critical thinking, and numeracy across the curriculum

When we function as guides on the side, we see that it makes more sense to integrate learning goals rather than to create discrete courses for everything that we want to achieve. We can more effectively motivate students to make connections if we structure connectivity into our courses. We do not need a separate course in civics, for example, to teach citizenship. We can instead integrate civic learning into every course we teach. In biology, we can pose questions about public policy, climate change, for example. In physical therapy, students can study statutes that pertain to the disabled. The same holds true for ethics, visual literacy, problem-solving, critical thinking, and numeracy. Integrating these perspectives into courses works better than separate courses. Compartmentalized thinking is not effective. To use an agricultural metaphor from the Illinois heartland, silos are our enemy. As the British novelist E. M. Forster says, "Only connect."

Employ high impact educational practices

In a monograph entitled, *High-Impact Educational Practices*, published by the Association of American Colleges and Universities (AAC&U), in 2008, Professor George Kuh reports on widely tested teaching and learning practices that I recommend for our complex learning environments. Research shows that these practices, quantified in the National Survey of Student Engagement (NSSE), benefit all students, with even greater impact on underserved students. Here is a list of these high-impact practices:
- o First-year seminars and experiences
- o Common intellectual experiences
- o Learning communities
- o Writing intensive courses
- o Collaborative Assignments and Projects
- o Undergraduate Research
- o Diversity/Global Learning
- o Service Learning, Community-Based Learning
- o Internships
- o Capstone Courses and Projects

While earlier in this presentation I have discussed some of these high-impact practices, for example, writing intensive courses as part of writing across the curriculum, it is useful to look at these proven best practices as a whole. Research shows that students learning will improve if they are involved in some of these practices. They do not have to be engaged in all.

So as we educate teachers for complex learning environments, we must recognize the epistemological revolution that has already occurred. Information is instantly available. Today, we can find out the factual answer to any question in seconds. Let's return briefly to American history and Abraham Lincoln. Only 150 years ago it took two years for the news of the Emancipation Proclamation, issued by President Lincoln on January 1, 1863, to reach Galveston, Texas, where the last slave was freed on June 19, 1865.

Today, without any trouble at all, we can locate information about the end of slavery in America and about the holiday that celebrates it—Juneteenth. But knowledge and wisdom about any topic—for example, slavery and freedom or celebrations and commemorations— are increasingly difficult to achieve, even as knowledge and wisdom become ever more important to society. Teaching

must change fundamentally from the delivery of information to the development of critical thinking. We must transform our classroom practices accordingly. As teachers, we must move away from the limelight of expertise to the more challenging role of guiding students to think, assess, integrate, and apply.

As John Dewey says, "If we teach today's students as we taught yesterday's, we rob them of tomorrow."

İNGILIZCE ÖĞRETMENLIĞI BÖLÜMÜ ÖĞRENCILERININ ÇEVRIM İÇI ÖĞRENME SISTEMLERI KABUL DÜZEYLERI İLE BILGISAYAR YETERLILIK ALGILARI ARASINDAKI İLIŞKI

Ar. Gör. Selda Kayak[32], Ar. Gör. Dr. Elif Kır[33]

Özet

Günümüzde uzaktan eğitim, birçok alanda olduğu gibi öğretmen eğitiminde de yaygın bir şekilde kullanılmaya başlamıştır. Ancak, uzaktan eğitimin, öğrencilerin bilgisayar dersi yeterlilik algısı üzerindeki etkisinin ne olduğu ile ilgili çok fazla araştırma yapılamamaktadır.

Bir yandan da uzaktan eğitim sistemi teknolojilerinin gelişmesiyle birlikte öğrencilerin uzaktan eğitim uygulamalarında çevrim içi öğrenme sistemleri kabul düzeyi ve öğrencilerin bilgisayar yeterlilik algıları arasındaki ilişki önem kazanmaktadır. Daha etkili bir uzaktan eğitimin gerçekleştirilebilmesi için bu tip araştırmaların alana katkı sağlayacağı düşünülmektedir.

Araştırmada üç farklı veri toplama aracı kullanılmıştır. Birisi kişisel bilgi formu, ikincisi araştırmacılar tarafından ders içeriğine göre geliştirilen yeterlilik algısı anketi ve diğeri ise Ilgaz (2008) tarafından geliştirilen 'Çevrim İçi Öğrenme Sistemleri Kabul Ölçeği'dir.

Araştırmaya Yabancı Diller Eğitimi İngilizce Öğretmenliği Bölümü 1. Sınıf öğrencileri katılmıştır. Öğrencilerin yeterlilik algıları ve çevrim içi öğrenme sistemleri kabul düzeyleri çeşitli değişkenlere göre tespit edilmiş, daha sonra da yeterlilik algıları ile çevrim içi öğrenme sistemleri kabul düzeyleri arasındaki ilişki saptanmaya çalışılmıştır. Veriler SPSS programında analiz edilmiştir. Araştırma sonuçları doğrultusunda önerilerde bulunulmuştur.

Anahtar kelimeler: yeterlilik algısı, çevrim içi öğrenme sistemleri kabul düzeyi, uzaktan eğitim.

The Relationship Between English Teaching Department Students' Self Efficacy and Technology Acceptance Levels

Absract

Distance learning has being widely used in teacher education as it is used in other fields. However, not many studies have been conducted about the impact of distance education on the perception of self-efficacy.

With the development of the systems in distance education, the relationship between technology acceptance level of the students in distance education applications and the learners' self-efficacy perceptions has gained importance. It is thought that conducting this kind of studies can make contributions to the field in order to provide more efficient distance learning education.

Three types of data collection tool were used for this study. One of them is personal information form, the other one is self efficacy perception survey which was developed by the researchers and the third one is "Technology Acceptance Level Survey" developed by Ilgaz (2008).

[32] Ar. Gör. YTÜ Eğitim Fakültesi BÖTE Bölümü, skayak@yildiz.edu.tr
[33] Ar. Gör. Dr. YTÜ Eğitim Fakültesi İngilizce Öğretmenliği Bölümü, ekir@yildiz.edu.tr

Freshmen students studying at foreign languages teaching department participated in the research. Firstly, students' self efficacy and technology acceptance levels were determined according to some variables. Then, the relationship between efficacy perceptions and technology acceptance levels was tried to be stated. The data was analyzed by using SPSS program. Suggestions were made according to data results.

Key Words: Perception of self-efficacy, technology acceptance level of online learning systems, distance education.

GİRİŞ

Uzaktan eğitim sistemlerin en yaygın kullanım alanlarının başında üniversiteler gelmektedir. Uzaktan Eğitim, geleneksel öğrenme-öğretme yöntemlerindeki sınırlılıklar nedeniyle sınıf içi etkinliklerin yürütülme olanağı bulunmadığı durumlarda eğitim çalışmalarını planlayanlar ve uygulayanlar ile öğrenenler arasında iletişim ve etkileşimin özel olarak hazırlanmış öğretim üniteleri ve çeşitli ortamlar yoluyla belli bir merkezden sağlandığı bir öğretim yöntemidir. Uzaktan eğitim için internet, bilgi aktarma, arama ve geliştirme aracı olarak kullanılmaktadır.

Uzaktan eğitim ile birbirinden uzak öğretmen ve öğrenci, iletişim kurabilmekte ve öğrenme sürecini devam ettirmektedirler. Web sayfaları sesli ve görüntülü araçlarına, etkileşimli araçlara (sohbet, video konferans vb.), haberleşme araçlarına (elektronik mektup, liste ve haber grupları) ve diğer web sayfalarına bağ içerebildiğinden, eğitim materyali hazırlanırken herhangi bir kısıtlama olmadan tüm bu servisler günümüzde kullanılmıştır (Akt. İlhan, 2010).

Uzaktan eğitim sistemlerinde verilen eğitimin eksiksiz gerçekleştirilebilmesi, uzaktan eğitimin önündeki problemlerin aşılabilmesi için önemli bir adım olacaktır.

Yeterlilik Algısı

Bireylerin inanışları, onların tutumlarının oluşmasında önemli rol oynadığı için davranışlarıyla da yakından ilişkilidirler (Bandura, 1986). Ancak, Pajares (1997) inançların doğrudan gözlenemeyeceğini, inançlar hakkında, insanların söylediklerinden, niyetlerinden ve yaptıklarından yola çıkarak bir yargıya varılabileceğini belirtmiştir.

Bireylerin sahip oldukları yeterliklerini amaçları doğrultusunda ne kadar başarılı bir biçimde kullanabileceklerine ilişkin yargıları, Bandura (1977) tarafından "Öz-Yeterlik İnancı" (Self-Efficacy Beliefs) olarak kavramlaştırılmıştır. Öz-yeterlik inancı, "bireylerin belli bir performansı göstermek için gerekli olan etkinlikleri ve eylemleri organize edip, bunları başarılı bir biçimde gerçekleştirebilme kapasitelerine ilişkin inancı" olarak tanımlanmaktadır. Öz-yeterlik inançları üç temel boyutta birbirlerinden farklılaşmaktadır. Bu boyutlar, düzey (magnitude), genelleme (generality) ve dayanıklılık (strength) olarak kavramlaştırılmıştır (Akt. Çapri & Çelikkaleli, 2008).

Bandura (1997)'ya göre öz-yeterlik inancı yüksek olan insanlar yeni karşılaştıkları ve mücadele etmek durumunda oldukları yaşantılardan kaçmazlar ve eylemlerini başarılı bir şekilde tamamlamak için oldukça kararlı davranmaktadırlar. Düşük öz-yeterlik inançlarına sahip bireyler de belli görevleri yerine getirme aşamasında güçlü öz-yeterlik inancına sahip olan bireylere göre daha çok gerginlik, stres ve hoşnutsuzluk duyguları yaşamaktadırlar.

Teknoloji Kabul Modeli

Öğrencilerin tutumları ve teknoloji kullanımları uzaktan eğitime yönelik memnuniyetlerini etkileyeceği için Teknoloji Kabul Modeli çerçevesinde öğrenci memnuniyetini inceleyen araştırmalar gerçekleştirilmiştir.

Araştırmalar algılanan yarar ve algılanan kullanım kolaylığının öğrencilerin internette yer alan kaynakları kullanmalarını arttıran bileşenler olduklarını göstermektedir. Böylece uzaktan eğitim deneyimine yönelik artan öğrenci memnuniyetinin sınıf aktivitelerine katılımı arttırarak uzaktan eğitim ortamlarının daha fazla kullanımını sağlayacağı düşünülmektedir (Lee, Cheung, & Chen, 2005; Mitchell, Chen, & Macredie, 2005 Akt. Ilgaz, 2008).

Bireylerin bilgi teknolojilerini kabul etmelerini ya da reddetmelerini neler etkilemektedir sorusunu araştıran araştırmacılar sistem kullanımını etkileyen birçok faktör arasında algılanan kullanım kolaylığı ve algılanan yararın en önemlileri olduklarını belirlemişlerdir. Modelde yer alan bileşenlere ilişkin tanımlar aşağıdaki gibidir:

Algılanan yarar (Perceived usefulness), bireyin bir sistemi kullandığında onun iş performansını arttırmasına yönelik inancının derecesi olarak tanımlanmaktadır. Bir sistem algılanan yarar açısından ne kadar yüksekse kullanıcıda da pozitif bir kullanma-performans ilişkisi inancı oluşur.

Algılanan kullanım kolaylığı (Perceived ease of use); bireyin bir sistemi kullanırken sarf ettiği çabanın azlığına olan inancının derecesidir. Bir uygulamanın kullanıcılar tarafından kabul edilmesinde kullanımının kolay olması oldukça önemli bir etkendir (Davis, 1989).

Bu modeldeki en önemli değişkenler algılanan yarar ve algılanan kullanım kolaylığıdır. TKM'de teknolojiye yönelik inançlar o teknolojinin kullanımının kolay ve yararlı olduğu yönündeyse bu durumun kullanıcıların tutumunu etkileyeceği ve dolayısıyla o teknolojinin kullanımını benimseyecekleri şeklinde yer almaktadır (Arbaugh, 2001).

YÖNTEM

Bu çalışmada, Yabancı Diller Eğitimi İngilizce Öğretmenliği bölümü öğrencilerinin yeterlilik algıları ile çevrim içi öğrenme sistemleri kabul düzeyi arasındaki ilişki incelenmiştir. Öğrencilerin çevrim içi öğrenme sistemleri kabul düzeyi ile yeterlilik algıları arasında ilişki olup olmadığını ortaya çıkarmak amacıyla katılımcıların demografik özellikleri, çevrim içi öğrenme sistemleri kabul düzeyi ve yeterlilik algıları ilgili verilerin toplanması için envanterler uygulanmıştır.

Araştırmanın Modeli

Araştırmada mevcut durumu tespit etmek amaçlandığı için, tarama modeli bir araştırmadır. Tarama modelleri, var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımlarıdır. Araştırmaya konu olan olay, birey ya da nesne, kendi koşulları içinde ve olduğu gibi tanımlanmaya çalışılır (Karasar, 2004).

Çalışma Grubu

Araştırmanın çalışma grubunu; 2011-2012 öğretim yılı güz yarıyılında Yıldız Teknik Üniversitesi Eğitim Fakültesi'nin Yabancı Diller Eğitimi Anabilim Dalı, İngilizce Öğretmenliği Bölümünde 1. sınıfta okuyan 51 öğrenci oluşturmuştur. Bilgisayar I dersini uzaktan eğitimle alan öğrencilerin tamamı çalışma kapsamında tutulmuştur.

Veri Toplama Aracı

Bu araştırmada, öğrencilerin cinsiyet, mezun olduğu lise türü, evde bilgisayar ve internet bağlantısına sahip olup olmama gibi değişkenleri belirlemek amacıyla araştırmacılar tarafından oluşturulan demografik bilgi formu dışında 2 tane veri toplama aracından faydalanılmıştır.

Birisi, öğrencilerin ders ile ilgili yeterlilik algılarını ortaya çıkarmak amacıyla dersin hedefleri temel alınarak araştırmacılar tarafından geliştirilen yeterlilik algısı anketidir.

Diğeri ise öğrencilerin çevrim içi öğrenme sistemleri kabul düzeyini belirlemek üzere Ilgaz (2008) tarafından geliştirilen "Çevrim İçi Öğrenme Sistemleri Kabul Ölçeği"dir. Ölçek Algılanan Kullanım Kolaylığı ve Algılanan Fayda olmak üzere iki alt boyuttan oluşmaktadır. Ölçeğin Cronbach α katsayısı 0.89'dur. Faktör puanları bazında güvenirlik katsayıları algılanan kullanım kolaylığı için 0.90, algılanan yarar için ise 0.93 olarak bulunmuştur.

Verilerin Puanlanması

Yeterlilik algısı anketi öğrencilerin yapabilecekleri yeterlilikleri ile ilgili olarak "Evet", "Kısmen" ve "Hayır" olarak derecelendirilmiştir. "Hayır" seçeneği 1 puan, "Kısmen" seçeneği 2 puan ve "Evet" seçeneği 3 puan üzerinden değerlendirilmiştir. Bu durumda puanın veya ortalamanın yüksek olması öğrencinin kendini daha yetkin hissettiği anlamına gelmektedir.

Çevrim İçi Öğrenme Sistemleri Kabul Ölçeği 7'li likert lipinde hazırlanmıştır. Maddelerin puan ortalaması 1 ile 7 arasında bir değer alabilmektedir. Ortalamanın yüksek olması katılımcının Çevrim İçi Öğrenme Sistemleri Kabul düzeyinin yüksek olduğunu ifade etmektedir.

BULGULAR ve YORUMLAR

Çalışma grubuna ait cinsiyet, mezun olunan lise türü, evde bilgisayarı ve internet bağlantısı olup olmadığı gibi demografik bilgiler aşağıdaki Tablo 1'de sayı ve yüzde olarak belirtilmiştir.

Tablo 1: Demografik Bilgiler

	Cinsiyet		Mezun olunan lise türü			Bilgisayarı olanlar		İnternet bağlantısı olanlar	
	Kız	Erkek	Düz lise	Meslek lisesi	Fen-Anadolu Lisesi	Evet	Hayır	Evet	Hayır
Yüzde	%76,5	%23,5	%15,7	%2	%82,3	%84,3	%15,7	%72,5	%27,5
Sayı	39	12	8	1	42	43	8	37	14
Toplam	51		51			51		51	

Çalışma grubunda 51 öğrenci yer almıştır. Tablo 1'e göre çalışma grubunun çoğunluğu kız öğrencilerden oluşturmaktadır. Aynı şekilde öğrencilerin çoğunluğu Fen-Anadolu Lisesi mezunudur. Meslek lisesi mezunu 1 tane öğrenci olduğu için lise türüne göre yapılan karşılaştırmada standart sapmayı etkilememesi için karşılaştırmaya dâhil edilmemiştir. Öğrencilerin %82,3'lük gibi büyük bir kısmının evde bilgisayarı ve %72,5'lik kısmının internet bağlantısı mevcuttur.

Tablo 2. Yeterlilik Algısı Öntest ve Sontest Puan Ortalamaları

Yeterlilik Algısı	Word Programı	Powerpoint Programı	Excel Programı	Genel Ortalama
Öntest	2,48	2,36	1,57	2,18
Sontest	2,76	2,77	2,12	2,58

Araştırmaya katılan öğrencilerin her bir içerik ve genel yeterlilik algı puan ortalamaları Tablo 2'de yer almaktadır. Yeterlilik algısı ile ilgili olarak alınabilecek en düşük puan ortalaması 1 ve en yüksek puan ortalaması 3'tür. Word programı kullanım becerileri ile ilgili öğrencilerin sahip oldukları yeterlilik algısı öntest ve sontest ortalama farkları 0,28 puan artmıştır. Powerpoint programı kullanım becerileri ile ilgili öğrencilerin sahip oldukları yeterlilik algısı öntest ve sontest ortalama farkları 0,41 puan artmıştır. Excel programı kullanım becerileri ile ilgili öğrencilerin sahip oldukları yeterlilik algısı öntest ve sontest ortalama farkları 0,55 puan artmıştır. Genel ortalamada ise 0,40 puanlık bir artış görünmektedir.

Tablo 3. Cinsiyete Göre Yeterlilik Algısının Karşılaştırılması

Cinsiyet	N	Ortalama	Std. Sapma	p
Kız	39	2,20	0,42	,153
Erkek	12	2,16	0,25	

Tabloya 3'e göre kız öğrencilerin yeterlilik algıları ile erkek öğrencilerin yeterlilik algıları arasında anlamlı bir fark bulunmamaktadır.

Tablo 4. Mezun Olunan Lise Türüne Göre Yeterlilik Algısının Karşılaştırılması

Lise Türü	N	Ortalama	Std. Sapma	p
Düz lise	8	2,07	0,46	,410
Fen-Anadolu Lisesi	42	2,22	0,37	

Mezun olunan lise türü ile yeterlilik algıları arasında yapılan karşılaştırmada meslek lisesi mezunu 1 tane öğrenci olduğu için istatistiksel karşılaştırmaya dâhil edilmemiştir. p değerine bakıldığında öğrencilerin mezun oldukları lise türü ile yeterlilik algıları arasında 0,15'lik bir ortalama farkından dolayı istatistiksel olarak anlamlı bir fark çıkmamıştır.

Tablo 5. Çevrim İçi Öğrenme Sistemleri Kabul Düzeyi Öntest ve Sontest Puan Ortalamaları

ÇİÖSKD	Ortalama
Öntest	4,22
Sontest	4,64

Çalışma grubunun çevrim içi öğrenme sistemleri kabul düzeyi öntest ortalaması 4,21'dir. Çevrim İçi Öğrenme Sistemleri Kabul Ölçeği'nden alınabilecek puan ortalaması 1 ile 7 arasında bir değer aldığı için, bu rakama bakarak grubun genel olarak teknoloji kabul düzeyinin ortalamanın biraz üzerinde olduğu söylenebilir. Sontestde de 0,42'lik bir puan ortalaması artışı gözlenmiştir.

Tablo 2 ve Tablo 5'ten görülebileceği gibi uzaktan eğitime tabi tutulan öğrencilerin dönem başında ve dönem sonunda sahip oldukları yeterlilik algıları arasında 0,40 ve çevrim içi öğrenme sistemleri kabul düzeyleri arasında 0,42'lik bir puan artışı olmuştur. Benzer derecede görülen bu artışın sebebi dersin uzaktan eğitimle verilmesiyle birlikte öğrencinin sistemi artık daha iyi kullanmaya başlamasından ve benimsemesinden kaynaklı olabilir.

SONUÇ ve ÖNERİLER

Bu araştırmada, uzaktan eğitimle bir dersi olan üniversite öğrencilerinin çevrimiçi öğrenme sistemleri kabul düzeyleri ile yeterlilik algıları arasındaki ilişki incelenmiştir.

Elde edilen veriye göre yeterlilik algısı öntest ve sontestin genel ortalama farkı sontest lehine 0,40 olarak bulunmuştur. Bu sonuca göre dersi uzaktan eğitim ile alan öğrencilerin bilgisayar kullanımı konusunda ifade ettikleri yeterlilik algılarında artış gözlenmektedir. Bu artış öğrencilerin çevrimiçi öğrenme sistemleri kabul düzeylerinin etkisinde gerçekleşmiş olabilir.

Çevrimiçi öğrenme sistemleri kabul düzeyleri öntest ve sontestin ortalamaları arasındaki fark incelendiğinde sontestte 0,42 puanlık bir artış olmuştur. Bu artışın nedeni dersin uzaktan eğitim ile alınması ve öğrencilerin ders yolu ile bu sistemi daha yakından tanımış ve kullanmış olmalarından kaynaklanabilir.

Sonuçlar ayrıca çeşitli değişkenler açısından incelenmiştir. Cinsiyete göre yapılan karşılaştırmada kız öğrencilerin yeterlilik algı puan ortalamaları biraz yüksek çıkmış olsa da istatistiksel olarak anlamlı bir fark bulunmamıştır. Aynı şekilde mezun olunan lise türüne göre incelendiğinde Fen/Anadolu Lisesi mezunlarının yeterlilik algı puan ortalamaları düz lise mezunlarına göre daha yüksek bulunsa da anlamlı bir fark çıkmamıştır.

Öğrencilerin yeterlilik algıları ve çevrim içi öğrenme sistemleri kabul düzeylerini artırabilecek şekilde düzenlenmiş dersler uzaktan eğitim ile verilebilir. Öğrencilerin yeterlilik algıları ile akademik başarıları arasındaki ilişkiyi araştıran çalışmalar yapılabilir.

Bu araştırma İngilizce Öğretmenliği bölümü öğrencileri ile sınırlıdır. Benzer çalışmalarda başka bölümlerde okuyan üniversite öğrencilerinin yeterlilik algıları ve çevrim içi öğrenme sistemleri kabul düzeyleri araştırılabilir.

INNOVATING THE COMPULSORY STUDY SUBJECT OF PAEDIATRICS AND THE CREATION OF MULTIMEDIA TEXT FOR PRACTICAL TRAINING

Ludíková Barbora, Mihál Vladimír[34]

Paediatric clinic, Faculty of Medicine and Dentistry, Palacký University Olomouc,I.P.Pavlova 6, Olomouc 77520, Czech Republic

Abstract

Paper is presenting project of innovation in teaching subject of Paeditarics at Palacky University in Olomouc. The project aims at modernizing and increasing quality, efficiency and development of student education. Innovating Paediatrics, as a subject, involves the creation and institution of the up-till-now missing multimedia learning support aimed at extending and changing the contents of practical training with direct involvement of infant patients in the teaching process. At the same time, the project also provides the possibility of effective self-study on the part of students using web interface and hypertext links to recent publications in renowned journals.

Keywords: paeditarics; innovation; multimedia text

Introduction

At the Faculty of Medicine and the Faculty of Health Sciences at Palacky University in Olomouc, a new project is being implemented where main objective is to innovate and revamp the subject of paediatrics with the intention of enhancing quality and modernizing and developing respective university teaching in order to extend students´ knowledge and skills. In line with the new trends in viewing medicine as an evidence-based medical subject and with new, ever-growing, findings in paediatrics, it was required to modify and customize the contents of lessons both at theoretical and practical levels, with focus on interlinking the theoretical knowledge, clinical skills and decision-making skills of students. Modernization changes were carried out, allowing students to use, in the course of their preparation, a wide range of modern information technologies, both with a teacher in a classroom and within one´s own individual studies at home.

At present, more emphasis is being given to the practical aspects of student teaching (bedside training during practical exercises), the ability to make their own decisions, practice the acquired skills and to incorporate multimedia learning support (within practical as well as theoretical teaching - teaching becomes more interlinked). Therefore, a new multimedia learning support was created (multimedia textbooks, web interface), which is based on individual case studies addressing specific paediatric patients and resulting in better decision-making skills of the students and the future graduates. This study support consists of hyperlinks to recent publications in renowned national and foreign magazines and web-based interface with the possibility of self-

study. Within the innovative teaching, students elaborate on case studies of individual patients within their workshops where they have the opportunity of consulting on possible solutions and alternatives with practising professionals. Processing of the given case according to this study support will become part of the state examination for students of general medicine and part of the examination in paediatrics for students of dentistry and physiotherapy.

It was essential to implement this project due to the rapid and unprecedented developments in medicine, as it is necessary to adapt and modernize the teaching of medical students in order to combine new theoretical findings with the acquired clinical skills, an aspect so badly needed for preparing the future generation of physicians. Students are increasingly overwhelmed with new theoretical knowledge, but modern study support for practical training and testing of students of paediatrics, as one of the core subjects of medical training, has been missing up till now. The creation of this multi-media support has brought new opportunities to students in the following sense:

- targeted and interlinked tuition of seminars to be prepared
- transfer of knowledge and skills in diagnosis and treatment
- widening the scope of clinical work in practical exercises during bedside training
- self-education
- applying the acquired knowledge and skills
- testing in the course of preparation for the state exam.

Another reason for the need of multimedia study support in the field of paediatrics was the fact that in the current study literature, introducing students to specific cases (patients) and their diagnostic and therapeutic solutions is totally missing. When compared with EU and other countries, our students lack continuity in practice, especially in independent solutions of individual cases. The aim of this project is to help offset this deficit.

2. Students

This project can be utilized by all students of the study programmes of General Medicineand Dentistry of the Faculty of Medicine, and by students of the bachelor's degree programme with specialization in health care (field of physiotherapy) and the master's degree programme with specialization in health care (field of physiotherapy) at the Faculty of Health Sciences UP in Olomouc. Paediatrics belongs among the compulsory subjects and is part of the fifth year of the study programmes for general medicine and dentistry, and second year of the physiotherapy studies. Students who take part in this subject have already fulfilled all compulsory theoretical subjects and are preparing for their practical professional performance. The subject of paediatrics is, in the general medicine study programme, accomplished with a final state examination; in other courses with a compulsory examination.

The total number of annual students in all programmes is at least 250, out of which 150 students study the general medicine study programme, 70 students fall under the dentistry programme and 30 students attend the physiotherapy fields. In the course of a study term, students are divided into blocks, each being a four-week block and the maximum number of students in one block is twenty five, which allows for a rather personalized approach to the teaching and enables achieving higher efficiency in education. Another application of the project, modified to the English language, is working with foreign students that study at the UP general medicine programme. It is necessary to emphasize that the newly created multimedia support has a website that can be, pursuant to posting a request to the administrator, used by virtually everyone, including the students of other medical departments all over the Czech Republic.

3. Preparation of the training materials

For the purposes of ensuring correct implementation of this project phase, the gathering of data and visual documentation were crucial as the necessary platforms for further high-quality processing of these materials. Data collection for the preparation of teaching materials was conducted through thorough examination of the available literature (textbooks, recent articles in professional journals, internet resources, including server

updates, etc.). Highly valuable information was also gathered from meetings with experts from other workplaces in the Czech Republic and through participation in professional conferences. The major part of data collection consisted of field work. At the meetings of the implementation team and at consultations with leading professionals in paediatrics, suitable patients were selected for case studies from various disciplines. Data was assembled in the form of extracts from medical records, patients´ cards, and photographing and filming patients, always with the consent of each patient and/or their legal representatives. In the course of creating base materials for case reports, a data base from the radiology clinic was used to obtain visual documentation. The values of laboratory results were acquired thanks to the hospital information system.

During this project phase, a new computer programme was developed, which has been fully operational since the end of November 2010. The programme is editable and the administrator can insert texts of case studies created by co-authors. The created editorial programme serves the purpose of simulating work with a patient, from acquiring information on admission up to the final treatment. When working with the programme, students gradually open individual windows with description of a patient, enter their own evaluation of the urgency of the patient´s case, through description and analysis of the considered differential diagnosis select indicated treatments (laboratory, visual and other - specialized-for each field). Students evaluate the findings, including picture and video documentation, as well as opting on the final diagnosis, justifying the selected therapy. All case studies are extended by a professional theoretical section and students have the opportunity to extend their knowledge through the internet literary references, which are part of each case.

The programme has its own internet domain-www.pedkaz.cz and is password protected. Every fifth grade student of general medicine at the Medical Faculty of Palacky University in Olomouc and assistants of the Department of Paediatrics have their access names and passwords. The site is also a reference to the principal investigator and it is possible to ask for access permission, which will be then sent to the applicant.

4. Creation of multimedia learning support

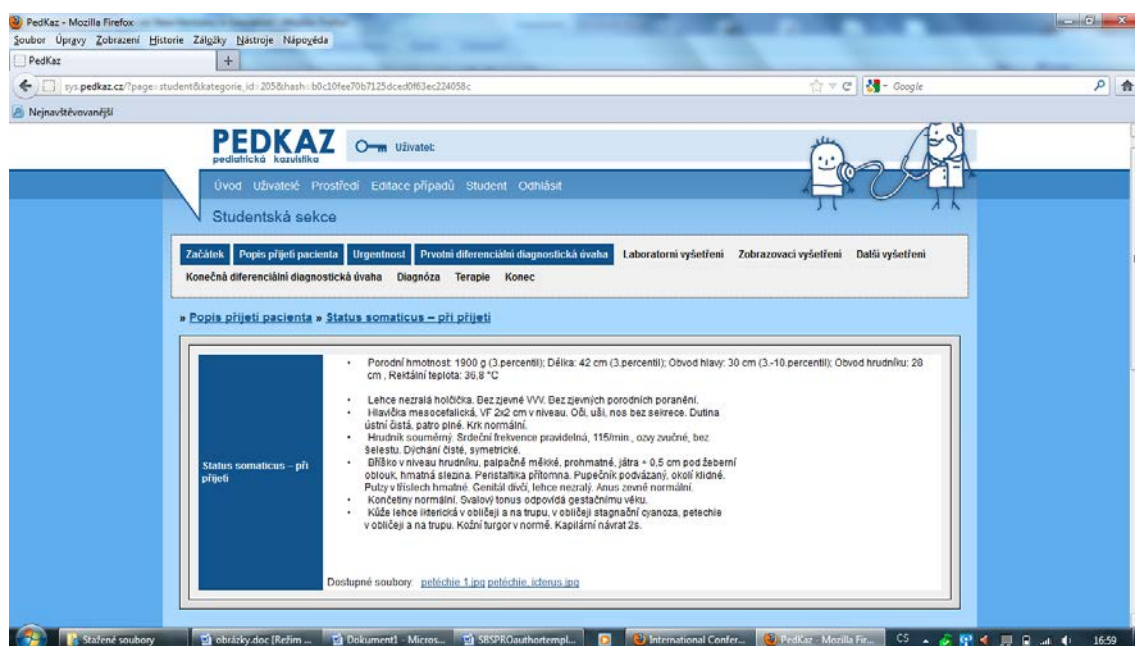
Another part of the project is creating multimedia learning support as such. This is realized by processing the documents obtained during the development of materials for case studies. The support is created by means of a computer programme, whereas the text has to be divided into several parts depending on its structure. Study support is also divided into several sections. The first part is anamnestic, in which a student obtains the basic information on a patient (history taking): current condition, personal history, social, family, pharmacological, allergy, epidemiological and gynaecological history, see Fig 1. After reading this information, a student should be capable of forming an idea of the source of patient´s problems and subsequently, he/she should be able to prepare the possible differential diagnosis of the case and to decide about potential hospitalization of the patient and thus determine the urgency of his/her condition.


Fig. 1. Current condition of the patient with accessible files- photos

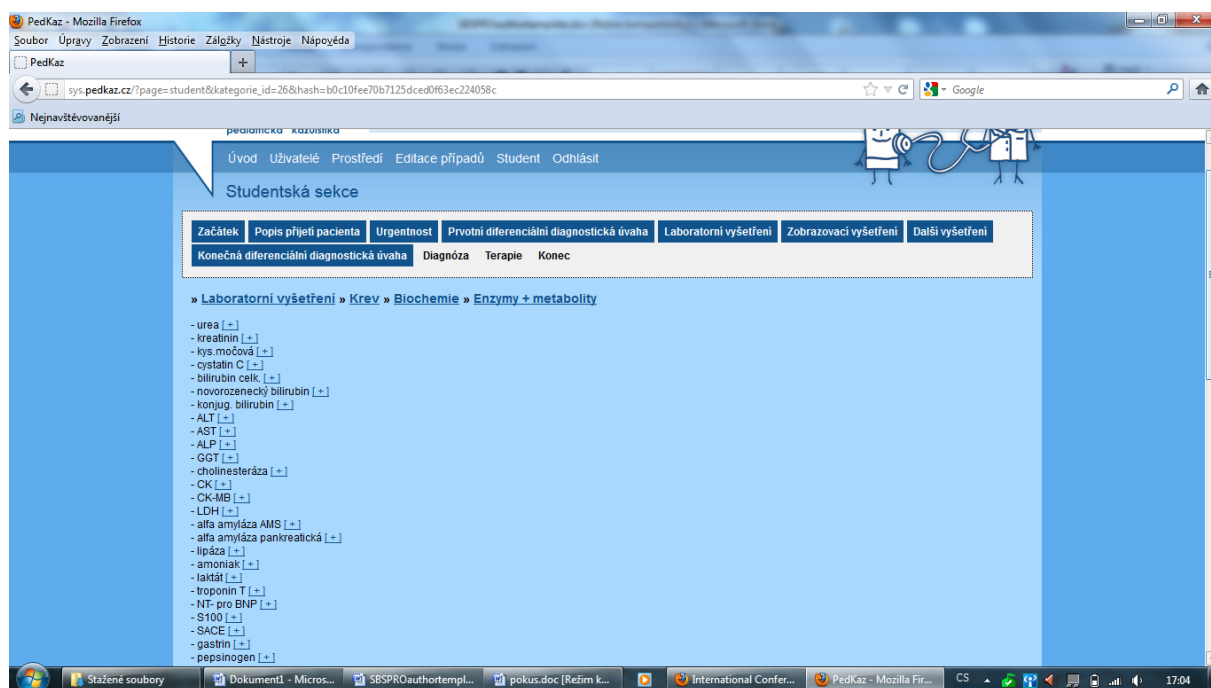
Another part is the diagnostic and therapeutic stage when a student indicates the respective examinations and evaluates the results. He/she chooses from a wide range of laboratory, radiological and specialized examinations divided into many subgroups, see Fig.2,3.


Fig. 2, Range of laboratory examinations- biochemical tests

Fig. 3, Radiological examination - x.ray of the patient

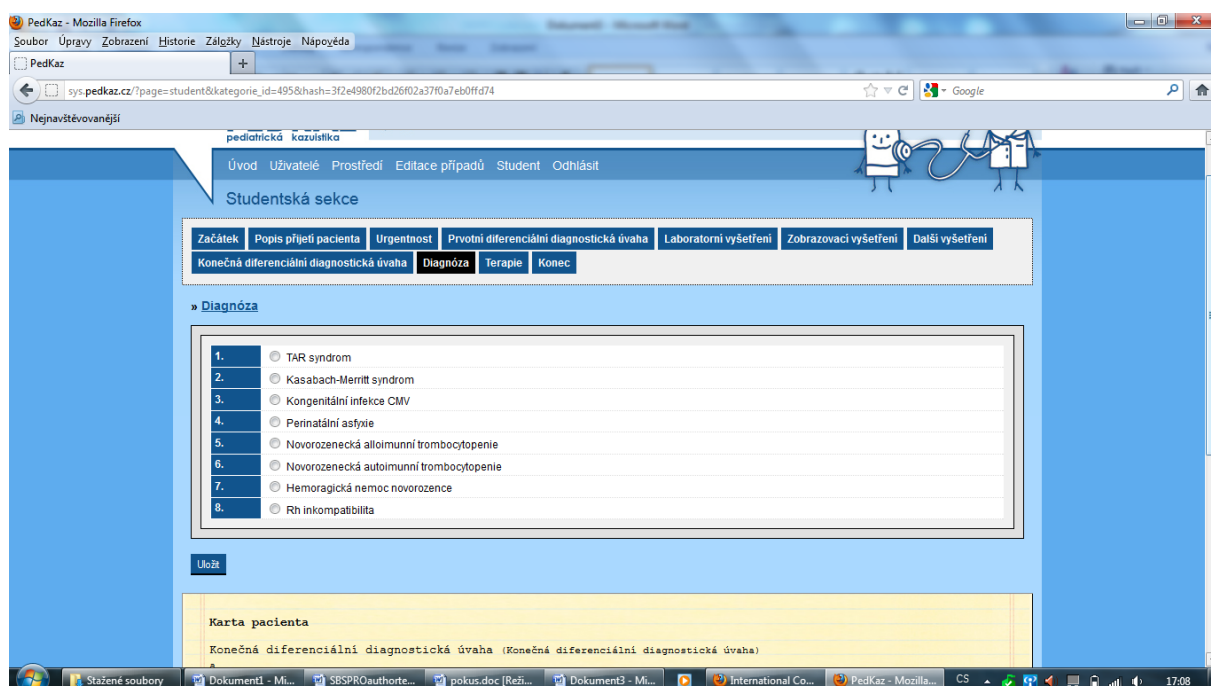
The aim is to teach students how indicate examinations in close-to-real-life situations and make their own decisions. On the basis of the obtained information, the student then selects from 5 -10 diagnostic options and justifies the correctness of his/her decision, see Fig.4.


Fig.4 Range of diagnostic options

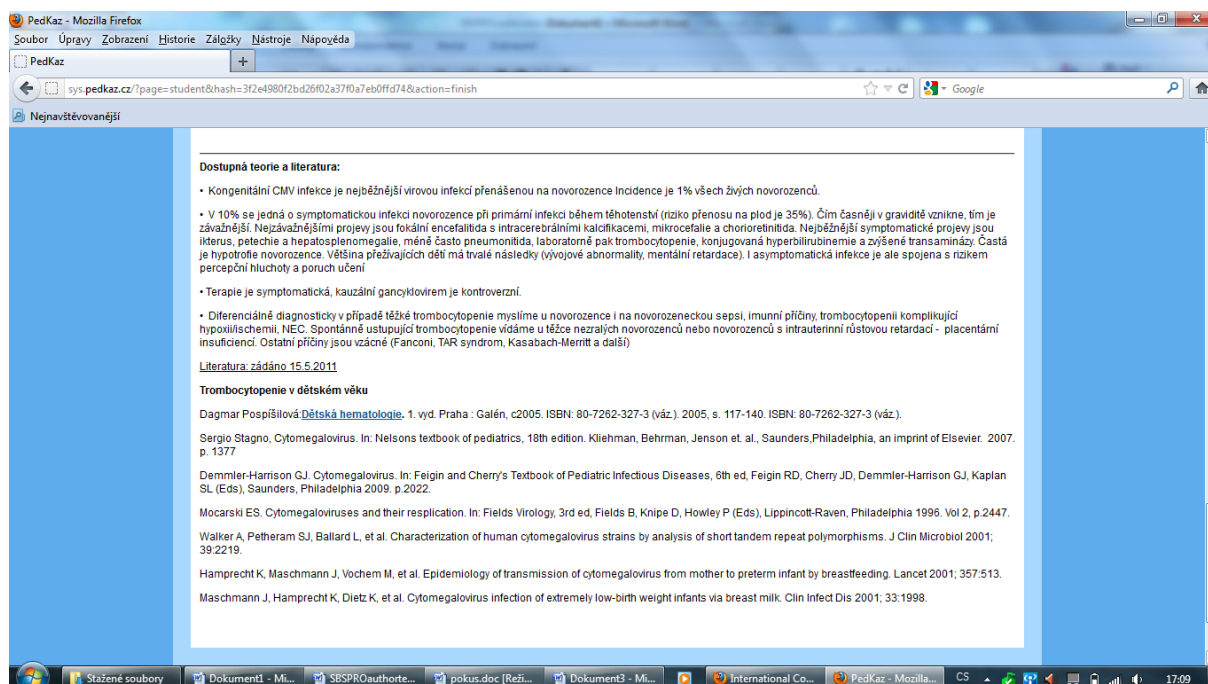
In the therapeutic part, the student again chooses from 5 -10 options of therapeutic approaches to the patient, based on the assumed diagnosis.After concluding the testing phase, evaluation of the student´s performance in the case study is displayed with a commentary on the mistakes and the correct answers, including notification of what should have been examined. Finally, the theoretical part is displayed with a theoretical summary of the diagnosis and the literary references, see Fig.5.


Fig.5. Theoretical part - theoretical summary of the diagnosis and the literary references

Case studies are analysed prior to entering the programme with the target group, since it is necessary to know the feedback from the programme users and at this stage, possible shortcomings or issues may be eliminated.

Until today, 66 case studies have been created, 6 on each field- cardiology, intensive medicine, allergology, surgery, neonatology, nephrology, endocrinology, gastroenterology, pneumology, rheumatology and haematology.

The Website with a new computer programme is fully functional. It is possible to enter any number of case studies to the computer application; three modes of starting-up have been configured. a) Teacher: the programme runs in trial mode and the results and the correct answers will be displayed to the examiner only after entering the personal username and password. b) Student: this mode serves as a self-study tool for students. Students, wherever connected to the Internet, can test themselves on a case study and correct answers are displayed immediately after saving the entered data. The programme is, however, set in such a way that the sequence of optional responses is mixed in repeated testing in order to prevent abuse by students training for the exam. c) The last option is the administrator: case studies can be inserted into the programme. The computer programme not only allows testing of the student but is also able to evaluate, according to a pre-

set submission by authors, errors in scoring and notifies the tested student of the failures or deficiencies, including the justifications and explanations. Case studies are, even at this stage, consulted with eminent experts in the field of paediatrics. The theoretical part also plays an important role where students learn more about the disorder and may further extend their knowledge.

The programme is set in such manner that the tested student works in the same way as if he/she would examine a real patient and thus he/she improves practical medical performance and develops one´s own skills. Visual documentation is also highly important as it, thanks to real radiological pictures and patients´ photos, simulates real work with a patient.

5.   Implementation   of   innovative   teaching

The final part of the project deals with the implementation of innovative teaching itself. It aims at working with students. A computer programme is applied during the practical student training at the department, both in the test mode as well as in interactive teaching using the student mode where the given health conditions and approaches to a patient are simulated on the basis of case studies. This is performed in the presence of an assistant who discusses the given health conditions with the students and is also familiar with the newly acquired information from domestic and foreign sources on this topic in the theoretical part of the programme. This type of tuition has been already conducted in eight study groups of the students of General Medicine, two groups of future physiotherapists and two groups of students of dentistry. The programme has also been presented to foreign students during their excursions. Each teaching block is opened with a seminar in which the students are introduced to the computer programme and to working with multimedia text. Thanks to the evaluation of the teaching, it was found that most students use the programme also during their home preparation and find such method of teaching preferred and beneficial.

Conclusion:

The aim of the project is to enhance the existing system of preparation of students resulting in greater awareness, flexibility and more independent decision-making that are essential for increasing their erudition and qualification. Hand in hand with the students´ increased competitiveness on the job market, this project also ensures better care for paediatric patients. Innovating the study subject of Paediatrics implies the creation of multimedia learning support (interactive, audio-visual, etc.,) that has been lacking to date, serving to change and extend the contents of practical training with direct involvement of an infant patient into the educational process. Our multimedia support enables to make self-study much more effective by means of web interface and hypertext links to recent publications in renowned journals.

INSTRUCTIONAL, TECHNOLOGICAL AND PSYCHOLOGICAL APPROACHES OF USING IWBS: A FRAMEWORK

Ömer Faruk Sözcü[a][35], İsmail İpek[b]

[ab]Fatih University, Buyukcekmece Kampus, Istanbul 34500, Turkey

Abstract

The purpose of the study is to define basic dimensions with a framework for using Interactive Whiteboards (IWB). There are some approaches, including instructional-pedagogical, psychological and technological approaches in addition to contextual factors. A thousand thirteen students (1013) from elementary and secondary schools and sixtyfive (65) teachers from different schools were selected to take questionnaire for defining their preferences, attitudes and learning variables for using IWBs. Descriptive statistical analysis was used to investigate whether or not there are differences between students' and teachers' views. Some emerging preferences were indicated to explain the effects of IWBs related to instructional, technological and psychological foundations as well as contextual variables. All results and conclusions were also presented and discussed to develop a framework at the end of study.

Keywords:Interactive whiteboard (IWB); approaches for using IWB; a framework; teaching and learning.

Introduction

Computer-Based Instruction (CBI) has been used extensively to teach students with different learning characteristics since its emergence in the 1970s (Alessi & Trollip, 1991; Gagne', Wager, & Rojas 1981; İpek, 2001; Mechling, Gast & Krupa, 2007; Jonassen, 1989). At this time, new projects have been completed for educational computing. In addition to these activities, new instructional applications have been used in learning and teaching with new instructional technologies and computers. One of them is interactive whiteboard (IWB) that teaches and presents information by integrating other technologies such as computer, board and projector used together in learning environments. Now, interactive whiteboards (IWBs) are used in many schools as replacements for traditional whiteboards. They provide ways to show students anything which can be presented on a computer's desktop (instructional software, web sites, blogs, audio-visual materials and others).

In the last decade, research focused on the effects of IWBs has been increased to explain several dimensions in the instructional processes. The research topics are different with instructional variables which include using IWBs in geology (Ateş, 2010), integrating IWBs in classrooms (Bennett & Lockyer, 2008; Lewin, Somekh & Steadman, 2009), learning collaborative activity (Mercer, Warwick, Kersher & Staarman, 2010), and effecting attitudes and contributions (Digregorio & Sobel-Lojeski, 2010; Ekici, 2008; Kaya & Aydın, 2011; Mathews-Aydınlı & Elaziz, 2010; These studies deal with following topics such as using IWBs in basic courses, cooperative learning, perception, teachers' opinions, marketing and technological characteristics in general. They

[35] Corresponding Author. Tel: +90 2128663300-2840 *Email address: ofsozcu@fatih.edu.tr*

are not good enough to define or clarify specific teaching and learning variables from different perspectives totally to establish foundations of using IWBs which is indicated as a framework.

Recently, IWBs have been used and qualified by different educational systems of states all around the world. Although IWBs were first produced in 1990s as a new learning tool, they are disseminating slowly depending on cost effectiveness, unknown educationally usefulness in schools, industry and markets so far. There are still lack of research for considering IWB effects in the different sectors and areas based on different view of approaches (Baran, 2010; Bennett & Lockyer, 2008). These approaches/studies are very limited to explain IWBs usefulness in psychological, instructional and technological perspectives. Thus, in order to develop contextual factors for applications and implementation, "a return on investment " (ROI) calculation needs to include these parts as well. The main view, in general, is directly related to technological characteristics and financial bases. There are not many studies that focus on perceptional-psychological and instructional effects on the users and learners. The effective use of IWBs requires a new ways of strategies to gain objectives in classes and organizations with instructional variables. Thus, we need new research to clarify and support the effective use of IWBs to meet instructional, financial and technological purposes as well as teachers' and students' perceptions, awareness and preferences as psychological aspects. Because using IWBs in learning environments can work as a whole in relation to human-technology interaction in teaching and learning process, which are based on technological, psychological and pedagogical/instructional dimensions for users and educators as well as contextual facts or variables. There is a need for more research to combine and explain those variables concerning using IWBs except for a return on investment (ROI).

Using IWBs provides benefits with increasing achievements, changing attitudes about technology, gaining new instructional procedures, keeping information to use later, learning lessons, changing students' behaviors, adapting and developing instructional materials and integrating technologies effectively in the classrooms (Ateş, 2010; Kaya & Aydın, 2011; Digregorio & Sobel-Lojeski, 2010; Shi, Xie, Xu, Shi, Chen, Mao, & Liu, 2003). As a result, these studies have indicated a number of benefits associated with use of this presentation technology, instructional uses, and psychological aspects, including increased motivation, visual effects, interaction and participation in the different courses (Digregorio & Sobel-Lojeski, 2010; Glover, Miller, Averis & Door, 2007; Hall & Higgins, 2005; Higgins, Beauchamp & Miller, 2007; Lewin, Somekh & Steadman, 2008; Sherton & Pagett, 2007; Wall, Higgins & Smith, 2005; Wood & Ashfield, 2008). The studies have been strongly focused on contextual factors in education, including school culture, teacher training, time and teacher confidence, and technical support. In addition, the effects of IWBs regarding instructional variables, including perception, motivation attention, learning and level of interaction, achievement, and pedagogy have been discussed and examined as well. Future research should focus on pedagogical, perceptional considerations and human characteristics as well as technological design approaches for IWBs (see in figure 1).
Figure 1. The relationships between variables in a framework for using IWBs

Bennett & Lockyer (2008) indicate percentage of IWB lesson time per subject area, including English, math, science, social studies and multiple subject and other. IWB lesson time according to subject area and participants in primary school classrooms is found less than 40 % of total lesson time, And using IWB lesson time decreases from English subject area to multiple subjects such as less than % 40 in English, 35% in maths, % 10 in science, % 2 social studies, and % 8 multiple subjects and other consequently. As indicated by previous studies, IWBs were used to support developed teaching styles rather than to transform teaching. There was no evidence that teachers changed their overall pedagogical approaches in response having an IWB. The IWBs were integrated into the teaching strategies that teachers taught already. Basically IWBs put in order teaching ways well with what teachers have (Bennett & Lockyer, 2008; Jewitt, Moss, & Cardini, 2007). As a result, there is no clear framework to define approaches or variables from different dimensions. IWB users need to understand these approaches for using IWBs effectively and creating instructional materials in schools and markets for the future performances.

Research Design

Research Design

The purpose of the study is to define basic dimensions and approaches with a framework for using Interactive Whiteboards (IWBs) based on literature review and research which is being conducted by researchers. For this reason, all conducted research so far was reviewed with their variables focused on research which was in a IWB framework design, and finally, related variables in using IWBs to define dimensions with this tool were defined. As a result, a framework model including instructional/pedagogical, technological and psychological variables in addition to contextual variables was presented in a figure 2 and 3 for using and designing IWBs in learning and teaching environments effectively.

Methods

Participants

The research used a descriptive statistics and analysis approach to explore the basic context, and foundations of IWBs and preferences of the participants as students and teachers. Participants of the research consist of sixty five (65) teachers who teach at the different levels of elementary and secondary schools with a thousand thirteen (1013) students who are attending those schools.

Gathering Data

The research used a descriptive statistics and analysis approach to explore the basic context, and foundations of IWBs and preferences of the participants as students and teachers. Participants of the research consist of sixty five (65) teachers who teach at the different levels of elementary and secondary schools with a thousand thirteen (1013) students who are attending those schools.

3.2.1. Teacher survey

A questionnaire was administrated to sixty five (65) teachers at the different levels of classrooms and schools at the end of fall semester 2011. The questionnaire consisted of two parts including general information items for teachers and their experiences in using IWBs and 38 statements with Likert-scale response and ranking general attitudes and preferences of teachers' related the IWB. Part one in teacher survey includes the following subjects with fourteen (14) items in details such as time of experiences, types of teaching school, using the IWB, computer literacy, using characteristics of IWB. Part two includes attitudes related to achievement, effectiveness of teaching, motivation, class participation, relationships between learning theories and using IWBs, students' preferences based on teacher opinions, integrating technologies with IWB, contribution on interaction between teacher and student, different purposes of using IWB, using in different courses, individual attitudes for using IWB in schools and classrooms, and also preferences related the IWB, teachers' feelings while using IWB.

3.2.2. Student Survey

A questionnaire was administrated to a thousand thirteen (1013) students at the different levels of classrooms and schools at the end of the fall semester 2011. The questionnaire consisted of two parts including eight-8 general information items for students' opinions using IWB and 24 statements with Likert-scale response and ranking preferences of students' reflections related the IWB. Part one in student survey deals with background knowledge about the students, including age, gender, type of schools, using time period and effects of IWB. Part two in student survey includes understanding subjects with IWB, attitudes related to learning strategies with IWB and its contributions for learning process as learning skills.

Analyzing of Data

After having responds, we reviewed both all results in literature and our research results and then use SPSS version 15 to analysis answers for each item both students and teachers. For this purpose, objectives as indicated were reviewed to explain preferences for each item. As a result, the survey items except for beginning parts are followed by a five–point Likert scale, with the alternatives labeled from 'Strongly disagree (1), to 'Strongly Agree' (5), to avoid halo effect, several questions were phrased negatively. Analyzing data intended to explain main problem and sub research problems as follows. Thus, data analysis was basically completed to clarify those questions in the paper. As a result, we made decisions about framework variables based on item responds and students' and teachers' comments in surveys and literature.

Results

A framework for using IWB was developed based on literature and responds from students and teachers to provide benefits for future experimental studies. So, the framework, not exactly a model, was considered to use or develop high level instructional design and technology materials in distance education and designing interactive e-learning (see in figure 1). Based on questionnaires, students' and teachers' responds were clarified as variables with different approaches for using IWBs and learning. Some of the varibles in a framework were given in related tables.

Students' attitudes and preferences toward the use of IWBs

The student population between 15 and 19 ages is 51% and between 6 and 14 ages is 49%. And The population consists of girls (47%) and boys (53%). Their educational level consists of elementary school students and grades 1-8 (43 %) and high school students with grades 9-12 (57%). For using IWBs before, 69% of students responded as answer yes, and 29% of students' responded no. 50% of students used IWBs more than three years and 73% of students used IWBs more than eleven hours in a week. Using for IWBs was preferred in courses as visuals (12%), numerical (41%), verbal (17%), foreign language (7%) and all of them (23%). Several

items in the student questionnaire aimed to investigate the participants' preferences toward the use of IWBs in terms of perceived affect on learning. Variables selected such as instructional/pedagogical variables were shown as sample dimensions below (see table 1).

Table 1. Students' attitudes and preferences about the use of IWBs (Instructional-Pedagogical)

		SD	D	NI	A	SA	Mean	STD
Q1- Easy to understand	F	70	57	166	456	491	4.01	1.11

	%	12.7	9.1	14.8	22.5	40.9

Notes: F= frequency, SD = strong disagree, D = disagree, NI = no idea, A = agree, SA = strongly agree; STD = standard deviation

4.2 Teachers' attitudes and preferences toward the use of IWBs

First part of survey deals general information of teachers' with knowledge background of IWB and how often and which purposes they are using it in the different courses. Teachers who are more than 3 years and less than 12 years experience prefer using IWBs in their schools (57 %). Teachers (69%) use IWBs more than 11 hours in a week and have training for using IWBs. And teachers (56 %) also used IWB before in their class. Teachers use IWBs in their classes as verbal (26%), numerical (30%), visual (10%), foreign language (18%), and all of them (16%) respectivelyTeachers' attitudes and approaches were shown in table 4, 5 and 6 as instructional/pedagogical, psychological and technological variables and dimensions while using IWBs respectively. These variables were combined with literature variables based on the approaches and finally, all dimensions were presented to create a framework for future designer, users and educators (see in figure 2). All users should be aware of those variables and their effects while using IWBs and creating instructional materials for this tool in the schools.

Table 3. Students' attitudes and preferences about the use of IWBs (Technological)

		SD	D	NI	A	SA	Mean	STD
Q7- It seems difficult for me to use IWB	F	553	229	29	78	71	1.90	1.25

As a result, with a framework and a classification table, dimensions including pedagogical/instructional, technological and psychological variables selected were shown in figure 2 in addition to interactive designs and other contextual variables. These variables can be used with different approaches as indicated in figure 1 and 2. There is an interaction as mixed variables which can be found in other approaches as well. Based on research on IWBs, some of the variables are considered and discussed for using IWBs in different environments. But there was no clear definition for creating a framework and clarification of basic dimensions in learning with IWBs as well as combining learning and designing materials for IWBs.

All findings and conclusions were also presented and discussed to develop a framework such a model at the end of study. Based on all considerations and discussions in literature and current research, a framework model was created and suggested for conducting the future research and developing high quality instructional materials for IWBs and instructional designers and teachers as given in figure 3.

Discussions and future research

This study investigated students' and teachers' attitudes toward the use of a framework of IWBs. Although there was no framework developed or model to use of IWBs, all variables in the studies were defined to classify basic steps for using IWBs in the classrooms as dimensions. Possible variables were selected from studies and the research surveys to indicate how to use and create materials for using IWBs. In general, findings are in agreement with previous research (Bennet & Lockyer, 2008; Glover, et. al 2007; Mathews-Aydınlı & Elaziz, 2010). IWBs variables were selected and shown in related tables, So, these results related to use of IWBs provide important data with variables for creating a framework. Selected statistical data is also given for future research to provide variables with designing effective materials for schools and users as well. Although IWBs are claimed to have impact on learning, this has not yet been confirmed. The effectiveness of the framework should also be examined. Future experimental studies should be conducted to explain more variables and their relationships in the approaches as well as contextual factors. Administrators, instructional designers, developers and students have strong roles to use effectively IWBs in our classrooms and investments in schools as well.

Figure 3. A framework model for using IWBs and learning

Conclusion

The study conveys ideas and approaches for using IWBs in the future applications. And it also presents basic dimensions for creating and designing high quality materials for IWBs and all board of education around the World as well as in Turkey. Programmers, instructional designers and teachers will be able to understand easily the importance of those variables and characteristics of approaches for using new learning technologies and developing high quality materials with IWBs. The study may indicate new research topics in experimental design to work on variables given on the framework for the future studies. As a pioneer of defining new dimensions and approaches on IWBs, the idea brings new concepts and working styles for designing, developing and applying instructional materials in classrooms and environments for future IWBs and people who expert in this field. As a result, students, teachers and presenters in business should focus on these approaches and variables while using IWBs and developing their materials in the future as users and developers.

Abstract

This talk aims at discussing the use of music, film and culture in an English (or Literature) class at college. We propose an analysis of the feature film "Once" (2006), directed by John Carney, from an intermedial perspective. The narrative is a beautifully woven patchwork of accounts, music, poetry, silence, creativity and partnership. The main characters, an Irish street musician and a young Eastern European girl, start a relationship heavily based on music. Both sing and play musical instruments. The songs they write tell the moving tale of their lives and their search for identity. Both the immigrant and the 'local' feel misplaced in Dublin, a city that comprises a great multicultural diversity. The places where they live and the language they use reflect their social background; the lyrics they write show their hope or frustration; the light in the scenes stands for their emotional state. "Once" is a kaleidoscope: it is lyrics, music, colour, images, words and silence. Everything is integrated thus ensuring that language, literature and culture are not studied in isolation. We have noticed that the use of music and film in the classroom greatly motivates the students. They seem to be eager to analyse the cultural – as well as the linguistic – aspects involved, which makes their learning (and our teaching experience) more rewarding. Therefore, we believe that the challenge of using different media in the classroom is essential: the classes become livelier and the students do participate enthusiastically.

Keywords: Music; Cinema; Culture; Language Learning; Language Teaching.

In Art, man reveals himself and not his objects.

(Rabindranath Tagore)

Introduction

Teaching English to adults at the Faculty of Arts (School of Languages / Letras) is a challenge. The classes are heterogeneous and full of students who come to college after a long working day. Most of the time, they are not motivated since they do not have knowledge enough in the target language. These are some of the aspects that have to be taken into consideration by the professors.

We have noticed over the years and after some reflection that there are some ways to instigate the students to awake their interest in their own learning process. The playful aspect is essential, but it has to be associated with

contents that enhance a broader understanding of their own world and their reality. This reflection can be done either through comparison or contrast. Whenever cultural aspects are concerned, observing and reflecting about the other lead us to a wider perspective on ourselves.

We think the use of music, films and culture in the English classes greatly contributes to the students' solid education, regarding both linguistic and cultural aspects. This paper aims at discussing the use of these resources in the classroom. Our analysis is based on the feature film "Once" (2006), written and directed by John Carney.

2. Once: a palimpsest

We have chosen this film for many reasons: it lends itself to a linguistic, cultural, musical, cinematic and poetic analysis. Set in Ireland, it approaches current subjects such as immigration and the search for identity. The lyrics, written by Glen Hansard and Markéta Irglová, who also play in the film as protagonists, reveal great dramatic poetry. Melody and lyrics complement each other and delight the audience. Involved in the story, the students greedily try to follow the narrative and grasp its nuances, complexities, its voices and silences.

Shot with not much money (only $150,000), the film portrays urban Dublin, its squares, parks, streets, pubs. Shot in only 17 days, the narrative is intense; it reveals Carney's great artistic talent, as well as Hansard's and Markéta's. The protagonists are an Irishman who sings on the streets and a young immigrant from Eastern Europe. One night, while selling "Big Issue" magazine – a magazine for the homeless –, the young girl meets the Irishman singing on Grafton Street, in downtown Dublin. In a subtle way, the film introduces the discussion about one of the central themes related to immigration: What are the professional activities that the immigrants are prepared to do? Are they skilled workers or not? Has the opening to immigration changed their profile? Are the people who arrive in the country now more – or less – prepared than before?

The Irishman and the young girl sing and play instruments. They start a relationship that is strongly based on music. Even though they are undergoing some emotional turbulence in their lives – since both live different situations and try to settle down, conquer their place and consolidate their identities –, they cannot help getting closer and closer. The story of their lives and the tender attraction that they have for each other is told through the songs they write. The songs make the narrative come alive and they become the nucleus of the film. They reveal the characters' emotions and tell the stories of their ups and downs. The main theme of the songs is a broken heart. The young man, who had been betrayed by his girlfriend who now lives in London, does not seem to have recovered from this blow. In a hilarious scene, while playing his guitar and singing, he tells his new friend that he wishes his ex-lover to die. Music is an element of extreme relevance; it catalyzes emotions, actions and interactions between the characters and it reveals the great desire to communicate that permeates all kinds of artistic expression.

Being an atypical musical, "Once" tends to certain realism when its characters work hard to write their songs. They do not come up with the lyrics and choreography readymade for a big spectacle. Maybe that is the reason why "Once" has an unusual charm. Simplicity is its secret. And it reveals itself in the poetic scene in which the girl plays the piano at the music shop. She does not have a piano at home because, according to her, the instrument is "too expensive in Ireland". The Irishman, admiring her musical skills, hums one of his own compositions and the girl plays it on the piano. They sing "Falling slowly", whose lyrics reveal their fond attachment. Curiously, this is the song that won the Oscar for best original song (2008).

Both the immigrant and the native live displaced in Dublin, a city that comprises a huge cultural variety. None of them is named: they are only "the guy" and "the girl". Some students are bothered by the fact that the protagonists have no name; they believe that not much time was dedicated into building up the characters. At this

moment, it is important to highlight that the fact that the characters have no name is an essential point of the film. This simple resource implies the universalization of the characters. At the same time that the guy and the girl live their story, their trajectory stands for the relationship between two people who meet for a reason, experience a huge and transcendental connection, but whose expectations are frustrated and they follow their ways, leaving behind the possibility to love and to surrender to it.

In Scott´s view (2007), a New York Times writer, "Once" is far from being a conventional love story. "It is, instead, the story of a creative partnership that develops by chance and that involves a deeper, riskier bond than mere sex ever could." Anyway, we can say that searching for the record of the human condition the film presents a "collection of situations which are common to all human beings and are, therefore, universal" (Brito, 2007, p.11 - our translation). Barry Divola (2007) highlights a curiosity: Markéta Irglová, the actress who plays the immigrant who comes and changes the guy´s life, figured out that real life and cinema fantasy can, sometimes, coincide: knowing Hansard for seven years, and despite the fact that he was 37 years old and she was 19, they fell in love and now they live and work together in Dublin.

Along with the songs, sounds and colors, John Carney uses flashback. He reproduces on the screen the subjective dimensions that the protagonist embodies, and skillfully introduces intervals of silence that intensify the narrative. For instance, when the protagonist remembers his ex-girlfriend, he sees himself in a garden full of daisies or remembers jumping on an elastic bed, which refers to happiness and innocence that have gone away. Carney´s language becomes richer, metaphorical; his object-glass turns into a poetic narration line that is almost intimate. The instant understanding of his visual metaphors is as important as the understanding of the words and songs that are in the film.

According to Robert Stam, the cinema, because of the heterogeneity of its materials, becomes complex and subtle. Its audiovisual nature allows

an infinitely richer *combinatoire* of syntactic and semantic possibilities. The cinema has extremely varied resources, even if some of those resources are rarely used […]. Film forms an ideal site for the orchestration of multiple genres, narrational systems, and forms of writing. Most striking is the high density of information available to the cinema. If the cliché phrase suggests that 'an image is worth a thousand words' how much more worthy are the typical film's hundreds of shots (each formed by hundreds if not thousands of images) as they interact simultaneously with phonetic sound, noises, written materials, and music? (Stam, 2000, p.12)

Using the endless cinematic possibilities highlighted by Robert Stam, John Carney prioritizes private emotion and not public moral. Tony Trace (2007), while praising the director's work, states:

Carney's romance extends beyond emotions to include a vision of modern Ireland inspired by a rose-tinted view of the past. Dublin is a place where no one has much money but everyone gets by and shares what they have. The 'locals' and the immigrants are basically the same, living classless, communal lives with open doors and shared resources.

Carney´s lenses show the unexceptional and the trivial in everyday life, which are not always visible in the speed of the urban chaos. His cinematographic language is emotional, clean and synthetic. Using humor, lyricism and an agile text, Carney reveals a contemporary Dublin that is also simultaneously displaced in time. The use of a tape recorder by the protagonists, for instance, seems to refer to a time displacement, to a certain

inadequacy of the characters as well as to their socioeconomic background. Nowadays, who would think of recording a tape?

The ties that bound the protagonists become tighter. Robert Stam (2006, p. 17) believes that

The cinema, considering its characteristic role of telling stories about humankind, has perfectly adapted to the narration of the stories of nations and empires, through projections. National self-reliance, generally seen as the precondition of nationality, i.e., the widespread belief that different men share common sources, conditions, locations and desires, was widely associated to the cinematographic fictions. [our translation]

Sharing, therefore, is the keyword. In Carney´s film, the scene in which the guy visits the girl can be read at different levels of comprehension. She lives in Mountjoy Square, a region that is inhabited by immigrants. He enters her apartment and observes. Simple furniture, precarious structure, meager lighting. The low light of the scene does not hide – on the contrary, it reveals. And it reveals the social and emotional condition of the family that hosts him. With little financial resource and a huge desire to share and learn from the other, the doors of her house are open to everybody who wants to be part of that community of foreigners who have just arrived in Dublin.

Despite the child's joy and excitement, the grandmother sleeps in the couch. Her role as a protective mother who keeps the roots and tradition that she brought from home is subtly shown. The guy is invited for dinner and he accepts immediately. The girl´s mother, who is an immigrant, refuses to use the little English that she knows. In her native language, she lets her daughter know that she thinks the guy is handsome. She prepares dinner, but she does not join them. She does watch television beside the boys from the building either. They already get into the house without asking for permission to do so. All of them are immigrants who watch the soap opera called Fair City in an attempt to learn the language from the country that hosts them. One of them, making fun of it, reproduces a speech from the soap opera: "Are you not pregnant?"

Concerning language, we can observe that the young protagonist does not speak standard English. Entering the music shop, she says that she goes there daily to play "one hour for day". The usage of "for day" instead of "a day" is a strong sociolinguistic clue. However, not speaking the language properly does not generate a distance between the girl and the boy. They get very close to each other and become good friends. Music, the universal language, brings them together and tightens their relationship.

In other moments, the slightly blurred image gives us the impression of affirming the characters' emotional instability, their doubts, uncertainties, questions. There is an intriguing scene where both (the guy and the girl) take a walk around Dublin and, from the top of a hill, they can see the sea. The sky is cloudy; the sea reflects its grayish tone. The characters look equally cloudy. The young girl confesses that she is married, and talks about her difficult relationship with her husband. The guy asks her how to say "Do you love him" in Czech and she answers, "Noor-esh-ho?". Then, he asks her, "Noor-esh-ho?", for he wants to know if the girl still has feelings for her husband. She hesitates and answers, "Noor-ho-tebbe". Without grasping the meaning of her words, the guy insists because he wants to know what she has just said. Nevertheles, she changes the subject and never reveals the meaning of the expression that meant "I love you".

John Carney´s movie has an indirect way of saying things. By means of camera movement, lighting, setting, meaningful looks and silence, many unsaid things seem to reveal to the audience. We agree with Antonio Tabucchi when he says, "I like movies about reality, but movies with symbology and metaphor. Art has an oblique way of saying things, looking for obscure areas, wreck areas. [...] Reality is important, but the filter of art is much more important" (Brito, 2007, p. 49). We can easily notice that "Once" has some of these obscure areas, which allow us to dive deeply into them. Its metaphors – visual or musical – filter reality with sophistication and elegance.

At the end of the movie we have a contradictory feeling. The love relationship between the protagonists does not take place, – which can be somewhat frustrating to the audience –, but the tenderness and affection that their

look shows indicate the transcendence of their feelings. We realize that the feeling that connects them is special and will last longer than if they had allowed their desire to blossom "only once".

3. Conclusion

Cinema and music have the magical power to awaken our imagination; their metaphors instigate reflection. Therefore, we believe that their use in the classroom must be encouraged. Even though art, for its aesthetic value, is an activity of non-utilitarian nature, we believe that it must be used in the classroom to promote more dynamic meetings and lead to deeper discussions.

In the cinema, the montage technique has improved and it has consequently "influenced other kinds of art. [...]. The usage of the portable camera and the proliferation of cameras multiplied the look properties and, in Art, they taught how to explore beauty segments which were eventually left unobserved in daily life" (Brito, 2007, p. 11). Similarly, the use of different resources in the classroom multiplies the possibilities of look and leads the student to the exploration of different areas of knowledge in a holistic way. Because of its artistic refinement as a mixture of cinema, music, poetry, culture and language all intrinsically interwoven, "Once" promotes a deep reflection on its themes and becomes a great tool to be used in the English / Literature classroom.

INVESTIGATING THE RELATIONSHIP BETWEEN MUSICAL TRAINING AND MATHEMATICAL THINKING IN CHILDREN

Edel Sanders[36]

University of Cambridge, Faculty of Education, Psychology & Education Group, 184 Hills Road, Cambridge CB2 8PQ, UK

Abstract

This study examines the potential for music education to enhance children's mathematical thinking. Specification of potential cognitive correlates between musical and mathematical components is sought and underpins the design (3 variables x 2 conditions each = 6 groups). Nearly 200 children aged 7-8 years experienced weekly music lessons (duration = 9 months). Lessons emphasized melody, rhythm or form; in half of the classes, the teacher made the musical-mathematical parallels explicit.

Apart from the specific musical-mathematical foci, the lesson content was kept as constant as possible within primary school settings. Pre-tests and post-tests in musical, creative, spatial and mathematical thinking were administered. Statistical analyses will examine improvement over time while considering differences among three musical components and two conditions for each.

This research addresses concerns that governments' quests for higher standards in mathematics may result in impoverished curricula with limited access to the arts. If it is shown that musical training appears to benefit logical thinking, as hypothesized, it may add to a growing body of research suggesting that policy-makers and educationalists reconsider curriculum balance.

Keywords: music; music education; mathematics; mathematical thinking; mathematics education; cognitive correlates; spatial reasoning; spatial-temporal reasoning; Mozart Effect; Makam Effect; Ellington Effect

Introduction

The relationship between music and mathematics has been considered for millennia. Enquiries have emerged in cognitive science and educational research literature in particular over the past four decades. Why should such seemingly different domains be linked? What aspects of both are connected? Can musical training improve mathematical ability? The aim of this study is to add to the body of literature that attempts to answer these questions. In essence, this study seeks improvements in the qualities and skills that can support children's development in mathematics as concomitants of an extended course of musical training focused principally on singing.

Motivation for this study was inspired by research co-conducted by the author at the Center for Arts Education Research at Columbia University. Research at five schools for over six years revealed consistently larger improvements in standardized test scores, particularly in mathematics, by children who had studied violin at a young age in comparison to control groups in the same grade level both within the same school and beyond (Abeles & Sanders, 2006).

Linking Musical Exposure to Spatial Sense

The modern discourse regarding the primary research question here perhaps began when Rauscher and colleagues (Rauscher, Shaw, Levine, Ky & Wright, 1994) conducted an experiment with university students in which ~1/3rd of the matched groups listened to Mozart's Sonata K. 448 in D Major for 10 minutes and then took spatial reasoning tests using the Stanford-Binet Intelligence Scale. Another group listened to relaxation instructions and the other, nothing. Those who had listened to Mozart (N=36) scored 8-9 IQ points higher than the other groups; the effect lasted 15 minutes. Thus was born the phrase, "The Mozart Effect," which implies that listening to Mozart leads to higher intelligence. The findings suggest a causal relationship, specifically in spatial-temporal reasoning, not necessarily general intelligence. Yet this study should be noted with temperance due to a tendency for the findings to be exaggerated. This has occurred, sparking a commercial frenzy with claims that Mozart's music will create "Baby Einsteins." Numerous replications of the study were later conducted. In 1999, Chabris analyzed 15 of such studies and concluded that the findings were not statistically significant. However, Rauscher criticized his report, noting that certain studies should not have been included in Chabris' analysis since they had tested for general intelligence, not specifically spatial.

Hetland (2000a) conducted two meta-analyses of 36 experiments with 2,469 subjects and compared tasks that qualified as spatial-temporal (31 of 36) to other types of spatial measures (5 of 36). Contrast analysis shows that the average effect of the experiments using spatial-temporal measures alone is $r = .20$. Experiments employing only nonspatial-temporal measures produced an average effect of $r = .04$, and experiments that employed a combination of spatial-temporal and nonspatial-temporal measures showed an intermediate effect size ($r = .15$). Hetland's analyses substantiate the idea that the consequence of listening to complex music is specific to spatial-temporal thinking, more than to general spatial thinking and even more than to general intelligence.

This specificity argues against the hypothesis that arousal and mood were the causes of the enhanced spatial reasoning abilities demonstrated (Hussain, Thompson & Schellenberg, 2002). Also helping to rule out the arousal and mood hypothesis were studies that used other forms of music such as electronic dance music, which did not have the same effect. Though the dance music had an impact on levels of arousal and mood, spatial-temporal skills were significantly lower for subjects who listened to this versus the classical music. The highly organized and sequentially evolving nature of Mozart's music may explain part of this effect. Repetition of logical patterns exists within the course of multiple melodic and harmonic modulations and unexpected rhythmic and textural shifts within the overall symmetrical design. Whereas, the patterns within the popular dance music would normally be much simpler and more statically repetitive. Additionally, when subjects were asked to focus on Mozart's music, their spatial reasoning scores were higher, again suggesting that specific elements within the music itself perhaps affected the outcome.

Listening to other forms of music such as jazz or non-western music such as Indonesian gamelan music, Turkish makam or Indian raga could presumably have similar outcomes to classical music of this nature if the particular pieces are similarly complex. Interlocking rhythms and/or melodies of Indonesian, Indian, Arabic, Latin or African music are frequently comprised of multiple layers that can be highly intricate. It would be interesting to see the cognitive effects after using one or more of these types of music while including multi-

layered melodic and harmonic elements of these cultures as well. Perhaps it could then be just as appropriate to refer to this phenomenon as the Ellington Effect[37] or the Makam Effect[38].

Shortly thereafter, Rauscher and colleagues responded to challenges to go beyond listening by conducting studies that looked at the effects of training, particularly with preschool children. One study yielding statistically significant increases in spatial reasoning ability in students after months of training involved keyboard lessons and computer lessons (Rauscher, Shaw, Levine, Wright, Dennis, & Newcomb, 1997). Other responses to Rauscher and colleagues' research include replications (Vaughn, 2000), clarifications (Rauscher, Shaw, & Ky, 1995), enquiries investigating why the effect occurs (Rideout & Laubach, 1996) and attempts to generalize to other cognitive abilities (Wilson & Brown, 1997).

In an effort to thoroughly examine all of these studies, Hetland conducted meta-analyses of 19 experiments involving musical training in a variety of instruments with children ranging in age from 3-12 that met certain criteria, such as having at least one control. She implemented three meta-analyses based on outcome measurements. In line with evidence from the listening studies, categorizations were based on which spatial reasoning tests were employed in the studies. The first, which included 15 (N = 704) studies that utilized spatial-temporal tests, yielded a large average effect size by meta-analysis standards (r = .37, d = .79). The second meta-analysis included five (N = 694) studies employing nonspatial-temporal measures yielded a small average effect size of r = .08, d = .16. The third included nine studies (N = 655) that employed a variety of spatial tests (including spatial-temporal). The average effect was moderate but still relatively strong (r = .26, d = .55), indicating that spatial reasoning skills in general are enhanced via musical training but not as significantly as spatial-temporal skills are (r = .37, d = .79).

Spatial Sense and Musical Processing

As discussed, numerous studies have shown a connection between music and spatial-temporal reasoning (Rauscher, et al, 1994; Graziano, Peterson, & Shaw, 1999). Since music is sound moving in time, it seems logical that training in this domain could facilitate temporal reasoning, yet why does spatial reasoning also seem to improve with exposure to and particularly with training in music? A recent study by Spelke (2008) offers promising clues to help answer this question.

In her previous and extensive research on mathematical cognition and development, Spelke found that mathematical ability is not confined to one system in the brain. She had also been intrigued by the longstanding idea that there is a special tie between music and mathematics. Thus, when challenged to see how the arts relate to the organization of cognitive systems, she and members of her lab began a correlative study among three school age groups to see if those with music training had an associated advantage in any area of mathematical aptitude. The three studies conducted looked at levels of training from low intensity to high. Of three core mathematical abilities, the children who received moderate or intensive music training performed significantly higher on geometrical and spatial tasks. There was also an associated advantage for the music group in using number lines and maps, which utilize spatial skills as well, even when controlling for elements such as reading IQ and motivation.

In order to discover the source of these correlations, Spelke conducted an infant experiment, patterned after one that her colleagues (Carey & Srinivasan, 2008) conducted. This looked at note durations and visual objects (worms) of different lengths to see if there is an inherent perceptual relationship between musical time and visual

---

[37] This particular usage of the term, "Ellington Effect" has been generated by the author for this article as both a counter and a compliment to the term, "Mozart Effect" to emphasize that music need not be of a particular style in order to cause a certain cognitive effect. It is believed by the author that the precondition is in the complexity and cohesiveness of the music, not the cultural origins. This term has been used in the past by Billy Strayhorn, a cohort of Ellington's, who once called Ellington's ability to create a unique sound via his compositions and arrangements for specific band members the "Ellington Effect" (Tucker, 1993).

[38] Makam (from the Arabic word مقام), in Turkish classical music, is a system of melody types, which contains a complex set of rules for composing and performance. These rules, however, are open for individual interpretation by the composer and performer (Beken & Signell, 2006).

space. They had presented infants with short and long note durations accompanied by corresponding short and long worms. The infants readily learned to connect the relationship. To test whether or not this was arbitrary, they presented another group of babies with the same sets of tones and worms, yet they were reverse-paired. Those infants did not learn the connection, suggesting a cognitive relationship between auditory duration and visual length that could reveal a foundational link between the perception of sound and the representation of space.

Spelke's experiment looked at pitch contour in relation to space, in this case height. Rising or descending sequences of tones were matched with corresponding heights of objects, and then reverse pairs were shown to a different group of babies. Again, the infants learned the relationship with the congruent pairs but did not learn to match the incongruent pairs, showing a connection between melodic contours and positions in space. This study suggests that an inherent relationship exists between musical and spatial processing; both may serve as a foundation for an emergence of the positive relationship between music and mathematics.

Spatial skills & numerical skills: Comparisons with musical thinking

In order to probe further into the reasons for the link between the two domains in discussion, it may be helpful to look at how children's mathematical thinking develops. Children continually attempt to organize their world by finding patterns and creating structures (Gopnik, 2004). Mathematics is an activity of organization, of problem-solving. Organizing subject matter within reality must be accomplished according to mathematical patterns in order to find solutions (Freudenthal, 1991). Music-making also requires the organization of material, and like a mathematician, the musician seeks patterns, creates structures and solves problems (Pogonowski, 1987; du Sautoy, 2007).

In agreement with van Nes and de Lange (2007), one could define a pattern as a numerical or spatial regularity and the relationship between the elements of a pattern as its structure. These researchers give examples of spatial structures that young children would normally be familiar with such as the dot configurations on dice, beads on a necklace and block constructions. If sound is considered in terms of space and patterns, a musical piece is a spatial structure made up of patterns of sound. Additionally, its standard notation is in fact a spatial structure with patterns of curves, dots and lines.

Van Nes and de Lange (p. 217) suggest that the intertwinement of different components of early spatial sense may contribute to the development of children's number sense, the discernment of quantities and relationships between numbers. In parallel, since every sound in music is spatial in some form, whether it is rhythmic, melodic, harmonic or tonal, it can be attached to a number. All of these musical components are in a specific, measurable relationship to the others within its own category as well as between categories. An understanding of these spatial-temporal and numerical elements within a piece may at least contribute to an implicit understanding of the structure of a musical composition as well as the patterns within this structure. Therefore, these spatial-numerical connections within music may help explain the potential link between musical and mathematical understandings.

Once children can imagine a spatial or temporal structure, whether visually or aurally, of a certain number of objects or sounds that are to be maneuvered, the emerging number sense, which includes knowledge of quantities as well as counting, should be largely clarified and strengthened.

Certain musical pieces are particularly effective for encouraging spatial-temporal reasoning as well as counting and accurate quantity discernment. The song America, for instance (Bernstein & Sondheim, 1957) is in a mixed meter, with alternating 6/8 and 3/4 time signatures or rhythm patterns. It provides a good opportunity to teach and learn grouping and counting skills and to alert students to the role that rhythm can play in structure as well as in more intangible ways, such as emotional response. See Figure 1 below.

Figure 1.   Below the standard method of notation shown at the top are two ways to count the song "America." Though the underlying tempo and pulse remain constant, the accents (in bold) fall on different beats as reflected by the time signature of 6/8 3/4 and are thus grouped and counted accordingly. The top row of numbers is a standard way to count in line with the underlying eighth note (or quaver) pulses within this alternating time signature. The first measure (or bar) could also be counted as two large beats, each containing three small beats within (compound duple meter, or compound time). If considered in that way, one could count, "**1** ee uh, **2** ee uh, **1** &, **2** &, **3** &." The bottom row shows an alternate way to count which points out the accents and subsequent grouping structure that is accessible to those who are not familiar with standard notation. The top method of counting is appropriate primarily for those who are learning more complex rhythm notations. This musical example is effective for teaching pattern recognition as well as the skills of counting and keeping a steady beat while accentuating certain ones. The challenge of working with the alternating patterns here also provides an opportunity to develop executive cognitive functions such as sustained attention and cognitive flexibility.

1	2	3	**4**	5	6	**1**	&	**2**	&	**3**	&
1	2	3	**1**	2	3	**1**	2	**1**	2	**1**	2

Mathematical abilities such as ordering, comparing, generalizing and classifying are supported by an ability to grasp spatial structure (Waters, 2004; NCTM, 2010). More formal, complex operations such as addition, subtraction, multiplication and use of algebraic variables, also benefit from a solid foundation in spatial reasoning (Kieran, 2004; van Nes & de Lange, 2007). Recent research has shown that children with serious mathematical difficulties tend to use minimal levels of structure if at all (Mulligan, Mitchelmore & Prescott, 2005). Thus, it seems clear that improving spatial reasoning is important for mathematical development.

Music Education in the Schools

Music may indeed provide a method for assisting growth in the area of spatial-temporal reasoning and numerical ability as discussed. This suggests possibilities for a comprehensive education that includes an inter-disciplinary approach for the enhancement of spatial learning skills. It would not be appropriate to simply substitute music training for spatial awareness guidance in the classroom, but it appears to be potentially helpful as an educational supplement for improving children's mathematical understandings. A growing body of evidence, including Hetland's meta-analyses (2000b), confirms the assumption that students improve more in both near and far transfer domains through individual lessons and when learning standard notation. Yet revelations of improvement under all conditions are strong enough to encourage the inclusion of music education in schools regardless of the level of privacy or musical reading skill taught. This consideration motivates the research described below. Final results are still to be analyzed.

Design and Methods

Overall Design

In order to test if musical training would improve mathematical thinking and further, to test if differing pedagogical emphases on specific musical elements would enhance specific mathematical correlates, an original between-groups, pretest-treatment-posttest 3x2 multivariate design was created (see Figure 2 below). Additionally, the author wanted to see if there would be a different learning outcome if mathematical links were made explicit in the lessons. Consequently, there are two independent variables: *musical training* (with three levels that reflect emphases – rhythm, pitch or structure/form) and *mathematical content explicitness* (with two levels – explicit or implicit). There are four dependent variables as measured by standardized tests: 1) *musical ability*, 2) *mathematical skills* for Year 3, as well as two cognitive constructs considered to influence analytical mathematical thinking, which are 3) *spatial-temporal reasoning* and 4) *creativity*. The chart on the following page illustrates the research design.

Figure 2. Below is the research design in terms of groups and the pretest-treatment-posttest process.

Group 1 Measurement ☐ (Pretest)	Intervention ☐ (Rhythm - Explicit)	Group 1 Measurement (Posttest)
Group 2 Measurement ☐	Intervention ☐ (Rhythm - Implicit)	Group 2 Measurement
Group 3 Measurement ☐	Intervention ☐ (Pitch Relationships - Explicit)	Group 3 Measurement
Group 4 Measurement ☐	Intervention ☐ (Pitch Relationships - Implicit)	Group 4 Measurement
Group 5 Measurement ☐	Intervention ☐ (Structure/Form - Explicit)	Group 5 Measurement

Group 6 Measurement ☐	Intervention ☐ (Structure/Form - Implict)	Group 6 Measurement

Participants

Participants, ages 7-8 (Year 3) of low-mid socioeconomic levels, were chosen from five similar state-funded schools. Out of these five schools, six groups have been identified for this experiment. Two of the schools had two classes of ~30 each and two of the smaller schools were combined into one group Therefore, each group comprised a self-contained class except for one, which comprised the two smallest classes (Group N = 25-35).

Activities within groups

The same teacher taught and conducted activities for all groups for consistency, quality and internal validity. Activities were compatible with the English National Curriculum for music in the schools (2010). Lessons were videotaped periodically, with parental permission, as well as the children's consent, for additional validity, monitoring and reference purposes.

All children received weekly 40-minute group singing lessons with additional musical activities included; the activities varied slightly depending upon the specific group. The lessons consisted of vocal technique fundamentals, discussion of ideas (plus composing for structure group), learning/singing songs, playing percussion instruments (pitched or unpitched depending upon group) and some movement, thus building up to a repertoire of eleven pieces over the ~nine months of study. All activities mentioned here were not necessarily done in one lesson.

The basic curriculum was presented to the school and parents before the start of the program. All material was appropriate for this age group and featured music from around the world – the first piece was a greeting song, which included "hello" or "good day" in eight languages. The other ten songs were all from different countries (although the structure group composed one piece, thus technically having two from England). The repertoire was selected in order to broaden the children's musical (and thus cognitive), cultural and linguistic perspectives. This author also wanted to illustrate that any cognitive development beyond normal growth would not have been due to exposure to "western art" music in particular.

Nine of the eleven songs were the same for all groups in order to keep all factors as equal as possible. Yet, the arrangements, instrumental elements and/or class discussions of the pieces varied depending upon the musical emphasis for the group. The final two pieces for each group were of the same level of challenge as the corresponding non-identical songs of the other groups and were either arranged or discussed according to the musical emphasis of the group or were inherently relevant to the musical emphasis. For example, the melody groups learned a Swiss yodeling song, while the rhythm groups learned a Scottish jig-like song. Both are folk tunes of a similar level of difficulty, the first challenges melodic awareness with sudden leaps in pitch while the second challenges rhythmic awareness particularly when including corresponding clapping and knee bending in time to the beat.

The words and music of all songs were frequently illuminated on the classroom whiteboard while the pupils learned the pieces; two weeks before the concert, they were given the lyrics to take home for additional motivation and re-enforcement. At this point, many of the children had memorized most of the lyrics. At the concert, the students sang all eleven pieces from memory (or at least it appeared so for most), which was noted by two of the head teachers after their performances. Another head teacher noted the authenticity of different cultural representations, notably the African and Japanese pieces.

It is possible that memorization of lyrics may have aided in the children's cognitive development to the degree that certain mathematical questions on the posttests requiring memory may have improved. Thus, though beneficial to the children, the language component could be a confounding factor in this experiment. On the other hand, evidence showing this potential benefit could support the use of singing in school curricula. In addition to memorizing lyrics and learning words and/or phrases of other languages, the students also memorized the specific melodic and rhythmic patterns of the music itself as well as overall structural components. Therefore, it could be argued that whether or not lyrics are involved, memory development can be an additional benefit of musical training and another reason why the link in question exists since most mathematical computations utilize some degree of memory, often both long-term and working. One might assume that both the memorization of lyrics and the music itself may have improved the students' memory capacity and usability, and even though it would be difficult to identify to what degree each had an influence, particular mathematical questions that may have benefitted most from memory development will be noted in the analysis.

The songs selected were simple enough for children yet challenging enough to encourage growth as well as the state of "flow" (Csikszentmihalyi, 1988). Flow has been described as the mental state that arises when fully immersed in an activity. Custodero, 1998, describes this phenomenon as occurring while the balance of enjoyment and challenge is optimum.

Data collection and analysis

SAT tests had been administered at the end of the school year before the experiment (at the end of Key Stage 1) and again at the end of that school year; these will be included in the final analyses. Paired sample t-tests will be used when comparing pretests and posttests within each group and two-way independent analysis of variance (ANOVA) when comparing the groups to each other and exploring their interrelationships. Two-way independent ANOVA will be used because two independent variables are being measured and each of the different participants will be contributing one score to the data (different participants took part in all conditions). However, though the six groups have been matched as closely as possible within the natural schooling system, in order to control for initial differences between groups and to minimize confounds, analysis of covariance (ANCOVA) may be used.

Implications and Conclusion

Implications

This research addresses current objectives for children's scholastic success in mathematics, which often extends to science, while at the same time considering the development of the whole child in order to foster these goals. If it can be shown that musical training enhances logical thinking, policy-makers may consider retaining or even increasing music education in schools as suggested before. What if students' spatial-temporal, pattern-recognition and problem-solving abilities are indeed improved via music lessons, which in turn support

mathematical thinking? By seeking creative ways to help children learn and develop, we would be serving children's needs, academic and beyond, responsibly and potentially more successfully.

Conclusion

Both music and mathematics are a part of our individual and collective evolution. We begin to make sense of this world even in the womb via our mother's voice and respond particularly to her singing, regardless of culture (Nakata & Trehub, 2004). We also build neural networks that process the "statistical structure of experienced events" from birth (Goswami & Bryant, 2007). Hypotheses linking the two domains have existed for thousands of years (Burkert, 1972) and are reappearing now in the wake of new opportunities for studying the brain (Schlaug, 2001; Schlaug, Norton, Overy & Winner, 2004; Fujioka, Ross, Kakigi, Pantev, & Trainor, 2006; Posner, Rothbart, Sheese & Kieras, 2008).

This research seeks to build upon existing literature and gain concrete evidence through sound methodology in order to elucidate possible causality between musical training and mathematical thinking. More research is needed, but perhaps there is enough evidence in the meantime to strengthen the discourse regarding expansive ways to enhance the educational lives of children.

Abstract

The purpose of this research is to study whether the use of internet could be an effective method for elderly people to cope with the loneliness. In the screening study based on the relationship model, a total of 569 elderly individuals were included. The obtained results showed that higher levels of loneliness in elderly people living alone, more than the elderly using the internet, such as more use of social networks, higher education level concluded that the increase in internet usage and decreased loneliness. In general it could be stated that use of internet has an important place among methods used in dealing with loneliness of mature and adult individuals.

Keywords: Elderly, loneliness, coping, use of the internet.

Introduction

The factors affecting life quality of old age are generally seen to be related with health. Being healthy may be defined as the complete well-being of individuals physically, mentally and emotionally (Danna & Griffin, 1999). The fact that old individuals perceive life quality positively or negatively depends partially on their subjective interpretations and partially on the real events they experience (Xavier, Ferraz, Marc, Escosteguy, & Moriguchi, 2003). One of the most important structures which affect the life quality of old people is loneliness. Loneliness is the situation in which the individual feels not understood and lonely (Geçtan, 1999); an unpleasant mood experienced as a result of the difference between the current social relations and desired social relations (Pepleu and Perlman, 1981); a situation in which there are the social relations needed by the individual or different social relations, however which relations do not include intimacy, sincerity and emotiveness (Weiss, 1973). According to Young (1982), loneliness is the lack of satisfying social relations or psychological stress accompanying this lack. Loneliness is affected by subjective lives of old individuals related with incomplete, secret and social needs (Peplau & Perlman, 1982).

There are two types of loneliness experienced by the old people: social and emotional loneliness (DiTommaso & Spinner, 1997). Especially old people experience emotional loneliness more intensively (Solomon & Greenberg, 2000) and emotional loneliness is a strong predictor which affects life quality when compared with social loneliness (Salimi, 2011) Social loneliness is mostly related with aging, health problems, living in the country, low communication with friends, reducing of incomes and restriction in movements while emotional loneliness is mostly related with familial status, getting divorced or never marrying, restricted visits of children and living alone (Drennan et al, 2008).

There are many factors which affect the appearance of loneliness in old people. In the studies, low social communication, factors which result from physical and demographical conditions and which affect the

individual psychologically (Hawkley & Cacioppo, 2007), living alone, having low social communication, experiencing intensive sadness, not being visited by especially friends and siblings (Adams et al, 2004; Dugan & Kivett, 1994), loss of spouse (Yell & Lo, 2004), being divorced (De Jong-Gierveld, 1987), aging, low education level (Pinquart & Sorensen, 2001; Ernst & Cacioppo, 1999; Hazer & Boylu, 2010), being physically disabled, using drugs permanently and not having any hobbies (Arslantaş & Ergin, 2011), being deprived of social support (Drageset, Kirkevold & Espehaug, 2011), physical inactivity, various illnesses, loss of a relative, physical and mental weaknesses and reducing of incomes (Fokkema & Knipscheer, 2007), living away from sons and daughters and neighbors (Chalise, Saito, Takahashi & Kai, 2007), low self-respect, not being content with the living space and being completely dependent on others in daily activities (Hacihasanoglu, Yıldırım & Karakurt, 2012) increase loneliness in old people.

Loneliness feeling in old people brings about some psychological problems. These are high level of anxiety (Fees, Martin & Poon,1999), low self-esteem (Van Baarsen (2002), low self-respect (McWhirter, 1990), low self-sufficiency (Fry & Debats, 2002), tiredness, lack of purpose, depression, insignificancy thoughts (Luo, Hawkley, Waite , & Cacioppo, 2012), self-pity and social dissonance (Joiner, Thomas, Peter, Seeley & John,2002; Baker & Bugay,2011), sleep and anxiety disorder (Heinrich & Gullone, 2006), hopelessness, thought and attempt of suicide (Schinka, Dulmen, Bossarte & Swahn, 2012; Chang, Sanna, Hirsch & Jeglic, 2010), thought of death, withdrawing from social interaction (Ayalon & Shiovitz, 2011), social harmony difficulty (Duru, 2008).

Many methods can be used in old people to deal with feeling of loneliness. One of these methods is using computer and internet. Using computer and internet is an efficient way to increase potential of friendship and social interaction and decreasing negative feelings related with loneliness. Obtaining reliable information from internet via e-mail or other channels, participating in various friendship groups contribute to making the lives of old people more efficient (Kiel, 2005). When the researches are analyzed, it is seen that the individuals who access social network facebook page most are the ones who are the loneliest (Ryan & Xenos, 2011), old individuals experiencing loneliness problem use internet and e-mail more than the ones who do not, they get more emotional support via this method, their loneliness decreases and their life satisfaction increases through their online friendships (Martin & Schumacher, 2003), there is a negative relation between internet use and loneliness, as level of internet use increases, loneliness level decreases (Bond, Burr, Wolf, & Feldt, 2010; Carpenter & Buday, 2007) in a study on internet use, life quality and loneliness, the loneliness level of the ones who use internet decreases when compared to the ones do not and their life qualities decreases (Blazun, Saranto & Rissanen, 2012).

In a research by Turkey Geriatrics and Technologies Foundation (TUYEV) , it was found that 14% of the old people in Turkey use computer and internet, 49% of them use internet for e-mail, 44% for research, 37% to follow the news (**www.tuyev.org/haber/index.05.01.2011**); it was concluded that 87,9% of college graduates and 87,2% of faculty or higher education graduates use internet (TUİK, Turkish Households Science Technologies Use Survey, 2008). Although these rates are low, using internet as a method to deal with loneliness may be proper.

Purpose

General purpose of this paper is to determine whether internet use is efficient or not in dealing with old-age loneliness problem. To this end, answers were sought for the following questions.

Sub-Cases

Following sub-cases will be used in order to achieve the general purpose defined above.

Does loneliness level differ according to using or not using computer in old people?

Do computer use and loneliness level differ according to education level in old people?

Do computer use and loneliness level differ according to age?

Method

Participants

563 people in total, 369 of who applied to different services in Sakarya State Hospital between 10.01.2012 and 25.03.2012 and 194 of who stay in Nursing Home in provinces of Kayseri and Sakarya were taken as sample in the study which is based on relational scanning model.

Table 1. Data on the sample of the research

Internet	Gender		Total
	Male	Female	
User	185	88	273
Non-User	165	125	290
			563

Used Scale

The UCLA Loneliness Scale Short Form (ULS-8): It was developed by Russell, Peplau and Ferguson and was re-ordered in 1980 (Russell, Peplau & Cutrano, 1980). Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), criterion-related validity and internal consistency were tested. Exploratory Factor Analysis (EFA) yielded one factor accounting for 36.69% of the total variance. Confirmatory factor analysis was performed in order to verify the previously identified one factor structure of the scale obtained by the initial EFA in a sample of Turkish university students. CFA revealed that the one factor structure of the scale had a reasonably satisfactory goodness of fit. The relationship between perceived social support, social emotional loneliness and depression were examined for criterion-related validity of the scale. The ULS-8 had a positive correlation with social-emotional loneliness and depression and a significantly negative correlation with perceived social support. The correlation between ULS-8 and the UCLA Loneliness Scale was .88 (p<.001). The internal consistency of the scale was good with a Cronbach's Alpha of .72. It is a scale made of 8 items of which 6 are direct and the other 2 are reverse coded. In each item of the scale, a circumstance that states a sense or a thought about the social relation is presented and the individuals are asked to state how often they meet this circumstance, on a four point Likert scale. Higher score are accepted as a sign of loneliness that is met very occasionally. In Turkey, the validity and reliability study of the UCLA Loneliness Scale was completed by Doğan, Çötok ve Tekin (2011).

Analysis of Data

Descriptive statistics and correlation analysis with the purpose of to determine the relation between the variables were applied to the data obtained in the research and t test was made in paired comparisons. Statistical analysis was carried out using SPSS 10 program.

Findings

Hypothesis 1 - Does loneliness level differ according to using or not using computer in old people?

Table 2. Mean scores, standard deviation, t test and significance level of loneliness levels according to using or not using computer in old people

	Internet	N	Mean	St.dv.	t	P
	Use	273	17,11	2,21		
Loneliness					-9,36	.001
	Don't Use	290	20,39	4,41		

In Table 2, data on mean score, standard deviation, t test and significance level of loneliness levels of individuals who use and do not use internet in old people are given. As a result of the significance test (t-test) of the difference between two mean scores, the difference was found significant. Accordingly, the loneliness levels of old people who do not use internet are higher than those who do.

Hypothesis 2-Do computer use and loneliness level differ according to education level in old people?

Table 3. Mean scores, standard deviation, t test and significance levels of loneliness levels according to education level and internet use in old people

Education Level		Internet	N	X	St.dv.	t	P
		Use	96	19,20	2.20	-3,12	.001
	Loneliness						
Primary		Don't Use	169	23,18	4.54		
		Use	103	16,45	2,37	6.56	.000
Secondary	Loneliness						
		Don't Use	83	20,18	4,23		
		Use	74	13,24	2,20	-4.47	.001
High School or Higher	Loneliness						
		Don't Use	38	16,54	3,91		

In Table 3, data on internet use and loneliness levels according to education level are given. When the results are examined, it is concluded that as the education level increases, internet use also does and loneliness level decreases; the loneliness levels of those who do use internet are significantly lower than those who don't according to education levels.

Hypothesis 3-Do computer use and loneliness level differ according to age?

Table 4. Mean scores, standard deviation, t test and significance levels of loneliness levels according to age level and internet use in old people

Age	Internet		N	X	St.dv.	t	P
		Use	201	16.79	1.91		.001
	Loneliness					5.25	
55-60		Don't Use	89	19.20	4.20		
		Use	111	17.22	2.23	3.49	
61-65	Loneliness						.001
		Don't Use	75	20.24	5.06		
		Use	28	19.84	3.26		
66+	Loneliness					1.76	.085
		Don't Use	59	21.93	3.73		

In Table 4, data on internet use and loneliness levels according to age level are given. In the table, it is concluded that loneliness generally increases with age, internet use is the highest between ages of 55 and 65, the loneliness levels of the internet users of the individuals of 55-60 and 61-55 are significantly lower than those who don't according to the result of t test analysis and the difference between the individuals who use and do not use internet is not significant at the age of 66 and over.

Conclusions and Discussion

According to the findings obtained in the research, it was concluded that old people using internet have lower loneliness levels than those who don't; as the education level increases, internet use also does and loneliness level decreases; loneliness level increases with age and the group who uses internet most is the age range of 55-65.

According to the result of the research, old people using internet generally have lower loneliness levels than those who don't. This result proves that internet use is an efficient method to deal with loneliness in old people. In the related researches it was found that there is a negative relation between internet use and loneliness, as internet use increases, loneliness level decreases Bond, Burr, Wolf, & Feldt, 2010; Carpenter & Buday, 2007); obtaining reliable information from internet via e-mail or other channels and participating in various friendship groups contribute to making the lives of old people more efficient (Kiel, 2005), old individuals experiencing loneliness problem use internet and e-mail more than the ones who don't, they get more emotional support via this method, their loneliness decreases and their life satisfaction increases through their online friendships (Martin & Schumacher, 2003), in an experimental study on internet use, life quality and loneliness, the loneliness level of the experiment group who uses internet decreases when compared to the experiment group

who does not and their life qualities increase (Blazun, Saranto & Rissanen, 2012). Related literature supports the obtained result.

In the research, it is seen that as the education level increases, internet use also does and loneliness level decreases in old people. Using computer and internet requires a certain level of education. Having a high education level increases the desire to learn and communicate with other people. This situation helps the individual to be more active and deal with loneliness problem. When the researches are examined, it is seen that desire to learn increases computer and internet use and therefore negative emotions related with loneliness decrease as a result of the increase in friendship potential and social interaction (Kıel, 2005), as the education level increases, loneliness decreases (Pinquart & Sorensen, 2001; Ernst & Cacioppo, 1999; Hazer & Boylu, 2010).

According to the result of the research, loneliness increases with age and the one who use computer and internet most are the individuals at the age of 55-65. Separating from friends, children or neighbors, economic problems, various illnesses, living depending on other people, physical inabilities and lack of many things increase with the aging. This condition naturally brings about the loneliness problem in the old people. Researches prove that aging is the biggest factor in the occurrence of loneliness (Pinquart & Sorensen, 2001; Ernst & Cacioppo, 1999; Hazer & Boylu, 2010).

As a result, when the results and literature information are examined, they prove that internet use is an efficient method to deal with loneliness in old people. Based on these results, providing trainings and necessary opportunities for computer and internet use would be beneficial in increasing the skills of old people to deal with loneliness.

KAYNAKÇA YAZIM STANDARTLARI VE KULLANILABILECEK YAZILIMLAR

Abidin ARPACI

Sakarya Üniversitesi, BÖTE ABD- Uzaktan Eğitim Dalı YL Öğrencisi, Türkiye

abidinarpaci@gmail.com

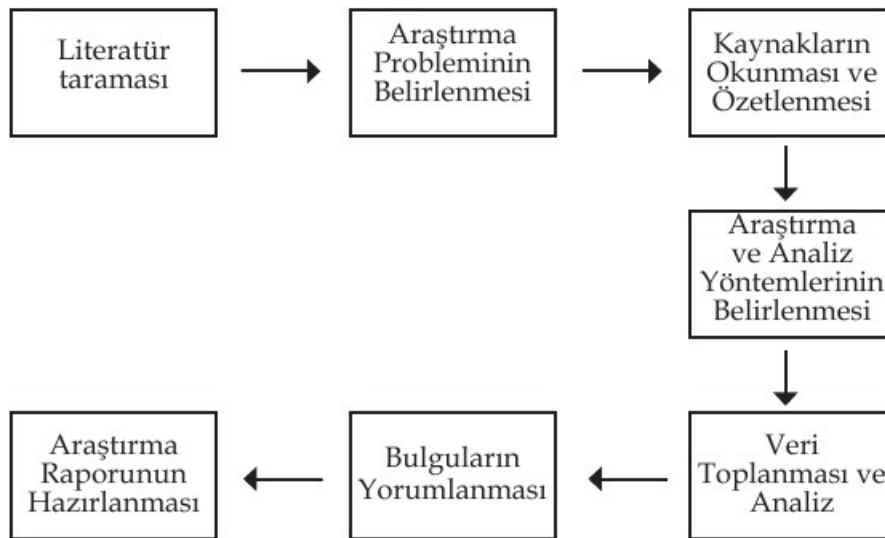
Özet

Bilimsel çalışmalarda kaynakça hazırlama, alıntı yapma, biçimsel özellikler vb. işlemler için birçok standart geliştirilmiştir. Bu standartlara uygun bir doküman hazırlamak bilimsel çalışmalar için bir zorunluluktur. Fakat bu standartlara uygun bir doküman hazırlamak çoğu zaman yorucu bir çalışma gerektirmektedir. İşte bu noktada bilgisayar yazılımları devreye girmekte ve bu tür çalışmalarda iş yükünü azaltmaktadırlar.

Bu çalışmada ilk olarak geliştirilen yazım standartları hakkında genel bir bilgi verilmektedir. Daha sonra bu alanda kullanılabilecek yazılımların neler olduğu, benzerlikleri ve farklılıklarına değinilmektedir. Son olarak bu yazılımlar içerisinden ücretsiz olarak sunulan Zotero isimli yazılımın kullanıma dair bilgi verilmektedir.

Anahtar Kelimeler: Yazım Kuralları, Kaynakça, Bibliyografya, Referans Yazılımları, Zotero

Giriş

Aşağıda Şekil 1'de gösterildiği gibi bilimsel araştırmalarda belli bir süreç izlenir. Bu sürecin ilk adımı konumuz hakkında daha önce yazılmış eserleri araştırmaktır. Literatür taraması olarak adlandırdığımız bu aşamayı internet üzerinden akademik veritabanlarında veya arama motorlarında gerçekleştirebileceğimiz gibi kütüphanelerden de yararlanabiliriz. Bu önemli aşamada çalışmamızın özgün olup olmadığını belirleyebilir ve çalışmamızın alanı hakkında detaylı birçok bilgiye ulaşabiliriz.


Şekil 1. Bilimsel Araştırma Süreci (Bailey, 1987)

Literatür taraması sonucu ulaştığımız kaynaklardan alıntı yapmışsak bu kaynakları bilimsel araştırma sürecinin son aşamasında (araştırma raporunun hazırlanması) belirtmemiz gerekir. Bunu yapmadığımız takdirde intihal (plagiarism) yapmış oluruz. Bu bir tür hırsızlıktır. Etik olarak hoş bir davranış değildir. Ayrıca dersten kalmak, üniversiteden atılmak ve meslekten ihraç gibi birçok olumsuz duruma yol açabilir.

Aşağıda listelenen durumlarda ise alıntılarda referans göstermeye gerek yoktur: (Şencan 2002, s. 586)

Herkesçe bilinen, herkesçe tekrarlanan terimler.

Üzerinde çok konuşulmuş ve yazılmış bulgular.

Sözlük, ansiklopedi, el kitabı bilgilerindeki anonim yazılar.

Orijinalliği olmayan gözlem ve fikirler.

Telif hakkı koruması bitmiş eserler.

Kamuoyuna açık, genel bilgiler.

Atasözleri, deyişler.

Araştırma raporunu hazırlarken belirli yazım kurallarına uymamız gerekir. Dünya çapında yaygın olarak kullanılan yazım kuralları olmakla birlikte kullanacağımız yazım kuralı araştırmamızı yayınlayacağımız kurum tarafından belirtilir. Bu nedenle çalışmalarımızı birden fazla dergide yayınlayacaksak biçimsel olarak tekrar elden geçirmemiz gerekebilir. Çünkü bu kurallar kurumdan kuruma değişebilir.

Günümüzde birçok esere elektronik ortamda ulaşabilmekteyiz. Bu eserlerin bir kısmı herkesin kullanımına açıkken bir kısmı genelde abonelik sistemi ile çalışan belirli bir ücret karşılığı yayınlara ulaşma imkanı tanıyan elektronik veritabanlarından oluşmaktadır. Örneğin ERIC (Educational Resource Information Center) veritabanı ile eğitim alanına yönelik birçok yayına ulaşabilmekteyiz. Ulaştığımız eserleri bilgisayarımıza kaydetme ve alıntı yapma noktasında yardımcı olacak birçok yazılım geliştirilmiştir. Bu yazılımların çoğunluğu ücretli olmakla beraber ücretsiz yazılımlarda bulunmaktadır.

Bu makalede ilk olarak yaygın yazım kuralları hakkında bilgi verilecek, kullanılabilecek yazılımlar tanıtılacak ve ücretsiz olarak sunulan Zotero yazılımının kullanımı hakkında bilgi verilecektir.

1.Yaygın Kullanılan Yazım Standartları

1.1. APA

APA, American Psychological Association (Amerikan Psikoloji Birliği) kelimelerinin bas harflerinin kısaltmasıdır. APA, Amerika Birleşik Devletlerinde psikoloji çalışmalarını temsil eden bilimsel ve profesyonel bir dernektir.

APA formatı APA tarafından belirlenmiş bir makale ve bilimsel yayın yazı formatıdır. Bu format bilimsel çalışmaların raporlaştırılmasında ya da yayınlanmasında ortak bir biçim kullanılmasını sağlar. Böylelikle inceleme ve değerlendirmede bir kolaylık getirmektedir. Temel olarak dergilerde yayınlanacak makalelerin biçimsel ve içeriksel yapısını belirtmek için geliştirilmiştir. İlk olarak 1929 yılında birinci sürümü basılan APA yazım kılavuzu 2010 yılında 6. sürümü yayınlanmıştır. APA yazılım kılavuzu resmi web sitesi olan http://www.apastyle.org/ adresinden APA yazım kuralları hakkında detaylı bilgiye ulaşabilirsiniz.

1.2. MLA

MLA, Modern Language Association (Modern Dil Derneği) kelimelerinin bas harflerinin kısaltmasıdır. 1883 yılında kurulan dernek günümüzde 100 den fazla ülkede yaklaşık 30 000 üyeye sahiptir. Dernek hakkında detaylı bilgi için derneğin resmi web sitesi olan http://www.mla.org/ adresini ziyaret edebilirsiniz.

MLA tarafından geliştirilen yazım kuralları edebiyat, sanat ve dil alanlarında yoğun bir şekilde kullanılmaktadır. MLA yazım kuralları hakkında detaylı bilgiye ulaşmak için Purdue üniversitesi tarafından hazırlanmış web sitesini http://owl.english.purdue.edu/owl/resource/747/01/ ziyaret edebilirsiniz.

1.3. CMS

CMS, Chicago Manual of Style kelimelerinin bas harflerinin kısaltmasıdır. İlk olarak 1906 yılında University of Chicago Press tarafından yayınlanmış yaklaşık 200 sayfalık bir kılavuzdu. Kılavuzun en son sürümü olan 16. sürümü 2010 yılında yayınlanmıştır.

Son yıllara kadar bilimsel çalışmalarda yoğun bir şekilde kullanılmış olan CMS günümüzde bu etkinliğini git gide yitirmektedir. Bununla birlikte gazete ve dergilerde hâlâ önemli oranda CMS yazım kuralları dikkate alınmaktadır. CMS hakkında detaylı bilgiye ulaşmak için resmi web sitesini http://www.chicagomanualofstyle.org ziyaret edebilirsiniz. CMS yazım kuralları hakkında detaylı bilgiye ulaşmak için Purdue üniversitesi tarafından hazırlanmış web http://owl.english.purdue.edu/owl/resource/717/01/ ziyaret edebilirsiniz

Yukarıda değinilen APA, MLA ve CMS yazım standartları arasında genel bir karşılaştırma için http://owl.english.purdue.edu//media/pdf/20110928111055_949.pdf sayfasını ziyaret edebilirsiniz.

Yukarıda bahsedilen yazım standartlarına ek olarak birçok yazım standardı bulunmaktadır. Genelde birçok kurum yaygın yazım standartlarını temel alarak kendi yazım standartlarını geliştirmişlerdir. Bütün bu yazım standartlarını bilmeniz elbette mümkün değildir. Hazırladığınız bir bilimsel araştırma raporunu farklı yazım kurallarına uygun olarak elden geçirmeniz gerekebilir. İşte bu nokta bilgisayar yazılımları sizin en büyük yardımcınız olacaktır. Şimdi bu alanda size yardımcı olabilecek yazılımlara bir göz gezdirelim.

2.Kullanılabilecek Yazılımlar

Günümüzde literatür taramasında ve araştırma raporunun hazırlanması işlemlerine yardımcı olabilecek bir çok yazılım bulunmaktadır. Bu tür yazılımlar genel olarak referans yönetim yazılımları (Reference Management Software) veya bibliyografya yazılımları olarak adlandırılmaktadırlar. Bu tür yazılımlar sayesinde internet üzerinde ulaştığımız kaynakları kolaylıkla kaydedebilir, sınıflandırabilir, alıntı yapabilir, koruyabilir, otomatik kaynakça oluşturabilir, dosyalarımızı yedekleyebilir ve hatta bunları paylaşabiliriz.

Hangi yazılımı kullanacağınıza karar vermek için belli sorulara cevap vermemiz gerekir. Kullanacağımız yazılım ücretlimi olacak ücretsiz mi? Kullandığımız işletim sisteminde (Windows, Macos, Linux vb.) çalışabilecek mi? Kullanacağımız yazım standartlarını (APA, MLA, CMS vb.) destekliyor mu? Kullandığımız elektronik veritabanlarından bilgi aktarabiliyor muyuz? Vb. soruları cevapladıktan sonra size en uygun yazılımı bulabilirsiniz.

İnternet üzerinden yayın yapan özgür ansiklopedi Wikipedia sitesinin Comparison of reference management software (Referans yönetim yazılımlarının karşılaştırılması) başlıklı sayfasında, bu alanda yer alan yazılımlar detaylı olarak karşılaştırılmıştır. Bu sayfada yer alan bilgiler ve yönlendirmeler sayesinde birçok sorunuzun yanıtını bulabilirsiniz. http://en.wikipedia.org/wiki/Comparison_of_reference_management_software adresini tıklayarak belirtilen sayfayı görüntüleyebilirsiniz. Örneğin bu alanda tüm işletim sistemlerini destekleyen bir yazılım kullanmak istiyorsak bu sayfada yer alan ve aşağıda Şekil 2'dede gösterilen tablo aracılığı ile bu yazılımların hangileri olduğunu görebiliriz. Belirtilen tabloya bakarak Zotero isimli programın yaygın kullanılan tüm işletim sistemlerinde kullanabileceğimizi rahatlıkla söyleyebiliriz.

Ek olarak internet üzerinden bu tür yazılımların web sitelerini ziyaret ederek veya bu tür yazılımları inceleyen sitelere göz atarak belirlediğiniz soruları cevaplandırabilirsiniz. Örneğin bu alanda yoğun bir şekilde kullanılan EndNote, RefWorks, Zotero ve Mendeley yazılımlarının http://libguides.mit.edu/content.php?pid=55486&sid=427307 adresinden ayrıntılı bir karşılaştırmasını bulabilirsiniz.

Birçok üniversite bu alanda ücretli olarak sunulan yazılımları veya web servislerini satın almakta, eğitim kadrosuna ve öğrencilerine ücretsiz olarak sunmaktadırlar. Üniversiteler anlaşma yaptığı elektronik veritabanlarına uyumlu yazılımları tercih ederek kullanıcıların bu kaynaklardan rahatlıkla faydalanmasını sağlamaktadırlar.

Örneğin Marmara Üniversitesi web tabanlı bir yazılım olan EndNote ile lisans anlaşması yapmıştır. Bu antlaşma çerçevesinde öğrencileri bu yazılımdan ücretsiz olarak faydalanabilmektedirler. Üniversite öğrencileri http://bilisim.marmara.edu.tr/icerik/endnote.php web sayfasını kullanarak yazılım hakkında detaylı bilgiye ulaşabilmektedirler. Sizlerde bu tarz bir yazılım kullanmadan önce kurumuzun böyle bir yazılım antlaşması olup olmadığını araştırınız.

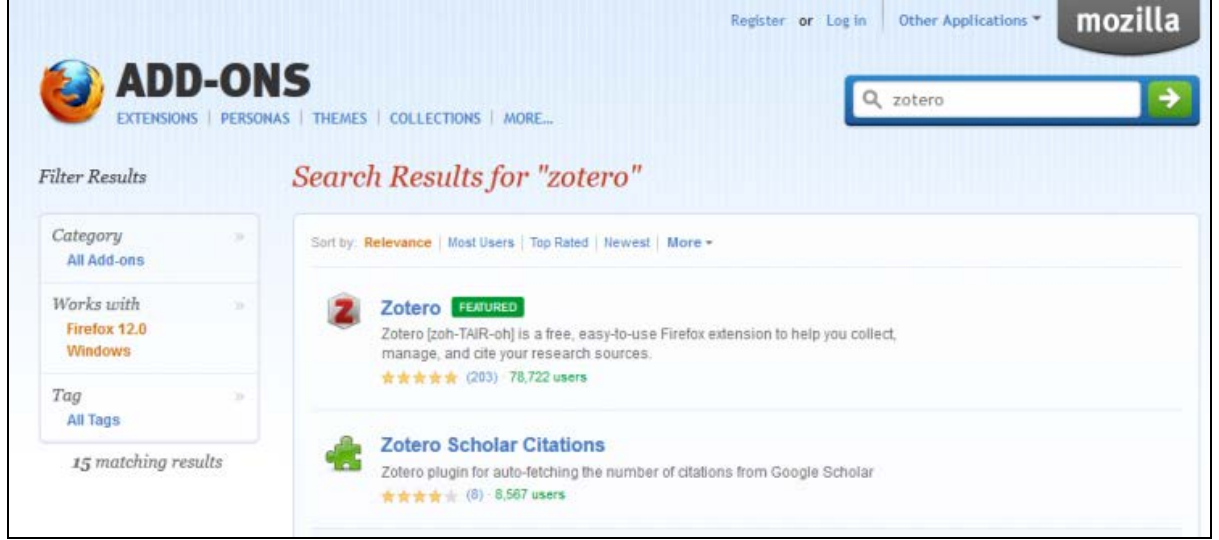
Şekil 2. Desteklenen İşletim Sistemleri

3.Zotero

Zotero literatür taramasında ve araştırma raporunun hazırlanması işlemlerinde yardımcı olabilecek ücretsiz, açık kaynak kodlu ve yaygın kullanılan tüm işletim sistemlerinde çalışan bir referans yönetim yazılımıdır. Bu yazılım sayesinde internet üzerinde ulaştığımız kaynakları kaydedebilir, gruplandırabilir, kullandığımız diğer cihazlar arasında eşleştirebilir, kolaylıkla alıntı yapabilir, kaynakça oluşturabiliriz. Hatta kendi yazım kuralımızı geliştirebilir ve bu yazılım içerisinde kullanabiliriz.

Zotero yazılımını internet tarayıcınız (Firefox, Chrome ve Safari) ile bir arada rahatlıkla kullanabilirsiniz. Örneğin Zotero yazılımı Mozilla Firefox web tarayıcısına bir eklenti olarak kurulabilmektedir. Şekil 3'de görüleceği üzere Mozilla Firefox eklentiler (Add-Ons) sayfasından arama kutucuğuna Zotero yazdığımızda ilk sırada Zotero programının kurulumu için gerekli eklentiye ulaşabilmekteyiz.

Zotero yazılımını kelime işlemci yazılımları ile birlikte kullanabilirsiniz. Zotero Microsoft Word ve Open Office ve Libre Office yazılımları ile arada kullanabilmektedir.

Zotero yazılımı hakkında daha detaylı bilgiye resmi web sitesi olan http://www.zotero.org adresinden ulaşabilirsiniz.


Şekil 3. Mozilla Firefox Eklentiler Sayfası

3.1. Nerden Temin Ederim

Zotero yazılımının en son sürümü olan Zotero 3.0.7 http://www.zotero.org adresinden download sayfasına tıklayarak ulaşabilirsiniz. Bu sayfada Zotero yazılımının tek başına çalışan (Standalone) Windows, Linux ve Mac OS X sürümlerini indirebileceğiniz gibi Mozilla Firefox tarayıcısına eklentisini de indirebilirsiniz. Yine bu sayfadan Microsoft Word ve Open Office ve Libre Office yazılım paketleri ile bir arada kullanabilmeniz için gerekli dosyalara erişebilirsiniz.

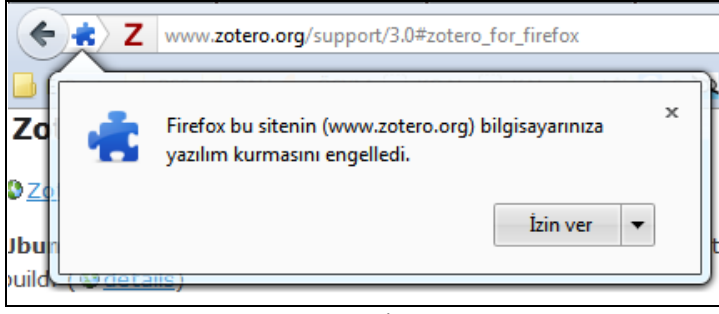
Zotero yazılımının boyutları kullanacağınız sürüme göre değişmektedir. Örneğin Windows sürümü 17.3 MB , Mac OS X sürümü 32.4 MB ve Firefox eklenti sürümü ise yaklaşık 3.6 MB boyutundadır.

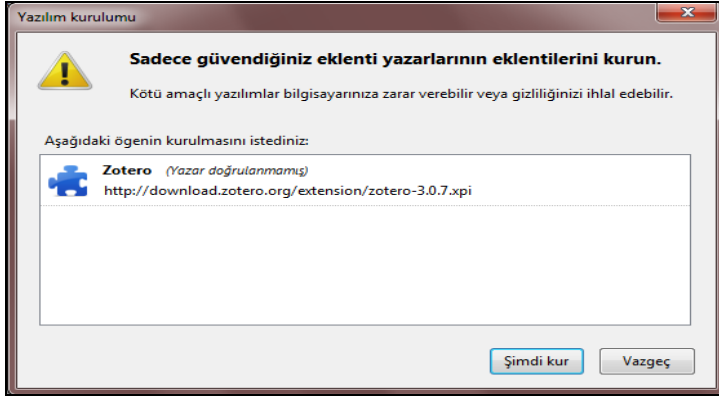
Zotero yazılımını birçok dili desteklemektedir. Örneğin Zotero yazılımını Türkçe olarak kullanmak isterseniz gerekli olan dil dosyasını https://www.transifex.net/projects/p/zotero/ adresinden temin edebilirsiniz.

3.2. Nasıl Kurarım

Bu makalede Mozilla Firefox yazılımına nasıl kurulacağı ve çalıştırılacağı üzerinde durulacaktır.

Zotero indirme (download) sayfasından Mozilla Firefox eklentisi bağlantısına tıkladığımızda Mozilla Firefox yazılımı Şekil 4'de görüleceği bizi uyaracaktır. Bu ekrandan *İzin Ver* butonuna tıkladığımızda Zotero eklentisi bilgisayarımıza indirilecektir. Daha sonra Şekil 5'de gösterilen *Yazılım kurulumu* başlıklı bir pencere ekrana gelecektir. Bu pencereden *Şimdi kur* butonuna tıklayarak Zotero yazılımının Mozilla Firefox tarayıcısına yükleyebiliriz. Kurulum tamamlandıktan sonra Mozilla Firefox tarayıcısını yeniden başlattıktan sonra Zotero

yazılımını kullanabilirsiniz. Zotero yazılımı Mozilla Firefox tarayıcısı çalıştığı andan itibaren çalışmaya başlayacaktır. Ayrıca çalıştırmanıza gerek yoktur.


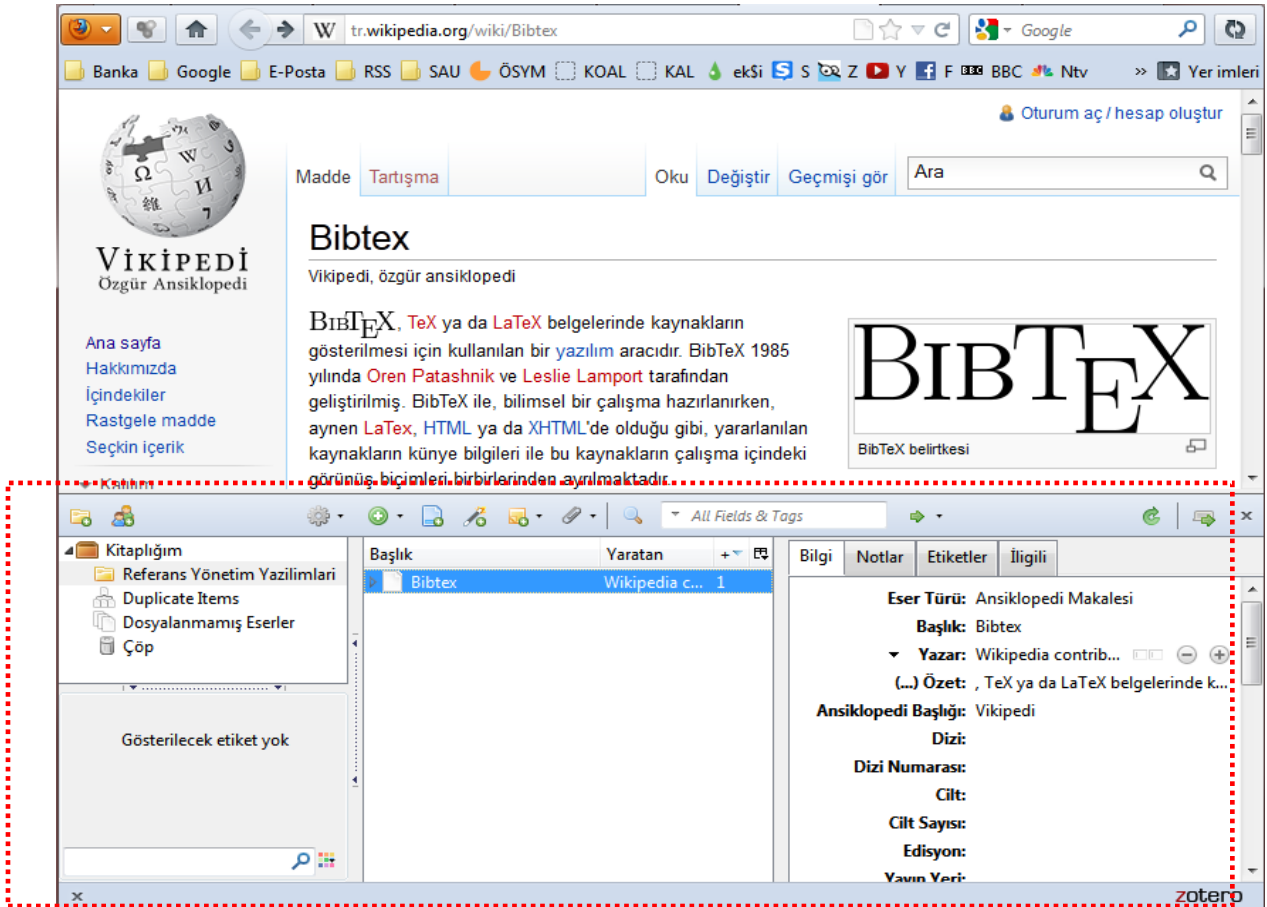
Şekil 4. Mozilla Firefox Eklenti Kurulumu İzin Ekranı


Şekil 5. Mozilla Firefox Yazılım Kurulumu Penceresi

3.3. Nasıl Kullanabilirim

Mozilla Firefox tarayıcısına Zotero yazılımını kurduktan sonra Şekil 6'da kırmızı oklarla belirtilen alanlarda görüleceği üzere tarayıcı ekranın en altında Zotero *eklenti çubuğu* ve adres yazım alanın sağında ise ufak bir sayfa simgesi yer alacaktır. Eklenti çubuğunun en sağında yer alan Zotero simgesine tıkladığımızda Zotero programının ara yüzü ekrana gelmektedir. Adres yazım alanın sağında bulunan simge ise görüntülenen sayfada yer alan dosyaları Zotero ya kaydetmenize imkân tanımaktadır. Bu simge üzerine geldiğimizde Zotero'ya kaydet mesajı görüntülenir.

Şekil 6. Zotero Eklentisi Kurulduktan Sonra Mozilla Firefox Ekranı

Zotero yazılımını rahat kullanabilmeniz için ara yüzü (GUI) hakkında bilgi edinmeniz gerekir. Şimdi Zotero yazılımının ara yüzü tanıyalım. Ara yüzü ekrana getirmek için Zotero eklenti çubuğunun en sağında yer alan Zotero simgesine tıklayalım. Şekil 7'de kırmızı çerçeve ile gösterilen alan Zotero programının ara yüzüdür. Ara yüzün üç sütundan oluştuğunu ve bu sütunların üzerinde ise bir araç çubuğunun yer aldığını görmekteyiz.


Şekil 7. Zotero Programı Ara Yüzü (GUI)

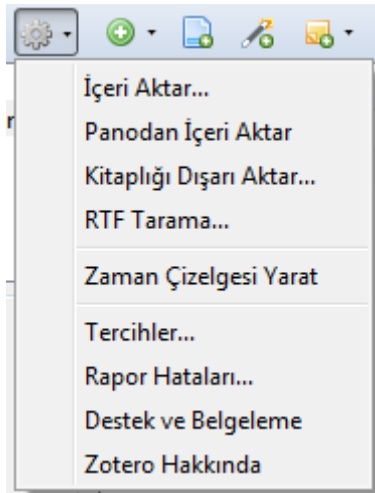
İlk olarak Şekil 8'de gösterilen Zotero ara yüzünün en üstünde yer alan simgeleri ele alalım.
Şekil 8. Zotero Programı Ara Yüzü Araç Çubuğu

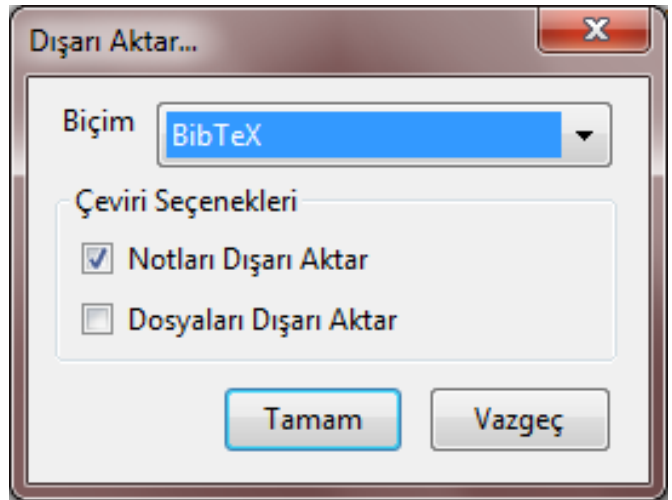
1 Nolu Simge (Yeni Derme) : Zotero programında çalışmalarımızı klasörlere ayırarak gruplandırabiliriz. Bu farklı alanlarda yaptığımız çalışmaları daha rahat yönetmemize imkân tanır. 1 nolu simge Yeni Derme olarak adlandırılmıştır. Bu simgeye tıkladığımızda bizden oluşturacağımız yeni derme için bir isim vermemizi isteyecektir. Dermeleri klasör olarak düşünebiliriz. Bu klasör içerisine çalışmamıza ait belgeleri kaydedebiliriz.

Örneğin *"BlackBox"* isimli bilgisayarımda Zotero aracılığı ile kaydettiğim dosyalar C:\Users\BlackBox\AppData\Roaming\Mozilla\Firefox\Profiles\chrch0pi.default\ klasörü içerisinde yer alan \zotero\storage\ alt klasörlerinde saklanmaktadır. Kayıt yolunu isterseniz değiştirebilirsiniz.

2 Nolu Simge (Yeni Grup) : Bir grubun üyesi olarak çalışma yürütüyorsanız grup oluşturabilir ve grup üyeleri arası veri alış verişi yapabilirsiniz. Bu simgeyi kullanabilmeniz için http://www.zotero.org web sitesinden bir hesap oluşturmanız gerekir. http://www.zotero.org sitesi üzerinden ücretsiz olarak hesap oluşturabileceğiniz gibi paralı hesap satın alabilirsiniz. Ücretsiz hesapları kullanımı için 100 MB alan tahsis edilmiştir. Ek alana ihtiyaç duyduğunuzda ücret ödemeniz gerekmektedir. Örneğin yıllık 1 GB alan için 20 $ ücret talep edilmektedir. Detaylı bilgi için http://www.zotero.org/support/storage sitesini göz gezdirebilirsiniz.

3 Nolu Simge (Olaylar) : Şekil 9-a'da görüldüğü gibi olaylar simgesini tıkladığımızda aşağı doğru bir menü açılmaktadır. Bu menü aracılığı birçok işlem yapılabilmektedir. Örneğin kitaplığımızda yer alan eserleri Bibtex formatında dışarı aktarmak istiyorsak Şekil 9-b 'de gösterildiği gibi Kitaplığı Dışarı Aktar… seçeneğini tıklayabiliriz.

Yine programımızla ilgili detaylı birçok ayarı değiştirmek istiyorsak Tercihler seçeneğini tıklayabiliriz. Örneğin dosyalarımızın kaydedildiği klasörün yolunu değiştirmek istiyorsak Tercihler seçeneğini tıkladıktan sonra karşımıza gelen pencereden veri dizini konumu başlığı altında ilgili yolu değiştirebiliriz.


Şekil 9 (a) Olaylar Simgesi Menüsü   (b) Kitaplığı Dışarı Aktar Penceresi


4 Nolu Simge (Yeni Eser) : Yeni Eser simgesini tıklayarak elle eser bilgileri ekleyebiliriz.

5 Nolu Simge (Geçerli Sayfadan Yeni Bir Eser Yarat) : O an ekranda görüntülenen sayfadan yeni bir eser oluşturur. Bazı web sitelerinde künye bilgileri tam olarak elde edilemeyebilir.

6 Nolu Simge (Belirteci İle Eser Ekle) : DOI, ISSN ya da ISBN numaraları ile belgelere ve künye bilgilerine ulaşma imkânı tanır. Örneğin http://dx.doi.org/ sitesini kullanarak DOI de kayıtlı bir belgeye ulaşmak yerine bu simgeyi kullanmak daha pratiktir.

7 Nolu Simge (Yeni Not) : Eserlerimiz hakkında veya çalışmamız hakkında not almak için bu simgeyi kullanabiliriz.

8 Nolu Simge (New Child Attachment) : Eserlerimiz için ekler kaydetme imkanı sunar. Örneğin eserimiz ile ilgili bir web sayfanı bu simgeyi kullanarak kaydedebilir ve eserimiz ile ilişkilendirebiliriz.

9 Nolu Simge (Gelişmiş Arama) : Kitaplığımızda yer alan eserlerimiz içerisinden detaylı arama yapmak için bu simgeyi kullanabiliriz.

10 Nolu Simge : Eserlerimiz içerisinden hızlı arama yapmak için bu alanı kullanabiliriz.

11 Nolu Simge (Yerini Belirle) : Eserimizin kaydedildiği klasöre, eserimizin görüntüsüne ve eserimizin bulunduğu web sitesine erişmek için bu simgeyi kullanabiliriz

12 Nolu Simge (Zotero Sunucu İle Eşle) : Bu simgeyi kullanabilmeniz için http://www.zotero.org web sitesinden bir hesabımızın olması gerekir. Bu simge kütüphanemizi Zotero sunucusu ile eşitler. Eserlerimizin bir kopyası Zotero sunucunda tutulur. Bu sayede kütüphanemizde yer alan eserlere internet bağlantısı olan herhangi bir yerden erişebiliriz.

13 Nolu Simge (Sekme Modunu Değiştir) : Bu simgeyi tıkladığımızda Zotero tam ekran görüntüsüne geçiş yapar. Tam ekran görüntüsünde iken tekrar tıkladığımızda normal görünüme geçiş yapacaktır.

14 Nolu Simge : Bu simgeyi tıkladığımızda Zotero ara yüzü gizlenecektir.

Zotero programının ara yüzünde yer alan sütunlar içerisinden sol sütun kitaplığımızda yer alan klasörleri görmemizi, klasörler üzerinde ekleme, çıkarma ve düzenleme yapma imkanı sağlamaktadır.

Zotero programının ara yüzünde yer alan sütunlar içerisinden orta sütun ise kayıtlı eserleri isim, yazar ve basım yılına göre sıralandığı ve çeşitli işlemler yapabildiğiniz alandır. Sol sütunda tıkladığımız klasör içerisinde yer alan eserler bu sütunda listelenecektir.

Zotero ara yüzünde yer alan sütunlar içerisinden sağ sütun ise orta sütunda seçilen eserin ayrıntılı künye bilgilerinin (eserin türü, başlığı, yazarı vb.) görüntülendiği bir alandır. Bu alanlar üzerinde değişiklik yapma imkânı da sunmaktadır.

4. Sonuç

Bu çalışmada yazım standartları ve referans yönetim yazılımları hakkında genel bir bilgi verilmiştir. Referans yönetim yazılımları içerisinde yaygın olarak kullanılan zotero programı tanıtılmıştır. Elbette bu makale eğitici bir doküman değildir. Dolayısıyla yazılım detaylı olarak ele alınmamıştır. Ama en azından okuyucuya genel bir fikir sunulmaya çalışılmıştır. Doküman içerisinde yer alan web adresleri ziyaret edildiği takdirde ayrıntılı birçok bilgiye ulaşılabilmektedir.

LANGUAGE LEARNING APPROACHES: A REVIEW OF RESEARCH ON EXPLICIT AND IMPLICIT LEARNING IN VOCABULARY ACQUISITION

LEE Bee Choo[a,39], Debbita TAN Ai Lin[a], Ambigapathy PANDIAN[a]

[a]School of Languages, Literacies and Translation, Universiti Sains Malaysia, 11800 USM, Penang, Malaysia

Abstract

The crucial role of lexis in both first and second language acquisition has long been acknowledged by researchers. As Singleton (1999) aptly put it – "the major challenge of learning and using a language, whether as L1 or L2, lies not in the area of broad syntactic principles but in the 'nitty-gritty' of the lexicon". With regards to the general discussions in L2 acquisition research, one glaring issue has always been whether explicit attention to vocabulary is absolutely necessary in vocabulary learning (Hunt and Beglar, 2005; Laufer, 2005; Hulstijn, 2001; Huckin and Coady, 1999). Various studies have come up with opposing conclusions and the consensus appears to be a compromise between the incidental and the intentional, summarised fittingly by Nation (2005) in his assertion that every course should involve some deliberate attention to vocabulary. The present paper will focus on surveying and comparing the various strands of research dedicated to intentional and incidental vocabulary learning, as well as delve deeper into relevant vocabulary acquisition issues. It is hoped that the observations in this paper will constitute a body of essential empirical evidence together with theoretical insights into the vital areas of vocabulary research.

Keywords: lexis/vocabulary; L2/second language acquisition; explicit/implicit vocabulary learning

1. Introduction

1.1. The Importance of Vocabulary in Language Competence

In the old days of language acquisition, vocabulary teaching and learning were given little importance (Alemi and Tayebi, 2011). However, the scenario today is drastically different as very few language instructors – if any – would even consider overlooking the lexical dimension in their regular teaching.

In fact, language learners themselves regard vocabulary knowledge to be of primary importance and often feel that many of their difficulties in both receptive and productive language use result from inadequate vocabulary (Nation, 1990).

The crucial role that vocabulary plays in language competence has been repeatedly acknowledged, particularly so since the 1990s. Laufer (1998) stated that the most striking difference between foreign learners and native speakers is in the quantity of words each group possesses. In the same vein, Lewis (2000) argued that the single most important task facing language learners is acquiring a sufficiently large vocabulary.

The relevance of the lexical facet in language learning has resulted in a substantial amount of theoretical and empirical studies in the area. In other words, as much as vocabulary is no longer neglected in the classroom, the same goes for its status in the realm of research.

1.2. The Explicit/Implicit Distinction

In knowledge acquisition, the distinction between explicit and implicit learning operate within definitions originating from psychology, definitions which generally highlight the presence or absence of conscious processes.

According to Ellis' (1994) terminology, implicit learning is typically defined as acquisition of knowledge by a process which takes place naturally, simply and without conscious operation, while explicit learning is said to be characterised by more conscious operation where the individual makes and tests hypotheses in a search for structure.

In the field of vocabulary acquisition, incidental learning is largely defined as the learning of vocabulary as a by-product of any activity not explicitly geared towards vocabulary learning (Rieder, 2003). In contrast, intentional vocabulary learning is defined as any activity geared at committing lexical information to memory (Hulstijn, 2001).

1.3. Past and Present – Vocabulary's Position in Language Acquisition

From the 1850s, and for approximately a century, it was via the Grammar-Translation Method that language was taught in most schools (Lowe, 2003). Vocabulary certainly did not garner as much emphasis as grammar did under the authority of the said method. In fact, as Kelly (1969) pointed out, direct instruction on vocabulary was presented only when a word exemplified a grammatical rule.

The popularity of Structuralism and behavioural psychology contributed to the Audio Lingual Method which appeared in the 1940s and lasted till the 1970s. Strong emphasis was given to the acquisition of oral skills as well as accurate form and structure, thus considerably relegating the significance of vocabulary to that of merely an accessory of other language skills (Twaddell, 1973; Fries, 1945).

After the 1970s came the Communicative Language Teaching concept and the Natural Approach, both of which were responsible for elevating and enhancing the status of the lexicon. Since then, language instructors and applied linguists have stressed on the importance of vocabulary in language teaching and learning (Carter and McCarthy, 1989; Laufer, 1986).

According to Maiguashca (1993), the lexical dimension in language teaching and learning has undergone a remarkable shift from "poor relation" to "guest of honour". This is perhaps best exemplified through Meara's (1995) observation that research on the acquisition of vocabulary has mushroomed enormously over the last 20 years to the extent that it is now almost impossible to keep up with the output, even if you hardly read anything else.

While the teaching and learning of vocabulary was unpopular in the old days, it is today at best a controversial issue. Although the current and general consensus remains that the lexical dimension is highly significant and indispensable in language learning, the teaching of vocabulary, for instance, still allows for questions like what kind of vocabulary to teach and how to teach it.

Furthermore, with regards to discussions in L2 acquisition research, one glaring issue has always been whether explicit attention to vocabulary is absolutely necessary in vocabulary learning (Hunt and Beglar, 2005; Laufer, 2005; Hulstijn, 2001; Huckin and Coady, 1999).

The present paper attempts to explore and observe the more recent studies in the area of vocabulary research. The studies that the authors have chosen for the purpose of this paper all concern the following – L2 attainment, mainstream vocabulary teaching and learning strategies, explicit/implicit vocabulary acquisition issues, and student performance.

2. Studies

2.1. First Study

One question that is frequently at the forefront of vocabulary learning is how effective extensive reading really is. According to McCarthy and Wigglesworth (2001), extensive reading will probably be the main opportunity for many learners to encounter a wide range of new words. Meanwhile, Huckin and Coady (1999) emphasised that many studies seem to indicate that except for the first few thousand common words, vocabulary learning largely transpires through extensive reading with the learner guessing at the meaning of unfamiliar words.

But Laufer (2005) suggested that extensive reading on its own may only result in relatively small gains and that reading combined with word-focused tasks is likely to be a more powerful means of vocabulary expansion. Numerous studies – particularly those on L2 learners – have also found that the use of extensive reading alone has resulted in low rates of vocabulary acquisition, demonstrating the inadequacy of this approach for L2 learners (Rosszell, 2007; Waring and Takaki, 2003; Zahar, Cobb and Spada, 2001; Horst, Cobb and Meara, 1998).

Although the present scenario seems to be in favour of a compromise between explicit and implicit lexical learning, there are still key issues that need to be delved into; the complexities of inferring word meanings, the effects of different instructional techniques, and long-term retention.

Hugh Roderick Rosszell's (2007) contribution deals with the matter of vocabulary teaching and learning through extensive reading. More precisely, he described a two-condition extensive reading programme conducted for 40 EFL students of a Japanese university which led him to conclude that an approach which couples extensive reading with intensive vocabulary study represents an option that is both more viable and effective for L2 learners.

In highlighting the questionable bias against using decontextualised study to help students with vocabulary expansion and the complexities of learning words implicitly through guessing and inferring, the study pointed out that incidental learning is best followed up with intentional learning.

This is represented by Rosszell's findings which showed a statistically significant and sustained advantage in favour of the students who experienced extensive reading complemented with intensive vocabulary study (ER+ group), as opposed to those who were not exposed to intensive vocabulary study (ER group). The participants were tested on meaning, use and recall, with the ER+ group outperforming the ER group in all three measures.

While drawing pedagogical implications (i.e., the inclusion of intensive vocabulary study can indeed boost vocabulary learning to higher levels), Rosszell also draws attention to the need for more longitudinal ER-based studies in future research.

2.2. Second Study

Over the years, the number of research dedicated to extensive reading has been steadily increasing and the same can be said for studies which highlight the use of specific reading texts/genres, as opposed to the use of multiple reading materials.

Naser Rashidi and Amir Ganbari Adivi (2010) investigated the correlation between vocabulary learning and the reading of specific short stories. One particularly interesting observation was also made by the authors regarding learner's purpose and vocabulary gain.

The research involved 40 Iranian EFL learners divided into two groups. The students in the experimental group were assigned to read five short stories for the purpose of comprehension while those in the control group were explicitly taught the target words. Both groups were homogeneous in terms of their proficiency in the English language.

The results garnered were in favour of the experimental group, revealing significant incidental vocabulary gains in comparison to the outcome of explicit instruction. It is observed that the findings appear to be inconsistent with past research (Laufer, 2005; Laufer and Yano, 2001; Cho and Krashen, 1994; Knight, 1994) in which more credit was accorded to explicit vocabulary instruction.

Rashidi and Adivi remarked that one essential factor, absent in most studies on L2 incidental vocabulary learning, was the specification of the purpose for reading. According to them, one reason why the students in the experimental group performed better might be due to the fact that a purpose was already defined for them: they had to read for the purpose of comprehension. The students must have therefore paid closer attention to the contextual clues in order to guess the meaning of the unfamiliar words they encountered in the given texts.

This might persuade one to contend that the learning process was consequently not entirely incidental, seeing that some degree of intentional attention was involved. Regarding this, the authors maintained that while the purpose of reading the texts was made known to the students of the experimental group, none of the participants were aware of the objective of the study or more importantly, that a follow-up vocabulary test would be administered.

In their summation, the authors called attention to Ellis' (2008) argument that both implicit and explicit learning are part and parcel of vocabulary acquisition. Unfortunately, the role given to incidental vocabulary learning is often a peripheral one, existing only in the presence of explicit instruction. Rashidi and Adivi asserted that specifying a purpose for reading can facilitate incidental vocabulary acquisition, and that the results of their study confirms the effectiveness of learning vocabulary via implicit means.

2.3. Third Study

Dana (2006) looked at the Grammar-Translation Method and its influence on a group of ten adult students' vocabulary acquisition. The Grammar-Translation Method of foreign language teaching, one of the most traditional methods, dated back to the late nineteenth and early twentieth centuries and was originally used to teach "dead" languages (and literatures) such as Latin and Greek (Thuleen, 1996).

The method is very much based on the written word and is focused primarily on learning the grammar rules and their application in translating texts from one language into another, with the teaching mainly made in the students' first language. Vocabulary, for the most part, is learned through direct translation from the native language and memorisation, using a bilingual word list. In terms of language skills, reading and writing are given preference over speaking and listening (Dana, 2006). Therefore, accurate use of language items is essential in this approach.

The samples in Dana's study, students of pre-intermediate level, were subjected to three 45-minute lessons followed by a vocabulary test. The theme of the lessons was food and on grammar, the researcher focused on regular and irregular verbs. The students were tested on their productive vocabulary knowledge as well as their ability to recall and place acquired vocabulary into context. An attempt was made to strike a balance between validity, reliability and practicality.

In the experiment, the students first took turns to read the text aloud which they later translated using a bilingual vocabulary list. It was then joined to the text. Then, they were drilled item by item, based on the

vocabulary and phrase pattern list. After that, the teacher would read aloud some of the words and the students would then translate them aloud in class. The lesson would then continue with the students' attention drawn to the grammar part where they would be drilled further on the irregular verbs. Students would then work in pairs, testing each other's memory. Finally, they would be asked to go back to the text, find and underline the new irregular verbs and then answered the questions asked in the text.

Dana (2006), in her study, came up with several conclusions. Firstly, she found that although the Grammar-Translation Method helped students at this level to analyse a particular language area, the range of vocabulary knowledge covered was too narrow although the students' knowledge of target vocabulary was excellent. Also, students faced problems integrating the words within context-conscious learning of rules. They were able to produce a base form of any word from the list but they tended to encounter difficulties when it came to putting the items into the correct form within a context, unless they were provided with fitting sentence structures. Students tended to regard language as an anthology of words that are independent and isolated – to be linked together to form a sentence. Dana (2006) also found that the students tended to disregard the content but were overly concerned with linguistic details. They were able to recall words in familiar sentence patterns but not so if those familiar words were to be presented in unfamiliar contexts.

Hence, Dana (2006) concluded that the Grammar-Translation Method does not lead to language acquisition and her findings supported the opinions of Thuleen (1996), Harmer (1993) and Krashen (1987) that the Grammar-Translation Method does not lead to effective vocabulary acquisition and that it should be tempered with other approaches to further promote acquisition. Thuleen (1996) went as far to say that the method may prove to be harmful to students' motivation and interest unless the students respond well to rules, structure and correction. Additionally, Harmer (1993) highlighted the difficulties of translation which requires an efficient speaker of both languages to translate well and stated that teachers should not be overly reliant on the method. Krashen (1987), who analysed the linguistic output of students from grammar translation classes, commented that it cannot lead to acquisition.

Thus, the conclusion one may arrive at is that language acquisition does not come from sheer conscious learning of rules. In this case, one may argue that deprived of a sound knowledge of the grammatical basis of the language, students may just end up possessing a string of communicative phrases that are sufficient for basic communication but which will be deemed sorely lacking when it comes to performing more refined or sophisticated linguistic tasks.

2.4. Fourth Study

Webb (2009) investigated the effects of receptive and productive learning of word pairs on vocabulary knowledge on a group of Japanese native speakers. Learning word pairs involves memorising foreign vocabulary items together with their synonyms or translations and is very much a conventional method of vocabulary learning. As described by Webb (2009), receptive learning of word pairs means first knowing a decontextualised L2 vocabulary article and then attempting to recall its L1 meaning. On the other hand, productive learning of word pairs refers to first knowing a decontextualised L1 article and then attempting to recall its L2 form.

The subjects of the study were 62 first year undergraduates attending EFL classes at a university in Japan and all of them had studied English for at least six years. Based on their scores in Paul Nation's Vocabulary Levels Test, they were deemed to possess receptive and productive knowledge of approximately 1700 of the 2000 most frequent words (Schmitt, Schmitt and Clapham, 2001; Laufer and Nation, 1999). The subjects were divided into two groups, with one group studying ten words pairs receptively and the other group studying the word pairs productively. The study was carried out within one 90-minute class period. The subjects were given six minutes to learn the ten target word pairs and were closely monitored by their teachers to ensure that the desired learning tasks were being correctly administered. Once the treatment was over, they were subjected to a vocabulary test whereby the five aspects of vocabulary knowledge – orthography, association, syntax, grammatical functions, and meaning and form – were each measured.

The results of Webb's (2009) study showed that the quantity as well as the type of vocabulary knowledge gained is considerably by the direction learning took place. Productive learning resulted in superior gains in productive knowledge of meaning, syntax and grammatical functions, and in productive as well as receptive knowledge of orthography. On the other hand, receptive learning garnered significantly larger gains in receptive knowledge of meaning. Webb's research findings lend support to previous studies on the comparison of receptive and productive learning of word pairs carried out by Mondria and Wiersma (2004), Waring (1997), Griffin and Harley (1996) and Mondria and Stoddard (1929). Given the superiority of productive learning over receptive learning, it may seem that it is the more effective method although receptive learning of word pairs is perhaps the more commonly used method.

On the whole, the findings of Webb's extensive study have shown that both productive and receptive tasks are very effective, as well as time-efficient methods of acquiring vocabulary knowledge. This gives rise to suggestions that it may be wise for researchers to use both receptive and productive tests since one task contributed to greater gains in one area while the other task achieved greater gains in another area. If only one method is used, either a productive or a receptive task, the acquisition of vocabulary may be compromised in one way or another. Vocabulary acquisition researchers such as Schmitt (2008, 2000), Hunt and Beglar (2005), Nation (2001, 1990, 1980), Prince (1996), Siebert (1930) and Thorndike (1908) had consistently found learning word pairs to be an effective method of acquiring vocabulary knowledge. In fact, Nation (2008, 2001, 1982, 1980) stated that vocabulary learning programmes should include learning word pairs because it can be a fast and efficient method of acquiring L2 vocabulary. However, decontextualised tasks have been criticised for focusing exclusively on linking L1 meaning with L2 form, and for neglecting learning from context. This has led some researchers such as Oxford and Crookall (1990), Krashen (1989) and Crow (1986) to suggest that intentional learning tasks should be discouraged and to focus more on learning from context. Webb's extensive study on the effectiveness of receptive and productive learning of word pairs has yielded valid results and coupled with the findings previous studies, it leaves little doubt on the benefits of both tasks to learners who seek to boost their vocabulary knowledge in a short period of time. Moreover, being relatively fast and efficient learning methods, it makes sense to combine them with other explicit and incidental tasks in a quest for an effective vocabulary learning programme.

3. Conclusion

We trust that the compilation of studies in this paper constitutes a body of important empirical evidence together with theoretical insights into the areas of vocabulary acquisition, teaching and assessment. As Eysenck (1982, p. 203) put it: "memory performance is determined far more by the nature of the processing activities engaged in by the learner than it is by the intention to learn per se".

Learning, whether incidental or intentional, is mainly a matter of selective attention and elaborated processing. The absence or presence of a learning intention does not play a decisive role as vocabulary acquisition is first and foremost determined by the nature and frequency of the processing of new words.

Incidental vocabulary learning is not necessarily more effective than intentional learning, nor is intentional vocabulary learning necessarily more effective than incidental learning (Brown, Waring and Donkaewbua, 2008; Laufer, 2005; Read, 2004; Nation, 2001). Hence, both the explicit and the implicit should be incorporated into the teaching and learning of vocabulary.

LEADERSHIP SUCCESSION FOR TOMORROW'S SCHOOLS

Patrick J. Renihan

University of Saskatchewan, 28 Campus Drive Saskatoon, S7N 0X1, Canada

Abstract

The purpose of the study was to elicit perspectives from teachers and educational leaders concerning leadership succession and the motivations/readiness of professionals to assume leadership roles in schools. The study involved electronic surveys and focus group involving teachers, in-school administrators, superintendents, directors and board chairs. In total, 838 educators participated. Implications of the perceptions of these educators for succession strategy are explored, and an argument made for a systematic plan for leadership succession in schools.

Keywords: school leadership; succession; teachers; principals; administrators

1. Introduction

Leadership is critical to school and system effectiveness and, more specifically, student success. There is a growing body of research pointing to the integral relationship between school leadership and student achievement. Marzano (2003) cited a variety of studies pointing to strong relationships between leadership and mission and goal clarity, overall school climate, the attitudes and classroom practices of teachers, the organization of curriculum and instruction, and students' opportunity to learn. (p. 172).

More specifically, in a study drawing upon several bodies of knowledge, Waters, Marzano & McNulty (2003) conducted a quantitative analysis of 30 years of research (over 5000 studies), an exhaustive review of theoretical literature on leadership, and a bringing together of professional wisdom on school leadership. Those researchers demonstrated a substantial relationship between leadership and student achievement. Leithwood and others (2004), following an in-depth and extensive analysis of the effects of leadership on student learning, concluded that leadership is second only to classroom instruction among all school related factors influencing what student learn in school (accounting for about a quarter of the total effects). More recently, Beteille et al. (2009) found that school leaders' personnel management practices play a central role in school improvement. There can be no more powerful argument than the above for the devotion of time and resources to leadership sustainability and to thoughtful and proactive planning for leadership succession.

2. Challenges of School Leadership

PriceWaterhouseCoopers, in an extensive study on school leadership conducted for the U.K. Department of Education (2007), reported a clear sense among school leaders that their role has become more challenging and that the complexity and range of tasks they are required to perform has increased greatly in recent years (p. V). This report documented evidence suggesting that many school leaders are struggling to meet all the demands currently being placed on them (p. V1). The report noted that, despite a widespread recognition across the sector that an essential role of school leaders is to promote and develop the quality teaching and learning in the school, many school leaders expressed their frustration that the current environment does not allow them to be as involved in this area as much as they would like.

The PriceWaterhouseCoopers' report noted that some of the barriers to distributing leadership included the persistence of the 'hero-head' perception amongst heads themselves and their staff, coupled with parent and community expectations of an ever-present, ever-available head. (p. 1x)

The international literature on educational leadership suggests that the *ubiquity of change, complexity of the role, level of remuneration, status of the profession, legal constraints, and impact on family life* (writer's emphasis) are now seen as negative features of the principalship (Caldwell, 2002). The impact of such developments upon the available leadership pool in school systems was identified by Phillips, Raham & Renihan (2003) in their review of international state of the field.

2.1 The Growing Succession problem

In a review of the responsibilities and issues in the school principalship across jurisdictions in Canada and internationally, Phillips, Raham & Renihan (2003) noted the impending shortages for the position across jurisdictions, due to large numbers of retirements and fewer applicants for the job. They reported, "the disparity between the rapidly expanding demands and the shrinking pool of qualified and willing candidates is almost universally sounding alarms for policymakers and practitioners." (p.12).

Fink and Brayman (2006), in a Canadian study, attributed the shortage of qualified principals to the dual issues of the emphasis upon standards/standardization on one hand, and the aging baby boom generation on the other. These researchers argued that the most critical issue is not one of succession, but the limited autonomy that principals can exercise on behalf of their schools and communities.

Read (2012), in an Ontario study on preparedness for the vice principal's role, joined the variety of researchers who identified leadership succession as a critical issue in school systems, attributing its emergence as a concern to retirements, the shortage of teachers entering administration, and administrators leaving the position, due to dissatisfaction or disillusionment with the job.

Read (2012) cited rapid and deep changes that have been the forces for concomitant changes in what schools do, how they are operated and governed, and how teachers and school leaders meet their professional responsibilities.

The above issues also present serious challenges throughout the corporate world and among social services and governmental organizations. There is a growing body of literature that examines these issues and proposes alternative strategies for addressing them. Much of this literature is informative and readily applicable to succession issues experienced within the education system.

2.2 Rationale for Succession Planning

Perhaps the strongest argument for focused and concerted attention to leadership succession lies in its integral role in the *sustainability* of relevant and effective leadership throughout the organization in the longer term. In light of this point, it is hardly surprising that writers such as Hargreaves & Fink (2003, 2006) placed such heavy emphasis upon the nature of succession and the dynamics of succession planning in their discussions of leadership sustainability.

Rothwell (2005) argued that the continued survival and viability of the organization depends on *having the right people in the right places at the right time to do the right things.* He noted that when succession planning is ignored, job incumbents tend to identify and groom successors who are like themselves in

appearance, background and values, thereby fostering a type of 'bureaucratic kinship system.' According to Cohn et al. (2005) organizations that fail to prioritize succession planning end up experiencing a steady attrition in talent or retaining people with outdated skills.

The resolution of these issues lies, in part, with school leadership incumbents. According to Hargreaves & Fink (2006), "one of the best ways to secure successful succession is to spread and stretch leadership across people now, not just in the future, to distribute and develop leadership so that successors will emerge more readily and take over more easily. Distributed leadership develops capacity in others, so they can become as gifted as those who lead them and can build on their achievements." (p. 93).

Horne (2009) provided a pragmatic and useful rationale for succession management by highlighting its role in assisting organizations to answer five critical questions:

Do we have enough qualified people to fill key positions now and in the next 3-5 years?

Will we have a sufficient pool of qualified candidates ready to fill key positions in the next 5-10 years?

Do we have diversity and inclusiveness in our leadership positions?

Will we have continuity of leadership for key executive positions?

How will we retain high-potential employees? (p.1).

Horne added that *succession planning* is not *replacement planning:* that jobs and organizations change too quickly to identify potential successors based on today's criteria.

2.3 Succession Strategies

Numerous researchers have examined the impact of succession upon the cultural contexts of the workplace. Schein's (2010) work on organizational culture is valuable in this regard, and it serves as a reminder that succession is change and, as such, has implications-many of them subtle, deep and complex- for the processes, relationships and strategies associated with *the implementation* of succession plans. For this reason, the types of questions suggested in the Maryland succession planning guide (2006) present a valuable focus for contemplation.

The work of Conger and Fulmer (2003) found, from an examination of the succession practices of companies, that those who were successful in developing deep and enduring bench -strength devoted energy to the integration of two practices: *succession planning* and *leadership development* (a focus on development and leadership in action) in order to create a sustainable process for managing the talent roster across their organizations. On a similar note, Salopek (2007) emphasized the need for succession planning to go further down in organizations in order to mine employee skills both deeper and across the organization. Salopek suggested four common properties of useful and effective succession management programs: they are *dynamic* (are frequently reviewed and monitored); they are *transparent;* they are *comprehensive a*nd integrated with other talent management initiatives; and they are *aligned with corporate strategy and objectives.*

The leadership succession plan adopted by the state of Maryland (2006) is based upon a series of questions pertaining to five succession-related practices, namely: *identification, development, Promotion, movement, and retention.* In Canada, The Treasury Board of Canada (2002) developed a comprehensive guide to serve as a resource for organizations considering their own transition and succession strategies. The goal is leadership sustainability: to identify pools of leadership talent- not 'heirs to specific positions.' Mentorship as a succession strategy has received significant attention in leadership research, and there is a growing recognition

as to its potential in educational organizations. Daresh & Playko (1993) pointed to research which suggests that school leadership is enhanced when clear, focused efforts are made to help novice school leaders through their first professional duties. Crow & Matthews (1998) advocated long-term, conscientious approaches to mentorship as important means of accomplishing this, and added that support and mentoring be a career-long experience.

Read (2012) sounded a warning that teachers tend to learn about the nature and issues of the in-school administrators' roles through *incidental* observations and interactions, that might not accurately reflect the true nature of the role. She added that the leadership succession phenomenon requires *careful recruitment, support and retention of persons who are well prepared and qualified for the challenges they will face as administrators.* Read noted that, while both *incidental* and *deliberate* learning are important to the novice administrator, structured (deliberate) programs are more important for such role-specific situations as dealing with the police and social services.

3.   Purpose, Research Design and Methods

The purpose of the study was to elicit perspectives from educational leaders at the school and the system levels of the provincial k-12 system, with a view to examining the issues surrounding leadership succession and the motivations/availability of well-qualified professionals to assume leadership roles. Most significantly, the goals were: to help the major partners in education to consider the types of infrastructure and support that can most effectively address school and system leadership needs in the coming years, to identify guiding principles for succession planning for schools, and to offer recommendations for future practice and policy development.

The design of this study involved three complementary activities: a) a *survey* of teachers, In-school administrators, (principals and vice-principals), superintendents of education, directors of education and board chairs; b) several *focus groups* (72 participants) of teachers, principals, superintendents and board chairs; and, c) an *interpretive panel* consisting of representatives from a variety of professional groups. The research activities undertaken in each of these areas are described in the sections that follow.

3.1 Surveys and Focus Groups

Surveys were designed to elicit ratings and commentaries on succession-related issues from each group, and included perceptions relating to the appeal of, and levels of interest in, school leadership positions, required skills and attributes, and perceptions as to succession processes and practices in schools and school systems. Part 1 of the instrument sought demographic data on position, gender, age and experience for each participant group. Questions in Part 2 gathered ratings of the importance of factors related to the appeal of in-school leadership on a 5-point Likert scale. In Part 3, participants were asked to rate the importance of requisite skills and knowledge required for school leadership, and Part 4 elicited perceptions regarding succession processes in schools. Verbatim comments on these issues were also requested. Chronbach's Alpha scores indicated overall reliabilities of .838, for teachers (n=160); .846 for school administrators (n=507); and .776 for superintendents (n=60).

Seven focus groups representing in-school administrators, teachers, superintendents, board chairs and Ministry professionals were selected for involvement in discussions about succession held in different areas of the province following the collection of survey data. These discussions were designed to provide elaboration and depth to the themes identified in the surveys. In the presentation of data throughout this report, mean scores from

5 point Likert scales were utilized for the *quantitative* survey data. The tables representing thematic analysis of *qualitative* data utilized percentages that represented the proportion of the total number of comments per item related to each theme.

3.2 The Participants

Responses to the survey and participation in focus groups are summarized in Table 1

Table 1: Survey Returns and Focus Group Participation

Participant Group	Survey Respondents	Focus Group Participants	Total
Teachers	169	27	196
In-School Administrators	507	6	513
Superintendents	60	5	65
Directors	16	20	36
Board Chairs	14	5	19
Ministry Personnel	-	9	9
Total	**766**	**72**	**838**

As illustrated in Table 1, completed electronic surveys were received from 766 respondents (169 teachers, 507 in-school administrators, 60 superintendents, 16 directors and 14 board chairs). In addition, focus group information was shared in 7 focus groups by 72 professionals (27 teachers, 6 principals, 5 superintendents, 20 directors, 5 board chairs and 9 Ministry personnel).

The gender breakdown of the respondent groups, while fairly reflective of that of the broader population, did contrast somewhat with the provincial figures. Among our respondents, females represented the larger proportion (60%) of the teacher group, while accounting for just over 40% of the In-school administrator and superintendent respondents.The in-school administrators were quite evenly distributed among the age 31-40 (30%), 41-50 (31%), and over 50 (36%) categories. Eighty eight percent of the superintendent respondents were in the 41-50 (40%) and over 50 (48%) categories.

Over 60% of the responding 169 teachers reported over 11 years total teaching experience. Teachers were strongly represented in the older categories, with 43% of them reporting a total teaching experience of 16

years or more. Fifteen percent of the teacher group were in the 1-5 years experience category. More than 60% of the in-school administrator respondents had less than 10 years of administrative experience. Sixty six percent of the in-school administrators group identified themselves as principals, while 34% reported holding a vice/assistantship position.

When these data were examined according to type of school, vice principals represented a larger proportion among respondents from high schools (43%) than from elementary and k-12 schools (35%). In terms of gender, 37% of the female school administrators, as opposed to 32% of male administrators, identified themselves as vice-principals. Elementary schools were most strongly represented among teacher and administrator groups. High schools constituted the workplace for 24% of the teachers and 17% of the administrators.

4. Findings

Data are reported according to the level of teacher aspiration to leadership positions, the skills and knowledge they require, perceptions as to how teacher skills and interest can be enhanced.

4.1 Teacher aspiration to in-school leadership positions

Teachers were asked two questions: a). Would you consider a position as a formal teacher leader (learning leader/catalyst teacher) in the next 5 years, the next 10 years, later than that, or never? b). Would you consider a position as principal or vice-principal of a school in the next 5 years, the next 10 years, later than that, or never?

It appeared from the survey data that teachers are more amenable to assuming some sort of school-level leadership than they have ever been. Over half (56%) of the teacher respondents indicated that they would consider a teacher leadership position in the next five years. In fact, 76% indicated that they would consider a teacher leader position some time in their career. When it came to their aspirations to formal leadership positions as principal or vice-principal, however, they were less interested (43% of them responded that they would never pursue such a post) though 54% of them indicated that they would consider such positions at some time. From the thematic analysis of the many comments offered on this issue, three qualities of the work stood out as rewards for people in these leadership positions (n=507): The opportunity to influence positive change was the single most frequently mentioned reward of the role, and was the focus of 17% of the verbatim comments made. The second and third rewards (Working and building relationships with new people, and seeing students and parents progress) accounted for 14% of the comments. Taken together, these three themes represented 45% of comments offered on this question. We asked teachers (n=169) and in-school administrators (n=507) what they believed to be the level of importance of selected reasons why in-school administration might be considered a desirable position. The opportunity to help children, the opportunity to influence change and make a difference, and the opportunity to positively influence school effectiveness emerged as the three most appealing qualities of the job for both teachers and administrators.

We also inquired about those factors that serve to discourage individuals from coming forward for in-school leadership positions. For teachers, the top four deterrents to in-school administration were, in order of

frequency of mention: lack of support from central administration during change; perceived increases in the demands and workload placed upon principals; lack of time; and lack of agreement with current directions and philosophies. Principals identified the prevalence of a hegemonic culture that perpetuates the notions that they are only successful if they are 'crazy busy' and that busy people are the best example to follow. This reaction to the expectations that accompany their work was made in combination with their expressed concern that they have families and other dimensions of their lives that should not be compromised by their professional responsibilities. This tension was prevalent throughout the study. In the teachers' focus groups, opinions about the desirability of leadership as an aspiration drew varied comments, and such factors as stage of career and family priorities were natural accompaniments to those opinions. Though some teachers were adamant in their conviction that they will never don the in-school administrator's mantle, many of them were still wrangling with the decision-making process involved.

4.2 Requisite Skills and Knowledge

The survey elicited perceptions of teachers and in-school administrators and directors as to the skills and knowledge required by school administrators. Data related to this area are summarized in Table 2. As the data illustrate, the perceptions of teachers, in-school administrators and directors reflected a high concurrence on most items across the three groups.

It is worth noting that the top five items related to human relations qualities: the ability to communicate and relate on an interpersonal level.

Table 2: Requisite Skills and Knowledge for Principals

Skills/Knowledge Item	Mean Rating 5-point scale		
	Director	Admin	Teacher
Communicating effectively with staff	4.9	4.8	4.8
Engaging parents/community	4.8	4.7	4.7
A caring Disposition	4.5	4.7	4.6
Connecting with children and youth	4.7	4.7	4.5
Providing a sense of school vision	4.8	4.6	4.4
Involving others in leadership	4.7	4.5	4.4
Leadership for staff development	4.7	4.4	4.4
Knowledge of instructional strategies	4.5	4.4	4.3

Instructional supervision skills	4.6	4.3	4.2
Planning/organizing the school's regular activities	4.5	4.3	4.2
Ability to provide leadership for cultural diversity	4.6	4.2	4.2
Knowing classroom assessment trends	4.5	4.3	4.1
Knowledge of child development	4.2	4.1	4.1
Legal knowledge of the principal's role	3.9	4.0	4.2
Knowledge of budgeting	3.8	3.7	3.9

Perhaps our groups of participants saw these qualities as foundational for critical *skills* in such areas as instructional leadership, supervision and conflict management that were identified as important. Respondents provided a wealth of explanation and elaboration on these priorities by way of verbatim comments contributed in the surveys and in focus groups.

We also asked leadership incumbents to reflect upon where they initially felt *deficient* in their roles. The major areas of perceived deficiency were, in order of frequency of mention: *Instructional leadership and staff development, budgeting; school law; and conflict resolution.* These four factors accounted for 67% of all the responses to this question. The volume of commentary among school administrators on the *instructional leadership as an area of deficit* warrants further comment. When this function (or set of functions) is considered in combination with related aspects of the role, such as knowledge of instructional strategies, and leadership for school and classroom assessment, it assumes even greater significance as an area requiring serious attention in school and system leadership professional planning, graduate programs and the roles of support agencies.

The most clear and pervasive message that echoed consistently throughout the perceptions described in this section was that *communication and basic human relations skills* comprise a critical prerequisite for successful in-school leadership. These, together with the establishment of effective and positive relationships with staff, parents, community and children emerged as central *human relations priorities.* However, certain *knowledge areas* emerged as priorities for consideration. In this respect, attention to *instructional leadership skills, budgeting, law and conflict resolution* were priorities in professional development and readiness plans among practicing and prospective administrators.

Though the practice has often been that the above qualities and skills are learned 'on the job,' there was a strong sense among respondents that we can do better. Mechanisms for their development require attention on the part of aspirants themselves (which tends to be a hit and miss affair) but also on the part of senior leaders in school systems and others with a professional interest in preparing professionals for school leadership.

4.3 Enhancing Leadership Skills and Interest: Building the Infrastructure

We asked teachers, in-school administrators, superintendents and directors for their perceptions as to how teacher interest in school leadership can be enhanced. Thematic analyses of their perceptions revealed numerous strategies. **For teachers,** the top four strategies for enhancing teacher interest were*: promoting support for the role at the division level, increasing rewards associated with in-school leadership, initiating more leadership development and graduate study opportunities, and more respect for the time demands of the job.* These four strategies accounted for 46% of all teacher comments made on this question.

Among in-school administrators, *the availability of relevant leadership preparation programs* was clearly the top priority. Other priorities included *improved benefits, building shared leadership opportunities and developing leadership academies.* The administrators, in their focus groups, discussed their responsibilities in preparing the next cycle of leaders, noting that one of the most effective ways to encourage people to consider leadership is to model the positive aspects of the job. The point was made that an important part of school and system leaders' work is to develop the talent base through two concomitant activities: *first, recognizing potential leaders within the context of their work, and second, providing support to their leadership development.* Administrators made a call for experiential opportunities and hands-on activities for interested teachers at the school level, opportunities for *acting* positions, and opportunities for observing and working with, school leaders.

Across all groups, there was a strong realization that the enhancement of professional readiness for in-school leadership will occur, not merely through random, isolated activities, but through well-planned programs that incorporate thoughtful incorporation of initiatives that are *experiential, informational, skill oriented, mentorship-based, and strategically designed* in keeping with the vision and directions of schools and their broader systems.

5. Concluding Comments

The lack of availability of well-qualified applicants for the principalship/headship emerged in this study as the most critical succession and leadership sustainability issue. The introduction of *teacher leadership initiatives* within schools has the potential to provide impetus and valuable focus to initiatives designed to enhance the learning and professional environment of schools. It also seems to be having the impact of increasing the level of interest in school administration among school professionals, and this represents a logically sound argument for formalizing teacher leadership in schools. This is likely a major explanation as to why the argument for distributed leadership has found favour in major school leadership succession studies, such as that conducted by PriceWaterhouseCoopers in the United Kingdom (2007). I*ssues relating to in-school administrator workload, a lack of time to meet the expectations of the vice-principals' and principals' roles, and a perceived lack of support provided by senior leadership, particularly in times of significant change, emerged from the data as key deterrents to teacher interest in these roles.* These are issues that have consistently been raised in previous studies of school leadership succession. Questions related to the extent to which these issues are amenable to strategic action in succession plans are worthy of consideration.

In light of the above points, it is hardly surprising that the *role image* of in-school administration emerged from this study as an important foundational succession strategy. The appealing aspects of leadership roles, and the rewards and joys of the job (such as *the opportunity to help children, the opportunity to influence change and make a difference, and the opportunity to positively influence school effectiveness*) is valuable knowledge to convey to those pondering the possibilities of these roles. On a related point, we were surprised at the lack of knowledge, among school professionals, as to the nature of the work of in-school leaders. We would agree with the warning sounded by Read (2012) that teachers tend to learn about the nature of the in-school administrator's role through *incidental observations* and interactions that might not accurately reflect the true nature of the role.

In this study, there was a greater emphasis upon work-life balance and the importance of family as critical aspects of career decisions than was the case in prior studies of in-school leadership. This has emerged as a central factor in teacher aspirations to in-school administration and, indeed, aspirations to leadership positions throughout the hierarchy.

Valuable insights into preparation and in-service needs were provided by the information shared by teachers and school administrators regarding their leadership deficiencies, needed skills and perceived strengths. This presents an opportunity for professional development centres and support agencies to gauge the continuing relevance of current delivery strategies and the substantive content of their offerings. The call for decentralized, community-based graduate programs, with attention to local/professional leadership contexts in their content and modes of delivery was strong in this study.

The above points, and others emerging from this study, represent topics for much-needed conversations across the education sector. The time is right for sector-wide discussion of matters (such as leadership succession and sustainability) that demand broader consideration. The growing research evidence pointing to the integral role of school leadership in student learning (Beteille, e al., 2009; Leithwood et al., 2004; Waters et al., 2003) constitutes in itself an eloquent argument for the elevation of leadership succession to sector-wide attention.

Abstract

The classroom use of independent reading primarily grew out of concerns for students' reading achievements. Various studies have indicated that engagement in Sustained Silent Reading (SSR) improves not only students' reading skills but also their attitude towards reading itself, an activity that many rarely associate with pleasure. SSR is a programme based on the belief that self-selection, among other factors, motivates learners to read with interest and works towards helping them feel that reading is an oasis rather than a burden. In turn, this produced other benefits; beyond improving students' attitude towards reading, silent reading programmes have also helped learners in terms of spelling, writing and vocabulary gains, as well as in developing their reading speed and reading comprehension skills (Birmingham, 2006; Gardiner, 2001; Weller and Weller, 1999; Arthur, 1995; Dwyer and West, 1994; Krashen, 1993). Although evidently advantageous to language learners, effective implementation of an SSR programme still depends largely on the discernments of those who stand to benefit the most from it. The results of this research specifically captures the perceptions of Universiti Sains Malaysia undergraduates with regards to SSR, and it is hoped that the information gained from these responses will assist in providing direction for educators who are interested in incorporating SSR into their respective literacy programmes.

Keywords: independent reading; Sustained Silent Reading (SSR); attitude towards reading; reading achievement; language skills; student perceptions

_____

1. Introduction

1.1. Reading for Pleasure

Before the dawn of the silver screen, televisions and computers, reading was a primary leisure activity. People would read for hours on end and many would "travel" the voyages of their books' characters. It is nothing less than tragic that people have forgotten the passion to read and that today's young have disregarded the significance of reading. Some even find reading a chore when it is in fact an indulgence that enhances knowledge and creates understanding.

Educators and researchers frequently advocate reading for pleasure in classrooms. Research strongly supports it as a primary tool for improving reading speed, reading comprehension, writing, spelling, grammar, and passive as well as active vocabularies among students (Birmingham, 2006; Gardiner, 2001; Weller and Weller, 1999; Arthur, 1995; Dwyer and West, 1994; Krashen, 1993; Foertsch, 1992; Anderson, Wilson and Fielding, 1988; Nagy, Herman and Anderson, 1985).

Storey (1993) and Modleski (1982) highlighted that reading for pleasure provides a terrain on which to dream, with fantasies that both reflect and counter the very real problems and tensions in people's lives. This, at the very least, generates a magnetic appeal that encourages people to read, and eventually make a habit out of it.

Offering pleasure reading to English language learners work towards helping them feel that reading is an oasis, rather than a burden. With regards to students in a literacy programme, practitioner-researcher Donna Earl (1997) reported that providing learners the opportunity to read high-interest, easy-to-read materials is one factor in enabling learners to learn to love reading. In essence, when a student enjoys reading, it generates his or her motivation to continue reading, thus creating an avenue for effective learning to take place. For instance, Cho and Krashen (1994) found that women studying English for Speakers of Other Languages who read romance novels – the Sweet Valley series – felt that these readings actually increased their interest in reading and also consequently enhanced their vocabularies.

1.2. Interest and Motivation in Language Learning

Over the years, interest and motivation have been central areas of research within the context of language learning, especially second language acquisition. Most findings concur that these elements play a crucial role with regards to a learner's achievement.

According to Gardner (2000), a highly interested and motivated individual will want to learn the language, enjoy learning the language and strive to learn the language. In the context of a language classroom, the learning condition generally includes elements such as learning materials and activities. The learner's attitudes towards these core elements will influence his or her interest, motivation and orientation. Positive attitudes towards these elements will likely produce greater enjoyment in the study of the language, desire to learn the language, and effort expended in learning the language (Liuoliene and Metiuniene, 2006).

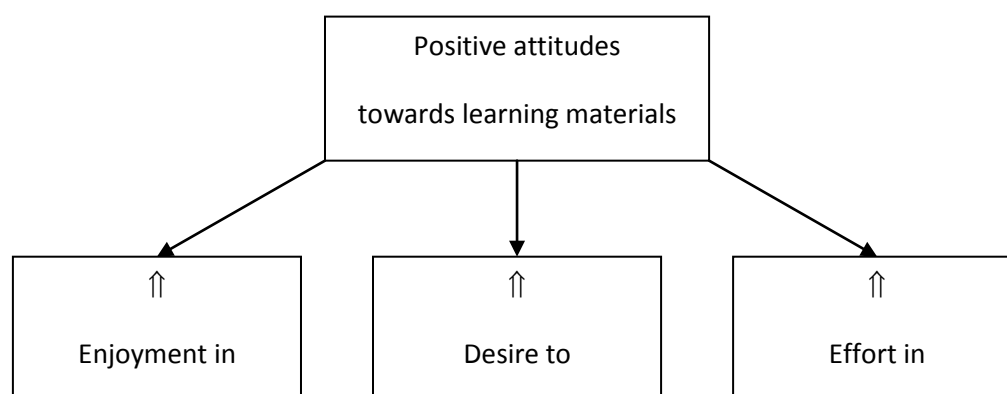
In other words, if an English language student forms positive attitudes towards the learning materials and activities that are used in his or her language classroom, he or she will most probably experience more enjoyment in learning English, have more desire to learn English, and put in more effort in learning English.


Fig. 1. Outcome of Learners' Attitudes towards Learning Conditions

Hussin, Maarof and D'Cruz (2000) commented that a persistent problem faced by many English language instructors is the attempt to sustain genuine interest and motivation in the learning of the language (see also O'Flahavan et al., 1992). A vast amount of research supports the idea that motivation plays a major role in learning (McCombs, 1989; Deci and Ryan, 1985; Dweck and Elliot, 1983), with motivation frequently making the difference between learning that is temporary and superficial, and learning that is permanent and internalised (Oldfather, 1993).

Sustained Silent Reading (SSR) in the language classroom involves, in essence, students reading self-selected materials silently for a designated period of time. This approach has gone by many different names, including DEAR (Drop Everything and Read), DIRT (Daily Independent Reading Time), FVR (Free Voluntary Reading) and Extensive Reading (ER). Although there are variations in terms of format and implementation, the basic principles of time and ownership are the same (Nagy, Campenni and Shaw, 2000).

The classroom use of SSR is based on the idea that self-selection, among other dynamics, motivates students to read with interest, resulting in sustained reading which will in turn aid in the improvement of language skills. In addition to gains in motivation and attitude (often termed as 'affect'), studies which utilise such reading programmes have demonstrated that they also result in better overall language proficiency (Day, Bamford and Lee, 2002).

1.3. Ownership, Time and Silence

The main goal of silent reading programmes has always been to increase students' enjoyment of reading, and allowing students to exert ownership and select their own preferred reading materials will enhance their motivation to read (Chow and Chou, 2000). In other words, readers are more likely to pay closer attention, persist in their reading for longer periods of time, learn more, and enjoy their involvement to a greater degree when they read materials that interest them (Yoon, 2002).

Hsui (2000) pointed out the following:

"Research on reading in which students read extensively, have ownership over the materials they choose to read and are allowed to read in a relaxed, non-judgmental environment within the classroom has mostly shown that these activities contribute to the development of independent reading and language learning." (p. 1)

Absolute self-selection, however, can prove to be problematic when students choose unsuitable materials; for example, selecting texts of levels which are inappropriate for improving language competence (e.g., gaining fluency and vocabulary development). The key element here, therefore, lies in the role of the teacher as the guiding factor. According to Mulling (1995), for the very reason that absolute self-selection results in the selection of inappropriate texts for language learning and development, students should ideally select their reading materials subject to the teacher's approval – in tandem with Susser and Robb's (1990) position that in a reading programme, one of the teacher's roles rests in guiding the students towards appropriate books which aid in the development of language skills.

Time and silence are also of essence in motivating students to read, and to continue reading. Susser and Robb (1990) noted that the practice of setting aside time in class for silent reading is alive and well, and that most language instructors continue to advocate the practice. When students are allowed time to read silently at their own pace, it develops positive attitudes towards reading, and fosters in them a lifelong habit of reading for both information and pleasure. Researchers have consistently maintained the importance of giving students time to read at their own speed and pace (Ivey and Fisher, 2005; Day and Bamford, 1998), as well as the necessity of having a quiet and comfortable environment conducive to uninterrupted reading (Ganz, 2012; Pilgreen, 2000).

1.4. Research Problem and Objective

In 2005, a study conducted by Malaysia's Economic Planning Unit revealed nearly 60,000 Malaysian graduates to be unemployed because of their poor command of English and lack of good communication skills (New Straits Times, 10 November 2005; Reuters, 3 November 2005).

In the Malaysian education system, English was the main medium of instruction until the Education Enactment Bill was passed in 1971. The Malay language, Bahasa Malaysia, was then introduced as the medium of instruction. By 1981, the change was completed and all subjects were taught in Bahasa Malaysia with the English language retained and taught as one of the subjects in the curriculum.

A steady decline in the standard of English among learners in the country soon followed and voices of dissatisfaction have since been consistently heard among the public via various media and educational forums (The Star, 11 September 2008).

According to a Bloomberg News report (6 December 2006), a lack of proficiency in the English language is not only causing unemployment among Malaysian graduates, but also hindering them from making the most of their degrees. Universities are now producing graduates who do not make the grade in the workforce. In a country with 237,000 job vacancies, about 45,000 graduates are unemployed mainly because of poor English, according to the Malaysian government. In addition, more than half of 3,800 recruiters and managers surveyed by an online recruitment company, Jobstreet, cited poor English as the reason for rejecting graduates.

There exists an urgent need to address this; for intervention methods to be explored and applied in efforts to help Malaysian learners achieve a higher level of proficiency in the English language. The primary aim of this research was to find out if Malaysian undergraduates find SSR interesting, if they are motivated by the approach, and if they would like to have it incorporated into their English language course structure. As mentioned, while SSR is advantageous to language learners, effective implementation and integration of such a programme still depends largely on the discernments of those who stand to benefit the most from it.

2. Methodology

2.1. Sample and Instrument

It is to be noted that this present study was conducted with a reduced sample size, due to its purpose and function as an initial evaluation. A total of 123 participants were involved, all of them first year Malaysian undergraduates undergoing a remedial English language course (LMT 100 – Preparatory English) at Universiti Sains Malaysia. The participants, randomly selected, underwent an intervention period for half an academic semester whereby they experienced SSR once a week for seven weeks, with each session lasting 20 minutes (the duration recommended by SSR researchers and practitioners).

Prior to the commencement of the intervention period, the teachers in charge of the participants were comprehensively briefed on the aims as well as the rationale of the research. Several aspects pertaining to ownership/self-selection, time and silence (as described in *1.3.*) were duly emphasised to ensure not only proper execution, but also effective implementation of the programme.

A two-part survey questionnaire was designed for this study. In the first section, the participants were asked for demographic details while the second portion comprised statements specifically designed to capture the participants' perceptions regarding the SSR programme. The items in the second portion were measured via the use of a five-point Likert scale. All of the participants were required to fill in the questionnaire in class upon completion of the SSR programme.

2.2. Research Questions

This study was guided by the following research questions:

R1   Does SSR help to increase students' enjoyment of reading?

R2   Does SSR help to increase students' motivation to read?

R3   Does SSR help to increase students' reading abilities?

R4   What are the students' attitudes towards SSR?

3. Findings

3.1. SSR and Reading Enjoyment [Survey questions 1-5, 17]

An overwhelming majority of the participants responded that they would like to experience more SSR sessions in class. 76% either agreed or strongly agreed that they liked silent reading, the calm setting of an SSR session and the fact that they were allowed to select their own reading materials. 18% of the participants formed the neutral group while the remaining 6% indicated that they did not enjoy SSR. Refer to Table 1.

Table 1. Does SSR help to increase students' enjoyment of reading?

YES	NEUTRAL	NO

| 76% | 18% | 6% |

3.2. SSR and Motivation to Read [Survey questions 18-20]

Having undergone SSR, most of the participants – 85% in total – either agreed or strongly agreed that they were motivated to read more, that they were more inclined towards recreational reading in the future, and that more students should be given the opportunity to experience SSR. The remaining 15% remained neutral for all three instances. Refer to Table 2.

Table 2. Does SSR help to increase students' motivation to read?

YES	NEUTRAL	NO
85%	15%	–

3.3. SSR and Reading Abilities [Survey questions 7-11]

84% of the participants indicated that with SSR they found they had more time to figure out and recognise more words. They also found that SSR has enabled them to read better and comprehend better what they read, and that they needed less help with their reading. 13% of the participants remained neutral while 3% indicated disagreement and strong disagreement with regards to SSR improving their reading abilities. Refer to Table 3.

Table 3. Does SSR help to increase students' reading abilities?

YES	NEUTRAL	NO
84%	13%	3%

3.4. Attitudes towards SSR [Survey questions 12-16]

Generally, the responses recorded indicated positive attitudes towards SSR. Almost 80% of the participants stated that when reading in an SSR setting they felt more comfortable, confident and relaxed. They also did not find reading to be a difficult task, and did not experience any feelings of stress or pressure. Around 20% of the participants, however, remained neutral. Refer to Table 4.

Table 4. What are the students' attitudes towards SSR?

YES	NEUTRAL	NO
79.5%	20.5%	–

4. Conclusion

Based on the analysis of data collected, the researchers found that the students enjoyed SSR and that those engaged in the programme did not merely experience increased motivation to continue reading, but also experienced confidence and ease in reading on top of improvements in their reading abilities. This supports the findings of previous research (e.g., Bowermaster, 1996; Pilgreen and Krashen, 1993; Pyle, 1990; Dionisio, 1989; Oberlin and Shurgarman, 1989; Farrel, 1982).

However, despite a sizeable number of advocates who affirm that SSR works, there are studies, such as those carried out by Dwyer and Reed (1989) and Herbert (1987), which suggest otherwise. A survey by Herbert (1987) drew responses that were largely negative towards SSR, in that students did not like it and did not feel that it improved their reading skills.

This present study has produced encouraging findings which indicate that our undergraduates in general enjoy SSR and show positive effects from it. The use of SSR in the language classroom appears to generate in them the interest to read and more importantly, the motivation to continue reading, one of the chief aims of SSR.

Therefore, the researchers feel justified in putting forth the recommendation that SSR be incorporated into the course structure of LMT 100. As aptly put by one of the students who took part in the study – "I think more of SSR is necessary. A lot more."

Survey Questionnaire on Sustained Silent Reading

Indicate the following by ticking (✔) the appropriate box / filling in the blanks provided

Gender

□ Male   □ Female

Race

□ Malay   □ Chinese   □ Indian   □ Others (specify): _____

MUET score

□ Band 1   □ Band 2   □ Band 3

School (in USM): _____

Age: _____

Indicate the following by ticking (✔) the appropriate box

Is this the first time you have experienced Sustained Silent Reading?

□ Yes   □ No

Would you like to have more Sustained Silent Reading sessions in class?

□ Yes   □ No   □ Neutral

State your agreement by ticking (✔) the appropriate box (Questions 3 – 20)

1–Strongly Disagree (SD)

2–Disagree (D)

3–Neutral (N)

4–Agree (A)

5–Strongly Agree (SA)

		1–SD	*2–D*	*3–N*	*4–A*	*5–SA*
3.	I like Sustained Silent Reading					
4.	I like the calm setting of a Sustained Silent Reading session					
5.	I like it that I get to choose my own reading materials					

When I do Sustained Silent Reading:

		1–SD	*2–D*	*3–N*	*4–A*	*5–SA*
6.	I can concentrate / focus better					
7.	I find that I have more time to figure out words					
8.	I find that I recognise more words					

9.	I understand better what I am reading					
10.	I need less help than I used to					
11.	I feel that I can read better					
12.	I feel more comfortable because no one is listening to my reading

LE SENTIMENT D'EFFICACITÉ PERSONNELLE EN TANT QUE FORMATEURS D'ADULTES CHEZ DES CONSEILLERS PÉDAGOGIQUES

Claire Duchesne[41]

University of Ottawa, 145 Jean-Jacques-Lussier, Ottawa (On), K1N 6N5, Canada

Résumé

Le travail des conseillers pédagogiques est complexe et peu documenté. Leurs principales fonctions relèvent de l'accompagnement et de la formation des enseignants des écoles et des collèges; pourtant, malgré qu'ils se soient démarqués par leur compétence élevée en matière d'enseignement aux jeunes, très peu d'entre eux possédaient de l'expérience en formation des adultes avant leur entrée en poste. Des recherches ont démontré que les conseillers pédagogiques rencontrent des défis d'importance dans leur pratique, notamment en ce qui concerne leur relation aux enseignants qu'ils ont pour mandat d'accompagner et de former. Notre recherche s'est intéressée à comprendre et à décrire les représentations que des conseillers pédagogiques se font de leur efficacité personnelle en tant que formateurs d'adultes. Onze conseillers pédagogiques ont accepté de témoigner de leur expérience à cet effet lors d'entrevues semi-dirigées. Cet article exposera les résultats issus de l'analyse des données recueillies.

Sentiment d'efficacité personnelle; conseillers pédagogiques; formateurs d'adultes; représentations.

Introduction

Le Canada compte un palier de gouvernement fédéral responsable des dossiers d'intérêts nationaux, mais également un palier de gouvernement provincial pour chacune de ses provinces ou territoires, duquel relève, entre autres, le domaine de l'éducation. C'est donc dire qu'en fonction de ses dix provinces et trois territoires, le Canada regroupe 13 ministères ou départements de l'Éducation opérant indépendamment les uns des autres. D'un océan à l'autre, l'éducation élémentaire s'étend du préscolaire jusqu'à la 6e ou à la 7e année et le secondaire se poursuit jusqu'à la 11e ou à la 12e année (selon les provinces ou les territoires); le lycée n'existe pas et les étudiants intègrent directement le collège ou l'université après le secondaire. Les écoles élémentaires et secondaires sont regroupées par régions géographiques à l'intérieur de chaque province ou territoire et sont soumises à l'autorité des conseils scolaires (ou commissions scolaires, pour le Québec). Le niveau collégial (dispensant des programmes professionnels et préuniversitaires) et le niveau universitaire constituent des paliers d'éducation postsecondaire gouvernés directement par le ministère de l'Éducation de la province où ils sont situés.

Les conseillers pédagogiques (CP) qui oeuvrent dans les conseils scolaires et les collèges canadiens, comme leurs confrères de certains pays européens, ont pour fonction d'offrir un accompagnement pédagogique et de la formation continue aux enseignants (Alin, 2008; Chalies, Flavier et Bertone, 2007; Draelants, 2007; Gagnon, 2010; Houle et Pratte, 2003; Lessard, 2008). Outre leurs fonctions d'accompagnateurs et de formateurs d'adultes en milieu de travail, les CP ont la responsabilité de développer les programmes de formation qu'ils dispensent aux enseignants. Ils peuvent également être invités à assurer la coordination de communautés d'apprentissage professionnel auprès de groupes spécifiques d'enseignants, à agir comme consultants en matière de stratégies d'enseignement et de ressources didactiques de même qu'à assurer la transmission des orientations, des politiques et des pratiques préconisées par le ministère de l'Éducation ou par la structure administrative qui les emploie. Les CP se présentent tels des leaders pédagogiques, porteurs de nombreux dossiers qu'ils opérationnalisent à travers diverses tâches; ce sont des agents de changement assurant le lien entre les décideurs du milieu de l'éducation et ses praticiens (Lessard, 2008; Orianne et Draelants, 2010). Ils sont généralement

[41]claire.duchesne@uottawa.ca

.

issus du corps enseignant, duquel ils se sont distingués par leur expertise et leurs compétences professionnelles dans une matière ou un domaine précis (Draelants, 2007).

Le travail du CP comporte de nombreux défis dont les principaux se rapportent à la formation et à l'accompagnement des enseignants, de même qu'aux relations qu'ils tissent avec ces derniers. L'absence de dispositif formel de formation pour les CP (Gagnon, 2010; St-Pierre, 2005) particulièrement en ce qui concerne la formation des adultes (Lessard, 2008), la nécessité d'établir les frontières de leur fonction et de préciser leur identité professionnelle (St-Pierre, 2005), le besoin d'être considérés crédibles et dignes de confiance par les enseignants plus expérimentés, pour les jeunes CP, et de surmonter la résistance au changement exprimée par des enseignants manifestant une attitude défensive (Draelants, 2007) constituent les enjeux majeurs auxquels font face ces professionnels.

Le sentiment d'efficacité personnelle

Le concept d'autoefficacité, appelé également sentiment d'efficacité personnelle (SEP), constitue l'une des contributions majeures d'Albert Bandura à la théorie sociale cognitive. Le SEP concerne les jugements et les croyances qu'entretient la personne à propos de ses compétences et de son rendement dans un domaine précis (Bandura, 1977). Il détermine le choix des actions de celle-ci et influence son attitude avant, pendant et après sa performance. Autrement dit, plus la personne croit en sa capacité d'accomplir une action ou une tâche avec succès, plus ses possibilités de réussite sont augmentées puisqu'elle aura tendance à choisir les comportements les plus appropriés, à pratiquer l'autorégulation et à persister jusqu'à la fin. Le processus inverse, selon Bandura, peut également se produire : c'est-à-dire qu'une faible croyance dans sa capacité à réaliser une action ou une tâche risque de conduire l'individu à adopter des comportements moins efficaces et à manifester un engagement plus faible, à abandonner plus rapidement devant les obstacles et, au bout du compte, à obtenir un rendement médiocre (Lecompte, 2004).

Le conseil pédagogique est méconnu du grand public et l'est parfois même au sein de l'organisation scolaire qui l'emploie. Les CP ont pourtant des responsabilités importantes en ce qui concerne le développement professionnel des enseignants et, de ce fait, ils ont un impact non négligeable sur la qualité des enseignements dispensés dans les écoles et les collèges. La question de leur compétence, mais également celle de leurs représentations de celle-ci, méritent d'être prises en compte par la recherche autant que par le milieu de l'éducation. En effet, une personne qui a un sentiment élevé d'efficacité personnelle manifestera une motivation au travail plus forte (Ryan et Deci, 2005) résultant en un engagement plus marqué envers sa profession (Duchesne, Savoie-Zajc, et St-Germain, 2006). Dès lors, notre recherche s'est proposé de répondre à la question suivante : *Quelles représentations des conseillers pédagogiques se font-ils de leur sentiment d'efficacité personnelle en tant que formateurs d'adultes?*

Méthodologie

Au cours de l'automne 2011, onze conseillers pédagogiques à l'emploi d'un conseil scolaire francophone de l'Ontario, soit huit femmes et trois hommes, ont accepté de participer à la recherche. Au moment de la collecte de données, ces derniers étaient âgés de 34 à 56 ans (m = 43) et ils avaient cumulé de 6 à 30 années d'expérience totale (m = 16) dans le domaine de l'éducation, dont 1 à 9 années (m = 4,6) en tant que CP. Tous possédaient un

minimum de deux diplômes universitaires dont le baccalauréat en éducation, obligatoire pour tous les enseignants canadiens. En outre, cinq d'entre eux détenaient une maîtrise en éducation, ou étaient en cours de formation.

La collecte de données s'est effectuée lors d'une entrevue semi-dirigée d'une durée approximative de 90 minutes. Les entretiens de recherche ont porté essentiellement sur les représentations du sentiment d'efficacité personnelle des CP en tant que formateurs d'adultes. Certaines des questions qui leur ont été posées les ont incités à témoigner des expériences vécues, par exemple : *Pouvez-vous donner l'exemple d'une situation au cours de laquelle vous vous êtes senti particulièrement efficace? À quoi - quel facteur, quelle source - attribuez-vous votre sentiment d'efficacité dans cette situation?* D'autres questions favorisaient l'analyse de leur expérience et visaient à connaître leurs points de vue sur ce sujet, par exemple : *Avez-vous observé des différences du point de vue relationnel, contextuel ou pédagogique entre vos expériences antérieures d'enseignement aux jeunes et votre expérience actuelle d'enseignement aux adultes?* Les données ont été analysées à partir de la méthode inductive issue de la théorisation ancrée telle que décrite par Strauss et Corbin (1990).

Résultats

Tous les participants à l'étude ont été conviés à évaluer leur niveau de SEP à partir de l'adaptation du questionnaire de Schwarzer et Jerusalem (1995) comportant dix questions. Les scores obtenus ont ainsi révélé que six des CP rencontrés avaient un SEP élevé (m = 90%), deux avaient un SEP moyen (m = 81%) alors que les trois autres avaient un SEP plutôt faible (m = 68%). Lorsque l'on compare ces résultats au nombre d'années d'expérience en tant que CP des participants, on remarque que tous ceux qui ont présenté un SEP élevé comptaient un nombre égal ou supérieur à la moyenne de 4,6 années d'expérience. Pour leur part, quatre des cinq participants présentant un SEP moyen ou plutôt faible avaient cumulé moins d'années d'expérience que cette moyenne. Une seule participante, ayant cinq années d'expérience en tant que CP, a présenté un SEP plutôt faible; lors de l'entrevue, celle-ci a expliqué qu'elle avait tendance à être sévère envers elle-même et que si, par exemple, c'était sa collègue de travail qui avait procédé à son évaluation, elle lui aurait sans doute attribué un score plus élevé. Il est en outre intéressant de constater que lorsqu'on leur a demandé s'ils se sentaient plus efficaces dans leur tâche actuelle de formateurs d'adultes que dans leurs fonctions antérieures d'enseignants auprès des jeunes, cinq des six participants présentant un score élevé de SEP ont affirmé se sentir *autant* ou *plus* efficaces en tant que formateurs d'adultes alors que quatre des cinq CP présentant un score moyen ou plutôt faible ont révélé se sentir *moins* efficace dans ce contexte.

Ce premier niveau d'analyse nous permet de constater le lien étroit qui existe entre le nombre d'années d'expérience dans la profession de CP et le sentiment d'efficacité personnelle. Nos résultats indiquent qu'au-delà de la *qualité* des expériences professionnelles vécues, la *quantité* de celles-ci influence elle aussi le niveau de SEP. Cependant, comme en a témoigné l'une des participantes, il peut aussi arriver que malgré un nombre important d'expériences positives, l'interprétation personnelle qui en résulte demeure défavorable aux yeux de la personne, ce qui tend à confirmer la position de Bandura a l'effet que le SEP ne concerne pas l'efficacité *réelle* manifestée par cette dernière, mais celle qu'elle *croit* posséder.

Se sentir efficace en tant que formateurs d'adultes

Les CP que nous avons rencontrés ont été invités à s'exprimer sur les situations associées à leurs fonctions qui généraient pour eux un sentiment d'efficacité. Justine a déclaré se sentir efficace lorsqu'elle arrive à résoudre les problèmes qu'elle rencontre, alors que Lisa a estimé que d'être une personne structurée dans son travail lui

permettait de se sentir efficace. Gabrielle et Antoine, pour leur part, voient leur SEP rehaussé lorsqu'ils ont l'impression d'être utiles, d'avoir apporté une réponse aux besoins qui leur ont été exprimés.

Dans leur rôle de formateurs d'adultes auprès des enseignants, les CP avec lesquels nous nous sommes entretenus ont fourni d'autres exemples d'expériences ayant contribué à développer leur SEP. Zoé relate ici le cas d'une intervention dont les répercussions se sont manifestées au-delà de l'effet escompté :

Dans un atelier que j'anime et où je laisse le droit de parole aux gens de façon à ce qu'ils s'aident entre eux; être capable de devenir le médiateur et de relancer cette notion de partage, et que ça roule de façon à ce qu'il y ait de l'entraide et d'atteindre mon objectif non seulement pour moi, pour ce que je présente, mais pour ce que les gens ont investi, puis de revoir [éventuellement] *ces gens-là, de voir qu'ils sont encore accrochés à ça et qu'il s'est créé un réseautage, ça c'est fantastique et je me sens vraiment efficace.*

Marion apprécie la confiance que lui témoignent les enseignants qu'elle accompagne lorsqu'ils lui font part de leurs insécurités face à leur travail et elle en tire une forme de valorisation personnelle :

[…] j'aime le fait que je peux être à l'écoute de ces gens-là et possiblement avoir un impact positif parce que s'ils me font part d'une inquiétude et que je suis capable ensuite d'en discuter avec eux et qu'on puisse s'ajuster après, j'ai comme l'impression que je les aide à mieux travailler […]

Des CP ont parlé de l'importance d'établir des relations fructueuses avec les enseignants qu'ils forment et qu'ils accompagnent dans le but de maintenir leur SEP. Ils sont conscients que leur position d'anciens enseignants devenus conseillers pédagogiques les place dans un rapport professionnel délicat, mais pouvant également susciter un sentiment de sécurité réciproque, comme l'exprime Lisa : *Les enseignants que je reçois en formation sont des collègues. Il y en a avec qui j'ai travaillé dans des écoles donc, avec ces personnes-là, il y a un lien d'amitié.* Gabrielle, quant à elle, prône un certain respect : *[…] tu ne peux pas prendre les enseignants comme des gens qui sont incompétents. Ils ont de l'expertise, ils ont de l'expérience et il faut vraiment les traiter comme des experts.* En outre, elle voit dans cette relation une occasion de vivre des rapports de confiance, d'égalité et de réciprocité.

Les défis que posent les apprenants adultes

Les participants ont admis avoir appris, au cours de leur mandat de CP, a percevoir les différences entre la formation des jeunes et celle destinée aux adultes, à ajuster leurs pratiques éducatives et, conséquemment, à développer leur SEP en tant que formateurs d'adultes. Hugo mentionne certaines adaptations auxquelles il a dû procéder, telle que de rentabiliser au maximum le temps destiné aux formations. Des participantes ont donné, pour leur part, des exemples éloquents de situations lors desquelles le comportement de l'apprenant adulte s'apparente à celui d'un adolescent et pour lesquelles le CP doit adopter une intervention appropriée :

[…] les adultes avec qui je travaille, c'est des anciens collègues; […] je ne peux pas leur dire «ben regarde…». Comme aujourd'hui, on avait une participante qui n'arrêtait pas de parler en même temps que nous, des fois, on fait...on marche un peu puis on s'en va en arrière [de la salle], *puis on se place à côté de la personne, mais je ne me verrais vraiment pas dire à une enseignante «c'est assez là, arrêtez de parler».* (Lisa)

La gestion de classe est très différente parce qu'[avec les jeunes], *je n'aurais senti aucun malaise à dire à un élève de ranger son dessin; mais quand un prof vient* [en formation] *puis qu'il sort sa correction, il faut que je lui dise, mais je ne peux pas lui dire avec la même assurance. Ça c'est très embêtant.* (Marion)

D'autres participants ont également évoqué le stress qu'ils ont ressenti, lors de leur entrée en fonction, à l'idée de préparer des formations pour une population adulte possédant un bagage de connaissances et d'expériences professionnelles bien établi. Les CP se sont montrés sensibles au regard et au jugement que les apprenants adultes posent sur leurs compétences de formateurs ou d'accompagnateurs. Jade et Marion estiment

important de ne pas être perçues comme menaçantes par les enseignants qu'elles accompagnent, aussi accordent-elles une grande importance à l'accueil, à l'ouverture et à l'accessibilité qu'elles leur témoignent.

Maxime, d'abord employé au sein d'un autre conseil scolaire, a reçu pour sa part un accueil plutôt tiède de la part des enseignants de la structure où il exerce actuellement en tant que CP :

Moi, je peux dire que quand je suis arrivé, franchement, c'était comme un cheveu sur la soupe, qu'ils disaient. C'est vrai. La plupart des conseillers ont travaillé ici pendant 5-10 ans, donc ils connaissent quand même le milieu. Alors, moi, je viens d'arriver, je suis tout à fait nouveau. […] *Donc, quelque part, vous voyez, il y a une certaine distance qu'on a vis-à-vis de vous.*

Cette attitude de résistance de la part des enseignants envers les CP a également été observée par d'autres participants avec lesquels nous nous sommes entretenus. Sophie relate une expérience éloquente :

Quand on est allé présenter [le nouveau programme pédagogique]*, on était pour s'acheter des boucliers et entrer dans la formation avec des boucliers! Les gens nous attendaient 'avec une brique et un fanal'* […]*!*

Les CP ont tous vécu, à un moment ou à un autre de leur pratique professionnelle, des expériences plus ou moins difficiles auprès d'enseignants résistants ou fermés à leurs interventions. L'attitude négative de certains apprenants adultes constitue pour eux l'un des défis les plus préoccupants, comme l'illustrent ces témoignages :

Certaines personnes auront aussi la perception qu'ils connaissent tout et qu'ils n'ont pas vraiment besoin de [la formation]. *Y'a des personnes comme ça. Et ça se voit dans l'engagement de la personne dans les rencontres; quand tu vois quelqu'un qui s'absente souvent ou qui n'est pas patient...* (Antoine)

Tu sens qu'ils ont une idée derrière la tête, c'est comme des petits pièges qu'ils te tendent pour te tester. […] *vous savez, personnellement, quand je vais dans une conférence ou une formation, ça peut être très théorique, je peux trouver que non, c'est pas véritablement ça que j'attendais, mais malgré cela, il y a quand même quelque chose qui peut être très profitable pour moi. Donc, je pense qu'il y a ce manque de flexibilité et cette intransigeance, des fois, de la part de certains enseignants, une attitude très négative d'ailleurs.* [Maxime]

Même s'ils rencontrent parfois des obstacles issus des relations qu'ils établissent avec certains enseignants, les CP ont cependant souligné que ce sont les tâches directement associées à la formation et à l'accompagnement de ces derniers qu'ils préfèrent, bien avant leurs responsabilités administratives ou le travail qu'ils effectuent à partir de leur bureau. Être sur le terrain, c'est-à-dire intervenir directement auprès des enseignants dans le but de contribuer au développement des compétences de ces derniers, constitue la source de SEP la plus importante pour les participants à l'étude.

Conclusion

Le sentiment d'efficacité personnelle d'un individu est directement lié à la compétence effective de celui-ci puisque, comme le souligne Bandura, la croyance qu'entretient la personne face à son rendement l'incitera à faire des choix et à poser des actions qui influenceront directement l'efficience de ce rendement. Le SEP constitue, dès lors, une composante d'importance qui doit être prise en compte par les organisations préoccupées par la qualité des services qu'elles dispensent.

Les conseillers pédagogiques qui ont contribué à notre étude ont offert des témoignages éloquents sur les défis rencontrés dans leur travail auprès des enseignants qu'ils ont pour fonction de former et d'accompagner. L'attitude de ces derniers à leur égard influence fortement leurs actions de même que leurs conceptions de leur

travail et, éventuellement, leur jugement à propos de leur efficacité. Ce constat nous amène à questionner la formation reçue par les CP dans le domaine de la formation aux adultes et l'accompagnement professionnel dont ils bénéficient à cet égard. Les travaux à propos du sentiment d'efficacité personnelle de même que les résultats de la présente recherche suggèrent que plus le SEP des CP sera élevé, plus grande sera leur efficacité réelle dans leurs fonctions. Dès lors, une attention particulière à cet aspect de la vie professionnelle des CP devrait être portée par les structures scolaires qui les emploient aussi bien que par la recherche qui, à l'heure actuelle, est peu développée dans ce domaine.

ÖZET

Sosyal paylaşım siteleri, bireylerin sanal ortamda bir araya gelerek bilgi paylaşımlarını amaçlamaktadır. Sosyal paylaşım sitelerini popüler yapan en önemli nedenler; bireylerin iletişim kuramadıkları eski arkadaşlarını bu platformda bulabilmeleri, çeşitli nedenlerden dolayı yüz yüze iken ifade edilemeyen bazı duygu, düşünce ve fikirlerin sanal ortamda daha cesurca ifade edilmesi ve fiziksel olarak aynı ortamda olunmasa bile birden fazla kişinin duygularını bu platformlarda herkese açık olarak paylaşabilmesidir. Sosyal paylaşım sitelerinin oldukça yaygınlaşması ile beraber, bireyler zamanlarının önemli kısmını bu sitelerde geçirmektedirler. Sosyal paylaşım ağlarının lise öğrencileri ve diğer bireyler arasında bu derece yaygın kullanımı sonucu ortak yeni bir bilişim kültürünün ortaya çıkmasını sağlamıştır. Fotoğraf yükleme, müzik yükleme, resim ve müzik paylaşma ve bunlara yorum yapma, kelimelerin kısaltılarak yazılması, bazı özel kelimelerin bir kaç kelimeden oluşması gereken soruları karşılaması bu kültüre örnek teşkil etmektedir. Bu çalışma ile lise öğrencilerinin sosyal paylaşım sitelerini ne amaçla kullandıkları ve bunun bir kültür olarak ortaya çıkış süreci araştırılmaktadır.

Anahtar Kelimeler: sosyal paylaşım, internet, paylaşılan unsur, web, kültür

The Usage Purpose of Social Network Sites of High School Students and Social Network Elements

Abstract

Sites of social networking aim are to share information by gathering people in virtual environment. The most important reasons of making these social networks are old friends that a person can't contact, because of many reasons, expressing the emotions, idea and thoughts in virtual environment bravely, which can't express face to face and even though they are not in the same physical environment, more than one person share their emotions with everyone at the platform. Together with the widespread use of social networks, people spend their important time in those sites. The use of social Networks among high school students and other people so much, emerged a new informative culture. Uploading pictures, music, sharing picture and music and comments on them, writing the words in short, the forming of some special words from a couple of words and their fulfilling the questions are some examples. With this study, the reasons of using social networking sites for what purpose and emerging this as a culture has been searched.

Key Words: social share, internet, shared element, web, culture

Giriş

Sanal ortam; gerçek ortam ile simgesel alan arasında kalan bir ortamdır (Kırcelli, 2011). Her ne kadar sanal ortam bizlere büyük avantajlar sağlayarak hayatımızda önemli bir yer tutsa da, gerçek fiziksel ortamdan vazgeçilememiştir, vazgeçilemeyecek gibi de görünmektedir. Nitekim insanlar sanal ortamları gerçek fiziksel ortamlar için bir araç, bir geçiş olarak kullanmaktalar veya gerçek fiziksel ortamda gerçekleşen olayları sanal ortamlar ile kolaylaştırmaya çalışmaktadırlar. Sosyal paylaşım, kişiler arası olsun gruplar arası olsun 21.yüzyılın en önemli iletişim araçlarından biridir. Sosyal paylaşım siteleri, sanal ortamda bir araya gelmeye çalışan milyonlarca insanı buluşturur. İnsanların bir araya gelmesi için okulda, işyerinde, evde, tatilde olmasının hiçbir önemi yoktur. Bu platform aracılığı ile bilgi ve deneyimler, günlük yaşantıları, arkadaşlıkları geliştirme, yemek yapma, sportif konular, ürünlerin pazarlanması, mesleki gelişim gibi bir çok konuda paylaşımda bulunulabilir. Konular, hayal dünyamızın elverdiği ölçüde çeşitli ve zengindir (whatissocialnetworking.com, 2012). Sosyal paylaşım siteleri aracılığı ile sisteme kayıtlı olan herkes birbirlerinin profillerini izin verilen ölçüde görebilir, arkadaşlık teklif edebilir, mesaj gönderebilir, yazılı, görsel ve sesli yayınlara yorum yaparak yayınları gören herkesin bu mesajları görmesi sağlanabilir. Ayrıca bu siteler aracılığı ile gruplar kurulabilir, insanlar bu gruplara üye olabilir, grup yöneticileri üyeler ile iletişim kurarak onları örgütleyebilir, yönlendirebilir. Sosyal paylaşım sitelerinin, özellikle uzun zamandır birbirleri ile irtibat kuramayan bireyleri tekrar iletişime geçirmesi, eğitim – öğretim v.b. gibi olumlu amaçlar için kullanılabilmesi, gruplar aracılığı ile daha seri ve etkili bir şekilde iletişim sağlaması bir avantaj olarak görülebilir. Fakat belki de site üyelerinin dahi farkında olmadıkları güvenlik tedbirsizlikleri, kullanıcı bilgilerinin ifşa edilmesi, üyelerin yayımlarının başkaları tarafından kopyalanıp, montajlanıp, farklı amaçlar için kullanılabilmesi de bu sitelerin dezavantajlarını göstermektedir. Yaygın olarak kullanılan Facebook, Twitter, Myspace, LinkedIn gibi sosyal paylaşım sitelerini kullanım amaçları, toplumlara göre değişiklik gösterebilmektedir. Bunun nedeni toplumun kültürü ile ilgilidir. Nitekim sosyal paylaşım siteleri, kullanıcıları arasında ortak bir iletişim kültürünün oluşmasını sağlamaktadır. Bu sitelerin kullanımı özellikle son yıllarda müthiş derecede artış göstermiştir. Bu siteleri kullanıcılar için yeni toplumsal alanlar, iletişim kanalları ve çevreleri oluşturmuştur. (Şener, 2009). Günümüz itibari ile sosyal paylaşım siteleri arasında 31,526,380 kişilik kullanıcı sayısı ile facebook ilk sırada yer alırken, Türkiye kayıtlı facebook kullanıcı sayısı bakımından bakıldığında dünyada 6.sırada yer almaktadır (checkfacebook.com, 2012). Teknolojideki hızlı gelişme, internet teknolojilerinin yaygınlaşmasına ve dolayısıyla yeni iletişim tekniklerinin oluşmasına neden olmaktadır. Sosyal paylaşım ağları bunun bir göstergesidir (Kalaman, 2011). Sosyal paylaşım sitelerinde kişisel bilgilerin ve belgelerin başkaları tarafından paylaşılarak özel hayatın ihlal edilmesi suçu işlenebilmektedir. Gizlilik ayarlarının yapılmaması veya eksik yapılmasından dolayı kişisel bilgiler ve profile eklenen resim, video, metin ifadeleri başkaları tarafından ele geçirilebilmekte ve bu belgeler pornografik sitelerde kötü amaçlı kişiler tarafından reklam unsuru olarak kullanılabilmekte ve mağdurlar durumu mahkemelere taşımaktadırlar (Kalaman, 2011). Zaten dünyadaki tüm sosyal paylaşım sitesi üyelerinin bilgileri ilgili sitelerin sunucularında saklanmaktadır. Yani tüm kullanıcıların gizlediklerini sandıkları tüm bilgi ve belgeleri site yöneticileri tarafından bilinmektedir. Bu bilgilerin istihbaratlara servis edilmediğinin de garantisini kimse veremez. Twitter başta olmak üzere sosyal paylaşım sitelerini politikacıların, siyasetçilerin, iş ve sanat dünyasının temsilcilerinin de yaygın bir şekilde kullandıklarını görmekteyiz. Sanal ortamın avantajlarından faydalanmak isteyen ünlü isimler, bu yolla daha geniş kitlelere hitap etme imkânı bulabilmektedirler. Sosyal paylaşım sitelerinin eğitim amaçlı kullanılabileceği de kullanım amaçlarına örnek olabilir. Göktaş ve Kalafat (2011), öğrencilerin %88 inin Facebook'un öğrenmelerine katkısı olduğunu düşündüklerini tespit etmişlerdir. Fakat ortaöğretim öğrencilerinin çoğunun bu siteye eğlence amaçlı girdiği ve mümkün olan her fırsatta öğrencilerin bu siteye girerek arkadaşlarının gönderilerini kontrol etme, yorum yapma ve gönderide bulunma eğiliminde oldukları tespit edilmiştir (Belin, 2011). Gülüm (2009) tarafından yapılan araştırmaya göre; ankete katılanların % 27.2' sinin Facebook arkadaş listesinde 100-200, % 20.2'sinin 50-100, % 19.8'nin 300-500, % 19.4'ünün 200-300, % 13.3'ünün ise 500'den fazla arkadaşı bulunmaktadır. Yani, kullanıcıların yarıdan fazlasının (% 52.5) arkadaş sayısı, 200'den fazla ve Facebook dünya ortalamasının da üzerindedir. Ortalama arkadaş sayısının yüksek olması, Türk toplumunun sosyal ilişkilere ve arkadaşlığa önem vermesinin bir sonucu olabilir.

Materyal Ve Metot

Sosyal paylaşım sitelerinin kullanım düzeylerinin, kullanım amaçlarının ve bu sitelerde yer alan unsurların belirlenmesi için görüşme formu hazırlanarak nitel veriler elde edilmiştir. Görüşme formunda ilk olarak öğrencilerin kişisel bilgilerine ait sorular yer almaktadır. Daha sonra en çok kullandığı sosyal paylaşım sitesi sorulup, sonraki sorular en çok kullandığı sosyal paylaşım sitesi temele alınarak ne amaçla kullandığına yönelik sorular sorulmuştur. Çalışma Adıyaman Anadolu Lisesinde öğrenim gören toplam 177 öğrenci üzerinde yapılmış olup ortaöğretimde öğrenim gören öğrencilerin sosyal paylaşım sitelerini kullanım düzeylerinin ve sosyal paylaşım sitelerini ne amaçla kullandıklarının belirlenmesi amacıyla yapılmıştır. Sorulan sorulara ilişkin verilen yanıtlar arasından aynı olanlar veya farklı şekillerde ifade edilen aynı cevaplar gruplandırılarak sorulara verilen cevap türleri belirlenmiştir. Her bir tür cevabın frekansı tespit edilip yüzdelik dilimleri hesaplanmıştır.

Bulgular

Tablo-1: Kişisel Bilgilere İlişkin Cevapların Dağılımı

Örneklemin Yaşa Göre Dağılımı		
Yaş	Frekans	%
14	8	4,5
15	33	18,6
16	75	42,3
17	54	30,5
18	7	3,9

Örneklemin Cinsiyete Göre Dağılımı		
Cinsiyet	Frekans	%
Erkek	96	54,2
Kız	81	45,8

Örneklemin Gelir Durumuna Göre Dağılımı		
Gelir	Frekans	%
500 TL ve daha az	15	%8,5
501 – 1000	51	28,8
1001 - 1500	18	10,1
1501 – 2000	54	30,3
2000 üzeri	39	22

Öğrencinin Sosyal Yapısına Göre Dağılımı		
Sosyal Yapı	Frekans	%
İçe Kapanık	10	5,6
Kendi Halinde	57	32,2
Girişken	99	55,9
Aşırı Sosyal	11	6,2

Araştırmaya katılan öğrencilerin kişisel bilgilerine ilişkin sorulara verilen yanıtlara göre öğrenciler, 14 – 18 yaş aralığında olup çoğunluğun 16 ve 17 yaş grubu öğrencilerden oluştuğu, cinsiyet bakımından öğrenciler % 54,2 oranında erkeklerden, %45,8 oranında kızlardan oluşmaktadır. Gelir durumuna göre en fazla 1501-2000 tl aralığında gelire sahip öğrenciler yer almaktadır. Öğrencilerin kendilerini sosyal bakımdan değerlendirmelerine yönelik soruya verilen cevaba göre, %55,9 oranında girişken öğrenciler çoğunluktadır.

Tablo-2: Sosyal Paylaşım Sitelerinin Kullanımına İlişkin Cevapların Dağılımı

En Sık Kullanılan Sosyal Paylaşım Sitesi		
Site Adı	Frekans	%
Facebook	154	87
Kullanmıyor	23	13
Katılımcıların Ne Zamandır Sosyal Paylaşım Sitesi Kullandıkları		
Süre	Frekans	%
1 yıldan az	31	20,1
1-2 yıl arası	54	35,1
2-3 yıl arası	42	27,3
3-4 yıl arası	15	9,7
4 yıldan daha uzun	12	7,8
Sosyal Paylaşım Sitesini Genel Kullanım Amacı		
Amaç	Frekans	%
Gönderilere Yorum Yap.	33	21,4
Video İzleme	14	9,1

	Frekans	%
Resimlere Bakma	19	12,3
Eski Arkadaşları Bulma	28	18,2
Paylaşımda Bulunma	26	16,9
Oyun Oynama	17	11
İletişim	12	7,8
Diğer	5	3,2

Sosyal Paylaşım Sitelerinde En Çok Paylaşılan Unsur

Unsur	Frekans	%
Resim	44	28,6
Müzik	27	17,5
Video	43	27,9
Önemli Haber	19	12,3
Anlık Düşünceler	17	11
Diğer	4	2,6

Sosyal Paylaşım Sitesine Bağlanma Süresi

	0 - 1 saat		1 - 2 saat		2 - 4 saat		4 - 6 saat		6 saat üzeri	
	N	%	N	%	N	%	N	%	N	%
Her gün	36	23,4	22	14,3	8	5,2	4	2,6	6	3,9
Her hafta	12	7,8	34	22,1	5	3,2	7	4,5	2	1,3
Her ay	3	1,9	4	2,6	1	0,6	-	-	-	-
1 aydan uzun	5	3,2	3	1,9	1	0,6	-	-	1	0,6

Sonuçlara göre katılımcılar sosyal paylaşım sitesi olarak sadece "Facebook" kullanmaktadırlar. Facebook kullanıcılarının çoğunluğu 1-2 yıldır siteye üye olduklarını beyan etmişlerdir. Yani genel olarak facebook üyeliği lise yıllarında başlamaktadır. Sosyal paylaşım sitesini kullanım amaçları bakımından gönderilere yorum yapma, paylaşımda bulunma ve eski arkadaşları bulma amaçlı kullanımların yoğun olduğu görülmektedir. En çok paylaşılan unsur olarak resim yayımlamadır. Bunu video, müzik ve haber yayımlama izlemektedir. Süre bakımından katılımcıların çoğunluğu günde 0-1 saat arası facebook a girmektedirler. Bu süreyi haftalık 1-2 saat arası kullanım izlemektedir.

Tablo-3: Sosyal Paylaşım Sitelerinin Değerlendirilmesi ve Bağlanılan Mekân

Sosyal Paylaşım Sitelerinin Okul Derslerine Katkısı

Katkı Var mı?	Frekans	%
Evet	9	5,1
Hayır	168	94,9

Sosyal Paylaşım Sitelerinin Özel Hayatı İhlali

İhlal Var mı?	Frekans	%
Evet	63	35,6
Hayır	99	55,9
Üyenin Kontrolünde	15	8,5

Sosyal Paylaşım Sitelerine Çoğunlukla Nereden Bağlandıkları

Mekân	Frekans	%
Evden	87	56,5
Okuldan	12	7,8
İnternet Kafeden	45	29,2
Diğer	10	6,5

Katılımcıların %94,9' u sosyal paylaşım sitelerinin okul derslerine herhangi bir katkısının olmadığını, %55,9' u sosyal paylaşım sitelerinin özel hayatı ihlal ettiğini düşünmektedirler. %56,5' i de sosyal paylaşım sitelerine evlerinden bağlanmaktadırlar.

Tartışma Ve Sonuç

Katılımcıların sadece facebook kullanıyor olmaları genel olarak facebook un kullanıcı kitlesinin yaygın olmasından, facebook kullanımının diğer sosyal paylaşım araçlarına göre pratik ve kullanımı kolay olmasından kaynaklandığı düşünülmektedir. 23 katılımcının herhangi bir sosyal paylaşım sitesi kullanmamasının nedenleri de internet erişimlerinin olmaması, özel hayatın gizliliğinin ihlali, bilgisayar ve internet kullanımı bilgisinden yoksun olma, sosyal paylaşıma ilgi duymama olabilir. Öğrenciler genel olarak 1 ile 3 yıllık bir sosyal paylaşım sitesi deneyimlerine sahiptir. Bu sonuç bireylerin ilk facebook ile tanışmasının ilköğretimin sonu veya ortaöğretimin ilk yılları çağlarına denk gelmektedir. Facebook kullanımının son yıllarda oldukça fazla artış göstermesi de bu sonuçta etkilidir. Gönderilere yorum yapma, yazılı, görsel, müzik bilgilerinin paylaşılması amaçlarıyla sosyal paylaşım sitelerinin kullanımı ortaöğretim öğrencileri arasında en yaygın kullanım amaçlarındandır. Yapılan yorumların, yayıncının ve yorumcunun tüm arkadaşları tarafından görülüyor olması yorumcuda herkese hitap ediyor hissi uyandırmaktadır. Yorumcu bunu dikkate alarak yorum yapar ve sanki kalabalık bir ortamda "herkes birbiri ile konuşuyor" kolaylığı sağlanır. Hangi saatte ve hangi mekânda olunursa olunsun bunun yorum yapma veya ileti yayımlamak için hiçbir önemi yoktur. Sosyal paylaşım sitelerinin kullanımının zaman ve mekândan bağımsız olması bu sitelerin kullanımının yaygın olmasında en büyük nedenler arasındadır. Kullanıcı, hoşlandığı yazı, resim, müzik, video gibi iletileri arkadaşları ile paylaşarak veya o anki düşüncelerini kendi profilinde yazarak adeta kendini ifade etmekte, kendi kişiliğini yansıtan bilgileri arkadaşlarına duyurarak kendisini gerçekleştirmektedir. Araştırma sonuçlarına göre katılımcılar en fazla resim, ardından video ve müzik iletileri paylaşmaktadırlar. Resim video gibi multimedya unsurları daha fazla duyuya hitap ettiğinden mesaj verilmek istenen kişide daha etkili ve kalıcı izler bırakmaktadır. Bu tür multimedya unsurları metinsel yorumlarla desteklenerek iletinin etkililiği artırılmaktadır. Kullanıcıların o anki düşüncelerini metin ile ifade etmeleri yoluyla kullanım oranı % 11' dir. Rakamın düşük olması, kullanıcıların kendilerini daha çok resim, video gibi multimedya unsurları ile ifade etmeyi tercih ettiklerinin göstergesidir. Ortaöğretim öğrencileri arasında çoğunluk, sosyal paylaşım sitelerine günde 1-2 saat arası süre ayırmaktadır. Bu süreyi haftada 1-2 saat izlemektedir. Sonuçlar bağımlılık derecesinde değildir fakat azımsanacak kadar az da değildir. Öğrenciler eğitimciler tarafından bilinçlendirilmeli, ilgili sitelerin kullanımı bilimsel yöne kanalize edilmeye çalışılmalıdır. Öğretmenler de sosyal paylaşım sitelerinde yer alarak öğrenciler ile arkadaşlık kurabilir, onlara eğitimsel iletiler paylaşabilir. Sınıf içi faaliyetlere web ortamında da devam edilebilir. Böylece bir tür uzaktan eğitim faaliyeti gerçekleştirilerek öğrenciler sosyal paylaşım sitelerinin ve internetin olumsuz etkilerinden korunmuş olacaktır. Ayrıca ebeveynler ve öğretmenler öğrencilere, onlar için yararlı olabileceğini düşündükleri sayfa veya grupları önererek yardımcı olabilirler. Fakat katılımcıların "sosyal paylaşım sitelerinin okul derslerine katkısı var mı?" sorusuna %94,9 oranında "Hayır" cevabını vermesi ebeveynlerin ve öğretmenlerin bu konuda öğrencilere yeterince yardımcı olamadıklarını göstermektedir. Öğrencilerin %55,9 oranında sosyal paylaşım sitelerinin özel hayatı ihlal etmediğini düşünmeleri, bilgilerin kimler tarafından nerelerde saklandığını bilmediklerinden veya resim gibi kişisel bilgi ve belgelerin üçüncü şahıslar tarafından kopyalanarak kötü maksatlı kullanıldığının farkında olmadığından kaynaklanabilir. %56,5 oranında katılımcılar sosyal paylaşım sitelerine evlerinden, %29,2 oranında internet kafeden, %7,8 oranında da okuldan bağlanmaktadırlar. İnternet bağlantılarının ekonomik oluşu, ebeveynlerin çocuklarını internet kafeler gibi evlerinin dışında bir mekâna internet için göndermek istememeleri ve bu nedenle evlerine internet ve bilgisayar almaları evde internete girme oranının yüksek olmasında etkilidir. Okullarda okulun internet hattından sosyal paylaşım sitelerine giriş, Milli Eğitim Bakanlığı'nın kararınca yasaklanmıştır. Öğrenciler cep telefonu, iphone v.b. gibi cihazlar ile bağlanıyor olabilirler. %7,8' lik oran bu durumdan kaynaklanabilir. Ortaöğretim öğrencilerinin sosyal paylaşım sitelerini kullanım amaçları ve kullanım süreleri yukarıdakilerden hangisi olursa olsun, bilinçli ve iradeli kullanıcı olmak gereklidir. Onları bu sitelerden tamamen yoksun bırakmak çözüm olamaz. Kullanıcıların etkileşim halinde olduğu büyüklerin öğrencileri bilinçlendirmesi, onları internet ve sosyal paylaşımın olumlu taraflarına yönlendirmeleri gerekmektedir.

Özet

LLP Erasmus hareketlilik programının amacı, Avrupa'nın farklı ülkelerindeki üniversiteler arasında öğrencilerin ve eğitimcilerin birbiri ile değişimleri sağlanarak üniversitelerdeki iyi uygulamaları Avrupa'nın bütününe yaymak ve karşılıklı fikir alışverişi ortamını oluşturmaktır. Bu kapsamda Erasmus hareketlilik programına katılmak isteyen öğrenci ve eğiticilerin programa başvurma ve yerleştirme işlemleri her üniversite için benzer süreçlerden oluşmaktadır. Bu benzer süreçleri bünyesinde barındıran bir çerçeve yazılımı geliştirmek her üniversitenin kendi Erasmus online başvuru sistemini en başından tasarlama zorunluluğunu ortadan kaldıracak ve gereksiz işgücü ve kaynak kullanımının önüne geçecektir. Bu çalışmada, üniversitelerin Erasmus hareketliliklerini düzenlemeye yönelik yazılım ihtiyaçlarını karşılayacak bir Erasmus Online Başvuru ve Bilgi Sisteminin geliştirilmesinde kullanılacak tasarım desenlerinin, sistemin tekrar kullanılabilmesi ve taşınabilmesine sağladığı katkılar üzerinde durulmuştur.

Anahtar Kelimeler: Erasmus, Öğrenci Hareketliliği, Personel Hareketliliği, Online Bilgi Sistemi, Tasarım Desenleri

Abstract

The purpose of the LLP Erasmus mobility program aims for creating a common base of mutual exchange of ideas and practices among universities of European countries . In this context, students and lecturers who want to participate in the Erasmus mobility program's application and placement process consists of similar processes for each university. In this context, enrollment and placement procedures Erasmus Mobility Program for participant students and lecturers are nearly similar among all universites. Developing a software framework that handles these similar processess prevent the unnecessary use of manpower and resources for design performances on creating their online Erasmus mobility programs. This study focuses on discovering principles of design patterns for reusability and portability of Erasmus Online Application and Information System used in Sakarya University.

Keywords: Erasmus, Student Mobility, Stuff Mobility, Online Information Systems, Design Patterns

Giriş

Bologna süreci kapsamında Avrupa Birliği hayat boyu öğrenme Erasmus programı, Avrupa'daki üniversiteler arası karşılıklı fikir alışverişi ve iyi olanı yayma anlayışını amaçlamaktadır (Ulusal Ajans, 2012). Avrupa Birliği Eğitim ve Gençlik Politikası, Avrupalılık bilinci oluşturmak ve Avrupa vatandaşlığı kavramını her bir Avrupalı bireye kazandırmayı hedeflemiştir (Üre, R., K., 2010; Tanyeri, 2006). Erasmus programı, belirtilen amaçları; üniversiteler arasında ülkelerarası işbirliğini teşvik ederek, öğrencilerin ve eğitimcilerin Avrupa'da karşılıklı değişimini sağlayarak ve programa katılan ülkelerdeki çalışmaların ve alınan derecelerin akademik olarak tanınması ve şeffaflığın gelişmesine katkıda bulunarak gerçekleştirmeye çalışmaktadır (Gümrükçü, 2006; Serbest, 2005). Bu karşılıklı değişim sadece öğrencileri değil öğretim elemanlarını hatta üniversite idari personeli de kapsamaktadır.

Erasmus programından yararlanmak isteyen adaylar, uzun bir süreçle karşılaşmaktadırlar. Başvuru yapma, sınava tabi tutulma, değerlendirilme ve yerleştirilme gibi adımlar sonucu kesin adaylar belirlenir. Bu işlemlerin hepsi uzun zaman alan işlerdir. Bu uzun süreçler karşılıklı değişim yapacak üniversiteler için büyük bir sorun haline gelmiştir. Üniversitelerin uluslararası ilişkiler ofisi personeli tarafından yürütülen bu zorlu süreçler programa başvurmak isteyen adayların sayılarının artmasıyla daha da karmaşık ve içinde çıkılmaz hale gelebilir. Bu problemler beraberinde daha çok sayıda insanın Erasmus programından yararlanmasına engel teşkil etmektedir. Böylece AB'nin hedeflediği iyi olanı tüm Avrupa'ya yayma hedefi bu tür uzun işlemler yüzünden sekteye uğramaktadır.

İnternetin yaygınlaşmaya başlamasıyla birlikte bilgisayarlar üzerinde yönetilen sistemler internete açılmış ve daha kolay erişim imkânı bulmuşlardır (Erkunt, & Akpınar, 2006). İnternetin aktif bir şekilde her alanda kullanılması eğitim alanında da yenilikler getirmiştir. Bu noktada AB'nin hedeflediği karşılıklı değişim programları da internet üzerinden daha büyük kitlelere ulaşmakta ve bu programlardan milyonlarca kişi haberdar olmaktadır (İşeri, 2005). Bilgi çağında bilgisayarın bize sunduğu hizmetlerden yararlanarak yukarıda bahsedilen uzun süren süreçler kısaltılabilir. Bu amaçla Erasmus programından yararlanmak isteyen adayların kısa sürede doğru sonuca ulaşmaları ve programın önündeki uzun kabul süreçlerini en kısa zamana indirgemek için internet olanaklarını da kullanarak Erasmus online başvuru ve bilgi sistemleri geliştirilmektedir.

Üniversitelerin Erasmus hareketliliklerini düzenlemek için geliştirilen sistemlerde bulunması gereken belli başlı temel yapılar vardır. Bu yapıların çoğu Bologna Süreci kapsamında belirlendiğinden her uygulamada bulunmalıdır. Örneğin öğrenim hareketlilikleri, ders verme hareketlilikleri ve staj hareketlilikleri gibi işlemler her Erasmus programında aynı şekilde çalışmalıdır. Bu şekilde benzer işlemleri yapan bir programı her üniversitenin kendisinin geliştirmesi gereksiz işgücü ve kaynak kullanımına sebep olmaktadır. Bunu engellemenin bir yolu ilgili programların ortak özelliklerini içinde barındıran ve uygulamalara temel bir çatı belirleyen yazılım çerçevelerinin (software frameworks) kullanılmasıdır (Morisio vd., 1999; Vladimir ve Sylvia, 2005).

Yukarıda bahsedilen benzerliklerin yanında Erasmus online bilgi sistemi, üniversitelerin kendi farklılık ve özgünlüklerine göre değişiklik gösterecek ve diğer üniversitelerdeki uygulamalardan ayrılacak özelliklere de sahip olabilir. Bu sebeple belli bir noktaya kadar geliştirilen çerçeve yazılımının üniversitelerin Erasmus hareketliliklerini yönetmeye yönelik sistemlere temel oluşturacak bir yapıda olması ve üniversitelerin kendi ihtiyaçlarına göre genişleyebilir ve taşınabilir olması gerekmektedir. Bu genişlemeye imkan verecek yapıların oluşturulmasında tasarım desenleri önemli bir role sahiptir.

Tasarım Desenleri ve Erasmus Bilgi Sistemi

Bir yazılım mühendisliği kavramı olarak tasarım desenleri, yazılım tasarımında ortaya çıkan benzer problemlerin genel çözümleridirler. Tasarım desenleri genel bir tasarım şablonudur. Tamamıyla bitmiş ve doğrudan kodlanabilen tasarımlar değillerdir. Ortaya koymuş oldukları genel çözüm yolları uygulamaya göre şekillendirilerek ve değiştirilerek kullanılırlar (Yıldırım, 2006).

Tasarım desenleri, kullanılmış ve başarıya ulaşmış tasarım ve mimarilerin yeniden kullanılabilmesini sağlarlar. Bu sayede üretilen sistemin yeniden kullanılabilirliği artmaktadır. Zaten kullanılmış ve başarıya ulaşmış tasarımları kullanmak, uygulamaya özel problemlerin çözümü için iyi bir başlangıç yapmayı sağlar ve düşülebilecek potansiyel hataları engeller. Geliştiriciler ve tasarımcılar, zaten çözülmüş problemlerle tekrar tekrar uğraşmazlar. Bunun yerine başarıya ulaşmış iyi tasarımları yeniden kullanarak kendi sistemleri için özelleştirirler (Douglass, 2002). Tasarım desenleri, yeni gereksinimleri önceden sezerek sistemi genişleyebilir olarak tasarlamak için kullanılırlar. Sistem değişimlere ve genişlemeye uygun tasarlanmadıysa, ilerde ortaya çıkan gereksinimler, sistemin belki de baştan yazılmasına ve test edilmesine neden olacaktır. Tasarım desenleri, sistemin daha rahat, hızlı ve sağlam bir değişebilirlik özelliğine sahip olmasını sağlarlar (Gamma vd, 1994).

Tasarım desenlerinin temelleri, mimar Christopher Alexander'ın 1970'li yılların sonlarında başlattığı çalışmalara dayanmaktadır. Alexander, desenlerin belgelenmesi için temel kabul edilen örnekler ile ilgili 1977'de "Desen Dili: Kentler, Binalar, Yapılar" (Alexander vd, 1977) ve 1979'da "Ebedi Yapım Yöntemi" (Alexander, 1979) kitaplarını yayınlamıştır. Bu kitaplarda mimari desen örnekleri yanı sıra, bu desenlerin nasıl belgeleneceği de konu edilmiştir. 1987'deki uluslararası "Nesneye Yönelik Programlama, Sistemler, Diller ve Uygulamalar" (OOPSLA) konferansına kadar tasarım desenleriyle ilgili bir çalışma ortaya çıkmamıştır. Bu tarihten sonra ise Grady Booch, Richard Helm, Erich Gamma ve Kent Beck başta olmak üzere tasarım desenleri ile ilgili birçok makale ve sunum yayınlanmıştır. 1987 yılından 1992 yılına kadar Erich Gamma, Richard Helm, Ralph Johnson ve John Vlissides çeşitli desen katalogları hazırlamışlardır. OOPSLA'91 görüşmelerinde çok sayıda tasarım deseninin tartışması yapılmıştır. Bu tartışmalarda Jim Coplien, Doug Lea, Desmond D'Souza, Norm Kerth, Wolfgang Pree gibi saygın model uzmanları katılmıştır. 1993 yılı Ağustos ayında Colorado şehrinde Kent Beck ve Grady Booch sponsorluğunda Hillside Group ilk toplantısını yapmıştır. Daha sonra desen toplantısı OOPSLA'93 yapılmış ve Nisan 1994'te Hillside Group ilk "Pattern Languages of Programs (PloP)" konferansını planlamak üzere toplanmıştır. Kısa bir süre sonra 1994'de Erich Gamma, Richard Helm, Ralph Johnson ve John Vlissides tarafından yayınlanan "Tasarım Kalıpları: Tekrar kullanılabilir Nesneye Yönelik Yazılımın Temelleri" kitabı, tasarım desenlerinin yazılımda kullanılmasında dönüm noktası olmuştur (Gamma vd, 1994)..

Erasmus online bilgi sisteminin geliştirilmesinde, ileride doğabilecek ihtiyaçlara göre bir tasarım yapmak ve sistemi diğer üniversitelerin de kendi ihtiyaçlarına göre genişletebilmesine olanak sağlamak gerekir. Bu da ancak, sistemin modüler bir yapıda tasarlanmasıyla mümkün olabilir. Bu şekilde, sisteme yeni eklenen bir modül, diğer modüllerin çalışmasını bozmayacak ve modüller arası iletişimi etkilemeyecektir. Bu modüler yapıyı sağlamanın en önemli unsuru ise sistemin tasarımı ve geliştirilmesi sırasında tasarım desenlerinin kullanılmasıdır (Horasan, 2007).

Erasmus Online Başvuru ve Bilgi Sistemi İşleyişi

Geliştirilen online bilgi sistemi çerçeve yazılımı , Erasmus programına başvuracak öğrenci ve öğretim elemanlarının aday kabul ve yerleştirme işlemlerindeki karmaşık süreçlerinin çözümü için tasarlanmıştır.

Bu kapsamda sistemin gerçekleştirdiği temel fonksiyonlar ve özellikler aşağıda verilmiştir:

Sisteme dahil olan ülkelerin, üniversitelerin, fakülte ve bölümlerin tanımlanması

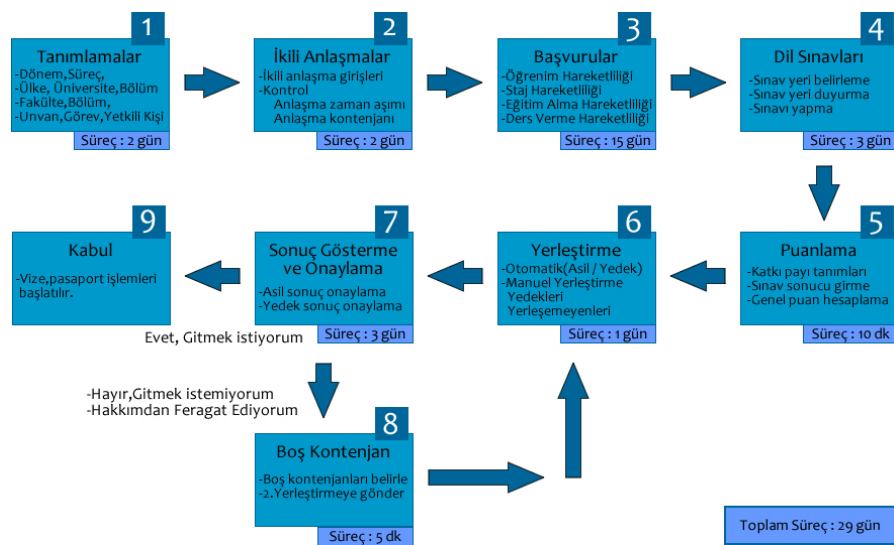
Yapılan anlaşmalar ve kontenjanların girilmesi

İnternet üzerinden başvuruların alınması

Belirlenen kriterlere göre puanlamanın yapılması

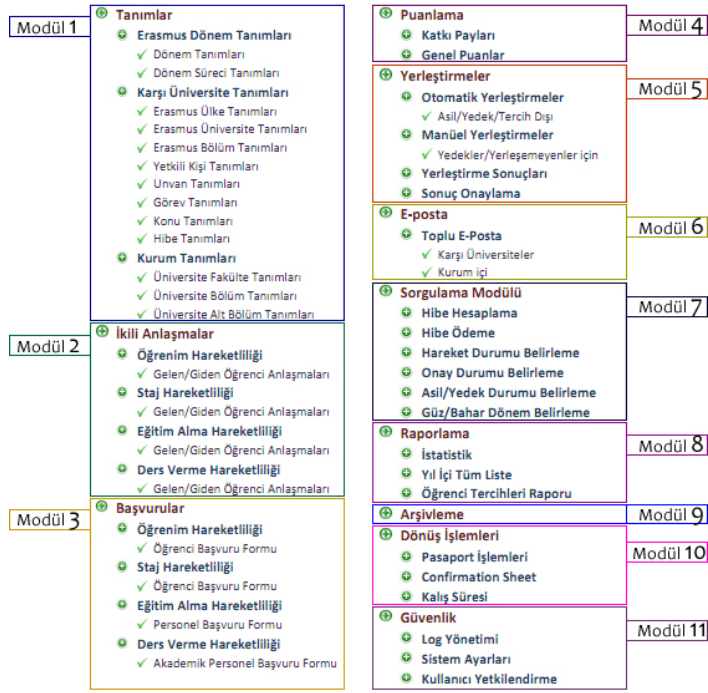
Otomatik ve manuel yerleştirme işlemlerinin yapılması

Yerleştirme sonuçlarının yayınlanması ve onaylanması

Boş kalan kontenjanlara yeni başvuruların alınması


Şekil 1: Erasmus Online Başvuru ve Bilgi Sistemi Aday Kabul ve Yerleştirme Süreci

Geliştirilen Sistemin Modülleri

Geliştirilen sistem modüller şeklinde tasarlanmıştır. Şekil 1'de verilen aday kabul sürecindeki her adım modüllere bölünerek sistemin entegre çalışmasına olanak sağlamıştır.


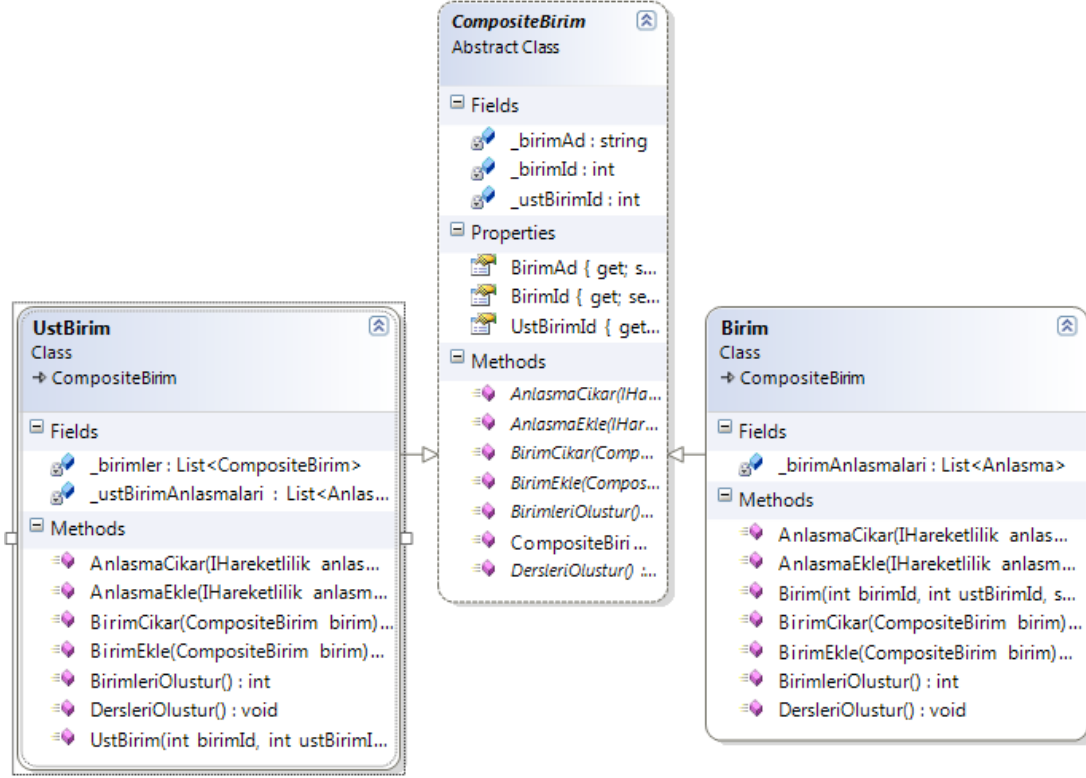
Şekil 2. Erasmus Online Başvuru ve Bilgi Sistemi Modülleri

Geliştirilen Sistemde Kullanılan Tasarım Desenleri

Tasarım desenleri, tasarımın yeniden kullanılabilirliğine ve taşınabilirliğine dayanmaktadır. Ancak bir sistemde kullanılan tasarım desenleri, sistemin belli özelliklerini iyileştirirken, bazı özelliklerine ise olumsuz yönde etki edebilmektedir. Bu nedenle bir sistem tasarlanırken kullanılacak tasarım desenlerinin ihtiyaca ne derece katkı sağladığına ve getirdiği avantajların ve dezavantajların neler olduğuna dikkat edilmelidir (Yıldırım, 2006).

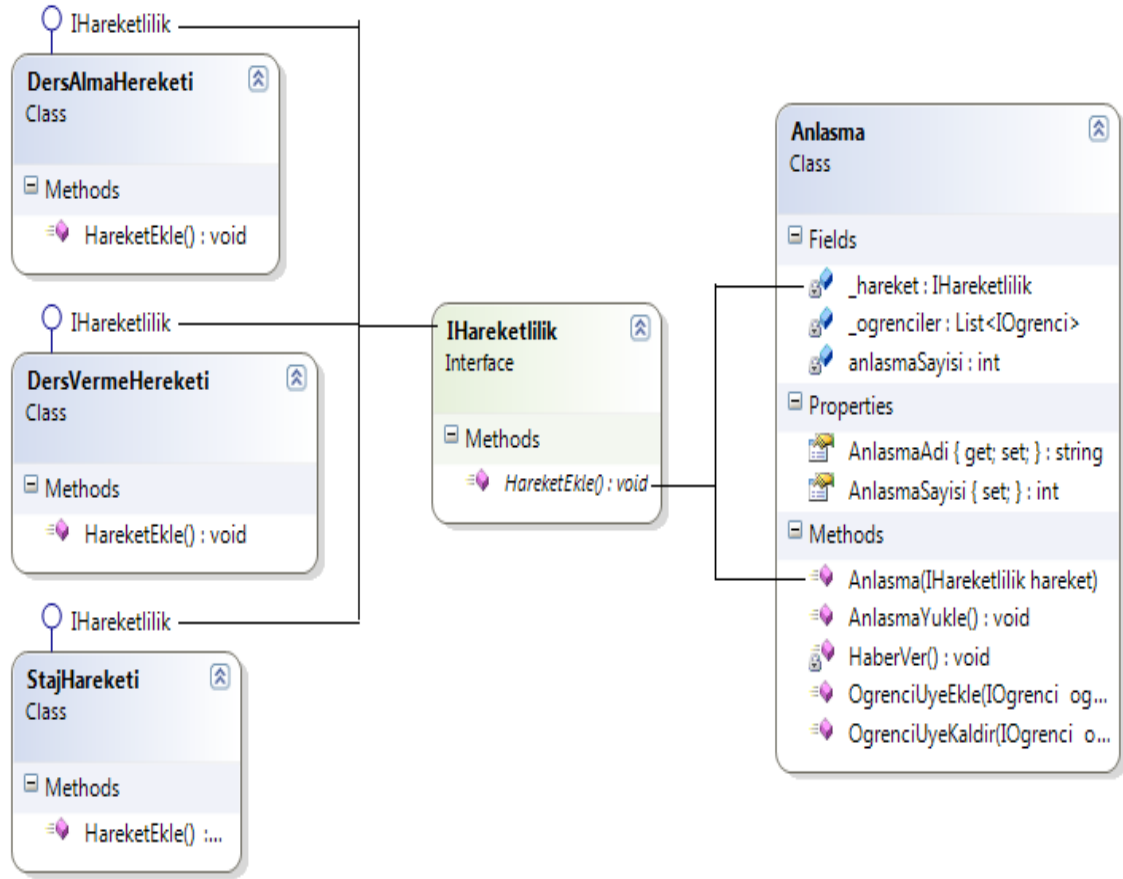
Geliştirilen sistemde bulunan modüller birbirinden bağımsız olarak sorumlu oldukları işlemleri yerine getirseler de sahip oldukları sınıflar ve işlevler açısından birbirlerini etkilemekte ve birbirlerinin sınıf ve metotlarını kullanabilmektedirler. Nesneye dayalı programlama paradigması çerçevesinde geliştirilen Erasmus online bilgi sistemi çerçeve yazılımında, yukarıda bahsedilen modüller arasındaki ilişkilerin sağlanmasını kolaylaştırmak ve uygulamanın sınıf hiyerarşisinin bir noktadan sonra karmaşık ve anlaşılması zor bir hale gelmesine meydan vermemek için sistemde bulunan sınıflar ve nesneler en uygun tasarım desenleri kullanılarak geliştirilmeye çalışılmıştır.

Tanımlar Modülünde Kullanılan Tasarım Desenleri

Üniversitelerdeki bölüm ve programları temsil eden birimler hiyerarşik bir yapıda bulunmaktadır. Örneğin bir fakültenin altında bölümler ve bölümlerin altında da ana bilim dalları vardır. Bu tip hiyerarşik yapıların yazılımda temsil edilmesi gerektiği durumlarda Composite(Bileşik) tasarım deseni kullanmak oldukça yerinde olacaktır. Composite tasarım deseni sayesinde sistemde bölüm ve programları temsil eden hiyerarşik yapıların kolay bir şekilde gerçeklenmesinin yanısıra bu hiyerarşik yapıya yeni birimler eklenmesi de oldukça kolay ve genişleyebilir bir yapıya kavuşmaktadır. Üniversiteler kendi eğitim birimlerinin hiyerarşik yapısını sisteme kolayca ekleyebilmektedirler.


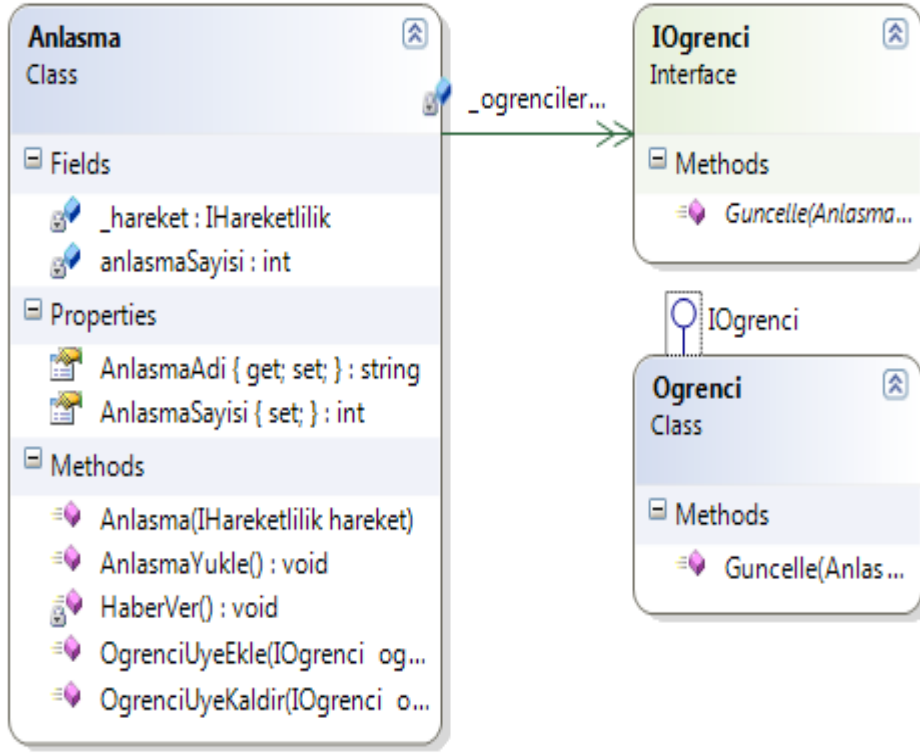
Şekil 3. Tanımlar Modülünde Kullanılan Composite Tasarım Deseni

İkili Anlaşmalar ve Başvurular Modüllerinde Kullanılan Tasarım Desenleri

İkili anlaşmaların tanımlanması ve başvuruların alınması işlemleri Erasmus hareketlilik tiplerine göre değişmektedir. Örneğin ikili anlaşma tanımlanırken öğrenim ve ders verme hareketliliğine göre kontenjanlar veya hibeler farklı özelliklerde olabileceği gibi başvuruların alınması işleminde de staj, öğrenim ve ders verme hareketliliklerine göre farklı özellikler bulunmaktadır. İkili anlaşmaların tanımlandığı veya başvuruların alındığı arayüzler farklı hareket tiplerinden etkilenmemelidir. Bu durumun sağlanabilmesi için ikili anlaşmaları veya başvuruları gösteren arayüz kendisine verilen hareketlilik nesnesinin hangi sınıfın bir nesne örneği olduğunu bilmemelidir. Bu arayüzün bilmesi gereken tek şey kendisine verilen hareketlilik nesnesinin IHareketlilik arayüzünü uygulamış olduğudur. Uygulamada bunu sağlamak için de Strateji tasarım deseni kullanılmıştır.


Şekil 4. İkili Anlaşmalar Modülünde Kullanılan Strateji Tasarım Deseni

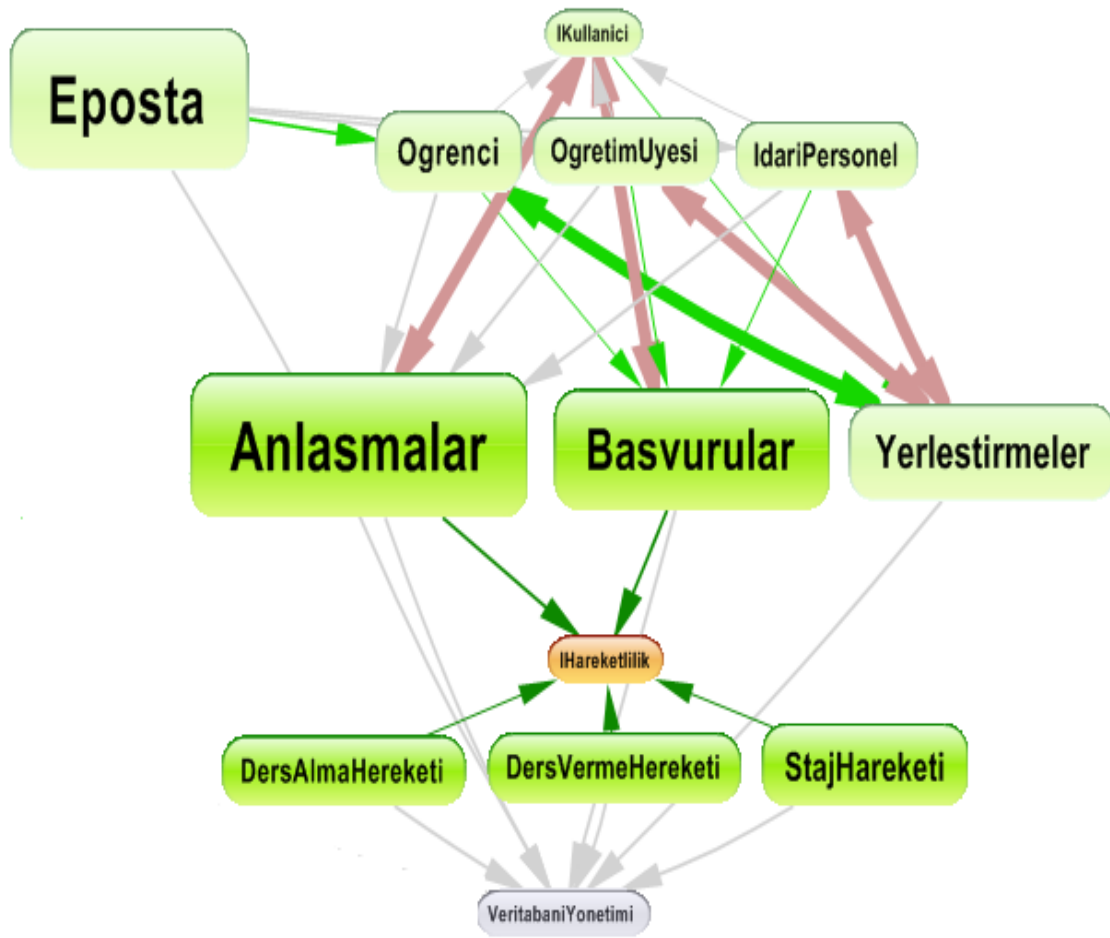
E-posta modülünde Kullanılan Tasarım Desenleri

Erasmus programından yararlanan öğrenci ve öğretim elemanlarına başvuru ve yerleştirme süreçleriyle ilgili duyuruların veya haberlerin, yapılan yeni anlaşmaların, sisteme yüklenen belge ve dokümanların bildirilmesi sistem üzerinden veya kullanıcılara manuel olarak toplu e-posta gönderilmesi yoluyla yapılmaktadır. Bunun yanında sisteme üye olan kullanıcıların sadece kendilerine veya bulundukları bölüme özel bir değişikliğin otomatik olarak bildirilmesi sürecin işleyişini hızlandıracak ve bilgilendirme işlemini manuel olmaktan kurtaracaktır. Bu bilgilendirme işlemi için Gözlemci (Observer) tasarım deseni kullanılmıştır. Gözlemci tasarım deseni, sisteme üye olan nesnelerin, sistemin herhangi bir yerinde olabilecek bir değişiklikten haberdar edilmesi esasına dayanır. Örneğin sisteme yeni bir anlaşma eklenmesi durumunda Gözlemci tasarım deseni sayesinde sistem, önceden tanımlanan herhangi bir yöntemle –mail yoluyla veya sistem içerisinde geliştirilebilecek mesajlaşma modülüyle olabilir- otomatik olarak o anlaşmanın yapıldığı bölümdeki kullanıcılara bilgilendirme mesajı gönderebilecektir.


Şekil 5. E-posta Modülünde Kullanılan Observer Tasarım Deseni

Kullanılan Tasarım Desenlerinin Sistemin Taşınabilirliğine Etkisi

Nesne tabanlı bir uygulamanın kalitesini ölçebilmek için çeşitli yazılım metrikleri kullanılabilir. Bu çalışmada Chidamber ve Kemerer metrik kümesinde tanımlanan nesneler arası bağımlılık (Chidamber&Kemerer, 1994) parametresine göre uygulama test edilmiştir.

Şekil 6' da görüldüğü gibi Anlaşmalar, Başvurular ve Yerleştirmeler modülleri arasında herhangi bir bağımlılık söz konusu değildir. Aynı zamanda bu modüllerin ihtiyaç duydukları Hareketlilik sınıflarıyla birebir bir ilişkisi yoktur. Gerekli olan bağlantı IHareketlilik arayüzü üzerinden sağlanmaktadır. Yeni bir öğrenim hareketliliği ileride sisteme eklenmek istendiğinde Anlaşmalar, Başvurular ve Yerleştirmeler modülleri içerisinde herhangi bir değişiklik yapmaya gerek kalmayacaktır. Çünkü yeni öğrenim hareketliğine ait sınıf, IHareketlilik arayüzünü uygulayacatır. Bu da sistemin modüler bir yapıya kavuşmasına ve sistemin değiştirilmeden genişletilmesine katkı sağlamaktadır. VeritabaniYonetimi modülü, veritabanıyla ilgili işlemlere ihtiyaç duyulan tüm sınıflarda sıkça kullanıldığından dolayı bağımlılığı yüksektir. Fakat diğer modüller arasında sıkı bağlı bir yapı söz konusu değildir. Bu da sistemin taşınabilir olmasına katkı sağlamıştır.


Şekil 6. Modüller Arası İlişkiler

Sonuç

Bu çalışmada üniversitelerin Erasmus hareketlilik süreçlerini düzenlemeye yönelik yazılım ihtiyaçlarını karşılayacak bir Erasmus online başvuru ve bilgi sisteminin geliştirilmesinde kullanılacak tasarım desenlerinin, sistemin tekrar kullanılabilmesi ve taşınabilmesine sağladığı katkıların önemi üzerinde durulmuştur. Genel bir Erasmus online başvuru ve bilgi sistemi çerçeve yazılımının sahip olması gereken standartlar incelenmiş, üniversitelerin değişen ihtiyaçları doğrultusunda yazılımın genişlemeye imkan veren bir yapıda tasarlanması, tasarım desenleri kullanılarak sağlanmıştır.

Sistem geliştirilirken ileride doğabilecek ihtiyaçları da hesaba katarak bir tasarım gerçekleştirmek ve sistemi diğer yükseköğretim kurumlarının da kendi ihtiyaçlarına göre genişletebilmesine olanak sağlamak amaçlanmıştır. Bu nedenle kullanılan tasarım desenleri, sistemin, tasarım prensiplerinde önemli bir yeri olan Açık-Kapalı prensibine göre tasarlanmasına yönelik olmuştur. Bunun anlamı ileride doğabilecek ihtiyaçlara göre yeni modüller eklenirken eski modüller değiştirilmeden sistemin genişleyebilmesine olanak sağlamaktır. Fakat kullanılan tasarım desenlerinin sistemin performansı üzerine yaptığı etkiler üzerinde ayrı bir çalışmaya da ihtiyaç bulunmaktadır.

Sistem genel olarak bir Erasmus online başvuru ve bilgi sistemi yazılımında sahip olması gereken işlevleri barındıran bir çerçeve programı olmasından dolayı her üniversitenin Erasmus başvuru süreçlerini düzenlemede ihtiyaç duyacakları temel işlevleri yerine getirebilmektedir. Bu sayede her üniversitenin, temel adımları

gerçekleştirecek işlemleri yerine getirecek program sınıflarını tekrar tekrar yazmalarının önüne geçildiğinden programın taşınabilirliğine ve genişletilebilirliğine katkı sağlanmıştır.

MAKING MUSIC, SOUNDSCAPES AND SPOKEN WORD: CASE STUDY OF CKUT

Donna Kakonge[42]

OISE/University of Toronto, Canada

Abstract

Using narrative inquiry, three case studies, "BlackTalk with CKUT, McGill University's community radio station in Montréal, Canada, a brief mention of CKCU's "Beyond Our Backyard" on Carleton University's community radio station in Ottawa and WETV, an effort to bring about international television with a human rights perspective will be discussed

Keywords: Music, Soundscapes And Spoken

Main text

When I was 10, the vice-principal of O'Connor Public School in Toronto set up a mini-television studio, called OCTV, so the students could have their announcements on close-circuit TV. A small group of grade 5 students, myself included, rotated through the various production jobs. Sometimes, I was the sound engineer, which meant playing the theme song "Here Comes the Sun," and sometimes I was the announcer, which meant informing the students about Peter Pan play auditions.

One "International Day," we had to bring a dish from our heritage to be sampled by other students. An OCTV announcer asked me on-air what I had brought in, and I told him "matoke" – a common Ugandan meal made of steamed and mashed green bananas. The announcer asked me where Uganda was, and upon hearing "Africa" exclaimed, "Oh Africa! I thought they ate people there!" I was so upset, I almost burst into tears, but I did not want to cry on-air. Instead, I told him – and also about 500 other students who were watching OCTV – everything I knew about Uganda. I told them stories about my family who lived in a brick house, not a grass hut; who drove cars, not camels, and who ate matoke, rather than people. The response was phenomenal. Scores of students wanted to know more. I came to know the power of broadcasting.

This was my first experience with public affairs broadcasting, and particularly, black public affairs broadcasting. The power that can make a young boy think all Africans eat people is the same power that can tell him that they are people. Working with OCTV developed my love television rather than radio…I was a child of the TV age. I grew up with access to radio in every room of the house, but I listened mainly when Michael Jackson or Boy George was singing. I lived for Top 40 countdowns so knowing the "coolest" music would help me in my public affairs in school. Still, television had a more dominant role in my life: even my music knowledge came mostly from watching music videos. To me, radio broadcasting was intended solely for music. Later, I discovered it could do more.

In journalism school, I did stories on a variety of issues, but really enjoyed the stories about Spike Lee's movie "Malcolm X" and its positive portrayal of Muslims, a feature on fraternal twins who both had sickle cell anemia and an all-black fashion show which opened up issues around re-defining standards of beauty. These are public affairs issues. Effective public affairs is knowledge, and also information, that better prepares you to function in society. Black public affairs is an important part of public affairs broadcasting. I agree wholeheartedly with Carter G. Woodson as quoted in Gerald Early's article "Understanding Afrocentrism": Furthermore, no one can be thoroughly educated until he learns as much about the Negro as he knows about other people (Woodson, 1933).

E-mail address: Donna.kakonge@utoronto.ca , www.donnakakonge.com

At first, I never found radio a useful medium for situating blacks in public affairs. In the time I was in journalism school, or my time at CBC's "Metro Morning" (where I got a chance to do radio stories) I never did a story that focused on black people. Radio for black public affairs…for many years this was a foreign concept. Who wanted to be simply heard, when you could be seen and heard? When I first started working with CBC Toronto in National Radio News, it was viewed as a kind of "racial Utopia," where colour did not matter, image did not matter, and as a black person, you had more freedom to express views you could not in TV. It was also around this time that I discovered WBLK on the radio dial, a black commercial radio station in Buffalo, New York. This station is not focused on public affairs talk programming, but on music, with a priority to entertain. It really wasn't until my involvement with community radio station CKUT's "BlackTalk," a day of programming devoted to black public affairs issues, that I realized that maybe radio could be a "racial Utopia"…or is it? This is what the following will explore.

By "racial Utopia" I mean the creation of a work environment and product that is anti-racist, anti-sexist, anti-heterosexist as it relates to people of colour. A "racial Utopia" as it relates to media is a product that is all encompassing of what is black, not stereotypical, and it is a work environment that is free from white supremacist structures, or black self-hating attitudes.

First, I will discuss the history of "BlackTalk" at CKUT and second the greater access black people have to radio compared to TV. A discussion of the "tyranny of the image," as Bill Gilsdorf refers to it and the "tyranny of sound," will follow.

History of "BlackTalk" at CKUT:

"BlackTalk" began in 1990 as an initiative of the Black Students' Network (BSN) at McGill University. The network felt that it needed a forum to discuss issues that black people face on a daily basis, and a radio program during Black History Month could address some of these issues. The BSN approached CKUT because the station had a reputation for being accessible to minority groups, a main part of its mandate. The accessibility of CKUT to minority groups was discussed in class by Rufo Valencia, Spoken Word Co-coordinator. CKUT agreed to interrupt regularly scheduled programming to devote a day of black-focused programs called "BlackTalk." The first group who did "BlackTalk" consisted mainly of the 18 to 21-year-olds who were part of the BSN. The first "BlackTalk" provided a model for future ones. The segments of black information called "Black Facts" has remained in the structure of the programming for eight years.

For 1998, "BlackTalk" was on Sunday, February 22nd and started at 7 a.m. on 90.3 FM. "BlackTalk" devotes more than 19 hours of airtime to programs dealing with aspects of black history, heritage and consciousness. That year was the ninth year of the program. It featured various shows that explored diverse and often under-represented aspects of blackness. The programming consists of panel discussions, call-ins, reviews, interviews, documentaries and live shows. Part of the objective of "BlackTalk" is "to acknowledge the achievements of black people through history, raise awareness of existing and emerging issues in the community and reinforce commitment to social change (Interview: Adrian Harewood, CKUT). Here is a run-down of what the day of programming was like in terms of its schedule, as well as a few explanations on the shows:

0700h – "Mind Soul and Spirit": this was a religious show that consisted of gospel music and interviews with ministers.

0900h – "Taking Care of Our Own": panel discussion on big brother program

1000h- "Kid's Show": featured interviews with children in schools and in studio discussing issues of interest to them

1030h – "Music Show": Jazz

1100h – "Ebonics": this is a term given to the type of language black people speak that is also referred to as slang. There was a movement-taking place that originates in the U.S. to have this language become a recognized one distinct from English and more reputable than slang.

1130h – "The Sir George Williams Affair": this was an incident that took place at Concordia University in the late 1960s that involved black Canadian students who were protesting.

1200h – "Black Canadian Literature"

1300h – interviews with youth

1330h – music show – Afro-Zouk

1400h – "Black Youth in Youth Protection" (live from ISART)

1500h – "Hair Politics" (live from ISART): a discussion surround the aesthetics of natural black hair versus chemically processed hair, and everything in between.

1600h – "Standards of Black Beauty"

1630h – "Blacks and Media Representation"

1700h – "Environmental Activism in Haiti"

1730h – "Blacks in Sport"

1830h – "Black Health Issues"

1900h – "White Families Adopting Black Children"

2000h – "Black Youth of the Diaspora": this discussion includes looking at issues around identity for young black people who may have citizenship in one country, but their parents are from somewhere else – where do they belong? What do they identify as?

2100h – "Emancipatory Education"

2130h – "The McGill Africana Studies Program"

2200h – music

2230h – "The Globization of Hip Hop"

2330h – "Male-Female Relationships"

0030h – "Black Gay and Lesbian Committee"

0130h – "Black Sexuality"

0230h – "DJ Culture" (Interview: Harewood, CKUT)

"BlackTalk" has had a significant impact on black community projects, particularly at McGill University. Adrian Harewood, the former station manager at CKUT, became part of "BlackTalk" in 1993. The success of the show prompted him to start a similar type of program in Ottawa after he left McGill. He was part of a day of black-focused programming at CKCU, Carleton University's community station, called "Shades of Blackness." This day of programming also took place during Black History Month of 1994. "Shades of Blackness" won a Standard Award sponsored by the National Campus and Community Radio Association. "BlackTalk" sparked a library at McGill University in 1993. The BSN felt in order to keep an on-going feeling of interest of black issues alive, well after "BlackTalk" was off-air, they needed resource materials for anyone with research

interests…the Alfie Roberts Library is still running at McGill. With the tradition of "BlackTalk" having an impact on the black community, the day of programming has also spawned a Black Audio Collective that will have a continuous role in producing oral histories and exploring some of the issues unable to be covered during "BlackTalk." The work of the collective will be broadcast on CKUT, and potentially become part of the Alfie Roberts Library.

"BlackTalk's" history in terms of content was concentrated on black firsts. There was an "emphasis on our place in history," (Interview: Harewood, CKUT). Segments of "Black Facts" were sponsored by small businesses. "BlackTalk" has changed. "It's become more aware, even more informed" (Interview: Harewood, CKUT). That year's programs did not include business sponsorship of "Black Facts" because the community of people involved decided against it. It was felt by most of the group that they did not want corporate interests to influence programming. In the past, "BlackTalk" volunteer producers and CKUT felt that some businesses that sponsored "Black Facts" were not committed to the development of the black community that was exemplified in such things as their hiring practices.

The age range of "BlackTalk" volunteers both on- and off-air has changed as well. There were about 40 people involved. People involved this year were from 18- to 43-years-old. Unlike the past, they were not all McGill students. The group consisted of students from most universities in Montreal, some CEGEPs, and community members. True to the nature of community radio, "BlackTalk" was a community-run production. Decisions from programming, to scheduling, to sponsorship, to training, were all made as a group.

"'BlackTalk'" is not just about the broadcast or the actual radio program. It's a demonstration of what we can do, that we can participate in these institutions and we produce something that is quality and a tremendous utility for the community," (Interview: Harewood, CKUT).

Access of Blacks to Radio and TV:

Television Access:

When I asked Adrian Harewood why the BSN did not approach community television stations to do black public affairs programming, he said it was felt that radio would be an easier medium for community programming. Technically, radio is not as complicated. The basics of radio could be learned easier. "All you need is a mic and a voice," (Interview: Harewood, CKUT). He also said that most people do not feel as intimidated by radio, whereas "TV is a bit of an abstraction" (Interview: Harewood, CKUT). It was felt that people may not watch a whole day of TV programming of black public affairs, and one has to put a lot more time and resources in to producing quality TV. At t he time, in 1990, there were not many BSN people who had skills in television. This is perhaps partially a result of the kind of access that black people have had to producing television. The same mass-produced writing was once the domain of upper class white men, as mentioned in class by Dr. Gilsdorf, so was mass-produced television. As Carlos I. Fontes points out in "Alternative Video at a Crossroads: A Global Perspective," it has only been in the last 25 years that because of changes to video technology, there have been a number of grassroots organizations and social groups who are using video for non-mainstream purposes. Often grassroots means of using television, with minimal broadcasting capacity, is the only way that blacks and other minorities can have access to having freedom in production. One does not need the CRTC to give approval to a grassroots video not show on cable.

The difficulties that blacks have had in producing public affairs programming for television were discussed in seminars at the National Association of Black Journalists conference in Chicago, June 1997. One seminar was called "Whatever Happened to Community Affairs Programming? And the other, "Black News Magazine Programs: Where Are They, and Are They Needed? The emphasis of the latter seminar was on looking at failed commercial television efforts made by Jesse Jackson, Ebony Magazine and Essence Magazine.

In 1994, the CRTC decided on new specialty channels, and among those who made a bid for their own station were broadcasters Sylvia Sweeney and Paul de Silva. They each made separate applications for channels that would have focused on black public affairs programming. Both of them lost their bids.

The African-Canadian Communication and Broadcasting Corporation (ACCBC) tried to create black-focused public affairs programming by aligning themselves with Black Entertainment Television (BET). ACCBC was trying to get BET into Canada, as well as using it as a catalyst to create programming that was being done in Canadian television. This group disbanded, though BET was let into Canada by the CRTC late in 1997. Unfortunately, without the ACCBC's involvement, BET has become a television version of WBLK. Because of its dependence on commercialism, the Canadian version of BET does not include black public affairs programming.

Even efforts that black people have made to have a presence on Canadian community television have been difficult in the past. I used to be involved with a black video collective in Ottawa called Black Community in Residence (BCIR). This group was linked with SAW Video, an artist-run video co-op. Because of the nature of the kind of video, with its non-mainstream content and aesthetics, community television was the main venue for broadcasting material from SAW. Several efforts BCIR members made to broadcast material on Rogers Cable were turned down. Thirty-minute pieces were considered too long for broadcast by programming directors. Many times, senior producers said they just did not have the airtime. The community served at Rogers often did not include black people.

Radio Access:

In the late 1990s, a group called Milestone, in Toronto, made efforts to have a black commercial radio station on the FM dial. This station is completely black-owned and also was meant to have public affairs programming. Milestone's application for a license was denied and the frequency was assigned to the CBC so they could broadcast on the FM dial, although they already had a station on the AM dial. Success, in terms of black commercial TV and radio, and community TV, had been minimal.

But, community radio seems to have a different story of access for blacks. CIUT and CKLN in Toronto have been involved in black public affairs programming for many years. CKCU has carried on with its tradition of "Shades of Blackness" and other programs that appear outside of Black History Month as well. CKUT, along with "BlackTalk," also includes programs about African news and current affairs, and a regular show called "Soul Perspectives" that includes black public affairs programming. It would seem that community radio is kind of a racial Utopia for black public affairs programming.

Tyranny of Image:

Despite successes made in community radio for African-Canadians in terms of public affairs, personally valuing this success is made static by my love for television. Some little boys, such as a young Dr. Gilsdorf, dreamt of being President of the United States as we got a glimpse of in the documentary "Primary." I was a little girl who dreamed of owning a television station, like OCTV, so I could broadcast messages that would correct the misinformation about black people. My experience with "BlackTalk" made me question the capability of television to be a racial Utopia – perhaps radio has the answer. The "tyranny of the image" has a special connection to the black experience. "Tyranny of the image" is a term I first heard from Dr. Gilsdorf. The way I understand the expression is the power of the image to dominate and define the content of television. I will be using this term from a black perspective.

The image is a powerful thing. Joel Worrell, how used to work for CUTV, Concordia's TV station, and as a producer and cameraperson for Maturity Video, says, "radio has a slight disadvantage because today's public is more visual (Interview: Worrell, CUTV and Maturity Video). Joel was one of the participants in "BlackTalk" and he said portrayal of blacks on TV is not reflecting reality and that, perhaps, radio does. A lot of the criticisms made by blacks and non-blacks about the media's negative portrayals and stereotyping is based on an analysis of film and television. Patricia Turner's Celluloid Mammies and Ceramic Uncles is an American book that analyzes the portrayal of many black-focused television program and movies. Even in my own experience, there seems to

be this view that radio is free of racial bias. When I worked for CBC Toronto's television news and current affairs program, "The Evening News," and "Metro Morning," a radio news and current affairs program, radio was viewed as a racial Utopia when compared to TV. In about the last month of my work with these shows, I was assigned to monitor to determine how diverse they were. Setting up a computer program to examine the "Evening News" was easy. It consisted of noting the race of the reporters and sources, the occupation of the sources, as well as their sex – it also included information on the topic of the story. Setting up a program to examine "Metro Morning" was so difficult though, that it never happened. How could you determine the race of someone based on their voice? (This is an issue I will discuss later in this essay). Recording the number of times the radio program dealt with issues of diversity did not seem sufficient in giving a complete picture of how much the show reflected Toronto – which was a definition of diversity based on race. The executive producer of "Metro Morning," and myself, also wanted to know how many times a person of colour commented on something that did not directly involve race, such as pollution in Lake Ontario. Because of a lack of the "tyranny of the image," radio was often seen as creating an inclusive world. In my work previous to monitoring of the "Evening News," I also organized editorial boards, for both the television and radio programs, with people from diverse communities. Most of the complements made were aimed at radio journalists. Most of the criticisms made in these boards were aimed towards the TV journalists. Rosemary Sadlier, in the black community editorial board, criticized the "Evening News" executives for always putting on their black anchors and reporters late at night.

The "tyranny of the image" brings into question the aesthetics of television. Joel has been told at CUTV that black skin and black clothing really do not look good on TV. What looks good on television is dominated by a white aesthetic. When black people do appear on Canadian television, often they are lighter skinned and resemble whites in their features. This fact was spoofed by "The Newsroom" who, when looking for a black anchor, favoured a woman who looked white, with a "subtle ethnicity" as opposed to an "in-your-face ethnicity":

They watch an anchor's audition tape. She is black:

Monique: (on monitor) The annual East Coast…

Carole: Monique is also very wonderful. She doesn't have an in-your-face ethnicity.

Leonard: No, exactly. Seventy-four per cent of her audience in Saskatoon actually thought she was white. It's a very subtle ethnicity.

Carole: An almost subliminal ethnicity.

George: Didn't Coke or Pepsi do some advertising like that? Subliminal.

Carole: Does anyone want a Diet Coke? Everyone drinks generic diet cola.

Leonard: Colour's great, but you don't want to hit the viewer over the head with it (Finkleman 30).

The above exemplifies the white aesthetic of television. As well, when I learned about technical production in ¾ inch video at SAW Video, Neil – who was training the group of us in the Black Community in Residence – commented on the fact that you always had to white balance the camera to get your colours correct. He pointed out how inherently racist the medium of television was that it was encoded into the technology.

The image is an important issue for black people and this was reflected in "BlackTalk" '98. Adrian comments on the shift that has happened in issues that came up during "BlackTalk," and mentions the "Hair Politics," "Standards of Black Beauty" and "Media Portrayals of Blacks" as examples. What these issues had in common was that they all discussed the power of the image. These programs explored everything from seeing natural black hair in magazines, film and TV, to views on the fat black body, to the prevalence of lighter skinned blacks on TV. Even on the radio, so many topics still deal with the image.

At "BlackTalk" '98, you did not see blacks gelling and straightening out their kinky hair before going on-air, you did not see make-up artists putting beige foundation on chocolate brown skin, you did not see large women

wearing vertical stripes so it would take off the 10 pounds TV adds on – there was less impact of the "tyranny of the image." In "light" of all this, did this make the radio a racial Utopia? I do not completely think so. There is a "tyranny of sound" that has a special meaning for black people.

Tyranny of Sound:

In order to explain what I mean by the "tyranny of sound" I will use Andrew Crisell's "Understanding Radio" as a starting point:

The contact, or medium as I will now term it, is utterly non-visual: the receivers, who are listeners, or collectively an audience, cannot see the sender or broadcaster as they can on television or film; nor are they offered the compensation of a visible and lasting message as they are in literature. Radio's codes are purely auditory, consisting of speech, music, sounds and silence, and since, as we shall see, the ear is not the most 'intelligent' of our sense organs their deployment has to be relatively simple. The risks of ambiguity or complete communication failure are high, and so in all kinds of radio much effort is expended on overcoming the limitations of the medium, on establishing the different kinds of context that we would generally be able to see for ourselves (Crisell, 5).

Crisell neglects to realize that because the ear is such a strong stimulus for our imaginations, it can be classes as a very intelligent organ. Radio's codes on the surface level are predominantly auditory, but there is also a visual aspect to radio, which Crisell suggest is akin to fiction.

Crisell exemplifies what he means by the fiction quality of the radio image by discussing Jimmy Young presenting his morning show on BBC Radio 2. Young may be an actual person, but since the audience only knows him on the radio by picturing and imagining him, he is, in a sense, "fiction." This relates to race in looking at the impact retired CBC announcer Dwight Wylie had. I had been listening to Dwight for years; when I met him in the CBC radio newsroom, I was astonished (and happily surprised) that he was black. Dwight Wylie does not "sound" black. But, what is sounding black or white…or Asian, or Aboriginal, or South American, for that matter? There are racial stereotypes attached to voice that become as complicated as the stereotypes created by image.

I received a taste of my own racial stereotyping based on images and voice at an exhibition in April 1997 at the Ontario Science Centre, in Toronto. The exhibition, called "A Question of Truth," had many displays that were based on examining racism and sexism. The exhibition's aim was to make people realize that bias can exist behind every experiment and way of doing things. One display really stumped me. It had faces that could be found all over the world. When you pressed a button, a voice came out talking about anything, and you had to match the faces with the voice. Even though I knew the exhibit was supposed to trick me, I was still fooled. When I heard a female West Indian accent, my reflexes wanted to choose the black woman. I considered choosing the white woman, but to me she loosed so Aryan, very much unlike the native white people I had seen in the West Indies, who "sounded more black" than me. So I chose the Indian woman. It turned out to be the very blonde and fair woman I dismissed as not looking white Caribbean enough. Sound and our perception of image can be deceiving.

Although I had the advantage of knowing that my racial stereotyping based on voice was incorrect, and I learned something from the experience, stereotypes, or "fictions" can dominate mental images. It happens at least twice a year since Have been old enough to use the telephone – someone will give me that surprised look when they meet me and sometimes tell me that I do not look the way they imagined. There are probably many people out there who do not know that Dwight Wylie (former CBC announcer) was black. Does it make a difference? I think it does, just as I think broadcasting can make a real difference in racial relations, one of the biggest public affairs issues of this century. The summer 1994 edition of the Media Studies Journal has on its cover – "Race – America's Rawest Nerve." This issue examines how race is covered in the media. Race is a raw nerve for Canada as well.

If a word can have this power, surely the spoken word has at least equal power. The article Harris writes in is titled "Whiteness as Property." In a stereotypical way, races own sounds. Music companies know well what is

termed as black music and what is termed as white music exemplifies how much racial sound is a commodity. White rappers such as Marky Mark and Snow are making lots of money from having a black sound. This phenomenon is not exclusive to rap music: some say Michael Bolton makes a lot of money from having a black sound, too.

Steering away from popular music, some may say news anchors Bernard Shaw and Bryant Gumbel are also making a lot of money by have a white sound. Just so I do not seem like I am taking a high moral ground, I myself have turned racial sound into a commodity. In the months I spent in Uganda in 1996 and 1997, I spent a lot my time doing freelance voice-overs for Sanyu Radio and Television. What I was once told by the programming director was that they liked my voice because I "sounded more white but was still Ugandan. We (Sanyu) could employ someone black to get the desired effect." The desired effect they were talking about was the sound of whiteness. I know of some West Indians and Africans who go to great lengths, including a speech coach, to get rid of their accents.

Radio is not necessarily a racial Utopia, but there are glimpses of it in the community radio at CKUT. Ebonics, the language originating from African-Americans, more commonly known as slang, is a big issue concerning Afrocentric issues, and I have yet to hear any form of Ebonics on CBC radio, as much as a racial Utopia it is sometimes touted as being. In 1993, "BlackTalk" did a show about relationships that consisted of language that would be hard to find anywhere else. "What's up," "Chill," "No Respect" – this is a dialogue that is related to a more informal style. It is not broadcast quality CBC style. Usually when you hear this kind of language, especially on TV, it is used to make objects out of blacks. For example, on the talk/trash former show "Rikki Lake," she often booked guests who talked in Ebonics about issues that made them look silly, such as a man sleeping with several women without a condom. With the relationship show on "BlackTalk," it was informal dialogue to discuss a serious issue, relationships between men and women. The language was not used to accentuate that they were from a lower class or for pure entertainment value. The whole nature of the "BlackTalk" show was to give information, and hopefully some knowledge too.

Conclusion:

Is radio a racial Utopia? Indeed, I do believe that radio is a racial Utopia, but I must qualify this statement. By radio, I do not mean commercial radio, or even public radio, but community radio. Unlike Robert McChesney, I make a distinction between public and community radio. I have worked in both and never in the time I was at the CBC were so many decisions made as a groups as they were with "BlackTalk." Yet, the individuality of people also came out in the programs. There is a difference between public and community radio. Also by qualifying my statement I must add that community radio is the closest thing in existence right now to a racial Utopia, of course using an Afrocentric definition of what is a racial Utopia/

Just because black people have managed to make some progress in terms of black public affairs programming with community radio does not mean they should not keep striving for more progress in commercial radio, such as Milestone, community TV, such as Rogers, or commercial TV, such as Sylvia Sweeney's Access Network. Using community radio, such as CKUT's "BlackTalk" as a role model, progress made in all these areas will make a real difference in diminishing the "tyranny of the image" and the "tyranny of sound." I have great faith in the future of black public affairs programming at all levels of broadcasting, even TV. If a bunch of 10-year-olds could do such a good job at educating others with OCTV, I think the older and wiser can do it too.

MATHEMATICAL TYPICAL AND PROBLEM TASKS AS AN EDUCATIONAL COGNITIVE CONTEXT

Alina Kalinowska

University of Warmia end Mazury, Faculty of Social Science Early Edukation, Olsztyn, Poland

Abstract

School education is always rooted in culture, which makes it involved in some kind of ideology. The ideology can manifest itself, for example, in the cognitive context created for school learners. In turn, mathematical problem tasks can be a manifestation of the cognitive context. Dealing mainly with typical problems may have a limiting effect on mathematical notions. This is characteristic of the cultural transmission ideology. The knowledge constructed in such a context is schematic, rigid and useless in situations outside school. Solving problem tasks creates a chance to attain a different cognitive context – based on constructivism. Creating situations which develop learners' concepts versus the context which limits them, activates a different cultural interpretation approach to what mathematical knowledge is and how it is used.

Keywords: Knowledge, cognitive context, educational transmission, constructivism

Introduction

School is where we experience contexts in which the pedagogical culture is defined. Culture as a whole is composed of interconnected parts, therefore it can be said to "consist of elements" (Eller, 2012). These elements, however, should not be perceived separately but with a deep awareness that while performing unique functions, they affect the entire culture (Ibidem). My assumption has been to limit their number to selected aspects. I am interested in educational experience from the perspective of the pupil's knowledge, which the school is concerned with. If education is considered, after J. Bruner, in the broad perspective of a complex process, focused on adjusting culture to its participants and, on the other hand, on adjusting the latter and their types of knowledge to culture (J. Bruner, 2006), then we must not neglect the role of a cognitive context. The cognitive context is like a filter through which constructed knowledge acquires certain constitutive characteristics. Thus, it is important what knowledge will serve as an instrument for creation and participation in culture.

The cognitive context is a tool for understanding and interpreting other people's behaviour. It is a source of more or less intuitive concepts about the minds of other people (Ibidem). The educational dimension of a cognitive context is primarily associated with the teacher's ideas regarding the child's mind. These ideas determine the teacher's actions and therefore create the pupils' understanding of what knowledge is and how it can be used. In the teaching process, it is necessary to conceptualize what schoolchildren do, but also what they think about what they are doing and why they are doing it (Ibidem). The need (or its lack) to have such cognition is related to the teachers' educational ideology. The ideas based on behavioural concepts will always focus the teacher's attention on the child's activities. Being certain that a child who does the tasks defined by the teacher is learning is at the foundations of educational transmission. In contrast, accepting theories which perceive the mind as a tool for constructing individual and unique senses creates an area of interests connected with pupils' metathinking. The cognitive context created for a pupil is a broadly understood background for the teaching process, which originates (among others) from a teacher educational theory [43].

---

[43]Because of the limited length of the text, I omit other elements connected with the generally understood school system.

The key category in the present considerations is the pupil's knowledge. It is a product of many types of cognitive experiences. But it falls outside any unambiguous description, being a concept very difficult to define. The knowledge being created in the human mind cannot be presented as a uniform model, neither from the perspective of cognitive psychology. In the most significant model, it is assumed that during the development process of any individual cognition is achieved in two ways: through experience and by transmission. By necessity, the category 'knowledge' is subjected to modifications of its meaning according to the latest tendencies in psychology. The cognitive theory perspective reveals creative values of an individual, the innovativeness which helps 'to surpass thresholds of one's achievements and in some cases to develop culture" (J. Kozielecki, 2000).

In the recent years, the approach to how the human mind thinks and analyzes the world has largely changed, stimulating interest in human mental processes and attempts at separating description of data from their explanation (Trzebiński, 1994). On the wave of these changes, a theory of knowledge has been created, known as constructivism, currently the most desirable and innovative approach, which defines a new attitude to the way we think about knowledge. B. Gołębniak suggests that the current, specific 'demand' for this theory is created by an extremely strong pressure to change the educational model, the pressure originating from different spheres of public life, and by the development of cognitive psychology (Gołębniak, 2005).

In opposition to the positivistic thinking about knowledge, the new concept – drawing from phenomenological sociology – assumes that knowledge "is a set of socially and historically constructed meanings" (Sawisz, 1989). It also negates the existence of objective knowledge, replacing it by socially negotiated concepts.

If we take as a starting point 'existence' of knowledge in the mind, we feel the need to distinguish two of its forms: personal and objective (scientific) knowledge, which function in a non-dichotomous manner.

Personal knowledge is the motif less exploited in school education, and especially in the context of teaching mathematics in youngest forms. Youngest pupils are perceived as not independent intellectually, with very limited capabilities of creating mathematical concepts. It is my understanding, however, that knowledge means concept-making strategies which are formed independently. Personal mathematical knowledge is therefore understood not as a set of information from life outside school, but as strategies of thinking.

2. Knowledge in paradigms: educational transmission versus constructivism

In our attempt to interpret the school educational context, let us take two models of thinking about education: educational transmission and constructivism, and use them as kind of a filter.

The model of educational transmission, originating from the positivistic thinking about reality, relies on the following assumptions:

knowledge is objective, permanent and unquestionable in character,

the learner gains knowledge by transmission,

the learner is a passive recipient of abilities and skills,

school knowledge is the type of uniformed concepts acquired by pupils in an identical way (Kohlberg, Mayer, 1993).

The constructivist theory of teaching is distinctly different, with its assumptions located at the other extreme:

knowledge about reality is constructed actively by an individual,

an individual acts independently,

the source of knowledge consists of personal experiences, whose sense is interpretable depending on the previous knowledge of an individual,

personal knowledge is continually re-constructed,

meanings are assigned individually (J. Dewey, J. Piaget, L. Wygotski, J. Bruner, in Poland: S. Dylak, B. Gołębniak, D. Klus-Stańska).

The theoretical context of teaching mathematics can be perceived through one of the above paradigms. Each will set a different cognitive backdrop. Mathematical knowledge constructed under such diverse cognitive and theoretical conditions need not, and cannot be a set of analogous competences. And although we often think about mathematical competences as being very clear, studies on mathematical concepts formed by pupils show differences in the understanding of notions due to previous cognitive experiences[44]. Analogously, one may say that the ability to solve problem tasks can depend on culturally determined cognitive context.

Solving mathematical word problems is one of the most common classroom activities. It activates the mathematical cognitive mechanism, which is colloquially recognized as constructing the ability to apply mathematical knowledge to real life. It is often assumed that a pupil who will work through certain schematic models while solving classroom tasks (for example, problems involving clock time calculations) will be able to use them in real life. But actually real life, which is not a school application of mathematics, abounds in problems not necessarily analogous to the ones in school textbooks. Real-life situations are most often the type of problems which need to be conceptualized individually and solved by applying a personal thinking strategy rather than a schematic action. In other words, a mathematical cognitive context should be an area where pupils create individual thinking concepts instead of learning many patterns of action.

Mathematical word problems in the youngest forms have been classified in many ways, taking the following as criteria for divisions: structure of a sentence, solution model or number of data. The assumptions underlying the elaborated typologies constituted an element of the approach where a problem is perceived as a certain mathematical object. According to the contemporary cognitive theories, it would be more appropriate to focus our attention on the ways in which the mind of a pupil functions whilst solving a problem and on the undertaken intellectual activity.

For the purpose of this text, the distinction of mathematical word problems into typical and problem tasks has been assumed. Although this division is not completely satisfactory, it points to some context potential. A typical task is the one where a pupil has learnt a mathematical model according to which the given problem can be solved and the model is imitatively executed in the following tasks. The activity that is initiated then most often involves matching ready-made patterns hidden in the memory to the problem's text. An example could be this problem: First-form pupils planted 8 deciduous trees in the school yard and second-form pupils additionally planted 6 coniferous trees. How many trees altogether did the pupils plant? The pupils who can do calculations on the required level of difficulty find the figures in the text and perform the operation according to the key word 'altogether'. This strategy suffices to handle mathematical problems in the school context.

Problem tasks are different. When defining a problem, J. Kozielski notices that solving it should be accompanied by productive thinking, connected with the enrichment of an individual's knowledge of the world., because while thinking a man "formulates new hypotheses about the world, constructs different machines or

[44]Cf. a survey of third formers, who solved untypical problems based on a mathematical model not yet introduced at school (access on 10.04.2012 http://trzecioklasista.cke-efs.pl/kategoria/publikacje)

elaborates action plans" (Kozielecki, 1969). Thus, the scope of one's knowledge changes too. Problem tasks are the ones where a mathematical model is unknown. The pupils need to use creative thinking to build a model and while doing it they create new knowledge. Examples are the sentences: How will the quotient change if I multiply the dividend by three? or There are three sisters in the *Kowalski family. Each has a brother. How many children are there in the Kowalski family?* When such problems are solved, the pupil must refer to own personal knowledge and carry out a research process consisting in putting the given situation in a real-life context and discovering the regularity which leads to the solution model.

3. The transmission cognitive context – limiting mathematical notions

The cognitive context is an important criterion differentiating the experience gained by youngest school children. Our understanding of how mathematical knowledge is used becomes constructed owing to the context in which mathematics is dealt with.

For some time now, many theoretical dissertations have been suggesting an unsatisfactory level of mathematical skills among youngest learners[45]. Attention is drawn to the excessive development of the technical aspect, i.e. the tasks given to pupils basically consist of having to calculate rows of sums, although they are made more attractive by adding a text, a picture or an additional task such as 'colour the picture' (Klus-Stańska, Nowicka, 2005) as if to reward doing mundane sums. Solving similar problems during many similar lessons makes it more difficult for pupils to extend the range of mathematical notions, because the latter appear repetitively in an identical mathematical context. If the term 'difference' occurs in similarly described relations, like: *Subtract 46 from 145. What is the difference?*, then children construct the notions related to the name but not to the relations between mathematical objects. They do not have an opportunity to examine this relationship or to build an awareness that such relationships are fundamental to mathematical thinking. In contrast, pupils who for example test the following problem: *How will the difference change if we add the same figure to the minuend and subtrahend?* will be able to assign other meanings to the term 'difference'.

If the mathematical knowledge is organized by the teacher in the minds of youngest pupils according to the above pattern, the learners become intellectually dependent. The school context teaches them that they are not independent solving mathematical problems. Pupils cannot construct own thinking about a situation described in a task[46] but should use 'the best' available proposals. In general, such mathematical skills are applicable in situations analogous to the ones in which a pupil has learnt the notions[47], which is at school. Learners then become convinced that they are not self-reliant intellectually because wherever they comes across any difficulty the teacher's suggestion seems to be the only aid strategy.

[45]This anxiety also occurs among older pupils, and the distinction has been made for the purpose of this text.

[46]It is not just accepting or not a different solution sometimes suggested by a more talented pupil. I am thinking here about the absence in youngest forms of a holistic mathematical educational concept on principle accepting, or consciously stimulating pupils to create own ways of handling cognitively difficult situations.

[47]Usefulness of mathematical knowledge (apart from the four basic arithmetic calculations) is often perceived by pupils as a school requirement but not useful in everyday life.

The scheme-creating cognitive context associated with solving similar typical tasks creates various, not always expected educational results. Apart from limiting the understanding of mathematical concepts, it is the basis for building specific strategies to handle problems. Many pupils who have just started school manage to add and subtract numbers up to ten. The strategy consists in drawing their attention to the numbers and key words in a mathematical problem (Cf. Dąbrowski, 2008). It does not require pupils to read a given text carefully or to become aware of mathematical relations between the objects described in a problem. Dealing with overly simple problems implies that children will construct a strategy that seems logical in that case, a strategy mentioned above. The observed similarities and differences do not relate to mathematical analogies (similarities in mathematical regularities), but are limited to pointing to an important key word which suggests what operation is to be performed. The scale of this phenomenon is worrying, as was demonstrated, for example, by surveys carried out in 2006-2011 on mathematical and linguistic skills among third formers. The surveys showed that learners handle very well simple problems including difference and ratio comparisons. They reached over 90% of correct answers. In one of the tests, next to some other untypical tasks, the following one was included: *There were 30 sparrows sitting in a tree. Suddenly most flew away apart from 6. How many sparrows stayed on the tree* (Dąbrowski, Wiatrak, 2011). This problem, whose correct solution was contained in the text itself, was correctly solved by just 30.9% of the surveyed learners. The most common mistake (49.1% of pupils) was to do the subtraction 30-6=24 and give the result as the answer (Ibidem). The schematic approach to a mathematical word problem proved to be a limiting factor. When summarizing the ability of third formers to solve typical problems, M. Dąbrowski puts forth a very worrying hypothesis that "a total of 60.4% of third formers could solve this problem by 'removing' from the text the given numbers and selecting 'a matching' action" (Ibidem).

Creating the transmission context during mathematics lessons is generated by a teacher, who was previously socialized at school in an analogous manner[48]. The teacher offers typical tasks to the youngest learners, being deeply convinced that this is the most effective educational method. This conviction grows deeper when pupils, especially the ones poorer at mathematics, do not handle so well other than typical problems given from time to time. This fact is accepted without any deeper reflection on behalf of teachers (sometimes, unfortunately, also learners) and becomes an important argument. However, the actual reasons why pupils fail lie hidden in ideologies to which teachers (and even the whole society) adhere. As an example, let us cite the belief that a mathematically talented learner is the one who solves problems quickly (Kalinowska, 2010). Problem tasks, by definition, require more consideration and time. When this happens, a pupil feels anxious when a solution cannot be found immediately and is unwilling to take such a risk. As a consequence, the learner's self-confidence suffers: *If I do not know the answer straightaway, I am not so good at mathematics.* Another reason could be the teachers' belief that when learners are trained in using many paradigms, they will be able to handle any problem. But this is not the case because, if taught as above, the youngest learners do not construct tools for thinking (drawing an image, making an unknown situation more concrete, etc.). Once fossilised in the above cognitive context, learners will find it more difficult to solve problems themselves, not only in the early school forms but also in the future.

4. A constructivist cognitive context – developing mathematical meanings

[48]It needs to be stated clearly that many of the actions pursued by teachers are connected to the need to comply with the requirements imposed by the transmission educational ideology hidden in the school system. For example, the contents and structure or early education textbooks are full of typical problems and action patterns. Few problem tasks are designed for the most talented pupils and are given very little time.

A different context for learning mathematics is created when the youngest learners become engaged in solving mathematical problem tasks. According to the model of developing mathematical thinking (Cf. Mason, Burton, Stacey, 2005), learners must use creative knowledge and independently build realistic contexts. Owing to such experience, they have a chance "to experience the feeling of being totally engaged in the problem, rarely felt at school" Bruner, 1978).

The development-stimulating cognitive context is created when the youngest learners are asked to create mathematical knowledge by themselves through activation of personal knowledge. Being confronted with a new cognitive problem, learners activate other strategies of thinking. Mathematical problem tasks can become an area of some kind of research and intellectual experiences. Creating a solution model for a task like: *There were 78 books on two shelves. On one shelf there are twice as many books as on the other. How many books are on each shelf? What would change if there were three-fold more books on one shelf than on the other? And five-fold?* stimulates pupils to uncover regularities. Learners have a chance to notice analogies in constructed models because they refer to the models of thinking they have already worked through. It is much more difficult when all that pupils possess are ready-made patterns stored in their memory, e.g. *this has to be divided by three*. When that is the case, they only analyze what action has to be written down and calculated, but relinquish the opportunity to search for any verification why it happens. Stimulating learners to discover mathematical regularities becomes an area of experimentation and creation, of questions asked by both the teacher and the learner. Constructing learners' capabilities of asking interesting cognitive questions develops their mathematical thinking.

Working on problem tasks encourages children to refer to representations of lower-order mathematical concepts. When trying to bring the story contained in a problem task closer to real life, they spontaneously use things or draw pictures, thus modelling the mathematical situation. Teaching mathematics in this sense, as J. Bruner claims, is a microcosm of intellectual development, which progresses from an instrumental action through the creation of images to a symbolic notation – an abstract notion, albeit based on visual images. It is then possible to reach a heuristic level while solving problems (Ibidem). Being able to handle real-life problems is similar to a situation of being capable of solving mathematical problems which require the recognition of a situation, observation of some regularity that governs a certain phenomenon and an attempt to describe it (create a model).

5. Recapitulation

Creating situations which develop learners and teachers' notions activates a different nature of cultural interpretation of what mathematical knowledge is and how it is used. The transmission cognitive context originating from the positivistic model of thinking describes a certain school reality. The teacher is the kind of a benefactor who transmits ready-made and uniformed notions to learners. The latter acquire these concepts in a ready-made and unchangeable form. The perspective of constructivism uncovers a completely new school reality. The learner can become an independent creator of own knowledge, which is continually reconstructed owing to the learner's personal experience. The constructed knowledge is understood as a cultural tool rather than a set of defined contents.

From the perspective of these two, so differently perceived cognitive contexts, school pupils may treat standard problem and real-life mathematical tasks as different cognitive categories, to which different strategies are applicable. With regard to typical problems, the ways in which pupils solve them are strictly connected with the strategy of recognizing the mathematical difficulty via identification of key words in the contents of a task. As a result, they build other mathematical notions, and their knowledge is characterized by other characteristics than when they deal with problem tasks independently.

Table 1. Pupils' meanings given to process of mathematics teaching-learning depending on the congnitive context

Transmissive context (solving typical tasks)	Constructivist context (solving problem tasks)
Impaired self-agency (learnt helplessness)	Constructing mathematical notions of different levels of generalization
Mathematical competences equated with imitative reasoning	Solving mathematical problems as an everyday cognitive experience
Personal knowledge invalid in the classroom	Using personal knowledge and building the feeling of competence
Lack of self-reflection	Formulating and verifying hypotheses
Mathematical notions become more rigid	Becoming familiar with a mathematical problem
No need to ask questions; being dependent on instructions	Asking questions: learner-teacher, learner-learner, learners-to themselves, feels necessary
Created mathematical knowledge: schematic rigid rarely useful inert	Created mathematical knowledge: flexible useful dynamic

In the light of the above considerations, it is worth reminding ourselves that "man is incapable of experiencing the natural and social world in any other way but through cultural prismatic symbols" (Eller, 2012). It is also impossible to interpret and use mathematical cognitive tools at school or in real life in any other way. The limiting cognitive context will not activate the capacity for cultural (i.e. based on personal thinking

strategies) use of mathematics. Moreover, it can become one of the causes of mathematical illiteracy among a large part of the society.

In the transmission method, we achieve more effective traditional understanding, whereas in the constructivism approach we create conditions for the youngest learners to build a critical identity, able to oppose the encountered notions. This way, the learning-teaching of mathematics enters the realm of emancipation and critical pedagogics, which to some extent may surprise many participants of the broadly understood educational process.

MATHEMATICS SET THEORY IN A PRE-SCHOOL CONTEXT

Pedro Tadeu[a,b] and Joana Lucas[c]

[a]Superior School of Education, Communication and Sport,

Polytechnic Institute of Guarda, Guarda, Portugal

[b][49]Research Unit for Inland Development (UDI),

Polytechnic Institute of Guarda, Guarda, Portugal

[c]Master student – Master in Pre-School and Primary School Teaching

Abstract

We are daily confronted with materials, objects and spaces and through their exploration we develop adaptation, discovering and comprehension abilities concerning the use of these resources.

In Pre-School context, everything that children have already seen make sense for them and they will explore the contents related with the first approach to the objects they already know. This study emphasizes situations related to Set Theory as well as its continuity in the first cycle of Basic Education.

The goal of this communication is to show in which way the contents learnt by students in high school, such as intersection, union, complementarity, notion of element belonging to a set or not, may also be worked by young students in Pre-School. The second author conducted several experiments in classroom during the school year, focusing on this idea.

The activities and the learning process have been integrated in the classroom's normal course, creating a continuous exploration. As result of the articulation between other contents and domains, the teacher will be able to feel the children's progress.

Is our intention to point that Mathematics, and particularly Set Theory, is, and should remain as a catalyst in children's teaching process, concerning the knowledge that can be transversal to other areas of this cycle.

The gradual move from playful experiments to a more formal environment requires contents also to be adjusted to this change from a concrete to an abstract reasoning. Off course ideas can always be targeted for improvement, considering the differences in the class or for other reasons.

It is desirable that "dialogue and collaboration between educators and teachers ease the transition and the child's positive attitude facing compulsory education".

It is also an objective to discuss in a sharing environment how is pre-school seen in an international context, highlighting Mathematics teaching, essential link to the development of other student's important characteristics that will be arise in the future.

MEANING IN LIFE AND SUBJECTIVE WELL-BEING AMONG TURKISH UNIVERSITY STUDENTS

Tayfun Doğan[a], Fatma Sapmaz[a], Fatma Dilek Tel[b] Seda Sapmaz[c], Selin Temizel[c]

[a]Sakarya University Education Faculty, Department of Psychological Counselling *and Guidance, Sakarya, 54300, Turkey.*

[b]Anadolu University Education Faculty, Department of Psychological Counselling *and Guidance*, Eskisehir, Turkey.

[c]Ege University Literature Faculty, Department of Psychology, Izmır, Turkey.

Abstract

The aim of this study was to investigate the relationships between meaning in life and subjective well-being. The sample of the study consisted of 232 university students (171 female / 61male) from Sakarya University. The Satisfaction with Life Scale, The Positive-Negative Affect Scale and The Meaning in Life Questionnaire were used to collect data. In data analysis, Pearson correlation coefficients and multiple regression analysis were used. The findings showed that presence of meaning in life and search for meaning in life significantly predict subjective well-being. According to regression analysis, meaning in life accounts for 34% of the variance within subjective well-being. The findings were discussed and in the light of these findings suggestions for future studies were proposed.

Keywords: Meaning in life, subjective well-being, presence of meaning, search for meaning

Introduction

Human beings have been questioning the meaning of life and trying to make their lives more meaningful since the beginning of their existence. Many religions, philosophies and other disciplines up to now have tried to contribute to the search for meaning in life (Sezer, 2012; Pope, 1999). The science of psychology is definitely one of those contributing to the search for meaning by humans. Especially after World War II, questions about meaning in life have become an important issue. Psychologist Viktor Frankl, who escaped from Nazi death camps, is the founder of 'Logotherapy', and attempts to answer these questions in his book *Man's Search for Meaning*. Frankl was influenced by the ideas of philosophers such as Nietzsche, Kierkegaard and Schopenhauer, and also mentioned his own experiences and observations from Auschwitz concentration camp. Frankl observed that people who had no meaning in their lives died earlier than people who had purpose in their lives (Frankl, 2000). According to Frankl, lack of meaning in life is associated with many pathologies such as weakness in the face of difficulties, depression, suicide, dependence and negative well-being (Frankl, 2000; Schnell, 2009).

The concept of well-being, according to many philosophers and psychology researchers, is based on the eudaimonic and hedonic approaches of Aristotle (Waterman, 1993). While the eudaimonic approach refers to self-actualization and full functioning, the hedonic point of view defines well-being as satisfaction and happiness (Diener, Suh, Lucas & Smith, 1999). Today, happiness is explained within the concept of subjective well-being (Eryılmaz, 2011). Subjective well-being, besides positive and negative affection, includes life satisfaction, which evaluates an individual's life and expresses the level of life goals one attains (Tuzgöl-Dost, 2010). Therefore, subjective well-being is a three-dimensional construct including positive affect, negative affect and life satisfaction (Hybron, 2000). Life satisfaction represents the cognitive side of subjective well-being and includes judgments about an individual's satisfaction from different life areas (Myers and Diener, 1995). High satisfaction from life and more positive affect mean that the individual has high subjective well-being (Eryılmaz & Aypay, 2011).

Based on the literature, the concept of meaning in life is positively associated with many concepts examined within positive psychology (Melton & Schulenberg, 2008; Steger, 2005; Zika & Chamberlain, 1992). In a study investigating the relationship between meaning in life and life satisfaction which represents the cognitive side of subjective well-being, it was found that there is a positive relationship between meaning in life and life satisfaction (Bonebright, Clay & Ankenmann, 2000). Another study of meaning in life similarly indicates a positive relationship between happiness represented by subjective well-being and meaning in life (Debats, Lubbe & Vezeman, 1993). Although there are existing studies on the relationship between meaning in life and subjective well-being, there has not been enough research on this issue in Turkey yet. The aim of the present study is to investigate the association between meaning in life and subjective well-being in Turkish culture. Two hypotheses were determined for the aim of the study:

H1: Presence of meaning in life positively predicts subjective well-being.

H2: Search for meaning in life negatively predicts subjective well-being.

2. Method

A relational screening model was used in this study. The aim was to examine the relationships between meaning in life and subjective well-being. Subjective well-being is the dependent variable and meaning in life and search for meaning in life are the independent variables of the research.

2.1. Participants

Participants of the study are 232 students from Sakarya University Faculty of Education, 171 female and 61 male. Age range of participants is 18-26 and mean of age is 21.43 (S=1.68).

2.2. Measures

2.2.1. The Satisfaction With Life Scale (SWLS)

The Satisfaction With Life Scale (SWLS) is a 5-item, Likert type self-report questionnaire, developed by Diener, Emmons, Larsen and Griffin (1985). Diener et al., (1985) found that internal consistency of SWLS is .87 and test-retest reliability coefficient is .82. Scale was adapted to Turkish by Yetim (1993). Yetim (1993) also reported that internal consistency of SWLS is .76 and test-retest reliability coefficient is .85.

2.2.2. Positive-Negative Affect Scale (PANAS)

Positive-Negative Affect Scale (PANAS) was developed by Watson, Tellegen and Clark (1988) and adapted to Turkish by Gençöz (2000). PANAS is a Likert type questionnaire including 20 items; 10 negative and 10 positive. Gençöz (2000) reported that internal consistency is .83 for "Positive affect" subscale and .86 for "Negative affect" subscale.

2.2.3. The Meaning in Life Questionnaire (MLQ)

The Meaning in Life Questionnaire (MLQ) was developed by Steger, Frazier, Oishi and Kaler (2006). The questionnaire is Likert type with 10 items and has two subscales: Search and Presence. Steger et al. (2006) reported that internal consistency coefficients are between .83 and .85 for "search" subscale, and between .83 and .88 for "presence" subscale. It was adapted to Turkish by Terzi, Tekinalp and Leuwerke (2011).

2.3. Procedure

A personal information questionnaire was also used to collect the demographical information of participants in addition to other measurement tools. Cross-sectional design was used and data was obtained at one time. Group practices were performed. Participants were informed about the purpose of the study and informed consent was considered. Questionnaires took approximately 30 minutes and data was analyzed by SPSS 15.0 and Lisrel 8.71 programs. Subjective well-being is defined as life satisfaction, feeling more positive emotions and feeling less negative emotions (Diener, 1984). Based on the theoretical definition, SWLS and PANAS were used to measure subjective well-being. Subjective well-being was considered by the following formula:

Subjective Well-being = (Satisfaction with Life + Positive Affect) – Negative Affect

3. Results

3.1. Descriptive Statistics

Mean scores and standard deviations of research variables were calculated and findings are displayed on Table 1.

Table1. Mean scores and standard deviations of searching for meaning in life, presence of meaning in life and subjective well-being

Variables	$\overline{X}$	Sd
Presence	27.41	5.88
Search	22.98	7.42
Positive affect	33.15	6.97
Negative affect	22.74	7.01

Satisfaction with life	21.86	6.05	
Subjective well-being	32.26	13.87	

N=232

Mean scores of search for meaning in life, presence of meaning in life and subjective well-being are showed on Table 1. According to these findings, the mean score of presence is 27.41 (Sd=5.88), mean score of search is 22.98 (Sd=7.42) and mean score of subjective well-being is 32.26 (Sd=13.87).

3.2. Multiple Regression Analysis Findings

Multiple Regression Analysis was conducted to investigate the relationships between subjective well-being and interpersonal relationship styles (see results on Table 2).

Table 2. Multiple regression analysis findings of subjective well-being prediction of presence and search variables

	B	Std. Error	Beta	t	p
Presence	1.327	.127	. 56	10.482	.000
Search	-.274	.100	-.15	2.738	.007

R=.58, R^2=.34, F=59.281, p<.001

According to the findings, presence of meaning in life and search for meaning in life subscales significantly predict subjective well-being (R=.58, R^2=.34, F=59.281, p<.001). In regression analysis, it was found that presence of meaning in life positively affects subjective well-being (β= .56; p= .000) and search for meaning in life negatively affects well-being (β= -.15; p<.007). Meaning in life accounts for 34% of the variance within subjective well-being.

4. Discussion and Conclusion

Meaning in life and subjective well-being are important research topics of positive psychology. This study aimed to test the relationships between presence and search for meaning in life and subjective well-being. Research findings indicated that presence of meaning in life significantly predicts subjective well-being in a positive way and search for meaning in life significantly predicts subjective well-being in a negative way. Accordingly, presence and search for meaning in life account for 34% of variance of subjective well-being.

These findings show that meaning in life is an important component of subjective well-being. It is inferred that presence of meaning in life has an increasing effect and search for meaning in life has a reducing effect on subjective well-being. Previous research done in different cultures also shows the same findings as this study (Cohen & Cairns, 2011; Galang, Magno, Paterno & Roldan, 2011; Ho, Cheung & Cheung, 2008; Morgan & Fastides, 2009).

The findings of the study can be utilized on two levels. The first is the positive relationship between presence of meaning in life and subjective well-being. Human beings are the only creatures who have awareness of meaning in life and death. Meaning in life can be described by the answer to the question 'What am I living for?', and individuals who can answer this question have meaning in their lives. The first hypothesis is that presence of meaning in life positively predicts subjective well-being. Findings of the study confirm the hypothesis. The second hypothesis was determined that search for meaning in life predicts subjective well-being negatively. Findings also confirmed this hypothesis. Search for meaning in life is actually a positive concept. Therefore this question arises: Why is the search by individuals for meaning in their lives negatively associated with subjective well-being? Search for meaning in life may indicate that there is still no meaning in life. Hence, search for meaning in life was found negatively associated with subjective well-being.

Consequently, findings of this study would contribute to the existing literature. Cultural factors are directly associated with the meaning in life. In this context, results of this research on Turkish university students have clinical utility. Considering the results, meaning in life can be focused on during psychological counseling procedures and programs aiming to increase happiness. Future research may examine the mediating effect of variables such as religion and altruism, which contribute to the meaning in life, between subjective well-being and meaning of life.

21.yüzyılda nitelikli insangücüne duyulan ihtiyaç artmakta ve mesleki ve teknik eğitim giderek önem kazanmaktadır. Mesleki ve teknik eğitimdeamaçların gerçekleştirilmesi, öğrencilerin istendik davranışlara sahip olmalarında öğretmenlerin mentorluk becerileri oldukça önemlidir.Bu araştırma,mesleki ve teknik eğitimde görev yapan öğretmenlerin mentorluk konusundaki görüşlerini belirlemeyi amaçlamaktadır. Araştırmada tarama türü yöntem ve nitel araştırma deseni kullanılmış olup, veriler yarı yapılandırılmış görüşme formu aracılığı ile toplanmıştır.Araştırmanın çalışma grubunu Bitlis merkez ilçede yer alan Meslek Lisesi, Halk Eğitim Merkezi ve Mesleki Eğitim Merkezinde görev yapan 30 öğretmen oluşturmaktadır. Araştırma sonucunda öğretmenler mentorluk becerilerinin geliştirilmesi, öğrencilerin ilgi ve yeteneklerinin göz önünde bulundurulması, aile ve iş çevrelerinin desteğinin sağlanması yönünde görüş belirtmişlerdir.

Anahtar Sözcükler: Mentorluk, mesleki ve teknik eğitim, öğretmen görüşleri, nitelikli iş gücü, mesleki rehberlik

TEACHERS' VİEWS ON MENTORİNG IN VOCATİONAL AND TECHNICAL EDUCATİON

Abstract

In 21th century, groving need for qualified human resources and vocational and technical education has increasingly become important. Mentoring skills of teachers are very important in realizing the objectives of vocational and technical education, and in making students acquire in this regard, this research aims to determine the views of the teachers working in vocational and technical high schools and training centres about vocational mentoring. This research is aqualitative survey study ,and semi-structured interview form has been used to collect data. The study group consists 30 teachers working in vocational and technical highs chools and public educatinal centres in the city centre of Bitlis. As a results of the study the teachers are of theopinionthatmentoringskillsshouldbe improved, thestudents'interestsandabilitiesshould be takenintoaccount, and support from the families and bussinesss circles should be provided.

Keywords: Mentoring, vocational, vocational and technicale ducation, teacher'sviews, qualified labor force, vocational guidance.

Giriş (Introduction)

Nitelikli ara insan gücünün ülkelerin kalkınmasındaki önemi yadsınamaz. Bu gücün oluşturulmasında mesleki ve teknik eğitim sürecinin niteliği önem kazanmaktadır. Bu bağlamda mesleki ve teknik eğitimde uygulanan öğretim programlarının, bireysel, sosyal, ekonomik ve ulusal gereksinimlere cevap verebilecek nitelikte olması gerekliliği ortaya çıkmaktadır (Alkan, Doğan ve Sezgin, 1996).Kalkınmanın hızlandırılması, istihdamın artırılması ve ülkenin rekabet gücünün yükseltilmesi yönünden kritik öneme sahiptir.

Mesleki ve teknik eğitim, Türk toplumunda 18. yy'a kadar geleneksel usullere dayalı bir sistem içerisinde Selçuklu döneminde Ahilik, Osmanlı döneminde ise Lonca teşkilatları tarafından yürütülmüştür. Bu yapıda anne ve babaları tarafından meslek öğrenmek üzere bir ustanın yanına verilen çocuklar, belli bir süre burada çalışarak önce kalfalığa, sonra da ustalığa terfi ederdi. Bunun yanı sıra devlete bağlı bazı büyük kuruluşlar da kurs ya da okullar açarak ihtiyaç duydukları kalifiye elemanları yetiştirmekteydiler (Semiz ve Kuş, 2004: 272–295).Selçukluların mirası olan ahilik anlayışı günümüzde de devam etmekte; bu bağlamda her yıl, "yılın ahisi" seçimi yapılarak, ahilik haftası kutlanmaktadır. Osmanlı devletinin esnaf teşekkülü olan lonca teşkilatının yerini ise günümüzde Esnaf ve Sanatkârlar Odaları almaktadır.

Türkiye'de mesleki eğitim, örgün ve yaygın orta eğitim kurumlarında verilmektedir. Örgün mesleki *orta öğretim kurumları*; Meslek Liseleri ve Teknik Liselerdir. Meslek Liselerinin bütün alanları temel eğitimini tamamlayan herkese açıktır. Teknik liseler ise, meslek liselerindeki ilk yılını başarıyla tamamlayan öğrencileri almaktadır. Anadolu Meslek Liselerinde 1 yıllık hazırlık sınıfında yabancı dil öğretilmekte, üç yıllık mesleki eğitim bunu izlemektedir. Teknik Liseler, mesleki eğitim müfredatlarıyla birlikte, genel liselerin fen kollarında uygulanan eğitime benzer bir eğitim vermektedir. Dolayısıyla, bu okullara devam eden öğrencilerin yüksek öğrenime yerleştirilme şansları daha fazladır (TEKEV. (2007). Yaygın eğitim ise zorunlu temel eğitimini bitirmiş, ortaöğretimini yarıda bırakmış veya ortaöğretimini tamamlamış bireylere gerçek iş ortamında fiilen çalışmak suretiyle meslek öğrenmek isteyen 15 yaş ve üzerindeki vatandaşların teorik ve pratik eğitimlerinin bir programa göre yapılmasını sağlayarak, çıraklık, kalfalık, ustalık eğitimleri ile meslek kursları şeklinde gerçekleştirilir.3308 sayılı "Çıraklık ve Meslek Eğitimi Kanunu" ile gerçekleştirilmiştir. Bu düzenleme ile tam zamanlı mesleki teknik okulu ile okul endüstri işbirliğine dayalı mesleki teknik okuldan oluşan karma bir model kabul edilmiştir. (C.Alkan, H.Doğan 1991).

Yüksek öğrenimde mesleki teknik eğitim iki yıllık Meslek Yüksekokulları ve dört yıllık Mesleki ve Teknik Eğitim Fakülteleri aracılığıyla yürütülmektedir. İki yıllık meslek yüksekokulları sanayinin ihtiyacı olan ara eleman (tekniker) ihtiyacını sağlamaya yönelik olarak kurulmuşlardır. Dört yıllık eğitim verilen Mesleki, Endüstriyel Sanatlar, Teknik ve Ticaret Turizm Eğitim Fakültelerinin temel amacı ise mesleki ortaöğretim kurumlarının öğretmen ihtiyacını karşılamaktadır(Şahin ve Fındık,2008). Mesleki ve teknik eğitim uygulama ağırlıklı bir eğitimi içermektedir. Örgün ve yaygın mesleki eğitimin nitelikli bir hale getirilmesinde öğretmenlerin mentorluk yeterlikleri önem kazanmaktadır.

Mentor kavramının kökeni Yunan mitolojisine dayanmaktadır. Mitolojiye göre,Kral Odysseusuzun süreli bir savaşa çıkarken, oğlu Telemachus'un eğitimi için yakın arkadaşı Mentor'u görevlendirir. Günümüzde ise bu kavramın karşılığı sözlüklerde, güvenilen ve deneyimli rehber, kılavuz danışman, akıl hocası ve yol gösterici gibi anlamlarda kullanılmaktadır.(Sheal, 1992,51) . Mentorluk; danışman, destekleyici, öğretmen, koruyucu, model ve rehber görevlerini kapsayan ilişkiler bütünüdür (Starcevich, 1997). Mentorluğun Türk tarihindeki yeri de önemlidir. Selçuklular 'da ahilik, atabeylik, Osmanlılar 'da lalalıkşehzadenin yetiştirilmesinde önemli kurumlar olarak görülmüştür.

Eğitsel açısından mentorlük, deneyimli bir eğitimcinin, başka meslektaşlarının öğretimsel gelişiminin sağlanması amacıyla yaptığı yardım ve destek çalışmaları, önerilerde bulunma süreci olarak tanımlanabilir.(Sullivan, 2000). Bu açıdan mentorlük uygulaması eğitim sistemi açısından kritik bir öneme haizdir. Bir yandan kıdemli ve başarılı öğretmenlere yeni bir kariyer fırsatı yaratırken, diğer yandan ürkek ve güvensiz bir biçimde sisteme giren yeni öğretmenler, kıdemli ve başarılı öğretmenler tarafından iş başında yetiştirilerek kendilerini daha güçlü ve başarılı hissetmelerine katkıda bulunmuş olmaktadır. Mentorlük özellikle öğretmenliğin ilk

yıllarında büyük bir rol ve önem taşımaktadır.(Feiman-Nemsen,1996).Bu önem mesleki ve teknik eğitimin mentorlük anlayışının yerleşmesi ve gelişmesiyle olur.

Amaç (Purpose)

Bu araştırma, Bitlis ili'ndekiMesleki ve Teknik Eğitim(Teknik veya Anadolu Teknik Liseleri, Halk Eğitim, Mesleki Eğitim Merkezi)kurumlarında görev yapan öğretmenlerin "Mesleki ve Teknik Eğitimde Mentorlük" konusundaki görüşlerini belirlemeyi amaçlanmaktadır. Bu amaçla aşağıdaki sorulara cevaplar aranmıştır.

1.Öğretmenler,Mesleki ve Teknik Eğitim(Teknik veya Anadolu Teknik Liseleri, Halk Eğitim, Mesleki Eğitim Merkezi)'de mentorlük konusunda kendilerini yeterli görmekte midirler?

2. Mesleki ve teknik eğitimin kalitesini arttırmak için öğretmenlerene gibi görevler düşmektedir?

3. Öğretmenlerin mesleki ve teknik eğitim ve istihdam konusunda görüşleri nelerdir?

4. Mesleki ve teknik eğitimde öğrencilere gerekli mesleki rehberlik ve yönlendirme yapılmakta mıdır?

5. Mesleki teknik eğitimde mesleki rehberlik ve yönlendirme nasıl yapılmalıdır?

Yöntem (Method)

Araştırmadabetimsel yöntem, nitel araştırma desenlerinden olgubilim deseni kullanılmıştır. Veriler yarı yapılandırılmış görüşme formu aracılığı ile toplanmıştır.Bitlis merkez ilçede bulunan Meslek ve Anadolu Meslek ve Teknik Liseler ile Halk ve Mesleki Eğitim Merkezi araştırmanın çalışma evrenini oluşturmaktadır. Bu amaçla, Bitlis merkez ilçede yer alan 3 Meslek Lisesi, 2 Anadolu Meslek Lisesi ve Teknik Lisesi,1 Halk Eğitim Merkezi ve 1 Mesleki Eğitim Merkezinde çalışan 30 öğretmenle görüşülmüştür. Görüşmelerde katılımcıların izni ile kısa notlaralınmış, kayıtlar içerik analizi yöntemi ile çözümlenmiştir. Veriler dört aşamada analiz edilmiştir: 1. Verilerin kodlanması, 2. Kodlanan verilerin temalarının belirlenmesi, 3. Kodların ve temaların düzenlenmesi, 4. Bulguların tanımlanması ve yorumlanması (Yıldırım ve Şimşek, 2008: 228). Çözümlemelerde görüşüne başvurulan öğretmenlere birer kod numarası verilerek (Ö1, Ö2...) açıklamalar yapılmıştır. Açık uçlu sorular ile elde edilen veriler sayısallaştırılarak frekans ve yüzde olarak ifade edilmiştir. İfadelerdeki benzer öğeler gruplandırılmış ve gruba uygun olarak temalandırılmıştır.

3.1.Çalışma Grubu (The study groups)

Anket formunun uygulandığı öğretmenlere ait kişisel özellikler Tablo 1 ve Tablo 2' de verilmiştir.

Tablo 1. Katılımcıların yaş, eğitim düzeyi, görev yaptıkları okul türü ve kıdem yıllarına ilişkin özellikler

Değişken	Cinsiyet		Yaş						Eğitim Düzeyi				Okul Türü						Kıdem Yılı				
Kategori	K	E	20-25	26-30	31-35	36-40	41-45	45+	Ö.L	L	Y.L	D	K.	E.	M.	T.	H.	A.	1-5	6-10	11-15	16-20	21+
f	6	24	4	13	11	1	0	1	2	22	6	0	5	5	5	5	5	5	22	4	3	0	1
%	20	80	13,3	43,3	36,7	3,3	0	3,3	6,7	73	20	0	17	17	17	17	17	17	73	13	10	0	3,3

Tablo 1'e göre çalışma grubunda cinsiyet açısından erkeklerin (%80), yaş değişkeni açısından en fazla 26-30'lu yaşların(%43,30) ve 31-35'li yaşların (%36,70), öğrenim düzeyi açısından en fazla lisans mezunlarının(%73), kıdem değişkeni açısından 1-5 yıl kıdeme sahip olanların (%73) en fazla oranı oluşturduğu görülmektedir. Okul türü açısından eşit bir dağılımın olduğu (her okul türünden 5' er kişi) görülmektedir.

Çalışma grubunda her branştan öğretmenin yer alması sağlanmıştır. Katılımcıların %20'sini Bilişim Teknolojileri, %10'unu Ahşap Teknolojileri,6,6'sını Elektrik Elektronik Teknolojileri, Makine Kalıp, Matematik ve Metal Teknolojileri, % 3,3'ünü ise diğer branşlar oluşmaktadır. Araştırmaya genel olarak kültür dersleri öğretmenine göre mesleki öğretmenlerin ağırlıkta olduğu görülmektedir. Katılımcıların mesleki ve teknik eğitim alanındaki yeterliklerine ilişkin görüşleri Tablo 3'te gösterilmiştir.

Tablo 3. Katılımcıların mesleki ve teknik eğitimde mentorluk yeterliklerine ilişkin görüşleri

İfadeler	Evet		Hayır		Kısmen	
	f	%	f	%	f	%
Mesleki ve teknik eğitimde mentorluk becerileriniz yeterli düzeyde midir?	20	66,7	3	10	7	23,3
Mesleki ve teknik eğitimi tamamlayan öğrencileriniz, alanlarında istihdam ediliyorlar mı?	7	23,3	4	13,3	19	63,3
Kurumda öğrencilere gerekli mesleki rehberlik ve yönlendirme yapılıyor mu?	15	50	5	16,7	10	33,3
Toplam	30	100	30	100	30	100

Tablo 3'te, anket formunda yer alan 1.,3.ve 4. sorular ve bu sorulara verilen cevapların analizi yapılmıştır.Tablo 3'teki ifadelerden ilki incelendiğinde öğretmenlerin%66,7'si mentorluk alnında kendilerini yeterli, %23,3'si ise kısmen yeterli görmektedir.3 katılımcı ise mesleki ve teknik eğitimde mentorluk konusunda kendilerini yeterli görmediklerini beyan etmiştir. Mentorluk alanında kendini yeterli görmeyen katılımcılara, hangi alanlarda yetersizliklerinin bulunduğu sorulmuş, katılımcıların hepsi özellikle işin teknik ve uygulama kısmında eksikliklerinin olduğunu, bunun gerekçesini de okullarında uygulamaya fırsat verilecek atölye,alet ve donanım eksikliği olduğunu belirtmişlerdir.Katılımcılar, mesleki ve teknik eğitimi tamamlayan öğrencilerin%23,3'sininistihdam edildiklerini, %63,3'ünün kısmen, %13,3' nün ise istihdam edilmediklerini beyan etmişlerdir.

Tablo 3'te öğretmenlerin %50'sinin öğrencilere gerekli mesleki rehberlik ve yönlendirme yapıldığını, %33,3'ünün ise mesleki rehberlik ve yönlendirmenin kısmen yapıldığını beyan etmişlerdir. Araştırmaya katılan öğretmenlerin %16,7'si öğretmen ve kurumların herhangi bir mesleki rehberlik ve yönlendirme yapmadıklarını bildirmişlerdir. Öğretmenler mesleki rehberliğin orta öğretim kurumlarından önce yapılıp, kişinin ilgi ve yeteneklerine göre yönlendirmenin yapılması gerektiği görüşündedirler.

Tablo3'teki sorulardan yola çıkarak araştırmaya katılanların büyük çoğunluğunun kendilerini alanlarında yeterli gördüklerini dolayısıyla iyi birer mentorolduklarını,mesleki ve teknik eğitim kurumlarının gerekli mesleki rehberlik ve yönlendirme yaptığını ve bunun sonucunda kendini yetiştirmiş öğrencilerin mesleklerinde iş hayatına atıldıklarını söylemek yanlış olmaz. Öğretmenlerin iyi bir mentordan beklentileri Tablo 4'te sunulmuştur.

Tablo 4. Mesleki ve Teknik eğitimde görev yapan öğretmenlere göre mentorluk yeterlikleri

S .No	Öğretmenlerin mentorluk yeterliklerine ilişkin görüşleri	f	%
1	Yeniliğe açık olup, kendini mesleki anlamda geliştirebilmeli.	12	40
2	Mesleki ve teknik eğitimin uygulama ayağına daha fazla önem vermeli.	3	10
3	Alanında yeterli donanıma sahip olup, mesleki bilgisini iyi aktarabilmeli.	3	10
4	Öğrencilerine meslekler hakkında rehberlik yapmalı.	3	10
5	Var olan imkânlardan azami ölçüde yararlanmayı amaç edinmeli.	1	3,3
6	Bilimsel çalışmalarda aktif görev almalı.	2	6,7
7	Öğrencilerinin ilgi ve yeteneklerini göz önünde bulundurmalı.	2	6,7
8	Öğrencilere alanlarında sorumluluklar(ödevler, projeler)vermeli	2	6,7
9	Öğrenci psikolojisi düşünen, çok yönlü bir profil oluşturmalı	1	3,3
10	Öğretmenler yasal olarak güçlendirilmeli.	1	3,3
	Toplam	30	100

Öğretmenlerin mentorluk yeterliklerine ilişkin görüşleritablo 4'te yer almaktadır. Araştırmaya katılanların %40'ı öğretmenlerin yeniliğe açık olması ve mesleki anlamda kendini geliştirmesi gerektiği görüşündedir. Mesleki ve teknik eğitimin uygulama ayağına önem verilmesi(%10), alanında yeterli donanıma sahip olup, mesleki bilgisini aktarabilmesi(%10),öğrencilerine meslekler hakkında rehberlik yapması(%10),var olan imkanlardan azami ölçüde yararlanmayı amaç edinmesi(%3,3),bilimsel çalışmalara aktif görev alması(%6,7),öğrencilerinin ilgi ve yeteneklerini göz önünde bulundurması(%6,7),öğrencilerine alanlarında sorumluluklar(ödev, proje) vermesi(%6,7),öğrenci psikolojisini düşünen çok yönlü bir profil oluşturması(%3,3),öğretmenlere güvenilmesi ve yetkilerinin arttırılması(1-%3,3) araştırmaya katılan diğer öğretmenlerin görüşleridir. Mesleki ve teknik eğitimde öğrencilere sunulacak yardım, mesleki rehberlik ve yönlendirme konusunda öğretmenlerin görüşleri Tablo 5'te sunulmuştur.

Tablo 5. Öğrencilere sunulacak yardım, mesleki rehberlik ve yönlendirme konusunda öğretmenlerin görüşleri

S. No	Öğretmen Görüşleri	f	%
1	Mesleki rehberlik ve yönlendirme işbirliği içerisinde, bilimsel, objektif uygulamalarla yapılmalıdır.	5	16,7
2	Fabrika, işletme, atölye vb kurumlara tanıtıcı geziler yapılmalıdır.	3	10
3	Görselliğe ve uygulamaya dayalı olmalıdır.	5	16,7
4	Öğrenci istekleri doğrultusunda yapılmalıdır.	3	10
5	Öğrencinin ilgi ve yeteneklerine göre yapılmalıdır.	10	33,3
6	Mesleki rehberlik ve yönlendirmede veli bilgilendirilmelidir.	1	3,3
7	Mesleki rehberlik ve yönlendirme, öğrenciye yerinde ve zamanında yapılmalıdır.	2	6,7
8	Hayatın içinden güzel örnekler verilmelidir.	1	3,3
	Toplam	30	100

Öğrencilere yönelik mesleki rehberlik ve yönlendirme konusunda öğretmen görüşleri incelendiğinde öğretmenlerin %33,3'ü öğrencinin ilgi ve yeteneklerine göre mesleki rehberlik ve yönlendirme yapılması gerektiğini beyan etmiştir. Okulla ailenin işbirliği içerisinde bilimsel testler ışığı altında objektif uygulamaların yapılması%16,7; fabrika, işletme, atölye vb kurumlara tanıtıcı gezilerin yapılması%10; görselliğe ve uygulamaya dayalı olması%16,7; öğrencinin isteklerinin göz önünde bulundurulması%10; mesleki rehberlik ve yönlendirme konusunda velilerin bilinçlendirilmesi %3,3; mesleki rehberlik ve yönlendirmenin yerinde ve zamanında yapılması%6,7 ve hayatın içinden güzel örneklerin verilmesi %3,3şeklindedir.

Mentorlukla ilgili öğretmenlerin diğer görüşleri ise; "Mesleki ve teknik eğitimin kalitesini arttırması konusunda gerekli yasal ve yapısal düzenlemelerin yapılması % 13.3; Meslek liselerine girişte öğrencinin yeterlikleri ve ilgilerinin göz önüne alınması % 16,6; "Mesleki ve teknik liselere genel bakış açısının değişmesi % 6,7; "Mesleki ve teknik eğitimin piyasa istek ve beklentilerini dikkate alarak teknolojik değişimlere uyum sağlayacak nitelikte olması gerektiği % 3,3 şeklindedir.

Sonuç ve öneriler (Result and proposal)

Yapılan araştırmalarda mesleki eğitim alanında yoğunlaştırılmış mentorluğun, bireye daha yüksek statü, gelir ve iş doyumu sağladığı sonucu ortaya çıkmıştır (Dreher ve Ash, 1990). Yine Amerika'da lise öğrencileri üzerinde yapılan bir araştırmada, mentorun öğrenci gelişimi üzerinde olumlu etkilerinin olduğu ortaya çıkmıştır (McCortie, 1991). Günümüzde teknoloji ve endüstri, çağdaş toplumsal kültürün vazgeçilmez bir parçasıdır. Bu

sayede birey kendini yetiştirme ihtiyacı duyar, toplumun refah düzeyi gelişir. Bireyin meslekleri tanıması, kabiliyetine uygun mesleki eğitim alması, işinde ve hayatında başarılı olması mesleki eğitimde kendisine sunulan yardım ve rehberlikle olasıdır. Mesleki yardım geçmişte ahiler, günümüzde ise mentorler tarafından verilmektedir. Bu konuda özellikle öğretmenlere büyük görev düşmektedir. Ancak öğretmenlerin mentorluk konusunda yeterli eğitime sahip olduklarını söylemek zordur. Ayrıca toplumun mesleki eğitime bakış açısı da olumlu değildir. Bir diğer önemli husus ta, mesleki eğitimin çağın, piyasanın beklentilerine uygun teknoloji ve uygulama eğitimi ile gerçekleştirilemeyişidir. Bu araştırmada mesleki ve teknik alanda çalışan öğretmenler mentorluğun, öğrencilerin gelişiminde önemli katkılar sağladığını, ancak mentorluk konusunda uygulamaya yönelik yeterliklerin geliştirilmesini, aile ve çevre ile işbirliğinin sağlanmasını önermişlerdir. Yapılan araştırmadan yola çıkarak ülkemizde mesleki ve teknik eğitimde mentorluk anlayışının tanınması ve yerleşmesi için şu önerilerde bulunmanın önemli olacağı tahmin edilmektedir:

1. Mesleki ve teknik eğitimde görev yapan öğretmenlere mentorluk konusunda eğitimler sağlanmalıdır.

2. Mesleki teknik alanda yapısal, yasal ve teknolojik değişimler gerçekleştirilmelidir.

3. Mesleki ve teknik eğitimde mentorluk, rehberlik ve işbirliği içerisinde ilgili tüm paydaşları kapsayacak şekilde yapılmalıdır.

5. Öğretmenere yaptıkları mentorluk uygulamaları için ücret verilmelidir.

6. Mesleki ve teknik eğitim görselliğe ve uygulamaya dayalı olarak yapılmalıdır.

7. Mesleki ve teknik eğitim kurumlarının oluşturulması konusunda özel sektör özendirilmelidir.

8. Mesleki ve teknik öğretimden mezun olan bireylerin istihdamı kolaylaştırılmalıdır.

MICRO-TEACHING VIDEOS IN EFL TEACHER EDUCATION METHODOLOGY COURSES: TOOLS TO ENHANCE ENGLISH PROFICIENCY AND TEACHING SKILLS AMONG TRAINEES

Assist. Prof. Dr. Perihan Savas [51]

Middle East Technical University, Department of Foreign Language Education, Faculty of Education, Ankara, 06800, Turkey

Abstract

The main goal of the study presented in this paper was to investigate the opinions of 40 prospective English as a Foreign Language (EFL) teachers about the effectiveness of micro-teaching videos in two English language teaching methodology courses. The study was conducted at a state university in Turkey and the data collection was mainly done via a questionnaire. Quantitative data analysis done on participants' responses to the questionnaire items show that absolute majority of participants believed in the usefulness of micro-teaching videos. The paper reports and discusses the English proficiency and English teaching skills enhanced by micro-teaching videos in detail.

Introduction

With the introduction of digital videos, incorporating teaching and learning activities with videos and video editing tools has been relatively easier and more popular. Videos in teacher education in particular can be powerful tools in enhancing professional development as videos can be used in several ways in teacher education and training programs. For example, videos can be used to allow trainees to watch "best practices" of experienced and effective teachers. In this way trainees can see the links between theory and practice in teaching (Dymond & Benz, 2006; Hsueh-Hua & Rosenbusch, 2005). Trainees can also watch and comment on peers' teaching videos, which can improve collaborative and reflective learning.

Another use of videos in teacher training can be on the videos of trainees' own teachings. Whether in inservice or preservice teacher training programs, trainees can watch and reflect on their own performances in teaching, which has several benefits. First of all, the teaching videos can provide trainees with a permanent record of their own teaching that they can watch and reflect on anytime (Hung et al, 2004; Wu and Kao, 2008). Furthermore, by watching their own teaching videos, trainees can have a more objective perspective on their own teaching practices (Dymond & Benz, 2006; Clarke, 2009; So, Pow, and Hung, 2009). This objective approach to one's teaching can also be accompanied by reflecting on one's teaching in a "non-threatening way" (Rich and Hannafin, 2009), which in return would result in an increase in awareness (Hernandez-Ramos, 2007; Kong, Shroff, & Hung, 2009; Liu, 2012; Tripp & Rich, 2011) for acquiring the necessary skills to become an effective teacher.

The use of videos in English as a Foreign Language (EFL) teacher education is additionally important because with the help of videos trainees can listen to and watch native speakers, learn culture-bound non-verbal language (Clarke, 2009). Moreover, EFL teachers can monitor and self-correct their language use with the help of videos because one of the most important components of being an EFL teacher is having a good command of the language that they are teaching. In addition to the proficiency in English, EFL teacher trainees can also reflect on their teaching skills that are specific to language teaching. Thus, it can be stated that videos are potentially effective teaching and learning tools in teacher education programs from a teacher educator's view.

Whether teacher trainees find videos as powerful tools of learning in teacher education programs- specifically in EFL teacher training programs- needs to be studied in detail so that trainees' experiences and opinions are also taken into account. Therefore, the main purpose of the study presented in this paper was to investigate the perceptions of 40 EFL teachers on the effectiveness of the use of videos in micro-teaching activities in English Language Teaching (ELT) methodology courses. An EFL teacher has to have the necessary knowledge and skills in at least two areas: being proficient in English and being competent in teaching English skills.

Thus, the specific *research questions* for the study presented in this paper were designed as follows:
1. *Based on the perceptions of 40 EFL teacher trainees*
- *are micro-teaching videos effective in improving EFL teacher trainees' English proficiency?*
- *are micro-teaching videos effective in improving EFL teacher trainees' teaching English skills?*

The rest of the paper covers the details of the methodology and findings of the present study followed by the discussion and conclusions sections.

Methodology

In this section the study presented in this paper is described in detail in relation to the context it was conducted in, the participants, data collection procedure including the data collection instrument, and the data analysis methods.

Context and the Micro-teaching Video Activity

The study was conducted in a Foreign Language Department at an English medium state university in Turkey. The micro-teaching videos were recorded and the data was collected in "ELT Methodology Course II" in which participants were trained on how to teach reading and writing to EFL students. All communication including the instruction, micro-teachings, and data collection procedure was conducted in English. The micro-teaching activity lasted for one academic semester and it was carried out mainly in four steps. The steps followed by the instructor-researcher can be seen in Figure 1 below:

STAGE I
- Teacher trainees prepared their lesson plans in pairs as a take-home project
- One of the pairs was assigned the role of the teacher for the micro-teaching to be done in class.

STAGE II
- Each micro-teacher (teacher trainee) taught his/her lesson in class to peers who assumed the role of learners in an EFL classroom.
- The micro-teaching of each teacher trainee was video-recorded by the instructor-researcher.
- Each trainee received oral feedback by both peers and the instructor-researcher after the micro-teaching, which was also video-recorded on the same day.

STAGE III
- One week after the micro-teaching each trainee received his/her micro-teaching and feedback videos on a DVD.

STAGE IV
- Each trainee watched his/her micro-teaching and feedback videos and wrote a reflection report as a take-home assignment.

Fig. 1. Overview of micro-teaching video activity

As Fig. 1 above illustrates the study involved a micro-teaching video-recording activity carried out in mainly four steps through one academic semester. Throughout the semester each teacher trainee micro-taught one lesson (either Reading or Writing in English) and their micro-teachings were recorded via a digital camcorder by the instructor-researcher. Each lesson recorded had been planned in pairs and one of the pairs took the role of the teacher so that each trainee had the chance to teach at least once in class in front of peers. Trainees' peers acted out as the learners in the micro-teaching. In addition, each lesson was designed to fit within 50 minutes whereas the micro-teacher taught 15 minutes of the lesson due to the high number of trainees in class and time constraints. After the micro-teaching was over, each trainee received oral feedback by both the instructor and peers which was also recorded. One week after the micro-teaching each trainee received a DVD that contained two videos burned by the instructor-researcher: Video A (trainee's micro-teaching video) and Video B (instructor and peer feedback video). All trainees watched their videos at home and wrote a reflection report on their performances and handed in the reflection report to the researcher two weeks after the micro-teaching. Reflection reports were used to ensure that trainees watched and reflected on their videos.

Participants

Participants of the study were 40 third year students in a four year B.A. program majoring in Foreign Language Education. Six of the participants were males and 34 of them were females. Their ages ranged between 21 and 22. The English proficiency level of the participants was advanced as they were prospective EFL teachers who were studying in an English medium university. All participants of the study were familiar with the micro-teaching video recording procedure as they had been through this procedure previous year in "ELT Methodology I" course in which they had been trained on how teach "vocabulary, listening", and "speaking" to EFL students. At the time of the study, each teacher trainee had gone through the micro-teaching activity shown in Fig. 1 twice.

Data Collection and Analysis

The main data collection instrument used in the study was a survey. Before the survey was conducted, all participants were given a consent form explaining the study. Only the volunteer trainees were included in the data collection procedure. The survey was implemented at the end of the academic semester during class time and it was organized under two main sections:

Section A: This section was designed to gather demographic data about participants and their previous experiences with being video-recorded while speaking and teaching in English.

Section B: This section included statements that require responses from the participants in the form of four Likert scale options which were "Strongly Agree", "Agree", "Disagree", and "Strongly Disagree". The statements in section B were organized under two sub-sections: Items 1-5: Statements about the effectiveness of Micro-teachings in relation to improving English proficiency and Items 6-15: Statements about effectiveness of Micro-teachings in relation to improving teaching in English

Data analysis done on the participants' responses to the survey was done via Frequency Analysis. Each participant's response was counted and the total number of responses to each option in every statement was calculated in terms of percentages. In addition, the duration of each teacher trainee's micro-teaching and feedback videos were written down using the video play software and all trainees' video durations were added. Finally, the average number of minutes for each video was calculated via dividing the total duration by the number of participants in the study.

Results

Data analysis done on the participants' responses to the survey questions and statements showed that 70% of the participants had had no experience in video-recording their performance while speaking in English and/or teaching in English before their ELT methodology courses. In other words, the majority of the participants had experience with video-recordings only during their micro-teachings in ELT Methodology courses. The average duration of micro-teaching videos (Video A) recorded for the present study was 17 minutes since each trainee taught the first half of his/her lesson plan in class due to time constraints. Peer and instructor feedback videos (Video B) for each trainee lasted for approximately six minutes. Table 1 below shows both the total and average duration of each video type in minutes.

Table 1. Duration of micro-teaching activity videos

Duration of Videos in Minutes	Video A (MT videos)	Video B (Feedback videos)
Total Number of Minutes	693	245
Average Number of Minutes for each Trainee	17	6

Participants' responses to survey statements in relation to the effect of micro-teaching videos on improving English proficiency

Table 2 presents the results to the statements between 1 and 5 in the survey. As it can be seen in Table 2 responses to statements between 1 and 5 in the survey revealed that the majority of the participants thought the micro-teaching videos helped them to improve their English proficiency. For example, in all statements more than half of the participants selected either "strongly agree" or "agree" for the statements on all sub-skills of English mentioned in the survey. Particularly, the participants believed that the videos were helpful in improving their "speaking" and "pronunciation" in English. Overall, the results of the data analysis done on the responses to the statements between 1 and 5 showed that micro-teaching videos were effective in improving English proficiency skills of EFL teacher trainees, which is the answer to the first research question of the study.

Table 2. Participants' responses to survey statements in relation to the effect of Micro-teaching videos on improving English proficiency

Statements	Strongly Agree (%)	Agree (%)	Disagree (%)	Strongly Disagree (%)
1. Watching my MT videos helped me to improve my grammar in English.	25	52,5	15	7,5
2. Watching my MT videos helped me to improve my vocabulary in English.	32,5	50	15	2,5
3. Watching my MT videos helped me to improve my listening in English.	27,5	50	15	7,5
4. Watching my MT videos helped me to improve my speaking in English.	60	32,5	7,5	0
5. Watching my MT videos helped me to improve my pronunciation in English.	57,5	37,5	5	0

Participants' responses to survey statements in relation to the effect of micro-teaching videos on improving teaching in English

Similar to the responses to statements between 1 and 6, participants' responses to statements between 6 and 15 showed that micro-teaching video activity had a positive impact on improving participants' teaching English skills. Table 3 presents the participants' responses to the statements on the sub-skills of English language teaching skill asked in the survey.

Table 3. Participants' responses to survey statements in relation to the effect of micro-teaching videos on improving teaching in English

Statements	Strongly Agree (%)	Agree (%)	Disagree (%)	Strongly Disagree (%)
6. Watching my MT videos helped me to improve my teaching English.	75	22,5	2,5	0
7. Watching my MT videos helped me to improve my giving instruction in teaching English.	75	25	0	0
8. Watching my MT videos helped me to improve my classroom management in teaching English.	65	27,5	7,5	0
9. Watching my MT videos helped me to improve my giving feedback in teaching English.	50	40	7,5	2,5
10. Watching my MT videos helped me to improve my material design in teaching English.	40	47,5	12,5	0
11. Watching my MT videos helped me to improve my activity design in teaching English.	45	37,5	17,5	0
12. Watching my MT videos helped me to improve my board use in teaching English.	52,5	35	10	2,5
13. Watching my MT videos helped me to improve my monitoring student while teaching English.	62,5	27,5	10	0
14. Watching my MT videos helped me to improve my time management in teaching English.	52,5	40	7,5	0
15. Watching my MT videos helped me to improve my problematic areas in teaching English.	80	15	5	0

As it can be seen in Table 3 majority of the participants thought the micro-teaching videos were helpful in improving their EFL teaching skills. For example, more than half of the participants (75%) strongly agreed that watching their micro-teaching videos helped them to improve their teaching English and giving instructions in teaching English. In fact, only one participant did not agree with these statements and none of them strongly disagreed. In addition, 65% of the participants strongly agreed that with the help of micro-teaching videos their classroom management skills were improved while teaching English. The positive impact of micro-teaching videos on improving teacher trainees' problematic areas in teaching English was another statement that participants' responded mainly homogenously. 80% of the participants thought that these videos helped them to improve their problematic areas in teaching English. In all other statements, more than half of the participants favored the use of micro-teachings in improving their English teaching skills. Thus, it can be stated that based on the participants' perceptions micro-teaching videos were effective in improving teacher trainees' teaching skills, which is the answer to the second research question of the study presented.

Discussion and Conclusions

The results of the data analysis showed that the participants in the study overwhelmingly believed in the effectiveness of the micro-teaching videos on improving both English proficiency and teaching English skills among EFL teacher trainees. In terms of English proficiency "pronunciation" in English was found to be mostly improved with the help of micro-teaching videos. Ninety-five percent of the participants either "strongly agreed" or "agreed" with this statement in the survey. If "strongly agree" and agree" responses are added and calculated in percentages for each sub-skill investigated in the present study, the positive effect of micro-teaching videos on improving English language proficiency can be better observed, which is illustrated in Figure 2.

Based on the results shown in Figure 2 the sub-skills of English that were improved by the micro-teaching videos were (in the order of the degree of improvement) a. Pronunciation (95%), b. Speaking (92,5%), c. Vocabulary (82,5), and d. Grammar (77,5) as well as Listening (77,5%) in English. Thus, teacher educators who wish to monitor and enhance teacher trainees' English proficiency can make use of video-recording activity. Kapanja (2011) and Wu, Yen, and Marek (2011) found that the use of video can lead to an increase in positive attitude toward instruction and motivation among EFL teachers and learners. In addition, Collins et al (2004) concluded in their study that teacher trainees found video reflection highly valuable. Similarly, in this study micro-teaching videos were found highly effective and favorable by the teacher trainees and there is a possibility that the use of this type of activity may motivate and encourage teacher trainees to excel in their performance in micro-teachings that are done in methodology courses. In addition, these video recordings give teacher trainees a record that they keep in their training as well as a chance to monitor their own progress in English language.

Furthermore a similar calculation can be done for the second sub-section of Survey section B; that is, both "strongly agree" and "agree" responses can be added to see the positive effect of micro-teaching videos on improving teaching English skills. This calculation is given in the chart presented in Figure 3. The chart shows that the most improved skill among teacher trainees is "giving instructions while teaching English" as all participants (100%) believed that watching their micro-teaching videos helped them to improve giving instructions in teaching English. Similarly, 97,5% of the participants believed that their overall teaching English skills had improved with the help of watching their own micro-teaching videos.

	Percentages
Giving instructions	100
Teaching English	97,5
Problematic areas in teaching	95
Time management	92,5
Classroom management	92,5
Monitoring students	90
Giving feedback	90
Material Design	87,5
Board use	87,5
Activity design	82,5
Fig.3. . "Strongly agree" and "agree" responses combined to teaching English skills statements in the survey

Figure 3 also illustrates the effectiveness of micro-teaching video-recording and watching activity on improving other sub-skills of teaching English. For example, videos were found effective especially in teacher trainees' overcoming problematic areas in teaching English as 95% of the participants either "strongly agreed" or "agreed" that they could overcome these problematic areas after watching their own micro-teaching videos. Overall all statements in relation to improving teaching English skills were responded as positively by over 80% of the participants in the study. Therefore, micro-teaching videos were clearly found effective by the teacher trainees in improving their teaching English skills and teacher educators can make use of video-recording as a tool to enhance teaching skills in their classrooms.

The findings and results of the study presented in this paper are limited to 40 teacher trainees in one institution. A similar study can be carried out across institutions and/or with different groups of learners in other disciplines to test whether similar results will be achieved. Nevertheless, the findings of the present study imply that the micro-teaching tools have great use and potential to enhance language proficiency and language teaching skills among EFL teacher trainees. Thus, based on the perceptions of the participants who took part in this study, it can be recommended that micro-teaching video activity may be used in methodology courses of teacher education programs.

MISCONCEPTIONS IN GEOMETRY AND SUGGESTED SOLUTIONS FOR SEVENTH GRADE STUDENTS

Ayşen Özerem

Faculty of Education, Near East University PhD. Student

Abstract

The principal aim of this study is to find the weaknesses of secondary school students at geometry questions of measures, angles and shapes, transformations and construction and 3-D shapes. The year 7 curriculum contains 4 geometry topics out of 17 mathematics topics. In addition to this, this study aims to find out the mistakes, 28, 7th grade students made in the last 4 exams including two midterms and two final exams. To collect data, students were tested on two midterms and two final exams using open –ended questions on geometry to analyze their problem solving skills and to test how much they acquired during the year. Frequency tables were used in data analysis. To fulfil this aim in the first midterm exam the subject measures were tested. In the first final exam which followed the first midterm exam in addition to measures and angles shapes skills were also tested. Following these tests, in the second midterm we tested the students on transformation and construction. A descriptive methodology and student interview were used in the study to analyze and interpret the results. The results from this study revealed that 7th grade secondary school students have a number of misconceptions, lack of background knowledge, reasoning and basic operation mistakes at the topics mentioned above

Keywords: mathematics education; student difficulties; geometry questions; misconceptions; geometrical errors; teaching suggestions for geometry.

INTRODUCTION

The general aim of mathematics is stated as making an individual acquire the mathematical knowledge needed in daily basis , teaching how to solve problems , making him/her have a method of solving problems and acquiring reasoning methods (Altun,2008) .For this purpose to acquire mathematical concepts one should be able to visualize the diagrams. In other words, mathematics is the field in which preconditions are crucial so before the teaching process student backgrounds on the subject should be tested (Baykul, 1987).Gagne divided the concepts into two as concrete and abstract concepts. Concrete concepts are learnt starting from the beginning of life by the person himself. However to learn abstract concepts sometimes being taught by others is necessary (Senemoğlu, 2000).In this context, mathematics based learning should be done according to three aims listed above (Baykul, 2002).

- To student acquiring mathematical concepts.
- To understand mathematical operations.
- To help students make connections with the concepts and operations.

According to Piaget and Inhelder(1956), there are certain stages of learning starting from birth. These stages are

Stage 0: scribbles (less than 2)
Stage 1: topological - irregular closed curves to represent circles, squares,etc(2-4 years)
Stage 2: projective- progressive differentiation of Euclidean shapes (4-7 years)
Stage 3: Euclidean- ability to draw Euclidean shapes(7-8 years)

Although there are specific age groups in this, it has not been widely accepted. It has been suggested that even younger children can sometimes operate with some Euclidean concepts. It is probable that topological, projective and Euclidean notions all develop over time and their usage becomes increasingly integrated.

Piaget suggested that children looked at the world from a very different perspective than adults did. So scientists started to investigate the reasons behind it by listening carefully what students were saying and doing

on a variety of subject-matter tasks. They found surprising facts that students acquire ideas that completed often quite effectively with the concepts presented in the classroom environment. They had a powerful development of conceptions but they were sometimes inconsistent with the accepted mathematical and scientific concepts.

The Van Hiele model (1986) continues to be the best-known theoretical account of students' learning about shape. The model suggests that children have to take a sequence of levels in a fixed order in their learning about shape. The first three levels in the model are as follows:

the Visualization level (Level 1, also known as the level of *recognition*) in which students recognize and learn to name certain geometric shapes but are usually only aware of shapes as a whole, and not of their properties or of their components;

The Analysis level (Level 2, also known as descriptive) students begin to recognize shapes by their properties.

The Abstraction level (Level 3, also known as relational), students begin to form definitions of shapes based on their common properties, and to understand some proofs.

Many teachers have observed that many young children have numerous misconceptions about geometry when a teacher discusses a geometry proof problem in class, it generally involves oral presentation of a formal proof and body movements pointing at different parts of the figure of the problem. Students must watch, listen, jot notes, and think as a lecture proceeds. They have to refer to many elements of the instruction and incorporate them into their memory (Sweller, 1988). This often causes cognitive overload and poses a negative effect on students' learning. Numerous researchers have experimented different ways of teaching and found serious problems in geometry learners: incomplete comprehension of the problem and mathematical symbols, producing proofs based on direct visual elements (e.g., Chazan, 1993; Healy & Hoyles, 2000), lacking strategic knowledge in producing proofs, etc. Addressing the difficulties in learning geometry, Duval (1998) and Healy and Hoyles (1998) explained that geometry instruction is often more complex than that of numerical operations or elementary algebra. It is therefore more important that geometry instructions incorporate new and tested approaches such as using visual and multimedia tools in the classroom.

Studying geometry is an important component of learning mathematics because it allows students to analyse and interpret the world they live in as well as equip them with tools they can apply in other areas of mathematics. Therefore , students need to develop an understanding of geometric concepts as well as gaining adequate geometry related skills. In this project, analyses the development of geometric skills and the use of tools, reproduction of constructions, properties verification, conjecture and research. It can be said that geometry is not used by students from the beginning due to their previous static learning experiences. Another difficulty with some of the students is the geometric language comprehension. After this survey, a seventh grade teacher can analyze students' geometric mistakes and help them to improve their geometric knowledge. In this paper, we describe some guided research techniques for teachers of seventh grade students' in a geometry lesson. This article gives the techniques about teaching.

In our sample class, when construction activities are used, they involve developing new ideas and connecting these with students' existing ideas. If students are not in a particular level of Van Hiele model they might not be able to perceive what the teacher sees in a geometric situation so higher levels of understanding is required. Misconceptions arise frequently if learners bypass or skip a level from the model. A teacher should get students to explain how they come to their answers or rules so that s/he can analyze the faulty interaction between the students' extant ideas and the new concept. By this way the teacher can understand the reason behind misconceptions and they can be corrected by challenging or contrasting it with the right conception. Students' prior learning sometimes arises misconceptions either in the classroom or from their interaction with the social and physical world. However the search for the origins of those misconceptions can not be located to the root of an educational problem. If misconceptions are persistent and resistant to change, that means they have got strong experiential foundations.

THE AIM OF THE STUDY:

The aim of this study is to reveal the performances of 7th grade college students at geometry and to show the conceptual difficulties they face while learning. By doing this, the study tried to identify the misconceptions which arouse during the learning process of geometry.

SAMPLE

28 seventh grade students consisted of 12 males and 16 females at Turk Maarif Koleji in Cyprus.

METHOD

The purpose of this research is to determine college students' misconceptions on geometry subject. The descriptive methodology and student interview were used in the study to analyze and interpret the results. The descriptive method was used since the main purpose of this study is to clarify an existing situation .This descriptive research analyzed the perspectives and experiences of 28 students' exam papers (two midterms and two finals).

THE IMPORTANCE OF TECHNOLOGY IN A GEOMETRY CLASS:

Technology enables both students and teachers to access wide range of tools to use in mathematics. Perkins (1995) offered three stages in the process of understanding in the context of an information and communication technology. These are
- They offer students explanations
- Make relational knowledge available
- Students can possess revisable and extensive web explanations

PROBLEM

The main problem addressed by this of research is the reality of misconceptions that the students already passes or acquire during geometry lessons. These misconceptions are often related to shape perception and three dimensions.

STUDENT INTERVIEW PART:

Students are interviewed and asked four questions to have their opinions taken. The researcher recorded the face to face interviews by taking notes. In order not to create a disturbing environment no recording machine was used. In the students' statements above, the students' names are represented by the numbers in the parenthesis. Main subjects of the research and the data of 10 students, which were above randomly chosen 7th grade students, at the end of the term, are:

1. What do you think about Geometry Lessons? Do you find it interesting?

Eight out of ten students love Geometry Lessons and they are interested in the lesson. One of these ten students loves Geometry Lessons however s/he finds the measurements subject challenging. S/he prefers subjects which includes logic and operations. The other 1 accepts the fact that Geometry is necessary but since it is very time consuming, it is not interesting. According to this data, 80 percent of students said they loved Geometry Lessons. Although the students love the lesson, they make mistakes so it can be resulted that more quizzes should be done and student misconceptions need to be more emphasized after the quizzes and addition to this more thought provoking questions should be chosen and the subjects should be related to real life.

2. Do you want to change Geometry lessons into something more visual by using computers?

Nine students said that computer use can make the lessons more interesting. It was thought that using computers enable them to visualize and this helps them to learn permanently. One of the students thinks that it is not necessary to use computers. S/he thinks that teacher drawing on the board is more helpful. According to this data, ninety percent of the interviewed students think that computer use in Geometry lessons helps them to learn and remember better.

3. How do you learn and remember the rules and formulae?

Two of the students said that they learn them by writing. One of them said by memorizing. Four of them said by writing and visualizing. One said that by writing and drawing. One said by reading out loud and writing. The ones, who learn by visualizing, claim that when they write and stick papers to some places around the house like their study or wardrobe doors find it easier to learn the rules and the formulae. The last one student said that s/he learns by making logical connections with them and so that she remembers better later by the logic she has created. According to the data, teachers should give students choices of learning rules and formulae so that the students can choose the best for them.

4. Why do you think Geometrical mistakes are made in the exams?

Seven of the students think the cause of the mistakes is hastiness and negligence. One of the student said that the classrooms are crowded so students can not get enough attention from the teachers. One of them said that s/he underestimated drawings so when s/he saw them in the exam s/he was panicked and could not do them properly. The last one thinks s/he did not study enough so got confused in the exam. According to the data, since seventy percent of the students think that the cause of their mistakes are negligence and hastiness, the teachers can suggest them methods to avoid their habits.

The data received after student interviews are directly quoted. During the interviews, it was found that students are satisfied with the method used however teachers can use computers and give more focus on drawings.

DIRECT STUDENT OPINIONS:

Student (1): '....I find Geometry lessons enjoyable however more emphasis should be given to drawings and more assignments should be given. I had the most difficulty in the enlargement topic.....'

Student (2): '....I didn't have any difficulties in geometry. After the mathematics topic algebra, it gave me motivation. I enjoyed drawing, using the compass and the protractor. I learn the formula by writing them on papers and white board....'

The curriculum of the 7 grade can be divided into four main categories as measures, angles, transformations and construction and 3D shapes.

FIRST MIDTERM EXAM:

The first midterm exam consisted of 25 questions.3 out of 25 questions were on geometry subjects

Mistake Made	Possible Reasons	Suggestions
While the area of the triangle was found the student forgot to divide the number by two which was on the area formula.(The area formula of triangle is base times height over two and the student forgot dividing it into two)	-Just memorized the formula -Cant visualize the image -Lack of reasoning -Few authentic in the primary grades	-More exercise on the topic -Frequent use of images by more interactive teaching -More visual –object use -Deduction of the area formula in class
Operation mistakes while finding the shaded area from the total	-Lack of spatial/thinking -Lack of construction idea -Lack of background education on operations	-More exercise -More homework -Practising the same procedure on paper to make understanding easier -More practice should be done on operations during primary school
Wrong or missing formulae use. (Ex: area of parallelogram is base times height. The student divided base times height by two)	-incomplete understanding -No concentration -Not enough practice of the topic	-Computer based teaching can be used to show students the formulae in more fun and colourful way to make them remember easier.

FIRST MIDTERM FINAL EXAM RESULTS

In the first midterm final exam, there are 25 questions of which 8 of them are on geometry subjects.

TABLE 2: The first midterm final exam misconceptions

Mistakes Made	Possible Reason	Suggestions
Wrong formula use (area of triangle, parallelogram...etc)	-Can not understand the term area. -no proper understanding of the formulae.	-More warm –up before teaching about shapes -Ask students to find the shapes in their real lives. For example a square coffee table, a rectangular notebook, triangular ashtray so that they can understand the shapes better.
No given reasons for the	-Problem in the second language usage(can not express themselves in the language)	-More mathematical term use in the classroom -More practice

answers	-Can not give explanations to their answers	-More stress on explanations in the classroom.
Lack of assimilation of the angles in parallel lines such as alternate and corresponding angles	-Ignore the importance of angles in parallel lines	-The importance of looking at the angles should be emphasized more in the classroom -Colourful images can be used to show alternate and corresponding angles.
-Lack of recognition and of perception properties of quadrilaterals -Can not distinguish the types of quadrilaterals	-Can not visualize -Can not assimilate the properties of quadrilaterals -Students put in little effort.	-More emphasis on properties of quadrilaterals and the similarities and differences while teaching -The students should be involved more during the similarity and difference stages of learning
Wrong conversion of metric measurements (such as changing millimetre to metre)	-No adequate use of conversions in real life -Not enough practice or studying	-Variety of activities can be used in the classroom to show their use in real life (such as showing the metric system on their own rulers)
Wrong detection of angles in an isosceles triangle	-Can not connect the background data learned in primary school to new material. -Answering the questions spontaneously without reading the rubric of the question. -Lack of spatial reasoning	-More variety of questions on different types of triangles
Operation mistakes (during area calculations, multiplication, and addition, subtraction or division mistakes).	-Lack of concentration -Underestimate -the importance of operations	-Lectures can be given by student advisors on paying attention techniques -More practice on operations
Mistakes done on angle , side	-Insufficient practice and	-colourful materials can be

and parallelism properties on special quadrilaterals	learning -Can not assimilate the properties of quadrilaterals	used while teaching properties of quadrilaterals to show the equal angles and sides and parallelism.(equal angles can be shown in red and equal sides in green to emphasize the difference)
Can not distinguish the concepts of equations and expressions (for example when the side lengths are given in algebraic expressions , students are unable to find the area)	-Equations and algebraic expressions topic are not learned well.	-Instead of using x,y,z (which are frightening letters for students a,b,c can be used more to show the unknown)

Table 3: The second midterm exam misconceptions

Mistake Made	Possible Reason	Suggestions
-While the student was doing enlargement s/he didn't write the coordinate of the center of the enlargement	-The student read the question carelessly -The student didn't follow the instructions of the question carefully	-Teacher should emphasize the importance of reading the questions more carefully to give relevant answers. -The teacher should summarize the topic to improve the understanding of students
-The students mixed the names of three dimensional objects. For example: instead of writing cuboid, the student wrote cubic.	-Basic vocabulary mistake The student started with wrong step so s/he couldn't finish correctly.	-Details should be shown clearly in the classroom -Revisions and more practice should be done
-The student found the sum of the interior angles incorrectly and also found the size of each interior and exterior angles incorrectly	-Learning formulas and definitions inadequately. -Students don't know what to do properly.	-Students should be encouraged to study and practice harder

-The student shifted the lines while applying reflection and rotation.	-Student can't use the tracing paper properly and counts the squares on the paper incorrectly.	-The use of tracing paper should be shown in detail by using computer based teaching

TABLE 4 Second Term Final exam misconceptions:

There are 20 questions and 8 of them are geometry topics.

Mistakes Made	Possible Reasons	Suggestions
Missing information in descriptive questions(for example, when the student was asked to describe transformation s/he did not use specific words like translation, rotation)	-Lack of enough knowledge -Forget the details about the topic	-Students should be more careful in the exams while describing transformation -The teacher should revise transformation more in detail from beginning to end by using visual aid.
The student did mistakes while enlarging objects and wrong use of coordinates	-Did not understand the process of enlarging. -Confused the coordinates when enlarging objects	-Computer based exercises can be practiced so that students can get a better knowlwdge on the enlargement topic. -Describe the position and movement more in detail. -2 and 3 dimensional objects should be used to make students able to visualize the images.
The student multiplied the number by 2 instead of 3 when calculating the volume of a cube	-Did not know the formula -Confused the formula of the cube with the formula of area	-To teach students volume , use visuals of 3-d objects from different perspectives and analyze the idea of volume
Wrong use of vocabulary (for example the student used the	-Lack of recognition of formal	-Formal mathematical terms should be emphasized more

word "translation " instead of "transformation"	terms	during teaching and practising
Measurements were wrong in bearings questions	-Wrong use of protractor -Wrong application of angle rules	-Make students use of real life objects in the classroom so that they can visualizeand learn better
Questions on polygons and square ,the student considered just one angle of the polygons and ignored the square	-Can not analyze compound figures	-Use geometric images to give students the idea of combining objects
Could not draw angle bisector (for example the student was expected to draw the angle bisector of the given angle but s/he constructed just the angle)	-Misunderstood the questions	-More variety of questions on similar topics should be practiced to avoid misunderstandings
Cube's surface area was miscalculated because of wrong length measurement	-The connection between the length and surface area calculations was not understood properly	-Strategies should be developed to teach students perceptions of cube and cuboid such as using related visual examples to answer questions of surface area and volume
Wrong rotation of images	-Wrong use of tracing paper	-Make students recognize positions and directions . -Use colorful images to teach students rotating objects -Make students draw the shapes onto their own notebooks and ask them to interpret the rotation.
Wrong positioning in translation questions	-Insufficient concentration -Mislearned measuring	-More practice at their own pace -Teacher should make available more practice questions (Moodle can be used more frequently and efficiently)

In a student learning process there are some key factors such as network, images, words, anecdotes, cases in point, formal principles and finally explanation structures.

Conclusion

According to my research, it can be concluded that 7th grade students succeeded in reaching the curriculum objectives. My research aims to make the teachers aware of student misconceptions and general educational issues. The results from the study revealed that seventh year secondary school students have a number of misconceptions and lack of knowledge related to geometry subject.

SUGGESTIONS:

The major problems in mathematics are inadequate thinking and reasoning abilities. The role of the teacher is very crucial to overcome this problem. The teacher should explain students what they should be careful about in image based questions in detail. In mathematics, teaching should be done in using visual aids. It was found out that students couldn't understand and evaluate mathematics, visual materials and methods which aim at students' five senses should be used to improve understanding . To succeed in geometry learning, it is very important to define objects and their definitions. Students get confused at recognizing the shapes. The reason for this is human perception. To eliminate this problem the teacher should first make students recognize the shapes then teach how to rotate the objects mentally to perceive them more clearly. According to the level of geometric thinking of the students, methods can vary.The teacher should continuously remind students that rotation of an object does not change its shape.

New practices for geometry lesson General suggestions

To teach students the names of various shapes, television, books and computer games can be used. Their comprehension of the concept should be improves. Their meta cognitive abilities should be enhanced.
- Teachers should use relevant vocabulary to describe relevant geometric statements and their relationships.
- To assess the validity of geometric arguments a teacher should apply logic. A way of doing this is, analyzing the consequences of using alternative definitions for geometric objects.
- To help students memorize the formulas easier, the formulas can be shown with either proofs using different approaches.

The properties of geometric figures and mathematical thinking should be applied in order to perform and justify basic geometric constructions. Simple straightedge and compass constructions should be performed and explained In order to increase efficiency and reach aims computer based , visual methods are necessary.To test or create the conjectures of geometric properties or relations geometric computer or calculator packages can be used.
- Geometry sketchpad is a software that can be used for constructing basic geometric figures. It also enables you to edit and with the display menu you can add figures and animate them. It's custom tools let you replay complex geometric constructions in an easy one step way.
- Scheme of work : A detailed scheme which topics and what order topics   should be covered.
- Practice book: They provide students plenty o exercises based on the content   of the units.
- Powerpoint Representations

MODERN TRENDS IN THE TEACHING THE VOCABULARY OF CZECH SIGN LANGUAGE

Jiří Langer[52]

Palacký University, Faculty of Education, Instituce of Special Education Studies, Žižkovo nám. 5, Olomouc 771 40, Czech Republic

Abstract

The paper deals with the possibilities of using modern information technologies in the self-study of signs vocabulary of Czech sign language. Whereas that there are not yet available the general Czech sign language textbooks presenting its grammatical and lexical component in the market, there is the only way to learn Czech sign language - attending intensive courses of sign language and its practical use. Because of time and didactic reasons, it is appropriate when students can self-study lexical components of sign language and the direct lessons with the teacher is then used to teach grammar and conversational skills. The self-study of signs may be used various teaching aids. As seems most appropriate, however, electronic dictionaries, today more and more often affixed to the Internet. Current possibilities of information technologies offer a variety of unique and useful features, including the use of modern mobile devices.

Keywords: Sign Language; Deaf; Information Technologies; Teaching; Study

Introduction

Obtaining sufficient communicative competence in the relevant sign language by teachers and parents of children with hearing impairment is one of the conditions to ensure full and effective communication, and thus the harmonious development of deaf children. Learning of sign language due to its specifics is significantly different from the study of other foreign languages. Macurová (2001) points out that the basis for really successful mastering of sign language is accession of his otherness and acceptance of the view that the "other" is not equal "worse". While the study of "classical" foreign language (eg English or German), the students have no doubt that it is "independent" and "peculiar" language (with its own lexicon, grammar, history, etc.) in case studies of national of sign language leads to of his underestimation and detraction, particularly in relation to the national spoken language.

The fundamental difference between the spoken foreign languages and sign language is a different form of existence. Sign language requires the student to use means of expression that have not yet to communicate by spoken language had not been forced to use (or a small extent), and which would be therefore unnatural. These include well-defined and sometimes very difficult position of the palms and fingers, hand movements, head and body, using three-dimensional space and the necessary use of facial expressions. Hearing users of spoken language (which has a linear character) have also considerable difficulties with simultaneity of sign language.

Learning sign language

Learning of visual-motoric communication systems, especially sign language, because of its difficulty is at least comparable with the study of any "traditional" spoken languages, encountered most of the population. In the case of sign language is the study further complicated esp. usually lacking study materials, crude methodology of teaching and visual-motoric form of existence of sign language. This gives him completely different linguistic features than we know of spoken languages. Sign language requires the student to use the means of expression that have not yet been used in communication by spoken language (or to a small extent), and which would be so unnatural. These include precisely defined and sometimes very difficult position of the palms and fingers, hand, head and body movements, using three-dimensional space and necessary to use facial expressions. For hearing users of spoken language (which has a linear character) the simultaneity of sign language is considerable difficult. Much more so depends on direct interaction between teacher and student with the most intense focus on practical conversation.

For hearing students sign language usually is a secondary language (their primary, native language is the national language spoken), so it is seen only as a "second" language. The authors of the guide for teachers of American Sign Language (in Jabůrek, 2000) declare these basic principles of teaching and learning a second language:

Aim of the study is the ability to communicate with the target language.

Most fundamental factor in learning any language is the appropriate contact of the student with this language.

Student must have a desire, motivation and opportunity to communicate in the target language.

Dialogues, practice, communicative activities and games are the basis for meaningful contact with the target language.

Language teaching, especially in adults, is in part a conscious process and not a mere imitation of the teacher's expression. The student should therefore always know what communicates about.

During the teaching process mistakes occur and it is important to realize that it its important and integral component of learning.

Macurová (2001) states that, like the study of any foreign language, is to study sign language necessary to focus on the lexical component of language (ie to learn signs in their quotation, dictionary form) on his grammar (ie to learn ways to different forms of turning quotation signs in sentences and how sentences of sign language are ever built). To learn about the signs (especially their manual part) is relatively simple phase of the learning process of sign language. Learning a sign language is not limited only on the signs (similarly cannot be possible to learn, for example, English language by studying Czech-English dictionary). Focussing on learning the lexical component of sign language and underestimation its grammatical part results in the acquisition of communicative competence rather than in a national sign language, but in the national signed language (e.g. Signed Czech). As carriers of the grammar of sign languages there are used facial expressions, movements of the head and upper torso. "The movements and positions of these parts of the body in sign language are not just something "extra", what may or may not be in addition to what is expressed by hands. Contrary, non-manual components are "mandatory" part of the sign language and usually have grammatical effect – carry grammatical meanings as well as the need to bear in Czech language the endings." (Macurová, 2001, p. 74)

The basic prerequisite for obtaining the required communication skills in sign language is its systematic theoretical and practical studies. Understanding the specificity and theoretical properties of the structures of the

studied sign language greatly facilitates and accelerates its mastering and practical training. Practical skills in sign language, in fact facilitate the understanding of its theoretical bases. Both components, theoretical knowledge and practical skills, it is necessary to develop simultaneously and in harmony. Another prerequisite for the successful learning of sign language is knowledge of the specifics of culture and communication norms of natural users, namely the deaf people (or the Deaf).

Hearing people interested in sign language can obtain the communication competence in three ways: by self-study, in sign language course and during spontaneous communication with deaf sign language users. Each way has its objective positives and negatives. The highest efficiency in the learning process can be best achieved by the systematic and blended combining of these ways. The quickest way to gain communicative competence in sign language is passing quality courses. A prerequisite of sufficient quality sign language course is a teacher (tutor) who is sufficiently skilled in sign language and has the necessary pedagogical skills. The best teacher is obviously deaf sign language user.

The problem of deaf teachers is often their low erudition in the theory of sign language and lack of teaching competence. Hearing, pedagogically and knowledgeable teachers again quite often lack of the communication competence in sign language and in their courses teach signed language rather than sign language. Situation where the teacher is fully linguistically and pedagogically competent is unfortunately quite rare. One way to eliminate insufficient sign language competence of teachers is to give them the quality methodological materials from which they can draw information, which then can be used in teaching. Students should have a quality learning tools.

In most courses, however, learning lexical component of sign language prevails the component of learning grammar, which undoubtedly decreases the quality and effectiveness of the learning process. Quite often the studying narrows to a mere teaching of isolated learning of signs, sometimes practised in whole sentences. Another reason why learning of signs usually takes more time is more complicated learning new concepts (signs) than is common in spoken language learning. As opposed to English or German vocabulary which we can simply write on the paper, including pronunciation, clear and re-usable note of new signs is much more demanding and complicated. Individual signs are repeated and thus more practiced in order to be accurate if they remember.

From this follows, therefore, that if the study of sign language has become an effective and is to be acquired sufficient communicative competence, it should be approached comprehensively and dynamically. Practical experience of sign language tutors show that increasing the quality and effectiveness of teaching is better self-study with using of teaching materials, which should be seen primarily as preparation for direct communication process, respectively for repeating the already learned skills The time saved in direct instruction (which does not need lengthy learning of new signs, but only their practice and control) can then be used to practice conversational interaction and direct communication. Sign Language courses led by a competent teacher allows a relatively rapid acquisition of communicative competence, to rise to a very good level, however, is only possible on the basis of direct and iterative communication with the deaf.

Methods of presentation of signs of Czech sign language

In the past, the most widely used printed (picture) books and sign language dictionaries are now overcome because the static images or photographs, accompanied by arrows and written descriptions do not exactly display the progress of dynamic signs. It is also very difficult to capture non-manual components of signs. In the early 90

of the 20 century educational programs of sign language were set up on video. Videotape, as a carrier of the signs of sign vocabulary, can (compared to static images, presented in the printed books), faithfully and accurately capture the process of the interpreted sign, including its non-manual components. Compared book publication, the user can also see the method of connecting of isolated signs in contiguous communication, incorporation in sign language, using the space around, classifiers, mimetic description and other specific characteristics of sign language. In the coherent narratives (or dialogs) is also possible to present grammatical structure of sign language and explain it with some examples. The disadvantage of teaching programs on video was, in addition to having to use expensive technical equipment, also difficult to orientate on the tape, especially evident when searching for a specific term and gradual deterioration of tapes and video. Modern alternative to video-programs would now be able to special educational programs on DVD. Their use, however, still not because the much as seems to be better use of modern computer technology.

Multimedia form of electronic sign language dictionaries allows you to combine sound (in the case of sign language dictionary the sound component is redundant, but it is up to the author decision if there will be the spoken commentary, which is intended to hearing users), text and image (in the form of pictures or video clips) expressions and provides therefore the possibility that previous forms of dictionaries did not offer. Interpretation of signs using digitized video clips is dynamic, allowing you to faithfully capture the process of the sign that can be played repeatedly at any speed or phasing the frame by frame. High operating speed of modern computers today also enables a very quick orientation in the dictionary, sorting signs into thematic units and lessons, or search for concrete signs according to various criteria (Langer, 2007, 2008). Like videotapes can multimedia present except of isolated signs of Czech sign language also a continuous communication and dialogues.

Looking for the best teaching tool, designed primarily for self-study and homework, there is no need to have at its disposal to use a personal computer a significant limiting factor. Wide range of features that offer electronic dictionaries, significantly exceed the capacity of books and videotapes. (cf. Langer, 2006) During the making electronic dictionaries of Czech sign language is more appropriate to focus on particular topics because of the limited capacity of data storage and create thematically oriented sign dictionaries. (Langer, 2001) When creating a sign language dictionary to serve primarily as a teaching tool, however, because of didactic reasons should be taken to give the user an overview of the general sign vocabulary needed for normal communication in the Czech sign language. Concrete signs should be (like the words in the textbooks of foreign languages), divided into separate, mostly themed sessions. Computer technology, however, allows the learning to use electronic dictionaries as classical alphabetically ordered dictionaries of Czech sign language.

In addition to really easy orientation in the electronic dictionary, easy searching the required term and possibility the playback of recorded sign at any speed, multimedia teaching tools offers many other functions. All signs can be presented in multiple views (standard is used front and side view or detailed view) so that all phases of sign can be well-observed. Meaning of the signs or their Czech equivalents may be further explained with concise definitions, images, spoken commentary, or other short clip with an explanation in sign language. From the didactic point of view is very useful to use testing and verification of already learned signs. Recent innovation is a new feature consisting in searching signs and their translations into spoken languages by parameters of concrete signs. This feature allows not only for translating from spoken language into sign language, but also vice versa.

Experiences of users of multimedia teaching materials and dictionaries of sign language show that the electronic processing is very suitable and beneficial for the study of Czech sign language. According to feedback received from users of this multimedia tools actually provide quality homework and self-study and allow greater use of contact with the teacher for teaching practicing conversation.

Creation of sign language dictionaries (which can become a useful tool in the study) deals the sign language lexicography. The first dictionaries of sign languages began to emerge in the late 18th century based on the work of Abbe de l' Epée, who introduced sign language in the education of persons with hearing impairment. To capture the signs were primarily used mainly the verbal descriptions, later supplemented by a graphical representation of a sign. The first sign language dictionary prepared according to the linguistic lexicographic principles was published in 1965 in the U.S. under the leadership of W. Stokoe (Okrouhlíková in Slánská-Bímová, Okrouhlíková, 2008). In the Czech Republic (or further in Czechoslovakia) were created first publication of dictionaries and Czech Sign Language and signed Czech (then called "sign speech") in the 80 of the 20th century. Until now there have been published 14 books or serial publications, 5 programs on video, about 40 multimedia CD-ROMs or DVD-ROMs and 4 internet online dictionaries.

On-line dictionaries of Czech sign language

In recent years begun to electronic dictionaries of sign languages expand into the Internet, which allows on-line access to a database of signs. In the Czech Republic are now 4 freely accessible online dictionaries containing the signs of Czech sign language:

Glossary of signs (Slovník znaků). Available online at: http://www.znakovka.cz.

Glossary of Dramatic Education: Czech – Czech sign language (Terminologický slovník oboru dramatická výchova: český jazyk – český znakový jazyk). Available online at: http://difa.jamu.cz/slovnik-vdn.

Spreadthesign.com – The sign language dictionary for the world. Available online at: http://www.spreadthesign.com.

Given that the development of electronic dictionaries online is still in its infancy, dictionaries are not usually equipped with all the features that the Internet as an electronic medium offers, but operate on a relatively simple platform. The dictionaries also typically lack information about their procession, making Subject Heading System, strategy of elicitation of signs, etc. For this reason, a user of the dictionary cannot know whether the signs contained in the database are linguistically correct, how and where they were searched, etc. If the dictionaries are not shielded by some trusted institution, the suitability of these products to self-study of sign language is then very questionable.

A much more ambitious aims the current developed **Online Dictionary of Czech Sign Language**, involving a University of West Bohemia in Pilsen, Palacký University in Olomouc and Masaryk University in Brno that results in long-term cooperation between these universities. Dictionary, available on the Web at **http://znaky.zcu.cz** in addition to standard functions, (which are to find and play the concrete signs), offers a variety of other features. These include for example:

Grammatical features of the Czech equivalent

Manual parameters of sign

Description (notation) of the sign in HamNoSys

Description (notation) of the sign in Signwriting

Hypertext links to synonyms, antonyms, hypernyms, hyponyms

Choice of front, side and a detailed view

Description of the meaning of the term

Examples of the use of the term

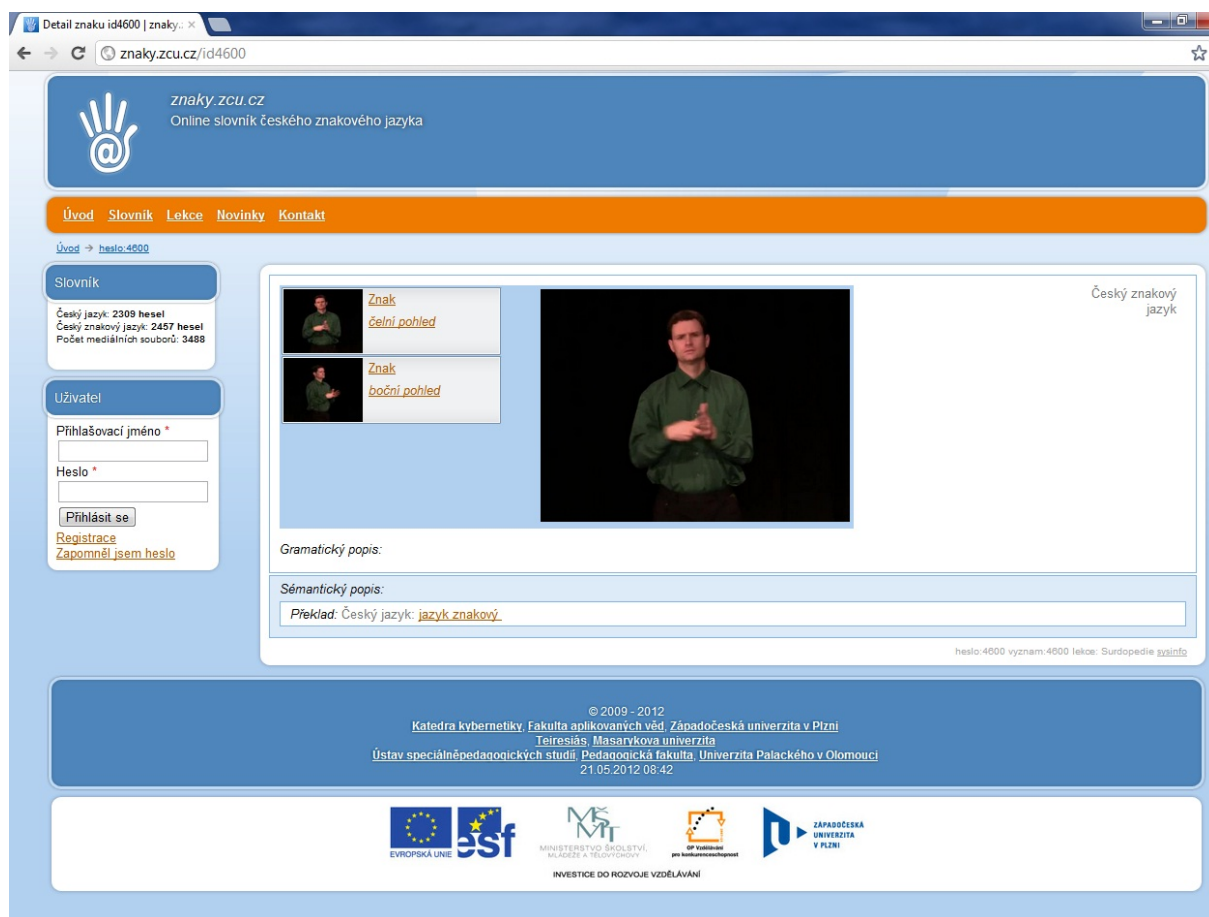
Animated avatar, etc.


Fig. 1. Workspace of the *Online Dictionary of Czech Sign Language*

Dictionary today contains approximately 7000 of signs of Czech Sign language from the general sign language vocabulary as well as vocabulary from the general study and special educational terminology. Gradually, the database will be supplemented with signs from the previously published electronic dictionaries of sign language and signs obtained from the continually maintained elicitation from currently required subject areas. The management of that online Dictionary has been supervised by expert editorial board, which guarantees the accuracy and validity of the contained data. The absolute innovation in the field of online dictionaries of sign language is the ability to search sign based on its parameters in the notation systems HamNoSys and SignWriting and then write its Czech equivalents. The dictionary is also able to translate the traditional way from the Czech language into sign language, but also vice versa. (cf. Langer, 2008)
Fig. 2. Virtual signing model (avatar)

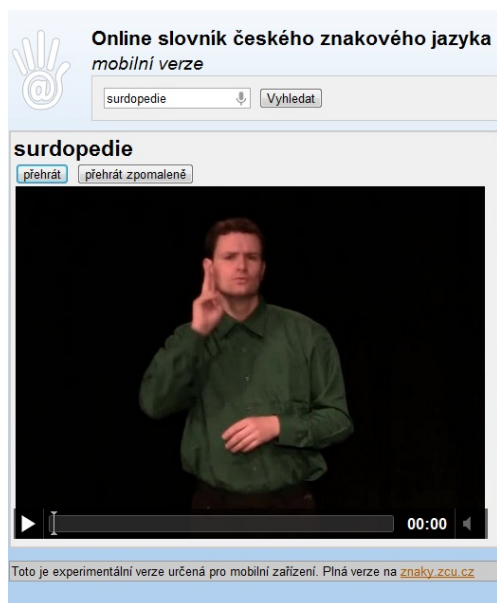
On-line dictionary will also allow users to export selected signs (eg, by topic, alphabetically, etc.) into a simple off-line version of the dictionary, which will eventually be used even without an Internet connection. After filling the database with a sufficient number of signs it will be possible to create special "individual" electronic dictionaries of sign language that will be able to create "tailored" by the tutor for his students. The dynamic development of information and mobile technology also eliminates one of the major weaknesses of electronic and online dictionaries of sign language, which is the necessity of using computer technology. The dictionary mentioned above is fully functional, even on mobile devices like smartphones or tablets, so it is entirely possible to use anywhere in the field.


Fig. 3. Mobile version of the online dictionary
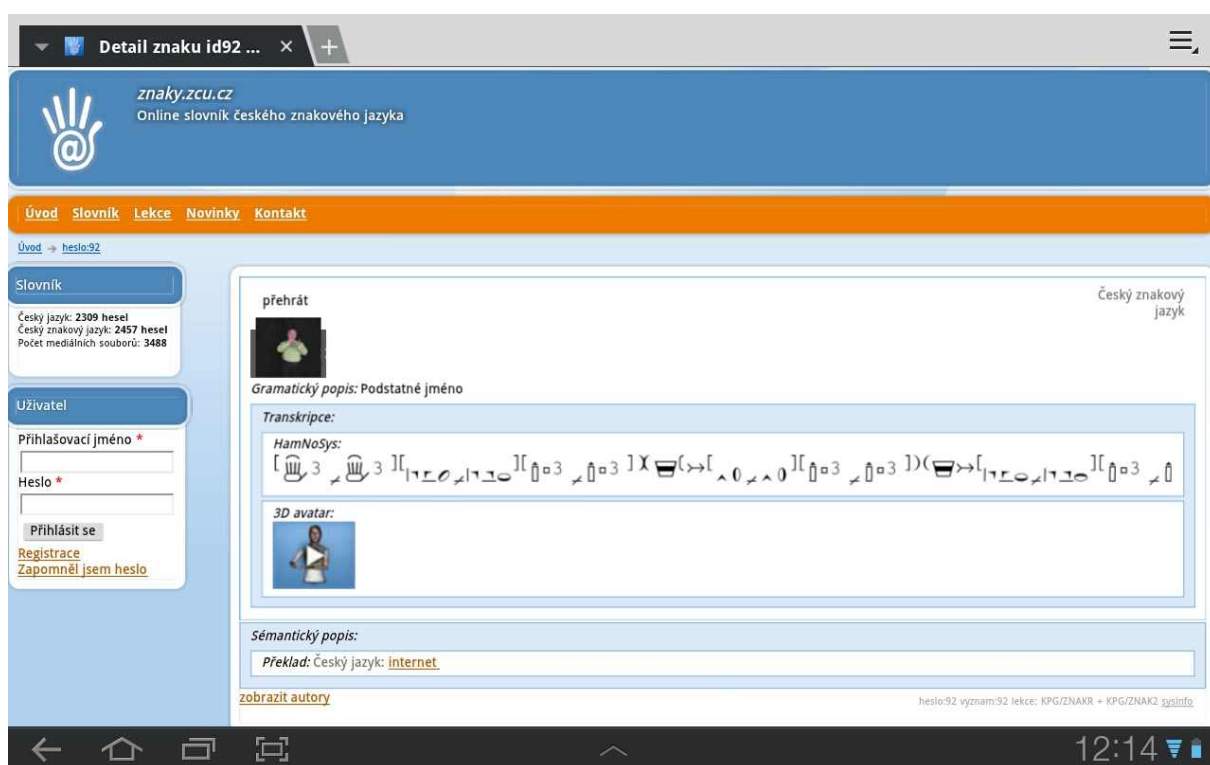

Fig. 4. *Online Dictionary of Czech Sign Language* on the tablet

The number of dictionaries and materials from which it is possible to study the vocabulary of the Czech sign language or Signed Czech is already relatively high, but none of them focus on teaching grammar Czech sign

language. For a description of the concrete publications and evaluation of their characteristics cf. Slánská-Bímová, Okrouhlíková, 2008; Okrouhlíková, 2008; Tomek, 2008; Langer, 2004. The only way the student can therefore learn the grammar of Czech sign language is in lessons with a teacher and direct communication with its native users.

MUSEUM CONCEPT FROM PAST TO PRESENT AND IMPORTANCE OF MUSEUMS AS CENTERS OF ART EDUCATION

Assist. Prof. Dr. BURCU GÜNAY

Abant İzzet Baysal University, Faculty Of Education, Department Of Fine Arts Education, Golkoy Campus, 14100, Bolu, Turkey

Abstract

The present study aims to examine the concept of museum and the transformation of museums to centers of education in its historical development. Museum, as a concept, comes from the 9 muses each possessing a different ability and source of inspiration (Calliope- the muse of epic poetry; Clio-the muse of history etc). Open and enclosed spaces (gardens and inside temples) dedicated to these 9 muses were called museums in Ancient Greece. However, The Museum of Alexandria, established in 4th century B.C, was the first museum that presented collection, exhibition, preservation and classification missions for museums in the historical development. A comprehensive archive was developed in Alexandria by visiting all settlements in the Mediterranean to collect artifacts sometimes through copying sometimes by seizing by means of pillages. In this sense, the Museum of Alexandria is the temple of the thought to bring together all cultural indicators of the world in the same location.

Medieval collections were the means to collect cultural treasures and to pursue what is different to display them. With the discovery of the New World and the resulting conquests to faraway lands, not only the land but also the universe of images of The Other was conquered. Museums with their Cabinets of Curiosity, that display everything that is extraordinary and rare, living and nonliving, are exalted to mysterious settings. Along with the Renaissance-the conveyor of the Ancient Greece and the messenger of the modern world view- museums transformed into visual encyclopedias established with a philosophy of classification and documentation rather than sorting the mysterious objects or the living things. In this sense, the museums have started to develop as service facilities that contribute to the progress of the society instead of settings that only collect and store objects. While Palazzo Medici built in 15th century laid the foundations of the modern museum, arts and science started to transform into academic structures. Now, the most precious artifacts of history are presented in the museum setting in a chronological order. The function of object based information usage started to be dominant in the 18th century along with the establishment of the institutional structure and the 19th century brought the provision of services to educate the working class that started to rapidly increase in the cities as a result of industrialization and the museums have obtained the mission of training citizens as well.

As a result, museums stopped being the indicators of wealth for rulers and the bourgeois in the history and started to gain importance as educational institutions. Hence, modern museums are settings in which research towards the preservation of cultural heritage is undertaken on one hand and training, publications, knowledge-document centers, performances, meetings, discussions and workshops are provided on the other.

Key words: Muse, Cabinets of Curiosity, National Museum, Universal Museum, Modern Museum Studies, Information Services

INTRODUCTION

Today museums have progressed from being mere spaces where art and science products are displayed and all treasures of the past are conserved to being informal educational areas and tools for communicating the mass culture. Museums, consisting wide base libraries, project development facilities, art ateliers and display rooms and with presentation techniques addressing the products comprehended not only with two or three but with five dimensions, are turning into educational areas which enrich social life. "The type of relationship that the Art and especially Nature and History of Science Museums have formed with children and their families not only proved that an object in a museum is not only for observation but also unearthed the field called museum pedagogy. These spaces salvaged from only being the temples of muses….are questioning the fundamental means of observing and learning" (Çalıkoğlu, 2009:7)

CONCEPT OF MUSEUM

Museums, "past guardians" of ancient objects or treasures, are generally known to be locations or buildings where art and science artifacts are preserved, kept and meet the viewers. When examined in more detail, museums are organizations with the mission of investigating the production of humanity along the ages from the viewpoint of science and art to enlighten them about the history in addition to being spaces that present and conserve the treasures of science and art and the under and above ground treasures. International Council of Museums in their meeting in 1955 defined museums as "permanent organizations in the service of society and its development, open to public, which acquires, conserves, researches, communicates and exhibits the tangible and intangible heritage of humanity and its environment for the purposes of education, study and enjoyment" and in their 1962 meeting the Council focuses on the mission of education in the definition of museums as "permanent organizations that preserve and exhibit collections consisting of objects with cultural and scientific value for research, education and enjoyment purposes" (Atik; 2009: 120). Sözen and Tanyeli define museums as "organizations open to public established to exhibit artistic, cultural, historical or scientific artifacts permanently or establishments that carry the properties listed above" (Sözen, Tanyeri 1987: 168) Riviere emphasizes the educational role of museums as ICOM does and portrays museums as "permanent organizations working for the benefit of the public by carrying collections of art, science, history, health and technology to preserve, study, assess and exhibit the cultural values as a whole in order to develop aesthetical enjoyment and education in public" (Riviere, 1962:22-23).

DEVELOPMENT OF MUSEUMS: FROM THE MUSES OF ANCIENT GREECE TO MODERN ART MUSEUMS

Origins of museum concept date back to Ancient Greek myths. Museums in Ancient Greece were defined as "adobes of the Muses" (Artun, 2006:11). The origin of the word museum comes from the Greek word "Museion" (İnel, 1998: 24) which means the temple of the goddesses called "Muses". According to these myths, the word "muse" derived from the word "men" meaning wisdom, thought and creativity means muse (source of inspiration). According to mythology, Zeus, the King of the Gods and the Goddess of Memory Mnemosyne had nine daughters each with a specific skill and inspiration: Euterpe, the muse of music; Erato, the muse of love poetry; Calliope, the muse of epic poetry; Clio, the muse of history; Melpomene, the muse of tragedy; Polyhymnia, the muse of hymns; ,Terpsichore, the muse of dance; Thalia; the muse of comedy and Urania; the muse of astronomy. Although there were muses in many areas form music to dance, from theatre to history, there were no

muses in plastic arts (painting, sculpture, ceramic etc) because in Ancient Greece painting and sculpting were not considered pure art at the time but seen as handcrafts or *techne*. Structures or artistic activities dedicated to these nine muses such as temples, festivals and poetry were called muses.

The collection of objects with artistic values was first undertaken by the Greeks. Along with colonization movements, buildings called "Theasuri" (Treasuries) were built in centers with political and religious significance (Yücel, 1999 : 19). The first development that can be cited as the nucleus for the museum concept is the Great Museum of Alexandria. In 3 BC after conquering Egypt, Alexander the Great planned to establish a city carrying his name that "would be the center of Hellenic culture in these lands and ordered that a library for the muses to be built to bring good luck to the city" (Artun, 2006:13). This ancient library built by Greek Ptolemaios Soter Dynasty in 306- 285 BC was known as "musaeum". Literary works owned by all emperors at the time were reproduced and books in all ships that visited Alexandria port were pillaged to have thousands of handwritten manuscripts. Library of Alexandria also consisted of a part called museum. "Museum section…the part where artists, philosophers and scientists freely did research under the guardianship of the dynasty; the part where intellectual, spiritual and philosophical production was undertaken was called the museum" (Madran: 2009: 66). In this sense, "The Great Museum of Alexandria is the first center for the design of dream, to collect all words and symbols from Hindu, Mesopotamia and Ancient Greek civilizations and maybe from the whole world" (Artun, 2006:15). The origin of modern museums started to be built in the 18th century dates back to The Library of Alexandria in terms of classification approach.

Centuries after the Ancient Greek approach filled with "the rational", the approaches to museology retreated into the irrational, magical and mystical brought by the Middle Ages. Western countries brought back all the interesting flora, fauna and crafts discovered during their expeditions undertaken to new continents and decided to create collections from these imageries to display their conquests. These collections existing all through the Middle Ages are called Cabinets of Curiosity. Cabinets of Curiosity are composed of all pillage materials that are obtained such as living and nonliving things, natural and artificial materials, dried plants, stuffed birds, unicorns, and embryos in short all mysterious objects collected together without rational classification criteria. The cabinets deemed the ancestors of the museums are the collections that belong to the pre enlightenment period and "since they did not carry a scientific form, the objects they sported were scattered in all directions and the museum in the sense we understand now is born" (Artun, 2005: 10).

Figure 1: Musei Wormiani Historia, (Kopenhag Ole Worm Museum), from Museum Wormianum, 1655.

Contrary to Middle Ages, in the period of the Renaissance museums recaptured the sense of the rational of the Ancient Greece. With the Renaissance, museums achieved the standing as being substantial elements in intellectual life in a humanist approach and they were no longer locations where lining and non-living objects and artifacts were exhibited. Palazzo Medici accepted as the conception of Modern European Museums revived museums by providing the museums with both chronological classification elements and aesthetical canon. The works in Palazzo Medici built in 1940 by Great Cosimo who started the Medici Dynasty in Florence were created according to the norms of classicism, the artistic approach of the time and the problematic of perspective was sought in the works which led to the decay of the worldview with the focus on the "other world" emphasized in the previous Gothic period. The works in the Medici achieved a norm that can be measured and calculated, that can have perspective problematic and that focus on how the nature and human body worked instead of portraying the other world. This power of reasoning increases the observation and assessment skills of the individuals in relation to the environment and art. The artifacts selected to be exhibited in the museum especially the works of Leonardo Da Vinci, Rafaello and Michelangelo all emphasized the central human structure contrary to paintings with religious themes ordered by the Church to exalt God. These works seen as the representations of the rational approaches of the Renaissance were transferred to Uffizi Gallery in the later years. The architect of Uffizi, Giorgio Vassari, was among the founders of Academia Dell'Arte del Disegno, the first art academy in addition to being the art director of Medici collections. In this sense, both the enlightenment of the Renaissance and the establishment of the Medici museums supported the formation of relationships among the university, academy, library and the museum. However, although Uffizi Collection was opened to public as an institution at the time, it was not cited in the literature as the first library. "Institutionalization of museums in the formal sense starts with the Ashmolean Museum located in Oxford University in England as the first museum space open to public" (Madran; 2009: 70). Along with the Renaissance and the information regimes of the 18th century; the leading museum in the transformation from the culture of collections to the memory rooms of the enlightenment period is the Louvre Museum in France. "Museums leading us as the perfect places for memory since the 18th century are among our theoretical instruments and in many respects they are the emblems for the aspirations rejuvenated by the Enlightenment" (Preziosi, 2006: 139). Louvre Museum is the location where art, historical civilizations and development gained a chronology, became institutionalized and the traces of the nation state were exhibited. The museum created by housing all the collections of the royalty in Louvre Palace after the 1789 French revolution has destroyed the structure that attributed art works only to royalty and made them the property of the public. Other developments of the 19th century declared as the golden age of the museums can be cited as the institutionalized establishment of the National Gallery (Britannia National Museum) and British Museum. "British Museum has the function of an encyclopedia or a dictionary based on historical facts. The ordering of spaces, the classification of objects, their exhibitions help comprehend the relationships among these objects and samples in a three dimensional world". (Artun, 2006: 41). Museums in this sense "have started to obtain the context towards the end of the 18th century to store and exhibit items of cultural heritage instead of collections themselves" (Onur, 2012: 20). America followed in the footsteps of Europe in the transformation of royal museums to public museums in the 19th century. Museum of Modern Art (MoMA) in New York built in 1929 is the first large public museum of America and reflects the Western painting tradition. The first floors of the museum are allocated to Greek-Roman-Egyptian artifacts and upper floors house the works of the Renaissance period. With this distinct representation that divides Western and Eastern art. MoMa embodies an imperialist ideology. The most significant point of the museum approach of MoMa is explained in art critic Brian O'Doherty's book "Inside the White Cube". According to O'Doherty, new modern museums are "white walled, carpeted in grey or parqueted, with no décor" (O'Doherty: 2000: 15). The exterior sections of MoMA give the feeling of modernism as the interior where the paintings are mounted in specific areas with seating systems that enables the viewer to observe the work for longer periods. In the place of imposing columns of the British Museum or the National Gallery, there is the simple, plain and minimalist façade. "The gallery aims to provide a neuter environment to observe and reflect on the works of art. The visitors in MoMA do not only view and reflect, they also take compulsory introduction to art history (Artun, 2006: 95). As opposed to MoMA's stern classification in presentation and the simplicity in its architectural structure, Pompidou Museum built in 1977 in France has a more voluminous architecture and a public oriented presentation style and usage. Pompidou reflecting a futurist approach with the colorful installation pipes

covering the exterior façade feature public libraries, art design ateliers, cinemas and collections which bring public and art together in addition its mission of bringing art, culture and education together.

Figure 2. MoMA, NewYork Museum of Modern Art   Figure 3. Pompidou Center, France.

MUSEUM AND EDUCATION

Investigation of the development of museums from the Ancient Greece to 20th century shows that museums have progressed from merely exhibiting collections to being the centers for observation, learning and questioning. They no longer are in the status of being objects to be merely observed. It is possible to link museum and education to 16th century cabinets of Curiosity. As a result of expeditions and imperialist approaches of the Western countries, all living-nonliving objects and natural-artificial things brought back to Western countries form the lands of the "other" were exhibited in these cabinets which in a sense provided information about the history of nature, geology, ethnography, archeological findings, historical remains and religious documents. 'Tradescent Ark' now called "Science History Museums" was opened in the 17th century by John Tradescent with the curiosities collected in his trips to faraway lands. In the subsequent years all the collection was donated to Oxford University. "The fact that these types of collections are seen as educational materials started after the establishment of the Ark and school principal Charles Hoole, in his book of 1660, mentioned the use of objects in education hence the education of museums of today" (Onur, 2012: 166). American philosopher and educator John Dewey regarded museums as a part of knowledge process of the educational organizations. According to Hein "Early 20th century museum educators and administrators applied Dewey's ideas and defended the museum education philosophy based on progressive educational movements" (Onur, 2012: 168). One of the results of integrating educational activities in schools with museums actively is the Brooklyn Children's Museum opened in 1899 in America aiming to develop children's interests and learning styles.

As opposed to formal learning methods in educational organizations which focuses on showing and presenting and in which students are expected to participate physically, museums promote museum based learning in which "students touch objects; discover houses and gardens climb the stairs… they use their senses and bodies as learning sources. The key to feeling different pleasures, recording concepts in the brain and developing skills and self respect is the formation of physical and bodily associations" (Onur, 2012: 190). In this

respect, museums have obtained pedagogical, sociological and psychological content and "museology" as a science has started to develop   in universities. Also transition from the passive educational systems consisting of rote learning and information transfer to more active educational systems which promote research, analysis and synthesis has supported the use of libraries and labs along with museums (Atagök 1999 : 16). In this context, modern museums are transforming into informal educational organizations.

TODAY'S MUSEUMS AS CENTERS FOR ART EDUCATION

The fact that during the course of the time, museums undertake the task of providing modern education and training has immensely contributed to children's bonds with art. Coming across art objects in museums from very early ages and getting involved in art activities will develop the aesthetical sensitivity and viewpoints of children. The share of today's museum approaches is very substantial in the enrichment of children's outlook to art. There are four important approaches in today's museum concepts: virtual museum, touchable museum, mobile museum and foundation museum. "Museums in modern museology undertake their activities by taking the different segments of society into consideration. These activities are permanent exhibitions, temporary exhibitions, guided tours, dia-film demonstrations, discussions, seminars and atelier trainings" (Keleş; 2000: http: //sosyalbilimler.atauni.edu.tr). Art education through museums goes back to mid 19th century in the West. In developed countries museums and galleries frequently consulted by art teachers develop special training programs for the public. Similarly museums in Western Europe and America are turning into centers where social, cultural and educational activities are undertaken in order to give back to society and to develop the community. Ateliers in modern museum for example "provide the kindergarteners with realistic archeological objects and ask them to make these objects with the clay or play dough" (Şahan http://www.tebd.gazi.edu.tr/arsiv/2005_cilt3/sayi_4/487-501.pdf). In this context, students under the supervision of the educator meet with archeology and art history and gain skills such as observation and manual dexterity. The best example of creating new forms and developing aesthetical ideas by touching objects is the "Philadelphia Please Touch Museum". "This museum organized exhibitions for children and reached out to groups in the slums. They taught and informed the children and their parents by letting the children play with the museum replicates carried in mobile trunks" (American Association of Museums in the Life of a City: 1995, Atasoy, 1998, 38.). This activity known as the "Philadelphia Initiative" is important in showing the effects of art and cultural organizations on the social and economic life of the city. Touchable museums both strengthen the communication between children and objects and serve individuals with special needs such as individuals with mental retardation, physical disability and visual problems. For example, an exhibition titled "Sculpture for the Blind" was organized in Tate Gallery in 1976 in London. Some of the works in the exhibition were gathered from collections and others were destined solely for this purpose. "Since the 1980's, exhibitions are the starting point in the period to touch; especially in sculpture" (Hooper- Greenhill, 1999:160). MoMa organized touching tours for blind and partially sighted visitors with a small collection of sculptures by having the visitors wear protective gloves in the beginning of the 70s. In 1991, MoMA Education Unit organized a training program with a group of 25 blind and partially sighted and provided the sustainability of the program to learn by touching. One of the most noteworthy galleries that combine art, commerce and education with collections is the Saatchi Gallery in London. The gallery, established in 2008 by the Iraqi origin Englishman Charles Saatchi, an important name who directs and manages the modern art market, attracts attention with the simplicity of its architecture in the first glance. The students not only work in the modern art ateliers but also in the main sections where artworks are displayed. Saatchi Gallery carries the mission to present modern art to students and educate the youth about new artistic trends of post 60s. the Gallery also undertakes the mission of an artistic educational organization by providing school projects, gallery tours under the supervision of the educators, educational packages and ateliers that promote active participation. The Gallery continuously updates these activities in its website. School visits to the Gallery are organized with the cooperation of the Directorate of Education and students are given free guided tours.

Figure 4-5-6-7: Students visiting Saatchi Gallery and participating in art classes

RESULTS

Museums today are the tools for mass culture. The missions of museum do not only consist of conserving and exhibiting treasures and objects that provide us with information but include the provision of educational tasks. Museums sporting object centered and self enclosed approaches until the 19th century have headed towards human centered and outward looking approaches since the '60s influenced by the changing world, modern art views and new outlook to museology. Museums have proved that objects are not only for observation and created a new field called the museum pedagogy. They have started to get involved with more projects and keep close relationships with the community to contribute to the education, development and culture of the communities with the help of the shares they receive from the public organizations. Many museums today develop and present different programs that can interest various groups by getting to know viewer groups better since it is known that the viewer will integrate the messages with his/her own experience, will be involved with the objects and topics of interest and the messages created by the curator cannot be directly imposed upon them. Modern museums such as Tate, MoMA and Saatchi consider the development of programs that contribute to the education and enrichment of children among their fundamental functions. Many theoreticians emphasize the importance of museums in children's education with the advancement of concepts such as active participation in

education, gaining experiences, environment, interaction and constructivism. Museum environments provide children with opportunities to learn by doing in a setting that contributes to their intellectual, physical, emotional, cognitive and social developments and they contribute to the acquisition of aesthetical taste from the very early years. In addition, museums present various documents related to culture aiming to train individuals who are more sensitive to the community and to the world and they facilitate the establishment of foundations for the development of personality, self confidence and citizenship. Museums play an important role in the integration of various groups in multicultural societies. In short museums are both social platforms that bring the region's artistic life and culture together with their exhibitions, concerts, wide based libraries and shopping centers and modern educational organizations that question the new methods to observe, learn through applications and obtaining artistic awareness.

NEW TRENDS AND PRACTICES IN TURKISH HIGHER EDUCATION POLICY: TEACHING STAFF TRAINING PROGRAM (ÖYP)

Oğuzhan Zengin[a], Gözde Çakır[b]

[a]Hacettepe Üniversity, Economics and Administrative Faculty, Department of Social Work, Ankara 06410, Turkey

[b] Karabuk University, Safranbolu Fethi Toker Fine Arts and Design Faculty, Department of Industrial Design, Karabuk 78600, Turkey

Abstract

Two of basic dimensions of lecturers in higher education institutions, who are identified as academicians, are functions of producing knowledge through scientific research and providing students with efficient theoretical and practical education service. Training of academicians as researchers and educators who constitute such manpower in higher education institutions are shaped by current high education policies in a country. Therefore, education programmes implemented to train academicians have a significant role in determining the qualifications of higher education.

According to Higher Education Personnel Code number 2914, academic teaching is conducted by three groups known as lecturers, instructors and prelectors with assistants. Academicians who serve under professor, associate professor and assistant professor cadres comprise the faculty members group. Lecturers and instructors are academicians who give lectures in their own fields and implement guidelines. In the group of teaching assistants; research assistants, specialists, translators and education-teaching planners take place.

In this paper, current situation of faculty members in our country and their training within the currently implemented higher education policy is being addressed.

Key words: New Trends in Higher Education, Faculty Member, Faculty Member Training Programme (ÖYP).

Introduction

With the new Turkish higher education strategy which can be summarized with the motto "one University for each Province", forty one new universities are founded in the last five years. With these new foundation of universities however, the lack of academic personnel came into question. In order to overcome this absence of academicians, the Higher Education Council (YÖK) put into effect the Faculty Member Training Programme (ÖYP). This programme is a new model developed to fulfil the need of faculty members with the support of State Planning Agency (DPT) by blending the 33rd and 35th articles of higher education law number 2547, which comprises national and foreign doctorate degree education. In this model, while universities' science and technology producing capacities are increased on one hand, faculty members are trained on the other. Under the coordination of the Presidency of Higher Education Council, the programme regulates in higher education institutions having the capacity for delivering post-graduate education, post graduate education of research

assistants from other higher education institutions which have the need of faculty members.(Procedures and Principles Regarding Faculty Member Training Programme, Article 1). Hence, ÖYP which is developed to close the gap in the numbers of faculty members is designed so as to train scientifically well equipped faculty members in a reputable university and a good research environment. Within the programme if required, students are economically and legally supported to attend language training for three months and carry out research for one year in during their doctoral thesis period abroad. ÖYP therefore is a domestic alternative to Post-graduate Education Programme Abroad (YLSY) which has been implemented by the cooperation of Ministry of National Education and YÖK for some time. A total of 5500 vacancies within ÖYP were designated, 2500 for universities founded in 2010 and 3000 for universities founded in 2011.As for this year, designation of 4000 vacancies for ÖYP is being expressed by YÖK officials.

2.Conditions of admission to the programme

Being younger than 35 years of age, not possessing any health obstacles which would prevent working as a research assistant, a minimum score of 70 (seventy) from ALES (Academic Personnel and Post-graduate Training Entrance Examination). (Scores obtained from this test are valid for three years following the test date). Placements will be made according to 35% of grade point average, 50% of ALES score, 15% of foreign language test score if any. (http://personel.yok.gov.tr/OypDuyuru/?sayfa=aciklamalar).

3. Post-graduate training placement

If research assistants accepted into the programme have 65 or higher foreign language score, they usually make a preference among post-graduate programmes of reputable universities over the internet during selection periods and in their relevant field. Admission of research assistants into this programme is according to their ÖYP scores. Research assistants with lower than 65 language score are placed with their ÖYP scores in 15 universities designated by YÖK to go through a language course for 6 months. Research assistants who cannot score a minimum 50 language points for a period of two years within their taking office are discharged from the university.

4. Study Period

ÖYP study period for post-graduate education is 4 half years, for doctorate programme 8 and for integrated doctorate programme 10 half years. For research assistants who could not complete their thesis work, a maximum 2 half years for post-graduate and 4 half years for doctorate or integrated doctorate degree are additionally provided upon thesis monitoring committee's reasoned decision and approval of institution's governing board. Research assistants who are provided with additional time cannot make use the support provided within the programme. (Procedures and Principles Regarding Faculty Member Training Programme, Article 9).

5. Completion of post-graduate education and assignment for faculty member

ÖYP research assistance who successfully graduate from doctorate programme, return within latest a month to their assignments in universities for which they are obligated for compulsory service.   In faculty member vacancy announcements, departments where research assistants who successfully completed post-graduate education within ÖYP are given priority. (Procedures and Principles Regarding Faculty Member Training Programme, Article 23).

6. Compulsory Service Agreement

Before being assigned to universities where they will receive post-graduate education, research assistants sign a bill. This bill states that research assistants will work in their affiliated universities for a period as long as the duration of their post-graduate education, otherwise, they should reimburse the total amount of salaries they received.

7. Foreign country experience

Upon their request, research assistants who scored a minimum of 65 from KPDSor ÜDScan be assigned for a foreign language course abroad for three months. Furthermore, again upon request, they can conduct their research for a maximum of three months during their post-graduate period and for a maximum of twelve months during their doctorate thesis period abroad. (Procedures and Principles Regarding Faculty Member Training Programme, Article 17).

8. Budget availabilities

Each research assistant and his advisor has a budget of 50.000 TL;20.000 of which is for project expenses (procurements for post-graduate education, basic office equipment, waste material, machine-equipment and service procurement) and 30.000of which is for travel expenses (Long term foreign assignments for research assistants – *for a maximum of 1 year during the course of education –*, attending national or international scientific meetings –*maximum 15 days annually -,* attending short term national or international scientific meetings for advisors – *maximum 15 days annually*)(oyp.uludag.edu.tr/belgeler/ogretim_uyesi_yetistirilme_esaslari.pdf).

9. Conclusion

Conclusively, higher education policy, shaped with the discourse of one university for each province is in the process of developing certain projects in order to overcome the shortcomings in the number of academic personnel in newly funded universities. One of such projects is the ÖYP. With ÖYP, young science people who has international experience, academically valid foreign language ability, familiarity with the scientific developments in the outside world, are affiliated with the scientific institutions in other countries, able to multi-directionally evaluate scientific facts, well trained in rooted national or international universities and has high research and reporting capability are expected to positively contribute to Turkish higher education system.

OBJECTIVES OF THE STUDENTS USE GENERAL AND VOCATIONAL EDUCATION STUDENTS TO FACEBOOK

Prof. Dr. Aytekin İşman[a] , Kadir Ucun[b]

[a]Computer Education and Instructional Technology, Faculty of Education,Sakarya University,Sakarya, Türkiye

[b]Computer Operating Training, Technical Vocational School of Higher Education, İstanbul Gelişim University, İstanbul, Türkiye

Abstract

Depending upon developing internet technologies in Turkey and in the world, the emerging innovations are commonly used by individuals. Social network websites are the most prominent innovation which assembles people from each part of community at the same point according to their interests by removing the borders in real life. Since communication and interaction are the top-level in these days, the attraction of using social network websites in education has significantly increased. The aim of this study is to indicate purposes of use of Facebook, which is one of the most popular social network websites, in educational environments.

Keywords: Education, Facebook, Social Networks, Social Network Sites, Social Networks For Education

Introduction

As a result of the technological developments obtained from information and communication technologies in the 20th century, each part of our lives has been significantly influenced by these developments (Keser, 1991). With internet technology, environments, that removed the concept of real time and real place and, that established interaction between people sharing their opinions, were formed (Preeti, 2009). In these formed environments, there are online communities called social network (Buss, 2009). The concept of social network; It includes virtual communities on the internet where individuals that have the same interest are able to interact each other and to share their thoughts (Preeti, 2009). . Social network websites are applications which escalate social communication and collaboration. The first social website was developed in 1995 called Classmates and it was followed by SixDegrees, which was developed in 1997. In the following years, many social websites were developed such as Livejournal (1999), Friendster (2002), MySpace (2003), Flickr (2004), Facebook (2004), Youtube (2005) and Twitter (2006) (Boyd ve Ellison, 2007).

Facebook, which has more than 800 million users and provides more than 70 languages, is the one of the most popular social websites which brings people together across the World (Facebook, 2011). As a result of studies conducted in the educational institutions in Turkey, the most preferred social network website was found Facebook (Schroeder ve Greenbowe,2009). In the higher educational institutions, the rate of use of Facebook was found significantly high (Şener 2009). Bu bağlamda sosyal ağ sitelerinin eğitim kurumlarında kullanılması gerekli olduğu söylenebilir. In that, it may be necessary to use social network websites in educational institutions. Custom social web environments created and managed by users in Facebook provide an alternative way to learning environments in process of education (Munoz ve Towner, 2009). Therefore, Facebook was ranked the first in education among the social network websites due to its customisable and developable environment and its ease of use feature in process of education (Gülbahar, Kalelioğlu, Madran, 2010).

Purpose

The aim of this study is to indicate purposes of use of Facebook, which is one of the most popular social network websites, in general and vocational education. In this study, the sub-questions below will be answered. These questions are;

- What are the purposes of associate degree students to use Facebook in general?
- According to variables of gender and age, are associate degree students able to show significant differences in their opinions about purposes of Facebook use?
- What are the purposes of associate degree students to use Facebook in vocational education?
- According to variables of gender and age, are associate degree students able to show significant differences in their opinions about purposes of Facebook use in vocational education?

Method

Research Methodology

This research is a descriptive study and relational scanning model was selected to use for examining this study. Scanning models are research approaches which depict issues as how they are or how they were in the past (Karasar, 1999). In descriptive scanning model, the opinions of the students were determined in terms of their purposes of Facebook use in vocational education, in relational scanning model, the obtained opinions were examined in terms of demographic variables.

Population ve Sapmle

The universe of this research consists of the students studying in Vocational School at Istanbul Gelisim University. The scope of this study is composed of 500 students that studied in 2011-2012 academic year.

Data Collection

In the research, individual information form, the scale of purpose of Facebook use, and the scale of purpose of Facebook use in vocational context were used as tools to collect data. Via individual information form, demographic data (gender, age, department etc.) were collected. The scale of purpose of Facebook use were developed by Mazman (2000), and it is a 5 likert scale. For each matter, interviewee can only select one of these items, which are "Never", "Rarely", "Sometimes", "Usually" and "Always".

The scale of purpose of Facebook use in vocational context developed for this study is also a 5 likert scale. As a result of reliability analysis of the survey, Cronbach Alpha value was found 0,927. The data obtained from the study were analysed via using SPSS 16.0 software application. In order to evaluate the obtained data, t-test and one-way ANOVA were used. The findings arisen from the variance analysis were evaluated as 95 per cent reliable results by disregarding the tolerance on the level of $P<0,05$ (Büyüköztürk, 2003).

Findings and Comments

The Findings and Comments Regarding to the Purposes of Facebook Use of the Students

Table 1. Demographic Information of the Participants

		Frequency	Percentage
Gender	Male	90	30,5
	Female	205	69,5
	Total	295	100,0
Age Groups	16 and 18	74	25,1
	19 and 21	178	60,3
	22 and 24	32	10,8
	25 years old or above	11	3,7
	Total	295	100,0
Departments	Computer Programming	33	11,2
	Child Development	117	39,7
	Logistics	30	10,2
	Health Care Management	31	10,5
	Civil Aviation Management	37	12,5
	Medical Documentation and Secretary	47	15,9
	Total	295	100,0
Visit Duration	Everyday	157	62,5
	A few times per week	82	32,7
	A few times per month	10	4,0
	A few times per year	2	,8
	Total	251	100,0

		Frequency	Percentage
	less than 30 minutes	85	33,9
	1 hours	73	29,1
Visit Frequency	1 and 2 hours	60	23,9
	2 hours or above	33	13,1
	Total	251	100,0

In table 1, when the gender variable is examined, it is seen that the most of the participants were composed of women (69,5%). According to the age variable, the most of the participants were composed of the students aged between 19 and 21 (60,3%). According to department variable, the students from child development department comprised the majority of the participants (39,7%). When the frequency of usage of the students is examined, it is seen that the most of the students are the ones who use Facebook every day (62,5%). When the time the students spend each day is examined, it is seen that the most of the participants (33,9%) use Facebook less than 30 minutes every day.

Table 2. T-Test Analysis Results of Opinions of Students about their Purposes of Facebook Use Based on Gender Difference

	Gender	N	Mean	Sd	df	T	P
I use Facebook to find new friends	Male	97	2,40	1,187	285	4,484	,000
	Female	190	1,82	,953	186,269		
I use Facebook to find new people who have the same interest and to join social groups	Male	97	2,55	1,181	285	3,434	,001
	Female	190	2,06	1,117	184,271		

Concerning gender variable, the result of t-test analysis performed to determine whether the students' opinions differ from each other or not is given in Table 1. It is seen in table 1 that with respect to gender variable, significant difference was found (P=,000, P<0,05) in this paragraph: "I use Facebook to find new friends". For this purpose it was found that male students (X=2,40) use Facebook more than female students(X=1,82) do. According to this paragraph; "I use Facebook to find new people who have the same interest and to join social groups", significant difference (P=,001, P<0,05) was found on the basis of gender difference. For this purpose, male students (X=2,55) use Facebook more than female students (X=2,06) do.

Table 3. The Variance Analysis Results of Opinions of Students about their Purposes of Facebook Use Based on Usage Time

	Age Groups	N		Sum of Squares	df	Mean Square	F	P
I use Facebook to find my old friends	16 and 18	63	Between groups	9,751	3	3,250	3,222	,023
	19 and 21	157						
	22 and 24	25	Within groups	249,197	247	1,009		
	25 years old or above	6	Total	258,948	250			
I use Facebook to follow up-to-date news	16 and 18	63	Between groups	17,838	3	5,946	3,918	,009
	19 and 21	157						
	22 and 24	25	Within groups	374,895	247	1,518		
	25 years old or above	6	Total	392,733	250			

As a result of findings obtained from the study; based on age variable, there is a significant difference found on the level of $P<0,05$ in these two paragraphs; "I use Facebook to find my old friends" and "I use Facebook to follow up-to-date news". After LSD test was applied these two paragraphs in the previous sentence, significant differences were found and the results below were obtained.

Table 4.According to the age groups LSD Test Results Applied to the Paragraph of "I use Facebook to find my old friends"

	Age Groups		Mean Difference	P
I use Facebook to find my old friends	25 years old or above	16 and 18	-1,333	,002

	Age Groups		Mean Difference	P
	25 years old or above	19 and 21	-1,222	,004
	25 years old or above	22 and 24	-1,200	,009

As a result of the test, for those students who are 25 years old or above, significant differences were found on the level of P<0,05 compared respectively to the students aged between 16 and 18 (average difference=-1,333, P=,002), the students aged between 19 and 21 (average difference=-1,222, P=,004) and the students aged between 22 and 24 (average difference=-1,200, P=,009). It is seen that the group of students aged 25 and above use Facebook to find old friends more than the groups of students aged between 16 and 18, between 19 and 21 and between 22 and 24 do.

Table 5.According to the age groups LSD Test Results Applied to the Paragraph of "I use Facebook to follow up-to-date news"

	Age Groups		Mean Difference	P
I use Facebook to follow up-to-date news	25 years old or above	16 and 18	-1,007	,057
	25 years old or above	19 and 21	-1,245	,016
	25 years old or above	22 and 24	-,580	,301

As a result of the test, for those students who are 25 years old or above, significant differences were found on the level of P<0,05 compared respectively to the students aged between 19 and 21 (average difference=-1,222, P=,016).
It is seen that the group of students aged 25 and above use Facebook to follow up-to-date news more than the groups of students aged between 19 and 21 do.

The Findings and Comments Regarding to the Purposes of Facebook Use of the Students in Vocational Context

Table 6. Demographic Information of the Participants

		Frekans	Yüzde
	Male	86	42,0
Gender	Female	119	58,0
	Total	205	100,0
	16 and 18	22	10,7
	19 and 21	110	53,7
Age Groups	22 and 24	40	19,5
	25 years old or above	33	16,1
	Total	205	100,0
	Computer Programming	55	26,8
	Child Development	76	37,1
	Logistics	16	7,8
Departments	Health Care Management	9	4,4
	Civil Aviation Management	29	14,1
	Medical Documentation and Secretary	20	9,8
	Total	205	100,0
	Everyday	97	54,8
	A few times per week	74	41,8
Visit Duration	A few times per month	6	3,4
	Total	177	100,0
Visit Frequency	less than 30 minutes	67	37,9

1 hours	48	27,1
1 and 2 hours	37	20,9
2 hours or above	25	14,1
Total	177	100,0

In table 6, when the gender variable is examined, it is seen that the most of the participants were composed of women (58%). According to the age variable, the most of the participants were composed of the students aged between 19 and 21 (53,7%). According to department variable, the students from child development department comprised the majority of the participants (37,1%). When the frequency of usage of the students is examined, it is seen that the most of the students are the ones who use Facebook every day (54,8%). When the time the students spend each day is examined, it is seen that the most of the participants (37,9%) use Facebook less than 30 minutes every day.

Table 7. T-Test Analysis Results of Opinions of Students about their Purposes of Facebook Use Based on Gender Difference

	Gender	N	Mean	Sd	df	T	P
I use Facebook to find new friends	Male	78	2,57	1,167	175	6,445	,000
	Female	99	1,59	,856	136,744		
I use Facebook to find new people who have the same interest and to join social groups	Male	78	2,79	1,342	175	3,173	,002
	Female	99	2,16	1,299	162,895		

Concerning gender variable, the result of t-test analysis performed to determine whether the students' opinions differ from each other or not is given in Table 1. It is seen in table 1 that with respect to gender variable, significant difference was found (P=,000, P<0,05) in this paragraph: "I use Facebook to find new friends". For this purpose it was found that male students (X=2,57) use Facebook more than female students(X=1,59) do. According to this paragraph; "I use Facebook to find new people who have the same interest and to join social groups", significant difference (P=,002, P<0,05) was found on the basis of gender difference. For this purpose, male students (X=2,79) use Facebook more than female students (X=2,16) do.

Tablo 8. The Variance Analysis Results of Opinions of Students about their Purposes of Facebook Use in Vocational Context Based on Usage Time

	Age Groups	N		Sum of Squares	df	Mean Square	F	P
I use Facebook to share a range of information and sources with my friends	16 and 18	63	Between groups	12,527	3	4,176		
	19 and 21	157						
	22 and 24	25	Within groups	208,197	173	1,203	3,470	,017
	25 years old or above	6	Total	220,723	176			
I use Facebook to communicate with my colleagues	16 and 18	63	Between groups	19,237	3	6,412		
	19 and 21	157						
	22 and 24	25	Within groups	301,282	173	1,742	3,682	,013
	25 years old or above	6	Total	320,520	176			

As a result of findings obtained from the study; based on age variable, there is a significant difference found on the level of P<0,05 in these two paragraphs; "I use Facebook to share a range of information and sources with my friends" and "I use Facebook to communicate with my colleagues". After LSD test was applied these two paragraphs in the previous sentence, significant differences were found and the results below were obtained.

Table 9.According to the age groups LSD Test Results Applied to the Paragraph of "I use Facebook to share a range of information and sources with my friends"

	Age Groups		Mean Difference	P
I use Facebook to share a range of information and sources with my friends	25 years old or above	16-18	-,617	,023
	25 years old or above	19-21	-,392	,203

	Age Groups		Mean Difference	P
	25 years old or above	22-24	-1,023	,00 3

As a result of the test, for those students who are 25 years old or above, significant differences were found on the level of P<0,05 compared respectively to the students aged between 16 and 18 (average difference=-,617, P=,023) and the students aged between 22 and 24 (average difference=-1,023, P=,003). It was found that the students aged between 25 and above use Facebook to share a range of information and sources with their friends more than the students aged between 16 and 18 and between 22 and 24 do.

Table 10.According to the age groups LSD Test Results Applied to the Paragraph of "I use Facebook to communicate with my colleagues"

	Age Groups		Mean Difference	P
	25 years old or above	16-18	-1,101	,01 4
	25 years old or above	19-21	-1,370	,00 2
I use Facebook to communicate with my colleagues	25 years old or above	22-24	-,659	,16 8

As a result of the test, for those students who are 25 years old or above, significant differences were found on the level of P<0,05 compared respectively to the students aged between 16 and 18 (average difference=-1,014, P=,014) and the students aged between 22 and 24 (average difference=-1,370, P=,002). It was found that the students aged between 25 and above use Facebook to communicate with their colleagues more than the students aged between 16 and 18 and between 22 and 24 do.

Results

As a result of research, the findings below were obtained.

The students use Facebook for various reasons such as communicating with their friends, interacting with people who have the same interest, taking advantage of the educational feature of Facebook, catching up news in Turkey and in the world and so on.

In the opinions of students about purposes of Facebook use, a significant difference was found based on gender variable. It was found that male students use Facebook to find new friends more than female students do. Male students compared to female ones use Facebook more to find people which have similar interest and

characteristic and to join groups. There were significant differences found in purpose of Facebook use based on age variable.

The students aged between 25 and above use Facebook to find their old friends more than the students from the other age groups do. It was found that the students aged between 25 and above use Facebook to follow up-to-date news more than other students do.

The students use Facebook for various reasons such as communicating with their colleagues, interacting with people who have the same interest, taking advantage of its facilities for their career, catching up news in Turkey and in the world and so on.

In terms of gender variable there is a significant difference found in the students' opinions about the purpose of Facebook use. It was found that male students use Facebook to find new friends more than female students do. Other finding is that male students use Facebook for their corporate business advertisements and introductions more than female students do. In terms of age variable, a significant difference was also found about the purpose of Facebook use. The students aged between 25 and above use Facebook to share various information and sources with their friends more than others do. The students aged between 25 and above use Facebook to communicate with their colleagues more than others do.

Towards these results, more significant evaluations may be performed to determine purposes of Facebook use of associate degree students in general and vocational context.

ÖĞRETIM ELEMANLARININ ÖĞRETMEN ADAYLARINDAN KIŞISEL ÖZELLIKLERI İLE İLGILI BEKLENTILERI- BIR ÖLÇEKLEME ÇALIŞMASI

Gülden KAYA*, Gülşen TAŞDELEN TEKER**   Selahattin GELBAL***

Öz

Bu araştırmada, Hacettepe ve Sakarya Üniversiteleri Eğitim Fakülteleri öğretim elemanlarından "eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri" ni ikili karşılaştırma yaparak ölçeklendirme çalışması ile belirlenmeye çalışılmıştır. Araştırma 2011-2012 öğretim yılı güz döneminde Hacettepe Üniversitesi ve Sakarya Üniversitesi Eğitim Fakültelerinde görev yapan öğretim elemanlarıyla yürütülmüştür. Hacettepe Üniversitesi Eğitim Fakülte'sinde görev yapan 68 öğretim elemanı ile Sakarya Üniversitesi Eğitim Fakülte'nde görev yapan 74 öğretim elemanı ile çalışılmıştır. İkili karşılaştırmalar yöntemi ile yapılan ölçekleme çalışmasından elde edilen bulgulara göre, Sakarya Üniversitesi Eğitim Fakültesi öğretim elemanlarının üniversitelerinden mezun olacak olan öğretmen adaylarının sahip olmalarını bekledikleri kişisel özelikler sırasıyla empati kurabilen, etkili iletişim kurabilen, meslek sevgisine sahip, demokratik, özgüvenli ve son olarak lider özellikleridir. Bunun yanında Hacettepe Üniversitesi Eğitim Fakültesi öğretim elemanlarının üniversitelerinden mezun olacak olan öğretmen adaylarının sahip olmalarını bekledikleri kişisel özelikler sırasıyla empati kurabilen, özgüvenli, demokratik, etkili iletişim kurabilen, meslek sevgisine sahip ve son olarak lider özellikleridir.

Anahtar kelimeler: Öğretmen adaylarının kişisel özellikleri, İkili karşılaştırma yöntemi

EXPECTATIONS OF LECTURERS FROM TEACHER CANDIDATES ABOUT THEIR CHARACTERISTICS- A SCALING STUDY

Gülden KAYA*, Gülşen TAŞDELEN TEKER**, Selahattin GELBAL***

Abstract

The characteristics that lecturers wish teacher candidates that should possess are determined in this paper quantitatively through pair-wise comparisons according to the lecturers' responses. This research was performed on 68 lecturers who are working in Hacettepe University and 74 lecturers who are working in Sakarya University at 2011-2012 fall semester. According to the results of scaling study by pair-wise comparison "expected characteristics of a skilled teacher" was sorted from the most desired characteristic to the least desired characteristic by Sakarya University lecturers. It was determined that the most desired characteristic was "emphatic". This characteristic was followed by, being able to communicate effectively, love of job, democratic, self-confident, and the least desired characteristic was determined as being leader. In addition to this; according to the results of scaling study by pair-wise comparison "expected characteristics of a skilled teacher" was sorted from the most desired characteristic to the least desired characteristic by Hacettepe University lecturers, it was determined that the most desired characteristic was "emphatic". This characteristic was followed by, self-confident, democratic, being able to communicate effectively, love of job" and the least desired characteristic was determined as being leader.

Key Words: Characteristics of teacher candidates, Pair-wise comparison method.

1. GİRİŞ

Günümüz insanı için üretilen bilgiye sahip olma ve bu bilgiyi kullanabilme yeterlilik ve kapasitesi önemli bir özellik olmuştur. Bunun bir sonucu olarak toplumlar, bireyin bilgiye daha kolay erişimini sağlamak için bir yandan teknolojik araçlardan yararlanma yoluna giderken öte yandan bireyin sahip olduğu bu bilgiyi daha işlevsel kullanmasını sağlamak için eğitim kurumlarının yeniden yapılandırılması yönünde birtakım çalışmalar yapmayı zorunlu bir görev olarak görmektedirler. Çünkü kalkınmanın önemli ayaklarından birinin de eğitim olduğu bilinmektedir.

Kalkınmanın eğitim boyutu dikkate alındığında; çağın yeterliklerinin farkında olan, yetişmiş "nitelikli insan kavramı" ile karşı karşıya gelmekteyiz. Diğer bir ifade ile toplumların, çağın koşullarına uygun "eğitilmiş insan" gücüne olan ihtiyaçları ön plana çıkmış ve çağın gerektirdiği yeterliklere sahip nitelikli insan gücü bütün ülkelerin eğitim politikalarının en önemli ve vazgeçilmez amacı haline gelmiştir (Ekinci,2005).

Eğitim sistemlerinin temel amacı o ülkenin nitelikli insan gücünü yetiştirmek ve yurttaşlarına vatandaşlık eğitimini vermektir. Bunu gerçekleştirebilmek için her eğitim sistemi, yetiştireceği insan modelini, sahip olduğu eğitim felsefesi ve insan gücü politikası ışığında saptayarak eğitim etkinliklerini bu amaca göre düzenlemektedir. Temel toplumsal kurumlardan birisi olan eğitim, bütün toplumların temel sorunlarının başında yer almaktadır (Altınok, 1999). Bu soruna çözüm oluşturacak bir eğitim sisteminin yapılanmasında en önemli aktör kuşkusuz

öğretmen olacaktır. Dolayısıyla bir eğitim sisteminin niteliği, sistem içerisindeki öğretmen nitelikleri ile doğrudan ilişkilidir.

Özellikle günümüzde öğretmenlerin rolleri değişmiş ve gelecekte de bu değişim sürecektir. Yeni anlayışta öğretmenler bilgi yayan ya da bilgiyi aktaran birimler olmanın ötesinde bilgiye ulaşma ve bilgiyi kullanma, daha genel bir ifadeyle *öğrenmeyi öğrenme* sürecine rehberlik edecek liderler olarak görülmektedir.

Öğretmenin mesleği ile ilgili olarak yüklendiği imgeler mevcuttur. Mesleği itibariyle öğretmen; bilgiyi aktarabilen, pedagojik ve mesleki alan bilgisine sahip, öğrenci danışmanı, disiplin unsuru ve benzeri özellikler taşıyandır. Ancak bunların yanında öğretmen kişilik, çevreye uyum, çevre kalkınmasına katılma, toplumsal katılımcı, halkla ilişkiler gibi birçok değişken içerisinde özgün özelliklere sahip olması gerekendir.

Ülkelerin kaderlerinde öğretmenler çok önemli roller oynamaktadır. Bu nedenle öğretmen yetiştiren kurumların her yönüyle eksiksiz bireyler yetiştirmesi bir zorunluluk haline gelmiştir. Bu zorunluluk üniversitelerin eğitim fakülteleri öğretim elemanlarına düşen görevi ve kendilerinin bu konu hakkındaki düşüncelerinin önemini arttırmıştır. Bu nedene dayanarak bu çalışma öğretmen adaylarında bulunması gereken kişisel özellikleri bakımından öğretim elemanlarının beklentilerini konu almıştır.

Çalışmada psikolojideki ölçekleme yöntemlerinden biri olan ikili karşılaştırmalar adıyla bilinen ölçekleme yöntemi kullanılmıştır. Thurstone (1927) tarafından geliştiren bu ölçekleme yöntemi "ikili karşılaştırmalar kanunu" olarak nitelendirilmiş olsa da, kanun olarak değil de, istatistiksel bir model olarak ifade etmek daha doğru olur (Turgut ve Baykul, 1992).

İkili karşılaştırmalarla ölçekleme yöntemi, ilk olarak tutum cümlelerinin ölçeklendirilmesinde kullanılmıştır. Cevaplayıcıların uyarıcıları ikişerli olarak değerlendireceği her durumda kullanılabileceği için bu yöntemin geniş bir uygulama alanı bulunmaktadır. Özellikle, duyuşsal alandaki pek çok davranışın ölçeklenmesinde ve bireylerin bazı kişilik özelliklerinin değerlendirilmesinde kullanılmaktadır (Anıl ve Güler, 2006)

İkili karşılaştırmalarla ölçeklemede, uyarıcıların fiziksel büyüklüklerine göre sıralandıkları eksene

fiziksel boyut, algılanan büyüklüklerine göre sıralandıkları eksene ise psikolojik boyut adı verilmektedir. Psikolojik boyut terimi ölçekleme boyutu olarak da ifade edilmektedir. Bu boyut uyarıcıların ölçeklecek niteliği ile belirlenir. Bu çalışmada ölçekleme boyutu 6 kişisel özellikten oluşmaktadır. Bu özellikler alan uzmanları ile yapılan görüşmeler, alanda yapılan çalışmaların incelenmesi ve yapılan pilot çalışma ile belirlenmiştir. Sonuç olarak, " demokratik, empati kurabilen, etkili iletişim kurabilen, lider, meslek sevgisine sahip, özgüvenli" kişisel özelliklerinin ölçek içinde kullanılmasına karar verilmiştir.

Bu çalışma öğretmenlik mesleğine aday olan eğitim fakültesi öğrencilerinin kişisel özellikleri açısından değerlendirilmesinin öğretim elemanları gözüyle yapılması açısından önem taşımaktadır. Bu çalışmada kullanılan ikili karşılaştırma ölçeği ile Hacettepe ve Sakarya üniversiteleri eğitim fakültesi öğretim elemanlarının, öğrencileri mezun olduklarında sahip olmalarını bekledikleri özellikleri sıralaması amaçlanmıştır.

Böylece birbirinden farklı üniversitelerin eğitim fakültelerinde yer alan öğretim elemanlarının bu konuyla ilgili çıkan sonuçlarının karşılaştırılması imkânı bulunması açısından önemli olduğu düşünülmüştür.

2. YÖNTEM

2.1. Araştırmanın Türü

Bu çalışmada, öğretim elemanlarının "eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri"ni ikili karşılaştırma yaparak ölçeklendirmeleri istenmiştir. Yapılan çalışmada, örneklem bilgilerinden bir evrene genelleme yapma amacı güdülmediğinden bu araştırma, temel bir araştırma (Büyüköztürk, Çakmak, Akgün, Karadeniz, & Demirel, 2008) niteliğindedir.

2.2. Araştırmanın Yapıldığı Grup

Araştırma, 2011-2012 öğretim yılı Güz döneminde Hacettepe Üniversitesi ve Sakarya Üniversitesi Eğitim Fakültelerinde görev yapan öğretim elemanlarıyla yürütülmüştür. Hacettepe Üniversitesi Eğitim Fakültesinde görev yapan Eğitim Bilimleri Bölümünden 27, İlköğretim bölümünden 12, Ortaöğretim Bölümünden 18, Bilgisayar ve Öğretim Teknolojileri Eğitimi bölümünden 8 ve Yabancı Diller Eğitimi Bölümünden 3 öğretim elemanı olmak üzere toplam 68 kişi ile çalışılmıştır.

Sakarya Üniversitesi Eğitim Fakültesinde görev yapan Eğitim Bilimleri Bölümünden 20, İlköğretim bölümünden 33, Ortaöğretim Bölümünden 2, Bilgisayar ve Öğretim Teknolojileri Eğitimi bölümünden 8, Özel Eğitim bölümünden 6 ve Türkçe Eğitimi Bölümünden 5 öğretim elemanı olmak üzere toplam 74 kişi ile çalışılmıştır.

2.3. Ölçme Aracının Hazırlanması

Ölçme aracının hazırlanması aşamasında, öncelikle random olarak seçilmiş farklı bölümlerdeki öğretim elemanlarından mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentilerini açık uçlu olarak listelemeleri istenmiştir. Bu listede yer alan ortak özellikler dikkate alınarak, uzman görüşlerine başvurularak ve alanda konu ile ilgili yapılan çalışmalar göz önünde bulundurularak 6 kişisel özellik belirlenmiş ve bu sürecin sonunda ikili karşılaştırmanın yapıldığı ölçme aracı hazırlanmıştır.

2.4. Verilerin Analizi

Bu çalışmada her bir öğretim elemanından, 6 kişisel özelliği ikili karşılaştırma yaparak sıralama yapmaları istenmiş ve her bir özelliğe ait frekans değerleri belirlenmiştir. Bu işlem sonucunda da frekans matrisi oluşturulmuştur. Frekans (F) matrisinin her bir hücresindeki değer toplam kişi sayısına (N) bölünerek oranlar matrisi elde edilmiştir. Oranlar matrisindeki hücre değerlerine (P) karşılık gelen (Z) standart değerler belirlenerek birim normal sapmalar matrisi elde edilmiştir. Matrisin sonunda her bir sütuna ait değerlerin toplamını gösteren bir satır oluşturulmuş ve bu satırdaki her bir z hücre değerinin sütunlar boyunca ortalamaları alınarak ölçek değerleri hesaplanmıştır. Eksenin başlangıcı (0 noktası) bu satırdaki ortalama z değerlerinden en küçük olanına kaydırılarak ölçek değerleri (S) sıralanmıştır. Bu işlem; eğer en küçük değer negatif ise tüm değerlere bu değerin mutlak değeri eklenerek, en küçük değer pozitif olduğunda ise tüm değerlerden bu değer çıkarılarak elde edilir. Bunun sonucunda her bir özelliğin ölçek değeri sayı doğrusu üzerinde belirlenmiştir.

3. BULGULAR

Bu bölümde, öğretim elemanlarının eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri Hacettepe ve Sakarya Üniversitesi'nden elde edilen veriler ile ayrı ayrı ikili karşılaştırma yapılarak ölçeklendirilmiştir.

Ölçeklemede yer alan aşamalar "eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri" ikili karşılaştırma ölçeği ile Sakarya Üniversitesinde yapılan uygulamadan elde edilen veriler üzerinden açıklanarak gösterilmiştir. Diğer analizlerin tamamı doğrudan verilmeyip sadece ölçek değerleri kişisel özelliklerin tercih edilme sırasına göre sıralı olarak verilmiştir.

Çalışmada öncelikle her bir öğretim elemanından, 6 kişisel öğretmen özelliğini ikili karşılaştırma yaparak sıralama yapmaları istenmiş ve her bir özelliğe ait frekans değerleri belirlenmiştir.

İkili karşılaştırma ölçeği sonucu Sakarya Üniversitesi öğretim elemanlarının eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentilerini içeren frekans matrisi Tablo 1'de gösterildiği şekilde oluşturulmuştur.

Tablo 1'de yer alan her hücredeki eleman f_{ij} ile gösterilmek üzere $S_j > S_i$ değerini veren frekansları göstermektedir. Oluşturulan bu matrise frekanslar matrisi (F) denir. Matris esas köşegene göre simetriktir ve simetrik elemanların toplamı, toplam gözlemci sayısını verir ki burada toplam kişi sayısı olan Sakarya Üniversitesi için 74 Hacettepe Üniversitesi için 68'dir.

Burada dikkat edilmesi gereken nokta, aynı uyarıcının kendisi ile karşılaştırılması yapılamayacağı için esas köşegen üzerindeki elemanların yazılmamış olmasıdır.

Tablo 1. Frekans matrisi

F MATRİSİ						
Uyarıcılar	A	B	C	D	E	F
A		15	28	68	36	48
B	59		33	68	36	48
C	46	41		71	22	39
D	6	6	3		14	5
E	38	38	52	60		40
F	26	26	35	69	34	

Bir sonraki adımda frekans (F) matrisinin her bir hücresindeki değer toplam kişi sayısına (N) bölünerek Tablo 2'deki oranlar matrisi elde edilmiştir. Bu matrisin elemanları Tablo 1 'deki frekans matrisinin elemanlarının (gözlemci sayısı olan N=74) 74'e bölünmesiyle oluşturulmuştur. Böylece oranlar matrisi (P) hesaplanmıştır. Bu oranlar matrisinin esas köşegene göre simetrik olan elemanlarının toplamı 1'i vermektedir.

Tablo 2.Oranlar Matrisi

P MATRİSİ						
Uyarıcılar	A	B	C	D	E	F
A		0,203	0,378	0,919	0,486	0,649
B	0,797		0,446	0,919	0,486	0,649
C	0,622	0,554		0,959	0,297	0,527
D	0,081	0,081	0,041		0,189	0,068
E	0,514	0,514	0,703	0,811		0,541

| F | 0,351 | 0,351 | 0,473 | 0,932 | 0,459 | |

Oranlar matrisindeki hücre değerlerine (P) karşılık gelen (Z) standart değerleri belirlenerek Tablo 3'deki birim normal sapmalar matrisi elde edilmiştir. Bu tabloya, Tablo 2'deki oranlar matrisinin her elemanına karşılık gelen, birim normal dağılımının z değerleri yazılmıştır. Bu matrise de birim normal sapmalar matrisi (Z) adı verilir. Burada esas köşegene göre elemanlar birbirinin ters işaretlisidir ve mutlak değerce birbirlerine eşittirler. Matrisin sonunda her bir sütuna ait değerlerin toplamını gösteren bir satır oluşturulmuş ve bu satırdaki her bir z hücre değerlerinin sütunlar boyunca ortalamaları alınarak yani sütunların eleman sayısı olan 5'e bölünerek ölçek değerleri hesaplanmıştır. Bu satırın toplamı da sıfıra eşittir.

Tablo 3. Birim normal sapmalar matrisi

Z MATRİSİ						
Uyarıcılar	A	B	C	D	E	F
A		-0,832	-0,310	1,398	-0,034	0,382
B	0,832		-0,136	1,398	-0,034	0,382
C	0,310	0,136		1,744	-0,532	0,068
D	-1,398	-1,398	-1,744		-0,881	-1,494
E	0,034	0,034	0,532	0,881		0,102
F	-0,382	-0,382	-0,068	1,494	-0,102	
Toplam	-0,604	-2,442	-1,726	6,915	-1,583	-0,561
Sj	-0,121	-0,488	-0,345	1,383	-0,317	-0,112

Aşağıdaki Tablo 4'de gösterildiği gibi, eksenin başlangıcı (0 noktası) bu satırdaki ortalama z değerlerinden en küçük olan -0,488 değerine kaydırılarak ölçek değerleri (S) sıralanmıştır ve her ölçek değerine en küçük değerin mutlak değeri olan 0,488 eklenerek her bir özelliğin ölçek değeri şekil 1'deki sayı doğrusu üzerinde belirlenmiştir.

Tablo 4. Ölçek Değerlerinin Sıralı Olarak Gösterimi

Sj	-0,121	-0,488	-0,345	1,383	-0,317	-0,112
Sj	0,367	0,000	0,143	1,871	0,171	0,376
Şekil 1: Özelliklerin Sayı Doğrusu Üzerindeki Ölçek Değerleri

Tablo 4'den elde edilen uyarıcı sıralamalarına göre, Sakarya üniversitesi öğretim elemanlarının Sakarya Üniversitesi eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri Tablo 5'te gösterildiği şekilde sıralanmıştır.

Tablo5. Kişisel Özelliklerin Ölçek Değerleri ve Uyarıcı Sıraları (Sakarya Üniversitesi)

Kişisel özellikleri	Ölçek Değerleri	Sıralama
Demokratik	0,367	4
Empati Kurabilen	0,00	1
Etkili İletişim Kurabilen	0,43	2
Lider	1,871	6
Meslek Sevgisine Sahip	0,171	3
Özgüvenli	0,376	5

Tablo 5'te görüldüğü gibi; Sakarya üniversitesi öğretim elemanlarının, Sakarya Üniversitesi eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri arasında en çok istenilen özellikten en az istenilen özelliğe doğru bir sıralama yaparsak; "Empati kurabilen"in ilk sırada yer aldığı görülmektedir. Bu özelliği de sırasıyla etkili iletişim kurabilen, meslek sevgisine sahip, demokratik, özgüvenli özellikleri izlemektedir ve bu özellikler arasında en son olarak lider özelliği yer almaktadır.

Benzer şekilde yapılan analizler sonucunda Hacettepe Üniversitesi öğretim elemanlarının, Hacettepe Üniversitesi eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri Tablo 6'da gösterildiği şekilde sıralanmıştır.

Tablo 6. Kişisel Özelliklerin Ölçek Değerleri ve Uyarıcı Sıraları (Hacettepe Üniversitesi)

Kişisel özellikleri	Ölçek Değerleri	Sıralama
Demokratik	0,090	3
Empati Kurabilen	0,000	1
Etkili İletişim Kurabilen	0,125	4
Lider	0,904	6
Meslek Sevgisine Sahip	0,215	5
Özgüvenli	0,087	2

Tablo 6'da görüldüğü gibi; Hacettepe Üniversitesi öğretim elemanlarının Hacettepe Üniversitesi eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri arasında en çok istenilen özellikten en az istenilen özelliğe doğru bir sıralama yaparsak; "Empati kurabilen"in ilk sırada yer aldığı görülmektedir. Bu özelliği de sırasıyla özgüvenli, demokratik, etkili iletişim kurabilen, meslek sevgisine sahip, özellikleri izlemektedir ve bu özellikler arasında en son olarak lider özelliği yer almaktadır.

4. TARTIŞMA VE SONUÇ

Bu araştırmada, Hacettepe ve Sakarya Üniversiteleri Eğitim Fakülteleri öğretim elemanlarından "eğitim fakültesinden mezun olacak olan öğretmen adaylarından kişisel özellikleriyle ilgili beklentileri" ni ikili karşılaştırma yaparak ölçeklendirmeleri amaçlanmıştır. Araştırma, 2011-2012 öğretim yılı güz döneminde

Hacettepe Üniversitesi Eğitim Fakültesinde yer alan 68, Sakarya üniversitesi Eğitim Fakültesinde yer alan 74 öğretim elemanı üzerinde yapılmıştır.

Bu araştırmada her bir katılımcıdan 6 kişisel öğretmen özelliğini ikili karşılaştırma yaparak sıralama yapmaları istenmiştir. Daha sonra, bu sıralama dikkate alınarak her bir özelliğe ait frekans değerleri hesaplanmıştır. İkili karşılaştırma ölçeği sonucu frekans matrisi oluşturulmuştur. Frekans (F) matrisinin her bir hücresindeki değer toplam kişi sayısına (N) bölünerek oranlar matrisi bulunmuştur. Oranlar matrisindeki hücre değerlerine (P) karşılık gelen (Z) standart değerleri belirlenerek birim normal sapmalar matrisi elde edilmiştir. Matrisin sonunda her bir sütuna ait değerlerin toplamını gösteren bir satır oluşturulmuş ve bu satırdaki her bir z hücre değerlerinin sütunlar boyunca ortalamaları alınarak ölçek değerleri hesaplanmıştır. Eksenin başlangıcı (0 noktası) bu satırdaki ortalama z değerlerinden en küçük olanına kaydırılarak ölçek değerleri sıralanmıştır. Bunun sonucunda her bir özelliğin ölçek değeri sayı doğrusu üzerinde belirlenmiştir.

Bu sıralamaya göre Sakarya Üniversitesi Eğitim Fakültesi öğretim elemanlarının üniversitelerinden mezun olacak olan öğretmen adaylarının sahip olmalarını bekledikleri kişisel özelikler sırasıyla empati kurabilen, etkili iletişim kurabilen, meslek sevgisine sahip, demokratik, özgüvenli ve son olarak lider özellikleridir.

Bunun yanında Hacettepe Üniversitesi Eğitim Fakültesi öğretim elemanlarının üniversitelerinden mezun olacak olan öğretmen adaylarının sahip olmalarını bekledikleri kişisel özelikler sırasıyla empati kurabilen, özgüvenli, demokratik, etkili iletişim kurabilen, meslek sevgisine sahip ve son olarak lider özellikleridir.

Bu çalışmanın sonuçları dikkate alındığında Hacettepe ve Sakarya Üniversitesi Öğretim elemanlarının üniversitelerinden mezun olacak olan öğretmen adaylarında olmasını bekledikleri kişisel özellikler sıralamasında her iki üniversitede de ilk olarak empati kurabilen yer almaktadır. Bu sonucun birçok yönden farklı olan iki üniversitede aynı olması öğretmen için empati kurabilmenin önemini vurgulamaktadır. Bir diğer deyişle, empati kurabiliyor olmak zamanın gereksinimlerini karşılayan bir öğretmen olmak için en önemli özelliklerden biri olarak görülmüştür.

Diğer yandan özgüvenli olma özelliği Hacettepe Üniversitesi öğretim elemanlarınca ikinci sırada yer alırken bu özellik Sakarya Üniversitesi öğretim elemanlarına göre beşinci sırada yer almaktadır. Özgüvenli bireyler yetiştirmek için özgüvenli öğretmenler yetiştirmek gerekir gerçeğinden yola çıkarak bu özelliğin üst sıralarda yer alması beklenen durumdur ancak Sakarya Üniversitesinde beklenenin aksi bir durum söz konusudur. İki üniversite arasında mezun edecekleri öğretmen adaylarının özgüvenli olması durumundaki sıralama farkı şu an içinde bulunduğumuz sınava dayalı eğitimin bir sonucu olabilir.

Toplumsal kalkınmanın aydınlatıcıları olarak görülen öğretmenler, öğrenmeyi öğrenme sürecine rehberlik edecek liderler olarak tanımlanmasına rağmen elde edilen sonuçlarda iki üniversite öğretim elemanları da mezun edecekleri öğretmen adaylarında bulunmasını bekledikleri özellikler arasında lider olma özelliğine son sırada yer vermişlerdir.

Abstract

Bu çalışma ile öğretmen adaylarının öğretim yazılımına yönelik görüş ve düşünceleri incelenmiştir. Araştırmaya Aksaray Üniversitesi İngilizce Öğretmenliği 1. sınıf öğrencilerinden 22 öğretmen adayı katılmıştır. Araştırmanın ilk aşamasında katılımcılar ilköğretim programına uygun olarak hazırlanan öğretim yazılımını incelemişlerdir. Araştırmanın ikinci aşamasında ise katılımcıların incelenen öğretim yazılımına yönelik görüş ve düşünceleri alınmıştır. Öğretmen adaylarının görüşleri araştırmacılar tarafından hazırlanan ölçek kullanılarak elde edilmiştir. Ölçekte öğretmen adaylarının incelenen öğretim yazılımlarının kullanımına, içeriğine, işlevselliğine ve hangi ek özellik ile bu boyutların daha etkili olabileceğine yönelik görüşlerine yer vermeleri istenmiştir. Araştırma kapsamında toplanan veriler araştırmacılar tarafından içerik analizi ile incelenmiştir. Elde edilen sonuçlar öğretmen adaylarının öğretim yazılımlarının öğrenci motivasyonu ve başarısında etkili olacağı ve bir takım ek özellikler ile bu etkililiğin daha da artacağı görüşünde olduğunu göstermektedir.

Anahtar Sözcükler: öğretim yazılımı, yazılım değerlendirme, öğretmen adayı

Giriş

Bilgi ve iletişim teknolojilerinde yaşanan hızlı gelişmeler toplumların yaşam biçimlerini değiştirmiş ve yaşamın pek çok alanında yeniden şekillenme ihtiyacı doğmuştur. Bilimsel ve teknolojik alanda yaşanan bu değişimler eğitim sistemlerini de etkilemiştir. Özellikle, teknolojik yeniliklerin ekonomide önemli bir pay haline gelmesi eğitim sürecinde teknoloji kullanımını bir zorunluluk haline getirmiştir (Akkoyunlu, 1998a; Aşkar, 1999). Yaşanan bu değişim ve gelişmelerde büyük bir paya sahip olan bilgisayar teknolojisi de eğitim sürecinde yerini almış ve bilgisayar destekli öğretim, eğitim faaliyetlerinin vazgeçilmez bir parçası haline gelmiştir. Yalın (2004)'a göre bilgisayar destekli öğretim, bilgisayarların sistem içine programlanan dersler yoluyla öğrencilere bir konu ya da kavramı öğretmek ya da önceden kazandırılan davranışları pekiştirmek amacıyla kullanılmasıdır.

Eğitim sürecinde bilgisayar teknolojilerinden etkili bir şekilde yararlanabilmek için donanımsal ihtiyaçların yanı sıra nitelikli öğretim yazılımlarına da ihtiyaç duyulmaktadır. Güzeller ve Korkmaz (2007)'a göre bilgisayar destekli öğretimin kalitesini belirleyen en önemli değişkenlerden biri bu süreçte kullanılan öğretim yazılımlarıdır.

Öğretim yazılımları, öğretilecek konuların bilgisayar teknolojilerinden yararlanılarak sunulmasını sağlayan öğretim materyalleridir. Bu yazılımlar okullarda öğretim programlarını desteklemek amacıyla hazırlanan ya da öğrencinin öğrenme sürecinde tek başına yararlanabileceği öğretim materyalleridir (Kazu ve Yavuzalp, 2004). Öğretim yazılımları önceden belirlenmiş konular için öğrenme kaynağı olarak düzenlenebildikleri gibi, diğer öğrenme ortamlarını destekleyici bir araç olarak da kullanılabilirler (Alkan, Deryakulu ve Şimşek, 1995). Bu özellikleri sayesinde öğrenciler, hem evde hem okulda öğrenmek ya da alıştırma yapmak amacıyla öğretim yazılımlarından faydalanabilirler. Ancak bu yazılımların doğru olarak seçilmesi önemlidir. Öğretim

E-mail address: pinar_mihci@yahoo.com

yazılımlarından beklenen yararın sağlanabilmesi ancak nitelikli yazılımların seçilip kullanılması ile mümkündür (Akkoyunlu, 1998b). Doğru öğretim yazılımının tercih edilmesi; yazılımı kullanacak öğrencilerin öğrenmesine katkı sağlanabilmesi, dersin öğretim hedeflerine ulaştırılabilmesi, öğrencilerin ilgilerinin derse çekilebilmesi ve motivasyonlarının artırılabilmesi açısından büyük önem taşımaktadır. Bu sebeple gerek yazılımları derslerinde kullanacak eğitimcilerin, gerekse çocuklarına satın alacak ailelerin bu konuda gerekli özeni göstermeleri gerekmektedir (Özmen ve Varol, 2011).

Nitelikli öğretim yazılımlarının en önemli özelliği bu yazılımların öğrenme ve öğretme ilkelerine uygun olarak hazırlanmış olmaları ve elverişli kullanım özelliğine sahip olmalarıdır. Öğretim yazılımları çoğu zaman süreçte öğretim işlevini yüklenmiş olmaları sebebiyle öğrenme için önem taşıyan pek çok faktörü barındırmak zorundadır. Özellikle; önkoşul davranışları kazandırma, öğrenim hedeflerinden haberdar etme, ipuçları verme, aktif katılımı sağlama, pekiştireç sunma, sunulan içerik ve değerlendirme etkinlikleri arasında tutarlığı sağlama ve dönüt / düzeltme verme öğretim yazılımlarında bulunması gereken önemli öğelerdendir (Akkoyunlu, 1998b). Ayrıca, öğretim yazılımları farklı kişisel öğrenme biçimlerine sahip bireyler göz önüne alınarak tasarlanmalı ve bireysel farklılıklara göre ek öğrenme yaşantıları sunabilmelidir (Kara, 2009).

Öğrenme ve öğretme sürecinde öğretim yazılımlarını kullanmayı planlayan öğretmenler, bu tür yazılımlarından beklenen verimin elde edilebilmesi için öncelikli olarak öğretim yazılımlarının kapsamlı bir değerlendirmesini yapmak ve seçimlerini bu değerlendirme sonuçlarına göre yapmak zorundadırlar (Güzeller ve Korkmaz, 2007). Doğru bir değerlendirme işlemine tabii tutulmadan kullanılan öğretim yazılımları süreçte bir fayda sağlamayacağı gibi öğrencilere birtakım zararlar da verebileceğinden değerlendirme işleminin önemi bir kez daha ortaya çıkmaktadır (Ateş, 2010).

Öğretim yazılımlarının değerlendirilmesinde farklı ölçütler söz konusudur. Farklı araştırmacılar bu tür yazılımların değerlendirilmesinde farklı ölçütleri ele alarak farklı değerlendirme araçları geliştirmişler ve yazılımların niteliğine bu ölçütler doğrultusunda karar vermişlerdir. Değerlendirme sürecinde farklı yöntemlerin izlenmesi, öğretim yazılımlarının değerlendirilmesine yönelik olarak geliştirilmiş standart ve genel kabul görmüş bir değerlendirme yönteminin olmadığı (Sim, MacFarlane ve Read, 2006) şeklinde yorumlanabileceği gibi değerlendirme yönteminde farklı bakış açılarına sahip araştırmacıların farklı ölçütler doğrultusunda değerlendirme işlemini yaparak sürece zenginlik kazandırdıkları şeklinde de yorumlanabilmektedir (Ateş, 2010). Bu görüş doğrultusunda eğitim yazılımlarının zenginleştirilmesine yönelik bir çalışma yapılmak istenmiş ve öğretmen adaylarının fikirlerine başvurulmuştur. Bu çalışma ile öğretmen adaylarının eğitim yazılımlarına yönelik görüş ve fikirlerinin belirlenmesi amaçlanmıştır. Çalışma kapsamında aşağıda belirtilen sorulara cevap aranmıştır:

1. Öğretmen adaylarının

a. uygunluk

b. işlerlik açısından öğretim yazılımına yönelik görüşleri nelerdir?

2. Öğretim yazılımlarına hangi ek özelliklerin eklenmesi etkiliği artırır?

Yöntem

Bu araştırma örneklem grubunda yer alan katılımcıların görüşleri doğrultusunda elde edilen verilerin açıklandığı betimsel bir çalışmadır.

Katılımcılar

Araştırmanın katılımcıları, 2011-2012 Eğitim-Öğretim yılı Bahar Dönemi'nde Aksaray Üniversitesi Eğitim Fakültesi'nde öğrenim görmekte olan 22 öğretmen adayından oluşmaktadır. Katılımcılar, Yabancı Diller Eğitimi Bölümü'nde İngilizce Öğretmenliği eğitimi alan birinci sınıf öğrencileridir. Araştırmaya katılan öğretmen

adaylarının süreç boyunca her an gözlenebilmelerini ve herhangi bir sorunla karşılaştıklarında rahatlıkla yardım alabilmelerini sağlayabilmek amacıyla katılımcıların seçiminde araştırmacının ders öğretmeni olarak aktif bir rol üstlendiği bir grubun seçilmesi ölçütü kullanılmıştır.

Veri Toplama Aracı

Çalışma kapsamında öğretmen adaylarının öğretim yazılımlarına ilişkin görüş ve düşüncelerini almak amacıyla araştırmacılar tarafından "Öğretim Yazılımları Değerlendirme Ölçeği" hazırlanmıştır. Ölçeğin hazırlanmasında Akkoyunlu (1998b) ve Şimşek (1999) tarafından belirlenen nitelikli öğretim yazılımlarının seçiminde dikkat edilmesi gereken değerlendirme ölçütleri temel alınmıştır.

Hazırlanan ölçek öncelikle kapsam geçerliliğinin sağlanması için uzman görüşüne sunulmuştur. Uzman görüşlerinden elde edilen dönütler doğrultusunda gerekli düzeltmeler yapıldıktan sonra ölçek çalışmanın katılımcıları haricinde üç öğretmen adayına sunulmuş ve bu kişilerin ölçekte yer alan maddeleri kullanılan dilin uygunluğu, ifadelerin anlaşılırlığı ve ifadelerin amaca uygunluğu açısından değerlendirmeleri istenmiştir. Elde edilen geri dönütler doğrultusunda gerekli düzeltmeler yapılmış ve ölçeğe son şekli verilmiştir.

Ölçek, temel alınan değerlendirme ölçütlerini yansıtan üç adet açık uçlu sorudan oluşmaktadır. Bu sorulardan ilk ikisi öğretmen adaylarının yazılımı öğretimsel uygunluk ve işlevsellik yönünden değerlendirmelerine ilişkin düşüncelerini keşfetmeye yönelik sorulardır. Ölçekte yer alan son soru ise incelenen öğretim yazılımının nasıl daha etkili bir hale getirilebileceğine yönelik önerilerin elde edilmesi amacıyla hazırlanmıştır.

Uygulama Süreci

Bu araştırma kapsamında öğretmen adaylarının öğretim yazılımlarına ilişkin görüş ve önerileri incelenmiştir. Araştırmanın ilk aşamasında ilköğretim programına uygun olarak geliştirilen bir öğretim yazılımı katılımcılara sunulmuştur. Bu süreçte ilk olarak katılımcılara öğretim yazılımının değerlendirilmesine yönelik olarak hazırlanmış veri toplama aracı verilmiş ve katılımcıların kendilerine sunulan yazılımı belirtilen ölçütler doğrultusunda incelemeleri istenmiştir. Araştırmanın ikinci aşamasında ise katılımcıların incelenen öğretim yazılımına yönelik görüş ve önerileri alınmıştır. Bu aşamada katılımcılardan inceledikleri öğretim yazılımını ölçme aracında yer alan ölçütler doğrultusunda değerlendirmeleri ve yazılımlara hangi ek özellikler katılarak daha nitelikli hale getirilebileceğine ilişkin önerilerini sunmaları istenmiştir

İncelenen öğretim yazılımının seçiminde Bilgisayar ve Öğretim Teknolojileri Eğitimi Bölümü'nde görev yapan üç uzmanın görüşlerine başvurulmuştur. Her üç uzman tarafından da belirtilen yazılımın araştırma kapsamında incelenmesine karar verilmiştir.

Verilerin Analizi

Araştırma kapsamında hazırlanan veri toplama aracında yer alan açık uçlu sorular yardımıyla elde edilen verilerin analizinde nitel analiz tekniklerinden yararlanılmıştır. Katılımcıların verdikleri cevaplar nitel veri analiz tekniklerinden olan içerik analizi yöntemi kullanılarak iki araştırmacı tarafından incelenmiştir. Büyüköztürk, Çakmak, Akgün, Karadeniz ve Demirel'e (2012) göre sistematik ve tekrar edilebilen bir yöntem olan içerik analizinde birden çok kelimeden oluşan metinler belirli kurallar çerçevesinde daha küçük içerik kategorilerine dönüştürülmektedir.

Bulgular

Sunulan İçeriğin Uygunluğuna İlişkin Bulgular

Araştırmaya katılan öğretmen adaylarının öğretim yazılımını sunulan içeriğin uygunluğu açısından değerlendirmelerine ilişkin görüşlerini belirleyen soruya verdikleri yanıtlar incelendiğinde, katılımcıların büyük çoğunluğunun ($n = 17$) sunulan içeriğin yazılımın hedefleri doğrultusunda uygun olduğu görüşüne sahip oldukları gözlenmektedir (bkz. Tablo 1). Katılımcılar; genel olarak incelenen öğretim yazılımının içeriğinin kolaydan zora doğru aşamalı olarak verildiğini, küçük adımlar ilkesi temel alınarak içeriğin öğrencinin bir defada kavrayabileceği şekilde küçük parçalara bölünerek modüler şekilde düzenlendiğini ve içeriğin ilköğretim ders programı ile tutarlı bir şekilde ele alındığı görüşünü belirtmektedirler. Bu konuya ilişkin olarak öğretmen adaylarının görüşleri şu şekildedir:

"İçerik öğrencinin düzeyine uygundur. Müfredata uygun hazırlanmıştır. Kolaydan başlayıp zora doğru gitmesi öğrenci için yararlıdır. "

Tablo 1. Öğretmen adaylarının öğretim yazılımına ilişkin görüşleri ($n = 22$)

	Ölçütler			
	Sunulan İçerik	Değerlendirme	Ekran Tasarımı	İşlerlik
Uygun	17	12	14	18
Uygun Değil	5	10	8	4
Toplam	22	22	22	22

Ayrıca, araştırmaya katılan öğretmen adayları öğretim yazılımında içerik sunulurken açık ve anlaşılır bir dil kullanıldığını, net ifadeler kullanılarak kavram karışıklığının önüne geçildiğini, dilbilgisi ve yazım kurallarına dikkat edildiğini belirtmiş ve içeriğin çoklu ortam materyalleri ile desteklendiğini ifade etmişlerdir. Bu konuya ilişkin olarak öğretmen adaylarının görüşleri şu şekildedir:

"İçerik öğrenci seviyesine uygun ve onların anlayabileceği nitelikte hazırlanmış. Her şey açık ve net anlatılmış. Karmaşıklık ya da anlamayı engelleyecek bir belirsizlik söz konusu değil."

"Konuların görsellerle ve çoklu ortam öğeleri ile desteklenerek verilmesi öğrenmeyi kolaylaştırma açısından önemlidir."

Yazılımın içeriğinin uygun olmadığını düşünen katılımcılar ($n = 5$) ise içeriğin çok fazla metin yoğunluğuna sahip olduğunu ve bu yoğunluğun ilköğretim öğrencilerinin gelişim seviyelerine göre fazla olabileceğini belirtmiştir:

"İçeriğin bazı bölümlerde tam anlamıyla anlaşılmaması öğrenciler için problem teşkil edebilir."

Değerlendirme Yönteminin Uygunluğuna İlişkin Bulgular

Öğretim yazılımının öğrenciye sunduğu değerlendirme etkinliklerinin uygunluğuna ilişkin görüşler incelendiğinde etkinliklerin uygun olduğunu düşünen ve düşünmeyen katılımcı sayılarının birbirine yakın olduğu görülmektedir (bkz. Tablo 1). Öğretmen adaylarının yarıdan fazlası (*n* = 12), yazılımda sunulan ve öğrencinin hedeflenen amaçlara ulaşıp ulaşmadığına ilişkin değerlendirme yapmasını sağlayan etkinlerin belirtilen ölçütler doğrultusunda uygun olduğu görünüşüne sahiptirler. Olumlu görüş belirten katılımcılar incelenen öğretim yazılımının değerlendirme bölümlerinde yer alan etkinliklerin; öğrenciye kazandırılmak istenen içerik ile tutarlı bir şekilde hazırlanmış olduğunu, öğrencinin kendi başarısını değerlendirmesini sağlayan geri dönütler sunduğunu ve hedef kitlenin yaşına ve gelişim seviyesine uygun sorulara yer verdiğini belirtmişlerdir. Bu konuya ilişkin olarak bir öğretmen adayının görüşü şu şekildedir:

"Değerlendirmede sorular dikkat çekiciydi ve onların düzeyine uygun olarak verilmişti."

Yazılımda yer alan değerlendirme etkinliklerinin belirtilen ölçütler doğrultusunda uygun olmadığını belirten öğretmen adayları (*n* = 10) ise yazılımların değerlendirme etkinliklerinde yetersiz sayıda soruya yer verildiğini, soru çeşitliliğinin az ve soru formlarının yetersiz olduğunu, öğrenciye verilen geri dönütlerin karmaşık olduğunu, öğrencinin performansı hakkında detaylı bilgi sunmadığını ve sorularda öğrenciyi yönlendirici ipuçlarının verilmediğini belirtmektedir. Ayrıca, olumsuz görüş belirten katılımcılar etkinliklerde yer alan sorulardaki ifadelerin net olmadığı ve bu durumun öğrencide kavram karmaşıklığına neden olacağı görüşünü belirtmişlerdir. Öğretim yazılımlarının değerlendirme yöntemi açısından uygun olmadığına ilişkin belirtilen görüşlerden birkaçı şu şekildedir:

"Öğrenciye kazandırılmak istenen hedeflere bağlı olarak sorular çeşitlendirilebilir."

"Öğrencilerin test sonuçlarını açıklarken yüzde yerine sayılardan yararlanılması daha uygun olurdu."

"Bazı sorularda dönüt karmaşık verilmiş öğrencinin düzeyine göre açık olarak belirtilmeli."

Ekran Tasarımının Uygunluğuna İlişkin Bulgular

Araştırmaya katılan öğretmen adaylarının yazılımın ekran tasarımının uygunluğuna ilişkin verdikleri yanıtlar incelendiğinde, katılımcıların çoğunluğunun (*n* = 14) yazılımın genel olarak ekran tasarımı açısından uygun niteliklere sahip olduğunu belirtikleri görülmektedir (bkz. Tablo 1). Ekran alanının etkili bir şekilde kullanılması, renklerin ve görsel öğelerin birbirleriyle uyum içerisinde sunulması ve öğrenmeyi destekleyici nitelikte olmaları, kullanılan renklerin dikkat dağıtmayacak ve öğrencilerin içeriğe odaklanmasını kolaylaştıracak şekilde sade ve uyumlu olarak seçilmesi ve sunulan görsel öğelerin (yazı, grafik, resim, vb.) belirli bir denge içerisinde verilerek hedef kitlenin yaş seviyesine uygun ekran yoğunluğunun sağlanması; öğretmen adayları tarafından öğretim yazılımının olumlu özellikleri olarak belirtilmiştir. Bu konuya ilişkin olarak bir öğretmen adayının görüşü şu şekildedir:

"Yazılar öğrencilerin seviyesine uygun boyutta verilmiş. Kullanılan şekil ve grafikler dikkat çekici. Renkler karışık değil gözü yormuyor."

Buna karşın öğretim yazılımının ekran tasarımı açısından bazı özelliklerinin uygun olmadığı görüşüne sahip olan öğretmen adayları (*n* = 8) da bulunmaktadır. Olumsuz görüş bildiren katılımcılar; öğrenciye sunulan yönergelerin ekranda uygun yerlere yerleştirilmemesi, görsel öğelerin (butonlar, şekiller, kaydırma çubukları, vb.) hedef kitlenin yaş seviyesine göre çok küçük olarak tasarlanması, metinlerde kullanılan yazı puntosunun göreceli olarak küçük olması, ekran okunurluğunun düşük olması; katılımcılar tarafından belirtilen olumsuz özelliklerdir.

Yazılımın İşlerliğine İlişkin Bulgular

İncelenen öğretim yazılımının işlerliğine ilişkin katılımcılardan elde edilen yanıtlar incelendiğinde katılımcıların büyük çoğunluğunun ($n = 18$) olumlu görüş belirttiği gözlenmektedir (bkz. Tablo 1). Olumlu görüş bildiren katılımcılar öğretim yazılımının genel olarak doğru bir biçimde çalıştığı ve teknik bir hata vermediğini düşünmektedir. Yazılımın sistem gereksinimlerinin yüksek olmaması ve kısa sürede hızlı bir şekilde başlatılabilmesi, farklı ekran gösterimleri arasındaki geçişlerin hızlı olması, ekran yönergelerinin doğru bir şekilde çalışması ve yardım menüsünün yeterliliği, öğretmen adayları tarafından belirtilen olumlu özelliklerdir. Bu konuya ilişkin bir öğretmen adayının görüşü şu şekildedir:

"Öğrenci programı kolayca çalıştırabilir. Diğer bölümlere geçişler kolay. Butonlar gayet açık ve net."

Buna karşın işlerliğe ilişkin olumsuz görüş bildiren öğretmen adayları ($n = 4$) da mevcuttur. Olumsuz görüş bildiren öğretmen adayları, bilgisayar kullanım tecrübesi zayıf olan öğrencilerin yazılımı kullanırken zorlanabileceğini, yazılımın çıkış menüsündeki yönergelerin yetersiz olduğunu ve kullanıcı onayı alınmadan direkt programdan çıkış yapılabildiğini belirtmektedir. Bu konuya ilişkin bir öğretmen adayının görüşü şu şekildedir:

"Yazılımın işlerlik açısından sorunlarının olduğunu düşünüyorum. 'Esc' tuşuna basıldığı zaman hemen çıkış sağlıyor bu durum bana göre dezavantaj."

Yazılımların Etkiliğinin Artırılmasına İlişkin Öneriler

Araştırmaya katılan öğretmen adaylarından yaptıkları değerlendirmeler sonucunda öğretim yazılımlarının nasıl daha etkili ve nitelikli bir yazılım haline getirilebileceğine ilişkin belirttikleri görüşler incelendiğinde, katılımcıların yazılımların farklı açılardan geliştirilebileceği görüşüne sahip oldukları görülmektedir. Katılımcılar, bu alternatif özelliklerin eklenmesi halinde yazılımların daha nitelikli hale getirilebileceğini ifade etmişlerdir. Öğretmen adayları tarafından getirilen öneriler şu şekilde sıralanabilir:

Öğretim yazılımlarında çoklu ortam öğelerine (ses, video, animasyon, vb.) daha fazla yer verilmelidir. Özellikle sunulan içerik yabancı dil öğretiminde büyük bir öneme sahip işitsel materyaller ile desteklenmelidir ($n = 12$).

Öğretim yazılımları öğrencinin ihtiyaçları doğrultusunda düzenlenebilmeli ve öğrencinin kendi hızına uygun olarak bireysel öğrenmeye olanak sağlayan özelliklere sahip olmalıdır ($n = 10$).

Yazılımlara kullanıcı kontrolünü artırıcı özellikler eklenmelidir. Yazılımında bulunan videoların istenilen yerde durdurulup yeniden başlatılabilmesi, ses kontrolünün yapılabilmesi, programın kapatıldıktan sonra kullanıcının kaldığı yerden tekrar başlayabilmesi öğretim yazılımlarına eklenmesi gereken özelliklerdir ($n = 8$).

Öğrenciye kazandırılmak istenen içerik özgün bir senaryo içinde verilmelidir ($n = 4$).

Hedef öğrenci kitlesinin yaş ve gelişim seviyesi göz önüne alınarak içerik görsel öğelerle zenginleştirilmelidir ($n = 4$).

Öğrencilerin eğlenerek öğrenmesine imkân sağlayacak etkinliklere yer verilmeli ve öğretim yazılımları aracılığıyla kazandırılmak istenen davranışlar öğrencilerin üstün düşünme becerilerini geliştirecek nitelikte oyunlar vasıtasıyla kazandırılmalıdır ($n = 3$).

Sonuç ve Öneriler

Bu çalışma ile öğretmen adaylarının öğretim yazılımlarına ilişkin görüş ve fikirleri belirlenmiştir. Öğretmen adaylarından verilen öğretim yazılımını incelenmeleri ve bu yazılımı uygunluk ve işlerlik açısından değerlendirmeleri istenmiştir.

Uygunluğa yönelik elde edilen bulgular içerik, değerlendirme, ekran tasarımı öğeleri açısından incelenmiştir. Araştırmaya katılan öğretmen adaylarının büyük bir bölümü içeriğin uygun bir şekilde sunulduğu görüşündedir. Konuların, belirlenen hedefler doğrultusunda, küçük adımlar ilkesi temel alınarak, kolaydan zora doğru verildiği en çok belirtilen olumlu görüşler arasındadır. Olumsuz görüş belirten katılımcılar ise daha çok metin yoğunluğu üzerine odaklanmıştır.

Yazılımın değerlendirme bölümüne yönelik görüşlerde ise değerlendirmenin içerik ile tutarlı olduğu, uygun geri dönütler sunulduğu ancak soruların çeşitlendirilebileceği görüşleri hâkimdir. Ekran tasarımına yönelik değerlendirmelere bakıldığında öğretmen adaylarının büyük bir bölümü tasarımın uygun olduğu görüşündedir. Ancak yönergelerin konumlarının açık olmaması, buton, kaydırma çubukları gibi görsel öğelerin hedef kitleye göre küçük tasarlanması katılımcıların ekran tasarımına ilişkin olarak olumsuz görüşlere sahip olmasına neden olmuştur.

Yazılımda değerlendirilen diğer bir ölçüt olan işlerlikte ise genellikle olumlu görüşler hâkimdir. Yazılımın çalıştırılmasına ya da sayfalar arası geçişlerine yönelik herhangi bir olumsuz görüş belirtilmemiş olmasına rağmen "esc" tuşuna basıldığı anda kullanıcıdan hiçbir onay almadan programın kapanması, katılımcılar tarafından yazılımın olumsuz bir özelliği olarak nitelendirilmiştir.

Etkili bir yazılıma yönelik katılımcılardan alınan görüşler incelendiğinde, cevapların genel olarak çoklu ortamlar ile içeriğin desteklenmesi ve yazılımın bireysel öğrenmeye olanak tanıyacak şekilde tasarlanması üzerinde yoğunlaştığı görülmektedir. Oluşturulacak yeni öğretim yazılımlarında, bu öneriler doğrultusunda daha etkili yazılımların sunulacağı düşünülmektedir. Ayrıca yazılım değerlendirmede kullanılacak farklı ölçütlerin daha çeşitli sonuçlar sunacağı, üreticilere daha etkili ve kaliteli yazılımlar oluşturması açısından yarar sağlayacağı düşünülmektedir.

ORGANIZATIONAL METAPHOR PERCEPTIONS OF PRIMARY SCHOOL ADMINISTRATORS AND TEACHERS TOWARDS THE INSTITUON THEY WORK FOR

Seda YILMAZ[a]*; Selda POLAT

Anadolu University, Faculty of Education, Eskişehir, Turkey

Kastamonu University, Faculty of Education, Kastamonu, Turkey

Abstract

The aim of this study is to investigate primary school administrators' and teachers' organizational metaphorical perceptions of the institutions they work in and whether metaphorical perceptions differ in their professional titles. For this aim, totally 311 people, primary school administrators and teachers, from 18 primary schools in the central district of Kastamonu were applied "The Organizational Metaphor Scale" developed by the researcher. The data gathered were entered in the computer and analyzed via SPSS (12) package program. In the study, it was concluded that school administrators and teachers generally express the institution they work in with more of a metaphor of organism.

Keywords: Organizational metaphor, teacher, primary school, school administrator, perception of metaphor

Introduction

Metaphor in Turkish means simile, figure of speech and analogy. It is referred in Turkish language dictionary as a word used in a different context different from its real meaning as a result of a reference or analogy and which is used in a literary way to connote various meanings apart from its real meaning (TDK, 1969). The exact meaning of metaphor in Latin is "to transform from somewhere to another place" (Anderson, 2005). It is a conceptual framework that intertwines with a notion carrying and discovering a meaning (Waguespack, 2010). The researchers that analyze the use of language claim that there is no other way than using metaphor to grasp the meaning of a notion (Becerikli, 1999).

It is used in Greek as a concept through which very intricate concepts could be elucidated (Dur, 2006). To put in a different way, metaphor is the relationship between two conceptual structures. This very structure may refer to a domain, space, category or conception. Along with this, it is not totally correct to name all connections between two conceptual structures metaphoric. The recent cognitive linguistics theories and researches show that metaphor, which is commonly known as the analogy between two conceptual structures, is very inclusive (Steen, 2007) and metaphor is a means of perception (Arnett, 1999). That is, metaphors enable one to unveil how the concepts analyzed are perceived (Cerit, 2008). In addition to all of these definitions, metaphor is used to convey symbolical meanings in a cultural context and to make an analogy between a situation and an action, object, idea or a word (Palmer and Lundberg, 1995).Gareth Morgan (1998) approaches metaphor to meditate on an organization or a quality of an organization. As Morgan underlines in his study, there is a close connection between ideas and actions. Making these relationships to be understood is significant to make sense of how organizations formalize an issue, how different areas they can adapt it to and how they create new organization models (Thomas and Allen, 2006). Metaphors may play a constructive role for managers to internalize, comprehend the situations and act accordingly. Metaphors associated with literature are analyzed as machine, organization, brain, culture, politics and means of domination and the prison of souls. Organization oriented metaphors have been analyzed in the same context in this study and an example of metaphor is explained below.

Organizations as Machines: The understanding that organizations could be constructed mechanically occurred with the Enlightenment Period and the institutional background was carried out as to comprehend the organizations (Tsoukas and Knudsen, 2003, 160). Although the approach of organizations as machines that prioritize stylistic qualifications in productivity growth contributed to organization theory to a significant extent, it was exposed to serious criticisms for it thought of human beings as a part of the organizational system (Özdemir, 2008, 1). The traditional organization theory associated with machine-organization metaphor is basically constructed upon non-human qualities of the organization. Human factor is back grounded. This theory, as mentioned before, considers the organization an entity without human beings that are seen as a gear of the machine. That is, traditional organization theorists focused on the organizational structure more and regarded the organization in terms of its performance and efficiency (Peker, 1995, 72). Traditional organization theories are linked with the machine metaphor.

Organizations as organisms: The problems of mechanical organization understanding resulted in many organization theorists shift their focus from mechanical approach to biological approach. Organization theory was transformed to a kind of biology in time and molecular cells, complicated organisms, the differences between species and ecology, relationships and individuals, groups, organizations, the populations of them (their branches) , the dichotomies between their social ecology and the similarities of the relationships were given priority within this understanding. The organization theorists espousing such an approach came up with many new ideas about the comprehension of organization processes and the factors affecting their well-being (Morgan, 1998, 45). The resemblance of the organization to an organism takes place among these new ideas and such a comparison resorts to the connection between the organization and environment. Environment is the atmosphere where the organization exists. When the environment is convenient, the organization can live and provides the nearby environments with necessary sources to survive. The organization is surrounded by other organizations whereby it has to be in a constant give and take (Hicks, 1975, Akt; Başaran, 1984, 74). Hatch, (1997, Akt; Nayır, 2008, 20)), compares the organization to an alive organism and supports the idea that they are bound to their surrounding likewise. What distinguishes the organization from creatures is that while creatures furnish themselves with food and accommodation, organizations acquire information, money, worker and raw material from its surrounding. Organism metaphor puts forward that different organizations require different wishes and reactions. Thus, there is no "a mere best" for them, which forms the basis of contingency theory and hails open system theory.

Organizations as Brains: The aim here is to be able to make a connection between brain process and working principal. Knowledge is defined as acknowledged believes (Nonaka, 1994, Akt: Tunç, 2010, 74). Knowledge is actualized in the brain of the recognizant and it carries the traces of the values, experiences, culture and learning of the individual. Knowledge can exist overtly in organizational structures as well as in values, acceptances and evaluations covertly. This definition points at the vantage of knowledge that is not simple but complicated, subjective and individual (Sallisve Jones, 2002, Akt: Tunç, 2010, 75). Information flow is vital for organizations to survive. The word cybernetics "kubarnetes" which means steersman in Greek is used to mean the processes of information flow necessary for the organization's existence and maintenance of routine besides the thinking and feedback processes of the system. As for March and Simon (1958),what determines the practices of organizations is the information necessity which will explain, interpret and eliminate the differences between aims and accomplished. Simon and March, through taking mechanisms' decision making approach into consideration, claim that the individuals in an organization make their decisions on the grounds of limited information during decision making and communication; therefore, they can analyze restricted alternatives and they are not exactly certain about the results (Akt: Morgan, 1998, 93). Organizations are associated with information processing system and learning organization approach.

Cultural Organizations: Organization culture is pertinent to the nature of organization identity (Whetten and Godfrey, 1998, Akt: Taşdan, 2010, 252). A positive and receptive organization culture stimulates creativity and provides satisfying results. An organization adopts creative behavior by means of affective coordination and integration and helps construct a balanced system that enables the organization operate effectively. Thus, organization culture represents a system based on mutual change and understanding which consolidates creativity within the organization and the framework of reciprocal admissions (Chang ve Chiang, 2007, Akt: Balay, 2010; 59). The organization is the place where mutual actions are carried out and it is important that the individuals share some common meanings and values (Schein, 1985, Akt: Şişman, 2007). Total quality management in organizations is related to culture metaphor.

Organization as Political Systems: Political issues like pecking order are certainly focused on while mentioning management in organizations. Management can take different shapes in organizations. While some are authoritative, some are democratic. Organizations could be labeled as political since it is required to manage different people in pursuit of different benefits. The ones who regard organizations as political systems consider them loose structures made of various people with different aims and interests rather than rational and integrated unities. In this respect, political point of view focuses on issues such as power/ rulership, benefit, disagreement, coalition, collective agreement and distribution of sources (Bolman and Deal, 1991, Akt; Şişman, 2007). Management of organizations (democratic/ autocratic) and organizational approaches are related to the disagreement management.

Organizations as Prisons of Souls: Individuals in contemporary work life complain about their position since they suffer from the suffocating and boring atmosphere from where they cannot step aside. This situation may be the metamorphosis of what Plato asserts centuries ago as the imprisonment of souls as an allegory of the impossibility of freedom. It may be considered that when the individual in modern life can understand his essence and his position in the organization, he can live in conformity with the organization and the social life (Akar, 2008, 99).

The imprisoned souls metaphor aims at introducing certain control processes and models. These models are subconscious processes under the iceberg waiting to be unfolded. Also, these models fall short of satisfying people. One of the most outstanding analyses of the metaphor is its contribution to one's understanding of organizational changes dynamics and challenges (Morgan,1998). Changing processes in organizations is also associated with this metaphor.

Organizations as means of dominance: The first types of formative organization probably emerged in hierarchical societies where a social group generally made the other accept its own will via subjugation. With certain people's being in service of the administrator class as bishops, clerks, accountants, sellers; societies became more layered. These people who do not deal with producing necessary for maintaining their lives formed a medium level class between the administrative class and the villagers who have to produce. Organizations have been associated with the processes of dominance where individuals and groups found ways to impose their own wills on others. The best way to understand various organizations in the history and in the modern world is viewing them as means which reflect the changes in the same style as the dominance applied. Furthermore, the idea that organizations are always based upon a class arrangement may be grounded on a well-supported basis (Morgan, 1998, 339-345).

People are inclined to view organizations generally as rational managements aiming at satisfying everyone's benefits. Nonetheless, there is a great deal of evidence demonstrating that this view expresses an ideology more than a reality. Organizations are mostly used as means of domination which put the selfish interests of elitists ahead for the sake of others and there is a dominant element in all organizations (Morgan, 1998, 339). While mentioning organizations, it becomes impossible not to mention power. When power is of question, various types of it may be stated. If the concept of power is to be addressed in view of administers, it may be defined as the power of having works done or the ability to control people. Administrators benefit from sources of power in directing employees so as to internalizing the purposes of the organization. As for the authority, it brings forth the linear hierarchical system. In such a structure, the uppers are at a more elitist level than the lowers, inequality and injustice are matters of fact, the process is in favor of the administrators in the difference of administrators and the ones administered.

Organizations are the systems established to actualize a target. The principal element directing a system is the human and actions by humans. It would not be wrong to state that school administrators and teachers mostly direct the organization/ school. School administrators both lead to the implementation of educational services and play a role for appropriate learning environment. Teachers have the important duty of conducting educational services efficiently. Undoubtedly, school administrators and teachers' perceptions styles of the institutions they work in would affect the quality of their jobs; in parallel to this perception, either the way for change and transition would be cleared or the repetition of the current situation would occur again. Therefore, teachers'' and school administrators' perceptions of the institutions they work in with which of the organizational metaphors; from among the metaphors of machine, organism, brain, culture, politics, prison of souls or domination gains importance. Moreover, whether there is a meaningful difference between the perceptions of teachers and school administrators with different duties and roles on the institutions they work in appears to be another issue which needs investigating.

2. Method

2.1 Study Group

The population of the study consists of primary school administrators and teachers working in primary schools located within the borders of the central district under Kastamonu Directorate of National Education. The total number of primary schools in the central district of Kastamonu is 51; 26 of which are in villages and the remaining 25 in the city centre. The number of teachers working in these schools is 781, the number of primary school administrators is totally 55; 20 of which are in primary schools in the villages dependent on the centre and 35 of which are in primary schools in the city centre. Considering that it would be appropriate to have 100 units in the bigger sub group and 25-30 units in each of the smaller sub groups during the surveys while obtaining samples (Balcı, 2009), a survey was applied to totally 450 people from among the school administrators and teachers working in 18 primary schools randomly selected from 35 public primary schools located in the central district in Kastamonu for the study sample. The survey applied to 311 people were taken into evaluation 287 (92.3%) of the participants in the study were primary school teachers and 24 (7,7%) of them were primary school administrators. 172 (55,3%) of the participants were female and 139 (44,7%) of them were male.

2.2. Data collection tools

The data were obtained by using "The Organizational Metaphor Scale" and personal information form.

Organizational Metaphor Scale (OMS) was developed by the researcher. At the first stage, principal components factor analysis was applied for the construct validity of the scale. With the help of the factor analysis, the scale consisting of 74 items was detected to have been divided into 7 dimensions and that 25 of the items whose factor load value was over .50 were found to be appropriate to be included in the scale. Cronbach alpha values were checked for the reliability of the scale. The reliability coefficient of the scale developed is α .80 and of the data collected within the context of the research is α .86. The OMS was constructed via 5-point Likert scale ranging from "I absolutely disagree" to "I absolutely agree".

Personal Information Form was developed in order to specify features such as the participants' professional titles, gender, and level of experience.

2.3. Data Collection Method

The data of the study were collected during 2009-2010 academic year. After receiving the necessary permissions, the scales were conveyed to the schools by the OMS researcher and the scales which were filled in were re-collected by the researcher.

2.4. Data Analysis

In the study, the metaphors which primary school administrators and teachers use to express the school they work in and whether these metaphors differ in their professional titles were examined via SPSS (12) statistical package program. First, normality tests were conducted on the analyzed data and while t-test was applied to the data showing normal distribution, Mann-Whitney U test was applied to the data which did not show normal distribution. Statistical meaningfulness level was taken as *"p<0.01.*

3. Findings and Comments

The t-test results regarding the metaphors which the primary school administrators and teachers participated in the study used to express the schools are given in Table 1.

Table 1: The Distribution of the Metaphors Which the School Administrators and Teachers Participated in the Study Used to Express the Institution They Work in According to their Professional Titles and T-Test Results

Metaphor	Title	N	$\bar{X}$	ss	Sd	Mean Difference	T	p
Machine Metaphor	Administrator	24	1,90	,99	309	-,33	-1,46	,144

Metaphor	Group	N	$\bar{x}$	SD	df		t	p
	Teacher	287	2,23	1,08				
Brain Metaphor	Administrator	24	3,49	1,15	309	,00	,02	,979
	Teacher	287	3,48	1,11				
Culture Metaphor	Administrator	24	3,71	1,03	309	,32	1,56	,118
	Teacher	287	3,39	,97				
Politics Metaphor	Administrator	24	2,14	,90	309	-,31	-1,42	,156
	Teacher	287	2,45	1,04				
Prison of Souls Metaphor	Administrator	24	1,45	,89	309	-,37	-1,77	,077
	Teacher	287	1,82	,99				
Domination Metaphor	Administrator	24	2,20	,98	309	-,14	-,61	,539
	Teacher	287	2,35	1,14				

As seen in Table 1, it is observed that the primary school administrators ($\bar{x}$: 3.49) and teachers ($\bar{x}$ 3.48) express the school they work in with the brain metaphor at the "most" level. There is not a meaningful difference statistically between the perceptions of the groups of the institutions they work in. It may be said that two factors underlie the fact that primary school administrators and teachers express their schools with the "brain" metaphor. The first one is that schools are the institutions where information is produced and stored. The second factor is that it is resembled to the operation of brain and is about the fact that negative experiences are not repeated (e.g. people do not make the mistake they have made before). The supervision and all other evaluation activities can be assessed within the context of this metaphor. This finding of the study also shows coherence with the results of other studies. In a study of Balcı (1999) where he examined the metaphors towards school, school is described as the place of information transfer and where the youth is educated; likewise, the same features are also included in the description of ideal school in the study of Aydoğdu (2008) mentioned above. Thus, this obtained finding may be said to be directly associated with the purposes of educational institutions.

It has been derived from the study of Güçlü and Türkoğlu (2003), the subject of which is on primary school administrators'' and teachers' perceptions of the learning organization, that the perception levels of school principals and assistant principals on the learning organization disciplines such as personal expertise, mental models, shared vision, learning as a team and system thought are higher than those of teachers. This result is similar to the result obtained in this study stating that primary school administrators' tendencies to perceive the school they work in as the brain metaphor are higher than those of teachers.

When the mean values regarding the groups' **cultural metaphor** perceptions are viewed, it is observed that primary school administrators ($\overline{x}$:3.71) expressed the institution they work in with the **metaphor of culture** at the "most" level but teachers' ($\overline{x}$:3.39) at the "medium" level (Table 1). The organization is the place where common actions are mostly actualized. The organizational climate, where the individuals to be included in common actions may share some common meanings and values, is created by school administrators. One of the strong sides of the cultural metaphor is that it points at administrators as the ones to create new changes and to actualize the decisions taken. Henceforth, the administrators' perceptions of themselves as the ones to commence and continue the change is a result consistent with their roles as administrators and this obtained finding show similar results to the findings of other studies. For instance, in the study conducted by Dönmez (2008) in order to describe the administrator metaphors in the education system, it has been concluded that school administrators are attributed characteristics such as leader, guide, and unifier.

Primary school administrators and teachers express the institution they work in with, respectively, the metaphors of politics, domination and machine at the "least" level; whereas the mean values of teachers are a little higher than the mean values of administrators, there is not a meaningful difference among groups (Table 1). When these three findings are evaluated altogether in view of both the perception of metaphors and the perception levels of teachers' being higher than those of school administrators, it may be said that the results obtained show inner consistency individually. Moreover, groups' or individuals' interests are the matters of fact in an organization according to the political metaphor. In other words, the "self" is one step forward in the organization. Employees can abuse and take advantage of others for the sake of their benefits, conflict of interest is abundant. Rivalry is evident in organizations. No cooperative action can be possible. According to the domination metaphor, there exist two groups in the organization; administers and the administered; the process continues in favor of administrators. In addition to a strict hierarchy, inequality and injustice are the matters of fact. Domination ways of organizations are similar to social imposition types. The meanings attributed to these three metaphors are more valid for the organizations established to make profit over exploitation of labor. Since schools serve for the purpose of creating social benefits, employees do not evaluate schools with this metaphor. These metaphors do not comply with humane values. Schools are the social institutions where humane values are created according to their purposes and which aim at providing students with these values.

The distribution of scores regarding the metaphor of organism which the participants used to express the institutions they work in according to their professional titles and Mann-Whitney U test results are given in Table 2.

Table 2: The distribution of scores regarding the metaphor of organism which the participants used to express the institutions they work in according to their professional titles and Mann-Whitney U test results

Metaphor	Title	N	Mean Order	$\overline{X}$	Ss	Mann Whitney U	Z	p
Metaphor of Organism	Administrator	24	210,98	4,05	1,03			
						2124,50	-3,137	,002
	Teacher	287	151,40	3,50	0,90			

As seen in Table 2, primary school administrators ($\bar{x}$:4.05) and teachers ($\bar{x}$: 3.50) generally express the institution they work in **more** with the **metaphor of organism**. Along with this fact, the difference among the group means are statistically (MW-U:2124,50, Z:-,137 and p:0,002) meaningful.

The fact that primary school administrators and teachers compare the institution they work in, in other words the school, to an organism can be said to be based upon the fact that there is a kind of dynamism compatible with the purpose and structure of schools. According to the metaphor of organism which pictures an organizational model where human needs are cared; physiological, psychological and social needs of organization members are important. In organizations which are resembled to the metaphor of organism, informal human relations are attempted to be developed and the needs of the organizations' employees and the needs of the organization are attempted to be integrated. Employees' embracing their jobs, their creating a feeling of possession towards the organization and perceiving the needs of the organization as their own needs can be accomplished with the human relations developed the values attributed to employees in the organization. In the organizations which are compared to organisms, what is meant by organism becomes the surrounding of the organization. School administrators' comparing schools more to an organism than teachers may be explained with administrators' feeling more responsible for these mentioned issues than teachers. Being inspired by this metaphor, educational institutions are defined as "open system" which receive inputs from their surrounding and give outputs. In the light of these explanations, the school administrators'' and teachers' using the metaphor of organism at the utmost level among the metaphors of organization and administration in explaining the institutions they work in can be explained by the reasons that school administrators and teachers are in close relationship with their surroundings, each other, parents, other employees in schools, directorates of national education as required by their jobs, and their level of responsibility for these mentioned groups is higher.

Due to the fact that descriptions of school are generally focused on the theory of open system, it may be said that a result has been achieved consistent with this finding of the study. Furthermore, this finding also shows consistency with the results reached in other studies. For instance, in the study conducted by Cerit (2008) which examined the metaphors attributed to teachers; teachers are perceived as the ones enlightening others and as guides, in other words, the ones who respond to the learning needs of students. Such a definition is explained as the relationship between organization and surrounding in terms of the system theory.

In another study by Saban (2004) where the metaphors of education faculty students towards the teaching profession are investigated, the meanings attributed to profession of teaching are the characteristics like supporting the student, being the guide, the one conveying information and shaping the student. A similar result was obtained in the study of Aydoğdu (2008) about the perceptions on ideal school. While the school is stated to be the place providing confidence and information; teachers are defined as the ones conveying information, providing confidence and protecting in the related study. All these are the results which can be explained in terms of the school – surrounding relationship and associated with the finding of the study which has been materialized through the metaphor of organism.

4. Results and Suggestions

In this study, with which metaphor primary school administrators and teachers express the institution they work in and whether their perceptions of metaphors differ in their professional titles were investigated. It was concluded in the study that primary school administrators and teachers generally perceive the institution they work in more with the organism metaphor. Even though both groups expressed the institution they work in with the metaphor of organism, primary school administrators' perceptions differ meaningfully from those of teachers.

The school's being compared to an organism in the study is about the schools' features of affecting and being affected. This obtained result is associated with the fact that education is societal, as well. Education's being societal cannot be explained with the cultural inheritance of future generations. Education is societal means how

much aims, targets and principles of education comply with societal priorities in addition to creating a common societal benefit and responding to the educational needs of the society. In the past few years, especially with the effect of globalism, education systems have started falling behind the needs of the society. Schools play the principal role in societal changes and integrated with its surrounding. Management-based approaches towards the school and education (for example, total quality management) damage the human-oriented side of education, and disconnects the societal bond of education. The school may gain meaning only if it is integrated into the society it resides in. Apart from that, they cannot go beyond being mechanical places technically where information is loaded.

The fact that primary school administrators and teachers do still view the school as an organism is an indicator of their not evaluating (or inability to do so) schools as managements, as well. When the subject is addressed within this perspective, many more studies are required on "what" are the meanings attributed to schools over metaphors by school administrators, teachers, parents, different parts of the society. The studies to conduct will shed a light to educational sciences and educational scientists. Metaphors include perceptions and could make the up-to-then not thought of blind spots to be visible.

ORIGINAL EXPERIMENTAL METHOD TO EVALUATE CONCEPTUAL STUDENTS' KNOWLEDGE

Evgeny A. Eremin[a, 55]

[a]Perm State Pedagogical University, Sibirskya, 24, Perm, 614990, Russia

Abstract

This paper considers the experimental research of measuring interconnections between the basic concepts, acquired during completion of a course in Computer Architecture. A special computer technique for estimating of students' knowledge entirety was developed and successfully tested. An original mode of experimental data visualization is proposed. Specific pedagogical regularities were revealed by assessing how students digested the main concepts of the course.

Keywords: concept; relation; knowledge structure; entirety; education; course; assessment.

Introduction

The accepted classification, described in well known book of Anderson & Krathwahl (2001), itemizes several different kinds of knowledge: factual, conceptual, procedural and meta-cognitive. The simplest tests, often used for an assessment of students' knowledge now, can amply estimate only the first one. Practical evaluation of conceptual knowledge, inclusive fundamental categories, their links and structure, is much more complex, but much more important (see Kay, 1995 for instance).

This work makes an experimental attempt to measure the interconnections between the basic concepts, acquired during completion of a course in Computer Architecture. The special computer method was developed and checked in order to estimate the rate of entirety of the system from basic concepts, which students acquired by studying the material. By term *entirety* (wholeness, integrity) here we mean the presence of essential links between basic concepts within a course, which student perceives and shows during assessment. Several gauges that can characterize student's knowledge entirety were proposed and compared; new complex method to visualize the research results is described. Some pedagogical regularity was discovered during the analysis of digesting the course's foundation.

The study started in 2008 and at present we have results for 7 academic groups of students. This paper is fully devoted to consideration of experimental method and its preliminary results for the first group; results for other groups need further detailed discussion.

Initial aim of the research was the surmise that an entirety of student's knowledge may be among effective characteristics of learning results. As follows from the proposed statement, those students, who see more associations between studied terms, have a higher rate of knowledge entirety, and, hence, digested this learning course better. The confirmation of this thesis would be very useful for learning process, especially for computer assessment of learning achievements.

Organization of experiment

Concept base

Using existing textbooks (see books Tanenbaum, 1998; Hamacher, Vranesic & Zaky, 2001; Cilker & Orlov, 2004 and Broydo & Ilyina, 2006 for example) and personal teaching experience (Eremin, 2003), the author formed a list of basic terms and concepts. It was assumed, that the rate of digesting and mastery of these terms verified the success of the course.

The full list of concepts for the architecture course, used as experimental base, contained more than 120 terms. The most general concepts – like *computer*, *software* and *hardware*, *theoretical foundations* etc., complemented by the terms that expand the previous ones – *operating system*, *processor*, *memory*, *DMA*, *principle of hierarchy*, *byte* and many others, were included in this base. Several terms from related disciplines such as microelectronics, logics and number notations were added into the list too. Contrary, the list did not include the names of concrete operating systems, external devices and their manufacturers, and other similar data, less essential from the position of learning the main course's regularities. Using the standard terminology from object-oriented programming, we may say, that classes of the concepts were under consideration, but not their instances.

Experiments showed that obtained list was large enough, so competent students usually used a little more than the half of it in their answers. So the selected set of terms was found to be sufficient for assessment.

The next step was to analyze the links between the selected terms. Non-trivial result of this work consists in the fact, that a limited set of relations was enough to describe the subject. The final set consists of standard relations such as, for example, *whole/part* or *class/subclass* as well as several links, specific for the course, like *base* (*principle of hierarchy – base – memory*) or *connection* (*controller – connection – bus*). The full table of relations with concrete examples for each can be found in author's publications (Eremin, 2007; Eremin, 2008): it contains only 11 base associations.

These results of analysis, published earlier, are of independent interest. From the point of view of this paper, constructed lists are original data, which is prepared to use during the experimental testing of student mastery of the knowledge domain under consideration. As knowledge control was realized with the help of computer, both lists (of concepts and relations), being input data for control program, were saved in the form of text files.

Computer software

To check students' knowledge, the author developed two computer programs, realized in Delphi programming environment.

The first program was written to check the associations between the concepts that students have and fix them in the text file, suitable for further computer analysis. Its window contains three lists (see Fig. 1), using which a student forms a relation looking the following way:

term 1 – relation – term 2

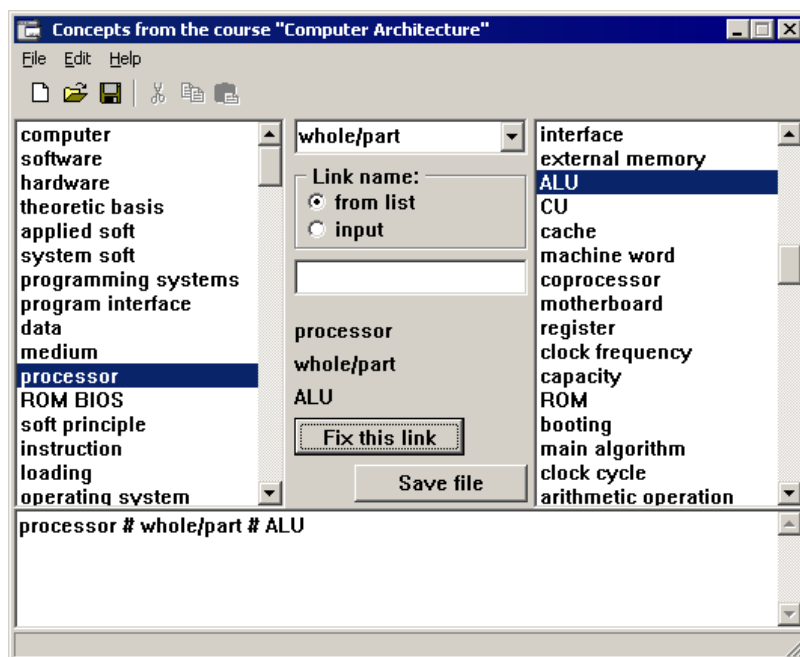
(for instance, the relationship *processor – whole/part – register* can be easily decoded as phrase "processor and register are linked by association whole/part" or, more exactly, "register is a part of processor"). After student constructs a linked pair of concepts, s/he fixes it clicking the control button "Fix this link". Then the constructed line is immediately added to multi-line text field, arranged in the bottom of the program window.


Fig. 1. Screenshot of testing software

Except the list of associations, loaded from pre-arranged file, the program covers a potential possibility to input additional (not provided by the author) name of relation between the terms: special radio buttons and text field in the center of the window allow such input. As experiments showed, students did not use this alternative, preferring to select link type from the available list.

When a student finishes his/her work, the results are saved in a text file, designed for the further analysis. All files were checked for correctness by the experimenter: distinctly wrong lines were erased from every result file. It was the only "manual" operation during the processing of testing results – all others were done by computer software automatically.

At the last step all checked files with the results of knowledge control fall under computer processing by means of the second program. Its main aim was to educe linked groups of concepts for every student. For example, when computer, processing a file, finds associations *functional units – class/subclass – processor*, *functional units – class/subclass – memory*, *functional units – class/subclass – input devices* and *functional units – class/subclass – output devices*, it joins all five concepts, mentioned there, into one group. Later on some other terms will be added to this group: for instance, relations *processor – whole/part – ALU* and *processor – whole/part – CU* join two new terms to the group – *arithmetic and logic unit* and *control unit*.

In ideal case all concepts of the course are interrelated; test running of the program with thoroughly prepared author's file, built according to full results from publication (Eremin, 2007), confirms this. But experiments show, that all real students' files represent more scattered picture, which consists of several isolated groups of concepts, and some groups are very small (2-3 terms). Every such small group must be interpreted as a separate fact that student does not associate with other facts from the course. You must note that an increased rate of fragmentation indicates student's knowledge is sparser.

Described program helps experimenting teacher to analyze the results of knowledge checking and output different statistics. During experiments software was modified for drawing graphic representation of calculated data.

Progression of experiment

The experiments estimated knowledge of students, who studied on the physical faculty of our university. Knowledge control took place twice: at the beginning and at the end of semester, that is to say before and after the learning of the referenced discipline "Computer Architecture". Unfortunately, the number of students, who learned the course and took part in the experiments, was not too large.

Students did not know that the aim of the experiment was entirety of concepts' system because it could artificially improve their results. They were simply told that testing tries to verify the rate of digesting the material. Their instruction was not to think about the parameters of evaluation, but just try to demonstrate digested knowledge the best way they could.

As students did not study the types of relations between concepts before, they were given a special table (with all types of links and numerous examples for each one) before testing. The results showed that it was insufficient and practically all students unsatisfactorily differentiated the types of links. Often they even missed classical relations *whole/part* and *class/subclass*, not to mention other link types. The aim of the experiments was to estimate the general entirety of the basic concepts – so from this point of view concrete kinds of links are not too important. Such effect became a motive to neglect the errors in this part of the task and just fix the existence of relation but not its type. This simplification of method notably facilitated the processing of results and ultimate analysis.

The time for implementation of the task was not limited, the work finished individually at students' will. Presumably, it brought some uncertainty into experiment, because some students really indicated all interrelations they knew, but others just got tired and finished their work. The task execution employed about an hour in average. According to my observation of computer testing, the students' reaction was mainly neutral ("we just get one more task"), so the checking procedure did not lead to any difficulty.

Discussion of results

Selection of gauge

Let us discuss what parameters can claim to be the characteristics of student's knowledge entirety.

Primary parameters are evident: *total number of terms* and *total number of links* between them; they can be easily counted from any student's file with the results. The ratio of these values, which means *average number of links per one concept*, also may be introduced into consideration. It is evident, that the more these values are, the better student mastered the material.

Another set of parameters may be built while arranging interrelated terms into groups. We can offer here *total number of concepts' groups* (this value must be as small as possible, in ideal case all terms must form the only group) and *size of the largest group* (this factor we want to see as large as possible). Additionally we can divide total number of terms by number of groups, i.e. get *average size of group*, which must be large when student learned the course profoundly.

All listed above characteristics were calculated for every student, and then compared for testing before and after the course. **Average number of terms per group** T/G seems to be the most suitable measure for knowledge growth. For the first experimental group this parameter varies from 3 to 13; essential changes of parameter make its experimental measure more reliable (Rogosa & Willett, 1983).

Diagrams of concepts' interconnection

For demonstration of entirety of concepts' system new original form of diagrams was proposed by the author (Fig. 2). This "spotted" diagram is organized the following way. Pairs of columns we see on it represent input and output testing (often called *pretest* and *posttest*): the right bar in every pair indicates final results. Height of any column is proportional to the number of concepts that student selected during assessment. Every dot in a column means one individual concept. All columns are divided into several areas; each of them represents a group of interrelated concepts, learnt by every student. For better visibility, neighbor areas are painted in white and gray colors. Number of the multicolored areas and their size characterize the rate of grasped data's scattering and indicate knowledge fragmentation. The black region in the bottom, which is always the largest, symbolizes the kernel of student's knowledge. As you can notice, all groups in every bar are regularized by size, so the smallest groups from 2-3 concepts (such groups may be interpreted as separate facts out of common picture) are always placed to the top of the bar.
Fig. 2. Diagram of concepts' interconnection

In ideal case the diagram bar must be heterogeneous black bar (consisting from the only group), and its height must include all the concepts of the course. Real picture, as you can see from Fig. 2, is far from ideal: students' knowledge comes apart on several independent groups of terms and the highest bar includes less than 70 concepts from more than 120 ones that were offered in the task.

It's important to mention that students on the diagram are rank-ordered according to some rating: the criterion of such arrangement was *time of finishing all the tasks*, given by the teacher. The students with small numbers finished the course earlier; hence they are supposed to demonstrate better results in learning the course content. In opposite, columns for "the slowest" students form the right part of the picture. My subjective impressions and interview with students during learning process confirm the acceptability of selected criterion as measure of learning success.

Examining Fig. 2, we may get several practical conclusions about successfully digesting of the course content. The most evident of them is that all weaker students, who have large numbers, improved the entirety of their knowledge. Such phenomenon was earlier reported by Libarkin & Anderson (2005). We must emphasize, that growth we see for low-perform students is not error caused by known *regression to the mean* statistic effect (Barnett, van der Pols & Dobson, 2005): students' level is evaluated independently in our research, but not from pretest scores.

Careful person may cognize, that there are some identical columns on Fig.2: for instance, compare right columns for students 2 and 10. This means that one of them cheated: just copied the result file from other student. Unfortunately, I noticed it too late to enforce students to redo their work. But for all further experiments special anti-cheating measures were developed.

Conclusion

The computer method for experimental research is offered, which allows to study the entirety of system of basic concepts after educational course learning. This method was tested on students' learning the course content in "Computer Architecture" and the results showed its efficiency. This paper also describes a new original visual form of data representation, which clearly demonstrates the structure of interrelations between concepts in student's knowledge. Some interesting pedagogical results were discovered during the research, for instance, how knowledge entirety depends on the level of student's background. Further experiments with improved testing technique already brought more detailed results – they are worth separate extended discussion.

PARENTAL STRESS AND DAYCARE ATTENDANCE. DOES DAYCARE QUALITY AND PARENTAL SATISFACTION WITH DAYCARE MODERATE THE RELATION BETWEEN FAMILY INCOME AND STRESS LEVEL AMONG PARENTS OF FOUR YEARS OLD CHILDREN?

Nathalie Bigras[a], Lise Lemay[a], Liesette Brunson[a]

[a]Université du Québec à Montréal, C.P. 8888, Succursale Centre-Ville, Montréal, H3C 3P8, Canada

Abstract

This study examine whether quality of daycare and parental satisfaction with daycare moderate the relationship between family income and parental stress. The sample consisted of 163 families of four year old children (Montreal), who have attended regulated daycare full time since 12 months old. Results indicate that parental satisfaction with daycare is a significant predictor of parental stress and that low quality of care moderates the relation between low family income and high parental stress. The results underline the importance of interventions to enhance quality in daycare settings, particularly in a childcare network largely funded by the government.

Keywords: Parental Stress; Daycare Quality; Family Income; Parental Satisfaction with Daycare.

Introduction

Parental stress is a strong predictor of difficulties in children's development (Attree, 2004). When parents experience chronically high levels of stress, their parenting practices are less appropriate (Huang et al. 2005; Lyons, et al., 2005). At the same time, their children's behavior is more problematic (Crnic, Gaze, and Hoffman, 2005) and their level of development less optimal (Attree, 2004). Parents who report a larger number of people in their social support network tend to have children who exhibit fewer developmental and behavioral problems (Ceballo and McLoyd, 2002; Oravecz, Koblinsky and Randolph, 2008). Some research has also indicated that the social support available to parents of young children can help to reduce parental stress levels (Lyons et al., 2005) and improve child outcomes. These relationships between social support and parental stress are stronger for families living in poverty (Kim-Cohen et al., 2004).

Daycare may provide a certain kind of social support to families. Daycare is increasingly important in the lives of today's families; parents who work full time increasing rely on regulated daycare and prefer this type of care for their children (ISQ, 2011). In Quebec (Canada), nearly 67% of children aged 0-5 years old attend regulated daycare settings. One goal of the Quebec's regulated nonprofit educational childcare network is to promote equal opportunities for all children (Gouvernement du Québec, 2007). But what about children whose parents live in conditions of economic insecurity (low income)? Daycare may provide an important source of emotional, instrumental and informational social support (Lepage, Vézina and Desrosiers, 1990) to low-income parents, which could in turn contribute to lower levels of parental stress. If so, daycare attendance could act as a protective factor for low-income families. Parental satisfaction with daycare may also play a role in parenting stress. When parents are worried about what is going on in their child's daycare, they probably feel more stressed; when parents are satisfied with daycare, they are likely less stressed about their children (Sund & Ostwald, 1985).

It is important to note that the quality of care is key to insuring the best outcomes for children and families, and that quality may be especially important for families from less advantaged backgrounds (Belsky, 2006, Lambert et al. 2006; Papero, 2005). Research has shown that daycare settings offer varying degrees of quality, and that family income and daycare quality interact to influence child and family outcomes. Notably, high quality daycare has been associated with improved outcomes for children living in poverty, while poor quality of care has been linked to worse outcomes (Burger, 2010). These relationships are present but not as strong for middle income families. This study explores these issues by examining whether quality of daycare and parental satisfaction with daycare moderate the relationship between family income and parental stress.

Methods

2.1. Subjects

The sample consisted of 163families and their four year old children who have attended regulated daycare full time since the age of 12 months old (M = 12.77, SD = 4.61). They were recruited from the Montreal metropolitan area between 2009 and 2010.

2.2. Measures and procedures

Measurements were taken at daycare and at home when children were 4 years old. During a home visit, mothers completed questionnaires about the selected variables. Daycare quality was observed at the same time.

Measures of the *socio-demographic characteristics of families* included age, income, education, marital status, language, country of origin of parents. Family income was reported by parents and was compared to low-income thresholds established by Statistics Canada (2004), a standard which takes into account the number of people living in the household and the area of residence. We determined whether families were situated above or below the poverty line according to these thresholds. Family structure (single-parent or two-parent family) and level of parental education (lower or higher than a high school diploma) were also categorized into two categories.

Parental stress was measured by a version of the Parental Stress Index (Bigras et al., 1996), designed for parents of young children (0 to 5 years) and validated for Québec (Lacharité et al., 1992). It consists of 101 questions divided into two broad categories of stressors: those related to the child (distraction / hyperactivity, enhance parenting, mood, parent acceptance, adaptability, degree requirement) and those linked to the parent (sense of competence, commitment to the child, role limitations, depression, relationship with spouse, social isolation, physical health of the parent). The questionnaire demonstrates good psychometric properties (Lacharité et al., 1992).

Parental *satisfaction with daycare* was evaluated by a questionnaire comprised of three scales (Emlen, 1999). The scale "satisfaction of parents with daycare" consists of 39 items rated on a Likert-type response scale (1 = never, 5 = always) and measures parents' perceptions regarding health and safety in the daycare environment. A second scale includes 12 items providing information on the "daycare's flexibility." A Likert-type scale (1 = strongly disagree to 4 = strongly agree) is used to rate the level of flexibility of hours of care based on the parent's work schedule. Finally, the scale "parent-teacher communication," composed of five items and also rated on a Likert type scale (1 = never to 5 = every day), measures the level of communication and emotional support between parent and educator.

Process quality was assessed using the EQOS, center-based and family-based daycare version (Bourgon et al., 2004b, c). A trained research assistant completed the instrument after 5 hours of observation (from 7:45 am to 12:45 pm on one selected day). A second assistant was present for 15% of observations to insure interrater reliability. The EQOS includes 153 items divided into four dimensions: 1- physical setting (44 items), 2-

activities (30), 3- interaction educator / children (49), 4- interaction educator / parents (7). Each item is rated on a four-point scale (1 = poor, 2 = minimal, 3 = good, 4 = very good). Global quality of care is indexed by computing the mean score across all items. Analyses of internal consistency of the center-based and family-based daycare versions show alphas ranging between 0.81 and 0.93 for each of the four dimensions (Drouin et al., 2004).

Results

A hierarchical regression analysis was conducted to verify which daycare characteristics best predicted parenting stress and to examine whether income level interacted with these predictors. Preliminary analysis indicated which family and daycare predictor variables were correlated with overall parenting stress scores. These predictive variables included family's income level, parental satisfaction with childcare, and global quality of care, as well as several interaction terms for income level with other daycare characteristics. Variables with predictive power were entered into a hierarchical regression in which the most proximal influences on parental stress were entered first, followed by more distal ones. Table 1 presents the descriptive statistics for and correlations among the final variables selected for the model.

Table 1. Means, standard deviations, and intercorrelations for parenting stress index (mothers scores) and family income level, satisfaction about daycare and overall process quality scores.

Variables	Mean	SD	1	2	3	4	5
1-Parenting stress a	217.72	33.30					
2-Income b	0.20	.40	.19**				
3-Satisfaction c	223.01	17.80	-.31***	-.01			
4-Quality d	1.70	.07	-.22**	-.07	.18**		
5-Income X Satisfaction	-0.02	1.01	.21**	.02	-.38***	-.18**	
6-Income X Quality	-0.48	1.45	.18**	.99***	-.01	-.08	.03

$*p < .05$, $**p < 01$, $*** p < .001$. Note : $n = 163$,

[a] Mean scores of Mother Parenting Stress Index total score, [b] -1 for income above the low income threshold level and 1 for income over the threshold level, [c] Mean score of parental satisfaction about daycare (mother scores), [d] Log of overall process quality scores

To predict overall parenting stress, the variable "income level" was entered in the first block in the regression as a variable representing family vulnerability, the most proximal characteristic. The second block included the variable "overall satisfaction with daycare," considered to be the next most proximal environmental variable. The third block included "overall process quality." The last block included interaction terms representing the interaction of income level with (1) "overall satisfaction with daycare'' and (2) "overall process quality of care." Some variables (parent's education, marital status) were excluded from the regression analysis because of multicolinearity (Tabachnick and Fidell, 2001). The results of this hierarchical regression analysis are presented in Table 2.

Table 2. Summary of hierarchical regression analysis for variables predicting parenting stress index scores for mothers of children in daycare at 4 years old.

Variables	B	SE B	ß
Step 1			
Income a	15.48	6.40	.19*
Step 2			
Satisfaction b	-.57	.14	.307***
Step 3			
Quality c	-70.96	34.61	-.15*
Step 4			
Income X Satisfaction	3.34	2.60	.10
Income X Quality	-99.85	39.39	-4.33*

$*p < .05$, $**p < 01$, $*** p < .001$. Note : $n = 161$, $\Delta R^2 = .03$ for Step 1 (p < .05); $\Delta R^2 = .09$ for Step 2 (p < .001); $\Delta R^2 = .02$ for Step 3(p <.05); $\Delta R^2 = .04$ for Step 4 (p <.05).

[a] -1 for income above the low income threshold level and 1 for income over the threshold level, [b] Mean score of parental satisfaction about daycare (mother scores), [c] Log of overall process quality scores.

The first step of the regression equation suggests that "income level'' is related to mothers' overall stress scores, explaining 3.5% of its variance, F(1, 161) = 5.86, $p = .017$. The Beta coefficients indicate that families below the low income threshold have higher stress scores (b = .187, $p = .017$). The second step of the regression equation reveals that ''overall satisfaction with daycare'' relates to mothers' stress scores, F(1, 160) = 11.89, $p = .000$, adding on its own 9.4% to the variance already accounted for by income level. The negative Beta coefficients indicates that lower satisfaction with daycare is associated with a higher stress scores for mothers (b = -.307, $p = .000$). The results for the third step of the regression indicate that the "overall process quality score" is also related to mothers' stress scores, F(1, 159) = 9.49, $p = .000$, even after controlling for income level and satisfaction with daycare, adding on its own 2.2% to the variance already accounted for by the other variables. The negative beta coefficient indicates that lower overall quality process scores are linked to higher mother stress scores (b = -.153, $p = .042$). The results of the final step of the regression show that a significant proportion of mothers' stress scores (3.9%) is explained by the interaction of income level and process quality, $F(1, 157) = 7.42$, $p = .000$. Figure 1 shows that for families in good quality daycare, parenting stress did not vary regardless of family income level (above or below the low income threshold). On the other hand, when quality scores were lower (below the good quality level), low-income mothers reported higher levels of parenting stress than mothers whose family income was above the low income threshold.
Figure 1. The relation between parental stress and family income level as a function daycare process quality

Discussion

These results suggest that low levels of daycare quality are associated with higher levels of parental stress for low-income mothers. This relation confirms results reported by previous studies (Burger, 2010) pointing to low quality of care as a key variable in outcomes for families living in poverty. In addition, correlations between the process quality scales and the parental stress index suggest that higher quality of relationships between educators and children are associated with lower parental stress for low income families. It is possible that these characteristics of the daycare environment provide emotional and informational support for parents, contributing to lower levels of stress. However, the proportion of variance explained by this interaction is small; indicating that other variables, such as parental satisfaction with daycare, remain important predictors of parental stress.

Correlations between parental satisfaction and parental stress variables indicate that a major part of the scales centered on children are linked with parental stress levels. For example, mothers who reported that the educator has the ability to answer the needs of their child also reported less parental stress. Studies show that children from less advantaged backgrounds are less likely to attend daycare either because daycare services are more difficult to find in their immediate environment or because their parents do not seek out these services (Bigras, Pomerleau, Malcuit & Blanchard, 2008; Denis et al., 2005; Magnuson et al. 2004; Parish, et al., 2005). Children from low-income families tend to have access to lower quality daycare (Japel et al. 2005; Marshall, 2004). Future studies should explore the reasons why lower income parents are more likely to use lower quality daycare, and what factors and interventions might improve quality in these settings. Research should also examine the factors that are associated with parental satisfaction with daycare. However, the correlational design of our study prevents us from inferring causal relationships among these variables. For example, it is also plausible that families who feel less stressed live in more resource-rich neighborhoods where daycares offer higher quality.

Conclusion

Ours results indicate that parental satisfaction with daycare is a significant predictor of parental stress and that low quality of care moderates the relation between low family income and high parental stress. The results underline the importance of daycare quality and of parental satisfaction in regulated daycare and the

importance of interventions designed to enhance quality in daycare settings where levels of quality are low. These results are particularly important in a context where a regulated nonprofit childcare services network is largely funded by the government in order to insure equal opportunities for all.

PERCEPTION OF ROMA PEOPLE BY PROSPECTIVE SECONDARY SCHOOL TEACHERS IN THE CONTEXT OF GENERALIZED ETHNICIZATION OF PROBLEMS RELATED TO NON-ASSIMILATED PART OF THE ROMA POPULATION

Vladislav Jankových[a][56], Petr Hlaďo[a]

[a] Institute of Lifelong Learning, Mendel University in Brno, Zemedelska 1, 613 00 Brno, Czech Republic

Abstract

The paper deals with the perception of Roma people by Czech students of education expected to perform future work with students where it is necessary to create equal opportunities for all students, regardless of affiliation to any group. In this short research we tried to capture the pedagogy students' degree of ethnicization of problems associated with the non-assimilated part of the Roma population. These values were compared to similar studies that capture the attitudes towards the Roma people not in terms of certain occupational groups, but in terms of population of the Czech Republic. Our research found significant differences in perception of the Roma in cases where the respondent evaluates the Roma simulacrum which s/he created by means of generalized ethnicization of problematic situations associated with the Roma and disseminated through the popular discourse of the Czech population, compared to cases in which the Roma are evaluated after a previous separation of character features which they are attributed by popular discourse, regardless of whether they are Roma who have adopted the values of the majority or not.

Keywords: Attitude; ethnicization; inappropriate generalization; popular discourse; Roma people; secondary school teachers; social exclusion; symbolic exclusion.

Introduction

The research presented herein shows the perception of the Roma on the part of prospective secondary school teachers, i.e. current students of bachelor study program Specialization in Pedagogy, particularly full-time as well as combined studies in Teaching of Vocational Subjects and Teaching of Practical Subjects and Vocational Training, who will after completion of their studies teach in schools that provide education at ISCED 3A or ISCED 3C levels. The paper maps the social aspects of ethnicization of contemporary issues related to broader social problems associated with those socially inadaptable communities whose members include a significant representation of Roma individuals.

This paper seeks to point out the impact of ethically questionable ethnicization of social problems associated with the lifestyle non-assimilated members of Roma communities, particularly in terms of the share of such ethnicization in the symbolic exclusion of Roma people as well as with respect to misleading interpretations of the positions of the majority population towards the Roma and with respect to non-systemic preference for Roma integration at the cost of Roma assimilation into mainstream society. Czech Government in its Report on the situation of the Roma minority summarizes the current situation as follows: „*The severity of problems associated with the Roma community is mainly due to the fact that a considerable part of the Roma minority in the Czech Republic belongs to the lowest social level, with high unemployment rate, low education level and taking into account the total population it has a disproportionately large share of crime. In addition, on the one hand the*

[56] Corresponding author. Tel.: +420 - 545 135 219.
E-mail address: vladislav.jankovych@mendelu.cz.

share of Roma population in the total population increases, on the other hand it engages in processes inherent to the majority of society with difficulty." (Government of the Czech Republic, 2012).

Research methodology

The research sample included 144 undergraduate students of the first and third year of bachelor degree program Specialization in Pedagogy, preparing for the profession of a secondary-school teacher. These were 38 men and 106 women of whom 29 were aged under 22 years, 32 aged 23 to 24 years, 20 aged 25 to 26 years and 63 aged over 26 years. Among the respondents there was no Rom.

As a research method two consecutive questionnaires were used, each of them, apart from questions concerning age and sex, included two research questions.

The first questionnaire included a modified question from the Social distance scale by Emory Bogardus "I would willingly admit members of each race to my street as neighbours" (Kleg & Yamamoto, 1998, p. 188) which we modified so as to meet our needs to be also comparable with other findings in this area, i.e. "Would you mind having Roma people as neighbours?" with options on the following scale: definitely yes, rather yes, rather no, no. Together with this question the respondents were asked to what extent they agreed that the statement "Roma people often steal" corresponds to reality.

In the second questionnaire the respondents were posed a question whether they would mind having a decent Roma neighbour who has a job, does not live on social benefits, has no trouble with the law and raises well their children, who go to school. Furthermore, a question was posed whether they would prefer such a Rom as a neighbour rather than a socially inadaptable white citizen of Czech origin and Czech nationality if they had the choice.

Results and discussion

The questionnaire survey brought findings which are partly comparable with previous studies carried out by other authors in the Czech Republic. Rabušic (2000) presents results of research in which the respondents (a representative sample of Czech population over 18 years old) were presented with the following task: "On this list there are various groups of people. Could you please select all those you would not want to have as neighbours?" While in 1991 (n=2110) approximately 75 % of respondents selected Roma people, in 1999 (n=1908) it was 40 %. In a 2000 IVVM's (Institute for Public Opinion Research) survey, 80 % of respondents selected by quota sampling chose Roma people in their response to the same question. In the last data collection of a longitudinal study European Value Study in 2008, 56.9 % (n=1821) responded to the question "*On this list are various groups of people. Could you please tell me any that you would not, generally speaking, like to have as neighbours?*" they would not like to have a Roma person as a neighbour (Rabušic, 2010). In our research, approximately 86 % would definitely mind or rather mind having a Roma person as a neighbour (see Table 1).

Table 1. Number of responses to the question: Would you mind having Roma people as neighbours?

Response	n_i	p_i (%)	+ (%) /- (%)
Definitely yes	48	33.3	86.1
Rather yes	76	52.8	
Rather no	17	11.8	13.9

Definitely no	3	2.1	

Although it may seem at first glance that among our respondents there is a slightly higher percentage of those who would mind having Roma people as neighbours than in the general population, this should not be deduced mainly because of a different set-up of the questionnaire. In compared research by Rabušice (2000), the respondents were presented with a list containing the following: alcoholics, drug addicts, criminals, Roma, left-wing extremists, right-wing extremists, people with HIV, emotionally unstable, immigrants, homosexuals, Muslims, another race, large family, Jews. The mentioned surveys at least partially differentiated for example between a group of Roma people and a group of criminals, while our questionnaire supposes respondents' association between membership of the Roma community and criminal behaviour. We attach the existence of this association to the influence of the popular discourse regarding Roma people associated with generalization and ethnicization of problems presented in media related to coexistence with those Roma people who have a lower degree of social adjustment with respect to the values of the majority population (Jankových, 2011). The existence of such association is subsequently confirmed by the results of the respondents' answers to the second question.

Since we are interested in the relationship between the frequencies of the above answers to the question "*Would you mind having Roma people as neighbours?*" and the contemporary popular discourse regarding the Roma, the respondents were posed a second question, which reflects a part of popular discourse regarding the Roma captured for example in a popular joke: *Two Roma meet and one asks the other: "Where are you going?" "To Tesco to buy a sweater." "If they don't catch you, buy one for me too."* (source: http://www.superanekdoty.cz/cikani-romove/stranka-8/). It follows from answers we obtained that the statement "Roma people often steal" fully or mostly corresponds to reality according to nearly 94 % of respondents in our survey (see Table 2).

Table 2. Number of responses to the question: In your opinion, the statement "Roma people often steal":

Response	n_i	p_i (%)	+ (%) / - (%)
Fully corresponds to reality	30	20.8	93.8
Mostly corresponds to reality	105	72.9	
Rather does not correspond to reality	7	4.9	6.3
Does not correspond to reality at all	2	1.4	

The popular discourse is closely related to the symbolic social exclusion of Roma people. In a pilot study preceding this research, we found a symbolic link between social exclusion of Roma people and some characteristics of Roma people traceable in popular discourse; one of these characteristics was precisely the concept of Roma people as individuals who often commit theft (Jankových, 2012).

However, it is necessary to take into account that the two questions of our questionnaire do not address the real relationship of the majority population and the Roma, but the relationship of the majority population towards Roma simulacrum which is part of the symbolic social exclusion by means of demarcation between "us" and "they" (Radostný, 2005).

Table 3. Correlation coefficients of responses to question 1 and question 2 from the first questionnaire.

			Question 1: *Would you mind having Roma people as neighbours?*			
			Definitely yes	Rather yes	Rather no	Definitely no
Question 2: *In your opinion, the statement "Roma people often steal":*		Fully corresponds to reality	**_0.4716_**	_-0.3711_	-0.1347	0.0449
		Mostly corresponds to reality	_-0.3315_	**_0.4252_**	-0.0676	_-0.2393_
		Rather does not correspond to reality	-0.1598	-0.1096	**_0.3176_**	**_0.1931_**
		Does not correspond to reality at all	-0.0839	-0.1255	0.1405	**_0.3982_**

Correlation Coefficients, using the observations 1–144; 5% critical value (two-tailed) = 0.1637 for n = 144

Table 3 shows an obvious correlation between the degree of belief that "Roma people steal" and the rate of rejection of the Roma as neighbours. It could also be concluded that the stronger the respondents' association between the membership of the Roma community and criminal behaviour (here represented by a tendency to steal), the stronger they refuse the Roma as neighbours. This judgment, however, does not follow directly from the survey carried out. At the same time our survey did not take into account the existence of any respondents' generalized personal experience with Roma people or with coexistence with Roma people, therefore we only assume the existence of mediated experience with the Roma simulacrum transmitted via popular discourse.

In order to distinguish the general relationship of the majority population towards Roma people not burdened by the generalizing characteristics stemming from ethnicization of problematic cases associated with the Roma, in the following question we introduced a Rom who lacks the characteristics that form part of the symbolic exclusion. The responses to the question set out in Table 4 are almost inverse compared to responses to question listed in Table 1.

Table 4. Number of responses to the question: Would you mind having a decent Roma neighbour who 1. works, 2. raises well their children, who attend school, 3. does not live on social benefits, and 4. has no trouble with the law?.

Response	n_i	p_i (%)	+ (%) / - (%)
I would definitely mind	8	5,6	22,2
I would rather mind	24	16,7	
I would rather not mind	52	36,1	77,8
I would definitely not mind	60	41,7	

In order to subsequently assess the impact of negative characteristics which the society attributes Roma people as a whole on the basis of symbolic social exclusion, we attributed these characteristics to a person identified as "a white fellow citizen of Czech origin and Czech nationality", and we let the respondents choose between him and a Rom who lacks these characteristics. Table 5 shows the results of the survey.

Table 5. Number of responses to the question: If you could choose your neighbour between a decent Roma or a socially inadaptable white fellow citizen of Czech origin and Czech nationality who does not work, sends children to steal instead of school, lives on benefits which they regularly spend on alcohol and gambling, and often have problems with the law not only because of their aggressiveness ... who would you chose?

Response	n_i	p_i (%)	+ (%) / - (%)
Definitely the decent Rom	83	57,6	96,5
Rather the decent Rom	56	38,9	
Rather the socially inadaptable white Czech	5	3,5	3,5
Definitely the socially inadaptable white Czech	0	0,0	

Conclusion

The response to the question "Would you mind having Roma people as neighbours" is related particularly to the degree of symbolic social exclusion of the Roma. What the respondents in response to the above question perceive as a Rom is mainly the Roma simulacrum which consists primarily of a mental image of a Rom expressed by means of symbolic social exclusion in popular discourse regarding Roma people. From this perspective, this research question may not be interpreted in terms of degree of racism (anti-Gypsyism) or social intolerance of the society.

Based on our research, we observe confirmation of the information obtained from the pilot study conducted before the research on the basis of non-standardized interviews. This is, through the Roma simulacrum the Roma people are often, at the level of symbolic social exclusion, perceived primarily as Roma who often steal (participate in minor thefts) or are involved in other crimes, including violence. Moreover, they are perceived as Roma who do not have a job or work illegally abusing social benefits, which they spend in a manner different

from what they are intended for and they are perceived as Roma who do not participate in a future change of the current state through proper education of their children and their support of education needed for integration into the society in a manner which is considered usual by the majority society.

It is highly probable that the formation of such image of Roma people owes to media and subsequently popular ethnicization of problems associated with those socially excluded communities that are mainly inhabited by Roma people who were integrated into society in a manner that does impede the traditional Roma way of life before the ban of itinerancy in 1958 (Hajská, 2011) which provided them with only minimal resources for their existence, and thus were supplemented and replaced by illegal means of livelihood, such as theft (Nečas, 2002).

It is apparent that the media image and popular discourse stemming from it based on the generalization of socially inadaptable behaviour of a certain part of the Roma people leads to ethnicization of the issue of coexistence of the majority with socially inadaptable citizens, which harms the interests of that part Roma population which was able to assimilate into Czech society and adopt its values, way of life and caring for children. Such interests may then be prejudiced at different levels of education if a Roma pupil or student is perceived by the teacher and classmates through their ideas about Roma simulacrum.

Problematic is also the politicization of all issues related to the coexistence of the majority and the Roma minority. In our research, we choose to refer to the Roma as "Roma" in particular with regard to the cult of political correctness. However, we are not sure whether the insistence on politically correct expression regarding Roma people does not rather lead to frustration of a certain part of the population, which in result may turn against Roma people.

Enforcement of politically correct expression tends to lead to opposing reactions consisting of advocating the refusal of politically correct language, which can be captured for example in the treatise by Jan Štěpán (2007) on Basic problems of reasoning: *"I object to the accusation that I use the so-called politically incorrect word "Gypsy" the following way: In Gypsy language, Rom means the same as man in Czech but I am a man too, although I am not a gypsy. Similarly in Eskimo language, Inuit means the same as man in Czech; I am a man, I am not an Eskimo. Thus, as we have no reason to start calling Eskimos Inuits (and no one is offended), there is no reason to stop using the word Gypsies (although some are offended)."*

Just as we more and more often hear of the failure of the multiculturalism concept in Europe, one can speak about failure of the integration process of the Roma into the Czech society which on the one hand tells the Roma "you cannot live your original way of life" and on the other hand tells them "integrate into the majority without losing your own culture and identity". Czech government (Government of the Czech Republic, 2006) states that according to expert estimates, in 2001 150 000 to 300 000 (2.93% of the total population of the CR) members of the Roma community lived in the Czech Republic, whereas in the census in 2001 (Czech Statistical Office, 2001), a total of 11,746 persons reported to belong to the Roma national minority (0.11% of the total population of the CR). In 1991, the census of people, houses and flats recorded 32,903 persons of Roma nationality (0.32% of the total population of the CR), in 2011 it was 5,199 persons, i.e. 0.05% of the total population of the CR (Czech Statistical Office, 2012). The argument that the integration process of Roma people would lead to maintenance of their identity is therefore untenable. It seems more probable that an assimilated Rom who adopts the values and lifestyle of the majority society will be appreciated by this society sufficiently enough not to deny their ethnic roots when defining their self-concept.

As illustrated in the presented research, if given the choice, 96.5% of respondents would prefer assimilated Roma neighbours to a socially inadaptable white ethnic Czech. This finding is a positive encouragement for teaching practice, particularly with regard to the awareness of the illegitimacy of the current perception of the problem of social exclusion and poverty of a part of the Roma population as a problem of coexistence of two groups in the Czech Republic. In the process de-ethnicization of the conception of social exclusion within civil society which removes the division of our company into "we" and "they", an important role may be played by the manner of education towards civil society in elementary and secondary schools.

PREPARING FACULTY TO TEACH THEIR FIRST ONLINE CLASS

Moe Shahdad[a], Joyce Shirazin[b]

[a]University of Maryland University College,3501 University Blvd. East, Adelphi, MD 20783, USA

[b]University of Maryland University College,3501 University Blvd. East, Adelphi, MD 20783, USA

Abstract

In a report, entitled "Class Differences", published by the Sloan Consortium (2010, Allen & Seaman), the authors reported that 5.6 million students were taking at least one online course during the fall 2009 term. This was an increase of nearly one million students over the number reported the previous year. Furthermore, over three-quarters of academic leaders at public institutions reported that online education is as good as or better than face-to-face instruction.

The Information and Technology Systems Department at the Graduate School of UMUC has experienced similar enrollment growth in several of its programs, such as the Project Management Program. This has motivated the department to introduce quality enhancement measures in its program curriculum to ensure that quality of teaching and learning is improved along with enrollment growth. Specifically, these measures include model classes that the faculty can use and customize to teach their semester classes.

This paper discusses the need for model classes, their contents, and their role in the program, as well as programmatic issues involved in introducing such classes.

Keywords: Distance Education, online learning, teacher training

Introduction

The courses in the Project Management Program at the Graduate School of UMUC are offered in three semesters: fall, spring, and summer, where fall and spring semester each include two start dates. Due to recent increases in enrollments, each course may have as many as 10 sections in a given semester. Furthermore, each course may be taught by several faculty. It is therefore necessary to make sure that the same quality standard is met across all sections of the same course, and that the same required content is covered. In order to meet this requirement, we have prepared model classes for each course. A model class is a customizable template which the faculty can use as a basis to quickly develop their semester classes.

Model classes are particularly useful for the faculty who are new to the department or who are teaching a course for the first time, as they provide the faculty with a ready-to-go template which they can easily import into their semester classes. It is expected that, for their first semester, the new faculty will use the template as-is. In the following semesters, when they are more comfortable with the courses, curriculum, and the overall program, they can easily modify and improve the template.

Previous Research

Strategies used for online teaching are substantively different from those of face-to-face. When teaching at a distance, the instructor assumes more the role of a facilitator than a traditional teacher. This is mainly because the students have to teach themselves. Because of this, training an instructor for distance education is different from training the same instructor for traditional classrooms. De Simone (2006) has argued that "much of the focus in distance education literature centers around the learner and learning, almost to the exclusion of teachers and teaching." She recommends that "it is important to institute a training program for initial preparation and ongoing support that is sensitive to the needs of the teacher and the learning goals."

Because of the difference in teaching strategies between face-to-face and online, it is necessary to separate the function of course designer from course facilitator. Furthermore, it is necessary to orient and train the faculty on how to deliver the course. McIsaak (2003) notes that "plans must be made far in advance of the beginning of the class. If complete and well-thought-out plans are in place, the course flows smoothly." McIsaak adds that "the first step is to build a complete and well-designed syllabus. A good online syllabus is essential for a successful course. It is the roadmap that will be used by the instructor and the students."

Requirements for Model Classes

Based on the previous research and our own experience, we adopted the following requirements for our model classes:

The model class should contain the complete content for the faculty to import into their semester classes.

There should be multiple copies of assignments, examinations, case studies, etc., such that the faculty can easily choose from them.

All assignments should be accompanied with sample responses.

The faculty should be able to use the model classes to set up the entire contents of their semester classes in a very short time, approximately one day.

Model Class Content

The following are the various categories of contents in our model classes.

Syllabus

The syllabus guides the faculty throughout the course. It includes topics, such as:

- Course description and objectives
- Required course materials
- Grade distribution and grading guidelines
- Course assignments
- Weekly session plan

Assignments and Rubrics

The model class includes the course assignments, as well as solutions and responses to various assignments. In addition, model classes include optional assignments. These assignments may be used by the instructors for

advanced students in the class. Assignments also include midterm and final examinations. Multiple versions of these exams are included.

Rubrics specify the criteria under which assignments are evaluated and graded. Model classes include rubrics for each class of assignments. Examples are rubrics for class participation, essay questions, and case study analyses.

Course Content

This section of the model class includes lecture notes, presentations, and learning objects that are used in the various class sessions. A Webliography is also included in the model class.

Sample Documents

These documents include samples for various course assignments, as well as sample responses to each assignment. Examples include:

- Sample project management plan
- Sample case study analysis

Reserved Readings

In addition to required textbooks, some model classes use library articles or extracts from various books. These materials are placed in the Reserved Readings section of the model class.

Weekly Checklist

Weekly checklists are an effective organizational tool for the students. Each checklist includes a list of tasks that the student must complete in each week of the class. This includes readings, assignments, project work, etc. The checklists include deadlines for submitting each assignment, as well as how each assignment should be submitted to the student's portfolio.

Software Tools

Some of our project management classes use various software tools, such as Microsoft Project, for project management. For each software tool, the model class includes installation instructions, tutorials, sample uses of the tools, and a Q&A. In addition, a conference is included to answer students' questions.

Instituting the Faculty Training Courses

The model classes include instructions, guiding the faculty on how to use the model classes. The guidance is presented in the class announcements, conferences, or documents which are posted in the class. In addition, we provide support for using model classes via phone and email.

The project management faculty will be using the model classes for the first time in summer 2012. We have invited our faculty and teaching assistants to provide feedback on the use of these classes. Our schedule calls for revising the model classes as a result of this feedback in order to produce their final production version in fall 2012.

We expect the model classes to require regular maintenance and improvement, both as a result of experience in using them, as well as new editions of required textbooks and other resources used in our courses.

PRESERVICE MATHEMATICS TEACHERS' UNDERSTANDINGS OF THE CLASS INCLUSION BETWEEN KITE AND SQUARE

Emine Gaye ÇONTAY[57], Asuman DUATEPE PAKSU

aPamukkale University, Faculty of Education, Denizli, 20070, Turkey

Abstract

The aim of this study is to examine the preservice mathematics teachers' understanding of class inclusion between kites and squares with the framework of Van Hiele levels. This descriptive study was conducted with 5 sophomore preservice teachers in Turkey. When we look at all the responses to the questions in terms of Van Hiele geometry thinking levels, it can be said that only one preservice teacher understood class inclusion relations and most of the preservice teachers were not at the expected level.

Keywords: definition, class inclusion, kite, preservice teachers, Van Hiele,

Introduction

Understanding class inclusion is the ability to have an overview of the possible relationships that exist among figures and this ability contributes students' deductive reasonings (Currie & Pegg, 1998). Hierarchical class inclusion is economical for example if a condition is true for parallelograms; it is also true for rhombuses, squares and rectangles (Fujita & Jones, 2007). It also helps to define the concepts more economically, helps to formulate the theorems to form more special concepts and contributes to problem solving processes and serves a global perspective (de Villers, 1994).

2. Related Literature

According to Fuys and others (1988), at Van Hiele Level 0, students perceive the shape of a kite as a whole, they can identify, name and compare it by its appearance. At this stage they solve the problems by operating on shapes visually rather than by using properties but they can not analyze figures in terms of their components and they can not make generalizations. At Level 1; students know components of a kite and they can analyze the relationships between these components and describe kites in terms of their characteristics. However they can not explain how certain properties of a figure are related and they can not understand class inclusions. At Van Hiele Level 2, students can identify minimum sets of the properties of a kite. They understand class inclusions as well as they can formulate a definition of a kite. At this stage they can give informal deductive arguments but they can not understand the meaning of these deductions in axiomatic sense. At Van Hiele Level 3, students can understand the properties of a formal definition and prove the axiomatic relations which were informally explained at Level 2 and they can give formal deductive arguments. At Van Hiele Level 4 students can rigorously establish theorems in axiomatic systems and they can compare these systems.

When we look over the Van Hiele Theory, it is clear that the development of the relationships between the characteristics of the figures, class inclusion, and formal definition understanding occur at Van Hiele Level 2 (Currie & Pegg, 1998; de Villers, 1998).

Many studies say that students have problems in classifying the quadrilaterals (Currie ve Pegg, 1998; de Villers, 1994; Erez & Yerushalmy, 2006; Fujita & Jones, 2006, 2007; Monaghan, 2000).

*E-mail address:*gayeermec@gmail.com.

Viglietti (2011) who conducted a study with mathematics teachers, found that teachers had imperfect knowledge of basic plain figures and kite was one of the subjects which they had many problems with. He found that most of the responses of teachers were based on physical appearances of the figures. Guiterrez and others (1991) examined Van Hiele geometric thinking levels of students and found that a student could have reasoning at two sequential levels at the same time.

The aim of this study is to examine the preservice mathematics teachers' understanding of class inclusion between kites and squares with the framework of Van Hiele levels.

3. Methods

This study was conducted with 5 sophomore preservice teachers from Elementary Mathematics Education Department at a state university in Aegean Region in Turkey. All of the participants got highest grade in geometry course (A1).

The instrument used in the clinical interview was formed by getting inspired from the study of Fuys and others (1988). The clinical interview has two parts. For the first part, the cardboards on which "kite" and "non-kite" was written were placed on the table in front of the preservice teachers and different quadrilaterals were given to them one by one at the same sequence. Then they were asked whether it was a kite or not. The quadrilaterals that were given to preservice teachers were; 1) unspecific quadrilateral, 2) kite, 3) trapezium, 4) square, 5) parallelogram, 6) rectangle, 7) unspecific quadrilateral Mainly in this part, preservice teachers were faced with the following questions:

1) Which of these are kites? (They were provided 7 different quadrilaterals and they were asked to put these into kites group or non-kites group)

1a) Why did you put square into the kites group?

1b) Why did you put square into non-kites group?

1c) Why did you put rectangle into the kites group?

1d) Why did you put rectangle into non-kites group?

The quadrilaterals which were given to preservice teachers and the true groupings are shown in Figure 1.

Fig. 1. Quadrilaterals and correct groupings

In the second part of the interview, the preservice teachers were given name cards for square, quadrilateral and kite and "is a special" arrows and they were asked if they could arrange these name cards correctly. Then, the preservice teachers were asked if a square was a kite and they were asked to explain the reason. Particularly, the following questions were asked:

2i) Can you put arrows between these cards to show some relationships?

2ii) Is a square kite, Why?

The example of the relationship is shown below:

Fig. 2. The correct arrangement of square, quadrilateral and kite

Before the main study, a pilot study was conducted with 3 preservice teachers. All of the grades of preservice teachers were high in the geometry course (A2). After the clinical interviews of the pilot study, minor changes were done.

After the transcription of the clinical interview, the answers of all preservice teachers were read question by question and the common expressions were grouped. Then, the answers were analyzed with the framework of Van Hiele levels. For the confidentiality, preservice teachers are referred as PT1, PT2, PT3, PT4, PT5 instead of their real names.

4. Findings and Discussion

4.1. Findings and Discussion of the responses of the first question

For the first question of the clinical interview, the preservice teachers were given different kinds of quadrilaterals and they were asked to put these into kites or non-kites group. Four of the preservice teachers (PT2, PT3, PT4 and PT5) grouped all of the quadrilaterals correctly while one of them (PT1) made mistakes. PT1 said that the square (number 4) was not a kite while the quadrilateral (number 7) was a kite. PT1 grouped quadrilaterals as kites and trapezoids. She also said that, it was enough to claim a quadrilateral as a trapezoid if at least two sides of it were parallel and added that this was the reason why she grouped square as a trapezoid.

When PT4 was asked why she put square into kites, she changed her mind and put square into non-kites group. As a result, the number of preservice teachers who answered correctly decreased to 3 (PT2, PT3, PT5) while it was 4 (PT2, PT3, PT4, PT5) at first.

When the answers of the preservice teachers were analyzed in a detailed manner, the preservice teachers who gave correct answers (PT2, PT3, PT5) gave responses which can be classified as Van Hiele Level 1.

Only one preservice teacher (PT3) who grouped square correctly didn't give visual expressions. This preservice teacher didn't give explanations on appearance of the shapes for her other responses, either.

PT3: "Because these sides are equal namely two consecutive sides are equal, in here the same thing, too, that's the reason"

When the explanations of the preservice teacher [(PT4) who made groupings correctly at first and then said that a square wasn't a kite] were examined in a detailed manner, it was seen that the reason for the first decision of her depended on the idea of "*square is a special form of a kite*"

PT4: "Square…..I know it as being a kite's special form. Square and rhombus….so I put it into kites group"

When PT4 was asked about the reason for doing like that, she made correct explanations while thinking visually and put square into wrong group. The reason for having a true explanation (*square is a special form of kite*) at first and for having a wrong answer with having a true explanation (*a figure with two isosceles triangles combining at bases...*) can be stemmed from rote memorization and she might not think deeply because of the visual memory in her mind.

In addition to the grouping error she made throughout the interview, PT1 gave visual expressions and besides she said that a square wasn't a kite. According to her it was a trapezoid because kite's two sides weren't parallel to each other.

PT1: "Two isosceles triangles coinciding in the bases first when we separate them like this (<u>shows on kite</u>) *this these reciprocal sides aren't parallel so I say that square is not a kite it is a trapezoid because of parallelism.*

The other preservice teacher who made incorrect groupings (PT4) gave visual explanations, besides she cut kite into pieces (instead of cutting square into pieces) and told that angles of kite weren't 90° and angles had to be perpendicular and so. This preservice teacher also explained kite in terms of a square like the other who had incorrect groupings.

PT4: When all side lengths of kite are equal....the measure of these angles doesn't change... ...again it is formed of two isosceles triangles coinciding in the bases. But these isosceles triangles then become congruent triangles but the angles of these don't become 90° any more. All the angles must be 90° for the square. This property must exist in square.....this figure (square) doesn't convert into here (kite)....

PT1 and PT2 used visual expressions in their explanations (indicator of being at Van Hiele Level 0). Besides, they mentioned about the properties as they were in Van Hiele Level 1 in addition to their grouping errors. However, the properties they stated were not correct. So, it can be said that these preservice teacher s were in Van Hiele Level 0 to 1.

As it is seen, both of the preservice teachers who put square into the incorrect group, perceived kite as being a figure which is formed of a combination of two isosceles triangles, and also tried to explain kite in terms of a square.

From this point of view, it can be said that the preservice teachers gave definitions visually as at Van Hiele Level 0 while having insufficient explanations. These visual explanations weren't enough for them and so they were in need of reflection with additional features. It was seen that these preservice teachers made mistakes in making class inclusions.

A prompt then were given to PT4 about the difference between a kite and a square, the preservice teacher arranged the characteristics of the two figures in order after thinking in terms of differences and found the true answer by putting the square into kites group with saying that a square was a special form of a kite (with using class inclusion).

PT4: "Hmmm..the difference between a kite and a square.... all the sides are equal like we see here....there is no difference...also side is longer...in square angles of side must be 90°. In kite, there is no such provision. In other words we can say that a square is a special form of a kite...but I've thought in terms of angles of 90° shortly before. It is true when we think of a triangle but when we go to quadrilateral......hmmmm...the angles must be 360°..It could be 90° then I've forgotten the detail. A short time ago I thought of that angles.....I thought these angles as wide angles....these base angels combining angles...but these...hmmmm aren't wide angles they can be 90°"

Interviewer: How did you know that?

PT4: I knew.....when we look...from...the figure misguide when we look at the figure we think that these can be wide angles but when we divide 90° into two when we think here like 45-45 when we think about a square

when we divide 90° into two precisely because diagonal lenth of this ....from here....I concluded this from the square"

As seen when the preservice teacher examined the two figures in terms of angles and sides besides their appearances she gave the correct answer. The preservice teacher deduced that square was a special form of a kite when she examined the difference between a square and a kite in terms of sides and angles. She justified her deduction with visual explanation by dividing the square into two isosceles triangles and by thinking the square visually. Thus, it can be said that when preservice teachers think in terms of class incusion characteristics besides visualization, they can change their inaccurate deductions to correct ones.

Besides, both of the preservice teachers who gave wrong answers to the question of "Is a square a kite?" (PT1 and PT4), mentioned that they had doubts about their explanations:

PT4: "Hmmm...this was an isosceles triangle....from isosceles triangle... I remember like that...I can remember wrong....When we equalize the lengths kite resolved to square as far as I remember...but...can't rightly say but....I know like that

Interview: Are you sure or not?

PT4:"I am not sure. I am not sure. But I remember like that.

Hence, it can be deduced that the explanations of these preservice teachers which are at Van Hiele Level 0 to 1 are hearsay, not contemplated and rote. Furthermore it can be said that these explanations doesn't canalize them to reflect on. The explanations of the preservice teachers were about the kite's form of two isosceles triangles and made wrong statements and they said that they had never thought on kite with this respect before.

All of the preservice teachers placed the rectangle into non-kites group correctly. One of the preservice teachers (PT1) had a wrong judgment and said that rectangle was not a kite because of being in the kites group. PT1 grouped quadrilaterals in two: trapezoids and non trapezoids and put rectangle into non kites group because of being in the trapezoid group and because it had at least two parallel sides.

PT1: "Because again it has two parallel sides like square, it resembles to trapezoid. In any case I put square, rectangle, rhombus in subclass of trapezoid .... Because all of them are trapezoids I say that it is not a kite"

Although PT1 could not make correct grouping, she answered the question correctly. Her explanations were rote and at Van Hiele Level 0 to 1.

All of the other preservice teachers stated that since consecutive sides are not equal rectangle is not a kite. They also mentioned about triangles forming the kite.

When we think that the inequality of consecutive sides is a sufficient explanation to claim the rectangle as not a kite, it can be said that preservice teachers gave unnecessary visual explanations. Hence it can be mentioned that preservice teachers had a tendency to deduce relying on visual explanation instead of considering the relationships between the characteristics.

When class inclusions about square and rectangle are discussed together, it can be said that preservice teachers who made mistakes in grouping square (PT1 and PT4) thought and deducted visually besides their wrong explanations and the preservice teachers (PT2, PT3, PT4, PT5) needed visual deduction when grouping the rectangle

4.2. Findings and Discussion of the responses of the second question

When the preservice teachers were given name cards of square, quadrilateral and kite and "is a special" arrows, only one preservice teacher (PT5) could arrange the name cards correctly at once. One of the remaining four (PT1) made a wrong arrangement, the remaining three (PT2, PT3, PT4) could reach the true answer after a

two or more attempts (PT2 after 3 attempts, PT3 and PT4 after 4 attempts) with the help of the prompts of the interviewer.

Although PT2, PT3 and PT4 put square into kites group before, they couldn't group square as a special kite or a special quadrilateral at baptism. The reason for three of four preservice teachers who put the square into kites group making wrong arrangements or making the true arrangements after two or more attempts at baptism can be an indication of the notion that thinkings of these preservice teachers about class inclusion may be conventional.

When the preservice teachers were asked if every square was a kite or not, except for the only preservice teacher who didn't put square into kites group (PT1), all of the preservice teachers were in the same idea of that every square was a kite.

PT1 made incorrect groupings as putting square into trapezoids group and therefore said that a square wasn't a kite. The only preservice teacher who couldn't arrange the name cards correctly (PT1) was the only preservice teacher who answered the question at Van Hiele Level 0 to 1. So, it can be said that preservice teachers at visual to analysis level are not capable in understanding class inclusion relationships.

PT1: "This (shows square which is figure of number 4) is in trapezoid group of quadrilaterals. This (shows kite which is figure of number 2)is in the group of kites. Every square can't be a kite.

When the responses of the preservice teachers who said that every square was a kite examined, it was seen that three preservice teachers (PT2, PT3, PT4) were at Van Hiele Level 1, one preservice teacher was at Van Hiele Level 2 (PT5).

Three preservice teachers who gave explanations in terms of sides (PT2, PT4 and PT5) besides these characteristics, used the characteristics of the equality of angles and visual expressions as two isosceles triangle combining a square to explain that every square was a kite. In other words, these three preservice teachers needed to talk about the relations of angles and sides in addition to visual expressions in order to explain that every square was a kite

PT2: "We usually draw kite. See... there are two isosceles triangle... we draw like this but if these triangles are equal to each other... if its sides, angles are equal, hmmmm if everything is equal I mean if it is composed of right isosceles triangle thus and if I coincide them in bases then I can obtain a square"

PT4: The important thing for us was that two isosceles triangle combining in bases in kite. Square always provides this condition because every side length is equal every time it is equal I mean we can get two isosceles triangles when we combine its diagonals. Hmmm the base angles are then equal every time because of the angles because it divides the base angles in 45-45. Thus square can always be a kite.

Two preservice teachers who said that every square was a kite (PT2 and PT5) had visual expressions besides angle-side expressions and said that every kite wasn't a square but every square was a kite.

5. Conclusion

When we look at all the responses to the questions in terms of Van Hiele geometry thinking levels, it can be said that two preservice teachers (PT1 and PT4) were at Van Hiele Level 0 to 1, two preservice teachers were at Van Hiele Level 1 (PT1 and PT3), one preservice teacher was at Van Hiele Level 2 (PT5). Thus, congruent with (Fujita & Jones, 2007) it can be mentioned that preservice teachers in the study are good at class inclusion relations of kite and square and have problems about class inclusion processes of quadrilaterals.

The preservice teachers who put square into kites group were at Van Hiele Level 1 and 2, while the others who put square into non-kites group were at Van Hiele Level 0 to 1. Two of the preservice teachers who grouped

square in the wrong way thought visually and cut the kite into pieces instead of doing this for square and sought its characteristics in the square.

The reason for doing this may be that they couldn't think of the characteristics of the figures at Van Hiele Level 0 to 1, despite they know the figure and they couldn't analyze the figure in terms of its components and they couldn't make generalizations about the figures (Fuys and others, 1988).

It can be said that the preservice teachers who gave correct answer to the question of classifying of the square didn't understand class inclusion relations and couldn't define kite in terms of its components.

It was seen that the preservice teachers' responses can be labeled between Van Hiele Level 0 and 2 in a fluxinal manner. We can say that congruent with the suggestions of Guiterrez and others (1991), responses of the same people can be varied according to task.

It can be mentioned that only one preservice teacher (PT5) understood class inclusion relations and most of the preservice teachers didn't reach the expected level.

When we think of the preservice teachers who got highest grade (A1) in geometry course, the unsufficiency of their responses may come from the relatively complex nature of kite. It could be harder for them to think about kite than square and rectangle. Besides, congruent with Viglietti (2011)'s study the responses of most preservice teachers were based on physical appearances of the figures

PRE-SERVICE PRIMARY SCIENCE TEACHERS' UNDERSTANDINGS OF THE MOON'S PHASES AND LUNAR ECLIPSE

Fatma AGGUL YALCIN[a], Mehmet YALCIN[a], Tevfik ISLEYEN[a]

[a] Agri Ibrahim Cecen University, Faculty of Education, Agri, 04000, Turkey

Abstract

The aim of this study was to explore pre-service primary science teachers' understandings of the moon's phases and lunar eclipse. The survey approach was used as the research method. The sample consisted of one-hundred and five first year pre-service primary science teachers. As a tool for data collection, a test composed of six open-ended questions that drew on the scholarly literature, developed by the researchers, was used. The data from students' responses was analyzed descriptively. The statistical analysis indicated that the chi square statistics calculated is significant at a level of 0.05, suggesting that the observed frequencies' differences among various levels of understanding are not due to chance. The findings showed that pre-service primary science teachers' understanding of the moon's phases and lunar eclipses was rather weak and that they hold common misunderstandings, suggesting that traditional instruction approaches are not enough to achieve meaningful, conceptual learning and must be replaced with alternative approaches.

Keywords: astronomy education, pre-service science teacher, moon phases, lunar

Introduction

In the last three decades, science education research has made great progress. (Nurrenbern and Pickering, 1987; Gabel, 1999). Research on student understanding of scientific phenomena indicates that student explanations, also called *misconceptions*, are often inconsistent with, inferior to, and incapable of explaining observable phenomena compared to the scientifically accepted descriptions (Andersson, 1986). It is known that students of all ages widely misunderstand natural phenomena (Mulford and Robinson, 2002), one of which is astronomy. The literature shows that students at all levels hold some common misconceptions in basic astronomy and their level understanding is rather low (Sherrod and Wilhelm 2009; Cid and Lopez 2010; Kavanagh et al., 2005; Baxter, 1989; Zeilik and Bisard, 2000; Trumper ,2001; Callison and Wright, 1993; Schoon, 1992; Bekiroglu, 2007).

National Science Education Standards (National Research Council, 1996) recommend that fundamental astronomy concepts be included as an important part of every child's education. Among these are the Earth's spherical shape and gravity, phases of the Moon, and solar and lunar eclipses (Kavanagh et al.,2005). Understanding the solar system involves a number of related conceptual areas that are clearly of importance in relation to children's existing frameworks. They include an understanding of spatial aspects of the Earth, a conception of day and night, of seasonal change, etc. (Trumper 2001). It has been determined that children have particular difficulty understanding the cause of lunar phases (Baxter, 1989; Lightman and Sadler, 1993; Zeilik and Bisard, 2000; Trumper, 2001; Sherrod and Wilhelm 2009). The most prevalent misconception regarding the cause of lunar phases is that *Moon phases are the result of the Earth's shadow*. This is not only common among children but many adults as well. In research with Australian teacher trainees, it was found that only 40% disagreed with the statement that '*The moon changes shape because of the varying amounts of the Earth's shadow cast upon it*' (Skamp,1998). This information is valuable to teachers and curricula designers when creating units of study to correct this common student misconception (Sherrod and Wilhelm, 2009)

Previous research shows that there are some frequently occurring notions displayed by children aged 9–16 regarding the phases of the moon: "Clouds cover the part of the moon that we cannot see", "Planets cast shadows on the part of the moon that we cannot see", "The shadow of the sun falls on the moon, blocking our view of it",

and "The shadow of the earth falls on the moon" (Baxter, 1989). Although the various alternative conceptions exist, the most commonly held notion for the causes of lunar phases is that *the earth casts a shadow on the moon*: the eclipse explanation. There are some other research findings in which students use the eclipse explanation to explain the phases of moon (Bisard et al., 1994; Callison and Wright, 1993; Schoon, 1992). Durant *et al.* (1989; cited in Trumper 2001) carried out research in Britain and in the USA, which indicates that only 34% of Britons and 46% of Americans appear to know that the Earth goes round the Sun once a year. A poll carried out in parallel in France (Acker and Pecker 1988) showed that about 33% of the public still believed that the Sun orbits the Earth. Lightman and Sadler (1993, cited in Trumper 2001) found that students in grades eight through twelve (from 13 to 18 years old) shared some of the conceptions held by elementary school children. Less than 40% knew the correct characteristics of the Moon's revolution. Moreover, less than 30% of the students had a correct conception about "the reason for the change in the Moon's phases", the Sun overhead at noon" and "an estimation of the Earth's diameter".

In an interdisciplinary study conducted to investigate science misconceptions held by groups of students ranging from middle school through university, Bisard *et al.* (1994; cited in Trumper 2001) determined that future general elementary teachers have about as many misconceptions concerning the topics covered in this survey as typical middle-school students. In addition, their findings showed that majority of students believed that the Earth was some way involved in producing lunar phases, either through the Earth's shadow obscuring portions of the Moon or by sunlight reflecting off the Earth and clouds.

There have been many studies conducted with university students, pre-service teachers and in-service teachers related to the moon and some lunar phenomena (Parker and Heywood, 1998; Summers and Mant, 1995; Suzuki, 2003; Trumper, 2003; Bekiroglu, 2007). From the study by Suzuki (2003) the findings revealed that pre-service teachers believed that the Moon could only be seen at night. In a study of primary school student-teachers, Trumper (2003) found a considerable number of students misunderstood the role of the Earth and Sun in the cause of Moon phases, a great proportion of students' reasons for seeing the same side of the Moon was that the Moon did not rotate on its axis, and some of the students claimed that the moon only revolved around the Earth and not around the Sun. Much research has been conducted to determine both children's and adults' understandings of moon phases (Callison and Wright, 1993; Trundle et al., 2002; Bekiroglu, 2007).

The literature shows that there are a number of studies about students' understandings of the phases of the moon and lunar eclipse. But there exist few studies of pre-service primary science teachers' understandings of phases of moon and lunar eclipse. Therefore, the question of the research was: What are pre-service primary teachers' understandings of the phases of moon and lunar eclipse?

Method

Research design

This research utilized the survey method. Surveys are used to learn about people's attitudes, beliefs, values, demographics, behavior, opinions, desires, ideas, and other types of information. This method is very popular in education, primarily for three reasons: versatility, efficiency and generalizability. (Mcmillan and Shumacher, 2006, p.233)

The sample

The sample consisted of one-hundred five first year pre-service primary science teachers (aged 17-23 and 66% male, 34% female) enrolled in the Science Teacher Training Department at AIC University, Turkey.

Data collection tool

To reveal student understanding of lunar phases and eclipse, six open-ended questions developed in consultation with the literature (Bekiroglu, 2007; Trumper, 2001; Sherrod and Wilhelm 2009) were developed by the researchers. All questions were piloted and required modifications were made prior to the administration. The content validity of the questions was assessed by the researchers. The questions are about:

The cause of the phases of moon

The cause of the moon's rising while the sun is setting in evening

The cause of why we always see the same face of the moon

Lunar eclipse (illustration)

Tide phenomena

The phases of the moon in different locations on the earth in same day.

Analysis of data

The students' written responses were read individually by the researchers and categorized (see Table 1 and 2) with respect to the scheme developed by Haidar and Abraham (1991). The reading of students' written responses by the three researchers aimed to check the reliability of the research. The similarity of the findings from three researchers suggested consistency in the analytical process. The findings, which were originally Turkish, were translated into English. The excerpts supporting the results from the written responses were given. Furthermore, chi square analysis was conducted to determine whether the differences in the number of responses observed for each response category result from random effects.

Table 1. The scheme developed by Haidar and Abraham (1991) to categorize student responses

Code.	The criteria used to classify the responses
R1	No response or no explanation
R2	No understanding: irrelevant explanations or answers such as "I do not know", "I have no idea" or " I do not understand"
R3	Misunderstanding: explanations that attempt to describe the target concept but do not match the scientific conception
R4	Partial understanding: incomplete but correct explanation
R5	Sounds understanding: explanation that includes all components of the science concept

Findings

From chi square analysis performed using data from Table 2 to determine whether variability of the response for each response category are statistically significant, it was established that the minimum expected value is 5.98 and there is no cell with an expected frequency less than 5. The analysis showed that the calculated statistics are significant at a level of 0.05 (χ^2 (20) = 21.09; p=0.00). It means that the observed frequencies differences among categories are not due to chance. And, the high frequency observed in code R3 could not be attributed to random effects.

Table 2. Distribution of pre-service teachers' responses to the response categories (N=105)

	R1**	R2	R3	R4	R5

Table 3. Individual misunderstandings identified from the student responses

	Misunderstanding identified (R3)	N	%
Q1*	The amount of the light coming from the sun to moon changes with times. So, the phases of moon appear	8	7.6
	Cause of the phases of moon is change of seasons	8	7.6
	The phases of the moon are due to the change in incidence angle of sun rays to moon.	9	8.5
	The phases of the moon are the result of rotation of the earth around its own axis	6	5.7
	The phases of the moon result from the difference between day and night durations	6	5.7
	The moon comes near to the earth and sometimes moves away. The phases of moon occur because the earth's shadow fall on the dark side of moon when they come close each other.	7	6.7
	When the earth passes between the moon and sun, the earth's shadow falls on a part of the moon, so the phases of moon occur	6	5.7
Total**		50	47.6
Q2	The cause of the rising of the moon in the evening and then falling is due to the fact that the sun comes close to moon or moves away from it	17	16.2
	The cause of the rising of the moon in evening and then falling is related to the rotation of the earth around the sun	11	10.5
Total		28	26.7
Q3	All surface of the moon is homogeneous. In fact we see all faces of the moon in time. It is an illusion	8	7.6
	In different countries, various faces of the moon are visible	8	7.6
	That the same side of moon always face the earth is related to the seasons	10	9.5
	We always see the same face of the moon, because rotation velocities of the earth and the moon are equal,	25	23.8
Total		51	48.6
Q4	Lunar eclipse takes place when the moon goes between the earth and the sun	32	30.5
	Lunar eclipse takes place when the sun goes between the earth and the moon	14	13.3
Total		46	43.8

Q5	Lunar tide is related to annual rotation of the earth	4	3.8
	Lunar tide is related to cooling and warming of air	4	3.8
Total		8	7.6
Q6	In different countries, different phases of the moon appear in the same night because of weather conditions.	9	8.5
	In different countries, different phases of the moon appear on the same night depending on the hemisphere in which a country is located	46	43.8
	In different countries, different phases of moon appear in the same night depending on the place line on which country is located	20	19
Total		75	71.4

*Q: Question number; N: The number of students; %: the percentage of students in proportion with the entire sample; **corresponds the numbers in R3 column in Table 2

As can be seen in Table 3, the analysis of student responses to the first question showed that fifty pre-service teachers, almost half of the sample, had significant misunderstandings of lunar phase and eclipse. It is apparent from the same table that they hold distinctive misunderstandings related to the cause of lunar phases, some of which is new in the literature. The percentages of misunderstandings encountered in the responses changes between 5.7 and 8.5. For this question, while only one student is at the "sound understanding" level, just three of them exhibit partial understanding, which is a rather low proportion. Findings of the analysis showed that the most prevalent misunderstanding is the idea that the "*phases of moon are due to the change in incidence angle of sun rays to moon.*" However, other misunderstandings were observed in the similar proportions within the sample. The results from analyses of question 2 indicated two prevalent misunderstandings: "*the phases of the moon are due to the fact that the sun come close to the moon or move away from it*" (16.2%) and "*the phases of the moon are related to rotation of the earth around the sun* "(10.5%)

When the results of question 3 are examined, four misunderstandings can be seen. It is clear from Table 2 that the number of students with sound understandings is rather low; just five students. However, the responses of 42 pre-service teachers were coded as "no response" and "no understanding". The analysis results regarding fourth question demonstrated that 13 and 4 students were classified as "no response" and "no understanding" levels, respectively, which are the lowest total numbers observed for the two categories in the table. A considerable number of them (forty two students) have partial and sound understandings. It appears that the majority of students (46 students) hold two common misunderstandings: "*Lunar eclipse takes place the moon go between the earth and sun*"(30.5%) and "*Lunar eclipse takes place the sun goes between the earth and the moon*"(13.3%). In question 5, the number of pre-service teachers categorized as "no response" and "no understanding" is 55 and 16, respectively, which are the highest values in the table, but a minority (7.6% in comparison with entire sample) demonstrated two misunderstandings. 7.6% of them thought that *lunar tide is related to annual rotation of the earth or to cooling and warming of air.*

The results from the analysis of the last question showed the highest number of misunderstanding, a total 75 students (71.4%). The majority of them (43.8%) hold the view that *in different countries, different phases of the moon appear in the same night depending on the hemisphere in which the country is located*". Again, 27.5% of them had the misunderstandings that "*in different countries, different phases of moon appear in the same night depending on the place on which country is located or weather conditions*. By considering the number of students with sound understanding and the total student number it was calculated that only an average of 13.5

(Table 3) pre-service teacher demonstrated sound understanding. A mean of 13.5 corresponds to only 12.9% of a total of 105 student teachers. It can be inferred that in comparison with 41%, the percentage (12.9%) of the students holding an acceptable, sound understanding is considerably low.

Discussion

Student teachers hold the idea that "the amount of the light coming from the sun to moon changes with times. So, the phases of the moon appear." It seems they think the amount of the sun rays reaching the moon decrease for unknown reasons. Some students incorrectly relate the phases of moon to the change in the incidence angle of sun rays to moon, instead of earth. Some of them explain the phases using the change of seasons, rotation of earth around its own axis, the difference between day and night durations and earth's shadow falling on the moon. The last explanation was also reported by previous researches (Bisard et al., 1994; Callison and Wright, 1993; Schoon, 1992). The following excerpts taken from written responses support this view:

I know that the amount of rays reaching to moon from the sun vary with time. This situation leads to moon phases we see in sky, such as half or full moon

I think that the phases of moon is resulted from gradual changes of four seasons

While moon move, depending on this situation, the sun send the rays to moon in varied angles

I think that if the earth had no rotation on it own axis there would no the phases of moon

Duration difference between day and night is the reason why the phases of moon occur

Earth' shadow is the main reason of moon phases

While moon approach to earth, shadow of earth begins to fall on moon surface. The more this overlap, the more much area of moon become dark

I think that its reason is movement of the earth into region between moon and the sun.

So, the earth in front of the sun gives rise to the shadow on the moon

The results from question 2 indicated that students believed that the rising and falling of the moon during the night is related to the fact that the sun comes close to moon or moves away from it, or rotation of the earth around the sun. Some quotations from written responses are given below as an example.

The moon arise in evening and then begin falling with respect to being close or far of the sun to moon

It is due to   rotation of earth around the sun

The findings from Third question revealed that although the valid knowledge that we always see the same face of moon is given in the question, eight students do not believe it and consider it to be false. Accordingly, one other group holds the view that various faces of the moon are visible for different countries. 25 students tried to explain this situation with reference to the equality of rotation velocities of the earth and moon. It is clear that they harbour an implicit misunderstanding: the moon move around its own axis. Some excerpts given below support this interpretation.

I don't believe that. In fact, we, due to gradual rotation movement of moon, see all surfaces in time.

I think it is dependent on location. For example, in USA, it can be seen a distinct side of moon from this place

It is not true. Thanks to the seasons, visible surface become constant

I ascribe it to equality of velocities of rotation of the earth and moon

From the analysis of question four it was found that misunderstandings about relative locations of sun, moon and earth during lunar eclipse were widespread. As can be seen in the excerpts below, while some students advocated the order sun-moon-earth, some of them preferred the order earth-sun-moon, both of which are significant misunderstandings, indicating students' knowledge levels of basic astronomical phenomena.

Whenever moon move between the earth and sun, lunar eclipse appear

The sun, during its rotation, sometimes is located somewhere between the earth and moon, then lunar eclipse occur

Question five aimed to explore how students relate tide phenomena to celestial movements. As can be seen in Table 3, students, although in low proportion, regard the cause of tide as the annual rotation of the earth or weather conditions, such as cooling an warming of air, which are newly encountered misunderstandings for pre-service teachers. The written responses given below represent this view.

I suppose it depend on rotation of the earth

It is resulted from weather situation such as warm or cool air

The last question intended to probe student teachers' understanding of whether, in different countries, different phases of moon appear in the same night. The results showed that majority of them predominantly believed there exist different phases of the moon on the same night in the skies of different countries. Excerpts below from responses represent this notion:

For example, in Japan, in the same night, somebody will see a different moon phase, because Japan is located in other side of the earth

I think it is related to the hemisphere. While I see a phase of moon in north hemisphere, someone will see another phase in other hemisphere.

Trumper (2003) acknowledges that students frequently come to their lessons having constructed their own explanations for many of the easily observed astronomical events, and that these children's notions are at variance with the accepted view. Some of the researchers (Parker and Heywood, 1998) agree that students' unfamiliarity with optics, geometry, and light is a main reason for the learning difficulty of the moon-related concepts. Again, Trundle et al. (2002) emphasized that students' conceptions of the lunar events might be related to their naïve knowledge and/or their understanding of some physics concepts. Physics and astronomy have topics that are highly spatial in nature i.e., electricity and magnetism, seasons, lunar phases. These topics are usually presented using two-dimensional 2D representations, some of which might reinforce preconceived ideas or introduce new misconceptions about the three-dimensional 3D system (Cid and Lopez, 2010). Students must grasp multiple concepts such as perspective, light, and angles as well as the waltzing motion of two astronomical bodies in order to adequately comprehend how the Moon's phases occur. To complicate matters, these young learners bring a hodge-podge of ideas to the classroom with which to express their understanding. Therefore, instruction of this complex phenomenon has proven to be challenging for teachers (Sherrod and Wilhelm, 2009). Cid and Lopez (2010) and Kavanagh et al. (2005) stressed that another problem of teaching basic astronomical concepts is textbooks. In textbooks, lunar phenomena usually are given in two-dimensional illustrations. They point out that the 2D representations can give rise to misunderstandings. So the mental manipulation of 3D images can play a role in developing students' understanding of these concepts.

Conclusions and Recommendations

The findings of this research revealed that student understandings of the phases of the moon and lunar eclipse are low and they hold some common misunderstandings. Only an average of 13.5 of them, making up 12.9% of

total number of pre-service teachers, demonstrated an acceptable, sound understanding. About half of them (41%) have common misunderstandings, suggesting that the undergraduates have considerable difficulty understanding the phases of the moon and lunar eclipses. The investigation of student teachers' misunderstandings is significant because of its contributions to the construction of new teaching approaches, which can take into consideration students' difficulties in learning scientific concepts (Azizoglu, 2006). The results of the study have the great importance of prospective teachers who will be teachers in the coming years and teach these concepts to many primary students, because their understanding will directly affect their primary students' understandings (Aggul Yalçin, 2012). This study identified a total of twenty misunderstandings held by pre-service teachers about the phases of the moon and lunar eclipses. The findings of the present study suggest that a revision of the traditional instruction approach used commonly in science courses and alternative teaching methods should be considered in order to enhance student understanding of science topics. It is clear that the lack of knowledge of fundamental concepts and issues may result in subsequent misunderstandings. Therefore, care has to be taken to establish solid knowledge of fundamental chemical ideas before teaching advanced ideas. It is important that prospective teachers develop conceptual understanding of science concepts, because they will teach those concepts on their own students in the near future (Aggul Yalcin, 2012). Although it is not appropriate to generalize the findings from this single, limited study, the results suggest that misunderstandings identified in this study can also be seen at other levels and in other grades.

PRE-SERVICE TEACHERS' NEED FOR COGNITION

Cagla Garipagaoglu[58], Hulya Kilic, Yelkin Diker Coskun

Yeditepe University, Istanbul, 34755, Turkey

Abstract

The purpose of this study is to investigate the level of pre-service teachers' need for cognition and to determine how it differs with respect to some variables. A total of 344 pre-service teachers (114 males and 230 females) from 4 different universities participated in this study. The data collected through Need for Cognition Scale which was developed by Cacioppo, Petty and Kao (1984) and revised by Demirci (1998). The findings revealed that pre-service teachers' need for cognition is high and it varies with respect to their class, frequency of doing search for their own sake and career planning.

Keywords: pre-service; need for cognition; career planning; scale; teacher education

Introduction

A rapid change in some areas such as technology, industry and economy entails some changes in the characteristics and qualifications of modern era citizens. Individuals are expected to be equipped with various kinds of knowledge and skills that enable them to adapt the changes and improve the quality of their lives. Among the others, high level of thinking skills including problem solving, decision making and critical thinking are the most desirable characteristics of modern era man. Because there are lots of parameters that potentially affect the quality of one's life, high thinking skills are required to cope with and manage those parameters wisely. In many countries, those thinking skills which are indicators of need for cognition are aimed to be developed during the school years. Although development of these thinking skills is one of the goals of the curricula of different subject areas, still there are students who do not want to think about issues in depth or solve problems or analyze a fact from different perspectives. In other words, despite of all the efforts to develop higher thinking skills and create an awareness of need for thinking, students' need for cognition is still relatively low. Therefore, teachers have a vital role in the improvement of high thinking skills and students' level of need for cognition.

Need for cognition is defined as an individual's intrinsic motivation to engage in and enjoy effortful cognitive activities (Cacioppo, Petty, & Kao, 1984; Petty, Brinol, Loersch, & McCaslin, 2009). People with high need for cognition are likely to enjoy solving challenging puzzles or problems, making research about a subject of interest and thinking about their own thoughts (Coutinho, Wiemer-Hastings, Skowronski, & Britt, 2005; Curşeu, 2011; Steinhart & Wyer, 2009). However, people with low need for cognition do not enjoy challenges, they do not want to think about any issues in depth and do not question about accuracy or validity of an argument (Coutinho et al. 2005; Petty et al., 2009). Although research findings revealed that internal factors such as personality, intelligence (Fleischhauer, Enge, Brocke, Ullrich, Strobel, & Strobel, 2010), and self-efficacy (Pillai, Goldsmith, & Giebelhausen, 2011) are more likely to affect the people's need for cognition, review of the literature indicates that there are also some external stimuli that have some potential to affect one's need for cognition. Among those, academic achievement (Sadowski & Gulgoz, 1996), social interaction (Curşeu, 2011), organization of learning environments, and the influence of teachers can be considered as one of the main antecedents to the students' need for cognition.

To foster students' thinking skills and need for cognition, teachers should be good models for their students such that they should discuss an issue from different perspectives, make conjectures and justify them, make interdisciplinary links, provide reasoning underlying the facts, relationships or formulas and give real life examples or applications. If teachers continue on using traditional teaching methods and do not allow students to question the reliability and validity of arguments and ask for their own reasoning, teachers cannot prepare their students for the requirements of the modern era. That is about educating people who can *think for themselves*. If the teachers themselves cannot think, it would be hardly possible to expect their students to *think for themselves*. Therefore, the aim of this study is to investigate the level of pre-service teachers' need for cognition and discuss how it differs with respect to some variables.

Methodology

Sample

A total of 344 pre-service teachers from 4 different universities participated in the study. The participants were from 12 different programs including teacher certificate program (n=17) and Master of Science in educational leadership (n=12). The other programs were Computer Education and Educational Technology (n=26), Elementary Mathematics Education (n=47), Secondary Mathematics Education (n=73), Elementary Science Education (n=13), Secondary Physics Education (n=15), Secondary Chemistry Education (n=24), Primary Education (n=48), Turkish Literature Education (n=30), English Education (n=17) and Guidance and Counseling (n=22). The age of the participants varied between 20 and 39.

Data collection and analysis

To collect data an 18-item Need for Cognition Scale was used. It was shorten by Cacioppo, Petty and Kao (1984) from the original scale. Gulgoz and Sadowski (1995) translated it into Turkish and Demirci (1998) changed the point scale of Likert-type items and made it 5-point scale. Then, the minimum score for the scale is 18 while the maximum score is 90. Demirci (1998) found the reliability of the scale as .89. In this study, the Cronbach alpha of the scale was found as .86.

To collect demographic information about participants, they were given a 14-item questionnaire. Their answers were categorized and analyzed with respect to their level of need for cognition. To analyze how need for cognition differed with respect to some variables, t- test or F-test was applied.

Findings

The major aim of the study was to investigate the level of pre-service teachers' need for cognition. The Need for Cognition Scale was used to determine that level. The descriptive statistics of the scale are given in table 1.

Table 1. Descriptive statistics about Need for Cognition Scale

Items	Mean	Std. dev.
Item 1	3.30	1.08
Item 2	3.52	0.94
Item 3	3.56	1.09
Item 4	3.92	0.99
Item 5	3.81	0.95
Item 6	3.65	1.03
Item 7	2.88	1.08
Item 8	3.72	1.00
Item 9	3.37	1.01
Item 10	4.00	0.88
Item 11	4.09	0.77
Item 12	4.06	0.92
Item 13	3.14	1.07
Item 14	3.62	0.97
Item 15	3.42	0.95
Item 16	3.23	1.18
Item 17	3.74	1.91
Item 18	3.66	1.91
Total	64.77	9.60

The minimum score that can be obtained from the scale is 18 while the maximum score is 90. The minimum score obtained was found to be 30 and the maximum score was 90 for the sample. Furthermore, the mean of the need for cognition for the sample was found to be 64.77 and the standard deviation was 9.30. According to Demirci (1998), the score which is above 61 indicates a higher need for cognition meaning that the participants enjoy activities requiring a lot of cognitive effort. Thus, the need for the cognition for the sample was high. The mean score (4.09) was found to be the highest for the item 11 "I really enjoy a task that involves coming up with new solutions to problems" and the lowest (2.88) for the item 7 "I only think as hard as I have to"

In the study we also investigated how the need for cognition differed with respect to some variables including gender, department, class, GPA, the frequency of reading periodicals, the frequency of doing research for their own sake, the willingness to pursue an academic career. No significant difference was found for the variables gender, department, GPA, and the frequency of reading periodicals as shown in table 2. On the other hand, a significant difference was found for the grade levels $(F(5,338)=3.29, p=0.006)$, doing research for their own sake $(F(4, 339)=3.331, p=0.011)$, and career planning $F(2, 340)=4.827, p=0.009$.

Table 2. Analysis of the need for cognition with respect to variables

		N	$\overline{X}$	Std. dev.	t/F
Gender	Male	114	65.53	8.68	1.040
	Female	230	64.39	10.02

	Not decided	128	64.25	8.51	

*p<0,05

Post-hoc analyses were conducted in order to determine the nature of differences between the grade levels, the frequency of doing research for one's own sake and whether or not the pre-service teachers have academic career planning. The findings revealed that senior pre-service teachers' need for cognition was higher than the junior pre-service teachers' need for cognition. In terms of the frequency of doing research for one's own sake, pre-service teachers who frequently do research apart from their course requirements seem to have higher need for cognition compared to pre-service teachers who occasionally do research beyond the scope of their courses. Furthermore, pre-service teachers who were willing to pursue an academic career tend to have higher need for cognition with respect to those who were not.

Conclusions

The aim of the study was to determine the level of pre-service teachers' need for cognition and investigate whether it differs with respect to some variables. The need for cognition was found to be high but it only differed with respect to a few variables which were grade level, frequency of doing research for their own sake and career planning. Although these findings were acceptable some of the findings were unexpected.

In Turkey, teacher education programs are mostly 4-year programs (secondary education programs are 5 years) and during the freshman year pre-service teachers are given courses that do not require much more

reading or investigation. They may not be aware of what becoming a teacher entails, how teaching and learning are related and what their responsibilities are. Furthermore, they may not have an intrinsic motivation to think thoroughly about issues related with their profession or about life. Therefore, it is expected that senior pre-service teachers' need for cognition is higher than the earlier levels. During the senior years, pre-service teachers begin to pay much more attention educational issues such as how students learn or how to teach more effectively. They may begin to feel a concern about becoming a teacher which makes them to read or investigate more about teaching and learning. Thus, they may feel an intrinsic motivation to think about educational problems and possible solutions. The distinction between grade levels is partially supported in Tok's (2010) study. She administered Need for Cognition scale only to freshman students in the early childhood program and found that their need for cognition was low. Although she did not make a comparison between grade levels, her finding was expected because of the reasons discussed above.

As discussed in the literature, making research about a subject of interest is a characteristic of an individual with high need for cognition (Coutinho, Wiemer-Hastings, Skowronski, & Britt, 2005; Curşeu, 2011; Steinhart & Wyer, 2009). This fact is also supported in this study. A significant difference was found between the needs for cognition of pre-service teachers who frequently or occasionally do research for their own sake. It might be due to the fact that students who frequently do research in line with their own subject of interest will more likely to encounter with the opportunities that will increase their curiosity, motivation and awareness to learn further. Moreover, because pre-service teachers who plan for academic career need to think about what problem they will investigate or how to contribute to the field, their level of need for cognition was higher as expected. However, we did not find a significant difference between the need for cognition levels of pre-service teachers who follow periodicals like newspapers, academic or non-academic journals and who do not. This may be because of not asking whether they follow them or not but asking them to indicate how frequently they follow.

Although Sadowski and Gulgoz (1996) and Coutinho et al. (2005) found a positive relationship between academic performance and need for cognition, in this study it was not observed. It might be because of using GPA scores to represent achievement instead of using a common instrument to measure academic performance. Because the participants were from different universities, GPA scores were not standardized which leads a fallacy to interpret the students' academic performance.

Briefly, need for cognition is an intrinsic motivation to engage in activities require high cognitive effort. Because people with high need for cognition likes solving challenging puzzles and problems, making research about subject of interest, analyzing an issue from different perspectives and looking for justifications of arguments, it is likely be one of the qualifications of modern era citizen. Teachers should attempt to increase students' need for cognition level by being a good model for them. Therefore, teacher training programs should provide opportunities for pre-service teachers to be aware of their level of need for cognition and to increase it if it is low.

Abstract

Rituals are a part of everyday life (Quantz & Magolda, 1997) and they also appear in experiences in educational institutions. National holidays, pupil oaths, reading festivals, and flag-raising ceremonies are the rituals which appear in classrooms, schools, and educational environments can be taken into consideration. This paper aims to examine pre-service teachers' perceptions about ritual in education and rituals' functions. Rituals as national holidays and Independence March have been perceived as positive by pre-service teachers. On the other hand, rituals to control the outfit and taking teacher as an authority figure have been perceived as negative by pre-service teachers. In addition to these, according to pre-service teachers' perceptions, rituals have both positive and negative impacts.

Keywords: Rituals, rituals in education, rituals' functions, pre-service teachers

1. Introduction

According to Durkheim, ritual is a set of rules which determine people's behavioral attributes in the presence of sacred things (Meseci, 2007). Rituals are not separate from everyday life, have function to shape the social structure and to connect community members to each other from the most primitive society to the most modern society. Rituals, both in primitive societies and modern societies make people be a member of community and society (Quantz & Magolda, 1997; Meseci, 2007; Campbell & Moyers, 2010).

Ritology field (interdisciplinary ritual studies field) has stressed the meaning and the function of ritual so much. Is ritual a social function as some of the Durkheimians argue or is it a social process as the Turnerians suggest? Is it used to maintain the status quo or is it used to let transformation? Is it limited to sacred events or is it related to secular events as well? Is it related to only ceremonial, special events (e.g.: commencement day) or is it related to everyday events (e.g.: shaking hands, waving) (Quantz, 1999)? Beyond these questions ritual has defined in this study like this: Rituals are patterned symbolic demonstrations and a set of symbols which not only constitute institutional unity and cooperation but also manage the differences like hierarchy, position, function and power (Meseci, 2007).

1. 1. Rituals in Education

Ritual as a variable in school's interaction primarily handled in Bernstein, Elvin and Peters' (1966) study. After this study, rituals started to densely focus on schools and the process of education (Warnick, 2010). Maloney (2000) has studied rituals of three preschool teachers in three preschool institutions, Göhlich and Wagner-Willi (2001) has studied rituals of everyday events in three preschool classes and meanings of these rituals, McCadden (1997) has studied rituals in kindergartens at North Carolina. Bushnell (1997) has examined the role of school rituals in parent involvement; Magolda (2000) has examined the function of campus tour ritual. Besides these, Meseci (2007) has studied rituals in Turkish educational system with the theoretical approach.

Bernstein, Elvin and Peters have mentioned that school transmits two cultures: Instrumental culture and expressive culture. Instrumental culture is related to academic and vocational skills. On the other hand, expressive culture is related to transmission of norms and values. Rituals are more related to expressive culture. Rituals can be divided into two groups according to their functions: Consensual rituals and differentiating rituals (Bernstein, Elvin & Peters, 1966).

Consensual Rituals

Consensual rituals are the ones function so as to bind together teachers, managers, staff members and pupils as a moral community, as a distinct collectivity. These rituals give the school permanence both in terms of time and place, recreate the past in the present, project it into the future, and create common ideals and identities. Consensual rituals help the integration of various school goals and socialization of parents into the school community. Hence, stakeholders internalize the values of the school and experience these values as a unity. Generally the consensual rituals consist of assemblies, ceremonies of various kinds to revivify historical contexts and other symbolic features. Beginning the school day with national anthems, oaths and songs; national holidays can be given as the examples of consensual rituals (Bernstein, Elvin & Peters, 1966; Meseci, 2007; Quantz & Magolda, 1997; Bushnell, 1997).

Differentiating Rituals

Differentiating rituals are the one which distinguish the groups in the school from one another usually in terms of age, sex, hierarchy or social function. While some of these rituals exclude some groups from school community and the others deepen the respect to the authority. Differentiating rituals deepen the boundary and the distance between unequal members of the school community. However, these rituals control of dual loyalties and the ambivalence, increase the commitment to the basic values. Standing up when the teacher comes in to the classroom, raising hand before talking about something during the course, the school uniforms, the classroom materials, like the chair of the teacher increase the distance between the teacher and pupils can be given as the examples of differentiating rituals (Bernstein, Elvin & Peters, 1966; Meseci, 2007).

2. Purpose of the Study

This study aims to examine pre-service teachers' *(who are educating at Kocaeli University Faculty of Education in Turkiye)* perceptions about rituals in education and rituals' functions.

3. Method

A descriptive model was used as the research model by researchers. Descriptive model is a research approach which aims to describe a situation in the past or in the present (Karasar, 2005). And also, in this research pre-service teachers' perceptions about rituals were described as it was by the researchers.

3.1. Study Group

Study group consists of senior students of Primary School Teaching Program and English Language Teaching Program at Kocaeli University in the Faculty of Education. Pre-service teachers who wanted to participate in the study voluntarily took place in the study group. Researchers gave form to 81 participants, and after checking them 74 forms were found appropriate and analyzed.

3.2. Instrumentation

Instrumentation consists of two parts. First part of instrumentation includes questions which are about demographics. The second part of it includes four open-ended questions to examine pre-service teachers' perceptions about rituals in education and rituals' functions. There is a ritual definition by Meseci (2007) at the beginning of second part of instrumentation (*Rituals are patterned symbolic demonstrations and a set of symbols which not only constitute institutional unity and cooperation but also manage the differences like hierarchy, position, function and power).* Researchers collected the data from the pre-service teachers via this instrumentation. While preparing the instrumentation, a draft form was reviewed by an expert who works at Educational Sciences Department, and some corrections were done based on the opinions of that expert.

3.3. Data Analysis

Data regarding pre-service teachers' perceptions about rituals in education and rituals' functions were analyzed and categorized qualitatively. First, researchers analyzed the data independently during coding. Then they came together to compare codes. They used consensus codes directly. Non-consensus codes were discussed, and they reached an agreement on the non-consensus codes. Data were read again via codes. Then it was classified according to the content similarities. At the end, the researchers named each classification, and they reached the main themes (Padgett, 2008). While findings based on open-ended questions are being presented frequencies of codes and themes are given. For this reason, the number of participants and the total frequency are not the same.

4. Findings

In this study, data were collected from 74 pre-service teachers *(women:58, men:16)*. These pre-service teachers were the senior students of Kocaeli University in the Faculty of Education, and 48 of them have studied English Language Teaching Program, 26 of them have studied Primary School Teaching Program.

The participants in this study got their education *(except higher education)* in all regions of Turkiye. 41 of them educated in Marmara Region, 11 of them educated in Black Sea Region, 6 of them educated in Southeast Anatolia Region, 6 of them educated in Central Anatolia Region, 3 of them educated in Aegean Region, 3 of them educated in Mediterranean Region, and 3 of them educated in East Anatolia Region. On the other hand, one participant educated *(except higher education)* outside Turkiye *(Central Asia)*. Based on this finding, it can be said that data were collected from the participants who educated in different regions of Turkiye.

Table.1 displays the answers of pre-service teachers to the first open-ended question: *"List the rituals which have affected you positively during your education processes except higher education."* Rituals which are shown on the Table.1 are the frequent answers in the data.

Table 1. Rituals which are perceived as positive by pre-service teachers

Ritual	Frequency (f)	(%)
Independence March	45	% 25.86
Andimiz (Pupil oath in Turkiye)	19	% 10.92
23rd of April	14	% 8.04
National holidays	13	% 7.47
Uniforms	10	% 5.74
The week of domestic goods	9	% 5.17
19th of May	9	% 5.17
Reading festival	7	% 4.02
Flag-raising ceremony	7	% 4.02

45 of pre-service teachers have stated that their perception to Independence March as positive. Another frequent ritual in the participants' answers is *"Andimiz"*. *Andimiz* is a pupil oath read by pupils in unison during primary schools' morning ceremony. Some of the other rituals perceived as positive by participants are 23rd of April *(National Sovereignty and Children's Day)*, national holidays *(23rd of April, 19th of May, 29th of November)*, the pupil's uniform, the week of domestic goods *(this is a week that people encouraged to consume domestics)*, 19th of May *(Commemoration of Ataturk, Youth and Sports Day)*, reading festival *(this is a holiday which organized for first classes of primary schools at the end academic year)* and flag-raising ceremony *(this ceremony is performed at the beginning of week and at the end of week)*. Table.2 shows the themes which are related to pre-service teachers' positive perceptions about rituals.

Table 2. The themes which are related to pre-service teachers' positive perceptions about rituals

Ritual	Frequency (f)	(%)
Marches & Oaths	64	% 36.79
National Holidays	41	% 23.56
Ceremonies & Carnivals & Entertainments	37	% 21.26
Formal Structure	17	% 9.78
Activities	10	% 5.74
Reinforcements	5	% 2.87
Total	174	% 100

As shown in Table.2, most of the pre-service teachers perceive marches (e.g.: Independence March), oaths (e.g.: Andimiz: a pupil oath which is read by pupils in unison during primary schools' morning ceremony), national holidays (e.g.: 19th of May), ceremonies (e.g.: commencement day, flag-raising ceremony), carnivals and entertainments as positive. In addition to these rituals; formal structure in schools (school rules, wearing uniform), activities in the schools and outside the schools (e.g.: school trips) and reinforcements from teachers to pupils (e.g.: giving red ribbon to successful students) perceive as positive by some of the pre-service teachers.

Table.3 presents the answers of pre-service teachers to the second open-ended question: *"Which features and which functions of these rituals affect you positively?"* Features and functions which are shown on the table.3 are the frequent answers in the data.

Table 3. Rituals' positive functions according to pre-service teachers' perceptions

Function	Frequency (f)	Quotation
Strengthening national consciousness	48	"Singing Independence March in unison has strengthened my national senses."
Socialization	13	"Activities during national holidays have socialized me."
Increasing self confidence	7	"Memorizing Andimiz and reading it in front of whole school community has increased self confidence."
Creating equality	7	"I can say that uniforms decrease the social gap between rich and poor."
Increasing motivation	6	"These activities have motivated me generally."

According to pre-service teachers' perceptions; rituals strengthen national consciousness of pupils, contribute to their socializing, and increase their self confidence. Furthermore, it can be said that rituals create social equality, increase pupils' motivation for educational processes. The themes related to perceptions of pre-service teachers about rituals' positive functions are given in Table.4.

Table 4. The themes which are related to perceptions of pre-service teachers about rituals' positive functions

Function	Frequency (f)	(%)
Providing unity, togetherness and equality	58	% 56.31
Positive impact on personality development	20	% 19.41
Socialization	15	% 14.57
Others	10	% 9.71
Total	103	% 100

Table.4 shows that according to pre-service teachers' perceptions; it can be mentioned that rituals contribute to unity and togetherness in societies. Rituals can also contribute common ideals and identities, too (Quantz & Magolda, 1997). Moreover, Deal and Key declare that during the rituals pieces combine with the whole, I unite with we(Sisman & Kucuk, 2011). Besides, it can be thought that rituals are the rites and symbols that contribute to the social equality, have positive impact on personality development of pupils, and their socializing.

Table.5 displays the answers of pre-service teachers to the third open-ended question: *"List the rituals which have affected you negatively during your education processes except higher education."* Rituals which are shown on the table.5 are the frequent answers in the data.

Table 5. Rituals which are perceived as negative by pre-service teachers

Ritual	Frequency (f)	(%)
Outfit control	15	% 15.95
Uniforms	14	% 14.89
School rules	13	% 13.82
Teacher as an authority figure	12	% 12.76

As displayed in Table.5, the pre-service teachers perceive the outfit control and the school rules such as wearing a uniform as negative. At the same time, teacher as an authority in educational environment is perceived as negative by the pre-service teachers.

Table.6 presents the themes which are related to pre-service teachers' negative perceptions about rituals.

Table 6. The themes which are related to pre-service teachers' negative perceptions about rituals

Ritual	Frequency (f)	(%)
Formal structure	54	% 57.45
National holidays	18	% 19.15
Ceremonies and activities	8	% 8.52
Marches and oaths	7	% 7.44
Others	7	% 7.44
Total	94	% 100

As presented in Table.6, most of the pre-service teachers perceive formal structure in schools *(school rules, uniform, outfit control, teacher as an authority figure)* as negative. However, it can be said that less than half of the pre-service teachers perceive some national holidays, some ceremonies and activities as negative.

Table.7 shows the answers of pre-service teachers to the fourth open-ended question: *"Which features and which functions of these rituals affect you negatively?"* Features and functions which are shown on the Table.7 are the frequent answers in the data.

Table 7. Rituals' negative functions according to pre-service teachers' perceptions

Function	Frequency (f)	Quotation
Physical fatigue	14	"Standing up with other pupils while principal's speech."
Uniformity	13	"I think that uniform makes pupils the same."
Scolionophobia	7	"Authoritative teachers cause phobia about schools."
To estranged from school	7	"Obligations have bored and estranged from school me."

As shown in Table.7, rituals may cause physical fatigue for students, uniform the pupils, create scolionophobia (Sisman & Kucuk, 2011), and estranged from school.

The themes which are related to perceptions of pre-service teachers about rituals' negative functions are given in Table.8.

Table 8. The themes which are related to perceptions of pre-service teachers about rituals' negative functions

Function	Frequency (f)	(%)
Contributing negative attitude towards school	20	% 30.31
Physical fatigue	14	% 21.21
Uniformity	13	% 19.7
Negative impact on personality development	8	% 12.12
Others	11	% 16.66
Total	66	% 100

As presented in Table.8, rituals can contribute negative attitude towards school and cause physical fatigue for students. Furthermore, it can be said that rituals uniform the pupils, affect them negatively because the pupils' creativity and freedom are limited by rituals.

5. Conclusion

According to pre-service teachers' perceptions, it may be said that rituals have both positive and negative impacts on pupils and their learning-teaching processes. Pre-service teachers have mentioned rituals' consensual and differentiating functions. This finding is similar to the finding of Bernstein, Elvin & Peters' (1966) study and Meseci's study, that is, two functions, in other words two categorization of rituals *(consensual, differentiating)*. Moreover, with regard to the pre-service teachers' perceptions, the same ritual *(e.g.: uniform)* can be both positive functioned ritual and negative functioned ritual. Thus, it can be said that rituals is related to both cooperation and disintegration (Meseci, 2007).

Pre-service teachers in study group perceive rituals as positive, for providing unity, togetherness and equality in societies; rituals' positive impact on pupils' personality development and socialization. However, rituals have been perceived as negative by some of the pre-service teachers. Since, some of the rituals have contributing negative attitude towards school, cause physical fatigue, uniform the pupils and affect negatively pupils' personality development.

In this study, rituals have been examined based on pre-service teachers' perceptions and the study is limited to the data that is gathered from them via a form. Rituals and rituals' functions can be examined in ethnographic researches that have study groups consist of pupils, teachers and administrators, too. Respective researches may be designed for each ritual as part of this study or other than this study.

PROJECT-ORIENTED STUDY AT THE CZECH TECHNICAL UNIVERSITY IN PRAGUE, FACULTY OF TRANSPORTATION SCIENCES

Jan KRCAL^{a}, Lucie KRCALOVA$^{a\,60}$, Michal JERABEK^{a,} Zdenek VOTRUBA^{a}

^{a}Czech Technical University in Prague, Faculty of Transportation Sciences, Konviktska 293/20, Prague 11000, Czech Republic

Abstract

The article discusses project-oriented study at the Czech Technical University in Prague, Faculty of Transportation Sciences. Study with project-oriented component prepares students of bachelor and master study programmes for their careers by exposing them to concrete problem-solving already during the course of their studies. Work on a project, i.e. on a real task commissioned by an external entity, requires students to apply acquired practical knowledge. Inseparable part of the practical problem-solving is team work with other students, academics and scientists. Project study reinforces preparation of students for solving expert problems in their future jobs and thus significantly increases their employment potential.

The article further discusses advantages and disadvantages of project-oriented study and statistical data from the last three project recruitments.

Keywords: project-oriented stud;, praxis; team work

Background

Transportation is a set of processes whereby persons, objects, energy and information are transferred in time and space. As an independent scientific and technical field, transportation studies are interconnected with other areas, such as technology of transportation routes and means, telecommunication systems and equipment, technological and economic aspects of management or maintenance of transportation routes and means, which can also be studied at the Czech Technical University. The basic methodology employed in the independent engineering field of transportation is a systemic approach, whereby general matters are related to the specifics in areas such as transportation routes, transportation means and mutually-interconnected operational or logistical systems.

Project-oriented study

Academic programme at the Faculty of Transportation Sciences (FTS) provides its students not only with the theoretical knowledge – indispensable for the future experts, but importantly also focuses on application of this knowledge into practical life. Students are exposed to this approach from the very beginning of their studies, ensuring the interface between theory and praxis. Project-oriented study provides the future graduates with an opportunity to take part in solving practical tasks already during the course of their studies. This prepares them for the challenges they will encounter in their professional lives.

Graduates with prior exposure to practical aspects of the field are better positioned to succeed on the job market. The ability to solve project-related tasks is an invaluable experience not only for managerial positions,

^{60} Corresponding author. Tel.: +420-22435-8411; fax: +420-22435-9534.
E-mail address: novotluc@fd.cvut.cz.

but also for careers in the public or private sector. Work on a project gives students opportunity to acquire habits of team work, sense of responsibility for own work, as well as an appreciation of the fact that their work contributes to the overall output of the entire team. Ideally, students should work on long-term projects commissioned by external entities and in cooperation with doctoral students, academic and scientific staff.

At the FTS, project-oriented study takes a form of specialized courses for all full-time students in the bachelor or master programmes, with the exception of future professional pilots and majors in Technology of Aviation Maintenance). Offer of such courses at the FTS is broad, covering a wide spectrum of professional fields. Currently, project-oriented study courses in Czech are offered in the following areas:

Bachelor study programme:

- Automation and Informatics
- Transportation Systems and Technology
- Intelligent Transport Systems
- Air Transportation
- Management and Economics of Transportation and Telecommunications

Master study programme:

- Safety of Transportation Vehicles and Infrastructure
- Security of Information and Telecommunication Systems
- Engineering Informatics of Transportation and Communication
- Transportation Systems and Technology
- Management and Economics of Transportation and Telecommunications
- Logistics, Technology and Management in Transportation
- Air Traffic Control and Management

In addition, the master study programme offers two fields of study in English:

- Intelligent Transport Systems
- Transportation and Logistic Systems

In the bachelor study programme, which now comprises only three years, students choose projects within their specialization in the third semester. In the subsequent two-year master study program, students choose their projects already upon applying. Students need to pass an examination to participate in projects which are in great demand. Last year, FTS offered 121 projects in Prague and 15 projects in Děčín in the bachelor study program and 142 projects for the subsequent master study program.

Each project should be linked to an external entity in the public or private sector. Students are greatly interested, for example, in projects undertaken in cooperation with the automobile industry. Projects undertaken in cooperation with the Ministry of Transportation or the Road and Highways Authority also bring interesting results.

Work on a project is a good opportunity to take part in genuine problem-solving, tied directly to the work of the commissioning entity. Both students and the commissioning entities can profit from these arrangements. For example, companies can recognize the students´ abilities during their participation on a project. As a result, students can start to work in a company already while studying, hence securing their future professional position. In addition, project cooperation with external entities can be a source of important financial means for the FTS, which can further contribute to the development of the Faculty and the entire University.

SWOT analyses of project–oriented study

SWOT analysis is an effective method for recognizing the strengths (S), weaknesses (W), opportunities (O) and threats (T) of a given project-oriented study. Lessons-learned can be elaborated based on this analysis. FTS used this analysis with the following results:

S (Strengths)

1. Students acquire basics of the field based on the combination of procedural and theoretical approach.
2. Students master in depth a sub-field of their project, both on the level of theory and practical processes and skills.
3. Students acquire approaches necessary for engineering work, including ability to finalize a project.
4. Students learn to work and communicate in a team.
5. Students have an opportunity to familiarize themselves with the professional environment, in which they are likely to work after completion of their studies.
6. Knowledge acquired during participation in a project is advantageous for future doctoral students.
7. Project leader works with a young team.
8. Senior students share their experiences with their junior colleagues.

W (Weaknesses)

1. Time dedicated to a project is limited and may not provide space to penetrate the topic in sufficient depth.
2. Participation in a project prolongs the time necessary to complete the studies.
3. Project-oriented study is time-consuming for the project instructors, which need to work with the students individually.
4. Given points II and III, project-oriented study is resource-demanding.
5. Students are not sufficiently skilled or mature for this type of work, especially towards the beginning of their studies.
6. Projects, which are carried out at the university premises, put demands on the quality and on laboratory equipment.
7. Projects bring the expected results only when they are "multi-generational," that is when they involve participation of students from different grades with different level of knowledge and skills.
8. It is difficult to find motivation for working on a project without financial reward, especially with increases in livelihood costs and for students who work during their studies.

O (Opportunities)

1. For external entities involved in projects:
    1.1. Students´ project-related work can create synergies with research work of the school and economic activities. Cooperation contributes to deepening of mutual understanding of the differences between academic and corporate/organizational environments.
    1.2. Narrows down recruitment demands and desired profiles of job seekers.
    1.3. Ensures managed recruitment of graduates, which are familiar with the inner functioning and culture of corporations and organizations.
    1.4. Corporations and organizations can influence choice of topics and focus of projects.
    1.5. Adaptation of graduates to the new working environment is faster.
2. Students´ theses which are related to the project can be qualitatively enhanced and often directly usable beyond the academic sphere.
3. Students who work on a project experience the so-called "spontaneous self-learning effect" – natural study and self-education by following a good example, alternatively by avoiding a bad example by analyzing

lessons learned. This effect generally arises in teams of students at different levels and in motivating work environment with a vital element of creativity.

4. Financially rewarded work on a project is more interesting for a student.

T (Threats)

1. Project instructors are not motivated or their motivation decreases over the course of the project under the level required for this type of instruction.
2. Cooperation between the external entities and university is not obtained or disappears.
3. Lack of necessary resources.
4. External instructors engaged in the projects prefer their employers´ approaches and interests over the academic needs. This could compromise the "market neutrality" of the university.
5. Limits posed by infrastructure, for example by legislation.

SWOT is helpful in indicating not only the strengths of the project-oriented study, but also its weaknesses, which the FTS can transform into strengths. Identification of threats is instrumental for trying to avoid them.

Statistics related to competitions for student projects

The following tables show statistical data of the projects offered in different fields of study, the capacity offered to students, and numbers of actually admitted students. The tables are divided into bachelor and master studies. They also indicate the general interest of students in different fields offered by the FTS.

All tables should be numbered with Arabic numerals. Headings should be placed above tables, left justified. Leave one line space between the heading and the table. Only horizontal lines should be used within a table, to distinguish the column headings from the body of the table, and immediately above and below the table. Tables must be embedded into the text and not supplied separately. Below is an example which authors may find useful.

Table 1. Statistics of tenders for bachelor's projects in Prague

Statistics students on projects - master study programme
Conclusion

Project-oriented study at the FTS for bachelor and subsequent master study programmes is unequivocally beneficial and plays an irreplaceable role in education. It prepares students for successful careers, since it gives them an opportunity to engage in genuine problem-solving already during the course of their studies. Their work has a specific impact on the external commissioning entity. FTS graduates therefore possess not only the theoretical knowledge, but also have an experience in application of this knowledge. Such approach is vital especially today, when companies and organizations are interested in recruiting primarily experts with prior work experience. FTS answers these demands. It is therefore not surprising that according to studies carried out in 2011 [see references], FTS belonged to the five schools whose graduates did not face any difficulties when entering the job marked. Project-oriented has played a significant role in this.

QUALIFY STUDENTS TO BECOME FAMILIAR WITH BEING A EUROPEAN EMPLOYEE EUROPEAN CITIZENSHIP AND THE FREE MOVEMENT OF EMPLOYEES

Mohammed Shamsul Arifin, Alexander Maschmann

From a juridical point of view "citizenship of the union" (European citizenship) means: "Any person who holds the nationality of an EU country is automatically also an EU citizen." (KOM 2010 a, p. 4). One of the greatest achievements for the citizens of the EU is to have the right to move and reside freely within the territory of the EU. National citizens enter the European stage as – cross boarder – tourists, costumers, consumers, employees, inhabitants, students etc. An increasing number of EU citizens took advantage of this freedom. Most of them changed their residence towards another EU country for employment purposes. Although people are well aware of their right to move and to reside freely within the territory of the EU, a lack of awareness and understanding is identifiable concerning that to be a European employee is an appearance of European citizenship. This chapter tends to give students a better sense of what it means to be an EU citizen according to this essential aspect.

The nature of the right to move freely

Fundamental for this development referring to European citizenship is "(…) the right to move freely around the European Union and settle anywhere within its territory" (KOM 2010 a, p. 4). Taking a closer look at this freedom, leads to a remarkable detail concerning the nature of this fundament of European citizenship. For workers and self-employed persons this freedom is valid without any conditions. In contrast, students have – among other conditions – to make sure that they "(…) have comprehensive sickness insurance cover (…)" and to proof "(…) that they have sufficient resources for their self and their family not to become a burden on the host EU country's social assistance system during their residence (…)" (KOM 2010 a, p. 4).

In its basic nature, the right to reside in another EU country is valid only for three month, for job-seekers the maximum period of stay is six weeks and actually unconditional only for employees or self-employed persons or citizens with sufficient resources. The right for workers to move and stay freely within the territory of Member States for the purpose of employment or application for employment, respectively, is founded in the union policy of establishing and ensuring the functioning of the EU Single Market (Internal Market) (cf. TFEU 2010, article 26 2. and 45 1.). Obviously, it is shaped as a right for every European working citizen but on the other hand it is formulated as a duty for the EU Member States and their authorities:

"Such freedom of movement shall entail the abolition of any discrimination based on nationality between workers of the Member States as regards employment, remuneration and other conditions of work and employment." (TFEU 2010, article 45 2.)

Notable at this point is that nationality or national citizenship, respectively, is something to be potentially discriminated against. The motive to enhance the free movement of professionals seems to be determined by economic reasons according to the realization of the Single Market. In this case the conclusion could be drawn that economical impacts have been more defining in the process of building a European community than the intention to advance the civil rights of EU citizens.

The first European community after the Second World War, quasi accepted as nucleus of the European unification, is the European Coal and Steel Community (ECSC) which was founded in 1951 by Belgium, France, Germany, Italy, Luxemburg and the Netherlands. Irrespective of the consideration about a European citizenship, there has already been a focus on the concept to interdict any discrimination based on nationality in case of employing workers from other Member States:

"Member States undertake to remove any restriction based on nationality upon the employment in the coal and steel industries of workers who are nationals of Member States and have recognised qualifications in a coalmining or steelmaking occupation (…)" (ECSC 1951, Art. 69 1.).

In the current treaty on the functioning of the European Union are both – the civil right and the discrimination interdiction – fundamental for being a European employee (cf. TFEU 2010, article 45, 1. and 2.). For the sake of completeness it has to be said that this provisions only apply to non-public service employment (ibid. 4.). Nevertheless, the free movement for workers could be seen as a great and actual improved achievement.

The awareness and utilization of free movement

The juridical point of view is a more technical aspect of European citizenship. For shaping a European community it is also important to take soft aspects into regard as for example the awareness of being an EU citizen. In every day life many people come in contact with evidences of European citizenship, e. g. European driving license, European currency and European product labels. But to which extent are people familiar with the

basic element "free movement" within the territory of the EU? The European Commission is regularly monitoring these kinds of soft aspects of European citizenship. As shown in figure 1, there is already a great awareness of it among the EU citizens. Compared to earlier numbers, the percentage of "citizens being well aware" is constantly increasing up to an even higher level.

To be aware of something is an important basis for a successful development, but is the possibility to move freely utilized at the same level?

Fig. 1: KOM 2010 b, p. 23 in excerpts

In fact, there are two groups of EU citizens which are using this freedom.

In first place those should be mentioned, who are migrating to another EU Member State. In 2009, already 11,937.22 EU citizens residing in another EU Member State (Eurostat 2011 a, Table 2.18) have been reported. Each year, about two million and the number is constantly increasing as well (Eurostat 2011 b, p. 4). It is worth it to take a closer look at the reasons that are given for moving to another EU state. Nearly half of the migrants are naming concrete work related reasons and about a quarter educational purposes (KOM 2010 c, p. 6). It could be assumed that after an education in another Member State, a significant number of students will stay as well with the intention to work. Among the remaining migrants, a significant group of those can be found who followed a family member that moved because of work-related purposes (ibid.). Identifiable in this context is that the majority of EU citizens migrating into another EU Member State have a direct or indirect employment purpose.

The second increasing group of EU citizens using the free movement are the so-called cross boarder commuters (cf. KOM 2009, p. 24). They take advantage of staying resided in their previous home country and working independently or being employed in a bordering EU country. It could be seen as a concurrence between two EU countries or even as a conflict about workforce resources but in most cases it is an advantage for both the countries as cross boarder commuting fosters the prosperity on both sides of the boarder. Furthermore, these so-called EU Regions are the fields of performance of European integration and thus also for European citizenship.

The migrations of employees and cross boarder commuting are achieving a contribution to harmonise the labour and living conditions of EU citizens. Simultaneously, a substantial area of conflict between the goal to develop a balanced European community and the existence of evolved national shaped systems – e. g. social insurances, family care, and qualification structures – is uncovered. For the single citizen this brings along a lot of challenges he has to cope with. Both kinds of utilization of the free movement are increasing but what is about the awareness of the challenges? Do EU citizens know what they should be prepared for when changing the home or working country? To illustrate the dimension of the difficulties that could be expected, some features about living and working in Germany are depicted exemplarily in the following chapter.

Living and working in Germany

Pupils who are planning to move from one EU Member State to another, almost all of them are aware of their right to reside and work in any Member State of the EU. This right is considered the fundamental right of EU citizens and one of the main advantages of EU membership. However, some questions may arise about the true nature of this right, particularly whether it applies equally to all EU members. This is because citizens of the newer EU Member States face work restrictions in certain countries. Nevertheless, before planning to move to Germany it is better to do a migration check**.** It will provide you a first orientation whether you will be able to obtain a work permit in Germany or not.

What needs to be known before move to Germany?

If you come from a country within the European Union, Switzerland, Liechtenstein, Norway or Iceland, you can live and work in Germany without any restrictions. However, Bulgarian and Romanian EU citizens may only have recourse to the basic European principle of free movement for workers after a transitional period. During this transitional period – up to 31 December 2013 at the latest – Bulgarian and Romanian workers may only engage in employment if they hold a permit from the Federal Employment Agency and likewise, employers may only hire those in possession of such a permit. The permit may be issued either as a full EU work permit or as a restricted EU work permit. Full EU work permit (*Arbeitsberechtigung-EU*) provides unrestricted access to the German labour market. An entitlement may be conferred, for example, after an uninterrupted twelve-month period of employment in Germany or to family members of a German citizen. Restricted EU work permit (Arbeitserlaubnis-EU), it is contrary to the full EU work permit, the duration and scope of a restricted EU work permit is limited.

When someone from a non-European country is planning to work in Germany, it is a big challenge for him/her. If he/she acquired a university degree at a German university, a work permit may be granted upon a specific employment contract. If he/she did not acquire a university degree in Germany, it is basically not possible to grant a work permit.

Before applying for work in Germany

If you have completed a course of study or a vocational course of training abroad and would like to work in Germany in the profession for which you have been trained, it is important to determine whether the qualification you have acquired abroad is recognised as equivalent to a German qualification or is professionally recognised. The portals *www.berufliche-anerkennung.de* and *www.enic-naric.net* will provide you information about the recognition procedures in Germany. The express purpose of the enic-naric.net website, a joint initiative of the European Commission, the Council of Europe and UNESCO/CEPES, is to help other interested organizations and individuals to easily find information on current issues of international academic and professional mobility and on procedures for the recognition of foreign qualifications.

Regulated profession: In Germany, there are about 60 regulated professions (e.g. physician, teacher and optician). They are listed on the website www.anabin.de under the key word "responsible offices in Germany".

Access to one of these professions and the right to practise are linked to the proof of a certain qualification by juridical and administrative prescriptions for regulated professions. Therefore, whoever would like to practise a regulated profession in Germany with a qualification gained abroad must have their qualification recognised by the responsible German authorities or the corresponding professional association (BA 2012, "Recognition of qualifications"). *Non-regulated profession:* Most professions in Germany are not regulated (e.g. mathematician, physicist, commercial professions). In reality, the employer provides the recognition. It therefore makes sense to apply for a certificate evaluation as it cannot absolutely be guaranteed that a German employer will be able to assess every foreign qualification for a course of study or professional competence. (ibid.)

How to find a work in Germany?

If you are living abroad, the International Placement Service (ZAV), (http://www.arbeitsamt.de/zav/index.html) can help you to find out which jobs are currently on offer and whether or not you could be suitable for them. If you are already resident in Germany, you can contact the local Federal Employment Agency office (www.arbeitsagentur.de > Partner vor Ort). However, do not just restrict your search to job offers advertised by the Federal Employment Agency. Many companies also publish their job vacancies on online job portals.

How do you find somewhere to live?

Local daily newspapers can help you find apartments, usually on the Friday- or Saturday-editions. Many apartments are rented out through an agent, which also involves an extra fee. The following links are useful when looking for accommodation: www.immoscout24.de, www.immowelt.de.

How much money for what? The major part of monthly living costs is for accommodation. Rent prices vary greatly from region to region; rents in cities are generally higher. The cost for living in Germany also depends on your lifestyle. The other living costs, e.g. foods are slightly cheaper. Here again, the price range varies depending on the area where you live in. In figure 2 the monthly expense for "International students" is shown.

If you bring your children with you

In Germany, often it is not very easy to organise the daily work with full satisfaction – particularly when both parents work or study. When one child is still in kindergarten but the other one already goes to school, the week needs to be planned very carefully. Who fetches whom and from where? And who looks after a sick child? Who does the shopping? Nevertheless, many parents manage this day after day. The Family Service has offices in a number of towns and cities in Germany which can help to find the best solution for your family circumstances. The web address is www.familienservice.de.

Monthly expenses for international students in 2009	
Rent (incl. additional charges)	281,- Euro
Food	159,- Euro
Clothing	51,- Euro
Transport (car/public transport)	76,- Euro
Health insurance	59,- Euro
Communication / Information	35,- Euro
Work/study materials	33,- Euro
Leisure activities	63,- Euro
Total	757,- Euro

Fig. 2: BMBF 2010, p. 23

Religion and holidays

Article 4 of the German Constitution guarantees freedom of belief. Anyone can freely have a religion, join a religious community, change or leave it, or decide to be non-denominational. In Germany, there is no state religion; this means that state and religious and philosophical communities may not enter into an institutional association with one another. Germany's main religion is Christianity, dominated by the two strands of Roman Catholicism and Protestantism. Islam is the largest minority religion in the country (cf. fig. 3). The large majority of Muslims in Germany are of Turkish origin. Holidays in Germany are based on Christian traditions. There are no holidays for pupils of other religious beliefs in Germany!

Religion in Germany (2008)	
No Religion	34.1%
Roman Catholicism	30.0%
Protestantism	29.9%
Islam	4.0%
Orthodox Christianity	1.6%
Judaism	0.2%
Buddhism	0.2%

Fig. 3: Wiki 2012, Statistics

What else you need to know?

Family and friends: The "Consumer Analysis 2010" study showed that Germans are very social & friendly but have no sense of humour. (MPG 2010, p. 48).

Punctuality: Germans put great emphasis on punctuality. It is therefore helpful to stick to the agreed time for meetings.

Greeting people: When greeting and taking leave of people, it is customary to shake hands and look at the person. It would be impolite not to make eye contact – this also applies to a direct conversation with someone. Hugging is only customary among close friends.

Formality: Unless you know someone well, do not use the "Du (you)" form, unless they have offered it to you; you should address people using the "Sie (you), but it's creating a sense of respect)" form.

Hierarchy: There are clear divisions between the different levels in the hierarchies. It is always advisable to be aware of the status of the people you are working with.

These shown aspects of "living and working in Germany" should help to give a good overview of the challenges that can be expected when moving to Germany or another EU Member State. There are quite a lot of them and the task is to promote students to become familiar with the European diversity and, as a result of it, to prepare them to be able to profit from the opportunity to be an EU citizen or employee, respectively. In the last chapter, successfully performed ways to reach this goal are presented.

Fit for Europe - promoting students to become a "European" citizen

To learn about the European diversity and to become familiar with being a European citizen is a task which should be integrated systematically in the curriculum of every educational programme – from pre-school, to primary, to secondary up to higher education, from general to vocational education and training as well as adult education. To facilitate this aim, the European Union has established effective instruments in the course of the Lifelong Learning Programme (LLP) that could be utilised by every teacher and also by everyone else involved in school education. The objective of LLP is to develop the European Community further by enhancing the "(…) *interchange, cooperation and mobility between education and training systems within the Community (…)*" (EU 2006, art. 2, 2.). Learning theoretically about the European Union, its institutions and its operating principles is one part of becoming a European citizen, but to become familiar with it requires competence promoting adoptable experiences. Exactly for this intended use, the LLP has been established. A closer look at the specific objectives of the Comenius programme clarifies that its purpose shall be:

"(…) to develop knowledge and understanding among young people and educational staff of the diversity of European cultures and languages and its value and (…) to help young people acquire the basic life-skills and competences necessary for their personal development, for future employment and for active European citizenship." (EU 2006, art. 17, 1.).

In every EU Member State a competent LLP National Agency that can be contacted by every interested actor involved in school education exists. A lot of reports and presentations of successfully executed projects are available via internet. The Comenius programme perfectly fits for "USING SCHOOL FOR DEVELOPING EUROPEAN CITIZENSHIP".

QUALITY ASSURANCE IN HIGHER EDUCATION INSTITUTIONS USING STRATEGIC INFORMATION SYSTEMS

Tuba Canvar Kahveci[a], Özer Uygun[a][61], Ulaş Yurtsever[b], Sinan İlyas[b]

[a] Sakarya University, Department of Industrial Engineering, 54187, Serdivan/Sakarya, Turkey

[b] Sakarya University, Computer Research and Application Center, 54187, Serdivan/Sakarya, Turkey

Abstract

Quality assurance is a holistic approach covering all the processes in a higher education institution, in order to serve the students and other stakeholders in expected quality standards. The success of a quality assurance system depends on the support of the management. Hence, quality assurance should also cover the strategic management, process management and measuring-monitoring system which interact with each other for enabling the institutions to improve its processes. Furthermore, information systems should be implemented to integrate the quality assurance system with management processes for enhancing the overall success, and to produce assessable information about quality assurance system. In this study, a quality assurance framework supported by strategic information system is proposed for higher education institutions. The proposed strategic information system also integrates the strategic management, process management and monitoring-measuring systems as well as takes into consideration international, national and regional external factors.

Keywords: Strategic Information Systems; Quality Assurance; Strategic Management

Introduction

Quality assurance is an integrated approach covering all the processes in a higher education institution, which supports improvements in these processes. The success of a quality assurance system depends on the support of the management. Furthermore, information systems should be implemented to integrate the quality assurance system with management processes for enhancing the overall success, and to produce assessable information about quality assurance system.

The institution needs a common strategy and action plan to integrate its activities and create cost efficiency and competitive advantage. Each institution is responsible for its quality assurance system and therefore the quality maps are likely to have varying architectures (Kettunen, 2008).

In Turkey, the Commission for Academic Assessment and Quality Improvement in Higher Education (YÖDEK), which has also been an associate member of the European Association for Quality Assurance in Higher Education (ENQA) since 2007, has started operations to run, coordinate and stipulate procedures for internal and external assessment activities of the higher education institutions. YÖDEK has prepared some regulations by taking into account the developments in the world and especially in Bologna Process in Europe. The regulations provide general principles of assessment of education, training and research activities and administrative services, improvement of quality of higher education institutions. YÖDEK has also issued an academic evaluation and quality improvement guidebook for higher education institutions to use in their preparations of strategic plans (YÖDEK, 2007).

E-mail address: ouygun@sakarya.edu.tr.

As Penbek *et al.* (2011) stated Bologna Process is a complicated change process which aims to bring many opportunities and help to improve the university. Therefore an effective strategic management is necessary to lead this planned change in order to get beneficial outcomes. For this reason they investigated the interdependence of strategic management and planned organizational change for universities during the Bologna Process.

In this study, a quality assurance framework supported by strategic information system is proposed for higher education institutions. The proposed strategic information system also integrates the strategic management, process management and monitoring-measuring systems as well as takes into consideration international, national and regional external factors.

Literature Review

Quality assurance in terms of the higher education is defined in several ways. Quality assurance refers to the process of maintaining standards reliably and consistently by applying criteria of success in a course, program or institution. Quality Assurance can be defined in terms of its four components (NAAC and COL, 2007):

everyone in the enterprise has a responsibility for enhancing the quality of the product or services;

everyone in the enterprise has a responsibility for maintaining the quality of the product or services;

everyone in the enterprise understands, uses and feels ownership of the systems which are in place for maintaining and enhancing quality;

Management regularly checks the validity of the system for checking quality.

According to Brittingham (2009), Quality assurance is an articulation by the higher education community of what a college or university must do in order to deserve the public trust. On the other hand, quality improvement is a framework for institutional development and self-evaluation.

According to the definition of the Finnish Higher Education Evaluation Council quality assurance refers to the procedures, processes or systems used by the HEI to safeguard and improve the quality of its education and other activities (FINHEEC, 2008).

This is defined as all the planned and systematic work to guarantee that a higher education institution or an educational program fully applies quality/performance processes in accordance with the internal and external quality standards defined within Europe Quality Assurance Principles and Standards in Higher Education (YÖK, 2012).

Quality assurance is the core aim of the Bologna process. Rezić et al. (2010) stated that quality assurance should be recognized as an instrument for strategic management of higher education institutions. Planning means change of (a) the way in which the world, in which the University exists, changes and (b) the way in which the University will change. They also highlighted that more important fact is that planning also means preserving and, whenever it is possible, improvement of quality through entire process of change. Without correct planning,

governing with changes cannot be nothing more than "governing with crisis", and it is not possible to assure quality.

According to Kettunen (2008), quality assurance overlaps strategic planning, because strategic planning is an essential management activity where high quality can be expected. Therefore strategic planning, management process, internal processes and systems must be taken into account in the framework to evaluate quality assurance. Information about the achievement of the targets should be taken into consideration for improving the processes in the light of quality assurance. Hence, the management information system integration supports the continuous improvement and produces information to develop corrective actions plan for quality audits. If the quality assurance system is not integrated with the management system, it will remain isolated and will not yield the desired results of quality improvement.

Furthermore, information systems should be implemented to integrate the quality assurance system with management processes for enhancing the overall success, and to produce assessable information about quality assurance system. In fact, the use of technology in the assessment of quality assurance system still is an innovative application area for higher education institutions. Welsh and Dey (2002) stated that most institutions have not effectively integrated information systems with their quality assurance plans. They emphasize that quality measurement is not just an academic debate about how to best understand and measure program quality; it is an organizational problem about how to best organize information systems to respond to both internal and external demands for information about the performance of programs and services.

There are ERP system vendors for higher education in the world such as Oracle, SCT, PeopleSoft, SAP, Jenzabar and Datatel. Many higher education institutions try to take advantages of ERP systems. Nevertheless many higher education institutions do not implement integral information solutions ERP systems (Zornada & Velkavrh, 2005).

The institution-wide application of technology and information systems to quality assurance is a need and an opportunity for universities. In this study the proposed model is designed for generating and utilizing information about the performance of universities for both internal and external quality assurance and improvement.

Information Systems for Quality Assurance in Higher Education

Quality assurance framework proposed in this study includes strategic management, process management and measuring-monitoring modules. The Strategic Information Systems (SIS) has been designed to facilitate the management and measurement of quality assurance processes in HEIs.

The quality assurance system should consider the expectations of stakeholders, national and international trends in higher education and other related areas. Therefore, the interaction between the external factors and the quality assurance system is provided by SIS in the proposed model. The external factors are the quality approaches and the quality requirements at regional, national and international levels. The quality approaches such as EFQM and Bologna Process should be taken into account to identify the quality expectation at the international level in the higher education institutions. Likewise, the higher education institutions should take into consideration the regulations such as YÖDEK and fulfill the criteria of the quality assurance agencies such

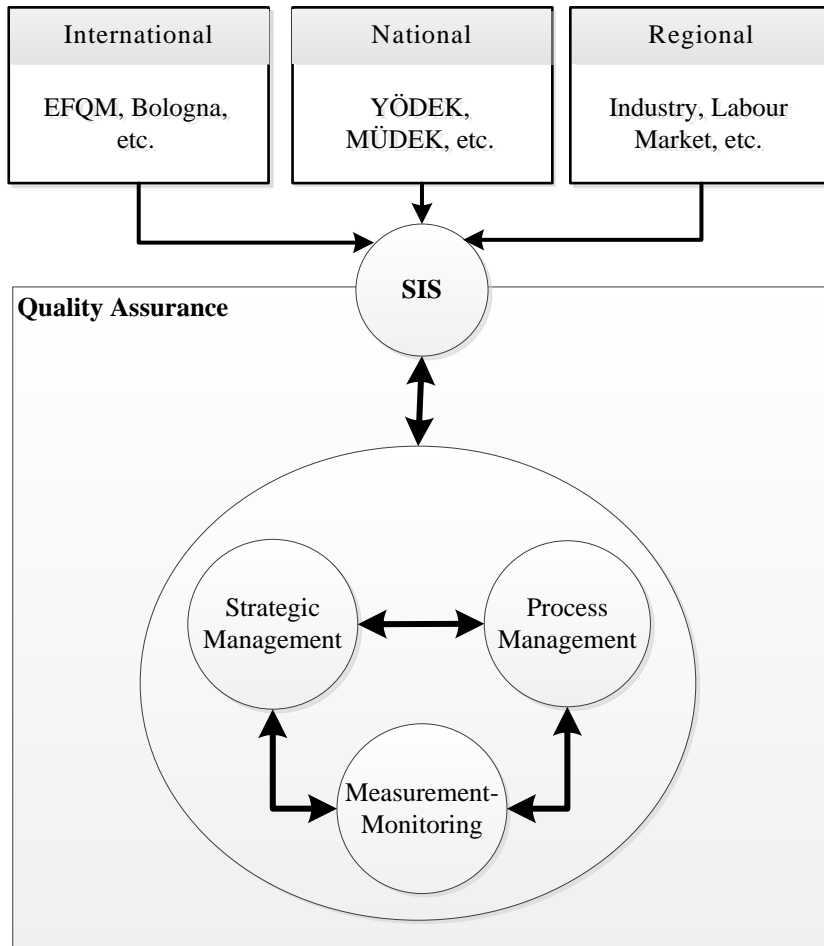
as MÜDEK at the national level. At the same time, the higher education institutions should meet the expectations of the stakeholders at the regional level. The proposed quality assurance framework is designed according to these external factors and shown in the Fig. 1.


Fig. 1. Conceptual model for quality assurance using SIS.

YÖDEK was founded to fulfill the needs of the national quality assurance system which takes into consideration the international quality trends. The Strategic Management Module within the Quality Assurance framework is developed based on the strategic management approach proposed by YÖDEK. The proposed model also meets the requirements of MÜDEK, which is the agency for accrediting engineering departments of higher education institutions. At the same time, educational, research and development, and service processes in the scope of quality assurance system are designed in line with the stakeholder expectations.

EFQM provides the integration of the some management approaches such as the leadership, the student and people focus, management by processes, partnerships development, innovation and improvement into the quality assurance. In this way, the quality assurance is associated with the excellence concept from the holistic view.

Certainly, there are some other excellence models as EFQM and the quality assurance system can be improved according to these models.

Bologna process has been implemented to create a European Higher Education Area (EHEA) based on international cooperation and academic exchange. The Bologna process has four main action fields such as recognition of degrees and diplomas, quality assurance, higher education qualifications framework, student participation and social dimension. In the proposed model, the implementation of quality assurance in higher education meets the requirements of the Bologna Process.

The Strategic Information System designed for managing the quality assurance in higher education institutions consists of three main components that are interrelated with each other.

- Strategic Management
- Process Management
- Measurement-Monitoring

Strategic Management Module of SIS

Strategic management aims adjusting the institution regarding the external environment. Although environmental change is unavoidable, it will always impact organizations eventually. Due to the legislation, as well as external pressures such as economic, social and international trends, strategic management process is a focal point for the successful management of higher education institutions. Therefore, strategic management activities should be supported by strategic information systems.

Strategic Management Module of the SIS enables the institution to define its mission, vision and core values. Functions which provide internal and external evaluation and analysis of the institution are also included in the module. SWOT (Strengths, Weaknesses, Opportunities and Threads) Analysis is implemented by using those functions. SWOT-Targets interrelation matrix can be developed by using analysis tools within the module. Several analysis tools facilitate defining strategic goals, targets, activities and projects, and monitoring procedures. Activities and projects should be compatible with the budget. Therefore budget allocation plan for activities and projects are conducted by related tools provided in Strategic Management Module.

Strategic Management Module is in interaction with other two modules. Performance Indicators of the processes addressed in Process Management Module are associated with the targets in Strategic Management Module. Moreover, targets can be clustered according to the related processes.

Process Management Module of SIS

Processes executed in a higher education institution can be defined within the Process Management Module of the SIS. Interrelations between the processes and the targets can be defined, and the matrix addressing the process and target interaction can be built by using the module.

The responsible of the processes, its inputs, sub-processes, interactions with other processes, performance indicators and outputs can also be defined in this module. A process model relevant to the YÖDEK, which

includes five main processes for higher education institutions, is utilized as a base for the Process Management Module.

The main processes are listed below:

- Education and Training Process
- Research and Development Process
- Application and Service Process
- Administrative and Support Process
- Managerial Process

Continuous improvement of the processes will positively affect the achievement of the targets defined in Strategic Management Module.

Measurement-Monitoring Module of SIS

Measurement-Monitoring Module is designed for measuring and monitoring the achievement of the strategic goals, targets, sub-targets, activities and projects identified in the Strategic Management Module. The module also can be used to monitor the achievement of the processes and sub-processes identified in the Process Management Module, based on the performance indicators.

In addition, several detailed reports can be taken for required time periods and for a specific department. These reports can be used for analyzing the variation of the targets and achievement values during a given time intervals for a specific department. The module provides a user friendly graphical user interface to facilitate the monitoring of the performance of the institutions and the processes visually.

Conclusion

During the implementation of quality assurance in a higher education institution, the main problems are to obtain accurate information from several sources, to work with huge information and documents, and analyze this information to generate knowledge. The reliable and useful information is also necessary for the success of the quality assurance system implementation. Therefore information systems should be implemented to overcome these problems.

Strategic Information System has been designed for the support of paperless implementation of quality assurance by means of collecting accurate and reliable data and accessing required information easily. Strategic information system also integrates the strategic management, process management and monitoring-measuring systems as well as takes into consideration international, national and regional external factors.

Strategic management module of the proposed system enables to define strategic goals, targets, sub-targets and activities-projects of the institution. Internal and external analysis of the institution can also be conducted using the module. Process management module of the system is designed for defining the processes of a higher education institution and associating the processes with the strategic goals. Measurement-Monitoring Module is designed for measuring and monitoring the achievement of the strategic goals, targets, sub-targets, activities and projects identified in the Strategic Management Module, as well as the achievement of the processes and sub-processes identified in the Process Management Module, based on the performance indicators.

REFLECTIONS ON PERSONAL LEARNING ENVIRONMENTS: THEORY AND PRACTICE

Ray Archee[62]

University of Western Sydney, Sydney, AUSTRALIA

Abstract

The nature of higher education has changed irrevocably due sweeping changes brought about by e-learning. Such changes include the educational experience, the research process, institutional expenditure & academic work. Possibly the newest development is the personal learning environment. This paper explores the question: what might be the higher education effects of personal learning environments (PLEs) within the context of already embedded learning management systems? A short history is given & the theoretical underpinnings of PLEs are investigated. The paper briefly describes institutional practice in terms of widely established learning management systems. Finally, contemporary approaches to PLEs are critiqued & their possible effects upon higher education evaluated.

e-learning; personal learning environment; learning management systems

1. Introduction

The term "personal learning environment" or "space" or "network" (PLE) is a relatively new concept usually meaning a digital space in which the user has the ability to access, aggregate, create, store, & share learning materials. The materials comprise such artefacts as lectures, notes, assignments, blogs, wikis, forums, with most PLEs also enabling users to socially interact with others. The first recorded use of the term comes from a session title at the 2004 Joint Information Systems Committee/ Centre for Educational Technology & Interoperability Standards conference in the UK. Since that time there has been a continual development of PLEs in contrast to an institutional backdrop that has been quick to erect learning management systems (LMSs) such as Blackboard, .LRN, Sakai & Moodle.

A significant difference between the PLEs & LMSs seems to be one of power – the institution traditionally owns pedagogical property rights, & so controls a large proportion of the content on the LMS, whereas with a PLE, the user has the ability to customise the interface, to add functionality & ultimately populate the interface with individually selected content. It remains to be seen if institutions & their IT departments will be able to bequeath their power & control by transferring their professional *raison d'etre* to their students.

2. Educational theory & PLEs

A perennial academic exercise is to examine new educational innovation under the spotlight of previous educational theory (Fiedler & Väljataga, 2011).

2.1. Instructivism

The oldest & most traditional educational theory is that of *Instructivism* which has its roots in early 20th century behavioural psychology. Instructivism depicts the learner as assimilating knowledge from expert teachers who impart their wisdom & skills to a largely passive audience. Instructivism has two major tenets at its core. First, the aim of instruction is to have the learner understand a particular syllabus, &, second, learners should be directly taught by instructors, who determine the content & sequence of the learning. The instructivist approach is to totally plan a curriculum by breaking down a subject area into its component parts, & then to sequence these parts into a progression, ranging from the simplest to the more complex. This approach is much like a Maths textbook, which starts with the simple principles & builds upon these in order to deal with the most difficult concepts. Coincidentally, textbooks are often a feature of the Instructivist method.

For students, there is little chance for self-discovery, & little time for exploration or discussion, with real-world examples usually subordinate to hypothetical models & often arcane exercises. The lecture is the main medium of the tertiary instructivist teacher & evaluation is usually performed by means of quizzes & examinations, with reproduction of ideal answers the way for students to excel (Diaz & Bontenbal, 2000). Employing the instructivist method is probably still the most popular way of designing & implementing tertiary-level courses, especially in disciplines such as Business, Science, Medicine, & Health.

In the e-learning context, LMSs would seem to be the closest thing to instructivist methodology. By encouraging teachers to place their lectures & teaching resources online, & insisting that students access these resources or fail, most educational institutions can be seen to be simply perpetuating the instructivist pedagogy of the early 20th century. PLEs however, are simply not found in instructivist methods. Student-centred learning is antithetical to behaviorist ideas since it removes control of the learning from the teacher & allows the student to be responsible for their own learning. With Instructivism tacitly underlying much of what passes for e-learning in many higher education facilities, the introduction of PLEs must be seen as an undertaking fraught with risks for many institutions.

2.2. Constructivism

Typically viewed as the opposite of Instructivism is the theory of *Constructivism,* which considers that all new knowledge & learning is based on previous knowledge & past learning, & that we construct our concepts gradually from experience with the world. There are three main constructivist principles: 1. learning & understanding comes from interactions with our environment; 2. the learner encounters cognitive conflict which in turn stimulates learning; 3. new knowledge develops through social interaction (Savery & Duffy, 1995). Other main beliefs of constructivism are that it emphasises learning & not teaching, encourages learner individuality, conceives of learning as a process, & nurtures natural curiosity. Constructivist learning experiences incorporate authentic tasks in meaningful contexts, it employs real-world learning situations (Jonassen, 1994) & minimises assessment in the learning process.

The two main schools of Constructivism are social constructivism & cognitive constructivism. Social constructivism is most often associated with Russian psychologist Vygotsky & his followers, who believed that the teacher plays an active role in facilitating the learner to develop their mental ability through discovery. Social constructivists believe that leaning is a social & collaborative activity that is not taught by a teacher, but rather constructed by the learner. Cognitive Constructivism, whose forefather was Jean Piaget, sees learning as being achieved through various developmental stages that are built upon stage by stage. The learner develops through these necessary stages by processes of assimilation, accommodation & equilibrium.

As attractive as Constructivism appears, much criticism has been directed at the constructivist method. The main problem is that constructivists tend to minimise the curriculum compared to the needs of the learner. A decade & a half ago, the "child-centered" version of progressive education from which so much of constructivism flows was reported to be hostile to standards, assessments & accountability. In the child-centered

classroom, teachers are supposed to "facilitate," not teach. Teaching is scorned as being too didactic, representing an almost authoritarian act (Finn & Ravich, 1996).

The advent of e-learning over the last 20 years, including LMSs & blended learning models, has encouraged teachers to use constructivist principles to employ a variety of "scaffolding" techniques within online environments. Such techniques include: activating previous knowledge, breaking complex tasks into more manageable chunks, modeling processes of a task by explicating the steps involved, using notated images to simplify complex processes, & modeling activities before students are asked to undertake similar tasks. Online scaffolding has been shown to be highly effective when students are first introduced to a new concept (Dabbagh, 2003). It facilitates student attention & engenders motivation, which is essential to learning new concepts & tasks.

The best exponents of e-learning have embraced interactive scaffolding (see Sharma & Hannefin, 2007; Stewart, et al, 2007) as a primary method of teaching new ideas, but such pioneers are usually dependant upon innovative technology. Implementing scaffolding techniques on websites/LMSs (or even in traditional face-to-face situations) has never been a simple task, thus as the Internet has matured into its highly socialised incarnation (the Web 2.0), new software & Internet applications have allowed more & more departures from traditional chalk & talk, strictly one-way, instructivist sites in favour of novel constructivist scaffolded sites, which encourage dialogue with fellow students & teachers.

2.3. Connectivism

Connectivism (Siemens, 2005; Downes, 2005) is one of the newest theoretical frameworks for understanding learning & is particularly relevant to online learning & social networks. Connectivist learning occurs through the process of a learner connecting to & transferring information into a learning community. The learning community can be aggregated into a cluster of similar areas of interest, which allows for interaction, sharing, dialoguing, & thinking together (Siemens, 2005). A learning community also forms a node, which arise out of the junction points found on networks (two or more nodes). Nodes may be large or small, strong or weak, depending on the concentration of information & the number of individuals who are using a particular node (Downes, 2005). Knowledge is the basic currency of the node & it may be stored in any number of digital formats.

In real life, the reliability & accuracy of knowledge usually changes over time, depending on new discoveries & research. Similarly, an individual's understanding of a concept, & their ability to learn about this concept, can also change over time. Connectivism stresses that two most important skills contributing to learning are the ability to seek out current information, & the ability to filter out extraneous information. The connectivist process is cyclical - learners may connect to a network to share & find new information, modify their beliefs on the basis of new learning, & then re-connect to other networks to share their beliefs with others. Learners ideally inhabit multiple networks & multiple knowledge spheres allowing many interdisciplinary connections to be made.

The Connectivist metaphor is obviously contextualised by Web-based experiences & behaviours. The network analogy owes huge debt to then-current professional & social networking sites, & generic user behaviour found on the Internet, & mobile telephony networks. A significant difference between Connectivism & all other major learning theories is that the individual is highly dependant on the learning network or node, without which all learning seemingly stops. Without the connectivity to other nodes or groups, an individual is lost, floundering in isolation & inactivity.

There are many similarities of the connectivist model to current PLEs. The shared facilities & social networking components of PLEs would thus conform to the connectivist nodes. In setting up their learning space, student users of PLEs would have access to several different networks - conceivably institutional groups, various class groups, & extra-mural groups such as friendship, professional & social clusters. Information can be stored on PLEs in a range of different formats. Daily use of the PLE would lead to aggregation of text, pictures,

videos & sound files, & allows students to filter the most important information for later re-use in assignments. Team-based learning is facilitated by the shared filespaces, & the student is motivated through engagement & the social networking possibilities.

3. Current personal learning environments

According to Johnson & Liber (2008) the PLE movement came about in the UK & USA as a label which recognised the application of the social communication technologies of Web 2.0 to education. In particular, the word "personal" has been a source of conflict & ambiguity. Personalisation has two distinct meaning in PLEs. The first meaning embodies the desire to create learner-centred, but management-driven education; the second meaning is the view that learning is essentially a learner-driven model of education, with the traditional instructivist role of the institution subordinated to the individual student (Johnson & Liber, 2008). There is yet a third view, which sees personalisation as an individual undertaking usually by sophisticated users who are already harnessing a variety of online tools to create informal networks.

The background for the last two views is given by the popularity of personal technologies such as personal blogs, Facebook, MySpace, LinkedIn, & Twitter, which are assuredly more advanced than most of the technology provided by institutions. Extra-mural online services are faster, more efficient, more reliable & have a critical mass of users far in excess of any one institution. Many communication technological practices enjoyed by students off-campus are unavailable within the institution. There is fierce competition for student attention, & the off-campus services are winning if one peruses most student computer screens. Multiple network communities (or Connectivist nodes) are established, much informal learning occurs; real relationships are forged in these communities, but commitment to any one particular site is limited & transitory (O'Brien, 2007).

To date, the reluctance of academic community to pursue research into PLEs is probably related to the newness of the technology & the fact that institutions have the most to lose from decentralised learning systems. Thus, the majority of the debate for the past five years has occurred, not in traditional academic circles, but in the blogosphere of professional & educational exchange. Sclater (2008) reports that advocates of PLEs take one of three approaches to the implementation of a PLE system: 1. client-side local software programs, 2. server-side Web browser services, which combine a set of social networking tools with LMS-type access; & 3. hybrid approaches which use existing software & Web-based tools.

The first approach argues that new locally-based client software needs to be developed to allow users to connect to the already existing resources on the Internet. The main reason for producing locally-based software is one of ideology. If students are truly to take control of their learning then they need to own the software & it needs to be on their computers not on a remote, controlled server, which can change or disappear at the end of term. Users also need the opportunity to utilise mobile devices such as cellular phones & personal digital assistants in order to take charge of their learning without being tethered to the Internet at all times. One alternative is a system, which utilises client software together with server-side technologies in order to download a range of tools/content, which the user can then possess on the their hard drive.

As yet there are few, if any, client-side PLEs, but the argument is that third-party vendors will emerge, & that these programs will enable users to download content & services from a variety of institutions & organizations. One scenario is for a user to not only connect with a university LMS on a regular basis, but also be able to automatically connect to workplaces, newspapers, magazines, & user-chosen sites providing a single familiar interface. The metaphor here is that of Windows software updates which are currently commonplace in the home & office.

The second approach, already begun, uses ordinary familiar browsers to connect to sophisticated Web servers & applications. An example of this approach is the ELGG community, which bears some resemblance to Facebook coupled with a LMS. The argument here is that there is already a number of evolved PLE-like environments & that educators can select the best aspects of each site for use in their courses. Students could select from various blogs, wikis, forums, podcasts, email, chat & archiving sites (see Chatti, *et al*, 2010). If an

institution was to lose its LMS access due to hardware or network problems, then the system could continue to work, without disruption to student access. One of the major problems to this system would be the multiple usernames/passwords & interfaces that students would need to accustom themselves to. Such a collection of websites are not scalable across large institutions especially where assessment depends on reliable & transparent access.

Finally, some argue that the PLE is already here in the form of portable laptops, which many students now carry to & from home, work & institution (see Tu, *et al*, 2012). The laptops have large hard disks & contain all the necessary software to access libraries, databases, LMSs & social networks. Many use the Google desktop, which allows searching, & retrieving using the familiar Google interface. All manner of files, media, & content can be downloaded using Google alone. Sophisticated users know how to make very efficient use of Internet services & may not embrace new client or local software.

4. Faustian effects upon higher education

While research into the considerable effects of LMSs on higher education is its infancy (see Coates, James & Baldwin, 2005), the possible consequences of PLEs have not been imagined by most higher education administrators. It is most probable however, that many of the effects of LMSs are equally applicable to PLEs. It is heretical but necessary to say that all technology has both good & bad effects. The development of the automobile, television, the Internet, even the printing press are all examples of technologies which have caused widespread & permanent changes – both positive & negative - to society as a whole. One view is that all technological change is a Faustian bargain where we gain some benefits over previous methods, but where we always lose something in the process (Postman, 1995; Sclove & Scheuer, 1995).

4.1. The Educational Experience

Ostensibly most students attend higher education institutions in order to learn, but anecdotal experience describes student attendance more in terms of personal interest & motivation (Moore, Armstrong & Pearson, 2008) & that engagement is a major component of ratings of teaching effectiveness (Beran & Violato, 2009). Students also regard attendance in class as a crucial factor in passing a course & obtaining good grades (Burns & Ludlow, 2005). Since the majority of undergraduate students come straight from a highly structured & didactic secondary school system, the vast majority are not prepared for the independent learning celebrated by some higher education optimists. In reality, most undergraduate tertiary students prefer an educational experience that is somewhat similar in structure to secondary school but contextualised in a more relaxed environment without uniforms, bells or disruptions.

Several years ago, the author gave Communication students at the University of Western Sydney, the option of predominantly attending the unit, 'Electronic Research Methods' via the dedicated website, which contained exactly the same content as the traditional face-to-face sessions. Most students were overjoyed at this freedom & commented on the forward thinking nature of the unit. Attendance at lectures & tutorials was not compulsory so many students took the opportunity to cut classes. Over 34 per cent of students failed in that particular year mainly due to missing deadlines or failing to submit compulsory assessment items. When attendance was made compulsory again, a year later, the failure rate dropped to normal levels (around 10 per cent).

The utilisation of a PLE as the main method of learning would markedly change the educational experience from one of familiar & ordered structure to an amorphous virtual experience. Having to use a PLE would oblige students to forge their own networks, to make unique connections & become overnight autonomous learners. Students would have to forsake their previously safe & protective timetable of units & attendance & embrace

unfamiliar territory, replete with a range of online distractions, which are completely alien in a traditional classroom. It is a mistake to think that all our students are computer literate, & an even larger mistake to think that the computer literate ones all currently inhabit Facebook or use Twitter. While there are compelling figures for social networking usage, the statistics do not tell the entire story with many students (especially males) eschewing social networking sites (see http://www.insidefacebook.com/2010/01/04/december-data-on-facebook%E2%80%99s-us-growth-by-age-&-gender-beyond-100-million/).

One analogy is that of health & fitness gyms. People visit gyms in order to focus on their fitness & perform exercises, to be inspired by trainers or partners, & not to be distracted by family/friends or a range of other domestic diversions. When people visit the gym, they generally concentrate on nothing else but exercise, & they usually accomplish their goals. Many people are incapable of exercising at home in the same manner as at the gym, even if they own professional equipment (Rigby, 1993). The separation of home & gym leads to separate behaviours & expectations of the two locations. The problem with allowing students to study using a PLE is that the location of study is loosely defined. University work can be studied anywhere there is an Internet connection. Thus, study becomes something that can be done at any time of the day, & is not given sufficient priority by students who are often juggling work, family, personal lives & study.

4.2. The Teaching Experience

A widespread PLE with a critical mass of users has the potential to radically change higher education teaching in similar way to LMSs. For example, due to considerable financial pressures five years ago, many Australian universities reduced face-to-face contact hours by removing expensive tutorials &/or lectures, & transformed the teaching role from that of leading discussion, to uploading readings to Web pages. The LMS was the fallback mechanism, by which the higher education institution maintained quality control in the face of diminishing contact hours & possible student dissatisfaction. However, LMSs have encouraged mainly one-way communication albeit with copious quantities of online resources placed online in the hope that students will eventually consume them. Although there are exact records of class attendance, no such records are taken of students' consumption of these materials. Moreover, what interactivity exists is usually in the form of discussion forums, which place undue emphasis on the teacher/facilitator to inspire & lead.

The LMS experience has been very successful from the institutional point of view. The LMS creates a sense of order & tidiness to units & courses that often had evolved over the years, by independent teachers working in isolation. By controlling the main access point to online resources, the administration centralizes all its course material resources under one roof, & appears to capably manage its teaching staff, & cater for its students at the same time. The LMS also becomes the repository of academic intellectual property, which it owns & has copyright control over. While many problems of LMSs are now acknowledged, most higher education administrators will not easily give up the comfort that LMSs have afforded them for the past decade.

The addition of PLEs will certainly change this situation. A PLE is a high risk gambit on the part of institutional management because it places the student at the centre of what passes for learning. That is, the institution will no longer be in charge of the exact content a student studies. PLEs are revolutionary insofar as they treat students as self-motivated, self-determining, fully functioning adults. What then is the role of the institution, & the teacher? The teaching role will eventually become one of facilitation, with teachers having to locate, disseminate & manage online resources such as readings, wikis, forums, & chats. Staff-student ratios will most probably increase with teaching staff being responsible for less face-to-face hours, but more consultation,

mentoring & leading of virtual discussions. There are signs this is happening already with the large emphasis placed upon e-learning in terms of audits, training courses & student demand.

4.3. Loss of Employment in Higher Education

There is some debate over whether technological change is evolutionary or revolutionary (Mark, 1987). Advocates of the former view are optimists & argue that technology is ultimately beneficial for all of society & that it creates more jobs than it displaces. The pessimistic view is that much technological change is disruptive of the normal evolutionary upgrading of industrial & clerical processes & that today, change is proceeding at a faster rate than previous periods in time resulting in many thousands of jobs being lost, never to be replaced. There is a third view, which ignores the increase-decrease argument & focuses solely on statistics. This view concludes that lower-skilled jobs (e.g. factory, rural) are declining, & that higher-skilled, more professional jobs are on the rise mainly due to the requirements of using new technologies. Whether new technology produces a beneficent effect is usually best decided on a job by job basis (Weaver, 1987).

One of the major casualties of the advent of desktop publishing was the printing industry. Computers & software made working with metal type totally unnecessary & this led to the demise of a range of employment positions which have simply disappeared from the employment landscape. A whole industry is now outdated, with many of the manual typesetting skills being still highly valued by computer-based typesetters.

At several Australian universities, as with other institutions, the entire internal reprographics sections have been axed because of supposedly low demand for printed materials. Previously, every student needed to receive a paper-based copy of the subject outline, & often, printed notes & readings. Students now receive only the Web address of the subject outlines & learning guides on the LMS. The printing of notes & readings has been tendered out to commercial printing houses, & the net result is greater expense for students, who must pay commercial rates for their educational materials, & poorer quality readers in terms of paper & print quality. With the advent of PLEs, the contribution of printed notes & readings will most probably diminish even further making surviving in-house printing departments within higher education institutions completely redundant.

Libraries are another area of concern due to falling demand for access to printed books & journals. Under successive Australian Liberal government budgets from 1996 to 2007, higher education library staff & funding for books in many institutions decreased although student enrolments expanded. More recently, under a Labor government, the popularity of online databases & low demand for books has led to more redundancies. At one Sydney university, one of the campus libraries has installed dozens of computers & removed its bookshelves almost completely from the ground floor of the building. The Internet-enabled computers can access the library catalogues, electronic databases, & the LMS, but most students use the computers to access Facebook, email & chat systems.

This networking experiment has resulted in increased usage of the library, & ensured job stability. However, the facility no longer resembles a place of study with students inhabiting the computers & holding group discussions, both real & virtual, with their friends. The environment more resembles a "shopping mall" than a library, one student remarked. The attraction of dozens of free computers in the one location has apparently turned the library into the community meeting place for the institution, & this in turn has generated mass social interaction & accompanying noise. Security staff now patrol the library on a regular basis, in order to remove

loud, & raucous groups who seem to be enjoying themselves too much. Could this also be the fate of students using socially networked PLEs in close proximity?

5. The mistaken Facebook analogy

PLE advocates frequently point to the incredible popularity of MySpace & Facebook applications with young people over the last seven years. The number of users of these social networking sites can now be counted in the hundreds of millions worldwide with no sign of abating. Organisations, advertisers, public relations bureaus & educational institutions have jumped on the bandwagon – having a Facebook presence is almost as essential as having a website. The question is whether a popular form of social networking is really the best analogy for people studying & learning.

Scholarly study of social networking services such as Facebook & MySpace is a relatively new area of research, given the newness of the technology & changing tastes in the userbase. Selwyn (2009) presents an interesting, if unremarkable analysis of 612 students' usage of Facebook at a UK university. Selwyn concluded that educational & university related message were a small minority (4%) of the 68,000 postings during an 18-week period. The majority of the postings concerned ordinary day-to-day themes such as leisure, entertainment, paid employment, interpersonal relationships & home life. Educational issues do not warrant much discussion, even in passing, in students' social lives. This surely is to be expected - one's social life is not the same as one's student life. Why would anyone expect students to use Facebook for discussing educational issues?

The underlying assumptions of this study highlight a serious error of judgment on the part of Facebook advocates. Such advocates who regard Facebook as a pedagogical model are technological determinists who view the popularity of social networking in terms of the program itself. Advocates fail to understand that the popularity of social networking comes about through human needs being satisfied in a timely, efficient & convenient manner. Needing to stay in touch, curiosity, friendship, humour, affiliation, self-esteem & many other social needs are being satisfied on a regular basis by using social networking services. However, fulfilling educational needs are not easily accomplished through Facebook. These needs are usually best fulfilled by finding mentors or colleagues, who motivate & support in one to one, real life situations. Displaying one's ineptitude by seeking educational advice on Facebook is likely to lead to low self-esteem & possible public ridicule.

Despite its popularity, Facebook has been the subject of continual controversy since its inception. The Wikipedia site (http://en.wikipedia.org/wiki/Criticism_of_Facebook) lists countless issues critical of the social networking giant. Especially problematic are privacy concerns, member safety, the use of advertising scripts, data mining, & censorship issues. Many of the user pages have been criticized because of highly controversial content such as holocaust denial, pro-anorexia, & obscene materials. Facebook itself has been successfully sued on a number of occasions for violations of intellectual property rights.

One of the most significant risks for users is that of being bullied, stalked or even killed. There have been numerous incidents showcased in the media where individuals have been bullied online using Facebook, or where groups have formed Facebook profiles on order to attack & abuse other people. On 21 Aug, 2009, an 18

yr old English girl was sentenced to 3 months after being found guilty of bullying one of her classmates on Facebook. Some have claimed that Facebook's lax privacy settings & the copious amounts of personal data can lead to cyberstalking. Burglars have used Facebook profiles to ascertain when people are going on holidays & so easily gain entry to their homes. Such stalking incidents are not uncommon - the author once taught a student who had posted personal details on a Web page, only to have received anonymous telephone calls from someone who had viewed her profile, & wanted to meet up in secret. There have also been several cases where people have been murdered after meeting first on Facebook.

6. Conclusion

All of the problems (perhaps more) associated with social networking sites, are equally possible on an officially endorsed PLE. The sheer volume of potential data would certainly inhibit student material being checked or moderated. One contentious issue specific to higher education is determining what an institution does with the PLE data from a graduating student? Is it deleted or left accessible? One argument is that it needs to be kept for the sake of the student's lifelong educational career, or when the student returns as a graduate student. By establishing a PLE, the institution might possibly provide the means by which students can criticize & defame courses, other students, & teaching staff, ultimately damaging its reputation. LMSs entail no such ability to publish material, & must regarded as a much safer e-learning medium for this reason.

Freeware, shareware & commercial PLEs are beginning to enter the marketplace vying for a place in the lucrative e-learning industry. The question is whether institutions are choosing this new technology because of real & measured needs of students, or because PLEs are seen as keeping up to date & a useful tool to attract new students. Higher education must become more critical of its technological choices since once a PLE becomes the chosen medium of e-learning, then the institution will certainly have to bear the consequences.

RELATIONSHIP BETWEEN 5TH GRADE STUDENTS' ATTITUDES TOWARDS SCIENCE AND TECHNOLOGY COURSE AND MISCONCEPTIONS

Asiye Bahtiyar[a*], Ramazan Basturk[b]

[a,b]Pamukkale University, Faculty of Education, Department of Educational Sciences, Denizli, Turkey

Abstract

The purpose of this study is to determine the attitudes of the 5th grade students towards Science and Technology course, their level of misconceptions on the subject of "Heat and Temperature", and the connection between the attitudes and misconceptions in terms of several variables. The tools used for data collection were "Attitude towards Science and Technology Course Scale" and "Concept Test". According to the results, attitudes of unsuccessful students are higher than attitudes of middle level and successful students. It is found that misconceptions of students who take extra courses are lower than those who learn only in lessons.

Keywords: Science and Technology, attitude, misconception [63]

Introduction

The aim of the modern science education is to gain required scientific attitude and cognitive process skills which are necessary for problem solving related to science that students encounter throughout their lives, rather than memorizing scientific knowledge about sciences (Bayrak ve Erden, 2007). Accordingly, in order to realize an effective science teaching; making them learn concepts that constitute the knowledge and also keystones of that knowledge meaningfully is needed rather than transferring available knowledge about sciences to the students (Gençer, 2006; Koray ve Tatar, 2003).

Students start their education having different experiences, ideas, and beliefs about scientific concepts. These ideas and beliefs which are far from being scientific and mostly gained by means of students' own experiences are called as misconception (Tekkaya, Özkan ve Balcı, 2002). Especially for the science and technology curriculum, due to its spiral nature, the misconceptions held in previous years are transferred to the years ahead and students continue to use these misconceptions increasingly (Yurd ve Oğlun, 2008). Among the subjects in Science and Technology course, "Heat and Temperature" is a topic where misconceptions are encountered the most. One of the greatest reasons of this situation is that the concepts of heat and temperature are used as substitutes for each other (Turgut ve Gürbüz 2011).

In recent years, research in science education has concentrated on revealing of various conceptual understandings of students who have different levels of learning capacity. These studies have mostly been conducted for the purpose of creating a solution with respect to determining the difficulties that students encounter on understanding of scientific concepts, revealing and explaining misconceptions, and also how to correct them (Özcan, 2006; Yurd ve Oğlun, 2008; Adıgüzel, 2006; Köse, Ayas ve Uşak, 2006; Koray ve Tatar, 2003; Ayvacı ve Çoruhlu, 2009; Yahşi, 2006; Palut, 2006; Yürümezoğlu, Ayaz ve Çökelez, 2009; Yıldırım, Yalçın, Şensoy ve Akçay, 2008; Bayrakçı, 2007).

There is no enough study encountered neither about the variables which affect these misconceptions nor about the relations between the attitude towards science and technology course and misconception in this field. In this term, this study is thought to contribute the body of literature.

In this research, determining the relationship between attitudes towards science and technology course and misconceptions about "Heat and Temperature" of 5th grade students is aimed. Moreover, it is aimed to determine the variables that affect both attitudes towards science and technology course and misconceptions about "Heat and Temperature". For this purpose five basic research questions have been asked:

For students who study at fifth grade;

[*] Corresponding author Tel.: +90-258-296-10-75
E-mail address: asiye.bahtiyar@gmail.com.

1. What are the attitudes of students towards science and technology course?

2. What is the level of misconceptions about the topic of "Heat and Temperature" in science and technology course?

3. Is there a significant difference between their attitudes towards science and technology course and their gender, extracurricular learning, and final exam marks of the science and technology course?

4. Is there a significant difference between their misconceptions about the topic of "Heat and Temperature" and their gender, extracurricular learning, and final exam marks of the science course?

5. Is there a significant relationship between the students' attitudes towards science and technology course and their misconceptions?

Methods

2.1. Participants

Research was carried out at three different elementary schools which were selected randomly in City of Denizli on the second term of 2010-2011 academic years. A total of 90 fifth grade students have participated as a study group for this research. Some qualities of the participants are summarized in the Table 1:

Table 1. Some Qualities of the Participants

Variables	Category	N	%
Gender	Male	40	44,4
	Female	50	55,6
Extra-curricular education	Custom Classroom	0	0
	Extra School Course	67	74,4
	Private Lesson	0	0
	None	23	25,6
Final exam grades	Lower than 58,18	16	17,8
	Between 58,18 and 89,02	56	62,2
	Higher than 89,02	18	20,0
Total		90	100,0

As can be seen in Table 1, the participants consist of 40 (44, 4%) male and 50 (55, 6%) female students. The groups for the variable of extra-curricular education were coded as extra school courses (n=67; %74,4) and none (n=23; %25,6) because no students chose the options of custom classroom and private lesson.

Moreover, the final exam marks of the students in Science and Technology course are divided into three groups in terms of ranges which are determined as to sum or subtract the standard deviation value (sd= 15, 417) from the general average. According to this grouping, it is deduced that the final marks of the 56 participants (62, 2%) in Science and Technology course were in a range of "$\bar{x}$= 58,183 and 89,017".

2.2. Instruments

The data were collected through two different scales which were "*Attitude towards Science and Technology Course Scale*" and "*Concept Test*".

"*Attitude towards Science and Technology Course Scale*" was developed by Işık (2007) and consists of 23 items (eight of them is negative and fifteen of them is positive). The content validity of the scale was calculated as 0.93. According to 5 likert-type attitude scale, the lowest score that the students can get is 23 and the highest score is 115. Internal reliability of the scale is determined as 0.91 (Işık, 2007).

For this study, in accordance with the aim of the study, three items were added to the scale in order to reach the students' personal information such as their gender, whether there are other areas that they take the Science and Technology course such as custom classroom, extra school course, or private lessons; and their final exam marks of Science and Technology course.

Developed by Seloni (2005) "*Concept Test*" consists of 10 questions. Questions are composed of one right answer and two distracters and students are asked to write down the reasons of the answers due to measure the conceptual understanding of

them. 10 questions in "*Concept Test*" were evaluated (Cited in Seloni, 2005) according to an evaluation technique conducted by Abraham et al, (1992), and research technique called "Determination of Levels of Understanding Basic Science Concepts" developed by Bayram et al, (1997). Comprehension levels of students were evaluated by point scoring (ranging from 1 to 4) out of 40 points as a numerical data. It was deduced that the higher point that the students get, the less misconceptions they have.

2.3. Data Collection and Analysis

Research was conducted at the end of the spring semester 2010-2011. The data collection tools were applied throughout two different lessons by the researcher and teachers in the schools of application.

Dependent variables of this study are points that students get from "Attitude towards Science and Technology Course Scale", and points that students get from "Concept Test" in relation to "Heat and Temperature". Independent variables of this study are gender, extra-curricular education, and students' final marks of Science and Technology course. The data were analyzed by SPSS (Statistical Package for Social Sciences, Version 11,5).

First of all One Sample Kolmogorov-Smirnov (K-S) Test was used in order to test whether the data distributed normally (Baştürk, 2010). According to the results of the analyses, it is determined that both variables show a normal distribution [(K-S(Z) concept test = 0.708; p > 0,05 and (K-S(Z) attitude scale = 0.935; p > 0,05)]. The relationship between students' attitudes towards Science and Technology course and their misconceptions about the topic of Heat and Temperature is investigated by calculating the Pearson Correlation Coefficient. Descriptive statistical methods, independent samples t-test, and One – way ANOVA were utilized for data analysis, as well. One-sample t-test was used in order to determine whether the average attitude score of the sample is different from the expected value. The significance level was taken as 0.05.

Findings

In this section, findings related to sub-problems are described in the tables.

Research question 1. What are the attitudes of students towards science and technology course?

Findings of students' attitudes towards Science and Technology course are given in Table 2.

Table 2. Analysis of students' attitudes towards Science and Technology course

	N	Min	Max	M	sd
The Attitude Score	90	62,00	105,00	74,41	7,33

Table 2 shows that the minimum and maximum scores of the attitude scale are 62,00 and 105.00. In this study, the mean of the attitude scores of 90 participants is 74, 41. Expected value for the mean of the attitude scores in the population, considering the highest and lowest values that can be taken from the attitude scale, is

$\dfrac{23+115}{2}$ = 69. In order to determine whether the average attitude score of the sample is different from the expected value, One-sample t-test was used and the results of the analysis are shown in Table 3:

Table 3. Analysis of students' attitude scores according to the expected value

	Test Value=69				
	N	M	t	df	p
The Attitude Score	90	74,41	7,01	89	,00*

* p<.05

As can be seen in Table 3, the difference between the students attitudes scores and the expected value is significant at 0.05 alpha level (t = 7,01; p < 0,05). Also, sample mean (M= 74, 41) is significantly higher than the expected mean of population (M= 69). Thus, it can be said that students' attitudes are closer to be in a positive manner.

Research question 2. What is the level of misconceptions about the topic of "Heat and Temperature" in science and technology course?

Findings of students' misconceptions about the topic of "Heat and Temperature" are given in Table4.

Table 4. Analysis of students' misconceptions about the topic of "Heat and Temperature"

	N	Min	Max	M	sd
Misconceptions Scores	90	2	34	18,82	6,551

When Table 4 is examined, it is seen that students get minimum 2 and maximum 34 points from the Concept Test. The mean score of 90 students participated in the survey was calculated as 18.82. Descriptive statistics are presented in Table 5 for items belonging to the Concept Test:

Table 5. Descriptive statistics of Concept Test substances

Items' Content	N	Min.	Max.	M	sd
1. The effect of heat on matter	90	0	3	1,30	,76
2. Heat and temperature measurement	90	0	4	1,44	1,08
3. Heat conduction	90	0	4	2,28	1,02
4. The effect of heat on matter	90	0	4	2,02	1,32
5. Heat transfer	90	0	4	2,47	1,13
6. The effect of heat on matter	90	0	4	2,03	1,19
7. Thermal insulation	90	0	4	1,94	1,17
8. Heat conduction and isolation	90	0	4	1,58	1,16
9. The effect of heat on matter and expansion	90	0	4	1,80	1,38
10. Thermal insulation	90	0	4	1,96	1,45
Total	90				

When Table 5 is examined, it is seen that the most common misconception that the students have is "The effect of heat on matter" with an average of 1.30, which is the first question of Concept Test. It is striking that according to the analysis, none of the students could get a full score of 4 from the first question. In this case, it shows that all of the students participating in the survey have misconceptions about the effects of heat on matter. On the other hand, the least common misconception that the students have is "Heat transfer" with an average of 2.47, which is the fifth question of Concept Test.

Research question 3. Is there a significant difference between the students' attitudes towards science and technology course and their gender, extracurricular learning, and final exam marks of the science and technology course?

To examine whether the gender and the extra-curricular education areas (custom classroom, extra school course, private lessons, or none) affect the students' attitudes towards Science and Technology course, Independent Samples T-test was used in this study. The results of the analysis are shown in Table 6.

Table 6. Students' attitudes towards Science and Technology course analysis by gender and extra-curricular education areas variables

Variables	Category	N	M	sd	t	p
Gender	Male	40	73,08	5,46	-1,559	0,122*
	Female	50	75,48	8,44		
Extra-curricular education	Extra School Course	67	74,33	6,51	-0,182	0,856*
	None	23	74,65	9,48		
	Total	90				

*p>.05

As a result of the Independent Samples T-test analysis, the difference between attitudes scales scores of male and female students is not significant at 0.05 alpha level (t = -1,559; p > 0.05). In other words, as shown in Table 8, both male (M= 73,08) and female (M= 75,48) students' attitudes towards Science and Technology courses are similar to each other.

Also, the difference between attitudes scales scores of students who attend extra school course and of students who study only in course is not significant at 0.05 alpha level, (t= -0,182; p>0.05). In other words, as shown in Table 8, both the students who attend extra school course (M= 74,33) and the students who study only in course (M= 74,652) are similar to each other.

To determine whether there is a significant difference between students' attitudes towards Science and Technology course and students' final exam mark of the science and technology course, One -way ANOVA Test was used and the results of this test are presented in Table 7.

Table 7. Students' attitudes towards Science and Technology course analysis by final exam mark in Science and Technology course

Source of Variance	Sum of Squares	df	Sum of Squares	F	Sig.
Between-groups	438,42	2	219,21	4,393	0,015*
Within-groups	4341,37	87	49,90		
Total	4779,79	89			

* p<.05

According to the results of One-way ANOVA, there is a significant difference between the attitudes towards Science and Technology course of students who are in different ranges of the final exam marks (unsuccessful,

average, or successful) in Science and Technology course (F = 4,393; p < 0.05). Descriptive analysis of students' final exam marks in Science and Technology course is described in Table 8.

Table 8. The students' marks range's mean and standard deviations

Variable	Category	N	M	sd
Range of students final exam marks	Unsuccessful	16	79,13	11,79
	Average	56	73,55	5,74
	Successful	18	72,89	5,12
Total		90	74,41	7,33

Tukey's Post Hoc Test was conducted to determine the source of the difference. The mean of attitude scores of unsuccessful students (M_U = 79,13) is lower than the mean of attitude scores of average students (M_A = 73,55) and the mean of attitude scores of successful students (M_S = 72,89).

Research question 4. Is there a significant difference between the students' misconceptions about the topic of "Heat and Temperature" and their gender, extracurricular learning, and final exam marks of the science course?

To examine whether the gender and the extra-curricular education areas (custom classroom, extra school course, private lessons, or none) affect the students' misconceptions about the topic of "Heat and Temperature", independent samples t-test was used in this study. The results of the analysis are shown in Table 9:

Table 9. Students' misconceptions about the topic of "Heat and Temperature" analysis by gender and extra-curricular education areas variables

Variables	Category	N	M	sd	t	p
Gender	Male	40	19,80	6,54	1,271	0,207*
	Female	50	18,04	6,52		
Extra-curricular education	Extra School Course	67	20,27	5,642	3,842	0,00*
	None	23	14,61	7,291		
Total		90				

As a result of the Independent Samples T-Test analysis, there is not a significant difference between between the misconceptions of male and female students about the topic of "Heat and Temperature" (t = 1,271; p > 0.05). In other words, as shown in Table 9, both male (M = 19,80) and female (M = 18,04) students' misconceptions about the topic of "Heat and Temperature" are similar to each other.

As a result of the independent samples t-test analysis, there is a significant difference at 0.05 alpha level between the misconceptions of students who attend extra school course and who learn only in lessons (t = 1,271; p > 0.05) about the topic of "Heat and Temperature". In order to understand the reason of difference mean scores of groups was investigated. As shown in Table 9, the mean square of students who attend extra school is higher than (M = 20,27) the students' who learn only in lessons (M = 14,61). Students who attend extra school course can be said to have less misconceptions about the related topic.

One - way ANOVA Test was conducted to determine whether there is a significant difference between students' misconceptions about the topic of "Heat and Temperature" and students' the final exam points of the science course. The results of this test are presented in Table 10.

Table 10. Students' misconceptions analysis by final exam mark in Science and Technology course

Source of Variance	Sum of Squares	df	Sum of Squares	F	Sig.
Between-groups	77,56	2	38,78	,902	,410
Within-groups	3741,60	87	43,01		
Total	3819,16	89			

p >.05

According to the results there is no significant difference between the students' misconceptions about the topic of "Heat and Temperature" and their final exam marks of the science course (F = 0,902; p> 0.05). Descriptive statistics of students' final exam marks of the science course are presented in Table 11:

Table 11. Descriptive statistics of students' note range

Variable	Category	N	M	sd
	Unsuccessful	16	17,06	4,65

Note Range	Average	56	18,93	6,61
	Successful	18	20,06	7,73
Total		90	18,82	6,55

Although the mean square of the final exam marks of the successful students is higher than the unsuccessful and average students', the difference is not statistically significant.

Research question 5. Is there a significant relationship between the students' attitudes towards science and technology course and their misconceptions?

To determine the relationship between students' attitudes towards Science and Technology course and their misconceptions about the topic of "Heat and Temperature", the Pearson Correlation Coefficient was used and the results are presented in Table 12.

Table 12. The relationship between students' attitudes towards Science and Technology course and their misconceptions about the topic of "Heat and Temperature"

Variables	N	M	sd	r	p
Attitude	90	19,80	6,54	-0,133	0,212*
Misconception	90	18,00	6,62		
Total	90				

* p > 0,05

As seen in Table 12, there isn't a significant relationship between students' attitudes towards Science and Technology course and their misconceptions about the topic of "Heat and Temperature" (r = - 0,133; p>0.05). In other words, there is no positive or negative effect of misconceptions on the attitudes of students towards science and technology course.

4. Results and Discussion

According to the findings, students' attitudes towards science and technology courses are positive. However, any significant difference could not be found according to gender and extra-curricular education variables for the students' attitudes. It is surprising that attitudes of unsuccessful students are more positive than the attitudes of average and successful students. It is not necessary for a student to be successful in this course for having a

positive attitude towards it. However, any research is encountered in the body of literature which supports this result.

When students' misconceptions about the topic of "Heat and Temperature" are examined, there seem to have common misconceptions about the effect of heat on matters. Moreover, students could not differentiate the concepts of heat and temperature. Although they know the units of heat and temperature and how to measure them, they could not transfer the same knowledge to the various situations on different items. Here are some examples they gave; "The heat of thermometer was found to be ºC 39" or "Only body heat can be measured by thermometer". In their research, Kırıkkaya and Güllü (2008), and Aydoğan and et.al. (2003) found a similar misconception such as "Weather heat is measured by ºC". The least common misconception of the students is the heat-exchange.

There is no significant relationship between misconceptions of students according to gender and final exam grades on the other hand students who take extra school courses have less misconceptions than those who learn only in lessons. In this case, it is possible to say that misconceptions can be reduced when students have more opportunities for extra learning.

A reasonable relation could not be identified between students' attitudes towards science and technology course and misconceptions about the topic of "Heat and Temperature". In other words, students' attitudes toward Science and Technology course do not affect the misconceptions as positive or negative way.

Öz

Eğitim teknolojisi, öğrenme-öğretme ortamlarını etkili bir şekilde tasarımlayan, öğrenme ve öğretme de meydana gelen sorunları çözen, öğrenme ürününün kalitesini ve kalıcılığını arttıran bir akademik sistemler bütünüdür. Tanımdan da anlaşıldığı gibi, eğitim teknolojisinin temel amacı, öğrenmeyi etkili ve kalıcı bir biçimde sağlamaktır. Günümüz eğitim sistemi içinde eğitim teknolojilerinin kullanılması kaçınılmaz bir hal almıştır. Aksi takdirde, eğitim teknolojisi kullanmayan okullarımız akıl almaz bir hızla gelişen teknolojiye ayak uyduramaz. Ancak, okullarımızdan eğitim teknolojilerini kullanma istekleri tam olarak yaygınlaşmamıştır. Bazı okullarımız ise eğitim teknolojilerini etkin olarak kullanmaya başlamışlardır.

Bu çalışmada, Sakarya ili merkezindeki öğretmenlerin eğitim teknolojilerini kullanımlarına göre yeterliliklerinin çeşitli değişkenler açısından incelenip 2001 yılında Aynı evrende yapılan çalışmayla karşılaştırılması amaçlanmıştır. Araştırmanın evrenini, 2010–2011 eğitim-öğretim yılında Sakarya ili Milli Eğitim Müdürlüğü`ne bağlı Merkez okullarda görev yapan öğretmenleri oluşturmaktadır.

Anahtar Sözcükler: Teknoloji, teknoloji eğitimi, teknoloji kullanım ölçeği.

1.GİRİŞ

Hızla gelişen teknoloji okullardaki öğretim alternatiflerini artırmakta ve paralelinde öğretim programlarında değişikliklerin yapılmasını zorunlu kılmaktadır. Okullarda öğrenmeyi ve öğretmeyi hızlandırabilmek için eğitimcileri farklı materyallere yönelmek zorunda bırakmıştır. Eğitim kurumlarının, öğrenci, öğretmen ve yöneticileri, bu yeni öğrenme yöntemlerini bireysel, toplumsal ve ekonomik yönden hayatlarına adapte edebilmek için mutlaka zamana ihtiyaç duyacaklardır. Teknolojinin eğitimde büyüyen etkisi, teknolojinin bir öğretim aracı olarak kullanılabilmesi için öğretmenlere yeni bilgi ve yetenekler oluşturma ihtiyacı duymaktadır. Öğretmenlerin teknolojiyi yeterince etkili kullanamaması ve teknoloji paralelinde eğitim sistemlerinde oluşan değişimlere uyum sağlayamaması eğitim sisteminin ana unsuru olan öğretmenin etkinliğini azaltmakta ve eğitim

kalitesini düşürmektedir (Haddad ve urich). Öğretmenlerin gelişen Eğitim Teknolojileri paralelinde halen kullanmakta oldukları öğretim yaklaşımlarını değiştirmeleri gerekeceği için, teknolojinin derslerde kullanılması öğretmenler açısından oldukça zor olmaktadır (OTA, 1995;Sheingold ve Hadley, 1990).

Öğretmenlerin teknolojiyi yeterince kullanamaması altında yatan bir gerçekte, öğretmenlerin hizmet içi eğitimleri için yeterli vakit ayıramamasıdır. Özellikle ülkemizde yapılan araştırmalara göre hizmet içi eğitimlerin öğretmenler tarafından iyi algılanmaması sonucu eğitimcileri gelişen teknolojilerden uzaklaştırmıştır. Eğitimcilerin hizmet süreleri arttıkça gelişen teknolojiye dirençlerinin de arttıkları gözlenmiştir. Eğitim fakültelerinde yapılan program değişiklerinden yeni mezunlar yararlanmakta bundan dolayı çalışma süresi 1-10 yıl arasında olan eğitimcilerin bilgisayar teknolojilerini daha iyi kullandıkları gözlenmektedir. Çalışma süreleri 10 yılın üzerinde olan öğretmenlerin iyi tasarlanmış hizmet içi eğitimlere özendirilmeleri ve bu eğitimlere katılmaları sağlanmalıdır. Charp (1996), teknolojinin eğitime entegrasyonunun yavaş ilerlediğini ve birçok faktör tarafından etkilendiğini belirtip, yönetim

desteğinin olmaması, eğitim eksikliği, teknolojinin yeterince desteklenmeyişi ve yeterince ödenek ayrılmamasından kaynaklanan sorunların öğretmenlerin eğitimde teknoloji altyapısına sahip olarak yetiştirilememesine neden olduğunu belirtmektedir.

Eğitim teknolojileri her ne kadar belirtilen bu fırsatları sağlasa da burada en önemli rolü öğretmenler üstlenmektedir. Öğretmenler, eğitim teknolojilerini etkili bir biçimde kullanabilir düzeye gelmelidir. Fakat küresel dünyanın bir gerçeği de, öğretmenlerimizin eğitim teknolojilerini öğrenme-öğretme ortamlarında kullanmamasıdır. Yapılan bir çok araştırma bu sonucu destekler niteliktedir. Bunun yanında, ülkemizde de sonucun hemen hemen aynı olduğu söylenebilir. Türk eğitim sisteminde de eğitim teknolojileri okullarımızda bulunmasına rağmen, öğretmenler tarafından kullanımı istenilen düzeyde değildir. Bu çalışmanın amacı, 2001 yılında A. İşman tarafından yapılan bir araştırmanın aynı ölçek kullanılarak 2011 yılında, aynı evrende tekrarlanarak 10 yılda öğretmenlerin teknoloji kullanımındaki yönelimlerinin nasıl değiştiğini tespit etmek ve iki çalışmayı karşılaştırmaktır.

Araştırmanın Amacı

Gelişen teknolojilere bağlı olarak eğitim sistemlerinin yeniden yapılandırılması ihtiyacı ortaya çıkmaktadır. Bu yeniden yapılanma çalışmalarında öğretmenlerin eğitim teknolojilerini etkili olarak kullanmaları önemli bir rol oynamaktadır. Bu araştırmada, eğitim-öğretim faaliyetlerini gerçekleştiren öğretmenlerimizin eğitim teknolojilerini öğrenme-öğretme faaliyetlerinde kullanma düzeylerini tespit etmek ve bu olgunun cinsiyete, yaşa, deneyime, görev yaptığı yere ve eğitim durumlarına göre farklılaşıp farklılaşmadığını ortaya çıkarmak amaçlanmıştır. Ayrıca aynı evrende 2001 yılında yapılan çalışmayı aynı ölçekle 2011 yılında tekrarlayarak 10 yılda meydan gelen değişikleri ortaya çıkarmaktır.

Araştırmanın Evreni

Bu araştırmanın evreni, Sakarya ili merkezinde bulunan ilköğretim okullarında görev yapan öğretmenleri kapsamaktadır. Bu öğretmenler arasından okullarına göre rasgele araştırma yöntemi kullanılarak seçim yapılmıştır. Bu öğretmenlere, çeşitli araştırmalar ile geliştirilen eğitim teknolojisi anketi uygulanmıştır.

Araştırma Anketi

Bu araştırma da kullanılan anket Amerika da bulunan Ohio Üniversitesinin Toplumsal Öğrenme Projesinden alınarak Türk Eğitim sistemine uyarlanmıştır. Bu anketin geçerliği ve güvenirliği sağlanmıştır. Uygulanan bu anketin ilk beş sorusu katılan öğretmenlerin bireysel durumları, diğer altı sorusu ise eğitim

teknolojileri ile ilgilidir. Bu altı sorunun alt soruları bulunmaktadır. Bu sorular, genel olarak gruplara ayrılmıştır:

1.　　　Düz yapıya sahip teknolojiler (Toplam 7 soru: yazı tahtası, grafikler, büyük boy resim, kitap, ilan panosu, karikatür ve şema).

2.　　　Bilgisayar teknolojileri (13 soru: IBM yada Mac, windows, Dos, word, powerpoint, excel, tarayıcı, digital kamera, datashow, lcd panel, multimedya, yazıcı ve laptop).

3.　　　Görsel-işitsel teknolojiler (10 soru: televizyon, video, laserdisc, film, film şeridi, video kamerası, radyo, teyp, ses kaseti, ve tepegöz).

4.　　　İnternet temelli teknolojiler (6 soru: internet, www sayfaları, modem, internet kamerası, internet sistemi ve araştırma makineleri).

5.　　　Öğrenme-öğretme yöntemleri (21 soru: düz anlatım, tartışma, örnek olay, gösterip yapma, problem çözme, grup çalışması, bireysel çalışma, bilgisayar lab, fen lab, araştırma, buluş, pekiştireç, ödül, ipucu, dönüt, beyin fırtınası, soru-cevap, rol yapma, benzetişim, eğitsel oyunlar, ve pratik).

6.　　　Kuramsal boyut (3 soru: davranışçı yaklaşım, bilişsel yaklaşım ve yapısalcı yaklaşım).

Anket içinde toplam olarak 60 soru bulunmaktadır.

Araştırma Verileri

Bu araştırmada kullanılan veriler öğretmenlere uygulanan anketten elde etmiştir. Araştırma anketi toplam olarak 2010-2011 öğretim yılında 365 öğretmene uygulanmıştır. Bu anket ile, eğitim teknolojilerini kullanma durumlarının cinsiyet, yaş, deneyim, eğitim, ve görev yerleri bakımından farklılık olup olmadığı araştırılmıştır. Buna ek olarak, öğretmenlerin hangi eğitim teknolojilerini sık olarak kullandıkları ortaya çıkarılmıştır.

Araştırmanın İstatistiksel Yöntemi

Bu araştırmadaki anketten elde edilen verilerden, yüzdelikler (frekans), ve cinsiyet farklılığına bakmak için t-testi diğerleri içinde one-way anova yöntemleri SPSS hazır istatistik paket programı kullanılmıştır. One-way anova ve t-testi ile, eğitim teknolojilerinin kullanım durumları cinsiyet, yaş, deneyime, görev yeri, ve mezun olduğu okula göre farklılıkların olup olmadığı ortaya çıkarılmıştır.

Araştırmaya Katılanların Demografik Yapısı öğretmenlerin cinsiyet dağılımı: Aşağıdaki tabloda öğretmenlerin cinsiyet dağılımları verilmiştir. Tablodan, öğretmenlerin cinsiyet dağılımında 2001 ve 20011 yılları arasında önemli bir değişiklik olmadığı gözlenmektedir. Ancak, azda olsa yıllar arasında bayan öğretmen sayısında bir miktar artışın olduğu tespit edilmiştir. Bu farklılaşmadan bayanların öğretmenlik mesleğine yönelimlerinde bir miktar artış olduğu sonucu çıkarılmıştır.

2001	2011
Yüzde 59.9 erkek (82 kişi).	Yüzde 56.9 erkek (208 kişi).
Yüzde 39.4　bayan (54 kişi).	Yüzde 43.1　bayan (157 kişi).

Araştırmaya katılan öğretmenlerin yaş durumları: Aşağıdaki tablodan, her iki yılda ankete cevap veren öğretmenlerin yarıdan fazlasının orta yaş civarında olduğu anlaşılmaktadır. Tablodaki verilere daha detaylı bakıldığında 2001 yılında 40 yaş üstü öğretmenlerin sayısı %57 iken bu sayı 2011 yılında %35 'e düştüğü anlaşılmaktadır. Bu sonuç genç öğretmenlerin şehir merkezlerine atanma eğiliminin arttığını göstermektedir.

2001	2011
Yüzde 15.3 ü 30 yaş ve altında (21 kişi).	Yüzde 10.9 u 30 yaş ve altında (40 kişi).
Yüzde 10.2 si 31-34 yaş arası (14 kişi).	Yüzde 30.1 i 31-34 yaş arası (110 kişi).
Yüzde 16.8 i 35-39 yaş arası (23 kişi).	Yüzde 23.2 si 35-39 yaş arası (85 kişi).
Yüzde 57.7 si 40 yaş ve üzeri (79 kişi).	Yüzde 35.8 i 40 yaş ve üzeri (130 kişi).

Araştırmaya katılan öğretmenlerin deneyim durumları: Aşağıdaki tablodan 20 yıl deneyime sahip öğretmenlerin oranının 2001 yılında %60.6 iken 2011 yılında %30.4 'e düştüğü görülmektedir. Bu sonuç genç öğretmenlerin şehir merkezlerinde çalışma yüzdelerinin arttığını göstermektedir.

2001	2011
Yüzde 14.6 sı 0-5 yıl arası deneyimli (20 kişi).	Yüzde 13.4 ü 0-5 yıl arası deneyimli (49 kişi).
Yüzde 10.2 si 6-10 yıl arası deneyimli (14 kişi).	Yüzde 33.1 i 6-10 yıl arası deneyimli (121 kişi).
Yüzde 14.6 sı 16-20 yıl arası deneyimli (20 kişi).	Yüzde 23 ü 16-20 yıl arası deneyimli (84 kişi).
Yüzde 60.6 sı 20 ve üzeri yıl deneyimli (83 kişi).	Yüzde 30.4 sı 20 ve üzeri yıl deneyimli (111 kişi).

Araştırmaya katılan öğretmenlerin eğitim durumları: Bu tablodan fakülte mezunu olan öğretmenlerin sayısının 2011 yılında yükselmiş olduğu ve yüksek lisans yapan öğretmen oranının %1.5 den %15'e çıktığı görülmektedir.

2001	2011
Yüzde 13.1 i iki yıllık yüksek okullardan mezun (18kişi).	Yüzde 14.6 i iki yıllık yüksek okullardan mezun (53kişi).

Yüzde 65.0 ı üç yıllık okullardan mezun (89 kişi).	Yüzde 16.4 ı üç yıllık okullardan mezun (60 kişi).
Yüzde 20.4 ü fakülte mezunu (28 kişi).	Yüzde 55.3 ü fakülte mezunu (202 kişi).
Yüzde 1.5 i yüksek lisans mezunu (2 kişi).	Yüzde 13.7 i yüksek lisans mezunu (50 kişi).

Araştırma Sonuçları

Araştırma anketinden elde edilen veriler üç farklı istatistiksel yöntem kullanılarak analiz edilmiştir. Birinci yöntem, sorulara verilen cevapların yüzdelikleridir. Burada, teknolojileri kullanan öğretmenlerin yüzdelikleri ortaya çıkarılmıştır. İkinci yöntem ise t-testidir. Erkek ve bayan olan öğretmenlerin cevaplarının arasındaki farkı ortaya çıkarmak için t-testi kullanılmıştır. Üçüncü yöntem, yaş, deneyim, görev yeri ve eğitim durumlarının özellikleri dört ana grupta toplandığından, sorulara verilen cevapların farklılığını ortaya çıkarmak için one-way anova testi kullanılmıştır. Ankette dörtlü likert ölçeği kullanılmıştır. Bunlar aşağıdaki gibidir:

1.   Hiç Kullanmadım

2.   Çok Seyrek Kullandım

3.   Sık Kullandım

4.   Çok Sık Kullandım.

Cevapların Yüzdelikleri

Araştırmada elde edilen anket sonuçları, eğitim teknolojilerini eğitim-öğretim faaliyetlerinde istenilen düzeyde kullanılmadığını ortaya çıkarmıştır. Öğretmenlerimiz, yazı tahtası gibi klasik eğitim araçlarını çok sık kullandıklarını ortaya koyarken bilişim teknolojilerini kullanmadıklarını göstermiştir. Ankette sorularına verilen cevapların yüzdelikleri aşağıdaki gibidir:

Yazı tahtası

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	2	1.5	0	0
Çok seyrek kullandım	2	1.5	20	0.05
Sık kullandım	29	21.2	150	41

	2001		2011	
Çok sık kullandım	104	75.9	195	58.5
Toplam	137	100	365	100

Tablodan da anlaşıldığı gibi öğretmenlerimiz yazı tahtasını eğitim-öğretim faaliyetlerinde çok kullandıkları ortaya çıkmıştır. Yazı tahtasını çok az öğretmenimiz sınıf ortamında kullanmıyor. Bilindiği gibi yazı tahtası çok klasik bir araçtır. Hemen hemen her eğitim-öğretim yapılan ortamda bulunur. Yazı tahtası kullanım açısından 2001 ve 2011 yıllarında yapılan çalışmalara bakıldığında çok önemli bir farkın olmadığı, öğretmenlerin hala ağırlıklı olarak yazı tahtasını kullanmaya devam ettikleri gözlenmiştir.

Grafikler

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	24	17.5	110	30
Çok seyrek kullandım	61	44.5	155	42
Sık kullandım	35	25.5	70	19
Çok sık kullandım	17	12.4	30	9
Toplam	137	100	365	100

Öğretmenlerimizin derslerinde grafik kullanma durumlarında herhangi bir artışın olmadığı hatta grafik kullanımın azaldığı ortaya çıkmıştır.

Apple-Macintosh yada Bilgisayarlar

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik

Cevaplar	137	100	80	22
Hiç kullanmadım	137	100	80	22
Çok seyrek kullandım	0	0	120	33
Sık kullandım	0	0	100	27
Çok sık kullandım	0	0	65	18
Toplam	137	100	365	100

Bilgisayar kullanımı açısından iki çalışmaya bakıldığında çok önemli değişiklerin olduğu gözlenmiştir. 2001 hiç kullanmadım oranı %100 iken bu oran 2011 'de %20'ye düşmüştür.

Word Programı

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	130	94.9	0	0
Çok seyrek kullandım	3	2.2	50	13
Sık kullandım	4	2.9	155	43
Çok sık kullandım	0	0	160	44
Toplam	137	100	365	100

Öğretmenlerimizin yaklaşık olarak 2001 %95 i word kullanımını bilmiyorlarken bu oran 2011 de %0 düşmüştür. Buradan 2001-20011 yılları arasında öğretmelerin bilgisayar teknolojilerini kullanma oranlarında çok büyük değişiklik olduğu söylenebilir.

Powerpoint

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik

Hiç kullanmadım	132	96.4	10	3
Çok seyrek kullandım	2	1.5	40	10
Sık kullandım	1	0.7	185	51
Çok sık kullandım	2	1.5	130	38
Toplam	137	100	365	100

PowerPoint kullanma oranlarında da Word kullanım oranındaki artışa paralel olarak artış gözlenmiştir.

Tarayıcı

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	137	100	10	3
Çok seyrek kullandım	0	0	50	13
Sık kullandım	0	0	187	51
Çok sık kullandım	0	0	118	33
Toplam	137	100	365	100

Araştırmaya katılan öğretmenlerin 2001 de hiçbiri tarayıcı kullanmamışken 2011 hiç kullanmadım oranı %3'e düşmüştür.

Dijital Kamera

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	137	100	100	27
Çok seyrek kullandım	0	0	120	33
Sık kullandım	0	0	80	22
Çok sık kullandım	0	0	65	18
Toplam	137	100	365	100

Araştırmaya katılan öğretmenlerin 2001 de hiçbiri dijital kamera kullanmamışken 2011 hiç kullanmadım oranı %27'ye düşmüştür.

Datashow

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	137	100	40	11
Çok seyrek kullandım	0	0	70	15
Sık kullandım	0	0	125	35
Çok sık kullandım	0	0	130	39
Toplam	137	100	365	100

Araştırma yapılan okullardaki öğretmenlerin 2001 hiç biri datashow ile tanışmazken 2011 neredeyse %75 derslerinde datashowdan yararlandıkları söylemektedir.

Yazıcı

Cevaplar	2000		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	126	92.0	0	0
Çok seyrek kullandım	6	4.4	95	26
Sık kullandım	5	3.6	180	50
Çok sık kullandım	0	0	90	24
Toplam	137	100	365	100

2001 yılında öğretmenlerin yazıcı kullanma oranı çok düşükken 2011'de bu oran dramatik olarak artmıştır.

Laptop

Cevaplar	2000		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	134	97.8	55	15
Çok seyrek kullandım	3	2.2	85	23
Sık kullandım	0	0	120	32
Çok sık kullandım	0	0	105	30
Toplam	137	100	365	100

2001 yılında öğretmenlerin laptop kullanma oranı çok düşükken 2011'de bu oran belirgin şekilde artmıştır.

Video

Cevaplar	2000		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	47	34.3	100	27
Çok seyrek kullandım	58	42.3	105	28
Sık kullandım	25	18.2	85	23
Çok sık kullandım	7	5.1	75	22
Toplam	137	100	365	100

Öğretmenlerimizin derslerinde video kullanma oranlarında çok önemli değişiklik olmadığı gözlenmiştir.

Film

Cevaplar	2000		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	73	53.3	120	32
Çok seyrek kullandım	56	40.9	130	34
Sık kullandım	6	4.4	100	27
Çok sık kullandım	2	1.5	15	7
Toplam	137	100	365	100

Anketimize cevap veren öğretmenler her iki çalışmada da film tekniği, eğitim-öğretim ortamlarında etkili olarak kullanmadıkları gözlenmiştir.

Tepegöz

Cevaplar	2000		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	89	65.0	85	23
Çok seyrek kullandım	40	29.2	95	26
Sık kullandım	6	4.4	147	40
Çok sık kullandım	2	1.5	38	11
Toplam	137	100	365	100

Tepegöz kullanımında önemli bir değişiklik olmuştur. 2011 deki çalışmaya göre öğretmenlerin büyük bölümünün derslerde bu araçtan yararlandıkları gözlenmiştir.

İnternet, WWW Sayfaları, Modem, İnternet Kamerası, İnternet Sistemleri ve Araştırma Makineleri

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	137	100	10	2
Çok seyrek kullandım	0	0	65	17
Sık kullandım	0	0	140	38
Çok sık kullandım	0	0	150	43
Toplam	137	100	365	100

İnternet kullanımında 2001 ile 2011 arasındaki cevaplar arasında çok önemli değişiklik olduğu gözlenmiştir. 2001'de öğretmenler tarafından hiç kullanılmayan

İnternet, 2011'de   neredeyse %100 oranında kullanmaya başlamıştır.

Bu metot her iki çalışmadan da görüldüğü gibi en çok kullanılan metottur.

Tartışma

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	14	10.2	18	13
Çok seyrek kullandım	42	30.7	90	19
Sık kullandım	55	40.1	148	40
Çok sık kullandım	26	19.0	109	28
Toplam	137	100	365	100

Tartışma yönteminin derslerde kullanımda önemli bir değişiklik olmamıştır.

Örnek Olay

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	18	13.1	38	17
Çok seyrek kullandım	35	25.5	97	20
Sık kullandım	53	38.7	128	33
Çok sık kullandım	31	22.6	102	30
Toplam	137	100	365	100

Örnek olay yönteminin derslerde kullanımda önemli bir değişiklik olmamıştır.

Gösterip Yapma

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	14	10.2	45	12
Çok seyrek kullandım	34	24.8	79	21
Sık kullandım	57	41.6	145	39
Çok sık kullandım	32	23.4	96	28
Toplam	137	100	365	100

Gösterip Yapma yönteminin derslerde kullanımda önemli bir değişiklik olmamıştır.

Problem Çözme

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	18	13.1	12	2
Çok seyrek kullandım	14	10.2	78	21
Sık kullandım	44	32.1	150	40
Çok sık kullandım	61	44.5	125	37
Toplam	137	100	365	100

Problem Çözme yöntemi her iki çalışmada da en çok kullanılan yöntem olduğu gözlenmiştir.

Grup Çalışması

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	23	16.8	45	8
Çok seyrek kullandım	43	31.4	124	34
Sık kullandım	46	33.6	99	29
Çok sık kullandım	25	18.2	97	29
Toplam	137	100	365	100

Grup çalışması yöntemi, öğretmenlerin her iki çalışmada da yaklaşık olarak %50 si tarafından öğretim faaliyetlerinde kullanılmaktadır.

Bireysel Çalışma

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	15	10.9	58	10
Çok seyrek kullandım	27	19.7	92	27
Sık kullandım	51	37.2	152	42
Çok sık kullandım	44	32.1	63	21
Toplam	137	100	365	100

Bireysel Çalışma yönteminin derslerde kullanımda önemli bir değişiklik olmamıştır.

Bilgisayar Laboratuvarı

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	126	92.0	98	28
Çok seyrek kullandım	5	3.6	100	29
Sık kullandım	1	0.7	124	33
Çok sık kullandım	5	3.6	43	10
Toplam	137	100	365	100

2001 yılında öğretmenlerin bilgisayar laboratuvarı kullanma oranı çok düşükken 2011'de bu oran dramatik olarak artmıştır.

Fen Laboratuvarı

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	44	32.1	145	42
Çok seyrek kullandım	55	40.1	125	32
Sık kullandım	24	17.5	85	19
Çok sık kullandım	14	10.2	10	5
Toplam	137	100	365	100

Fen Laboratuvarı kullanımın gittikçe azıldığı gözlenmiştir.

Ödül

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	21	15.3	42	8
Çok seyrek kullandım	38	27.7	45	9
Sık kullandım	60	43.8	147	44
Çok sık kullandım	18	13.1	131	39
Toplam	137	100	365	100

Ödül yönteminde olumlu yönde değişikler olduğu gözlenmiştir.

Beyin Fırtınası

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	90	65.7	72	17
Çok seyrek kullandım	26	19	125	34
Sık kullandım	13	9.5	145	41
Çok sık kullandım	8	5.8	23	8
Toplam	137	100	365	100

Beyin Fırtınası yönteminde çok önemli değişikler olduğu gözlenmiştir

Soru Cevap

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	7	5.1	0	0
Çok seyrek kullandım	1	0.7	0	0
Sık kullandım	33	24.1	45	12
Çok sık kullandım	96	70.1	320	88
Toplam	137	100	365	100

Soru cevap yöntemi, her iki çalışmada öğretmenlerin hemen hemen bütünü tarafından öğretim faaliyetlerinde etkili olarak kullanılmaktadır.

Eğitsel Oyun

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
Hiç kullanmadım	18	13.1	45	10
Çok seyrek kullandım	27	19.7	65	16
Sık kullandım	61	44.5	140	38
Çok sık kullandım	31	22.6	115	36
Toplam	137	100	365	100

Eğitsel Oyun yöntemin derslerde kullanımda önemli bir değişiklik olmamıştır

İstatistik Analizleri

Eğitim teknolojilerinin kullanım yüzdelikleri belirlendikten sonra cinsiyete, yaşa, deneyime, görev yerine ve eğitim durumuna göre teknoloji kullanımında farklılığın olup olmadığının ortaya çıkarılması için farklı istatistiksel yöntemler kullanılmıştır. Cinsiyete göre farklılaşmaları ortaya çıkarmak için t-testi, diğerleri için de one-way anova yöntemi kullanılmıştır. Burada alfa (α) değerinin 0.05 altında olması guruplar arasında farklılığın olduğunu gösterir. Alfa (α) 0.05 üstünde olması ise guruplar arasında farklılığın olmadığını gösterir. Karşılaştırmalı analizler bu değere göre yapılmıştır.

Cinsiyet T-testi : :(α) değerine göre soruların dağılımları ve yüzdelikleri

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
alfa (α)<0.005	13	16	23	29
alfa (α)>0.005	65	84	55	71

Cinsiyet bakımından T-testi değerlendirmesi sonuçları incelendiğinde 2001 yılında yapılan çalışmada alfa (α)<0.005 anlamlı olan faktör sorusu sayısı 13 iken bu sayı 2011'de 23 yükselmiştir.

Anlamlı olmayan faktör sorusu sayısı da 65'ten 55'e düşmüştür. Bu sonuç, bayanların bilgisayar teknolojileri kullanma oranları arasında farklılık gösterdiklerini ortaya koymaktadır.

Yaş One way Anova :(α) değerine göre soruların dağılımları ve yüzdelikleri

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
alfa (α)<0.005	20	25	30	38
alfa (α)>0.005	58	75	48	62

Yaş bakımından One way Anova testi değerlendirmesi sonuçları incelendiğinde 2001 yılında yapılan çalışmada alfa (α)<0.005 anlamlı olan faktör sorusu sayısı 20 iken bu sayı 30'a yükselmiştir. Anlamlı olmayan faktör sorusu sayısı da 65 ten 48 e düşmüştür. Öğretmenlerin yaşları arttıkça bilgisayar teknolojilerini kullanma oranlarında azalma olduğu gözlenmiştir. Bu verilerin analizi, 40 yaşın altında olan öğretmenlerin teknoloji kullanmaya karşı meyilli eğilimlerinin daha fazla olduğunu göstermektedir.

Deneyim One way Anova: (α) değerine göre soruların dağılımları ve yüzdelikleri

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
alfa (α)<0.005	10	12	24	30
alfa (α)>0.005	68	88	54	70

Deneyim bakımından One way Anova testi değerlendirmesi sonuçları incelendiğinde 2001 yılında yapılan çalışmada alfa (α)<0.005 anlamlı olan faktör sorusu sayısı 10 iken bu sayı 2011'de 24'e yükselmiştir. Anlamlı olmayan faktör sorusu sayısı da 68 den 54e düşmüştür. İlan tahtası, şema, mac ya da ibm, tarayıcı, dijital kamera, datashow, multimedya, televizyon, video, film şeridi, radyo, modem, internet kamerası, internet sistemleri, araştırma yöntemleri gibi araçları, deneyimi 15 yılın altında olan öğretmenlerin daha yoğun olarak kullandıkları gözlenmiştir.

Eğitim One way Anova göre (α) değerine göre soruların dağılımları ve yüzdelikleri

Cevaplar	2001		2011	
	Sayı	Yüzdelik	Sayı	Yüzdelik
alfa (α)<0.005	22	28	32	41
alfa (α)>0.005	56	72	46	59

Eğitim bakımından One way Anova testi değerlendirmesi sonuçları incelendiğinde 2001 yılında yapılan çalışmada alfa (α)<0.005 anlamlı olan faktör soru sayısı 22 iken bu sayı 32 yükselmiştir. Anlamlı olmayan faktör sorusu sayısı da 56'dan 46'ya düşmüştür. Eğitim düzeyleri bakıldığında lisans ve yüksek lisans mezunu öğretmenlerin özellikle bilgisayar teknolojilerini kullanma oranları yüksek olduğu gözlenmiştir. Bu analiz verileri, öğretmenlerin eğitim düzeyi yükseldikçe eğitim teknolojilerini kullanma yoğunluklarının arttığını ortaya koymaktadır.

Sonuçlar

Araştırma sonuçlarına bakıldığında 2001 yılında yapılan çalışmayla 2011 yılında yapılan çalışma arasında özellikle bilgisayar ve internet teknolojilerini kullanma oranları arasında oldukça farklılıklar gözlenmiştir. Bunun sebebi olarak Milli Eğitim Bakanlığının okullarda Bilgisayar teknolojilerine ağırlık vermesi gösterilebilir. Öğretmenlerin yaş ve deneyimleri arttıkça teknolojiyi kullanma oranlarının düştüğü gözlenmiştir. Bu durumun yeteri kadar hizmet içi eğitim yapılmadığından kaynaklandığı düşünülmektedir. Öğretmenlerin öğrenmeleri güdüleyen ve artıran eğitim teknolojilerini eğitim-öğretim ortamlarında yeteri kadar kullanmadıklarını her iki çalışmada ortaya çıkarmıştır. Bu sorunun ortadan kalkması için, Milli Eğitim Bakanlığı, İl Milli Eğitim Müdürlükleri ve İlçe Milli Eğitim Müdürlükleri üniversitelerin ilgili bölümleri ile irtibata geçerek planlı ve etkili olabilecek hizmet içi eğitim seminerlerini ortaklaşa düzenlemeleri yararlı olabilir.

Gelişen ve değişen teknolojilerin eğitim süreçlerini yoğun biçimde etkilediği ve teknolojilerin süreç içerisinde araç olarak önemli biçimde yer tuttuğu ve bu durumun zaman içiresinde artarak devam edeceği görülmektedir. Eğitim sürecinde, eğitici olarak rol alan öğretmenlerin bu teknolojileri daha etkin kullanması için tedbirler alınmalıdır. Türkiye'de Milli Eğitim Bakanlığı FATIH projesi ile eğitim teknolojilerini eğitim sürecinin içene daha fazla katmak için önemli bir çaba başlatmıştır. Bu ve benzeri projelerin başarıya ulaşması için öğretmenlerin eğitim teknolojilerini etkin biçimde kullanacak düzeyde bilgi ve beceriye sahip olması kaçınılmazdır.

Abstract

The main objective of this article is to analyze the policy implanted in the schools in the State of São Paulo, Brazil, with a view to the prevention and intervention in the violence that occurs in the schools. The importance of such discussion is related to the analysis of the principles that are present and of the possible effectiveness of such a program in the prevention of school violence. This research is qualitative and the research methodology used was documentary analysis. The documents analyzed were those related to the policy of preventing violence in schools in the state of São Paulo / Brazil, called Protection System School.

school violence; educational policy;prevention policy in schools.

Introduction

The main objective of this article is to analyze the policy implanted in the schools in the State of São Paulo, Brazil, with a view to the prevention and intervention in the violence that occurs in the schools.

This research is qualitative and the research methodology used was documentary analysis. The documents analyzed were those related to the policy of preventing violence in schools in the state of São Paulo / Brazil, called Protection System School.

It is a study that analyzes the documents referring to the "School Protection System" and its focal point will be the legal and punitive or pedagogical perspective which pervades this prevention policy. The importance of such discussion is related to the analysis of the principles that are present and of the possible effectiveness of such a program in the prevention of school violence.

The discussion about school violence and conflicts should be understood within a deeper context which is that of the violence which has been disseminated in the social tissue as something normal and natural and that Tavares dos Santos (2004) calls diffused violence. This diffused violence, according to the author, is prior to crime, not coded as crime in the penal code and is legitimized by the collective conscience, instituting itself as a social norm, even if controversial and polemic. The phenomenon of diffused violence permeates the relationships in the twenty-first century promoting an unexpected result in terms of the advance of civilization:

The social production of insecurity and the fear of crime with the weakening of social ties as well as the job insecurity and together with the fear of failure are characteristic factors of what can be called post-modernity, pointed out by different authors (Sennett, 2006; Taylor, 2006; Bauman, 1998). In this context of the diffused violence and of the feeling of social insecurity, Tavares do Santos, citing Bauman(1998) and Wacquant, (2000), points out the growth in the last twenty-five years of the population of prison inmates and of all who live off the penal industry – the police, lawyers, suppliers of prison equipment.

The relationships in the schools reflect these insecurities and through diffused violence in the everyday dealings not only in the relationships between students, but also between the former and other school professionals such as teachers, directors and employees. The insecurity felt by the school cause the punitive and judicial policies to be more frequently implemented, therefore seeking legal measures rather than pedagogical measures for the school conflicts.

School Protection System: protecting who, from whom?

The State of São Paulo government policy that is the subject of the analysis in this article is the "Sistema de Proteção Escolar" (School Protection System), an initiative by the Education Secretariat (SEE) in partnership with the Foundation for the Development of Education (FDE) and the Secretariat of Public Safety.

Basing itself on the assumption that the multiple socio-cultural variables can interfere in the school's pedagogical work and at the same time stimulate transformation, in 2009, the SEE made the "Manual of School Protection and Promotion of Citizenship" and the "General Norms for Conduct in School" available to all the schools that are part of the state education network.

The presentation text of the "Manual of School Protection and Promotion of Citizenship" refers to the pedagogical character of the school procedures that should not be subjected exclusively to an administrative/juridical position and highlights the necessity of strengthening the interpersonal relationships in conflict management as a fundamental role for school administrators and educational supervisors. Furthermore, the presentation of the Manual refers to building a "culture of peace" in pursuit of a less conflict filled and contradictory reality. With the "General Norms for Conduct in School", SEE has the intention of providing a "support tool to the procedures in the state educational network, becoming an indispensible reference for all schools" (SEE, 2009a, p. 5).

However, upon analyzing these references, we see that the pedagogical character is only an additional element, superficially explored. We clearly notice that the project's intention is based on the strict control and punishment of students that do not fit into the norms and standards established by the school. In the same manner, its objective is to disseminate the best ways of punishing and gives the legal details of the possible procedures for each infraction occurring in the school, demonstrating new forms of control by the State apparatus. In the meantime, the "institutional violence" is totally ignored, demonstrating that the understanding of the definition of violence is unilateral, marked only by the students' violence towards the institution.

Though in its presentation, the "Manual of School Protection and Promotion of Citizenship" approaches the educational character as an essential element for the daily living relationship in the school environment, this referential is lost in the sequence.

The first section of the Manual, "What is what" (SEE, 2009a, p.9-18), defines the concepts of citizenship, violence (gender, family, and domestic), conflict, abuse, sexual exploitation, crime, misdemeanor, infraction, theft, burglary, verbal aggression, bullying, prejudice, discrimination, racism, drugs, addiction, peace, the Culture of Peace, the Rights of Children and Adolescents. These concepts are based more on the knowledge of the Law, rather than in fact educational.

In the second section (SEE, 2009a, p.19-22), the Manual defines "Who is who", as the title indicates, informing the institutions responsible for the various referrals, for example the Vara da Infância e da Juventude (Infant and Youth Court), the Conselho Tutelar (Guardian Council), Defensoria Pública (Public Defense Office), amongst others.

In the immediately following section, the Manual answers any doubts that may come up in the schools, (SEE, 2009a, p.23-32). "About the School" is the title of this third section that deals with topics such as urban area, the school's responsibility to the students while on the premises or on the way from home to school. It also deals with the dispensation of students, unjustified absenteeism, the student's representatives in the absence of parents, and permission to the parents or guardians to have access to the school. It discusses issues on defamation caused by a student, parent, or guardian against a colleague, teacher or the school, about the knowledge of the parents or guardians of the school rules and the disciplinary measures adopted by the school. It goes on to give the reasons for the school staff to mandatorily register the school occurrences in the appropriate systems; how to receive the convicted students, who in abidance socio-educational measures, are on probation, in semi freedom or rendering service to the community, and whether they can have their identity revealed. It gives the guidelines on the entrance of the police and journalists into the school, bomb threats, and surveillance and monitoring. The majority of the answers to these doubts are based on the current legislation, mainly the Estatuto da Criança e do Adolescente (ECA, 1990). However, some of the statements, as for example the permission for the police to enter the school, do not present the legal base to support the text. Actions that are in fact educational are not discussed, only the applicable legal procedures for each situation.

In the sequence, the Manual brings in its fourth section, "About the students", the actions that should be taken when verbal or physical aggression on the part of the student occurs, the use and sale of drugs and alcohol on the school premises, the carrying of weapons, bullying, racism, vandalism, theft or burglary. The attitudes the professionals should have when identifying children and adolescents that have suffered sexual abuse or ill-treatment, when there is sexual harassment by the student against a member of the staff and finally, when there is a sexual relation between students. In most part, the actions cited in the material foresee the calling in of the Guardianship Council and of the Military Police, giving little or no space to the real pedagogical action within this context.

In the fifth section, "About the staff", the Manual brings up the actions to be taken with members of the staff in cases of domestic or family violence, verbal or physical aggression against colleagues or students, the use of tobacco, drugs and alcohol on the school premises, manifestation of racist attitudes, in the case of theft, burglary, carrying of weapons, sexual and moral harassment of students and sexual relations with students under the age of 18.

"Sexual violence against children and adolescents?", the sixth section of the Manual (SEE, 2009b, p.44-47), brings the guidelines of how to proceed in the cases of sexual violence and homophobia in the school. This is

the first part of the Manual that discusses the educational actions and approaches that are not juridical, in order to deal with the subject matter in such a way as to prioritize human relationships within the school, in favor of living with the differences.

In "Notification and Referrals", the seventh section of the Manual, there is an intensification of the requirement that permeates the whole reference: to register an Occurrence Bulletin with the Police when illegal acts are practiced in the school. This section determines that a Police Occurrence Bulletin should be registered in an attempt for the authorities to investigate the illegal acts, contraventions or crimes. Additionally, it explains the significance of the notification, how to proceed with notifications of abuse, where to send them, the situations in which the Military Police should be sought out, the Mobile Emergency Service, the Fire Brigade, the phoned denouncement and the Police District. In the last part of this section, there is an explanation of the reasons that lead educators to be remiss, even when they know that it is a legal obligation to notify the occurrence of violence.

Finally, and in the last section of the Manual, there is a mention to "Some school actions for the prevention of violence and the promotion of the "Culture of Peace". These actions are based on the idea of the Culture of Peace, with the belief that in the future there will be the "construction of a social structure and of social relationships characterized by the presence of justice, equality, respect, liberty and by the absence of any type of violence". (SEE, 2009a, p.9).

On giving definitions for the concepts of what are crimes, contraventions and infractions, The Manual of School Protection and Promotion of Citizenship, points out that "contraventions and crimes committed by persons under the age of 18", are infractions (SEE, 2009a, p. 14). However, when dealing with misdemeanors that occur within the school, the text repeatedly utilizes the term 'crime', and also presents a list of "the most common crimes in school" (p.15) that go from acts of damage, graffiti, threats, to carrying of weapons, drug dealing and rape; dealing with all of them with the same severity. Furthermore, it uses legal terms to qualify the students, such as "convicted" for adolescents in conflict with the law and who are carrying out socio-educational penalties. It presents simplistic solutions such as the suggestion for dealing with bullying at school; recommending that the aggressor be *referred* to therapeutic treatment and that the Guardianship Council give *warning* to the aggressive student to "cut down" on this undesirable behavior. (p. 34)

The pedagogical superficiality and the hardening of the legal and police measures are clear to us, as evidenced by the above examples.

Another relevant aspect, that we highlight in the material, with regard to the treatment given to the students that commit the so-called "contraventions", is the difference established between similar acts carried out by the students and by the members of the staff. We use as an example a person under the influence of drugs or alcohol on the school grounds. When the problem occurs with a staff member, after immediate measures taken by the school director, such as the sending the staff member home, the material presents a list of guidelines that may be followed in order to avoid future problems and help the staff member to re-adapt to the work environment. Amongst the eleven suggestions (p.77) there are those which have to do with explanations about the ills of using drugs, the permanent observation of the performance and behavior of the staff member and the referral to health and support services.

When referring to the student, in relation to drugs the material guides that "regardless of the student's age, the Military Police (190) should be called, in order for the applicable actions be taken (SEE, 2009a, p.33)." Following this there are no detailed suggestions, as there are for the staff members, to guide the school staff on how to abide with and addicted student. It only suggests that the student be sent to the Guardianship Council, who in turn, will send him to the proper Social Service office.

Conclusion

As a **conclusion,** we highlight the punitive and legal referral at different moments present in the principles of the "School Protection System", releasing the school of any pedagogical and educational action with regards to the conflicts that are as much results of external issues such as the violence in society, poverty and the presence of organized crime, as they are results of the internal organization of the school that is not prepared to work with the idea of a democratic, inclusive school for everyone.

SECURE AND INTEROPERABLE E-LEARNING PLATFORMS BASED ON WEB SERVICES

Umit Kocabicak[a]   **Deniz Dural**[b] 65

[a,b] Computer Engineering Department, Faculty of Computer and Information Science

Sakarya University, 54187 Serdivan / SAKARYA / TURKEY

Abstract

Distance education's popularity is increasing day by day and has become one of the most preferred methods for obtaining information. It provides great facilities in many aspects according to traditional education. With these improvements, many requirements have appeared in this area. First of all, keeping to one electronic platform began to be insufficient for users and they need to access other platforms for obtaining more information. This means that e-learning platforms of universities may work together. In this study, through advantages of web service technology, security problems of interoperable e-learning platforms could be solved with the designed framework.

Keywords: Distance Education; Security; Interoperability; Web Services

Introduction

Electronic learning is defined such as a concept that independent-time, student-centered. It is provided to benefit knowledge of a person anywhere in world. Its training cost is very low according to traditional education and feedback can do very fast. Through many positive properties, electronic learning has been become impossible to stay away from it, nowadays (Wikipedia, 2012).

With increasing the benefits and acceptability of e-learning, many educational institutes have created e-learning system according to their own requirements. Thus, redundant heterogeneous e-learning platforms have appeared that are nonflexible, high cost and can't work together. However, in distance education, users need different e-learning platforms for accessing information in anywhere at any time. So, with spread and growth of e-learning system, data exchange with other e-learning systems and other applications have become more needs (Lursinsup and Sophatsathit, 2005). Therefore, using advantages of web service technology that is indispensable element for distributed processes during the heterogeneous systems has become homogeneous, is inevitable. Thus, a service oriented and distributed architecture for e-learning systems that is based on web services, is presented (Kuru, 2006). Usually, service oriented architecture is composed of many web services that work at different conditions and under different security management systems, are developed by different organizations in different platforms.

If thinking that e-learning systems are developed by each institution depending on their requirements and platforms they use, each of them will use their own security methods. As a result, heterogeneous systems will occur. In here, one of the main problems is security that arises during the integration of heterogeneous systems (Rodriguez, Anido and Fernandez, 2003).

This study is based the combining different e-learning systems that is necessary for distance education. And then, a solution is proposed to find about the security problems that occur while combining these systems, with

---
65 Deniz Dural. Tel.: +902642955895
E-mail address: ddural@sakarya.edu.tr

XML web services. In study, needed security for all of the systems is provided via designed architecture. Users can login with a single entry. Also, if a service is wanted to add or delete, the system can be configured without making more modifications through designed framework. In this way, more flexible, easier configurable, distributable, more secure service oriented architecture is intended.

E-Learning and Web Services

E-Learning

Electronic learning concept can be defined that authors, students, teachers and education designators work together to how student groups learns more effectively. In e-learning systems, generally the course materials appear such as a web page to the students. But a learning network provides an opportunity for students to learn much more. Most important advantage of online learning is that to be accessible at everywhere on every time. Users can access to e-learning network from anywhere of the world and can benefit from advantages of individualized learning. Online learning can be used at education of employees in industries and can provide them to increase their skills. Also, it is very useful for universities and provides to meet educational requirements of students quickly, who want to benefit e-learning services.

E-learning is student-centered and students can study until they have learned a subject exactly. Required resources can be accessed very short time. Educational cost is very low according to traditional education. Materials can be updated quickly based on changing conditions. Feedbacks can be taken quickly and all activities of users can be reported (Wikipedia, 2012).

Besides of all of these advantages, e-learning can allow the personalization, education forums, digital libraries, virtual classes etc. Not only students; teachers and authors can benefit from these advantages while they are preparing courses contents or are using them as reference material (Hussain and Khan, 2005).

Web services

The reason of success of the web service technology is using HTTP and XML that are the standard communication protocols. Additionally, there are standard protocols that a web service needs to. First one of them is SOAP (World Wide Web Consortium [W3C], 2007) that has been developed for integrating applications, formatted with XML. This protocol provides communications of information and can work with any operating systems, programming languages and platforms. Second one is WSDL (W3C, 2007) that defines information like description of web service, processes, input-output message formats in XML format. Last standard is UDDI that provides the definition of institutions by publishing their services and then this information can be accessed by other institutions (Advancing Open Standards for Information Society [OASIS], 2012).

Concordance of web services that is used for bringing together heterogeneous systems, becomes very easy through to widely usage of web services. (Nordbotten, 2009) Having characteristics XML-based makes web services are usable between service provider and service requester, no matter how background systems are different. This property makes web services XML-based technology. In other words, all of basic components of web services such as SOAP, WSDL, BPEL, are XML-based. Therefore, when we mentioned about web service security, XML security comes to mind. XML-Signature and XML-Encryption that are presented by W3C (World Wide Web Consortium) in 2002, are main parts of XML standards (Mirtalebi and Khayyambashi, 2011). A lot of

languages are developed for same purpose. One of them is WS-Security and it provides XML digital signature and XML-Encryption elements to be used in SOAP. It is used for message integrity and confidentiality.

Other languages which are expanded version of XML;

- XML Signature: (W3C, 2008) It provides cryptographic protection to XML documentation. Integrity, authentication and non-repudiation are provided through this specification. (Buchmann and Jecan, 2008)
- XML Encryption: (W3C, 2002), It provides supporting about encryption of XML documents and sending them in same security level.
- XKMS: (Sun and Li, 2008) It is used for management of used public keys along with the XML-Signature and XML-Encryption.
- XACML: (OASIS, 2011), (Extensible Access Control Markup Language) It is defined as a standard that provide to decide complex authorization policies by specifying a set of rules.

2.3. Web services in e-learning

Using web services in e-learning management systems makes e-learning is stronger and more functional because web services provide processes for independence. This situation prevents expanding e-learning systems depend on a single system and makes it possible to communication of each of them and other applications.

Many people are using e-learning environments. Therefore, these systems must to provide information security for users. So security is basic requirement in these systems. Providing systems security for users is very important whatever contents of learning. Main task of e-learning is that providing end-to-end security between users and environment about security issue. While system is being designed, important notions as authentication, non-repudiation, confidentially, integrity must be thought for security (Gualberto and Zorzo, 2010) (Basha and Dhavachelvan, 2010).

The Challenges and Proposed Architecture

Distance education's users need to access to different e-learning platforms for getting more information. Universities may want to obtain different courses they have not in their own e-learning system or provide variety of courses to their students. Therefore, many problems and requirements occur during accessing to the systems in an environment where multiple systems are. One of these problems is about providing security of users' information. When the user makes a request to an e-learning platform, integrity of generated message must not be failed during the transmission end-to-end and confidentially of identification as users name and password must be provided.

Another problem is that users have to remember different id and password for every platform. E-learning platforms constitute several systems to themselves for authentication and authorization. Number of users id and passwords increase with increasing number of e-learning platforms. Therefore, keeping in mind the different information becomes difficult for every platform (Alkouz, and El-Seoud, 2007).

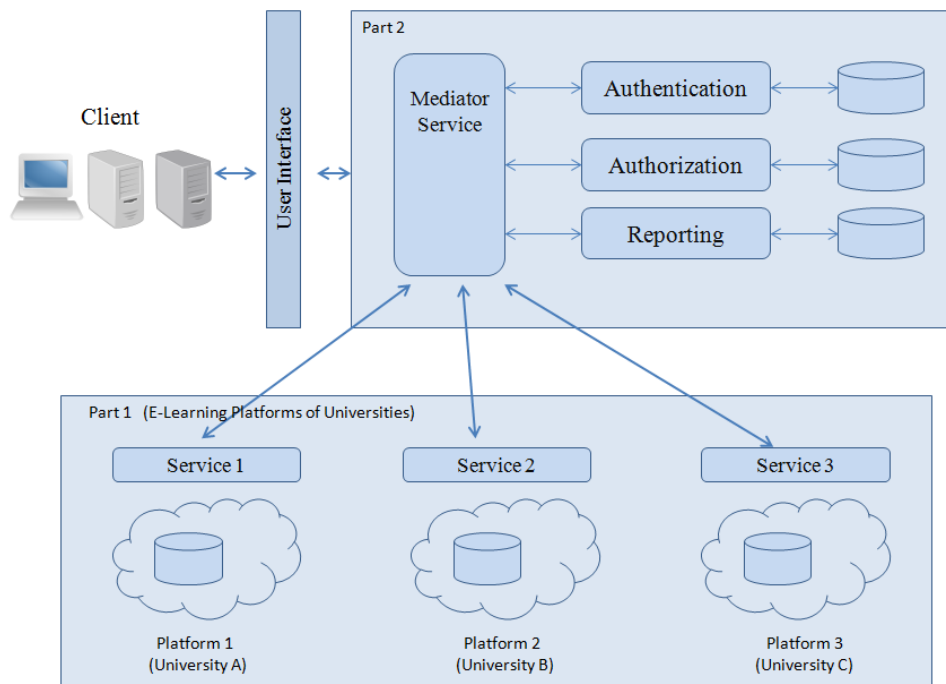
For challenges mentioned above, the proposed architecture is shown as in Fig 1.


Fig.1. Proposed Architecture

According to the proposed model, users can access to different e-learning platforms with a single entry. The model consists of 2 parts. First one consists of three databases and three web services. Databases belong to three different universities and three web services are used for exchanging data from these databases. Second part of the model is used to prevent security problems while accessing to e-learning systems in first part. And second part includes some security definitions the user must success to connect to web services that are in the first part.

In second part, the functions of web service security as authentication, authorization and logging are designed in form of a separate web services. There is no communication between these designed three services. The reason is to enhance security, separating services that the information will be controlled in, from each other. A web service that is called Mediator Service exists for communication of three separation services. So, every services in system or added new services to system are users of Mediator Service. The reason is that gathering the management to one place and increasing the safety by creating independent and unaware services of each other. So a new web service is requested to add into model, only a small configuration is enough in Mediator Service. There will be no need to change the entire system.

The processing of the designed model is determined in this sequence. A student who is registered to distance learning of one of universities in the model, wants to login with his number and password. While this request is transmitting to Mediator Service, identification, time stamp and validity are added to this SOAP request message primarily. Then adding the certificate information, message is encrypted and is sent to Authentication Service via Mediator Service.

In the Authentication Service, the received message is controlled from database whether there is a valid login or not. After the control, with adding the valid/invalid information, firstly the message is sent to the Mediator Service and is sent to Authorization Service from Mediator Service.

In the Authorization Service, the received message is resolved and is controlled from the database for learning what the user has authorities. This info is obtained and added to the messages' end. And then this combined message is transmitted to the Reporting Service via Mediator Service.

In the Reporting Service, the received message is resolved again and which platforms the user can access to, is determined according to all of the answers from Authentication and Authorization Services.

During the communication between three services, SSL protocol is used for security. In briefly, during accessing to different e-learning platforms, instead of accessing to the platforms directly, user accesses to the databases via two-tier architecture that is shown in fig.1. and so there is more secure environment against to possible attacks.

Conclusion

This study helps to provide security of language-independent and combined e-learning platforms through web service technology. Also, a model that has more secure infrastructure is constituted using basic standards of web services security. In this model, authentication, authorization and reporting functions that having to be important issues in security, are defined as a separate web service for building secured web services. Also these services have no connection between them. Therefore, a Mediator Service is developed that have direct communication with every service. Thus, the model's configurations and management is to be easier, management is collected in a one place and services that are independent and unaware of each other are created. Finally, the security is tried to be increased. If a new service is wanted to add to the model, a small configuration is will be enough on the Mediator Service. There is no need to change anything in whole of the system. When users wanted to connect to the services that are defined on local or internet, they must provide the system's security conditions.

Consequently, designed architecture is flexible, distributable, extensible, easy configurable, more secure and a service oriented structure. In this system, e-learning platforms of three different universities are used. But adding new platforms and increasing this number become easy because of the architecture has flexible structure. Through this increase, using different e-learning platforms, access to different resources is always needed in distance education is provided. A solution is proposed to security problems during communication between web services.

SMART, INNOVATIVE AND PLAGIARISM-DETERRENT ASSESSMENTS

Mohammad Yamin

Department of Management Information Systems

Faculty of Economics and Administration, King Abdulaziz University, Jeddah, Saudi Arabia

Abstract

Designing creative and effective Learning and Teaching material is always a challenge. To prepare innovative assessments, which at the same time deter students from plagiarism, may not always be an easy task to the instructors. This paper highlights the importance of smart assessments whose format can be adapted to all modes and forms of learning & teaching, and which would discourage students from indulging in plagiarism. The paper also presents a model assignment which can have numerous case-based solutions, any two of which would never be the same unless in case of blatant plagiarism. An added advantage of our assignment format is that it can be effectively administered both in interactive as well as distance learning environments. The format presented in this paper can be adopted in any discipline; however our implementation is carried out to an introductory Database Systems course. The assignment presented in this paper, on the basis of student feedback, is regarded to be very effective, detrimental to plagiarism and was liked and appreciated by the students who returned a higher approval rate.

Keywords: Innovative, plegiarism-deterrent, database, feedback

Introduction

For most subjects and courses, designing innovative assessments is an important part of successful Leaning & Teaching. There are a number of issues associated with design of student assessments (e.g. Carroll 2002), which focus on relevance and plagiarism. According to Melissa (2007), instructional design does play a significant role in the deterrence of plagiarism in online courses. Many researchers e.g. Handley & Williams (2011), Olt (2007, 2009) and Gibbs, & Simpson (2004-05) have contributed to the study of plagiarism According to Johnson (2004), plagiarism is a major area of concern to all educators, and in view of Ross (2003), its prevention takes precedence over its cure.. In view of Carroll (2002), there is not one single approach that will deter plagiarism but a raft of strategies that can be adopted and reinforced. These range from course and assessment design through to how you inform students what is acceptable / unacceptable and then, only finally, through to detection. According to Leong (2005), instructors want the students to successfully complete a course that stimulates their interest in learning. Students' successful learning in an information science course heavily depends on the kind of assignments they complete. Poorly designed assignments are likely to create many problems to both students and educators. For example, some students may find it hard to comprehend how the assignments are linked to the overall learning outcomes of the subject, and how the different assignments are integrated with each other. Assignments, which do not provide a framework on how to attempt and successfully complete them, might encourage some students to indulge in cheating and plagiarising. In view of Born (2003), making students aware as to how plagiarism affects their learning goals is very important. Designing assessments which have significantly less chances of plagiarism can be very challenging.

From my teaching experience of last twenty five years, I have found that inadequate information about an assignment would normally prompt students to seek more and more clarifications from the instructor. Normally, seeking more information would be considered as a sign of learning but the lack of it might lead to waste of time

both to the students and the instructor. Seeking clarification, which should otherwise be part of the assignment, may consume a significant portion of students' consultation time, which could perhaps be invested for better learning ideas. In addition, some students, due to lack of opportunities, may not opt to seek additional information and hence may end up with poor quality submissions. While teaching Database and Management Information System units for several years, I have learned the kind of problems that students face in summative assessments. In such traditional assessments, I have found some cases of plagiarism. This has provided me with an incentive to design assignments which

1. are innovative and promote creative learning by way of building blocks of case studies,
2. provide an example of a solution and other relevant information as part of and in the text of the assignment,
3. minimize the possibility of cheating and plagiarism,
4. are equally effective for online environments, and
5. are appreciated by the students.

Having these objectives in mind, I had designed some assignments for a Database Systems unit that I taught at the University of Canberra during 2001-2009 and at the Australian National University in 2011. These assignments deviate from a traditional assignments with tunnel vision and hence do not lead to a single solution. It can be challenging and time consuming but not too difficult for instructors to design assignments with numerous possibilities of solutions. In my assignments, I had provided students with an example of a model solution for every question that I asked. An added advantage of providing model solutions is that the assignments may be adapted to suit non-traditional learning environments, such as blended and online modes of learning. In the rest of this paper, a framework for designing and implementation of an assignment to an introductory undergraduate course in Database Systems is discussed. The framework is backed up with examples of solutions in a format upon which students can visualize and build their cases independently.

A new approach to database course assignment

Traditional or summative approach

In view of Baron and Keller (2004), the assessment should be part of the learning process, which is an emphasis on formative rather than summative assessment. In view of Harlen, (2005), the traditional or summative approach for students' assessments can be very useful in some cases. However, in some other cases, students may be required to understand descriptions of contextual problems along with a range of required tasks. Such assignments assume that students can gain enough information from the text of the assignment and be able to fully understand the set of academic requirements. In some cases, it is highly probable that the majority of students would not understand all the requirements. This would lead them to seek more and more clarifications, resulting in usage a significant portion of students' consultation or lecture time. Such assignments are prone to plagiarism and are not suitable to an online mode of study. Such assignments may also not promote creative learning environment.

A new approach

According to Leong (2005), if the students are approached in a way that they care and understand the experience, learning occurs. Moreover, cases help stimulate critical thinking and discussion. While teaching a first year undergraduate database systems unit at the University of Canberra during 2001 - 2009, and a similar unit at the Australian national University during 2011, I was led to develop and design an assignment, which, unlike traditional or summative approach, has infinite number of possibilities of solutions. This achieves a number of desirable objectives:

1. If any student resorts to copying or plagiarism, the design guarantees that such an occurrence will be easily detected

2. The manner in which the concepts are combined makes it almost impossible to find a complete solution for this assignment in the texts. Hence, students cannot lift a solution from the textbooks or internet as it would be very difficult to solution even to match half of the scenario of my design

3. Students having different levels of understanding can choose cases of their solutions commensurate to their capabilities and understanding.

4. With the help of the model solutions, understanding of the requirements of assignments is made easy.

5. The design is simple and every student can attempt it without requiring any external assistance. The assignment promotes reading of the subject matter and provides an opportunity and challenge to students with varying degrees of understanding.

The other features of my design are guided by the well-established principles. For example, its style follows from the "building blocks methodology". In this way the assignment is comprehensive yet simple, and is made easier to understand with the help model solutions. According to Leong (2005), creativity helps to stimulate an interest in learning. According to Sweeney (2003), a climate of creativity should be appropriately included in all IT topic areas. According to Evans (1995), creativity is the ability to form new combinations from two or more concepts. This assignment combines a number of concepts in a logical manner and aims to inculcate the targeted skills amongst the students. This assignment can also be extended to another advanced assignment on normalization of relations for the same or different subject on database systems. I used my assignment from 2005 – 2009 at the University of Canberra and discovered that

1. Student enquires and clarifications related to the assignment were resulted only to a few in number.

2. Occurrence of plagiarism was not found.

3. Most of the students demonstrated better learning of the concepts

During the last decade or so, many institutions and instructors, in order to detect internet related plagiarism, have resorted to plagiarism tracking software like Turnitin, which can be found at http://www.turnitin.com/static/index.php and other software tools like CopyCatch, which can be found at http://www.universityaffairs.ca/turn-it-in-for-a-learning-opportunity.aspx. A lot of studies, e.g. Adam Chapnick (2008), can be found about the benefits and concerns in using such plagiarism-detecting tools. While the benefits of such tools can hardly be denied, there are widespread moral and ethical apprehensions and concerns about the usage of such software tools. Sally Savage (2004) concludes that "some students hold objections to Turnitin that relate to legal issues concerning privacy, copyright and ownership of labour". My experience of using Turnitin was also met with some objections from the students as in their view it breached or compromised ethical and privacy guidelines. In addition, as it turned out, to analyse the results of Turnitin was very laborious and time consuming. It is worth emphasizing that during three consecutive semesters, my assignment resulted in a drastic reduction in plagiarism. Even in the cases when the plagiarism had occurred, it was easily identified without the help of any software like Turnitin. This was made possible because my design made it very easy to detect identical or similar submissions.

I conducted surveys to measure the effectiveness and appropriateness of this assignment with my students at the Australian National University in 2011 and at the University of Canberra during 2008 and 2009. I also received informal feedback from my colleagues at the University of Canberra, the Australian National University, the Australian Defence Force Academy, the Management and Science University of Malaysia and the King Abdulaziz University of Saudi Arabia. Apart from routine questions, I was very curious to find out whether providing an example of model solutions as part of the assignment, which I did, was relevant and justified. Informal and formal feedback resulted in the following outcomes:

A unique assignment design

Unlike the traditional approach of database assignments, my approach can theoretically have a variety of solutions. It also takes care of students having different levels of understanding. It builds concepts in a gradual manner. In this way the assignment is comprehensive but very simple to begin with the help of model solutions. The manner in which the concepts are combined makes it almost impossible to find a complete solution for this assignment in the texts. The assignment promotes reading of the subject matter and provides a challenge for all

students irrespective of their degrees of understanding. With an assignment like mine, instances of plagiarism are likely to be reduced drastically, and if not, plagiarism would be easily identified without having to use software tools like Turnitin, which is primarily for the reason that any two or more submissions cannot be the same or similar. My assignment also demonstrates that the model solution form an interesting case can be used to create a new assignment

The assignment questions with model solutions

Contents of the Assignment

The following assignment was designed for Database Systems, a first year undergraduate unit which I taught at the University of Canberra. This assignment aims to provide an understanding of introductory database concepts. For each task of the assignment, included is a model solution based on a case study. These solutions are intended to provide a better understanding to learning the concepts, and to help students produce high quality results. The relations or tables of these examples are combined to an advanced assignment on normalization of relations.

Task (a): "Give a short description of two relational database systems, real or hypothetical. Your description should include the details of data stored by the system, and three important functions that the system would perform."

Model Solution for Task (a):

Name of Database System: Timetable Management Information System

Description: The Dream University is trialing a database system known as Timetable Management Information System (TIMS) to store and manage information of lectures given at the main campus. This database is used by students, teachers and administrators. It stores data about subjects, teachers and classes. Data about subjects include subject Code (subCode), a three letter abbreviation of the subject name (subName) and a single digit number for the credit value (Credit) of the subjects. Data about the lecturers includes lecturers' identification number (staffNo), initials of the first and last names (staffName), and office contact address (Address). The data stored about classes apart from subject and lecturer details include day (classDay), time (classTime), room (classRoom) and year-semester (yearSem) of the class.

Details of Functions:

1. Find the details of lecturers or details of all classes.
2. Find out details about various subjects.
3. Find out details of classes for a particular subject.
4. Enter details of new classes.

Task (b): "Write at least three relations or tables for each of the two database systems which are sufficient to resolve your queries, and identify primary and foreign keys for each of these relations. Include all business rules relevant to your relations/tables."

Model Solution for Task (b):

The relations shown as Table 1 Subject, table 2 Lecturer, Table 3 as SubLect (subject and lecturer) and Table 4 SubClass (subject and class) given below, are chosen to meet the requirements of the queries in the above example.

Business Rules:

1. A lecture for a subject is meant for all the students enrolled in that subject in a particular semester.
2. A lecturer may teach more than one subject in a semester but a subject in a semester will be taught by only one lecturer.
3. A subject can have two lectures on the same day but at different times.
4. One subject is taught by only one lecturer during one semester.
5. Different lectures may teach the same subject in different semesters.
6. Subject Name (three letters) of the subject name may not be unique for the same subject.
7. Two lecturers may share the same office.

Task (c): "Write primary and alternate keys for all relations or tables."

Model Solution for Task (c):

Subject

Primary Key: subCode, Alternate Key: None (why)

Lecturer

Primary Key: staffNo, Alternate Key: None (why)

SubLect

Primary Key: subCode, yearSem, Alternate Key: None

SubClass

Primary Key: subCode, classDay, classTime, yearSem,

Alternate Key: classDay, classTime, classRoom, yearSem

Task (d): "Write two queries in English for each of the database systems (at least one of them should refer to the data from two or more tables)."

Model Solution for Task (d):

1. List subject codes of all subjects taught by the lecturer whose staffNo is 650011.
2. List staff number, name and the address of the lecturer who taught the subject having code 6672 in the first semester of 2011.

Task (e): "Write the resolution of the queries in (d) in relational algebra using the relations / tables in (c) (at least one of them should contain a join operation on two or three tables."

Model Solution for Task (e):

1. ΠsubCode(σstaffNo= 650011(SubLect))
2. [ΠstfflNo,staffName,address(Staff)] χ Staff.staffNo=Subject.staffNo
   [ΠstaffNo(σsubcode=6672 ^ yearSem (SubLect))]

   (Here χ is an equijoin)

Task (f): "Write the resolution of the queries in (d) in SQL using the relations / tables in (c)."

Model Solution for Task (f):

1. SELECT subCode
     FROM SubLect

     WHERE staffNo = 650011.

2. SELECT staffNo, staffName, address
     FROM Lecturer

     WHERE staffNo = (SELECT staffNo FROM SubLect WHERE subCode = 6672 AND

     YearSem ='2011S1')

Task (g): "Write a table which results from the Cartesian product of any two tables (or part of) that you have presented."

Model Solution for Task (g): Table is the Cartesian product of the first two columns of Guest and Booking tables:

Building yet another assignment

The above assignment can be extended to an advanced assignment as follows. Suppose we are given the relation as in Table 7, whose attributes and business rules are described in our model example above. The students' task would be to normalize the above relation into 1st, 2nd, 3rd normal forms as well as into the Boyce Code Normal Form (BCNF). A close examination of the problem would suggest that the four relations/tables presented as Table 1, table 2, Table 3 and table 4 in our model example in (b) are actually the BCNF form of our relation in Table 7. There are absolutely no issues even if students are able to sense the solution even before attempting to normalise the relation because they would still have to describe the entire normalization process in detail. To describe and sketch the normalisation process is hardly impacted by knowing the solution. In fact the beauty of such an assignment as this one is that it emphasises on learning rather than a solution. However, these

kinds of assignments require more time to evaluate them as virtually all of the submissions, unless plagiarised, would be significantly different.

subCode	subName	staffNo	sName	Address	classDay	classTime	YearSem	classRoom	Cr

Conclusions

When this assignment was used, it was highly endorsed by students, perhaps due to the reason that it included model solutions. This assignment aroused creativity and contributed to better learning of the concepts. These results were evident from the end of semester evaluation forms returned by students.

Key Performance Indicator	Score on a scale of 5
Because of its design, I understood the assignment questions easily	3.7
Because the sample solutions were provided, I had a clear idea of what was required of the assignment	3.9
Because of the clarity of the design and a set of sample solutions, I was able to do the assignment on my own without any external help	3.8
The design of this assignment was better than a conventional theoretical assignment	4.0

Table 8 Survey Results

Because of the open ended format of the assignment, students presented a diverse range of interesting examples/. When the same assignment without model solutions was administered to about one hundred students in semester two of 2004 and about fifty students in the first semester of 2005, it resulted in some cases of plagiarism. Whereas in the first and second semesters of 2006, when the assignment was administered in its present form to about the same number of students, only one case of plagiarism was detected. The results of 47 student feedback survey returned the following ratings:

Abstract

Quality of life has become a very topical scientific phenomenon over the recent two decades and it is reflected in many fields of research. In the context of special pedagogy a very highlighted issue is the assessment of the quality of life of specific client groups in order to establish an adequate level of the provided support and to optimise the complex intervention. This is why there was designed a concept focusing on the research of the quality of life of children with retinopathy of prematurity, which is one of the main causes of blindness in advanced and medium developed countries of the world. This study focuses on the description of the research concept. The whole issue is studied in the context of the theoretical background and practical applications.

Keywords: Retinopathy of Prematurity, Quality of Life, health related quality of life, visual impairment, special education, children

1 Introduction – theoretical base

Retinopathy of prematurely born children - Retinopathy of Prematurity, Retinopathiapraematurorum ("ROP") is at present on the top of the list of causes of blindness of children in developed countries of the world. ROP was the cause of eyesight loss for ca 70% of the blind children (Rozsíval, 2005). This vasoproliferative disease of the retina affects especially prematurely born children with low birth weight. The ROP incidence grows due to the increasing number of extremely premature children, who manage to survive. In the Czech Republic every year 80% of children with less than 1000 g birth weight survive (Štembera, 2004). Every year in the Czech Republic there are registered ca sixty children with serious damage of vision due to ROP (Kuchynka et al. 2007). The contemporary advances in ophthalmology have significantly improved the prognosis of vision functions of children with ROP, yet its impact can have fatal consequences of total loss of visual perception, which confirms its dominant position among the child blindness causes.

The presented data clearly show, that ROP remains, in spite of the significant scientific and technical advances in neonatology and ophthalmology care, a very pressing medical, social, economic, social-pedagogic and ethical problem. Depending from the level of retained eyesight functions, which range from weak eyesight up to total blindness and in connection with other accompanying complications arising from the degree of immaturity, there was prepared a concept focusing on the quality of life of children, who suffer from retinopathy of prematurity.

The most frequent effect of ROP is serious eyesight impairment, or even blindness. Due to the technical advances in the neonatology and perinatology fields we can expect rising incidence in the category of extremely immature newborns at the very limit of viability, which will mean a rising incidence of retinopathy of prematurity, especially its atypical forms. The lost of vision affects the whole personality of an individual and his/her quality of life.

The QOL (Quality of Life) phenomenon is an issue, which is currently highly discussed and widely understood and many fields of science study it (philosophy, sociology, psychology, medicine, economy, ecology, pedagogy, special pedagogy etc.). The wide options of application are reflected in the multi dimensional nature of this problematic. The assessment of QOL of children has become the focus of interest of experts only during the last ten years. A wide range of research is dedicated to the quality of life of the adult population, however the category of children and adolescents is slowly gaining in importance and it becomes an "emerging field of study". In the past there were developed various theories describing the quality of life of children. Mostly the theories focused on only one dominant aspect of a child's world. According to the present view of many authors, the development theories focusing on the psychological aspect (e.g. Limber, Hashima, 1999), or physical aspect (such as Ruštin, Greenberg, 1999), social (e.g. Flakkoy, Hevener, 1997), moral or spiritual growth (such as Thompson, Randal, 1999) do not provide sufficiently complex basis for creation of tools to monitor QOL of children" (Dostálek, Troneček, Hejcmanová, Petriščáková in Mareš et al., 2006, p. 209). Currently even in this area of interest there dominate the quantitative methods of QOL assessment in the form of questionnaires, which may not be sufficiently sensitive to the specifics of certain groups of children, especially ill children. The questionnaires are also designed for an "average" child, which does not exist. This is why there is a worldwide increase of interest in a qualitative approach and specific instruments of qualitative nature (Mareš, Marešová in Koukola, Mareš, 2007).

From another perspective, the aforesaid authors speak about other problematic aspects of measuring the quality of life of children – we, the adults, ask children from our point of view, using our methods and our words. Vaďurová (2006) notes the attention span and points out, that in reasonable cases there is no other alternative than "proxy rating", when the quality of life is assessed by a parent, doctor or other relative. This brings us to the question of the evaluator of the quality of life. Vaďurová (2006) considers the assessment of the source of information as a very important aspect of the QOL assessment. The source of information may be the patients (clients), nurses, medical staff. Each of the groups clearly provides a different point of view about the quality of life of a child and interprets the situation from its own perspective. One of the variants is the "proxy rating" – assessment done by the parent or nurse. The parent's opinion about the quality of life of a child may not be quite relevant, it may be distorted for instance due to different perception of the present situation of the child and anticipation of its future and it can be significantly determined by emotional influences. In this context Salajka (2006, p. 68, 69) notes, that the "tools assessing the HRQOL of children have until recently almost always been based on data from the relatives, usually the mother."

Measurement of the quality of life of handicapped children may be even more complicated. QOL of specific client groups must be assessed so we could improve the quality and optimise the complex individualised intervention in order to achieve the maximum possible social integration of a handicapped person into the intact society. Even in this context the total QOL cannot be described only by health indicators. An illustration of this is the definition of health created by the National Institute on Disability and Rehabilitation Research – "Being handicapped does not equal being ill." The international classification of functioning, handicap and health according to WHO on the other hand emphasises the social dimension of a handicap and the limitations arising from that (Vaďurová, Mühlpachr, 2005). "In the recent decades there has been spreading an attitude, that the handicapped people themselves identify the elements of the "disabling environment" instead of the axiom, that the organic damage is the primary source of their problems. This has led to a significant change of paradigm, when the functional limitation was replaced with a model of a minority group, which faces basically the same problems as other disadvantaged groups (Hahn in Vaďurová, 2006, p. 88).

Underlying ideas of the research

The quality of life issues can be defined by several attributes, which illustrate the contemporary state of scientific research in this area – wide applicability, multi-dimensional nature, vague terminology, strong interdisciplinary overlaps, differing interpretations, fragmented concepts and multifactor conditionality. In spite of a great diversity in the theoretical background, models, approaches and terminology, the unifying element is the attempt to present a complex view of a person on various levels, which reflect the overall quality of life with

an accent on the subjective feelings and the person's preferences instead of objectively measurable attributes. From what has been said above, from the fragmentation of the whole concept up to the subjective specifics of the quality of life, it leads us to the key question – Why should we study the quality of life anyway? Spilker (1990) notes that on the individual level the answer is self evident - the purpose is to optimise the intervention directed to a specific individual. This is the context, in which the concept of QOL assessment of children with ROP originated. Finková (2004, p. 33) points out that "children with the ROP syndrome suffer from multifactor influence on their motoric development. These children often have combined disabilities, but also the nature of their early experiences plays a role." Some characteristics of the eyesight disability may be an obstacle in the path towards life satisfaction, well-being, and can significantly affect the key pillars of the quality of life in the widest sense.

Depending from the extent of the retained eyesight functions and in relation to other accompanying complications arising from the degree of immaturity, there came an idea to assess the quality of life of children with this specific eyesight impairment. In this sense it is required to identify and fully analyse the specifics of the given target group and perform its thorough description in order to optimise the complex intervention process, which might, in an ideal case, lead to an improvement of the quality of life. The main goal of the research was subjective evaluation of the ROP impact on the quality of life of individuals, with the focus on child population. One of the partial objectives was to identify relevant QOL indicators specific for children with this type of eyesight impairment.

Survey design

Though the present dominant trend is to use quantitative methods to measure QOL, such as generic and specific questionnaires, the presented research is conceived as qualitative. So far the experts have not clearly solved the question, how can quality of life be assessed quantitatively and to what extent the used questionnaires are suitable for this purpose. In the context of the target group of our survey there is also the specific and so far not scientifically preferred field of QOL measurement of children, modified for children with health disability, often combined with other disabilities. Not only due to the aforesaid factors, the worldwide interest in the qualitative methods and qualitative approach as such is rising. We decided to reflect this trend and conceive a qualitative design for our survey. Due to the character of the researched subset we consider qualitative methods as the most relevant.

Mareš (in Mareš et al., 2006) characterises qualitative approach to QOL assessment as an approach, which does not attempt precision and generalisation. Qualitative methods in general enrich our view of the examined problem and allow us to generate new hypotheses." Svatoš, Švarcová (in Mareš et al., 2006, p. 174) point out to methodological difficulty, when a child subjectively assesses the quality of its own life – "Unlike adults here it is methodologically more difficult to get reliable data about quality of life from a self assessment – especially in case of little children, in general it can be said, that with falling age our diagnostic options decrease." This is one of the reasons for combining a subjective self- assessment performed by children with ROP and proxy rating provided by parents or nurses.

Due to the problematic aspects connected with the assessment of QOL of children with visual impairment, the chosen data acquisition method is semi-structured interview, which should reflect the aforesaid problematic nuances so the interpretation imprecision is as reduced as possible. At the same time this method should contribute to a truly subjective assessment of the child's life quality and it should allow for identification of the subjectively important elements of the child's every day life.

Interpretation of the research outcomes

Our survey should help as a primary research about the development of children with ROP. The result is an integrative description based on authentic opinions and statements of the respondents, so we could paint a maximally complex picture about the life experiences of children with ROP in the context of their quality of life. During the realisation of the surveywe chose the following research questions, whereas some of them emerged spontaneously from the data only during the very research:

- What are the characteristics of the quality of life with retinopathy of prematurity?
- In what way does retinopathy of prematurity affect the quality of life of children?
- What is the subjective perception of the quality of life of children with retinopathy of prematurity?
- Is retinopathy of prematurity subjectively viewed as something connected with worse quality of life?
- What areas of quality of life are considered by children with retinopathy of prematurity as subjectively problematic, or which are the most determined by eyesight impairment?
- How do children with retinopathy of prematurity view their quality of life and how does their view differ from the one of their parents?
- What is the role of the overall health condition in the assessment of the quality of life of children with retinopathy of prematurity?

Concerning the first of the research questions (What are the characteristics of the quality of life with retinopathy of prematurity?) our objective was to define the individually specific and subjectively assessed level of the quality of life. At the same time we wanted to define the specific predictors of QOL improvement based on identification of any specific indicators.

Though we used general measurement instruments to create the concept of the assessed QOL areas, the tool we designed can be considered as adequately sensitive. The spectrum of indicators corresponds to the empirically verified areas of QOL of the intact population, so we can expect that it captures all the relevant attributes. Schalock (2009, p. 5) confirms our approach on a more general level: "Individual quality of life is a multidimensional phenomenon consisting of key areas affected by both personality and environment. These key areas are the same for all humans, though they may differ individually according to the relative value and importance." The general measurement instruments thus reflect even specific indicators for the category of people with visual impairment, who however have different individually specific characteristics. Due to a relatively wide range of the used indicators, they can be expected to cover all the subjectively important aspects of the quality of life. At the same time the assessed indicators are identical with the determining factors of the quality of life of each individual, regardless the existence of any health problems. However the resulting profile of the quality of life bears the specific characteristics of a disability, in this case a visual disability.

The second of the presented research questions (In what way does retinopathy of prematurity affect the quality of life of children?) has a very wide scope – from individually specific characteristics of health condition – concerning the retained vision functions there are two extreme positions, when comparing the case studies and authentic interviews - through other anamnesis data confirming the aforesaid variability of the overall health condition; up to the characteristics of mental and social dimension related to the visual or even combined disability. Authentic statements, or individual QOL profiles allowed us to capture and describe all the differences in the individually specific quality of life indicators.

These aspects can be further connected with the interpretation of results related to the third and fourth question (What is the subjective perception of the quality of life of children with retinopathy of prematurity? Is

retinopathy of prematurity subjectively assessed as something connected with worse quality of life?). It is clear, that ROP and complications connected with prematurity affect the quality of life. On the individual level, the question is, how to determine the subjectively perceived well-being. International research concerning the quality of life of people with disabilities examined a representative sample and proved specific features identified by a wide range of disabled people – a communication and information barrier between the intact population and the community of the disabled, which has implications for social integration, acceptance and non-acceptance by the intact society and also identification with the community of the disabled. These characteristics are, due to the age range of the respondents, especially in the casuistic studies made by us.

Though it is not possible to reach a truly relevant generalisation, there is no denying, that ROP significantly determines the quality of visual perception and secondarily even the whole development of an individual concerning the possible strong vision impairment with all the described negative impacts and limitations. Another complication is the etiology factor of the ROP formation – prematurity implying a number of health complications, often life endangering, and late polymorbidity. The above mentioned attributes certainly contribute to the personal well-being and in the general sense they affect the quality of life of each individual.

The generally accepted view is that health disability implies a lower quality of life, however regardless the resulting health condition, which may or may not be affected by these factors, we would like to highlight an empirical confirmation of the "disability paradox" which brings also one of answers to the fourth research question (Is retinopathy of prematurity subjectively viewed as something connected with worse quality of life?) – it is a disparity between the objectively documented serious diagnosis and its expected serious impact as viewed by the exterior evaluators on one side and the subjectively positive evaluation of quality of life by the persons, who lives with health problems (Mareš, Marešová in Řehulka, Řehulková, Blatný, Mareš et al., 2008). Mareš, Marešová (in Řehulka, Řehulková, Blatný, Mareš et al., 2008) call it a paradox of the beneficial influence of health problems.

The research of this phenomenon has shown, that people with various types of health problems claim to have the same or even higher quality of life than people, who are healthy or "intact". So we cannot a priori anticipate a lowered quality of life, even though serious scientific studies (Silva, Oliveira, Ferreira, Pereira, 2005) proved a significant impact of health impairment on the quality of life of an individual – as we have emphasised several times, in case of QOL it is a multifactor conditioned concept, which needs not necessarily be affected by health condition, or the limits arising from it. The authors also present an explanation for this divergence, as shown by Albrecht and Devlieger (in Řehulková, Řehulka, Blatný, Mareš et al., 2008, p. 11) using the theory of balance: "Many people with a serious disease can find a balance among the physical, mental and spiritual segment of their lives. They are helped also by the positive influence of their environment, whether it is social or nature environment." This explanation can be applied also to the problem of health or visual disability. Our findings are more optimistic, than we had anticipated originally, not only concerning the retained visual functions, but also concerning the assessment of the overall development and the related social factors. In this context Salajka (2006) points to a very careful and reasonable interpretation of the data acquired from the QOL assessment. Also, considering the disability paradox, he warns about the possibility of data distortion due to the prejudice, which automatically expects the health problems to have a negative impact on the quality of life. In this sense he highlights the individual hierarchy of life values, the level of adaptability to changed conditions and the ability to "perceive various aspects, which form the rich tapestry of everyday life, to what extent this influence will manifest, how much it is perceived by the ill person" (Salajka, 2006, p. 105). On the level of the third research question (What is the subjective perception of the quality of life of children with retinopathy of prematurity?), apart from the aforesaid disability paradox we can only highlight the individually specific profiles of the quality of life of each respondent.

Of all the proposed indicators of the quality of life, the most highlighted one – not only by our respondents – is the psycho-social dimension, which is – in compliance with the outcomes of the international handicapped person QOL assessment projects – the main troublesome dimension of a disability – which opens the question of the attitude of the intact population to disabled persons, the question of social integration, influence of the disability on the process of socialisation of an individual, the level of acceptance and non-acceptance of the handicap and identification with the community of the handicapped people and a number of other long term

topical all-society issues – the influence of family and the upbringing attitudes of parents, social determinants (wider environment, other members of the same age group, contact with the community of the disabled) and other nuances. On this level we have actually answered the fifth question (What areas of quality of life are considered by children with retinopathy of prematurity as subjectively problematic, or which are the most determined by eyesight impairment?).

Concerning the sixth research question (How do children with retinopathy of prematurity view their quality of life and how does their view differ from the one of their parents?), there was assessed the hypothetically different viewing angle of the parent and the child about the ROP impact and the related QOL aspects. From the view of the researcher the parents were able to adequately and relative rationally assess the impact of the health problems and the disability on the life of the child. The realised interview also allowed them to reflect on the development of the child and to get a feedback. Schalock (2009) points out, that except providing the feedback there are also other ways, how the data can be useful for the parents – it can create their expectation that change is possible and it can occur on several levels. At the same time it confirms functionality of organisations in the sense of a holistic attitude to the client and comparison of the subjective and objective dimension. In this context it also clarifies the importance of the use of personal data, either in the form of individual or summary information on the organisational level – it highlights the need to allow sharing of information about the client's outcomes and changes on various levels of support, to incorporate the information about the outcomes and the findings arising from that to the theory of scientific disciplines, and last but not least, to define the individual, organisational and community factors, which may indicate the prospective development.

The specific features of the health care of the surveyed group usually have the attributes of a combined disability in the ROP context and also complications connected with prematurity, however some of the contacted respondents feel only minimum negative impact of the aforesaid factors. The level of retained visual functions seems relatively positive in this respondent group, compared with the anamnesis data from the case studies. In the sense of the last research question (What is the role of the overall health condition in the assessment of the quality of life of children with retinopathy of prematurity?) we can, again, only point to the individually variable influence on the quality of life.

Concerning the visual impairment and its negative impacts on the independent and his/Her well-being, the answer to the last question is clear – if the outcomes of ROP reach the dimension of visual impairment, the psycho-social indicators of QOL are modified in the above presented way.

As part of a specific module intended only for the parents, there was assessed not only QOL of their children in the sense of proxy rating, but we were also interested in the attitudes, feelings and knowledge of the parents concerning the options for the optimal development of the child. Again, we cannot reach a relevant conclusion with an adequate value, but in a number of specific examples we noted very rational democratic approach of the upbringing. However talking about the acceptance of the disability by the parents or by their children, proved to be embarrassing for the parents, as well as the topic of the options to identify with a group of disabled people in order to form an adequate identity of a disabled person. This issue of course has implication for the area of personal self-perception, but in a wider dimension also to the social integration area. From the interviews and the casuistic studies we can see an emphasised role of the family and family influence towards adequate socialisation, or social integration and the overall psycho-social dimension of the disability.

In general, our research aimed to become the first survey of a "new or complex area" and initiated a quantitative research while "proposing measurement procedures or acquiring a deeper insight into the specifics" (Hendl, www.kpg.zcu.cz/capv/HTML/5/5.pdf, p. 5). Our objective was not to create a generalising theory, but to provide a relatively complex picture of the quality of life of children with ROP so as to allow subsequent deep analysis of a quantitative nature.

Conclusion

What was the premise of our work, from what idea did the research design originated? These questions have been answered in the previous text, however, several characteristics will serve here for final balancing:

- Quality of life – multidimensional, broadly interpreted, multifactiorially conditioned scientific concept attracting in the last three decades attention of expert public within the intentions of social disciplines.
- Retinopathy of the premature babies (ROP) – one of the main causes of sightlessness of children in the economically developed world, a specific disease characteristic for premature babies with low birth weight, which may and, at the same time, due to technological advance in the field of interventional procedures, does not have to lead to fatal consequences in the form of meaning loss of sight perception, respectively to sight disability.
- Extreme prematurity of a new born baby – factor carrying along a very wide spectrum of life threatening complications and late consequences, situations evoking a number of ethical dilemmas, key etiological factor of origin of ROP.
- Sight disability – attribute determining overall development of an individual, factor conditioning the socialization process and social integration process, one of key determinants of quality of life and the life satisfaction.

We decided to reflect these phenomena of contemporary scientific research on various levels of knowledge – the result is a concept of evaluation of quality of life of infant population with ROP with accent on subjective evaluation of impact of above presented factors, mutual interaction of which and determination of complexly understood quality of life in the sense of well-being – personal well being integrating in itself indicators of psychical and social health.

The objective of the research has been to formulate subjective influence and impacts of ROP onto the sphere of regular everyday life and the rate which determines its quality. We tried to evaluate to which extent ROP, and its consequences and other related aspects, influence the quality of life – physical and psychical state, way of life and the feeling of life satisfaction. Respectively we wanted to confirm empirically correlations between its consequences and altered quality of life. A partial objection was in this matter to find subjective importance and meaning of proposed indicators of quality of life for target group, while, at the same time, identifying other subjectively important factors. In this sense an analysis of the statements of children was a premise. The subject to measurement of quantitative nature was a category of children with ROP, whose current quality of life was evaluated.

The proposed indicators are, according to our opinion, relevant in relation to studied issues and, at the same time, these are identical with the determinants of quality of life of each individual despite the presence of the health disability. However, the resulting profile of quality of life carries just the specific features of health disability, in our case sight disability in particular. Despite it is not possible to reach really relevant evaluation, it is evident   that ROP significantly determines quality of sight perception and secondary the entire development of an individual in the sense of potential severe sight disability with all described negative consequences and limitations. As another complication factor comes to the front line the etiological factor of occurrence of ROP – prematurity implicating a number of health, often life threatening, complications and late polymorbidity. The outlined features are undoubtedly taking part in the feeling of personal well-being, in the most general sense of the word these influence quality of life of every individual. However, without taking into account the health state, which may or may not be influenced by these described factors, we would like to stress the empiric proof of, so called, disability paradox – illustrating case may be case study of Lukas, on the basis of which we may predict his positive future development towards self-reliant, independent and satisfactory life. Of all the proposed indicators of quality of life psychosocial dimension is accented, not only by our respondents. It is in line with the conclusions of international projects evaluating quality of life of persons with disability, the main acrid dimension of disability – here comes a question of the approach of intact population towards the persons with disabilities, The area of social integration, influence of disability on the socializing process of socialization

of an individual, level of acceptance and not acceptance of disability and identifying with a community of persons with disability and a number of others long term topical society-wide topics.

The results of empiric research would, in ideal case, be reflected in optimizing of special pedagogy intervention process with the observed category of individuals with sight disability - both on individual levels, towards improved quality of the approach of professionals, and on the level of organizations in the sense of interdisciplinary cooperation. An integral part of this requisite represents enrichment of theoretical base of special pedagogy of person with sight disability by the phenomenon of the quality of life and especially by the problems of ROP, to which adequate, and from the point of view increasing incidence ever more accenting, attention has not been paid so far. We expect that applicable potential of the research output may be found not only in the field of social pedagogy, but also in medicine, respectively in neonatology and ophthalmology practice. The presented proposals for practice aim also to this conclusion. At the same time the resulting findings may project into the process of creating of a standardized specific tool for measuring the quality of life for the category of persons with ROP. In association to this was one of partial objections checking the extent of proposed concept of evaluating of quality of life of children with this specific disease on a relatively small group and its viability and its use for further applied research.

In general approach our research sought primary acknowledgement "with a new and complicated field of science" and initiation of quantitative research "with proposal of measuring procedures or reaching of deeper insight into peculiarities" (Hendl, www.kpg.zcu.cz/capv/HTML/5/5.pdf, p. 5). Our objection was not to establish a generalizing theory, but rather to present a relatively complex picture of life of children with ROP.

The key objection of this work was to broaden theoretical base of special pedagogy for persons with sight disability on the basis of longitudinal quality oriented research by, so far never reflected, issues of quality of life of persons with ROP and to open space for related applied research. Secondarily, these efforts should lead to optimizing of complexly understood intervention towards the given target group.

On individual level our objection was not only to present particular life histories, but, at the same time, using this self-evaluation secondarily provide to respondents, respectively to their parents, a feedback, opportunity for self-reflection. On the level of cooperation with professionals should these features, related from distribution of information, to adequacy of approach of experts, and the level of empathy, via interdisciplinary cooperation as far as optimized accessibility of services on various levels, illustrate a very real picture of used services, which should be a premise for further applied research aiming towards saturation of specific needs of individuals with sight disability resulting from ROP and towards increased quality of their everyday life. The pivot point of this idea is achievement of independent, self-reliant and satisfied life on various levels in the sense of well-being.

Conclusion of this work is not based on rough scores or statistical data, not even on generalized theory – it is based on description of images of particular authentic life histories of children with ROP.

[b]Faculty of Engineering and Natural Sciences, Sabancı University, Tuzla, Istanbul 34956 Turkey

Abstract

This study examines the study skills and the learning styles of university students by using scoring method. The study investigates whether the study skills can be summarized in a single universal score that measures how hard a student works. The sample consists of 418 undergraduate students of an international university. The presented scoring was method adapted from the domain of risk management. The proposed method computes an overall score that represents the study skills, using a linear weighted summation scheme. From among 50 questions regarding to learning and study skills, the 30 highest weighted questions are suggested to be used in the future studies as a learning and study skills inventor. The proposed scoring method and study yield results and insights that can guide educators regarding how they can improve their students' study skills. The main point drawn from this study is that the students greatly value opportunities for interaction with instructors and peers, cooperative learning and active engagement in lectures.

Introduction

There are several factors that affect the students' ability to complete a college degree successfully. While college admissions officers' consider mainly the predictors of academic success by looking high school GPA and standardized test scores, many researchers are interested in identifying variables that affect the college retention and dropout (Proctor et al., 2006). Examples of these variables include student motivation, self-concept, beliefs regarding success, learning styles, and study skills (Goldfinch & Hughes, 2007; Marriott and Marriott, 2003; Proctor et al., 2006).

Study skills characterize the students' capability in acquiring, recording, and using information and ideas (Harvey & Goudvis, 2000). Study skills include different types of activities, such as time management, students' information processing skills, setting appropriate goals, selecting an appropriate study environment, applying suitable note-taking strategies, concentrating, selecting main ideas, self-testing, organization, and managing anxiety (Coughlan & Swift, 2011). Students do not bring class not only their general ability that can affect their academic success but also bring demographic variables such as gender, age, culture, and race; psychological variables such as academic self-efficacy; and motivation and behavioral variables such as time management skills (Nonis & Hudson, 2010). In addition to these, there is one more important asset: study skills or strategies that students use to learn, such as paying attention in class, taking good notes, and reading the study material before a lecture (Nonis & Hudson, 2010).

The strategies students adopt in their study are influenced by a number of social-cognitive factors and have an impact upon their academic performance (Prat-Sala & Redford, 2010). The study of Prat-Sala and Redford (2010) indicates that both intrinsic and extrinsic motivation orientations were correlated with approaches to studying. In addition, research on student learning in higher education has identified clear associations between variations in students' perceptions of their academic environment and variations in their study behavior (Richardson, 2006). Furthermore, both achievement goals and study processing strategies theories have been shown to contribute to the prediction of students' academic performance (Phan, 2011). There are several empirical evidences showing how study habits impact academic performance (e.g., Coughlan & Swift, 2011; Nonis & Hudson, 2010). Lack of study skills influences drop-outs from higher education (Byrne & Flood, 2005). In the first year, strategies to improve retention and preparation between the student and the institution are required (Tinto, 2006). For this purpose, study skill courses have come out as suitable interventions to bolster academic skill development and increase the liability of student retention and satisfaction and success in higher education (Coughlan & Swift, 2011; Enfait & Turley, 2009; Fergy et al. 2008). Various inventories have been identified in literature (e.g. Jones, 1992; Tomes, Wasylkiw, & Mockler, 2011; Weinstein & Palmer, 2002), yet a fundamental question that remains unanswered is whether the learning and study skills can be summarized in a single universal score that measures how hard a student works.

Scoring literature

A major novelty of this paper is the adoption of the scoring approach from the field of financial management into the field of education sciences. Scoring is a popular approach in the management of service industries, and especially in financial management (Ertek et al., 2011). Financial institutions such as banks, investment funds and insurance companies are known to use surveys to characterize their customers along a dimension of interest, such as the propensity to take financial risk. This enables them to integrate the survey results into their Customer Relations Management (CRM) systems, and to offer customized financial services to their customers. For example, the institution can emphasize safety and predictability of investments for customers who are categorized as risk-averse, while emphasizing potential gains to customers who are categorized as risk-seeking.

Ertek et al. (2011) offer a methodology to determine weights for the questions of a given survey, applying a regression-based algorithm. As applied to the domain of finance, their methodology enables the calculation of a risk score for each survey respondent, which can then be used for customizing the offerings made to each respondent. The problem of appropriately combining the values for different questions in a survey into an overall metric is also encountered in education sciences. To this end, this paper adopts the methodology developed by Ertek et al. (2011) for the scoring of study skills of university students.

Methodology

Participants and Data collection

Participants were the undergraduate students of an international university in Istanbul, Turkey. The sample size was 3500 students. From 512 voluntary participants, 418 students' responses were analyzed, as 94 students did not respond to all items in the survey. Forty-three per cent of the participants were (n = 181) female and 57% were male (n = 237). The survey was administrated to students from three different faculties: (1) Faculty of Engineering and Natural Sciences (FENS); (2) Faculty of Arts and Social Sciences (FASS), and (3) Faculty of Management (FMAN). Sixty two per cent of the students (n = 260) were participated from FENS and 37.8% (n = 158) were participated from FASS and FMAN. Students from FENS were overrepresented, since they form the majority of university population.

The survey instrument, the aim of the research and the consent form were mentioned to undergraduate students via e-mail and also by means of students who took the introductory project course PROJ 102 in the 2009-2010 Spring semester. There were 50 questions as learning and study skills. Each survey application lasted approximately half an hour. 50 items, called *perception attributes*, were developed and participants were instructed to indicate how frequently they used each study skill on a scale ranging from 1 (*never*) to 5 (*always*) (Gogus & Gunes, 2011).

Scoring algorithm

The scoring algorithm starts with the survey data, which consists of the answers given by *I* respondent students to *J* questions on study skills. The algorithm returns an overall study skill score for each respondent, as well as weights for questions. The survey data is fed into the risk scoring algorithm as a matrix, with *I* rows corresponding to the *I* respondents and *J* columns corresponding to the *J* attributes. The algorithm determines which attributes are to be used in scoring; the weights for each attribute, and based on these, the scores for each respondent. The detailed mathematical notation and the pseudo code of the scoring algorithm are given in Appendix B of Ertek et al. (2012). Here, we will briefly describe how the algorithm operates. The initialization step in the algorithm transforms multiple choice data into numeric values between 0 and 3. In the collected survey data the numerical values corresponding to choices (a, b, c, d, e) would be (0.00, 0.75, 1.50, 2.25, 3.00). One important condition in here is that for all the questions, the choices should be ordered in the same order. In our case, this is choice "1" corresponding to the least level of a skill, and choice "5" corresponding to the highest level.

Following the initialization phase, the attribute values are fed into a regression based algorithm. The algorithm operates iteratively, until scores converge. The stopping criterion is satisfied when the average absolute change in scores in the final iterations is less than the threshold provided by the analyst. At each iteration of the algorithm, a linear regression model is constructed for each attribute, and the response in the incumbent score vector. Based on the regression, weights for the attributes are updated at the beginning of each iteration. One characteristic of the algorithm is that it allows for change in the direction of signs when the choices for an attribute should take decreasing -rather than increasing- values from choice "1" to the final choice "5". Hence, the algorithm not only eliminates irrelevant attributes, but also suggests the real direction of study skills for the choices of a given attribute, given the presence of other attributes. The algorithm is a self-organizing algorithm (Ashby, 1962), since the scores it computes converge at a desired error threshold.

Results

The weights were obtained for each of the 50 questions. The study skills with the highest weights are (S27, S24, S26, S03), referring to the following study skills: (S27) answering questions of the instructor during the class, (S24) seeking help from the instructor outside the lecture hours, (S26) asking questions during class, and (S03) learning by listening during class. This is a fundamental insight into what really counts with regards to the overall study skills.

Six of the 50 questions (S09, S32, S08, S14, S19, S40) are assigned a weight of 0 by the algorithm. That is, the algorithm removes these six questions from the risk score computations, because they fail to impact the overall scores in a statistically significant way, given the presence of the other 44 attributes, observed in the range (0.29, 1.65). The hypothesized directions of choice ranks are found to be correct for all the questions, except S33, S15, S47. For these three questions, selecting choice "1" translates into a *higher* value of overall study skill compared to selecting choice "2", and same for (2, 3), (3,4), (4, 5), *opposite* of all the other questions. The first 30 questions in the weight range (0.85, 1.65) can be selected to observe study skills and effective learning habits of university students. Figure 1 shows the distribution of overall (standardized) study skill scores.
Figure 1. Distribution of overall (standardized) study skill scores.

Conclusions

This paper presents a scoring method adapted from the domain of risk management. The proposed method computes an overall score that represents the study skills, using a linear weighted summation scheme. The highest ranking questions in the weight range (0.85, 1.65) can be enough to observe study skills and effective learning habits of university students. Instead of using 50 questions, the researchers can use much fewer questions in the future studies. The proposed method and study yield results and insights that can guide educators regarding how they can improve their students' study habits. The top four questions have the highest scoring indicate that variables related to students' interactions with their instructors and active participations have significant impact on the overall study skill levels. This data implies that students want to be active learners. Students appreciate if the instructors integrate active learning techniques into instruction (Gogus, 2012).

The contributions of this study are:

1) Using a scoring approach to represent the study skills of students in a single dimension.

2) Adopting a technical method developed in the domain of risk management to the field of educational sciences, and implementing it with real data.

3) Ranking the importance of study skills, with regards to how much they contribute to the overall study skills, and thus improving the understanding of the importance of study skills in the overall picture.

Contributions 1 and 2 are, to the best of our knowledge, unique in the educational sciences field. Instead of simple arithmetic calculations such as addition, subtraction, or multiplication, we introduced a technical method that automatically computes the weights for the involved factors. This method can identify study skills that do not contribute to the overall "study skills score" of students by assigning a weight of zero. The method can also identify whether a particular study skill, which is believed to be positively related to a student's overall skill, may in fact be negatively related.

Abstract

The trend of population aging led European institutions to choose 2012 as the European Year for Active Ageing and Solidarity between Generations. Taking advantage of this fact and aware of the potential of socio-economic contribution of elderly for society development, the importance of creating opportunities towards an active ageing and the significance of occupational therapy (including crochet) as a way to reconstruct healthy behaviours, we engaged senior citizens in an activity held on behalf of Festa da Ciência. More specifically, they participated in the construction of a coral reef made of crochet hyperbolic models combining Biology, Mathematics, colour and fun.

Non-Euclidean Geometry; Hyperbolic Geometry; Biological Growth; Occupational Therapy; Crochet; Society Engagement; Active Ageing

1. Science and Society Engagement in the Scope of EY 2012

According to the World Health Organization (WHO), active ageing is the "process of optimizing opportunities for health, participation and security in order to enhance quality of life as people age" (http://www.who.int/en/). Active ageing means better education and lifelong learning, age-friendly working conditions, and supporting the role of older people in family life and society as a whole. With active ageing elderly people can realize their potential for physical, mental and social well being (as expressed in the WHO definition of health) throughout life, while participating in society. On the other hand, ageing takes place within the context of family, friends and work making interdependence as well as intergenerational solidarity important principles of active ageing. In order to foster a sustainable active ageing culture it is mandatory to make a true impact in lifestyle, trying to engage senior citizens – who are retired, ill or living with disabilities – and making them active participants and contributors to their families and communities.

Strongly supported by the basic idea of European Year for Active Ageing and Solidarity between Generations (YE 2012) and wishing to promote actions towards the engagement of elderly citizens, the STOL – Science Through Our Lives team decided to promote an initiative targeting this type of public during its annual activities. The opportunity to engage such citizens, making them active contributors to an idea/project, arose while programming activities to the annual Science Festival 2012 (Festa da Ciência 2012), promoted by the School of Sciences of the University of Minho (ECUM). On behalf of this event, the group decided to invite a

colleague from Mathematics Department to explore and explain other kind of geometries, different from the Euclidean geometry, such as the designated hyperbolic plane geometry, while simultaneously showing its occurrence in the biological world and using crocheted 3D-models to illustrate such hyperbolic planes. For this, some local institutions for the elderly were invited to contribute to the creation of a coral reef made with crochet. The whole activity, designed for society in general was named "Stitch by Stitch the Science Fills the Space" and it is described in the present work.

2. Joining All The Pieces Together

2.1. Getting older – Threats and opportunities

People are living longer and healthier lives today than ever before. This almost worldwide lengthening of life expectancy, attained mainly due to science and technology progresses during the last century, has been creating new challenges. The paradigm is changing and societies must adapt to a new whole scenario, organizing and searching for solutions towards the maximization of health and functional abilities of elder adults and to the promotion of their participation and security. As an old age is often associated with some degree of illness and/or dependence, senior citizens can easily feel loneliness and depression or can become excluded from job, family and society. The great challenge is to strength the conditions that provide citizens' active aging, namely in areas such as employment, health care, social services, adult education, volunteering, housing, information technology and transport (Walker, 2008). Maintaining the vitality of older people, enhancing their involvement in society and removing barriers between generations should be the main aim of the EY 2012 believes the European Parliament Employment Committee (EMPL Employment policy 17-03-2011). This initiative aims to make society conscious and aware of the socio-economic contribution of older persons, and promotes actions aimed at creating more and better opportunities towards an active ageing, maintaining the vitality of senior citizens and enhancing their involvement in society (http://www.europarl.europa.eu/news/en/search?q=european+year).

Along with global aging, age related diseases such as cognitive impairment and dementia would increase dramatically in the coming years. Dementia is one of the most common diseases among elderly people. It is a leading cause of disability, institutionalization, and mortality; therefore it has a tremendous impact on both, the individual and the society. As limited effective treatment alternatives for dementia are currently available, identification of risk or protective factors, especially modifiable factors, could provide potential for preventing the disorder.

Everyday leisure activities in adulthood and old age have been investigated with respect to constructs such as successful aging, an engaged lifestyle, and prevention of age-related cognitive decline. They also relate to mental health and have clinical value as they can inform diagnosis and interventions. The recent resurgence of knitting and other craft activities such as crochet and modelling is an ambiguous social phenomenon because it has pre-industrial connotations in late modern society (Parkins, 2004). *Crocheters* across the world say it's simply the best therapy mainly due to the fact that experiences of particular feelings and emotional states that constitute the characteristics of crocheting practice are closely related to *crocheters*' corporeal engagements with the practice (Shin & Ha, 2011). Moreover crocheting is also an embodied and materially mediated practice formed around the close relationship between the physical, mental and emotional dimensions of the involved person, who are deeply entrenched in the material environments of the practice (Warde, 2005).

The evidence to-date indicates that leisure activities, especially mental and physical activities may protect against cognitive decline and dementia (Wang *et al*, 2012). The precise mechanism through which leisure activities such knitting and crochet impact cognition is still unclear, but there are a number of proposed hypotheses. One of them is cognitive reserve, where the life experience, such as leisure activities, may influence neural processing and synaptic organization by permitting neurological processes to become more efficient, adaptive, and plastic thus allowing some people to cope with progressing dementia pathology better than others (Stern, 2002; Kramer *et al*, 2004). Leisure activities may also have beneficial effects through psychological and

behavioural pathways by lowering stress (Crowe *et al*, 2003). Many knitters/ *crocheters* point out that a high level of concentration on the ongoing projects helps ease the tensions and stresses encountered in daily life. Often, performing these craft activities is compared to having a meditative function, described as an alternative form of religion and spirituality (Murphy, 2002; Parkins, 2004).

2.2. Crochet and unexpected applications

Crochet is the art of pulling loops of yarn through other loops, in the first times using only the fingers and latter on with the aid of a crochet hook. Worked in rows or rounds, this handwork ultimately results in the creation of a fabric, most of the times with stunning results. Unlike other forms of handwork with wool or cotton thread, nobody knows for sure where or when crochet first originated - places such as Arabia, South America or even China were pointed out as probable origins by different theories. However, according to the American crochet expert Ann Potter (1990), it seems the word crochet appeared somewhere in the 16th century and comes from the Middle French words *croc* or *croche*, meaning hook.

In the early days crochet was considered a hobby of the rich ladies and later, especially in times of war or generalized diseases, it became common for people to join in groups in order to crochet clothing for soldiers, hospitals and homeless shelters. More recently crochet has found other applications which range from mathematics, first used by the mathematician Daina Taimina (2009) with the intention to create 3D-models of the hyperbolic plane geometry, to urban art, the modification and decoration of outdoor surroundings using knitted or crocheted cloth, a practice called yarn bombing which appeared in the US a few years ago and spread worldwide rapidly.

2.2.1. The Hyperbolic Geometry

The world we have built is chock-full of rectilinear impressions, our houses, doors and windows, the skyscrapers we work in, our streets, many of our gardens, we are always cruise on our daily life's straight lines. We have learned to play by Euclidean rules, which have two thousand years. In the early 19th century mathematicians became working in the constructing of new kinds of geometries, and surprisingly new spaces in which lines cavorted have aberrant formations were discovered suggesting the existence of news geometries, such as spheres geometry and hyperbolic geometry. Since then, one of the most difficult tasks was to find real models (in our Euclidian space), made with some kind of material, where these curves could be visualized and ideally, touched. The attempts to demonstrate the fifth Euclides' postulate, the parallel postulate (*given a line r and a point not on the line, there is one and only one line which contains the point, and it is parallel to line r)* originated the largest and most dreaded discovery for the Euclidean geometry of the 19th century. In this geometry the fifth postulate is not valid, and if we consider a line and a point not belonging to it, there are an infinite number of lines that pass through the single point and never intersect the original line, as they are parallel to the first line. All other postulates are valid to the line given. Application of the craft of crochet in the construction of 3D-models of the hyperbolic plane geometry was first realized and used by the mathematician Daina Taimina in 1997 (Buescu, 2011). Each hyperbolic model advances by increasing crochet stitches according to a primitive algorithm (Herderson & Taimina, 2001). And with these models, the task of demonstrating the consistency of non-Euclidean geometry, in particular the not valid parallel postulate, in the hyperbolic space was much facilitated (Taimina, 2009; Buescu, 2011). As we can see, if we observe the Figure 1A, which represents a hyperbolic model, there are lines through the same point and not intersecting another line in the same hyperbolic model. The surprise is that we can have this 3-D model of hyperbolic geometry in our hands (actually it could have been constructed by us!) that corresponds to doing geometry on a surface of constant negative curvature.

Another property that can be explored, and in particular explained to children at schools, using this crochets models, is the value of the sum of the interior angles of a triangle. As we have learned, for any rectilinear triangle this sum is always 180^0. This propriety is not valid in hyperbolic geometry. If we try to make a triangle in a crochet model, using lines with different colours from the model (Fig. 1B), we can observe that the sum of

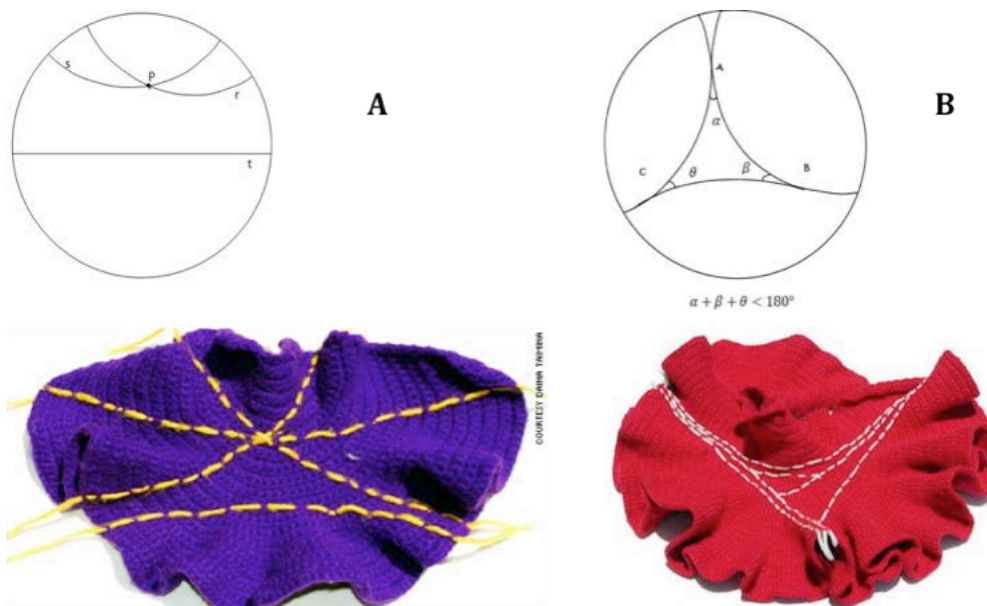
the interior angles is less than 180^0. And the bigger the triangle the more this sum approaches zero. The largest triangle is called the *ideal triangle*. This can be a hands-on experience made by people of all ages.


Figure 1. Hyperbolic Geometry (A) Lines passing through the same point and not intersecting another line in the hyperbolic plane. (B) Triangle where the sum of interior angles amounts less than 180 degrees, in fact this sum approaches zero. (3D-crochet models from Daina Taimina. (Taimina, 2009)

2.2.1.1. Hyperbolic Geometry in the Biological World

The hyperbolic laws, roughly speaking, require that the division makes the organisms grow in all directions and allow that some areas increase faster than others. Hyperbolic geometry in allowing surface area maximization turns out to be the underlying geometry of many living things (Fig. 2) from corals to kelps, sponges and land plants just to mention a few (Firmo, 2003). Specifically for sessile filter feeders like corals it is a very beneficial form of space conquest because it increases surface area in a limited volume and makes the uptake of nutrients much more efficient.

In 2005 Taimina's ideas about crochet and hyperbolic geometry inspired the Hyperbolic Crochet Coral Reef Project, created by The Institute For Figuring in Los Angeles (www.theiff.org) and since then dozens of crocheted reefs have been created worldwide. Corals are dying due to many conditions largely caused by humans: overfishing, pollution, climate change, ocean acidification and sedimentation (Babbemeier *et al*, 2004). Simultaneously to the playful aspect of crocheting, these yarn corals reefs have given the opportunity to alert and make aware of the danger these ecosystems are facing, making the ideal scenario to multiply large scale environmental awareness campaigns. All approaches and efforts in order to rehabilitate corals reefs in particular and wild life in general are more than welcome.

Figure 2. The hyperbolic geometry in the biological world.

2.3. Stitch by Stitch the Science fills the Space

The Science Festival is an initiative of the School of Sciences of the University of Minho (ECUM) that takes place in a yearly basis on the second week of May and that lasts for nearly ten days. The event takes place in the university *campus* in Braga, with extensions in Guimarães and Viana do Castelo, and joins more than 1,800 students from pre-school, primary and secondary schools, teachers and general public. The program has several activities sweeping all natural/ exact Science (Biology, Chemistry, Mathematics, Physics and Geology) and includes diverse outreach Science activities like workshops, hands-on sessions, lectures, competitions and exhibitions aimed at the general population, especially to students of pre-school, primary and secondary.

"Stitch by Stitch the Science fills the Space" was an activity idealized by STOL – Science Through Our Lives team, together with a colleague from the Mathematical Department and it was implemented in the scope of the Science Festival. Its main objective was to involve and surprise all the visiting public under the central motto "The hyperbolic forms that are observed in nature." The target audience was as broad as possible, ranging from students and teachers from all school grades who visited the Science Festival to the involved elderly institutions and public in general.

The stand could be visited during three days from 15 to 17 of May and comprised several components: (i) a "coral reef" constructed with crochet models, (ii) posters with the mathematical fundaments of the three geometries as well as examples of the widespread influence of hyperbolic forms in nature, (iii) a small exhibition of real coral forms, (iv) a repeat-mode slideshow comprising snapshots of the work in progress as well as parallel details of both, real and yarn coral reefs and, last but not the least, (v) a "hands-on" corner where all the visitants could try a crocheting experience and collaborate in the growth of a big everybody's coral (Fig. 3).

Figure 3. "Stitch by Stitch the Science fills the Space" stand at Science Festival (details).

2.3.1. Elderly people involvement and their testimonies

Leisure activity can be defined as the voluntary use of free time for activities outside the daily routine and is one of the major components of a healthy lifestyle. After retirement, leisure time constitutes a relatively larger part of the daily life and leisure time activities have emerged as the most important target for lifestyle changes among older adults because of the potential beneficial effect on various health outcomes. With this in mind STOL visited two institutions for elderly (Bogalha in Braga and Centro Social de Durrães in a small village in the countryside) in order to personally invite/challenge/engage them in joining this project/experience. Both institutions accepted the invitation although informing that the great majority of their users would not be capable of joining the project due to their deep disablement. To make the idea easily understood, an one-page tutorial with three images and a small and simple explanation text corresponding to the also three basic 3D-forms of non-Euclidian geometry (namely hyperbolic simple plan, hyperbolic double plan and pseudo-sphere) was prepared and distributed. Altogether we succeeded in co-opting five ladies ranging from 70 to 92 years old and 3 professionals who take care of them, being also engaged in the task.

Beyond the invitation to institutions for the elderly, we were interested in knowing how the participants in the crocheting of the coral reef felt about contributing actively to such task, having with them informal conversations. The participants of one of the institutions (Bogalha) referred that they appreciated to be involved in such initiative and were particularly happy seeing the final result, although not imagining the impact of their work during the crocheting work-in-progress.

From the conversation with the participants from Social Centre of Durrães we may conclude that there is the general opinion that the crochet is addictive. All the ladies were extremely satisfied with the outcome of their handicraft and when asked if they were interested in keeping on with this project, their answer was an energetic yes. In what concerns to the difficulties eventually faced, some of them told that from time to time their eyes were not very cooperative or that after some time their hands began to ache. Nevertheless, a lady with only one functional eye told, in a glance, that there wasn't any problem as this activity was a good distraction/ recreation for her and the others, who have no longer good vision, referred "If we make an error, we rebuilt the work and there is no problem at all". Another lady that had stop crocheting over forty years ago confessed that it still took

a while to remember and start but with a little help from another lady from the institution she got the hand and could not stop anymore. Now, she is knitting a sweater for her three years old granddaughter and feeling very proud about it.

After visiting the stand "Stitch by stitch the science fills the space" at Science Festival the reactions and their testimonials concerning to the disposition of the crochet pieces in the coral reef were also collected and from them it was evident that the coral reef was very appreciated by the elderly who felt very happy with their commitment and participations. One of recurrent actions was their eager urgency in finding their own crocheted models among all the other tens that altogether build the total coral reef. One of the visitor ladies also crocheted at the exhibition stand, adding some stitches to the ongoing big coral model that could be tried by all visitors interested (Fig. 4).

2.3.2 Visitors opinions and testimonies about the stand

In an attempt to evaluate public receptiveness and some impacts of the initiative, a questionnaire was designed and addressed to some visitants that filled it *in loco*.

All of the 33 persons (23 women and 10 men) (Fig. 5) with ages from twelve to eighty four were invited to fill in the questionnaire: globally they referred they liked the stand and were very curious about it. All of them, women and men, also, were unanimous saying that they have learned something new and their interest in Science was encouraged. Relatively to be question about the quickly understand of what was represented (Fig. 5 - question 3) 78% of the women said yes, and the men were equally divided, 50% saying yes and 50% saying no. We also observed that 76% of all the persons (74% women and 80% men) agreed that the subjects represented in the stand are related with the ones they learn, or have learned, at school (Fig. 5 - question 5). In what concerns doing that experience with crochet models at home, 65% of the women would say yes and 79% of the men would say they will not (Fig 5 - question 6) .

We were nicely surprise that all of the 33 persons that fill the questions, more or less the double number of women (23) than men (10), have liked and were curious about the stand. This may be related with the new subject, or with the way of explaining it. May be the new and quite different way of presenting things that they said are taught at school, (65% women and 70% of the men) (Fig. 5 - question 6) is the key for so unanimous good opinion about the stand. Nevertheless only 65% of the women said they were going to try to do it at home and worst opinion becomes from men, as only 30% have intention to try the crochet at home.
3. Final Remarks

By and large we should say that this was an extremely gratifying experiment in all senses: from the engagement of the old ladies, colleagues and ourselves in the crocheting activity; to the wow factor inherent to the stand; the notorious surprise of all the visitors in their words and, mostly, the complete astonishment in their wide-opened eyes about the existence of other kind of geometries and its properties, the positive critics in the local newspapers and, finally, to the consecutive invitations received from public institutions, in Braga, interested in hosting the coral reef for defined time periods, as well as in contributing to its growth to an even more striking scale.

Speaking for ourselves, we feel this was a groundbreaking experiment in joining generations, narrowing the gap between them, and simultaneously showed to be a very successful way of communicating science in an effective, appealing and integrated way to a non-specific heterogeneous public. Indubitably is a strategy to carry on.

The authors declare that they have no conflict of interest.

STRESS FACTORS IN THE PROFESSIONAL ACTIVITIES OF ROMANIAN TEACHERS

Prof. univ. dr. Ion Dumitru, Prof. univ. dr. Ioan Talpos

Faculty of Sociology and Psychology, Department of Sciences of Education , West University of Timisoara, Romania

Faculty of Economics and Business Administration, West University of Timisoara, Romania

Abstract

Stress manifests itself through different degrees of intensity and frequency. It has been noticed that the burnout occurs more and more often with people that work in fields involving human relationships. It affected people who become emotionally involved and invest a great deal of psychological and physical effort into their work and consider that the results of their labour are not at the expected level.

It is known that professional stress also occurs in teaching.

Researching the problem of professional stress in the education system is very important for mitigating the negative effects that stressors have on the quality of teaches' activities and their health.

The conditions in which teachers conduct their professional activity are one of overburden generated by the countless roles that they have to assume, the great number of pupils in a classroom, the less than desirable behaviour of some pupils, the school atmosphere etc. These are some of the stress-generating factors.

Key-words: stress, burnout.

Research objectives

Our research objectives were to identify the stress-generating factor that teachers encounter in their professional activity.

The general hypothesis

1.   The low salary, the lack of social recognition towards their profession, the difficulties in teaching a curriculum that is too busy as well as the pupils' reprehensible behavior are some of the major stressors for all teachers in the pre-university education in Romania.

2.   Female teachers have a higher registered stress level than male teachers.

3.   There is a strong correlation between the perceived stress level and the burnout experienced by the majority of teachers. Female teachers are more prone to emotional burnout when the perceived stress level is above average.

The approach

The research took place in two stages. First, during the 2010-2011 school year we asked 175 primary, secondary and high school teachers to fill in a list of the main stress factors in their professional activity.

The teachers mentioned approximately 40 stressors, which were included in 12 categories of stress sources (Table 1). Based on these, we drew up a questionnaire which included questions referring to the 12 categories. In order to determine the frequency and the intensity of these factors, as they are felt by the teachers, we employed a Likert scale on five levels: 1 – never, 2 – rarely, 3 – relatively frequently, 4 – frequently and 5 – very frequently.

Table 1: The categories of stress sources as identified by Romanian teachers (arranged alphabetically)

Nr. crt.	Sources of stress
	The school environment
	The autocratic leadership of the school
	The difficulties of teaching an overly busy curriculum
	The difficulties of managing the time allocated to teaching activities
	Evaluating pupils' results / scholastic performances
	Pupils' lack of discipline (including verbal and physical violence)
	Not achieving one's professional expectations / aspirations
	The (large) number of pupils in the classroom
	The inconstant educational policies and regulations
	The parent-teacher relationship
	Financial restrictions regarding the material, financial resources of the school
	The salary

The questionnaire was distributed to a number of 675 teachers in the second stage of our research (the 2011-2012 school year). The questionnaires were filled in at the schools, at home or during professional training and development courses.

A number of 472 teachers replied to the questionnaire (69.92%). The socio-demographic characteristics of the sample are presented in Table 2.

Table 2: The socio-demographic characteristics of the sample (N=472)

Table of participants (N=37)	Women	Men
	310	162
Distribution according to age groups		
23 – 30	76	30
31 – 40	90	52
41 – 50	84	50
51 – 57/60	60	30
Age: average / standard deviation	38,6 (12,4)	42,5 (9,5)
Seniority in education: standard deviation	19,5 (11,4)	23,6 (10,8)
The type/level of the school		
Primary	80	42
Secondary	100	60
High School	130	60

The data obtained after processing the questionnaire underscores the fact that for the majority of teachers in Romanian, pre-university education, who work in primary, secondary and high school levels, the main sources of stress (the answers being valued as 4 or above, namely frequently and very frequently) are: the low salary, the difficulties of teaching an overly busy curriculum, the lack of social recognition for their work, reprehensible pupil behaviour (table 3). For teachers working in secondary and high school education, the sources of stress mentioned above are compounded by the changeable educational policies, as well as by some other difficulties concerning the management of time allotted to teaching activities and class discipline. The obtained results confirm the first hypothesis.

Table 3: The stress sources of the teachers from primary, secondary and high school education, in the order of their impact, evaluated on a scale from 1 to 5

STRESS FACTORS	CHARACTERSTICS OF STRESS FACTORS	THE AVERAGE LEVEL OF THE STRESSORS' NEGATIVE IMPACT		
		PRIMARY N=122	SECONDARY N = 160	HIGH SCHOOL N=190
Poor salary	Insufficient financial resources for a decent life	5	4,80	4,60
Curricular overburdening	Difficulties in teaching an overly busy curriculum	4,75	4,60	4,50
Educational policies	Inconstant regulations, changeable educational policies	4,50	4,50	4,35
Lack of social recognition	Not attaining one's professional aspirations	4,25	4,40	4,25
The pupils' undisciplined behavior	Pupils' lack of discipline, including verbal and physical violence. Raucous, noisy and aggressive pupils	3,80	4,25	4,15
Managing time and discipline	Difficulties in managing the time allotted to teaching activities. Difficulties in maintaining discipline in the classroom	3,75	4	4
Financial restrictions	The lack of technical (IT) and didactic materials. The poor endowment of school libraries	3	3,25	3
The number of pupils in the classroom	Too many pupils per classroom	2,75	2,75	2,80
Teacher – parents relations	Conflictual teacher – parents relations	2,50	2,50	2,50
Pupil evaluation	The evaluation of the pupils' scholastic performance	2	2,25	2,25
The school management	The autocratic school management	1,75	2	2

The school atmosphere	Inadequate physical and psycho-social atmosphere	1,50	1,75	1,75

In order to verify the second hypothesis we applied the stress self-evaluation questionnaire (borrowed and adapted from P. Légeron). This questionnaire has 12 entries referring to the frequency and the intensity of the perceived stress. The respondents need to self-evaluate themselves on a four-level scale: 0 – never, 1 – rarely, 2 – sometimes, 3 – always. The interpretation of the score is the following: a overall score between 0 and 5 signifies the lack of stress, between 6 and 12, a low stress level, between 13 and 20, an average stress level and a score equal to or greater than 21 indicates an elevated or highly elevated stress level.

The data were processed statistically with the help of SPSS 13.

The distribution of teachers in accordance with the perceived level of stress is presented in Table

Table 4: The distribution of teachers (%) according to the perceived stress level

Stress level	Subaverage stress level, score between 6 and 12	Average stress level, score between 13 and 20	Above average stress level, score over 20
Women (N=310)	28,06% (N=87)	9,35% (N=29)	62,58% (N=194)
Men (N=162)	42,58% (N=69)	23,45% (N=38)	33,95% (N=55)
Total:	156	67	249

The relationship between the perceived level of stress and the burnout level

In order to verify hypothesis number 3, we used the Maslach Burnout Inventary (M.B.I.) scale of burnout self-evaluation. It is a questionnaire consisting of 22 items distributed in three groups that assess three dimensions, on a scale of 7 intensity and / or frequency levels, namely:

- burnout (9 items)

- the depersonalization / dehumanization of interpersonal relations (5 items)

- the personal professional involvement / development (the fulfillment of tasks – 8 items).

In our research, we were interested only in the results of the burnout subscale. The relationship between the stress level and the burnout level of female teachers is presented in Table 5, and the degree of association between stress and burnout (as revealed by the Chi- Squared test) in Tables 6 and 7.

Table 5: The relationship between the stress level and the burnout level of female teachers

			Burnout			
			High	Average	Low	Total
Stress	Lower than average	Count	1	24	36	61
		Expected count	20.9	25.6	16.6	61.0
		% within stress	1.6%	39.3%	59.0%	100.0%
		% within burnout	1.9%	36.9%	97.3%	39.4%
	Higher than average	Count	52	41	1	94
		Expected count	32.1	39.4	22.4	94.0
		% within stress	55.3%	43.6%	1.1%	100.0%
		% within burnout	98.1%	63.1%	2.7%	60.6%
TOTAL		Count	53	65	37	155
		Expected count	53.0	65.0	37.0	155.0
		% within stress	34.2%	41.9%	23.9%	100.0%
		% within burnout	100.0%	100.0%	100.0%	100.0%

Table 6: The degree of association between stress and burnout for female teachers. The significance of the frequency difference as revealed by the Chi-Square test (λ 2)

Chi-Square Tests

	Value	Df	Asymp. Sig. (2-sided)
Pearson's Chi-Square	83.384 a	2	.000

	Kendall´s tau-c	-.754	.048	-15.627	.000
	Gamma	-.972	.021	-15.627	.000
N of Valid Cases		310			

a. Not assuming the null hypothesis

b. Using the asymptotic standard error assuming the null hypothesis

By applying the Chi-Square Test (λ 2) we notice significant differences (p < 0,0001) in the stress level perceived as influencing burnout in the case of female teachers with a stress level lower than the average and those with a stress level above average.

For female teachers with a stress level higher than average, burnout is more frequent and higher than average. Thus, the hypothesis that there is strong connection between stress and burnout is confirmed.

In the case of male teachers, the relationship between the stress level and burnout is presented in Tables 8, 9 and 10.

Table 8: The relationships between the stress level and burnout for male teachers

			Burnout			
			High	Average	Low	Total
Stress	Lower than average	Count	0	31	15	46
		Expected count	8.5	25.6	11.9	46.0
		% within stress	.0%	67.4%	32.6%	100.0%
		% within burnout	.0%	68.9%	71.4%	58.8%

Symmetric measures

		Value	Asymp. Std. error a	Approx. Tb	Approx. Sig.
Ordinal by ordinal	Kendall´s tau-b	-.405	.094	-4.081	.000
	Kendall´s tau-c	-.435	.107	-4.081	.000
	Gamma	-.657	.137	-4.081	.000
N of Valid Cases		162			

a. Not assuming the null hypothesis

b. Using the asymptotic standard error assuming the null hypothesis

What ensues is the existence of a strong association between the frequency and intensity of the perceived stress and the degree of burnout, which confirms the third hypothesis.

Conclusions

For the teachers in pre-university education that we surveyed, the main sources of stress are the poor salaries, the difficulties in teaching an overburdened curriculum, the fluctuating educational policies of the Education Ministry, some students' bad behaviour and the difficulties in managing the time allotted for various teaching activities.

Our research has shown that there is a strong connection between the perceived level of stress and the teachers' burnout. For female teachers with a higher than average stress level, emotional burnout is more frequent and more intense than in the case of male teachers.

STRESS, PROACTIVE COPING AND SELF- EFFICACY OF TEACHERS

Marcela Verešová[68]and Dana Malá

Constantine the Philosopher University in Nitra, Faculty of Education, Department of Educational and School Psychology, Drážovská 4, 949 74 Nitra, Slovakia

Abstract

In this paper we point to mutual relations of experienced teacher's stress (in all areas – cognitive, emotional, physical and social) with coping strategies (Proactive coping, Reflective coping, Strategic planning, Preventive coping, Instrumental support seeking, Emotional support seeking, Avoidance coping) and with self-efficacy of teachers. Based on professional resources, we assumed and discovered a considerable positive relation between proactive coping and self-efficacy by 291 teachers from Slovak republic. In the context of teachers experiencing stress we assumed and discovered that the more teachers prefer proactive coping with load, the smaller is their level of experienced stress (this is valid also for individual areas of experienced stress – cognitive, emotional, physical and social). We also assumed and discovered considerable negative correlation between self-efficacy of teachers and experiencing stress (in all observed areas). Above mentioned fact shows the significant coherence of personal characteristics and features (proactive approach and perceived self-efficacy) connected with effective stress coping in all its levels – cognitive, emotional, physical and social.

Keywords: Teacher's Stress; Coping Strategies; Proactive Coping; Teachers Self-Efficacy.

1. Introduction

Teacher's profession as a component of coadjutant professions belongs to those that impose significant requirements on the person performing them from emotional, cognitive, social and also physical side. In the context stated by Kyriacou (1996), he used the term "teacher's stress", which he further defines as situations, in which teachers feel angry, aggrieved, nervous, disappointed, when they feel tension or anxiety as a result of some fact, which is related to their pedagogical activity. Kyriacou (2001) states that teacher's stress represents a complex of interactions between coping mechanisms, personal features and environment, which are in a mutual relationship. Based on works of Kyriacou (1996, 2001), Kyriacou & Sutclife (1977), Židková & Martinková (2003), Kačmárová & Kravcová (2011), Mrozek (2010), Miškolciová (1997), to most significant stressors within teacher's profession belong: inappropriate conditions in the classroom and lack of proper material equipment in school; low teacher's salary; frequent reorganization in school and change of school programs; violation of education process and bad conduct of pupils; time stress; various teacher's roles: teacher, mother/father, trainer, advisor; absence of relaxation as a result of intensive work load and work at home related to school; responsibility towards students, parents, school administrative/school management; conflicts with colleagues, with the management, with parents; problems in career (lack of perspective, little possibilities for personal development and professional growth, insufficient evaluation of teacher's work by society.

Jennet et al. (2003, in Skaalvik & Skaalvik, 2010) states, that the majority of teachers copes with stress successfully. Nevertheless, long-time influence of stressors in connection with non-effective coping strategies

can lead to burnout. Burnout is often described as the syndrome of emotional exhaustion, depersonalization and reduction of personal success. (Maslach et al., 1996). Maslach et al. (1996) identified emotional exhaustion as the key aspect of burnout, while Pines and Aronson (1998) included physical exhaustion characterized by low energy and chronic exhaustion.

Authors Hennig and Keller (1996) divide strategies for coping with stress to professional area, private relationships, life attitude and health. According to authors, there are three bases for stress prevention: 1) decrease of stress situations throughout the work day; 2) reduction of emotional excitement appearing together with stress and 3) change of way of dealing with stress situations, which the individual can't influence. In the context of above mentioned an effective method for coping with stress load in teacher's profession can be considered the proactive coping. Proactive coping is oriented to achieving targets and includes future requirements, which can lead to self-development. (Greenglass, 2002, Šolcová, Lukavský & Greenglass, 2006). Swarzer et al. (1999) describes proactive individual as ingenious, responsible, scrupulous, who bears responsibility for his/her own results and applies the vision of success. Proactive coping includes target environment and persistent heading towards set goal. Proactive individual accumulates resources, he/she is able to mobilize all resources if necessary, he/she consecutively avoids the sources of exhaustion, owns highly developed social skills of how to mobilize resources.

Next to proactive coping, an important personal resource of coping with stress and load can be considered also self-efficacy of an individual, which according to Schwarzer (1992) is focused on broad and settled sense of personal competences to deal effectively with various stress situations. Pajares (2005) describes self-efficacy as the expression of will, energy and self-resolution. Self-efficacy of a teacher is described as a factor of personal resource, which probably protects teachers from experience with tension at work as well as from gradation of burnout. Teacher self-efficacy is studied as a personal resource factor that may protect from the experience of job strain and, thus, make the escalation of burnout less likely (Schwarzer & Hallum, 2008). A teacher's self-efficacy is therefore a major source of motivation and commitment in all aspects of teaching (Tschannen-Moran, Woolfolk Hoy, & Hoy, 1998, in Moé et al., 2010), affecting student achievement and motivation (Bandura, 1993, 1997; Ross, 1998, in Moé et al., 2010), student self-efficacy (Ashton & Webb, 1986; Ross, 1998, in Moé et al., 2010), and the teacher's own job satisfaction (Caprara, Barbaranelli, Borgogni, & Steca, 2003; Caprara, Barbaranelli, Steca, & Malone, 2006, in Moé et al., 2010). Nevertheless, in reality the teachers can become easily unsatisfied with their job if they don't believe that they are able to face difficult tasks, which they might encounter during performing their occupation. Instead, the teachers who have a high level of self-efficacy show a high level of elation in their occupation (Allinder, 1994). Self-efficacy influences the effort that was entered into teaching: high self-efficacy is consistent with better planning and organization, a higher tendency to try out new approaches (Guskey, 1998; Stein & Wang, 1998, in Moé et al., 2010). Teacher burnout has been shown to be moderately strong related to teacher self-efficacy (Skaalvik & Skaalvik, 2010).

Aim of our research is to analyse the coherences of experienced teacher's stress (in all areas – cognitive, emotional, physical and social), strategies of dealing with stress load (Proactive coping, Reflective coping, Strategic planning, Preventive coping, Instrumental support seeking, Emotional support seeking, Avoidance coping) and self-efficacy. We assume a significant positive relation between proactive coping and self-efficacy of teachers. In the context of teacher's experiencing of stress we assume, that the more the teachers prefer proactive coping with stress load, the significantly lower is the level of experienced stress by them (valid also for individual areas of experiencing stress – cognitive, emotional, physical and social). We also assume significant negative correlation between self-efficacy of teachers and experiencing stress (in all areas – cognitive, emotional, physical and social).

2. Methodology

2.1. Measures

To identify the level of stress and burnout syndrome by teachers, we used Questionnaire for identification of stress levels and burnout syndrome from Henning and Keller (1996). The questionnaire is dedicated to define the level of stress influence on central psycho-physical functions and how strong is the general inclination to stress and burnout syndrome. Henning and Keller (1996) specify four levels of reaction on stress: 1) Cognitive level: negative picture of own abilities, loss of self-confidence, a negative up to cynic attitude towards pupils or their parents; loss of interest for happening in own occupation field; problems with concentration and escape from reality. 2) Emotional level: Irritation and impulsive behaviour; nervousness; and internal tension; affective exhaustion; anxiety, feeling of helplessness; self-remorse, feeling of hopelessness; loss of joy from work and feeling of non-appreciation. 3) Physical level: quick exhaustion; increased tendency to diseases; vegetative problems (heart, breathing, digestion); headaches, sleep disorders; high blood pressure; muscle tension (stiff neck, shoulders, back muscles pain); vertigo and nausea; appetite disorders. 4) Social level: decrease of educational commitment; limitation of contacts with colleagues and friends; problems in family and personal life; neglecting own hobbies and indulgences. Every area is measured by 6 questions, while the respondent answers on a scale: always (4 points), often (3 points), sometimes (2 points), rarely (1 point) and never (0 points). Level of inclination to stress and burnout syndrome is moving from 0 to 96 points, the higher the number of points, the higher the level of experienced stress.

To identify the strategies of coping with stress load, we used Proactive Coping Inventory (PCI) from authors Greenglass at al. (1999). PCI questionnaire consists from 7 scales: Proactive coping – 14 items, Reflective coping - 11 items, Strategic planning, Preventive coping, Instrumental support seeking, Emotional support seeking, Avoidance coping), it is created altogether from 55 statements to which the respondent gives answers on a scale: (1) not at all true, (2) barely true, (3) somewhat true, (4) completely true.

To find out the self-efficacy of teachers, we used Teacher Self-Efficacy Scale (Schwarzer et al., 1999). The scale consists of 10 statements to which the respondent gives answers on a scale: (1) not at all true, (2) barely true, (3) moderately true, (4) exactly true.

2.2. Participants

The research sample was created from 291 teachers from Slovak republic. 146 teachers acted on the second level of primary education, 145 teachers on high schools. From the total number, 79% were females (N=230) a 21% males (N=61). Average age of research sample was 41,66 years; age scope was 24 to 68 years. Average length of teaching practice was 16,8 years (minimum 1 year, maximum 41 years of teaching practice).

We didn't discover differences by teachers in observed variables (Proactive coping, Reflective coping, Strategic planning, Preventive coping, Instrumental support seeking, Emotional support seeking, Avoidance coping, Teacher self-efficacy, Stress, Cognitive level of stress, Emotional level of stress, Physical level of stress, Social level of stress) or from the aspect of sex, or the duration of teaching practice.

3. Results

Descriptive indicators (Table 1) are the representation of gross score (minimum, maximum, average and standard deviation) in observed variables. In the area of stress experiencing and burnout by teachers, we discovered that in average are teachers in the light stress level. Most intensive reaction to stress is visible in teachers' physical symptoms, but average values also in this area show only mild level of stress experiencing. In the level of burnout (score over 73 points) appeared 3 teachers (females).

Table 1 Descriptive Statistic of Variables

	Minimum	Maximum	Mean	Std. Deviation
Proactive coping	28,00	56,00	41,73	4,27
Reflective coping	18,00	44,00	33,92	4,74
Strategic planning	5,00	16,00	11,73	2,07
Preventive coping	17,00	40,00	30,20	4,28
Instrumental support seeking	10,00	32,00	23,84	3,85
Emotional support seeking	5,00	20,00	15,43	2,92
Avoidance coping	3,00	12,00	7,24	1,99
Teacher Self-Efficacy	16,00	40,00	30,48	3,71
Stress level	1,00	80,00	28,55	11,99
Cognitive level of stress	1,00	18,00	6,55	3,19
Emotional level of stress	1,00	20,00	7,93	3,57
Physical level of stress	1,00	21,00	8,24	3,72
Social level of stress	1,00	22,00	5,77	3,51

	Sig.(2-tailed)	,000	,000	,000	,000	,144	,000	

In the area of analysis of relation between proactive coping and self-efficacy of teachers (Table 2), we observed highly significant positive correlation (r = ,403), which means that teachers which are proactive have also high self-efficacy. Self-efficacy of teachers significantly correlates with some other coping strategies: reflective coping (r = ,303); preventive coping (r = ,168); emotional support seeking (r = ,135); strategic planning (r = ,106).

In the area of analysing the relation between proactive coping and stress experiencing (Table 3) we discovered significant negative correlation (r = -,286), which shows that the more the teacher is proactive, the significantly lower is his/her experienced stress. Likewise, we noticed a significant negative correlation between proactive coping and individual areas of reaction to stress - cognitive (r = -,283), emotional (r = - ,286), physical (r = -,124) a social (r = - ,302).

In the area of analysing the relation between self-efficacy of teachers and experiencing stress (on all areas – cognitive, emotional, physical and social- Table 3), we discovered significant negative correlation (r = -,264), which shows that the higher is the teacher's self-efficacy, the lower is his/her experienced stress. Likewise we noticed significant negative correlation between self-efficacy of teachers and three areas of reaction to stress - cognitive (r = -,306), emotional (r = - ,212) a social (r = - ,314). We haven't noticed a significant correlation with self-efficacy in the physical area, although the direction of this correlation is negative.

4. Discussion and Conclusion

Our performed research had the ambition to contribute to clarification of relations between teacher's stress and teacher's personal features related to coping with load – proactive coping and self-efficacy of teachers. Lazarus (1991, in Schwarzer & Schulz, 2001) considers stress as active, developing process, created by causal precursors, mediating processes and direct effects. He assigns to causal precursors personal variables and environmental variables. Mediated processes deal with coping and evaluation of requirements and resources.

Experienced stress and coping bring direct effects related to psychological state of well-being, somatic health and social interaction.

In our research we verified the causal connection of experienced stress of teachers with self-efficacy as personal variable. We discovered, that the stronger is teacher's sense of self-efficacy, the more he/she believes that he/she is able to positively influence his/her students and accepts also the responsibility for motivation of students and makes also necessary progress for this kind of behaviour, the weaker is his/her reaction to stressors in physical, emotional, cognitive and social form, and so his/her psychic as well as his/her physical functions are not significantly influenced by the affection of stress.

Our research has shown also mediating processes of stress reaction while we primarily focused on analysis of relation between proactive coping and levels of stress by teachers. Proactive coping is described as highly effective strategy from the aspect of health support, while at the same time it integrates processes of individual management of life quality (Greenglass, 2002). As Greenglass (2002) points out, Greenglass, Schwarzer & Taubert (1999) or Ruiselová (2009) traditional conceptions and understanding of stress show a more reactive coping of stress. While reactive coping strategies are focused on experienced stress situations or stress in the past, to decrease the risk of unsuccessful solution of a situation, proactive coping on the other hand focuses on future, on own internal sources, which enable the enforcement of personal aims and plans, enable to understand the problem situation as a challenge, while risks and at the same time requirements are compared to aims which are to be achieved. In general it is possible to state a significant positive direction and motivation of a person which is connected with the term proactive. In our research we also found out, that the more the teachers are internally psychically motivated to pass obstacles, perceive problems as challenges and try to analyze the risks and demands in connection with aims, to which they are systematically heading, the weaker is their reaction to stressors in physical, emotional, cognitive and social form, and so their psychical cognitive and also emotional processes and conditions, as well as their physical function and social characteristics (decrease of education commitment; limitation of contacts with colleagues and friends; problems in family and private life, neglecting own hobbies and past times) are not significantly related to stress effect.

Like Schwarzer (1992) describes the self-efficacy of human in the effect of broad and stable sense of personal competences to deal and act effectively with various stress situations, so we also decided to connect it on the level of self-efficacy of teacher with his/her proactive coping as effective coping strategy. We found out, that the higher is the self-efficacy of teachers, the higher is their proactive coping. Proactive teacher is also the field and source of motivation and success of his/her students.

The construct of self-efficacy suggests a protective effect when coping with adversity. An optimistic belief in one's competence to deal with daily challenges enhances the motivation to engage in constructive ways of coping. Thus, self-efficacious teachers would perceive the objective demands of daily teaching as being less threatening than those teachers do who harbour self-doubts about their professional performance. Successful adaptation to stressful demands, in turn, would prevent the emergence of job burnout. (Schwarzer & Hallum, 2008).

STUDENTS' OPINIONS ON THEIR COMPETENCES FOR REACHING LIFE SUCCESS

Katarzyna Klimkowska[a] [69]

[a]Maria Curie-Sklodowska University, Lublin, Poland
Department of Adult Education, Institute of Pedagogics, Narutowicza 12, 20-004 Lublin, Poland

Abstract

Life success is an equivocal and a highly subjective notion. Nevertheless, for a lot of people it constitutes an important parameter which they rely on when assessing their life achievements, experiences and decisions. It is a parameter which they use to define their life strategies, aspirations and objectives. Higher education gives students an opportunity to enhance their competences for reaching professional success. However, professional success is only a component of a holistically-defined life success. This is why the author has decided to determine if students of education studies have their definitions of life success, and if they assess their chances of reaching it, and if so, under what conditions. Research results show that the subjects define life success as a multicomponent concept: life success means to them reaching their private and professional objectives in a balanced way. Students admit being apprehensive of failing to reach professional success. The criteria that influence reaching life success include – in the students' opinion – their own actions and external factors. They also believe that education studies do not give them sufficient opportunities to develop their competences for reaching life success, despite the considerable amount of knowledge that the academic courses offer. The students point out to their low level of self-esteem as the most vital hindrance on their way to success. Unfortunately, in their opinion, their academic studies do not help them develop in this respect.

Keywords: *life success, professional success, personal success, competences, students*

Introduction

Success is extremely important in people's life and has therefore long been the subject of various studies. The interest in success is evident: there are numerous scientific publications regarding the subject, as well as a number of popular books and handbooks that aim to present ways of achieving success and of developing personality features necessary to attain it.

From the scholarly perspective, success is an equivocal notion. The literature on the subject defines it as luck or achievement (Krupski 1997, 21), fame, prestige, wealth (Bartkowiak 2000, 15), positive outcome (Penc 1997, 428), or a goal-oriented activity (Belitz 1999, 29). The researchers emphasize that the difficulties in providing an unambiguous definition stem from the fact that success is directly connected with the individual's outlook on life and the values one appreciates (Firkowska-Mankiewicz 1999, 17). Moreover, literature more and more often mentions professional success (cf. Kmiecik-Baran 1996, Kranas 1995, Tyszka 1997, Kasprzak 2006), which seems to be more easily defined as it refers to people's professional activity, as this activity can be more precisely assessed with the use of objective criteria.

G. Bartkowiak, discussing professional success, states that it is "defined by objective and subjective determinants – the conditions that should be met so that individuals can consider themselves successful" (Kupczyk 2006, 11 after Barktowiak 2004, 43). This approach can also be applied to life success and a person can measure their life success in reference to some determinants defined internally or externally. The researchers dealing with the conditions of success claim that to be successful, a person has to possess certain competences – they should know how to act, which of their personality traits to employ in a given situation, and which skills to develop.

The research into social studies students' perception of life success is fully justified. First of all, to achieve success an individual should have a clear vision of their future life and life success. It facilitates making decisions compliant with one's objectives, as well as evaluating stages and dimensions of success. Secondly, caring professions involve close relations with wards, clients, and students, so they are full of difficult situations, disappointments and frustrations. They are also time-consuming and charged with emotions, which often leads to transferring professional discomforts to private life. The results of the empirical analyses conducted among different social groups indicate that life success is often understood as achieving proper balance between one's professional career and family life and finding fulfillment in both areas (Kupczyk 2002, 2006, *Menadżerka sukcesu* 2011). Therefore, competences needed for achieving success in the case of people working in educational and vocational professions oftentimes overlap with professional competences. The author uses the definition of competence offered by Furmanek (2007,16), who emphasizes that "the mature psyche is based on certain competences (competence syndrome) that allow people to define their identity and the directions of further development and self-development. The catalogue of competences includes some important ones - the ones which point a person towards mastering the ability to communicate with others, the ability to find one's bearings and the ability to evaluate and transform one's surroundings."

Research

The aim of the research was:

to determine how success is defined by pedagogy students

to find out how they assess their chances of reaching it

to define conditions necessary to reach success

to determine students' competences for reaching success.

The research was conducted among 138 first and second years students of full-time undergraduate studies in pedagogy and social work at Maria Curie-Skłodowska University in Lublin. Since the majority of pedagogy students are women, only seven men participated in the research. The age of the students was 21-23 years old.

The research material was collected in a poll using an author's questionnaire about the students' life success.

Results

The first aim of the research was to determine how people who are about to start work in educational and caring professions define life success.

Table 1. Students' definitions of life success

What is success?	N	%
Reaching goals and finalizing plans	37	26.81
Successful family life	25	18.11

	N	%
Good financial status	21	15.22
Balance between professional and family life	38	27.54
Realization of dreams	11	7.97
I don't know	6	4.35
Total	138	100.0

The data presented above shows that most people pointed to two categories of success; almost equal numbers of the subjects defined life success as the *balance between professional and family life* (27.54%) or *reaching goals and finalizing plans* (26.81%). Although, semantically, the two categories differ from each other, it can be assumed that some respondents for whom life success means achieving goals treated the balance between private and family life as one of such goals. The same can be concluded from the research into the hierarchy of values conducted by various researchers (Klimkowska 2010). The results revealed that people regard family life and professional career as the most appreciated values.

The question concerning the students' assessment of their chances of achieving success in life was the direct consequence of the first researched problem. The students' answers to the question are presented in Table 2.

Table 2. Chances of achieving the life success

What are your chances of achieving life success?	N	%
High	16	11.59
Rather high	41	29.71
I don't know	47	34.06
Rather low	22	15.95
Very low	12	8.69
Total	138	100.0

The data presented in the table above indicate that slightly over one-third of the respondents (41.30%) assessed their chances of success as high, and only 16 respondents as very high. One in three people (34.06%) were unable to assess their chances of success, and this result is alarming.

There are certain developmental expectations - concerning both the private and the social sphere - that one has of young adults (for instance the developmental tasks theory by R. Harvighurst); this group is therefore supposed to have a clear vision of their adult life. In order to finalize plans, the adult has to possess a specific disposition and a set of skills - in other words, a set of competences necessary to achieve success. What is more, one should also be conscious of them. Hence, it may be suspected that students who had difficulties with assessing their chances of success may face significant obstacles on their way to achieve it. It may stem from the low self-awareness and self-reflectivity. However, to determine the real cause of the respondents' indecisiveness and to predict the probable consequences, one would have to carry out a more in-depth analysis.

Another issue explored in the research was the determinants of life success determined by pedagogy and social work students (Table 3).

Table 3. Determinants of life success

What conditions your achieving life success ?	N	%
Luck, chance	38	27.35
Ambition	27	19.56
God's will	7	5.07
Hard work, engagement, determination	62	44.93
Knowledge, qualifications, skills	60	43.48
Connections, support	47	34.06
Health	14	10.14
Situation on the local job market	69	50,00
Country's economy	49	35.51
Talents and gifts	51	36.95
Parents' social position (social class)	6	4.35
Appearance, clothes, presence	25	18.11

The data does not sum up to 100 per cent since the questionnaire allowed multiple answers for each question.

The data presented in the table above shows that students believed their success depended on both internal and external factors. On the one hand many of them chose factors such as *hard work, engagement in the work and determination* (44.93%), *knowledge, qualifications and skills* (43.48%) and *talents and gifts* (36.95%). This selection is quite optimistic since it can be expected that respondents who made such choices have highly developed competences for achieving life success. On the other hand, however, 50.00% of the respondents linked their success with the *situation on the local job market*, and one in three respondents - with *the country's economy*. It can be observed that a numerous group of the respondents associate life success with financial and professional success. If one assumes that this reflect the subjects' tendency to remain passive on the job market, the results may be rather alarming. It should be also remembered that the situation on the Polish job market as far as educational and caring professions are concerned is really difficult. A relatively small percentage of the graduates find jobs in their studies-related professions (Klimkowska, Dudak 2012). This, in turn, leads to frustration among young employees and affects their perception of the quality of life and success.

Another issue that requires a closer analysis is the frequency of answers such as *connections, support* (34.06%) and *luck and chance* (27.35%). The fact that one in three respondents consider connections and support as a factor necessary for achieving success indicates that the society still believes that achieving various elements of success (good job, high position, attractive salary, prestige) depends on connections and favoritism. Also surprising is the fact that one-fourth of the respondents linked their success with *luck and chance*.

Another aim of the research was to determine how students see their competences for reaching success and if they consider studies to be helpful in developing these competences (Table 4).

Table 4. Assessment of competences for reaching life success

How do you assess your own competences for reaching life success?	N	%
Very high	10	7.25
Rather high	46	33.33
I don't know	51	36.95
Rather low	29	21.03
Very low	2	1.44
Total	138	100.0

As far as students' own competences for reaching life success are concerned, the research revealed that 40.83% of subjects assessed their competence as high, and 33.33% of the study group - as rather high. The result could invite rather optimistic conclusions – the majority of the respondents had a high opinion of themselves, and only one in five respondents – a low one. Still, also the negative answers could be interpreted in a positive way, since any change begins with the awareness of one's own resources. The respondents who claimed they lacked competences for achieving life success may treat this situation as an inspiration for self-development. What requires some analysis is the fact that 36.95% of students were unable to decide if they had any competences. The adults' inability to determine their own disposition and skills is really alarming as far as their

development is concerned. Referring to the earlier analysis, one may expect young adults to be aware of their own competences, especially since they are prepared to work in educational and caring professions. As it was mentioned in the introduction, these professions are perceived as demanding and stressful. They therefore require certain competences that comprise: personal qualities, knowledge, ability to deal with stress, responsibility, task management, and establishing close relation with pupils and students. Many of the competences required in educational and caring professions, are key competences for realization of personal goals and plans.

The final issue analyzed is the opinions of students concerning whether pedagogical studies develop their competences for reaching life success (Table 5).

Table 5. Pedagogical studies and the development of competences for achieving life success.

Does your university program develop competences for achieving life success?	N	%
Definitely yes	5	3,62
Rather yes	40	28.98
It's hard to say	64	46.38
Rather not	23	16.67
Definitely not	6	4.35
Total	138	100.0

The collected data presents a rather unsatisfying and alarming picture. Nearly half of the respondents indicated that their studies do not help them to achieve success. The subjects admitted that their studies prepare them for professional work and help them develop their skills and become more mature, however they do not help them become more self-confident or have more faith in their abilities. Many respondents stressed that a person who starts university education with a low self-esteem, is usually equally self-conscious after graduation.

Conclusions

Summing up, it can be observed that the majority of subjects had a clear vision of their success and many of them expected to accomplish it.

However, the research also revealed that many study subjects had difficulties assessing their chances of success. A significant group of respondents had problems with evaluating their chances of attaining life success as well as their competences for achieving it. Also, the members of the group pointed to the internal factors determining success as often as to the external ones.

It should also be emphasized that the study subjects – pedagogy and social work students – oftentimes did not perceive any direct relation between their studies and the development of success-oriented competences.

Therefore, a question arises whether the students of social studies are likely to graduate as potentially successful people. Success is not limited only to spectacular achievements, but it also concerns the ability to lead a satisfying life. It may be expected that curricula full of courses in pedagogy, psychology, philosophy and sociology – both theoretical and practical – will encourage students to develop personal competence, and to perceive themselves as successful.

The research, although fragmentary and encouraging further, more in-depth analyses, revealed the need to introduce the issues concerning success-related competences into the list of objectives of higher education. It is clear that teachers do need to make students more aware of how useful the knowledge and skills they acquire are for achieving personal goals, dreams, and therefore attaining life success.

STUDENT OPINIONS ON TEACHING BASED ON MATHEMATICAL MODELLING[70]

Emine Özdemir[a, 71]Devrim Üzel[a] ,

[a]Balıkesir University, Educational Faculty of Necatibey, Department of Elementary Mathematics Education, Balıkesir,Turkey

Abstract

This study aimed at determining student opinions about teaching based on mathematical modelling were taken. Study was designed according to descriptive research model. Prospective mathematics teachers carried out the teaching based on mathematical modelling which was included in teacher practices class in elementary mathematics undergraduate program. Before the practice, prospective teachers had a 3 months length education process about learning-teaching applications based on modelling. They prepared classroom practices which include modelling tasks in order to ensure the acquisitions that are included in 6th, 7th and 8th grade mathematics curriculum based on mathematical modelling. During modelling process, the class was divided into groups made of 4-5 people and a homogenous distribution between groups was ensured. 14 voluntary students were chosen from these groups and semi-structured, modelling based interviews were made with them. Data analyzed with descriptive analysis method. When student views were analyzed, it was determined that most of the students have positive thoughts about the teaching. Students stated that they experienced a different class environment, and the study made a positive effect on them in terms of effective learning of mathematics. While some students expressed that the study was enjoyable and applicable, some others stated some negative ideas because of the test anxiety.

Keywords: Teacher education; mathematics education; mathematical modelling; prospective mathematics teacher.

Introduction

Mathematics is a systematical way of thinking that creates solutions to real world events with modelling. Modelling can be defined as converting an existing problem to mathematical notations and representations (Burkhardt & Pollak, 2006; Niss, 1987; Kaiser; Blomhøj & Sriraman,2006). Mathematical modelling is meant to help students' better understand the world, support mathematics learning (motivation, concept formation, comprehension, retaining), contribute to develop various mathematical competencies and proper attitudes, contribute to create an adequate picture of mathematics, namely using enough mathematics. In this context, purposes of mathematical modelling are; enable students make predictions, explain problems, describe and understand different situations in the real world (Galbraith & Catworthy, 1990).

Mathematical modelling is an important component of professional training, which is similar in all areas, particularly in mathematics education. The incorporation of mathematical modelling in mathematics education provides a learning environment (D'Ambrosio, 2009). There are many characterizations or modelling cycles of modelling process (Hirstein, 1995; Berry&Houston,1995; Borromeo, Ferri, 2006; Galbraith & Stillman, 2006; Verschaffel, Greer & De Corte, 2000). A cognitive analysis of modelling process gives a model of the modelling cycle. Modelling cycle can look like algorithmic process, but indeed it is not. Especially the construction process of modelling is challenging as it include formulating a problematic situation. The process requires selection of appropriate variables, determining connections between these variables, developing a mathematical model related to these variables and connections, and testing the model and its applications. The

---

basic purpose of involving mathematical modelling in secondary school curriculums is to encourage students make connections between mathematics and the real world (Blum & Niss, 1991).

One of the process models to describe modelling activities is the modelling cycle proposed by Blum & Leiss (2007). In an idealised form, the solution process for a modelling problem can be characterized by a seven-step sequence of activities: (1) understanding the problem and constructing an individual "situation model"; (2) simplifying and structuring the situation model and thus constructing a "real model"; (3) mathematising, i.e. translating the real model into a mathematical model; (4) applying mathematical procedures in order to derive a result; (5) interpreting this mathematical result with regard to reality and thus attaining a real result; (6) validating this result with reference to the original situation; if the result is unsatisfactory, the process may start again with step 2; (7) exposing the whole solution process. From this point of view, the modelling process is made up of seven steps. Distinguishing between these steps is helpful for reconstructing the modelling processes used by students when solving mathematical problems. However, students' actual processes are typically not linear but rather jump back and forth several times between mathematics and reality (Borromeo Ferri, 2007; Leiss, 2007).

According to the mathematics educators, students have opportunities to use and apply mathematics through mathematical modelling (Blum & Niss, 1991). Mathematics classes that are designed in the form of using mathematical modelling, give students chance to use mathematics actively. Students with mathematical modelling competencies learn and develop mathematical concepts very well which makes important contribution to their mathematical experiences outside school (Aydın, 2008).

If this phenomenon can be learnt as early as secondary school, high school will be able to evaluate everything mathematically in their lives and will be more successful in mathematics classes. PISA 2006 results revealed that students all over the world have some problems with modelling tasks (EARGED, 2010). At the end of PISA professional mathematicians' analyses, difficulty of modelling tasks were able to be explained by the cognitive complexity.

In this context, in order to improve present conditions, it is very important to increase the education activities based on mathematical modelling and their effective practices in classes. In this study, which aims at determining students' views in present situation, students' ideas on the issue of mathematical modelling were taken.

Method

The study was designed according to the qualitative research and was carried out on the second semester of 2010-2011 academic years. Prospective mathematics teachers carried out the teaching based on mathematical modelling which was included in teaching practices class in elementary mathematics undergraduate program in Balıkesir University. Before the practice, prospective teachers had a 3 months length education process about learning-teaching applications based on modelling. In this process, they prepared lesson plans which include modelling tasks appropriate for the acquisitions that were included in the 6th, 7th and 8th grade mathematics curriculum; these modelling tasks were evaluated by researchers and took their last shape. Prospective teachers implemented teaching applications according to their lesson plans. Before the teaching applications, students were divided into groups made of 4-5 people. Mathematics class teacher's and students' opinions were taken in deciding the group members and a homogenous distribution was ensured. 14 voluntary students were chosen from these groups and semi-structured, modelling based interviews were made with them. Data were gathered with an interview form prepared by researchers and analyzed with descriptive analysis method (Yıldırım & Şimşek, 2005).

Findings

When student views were analyzed 7 sub-themes were seen. These sub-themes are: contributions of group studies, contributions of class discussions, views on modelling tasks, views on teachers' role, and contributions to learning mathematics, anxiety and enjoyment. Descriptive findings of the data are given in Table1.

Table 1. Descriptive findings of the data .

Main Theme	Sub Themes	Codes	Quotations from Student Views
Views on Mathematical Modelling based teaching	Contributions of Group Studies	• The effort to prove oneself • Attendance of general class • Collaboration • Active participation • Creating common ideas • Homogenous distribution of groups	S1. It wouldn't be this much beneficial if we'd study together. In this method, everybody said something to prove himself/herself. S12. I was satisfied with the group study. There were some conflicts sometimes, but these were the joy of the study. S2. Groups were proportional, equal in terms of information. If we would arrange the group, it wouldn't be better. The others would look while one or two were studying. All of the class participated in the study in this way. S8. We saw that our ideas agreed. We gave decisions in here as a group, it was easier. S13. As there were group studies in that, we had the chance to work together more. S14. There are some successful and unsuccessful students in our class. If we would determine group members, we would be better than the other groups. Teachers' gave more fair decisions; almost all of the groups were equal. If we'd work individually, everyone would find something different; we wouldn't come to an agreement. We worked together, collaborated; so all ideas were gathered in one place, it was better. S1. There were no groups in mathematics classes, this is better. We can ask our friends if we can not do something. It wouldn't be this much effective if we did this individually.
	Contributions of class discussions	• Defending group's solution • Seeing different solutions • Realizing mistakes • Desire to win • Competition	S6. It was better for groups that made mistakes. They realized that they made mistakes on the paper, and corrected their mistakes on the board. They won't forget what they learnt. S11. When we solved questions on the board as separate groups, we saw one another's mistakes. For example I was sure that we found the right solution; when I saw that we gave wrong decision I was shocked. S13. Discussion environment was useful for us as we were able to see our mistakes. S10. Class discussions were very well, we saw our friends as competitors. We tried to beat them and became ambitious. This enabled us become more effective in defending our solutions. Namely, discussions were good. S14. As we discussed solutions in class, we had the chance to see our mistakes. We became more ambitious as there were groups. S4. We agreed on the solutions we made in groups. Although there were debates in class discussions, we saw our mistake, which was better. Some of us saw his/her mistakes before it was too late. S2. I think class discussion was very effective. Because I was absolutely sure that our answer was correct. We checked it a few times. But something changed when we came to the board. We thought that their answer was more sensible. I was shocked when I saw that we did wrong.
	Views on modelling tasks	• Interesting • Increasing curiosity • Not easy • Not difficult • Thought provoking • Necessary • From daily life • Appreciation • Valuable • Entertaining	S3. Making calculations were interesting. We were curious about the solution while dealing with the problem. S4. Problems weren't difficult, but they weren't easy either. S5. Applications were enjoyable, and more thought provoking. S14. Activity wasn't that much easy, there were especially a lot of operations. S1. Questions in the activity weren't easy or difficult. They were all necessary. S5. Everybody liked the activities; they were reflecting the parts of our lives S6. It was very valuable for us, it made us feel valuable, we were being thought. That was why we liked them.

Views on teacher's role	• Guidance • Supporter • Encouraging to thinking • Questioning	S7. Teacher in this class was better. He/She was more interested. He/she gave very clear answers to our questions in a way that we can understand. S10. He was sympathetic. If we would make individual studies, he couldn't answer all of our questions. He gave answers to most of the questions. S1. I was anxious at the beginning, I didn't know if I could answer; it was easier when the teacher came and explained. S2. The teacher was like a supporter, he/she was our second way. He/she was like a guide and eased our studies. S4. The teacher wanted us to decide which method to use. He/she only asked questions like "how would it be if you used this way?" and made some suggestions. S1. Teacher guided and encouraged us to think, said that I didn't give this in this question, find it on your own.
Contributions to mathematics learning	• Arousing interest • Focusing on the task • Seeing different activities • Realizing mistakes. • Seeing friends' situation. • Permanent learning • Effective learning • Learning from one another • Learning and enjoying • Endearing mathematics • Looking from a different perspective	S12. As everybody focused on the class, they did something. Everybody was interested. Some people wouldn't be interested if we studies individually. S10. Generally everybody liked the activity; these kinds of studies are very attractive. Everybody focused on that at the same time. I am picturing the situation now, everybody is thinking about the same thing, which one is the right answer, who is right who is wrong… S13. We become more ambitious if we are taught in this way, our interest in mathematics increase. S10. If mathematics is taught by this way, I think everybody would become more interested, it would be enjoyable. S1. We always thought about formulas. We don't do such activities in mathematics. S5. Everybody in group study firstly wrote their opinions on papers, and then we combined them in a paper. For instance I found a solution but it was false. I realized my mistakes. S11. In our group studies, we saw that some of our friends were better than us –we are successful in mathematics-. I didn't realize that before as they hadn't told us. We are in the class for years; I had never seen that before. It was very well for this. S7. I liked the application very much. We reached a cone in a way with stars and we rearranged the formula we know according to the data. We arranged them in order to reach solution. This was a very good example for us to see that only memorizing the formula isn't enough. S6. When the activity is individually made, different answers are given. We weren't able to see our own and our friends mistakes clearly in that way. S9. Our learning was more permanent with this method. If we do such applications in order to repeat an issue, it becomes permanent and we don't forget. S10. We both enjoyed the process and learnt. It was very good. S4. We learnt a lot from one another both in groups and on the board. S11. Mathematics learning becomes more permanent, solutions become well if we take classes in this way. S7. I think that these practices are more effective in our learning. S5. I gained something in this lesson. For example with the help of group study, I saw where and why I made mistakes. I saw from a different perspective which method should we use. It was a good activity for me. S4. If I see a similar question in secondary education entrance exam, I will be able to answer consciously. We didn't know what and how to do; this is why this application was very useful for us.
Anxiety	• Irritated • Stressed • Being afraid of getting reaction • Being relaxed	S13. When we heard that there will be groups, we first thought that there were going to be a competition. I became agitated as I didn't know if I could be successful. S1. I was a little stressed as we were being recorded on video. S9. We relaxed as we spent more time with teacher. S8. The students who weren't convinced with the class discussions said "what we did is right", I think that they didn't want to draw reaction from their group friends.

Enjoyment	• Enjoyable • Nice • Good • Pleasure	S11. In my opinion, the lesson was enjoyable. We also solve problems in the class but they aren't as difficult as this. We also don't study with groups, we study on our own. This is why these applications were better. S1. Generally everybody said that they enjoyed and took pleasure from mathematics lesson. S10. Activities were good; enjoyable and nice; generally everybody said that they enjoyed. S5. The lesson was good, I enjoyed it very much. S6. I got happy because we had never done these kinds of stuff in my previous school. It is easier for us to learn something while enjoying. This is why this method is better.	

We see the views on mathematical modelling based teaching as the main theme in Table 1. As modelling process continued in this teaching, views on modelling process can be taken as the main theme. Kyleve & Williams (1995) identified that students' abilities have some effects on their attitudes. According to this finding, it can be said that students' modelling abilities affect their attitudes. Because sub-themes that were determined according to the data put forward the experiences and feelings in the process. Lim, Tso & Lin (2009), analyzed the attitudes of students towards mathematics in 4 dimensions: beliefs, usefulness, enjoyment and anxiety. Beliefs are the judgments that students make for the application and they are based on knowledge and previous experiences of students. Usefulness is defined by the researchers to be what is useful for and in favor of students, practical and what makes the project worth being applied. While enjoyment is defined to be satisfaction and not feeling any pressure, anxiety is feeling pressure and anxiety about the project.

When these definitions are analyzed, it is seen that the sub-theme of "contributions to mathematic learning" that we determined in our study (*focusing on the class, arousing interest, seeing different solutions, seeing friends' situation, realizing mistakes, permanent learning, learning from one another, learning and enjoying, endearing mathematics, effective learning*) includes beliefs and usefulness. Lester Jr (1987) stated that beliefs are made of the subjective knowledge developed by a students in order to interpret events. Galbraith et al(2003), mentioned that beliefs in mathematical modelling which affect judgments and views are very important in terms of putting model's variables forward. In this context, students emphasized that modelling process is a useful device in learning mathematics and they will see the possible advantages in their future career.

Most of the students stated that the education was enjoyable and good, they enjoyed the process and they were satisfied. These views are grouped under the theme of enjoyment. Galbraith, Izard & Christopher (2003) stated that enjoyment is an instinctive or intuitive feeling that students show in their mathematical experiences. In this context, another important side of the study was revealed with the fact that students had positive feelings about teaching, and they said that they both enjoyed the process and learnt at the same time, they had the chance to study more effectively in a more comfortable environment.

Study group who were preparing for secondary education entrance exam participated in this study. There are fewer questions in modelling tasks. Very few of the students stated this feature to be a negative feature of teaching based on mathematical modelling.This was expected as students had test anxiety; students attended the application stated that their knowledge will be useful in future, they were enjoying the process while learning and they didn't have learning anxiety while studying on modelling tasks.

Kaino & Salani (2004) determined similarly in their studies that students related the usefulness of their study with their future professional lives; but on the contrary to our study, as the negative side of teaching, they expressed that they didn't enjoy the process and they related this with learning anxiety instead of test anxiety.

Conclusions

When students' views on mathematical modelling were analyzed, it was determined that most of the students in this study had positive views on the mathematical modelling based teaching. Students experienced a different application in mathematics class and the study positively contributed to them in terms of learning mathematics.

Increasing students' mathematical success on international level, ensuring effective and permanent learning of mathematics can be done and students' anxieties can be relieved with education situations that are prepared according to mathematical modelling.

Abstract

An important prerequisite for prospective competitive factories is an effective and enduring development of production-related competencies in today's universities for manufacturing engineering. Learning Factories are an action-oriented approach for developing these competencies. They are highly authentic learning environments in which genuine products are manufactured in a simulated but life-like production setting. The study aims at investigating the learning success of engineering students in a Learning Factory. Results of a conducted experiment are presented and discussed giving proof to the hypotheses that students have a greater application-performance and a higher degree of action-substantiating knowledge after having attended an action-oriented learning event within the Learning Factory than after receiving a conventional treatment.

Learning Factories; action orientation; competencies; manufacturing engineering

Introduction

In order to withstand international pressure of competition manufacturing companies must continuously develop their manufacturing processes, their production equipment as well as their operational and organizational processes. An equally important prerequisite for prospective competitive factories is an effective development of production-related competencies and the capability of adapting and evolving these competencies independently (Abele, Tenberg, Wennemer & Cachay, 2010). The exponential increase of production-oriented knowledge accompanied by shorter employees' dwell times in certain positions thus requires new effective production learning approaches. In addition, the ongoing effects of knowledge aging make a rethinking necessary (Abele & Reinhart, 2011).

These trends can only be countered by new learning approaches that contribute to the development of staff's competencies. It is beginning to show that the association with competencies of employees from all hierarchical levels is a key success factor for production engineering (Abele et. al., 2010). Often, the lack of staff's competencies complicates the implementation of sustainable productions that are able to react to unknown future developments.

In addition to a high knowledge degree, companies expect their employees therefore to utilize their knowledge but also to operationalize this knowledge in unimaginable situations (competency). Therefore, production-related academic education as well as advanced training requires new approaches that allow future and actual employees to act independently in real problem situations. The Learning Factory CiP (Center for industrial Productivity) maintained by the PTW at the TU Darmstadt could be considered as such an action-oriented learning approach. In the following, a scientific discourse on learning factories is documented. Additionally, an empirical test approach aiming at assessing action-oriented learning in the Learning Factory CiP and the discussion of the results are presented.

State of the art: competency development in manufacturing

Developing competencies for manufacturing engineering

Around the world, engineering education predominantly takes place in universities. In the wake of the European 'Bologna Process' first steps to competency-based studying have been initiated, but as yet it still has to be assumed that engineering study courses remain relatively science-oriented and highly abstract. This equally refers to contents as well as methods (Tenberg, 2011). The situation in the highly application-oriented German vocational training proves to be very different, as curricula with a consistent competency-orientation have been implemented. Here, educational objectives have been worded not in a knowledge-oriented but in an action-oriented manner.

Competency orientation

Erpenbeck and Rosenstiel (2007, p. XIX) define competencies briefly as "dispositions to act independently" and in doing so refer to the linguistic approach of Chomsky (1962) and the psychological approach of White (1959). They are seen as context-specific cognitive dispositions that enable individual independent actions and are due considerably to knowledge (Klieme & Leutner, 2006; Weinert, 2001). The single action is referred to as 'performance' (Chomsky, 1962) and emphasizes the difference between what enables, presupposes and determines independent actions and the virtual action. This means that a single action cannot uncover all the underlying competencies. Several independent actions in a variety of situations are required (Tenberg, 2011). Erpenbeck and Rosenstiel's (2007) approach distinguishes between two competency-classes and four competency-categories: Competency-classes describe two typical kinds of problem solving competencies which can be acquired by executing either 'gradient strategies' or 'evolutionary strategies'. Gradient strategies, on the one hand, follow an algorithmic approach, evolutionary strategies, on the other hand, predominantly follow a heuristic approach. In daily work characterized by a small variety of working situations gradient strategies are applied. If different problem contexts or complex or new demanding situations occur usually evolutionary strategies are executed (Tenberg, 2011). Competency-categories describe four particular but systemic-linked competencies: personal, activity- and application-oriented, specialist and methodological, social-communicative (Erpenbeck & Rosenstiel, 2007).

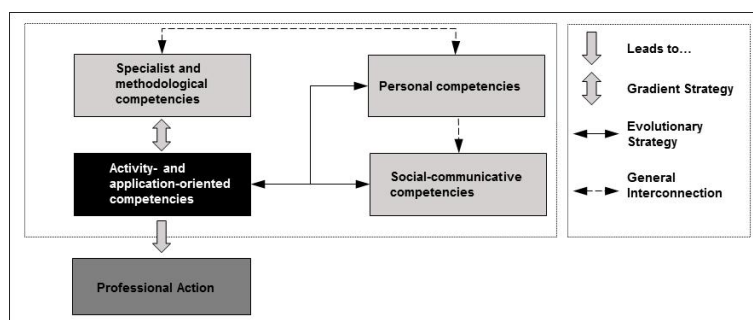
In linking the gradient and evolutionary strategies with the four key competencies defined by E&R the competency model by Tenberg is derived (Figure 1). In order to perform successfully in unknown constellations (competencies) companies expect their employees to be able to apply certain knowledge (qualification). Thus, the key to competency development is the ability to master knowledge; this comprises cognition and comprehension of knowledge.


Figure 12. Competency model by Tenberg (on the basis of Tenberg, 2011)

Action-substantiating and action-independent knowledge

Due to their ambiguity and terminological fuzziness Tenberg (2011) published a theory about the relationship between competencies and knowledge avoiding the hitherto used terms of declarative knowledge and procedural knowledge. He restricted his basic model to three knowledge concepts: technical knowledge, process knowledge and conceptual knowledge.

In order to obtain flexibility of action, conceptual knowledge is needed in addition to technical and process knowledge. Conceptual knowledge can be subdivided into two distinct categories: 'action-substantiating knowledge' and an 'action-independent knowledge base'. Action-substantiating knowledge is generally required for the understanding of entities and their handling. Without this kind of knowledge, factors would unthinkingly be taken for granted and actions would be regarded as unalterable and definite. The understanding of knowledge is a central feature of expertise (Tenberg, 2011).

According to Ebner, Oertel and Schumm (2001), it is neither required nor possible to distinguish definitely between technical and process knowledge. So, in this model, it can be summarized as professional knowledge. Conceptual knowledge is linked with technical and process knowledge since it represents the referential background of each knowledge type. Solely, a person with conceptual knowledge has insight into the underlying causal coherences that can be made available in problem solving situations (Pittich, 2011). Not the more but the higher value (meaning action-relevant) conceptual knowledge enables the individual to determine a changed context adequately and to vary familiar actions in a reasonable way.

Theory of action-oriented learning

Academia and industry concur that by means of vocational education and competency development in universities comprehensive job-related competencies and thereby a capacity to act in terms of planning, implementing and evaluating must be generated (Dehnbostel, 2003). Action-oriented learning is a prerequisite for obtaining such a professional competency as it is always tied to specific working situations.

Therefore, an action-oriented learning process must be designed in a way that self-organizing competencies can be developed enabling learners to act independently, focused and performance-oriented. This means that students have to configure their own learning processes by handling complex problem statements as complete tasks. During these tasks they deliver independent judgments and make own decisions, thus, stimulating responsible actions. Teachers should stay in the background and rather assume a moderating role.

The teaching and learning settings must be modeled as closely as possible to the actual working context and process (Bader, 2003). Naturally, these must have to have a high degree of realism and clarity. Typical supporting media are computer simulations and role play, but also multimedia applications such as virtual reality (Weidenmann, 1993). However, this approach has not been pursued extensively at university level in the German engineering education. Although, in the meantime so-called learning factories have been used in this context.

Learning Factories as an approach for developing competencies

In research literature various definitions are provided for learning factories (Barton & Delbridge 2001; Pullin, 2009; Roth, Marucheck, Kemp, & Trimble, 1994, Siqueira, Barbarán & Becerra, 2008; Tian, 2011).

Usually, these approaches are to be found in the field of software development and are regarded as learning factories in German-speaking areas: an industrial environment that simulates realistic production processes while enabling practical training in various topics and at various professional levels. However, in terms of the product

to be manufactured as well as the equipment- and organization-related environment a lot more objective approaches are required in production engineering. Therefore, modern learning factories represent one or more complete complex production lines in which far-reaching interventions into the manufacturing, assembly and logistics processes are possible for the trainees. However, as opposed to real production sites these interventions can be undertaken risk-free and without cost pressure (Cachay & Abele, 2012). As of today, mainly automobile-OEM operate learning factories in this sense (Reiner, 2009).

Furthermore, in the past learning factories have been established in varying extent, under different learning contexts (e.g. lean manufacturing, process optimization, energy efficiency) and with differing target groups (e.g. students, skilled workers, managers) at research institutions throughout German-speaking countries (Abele & Cachay, 2011). For a comparative investigation on existing learning Factories see Wagner (2012). A pioneer in this field is the existing Process Learning Factory CiP at the TU Darmstadt, inaugurated in 2007 (Lehm, 2011).

Research aim and methodology

Research aim

The study's research aim is to determine whether the action-oriented Learning Factory approach has advantages over conventional teaching methods. It is assumed that the Learning Factory as a teaching and learning approach enables manufacturing engineering students to cope better with real problem situations and to successfully apply learnt techniques. Consequently, it has to be reviewed by how much the Learning Factory approach exceeds the conveying potential of a conventional (not action-orientated) lecture. Thereby it has to be differed between the acting capacity of the learner and the corresponding knowledge. This means that the corresponding knowledge as well as the students' capacity of acting in practical problem statements have to be determined. The research hypothesis is: Students have a greater application-performance and a higher degree of action-substantiating knowledge after having attended an action-oriented learning event within the Learning Factory than after receiving a conventional treatment.

Study design and structure

The experiment is based on methods of empirical social research with partially open proportions of non-participatory observation. This study design allows the testing of prefabricated hypotheses and the explorative exposure of structures in the research field itself at the same time. The study can be assigned to the field of real experimental designs and therefore offers a structured research field that allows comparisons between different cohorts as well as comparisons between investigative and comparison groups (Schnell, Hill, & Esser, 2008).

In order to verify the effectiveness of the action-learning approach in the Learning Factory in comparison to conventional learning methods two randomly composed groups of probands receive two different types of treatments dealing with the analysis of production processes. During the first day of the study the comparison group consisting of 9 students receives a conventional tuition. On the second day the 16 students accumulating the investigative group are trained by means of the new action-learning approach developed in the Learning Factory.

To begin with, both groups are subjected to take a short preliminary test in order to determine their initial knowledge level on lean production in general and process analysis at the start of the study. The questions aim at addressing the probands' expertise and thematic comprehension. These tests are important in order to pinpoint the exact individual learning progress effected by the respective treatments. For this purpose, the students are asked to give certain information concerning their person so that individuals can be traced throughout the study (control variables).

Following the preliminary tests, both groups are provided with the same theoretical knowledge concerning their task of analyzing a production process. During these circa 30 minutes of lecture the most important facts about process analysis (PA) and lean production in general are illustrated such as signification, purpose and procedure of PA. In the following 60 minutes the comparison group and the investigative group receive their respective treatments. The comparison group is instructed in form of a conventional teaching tuition in accordance with Schelten (2005).

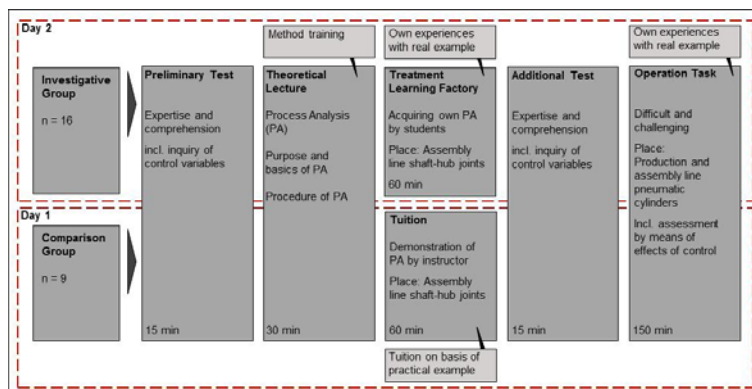
The lean method of process analysis is thus demonstrated to the probands on the basis of an example. In this case, the process example is the assembly of a simple shaft-hub joint. The complete lack of action-oriented learning methods is characteristic for this kind of treatment. Tuitions as a learning form have great resemblance with conventional learning methods at university.


Figure 13. Overview over study on action-oriented learning in the Learning Factory CiP

The investigative group, on the other hand, is trained by an action-learning approach in the immediate vicinity of the Learning Factory. In the same 60 minutes these probands, divided into three groups, are able to experience the procedure of process analysis on the real shaft-hub joint example. They are allowed to make mistakes and experience the consequences. Very importantly, the supervisors accompanying the study do not interfere in the treatment enabling the probands to make their own experiences.

After their particular treatments the probands of both groups are asked to take a second additional test with the exact same questions as in the preliminary test. By comparing the control variables the individual answers can be associated with the answers given in the first exam. But in order to really be able to evaluate the learning progress it is not sufficient to only test the accessory knowledge gained throughout the learning treatment. The action-learning approach additionally addresses comprehension and the ability to actually apply the learning content in a real problem situation.

Thus, as a last test both groups are asked to solve the same more realistic and more challenging task (operations task). The investigative group is divided into three groups, the comparison group into two groups. The corresponding processes are real assembly processes extracted from the assembly of pneumatic cylinders in the Learning Factory CiP. The degree of complexity is very high making the process analysis more complicated as in the shaft-hub joint example. Supervisors accompanying the groups during the period of 150 minutes qualitatively assess the probands' courses of action, their behavior and the results with the help of previously determined effects of control.

At the end of the study short interviews are conducted with the probands. The objective of these interviews is to find out how the probands have experienced their respective treatment and what suggestions for improvement they may have. The idea is to get an overall judgment of the learning approach.

Surveying method

Control variables

During the preliminary and additional tests variables of control are imposed. This has two major reasons: On the one hand, for the study to be valid it is important that the investigative and comparison groups are similar. This can be ascertained by imposed variables of control (personal information on the probands). It is important that overall all probands of both groups have had similar life experiences and have similar previous knowledge rates. On the other hand, in order to make a statement on the learning progress of every individual it is important to impose certain personal information so as to be able to keep trace of the probands throughout the study. This is not problematic as all results are kept anonymous.

Comprehension tests

13 questions are posed in the tests, 8 of which address theoretical knowledge. The remaining 5 questions can only be answered if the probands have the respective comprehensive knowledge. The goal is to see how much of the learning contents the students have really understood. Table 1 lists these 13 questions.

Table 3. Overview over theoretical and comprehensive questions in preliminary and additional tests

Theoretical Questions	Comprehensive Questions
What are the goals of Lean Production?	Why is a one-piece-flow production organization desirable?
What are the different types of waste in Lean Production?	Name the reasons why production figures alone do not suffice to judge an actual production state?
What are the steps of a process analysis?	Why is the customer takt time important?
How can the customer takt time be calculated?	For what is an A3-sheet used in the context of Lean Production?
What is meant by a cycle time?	What obstacles may arise in the procedure of process optimization?
What does the acronym PDCA mean?	
Name the steps involved in process improvement in Lean Production.	
What points are listed in an A3-sheet?	

Between 1 and 5 points are awarded depending on the amount of correct answers per question. If no answer or no correct answer is given 1 point is awarded. 2 points correspond with 'predominantly wrong', 3 points with 'partly correct', 4 points with 'predominantly correct' and 5 points with 'correct'. By using this scheme it is possible to evaluate the two tests within the scope of the study. Every proband achieves a certain score in the preliminary test and naturally a better score in the additional test. By comparing these two scores of all probands the respective learning progress of the investigative and the comparison group in respect of gained expertise can be accounted for.

Criteria of effect control

In the context of the operations task the groups are asked to carry out a process analysis on a complex assembly process. By observing their activities a qualitative assessment is possible. The five steps of the process analysis to be undertaken by the probands are:

- Determination of customer requirements such as customer takt time.
- Plotting of process steps: the assembly process consists of several executions known as process steps.
- Recording of inventory: all stocks directly related to the process are to be identified.
- Recording of information and material flow: material and information movements help understand the process.
- Recording of process data: the most important data is in this case the cycle time – the time necessary for assembling one workpiece.

Having a chronologic order, the evaluation sheet orientates on the respective steps of the process analysis. But also comprehensive effects of control can be found aiming at describing the overall behavior and achievements of the probands. Within the scope of this study it is notably important to evaluate the problem solving manner and the more or less structured modus operandi of the two groups.

In order to facilitate and standardize the qualitative assessment several effects of control are defined. Only by these means it is possible to characterize the probands' learning progress in terms of comprehension and applicability of learning contents. The effects of control constituting the evaluation sheet orientate on the steps of the PA:

1. Customer requirements have been determined (completely, partially, not at all): The groups are provided with information from which the customer requirements are to be derived. Main focus is on the customer takt time assuming the time in seconds that a customer demands a product.
2. Process steps have been plotted (completely, partially, not at all): In order to fully understand the process the proband has to analyze every process step. Every step has to be plotted visually to facilitate the exposure of optimization potential.
3. Inventories, material and information flows have been recorded (completely, partially, not at all): Before the actual analysis of the process can take place the process has to be described as a whole.
4. Process data, especially cycle times, have been recorded (completely, partially, not at all): A production process cannot be fully described without production figures. The most important figure is the cycle time. In this stage of the PA the probands have to use a stop watch and stop the times of several assembly cycles.
5. Realized analysis has been evaluated (completely, partially, not at all): The groups must show their ability to evaluate their hitherto work. Whether they have completely understood the process with all its strengths and weaknesses will show during the evaluation process of criterion 5.
6. Process analysis has been presented to and discussed with the group (completely, partially, not at all): In presenting and discussing their results the groups show their team working skills.
7. Further comments: This criterion enables the supervisors to mark any further points of interest that effect the evaluation of the probands in their respective groups. Mostly, comments on teamwork, general behavior and conduct, structured course of action as well as results are stated here.

Results

Study quality and validity

An important factor concerning the validity of a laboratory study is the composition of the two groups being analyzed. In this case, the probands of both groups should have an identical initial knowledge rate concerning the topic 'Lean Production'. As Table 2 shows, both groups are virtually identical in reference to the surveyed variables of control. Both control samples are large enough to enable a scientific predication. The average age and the female quotient are similar between the groups. The female quotient is a bit lower than the male quotient as the TU Darmstadt is a technical university and the female quotient is thus traditionally lower. All probands are students of either mechanical or industrial engineering having no vocational precognition. As both groups have similar average grades and consider themselves rather uninformed about lean production it can be expected that all probands have similar engineering skills. In summary, it can be determined that the investigative and the comparison groups are sufficiently similar and thus the validity of the study can be ascertained.

Results of the preliminary and additional tests

Tables 3, 4 and 5 show the results of the two tests conducted during the study. The preliminary test took place first thus giving an impression of every probands' degree of initial knowledge at the beginning of the study. The results show that the probands all have an identical initial situation. The comparison group was able to answer 32,0%, the investigative group 29,2% of the questions correctly. Concerning the knowledge and comprehension questions the allocation was similar.

Table 4. Composition of investigative and comparison groups (none = 1; middle = 2; high = 3).

Attribute	Investigative group	Comparison group
Number of	16	9
Average age	22,8	22,2
Share of womankind	31%	22%
Course of studies	engineer, industrial engineer	engineer, industrial engineer
Grade point average	2,0	2,1
Work experience	0	0
Assess their own knowledge	1,4	1,6

Table 5. Results of overall analysis.

Total analysis				
Comparison group				
Pretest	Posttest	Absolute increase	Relative increase	Absolute difference
32,0%	56,8%	24,8%	77,5%	
Investigative group				24,8%
Pretest	Posttest			
29,2%	59,1%	29,9%	102,3%	

Table 6. Results of the analysis on the action-independent knowledge.

Analysis of the action-independent knowledge				
Comparison group				
Pretest	Posttest	Absolute increase	Relative increase	Absolute difference
31,1%	54,7%	23,6%	75,9%	
Investigative group				27,5%
Pretest	Posttest			
28,0%	56,9%	28,9%	103,4%	

Table 7. Results of the analysis on the action-substantiating knowledge.

Analysis of the action-substantiating knowledge				
Comparison group				
Pretest	Posttest	Absolute increase	Relative increase	Absolute difference
33,3%	51,1%	17,8%	53,3%	
Investigative group				47,5%
Pretest	Posttest			
31,3%	62,8%	31,5%	100,8%	

The results concerning the additional test which occurred after the respective treatments show that the probands did have different learning progresses. Overall, the comparison group was able to ameliorate their score by 77,5% up to 56,8%. The investigative group on the other hand was able to more than double their score (+ 102,3%) reaching a score of 59,1%. In total, the results of the investigative group improved by 24,8%-points in comparison to the comparison group.

Although the investigative group did better concerning the knowledge questions (absolute increase to the amount of 28,9% versus 23,6%) their main gain versus the comparison group can be explained by the performance concerning the comprehension questions. The absolute increase was almost double as the investigative group relished an absolute increase to the amount of 31,5% versus 17,8%. The results of the investigative group improved by 47,5%-points in comparison to the comparison group.

Evaluation of the operations task

Overall, the emphasis of the evaluation of the operations task lies on two basic declarations. Firstly, the study allows comments on the effectiveness of the learning method 'Learning Factory' compared to traditional learning methods such as tuitions. The results of the comparison group can be compared directly with the results of the investigative group. Table 6 shows the different results of the two groups (the investigative group consisted of three smaller groups working on three assembly places, the comparison group was divided into two groups working on two respective assembly places) in respect to overall behavior, structured course of action and outcomes as described in the mentioned criteria catalog.

Table 8. Results of the operations task maintained by investigative and comparison groups

Criterion	Investigative Group	Comparison Group
Plotting of process steps	Plotting occurs successfully and completely – few minor questions	Plotting occurs merely partially – significant need of inquiries: Neither the process steps nor the symbolism seem to have been understood.
Recording of inventories, material and information flows	One group: complete recording, no problems. The two other groups forgot to inscribe the names and amount of stock in their plots.	No recording of the information flow. Partial recording of the material flow in one group. Inventories are locally determined but only partially quantified.
Recording of process data	Complete recording in all groups	Cycle times have been recorded completely. Although no coordination or division of work distinguishable: Some probands are actually already working on subsequent steps.
Evaluation of realized process analysis (PA)	One group successfully and completely evaluates the analysis independently. The other two groups manage after a short inquiry about the next steps in the PA. Nonetheless, peaks in the cycle times are not in the center of interest, their causes are not investigated.	Realized analysis is only partially evaluated. Oscillations in the recorded cycle times are noticed, but the existence of different product variants is not recognized (no reflection). There is confusion and disorientation regarding the further course of action.
Presentation of process analysis	The PA is presented only in part because the evaluation results of the analysis are not used.	The PA is presented in part and only after repeated prompting. The evaluation results of the cycle times are not of key interest.
Further comments	Duration in one group: 10 minutes. Duration in the other two groups: less than 30 minutes	Instead of commencing with the PA the groups start optimizing the process without further reflection (not part of the task!). Duration: ca. 60 minutes

Interpretation of the results

All in all, both groups entered the study having an identical background and knowledge rate. Thus, it is not surprising that the results in the preliminary test differ merely by 3% (29,2% versus 32,0%). As expected, both groups were able to increase their knowledge and comprehension levels significantly after their respective treatments. But the investigative group's learning progress was significantly better than in the comparison group. The degree of amelioration in the investigative group is with 102,3% much stronger than the comparison group's 77,5%. As the learning progress remains similar on the knowledge basis the investigative group did much better

in answering the comprehension questions (100,8% versus 53,3%). It is evident that the action-learning treatment in the Learning Factory CiP in contrast to the conventional treatment by tuition had a much greater impact on the investigative group's comprehension skills. Certainly, these conclusions still have to be acknowledged by a longitudinal study with statistical significance. Anyhow, the interpretation of the operations task's results affirms this conclusion as two basic theories can be upheld:

In the operations task the investigative group performed better than the comparison group.

The investigative group's learning progress was exceptional.

The investigative group did very well during the operations task showing a structured approach along the 5 steps of the process analysis. There were only minor points of criticism to be addressed and there was practically no need for supervisors to interfere. The comparison group, on the other hand, was only able to solve the task partially and many supervisor interferences were necessary to put them back on the right track. Neither the steps of the process analysis nor the symbolism seem to have been understood. A structured approach along the steps of the process analysis was not to be observed. The needed times for solving the task make this point very clear. One group amidst the investigative group required 10 minutes, the other two groups circa 30 minutes. The comparison group needed circa 60 minutes relying on considerable assistance from the supervisors along the way.

The investigative group's learning progress could be nicely observed by comparing their performance during the treatment with their performance in the operations task. As they were allowed to make mistakes and experience the consequences during their action-learning treatment they understood well why it is best to follow the steps of the process analysis in a very structured manner. The same mistakes were not repeated in the operations task.

These interpretations were underlined by the probands' statements made during the interviews conducted at the end of the study. The probands were asked to comment on four main topics: Reflection on the own learning progress, course structure, practical orientation and hints on how to deal with the learning approach. Table 7 shows some of the answers given by the students.

It is interesting that even the probands recognize that their learning progress augments when they themselves are allowed to try and solve the problem statement hands-on. Quite often during the study the probands of both groups spoke of light bulb moments when working hands-on. The results of the interviews allow several conclusions:

- Both the comparison and investigative groups expressed positive opinions towards the Learning Factory concept. Especially, the action-oriented learning approach with hands-on activities and the predominant practical orientation are emphasized.
- The proposals made by the comparison group concerning the course structure resemble the actual investigative group's Learning Factory treatment. Practical exercises would have been better than the tuition.
- Both groups rated the operations task as very positive. Although, one should keep in mind that the comparison group perceived the operations task as part of the training and not as it was intended as a test.

Table 9. Selected quotes from the interviews with the probands.

Investigative Group	Comparison Group
Reflection on own learning progress:	Reflection on own learning progress:
"Not until the first practical example I understood how important it is to comply with the order of the analysis process and how important a structured approach is for success."	"After the tuition I hadn't understood what the process analysis is about. This only became clear to me after having the opportunity to perform the task by myself. Only then did I understand what difficulties can arise in the course of the application."
Course structure:	Course structure:
"The mixture of theory and practice was very well-balanced." "The sequence from simple to complex examples made it very easy to understand the problem statement."	I liked the practical examples in the lecture." "Instead of a tuition the training should have been like the operations task."
Practical orientation:	Practical orientation:
"I thought that the practical orientation was great. I could really imagine how this problem statement can occur in real life."	"I found the tuition quite abstract. Therefore, I was happy to work on the realistic assembly working places during the operations task."
Hints on how to deal with the learning approach:	Hints on how to deal with the learning approach:
"You should provide this training for all students. The training principle should be adopted by other university departments."	"At the end of the operations task a best practice solution should be presented or handed out."

Conclusion

In this paper, a study is presented with the goal of verifying a certain hypothesis that students have a greater application-performance and a higher degree of action-substantiating knowledge after having attended an action-oriented learning event within the Learning Factory than after receiving a conventional treatment. At this, a comparison and an investigative group of probands received different treatments, subsequently having to solve an identical operations task independently. The former group was instructed by means of tuition, the latter group attended an action-oriented training in the Learning factory. Within the limits of the study, the hypothesis has been verified and confirmed comprehensively.

The results indicate that participants of action-oriented trainings in the Learning Factory have significant advantages over participants attending traditional schooling. This is the case because the former are much more capable of grasping problems and validating as well as implementing solution hypotheses so as to improve and stabilize the status quo of a production line. Without a doubt, it can be noted that the investigative group showed a better performance than the comparison group in the operations task. Moreover, the investigative group's learning progress was exceptional.

Due to practical implementation reasons the conducted experiment reverts to a relatively small cohort (n <20). Therefore, the generality of the results cannot be ascertained, however the results can be regarded as a first indication of the validity of the underlying basic assumptions.

In order to confirm these results, further identical studies are currently being carried out with different cohorts. In order to allow both regression analysis and variance explanations cross-sectional and longitudinal studies with cohorts larger than 150 probands will be conducted. The goal is not only to generally confirm the effectiveness of the approach but also to differentiate the causes and control variables contained in the studies.

TARIH VE SOSYAL BILGILER ÖĞRETMENLERI MÜZE VE TARIHI MEKÂNLARDAN EĞITIMDE NASIL YARARLANABILIR? MODEL BIR PROJE

Yrd. Doç. Dr. Hasan IŞIK[73]

Yıldırım Beyazıt Üniversitesi İnsan ve Toplum Bilimleri Fakiltesi Tarih Bölümü, Ankara,06110, Türkiye.

Özet

Çalışmanın amacı müze ve tarihi mekânların bir eğitim mekanı olarak, öğretmen eğitiminde kullanılmasının önemini vurgulamaktır. Günümüz eğitim anlayışı bağlamında müze ve tarihi mekânlardan eğitimde yararlanılmasına yönelik oluşturulacak bir modelin, öğretmen eğitiminde kullanılmasının yararlı olacağı kuşkusuzdur. Bu çerçevede ortaya konulan bir eğitim modeli, proje olarak uygulanmıştır. Söz konusu proje, Türkiye'de TÜBİTAK* tarafından desteklenen alanındaki ilk proje olma önemine haizdir. Bu çalışmada, projede kullanılan içeriğe yer verilmiş, bunun yanında çalışma süresince öğretmenlerden elde edilen gözlemler ve veriler yorumlanmıştır. Böylece bu eğitim modelinin öğretmenlere katkısı ortaya konulmaya çalışılmıştır. Araştırmada hem nicel, hem nitel veri toplama yöntemlerinden yararlanılmıştır. Uygulanan ölçekler sonucunda verilen eğitimin öğretmenlere dikkate değer bir ölçüde olumlu katkısı olduğu tespit edilmiştir. Elde edilen sonuçların ileride konuyla ilgili uygulanacak benzer içerikteki hizmetiçi eğitim programlarının başarılı olmasına katkıda bulunacağı düşünülmektedir.

Anahtar Kelimeler: sosyal bilgiler; tarih; müze; tarihi mekan; eğitim.

How Can History and Social Studies Teachers Benefit From Museums and Historical Places in Education? A Model Project

Assistant Professor Hasan IŞIK

Yıldırım Beyazıt University, Faculty of Humanities and Social Sciences, Department of History, Ankara,06110, Turkey.

Abstract

The objective of this study is to emphasize the importance of using museums and historical places as a place of education in teacher education. It is surely beyond doubt that using in teacher education a model to be created for the purpose of benefiting from museums and historical places in education in the context of today's sense of education shall be useful. An education model introduced within this framework was implemented as a project. The project in question is important in terms of being the first project in its field supported by TÜBİTAK* in Turkey. In this study, the content used in the project is given and, in addition, the observations and data obtained

from teachers during the study are interpreted. Thus, the contribution of this education model to teachers is revealed. Both quantitative and qualitative data collection methods were employed in the research. As a result of the scales applied, it was ascertained that the education offered made a considerable positive contribution to teachers. It is thought that the results obtained shall contribute to the success of inservice training programs that will be implemented in relation to this matter and have a similar content.

Giriş

Farklı amaçlar için kullanılabilecek olan müze ve tarihi mekânlar, eğitim ve öğretim sürecinin etkinleştirilmesi ve zenginleştirilmesi açısından çok önemli bir konuma sahiptir (Tosun, 2009:1). Müze ve tarihi mekânlardan yararlanılarak yapılan eğitim, okuldaki eğitimi zenginleştirici, destekleyici ve tamamlayıcı bir potansiyele sahiptir. Müze eğitimi zihinsel kavrayış yanında empatik bağlar kurmayı, merak etmeyi, eleştirel bakmayı ve pratik beceriler kazanmayı da sağlayabilmektedir (Seidel ve Hudson, 1999:9). Okulda veya okul dışında yapılacak müze aktiviteleri, çocukların sorgulama özelliklerini, zihinlerini ve hislerini geliştirebilir (Hein, 2004:3; Murphey, 1970; Akt.; Buyurgan ve Mercin, 2005:91). Bir çok açıdan öğrencilere kazanım sağlayan müze ve tarihi mekânların eğitimde bir araç olarak yer alması önemli görülmektedir.

Bu bağlamda müze ve tarihi mekanlar ile yapılacak eğitim önemli görülmekte, çok yönlü öğrenmeye dayalı etkin katılımı içermesi gibi bir çok yönden bu mekânların eğitim ve öğretim etkinlikleri için araç olarak kullanılması önerilmektedir (Buyurgan ve Mercin, 2005:24; Çıldır; 2007:16; Tosun, 2009:45; Demircioğlu, 2010:75). Müze ve tarihi mekânla ilgili yapılacak eğitim çalışması öğrencilerin alternatif öğrenme yolları ile karşılaşma ve maddi kanıt ile aktif biçimde çalışma fırsatı da verir (Hooper - Greenhiil, 1999:175). Son zamanlarda eğitimde önemi vurgulanan, öğretim programların hazırlanmasında göz önünde bulundurulan aktif öğrenme yöntemleri açısından da bu mekanlardan yararlanılması kaçınılmazdır.

Müzeler, pasif öğretim yerine aktif öğretim yöntemlerini kullanabilmeyi sağlaması açısından eğitim için önemli bir kaynaktır (Abacı, 1996). Müzede geçmiş uygarlıklarda yaratılan eserlerle ve yaşam biçimleri ile ilişki kurma, sorgulama, yorumlama, oyun ya da canlandırma ile o anı yaşama, sınıfa göre aktif bir eğitim ortamı oluşturmaktadır (Maccario, 2002:276). Aynı şekilde müze ve tarihi mekanlar ile sınıf ortamında da yapılacak etkinliklerin öğrencileri aktif kılması, belli başlı düşünme becerilerinin geliştirilmesinin sağlanması açısında da önemli bir yeri vardır. Bu etkinlikler öğrenci merkezli çalışmalara da fırsat verebilir.

Dünyada kültürel ve tarihi varlıkların korunup sergilendiği müzeler, uzun yıllar boyunca çeşitli objelerin kısa notlar eşliğinde cam vitrinlerde sergilendiği sıkıcı mekânlar olarak algılanmıştı (Fairley, 1977; Akt; Aktekin, 2010:270). Müzelerin bu olumsuz imajı son yıllarda müzelerdeki eğitim bölümlerinin gelişmesi ve ileri sunum tekniklerinin kullanılmasıyla değişmeye başlamıştır (Buyurgan ve Mercin, 2005:24; Ata, 2010b:195). Bugün müzeler, gelişmiş birçok ülkede daha çok eğitim amaçlı yaygın eğitim kurumları gibi kullanılmaktadır (Buyurgan ve Mercin, 2005:9). Modern müzelerin çoğunda eğitimin amaçlandığı özel dershaneler ve atölyeler bulunmaktadır (Hooper-Greenhill, 1999:140; Şahan, 2005:489).

Müzeler geçen yüzyılın olduğu gibi, bilgi ve iletişim çağı olarak nitelenen yirmi birinci yüzyılın da en önemli eğitim alanlarından biri olmaya devam edecektir (Özsoy, 2003:15). Günümüzdeki eğitim sisteminde bireyde kalıcı öğrenmenin gerçekleşebilmesi için sözel ve sembolik ağırlıklı öğretimin yerini, görsel ve yaşantılara dayalı öğretim ve aktif öğrenme almıştır. Bunun yanında müze ve tarihi mekânlar, öğretmen merkezli öğretim yapma yerine, öğrenci merkezli ve daha zevkli bir öğretim yapma imkânını sağlarlar (Buyurgan ve Mercin, 2005:109; Tosun, 2009:45). Gün geçtikçe eğitimdeki önemi ve yeri artan bu mekanlardan gerektiği şekilde yararlanılması gerekmektedir. Bu konuda gerek öğretim programlarında gerekse öğretmen eğitimlerinde üzerinde durulmalı, yaşanan gelişmeler, yenilikler takip edilmelidir.

Tarih ve sosyal bilgiler dersleri öğretim programlarında yer alan konuların birçoğunu müze ve tarihi mekânlar ile ilişkilendirilerek işlenebilir. Bu nedenle öğrencilerin mümkün olduğunca sınıf içinde ve dışında bu

çalışmaları yapmasına fırsat verilmelidir. Böylece konular daha heyecan verici ve kalıcı kılınabilir. Bu nedenle de müze ve tarihi mekânların uygulama amaçlı yararlanılmasında bir araç ya da ortam olarak kullanılmalıdır. Bu konu hiç şüphesiz öğretmen yeterlikleri ile de yakından ilişkilidir. Öğretmenlerin müze ve tarihi mekânlarda ne tür öğretim yöntem, teknik ve etkinliklerinin kullanılabileceğini bilmeleri önemlidir.

Günümüzde geleneksel anlayışla yapılan müze ziyaretlerinde öğrenciler, fiziki olarak müzelerde bulunmakta ve izleyici olmaktan öteye gidememektedirler. Öğretmenlerin ziyaret esnasında kullanılabilecek yöntem ve teknikler hakkında yeterli bilgi sahibi olmaması, bu konuda eğitim alamaması bu durumun ortaya çıkmasındaki en önemli sebeplerin başında gelmektedir (Shabbar, 2001:69, Buyurgan ve Mercin, 2005:154; Demircioğlu, 2010:75). Öğrenciler ile müzeye gidilip, kapısından girilip, sadece düz anlatım yöntemi ile koridorlarından hızlı bir şekilde geçilip çıkılması beklentileri karşılamamaktadır. Çocukların dokunmaları, görmeleri, duymaları, çizmeleri, tartışmaları, sorgulamaları yani aktif katılımda bulunmaları gereklidir. Bu eğitim süreci hem eğlenceli, hem faydalı, hem de hoş bir şekilde çocukların öğrenimine, hayal güçlerini geliştirmeye yardım edecektir (Shabbar, 2001:69; Çıldır, 2007:20). Bu konuda çağdaş gelişmeler ile birçok etkinliğin, yaklaşımın bilinmesi ve uygulanmasının önemi büyüktür. Öğretmenlerin müze ve tarihi mekânlarda eğitim yapma konusunda programlar yapabilme, yapılabilecek öğretim teknik ve yöntemlerini kullanabilme yeterliliklerine sahip olmaları gerekmektedir.

2008 yılında Milli Eğitim Bakanlığı Talim ve Terbiye Kurulu Başkanlığı tarafından sosyal bilgiler öğretmenlerini de ilgilendiren "Müze ile Eğitim" başlıklı bir genelge yayınlanmıştır (TTKB, 2008). Bu genelgede müzelerin yanında tarihi mekânlara da vurgu yapılmaktadır. Konuyla ilgili kazanımlar, ilköğretimde birçok ders ile ilişkilendirilmiş fakat ağırlıklı olarak sosyal bilgiler öğretim programının kazanımları ile ilişkilendirme yapılmıştır (TTKB, 2008). Bu çerçevede sosyal bilgiler öğretmenlerinin müze ve tarihi mekanların eğitimde kullanılması ile ilgili yeterlilikleri, daha önce aldıkları eğitim gibi konular gündeme gelmiştir. Aynı şekilde ortaöğretim tarih derslerinin 2007 yılından sonra yenilenen öğretim programlarında müze ve tarihi mekânların eğitimde kullanılmasına yönelik direktiflere, kazanımlara ve etkinliklere yer verildiği görülmektedir (TTKB, 2007). Bu durum konuyla ilgili ülkemizde çağdaş yaklaşımların ışığında yapılması gereken çalışmaların önemini ve gerekliliğini ortaya çıkarmaktadır. Bugün çağdaş anlamda müze ve tarihi mekânlar ile eğitim konusunda; yaratıcı drama, tarihsel canlandırma, nesne inceleme, sanal müze gezileri, müze rehberi hazırlama, çalışma yaprakları, örnek kazı çalışması, okul müzelerinin inşa edilmesi, kültür yolu, müze-okul işbirliği gibi birçok konu öne çıkmaktadır.

Müze ve tarihi mekânların eğitimde kullanımının ve yeniden yapılandırılan sosyal bilgiler ve tarih dersleri öğretim programlarının dayandığı temeller, yaklaşımlar, öğrencilere kazandıracağı noktalar açısından önemi görülmelidir. Bu konularda istenilen amaca ulaşılmasında da sosyal bilgiler ve tarih öğretmenlerinin yeterliliklerinin geliştirilmesi göz ardı edilmemelidir.

2. Yöntem

Bu bölümde çalışmanın modeline, çalışma grubuna, müze ve tarihi mekânlar ile eğitim kapsamında geçekleştirilen etkinliklere, veri toplama araçlarına ve verilerin analizine yer verilmiştir.

2.1. Çalışmanın modeli:

Araştırmada hem nicel, hem nitel veri toplama yöntemlerinden yararlanılmıştır. Nicel veriler için "Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Tutum Ölçeği" ve "Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Öz-yeterlilik Ölçeği" nitel veriler için ise "Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Görüşme Formu" uygulanmıştır.

2.2. Çalışmanın grubu:

Çalışma gurubu, TÜBİTAK tarafından desteklenen 27 Haziran – 1 Temmuz 2011 tarihinde gerçekleştirilen "Sosyal Bilgiler ve Tarih Öğretmenlerine Yönelik Müze ve Tarihi Mekânlar ile Eğitim" başlıklı projeye katılan Aksaray ilinde görevli toplamda 25 tarih ve sosyal bilgiler öğretmeninden oluşmaktadır. Çalışma gurubu 10'u bayan, 15'i erkek; 11'i tarih, 14'ü de sosyal bilgiler öğretmeninden oluşmaktadır.

Projenin desteklenmeye uygun bulunmasının ardından Aksaray Milli Eğitim Müdürlüğü'ne resmi yolla başvuru yapılmış, ilgili projeye başvuru için afişler bütün ilköğretim ve ortaöğretim okullarına gönderilmiştir. Ayrıca Aksaray'da görevli bütün sosyal bilgiler ve tarih öğretmenlerinin e-posta adreslerine projenin duyurusu iletilmiş, katılmak isteyenlerin projenin web sitesi üzerinden başvuru formu doldurmaları gerektiği bildirilmiştir. Katılımcılar, online başvuru yapan 87 aday arasından seçilmiştir. Başvurular değerlendirilirken; hizmet süresi az olanlar, lisansüstü eğitim almış ya da almakta olanlar, proje konusu ile ilgili daha önce eğitim almamış olanlara öncelik verilmiştir.

2.3. Müze ve tarihi mekânlar ile eğitim projesi kapsamında gerçekleştirilen etkinlikler:

Projenin kapsamı, İlköğretim Sosyal Bilgiler Öğretim Programları ve Ortaöğretim Tarih Öğretim Programları kapsamında yeni yaklaşımlar da göz önüne alınarak hazırlanmıştır. Projede 5 adet uygulamaya yer verilmiştir. Bunlardan ilki bilgisayar laboratuarında, ikincisi bir kervansaray olan Sultanhanı'nda, üçüncüsü Acemhöyük Arkeolojik kazı alanında, dördüncüsü ise Aksaray Kültür evinde; sonuncusu da Aksaray Müzesi'nde yapılmıştır. "Müze ve Tarihî Mekânlar ile Eğitim" çerçevesinde; dünyada ve ülkemizdeki son gelişmelerin, yeni uygulama yaklaşımlarının, yeni eğitim tekniklerinin, bilgi iletişim tekniklerinin kullanılması ile ilgili teorik bilgiler sunulmuş ve daha sonra konular ile ilgili uygulamalı eğitimler yapılmıştır.

Projenin temel amacı öğretmenlerin müze ve tarihi mekânları eğitimde etkili kullanmalarına ve sınıf içinkide uygulamalarına katkıda bulunmaktır. Bu nedenle yapılan çalışmaların birçoğunun uygulamalı olmasına dikkat edilmiştir. Dersler teorik ve uygulamalı olarak iki aşamada planlanmış, teorik dersler de yapılacak uygulamalara hazırlık olarak tasarlanmıştır.

Müze ve tarihi mekânlarda yapılacak eğitimler ile ilgili çağdaş yaklaşımların kullanıldığı bu projede ilk gün; projenin amaç ve içeriğine ilişkin bilgi verilmiş, sosyal bilgiler ve tarih dersi öğretim programlarında müze ve tarihi mekânlar ile ilgili direktifler ve kazanımlar katılımcılarla paylaşılmıştır. Daha sonra "Okul Müzeleri İnşa Etmek" konulu ders teorik olarak devam etmiştir. Bu ders kapsamında daha çok okul müzeleri hazırlamak için öğretmenlerle örnekler üzerinden bilgi paylaşımında bulunulmuştur. İlk gün ayrıca drama uzmanı tarafından projenin üçüncü günü Aksaray Kültür Evi'nde yapılacak yaratıcı drama etkinliğinin hazırlığı için kursiyerlere ön bilgi verilmiş ve etkinlik gününün hazırlığı bağlamında kursiyerlere görev paylaşımı yapılmıştır. İlk günün son çalışması olarak da sanal müze, sanal alan uygulama örnekleri üzerinde durmuştur. Sanal müze ve sanal alan konusunda bilgisayar laboratuarında kursiyerler ile uygulamalı etkinlikler yapılmıştır. Sanal müze ve alan çalışmaları özellikle çeşitli nedenlerle öğrenciler tarafından ziyaret edilmesi mümkün olmayan mekânların ders ortamında etkin olarak kullanılması açısından oldukça önemlidir. Sanal Müze ve alan çalışmaları geniş bir sahayı kapsayan Türk tarihinin çeşitli dönemlerindeki eserlerin sosyal bilgiler ve tarih derslerinde kullanılması açısından yeni fırsatlar sunmaktadır. Örneğin dünyanın en önemli müzelerinin arasında yer alan Ermitaj gibi müzelerin sayfaları kullanılarak öğrencilerin konuları daha kolay kavramaları sağlanabilceği gibi yakından görme ihtimalleri çok düşük olan Türk tarihine ait eserleri de tanıma imkanına sahip olabileceklerdir. Ayrıca Google Earth gibi çeşitli programlar kullanılarak tarih ve sosyal bilgiler derslerinin mekândan soyutlanmış bir şekilde işlenmesinden kurtarmak mümkündür. Projede, öğretmenlerle bunlara yönelik çalışmalar yapılmış,

internet ve bilgisayara meraklı olan öğrencilerin bu ilgilerinin tarih derslerinde nasıl kullanılabileceğine ilişkin uygulamalara yer verilmiştir.

Etkinliğin ikinci gününde ise alan uzmanı tarafından, Avrupa ülkeleri, Amerika örnekleri üzerinden "Çağdaş Ülkelerde Müze ve Eğitim İlişkisi," konusunda paylaşımda bulunulmuş, yapılan örnek etkinliklerden bahsedilmiştir. İkinci gün öğleden sonra ise "Kervansaray Örneğinde Tarihi Coğrafya Uygulaması" için Sultanhanı Kervansarayı'nda uygulamalı bir eğitim yapılmıştır.

Etkinliğin üçüncü gününde de alan uzmanı ile uygulamalı olarak "Müzede Yaratıcı Drama" konusunda etkinlikler yapılmış, katılımcılar fiilen etkinliklerde rol almış, katılımcıların yaratıcı drama etkinlikleri üretmeleri ve sergilemeleri sağlanmıştır. Aynı günün öğleden sonrasında ise Arkeoloji uzmanı tarafından "Tarih ve Sosyal Bilgiler Öğretiminde Arkeolojik Alanların Yeri ve Önemi" konulu öncelikle sınıf ortamında teorik bir ders yapılmış ardından Aksaray Üniversitesi Eğitim Fakültesi'nin bahçesinde hazırlanan kum yığınının başında önceden gömülmüş bir vazo çeşitli araç gereç yardımı ve belli arkeolojik teknik ve yöntemler ile kursiyerler tarafından çıkarılmıştır. Bu etkinliğin ardından arkeolojik çalışma alanı olan Acemhöyük'e gidilmiş, Acemhöyük kazı başkanı tarafından kursiyerler bilgilendirilmiştir. Daha sonra alan uzmanı nezaretinde arkeolojik kazı alanı incelenmiş, nereden ne tür eserler çıkarıldığı, ne tür çalışma yapıldığı ile ilgili bilgi verilmiştir. Son olarak da alan uzmanının önceden hazırladığı dokümanlar kursiyerlere dağıtılarak, tarihi bir mekânda kursiyerlerin de katılımı ile etkinlikler yapılmıştır.

Projenin dördüncü gününde ise "Sorumluluk Bilincinin Geliştirilmesi Açısından Vakıflar " başlıklı teorik ders işlenmiş, "Sorumluluk Bilincinin Geliştirilmesi Açısından Vakıf Eserleri Örnekleri" başlığı altında örnek etkinlik çalışmasında bulunmuştur. Daha sonra sanat eğitimi alan uzmanı tarafından "Disiplinler arası Sanat Yaklaşımı ile Müzelerde Eğitim" başlıklı teorik derse geçilmiş böylece öğleden sonra yapılacak olan müze gezisi öncesi ön hazırlık yapılmıştır. Öğleden sonra Aksaray Müzesi'ne gidilmiş inceleme amacı ile müze görevlisi rehberliğinde müze gezilmiştir. Müzenin sergi salonunda bir çalışma ile kursiyerlerin müze önünde yapacakları kolaj (kesyap) çalışmasının hazırlığı yapılmıştır. Daha sonra müzenin önünde yer alan Roma dönemine ait bir kartal heykeli incelenmiş ve bu heykele dönük kursiyerlere kolaj çalışması yaptırılmıştır. Bunun yanında alan uzmanı tarafından müze girişinde "Tarihi Mekânı ve Kendini Algılama" başlıklı bir çalışma yapılmış son olarak da "Bir müze rehberi öğrencilere nasıl hazırlatılmalı?" başlıklı bir çalışmanın nasıl yapılması gerektiği konusunda kursiyerler bilgilendirilmiş ve bir gün sonrası için adı geçen çalışma ödev olarak verilmiştir.

Etkinliğin son gününde ilk olarak bir gün önce kursiyerlere ev ödevi olarak verilen"Bir müze rehberi öğrencilere nasıl hazırlatılmalı?" başlıklı kursiyerlerin çalışmaları incelenerek sınıf ortamında değerlendirilip, önerilerde bulunulmuştur. Bu değerlendirmenin ardından "Müze ve Tarihi Mekânlar ile Tarihsel Düşünme Becerileri Kazandırma" konulu ders işlenmiştir. Daha sonra "Müze ve Tarihi Mekânlarla ilgili Etkinlik Tasarlama" başlıklı konu çerçevesin de kursiyerlerinde katılımı ile etkinlik yapılmıştır. Son olarak "İnceleme Gezilerinde İzlenecek Yol" üzerinde durulmuş ve çalışma bitirilmiştir. Çalışmanın sonunda ise; kursiyerler proje süresince hazırladıkları çalışmaları bir sergi halinde sunmuşlardır. Sonuç olarak bu proje kapsamında; müze ve tarihi mekânların eğitimde kullanımı konusunda son gelişmelerin uygulamalı olarak alan öğretmenlerine aktarılmasına çalışılmıştır.

Proje kapsamında uygulamalı olarak yapılan etkinlikler hazırlanırken yapılandırmacı öğrenme yaklaşımının gerektirdiği ön koşul olan öğrenci merkezli öğretim tarzı benimsenmiş, katılımcılara eğitim uzmanları tarafından rehberlik yapılması ve aynı zamanda katılımcıların sürekli etkinliklerde aktif rol almasının sağlamasına önem verilmiştir.

2.4. Veri toplama araçları:

Araştırmada hem nicel, hem nitel veri toplama yöntemlerinden yararlanılmıştır. Araştırmanın nicel verilerinin bulguları için müze ve tarihi mekânlar ile eğitiminin katılımcılara etkisini ölçmek amacıyla 20

maddeden oluşan "Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Tutum Ölçeği" eğitimin ilk gününde ön-test, son gününde son-test olarak uygulanmıştır. Bunun yanında proje öncesi konuyla ilgili öğretmen yeterliliklerinin belirlenmesi; proje sonrasında ise verilen eğitim içeriğinin öğretmen yeterliliklerine etkisini belirlemek amacı ile 7 maddeden oluşan "Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Öz-yeterlilik Ölçeği" kullanılmıştır. Ayrıca öğretmen görüşlerinin alınması için 6 adet açık uçlu soru ifadesinden oluşan "Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Görüş Ölçeği" proje sonunda uygulanmıştır.

2.4.1. Müze ve tarihi mekânlar ile eğitime yönelik öğretmen tutum ölçeği:

Ata'nın (2002) "Tarih Öğretmenlerinin Müze Eğitimine İlişkin Görüşleri" ve Çıldır'ın (2007) "Öğretmenlerle Müzede Yetişkin Eğitimi" başlıklı çalışmalarında kullandıkları anket sorularından proje içeriği ile ilgili olan 25 madde seçilmiş, daha sonra bu maddeler araştırmacı tarafından geliştirilmiştir. 5 seçenekli Likert tipi olan ölçek, konu ile ilgili uzman görüşleri ve önerileri doğrultusunda gerekli düzenlemeler yapıldıktan sonra 20 maddeye indirilmiştir. Ölçek maddeleri güvenilirlik ve geçerliliğini tespit etmek için projeye katılmayan 30 tarih ve sosyal bilgiler öğretmenine uygulanmıştır. Uygulama sonucunda ölçeğe en uygun görülen maddeler uzman görüşü de alınarak seçilmiştir. 20 maddeden oluşan anket ön-test ve son-test olarak kullanılmıştır. Çalışma, ön-test son-test desenine uygun olarak yürütülmüştür. Ölçeğin katılımcılara uygulanması ile elde edilen Cronbach Alpha güvenilirlik katsayısı α=.91 olarak bulunmuştur.

2.4.2. Müze ve tarihi mekânlar ile eğitime yönelik öğretmen öz-yeterlilik ölçeği:

Proje öncesi ve sonrasında katılımcıların konu ile ilgili öz-yeterliliklerinin belirlenebilmesi amacı ile araştırmacı tarafından geliştirilen 7 maddeden oluşan "Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Öz-yeterlilik Ölçeği" uygulanmıştır.

Bireylerin bir işi başarıyla yapabilmelerinde etkili olan faktörlerden biri bireylerin o işi yapabilmeyle ilgili sahip oldukları öz-yeterlik düzeyleridir (Ekici, 2005: 85). Bandura (1997, Akt.; Ekici, 2005:85)'ya göre, öz-yeterlik kavramı, davranışların oluşmasında etkili olan bir nitelik ve bireyin, belli bir performansı göstermek için gerekli etkinlikleri organize edip, başarılı olarak yapma kapasitesi hakkında kendine ilişkin yargısıdır. Yapılan araştırmalar öz-yeterliği etkileyen faktörlerden birinin de deneyimler olduğunu, yeterlik algısının zaman içinde deneyimlere ve buna bağlı olarak becerilerin yavaş yavaş artması ile öz-yeterliğin geliştiğini göstermektedir (Bandura, 1986; Akt: Ekici, 2005: 86). Sonuç olarak bireylerin yaşadıkları olumlu yöndeki tecrübeleri onların öz-yeterliğinin de gelişmesini sağlamaktadır (Ekici, 2005: 85). Bu çerçevede yapılan projede katılımcıların öz yeterliliklerindeki gelişmelerin belirlenmesi amaçlanmıştır.

Araştırmada kullanılan ölçeğin ifadeleri, sosyal bilgiler ve tarih derslerinin öğretim programları incelenerek konu ile ilgili öğretmenlerden beklenen yeterlilik göz önüne alınarak hazırlanan ölçek 10 maddeden oluşmaktadır. Ölçekte öğretmenlere "müze ve tarihi mekânlar ile ilgili etkinliklerin gerçekleştirmede alana yönelik kendi yeterliliklerinizi nasıl değerlendiriyorsunuz?" sorusu yöneltilmiş ve bu soru altında ifadelere yer verilmiştir. Ölçeğin hazırlanması aşamasında iki farklı uzmanın görüşüne başvurulmuştur. Uzman incelemeleri sonunda son haline gelen görüşme sorularının ön denemesi için projeye katılmayan 10 öğretmen ile pilot görüşme gerçekleştirilmiştir. Pilot görüşmeler sonucunda elde edilen bilgiler, araştırma kapsamı dışında tutulmuştur. Pilot görüşmeler sonucunda elde edilen verilerin analizi yapılarak, uzman görüşü alındıktan sonra teste en uygun maddeler seçilerek ölçek 7 maddeye indirilmiştir. Ölçekte öğretmenlerin konu ile ilgili kendi yeterliliklerini karşılayan 7 ifadeden ilgili olanları işaretlemeleri istenmiştir. Bulgular öğretmenlerin verdikleri cevapların frekansları ile belirtilmiştir. Çalışma, ön-test son-test desenine uygun olarak yürütülmüştür. Ölçeğin elde edilen Cronbach Alpha güvenilirlik katsayısı α=.79 olarak bulunmuştur.

2.4.3. Müze ve tarihi mekânlar ile eğitime yönelik öğretmen görüşme formu:

Araştırmada kullanılan bir diğer veri toplama yöntemi ise görüşmedir. Araştırmanın nitel bulguları için katılımcıların aldıkları eğitime ilişkin görüşlerinin alınması için proje sonunda araştırmacı tarafından geliştirilen 6 maddelik açık uclu sorudan oluşan öğretmen görüşme formu uygulanmıştır. Görüşme formu, proje kapsamı ile ilgili literatür taraması (tez, makale, bildiri vs.) sonucunda araştırmacının kendisi tarafından hazırlanmıştır. Görüşme formunun oluşturulması aşamasında iki farklı uzmanın görüşüne başvurulmuş ve görüşme formunun projenin amaçlarına uygun olarak hazırlanmasına gayret edilmiştir. Uzman incelemeleri sonunda son haline gelen görüşme sorularının ön denemesi için projeye katılmayan 10 öğretmen ile pilot görüşme gerçekleştirilmiştir. Pilot görüşmeler sonucunda elde edilen bilgiler, araştırma kapsamı dışında tutulmuştur. Araştırmanın güvenirlik çalışması için alandan iki uzmana, öğretmenlerin görüşme dökümleri incelettirilmiştir. Gerekli düzeltmeler yapılarak görüşme formuna son şekli verilmiştir.

2.5. Verilerin analizi:

"Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Tutum Ölçeği" ön ve son test olarak uygulanarak değerlendirilmiştir. Bu ölçekten elde edilen verilerin istatistiksel analizinde SPSS 15.0 programı kullanılmıştır. Tutum ölçeği puanları hesaplanırken, cevaplara göre 5 (Tam katılıyorum) ile 1 (Hiç katılmıyorum) arasında değerler verilip her katılımcıya ait konuyla ilgili bir puan elde edilmiştir. Öğretmenlerin tutumunun projeye bağlı olarak anlamlı bir farklılık gösterip göstermediği bağımlı gruplar için t-testi ile analiz edilmiştir.

"Müze ve Tarihi Mekanlar ile Eğitime Yönelik Öğretmen Öz-yeterlilik Ölçeği" proje öncesinde ve sonrasında uygulanmıştır. ""Müze ve tarihi mekânlar ile ilgili etkinlikleri gerçekleştirmede alana yönelik kendi yeterliliklerinizi nasıl değerlendiriyorsunuz?" sorusuna yönelik 7 ifadeden hangilerini işaretledikleri incelenmiş, bulgular öğretmenlerin verdikleri cevapların frekansları ile belirtilmiştir.

"Müze ve Tarihi Mekânlar ile Eğitime Yönelik Öğretmen Görüşme Formu" ise proje sonunda kullanılmıştır. Elde edilen bulguların analizi öğretmenlerin görüşme formundaki sorulara yönelik verdikleri yanıtların incelenmesi, alıntılar yapılması ve yorumlanması şeklinde olmuştur. Bu tür bir yaklaşım nitel araştırmada "betimsel analiz" yaklaşımı olarak kabul edilmektedir.

3. Bulgular Ve Yorumlar

Bu bölümde, veri toplama araçları ile elde edilen bulgulara ve bulgulara ilişkin yorumlara yer verilmiştir. İlk olarak ön-test son-test puanları arasında istatistiksel olarak anlamlı bir farklılığın olup olmadığı test edilerek aşağıda sunulmuştur.

3.1. Katılımcıların müze ve tarihi mekânlar ile eğitim ön-test ve son-test puanlarının değerlendirilmesi

Tablo 1'den de anlaşılabileceği gibi, uygulanan 5 günlük "Müze ve Tarihi Mekânlar ile Eğitim" programına bağlı olarak, katılımcıların ön-test ($\overline{X}$=67.68) ve son-test puanları ($\overline{X}$=85.60) arasında, son-test puanları lehine, 17.92 puanlık bir fark oluşmuştur. Söz konusu fark, yapılan t-testi sonucunda istatistiksel olarak anlamlı bulunmuştur (t(24)=-7.418; p<0.001). Dolayısıyla, bu sonuçlara dayanarak, uygulanan "Müze ve Tarihi

Mekânlar ile Eğitim" programının bireylerin müze ve tarihi mekânlar ile eğitim konusundaki tutumlarına önemli ölçüde katkı sağladığını söylemek mümkündür.

Tablo 1. Katılımcıların Müze ve Tarihi Mekânlar İle Eğitim Ön-test ve Son-test Puanlarının Bağımlı Gruplar İçin t-testi İle Karşılaştırılması

Değişken		N	$\overline{X}$	SS	Sd	T	P
Müze ve Tarihi Mekanlar İle Eğitim Puanları	**Öntest**	25	67,68	9,370	24	-7,418	,000(*)
	Sontest	25	85,60	7,331			

*p<0.001

Müze ve tarihi mekânlar ile eğitime yönelik öğretmen tutum ölçeğinden elde edilen sonuçlar genel olarak değerlendirildiğinde, gerçekleştirilen 5 günlük "Müze ve Tarihi Mekânlar ile Eğitim" programının, katılımcıların hem müze ile eğitim hem de tarihi mekânlar ile eğitim konusundaki tutumuna önemli düzeyde katkı sağladığını söylemek mümkündür. Bu da program içeriğinin son derece etkili ve verimli olduğunu göstermektedir.

3.2. Katılımcıların müze ve tarihi mekânlar ile eğitim konusunda öz-yeterliliklerinin karşılaştırılması

Katılımcıların, müze ve tarihi mekanlar ile eğitim verme konusunda öz-yeterliliklerinin belirlenmesi amacıyla hazırlanmış olan " Müze ve tarihi mekânlar ile ilgili etkinlikleri gerçekleştirmede alana yönelik kendi yeterliliklerinizi nasıl değerlendiriyorsunuz?" sorusuna ilişkin yanıtlar ve frekans dağılımları Tablo 2'de verilmiştir. Proje öncesinde katılımcıların konuyla ilgili öz-yeterliliklerinin belirlenmesi; proje sonunda verilen eğitimin ve yaşanılan deneyimlerin katılımcıların öz-yeterliliklerine etkisinin karşılaştırması amacıyla uygulanan ölçeğin verileri aşağıda yer alan tablo 2'de sunulmuştur.

Tablo 2. Katılımcıların Müze ve Tarihi Mekânlar İle Eğitim Konusunda Öz-yeterliliklerinin Karşılaştırılması

Müze ve tarihi mekânlar ile ilgili etkinlikleri gerçekleştirmede alana yönelik kendi yeterliliklerinizi nasıl değerlendiriyorsunuz?	Uygulama öncesi (f)	Uygulama sonrası (f)
a. Öğretim programlarında konu ile ilgili kazanımları tam olarak yerine getirebilirim.	7	15
b.Konuyla ilgili yeterli olduğumu düşünmüyorum	14	4
c.Müzeler ve tarihi mekânlar ile ilgili sadece gezdiğim, gördüğüm kadarıyla bilgi sahibiyim.	15	7
d.Müze ve tarihi mekânları kullanarak farklı türde etkinlik yapma konusunda yeterli bilgiye sahip değilim .	14	4
e. Müze ve tarihi mekânlar ile eğitim yapmak için teknolojik araçlardan (Bilgisayar, internet vb.) nasıl yararlanacağı konusunda yeterli değilim.	20	9
f. Müze ve tarihi mekânların eğitimde kullanılmasına yönelik kılavuz kitap gibi ek bir kaynağa gereksinim duyuyorum	13	7
g. Müze ve tarihi mekanlar ile eğitim konusunda hizmet içi eğitim kursuna ihtiyaç duyuyorum.	23	6

Tablo 2'ye bakıldığında 5 gün süre ile özellikle uygulamalı olarak müze ve tarihi mekânlar ile ilgili verilen eğitimin katılımcıların öz-yeterliliklerine olumlu anlamda katkısı olduğu görülmektedir. Birinci maddede yer alan "Öğretim programlarında konu ile ilgili kazanımları tam olarak yerine getirebilirim" ifadesini eğitim öncesinde 7 katılımcı işaretler iken; verilen eğitimin sonucunda bu sayının 15 çıktığı görülmektedir. Bu artışın önemli olduğu değerlendirilebilir. Özellikle de son yıllarda sosyal bilgiler ve tarih öğretim programlarının yeniden yapılandırılması sonucunda müze ve tarihi mekânların eğitimde kullanılmasına önem verildiği görüldüğünde bu ifadede katılımcılarını öz-yeterliliklerinin arttığını düşünmeleri önemlidir. Öğretim programlarında konuyla ilgili olan kazanımlar; öğretmenlerden müze ve tarihi mekânları öğrencilere verdikleri eğitimde kullanmalarını istemektedir. Öğretim programlarında yer alan ilgili kazanımların öğrencilere kazandırılmasında hiç şüphesiz öğretmen yeterliliklerinin önemli bir yeri vardır. Bu nedenle proje kapsamında verilen eğitimin önemi bu açıdan da değerlendirilebilir.

Ölçeğin ikinci maddesinde yer alan "Konuyla ilgili yeterli olduğumu düşünmüyorum" maddesini 14 katılımcı işaretlerken bu sayının eğitim sonucunda 4'e düştüğü görülmektedir (Tablo 2). Bu maddedeki verinin azalması katılımcıların ilgili yeterliliklerine önemli ölçüde katkı sağlandığı sonucuna varılabilir.

Tablo 2'de yer alan üçüncü maddedeki "Müzeler ve tarihi mekanlar ile ilgili sadece gezdiğim, gördüğüm kadarıyla bilgi sahibiyim." ifadesini ise 15 katılımcının işaretlediği görülmektedir (Tablo 2). Bu ifadeden elde edilen veriler ikinci maddeden elde edilen verileri destekler nitelikte sonuçlar olduğu söylenebilir.

"Müze ve tarihi mekanları kullanarak, farklı türde etkinlik yapma konusunda yeterli bilgiye sahip değilim" ifadesini de 14 katılımcı işaretlerken bu sayının eğitim sonucunda 4'e düştüğü görülmektedir (Tablo 2). Elde edilen bu verinin ikinci madde ile elde edilen verilerle aynı olduğu dikkat çekmektedir. Kendisini konu ile ilgili yetersiz bulan katılımcı sayısı ile konuya yönelik farklı türde etkinlik yapma konusunda yetersiz bulan katılımcı sayısının aynı olduğu görülmüştür. Verilen eğitim sonucunda burada elde edilen sonuç olumlu olarak yorumlanabilir.

Tablo 2'de beşinci madde de yer alan "Müze ve tarihi mekânlar ile eğitim yapmak için teknolojik araçlardan (Bilgisayar, internet vb.) nasıl yararlanacağı konusunda yeterli değilim." ifadesini ise katılımcıların önemli bir oranının işaretlediği görülmüştür. Öğretim programlarında özellikle vurgulanan sanal müze ve sanal alan çalışması gibi konularda teknolojinin (internet, bilgisayar vb.) kullanılmasının gerekliliği göz önüne alındığında; katılımcıların çoğunun bu konuda kendilerini yetersiz görmeleri konuyla ilgili verilecek eğitimin önemini ortaya koymaktadır. Proje kapsamında katılımcılara sanal müze ve sanal alan hakkında teorik bilginin yanında, bilgisayar laboratuarında uygulamalı örnek etkinlikler yapılmış bu konuda katılımcıların önemli kazanımlar elde etmeleri sağlanmıştır.

"Müze ve tarihi mekânların eğitimde kullanılmasına yönelik kılavuz kitap gibi ek bir kaynağa gereksinim duyuyorum" ifadesini ise işaretleyen katılımcıların sayısının 13 olduğu belirlenmiştir. Hemen hemen katılımcıların yarısı konuyla ilgili yardımcı kitaplara gereksinim duyduklarını belirtmişlerdir. Bu sayı verilen eğitim sonunda ise 7 olarak belirlenmiştir. Öğretmenlerin, öğretim programlarını tatbik edebilmeleri için kaynak kitaplara ihtiyaç duyulduğunu da vurgulayabiliriz.

Ölçeğin son maddesinde yer alan "Müze ve tarihi mekânlar ile eğitim konusunda hizmet içi eğitim kursuna ihtiyaç duyuyorum." maddesine bakıldığında katılımcıların hemen hemen hepsinin (N=23) bu konudaki bir eğitime ihtiyaç duydukları sonucuna varılabilir. Bunun yanında verilen 5 günlük eğitime rağmen 5 katılımcının konuyla ilgili eğitime yine de ihtiyaç duyduğu da görülmektedir.

Tablo 2'ye genel olarak bakıldığında katılımcıların proje öncesi yeterlilikleri ile aldıkları eğitim sonucundaki yerelilikerinin farklı olduğu ve olumlu manada bir gelişme olduğu görülmektedir. Burada elde edilen verilerin, konu ile ilgili benzer içerikte bir eğitimin öğretmenlere hizmetiçi eğitim olarak verimesinin önemini ortaya koyduğu söylenebilir. Verilen eğitimin katılımcıların büyük bir kısmının kendilerini daha yeterli görmesinde olumlu olarak etki ettiği söylenebilir. Bunun yanında katılımcıların konuyla ilgili yardımcı kaynaklar ile desteklenmeleri gerektiği de görülmektedir.

3.3. Katılımcıların müze ve tarihi mekânlar ile eğitim konusunda görüşlerinin değerlendirilmesi

Müze ve tarihi mekânlar ile eğitim başlıklı proje kapsamında 6 açık uçlu sorudan oluşan bir son ölçek uygulanmıştır. Burada beş gün süren eğitim ile ilgili katılımcıların görüşlerine yer verilecektir. Elde edilen bulguların analizi katılımcıların görüşme formundaki sorulara yönelik verdikleri yanıtların incelenmesi, alıntılar yapılması ve yorumlanması şeklinde olmuştur. Katılımcıların formları sırası ile numaralanmış, katılımcıların isimleri kullanılmadan sıra numarası ile ifade edilmiştir. Bulgular ve yorumlar görüşme formunda yer alan soru maddelerinin sıralamasına göre aşağıda verilmiştir.

3.3.1. Görüşme formunda yer alan "öğretmen olarak derslerinizde bu çalışmadan önce müze ve tarihi mekânlardan yararlanıyor muydunuz? cevabınız 'hayır' ise nedeni ile birlikte yazınız? Bundan sonra yararlanmayı düşünüyor musunuz?" şeklindeki birinci soruya ilişkin görüşler aşağıda verilmektedir:

Katılımcıların birinci soruya verdikleri cevaplar incelediğinde; müze ve tarihi mekânlardan 18 katılımcının daha önce hiç yararlanmadığı, 4 katılımcının yararlandığı, 3 katılımcının ise kısmen yararlandığı görülmüştür. Yararlanmayan katılımcıların 6'sı bürokratik işlemlerden; 2 katılımcı fiziki şartlardan; 3 katılımcı bilgi birikiminin yetersizliğinden ve ilgisizliklerinden dolayı; 1 katılımcının ise müfredatın yoğunluğundan ve öğrencilerinin hazırlanmak zorunda olduğu SBS sınavından dolayı yararlanamadıklarını belirttikleri görülmüştür. Bunun yanında daha önceden yararlananların ise bu çalışmada gördükleri yöntem ve teknikleri kullanmadıklarını ve bundan sonraki uygulamalarında bu çalışmalardan da yararlanacaklarını belirttikleri görülmüştür. Katılımcılardan 1'i müze ve tarihi mekânlardan eğitim amaçlı yararlanmadığını şu ifadeler ile belirtmiştir; "En son lisedeyken sanat tarihi dersi gördüm, daha sonra konuyla ilgili hiçbir ders almadım (Katılımcı–21)." Buna göre katılımcının lisede sahip olduğu bilgilerle konu ile ilgili dersini yürütmeye çalıştığı söylenebilir. Bunun yanında bu soruya hayır cevabını veren kursiyerlerden birisi de ; "Çünkü bu konuda çok fazla benim öğrenciliğim zamanında bir şey yoktu. Tarih öğretmenliği bölümünde müzeler ve tarihi mekânlar ile ilgili bir konu dahi geçmedi (Katılımcı–24)." diyerek bu konuda bir eğitime sahip olmadığını belirtmiştir. Çalışmada eğitime katılan kursiyerlerin hepsi bir şekilde bu çalışmada gördükleri yöntem ve teknikleri kullanarak daha sonra müze ve tarihi mekânlardan yararlanacakları belirlenmiştir.

3.3.2. Görüşme formunda yer alan "Bu çalışmada beklentilerinize ne şekilde cevap buldunuz?" şeklindeki ikinci soruya ilişkin görüşler aşağıda verilmektedir:

Katılımcılara yöneltilen ikinci soru üzerine genel olarak; çalışmaya katılmadan önce çok fazla bir beklenti içinde olmadıklarını belirten katılımcılar; konuyla ilgili kendilerini yetersiz gördüklerini, daha önce konu ile ilgili her hangi bir eğitim almadıkları şeklinde ifadelerde bulunmuşlardır. Beklentileri konusunda görüş bildiren katılımcılar ise; genel olarak beklentilerinin çok üstünde bir eğitim aldıklarını belirtmişler; burada aldıkları eğitim ile tarih öğretim tekniklerine yönelik çıkarımda bulunma imkânı bulunduklarını belirtmişlerdir. Özellikle bu son tespitte çalışmada uygulanan müze ve tarihi mekânlar ile ilgili etkinlikler yapılandırılırken eğitimde çağdaş yaklaşımların, yapılandırmacı eğitim anlayışının göz önüne alınmasının, etkinlik merkezli eğitimin etkisi olduğu düşünülmektedir. Katılımcıların beklentilerinin üzerinde bir sonuçla karşılaştıklarını belirtmelerinde konuyla ilgili gerek lisans eğitimlerinde, gerekse meslek hayatlarında hizmetiçi benzeri bir eğitim almamış olmalarının etkisi olduğu belirtilebilir.

3.3.3. Görüşme formunda yer alan "Bu çalışmadan aldığınız eğitimin konu ve mesleğinizle ilgili bilgi ve beceriler kazanmanızda etkisi olduğunu düşünüyor musunuz? lütfen açıklar mısınız?" şeklindeki üçüncü soruya ilişkin görüşler aşağıda verilmektedir:

Katımcılarının çoğunun üçüncü soruya verdikleri cevaba "kesinlikle" ifadesi ile başlamaları dikkat çekici bulunmuştur. Bunun yanında katılımcıların bu soruya verdikleri cevaplardan; mesleki bilgi ve beceri açısından kazanımlar elde ettiklerini, bu çalışmada edindikleri birikimi derslerinde farklı konulara da transfer edebileceklerini, tarih eğitiminde yeni yaklaşımlar ve yöntemler konusunda tecrübe edindiklerini, bilgisayar ve İnterneti ders konularında kullanmalarına katkı sağladığını belirtmişlerdir. Katılımcıların görüşleri dikkate alındığında katılımcıların çoğu müze ve tarihi mekânlar ile eğitim yapılması konusunda önemli bilgi ve beceri elde ettiklerini bildirmişlerdir. Yapılan görüşme sonunda katılımcıların, proje kapsamında uygulanan etkinliklerin, bilgi ve becerilerini arttırmada etkili olduğu görüşündedirler.

3.3.4. Görüşme formunda yer alan "Çalışma sırasında sizi en çok etkileyen, en faydalı eğitimin hangi çalışma olduğunu belirtir misiniz?" şeklindeki dördüncü soruya ilişkin görüşler aşağıda verilmektedir:

Katılımcıların dördüncü soruya verdikleri cevaplara bakıldığında; çalışmada katıldıkları eğitimlerden müzede yaratıcı drama çalışmasını 7 kişi; sanal müze çalışmasını 5 kişi; kumda yapılan örnek arkeoloji kazı çalışmasını 4 kişi; çağdaş ülkelerde müze konusundaki gelişmeler ve örnekleri 4 kişi; Müzede yapılan kolaj çalışmasını 2 kişi; müze ve tarihi mekanlar ile ilgili sınıfta etkinlik yaprakları hazırlama çalışması 1 kişi; Sultanhanı Kervansarayı'nda yapılan çalışmayı 1 kişi; müze rehberi hazırlama etkinliğini ise 1 kişi en çok etkilendiği ve en faydalı olarak ilk sırada belirtmiştir. Katılımcıların verdikleri cevaplara göre en faydalı görülen eğitimin Aksaray Kültür Evi'nde yapılan yaratıcı darama çalışması olduğunu, bir sonraki etkinliğin ise bilgisayar laboratuarında yapılan sanal müze çalışması olduğunu belirtebiliriz.

3.3.5. Görüşme formunda yer alan "Sizce sosyal bilgiler ve tarih öğretmenliği bölümlerinde müze ve tarihi mekânlar ile eğitim adlı bir ders lisans eğitiminde zorunlu olmalı mı?" şeklindeki beşinci soruya ilişkin görüşler aşağıda verilmektedir:

Beşinci soruya verilen cevaplar incelendiğinde; müze ve tarihi mekânlar ile eğitim konulu bir dersin sosyal bilgiler ve tarih öğretmenliği bölümlerinde zorunlu ders olması gerektiğini kursiyerlerden 24'ü belirtirken, bir kursiyer ise seçmeli ders olarak olması gerektiğini belirttiği görülmüştür

3.3.6. Görüşme formunda yer alan "Bu çalışma ile ilgili öneri ve eleştirileriniz nelerdir?" şeklindeki altıncı soruya ilişkin görüşler aşağıda verilmektedir:

Altıncı soruya yönelik genel olarak katılımcıların görüşüne bakıldığında; yapılan çalışmayı faydalı buldukları, bunun yanında çalışma için ayrılan sürenin yeterli olmadığını belirttikleri, teorik bilginin yanında konu ile ilgili uygulamalı eğitime yer verilmesinin çok olumlu buldukları, fakat uygulamaya ayrılan sürenin daha da fazla tutulması gerektiği, çalışmanın katılımcıların konuya bakış açılarının değiştirmesinde olumlu anlamda katkısı olduğu, çalışmada etkinlik çeşitliliğinin katılımcıların dikkatini çektiği özellikle de konu ile ilgili teknolojin kullanıldığı uygulama örneklerinin dikkat çekici ve faydalı bulunduğu, konu ile ilgili yapılan çalışmaların katılımcıların kendi eğitim öğretim yöntemlerine bakışlarını da etkilediği, bu ve buna benzer etkinliklerin ilerleyen sürede de devam ettirilmesi gerektiği tespit edilmiştir. Bir katılımcı çalışma saatleri dışında da kursiyerler ile aynı mekânda kalmalarının paylaşım açısından daha faydalı olacağını düşünürken; bir katılımcının da açık alan çalışmalarında şapka temin edilmesi gerektiğini belirttiği görülmüştür.

Genel olarak öğretmenlerin görüşlerine ve araştırmacının çalışmalardaki izlenimine bakıldığında; konu ile ilgili daha önce katılımcıların büyük bir kısmı kendilerini müze ve tarihi mekânlar ile eğitim konusunda yeterli bulmadıkları görülmüştür. Bunun yanında dersin öğretim programlarında belirtilmesine rağmen, müze ve tarihi mekânları eğitimde kullanmadıkları da gözlemlenmiştir. Bu konuda katılımcıların daha önceki eğitim hayatlarında konuya yönelik hiçbir eğitim almamış olmalarının büyük bir etkisi olduğu düşünülmektedir. Bu çalışmadan katılımcıların çok memnun kaldıkları, bütün çalışmalara zevkle, isteyerek katıldıkları, müze ve tarihi mekânların eğitimde kullanılmasına yönelik tutumlarında değişiklik olduğu, bu konuya bakış açılarının değiştiği edinilen gözlemler sonucunda söylenebilir. Katılımcıların yapılan çalışmadan memnun kalmalarında yapılan etkinliklerin özelliklerinden biri olan, öğretmenin sınıf ortamında yapılandırmacı öğrenme yaklaşımının gerektirdiği ön koşul olan öğrenci merkezli bir öğretim tarzını benimsenmesinin, katılımcılara özellikle rehberlik yapılmasının ve aynı zamanda katılımcıların sürekli derse katılımlarının sağlamasının etkisi olduğu belirtilebilir.

4. Sonuç, Tartışma ve Öneriler

Bu araştırmada; 5 günlük müze ve tarihi mekânlar ile eğitim konusunda çalışmaya katkılan sosyal bilgiler ve tarih öğretmenlerine yönelik uygulanan öğretmen tutum, öz-yeterlilik ölçekleri ile görüşme formu sonuçlarına yer verilmiştir.

TÜBİTAK tarafından desteklenen "Sosyal Bilgiler ve Tarih Öğretmenlerine Yönelik Müze ve Tarihi Mekânlar İle Eğitim" başlıklı projenin içeriğinin katılımcıların tutum, öz-yeterlilik ve görüşleri üzerindeki etkililiğini konu alan bu araştırmada aşağıdaki sonuçlar elde edilmiştir:

Müze ve tarihi mekânlar ile eğitime yönelik öğretmen tutum ölçeğinin son-test puanları ön-test puanlarına kıyasla önemli ölçüde artış göstermiş ve son-test lehine anlamlı bir farklılık tespit edilmiştir. Ön-test ve son-test puanları arasında, son-test puanları lehine, 17.92 puanlık bir fark, yapılan t-testi sonucunda istatistiksel olarak anlamlı bulunmuştur. Dolayısıyla, bu sonuçlara dayanarak, uygulanan "Müze ve Tarihi Mekânlar ile Eğitim" programının bireylerin müze ve tarihi mekânlar ile eğitim konusundaki tutumlarına önemli ölçüde katkı sağladığını söylemek mümkündür.

Proje öncesinde katılımcıların konuyla ilgili öz-yeterliliklerinin belirlenmesi; proje sonunda verilen eğitimin ve yaşanılan deneyimlerin katılımcıların öz-yeterliliklerine etkisinin karşılaştırılması amacıyla uygulanan müze ve tarihi mekânlar ile eğitim verme konusunda öz-yeterlilik ölçeğin sonuçlarına bakıldığında; özellikle uygulamalı olarak gerçekleştirilen çalışmaların katılımcıların öz-yeterliliklerine olumlu anlamda katkısı olduğu görülmüştür. Katılımcıların öz yeterliliklerine yönelik verdikleri cevaplara bakıldığında çalışma öncesi ile sonrası arasında olumlu manada artış olduğu gözlemlenmiştir. Burada elde edilen veriler, konu ile ilgili benzer içerikte bir eğitimin öğretmenlere hizmetiçi eğitim olarak verimesinin önemini ortaya koymaktadır. Bu sonuçlara göre, verilen eğitimin katılımcıların büyük bir kısmının kendilerini daha yeterli görmesinde olumlu olarak etki ettiği söylenebilir. Bunun yanında katılımcıların konuyla ilgili hizmetiçi eğitim almalarının sağlanması, yardımcı kaynaklar ile desteklenmeleri gerektiği de görülmektedir.

Verilen eğitim ile ilgili katılımcıların görüşlerini almak amacı ile çalışma sonunda yönlendirilen sorulara göre elde edilen bulguların analizi sonucunda; katılımcıların çoğunun daha önceden derslerinde müze ve tarihi mekânları kullanarak eğitim vermedikleri, çok azının ise bu mekanları derslerinde kullandığı, daha önceden yararlananların ise bu çalışmada gördükleri yöntem ve teknikleri kullanmadıklarını görülmüştür. Bunun yanında çalışmada eğitim alan katılımcıların hepsi bir şekilde bu çalışmada gördükleri yöntem ve teknikleri kullanarak daha sonra derslerinde müze ve tarihi mekânlardan yararlanacakları belirlenmiştir.

Katılımcılar genel olarak beklentilerinin çok üstünde bir eğitim aldıklarını belirtmişler; burada aldıkları eğitim ile tarih öğretim yöntemlerinin farklı yaklaşımlarına yönelik bir sonuçla karşılaştıklarını, buradaki eğitim ile tarih öğretim tekniklerine yönelik çıkarımda bulunma imkanı bulunduklarını belirtmişlerdir. Özellikle bu tespitte çalışmada uygulanan müze ve tarihi mekânlar ile ilgili etkinliklerin yapılandırılırken eğitimde çağdaş yaklaşımların, yapılandırmacı eğitim anlayışının göz önüne alınmasının, etkinlik merkezli eğitimin etkisi olduğu düşünülmektedir.

Katılımcılar bu eğitimle; mesleki bilgi ve beceri açısından kazanımlar elde ettiklerini, bu çalışmada edindikleri birikimi derslerinde farklı konulara da transfer edebileceklerini, tarih eğitiminde yeni yaklaşımlar ve yöntemler konusunda tecrübe edindiklerini, konu ile ilgili teknolojin kullanıldığı uygulama örneklerinin dikkat çekici ve faydalı bulunduğunu ve İnternetin ders konularında kullanılmasına katkı sağlayacağını belirtmişlerdir.

Katılımcıların görüşleri dikkate alındığında, çoğu müze ve tarihi mekânlar ile eğitim yapılması konusunda önemli bilgi ve beceri elde ettiklerini bildirmişlerdir. Yapılan görüşme sonunda katılımcıların, proje kapsamında uygulanan etkinliklerin, bilgi ve becerilerini arttırmada etkili olduğu görüşündedirler. Ayrıca çalışmada kullanılan etkinlik çeşitliliğinin katılımcıların dikkatini çektiğide belirlenmiştir. Görüşme formunda kursiyerlerin hemen hemen hepsi müze ve tarihi mekânlar ile eğitim konulu bir dersin sosyal bilgiler ve tarih öğretmenliği bölümlerinde zorunlu ders olması gerektiğini belirttiği görülmüştür. Katılımcıların ifadelerinden, özelliklede bu ve buna benzer etkinliklerin ilerleyen sürede de devam ettirilmesi gerektiğini belirttikleri belirlenmiştir.

Çalışmadan elde edilen sonuçlar çerçevesinde ülkemizde eğitim fakültelerinde Sosyal Bilgiler ve Tarih öğretmeni olacak öğrencilere "Müze ve Tarihi Mekânlar İle Eğitim" dersi zorunlu ders olarak verilmesi gerektiği düşünülmektedir. Günümüzde Türkiye'deki üniversitelerde tarih ve sosyal bilgiler programlarında, müzecilik gibi dersler ya yok ya da seçmeli ders olarak konulmuştur. Ama bunun yanında sosyal bilgiler ve tarih dersleri öğretim programları ile ilişkilendirilmiş, ya da programın kendisinde müze ve tarihi mekânların kullanılmasına, yer verilmesine yönelik birçok direktif bulunmaktadır. Öğretmenlere müze ve tarihi mekânların kullanılmasına yönelik öğretim programlarında direktifler verilmesine rağmen, bu dersi verecek öğretmenlere lisans yıllarında bile bu konuda eğitim verilmemesi bir çelişki olarak değerlendirilebilir.

Müze eğitimi almamış okul öğretmenlerinin genellikle müze ziyareti sırasında öğrenme potansiyelinin her zaman farkına varmadıkları ve böylece öğrenme fırsatlarının kaçırıldığına dair bazı bulgular vardır (Hooper-Greenhill,1999).

Katılımcıların görüşleri doğrultusunda; Kültür ve Turizm Bakanlığı ile Milli Eğitim Bakanlığı arasında yapılacak ortak çalışmalar ile müzeler ve tarihi mekânlara yönelik detaylı bilgilerin, örnek etkinliklerin yer aldığı eğitim materyalleri, ziyaret öncesi ve sonrası kullanılabilecek öğretim teknikleri konusunda dokümanlar, ilgili görsel materyaller, çalışma yaprakları, interaktif materyaller hazırlanıp okullara ulaştırılabilir.

Ayrıca okulların yakın çevrelerindeki müzeler ile işbirliği içinde olmalarının önemli olduğu belirtilebilir. Eğitmen'in (1995) belirttiği gibi; her müze kendi konusu çerçevesinde eğitime doğrudan katkıda bulunabilecek yapıya sahiptir. Tarih eğitiminde kanıt denildiğinde ilk olarak yazılı belge akla getirilirken müzeler ve tarihî mekânlar gibi görsel kanıt sunan alanlar göz ardı edilmektedir. Özellikle müzeler, tarihî çevreye ait pek çok önemli materyalleri bünyesinde barındırmak, korumak ve sergilemenin yanında, toplumların, sosyal, kültürel, ekonomik ve bilimsel gelişmelerine de ışık tutmaktadır. Bu nedenle tarih eğitim sürecinde müze ve tarihi mekânların öğrenme alanları olarak görülmesi ve buralardan yararlanması önem kazanmaktadır (Kale, 2010:195).

Edson (1990:32)'a göre, müzeler ve onların uygulamaları, küreselleşen dünyada sosyo-kültürel etkinlikleri sayesinde daha önemli bir konuma gelmiş ve yarının dünyasını şekillendirecek uygulamalarla daha etkili bir yönlendirici olacaktır. Müzelerin yanında tarihi mekanları da düşünerek bu önemli alanların eğitim dışında bırakılması, eğitimde bir araç olarak yararlanılmaması büyük bir eksiklik olarak değerlendirilebilir. Bu nedenle de gerektiği şekilde bu konuya önem verilmeli, farklı yöntem ve teknikler ile çalışmalarla sürekli yararlanılmalıdır. Bugün mevcut ders programlarında "müze ile eğitim" yer almakta ancak, birçok okulda programın amaçlarına uygun olarak müzelerde gerçekleştirilememektedir. Türkiye için yapılan araştırmalar okulların tüm derslerinde müzeden kaynak olarak yeterince yararlanılamadığını da ortaya koymuştur (Uslu, 2008:4).

Proje çerçevesinde yapılan çalışmalarda; müzede yaratıcı drama, sanal müze, kumda örnek arkeolojik kazı çalışması, müzede yapılan kolaj çalışması konularının kursiyerlerin büyük ilgisini çektikleri gözlemlenmiştir.

Özellikle yaratıcı drama konusunda öğretmenlerin yeterliliklerinin arttırılması ve bu konunun daha sonra verilecek müze eğitimi ile ilgili hizmetiçi vb. çalışmalardın içeriğinde yer verilmesinin önemli olduğu düşünülmektedir. Katılımcıların büyük bir ilgi gösterdikleri diğer bir çalışma olan kumda yapılan örnek arkeolik kazı uygulamasını daha sonra okullarında uygulayacaklarını belirtmeleri dikkat çekmiştir. Katılımcıların arkeoloji ile ilgili bu çalışmanın öğrencilerin tarih konularına olan ilgilerini arttıracağını, dersten zevk alacaklarını, öğrencilerin tarihsel düşünme becerilerinin gelişmesine etki edeceğini belirttikleri görülmüştür. Daha sonra müze ve tarihi mekânların eğitimde kullanılmasına yönelik öğretmenlere verilecek eğitimin içeriğinde bu konuya ilişkin de çalışmalara yer verilmesinin gerektiği düşünülmüştür.

Projede kursiyerlere verilen eğitimin içeriğinde yer alan sanal müze ve alan çalışmalarının bundan sonra yapılacak benzer hizmetiçi eğitimlerin içeriğinde de yer almasının önemli olacağı düşünülmektedir. Özellikle İnternet ve sosyal medyanın gençler arasında kullanımının çok yüksek olduğu göz önünde bulundurulduğunda öğretmenlere derslerde bu araçlardan nasıl yararlanabileceklerine ilişkin eğitimler verilmelidir. Böylece dersler daha ilgi çekici hale getirtilebilir. Günümüzde bilgi ve iletişim teknolojilerindeki gelişmeler çerçevesinde, müze ve tarihi mekânlar ile ilgili İnternet ortamında birçok konu bulunmaktadır. Özellikle sanal müze gezileri konusunda İnternet birçok imkân sunmaktadır. İnternet ortamında 3D sanal turları buna güzel bir örnek teşkil etmektedir. Öğrencilerin çeşitli tarihi mekânlara götürülme imkânı olmadığında bu yolla sınıf ortamında sanal olarak çeşitli çalışmalar yapılabilmektedir. Öğretmenlerimizin bu konuda yeterliliklerinin ve konuyla ilgili farkındalık düzeylerinin arttırılması gerektiği önerilebilir.

Ayrıca Projede yer alan müzede yapılan kolaj çalışmasının da öğretmenlerin çok ilgisini çektiği, zevkle konuya katıldıkları, güzel çalışmalar ortaya çıkardıkları görülmüştür. Buradan hareketle; disiplinlerarası yaklaşımın önemi, sanat eğitimi konularının müze ve tarihi mekânların eğitimde kullanılmasının gerekliliği vb. açılardan daha sonra müze eğitimi konusunda verilecek eğitimde bu konunun da yer almasının gerekliliği düşünülmektedir. Bunun yanında tarihi alanda yapılacak dönem canlandırmalarının da faydası olabileceği önerilebilir.

Hiç şüphesiz ki öğrencilerini geleceğe hazırlayan öğretmenlerimize gerekli becerilerin kazandırılmasına yönelik eğitimlerin verilmesi tartışmadan uzaktır. Ayrıca bu konuda önemli bir nokta da; lisans eğitimi sırasında tarih ve sosyal bilgiler öğretmen adaylarına müze ve tarihi mekânlar ile eğitim konulu bir dersin verilmesidir. Ata (2002:256) öğretmen görüşlerine yer verdiği araştırmasında; tarih öğretmenlerine lisans eğitiminde müzelere ilişkin bir ders konması ve müzelerin okul-müze işbirliği bağlamında tarih öğretmenlerine hizmet içi eğitim verilmesi gibi bazı önerilerde bulunmuştur. Müze ve tarihi mekânlar ile eğitim konusunun Milli Eğitim Bakanlığı tarafından sosyal bilgiler ve tarih öğretmenlerine hizmetiçi eğitim olarak verilmesinin, bunun yaygınlaştırılmasının yararlı olabileceğini söylenebilir. Daha sonra yapılacak benzer hizmetiçi eğitimlerde, bu projede uygulanan eğitim içeriğinin göz önüne alınmasının katkısı olacağı düşünülmektedir.

TEACHERS AND CHANGE: THE ROLE OF REFLECTIVE PRACTICE

Maura Sellars

University of Newcastle, Callaghan, NSW 2308, Australia

Abstract

This paper argues that the most powerful, durable and effective agents of educational change are not the policy makers, the curriculum developers or even the education authorities themselves; they are the teachers. It further contends that the quality of the educational changes that teachers have the skills and opportunities to effect will only be as reliable and proficient as the teachers' individual capacities for reflective practice and the development of self knowledge. These aspects of teacher development have, historically, been largely overlooked in the preparation and promotion of effective teachers. The emphasis has been more explicitly focused on the development and demonstration of teachers' understanding of content knowledge and the associated pedagogies and in their capacities to understand their students as individual constructors of knowledge in diverse social contexts. Whilst the former teacher characteristics have traditionally been valued as desirable or even mandatory indicators of teacher quality, the latter are heavily impacted upon by the individual pedagogue's values, attitudes and notions of what it is to be a professional practitioner. In order for teachers to be effective in the Information Age, they need to recognize more than just their students' background and learning preferences. They need to be able to take effective, positive action in the classroom context to improve the educational outcomes for their students. In order to do this they must have the willingness and cognitive capacities to recognize ethical dilemmas and examine their own perspectives on the issues they face critically and analytically. This requires regular, authentic reflection. The reflective process in which one teacher engaged as part of his role in a research study is documented.

Main Text

2.1 The rate and nature of change in modern society is unprecedented (Burchsted, 2003; Dickenson, 2000; Gardner, 2006; Houston, 2002). Teachers, in undertaking one of the basic aims of education, are endeavoring to prepare students for a world that is constantly reinventing itself. There exists an ethical and moral commitment (Burgh, Field, & Freakley, 2005) to prepare, not just an elite few, but all students to participate in society with high levels of intellectual and academic potential and the capacity to develop the skills of lifelong learners. In order to embark on this extremely challenging task, the traditionally held notions of what it is to be an effective teacher must be transformed (Darling-Hammond, 2006, 2009; Lingard, 2011; Marginson, 2008; Mockler & Sachs, 2011; O'Brien, 2002; Ramage, 2011; Shostak, 2011; Warner, 2006; Webster-Wright, 2010). In addition to the long established criteria relating to content and clientele knowledge, teachers must now be prepared to engage with the entirety of the holy trinity for teachers: know your content and how to teach it, know your students and how they learn and know yourself, your values and your capacity for reflection and ethical decision making. The latter capacity, always important (Calderhead, 1989; J. Dewey, 2005; Gore, 1987; Halliday, 1998; Kemmis, 2011; Schon, 1983, 1987, 1991; Tsangaridou & OSullivan, 1994; K Zeichner, 1981; K Zeichner, 1994), rises to new importance at this time for several significant reasons, including claims that many preservice teacher enter and leave their professional preparation programs with the same beliefs about teaching (Morine-Dershimer, 1989).

2.2 Teaching has recently been designated as a profession and teachers now have the same responsibilities as others engaged in professional work. They have increased levels of individual responsibility, accountability and liability. One result of this is that there now is a legal commitment to supporting scholarly success for all students, despite the cognitive complexity that is required being elevated in terms of educational expectations and societal demands (Ministerial Council on Education Employment Training and Youth Affairs, 2008). Additionally, teachers are impacted upon by increasing globalization and mobility in that they are mandated to

accommodate the cultural, religious and societal differences that are presented in diverse classrooms (Clarence, 2011; Dyson, 2004). Whilst these are not the only concerns that teachers face, these particular professional obligations challenge teachers to reflect on how best to present content, select pedagogical strategies, understand student differences and the accompanying parental and community demands and expectations, redefine what it is to be a teacher in the modern world and even to reconsider their notions of basic constructs such as the nature of intelligence. While teacher standards, government policies and proclamations, curriculum boards and national requirements are developed and teachers are expected to use these as guidelines in their everyday professional practice, the reality remains that teacher practice in the closed environment of their own classrooms relies almost totally on the individual's capacity to interpret, understand and perform the role of a teacher as mandated by these documents, whilst simultaneously making spontaneous decisions and attending to the inevitable classroom interactions that cannot be planned for. Documents of change do not automatically empower teachers and, to add to the complexity, individuals bring unique understandings, personal values and varying degrees of competencies to their acknowledgement of, and dedication to, these documents in practice. This situation compels teachers to describe, to analyze and evaluate and to use the resulting insights to improve practice; in other words, to develop skills in reflective practice. Whilst the notion of practitioner reflectivity is not new, it is argued that teachers in contemporary classrooms now need to undertake their reflections from an increasingly informed personal understanding (Akerson, Abd-El-Khalick, & Lederman, 2000; Boud, 2001, 1993; Boud, Keogh, & Walker, 1985).

2.3 The purpose of all the various types of reflection in professional contexts appears to two be fold; to engender change in order to improve the practice (Calderhead, 1989; Gay & Kirkland, 2003; Kemmis, 2011; Rolfe, Freshwater, & Jasper, 2001; Scanlan & Chernomas, 1997; Schon, 1991; Schuck, Gordon, & Buchanan, 2008; Wildman & Niles, 1987) and to develop further self knowledge and understanding (Abell, Bryan, & Anderson, 1998; Akbari, 2007; Boud, et al., 1985; Gay & Kirkland, 2003). However, as reflection is, of necessity, a metacognitive undertaking and as such is an intensely personal pursuit, especially when undertaken to improve professional practice. Even the act of describing an incident or occurrence which triggers (Boud, et al., 1985; Calderhead, 1989; Hill, 2002; Kemmis, 2011; Schon, 1991) the reflective cycle itself relies for its accuracy on personal interpretation and perhaps is not as rational, scientific and able to be 'objectified' as Dewey (1933) initially suggests. Despite the individual characteristics of various models of reflective practice, the initial event is described and then universally analyzed and evaluated against specific, appropriate criteria. In each of these cognitive processes, there is the considerable impact of the individual's personal attributes, including their previous experiences, values and ethical perspectives. In the final stage of reflection, some decisions are made related to change, adaptation or moderation of professional practice with a deliberate focus on professional improvement. It is because of the uniqueness that each person brings to their reflective activity, and to the interpretation of the meaning of the experience being recalled or enacted, that accurate intrapersonal intelligence becomes so vital. It is therefore suggested that teachers need to purposely develop, examine, re examine and check both their self knowledge and their capacity to use this knowledge in order to improve their professional practice, utilizing the notion of the intrapersonal intelligence domain introduced by Gardner (1993) as one aspect of his Multiple Intelligence Theory. This theory not only brings together and meaningfully links the purposes of reflective practice, but facilitates personally meaningful ways of planning to improve practice by utilizing relative strengths.

2.4 The notion of intrapersonal intelligence as foundation for reflection has been explored extensively by Lazear (1999a; 1999) who identifies intrapersonal intelligence as the 'introspective intelligence' (1999a p.111) and explores a number of mindfulness exercises aimed at improving self awareness and promoting effective reflection. Gardner (1993) presents the dual nature of intrapersonal intelligence as (i) self knowledge and (ii) executive function (Moran & Gardner, 2007). Self knowledge in this case is how an individual understands themselves both as teacher and learner. It allows individuals to acknowledge various self expressions such as *'I need, I want, this is a good way for me'*. It also facilitates an understanding of the ways in which others may know an individual and how these may differ from an individual's own knowledge of himself or herself. This knowledge of self representations can be expressed as *'I know myself in ways that others may not know me, I know that others may perceive me differently to the ways in which I know myself'*. Both aspects of this self knowledge are created, maintained and challenged by personal insights and socially mediated perceptions and

feedback. The second aspect of intrapersonal intelligence and the least explored is executive function. Self understanding in this aspect focuses around what Moran and Gardner (2007) name as the '*Hill, the Will and the Skill'*. It is this aspect of intrapersonal intelligence that has the capacity, once developed, to impact most profoundly on an individual's reflective practice, most specifically on the final stage of the reflective cycle, the plan for improvement, although it does influence the quality of reflection in the stages of the cycle.

2.5 The *Hill* refers to the plan of action or the goals that are set for improving teaching and the skills that are embedded in this decision making process: the capacity to identify personally relevant strategies and procedures, to make decisions based on personal needs and desires and to plan actions when faced with difficult or unfamiliar situations. The *Will,* as expected, is related to how motivated an individual is to initiate and implement their plans. The *Skill* refers to the self monitoring aspects of implementation, namely; an aptitude for flexible thinking and the effective use of the working memory, the capacity to monitor and change behaviours in order to achieve goals and to monitor inappropriate responses, the discipline and interest to sustain attention and concentrate on goal appropriate activities and the compulsion to persevere when faced with goal- related difficulties. Working with this theory of self knowledge, teachers have the opportunities to develop accurate knowledge of self and to recognise more readily their personal relative strengths and limitations. Engaging in the skills associated with the '*Hill, the Will, and the Skill'* not only facilitates strengths based planning for professional improvement, but provides a framework for authentic, lasting, professional change. An example of one beginning teacher who found himself in such a situation is detailed below. Despite this teacher openly welcoming the proposed changes in which he was to be involved with his class, difficulties were encountered. It was by engaging in a reflective process in which he considered not only how best to teach the curriculum content or how best motivate his students by identifying and planning for their individual learning preferences but also what he knew about himself.

3.1 In response to the Melbourne Declaration (Ministerial Council on Education Employment Training and Youth Affairs, 2008), school systems in Australia were required to make provision, in all their teaching related official documentation, for the education of every child in each classroom, irrespective of the variants that constitute student difference. One school's response to the requirement that teachers differentiate their teaching, content and tasks to provide an inclusive, productive learning environment was to invite the implementation of a research project which was designed to support the development of the cognitive skills of executive function as defined by Moran and Gardner (Moran & Gardner, 2007). The research design introduced a differentiated program of work for 10 -12 year old students to be implemented in the combined time allocated to Social Studies and English. Three teachers agreed to participate in the study. Each was responsible for one class of combined year 5 and year 6 students. These classes were collectively known as stage three classes. The implementation of the differentiated programs of work was the responsibility of each of the teachers. The design was developed using a Revised Bloom's Taxonomy (Anderson & Krathwohl, 2000) identified hereafter as RBT and Multiple Intelligences (Gardner, 1993) identified hereafter as MI matrix. This framework afforded multiple tasks at different levels of cognitive complexity across different content domains. Research evidence (Noble, 2004) was available to indicate that this planning framework had the potential to be implemented in multitudinous ways to suit individual teacher's pedagogical preferences and to support increased student academic outcomes.

3.2 The research required students to indicate any awareness they may already have relating to their personal MI strengths and relative limitations. Each student participant was then required to select tasks for completion from the eighty tasks provided across the matrix. They were instructed to select tasks that they would personally consider in each of the following categories: Easy, Consolidating and Challenging. The teachers' roles were to mentor the students in the event that they were unsure of what to choose at the each of the three levels and to facilitate new learning in the knowledge, skills concepts and strategies that students may require to complete the selected tasks successfully. To ensure this was achievable, each f the three differentiated programs of work that

were implemented over the six month duration of the study were developed from specific sections of the K-6 English and K-6 HISE document and so common foci were able to be identified for the supporting skills programs. Although suggested organizational procedures were available, the three participating teachers found the implementation and management of this program very challenging. Each of the three teachers had, as expected, executed the implementation in the context of their classrooms and class cohorts quite differently, despite the specific design and the preparation time that had been devoted to developing common understandings. This, however, had little impact on the overall results of the study. What did impact, not so much on the study itself, but on the manner in which the overall findings influenced the teachers and the direction in which the school intended to implement its differentiation plans, was the capacity of one teacher to critically reflect on the challenges that implementing the differentiated program of work had presented and to take appropriate action based on his desire to improve his practice. The remaining two teacher participants, while acknowledging the challenges, either sought help from the researcher who was an experienced teacher of this age of student, or minimized the length of time spent engaging with the differentiated programs.

3.3 The critically reflective teacher found the implementation of the differentiated program highly problematic. During the initial four weeks he struggled to meet the needs of his students in several areas. He found that resourcing and managing the students and their works in progress was time consuming and exhausting. He knew that he wanted to make differences to his practice for a number of reasons related to improving students' learning experiences in his classroom but felt totally overwhelmed by the sheer physical effort that the differentiated program demanded. This may be because, unlike the other two teacher participants who were quite happy to implement the differentiated program, this teacher began to 'own' the research study and placed a high degree of importance on providing the best possible mentoring for his student participants. By the end of the first month, he reported that the study was 'consuming' him as he struggled to remain organized and effective in other curriculum areas. He felt overwhelmed at the prospect of participating in the project for the remainder of the time. In discussions with the researcher he found it difficult to identify precisely the areas in which he might be supported. It was at that point that he realized that he needed time for formal reflection. He needed to 'get back to basics'. He questioned why he had wanted to be a teacher and spent time critically analyzing why the implementation of the differentiated program was making such a strong impact on him and yet was not fulfilling him as a teacher. In fact he acknowledged the impact was quite the opposite: he was finding that implementing the differentiated program of work was increasingly frustrating. During the reflective process here- examined the initial motivation that had determined his career choice. He was then able to articulate the reasons behind his decision to engage with, and to take ownership of the study in which he was a participant. He had wanted to make a difference to students' learning in school. He had wanted students to be enthused about new learning and to explore their learning potential. In his reflections he indicated a strong commitment to schools and to education in general as mediators of social change and transformation. He also deeply cared about the quality of the students' school experiences and the opportunities he could provide for them to have authentic task choices, make personal learning decisions and learn in the context of a collaborative community, without losing sight of his accountability in assessment. He was sensitive to the difficulties that these ideals created in a formal learning environment and acknowledged that institutional demands, systemic demands, community expectations and managing diverse student needs had drawn him to be socialized into a teaching and learning context that did not always encourage him to fully explore ways in which this could be achieved within these existing constraints. As a relatively new teacher he had four years of experience from which to reflect and learn, but he felt that his critical analysis and evaluation of his professional practice to date did not provide him with the solutions he needed.

3.4 However, when it was suggested that reflecting on his self knowledge, that is his intrapersonal intelligence (Gardner, 1993), may help him find an appropriate and practical way forward, the situation began to change. Instead of focusing explicitly on the teaching standards(New South Wales Institute of Teachers, 2005) , the school policies and curriculum documents, he began to consider his own personal values and expectation and to acknowledge his individual relative strengths and limitations. As he identified in his recollections of the

factors that motivated him to be a teacher, he was committed to ethical professional practice and to the wellbeing of his students. What he needed to consider were the implications of his understandings and perspectives, his preferred ways of working professionally what priorities he held to be important in all his endeavors and how to use this self knowledge to achieve his goals; in this case those that were important to him when working in the teaching and learning environment with his students. He realized that, as an enthusiast of extreme sports, he was particularly methodical and well organized. The framework within which the implementation of the study had been developed was too open ended for him to be professionally comfortable. It was then he began to use his skills and strategies to meticulously work through areas of the implementation and to identify strategies that could be introduced incrementally and which would gradually restore his sense of 'balance' in his professional life whist maintaining the integrity of the research project.

3.5 The students continued to self select their tasks from the considerable number provided, but, in order to improve his assessment opportunities and maintain a record of the tasks that the students were undertaking and the learning that had been achieved, he instigated two simple procedures. Instead of the tasks being available to students as color - coded laminated task cards, they were made available on colored paper with the corresponding syllabus outcomes and indicators on the back. As the intervention required the students to share their work with their peers as they completed their challenge tasks, he drew up a timetable, which indicated the days and times that could be made available for sharing learning. This was readily available in the classroom and the students 'booked' themselves in for their presentations as they neared the completion of their challenge tasks. The presentations were comparatively formal and the teacher was able to check the degree of competency that the student presenters had achieved during the actual sharing time as assessment information was available on the task sheets the students handed to him prior to the commencement of the children sharing their products. These records of achievement, suggestions for further progress and general comments were then share with each student before becoming part of the assessment records. The simplicity of the whole procedure made a remarkable difference to ways in which the teacher perceived his participation. The students were very willing participants. The teacher made his laptop available to the students and many presented their products accompanied by a power point presentation. The routines motivated the students to prepare well for their presentations to the class and this resulted in greater attention to the quality of their work, their presentation skills and their capacities, in turn, to be an appreciative, respectful audience. The end of the research project was not the end of differentiated practice for this teacher. By the end of the six month research period, he had planned a similar differentiated program for himself. He designed extra record keeping charts to start off the new class that he would welcome the following year into his classroom and had organized the other teachers to work on the first program with him and then to participate in the development of differentiated programs of work across stage three. They worked as a team, selecting tasks using based on each of their individual relative strengths. Documenting what happened the following year and the degree of change that was sustained was beyond the scope of the study, but would have been of interest.

5.1 The teaching profession is, like any population, comprised of individuals. Each has unique experiences that have, in turn, been interpreted in time and context in their particular manner. Each also has personally constructed understandings of what it is to be professional, to be a teacher and to be reflective. An individual's capacity to be totally objective may be a hotly contended topic in philosophical debates (Burgh, et al., 2005) but it is generally accepted that it is almost impossible. The implications for reflection on professional practice are obvious: individuals describe, analyze and plan a way to improve in their own ways. This writing has presented an argument for the implementation of Gardner's (1993; Moran & Gardner, 2007) notion of intrapersonal intelligence as a supportive framework for authentic teacher reflection as it requires authentic personal response, facilitates planning to improve using strengths based strategies that allow for individual approaches to the changes needed to improve professional practice. This approach fosters ongoing, genuine enrichment of individual personal practice irrespective of the level of initial engagement. This is simply because it permits teachers to start from their own individual experiences and perspectives; consider these in their contextual variations and draw upon the theoretical, professional strategies that they have encountered or plan to explore. It

validates the time and efforts spent on reflection as it allows the planning of actions to improve to draw on all three aspects of the holy trinity for teachers; pedagogical and content knowledge, students and community preferences and differences and an understanding of self and the personal potential that each has to improve their professional practice and to initiate and sustain change.

TEACHERS' BELIEFS ABOUT TEACHING ENGLISH TO ELEMENTARY SCHOOL CHILDREN

Orhan Kocaman[a] &Gökhan Cansız[b]

[a]Sakarya University, Department of Foreign Language Education, Faculty of Education, Sakarya, Turkey

[b]Fatih University, Department of Foreign Language Education, Faculty of Education, İstanbul, Turkey

Abstract

Recent research has focused much attention on teacher beliefs because beliefs are considered to greatly influence teaching practice. Teachers' belief systems need critical inquiry so that teachers can reflect on their practices more closely and teacher training institutions can take necessary steps to improve teacher practice. This study compared beliefs held by 192 non-native in-service and pre-service teachers in Istanbul, Turkey. Data about the teachers' beliefs were collected by means of a questionnaire and observations. The results indicated that both groups strongly supported communicative language teaching methodology, emphasizing the need for addressing children's educational and emotional needs. The agreement rates, however, differed significantly in some respects.

Main text

The Turkish educational reform in 1997 required that foreign languages (English, German or French), begin at grade 4 instead of 6 and compulsory primary education become eight years. Because the number of learners nearly doubled as a result of the reform, the Turkish Ministry of National Education had to deal with an acute shortage of foreign language teachers, a deficit met by appointing teachers from other subject areas after a brief in-service education. The newly appointed teachers lacked even minimum linguistic skills and knowledge of language teaching methods and techniques, causing major debates as to the efficiency of their teaching (Çetintaş, 2010). The problem of teacher shortages was compounded by a lack of materials and overcrowded classrooms (Doğançay-Aktuna, 1998).

The educational reform introduced the communicative approach to language instruction into the ELT curriculum, but its success depended heavily on the teacher enacting it (Çakıroğlu & Çakıroğlu, 2003). The basic goal of the reform was to develop students' communicative capacity in the target language (L2); therefore, teachers had to become practitioners who could carry out communicative classroom activities. Today many teachers know that they should display a wider range of responsibilities, including helping students develop communicative performance and promoting positive values and attitudes towards English language learning (Kırkgöz, 2007). They should be able to play many roles in the course of teaching; and in the process of playing their roles, they must be well aware of the importance of interactions with their students. They should know interactive principles such as automaticity, intrinsic motivation, strategic investment, risk-taking, language and culture connection, interlanguage and communicative competence (Brown, 2001). They should also know how to correct their students' mistakes for the sake of accuracy. Harmer (p.105, 2001) suggests that "…during communicative activities, … it is generally felt teachers should not interrupt students in mid-flow to point out a grammatical, lexical or pronunciation error, since to do so interrupts the communication and drags an activity back to the study of language form or precise meaning." Besides, teachers are expected to be well aware of their students' ability to grasp meaning, level of creativity in using the course materials, capacity for indirect learning, instinct for play and fun, delight for imagination and fantasy, and instinct for interaction and talk (Halliwell, 1992). In brief, the Turkish education reform demands teachers who strip off their old ways and embrace a new approach to language teaching.

Much of the literature on teacher education suggests that teachers' beliefs affect their teaching practices and instructional decisions in the classroom (Richards, 1998; Richards & Lockhart, 1996). These beliefs are usually guided by a number of factors: their own experience as learners in classrooms, prior teaching experience, classroom observations they were exposed to, and their previous training courses at school (Richards, 1998). Teachers' actions reflect their knowledge and beliefs, which "provide the underlying framework or schema which guides the teachers' classroom actions" (Richards & Lockhart, p. 29, 1996).

Williams and Burden (1997) underlines the fact that teaching must be concerned with teachers making sense of meaning from the conditions they encounter. Teachers' awareness of their own beliefs and how they view the world around them is an important component of the constructivist approach and the fountainhead of becoming a reflective practitioner. Even in the case of experienced teachers, a constructivist view suggests that their perceptions and beliefs are continually strengthened by teaching expe¬rience, becoming increasingly central to their view of themselves as they develop confidence in meeting role demands (Roberts, 1998).

However, little is still known about how pre-service and in-service teacher beliefs might vary and whether teachers acquire their beliefs during teacher training or in actual practice. Thus, the main purpose of this study was to compare the teaching beliefs held by elementary school in-service and pre-service English teachers. The research questions were:

What core beliefs do in-service and pre-service English teachers hold about the process of teaching and learning English in elementary schools?

What are the similarities and differences between in-service and pre-service elementary school teachers' beliefs about English teaching?

2. Method

This section gives detail about the participants, research instruments, and data analysis methods.

2.1 Participants

192 participants (157 female and 35 male) agreed to complete the questionnaire. 68 were in-service teachers teaching in 17 state and private elementary schools, and 124 were pre-service teachers studying at four different state and private universities. The questionnaire was only administered to Turkish teachers of English.

2.2 Research Instruments

2.2.1 Scale: Liao's (2007) The Questionnaire of Elementary School English Teachers' Teaching Beliefs was translated into Turkish by the researcher and two other proficient speakers of English and Turkish. The original questionnaire was composed of 40 discrete items organized into three major categories, namely, the nature of children's English development (CED), teaching methods and techniques (TMT), self-efficacy as an English teacher (SE). The participants were asked to assess their beliefs about teaching English to elementary school students on a five-point Likert scale, by indicating the extent to which they agreed with each statement using (1) SD = strongly disagree, (2) D = disagree, (3) N = neither agree nor disagree, (4) A = agree, or (5) SA = strongly agree. Cronbach's alpha coefficient of the original questionnaire was stated to be 0.72.

The reliability of the adopted scale was examined in terms of its consistency. Cronbach's alpha coefficient of 0.96 was obtained for the whole scale. The first factor, the nature of children's English development, had a reliability value of 0.93; the second factor, teaching methods and techniques, 0.84; and the third, self-efficacy as an English teacher, 0.86. The fact that all the internal consistency values were over 0.80 indicates that the scale has high reliability (Fraenkel & Wallen, 2006).

2.2.2 Open-ended question: Liao's original question "What qualifications does a person need to acquire in order to be a successful English teacher in an elementary school?" was translated into Turkish by two proficient bilingual speakers of English and given to the participants.

2.2.3 Observations: The observations were conducted in a private elementary school over two school days. Five items from each of the three factors were selected by the researcher and two experienced teachers. Because observing all 40 items on the scale was not feasible, the observers chose a total of fifteen areas of inquiry. Four in-service teachers were observed for the whole class duration by the researcher and an experienced instructor.

3. Results

3.1 Statistical Analysis of the Survey

Of the 40 items, 27 had means greater than 3.5, and none below 2.5. Most participants were found to agree on most factors.

Table 1. Correlations of survey sub-factor

		CED	TMT	SE	Total
CED	Pearson Correlation	1	,885(**)	,830(**)	,976(**)
	Sig. (2-tailed)		,000	,000	,000
	N	191	191	191	191
TMT	Pearson Correlation	,885(**)	1	,780(**)	,949(**)
	Sig. (2-tailed)	,000		,000	,000
	N	191	192	192	191
SE	Pearson Correlation	,830(**)	,780(**)	1	,892(**)
	Sig. (2-tailed)	,000	,000		,000
	N	191	192	192	191
Total	Pearson Correlation	,976(**)	,949(**)	,892(**)	1
	Sig. (2-tailed)	,000	,000	,000	
	N	191	191	191	191

** Correlation is significant at the 0.01 level (2-tailed).

Table 1 shows that as pre-service and in-service teachers develop greater self-efficacy and use methods and techniques more effectively, they contribute more to children's English development.

Table 2. Comparison	Group	N	x	SD	df	t	P
CED	Pre-service	124	69,13	15,44	189	-1,76	,041
	In-service	68	72,69	8,42			
TMT	Pre-service	124	55,99	10,56	190	-2,11	,019
	In-service	68	59,01	7,10			
SE	Pre-service	124	26,16	6,37	190	-3,51	,000
	In-service	68	29,13	3,77			
Total	Pre-service	124	151,25	31,15	189	-2,34	,007
	In-service	68	160,83	17,36			

Table 2 shows that there are significant differences in both teaching beliefs, which include the scale as a whole and represents the one-factor structure and all the sub-factors. It was found that the two groups differed

significantly in children's English development (t= -1,76), methods and techniques (t= -2,11), and self-efficacy (t= -3,51) (p.<.05). The following discussion will highlight the quantitative results by grouping relevant items in three groups: the nature of children's English development, teaching methods and techniques, and self-efficacy as an English teacher.

3.1.1 The Nature of Children's English development

Eighteen items in the questionnaire addressed different aspects of children's English development ranging from classroom activities to different patterns of learning and optimal age for language education. The in-service teachers and pre-service teachers agreed or strongly agreed on most of the items although the agreement rate was almost always higher for the former group.

Several items were concerned with doing activities, having interesting classes, fully understanding the lesson, interacting with others, using English during activities, and getting support from parents and teachers. The greatest discrepancy within these items was about interacting with others, for which there was about 84% (strong) agreement among pre-service teachers and about 99% among in-service teachers. A considerable ambiguity arose for both groups about whether children should be given opportunities to move around in class. Only half of both groups stated that children should be given opportunities to move around in the English classroom. More than 45% of in-service teachers either disagreed or strongly disagreed with the idea. Almost 20% of pre-service teachers remained neutral, and more than 30% either disagreed or strongly disagreed. This attitude toward limiting students' moving around in class can be attributed to reasons related to classroom management.

Four of the items addressed the issues of variations in gender, individual cognitive development, learning styles, and overall capacity to learn foreign languages. 67% of pre-service teachers agreed or strongly agreed on gender differences in the rate of developing proficiency and response to instruction, whereas exactly half of in-service teachers took this stance. About 20% of pre-service teachers believed that female and male students develop English proficiency at different rates and respond to instruction differently, a rate that doubled for in-service teachers. A majority of both groups agreed that every child has a different learning style and that children have obvious individual variations in their cognitive development process, though in service teacher agreement was quite higher (98% versus 83). The groups had quite different beliefs about whether every child can learn English well. 41% of in-service teachers believed that not every can learn it well, whereas only 21% of pre-service teachers held the same belief. Less than half of both groups somewhat believed that every child can learn English well. This result was interesting in that practicing teachers were less optimistic about every child's ability to learn a foreign language.

Three items were concerned with the optimal age for language learning. Almost 65% of in-service teachers strongly believed that children can learn English faster, while about only 40% of pre-service teachers strongly supported this belief. The total percentage reached almost 93% for in-service teachers when the choice 'agreed' was included. For pre-service teachers, the total number reached 75%, the rest either somehow disagreeing or remaining neutral; whereas only about 6% of in-service teachers believed adults can learn English faster. A similar result held true for teachers' beliefs about teaching English at early ages. A great majority of in-service teachers (97%) believed that learning English as early as possible produces better results. About 81% of pre-service teachers supported this view, while almost 14% somehow disagreed. The groups held completely different beliefs about whether the first grade is the best age for learning English. Only about 34% of in-service teachers thought it was a good idea, 50% somehow disagreed and 16% remained neutral, while 37% of pre-school teachers somehow disagreed and 25% remained neutral.

The relationships between the ways L1 and L2 are acquired were dealt with two items. More than 80% of both groups believed that the way children use their mother tongue affects their learning English. More participants opposed the item that children should learn English the same way as they learn Turkish than those who agreed to it. 44% of in-service teachers somehow believed it to be a bad idea, 10% remaining neutral. It was 40% and 22%, respectively, for pre-service teachers.

3.1.2 Teaching Methods and Techniques

The fifteen items in the questionnaire addressed different aspects of teaching methods and techniques ranging from activities and tools to the perceivably most important skill for language education. The in-service teachers and pre-service teachers agreed or strongly agreed on most of the items although the agreement rate was again almost always higher for the former group.

Concerning the most important skills to teach, five items revealed that both groups agreed most strongly on listening and speaking skills. An overwhelming majority of in-service teachers (99%) considered it important to teach elementary school children English listening and speaking skills. About 12% of pre-school teachers disagreed or strongly disagreed on the statement. Likewise, the two groups had similar beliefs about the importance of oral conversation when teaching children. 73% of both groups considered oral conversation to be the most important element in teaching children. Both groups perceived the role of pronunciation, an important part of listening and speaking skills, as considerably less important. Only 38% of in-service teachers believed pronunciation to be the most important element in teaching children, while 33% disagreed. pre-service teachers had a higher regard for pronunciation (50%), 34% disagreeing and 16% remaining neutral. 69% of in-service teachers considered vocabulary learning the most important element in teaching English, and 30% disagreed with the idea. About 56% of pre-service teachers held the same belief, while 36% disagreed. The two groups held wildly different views about teaching children English spelling and grammar in the early stages of instruction. About 63% of in-service teachers believed that it was unnecessary to teach the two skills, while only 36% of pre-service teachers considered likewise.

Items related to assessment revealed that both pre-service teachers and in-service teachers believed that multiple assessment types should replace paper and pen tests, rating the average of former 90% and latter 45 %. Almost 96% of both groups believed that children's English performance in the classroom should be evaluated by using multiple assessments. The groups had different ideas about the use of paper-and-pencil tests. 55% of in-service teachers somehow agreed to the idea, 4% remaining neutral. Only about 35% of pre-service teachers supported it, and more than 50% somehow disagreed.

Items related to the ways of teaching showed that more in-service teachers then pre-service teachers agreed or strongly agreed on all of the items except Item 21. About 61% of both groups favored English immersion programs over bilingual programs where English and Turkish are used. Over 89% of in-service teachers believed that the teaching of English pronunciation, vocabulary, and grammar should be integrated. Only 68% of pre-service teachers believed so, and 24% believed teaching these skills separately. Both groups held similar beliefs about error correction. 68% of in-service teachers and 74% of pre-service teachers believed that beginning students should not be permitted to make errors in English pronunciation because it would be more difficult to correct them later. About 20% of both groups disagreed. The two groups had different beliefs about the role of memorization in learning English. 51% of in-service teachers and 62% of pre-service teachers considered it to be unnecessary. Yet almost 44% of in-service teachers believed memorization to be necessary, whereas the rate was 28% for pre-service teachers.

Items related to the activities to teach English revealed that both in-service teachers then pre-service teachers agreed or strongly agreed on all the items. Both groups favored singing and role-playing as appropriate English teaching activities. 95% of in-service teachers and 86% of pre-service teachers stated so. About 11% of pre-service teachers believed the opposite. 97% of in-service teachers believed that integrating games into English instruction can facilitate children's learning, while the rate drops to 87% with pre-service teachers. Interestingly, 12% of pre-service teachers oppose using games for English instruction for children. Both groups believed in the importance of using multimedia equipment (Item 36). 11% of pre-service teachers disagreed to its importance, while only 4% of in-service teachers disagreed. In addition, both groups expressed the need to teach foreign cultures along with English, the difference being in the strength of the opinion. 90% of in-service teachers believed in its necessity, only 29% strongly agreeing. 77% of pre-school teachers supported the teaching of culture, more than 44% strongly agreeing.

3.1.3 Self-efficacy as an English Teacher

Seven items in the questionnaire addressed different aspects of language teacher efficacy ranging from student-teacher interaction to teachers' qualifications. The in-service teachers and pre-service teachers agreed or strongly agreed on most of the items although the agreement rate was once again almost always higher for the former group. Items concerned with getting on with students, meaning attributed to teaching English, high confidence in language teaching produced similar results. in-service teachers felt more confident than pre-service teachers in getting along with children in English classes. 59% of the former group strongly agreed that they get along well with children in class, while 42% of the latter expressed such a strong opinion. Slightly less than 40% in both groups agreed to the statement, making the sum total about 86%. 9% of pre-service teachers strongly disagreed to the statement, while no in-service teacher had any strong disagreement. The majority in both groups found teaching English in elementary school a meaningful job, in-service teachers finding it even more so (69% strong agreement against 60% with pre-service teachers). Surprisingly, almost 10% of pre-school teachers strongly disagreed to the statement in contrast to less than 2% with in-service teachers. A great majority of in-service teachers believed that they were capable of teaching English to children, with 70% strong agreement and 26% agreement. pre-service teachers was less confident. 54% strongly believed in themselves, while 9% seriously questioned their capabilities. No in-service teacher had strong beliefs against their capabilities to teach English to children.

Three items were related to the participants' confidence in satisfaction with the profession. In-service teachers overwhelmingly believed (93%) that teaching English in elementary school is fun, with 51% strongly holding this belief. For pre-service teachers the prospects were less optimistic. While 43% of pre-service teachers strongly believed that the experience would be fun, 28% simply agreed to the idea. 6% disagreed and 10% strongly disagreed, while 11% remained neutral. The greatest difference between the beliefs of the two groups lay in their confidence in becoming a good elementary school teacher. 60% of in-service teachers strongly believed that they would make good teachers, while only 27% of pre-service teachers believed so. A high percentage of pre-service teachers (28%) remained neutral in contrast to 9% of in-service teachers. About 15% of pre-service teachers lacked the confidence in becoming good teachers. A similar difference emerged between the groups beliefs in their teaching abilities as opposed to native English teachers. While 29% of in-service teachers strongly believed that they were as good as native teachers, only about 10% of pre-service teachers believed so. More of the former group agreed to the statement than the latter (35% versus 31%). Although similar rates of teachers remained neutral (20% and 22%), a much higher percentage of pre-service teachers doubted their capabilities (32% versus 13%).

Only one item revealed a contrasting result to the other items for the self-efficacy factor. 44% of in-service teachers believed that teaching English in elementary school was easy, with only 4% strongly holding this belief. A higher percentage of pre-service teachers (47%) believed that the experience would be easy, with 10% strongly holding the belief. Almost 15% of in-service teachers strongly disagreed with the statement, whereas only 5% of in-service teachers did so. Although disagreement rate was similar for both groups (38% and 39%), almost 10% of pre-service teachers remained neutral in contrast to the 1% in the other group.

3.2 Content Analysis

41 of the 68 in-service teachers and 15 of the 124 pre-service answered the open-ended question. A total of 320 words and expressions about perceived teacher qualifications (206 of which were from in-service teachers) was examined for patterns. Finally, three major categories were classified, and single instances were grouped under "others."

Professional competence: This category included content knowledge, pedagogic content knowledge, and openness to innovations and self-development. English language proficiency was a frequently mentioned part of content knowledge. Pedagogic content knowledge comprised knowing how to put across the subject matter

according to the student group and employing technology for that end. Being open to innovations and self-development encompassed being engaged in a wide range of activities such as seminars, workshops, conferences, journal subscriptions, and colleague observations.

Personal traits: Of the nine personal traits of a successful teacher, being patient was mentioned most frequently, followed by being loving and fair. Ability to get along with students also ranked high on the frequency list. Other traits were understood, creative, responsible, and energetic.

Student centeredness: Providing fun and motivation through activity ranked highest (mentioned 27 times) together with teachers' awareness of students' needs, levels, and differences. Also included in this category were use of games, songs, and drama activities suitable for the age group.

Others: The category involved infrequently mentioned characteristics such as being smart, having a good memory, focusing on vocabulary, and being a leader. Although they could be included in the above mentioned categories,   they   were   left   out   due   to   their   isolation. For ease of comparison, Table 3 rank these categories by the frequency and percentage of responses made by the pre-service teachers and in-service teachers.

Table 3. The Ranking of both groups about a Successful Elementary School English Teacher

Rank (PST)	Category	F	%	Rank (IST)	Category	F	%
1	Professional competence	47	41	1	Personal traits	72	34.5
2	Personal traits	39	34	2	Professional competence	65	31.1
3	Student-centeredness	23	20	3	Student-centeredness	62	29.6
4	Others	5	5	4	Others	7	3.3

As indicated in Table 3, the ranking differed for the two groups. The pre-service teachers regarded professional competence as the most important qualification a successful elementary school teacher should possess. 41% of the pre-service teachers reported it as a necessary qualification, while the percentage was 31% for the in-service teachers. Both groups mentioned personal qualities with the same frequency, which ranked second for the in-service teachers, though. Student centeredness came third for both groups, but the in-service teachers had a higher regard for placing students at the center of the profession. Almost 30% of the in-service teachers specified student centered concerns, whereas the percentage was 10% lower for the pre-service teachers.

3.3 Observations

On the first day of observation, a meeting was held with the teachers in a private school and a schedule was determined by both sides. Unwilling to accept the request for observations right away, teachers wanted to make sure of confidentiality before letting us in their classes. The participants seemed fairly capable of handling classes of very active students. The first participant was a trainee teacher teaching grade four. The observation in her class added the research a new dimension since she was also observed by the vice-principal who happened to be in that class, so she was very well organized in her presenting the lesson on animal life. The students aided their teacher during her hardest experience in her career by actively participating in the lesson. The participant did not use L1 and the topic seemed to be a correct selection considering young learners' interest in animals. The students were mainly seated and the practitioner, who seemed fairly confident and delightful, overlooked grammar and pronunciation mistakes at all times.

The second participant was a more experienced teacher who was going to teach grade 4 students. The students were asked to form groups of five and so they did without any confusion. It was clear that the teacher

often had group work in her classes. The first activity was a knowledge contest which aimed to teach word order with questions like "What is the name of capital of Turkey?" and the students' responses had to be in written form and syntactically correct; otherwise, no score was won. The second game was "Simon says," a famous total physical response activity that required students to respond to give directions. The last game was "twelve," targeted practicing numbers when students were standing in a circle. The teacher was completely in control of the activities and seemed to have developed a good rapport with the students. L1 was not allowed during all these activities and feedback was given on syntactical mistakes instantly. The teacher also presented a good figure of confidence and seemed to be pleased with her profession.

The third participant was teaching grade six and was making necessary preparations for a video lesson when we arrived at her class. When she said that they were going to watch the film "The Lion King", I was a little perplexed because I never imagined that this film was appropriate for this age. But the teacher was so experienced in simplifying the scenario that students were eager to respond to their teacher's questions. The teacher paused the film every ten minutes to let the students comment on whatever they saw on the screen. Many of the students seemed to have already made considerable progress in language learning. She made some corrections and portrayed a skillful and highly confident practitioner in her class. At the end of the lesson, she assigned the students to write a summary of the film. The observers found that observation notes had quite a number of commonalities and the participant successfully had integrated the listening, speaking and writing skills.

When we arrived at the school next day, we were informed that one of the participants would not come to school due to personal reasons, so we were invited by another participant to a grade 4 class. The objective of the lesson was to practice Simple Past, and the participant asked each student to talk about their previous day. The students were quite good at using irregular verbs for this level. Despite her obvious excitement due to our presence in the class, the participant, a teacher with two years of teaching experience, actively encouraged and motivated the seated students to ask further questions to and interact with the speaker. When the students acted diffidently, she herself assumed a participatory role by asking genuine questions. Occasionally she had eye contact with the researchers asking for approval of what she was doing. She used L2 all the time and in no way were the students allowed to speak Turkish.

In the afternoon we were planning to observe the sixth participant, but when we encountered her in the corridor just before the lesson, she asked us not to join her class since she felt rather tired and it might not be a very active lesson and apologized for not keeping her promise.

To sum up, the four participants who were observed during actual classes mainly followed methodologies advocated by the communicative approach and focused on speaking activities, which motivated students to participate actively. Student-centered activities dominated all the classes, relegating teachers to facilitator role. Moreover, the participants seemed to spend a lot of energy, a fact frequently mentioned by in-service teachers in their responses to the open-ended question. Furthermore, the participants all showed understanding to the students' little misdemeanors, generally overlooked their minor errors that did not prevent comprehension, and smiled most of the time. Comfortable with class management issues and having established routines, the participants had confidence in themselves and displayed their personal characteristics effectively.

4. Discussion

The data in this study revealed that Turkish in-service teachers and pre-service teachers differed considerably in the extent of their beliefs. Even the items that were agreed upon by the majority of two groups did not produce a convergence over 90%. The in-service teachers scored 13% higher on average in the 34 items they agreed or strongly agreed, the difference sometimes running as high as 31%. The differences between the groups for the factors (Children's English Development, Methods and Techniques, and Self-efficacy) were 11%, 12%, and 19%, respectively. The greatest difference in self-efficacy showed that in-service teachers had a stronger sense of self-efficacy. The gap can be attributed to pre-service teachers' inexperience and thus feelings of insecurity.

Of the six items the pre-service teachers score higher than the in-service teachers, three items concerned children's development, two self-efficacy, and only one method and techniques. For example, almost 67% of the pre-service teachers believed that male and female students develop English proficiency at different rates and respond to instruction differently, while only 50% of the in-service teachers stated so. Also, 11% more pre-service teachers believed that every child can learn English well. In addition, the pre-service teachers believed in the importance of pronunciation more and that of memorization less. It was interesting that less than 40% of both groups believed grade 1 to be the best age to start learning English, the rest either disagreeing or remaining neutral.

Responses to the open-ended question revealed discrepancies as well. While the pre-service teachers ranked professional competence highest in importance for a successful language teacher, personal traits were deemed most important for the in-service teachers. The in-service teachers also valued student-centered teaching more. A finding that corroborates a result of Liao's study was that pre-service teachers never mentioned physical readiness required by a successful teacher, a fact that became obvious during the observations: teaching at elementary schools requires energetic teachers. Previous research found that novice teachers focused on maintaining the flow of instructional activity (Akyel 1997 cited in Atay, Kaslioglu, & Kurt, 2010). In a similar vein, pre-service teachers might be paying more attention to the flow of the lesson than to displaying their personal traits or placing students in the center.

Interviews could help clarify the differences between the two groups' responses, so future researchers may incorporate them into the study for further triangulation. Also, beliefs of teachers from private and state schools could be compared. These lines of research can provide further insight into teachers' beliefs in their English teaching.

TEACHERS' EQUITY SENSITIVITY TO THE SINGLE-SPINE SALARY: THE CASE OF TEACHERS IN CENTRAL AND WESTERN REGIONS OF GHANA

Joseph Tufuor Kwarteng

Department of Arts & Social Sciences Education, Faculty of Education,

University of Cape Coast, Cape Coast, Ghana

Abstract

The purpose of this study was to determine how sensitive teachers were about the single spine salary. It surveyed 129 basic school teachers from Central and Western Regions with the Equity Sensitivity Instrument. Both descriptive and inferential statistics were used to analyse the resulting data. It was found that teachers were mainly equity sensitive just demanding what is fairly due them. This indicates that it is recommendable for the Fair Wages and Salaries Commission to be fairer in the fixing of teachers single spine salaries or teachers might result to reducing their input to measure up to such discontented salary level.

Keywords: Single-spine salary, Teacher motivation, Compensation, Equity sensitivity, Ghana

1. Introduction

1.1 Triggering Employee Performance with Motivation

McGregor's Theories X and Y are a snapshot, taken episodically, of diverse human behaviour. Only to some extent does Theory Y suggest that what is needed is the wisdom, tact and ability of management to motivate workers so that their natural disposition to work hard can be nurtured and realized. Although by this, McGregor's work makes some contribution to the development of the concept of worker motivation, to a greater extent, it fails to capture human behavior in its entirety. Work is not as natural as play as Theory Y postulates; neither does coercion in itself elicit increased productivity as Theory X contends. Indeed, motivation is pivotal in winning the sympathy of workers to work satisfactorily. The reward system in place is capable of driving the workforce to work their hearts out without having to coerce them. Employees will not work just because they itch for work. It is the reward attached to the efforts that drives them to do as much as to obtain that pleasurable gesture. Maslow (1970) found that human needs are developmental, which presupposes that people endeavor to get those needs satisfied. No one will work for no fee while the person lacks the basic physiological needs. Apparently, there will not be any intrinsic motivation where there is nil or insufficient extrinsic motivation. The propensity to work is usually triggered by the reception or experience of certain satisfaction that pleases the individual.

Compensation is one of the key elements of the reward system to appreciate and reinforce appropriate work conduct. The extent of performance can be determined after the employee has been appraised. This has the tendency of propelling the employee to work assiduously towards the achievement of the stated goals in order to maximize income as justified by the expectancy theory. Even the most intrinsically motivated employee will become discouraged if the salary is incapable of *paying rent* or *buying bread*. Occasionally, salary adjustments

are necessary to enable workers cope with economic pressures and also to motivate employees to work harder so as to collectively drive the nation to achieve its desired goals.

1.2 Teacher Compensation Packages in Ghana

The economic wellbeing of Ghana, just like any other nation, is directly related to the skills of its citizenry. As well, it is becoming broadly recognized that quality teachers are the key ingredient to a successful school and to improve student achievement. Yet educational policies, forcibly forged by the level of resources in the country, do not ensure that quality teachers are recruited and retained in the profession. Accordingly, over the years, Ghana has been stuck with a compensation system that works against improvements in the teaching force. Without some significant changes, the hope of systematically improving student outcomes is small. Of course, the teacher compensation system works within the entire set of policies that govern teachers including recruitment, certification, tenure, and retirement. Things done in those areas interact with the compensation system and determine the outcome of the kind of teachers that are recruited and the consequential students' performance. Any coherent set of policy prescriptions aimed at improving the quality of the teachers in classrooms must have multiple dimensions. An induction policy is obviously crucial. But an induction policy must be coordinated with policies that manage teachers and reward them according to their performance once they have been inducted.

These grotesque inequitably unsatisfactory compensation packages that bedeviled Ghana coupled with the outcry of the entire labour force in the country compelled the 5th government of the 4th republic to implement the single-spine salary scheme. Under this new salary structure, appropriate compensation that measures up to an individual's circumstance is awarded to deserving workers. This is deemed to ensure that workers are treated fairly and equitably. However, the lack of adequate consultation with the workers in the determination of the remuneration and the approach of the new salary scheme implementation might beget mistrust in the scheme. The result of this might be the feeling of inequity and unfairness among the workforce including teachers which may have negative implications on their productivity.

1.3 Teacher Heightened Expectations Referent to Other Public Servants

Pay differentials always bring about unhealthy situations and conflictual and confrontational industrial relations. Such was the long-standing state of affairs in Ghana. However, the quest of the Ghanaian government in addressing the unevenness in compensation packages among employees in public service in the country by introducing the single spine salary has brought about mixed feelings. Civil and public servants whose salaries are higher than what is equitably due them feared that the single spine salary would erode their remuneration. However, the majority of the workforce (mostly teachers) who think they have been unfairly dealt with all this while insofar as the salaries are concerned are in expectancy of colossal upward adjustments. Since its introduction, the single spine salary has been fraught with implementation challenges. As a result, the committee charged with its implementation recommended a piecemeal implementation approach.

The inclusion of the personnel of the public service in the first batch of the implementation could heighten teachers' expectation. Using the Police as the reference point, teachers who form the greatest percentage of the government workforce might think that they have higher qualification than the Police and as such they deserve better treatment. Even though they were yet to see how much was due them when it got to their turn of the implementation of the new salary scheme, some teachers were estimating how much they are likely to earn. In

other words, some teachers were using the salaries of the Police as a benchmark in calculating their anticipated salary increment. This was a likely indication that if they are not given a better condition of service they might be disillusioned to work. Although their package under the new salary scheme was yet to be implemented one may consider the extent to which teachers think the new salary scheme was equitable. Therefore, it was prudent to know how sensitive Ghanaian teachers were about pay differentials relative to other workers under the new scheme. Any such feeling of inequity among teachers could lead to reduced morale which could be translated into reduction in commitment to duty which might lead to turning out graduates who are not fully functional and educated with the desired attributes of the Ghanaian education system.

1.4 Objectives of the Study

The study sought to find out how workable and equitable teachers saw the single spine salary structure. The purpose of this study was to take a closer look at the efficacy of the applicability of the Equity Sensitivity Theory to teachers. More specifically this study focused on the ability of Equity Sensitivity to discriminate between the responses of three different classifications of individuals posited by the theory (Benevolents, Equity Sensitives and Entitleds) in response to the single-spine salary structure. The specific objectives were to:

1. assess how sensitive teachers were to the equitable nature of the single-spine salary structure;
2. investigate whether teachers' gender, rank or qualification influenced their equity sensitivity to the single spine-salary structure.

2. Theoretical Framework

There have been practical problems with the use of equity theory. Greenberg (1990) illumines the incapability of the theory in aiding prediction of the action to be taken by employees, when faced with inequity, to bring their equity ratio into balance. This lack of specificity regarding what responses individuals experiencing inequity are likely to have is a serious shortcoming of the original equity theory (Furby, 1986) and as such, the original equity theory eventually became less popular (Greenberg, 1990). Accordingly, research efforts were focused on generating a solution to the inadequacies of the equity theory eventually created the equity sensitivity theory (Sauley & Bedeian, 2000). This regeneration of interest in equity has been promulgated in part by an extension of the original equity theory to include individual differences and accordingly modified as equity sensitivity theory (Patrick and Jackson, 1991).

Inasmuch as equity sensitivity theory is an offshoot of the equity theory, equity sensitivity has proven to be a refinement of the original equity theory (Adams, 1963, 1965). However, if equity sensitivity is to prove more useful than the original equity theory, it must be more predictive with regards to how employees respond to feelings of inequity. Without this ability, equity sensitivity theory risks the fate of being considered an interesting notion with little or no practical value and falling out of favour much as the original equity theory (Greenberg, 1990).

Equity sensitivity, posits that employees can be conveniently categorized into three groups: equity sensitives, benevolents and entitleds, along points of a continuum. On one end of the continuum are the benevolents, otherwise known as "givers," who express high satisfaction relative to others when their output/input ratios are less than the referent persons. Benevolents have higher tolerance for under-reward situations. At mid-range are

the equity sensitives. These individuals most closely adhere to the traditional norm of equity – with the balance of inputs to outcomes (Allen & White, 2002). On the other end of the continuum are the entitled individuals or "takers," who are most satisfied when they receive more outcomes than inputs (King, Miles and Day, 1993). Entitleds are most sensitive to perceived under–reward inequity (Sauley & Bedeian, 2000).

According to the latest view, equity sensitives fit the classic equity theory propositions. Equity sensitives prefer to be in a state of equity with regard to the outcomes they receive for the amount of inputs they expend when compared to someone doing similar work. The original propositions of equity theory apply to this group. If an equity sensitive's ratio of outcomes to inputs is out of balance with their referent other, the person will be motivated to act in a way so as to get their ratio back into balance.

Benevolents are more tolerant of situations in which they are being under-rewarded. While they do not seek to be under-rewarded, they are assumed to be less likely to respond (at least overtly) when they are placed in an under-reward situation. Entitleds are posited to experience less dissonance when they are over-rewarded and more dissatisfaction when under-rewarded. As such, they are assumed to be more likely than the other groups to respond overtly to an over-reward situation.

3. Method

3.1 Sample

The target population for the study consisted of all basic school teachers in the Western and Central Regions. A sample of 150 basic school teachers were selected from the University of Education, Winneba, Institute of Educational Development and Extension (IEDE) Cape Coast study centre. Students who are at this study centre are predominantly from the Central and Western Regions. Simple random sampling was used to select 150 basic school teachers to participate in the survey, only 129 completed and returned the survey instrument. This method was adopted because each basic school teacher at the centre was a potential candidate of giving the required pieces of information needed.

3.2 Instrumentation

The Equity Sensitivity Instrument (ESI) by Huseman, Hatfield and Miles (1987) was employed to gather the necessary data from the selected respondents. ESI attempts to measure how individuals differ in their allocation of outcomes. The ESI is a five-item, forced-distribution measure on which the respondent allocates 10 points between a benevolent response and an entitled response for each of the five items. The standard conventional ESI was modified to contextualise its usage. Wherever *organisation* was found in the ESI it was substituted with *government* for the purpose of this study. No other alteration was made to the instrument.

Although the ESI has established validity and reliability, in its edited form the entire questionnaire was tested to determine whether there had been a reduction or further strengthening in this wise. Previous research studies using the ESI have reported coefficient alphas ranging from .77 to .88 (King and Miles, 1994; Patrick and Jackson, 1991) and a test-retest reliability of .80 (Miles, Hatfield and Huseman, 1989). For this study, the Cronbach's alpha was .78, which was consistent with the values found in the other studies cited above.

3.3 Measuring Equity Sensitivity

After scoring the items and averaging the scores of respondents a total ESI score was obtained by adding the points allocated to each of the five benevolent statements. Equity sensitivity scores have a possible range of 0 to 50. In order to generate the 3 classes or sub-groups representing benevolents, equity sensitives and entitleds, the conventional rule set by previous researchers (King et al., 1993; Allen and White 2002) was utilized. The mean equity sensitivity score of the total study sample was 25.9, with a standard deviation of 5.66. and a range of 8 to 45. The decision rule of plus/minus one-half of the standard deviation from the ESI mean was adopted to define the breakpoints for each sub-group. King et al. (1993, p. 305) suggest that "sample-specific breakpoints are necessary because of the unique characteristics on any particular sample that can influence response to the ESI". For example, gender, differing ranks, varied school contexts, age homogeneity, and other variables may influence responses (King and Miles, 1994). This decision rule was applied to trichotomize the sample into the three groups. Thus, teachers with an ESI score of 24 or less were classified as entitleds. Those with a score between 25 and 29 were considered equity sensitives. Benevolent teachers were those with an ESI score of 30 or higher.

4. Results and Discussion

4.1 Equity Sensitivity to the Single-Spine salary

The expectation of taxpayers is to have a system of accountability of the stewardship they entrust in the hands of policymakers and specialists. Teachers by their professional training as specialists are expected to bring their expertise to bear to bring about desired learning in students. They are accountable to the various stakeholders of education since "they are well placed to observe the reaction of pupils to different instructional context" (Pratt, 1980, p. 82). Parents and other stakeholders of education repose faith, trust and confidence in teachers to deliver as expected of them, as they are considered competent. Yet, achieving any phenomenal results in teachers' output depends greatly on their motivation and thus how sensitive they are to the single-spine salary. Typical data on teachers' equity sensitivity to the single-spine salary have gathered, analysed and synthesized.

Participants who had a benevolent score of at most 23 were classified as *entitleds*; those with scores between 24 and 28 inclusive were labeled *equity sensitives*; and others with a benevolent score of at least 29 were categorized as *benevolent*s. Thus the total study sample was split into 40 entitleds, 51 equity sensitives and 38 benevolents.

There was almost an even distribution of teachers across the categories of equity sensitivity. Apart from the equity sensitive teachers who were the simple majority (39.5%) in the teachers surveyed, the entitled and benevolent teachers almost tied with 31 per cent and 29.5 percent respectively of the total study sample. This means that 31 per cent of the teachers surveyed are interested in receiving a relatively higher amount of pay under the single-spine salary scheme than their input may warrant. Approximately 40 percent of the basic school teachers surveyed were just interested in receiving an equitably equivalent output in the form of pay that their input may allow. However, another 29.5 percent of them were ready to receive some amount of pay lesser than

what would have otherwise been provided. The bottom line is that basic school teachers are not indifferent to differences in compensation packages. Rather they were mindful of the extent to which their treatment compares with other workers.

According to King et al. (1993), benevolent employees experience less distress than entitleds when facing either under-compensation or over-compensation scenarios. They found further that entitleds placed significantly more importance on pay and benevolents placed more importance on work characteristics. Furthermore, Miles et al. (1994) found that entitleds tend to place a greater emphasis on extrinsic tangible rewards (e.g., pay), whereas benevolents are more focused on intrinsic intangible rewards. Therefore, since a majority of teachers are equity sensitives, they are likely to demand a fair compensation. However, since the number of teachers who are benevolent do not match either of the entitled and equity sensitive teachers, it is less likely for teachers, in general, to be more concerned about the intrinsic intangible rewards and focus on their work characteristics. Rather, teachers are more concerned about what is due them, at least.

In any case both equity sensitive and entitled teachers outnumber the benevolent teachers. The implication is that teachers were responsive to the minutest pay differentials which they will always struggle to level out. This tends to exemplify the description of Osafo Marfo, then Minister for Finance in the third government of the 4th republic, that "teachers are economic vampires". Thus they agitate every now and then to get higher rewards without recourse to recent or current attempts made by government to improve their conditions of service. This is literally translated to imply that teachers seem not to get satisfied with any pay package.

However, one cannot blame teachers for the insistence in striving for fair and equitable treatment. At least a majority of teachers, as equity sensitives, are just interested in receiving fair compensation under the new salary scheme. It therefore could be predicted that teachers, in general, might resist the single-spine salary scheme if the scheme fails to bring about equitable treatment among the various categories of workers captured under the pay policy.

The ability of the single-spine salary to respond positively to teachers' needs might propel the teachers to work assiduously towards the achievement of or meeting the stated or desired goals in order to maximize income as justified by the expectancy and equity theories. As alluded to earlier, the most intrinsically motivated teacher will become discouraged if the salary does not pay rent or buy bread. Occasionally, such adjustments in salary are necessary for improved teacher motivation. This could only happen if the adjustment is favourable to teachers. In any case, if teachers lift up their performance, because they do not turnout physical products, it would be a bit difficult to measure the resulting productivity. Even where it is possible to do so, Johnson (1986) warns that such a practice might change the relationships between teachers and students as poor student ratings are used as a means of gathering evidence or information to judge teachers' effectiveness and subsequent reward.

4.2: Influence of Teacher Characteristics on Teacher Equity Sensitivity

In spite of these results, it was prudent to analyse the phenomenon in detail to find out whether certain characteristics of the basic school teachers influence the equity sensitivity. The independent variables assessed whether to have influenced teachers' equity sensitivity included teachers' gender, qualification and their rank. To determine whether basic school teachers' equity sensitivity about the single-spine salary structure was tied to

these characteristics, a between group Analysis of Variances (ANOVA) was conducted in search for significant differences at 5% significant level.

None of the results indicated significant differences between teacher equity sensitivity and teacher characteristics. Thus basic school teachers' equity sensitivity was independent of their gender, qualification and rank. The gender of the teacher does not matter in making demands from the government about the adequacy or not of the single-spine salary.

Yet in a typical Ghanaian setting where the man is considered bread winner, it is expected that he demands more so as to distribute such resources to benefit the household. The finding may be authenticated by the recent shift from traditional view of the control and management of households where women are now empowered to contribute. The quest of generating enough to support the family, therefore, is not the preserve of the man. This might account for the lack of any apparent differences between the equity sensitivity of male and female basic school teachers about the single-spine salary.

The differing qualifications of the basic school teachers are said not to make any difference in their equity sensitivity. Possibly, basic school teachers have just settled with tradition that has been with the Ghana Education Service which does not value qualification that much. Basic school teachers most whom have virtually the same qualification (Diploma in Education) might not be disturbed about how their salary compares with other workers.

5. Conclusions

The fact that teachers are mostly equity sensitives and thus they requiring a fair and equitable treatment from the single-spine salary is an indicative of the fact that they might act in commensuration of the compensation given them. Should the single-spine salary fail to meet their expectation, teachers might give a work output of the same measure suiting the salary level. This implies reduced productivity. It is always argued whether improved conditions of service should precede increased productivity or the other way round. Whatever being the case there seem to be some relationship between worker morale, which is the consequence of conditions of service, and productivity. Therefore the average teacher will work harder when they anticipate some actual or perceived benefits to derive from their efforts. Hence, teachers' actions and inactions are contingent on the satisfaction or otherwise of their needs to be met by the single spine salary.

Although found to be mainly equity sensitives, teachers' equity sensitivity is independent of their gender, qualification, and rank. Hence, such teacher characteristics are not predictors of teacher equity sensitivity to the single-spine salary. Teachers' equity sensitivity to the new salary is therefore generally arbitrarily predictable based on their general quest to for salary adjustment. Therefore, there is need for the Fair Wages and Salaries Commission to be actually *fair* in principle and indeed. If the Commission fails to design an equitable salary that teachers would be comfortable with, this pay structure might fail just like the old pay policy.

TEACHERS' OPINIONS AND BELIEFS REGARDING THE NECESSITY, THE USEFULNESS AND THE IMPACT OF MODERN EVALUATION METHODS ON THE PERFORMANCE OF PUPILS IN SECONDARY EDUCATION

Assis.Prof. PhD. Otilia Sanda Bersan,

Faculty of Sociology and Psychology, Department of Sciences of Education West University of Timişoara, Boulevard V. Parvan, no. 4, Timisoara, Romania

Abstract

In their attempt to improve educational evaluation, teachers' efforts and interests are most often focused on identifying and using the most suitable ways, strategies, methods and techniques of evaluating pupils' scholastic performance.

Our research analyzes the teachers' opinions and beliefs regarding the necessity, the usefulness and the impact of alternative evaluation methods on the scholastic performance of pupils in secondary education.

Keywords: opinion, beliefs, alternative evaluation methods, performances, scholastic results

Research objectives

The overall objective of this study consists of investigating secondary education teachers' opinions regarding the necessity, the usefulness and the impact of alternative evaluation methods on the scholastic performance and results of pupils in secondary education.

We started from the premise that teachers' understanding and appropriation of the necessity and usefulness of alternative educational evaluation methods leads to a (more) favorable attitude towards the latter, and, implicitly, to the disposition of using them more frequently in their didactic activity.

The general hypothesis

As teachers become more aware of the necessity and the usefulness of alternative evaluation methods, they start using them more frequently in their didactic activity.

Specific hypotheses

- making teachers aware of the usefulness and efficacy of alternative evaluation methods, by way of pupil feedback and personal reflection, engenders a change of the teachers' beliefs towards these methods and determines them to use these methods more and more frequently in evaluating pupils' scholastic performance;

- (self-) monitoring the progress obtained in evaluating pupils' scholastic performance increases teachers' confidence in the worth of alternative educational evaluation methods.

The research design

In our investigation we have used several research instruments that we ourselves devised, namely:

► The structured journal which was used to find out what the teachers' opinions and beliefs were regarding the necessity, the usefulness and the impact of alternative/complementary educational evaluation methods on the scholastic performance of pupils in secondary education.

► The reflective journal is an open instrument which was intended to find out if the teachers' answers grew less conformist and if their inclination toward social desirability bias decreased.

► The progress sheet assessed the degree in which the use of some alternative evaluation methods contributed to the evolution of the responding teachers' careers, from a cognitive, methodological and behavioural point of view.

Before starting out study, we organized short meetings and debates, in the form of focus groups, among the teachers from each participating school, in order to make them aware of the main alternative methods of scholastic evaluation and their necessity and usefulness (the way in which they complement classic/traditional evaluation methods). At the same time we wanted to encourage teachers to use certain alternative evaluation methods in their didactic activity and to determine what impact these methods have on the pupils' performance levels and their psychological comfort.

Within the focus group we also introduced the proposed investigative methods (the structured and the reflective journal, the progress sheet) to make sure that these will be used adequately and in accordance with the objectives of our research.

The subject sample

The subject sample we studied consisted of 151 secondary school teachers.

The participating teachers had on scholastic semester at their disposal to respond to the research instruments we have described previously. Their supervision took place through periodical (monthly) meetings in order for us to determine and encourage them to record their responses to the tasks that they were given. At the same time, we also took care to ensure the confidentiality of their answers.

Data analysis and interpretation

The teachers' answers to the items of the structured journal reveal the fact that most secondary school teachers are constantly preoccupied with evaluating their pupils' scholastic output correctly and objectively.

Thus, where pupil evaluation planning is concerned the cumulated percentage of all the items referring to this activity, as reflected in the teachers' answers (questions 1 to 6 in the structured journal), is 94.6% favorable to understanding the need to come up with, design and plan the performance evaluation in accordance with teaching objectives – learning in the sense of the pupil's awareness of what the teachers' expectations are and learning to attain the required scholastic progress (Figure 1).
Figure 1: The graphic representation of teachers' responses regarding evaluation planning (false, neither true nor false, true)

In this context, at the stage of designing their didactic activities, we can identify the teachers' preoccupation with establishing their pupil evaluation strategies, methods and instruments. Thus, 98.7% of teachers claim that evaluation is a key preoccupation and all the questioned teachers (100%) claim that they want to diversify evaluation methods by including some alternative methods.

The subjects' responses to the items regarding preoccupation with improving pupil evaluation, the objectivity of evaluation and ensuring the necessary psychological comfort for pupils proves that the great majority of responding teachers have a strong interest in the area (Figure 1 and Figure 3).
Figure 2: Teachers' preoccupation with improving pupils' scholastic performance evaluation (neither true nor false, true)
Figure 3: Teachers' preoccupation with the accuracy and objectivity of pupil evaluation (false, neither true nor false, true)

Where formative evaluation is concerned, we can notice that over 97% of teachers who participated in our study display an interest in and preoccupation for assessing the effort put in by the pupils in the learning process. At the same time, teachers are interested in using alternative evaluation methods that have a positive impact on the pupils' psychological comfort. Figure 4 illustrates this fact:
Figure 4: Teachers' evaluation of pupils' learning process (Percentage: neither true nor false, true)

Summative evaluation, which is predominately used by teachers, is meant to determine and assess the results of the pupil's learning process. The teachers confess that they are interested in the pupils' performance levels and, simultaneously, that in achieving this goal, especially with the aid of alternative methods they assess:

the quality of the pupils' information sources;

the original approach to given learning tasks;

the originality of the outcome;

the cooperation an collaboration among pupils, in the case of group assignments, etc.

Thus, 94.7% of participating teachers mention being preoccupied with achieving as objective a summative evaluation as possible, mostly by employing alternative methods for the evaluation of pupils' scholastic performance (Figure 5).
Figure 5: The graphic representation of teachers' responses regarding the summative evaluation of the pupils' scholastic performance. (false, neither true nor false, true)

Where the formative character of evaluating pupils' scholastic performance is concerned, 77.5% of teachers claim to believe in the veracity of the following affirmation: "I can evaluate pupils' scholastic

performances with greater accuracy and objectivity, provided I use alternative methods, as opposed to classic ones" (Figure 6).
Figure 6: Teachers' opinions regarding the accuracy and objectivity of evaluating pupils' scholastic performances through alternative methods (Summative evaluation: false, neither true nor false, true)

Where the formative gain of pupils assessed through alternative methods is concerned, 86.8% of participating teachers declared that this can be recorded with the help of alternative methods of evaluating pupils' scholastic results (Figure 7).
Figure 7: The teachers' opinion regarding the formative character of pupils' scholastic performance evaluation with the help of alternative methods (false, neither true nor false, true)

Cumulating teachers' answers to the questions pertaining to this section of the structured journal (feedback and personal reflection), we can ascertain that 82% of the participating teachers claim that the following affirmations are true:

a) "I am interested to find out the pupils' opinions regarding the means of scholastic performance evaluation I use";

b) "I am interested to diversify the performance evaluation methods I use";

c) "I take into consideration the satisfaction and the psychological comfort of my pupils when I evaluate their scholastic performance";

d) "I try to establish the efficacy of alternative evaluation methods";

e) "I have some reservations about the use of alternative evaluation methods".

Figure 9 illustrates what has been mentioned above.

The teachers' answers to the question about their reservations concerning the use of alternative evaluation methods confirm that, quite on the contrary, for the majority these reservations are unfounded. A percentage of 76.2% of respondents claim that in their case the following assertion is false: "I have some reservations about the use of alternative evaluation methods" (Figure 8).
Figure 8: Teachers' opinion concerning their reservations about alternative evaluation methods (false, neither true nor false, true)

Where the efficacy of alternative evaluation methods is concerned, 91.4% of respondents declare that they are preoccupied with determining these methods' degree of efficacy (Figure 9).
Figure 9: Teachers' opinion about the efficacy of alternative evaluation methods (false, neither true nor false, true)

In conclusion, the analysis and interpretation of the data we obtained from the teachers' responses to the items of the structured journal underscore the fact that our hypotheses are in fact confirmed.

Thus, as the teachers become aware, through feedback and personal reflection, of the qualities and virtues of alternative evaluation methods when it comes to assessing pupils' scholastic performance, their willingness to use them more and more frequently will also intensify.

At the same time, the teachers observe the efficacy of these methods of scholastic evaluation together with the increase of the evaluated pupils' psychological comfort.

It is obvious that, despite their qualities and virtues, alternative methods of scholastic evaluation are not without flaws. Therefore, they should be used cautiously and moderately alongside classic methods.

Through its particularities, the structured journal, which asks for subjects' answers about themselves, their attitudes, their beliefs and personal opinion, could be and, to a certain extent is already, influenced by the social bias phenomenon (the subjects' tendency to shine a favourable light on themselves). Due to this fact, we considered it necessary to find new solutions that might mitigate the "distorted effects" of this investigation instrument. Thus, we employed a different research instrument, the *reflective journal* which "formally has approximately the same configuration" as the structured journal. However, it allows for a greater freedom for the subjects to express their opinions honestly and freely regarding the necessity, the usefulness and the impact of alternative evaluation methods on the pupils' personal development.

Thus, the teachers participating in our research were asked to write such a journal, expressing their onions, ideas and reflections concerning modern / alternative evaluation methods. In order to prevent the uncontrolled dispersion of the respondents' opinions, the (open) reflective journal included several suggestions at the beginning.

The instructions for filling in the reflective journal, formulated in the form of several self-interrogations guided the teachers' reflective activity. Their answers were analyzed taking into account the requirements of the reflective journal (evaluation planning, formative evaluation, summative evaluation, feedback and personal reflection) and the curricular field to which the participating teacher belonged (language and communication, mathematics and science, people and society).

A qualitative analysis of the teacher's opinions regarding their evaluation activity and the pupils' scholastic performance emphasizes the following elements:

most teachers, regardless of the their specialization, plan their evaluation activities taking into account their pupils' abilities, the nature of the subject that is taught and the established teaching-learning objectives;

many teachers use alternative methods of educational evaluation, which they believe to be useful, and helping the pupils feel that they are appreciated and valued;

the use of alternative evaluation methods should occur in parallel with the application of classic/traditional methods;

alternative methods of educational evaluation have a higher degree of efficacy because they allow pupils' results to be gauged and assessed with greater accuracy and objectivity, and at the same time they give pupils a higher degree of psychological comfort;

more so than traditional evaluation methods, alternative methods gauge and assess pupils' originality and creativity better, they stimulate pupils' intellectual potential, their active involvement in the process of learning, they stir pupils' interest and curiosity , favouring a heuristic type learning;

some teachers claim that using alternative evaluation methods is comfortable but they cannot give up traditional types of evaluation;

alternative methods lead to predominantly qualitative evaluation, which is why some teacher seem reluctant to use them;

alternative evaluation methods are liked by students but their efficacy is not always as expected;

alternative methods make evaluation more attractive to pupils, more likeable;

some teachers' reluctance to use alternative evaluation methods derives from the lack of knowledge surrounding these methods' positive characteristics and the lack of knowledge in how to use them;

alternative evaluation methods achieve a global evaluation of the pupils, advancing their type of intelligence;

alternative evaluation methods fulfill a motivational function, stirring pupils' interest in learning;

many teachers claim that they are interested in knowing more alternative evaluation methods and acquiring the necessary abilities to use them adequately.

In order to underscore the progress from a cognitive-informational and technical-procedural point of view (of the abilities to employ alternative methods of educational evaluation), we used an instrument entitled "progress sheet" through which we tried to quantify the gain achieved during a school semester by all the teachers involved in our study who used alternative evaluation methods. With the help of this progress sheet we tried to identify:

the cognitive and procedural gain achieved by employing new methods of educational evaluation;

the participating teachers' perception and opinion regarding the efficacy of these methods;

teachers' awareness of both the strong and the weak points of alternative evaluation methods, and a subsequent change in attitudes;

the degree of usefulness, efficacy and comfort (for students) that teachers assign to alternative evaluation methods in comparison to traditional ones.

The progress sheet was filled in by teachers towards the end of the evaluation period. This progress sheet followed the trajectory and evidently the progress achieved by pupils during the months they were monitored and evaluated through various evaluation methods, and especially through alternative evaluation methods.

Final conclusions

Our research has shown that:

a) using alternative methods of evaluating scholastic performances increases pupils' learning motivation, enhances the quality and the efficacy of the instinctual-educational process in school and creates a higher psychological comfort for the pupils,

b) the teachers becoming aware of the necessity, usefulness and the value of alternative methods of evaluation generates changes in their attitudes and practices, in the sense that they begin to use alternative methods more often.

Teachers in secondary education manifest a willingness to use alternative evaluation methods in the belief that it increases their objectivity in evaluating pupils' scholastic performance. At the same time, the pupils believe that in this way they are evaluated more fairly and the controversies regarding possible evaluation errors decrease.

We can notice that the teachers' reluctance to use alternative evaluation methods goes down as they start to understand these methods' usefulness and necessity and as they learn how to use them. Changes in attitude, mentality and practice are brought about by the teachers becoming aware of the value of these alternative evaluation methods and employing them in the classroom. The pupils' perception when it comes to the evaluation of their scholastic results determines teachers to adapt their evaluation methods and strategies to the characteristics of the discipline and the pupils' expectations.

The qualitative analysis of teachers' opinions regarding the evaluation activity has highlighted significant aspects about the use of alternative evaluation methods. Out of these we would like to mentions the following:

- the favorable opinion held by the majority of teachers participating in this research referring to the necessity, usefulness and the value of alternative methods of educational evaluation

- the teachers' belief that alternative evaluation methods have a greater efficacy due to the fact that pupils favour them and that they believe evaluation as no longer being a condemnation but a stimulus;

- most teachers have realized that the use of alternative evaluation methods contributes to achieving a predominantly qualitative evaluation;

- despite some difficulties and the teachers' reluctance concerning alternative evaluation methods, most support the idea that these methods are favoured by pupils and that as a consequence they feel that they "have to use" them;

- many teachers show the desire to learn more information, especially of the technical and procedural kind, referring to the use of alternative methods of educational evaluation.

Abstract

This article intends to present the result of some teacher´s work at the college education in a university in the South of Brazil. We are going to show how the work with new technologies was effective in spreading knowledge and even in allowing the interaction with groups. We are going to draw a brief profile about the teacher´s college education in Brazil, discuss different technologies such as the virtual learning environment (Moodle), Cmap tools, blogs and Facebook, and finally, we are going to talk about the importance of teachers training to work with technologies that are constantly being updated.

New technologies; Teacher education; Teacher training.

Introduction

I'm a great believer that any tool that enhances communication has profound effects in terms of how people can learn from each other, and how they can achieve the kind of freedoms that they're interested in.

Bill Gates

This analysis is a result of the lived experience of four professors who act training future teachers to teach in Basic Education and its goal is to discuss and present activities that were performed in the subjects Education and Technology, English and English Literature at the Linguistics Course from a Brazilian University in Curitiba, Paraná. It is a qualitative and quantitative research done in the first semester of 2011.

As professors we recognize the impact in the pedagogical practices that comes from the contemporary technological expansion and that the written, reading, comprehension practice and the teaching and learning process were also changed by this new scenery. Thus, we understand that the teaching process became more complex and compromising, because the current technology allows ubiquity in the academic education; place and time are sparse and it is necessary to have new ways of teaching and learning; the interaction process between teacher/student and student/student are not restricted to predetermined schedules and places.

This analysis of the professors' experience is organized in three different stages: first, some theorectical references, in which we intend to show a brief history of the teacher education in Brazil; second, we discuss contemporary technologies and their practices and finally, we have some considerations about training professors and teachers to work with contemporary technology.

The Higher Education Professor in Brazil

To talk about teaching in Brazil we have to remember that we are a country that bears a late breakthrough in college education; we have in our culture the Jesuit philosophy, after all, they were our first teachers. We must also have in mind that the scientific research in Brazil started in the 1930´s with the beginning of CAPES (Coordenação de Aperfeiçoamento de Pessoal de Ensino Superior), an agency that helps Brazilian students with their researches across the country. These are some features that were responsible for the making of the Brazilian teachers´ profile and their national identity. Our intention, therefore, is to scan the professor´s specific training; in other words, we are going to analyze how the professionals who work in the universities and train future teachers to work with the Basic Education are prepared.

The university educational practice or the teaching in a university is related to the conditions of the society that suggest different ideas about human beings and the society itself; consequently, we have different elements and assumptions about the role of the university and about the teaching and learning process. In other words, the way professors accomplish their educational actions are related, directly or indirectly, to these academic elements and assumptions. Therefore, it is important to say that the knowledge about reality and about its contradictions and its different understandings motivate changes in the educational and social paradigms, because it allows the professional tasks with more quality, parameter and planning.

For these reasons, Cunha (2006, p. 258) says that:

The performed analyses about professors in the universities make us think systematically about the teaching profession at this level of education, about the professor knowledge and skills and about the innovations that take place in the academic places. These concerns intend to help the understanding of the professor´s pedagogical practice and advance a specialized knowledge about their profession.

Therefore, the teacher is a professional who, in order to develop his teaching skills, needs to be always looking for innovations to enlarge the possibilities in the teaching and learning process.

College education in Brazil has in its cadre of professionals, professors from different areas; they know the environment because they are academics or managers who are studying basic or specific subjects related to their profession. In some cases, these professionals do not have in their curriculum any specific subjects like didactics, developmental psychology, curriculum, history of education and other subjects that help building a theoretical and/or scientific basis for teaching education, and, consequently, provide them with a pedagogical basis. As Anastasiou and Pimenta (2005, p. 35) say, "How do professors identify themselves professionally? [As a] physician, a lawyer, a doctor, a geographer, an engineer […]".

According to this scenery, professionals from different areas become professors. Through continuous studies these professors try to develop their teaching skills by taking post-graduate courses. Some of them do that on their own initiatives; some of them because the institutions where they work offer a career planning, although there is not, by now, a national project for the improvement of higher education professionals. This lack of specific teacher education programs seems to be even more critical when we have to face new technologies and the different ways of using them in class. Most professors graduated in a time when there were not any blogs, software, computers or other technological tools in their educational environment.

Considering this information, we believe professors are professionals who own a specific knowledge. They need to take consistent actions to make their students intensely take part in classes, in order to try to avoid the

traditional way of just transmitting knowledge. We understand that college education is active and proactive. Therefore, we must consider the influence of the new settings that the virtual learning environments as well as the technological resources impose daily to professors.

Under these terms, teaching is the result of the construction and deconstruction of concepts, values and experiences that respect the fact that the world is not limited to a determined and controlled space anymore. The development of communication and computerization technologies has changed the world into a place with no boundaries. The professor who is not able to face this new planetary organization runs the risk of being overcome by the history, being defeated by the new geopolitical reality and by the education beyond the classroom.

We believe that higher education teaching is something challenging, creative and scientific. Having its basis on science and on science criticism – fields of study that have been largely used in the academy – it tries to promote a new appropriate knowledge to a specific time and place.

Contemporary Technologies and Practical Perspectives

We witness different times and they bring us some changes: overcoming paradigms has become a permanent proposal. Technologies allow the contemporary society to enjoy new possibilities of production and socialization of knowledge. According to Kenski (2007, p.11), "I turn on my computer and immediately I access the internet. I get in my university address in the virtual world. A screen stands before my eyes."

When we talk about the use of technologies at the educational environment, we are getting closer to other pedagogical practice perspectives, using the technological tools to help in the teaching process, facilitating the access to information and to the systematized knowledge. It is interesting to try to understand that the technological advances are work tools for teachers and that the ghost that used to haunt us with the idea that the machines would get the teacher´s place is now in the past.

As the aim of the technological tools is diversified, in this stage of the research we are going to talk only about the tools that are used by the professors in the institution in focus in this article. They are: virtual learning environment (Moodle), Cmap tools, blogs and Facebook.

The virtual learning environments are prepared to receive and send information from distance places through technological systems. Nowadays, we can find these virtual learning environments in educational institutes that have noticed the power of the technological resources to students after being in the classroom. They allow the use of pedagogical strategies related to teaching and learning skills, and help students to overcome barriers related to time and place in an easier way. The virtual learning environments are organized in a way that allows students to open their minds. According to Almeida (2003, p. 119) "These environments can be used in online distance education systems; supporting the activities that are done in the classroom, spreading the interaction between students beyond classroom´s time and place."

The virtual learning environment from the university that we are analyzing here is organized to cooperate facilitating the learning process, attending requirements from the actors that use the place. The tools must be adequate, according to the needs and requests from a specific moment. Almeida (2003, p. 119) states that "The virtual learning environments´ resources are basically the same we have on the internet (mail, forum, chat, conference, resources center, etc)." The virtual learning environment is available on the web and it can be accessed by the students from everywhere, allowing professors to have activities with their students even when they are not at the premises.

The use of Moodle in our institution has proved to be an effective tool to be used in virtual classrooms and forums. In distance learning, students participate by asking and answering questions concerning themes proposed

by the professor. In real time, the professor talks to the students, motivating them to enlarge and/or deepen their research. In the Forum, the questions are posted in advance, and the students post their replies. Besides reading the answers, the tutors map them, and make some statistics in order to improve the use of the tool.

The tool maps technique was developed by Joseph Novak and his team in the 70´s, after working research with children. Novak´s employees tried to search the learning applicability of Ausubel and Vygotsky's theories. The tool maps technique comes up from the necessity of organizing all the collected information. As a consequence, we have what we know today as Cmap Tools. They are a teaching and learning tool that helps the student to learn in a meaningful and reflexive way; it stimulates the student, who acts and reacts, in a rediscovery process. It is considered a pedagogical visual resource that actives and motivates those who learn better through vision. To work and to learn from a Cmap tool, reading comprehension is mandatory. By using the tool, it is possible to share ideas, organize knowledge, act and react before, and thus develop independence.

Novak (2003) defines Cmap tools as a tool to organize and represent knowledge. This meaningful material helps studying and learning; it also promotes cognition and social interaction. To create a cmap tool one needs to read the material, to choose main concepts, to use arrows, ramifications, key-words and links.

To share information, ideas and discoveries with other professors and to be updated in their area, the professor needs to be "websocially" added on the web and have to access the so-called cyberculture world that, according to Levy (1999, p.17), is "a set of techniques (material and intellectual), practice, attitudes, ways of thoughts and values that develop with the cyberspace growth."

Years ago it was necessary to be in lectures, seminars and events to know people that could contribute with news relating to the improvement of our classes. Nowadays it is possible to know what happens all around the world in real time in cyberspace. The Social networking is a good example: through Facebook, professors from the university that we are analyzing here have coworkers´ groups that share the same interests and that keep them updated about everything that is new concerning the web pedagogical tools that can be used in the classroom.

One of these tools that are really useful to the contemporary pedagogical practice is what we call blog. Even though it was not created as a teaching/learning resource, it has been used by professors, teachers and students from different areas and institutions as a complement of their classes. Through this resource, professors from the university mentioned here publish their own articles and post materials written by different people about the themes that have been – or are going to be – discussed with their students. Professors of English also use blogs as a digital journal to motivate their students to practice writing. These materials can become articles and they can be published in academic journals.

Conclusion

Let us turn now to some final remarks. For a long time, we have been searching for innovative ways of meeting the needs of our students. We have noticed that their performance and their interest have improved after we started using the new technologies mentioned above. Interdisciplinary studies and the integration of contents have been greatly stimulated, and there is no doubt that the new technologies play a crucial role in this process.

Our institution stimulates the use of technologies. Professors, students and people in general can access everything that is produced by the university which, on its turn, fulfills its social function, stimulating research and sharing knowledge. (10 pt) Here introduce the paper, and put a nomenclature if necessary, in a box with the same font size as the rest of the paper. The paragraphs continue from here and are only separated by headings, subheadings, images and formulae. The section headings are arranged by numbers, bold and 10 pt. Here follows further instructions for authors.

TEACHER THINKING ABOUT KNOWLEDGE, LEARNING AND LEARNERS:A METAPHOR ANALYSIS

Mani Bhasin Kalra[a], Bharati Baveja[b]

[a] Associate Professor Department of Education, Lady Irwin College, University of Delhi, Delhi, India

[b] Professor, Faculty of Education, University of Delhi, Delhi, India

Abstract

Metaphors reflect the insight about teacher knowledge and its execution when teachers teach. Metaphors are acknowledged as elemental constituents of human cognitive processing that have a useful place in teacher thinking and beliefs research today. Metaphors manifest teacher's beliefs and 'Beliefs reflect their perceptions. Though it is true that a Metaphor analysis may not be able to completely interpret or uncover teachers' veritable beliefs as uncovering beliefs or personal theories requires a detailed qualitative analysis, it certainly helps us to gain deeper insight into teacher's thinking and our understanding of teacher's beliefs, behaviours and actions. The objectives of the study are: 1. What metaphorical images do preservice teachers use to describe Knowledge, learning and learners? 2. What typologies or categories can be evolved from these metaphors? 3. What images can be derived from preservice teachers' metaphors about knowledge, learning and learners? 4. What implications can be drawn from the Metaphor analysis for teacher education programmes?

This research is the part of a larger study that comprised a sample of 637 preservice and in-service teachers in India with the objective of analysing their beliefs or personal theories about knowledge, learning and learners. The findings indicated that the participants unconsciously constructed and used their own metaphors that became the basis of their conceptualization about the three aspects - knowledge, learning and learners.

Keywords: Metaphors; Beliefs; Personal Theories; Pre-service teachers.

Introduction

The Dictionary defines a metaphor as a literary figure of speech that uses an image, story or any tangible thing to represent a less tangible thing or some intangible quality or idea. Metaphor is a Greek word, which means transfer (meta means trans, or "across"; phor means fer, or "ferry") (Fenwick 2000, in Kasoutas and Malamitsa 2009). It is also described as a figure of speech in which an implied comparison is made between two unlike things that actually have something in common. A metaphor expresses the unfamiliar in terms of the familiar. A Metaphor is also observed to be used to express a phenomenon or a situation in familiar terminology. According to Senge (1990) in Farrell (2006) these are 'what humans carry in their heads', in the form of images, assumptions and stories, and not only determine how we make sense of the world, but how we take action'. According to Clandinin (1986) metaphors are indicators of the way teachers think about teaching and also guide the way they act in the classroom. Metaphors reflect the insight about teacher content knowledge and its enactment when teachers teach. Metaphors are acknowledged as elemental constituents of human cognitive processing that have a useful place in teacher thinking research today. According to Lakoff and Johnson (1980),'a metaphor is one of the most important tools for trying to comprehend partially what cannot be comprehended totally: our feelings, aesthetic experiences, moral practices, and spiritual awareness. These endeavours of the imagination are not devoid of rationality; since they use metaphor, they employ an imaginative rationality. Metaphors also relate to reality as many of us share the same insight shown by using the same metaphors. The metaphor helps to highlight certain features of reality while forcing others into the background, and thus points to the most relevant and important features of the situation.' Tubin, (2005).

Metaphors and Beliefs

Metaphors reflect beliefs and 'Beliefs focus people's perceptions. They determine which features of a new situation will be selected. The mind then tries to find a match for those features in prior experience'. Yero (2002). The essence of metaphor, according to Lakoff and Johnson (1980) is the understanding and experiencing of one kind of thing in terms of another. "A teacher who believes students learn through active interaction with their environment will perceive the same levels of noise and motion, but with a more positive interpretation and a different "feeling". The teacher may unconsciously find a match in situations where productive activity is taking place such as a beehive or a construction site. To this extent, a metaphor a person uses reflects that person's beliefs." Yero (2002). Metaphors have been found to be culturally rooted. The choice and use of metaphors is also influenced by the situation in which those metaphors are to be used; different situations may bring about different metaphors in the same teacher and different teachers in the same situation. Difficulties with the interpretation of metaphors include: (i) too many possible interpretations; (ii) some are too ambiguous and abstract to be interpreted; and (iii) they can be interpreted differently by different researchers (Lim 1999; Glucksberg et al. 1992 In Kasoutas and Malamitsa (2009).

Review of Studies

Hoa (2009) in her study on processes of knowledge construction in Vietnamese Children found that teachers believed their own roles of be of mother, boat rower and used such metaphors to describe their roles. According to most teachers in her study, the 'giver – receiver' model of teaching-learning was considered important to support the process of construction of knowledge. The image of a boat rower metaphor, the noble functions of a teacher in taking the learners from unknown shores to known with his/her tireless efforts were highlighted. Tobin and Tippins (1996) also pointed out that metaphors serve as a link between what is known and what is unknown and provide a connection between images and language. They further emphasized that these two qualities may allow the teacher to build new knowledge and construct better strategies for teaching (In Chen (2003). Lim Chap Sam (1999) in her study used metaphor analysis to explore adults' images of mathematics. She discusses the possible use of metaphor analysis in exploring adults' images of mathematics. Based on reviews of past literature and the author's own experience of using this kind of analysis in one of the image study, the potential advantages and problems encountered during the study are discussed. Cortazzi and Jin (1991) explore teacher's and students' metaphors about teaching, learning and language and found that teacher's accounts of significant learning events are deeply and widely pervaded by metaphors. Chapman (1997) investigated the teaching of mathematical problem solving from a teacher's perspective. The study focused on three teachers and their way of making sense of teaching problem solving. The findings indicated that the participants unconsciously constructed personal metaphors that became the basis of their conceptualization of problems and making sense of their teaching. Community, adventure and game were determined to be the key metaphors of the three participants, respectively. Inbar (1996) in Saban et al (2007) collected and categorized over 7000 metaphorical images of what a teacher, the learner, the principal and the school are. It appears from these data that most of the educators in the study tended to perceive themselves more in a caring role while the majority of the students tended to focus more on the evaluative and controlling aspects of teaching.

Schinck et al (2008) in their paper report on the beliefs that ninth and tenth grade students have about mathematics. These beliefs were revealed using contemporary metaphor theory. An analysis of the students' metaphors for mathematics indicated that students had well developed and complex views about mathematics. Metaphors seem to provide a powerful cognitive tool in gaining insight into prospective teachers' professional thinking. Saban et al (2007). **Saban (2010)** investigated the metaphorical images that prospective teachers in Turkey formulated to describe learners. Farrell (2006) finds that Preservice teachers come to any teacher education course with prior experiences, knowledge and beliefs about learning and teaching. Additionally, the belief systems of preservice teachers often serve as a lens through which they view the content of the teacher education program. Consequently, it is essential that teacher educators take these prior beliefs into account because any new material taught will have to compete with these existing beliefs and theories. However, these beliefs are usually held tacitly. One method of making this prior knowledge explicit is to examine the metaphors preservice teachers use during their practice teaching. **Saban et al (2007) in their study** investigated the metaphors that prospective teachers in Turkey formulated to describe the concept of "*teacher*". Participants

completed the prompt "*A teacher is like... because...*" by focusing on only one metaphor to indicate their conceptualization of teaching and learning. Ten main conceptual themes of metaphors were identified. Metaphors are commonly used as a powerful research tool in teacher education programs for eliciting the personal theory of teaching and learning (Goldstein 2005; Saban 2004; Saban et al. 2007; Wright et al. 2003). (In Kasoutas and Malamitsa (2009). Kasoutas and Malamitsa (2009) while exploring Greek teachers' beliefs using Metaphors, write in their paper about 'known difficulties in working with Metaphors', "conceptual metaphors are not only created but also inherited from the community to which each one belongs. Also cultures embed a changing repertoire of favoured metaphors, which reflect particular aesthetics (Fenwick 2000). As a result, persons belonging to the same community tend to prefer specific metaphors frequently oblivious to the meaning constructed and communicated through their use (Robertson 2003)."

Objectives

1. What metaphorical images do preservice teachers use to describe Knowledge, learning and learners?
2. What typologies or categories can be evolved from these metaphors?
3. What images can be derived about 'knowledge' from preservice teachers' metaphors about learning and learners?
4. What implications can be drawn from the Metaphor analysis for teacher education programmes?

Methodology

This research is the part of a larger study that comprised a sample of 637 preservice as well as in-service teachers with the objective of analysing their beliefs or personal theories about knowledge, learning and learners. The larger study being a mixed method study used Self reports, Interviews and Observations of both student teachers as well as in-service teachers. According to Moser (2000), in Saban et al (2007) metaphor analysis is essentially a qualitative research methodology related to content analysis, but it also allows researchers to apply quantitative procedures on the categorical data, resulting from the uncovering of the meanings and reasoning beneath those consciously set forth by the participants in each metaphorical relationship. In order to study the beliefs of preservice teachers further, a short very questionnaire comprising two questions was administered to 103 preservice teachers at the beginning of the teacher education programme.

The preservice teachers were required to complete the statements with the images that came to their minds while completing the following statements. The three questions are: Learners are like__; Learning is like_; Knowledge is like___. The student teachers were given 30 minutes to complete the three statements with appropriate metaphors that adequately represented their thinking about learners and learning. More time was not given because a prompt response was required from the teachers, without giving them time to think but enough time for them to write the first and immediate thought that came to their mind about the statements to be completed.

Analysis

In the analysis of qualitative data, the metaphors from the pre-service teachers were analysed using content analysis. Employing the Emergent Coding Technique, categories were established following the preliminary examination of the collected data. The data i.e. metaphors thus obtained were categorized in broad categories or typologies that explained and expressed their beliefs and thinking. The metaphors thus obtained were put together in lists and pasted on data sheets, based on their similarities the metaphors were analysed one by one and categorised into different categories, by the researchers. An attempt was also made to categorize the responses into as many categories as that could be possible because some of the responses contain multiple views or varied expressions.The invalid metaphors were identified and removed from the final sheets that were then coded and organised. In order to obtain validity the data from students have been presented as data sheets. The process of analysis has also been clearly explained. The responses from the students too are included in

quotes. After eliminating the data from 8 teachers, because the teachers had not filled in the responses, or the responses were too ambiguous, the rest of the 95 metaphors each for 'Learners' and 'Learning' and were coded, categorized and analysed while 81 metaphors from student teachers were coded after removing the invalid metaphors for Knowledge. It is true that the responses were open to multiple interpretations because of their subjective nature; attention was therefore taken by the researchers to be as objective as possible while categorizing the metaphors in different typologies or categories. The data was collected, coded and analysed by a single researcher, this analysis was then discussed and agreed upon by one expert who placed the Metaphors in respective categories that were identified by the first researcher. Ten student teachers were also asked to complete the following statement "A teacher is like _____ because _____", in order to confirm that the researcher had appropriately interpreted the Metaphors and placed them in suitable categories.

The Learner

Metaphors for Learners described by the student teachers fell under only three categories i.e. ***Learner as Elements of nature, Learner as object of Use and Learner as a being or a human being, with one Miscellaneous.***

Table 1.7. Learner Categories

S.No.	Categories	No. of Students	Percent
1	Elements of Nature	42	44.2
2	Objects of Use	38	40.0
3	Being/Human Being	14	14.7
4	Misc.	1	1.05
	Total	95	100

1.7.1. Learner as Elements of Nature

Student teachers who believed their learners to be elements of nature or a natural phenomenon viewed their learners to be a ***seed, fish, plant, flower, tree, blossom, bud, earth, river, bird, star, moon, rainbow, rays, growing plant, aroma, ripe fruit, meandering river, sea, budding plant, light, drop of water***, suggests that the student teachers believe their role to be that of a nurturer or a cultivator who likes to see their students grow and develop.

The metaphors of a ***seed, plant*** etc. shows that learners are like plants and seeds etc that need support and care, it also suggests that the learners are very delicate and if not taken care of, may 'wilt'. Other elements of nature are such as ***ripe fruit***, that suggests that the effects of teacher's teaching is visible in the form of a 'ripe' or educated learner; ***earth, moon, rainbow*** all depend upon; are interpreted as, 'someone other than the learner that makes a learner shine, show colours etc. when compared to a ***fish***, it conveys that a learner can be compared to a small fish, helpless in a large ocean, where it might get lost if not for a support like a teacher.

1.7.2. Learner as Object of Use

Student teachers believed their learners to be ***potter's clay, boat, diya, candle, plain sheet of paper, freezer, food, instrument, musical instrument, a blank wall, glass, monitor, bulb, empty pitcher, sweet, sponge, pot, clay***, suggesting that their learners could be moulded in any way that they liked.

It however also shows that the student teachers could also see the changes that they desired in their learners as a result of their teaching when they compare their learners with clay that can change shape depending upon which shape the potter desires to give it, empty pitcher or a glass, that can be filled with anything and in any quantity; like a refrigerator that can be stuffed up with food (information here), even stores that something that you may use later or even never use, a monitor, that shows only what humans feed in the CPU; a sheet of paper, on which one can write anything, a blank wall that can be painted in any way and in any colour, learners here are believed to be passive recipients of knowledge. All these metaphors also suggest that the learner is devoid of any previous knowledge and awaits someone to 'fill' in that knowledge. The state of a learner is like a storehouse that stores everything but is unable to process. Learners associated with computers too suggests that like a computer can store large amount of data, so can the learner, except now maybe the information can be processed, but only when required (exam time). Learners are like 'sponge' when they absorb all the information that is provided by the teacher, without ever needing to understand. It also suggests the capacity of a learner who is able to absorb many times more than its size as in the case of a sponge.

1.7.3. Learner as a Being or a Human Being

Student teachers' metaphors such as *hungry person, infant, care giver, mother, rider, baby, child, body, soul, artist, astronaut, receiver, traveller, seeker, enthusiast,* suggests that the student teachers believe a learner to be a being or a human being. It also implies that learners are equated to animate beings suggesting that they are responsive and have needs and desires, are hungry to learn. Learner is likened to a *receiver* because he/she accepts without questioning the giver; a *rider*, who likes to take risks and challenges and is very strong. As in the case of an *infant* or a *baby* or a *body*, it conveys that as a baby struggles and discovers new things around himself or herself, also cannot manage on his or her own, is someone who is helpless, doesn't know much and needs support to grow, so does a learner.

Learning

Metaphors for Learning described by the student teachers fell under six categories i.e. *Learning as Elements of nature, Learning as object of Use, Learning as a being or a human being, Learning as Process, Learning as Product and the Miscellaneous category.*

Table 1.8. Learning Categories

S.No.	Learning Categories	No. of Students	Percent
1	Elements of Nature	33	39.29
2	Objects of Use	17	20.24
3	Being/Human Being	7	8.33
4	Process	14	16.67
5	Product	5	5.95
6	Miscl.	8	9.52
	Total	84	100.00

1.8.1. Learning as Elements of Nature

Student teachers who believed learning to be elements of nature or a natural phenomenon viewed learning as *soil, water, sunlight, fragrance, blossom, fruit, gravity, rain, sea, sky, sun, ocean, bottomless ocean, moon, sunshine, coloured pigment, blooming garden, light.* Most of the student teachers used *sun, sunlight, sunshine,*

light as a metaphor suggesting that knowledge or learning is so powerful that it emits' light'; likewise the emitted light is so strong that it has the ability to light the world around and provide heat and energy. Other metaphors of *sea, bottomless ocean* suggest that learning is as deep as an ocean; in fact its depth is unknown, it also conveys the difficulty in learning which is like *crossing the ocean*, *sun, the moon, the sky* suggests that learning cannot be achieved easily and may also be unreachable.

1.8.2. Learning as Objects of Use

Learning metaphors from the student teachers mainly comprised s*ugar, nutrition, food, fruit, colours, brushes of art, CPU, electricity, light and wheel.* Most of the student teachers compared learning to food items such as *sugar, fruits* etc. The metaphor when related to food items shows the importance of learning same as food is for life. It also suggests something that is sweet which conveys that learning is attractive i.e. it pulls one to itself in the same way as sweets and fruits. *Colours and brushes of art* as metaphor for learning again suggests that learning can be of a variety of types and it finds its place in different ways just as the colours do in a persons' life, it also suggests that learning is interesting and not boring. The student teachers realizing the need and importance; or a *wheel,* which has been a basis for life and has continuity, suggest learning as a continuous process and its use in various spheres of life.

Some student teachers compared learning to a mould that gives shape to any object suggesting that learning like a *mould* gives shape to a learner in any desired shape that the teacher provides a 'mould' in.

1.8.3. Learning as a Being

The category of learning as a being comprised only 4 metaphors, with most of the metaphors on learning as a *mother*, who takes care of her children and provides for anything that a child needs, similarly learning too 'provides' a learner with necessary skills and knowledge to accomplish anything that a learner wants to achieve in life. An *experienced teacher or a guide* as a metaphor suggests that learning is not memorizing but experiencing, it also suggests that for a teacher learning is 'the real learning' and her experiences are the ones that are important to learners. The other most important metaphor under this category comprises learning as *soul* or as *life*, again suggesting the 'all important' tag for learning just as in the same way as soul and life are crucial for a body. Soul also conveys the 'central' meaning to learning. Learning is like *travelling* when a learner goes through it like a traveller, discovering and experiencing things and learning as the learner travels.

1.8.4. Learning as a Process

With 7 metaphors identified in the category of Learning as a process most of the metaphors conveyed learning as a process that is never ending and is lifelong, suggesting that a learner continues to learn throughout his or her life, learning does not end with the learning achieved at an educational institution but it goes on beyond it, living one's life too teaches many things to a learner, as a result it is a never ending process. Many student teachers used *cooking* as a metaphor for learning suggesting that learning may be as simple or as difficult as cooking, also reflecting the importance of the result of cooking i.e. food which again is very important for life. Cooking also entails various processes and skills which convey that for learning to occur a learner needs to use different skills and strategies. A few student teachers used *grinding motion, climbing up a ladder, going up,* suggesting the difficulty in learning, while grinding suggests that the student teachers need to use 'grinding' or great effort to enable students to learn. Climbing up a ladder also suggests that as one goes up the ladder which requires a lot of effort, ones view of things around becomes clearer......because of height suggesting more knowledge.

1.8.5. Learning as a Product

Learning as a Product category comprised 4 metaphors that were used by the student teachers to compare with learning. The student teachers used *music* as a metaphor for learning which makes learning as sweet and melodious as music. At the same time sweet music can only result if the musician plays his or her instrument suggesting that the music or learning can only be produced once a teacher with her students constructs

Knowledge together. Most of the student teachers used *experiences* as a metaphor to convey that learning can occur if experiences stored with the student teachers are shared with their learners. Learning is an *asset* because it can be stored and used as and when required, can be transferred just as assets can be transferred. It also suggests the great value of learning just as assets are valued.

1.8.6. Learning as Others/Miscellaneous

With 5 metaphors in the miscellaneous category student teachers used metaphors such as *energy, personality, path and places* for learning. Most of the student teachers used *Energy* as metaphor conveying that learning gives energy and ability to a learner making him or her stronger to face the challenges in society. Learning is a *path* because it is something that has been treaded before, in this case by the teacher, mentor or a guide who then 'puts' the learner on the same path carved by him or her. *Places* as a metaphor conveys that learning can be explored just as places can be explored. The learner needs to discover to learn. Learning is like *knowledge* as this is what is transferred that result in learning.

Knowledge

Metaphors for Knowledge described by the student teachers fell under only three categories i.e. **Learner as Element of nature, Learner as object of Use and Miscellaneous category.**

Table 1.9. Knowledge Categories

S.No.	Knowledge Categories	No. of Students	Percent
1	Elements of Nature	54	66.67
2	Objects of Use	18	22.22
3	Misc.	9	11.11
	Total Students	81	100.00

1.9.1. Knowledge as Elements of Nature

Most of the student teachers used the metaphor of *rising sun, sun, sunlight, sunshine* for knowledge relating knowledge as Knowledge gives a person 'shine' like sun gives us shine, spreads its rays to lighten the world, it distributes sunlight equally to all, lights up our lives in the same way and brightens future. Many student teachers likened knowledge to *sea* or an *ocean* as it contains many things, living things etc., It can accommodate a large number of things, it is endless and a learner dives in the ocean of knowledge, more one explores, deeper it gets; it never ends and just gets bigger and deeper as one wade into the ocean, has no end, no limit, it is wide, unlimited water even after so much is used and consumed each day, has currents. Knowledge is like a *flower* as it blossoms like a flower, makes people happy, makes one's life blossom, and gives fragrance to all without discrimination, just like knowledge. When knowledge is like a *tree* it gives fruit, shade and shelter to all equally, just as knowledge does, removes carbon dioxide and gives oxygen like impurities are removed from mind because of knowledge. Knowledge is like a *well* because we can put many concepts in it because of its depth,

just like a well can contain a lot of water, so can knowledge. Knowledge is likened to a *pearl* as we only get a pearl if we go deeper in the sea similarly only once we go deeper into learning we get the *pearl* of knowledge. It is like Life in the same way as life teaches us lessons.

1.9.2. Knowledge as Objects of Use

Knowledge is like a ***burning candle, candle, diya, light, ray of light*** because it gives 'light' to others, knowledge lights up a person like candle lights up a dark room, removes darkness, shows direction in a dark room, removes darkness, gives awareness. Darkness here is referred to the ignorance because of the lack of knowledge. When knowledge is likened to a food item it is as the Mind needs the food of 'knowledge' and it is like *sugar* because like sugar knowledge too is sweet, knowledge makes a person's life comfortable and useful. Mind like treasure can be stored and is taken care of like we take care of our treasures. Knowledge is like *electricity* because it has a lot of Energy; one can achieve a lot because of the power of knowledge. Knowledge is like a *pot* as we can give a pot any desired shape; likewise knowledge can occur in any form the teacher gives it a shape. It is like a *flower pot* as teachers have sown the seeds of knowledge in the flower pot which will bring out flowers that will give fragrance. It is like a *mirror* when it reflects our true self like knowledge does, our knowledge shows others who and what we really are. The metaphor of a *book* is used for knowledge as unless you open the book of knowledge, your goal cannot be reached. It is like *money* which suggests that a person's needs cannot be fulfilled without money, similarly without knowledge it is not possible to achieve anything in life. Knowledge is like *storage* when it is like a storehouse of information that stores a lot of content.

1.9.3. Knowledge as Miscellaneous Category

Knowledge under Miscellaneous comprised metaphors such as ***gaining profit, success, experiment, God, soul, life, learning and experience***. Most of the student teachers used the metaphor 'experience' for Knowledge as experience enlightens our minds and has a long life. It is like ***gaining profit*** as like profit knowledge helps us in gaining many things in life. Knowledge is *immortal* like 'God' as it never dies; it always remains in some form or another. It is likened to a 'soul' as everything depends on it as all depends on knowledge. Knowledge is like an experiment as it gives results just as any experiment does. Some student teachers used *learning* as a metaphor for knowledge believing that they were like synonyms.

Discussion

We came across a rich variety of images in the form of metaphors when we analyzed the data from the Pilot study and also in the data received from the student teachers. It was interesting to see the variety in the types of Metaphors that these student teachers used. This study with the final sample of 95 female student teachers reveals that student teachers used a variety of metaphors to relate and make sense of the world around them and used metaphors very often. As compared to other recent studies that have been conducted by **Saban et al (2007); Hoa (2009) etc, it was found that the Metaphors used by the participants of the study reflected their own socio-cultural background. Metaphors such as teacher as an 'Octopus'**, 'teacher as butterfly' and 'teacher as chameleon' **and the like were not seen to be used. In all t**here were 6 major categories derived for learning; 4 categories for learners and 2 for knowledge.

This research helped us gain a better insight about the concepts of knowledge, learners and learning of pre-service teachers. We as teacher educators need to prepare a reflective group of teachers. There are various studies that have used Metaphor analysis as a methodology to study student teachers' beliefs. According to

Senge (1990) in Farrell (2006) these are 'what humans carry in their heads', in the form of images, assumptions and stories, and not only determine how we make sense of the world, but how we take action'. Clandinin (1986) has suggested that metaphors are indicators of the way teachers think about teaching and also guide the way they act in the classroom.

Metaphors therefore help us establish how we see the world and also how and why we take action in different situations and make beliefs explicit; these thus need to be a focus of dialogue in teacher education programmes. When teachers reflect on their actions and write case studies, it has been seen that they also use Metaphors. The analysis of Metaphors that the teachers use helps them to reflect on and assess their own beliefs and personal theories. Teachers are then able to inspect their own behaviour and also are able to reflect upon how these impact their own actions in the classroom. The metaphors thus can effectively be used as a tool for teachers to reflect upon their own actions. Organization of such exercises or Diary writing for preservice teachers by teacher educators will go a long way in improving teaching practice. Diary writing has been found to be an effective process for teachers to reflect on their actions. It enables a teacher to write down her reflections and read them through to reassess her actions. The diary writing by the prospective as well as the in-service teachers needs to reflect the major aspects of their teaching and it must be able to answer certain questions. These actions taken by the teacher will go a long way in making their beliefs and personal theories explicit which will then also become a focus of dialogue leading to the improvement of teaching and learning in schools, which is the need of the hour. Teachers need to be persuaded to organise their thoughts, see the associations with theories and also make conscious efforts to posit and hypothesize. In a study by Chan (2004) on beliefs where results give support to researchers' assumptions in the literature that 'teachers' conceptions and class teaching are beliefs driven and if teacher education students are able to make their beliefs explicit, it would help their learning 'how to teach' through discussion and analysis of what they believe to work in their teaching.' Teacher preparation programmes as a result need to endeavour at cultivating in students an inquiring attitude and the abilities to learn by analysing and reflecting on their actions. The teacher educators need to take prospective teachers' prior beliefs and personal theories while planning their teaching strategies and providing experiences that allow for reflection to bring about changes in teacher education. In order to structure effective learning environments that promote reflection, teacher educators and policy planners need to draw on research related to teachers' beliefs and personal theories and also use effective, socio-culturally relevant tools and strategies such as Metaphor analysis to bring forth and challenge their beliefs.

Abstract

In this study, two of gains related to Ataturk in the course of life sciences in primary school curriculum and renewed pre-school curriculum were determined by researchers for the purpose of the study. Gains are related to the disciplines of mathematics and life sciences. Scheduled teaching for 6 age group and 1st class students were administered by a total of four groups including prospective teachers from classroom teachers and pre-school education. Prospective teachers in each group were constituted by 4-5 persons. The study used a combination of qualitative and quantitative patterns. Data were gathered with *evaluation form of the teaching process* which was prepared by the researchers. Due to the closeness of the 6-7 year old age group's age and development characteristics, the conducted activities demonstrated similarity. Prospective primary school teachers had the opportunity to observe the circumstances of year 1 students before they come to primary school and prospective pre-school teachers had the opportunity to observe the development of students in 6 year old age group after them. With this study, prospective teachers have had the opportunity to practice the theoretical knowledge on development, learning and teaching they learnt till present.

Key words: Prospective teachers, concept of Atatürk, transition to primary school and pre-school education, primary school education, pre-school educatıon.

Introduction

Primary education preparation is easy and adequate learning of the child without experiencing emotional confusion. The child reaches this preparation by completing the things it has learnt in the "pre-school period" (Oktay, 2002). It is important that preparatory activities are carried out for children coming to school without benefitting from the opportunities of pre-school education (Bilir, 2005). The setting in which the child is can directly influence the child (Oktay, 2002). The readiness of the child for school is possible with the child getting through this critical period in its development successfully and through conscious guidance. Education of the child begins at home and experiences acquired at home are combined with newly learnt knowledge (Yazıcı, 2002; Parlakyıldız & Yıldızbaş, 2004). Preparing children for primary education is among the most important objectives of pre-school education. Thus, in pre-school education preparation for primary education is one of the most important areas to be emphasized (Polat Unutkan, 2006, pp.7). Conducted studies suggest that children, who have received good pre-school education are better than their peers in adaptation to primary education and their academic achievement, just as in all fields of development in future years (Yılmaz, 2003, pp. 13; Sevinç & Bayhan, 2006, pp. 212). The first step to primary education and thus, life is possible through the correct learning of concepts.

Learning Concepts

According to Piaget, concepts actualize in two stages: The first stage is concept formation and the second stage is concept attainment. Concept formation occurs in two steps: 1. First concepts are learnt through experiences children acquire visually. 2. Afterwards, details among abstract characteristics are learnt. By perceiving the similar and different aspects of the concept, the individual generalizes the similarities and forms concepts. Concept formation is intense in childhood years as everything around the child is new. The concept acquisition is the second stage of concept learning. In this stage logical grouping is based on the characteristic of the formed concept together with the developed schema. Concept learning in children generally proceeds through the stages of recognition, naming, matching, ordering, grouping, and differentiating.

In learning concepts, in order to aid concepts and generalizations, model works, illustrations, photographs, pictures, video etc. experienced with real objects as a result of an activity is required (Cited by: Birbili,2007, pp. 144). Another approach suggested by Taba (1966) is guiding of the student to discovery by the teacher through questions asked. It is the direction of children to observe through questions such as "what did you hear? What did you see? Why?" etc and ensuring that they differentiate similarities and differences between concepts as a result of their observations. Here, the teacher is only the one that asks questions. This strategy is called the "list, group, label strategy" (Cited by: Birbili, 2007, pp. 145).

According to Birbili (2007), no matter which strategy is utilized, the early childhood period should be focused on carefully in concept education. Another factor to be paid attention to in concept learning and generalization is to present the child with the most possible examples and experiences. When presenting children with various examples, the teacher has the opportunity to observe the achievement of the child in concept learning (Birbili, 200, pp. 146). Example selection is a critical component of concept acquisition. The first samples should be real samples or pictures. This ensures that the concept is learnt more firmly by the child (Birbili, 2007, pp. 146). The role of the teacher in concept learning is to ensure the child has the most possible experience using his/her senses, the child has knowledge on what s/he knows till present, form experiences suitable for comparison, to guide in the determination of similarities and differences between objects, and thus, to ensure that the child finds meaningful and useful information in daily life (Birbili, 2007, pp. 147).

Purpose and significance of the study

Statements for Ataturk used by families, teachers, visual media and social environment are the first concepts created by pupils mentally and learned by them. The way subject of Ataturk is being taught changes depending on these factors. This hinders proper learning of the concept of Ataturk and causes miscomprehension. However a pupil has his/her first information on Ataturk in the preschool period. Introduction of Ataturk to the pupils is achieved with the education delivered in preschool and primary education. Learning basic concepts in a meaningful way seems to be associated with success in reading, comprehension and mathematics (Busch, 1980, pp. 38–48). When the literature is examined, it can be observed that there are no textbooks, materials or teaching cases oriented at practice that are suitable for 6-7 year old age group student development with regards to the teaching of the concept of Ataturk. At the same time, as the study is first in its field, it is expected that the results to be obtained from the study shall constitute an example for and guide future studies. In the revised pre-school and year 1 primary social studies curriculum in this study, the acquisitions concerning Ataturk can be gathered under the objectives of "Recognizing Ataturk" and "Comprehending the significance of Ataturk for the Turkish nation". For this purpose, by taking the development levels of pre-school 6 year old and primary year 1 students into consideration, the necessary acquisitions have been arranged by researchers as follows.

Objective 1. Recognizing Ataturk

Acquisitions:

1. Being able to tell Ataturk's place of birth, date of birth, date and place of death,

2. Being verbally able to share memories of Ataturk pertaining to his childhood,

3. Being able to form a family tree demonstrating Ataturk's father, mother, and sister,

Objective 2. Comprehending the significance of Ataturk for the Turkish nation

Acquisition:

1. Having knowledge on reforms in the fields of alphabet, measurements, units, and dress.

Having students acquire the selected objectives is important for them to have an in-depth understanding and knowledge of the concept of Ataturk. At the same time, how Ataturk is taught at educational institutions and which matters concerning Ataturk are focused on in lesson plans have an active role in the selection of objectives. By taking these matters into consideration, teaching of the concept of Ataturk is actualized in the 1st primary year by prospective pre-school (PreS) teachers and prospective primary school (PS) teachers in the 6 year old age group through unique designs they have developed.

Research Problem

How is the teaching process developed by Prospective PreS and PS Teachers for developing the concept of Ataturk in the 6-7 year old age group?

METHODOLOGY

In this study, two of gains related to Ataturk in the course of life sciences in primary school curriculum and renewed pre-school curriculum were determined by researchers for the purpose of the study. Gains are related to the disciplines of mathematics and life sciences. Scheduled teaching for 6 age group and 1st grade students were administered by a total of four groups including prospective teachers from classroom teachers and pre -school education. Prospective teachers have been divided into 8 groups with 4-5 persons in each group. When the groups were being formed, the teacher determined the group members themselves; however, matching between the groups was determined randomly by the researchers. The study used a combination of qualitative and quantitative patterns. Data were gathered with evaluation form of the teaching process which was prepared by the researchers.

FINDINGS AND INTERPRETATIONS

Data pertaining to the structured field study were collected through the graded scoring key called "teaching process assessment form" developed by the researchers. It was evaluated through the preparation, teaching process, and presentation stages. The three achievement levels of poor (1 point), acceptable (2 points), and can be set as an example (3 points) have been determined in grading. Educational curriculums & teaching and assessment &evaluation experts' opinions have been obtained for the content validity of the scale. The items have been arranged in line with expert opinions and in compliance with the purpose of the study. The reliability of the graded scoring key has been examined through the consistency percentage of the scoring of the researchers. For the consistency between the evaluation results of the researchers, the Cohen Kappa coefficient has been calculated and determined as Kpreparation = .82, Kimplementation= .88 and Kpresentation = .55. According to the obtained Kappa coefficients, excellent consistency in the preparation process, excellent consistency in the implementation process, and reasonable consistency in the presentation process have been observed between researchers.

Findings on the evaluation of observers on the teaching process of the work groups can be found in Table 1 (See appendix I). Accordingly, it has been observed that only the 2nd group in the PS teacher group could not complete their pre-teaching preparations (For instance, ordering of desks, preparation of students for teaching). It has been determined that the groups experienced problems in preparing a detailed curriculum in compliance with objectives and acquisitions. When prepared lesson plans were examined, it has been observed that the groups did not assist each other in the preparation of lesson plans and they could not prepare lesson plans complying with

acquisitions. There were no bibliographies in any of the lesson plans, no information was provided on the assessment process, and there were no activities for the development areas of students (prepared by prospective PS teachers) in any of the pre-school lesson plans. In the PS teaching lesson plan (prepared by prospective PreS teachers) the introduction and development steps have not been prepared at a suitable level. All the groups were able to complete the teaching process as they had planned.

When the teaching process was examined, it has been observed that attention was drawn to the topic in the groups and continuity was achieved. No association between subjects was observed in the presentations of the 2nd Group of prospective PS teachers. It has been observed that the prepared instruments and materials in the general of the groups were not in compliance with teaching principles and they were not functional. It was observed that some of the stages of concept teaching were carried out correctly. For instance, photos with Ataturk and his family together were brought to the classroom. The students were told that the person in the photo was Ataturk and the materials with photos of Ataturk were presented to the children and Ataturk's physical and general characteristics were discussed. Right after the correct identification and reference of Ataturk's physical characteristics, informative feedback was provided. For instance, after the child found and pointed out Ataturk, the prospective teacher reinforced the correct behavior by saying "Good for you! You recognize Ataturk". Different photos (photos taken in crowded settings) were shown again afterwards in order to determine whether or not the child recognized Ataturk and permanence of the behavior was ensured.

Before coming to the 1st year of PS, children will have learnt many concepts around them with concrete samples at a classification level. By means of showing children photos of Ataturk's family, through various exemplifications, Ataturk, his mother, father, and sister have been introduced. Thus, having the child associate the concept of family and Ataturk is achieved. In addition to this being necessary for the teaching of the concept at a concrete and recognition level, concepts enable the recalling of concerned preliminary learning. Despite Ataturk's resemblance of his father, they were able to differentiate Ataturk. However, there have been children, who said that his mother was his grandmother. When presenting Ataturk's family photo in textbooks, his father, Ali Rıza Efendi should also be in this photo. As a matter of fact, in the 2004 the 1st primary year Turkish textbook, Ataturk's father's photo was not used and in the 3rd Social Sciences textbook it was presented in a separate small photo. It is considered that this shall cause the student to acquire a deficient behavior in recognizing Ataturk's family (Acar, 2006).

For the purpose of preventing incorrect comprehension of students, the following activities have been conducted by prospective teachers: Children have been talked about the family photos in Ataturk corners. Recognition and naming of his mother, father, and sister was ensured. In order to ensure the permanence of learning, photos used in the presentations were utilized. First, the children were directed the question of "Do you know the person or persons in this photo?" and then these photos were randomly handed out to the children. The names of Ataturk's mother, father, and sister were asked separately and they were requested to match the handed out photos and the names. The photos of students providing the correct answer were hung up on the panel on the wall.

The students were provided the reforms in the form of dressing and the changes in measurement and units of measure through the drama technique. The prospective teachers formed pairs and had them wear the old and new form of dress. The pairs in both cases displayed three plays consisting of reading a newspaper, purchasing fabrics, and purchasing fruits. In the first case, the pairs read newspapers with the old and new alphabet. In the dialogue among themselves, they stated that they could read the newspaper in the old alphabet but they could not write using this alphabet. In the second case, the newspaper written in Turkish could be easily read. In the second and third plays, units of measurements were provided to the students by using standard and nonstandard units. After the students watched the drama, they answered the questions of the prospective teachers. The difference between pairs in terms of dress and units of measurement were demonstrated. Afterwards, the prospective teacher conducted comparative activities enabling the students to learn through "overarm" and "okka" as nonstandard units of measurement and "meter" and "kilogram" as standard units of measurement. An idea of the length of the desk was obtained by the prospective teacher and students through measurement in fathoms. Afterwards, information was obtained on the length of the desk in meters through the use of a measuring stick. In this way, the students acquired the types of reforms in terms of units of measurement.

Furthermore, 4 human models were stuck to the board. A selection was made between the old and new form of dress and the students were requested to dress the models.

The following questions were directed at the students as assessment questions and examples were provided from the answers:

1. Was it good for us to shift to the new measurement instruments from the old measurement ones?

2 How did we shift from our old circumstance to our new circumstance?

3 Who caused us to experience this shift?

4. What would have happened if Ataturk had not done these? (We would always have to wear burqas. We could not go shopping. We could have read newspapers but not be able to write. The letters are too difficult.)

5 If it wasn't for Ataturk, what would have we be wearing? (Burqa, Fes)

6 If it wasn't for Ataturk, would we have been measuring everything correctly? (No. overarm was removed and it was replaced with meters.)

7 If it wasn't for Ataturk, what type of letters would we have had? (very confusing.)

8. Was it a good thing that Ataturk granted us new letters? (yes)

In the Pre-S group, the responses of students to the assessment questions were considered to be satisfactory and successful. Studies on length in the 1st year of PS education and in the Pre-S period begin with nonstandard units of measurement. Children measure objects they own and objects in their daily lives with nonstandard units of measurement. This procedure is repeated with the assistance of the teacher using a ruler. They are informed on units of measurement by discussing the differences of standard and nonstandard measurements and using terminology such as which is longer, which is shorter, which is older, which is newer, which is heavier, which is lighter,etc. Rulers are used in length activities and scales are used in weight activities (Copley, 2000;Clements and Stephan 2004; Charlesworth & Radeloff,1991;cited by:Yıldırım,2010, pp. 149-152).

When the Table in Appendix 1 is analyzed, it has been determined that there are deficiencies in prospective PS teachers effectively using their voice and body language. The fact that prospective teachers are having such an experience in different educational institutes for the first time can be indicated as a reason for this. Prospective PS teachers have had the opportunity to acquire experience in relation to pre-school children and prospective PreS teachers had the opportunity to acquire experience in relation to the classroom setting of 1st year students, the approach of teachers, functioning of rules, and in-class arrangements. Prospective PS teachers had difficulties in drawing the attention of pre-school children and ensuring classroom dominance. In most groups, most members attended the presentations. During presentations, prospective teachers generally provided satisfactory and correct answers to questions from students. Full participation in groups observing each other was not possible for the 1st Group of the pre-school section.

Results and Recommendations

The findings obtained in this study have been assessed:

1. Due to the closeness of the 6-7 year old age group's age and development characteristics, the conducted activities demonstrated similarity. This caused researchers and groups to obtain reliable results in their assessments of each other.

2. Prospective PS teachers had the opportunity to observe the circumstances of year 1 students before they come to PS and prospective PreS teachers had the opportunity to observe the development of students in 6 year

old age group after them. Education is a whole and PreS and PS teaching should be assessed with a scientific approach as the continuation of each other. The study has attempted to ensure this.

3. In their evaluations, the researchers have determined that some difficulties were being experienced when prospective teachers were teaching in conformity with the development level of the 6 year old age group. This could be caused by the failure of the groups to adequately inform each other on the concerned classroom settings.

4. Another result of the study is the prospective teachers experiencing different class levels for the first time, interdisciplinary works, and producing a joint product.

5. With this study, prospective teachers have had the opportunity to practice the theoretical knowledge on development, learning, and teaching they learnt till present.

The correct and effective teaching of the concept of Ataturk can be ensured through interdisciplinary studies and education-teaching cases that are arranged according to the development level of students by taking study based teaching as a basis.

Abstract

The process of internationalisation of higher education results in challenges for didactics who are involved in teaching the incoming students. By use of descriptive method, this narrative paper offers an analysis of the challenges and possible areas of dysfunctions that may arise while implementing team projects in teaching corporate finance related themes in the international groups of students. It revises the current shape and philosophy of team projects included in the educational offer of the Faculty of Finance and Insurance at the University of Economics in Katowice. Additionally, the experiments in adjusting team projects' organisation in order to avoid team dysfunctions are discussed.

Keywords: team projects; international education; higher education; educational offer; incoming students; corporate finance;

Introduction

Contemporary didactics meets plenty of challenges springing from the internationalisation of education processes. For universities, a growing number of incoming students from all over the world create a need to adjust the educational offer properly. For more than the past decade, University of Economics in Katowice, Poland, faced these issues and worked over developing attractive educational offer for incoming students. One of inventions in this process was an implementation of team projects which require students to work as a group in order to enlarge both theoretical and practical aspects in different fields of economic knowledge. The Faculty of Finance and Insurance of the University of Economics in Katowice (which is one of four faculties of this University) offers for the incoming students the possibility to attend a few team projects within corporate-finance related issues. As we are the teachers who developed these team projects, in this paper we aim at sharing our experiences in this field. Thus, the paper is kept in narrative tone and based on descriptive method. Accordingly, our experiences described here should be treated as a form of an experiment within implementation of team projects as heuristic didactic method, followed by their necessary improvements and modifications due to being applied in international group of students. In particular, the description of our experiment is directed to reveal the most demanding areas of cooperation within student-student and teachers-students relationships.

In the second section of the paper we recall some literature review on the importance of using team projects in didactics, together with highlighting the potential areas of concern. We also discuss here the challenges of teaching in international groups. In the third section of the paper we offer a model of our approach to organise

and implement team projects. In the fourth section we discuss the challenges we met and how we managed to solve the problems and dysfunctions that emerged. The last section briefly concludes the study.

Team project as teaching method and its application in international groups

Team projects belong to the heuristic methods of teaching and are based on the idea of giving students a real task which is supposed to be solved by themselves as a group within a defined period of time. A form of team projects ensures that the learning experience for students is real and thus more relevant to them. The prime goal of using team project in didactics is to make students active in the understanding of the real world. The real world practice demands the need of contacting each other and shaping leadership skills. It is worth to notice, that for the above mentioned reasons the application of team projects in education is constantly growing on importance (Michaelson, Knight & Fink, 2002, Stein & Hurd, 2000).

Team projects are applicable for any type of economic-related courses. By attending such projects students have an opportunity to be equipped with a blend of technical and interpersonal skills that will be useful in meeting challenges of the contemporary workplace. Groups enable students to learn in more real situations and to develop their interpersonal skills in interacting, negotiating, leading others to desired outcomes. Accordingly, students forge new networks with people beyond their familiar peers to mirror their workplace situations (Dickinson, 2000; Gammie 1995, Hunter, Vickery & Smyth, 2010; Nelson & Bass, 1994; Ravenscroft & Buckless, 1997;Stein et al., 2004). However, team projects remain emotionally and intellectually challenging as they require students to take active participation and perform cognitive and social tasks at the same time, which is often difficult.

However, the implementation of team project in didactics is exposed to the risk of dysfunctional behaviors in teams. Typical areas of dysfunctions include (Ferrante et al., 2006; George, 1992; Liden et al., 2004; Sinclair, 2003; Tyler & Blader, 2003;):

- negative perception of team work because the feeling of inequity – e.g. inequity? in granting,
- social loafing (also referred to as a free-rider problem) – a risk that some students will not participate to the best of their abilities and generally decrease in individual effort,
- team leader attitude – e.g. poor treatment of team, ignoring team member input, being rude or disrespectful in communication, confusion over team leader's role,
- instructor attitude – e.g. poor treatment with regard to team formation, communication barriers, unclear instructions and rules of team project.

Dysfunctional team behaviour should be avoided as it reduces the effectiveness of team performance. Usually, it is because dysfunctions lead to conflicts in groups. In particular, the conflicts may be manifested positively – in the form of a debate, or negatively – by hostility of group members. Conflicts arose both over the solution of a given task and on interpersonal issues. The resolution of conflict may be achieved by means of voicing and considering all opinions and – in case of interpersonal conflicts – the effort to build healthy relationships (Utley & Brown, 2010).

The implementation of team projects in international students' environment poses even more areas of dysfunctions. International group of students are not homogenous if taking into account their cultural background, prior studying experience and learning style differences – that all inflicts the interpersonal relationships in the group. Even more important are the obstacles in communication that are predominantly based on the language skills of team members. In most of the cases the incoming students are ESL (English as a Second Language) students. If they are linguistically ill-equipped, they have problems with communicating with others and thus the effectiveness of the group performance decreases. In addition, Napier & Gershenfeld (2004) spotted that people judge others by they speech. Thus, there is a risk that linguistically ill-equipped student may decrease their participation in the group as a result of being ignored by team leader and other team members. It is because the poor communication impacts the performance and satisfaction of team work. The effect of decreased participation of the ESL students may be even strengthened by the general problems of ESL students with poor language proficiency in dealing with their new academic environment (Watty, 2007). A solution would be to

recruit students with an adequate language proficiency. However, in practice the recognition of the language skills is often based on declarations of student's home university or based on student's own judgment.

The current model of organisational and implementation framework of the offered team projects

Team projects should distinguish with a few features. First of all, the goal of team project should be clearly defined and accepted by students. Secondly, the methods of working over a given task should be clearly stated, together with the deadlines of delivering following parts of the project. Finally, the transparent criteria of final assessment should be formulated, together with the specification of the required form of presentation of the team work results (Królikowski, 2000; Mikina & Zając, 2001).

Drawing upon these requirements, we decided to organise our team project offer for the incoming Socrates-Erasmus students of the Faculty of Finance and Insurance (FFI), University of Economics in Katowice, Poland. The current shape of team projects educational offer of FFI is based on the assumption that projects should give international students an opportunity to enlarge some problems that are subject to corporate finance. The 'Corporate Finance' course is offered on FFI and currently covers 60 direct contact hours. However, we spotted that some aspects of corporate finance remain only partially accomplished. It is because the 'Corporate Finance' course offered in English mirrors the content of the same course placed in the standard educational offer (for Polish students) where it is assumed that 'Corporate Finance' course is preceded by 'Financial Accounting' course and followed by 'Financial Analysis' course. Thus, we decided to give students a chance to study some less-deeply accomplished areas of corporate finance by means of attending team projects, which they can choose respectively to their interests. The current shape of our team projects offer is specified in table 1.

Table 1. The current offer of corporate-finance related team projects of the Faculty of Finance and Insurance, University of Economics in Katowice, Poland

Team project theme	Semester of delivery	Problems to be explored
CICF: Contemporary Issues in Corporate Finance Instructor: Joanna Błach, Ph.D.	winter summer	(1) Capital structure decisions: raising equity capital, raising external sources of long-term finance, acquiring funds in times of globalization, financing patterns across countries, building adequate financial structure; (2) Cost of capital; (3) Dividends policy; (4) Investor Relations; (5) Corporate Governance; (6) Corporate Social Responsibility in the context of company's financial objectives; (7) Financial innovations and their consequences for the financial situation of the company: financial innovations in the investment and financing activity
FDMUR: Financial Decision Making Under Risk Instructor: Monika Wieczorek-Kosmala, Ph.D.	winter summer	(1) Analysis of different kinds of risk that may arise in a company (2) Catastrophic risk and company's performance: how floods in Poland (2010/2011), volcano ash (2010), Japan earthquake (2011) etc. influenced the business environment (in micro and macro scale); (3) Risk in investment projects; (4) Risk in Mergers and Acquisition; (5) Decision-making in the area of selecting risk treatment techniques (in particular derivatives and insurance) ; (6) Contribution of risk management process to value creation
FLAM: Financial Liquidity Analysis and Management Instructor: Monika Wieczorek-Kosmala, Ph.D. Joanna Błach, Ph.D	winter	(1) Financial liquidity strategies and their impact on indebtedness and profitability; (2) Financial management of current assets: accounts receivable management, setting credit policy of a company, inventories management, cash budgeting (professional planning of cash inflows and outflows in the company); (3) Raising external sources of short-term finance (availability of money market instruments, short-term funds in capital structure – the problem of short term financial balance)
FASA: Financial Analysis – Selected Aspects	summer	(1) A deeper analysis of a set of ratios within the chosen aspect of financial management (covering min. 3 year period, based on comparison of at least two companies),

		e.g. capital structure ratios, liquidity ratios, profitability ratios, capital market ratios; (2) A complex analysis of a chosen company (covering min. 3 year period); (3) Bankruptcy prediction models and their application - early-warning signals analysis; (4) Information potential of the financial statement of the company
Instructor: Joanna Błach, Ph.D Monika Wieczorek-Kosmala, Ph.D.		

The list of problems to be explored (table 1) represents our suggestions and recommendations for students how they can develop the topic of their own project. However, we are open for students' own ideas until it fits the general theme of the team project. We observe that in most of the cases students prefer to choose one of suggested issues and individually search for applicable case study.

First team projects were included in educational offer in the winter semester of 2004/2005 and at that time 47 students from different European countries took part in the projects (Tarasek & Wieczorek, 2005). Since then, the offer evolved with regard to both the themes of team projects as well as the core organisational aspects. A precise number of students attending each of the offered team project in the next academic years up till now is presented in Appendix A.

Our philosophy of organising each of above specified team project, which is discussed in the remainder of the paper, is based on four core assumptions:

- students individually select a topic and define a goal that hey are going to develop within one of offered team projects,
- students will systematically work over selected topic that matches the general scope of the team project,
- the cooperation within the team will be clearly structured (with transparent role of teachers as instructors, team leaders and team members),
- the assessment covers both systematic work as well as the results of the project that are constituted by written paper followed by oral presentations.

Topics of team projects

We assumed that students will have an opportunity to select a topic of team project solely. We encourage students to invent a topic (problem) which matches the general theme of team project but which is still adjusted to their personal interests or main field of study. For example, students of marketing may formulate a topic that will develop an aspect of corporate finance highly tied to marketing issues (e.g. any aspect of analysis of sales revenues). We also require our students to do their best to collect all necessary literature and empirical data for solving a chosen problem. We strongly urge students to clearly distinguish in their project the theoretical insights (that give a chance to deepen a knowledge) from research (often case study) part.

Systematic work over the project

In order to achieve the systematic work over the project, the organisation of offered team projects is accompanied by a well-thought-out work timetable, which is presented in Fig. 1. Usually, in the second or third week of the semester (which lasts 15 weeks on FFI), we organise so called 'First meeting' which has two parts. The first part is in a form of lecture where we present the offer of team projects. We discuss the theme and general idea of particular team project, together with the presentation of topics that were prepared by students in the previous years. The presentation ends with the explanation of the team project rules (including its organisation, timetable and assessment). The second part of the meeting is more active as we offer students a

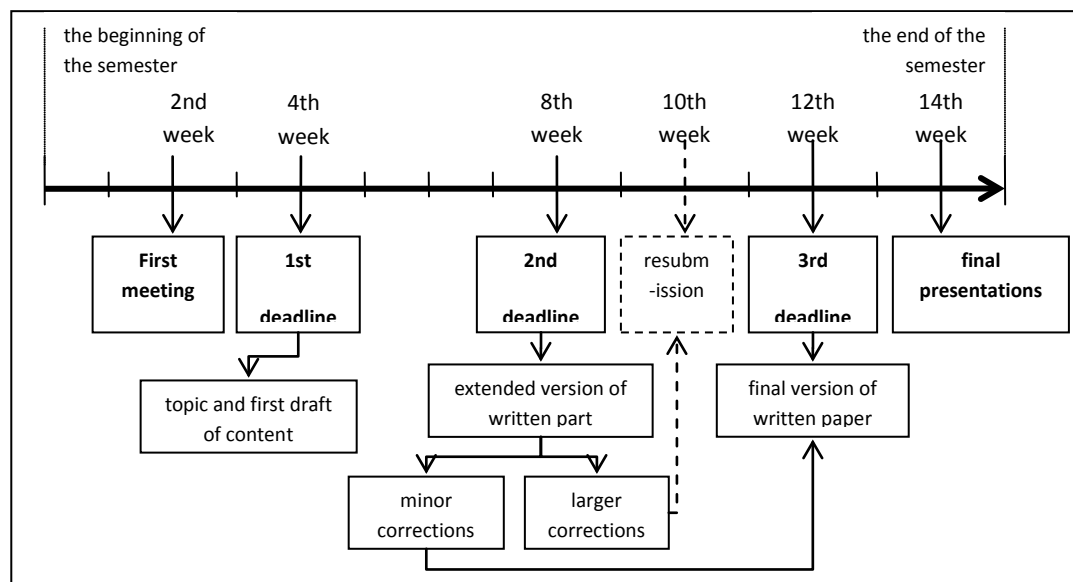
chance to decide which project (or projects) they wish to attend and then to find partners for the project. We allow students to join in teams of 4-6 members, enhancing them to build international teams, in particular to join with Polish students who have a better understanding of the functioning of the Faculty (which is important while searching literature in university library or gathering data). The second part of the meeting is closed by the fulfilment of students' team declarations. If there are students who do not find partners, we – as instructors – join them in teams with regard to their general field of studies.


Fig. 1. A model of team project timetable within a semester

Our timetable assumes that between the 2nd and 12th week of team project work we check threefold the progress in project preparations. The first deadline is in the 4th week where we expect students to clarify final topic of team project together with a brief description of the content. The second deadline is in the 8th week where we expect students to provide a more extended version of a written part of the project for our (instructors') larger comments. If the comments are considered as minor, students continue their work over the project and in the12th week they are expected to complete the written paper for final assessment. In case of the need of deeper improvements, students are requested to resubmit the project for larger comments in the 10th week in order to control the correctness of improvements, and then prepare the final version of written paper for the 12th week. Then, students are given two weeks to prepare final public oral presentations which begin in the 14th week of the semester.

The structure of cooperation in a team

The assumed model structure of cooperation in team is presented in Fig. 2. and it is based on transparent rules. The transparency is supported by placing all materials touching the organisation and assessment of the results of the project on Moodle Platform (previously on a simple web site for Erasmus incoming students). The teacher – as instructor – offers a possibility to discuss any doubts and problems arising while working over the project by means of both direct contact hours and e-mail contacts. It is assumed that each team identifies a team leader who is responsible for communication with instructor. Any comments are then channelled by the team leader to all team members. In addition, meetings with team leader or even with all team members may be arranged by instructor whenever an urgent need appears (e.g. if students have serious problems with the understanding or developing the project or are far delayed in preparations).

Team leaders are informed that they are responsible for resolving any interpersonal conflicts that arise in team. The instructor has a power only to help in conflicts over a method of solving particular problems related to

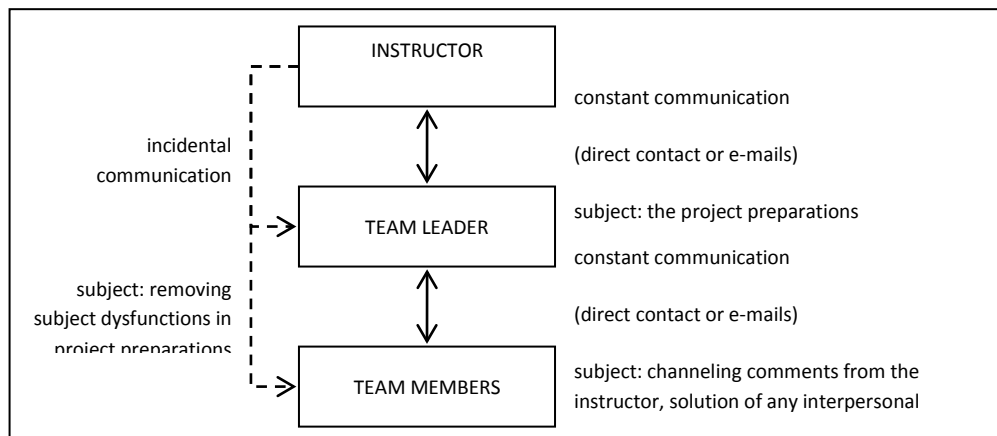
the subject of team work. Also, instructors offer their help to make available appropriate literature sources for the problems revised in team projects, as an access to English-language literature on FFI is limited for incoming students.


Fig. 2. A model structure of cooperation in team

Final assessment

The criteria of final assessment are transparent and explained in detail on the 'First meeting' (as mentioned above). In particular, we divided the assessment criteria by distributing points separately for systematic work over the project, written part and oral presentations. We use a special, far detailed assessment form that grant points for listed elements of each of these criteria. The prime assumption of our assessment procedure is that all team members are equally assessed. We do not grant team leaders for their function as we perceive the function as more administrative than creative. Within the first criterion – the continuous preparation of the project – students may be granted up to 40 points out of 200, which gives 20% of their final note. Students are penalised by the reduction of points in case on delays from deadlines. The second criterion of assessment is the quality of a written paper together with the quality of the solution of selected problem. This criterion offers up to 80 points, which constitutes 40% of the final note. In particular we assess the quality of theoretical assumptions and empirical findings. The last criterion is the quality of the oral presentation, where students may be granted up to 80 points, which constitutes the remainder 40% of their final note. Students are informed in advance that the presentation of final results should be between 10-15 minutes and that all team members should be involved. A relatively short time for presenting the results forces students to select the most interesting elements of their findings. On the other hand, this time is enough to give chance each team member to speak. In addition, relatively short presentations are more attractive for the audience (formed by the other team project participants).

The challenges of offering team projects in international students' environment

Our experience in offering team projects for incoming Erasmus students allowed observing almost each area of possible dysfunctions. The current shape of our offer, presented in the previous section, is a result of many modifications we implemented as a response to the challenges and obstacles we met. We gathered the prime issues in table 2, together with a short description of steps that were taken flowingly. However, still some issues remain hard to be solved completely.

Table 2. The methods of responding to the prime challenges of the international team project

Challenge	Response
national rather than	purposeful reorganisation of teams (which helped to

international teams	solve the problem partially)
ESL disturbing communication	modification of assessment criteria – implementation of criteria addressing the involvement of all team members and the ability to discuss the team project problem easily, to explain the assumptions and results of the projects
risk of plagiarism	creation of an electronic base of team projects from previous years; warning meetings of students, careful analysis of projects of similar problem or case
delays in keeping deadlines – last minute projects of poor quality	modification of assessment criteria – 20% of final grade dependant on continuous progress in preparations
low culture of presentation	modification of assessment criteria – implementation of criteria addressing student's attitude during the presentation

We realised that students tend to form more national that international teams. If possible, they are interested in forming a team constituted of their home country members. Our response to this problem was a purposeful reorganisation of teams leading to complete teams of students representing at least two nations. However, we are not fully successful in this effort as students often join in national teams due to co-habitation (and thus comfort of cooperation) or communication purposes (they prefer to communicate in their home language rather than in English). Thus, we perceive the problem of a tendency to build national teams to be partially linked to ESL (English as a Second Language), which is our biggest concern. We observed that the communication problems arise mainly due to students that are linguistically ill-equipped. These students tend to join in national teams and a team leader is always a student with the best English qualifications. It allows students to communicate without any barriers inside a team. However, the communication with instructor is sometimes highly difficult (e.g. students do not understand the criteria of assessment or the current information displayed on the web site with regard to dates and classroom where final presentation take place). In addition, while presenting the results of the project the linguistically ill-equipped students avoided to be active and did not take voice. Thus, in the assessment criteria we decided to grant points for the involvement of all team members. However, this solution brought only partially satisfying results – the linguistically ill-equipped students tended to read word by word their part displayed on slide and/or prepared notes. Thus, we decided to inform such teams that studying in English requires them to enlarge the related vocabulary. Students are warned that during the oral presentation we are going to ask them some questions and that their inability to answer these questions (due to problems with communication in English) will cause a penalty in one of the assumed criteria, thus lowering their final grade.

Another important area of problems that aroused after a few years of team project existence was an observation that the topics of students projects tend to be repeated. In order to avoid a plagiarism, we created an electronic base of the previous projects (only with written parts). Whenever the incident of a repetition of the project idea or analysed company occurs, we invite all team members for a discussion. We show students the previous project similar to their proposal and warn them that we are going to compare carefully the results of their work (in order to check whether they solved the problem on they own, original way).

We noticed also that students have many problems with keeping the deadlines. At first, the continuous progress in preparations was not included in the assessment criteria which caused the carelessness of students who often prepared last minute projects of very poor quality. Thus, we decided to penalise students for any

delays in project preparations by reducing the points they may be finally granted. Currently, 20% of the final score depends on the continuous work over the project.

The last area of dysfunctions we discovered was the culture of final oral presentations. Here we could easily observe the impact of students' culture background and the problems it may cause. Very often the attitude of our students during the presentation was unacceptable as compared to the requirements of public speeches (e.g. students keep hands in pockets, chew gums, stay back to the audience etc.). Once again, the only solution we found useful was a modification of assessment criteria by granting points for students' attitude during the presentation.

Conclusions

Although we met plenty of challenges, we consider teaching with team projects in international students' environment as a rewarding task. We are full of recognition to the individuality of our students which is demonstrated by original topics of team projects followed by the unique methods of solving the corresponding problems. Drawing upon our experiences, we are of the opinion that team projects are also effective in international students' environment. This method truly helps to develop interpersonal skills and increase language proficiency. Students have a chance to closely cooperate with their team mates from other countries which gives an opportunity to develop cross-cultural abilities. However, organisation of team projects directed to remove possible areas of dysfunctions reducing team work effectiveness, teachers (as instructors) faces a significant challenge. Our experiences confirmed that probably the quickest and most effective tool to direct students and to force them for required behaviours is the modification of assessment criteria. However, we are aware that it raises the risk of illegibility of these criteria for students. In many cases the challenges may be met by accomplishment of some solutions that are more organisational in nature.

We believe that our experiences described in this paper offer an interesting field for discussion over the challenges and solutions springing from didactics in international students' groups. We hope to find new ways to solve the observed problems with team project method as despite these dysfunctions we consider it as one of the most effective method of teaching corporate finance related issues in the international students' environment. Team project method brings many advantages not only within didactics. As researchers offering expertise in corporate finance related issues, we are offered an inspiration for further comparative studies of international scale. Student's projects are often based on national point of views, bringing closer the valid sources of information that may deepen the scientific researches.

THE AGE AND JOB SATISFACTION RELATIONSHIP IN HIGHER EDUCATION

Tülen Saner 77*, Şerife Zihni Eyüpoğlu

School of Tourism and Hotel Management, Near East University, Lefkosa, 98010 North Cyprus

Business Administration Department, Near East University, Lefkosa, 98010, North Cyprus

Abstract

This study examined the age-job satisfaction relationship in higher education. The study instrument used was the short form Minnesota Satisfaction Questionnaire (MSQ) which measures overall job satisfaction, intrinsic satisfaction, and extrinsic satisfaction using 20 facets of the job. The instrument was personally administered to the respondents. The population for the study consisted of academics in North Cyprus. The results show that the job satisfaction levels of the older age groups of academics are on the whole higher than the younger age groups. Overall job satisfaction and extrinsic satisfaction do not seem to indicate a linear relationship with age, with overall job satisfaction and extrinsic satisfaction levels varying for different age groups.

Keywords: Job satisfaction; intrinsic satisfaction; extrinsic satisfaction; academics; age; North Cyprus.

1. Introduction

Our job is not only a main source of income but also an important part of our life that contributes to our social standing (Sharma and Jyoti, 2009). In this respect the search for an understanding of the causes of satisfaction and/or dissatisfaction experienced on the job is an ongoing area of interest for social scientists, managers, and policy makers worldwide. Satisfied employees will be more productive and remain with the organization longer, however dissatisfied employees will be less productive and more inclined to quit (Sarker, Crossman, and Chinmeteepituck, 2003). Satisfied employees are also more likely to be creative and innovative and come up with breakthroughs that allow an institution to grow and change positively with time and changing market conditions (Sharma and Jyoti, 2009).

Job satisfaction has been defined in a variety of ways, the most widely used definitions in the literature being those of Locke (1976), Dawis and Lofquist (1984), and Porter, Lawler, and Hackman (1975). Locke (1976) defined job satisfaction as a pleasurable or positive emotional state resulting from the appraisal of one's job experiences. Dawis and Lofquist (1984) defined job satisfaction as the result of the worker's appraisal of the degree to which the work environment fulfills the individual's needs, and Porter, Lawler, and Hackman (1975) defined job satisfaction as one's reaction against his/her occupation or organization. In general, it can be said that job satisfaction is an affective reaction to a job that results from the person's comparison of actual outcomes with those that are desired, anticipated, or deserved (Oshagbemi, 2000).

Research findings have indicated that many personal characteristics affect job satisfaction in different and complex ways, these personal characteristics including gender, age, marital status, and working experience, to name a few (Koustelios, 2001). Along with gender, age is probably the most reseached characteristic in respect to its association with job satisfaction. A number of studies have suggested that the importance of job attributes is age-related (Moyes, Williams, and Koch, 2006), though the nature of the relationship between age and job satisfaction is not clear (De Nobile and McCormick, 2008). Many studies have suggested a positive relationship between job satisfaction and age (Aldag and Brief, 1975; Ronen, 1978; Rhodes, 1983), while others have

suggested a U-shaped or non-significant relationship (Luthans and Thomas, 1989; Clarke, Oswald, and Warr, 1996). Siassi, Crocetti, and Spiro (1975) reported higher levels of job satisfaction in workers over 40 than those under 40. Ronen (1978) reported a linear relationship between age and job satisfaction in a sample of private sector production workers but not in a sample of Israeli Kibbutz workers. Near et al., (1978) examined the relationship between age, occupational level, and overall job satisfaction and found that the strongest predictors of job satisfaction were rank and age. In his own review and analysis, Rhodes (1983) concluded that job satisfaction was positively and linearly associated with age arriving at this conclusion after a review of the findings from seven other separate studies (Aldag and Brief, 1975, Near, Rice, and Hunt, 1978; Ronen, 1978; Siassi, Crocetti, and Spiro, 1975; Stagner, 1975; Staines and Quinn, 1979; Weaver, 1978). In his study which examined the level of job satisfaction experienced by Greek teachers, and the relationship between personal characteristics and specific aspects of job satisfaction Koustelios (2001) found age to be a significant predictor of different aspects of job satisfaction. Additionally, Ssesanga and Garrett (2005), in their study of the job satisfaction of university academics from Uganda, reported age to be a significant influence on teaching satisfaction.

A wide range of research exists related to job satisfaction along with its causes and consequences in various settings (mostly profit oriented), however much of this research has been conducted in the west with even less evidence available from non-western nations (Maghrabi, 1999). Several studies have also concentrated on workers within the industrial sector to the neglect of workers in higher education (Oshagbemi and Hickson, 2003). Even less evidence is available related to job satisfaction in higher education for non-western nations. Research focusing on job satisfaction in higher educational organizations has indicated that, on the whole, academics are generally satisfied with their work. Findings indicate that academics want work tasks that correspond to their personal interests and allow them considerable autonomy in task selection and decision-making; they want a sense of achievement, facilitated by feedback from supervisors; they want clarity as to what is expected of them and harmony among the various people they work with; and they want salaries awarded equitably and at a level that meets their expenses; and they want promotions to be awarded fairly (Kelly, 1989). The job aspects that are most frequently perceived as responsible for low satisfaction are pay, university administration policy, availability of resources, and working conditions (Kelly, 1989).

Dissatisfaction amongst workers is undesirable and dangerous in any profession, but it is suicidal if it occurs in the teaching profession (Sharma and Jyoti, 2009). As Johnes and Taylor (1990) state, the goals of higher education are to provide in-depth knowledge, seek academic development, educate students, as well as to coordinate national development demands (cited in Chen, Yang, Shiau, & Wang, 2006). None of these goals can be accomplished efficiently if low satisfaction or dissatisfaction exists amongst academics. The job satisfaction of academics, their commitment, and their retention are crucial to effective academic institutions (Saner and Eyupoglu, 2012). Academics find themselves in a profession that is highly stressful. The requirements of career completion, excessive course loads that tend to hinder research and insufficient payment are all factors that may cause financial and physiological discomfort for individuals (Koyuncu, 2001). Unless they maintain positive attitudes towards their profession they will inevitably fail in their professional career (Sirin, 2009).

The main purpose of this study is to examine the age-job satisfaction relationship in higher education, more specifically academics in North Cyprus, and to identify which aspects of the job are sources of satisfaction and which are source of dissatisfaction. The results of this study will enable university authorities and policy makers to develop and implement policies towards the improvement of the undesirable conditions and the strengthening of the desirable conditions, reinforcing the higher-educational system. Studies that examine this relationship in a Turkish cultural context are few thus providing an ideal opportunity for research aiming to fill the gap in this field.

2. Methodology

To measure the job satisfaction of the academics the short-form Minnesota Satisfaction Questionnaire (Weiss, Dawis, England, and Lofquist, 1967) was utilized. The Minnesota Satisfaction Questionnaire (MSQ) is one of the most widely used instruments in the measurement of job satisfaction (Scarpello and Campbell, 1983)

and its validity and reliability has been proven over the 40 years that it has been in use. It has been used to measure job satisfaction in a variety of sectors, including education. The short-form MSQ is composed of twenty facets, each facet represented with just one satisfaction item. The short-form MSQ measures three satisfaction scales, namely intrinsic satisfaction, extrinsic satisfaction, and overall job satisfaction. Intrinsic satisfaction refers to occupational conditions (how people feel about the nature of the job's tasks), and extrinsic satisfaction refers to environmental conditions (how people feel about features of the job that are external to the work). Respondent academics were asked to express the extent of their satisfaction with each of the 20 facets of their job on a five-point Likert scale ranging from 1 (very dissatisfied) to 5 (very satisfied). The original short-form MSQ was translated into Turkish by the authors and tested on ten academics to test its validity and reliability. The internal consistency of the translated questionnaire was 0.85, obtained using Cronbach's alpha coefficient. The questionnaire was accompanied with a personal information form in order to determine the demographic variables of the academics that participated in the study.

The population for this study comprises academics from 5 of the North Cyprus universities. A total of 600 academics were randomly approached with 412 agreeing to take part in the study, resulting in a response rate of 69%. The questionnaires were administered in an interview format. Though extremely time consuming, this method was utilized so as to ensure as high a response rate as possible, hence the use of the short-form MSQ over the long-form. Of the 412 respondents, 67.7% were lecturers with a master degree, 7.8% were lecturers with a PhD, 13.3 per cent were assistant professors, 4.6% were associate professors, and 6.6% were full professors. The low number of respondents from the academic ranks associate professor and full professor is an indication of their relatively small numbers in the academic population in North Cyprus compared to the other ranks, though this is not surprising for a developing country. However, it is not felt that these percentages have had an affect on the final results as comparable studies conducted have also yielded both similar sampling percentages and similar results. Such studies include Ssesanga and Garrett (2005) and Oshagbemi (1997). Just slightly over half the respondents (53.4%) were male and 46.6% were female, and 63.8% were married and 36.2% were not married. The greatest percentage of respondents (37.6%) were in the age range 21-30, 34.5% were in the age range 31-40, 17.2% were 41-50, 6.1% were aged 51-60, and the remaining 4.6% were in the age range 61 and above.

The statistical package for the social sciences (SPSS) version 13.0 was used to analyze the data collected. Analysis consisted of the computation of descriptive statistics in order to examine the different job satisfaction levels of the academicians across the different age ranges and ANOVA in order to understand the relationship between job satisfaction and age.

3. Findings and Discussion

The mean scores (M) and standard deviations (SD) for the job satisfaction of academics in North Cyprus in relation to age can be seen in Table 1. Mean scores below 3.50 are considered to be more on the "dissatisfied" side of the "satisfaction-dissatisfaction" scale with mean scores above 3.50 being more on the "satisfied" side of the scale (Pearson and Seiler, 1983). As Table 1 presents the level of overall job satisfaction experienced by the academics in all age groups are above 3.50 thus indicating job satisfaction.

The level of overall job satisfaction increases and continues increases until the 51-60 age group and then starts to decrease, though only very slightly at the 61 and above age group. When we look at intrinsic satisfaction again satisfaction experienced by the academics in all age groups are above 3.50 thus indicating satisfaction. There is a steady increase from the younger age group up to 31-40 age group and the satisfaction level remains almost constant during the 41-50 age group. Then a rapid increase continues up to the maximum level experienced by the older age group. The extrinsic satisfaction scores indicate that the 21-30 and 31-40 age group are dissatisfied with the 41-50 age group indicating only moderate satisfaction. The 51-60 age group indicate an increasing level of satisfaction however a decrease is experienced in the 61 and over age group. Therefore, extrinsic satisfaction indicates a progressive increase from dissatisfaction to satisfaction starting with the 21-30 age group up until the 51-60 age group (maximum level) after which a decrease is observed, though still indicating satisfaction.

Table 1 Age-Related Mean Satisfaction Scores

Variables	Overall Job Satisfaction		Intrinsic Satisfaction		Extrinsic Satisfaction	
	mean	sd	mean	sd	mean	sd
21-30	3.60	0.66	3.70	0.64	3.41	0.78
31-40	3.70	0.69	3.82	0.73	3.45	0.75
41-50	3.74	0.61	3.80	0.63	3.63	0.66
51-60	3.95	0.38	3.98	0.36	3.89	0.55
61and over	3.93	0.53	4.03	0.51	3.73	0.63

The mean scores indicate that the overall job satisfaction and extrinsic satisfaction of academics are not linear in relation to age. However, intrinsic satisfaction can be considered to have a linear relationship with age. Support is also provided in Table 2 which indicates that the mean satisfaction scores for overall job satisfaction and extrinsic satisfaction were found to be significantly different in relation to age. This finding is consistent with the literature (Sharma and Joyti, 2009; Picket and Sevastoss, 2003). Intrinsic satisfaction was found not to be significantly different in relation to age. This indicates to us that overall job satisfaction and extrinsic satisfaction levels vary for different age groups and are at maximum at the older age groups, whereas intrinsic satisfaction levels do not vary for different age groups.

Table 2. Age-Related ANOVA

	Sum of Squares	df	Mean Square	F	Sig.
Intrinsic Satisfaction					
Between Groups	3.484	4	.871	2.028	.090
Within Groups	174.799	407	.429		
Total	178.283	411			
Extrinsic Satisfaction					
Between Groups	7.540	4	1.885	3.507	.008
Within Groups	218.784	407	.538		
Total	226.324	411			
Overall Job Satisfaction					

Between Groups	4.173	4	1.043	2.525	.040
Within Groups	168.157	407	.413		
Total	172.330	411			

4. Conclusion

The main purpose of this study was to examine the age-job satisfaction relationship amongst academics in North Cyprus. The results show that the job satisfaction levels of the older academics are on the whole higher than the younger academics. The findings indicate that overall job satisfaction and extrinsic satisfaction levels vary for different age groups of academics (that is, a statistically significant relationship exists between age and the two satisfaction measures). However, a statistically significant relationship does not exist between age and intrinsic satisfaction. It is hoped that this study makes a contribution to the job satisfaction literature, especially in Turkish cultural perspective.

Abstract

In today's ever developing and changing world, teachers need in-service training since they are required to improve their knowledge, ability and attitude. In Turkey there are a lot of in-service training programs (ITP) that cater to the needs of teachers in elementary and secondary schools. Determining the effectiveness of ITPs and reflecting on possible improvements is of great benefit. This study, which is based on the need, aims to investigate the research fulfilled to analyze the effectiveness of ITP for teachers in Turkey and to discuss the results.

Keywords: In-service training; effectiveness; evaluation; document analysis; case study

1. Introduction

In today's ever developing and changing world, teachers as in every profession need in-service training since they are required to improve their knowledge, ability and attitude. Mercer, Forgnone, and Beattie (1978, p.30) have observed that "no profession in the social sciences can assume that pre-service education alone is sufficient for maintaining professional status". Egbert and Kluender (1979, p.19) have presented a similar rationale in noting that "it is not reasonable to assume that a given training period can prepare a person for a lifetime in any complex profession" (as cited in Powers, 1983). Therefore, in-service training (IT) is likely to have positive impact on teachers and school programs.

In the literature, IT is described in different ways. Taymaz (1981) states that IT is the training provided to the newly-employed or already working individuals to enable them to gain the necessary knowledge, ability and attitude that the profession requires. However, Aytac (2000) describes IT as all types of activities that meet an individual's adaptation, progress and development needs from the moment one starts a job in an institution. Guskey (2000) views it as processes and activities necessary to promote the professional knowledge, skills and attitudes of educators which in turn enhance students' learning. According to Hull (2001, p.43), the term in-service training is used to represent "all kinds of activities ranging from a brief teachers' meeting after school to a program to keep the community informed about school events."

In Turkey there are a lot of in-service training programs (ITP) that cater to the needs of teachers in elementary and secondary schools. In Turkey, professional development of teachers has been administered through central authority since 1960 and has been conducted by the In-Service Training Department of the Ministry of National Education since 1982. In recent years, some professional development activities for teachers in addition to the courses and seminars implemented by the Ministry of National Education have been conducted by various institutions (Bumen, Ates, Cakar, Ural&Acar, 2012).

The achievement of in-service training programs depends on effective planning, organization, application and evaluation (Karacaoğlu, 2009). Determining the effectiveness of ITPs and reflecting on possible improvements is of great benefit. Therefore, this can be achieved through program evaluation. Yuksel and Saglam (2012) define program evaluation broadly as a process of collecting information about the effectiveness of a program that is designed and implemented, analyzing and interpreting that information and ultimately taking decision regarding continuation, improvement or termination. McCain (2005) views evaluation as a process of appraising training to determine and improve its value. According to McCain (2005), gathering data for evaluation and conducting an

analysis only provides information; therefore, that information must be used for some purpose. Some of the purposes for conducting an evaluation include the following:

to improve the design of the learning experience

to determine if the objectives of the learning experience were met and to what extent

to determine the adequacy of the content

to assess the effectiveness and appropriateness of the instructional strategies

to reinforce learning

to provide feedback to the facilitator

to determine the appropriate pace and sequence

to provide feedback to participants on learning

to identify which participants are experiencing success in the learning experience

to determine business impact, the cost-benefit ratio

to identify the learning that is being used on the job

to assess the on-the-job environment to support learning

Moreover, Mathinson (1992) highlights the points in the evaluation of an effective ITP: (1) deciding on what teachers are going to acquire in the ITP and the proportion of it, (2) the effect of ITPs on the professional development of teachers and (3) identifying and evaluating the effect of inevitable difference between schools and teachers in varying school experiences (as cited in Ozan &Dikici, 2001). Good evaluations lead to get sound, meaningful and sufficiently reliable information which can be used to make thoughtful and responsible decisions (Guskey&Sparks, 1991 as cited in Guskey, 2000).

Guskey (2000; 2002) also indicates five critical levels of professional development evaluation including 1) participants' reactions, 2) participants' learning, 3) organization support and change, 4) participants' use of new knowledge or skills, 5) student learning outcomes. Collecting data in each level gets more complex and since each level is based on the previous, success at an early level may be necessary for positive results at the next higher one. Guskey (2000), proposes 'working backward' from Level 5 "the student learning outcomes that you want to achieve" and through each successive level to "what set of experiences will enable participants to acquire the needed knowledge and skills (Level 1)."

Evaluation must become an integral part of staff development. Purposeful evaluation before, during, and after a professional development program that is initiated is essential for determining if the program is worthwhile. Both formative evaluation, employed prior to and during a professional development experience, and summative evaluation, used afterward to assess results, are valuable.

The research investigating the effectiveness of ITPs actually presents the quality of these programs. Therefore, depending on the importance of evaluations, the overall analysis of studies conducted to evaluate the effectiveness of ITP in Turkey is of great importance.

1.1. Aim

This study aims to analyze the research conducted to evaluate the effectiveness of in-service training programs for teachers in Turkey. Based upon the main aim, the research questions are 1) What are the aims of the research conducted to evaluate the effectiveness of ITP? 2) In what dimensions are the results of the research conducted to evaluate the effectiveness of ITP?

1.2. Significance

Determining the effectiveness of ITP, gathering the results of evaluation studies under common themes and reflecting on possible improvements are of great benefit for the In-Service Training Department and for the education units of various public corporations and institutions. Therefore, it is necessary to analyse the results of studies done to evaluate ITP in Turkey. The findings obtained from the

research are significant in terms of putting forth the results of the research for consideration. Hence, the present circumstance related to various ITPs can be seen and the weaknesses of these programmes and the dimensions to be developed can be shown to curriculum development experts and curriculum practitioners.

1.3. Limitations

This study is limited to 35 pieces of research which consisted of master's theses, articles published in national refereed journals, and papers presented at national conferences and symposiums which were all conducted to evaluate ITP in Turkey from 2000 to 2011.

2. Research Methodology

The methodology of the research procedure included two major sections: design, data collection and analysis.

2.1. Design

This study was conducted through document analysis method which is one of the methods of qualitative research. The main purpose of document analysis is to analyse sources including written information that is targeted to research about events and facts in detail. Document analysis may be the sole research method when it is not possible to make in-depth interviews and comprehensive observations (Yıldırım and Simsek, 2011).

2.2. Data Collection and Analysis

Data was collected through document analysis. Within the document analysis, 35 studies were included in the research which consisted of 7 master's theses, 22 articles published in national refereed journals, and 6 papers presented at national conferences and symposiums fulfilled in Turkey from 2000 to 2011. In this study, instead of some articles which are the summary of theses, the theses were included.

Descriptive analysis technique was administered to analyze the collected data obtained during the document analysis process. In that process, the research was analyzed individually and, depending on the findings of the research, a thematic framework was formed and themes and sub-themes were determined. Analyzing the findings, the frequency values were counted both for the main and sub-themes. Then, two experts having qualitative research and field knowledge were consulted related to the reliability of the thematic framework. Based upon their opinions, the data were reorganized and the findings were discussed.

3. Findings and Discussions

The major findings were presented based on the two research questions. Discussions on each aspect were summarized together with the findings.

3.1. The aims of the research

When the aims of the research are analyzed, it is seen that the aims gather under four main themes. The themes are displayed in Table 1.

Table 1. The aims of the research

Themes	Frequency (f)
The evaluation ITP conducted in specific subjects/topics	21
The evaluation of ITP organized by the Ministry of National Education	8
The evaluation of ITP to see whether it is put into practice in schools	5
The evaluation of educators serving in ITP	1

Examining the aims of the research overall, it is seen that 21 of the ITPs were conducted to evaluate specific subjects/topics, 8 of them were organized by the Ministry of National Education and 5 of them were fulfilled to see whether what is learned in ITP is put into practice by teachers in schools. Only one study aimed to evaluate the educators serving in ITP. Educators actually play important role in the success of ITPs by planning and organizing them so there could be more studies as to the evaluation of educators.

Sample aim related to the evaluation of ITPs conducted about specific subjects/topics can be shown as in the following:

"The aim of the study is to analyse the effect of in-service training program on the improvement of views about the nature of science of elementary science and technology teachers" (A3)

Sample aim related to the evaluation of ITP organized by the Ministry of National Education can be shown as in the following:

"The aim of the study is to analyse the views of teachers and administrators working in state schools about the ITPs conducted by the the Ministry of National Education" (A10)

Sample aim related to the evaluation of ITP to see whether it is put into practice in schools can be shown as in the following:

"The aim of the study is to evaluate an in-service training about laboratory studies of physics teachers in long term" (A13)

Sample aim related to the evaluation of educators serving in ITP can be shown as in the following:

"The aim of the study is to examine the perceptions of participants in relation to the competencies of program instructors" (A25)

3.2. The dimensions of the research results

The sub-themes as positive and negative regarding the dimensions of the research results are displayed in Table 2.

Table 2. The dimensions of the research results

Sub-Themes	Frequency (f)
Positive Results	203
Planning	17
Approval of the place and physical facilities (such as course place, materials) by participants	7
Voluntary participation to ITP	4
Adequate planning of ITP by the course manager	3
Approval of the time and duration of ITP by participants	3
Needs Analysis	18
Doing a needs of analysis at the beginning of the process	11
Meeting the training needs of participants	7
Objectives	13
Objectives prepared in accordance with the needs	6
Objectives meeting the needs of participants	6
Clearly stated objectives of the program	1
Content	14
Content meeting the needs of participants	7
Clear content of the program	5
Content prepared in accordance with needs	2
Practice	19
Including practice as well as theory	11
Appropriate use of teaching methods and techniques	6
Organization of available equipment	2
Evaluation	26

Using process–based evaluation	10
Evaluations measuring the realization of ITP's aims	7
Use of different measurement tools	5
Evaluation of ITP with different methods	4
Educator	25
Having strong communication skills	9
Having sufficient professional and field knowledge	8
Guidance and assistance provided to the participants	6
Making effective presentations	2
Participants	71
Contribution to the professional and field knowledge of the participants	31
Positive changes in the attitudes of the participants	14
Acquired knowledge and skills reflected in the classroom context	11
Positive effects on students	10
Positive changes in psychomotor skills of the participants	4
Cooperation between participants	1
Negative Results	153
Planning	59
Disapproval of the place and physical facilities (such as equipment, materials, course place) by participants	21
Disapproval of the time and duration of ITP by participants	20
Mandatory participation to ITP	7
Failure to cooperate with universities	5
Inadequate number of educators	4
Inadequate planning of ITP by the course manager	2
Needs Analysis	10
Objectives	10

Content	13
Practice	11
Inappropriate use of teaching methods and techniques	5
Explanation of just theoretical knowledge	5
Inadequate practice	1
Evaluation	9
Not using process–based evaluation	4
Evaluations not measuring the realization of ITP's aims	2
Ignoring evaluation	2
Not awarding successful participants	1
Educator	19
Insufficient general qualifications	8
Not being able to use learning environment effectively	4
Insufficient professional and field knowledge	2
Not having enough adult education competency	2
Not having strong communication skills	2
Not giving feedback to participants	1
Participants	22

As seen in Table 2, the positive and negative results of studies gather under the same sub-themes: planning, needs analysis, objectives, content, practice, evaluation, educator and participant. The findings of this study revealed that the positive results in total were more than the negative results. Most of the positive results were included in the participant dimension. The ITPs mostly contributed to the professional and field knowledge as well as attitudes of the participants. Furthermore, the ITPs resulted in the participants to reflect what they learnt on the classroom context, thereby positive effects on the students. The positive results of studies related to participant dimension can be shown as:

"The ITP has resulted in participants to gain positive feeling, views and attitudes related to behaviour control and skill teaching" (A8)

"The ITP led the participants to use the techniques that is taught in the course in the classroom and be more effective" (A15)

Determining the needs of participants at the beginning of the process, preparing objectives and content in accordance with the needs, including practice as well as theory and using process-based evaluation are the other frequent positive results. Positive results of studies related to these dimensions can be shown as:

"The content of the ITP has been designed by determining the needs of physics teachers about science laboratory" (A24)

"The ITP included activities to be done in groups and gave the chance to apply the methods that were presented" (A27)

However, most of the negative results are related to the planning dimension. Time, duration, pace, place of ITPs and physical facilities in the course place were mostly disapproved by the participants. Some results of studies related to these dimensions can be shown as:

"The course started at the beginning of the semester after the summer holiday so teachers could not be motivated" (A18)

"The pace of the course was too fast and it was short term" (A30)

Moreover, some of the negative results are regarding the professional knowledge and skills of participants and not being able to reflect acquired knowledge and skills in the classroom context. The results of studies can be shown as:

"The physics teachers stated that they still could not use the laboratory effectively" (A34)

Also, educators' general qualifications, not being able to use the learning environment effectively, insufficient field/professional knowledge and adult education competency, inappropriate use of teaching methods and techniques, explanation of just theoretical knowledge are not approved by the participants in the ITP. The results of the study related to this dimension can be shown as:

"The educators should be expert in their fields and should be selected from the academics in the universities" (A25)

4. Conclusion and Suggestions

The evaluation of ITPs in a continuous and holistic approach and improvement of ITPs according to the results is essential so as to cater to the needs of teachers. This study was based on this need and 35 studies were analyzed. According to research findings, the positive results are more than the negative results; however, there are a lot of points to develop in ITPs that are arranged in Turkey.

The research findings also revealed that teachers' views as the participant were mostly preferred for the evaluation of ITPs in Turkey. Based on this finding, it can be suggested that evaluations should be made not only through teachers' views but also via more than one data collection instrument such as students. It can also be suggested that evaluation conducted to determine the effectiveness of ITPs should be applied not only at the end of the process but also during the program. Besides, it was noted that there was not an agreement related to the timing of ITPs (in summer, in winter, after the lessons, at the weekend, in the seminar periods of June and September). For that reason, it may be logical to ask for participants' views regarding the time of the program. Also, it was identified as a requirement that the educators should be selected from those who are expert in their fields and have adult education competency.

Based on the research findings, the following can also be suggested:

Scientific methods should be implemented to determine the needs of participants,

Participants should be selected objectively,

Participants who are successful in ITPs should be awarded,

ITPs should be arranged in appropriate physical places to meet the needs of participants,

The number and duration of ITPs should be increased and for that reason distance education may be utilized to reach more teachers,

Instructional strategies and techniques should be varied to motivate the teachers,

ITPs should be conducted in cooperation with universities,

Follow-up studies should be conducted at schools after ITPs.

THE CASE OF SCHLEIERMACHER IN THE CONTEXT OF HERMENEUTIC METHOD IN EDUCATION

Associate Professor Mehmet Faik YILMAZ[a][78]

[a]Yildiz Technical University, Faculty of Education, Head of the Department of the Primary School Teaching

Abstract

Very wide range of methods has been used throughout the history of education. Some of these methods have been long-running and employed for centuries; some of them occupied a significant place in the history of education only for a certain period of time and some of them have been frequently in and out of sight in the historical scene. Hermeneutic method, which is also known as a form of interpretivist method, whilst having experienced very functional periods throughout the history of science, also have seen certain periods in which it was not much mentioned and even fall into oblivion.

Having taken its name from Hermes who was believed to be a messenger between the gods of the ancient Greek Mythology and the human beings, Hermeneutics experienced a very functional period in the ancient Greek philosophy and literature and played a very active role in interpreting the religious and profane texts.

Not much mentioned along the medieval ages encompassing practically a period of a thousand years, in the New Age, especially after Renaissance and Reform, hermeneutic method played a key role in the reinterpretation of the Sacred Texts.

In the eighteenth century, the natural sciences virtually monopolized the science by using the "explanation" method and the social sciences retreated to the background. As a consequence, hermeneutics was left aside and not mentioned at all till the end of the nineteenth century.

It was not until Wilhelm Dilthey, the most significant theoretician of the discipline called Geisteswissenschaftlicen Hermeneutik, came up with the "understanding" method as opposed to "explanation" method, and hence hermeneutics reappeared in the historical scene.

This paper will deal with Schleiermacher as an educator and discuss his teaching method in the context of the application of the hermeneutical method to education.

Keywords: Education, hermeneutic method, hermeneutics, Dilthey, Schleiermacher.

Main text

Introduction

It would be proper to inform the reader about the life and thought of Schleiermacher, before we get started on this paper named "The Case of Schleiermacher in the Context of the Hermeneutic Method in Education".

One of the famous thinkers of the nineteenth century, Friedrich Ernst Daniel Schleiermacher, was born on October 21, 1768 in Breslau, Poland and died on February 12, 1834 in Berlin. The German philosopher is a theologian and also a philologist. He laid the foundations of the Protestant Theology and made a systematical interpretation of the Christian dogmas in his book named Der Christliche Glaube / The Christian Faith.

E-mail address: mfaikyilmaz@hotmail.com

Approximately in 1925-55, the theological ideas of Schleiermacher which had been influential during the nineteenth century was criticized harshly by a group named "The Word of God" which was led by Karl Barth ve Emil Brunner on the grounds that his ideas created a religion depended on the human culture rather than the absolute truth. However, the importance of the contributions of these ideas have begun to be better understood recently (Yılmaz, 2003, 104).

According to Schleiermacher, hermeneutics is the art of understanding the meaning of another person's words correctly. That means building a bond between the person one understands and the third person to whom the thing that one understood was transmitted to (Berger, 1999, 14; Schleiermacher, 1977, 11). As opposed to the former theoreticians, Schleiermacher problematized the question of understanding another person and rendered it a general problematic about knowledge by dealing with intent rather than reality and appealing to intuition rather than research. His analyses depend on examples from Bible or Classical Antiquity and for all that his attempt remains to be a bit theological still (Freund, 1997, 30).

At the beginning, the hermeneutical techniques had been developed to overcome the difficulties or failures in understanding the obscure or apparently incoherent passages which takes place mostly in religious texts. Schleiermacher thought our seeing neither an obscurity nor incoherence in a text is not a clue that our interpretation was correct. Potentially, understanding is always open to misunderstanding. We can't get anywhere as long as we acknowledge that the familiar words bear the same meaning as they are understood by us in daily usage when they take place in a historical text. As Linge claims, misunderstanding can naturally occur because of the changes in the meanings of words and worldviews which have occurred in the period that set apart the writer from the interpreter. These historical changes bring forth a trap which will make the understanding inevitably difficult, unless the consequences of these changes are neutralized. Thus, we appeal to hermeneutical rules not only when we confront difficulties, but also whenever we attempt to understand anyhing (West, 1998, 121).

The essential contribution of Schleiermacher to the formation of a hermeneutical approach is his attempt to investigate the conditions for the possibility of valid interpretation and to develop a new concept of understanding by relying on the legacy of the former transcendental philosophy and romanticistic movement. According to Schleiermacher, while a literary text belongs to the entire works of the author (objective factors of the texts), the peculiar meaning of the text depends on the subjectivity of the author at the moment of creation (subjective factors of the text). He thinks that understanding is a creative reformulation and reconstruction acting in a circular and dialectial flow, since it always contains a formerly known appeal. This approach to understanding anticipates the concept of hermeneutische zirkel (hermeneutical circle), which in future will be one of the main concepts of the hermeneutical approach. Having distinguished two types of interpretation, grammatical and phsychological, and having tried to determine the particular laws of these two types, Schleiermacher has been interested only in understanding and interpreting the text yet, but he has also claimed that the true object of understanding is a text which is to be understood and deciphered, an idea which will be influential along the whole development of the hermeneutical thought (Göka, 1993, 86; Göka, Topçuoğlu, Aktay, 1996, 28-29.).

Schleiermacher's hermeneutical circle approach can be outlined in three steps: (1) In order to reach the meaning of a text, one has to place it in the entire works of the author, in the same way as one has to place each word in the context of the entire work. (2) Likewise, one has to place the works of the author in the relevant literary genres and gradually in the whole literature. This is the objective aspect of the matter. (3) On the other hand, the interpreter has to determine the place of the same text in the spiritual life of the author as an expression of a moment of the creative process. Thus, according to Schleiermacher, when the circle containing the objective and subjective dimensions were completed and thus the "hermeneutic circle" was formed, only then it would be possible to reach the meaning (Kasaboğlu, 1992, 61).

The Development of the Hermeneutic Method since the New Age

With the Renasaissance, the interpretation and its rules had gained a new dimension and as a consequence the language, life conditions and nationality concept of the classical, Christian Mediaeval Ages had been fully changed. Thus, the interpretation shifted to a a new area different than the former one in Rome where its function was interpreting the Bible and it began to be employed to interprete another spiritual life through grammatical, objective and historical researches. This new philology, polymati and critique usually had to work with only small pieces of information. So these new sciences had to change into a new type and become creative and constructive. Therefore philology, hermeneutics and the critical science approach rose to a higher position. Last four hundred years have witnessed a very broad hermeneutical literature. Classical and sacred texts were powers to be gathered, so hermeneutics formed two movements. Classical and philological prescription was described as the art of critique (ars critica). The then-uncompleted works of Scioppius, Clerius ve Valerius manifested themselves in this period. These works gave the hermeneutical teaching of art in their first chapters. Countless writers and speakers wrote and talked about interpretation (de interpretatione). However, in the final analysis, the construction of hermeneutics was indebted to the interpretation of the Bible. The most important and perhaps the essential one among these works was Key (Clavis) which was written by Flacius and oublished in 1567 (Dilthey, 1924, 317).

The rules of interpretation which had been discovered and then reached the climax up to that time were brought together in a teaching structure. So, with these rules, artistic method had to acquire universality as a means of the postulate. This rule-based point of view that shaped hermeneutics raised the awareness of Flacius through the discussions of sixteenth century. He had to struggle in two fronts. One of these fronts was the authorities of restorated Catolicism, who claimed that there was no ambiguity in Bible. Having learned much, especially from the interpeeretations of Calvin, Flacius objected to these ideas. This interpretation of Calvin was a return to its foundations rather than merely interperation. For a Lutheran of that time, the most important mission was to refute the traditional teaching of Catolicism which had been recently formulated. The Catholic tradition which determined the interpretation of the Bible opposed to the rules of interpretation which was adopted by Protestants to interpret the Bible only on the grounds that it was impossible to deduct universal and sufficient interpretations from the sacred text. Some time after the publication of the works of Flacius, Bellarmin, the Catholic representative in the Trieste Concile, published an essay opposing severely to the idea that the Bible interprets itself in 1581 and tried to prove the necessity of the tradition. In the context of these discussions, Flacius attempted at raising the rules of interpretation into the universal rules of hermeneutics. In order to bring these efforts to conclusion, means and rules which had never been used in any hermeneutical study before were developed. The interpreter will be in need of an elavatory means, if he confronts a difficulty in a text. These are the sacred texts formed in the context of the living Christian piety. We translate this from the dogmatical cast of mind into our way of thinking. This hermeneutical value which is the experience of this piety is only the principle of particular events. Therefore, in each method of interpretation, the interpretation itself is a factor derived from the objective context. However there is a rational rule of interpretation besides this religious rule of interpretation. Grammatical interpretation is the next one. However Flacius underlines that the physchological and technical rule of interpretation should be interpreted according to the composition of certain parts and the entire text and also the aim of the work. And the studies on the re-organization of Aristotelian Rhetoric were conducted by Melanchthon. Flacius was conscious of the necessity to consider some parts and elements of the text according to the context, aims, proportion and equality which was inherent in them in order to determine the monosemy of the text by this means. Therefore he adds the hermeneutical value to the viewpoint of his methodical teaching itself. "Just like the parts of a whole hold their own understanding in their relationship with this whole and the other parts of it." He starts with the inner form of an object, then proceeds to its style and the elements of influence and develops the fine characteristics of the Pavlusian and Johannesian style. This was a great step within the scope of the rhetorical understanding. Melanchthon and Flacius claim that each text is written and understood according to certain rules. This resembles a logical automat by which the text is transformed into the figures of style, form and speech (Dilthey, 1924, 318).

The deficiencies of Flacius' work were overcomed in the hermeneutics of Baumgarten which was developed much after. Baumgarten accomplished in his work a second great theological and hermeneutical movement.

Owing to the information supplied by Baumgarten from a Halle library, not only the Dutch interpreters and English free thinkers but also the interpreters who expounded the Bible in a German framework rather than as an ethnological work apperad in the field. Semler and Michaelis got contact with him and joined his researches. Michaelis applied the uniform outlook of language, history, natura and law to the interpretation of the Old Testament. Semler, predecessesor of the Great Christian Baur, destroyed the uniformity of the interpretation of the Old Testament text and started a proper study. In this way he tried to understand each Holy Scripture according to its own local character. He then bound these Holy Scriptures together and formed a new unity. With this unity, he put the the oldest Christian-Jews conflict in the living historiografies in order. In the preliminary phase of the theological hernemeneutics, he divided the whole science into two parts resolutely: Interpretation based upon the usage of language and interpretation based upon the historical situations. In this way, interpretation was freed from dogmatism and the grammatical and historical schools were founded. Careful and sophisticated genious of Ernesti formed a new hermeneutics for the interpreters of the classical texts (Dilthey, 1924, 319).

Contributions of Schleiermacher to the Hermeneutical Method

Schleiermacher developed his own hermeneutics from his readings. These developments formed within the precise limits. Compositions and thoughts were formed by these interpreters according to the conditions of the time of each text within the frame of local and temporal visions. According to this pragmatical understanding of history, the human nature seen as consisting of equal religious and ethical aspects was confined only outwardly, locally and temporally. The human nature is not historical.

Up to that time, classical and Biblical hermeneutics acted in unison. Didn't these two practices have to be understood generally? In 1757 Meier took this step with his book named An Essay on a General Art of Interpretation. He tried to generalize the concepts of his own scientific field. It was necessary to develop rules from the signs which can be followed in each interpretation. However this book once again indicated that it was impossible to form a new science according to this architectural and symmetrical point of view. Only thing that this point of view could generate were blind windows that nobody could enter in. A very influential hermeneutics could only be generated by an attitude of mind that had brought the mastery of philological interpretation and the real philosophical talent together. He was Schleiermacher who had such a mind (Dilthey, 1924, 320).

Under what conditions did Schleiermacher work? His interpretation of the art works of Winckelmann, Herder's ability to understand the spirit of the ages and societies cognitively, Heyne's, Friedrich August Wolf's and his students' (among whom Heindorf carried out Platonic studies in a close contact with Schleiermacher) introducing a new aesthetical point of view to the philological studies—all these conditions together bound Schleiermancher to the experience of the German Transcendantal Philosophy. The idea of returning to an ability given in subconscious and the impact of this association unwittingly revealed the whole form of our inner world and from the association of these two moments emerged a particular art of interpretation and the grounding of the scientific hermeneutics.

Up to that time, Hermeneutics was at least a structure of rules. Its parts and own rules were linked together by the aim of a universal interpretation. Hermeneutics had some functions classifying the interpretation into certain parts grammatically, historically, aesthetically, rhetorically and objectively. For centuries, Hermeneutics had raised awareness about how the functions of the rules stemming from philological mastery should operate. Now Schleiermacher had returned again to these rules in order to analyze the understanding. In this way, in order to understand this movement itself, he deduced from this understanding the potentiality, means, limits and rules of the universal interpretation. However he expressed that the understanding which he defined as imitating, constructing and planning could only be analyzed if there is a living relationship between the method and the literary product. An influential work emerges from this creative method and thus it recognizes the necessary condition for another method to be understood. We can understand the author's state of mind from his aim, in the same way as we understand the whole of a work from its style (Dilthey, 1924, 324).

Therefore, a new historical-phsycological outlook was required for the solution of the problem. In this context, we tried to find out what is mentioned here by tracing the formation of hermeneutics as an artistic teaching of a certain kind of literary product between the Ancient Greek interpretation and rhetoric. However the concepts of these two methods always remained historical and logical. The categories in which these ideas realized were continuous practices, logical context, logical order and the dressing of these logical products with style, speaking figures and pictures. Now very new concepts are used to understand a literary product. This ability which contains integrity and creativity accepts the firstly expressed ideas and shapes them without being aware of its own influence and creativity. Receiving and forming spontaneously these ideas are the integral parts of it. Here, individuality manifests itself in each word. The inner and outer form of a literary work is the highest expression of it. Now, in order to understand this work, an unceasing requirement occurs: The necessity to confine one's own individuality because of the opinions of the other people. Understanding and interpretation is constantly active in life. They fulfill their development in the artistic interpretations of the crucial works and in the minds of writers themselves. This is a new perspective formed in Schleiermacher's mind in a different manner.

However there was a one more condition required for this great leap forward of the general hermeneutics. This historical-phsycological outlook was developed by Schleiermacher and his friends together with the philological art of interpretation. The German Spirit of Schiller, Wilhelm von Humboldt and Schlegel brothers ceased to be a poetical literary product and turned out to be the understanding of the historical world. This was a powerful movement. Böckh, Dissen, Welcker, Hegel, Ranke and Savigny joined this movement. Friedrich Schlegel became the pioneer of Schleiermacher in the philological art. The concepts which was used by Schlegel in his brilliant works on The Greek Poetry, Goethe and Boccaccio, shed light on the inner style of the work, the developmental history of the author and every fields of literature. The particular success of this profoundly-constructed philological art stemmed from the scientific critique. Art of critics (Ars critica) must have been founded upon the theory of these generated literary abilities, as mentioned briefly in Schleiermacher's "Hermeneutics and Critique (Hermeneutik und Kritik)" (Dilthey, 1924, 324).

First of all, Schlegel developed a scheme for the translation of Plato. It was followed by the founding of the new interpretation technique which will firstly be applied to Pindar by Böckh and Dissen. According to this technique Plato had to be understood as an artist of philosophy. The aim of this interpretation is to create coherence between the Platonic philosophical character and the artistic form of the Platonic works. At that time philosophy is still a living phenomenea united with speech. Its literary formation is necessary for only remembrance. It should be a dialogue in an artistic form. Philosophy is in need of a living connection of thinking to continue reproducting itself. According to this Platonic thought which has also a firm integrity in itself, each dialogue should involve the background of the event, organize its aftermath and continue forming the various parts of the philosophy. If we follow this relationship of the dialogue, then the connection of the sources are formed which will reveal the undermost inner aim of Plato. Schleiermacher claims that Plato can only be understood after the connection which is formed artistically. With regard to this, in the chronological order of his works a disconnection might occure or the connection might become less important. In his famous critique (Rezension), Böckh claims that this work on Plato is a masterpiece in the science of philology.

Such a philological mastery and a philosophical talent first came together in the genious of Schleiermacher. In this success, the solution of the hermneutical problem and the transcendental philosophy which offers an adequate means for all the texts played a great part. So hermeneutics as a general science and an art of interpretation emerged.

In the fall of 1804, Schleiermacher developed the first scheme of hermeneutics from the Ernestian interpretive readings. So he wanted to start the interpretation lectures in the University of Halle. We had only an ineffective form of this hermeneutics. It was Böckh who was his student in the University of Halle that brought the required influence to his hermeneutics in the wonderful part of his lectures on the encyclopedia of philosophy (Dilthey, 1924, 332).

In conjunction with another development, I would like to quote some sentences which seem to me essential from the hermeneutics of Schleiermacher. The interpretation of each literary work can only be fulfilled by the

method of understanding which was formed artistically. It extends to all aspects of life and contains all types of speech and writing. Accordingly the analysis of understanding is essential for the rulemaking in interpretation. However this can only be associated with the analysis of the literary works. The relationship between the understanding and fruition which determines the means and limits of interpretation can only help to form the connection of the rules.

The potentiality of emerging of a universal interpretation can only be generated from the nature of understanding. The characters of the interpreter and the author of the text do not confront each other since they are uncomprable facts. This two facts lie in the foundation of the general human nature. Therefore, the collectivity of human is only possible with speaking and understanding. Here we can once again explain the expressions of Schleiermacher phsycologically. Ultimately, all differences depend on the differences stemming from the essential mental conditions of different people rather than the qualitative differences. However, the interpreter can succeed in emphasizing and strengthening the mental conditions in effect, leaving behind the others and embedding the imitation of the foreign lifes in himself, if he practices and places his own vitalness into an historical environment.

This logical aspect of the interpretation which we have expressed in our logical terminology is founded in the coeffect of induction, in the application of general truths to the particular situtiations and in the comparative method. The last thing to do is to determine the particular forms, fulfill the logical operations aforementioned and recognize the connections.

Here the main difficulty common in all arts of interpretation becomes evident. It is supposed to understand whole of the work from each word and their connections, however understanding the "part" depens on understanding the "whole". This cycle repeats itself in the relationship between the work, the development and mood of its author and the literary genre to which it belongs. Schleiermacher best analyzed this problem in his work, "The Introduction to the Republic of Plato". I came across different examples of the same method in his lecture notes on interpretation. ☐He started his compared to a slapdash reading. This introduction involved the entire context, including the main lines. He shed light to the difficulties. In everywhere that informs us about composition, he stopped and contemplated. Then the real interpretion began. ☐Theoretically we here determine the limits of all possible interpretations which to some extent perform their function. So understanding everything is impossible because it is a relative thing and it never ends.

Schleiermacher refused to divide the method of interpretation to four categories (grammatical, historical, aesthetical and objective) as it was practiced before him. If the interpretion has begun and been capable of having an impact on each category, then this division only points out to the realization of the grammatical, historical, aesthetical and objective cognition. However, the method of interpretation itself can be divided to two categories which serve to deduct from the things inherent in the lenguistical signs a mental creativity. Grammatical interpretation goes from context to context and continues until the highest connection in the whole of the text is established. Psychological interpretation starts with the formation of the inner creative process, proceeds with the inner and outer form of the work and finally records the development and mood of the author creating the coherence of the work (Dilthey, 1924, 336).

It is just the point where Schleiermacher masterfully brought the art of interpretation. In his teaching, the inner and outer form is essential. Especially, the general theory of the literary products bears a profound meaning, in the same way as Organon has an important place in the history of literature.

The highest aim of the hermeneutical method is to understand the author better than himself. Imagine a sentence that the coherence of its teaching has been come into existence from an unconscious creating.

Now we have arrived at the conclusion, which says understanding is only possible with an interpretation which reached universality against the language monuments. If hermeneutics is conscious of the philological interpretation method and the causes of truthfulness; when the practical use of this discipline is compared with a living exercise, it can't have a great impact, as Friedrich August Wolf has rightly criticized. However, besides

this practical use, it seems to me that, the second and even the most important duty of interpretation is grounding the universality of interpretation theoretically in a historical perspective against the persistent pressure of skeptical subjectivity, because the reliability of history completely depends on this. When the teaching of interpretation is recognized as the logical and methodological teaching of the human sciences in the context of the theory of knowledge (Erkenntnistheorie); then it becomes an important link between historiography and philosophy. In other words, it becomes the essential supplementary and grounding element of human sciences (Dilthey, 1924, 317).

Abstract

The aim of this research is to investigate the Web site evaluation skills of computer teacher candidates as they assess the Trakya University Faculty of Education web site in terms of visual design, structure and navigation. The research utilizes a Web Site Evaluation form and a semi-structured interview in order to collect the required data. The analysis of the quantitative data has been carried out via descriptive statistical techniques; with the frequency and percentage distribution figures for each item given in charts; whereas the analysis of the qualitative data has been carried out through descriptive analysis techniques. It was concluded from the study that the computer teacher candidates found the faculty web site to be easy to use and fluid in terms of navigation and they reported that the site works as intended and without problems. However, it was also reported by the teacher candidates, that the faculty web site had neither a customized site search engine nor a promotional video and that, the promotional images needed a more professional touch in order to have a stronger effect on visitors. Another conclusion was that the computer education teacher candidates tended to pay attention on issues like color schemes in the visual design of a web site and that they preferred not having too much visual detail or animations within similar websites.

Introduction

The rapidly developing Web technologies in the recent years have resulted in improved dynamicity, richer visual content and faster loading times of Web pages. Even though most of these new technologies may seem to be exclusive to private industries; they are also employed by Web sites of governmental organizations, including educational institutions such as universities or libraries.

The Web sites, which serve the purpose of education, have been positively affected in terms of technical structure and ease in content updates by developing Web technologies. As a consequence, the Web sites of many academic institutions have been re-structured. However, Web technologies alone are not enough to create Web sites that serve the needs of the target audience; and there is always a need to implement them by taking usability issues into account (Calongne 2001), since usability means quality in Web sites and it puts the users and their real needs in the center (Zaharias 2004). There have been numerous studies seeking to evaluate the usability of Web pages that belong to academic institutions and re-structure them according to the results. Cobus et al., as well as McGillis and Toms, have worked with users of library web sites in order to evaluate the usability of the said sites (McGillis and Toms 2001; Cobus, Laura et al. 2005), whereas Uçak and Çakmak, as well as Zengin and colleagues, (Uçak and Çakmak 2009; Zengin 2011) have collected user opinions in order to evaluate the web sites of respective academic departments. Kutluca, Tamer and Aydin have conducted a large scale research to evaluate through expert reviews the Web sites for 67 Faculties of Education in Turkey and reported the results (Kutluca, Aydin et al. 2009).

A recent example of an academic institution web site that has been re-structured to reflect new technologies in Web site design is the Trakya University Faculty of Education Web site. The faculty houses a department of Computer Education and Instructional Technology (CEIT), where pupils enrolled also take up Web page design and Web programming courses as part of the undergraduate curriculum. The undergraduate program thus helps the students become individuals that are knowledgeable in these fields

This study provides information on the infrastructure of the new Trakya University Faculty of Education Web site, which was re-structured and published in 2011; then showcases an evaluation of the new Web site by the computer teacher candidates that are enrolled as students in the Computer Education and Instructional Technology undergraduate program offered by the faculty; and finally discusses the results of the evaluations.

The Technological Infrastructure of the Web Site

The previous version of the web site, which had been based solely on HTML, proved to be inefficient in terms of page updates, user interaction and dynamic processes. However, the re-structured Web site, which was built and published in the year 2011, uses Jquery and Ajax structures, which form the basis of today's Web 2.0 and Semantic Web technologies. Therefore, dynamic web pages that allow for updates through user interaction have been created for the site. The programming language employed for the construction of the site was C# under ASP.NET technology. Additionally, data such as personnel hierarchy and website news feed entries have been recorded into a database running on MS SQL Server 2008 database management system. At the design stage, the CSS language has been used in order to achieve identical appearance over different Web browsers.

The purpose of the research

The purpose of this study is to assess the evaluation of the new Trakya University Faculty of Education Web Site, which has been published as of 2011, by the students of the Department of Computer Education and Instructional Technology at Trakya University Faculty of Education.

The answers for the following questions have been sought in accordance with this purpose: According to the students of the Department of CEIT, who are also Computer Teacher candidates, how is the Faculty of Education web page evaluated

- in terms of technical and navigation structures; and
- in terms of visual design?

Method

Research model

The research employs two methods, namely the quantitative "general screening model" and the phenomenological model, which is a qualitative research method. As a result of a review on current literature, a 37-item questionnaire named the "Web Site Evaluation Form", which was developed by Kutluca, Aydin and Baki (Kutluca, Aydin et al. 2009), has been chosen as the data collection tool for screening purposes. The aforementioned research employs the form as a tool of expert review and the form has been used within this research on computer teacher candidates, who are both site users as students and Web site design experts in-training. Additionally, in order to clarify the results and to precisely find out about students' opinions, interviews have been made with 2 students from each class and evaluated in terms of qualitative methods.

Population and sample

It is intended to assess the evaluations of the Trakya University Faculty of Education Web Site by computer teacher candidates that are undergraduate students at the Department of Computer Education and Instructional Technology (CEIT). The population of the study has been set as 143 students that are studying in Trakya University Faculty of Education Department of CEIT. Purposive sampling has been used at the qualitative data collection stage of the study, where two students have been chosen from each classroom for interviews. The purposive sampling variables for the selection of interview participants have been set as student class and gender.

Data collection instruments

Data for the evaluation of Trakya University Faculty of Education Web Site has been collected via the form that has been selected, during February 2012 and March 2012. The scoring for items in the Web Site Evaluation Form have been set as Yes (2), Partially (1) and No (0) The frequencies and percentage values acquired as a result of analyses on quantitative data have been shown in charts. A semi-structured interview form has also been created by the researchers in order to use in the interviews made for the qualitative data collection stage. The form, which has been based on relevant literature, has been subjected to expert review and edited in accordance with the feedback received.

Data analysis

The data that has been collected via the Web Site Evaluation Form has been entered into a spreadsheet created in MS Excel software. Frequency and percentage values have been obtained from this spreadsheet. As for qualitative data, interviews made with the students have been recorded as audio data; to be transcribed into computer text later and handed to an expert for review of integrity. Once the integrity of the interviews has been verified by the expert, they have been indexed. The necessary opinions regarding the interview questions have been selected and entered into an MS Excel spreadsheet. Then, the opinions that have been entered into the spreadsheet have been collected under certain theme categories. Lastly, the opinions which have been categorized under themes have been interpreted by experts and reported as findings

Findings

Findings obtained from form data

Table 1. Findings on items pertaining to technical and navigational structures sub-category

Technical and Navigational Structures	Yes		Partially		No	
	f	%	f	%	f	%
Is it easy to control the use of the site?	88	62	39	27	16	11
Are all the pages of the Web site working without problems?	81	57	45	31	17	12
Is the information architecture of the Web site too complex?	30	21	48	34	65	45
Is it easy to navigate between pages?	90	63	40	28	13	9
Is there a search engine within the site?	40	28	15	10	88	62

According to the values on Table 1, it can be deduced that the Web Site is easy to use; that there are no problems at any of the web pages and that; navigation in the website is easy. However, there seems to be a problem regarding the site search engine. There also seems to be a partial problem regarding the information architecture.

Table 2. Findings on items pertaining to the visual design sub-category.

Visual Design	Yes		Partially		No	
	f	%	f	%	F	%
Are font faces and sizes consistent in all the pages that comprise the site?	83	58	34	24	25	17
Does the site include visuals and photographs that promote the faculty?	103	72	36	25	4	2,8
Do the web pages for different departments/divisions share a common visual theme?	91	64	41	29	11	8
There are web pages within the site that do not work / can't be reached.	28	20	33	23	82	57
Are there animations on the site pages?	63	44	36	25	44	31
There is much detailed information on the pages	31	22	49	34	63	44
Too many different colors have been used in the site's pages.	20	14	50	35	73	51
Do you think that color harmony has been preserved throughout the site?	102	71	31	22	10	7
Are there pages that are still under construction?	23	16	39	27	80	56

According to the figures on Table 2, the only problems regarding visual design seems to be about animations and about lack of detailed information on the pages.

Findings obtained from interview data

Technical and navigational structures

The teacher candidates that have been selected for participation in the interview phase of the research have been initially asked about their opinions on the technical and navigational structures of the Faculty of Education Web page. It was found that the teacher candidates generally thought that the means of access to the Web site is quick and sufficient and that the content of the Web page is easily reachable through the menus and other organizational elements that are parts of the site navigational structure. On the other hand, some participants of the interviews have reported that certain menus have failed to operate and that transition between pages failed at times. The computer teacher candidates also reported that, in spite of the occasional technical difficulties, the transition through menus and pages is clear and fluid; whereas the menus have been designed as neat, simple and understandable.

"Yes, it works fast but, I mean, we do have a CEIT group in the Faculty of Education and because of that... well, I guess the site could have been designed to be more lively. I thought the navigational structure could be improved." [Y.B.]

"Transitions are swift in general. There are no problems in that aspect. However, there seems to be some problems when moving between menus. Menus seem to close by themselves in case they are not aligned, and then you have to re-open them.." [Y.B.]

"Yes, I mean, as far as navigation is concerned, I can freely move around the site. I can check out all the educational departments of the faculy, as it can be seen from here"[G.K.]

Visual Design

It can be said that the opinions of the interviewed teacher candidates regarding the visual design of the Web site is generally in the positive direction. The overall themes discussed in the stated opinions are the color palette, picture quality, and the use of video and animations. The teacher candidates have reported that the color palette is designed as harmonious; however, the selection of th colors should have been more appropriate for a

university, which is a governmental institution after all. In addition, one teacher candidated reported that the orange color, which was one of the colors contained in the color palette for the Web site, was discomforting for the eyes, hence creating trouble for the site visitors.

"Orange. I've read somewhere about the orange-blue combination in Web sites, about how it is exhausting for the eyes. It keeps attracting unnecessary attention."[E.K.]

"The color scheme is harmonious, it is beautiful, there is nothing too extreme or eye-biting about it . Which is normal since, I mean, it is the Web site for a University, which is an official institution. So I can say yes, it is good"[Y.B.]

Another aspect of visual design that has been discussed is image quality. Teacher candidates reported that they found the images to be very 'amateur' in terms of technical quality and appropriateness for the Web site. They also reported that they expected more professional images that promote the Faculty more effectively.

"A lecture hall ahs been shown in one image but, it is completely empty. I think it would be better to have the image of a hall with students inside."[B.B.E.]

"Sure, there could be more appropriate, proper images at the site. These photos also look, how shall I say, a little artificial"[A.Ö]

Various opinions on visual design have also been discussing about video and animations. Teacher candidates have reported that the lack of videos that are promoting the faculty is a disadvantage and that these needed to be included in the Web site. As for animations, the teacher candidates reported the number of animations used in transitions between site images is sufficient and that too many animations in the Web page would have been inappropriate anyway.

"There are image transition animations. That is a good thing. There are no problems with it either, so I can say it's pretty nice." [E.Ö.]

"Too much of that would be disturbing. The current level of animations is enough." [Y.B.]

"Yes, a promotional video could be effective."[E.K.]

The interview featured several questions regarding the visual design of the site text content. The answers pointed out that the font face and size used in the web site are appropriate for the target audience. It has been reported that the text was easily readable and the content wa sunderstandable.

"The notice board text is beautiful. The overall font faces are normal, too. They're not too large, nor too small. The size is completely readable, which is nice."[E.Ö]

"No, I think the font sizes are quite fine for me. For example, here, this notice board text, which keeps flowing, and the fact that it changes color when i click here, it is good, useful."[G.K.]

Conclusions and recommendations

According to the research, computer teacher candidates believe that, as far as technical and navigational structures are concerned, Web sites with menu elements that enable fluid and dynamic transition between pages are more effective. In addition, as far as visual design is concerned, the computer teacher candidates seem to care about harmony in the color palette, believing that a Web site for an official government institution needs to have simpler colors. It was stated that the images used in the Web site are not effective for the promotion of the faculty, that more professional and higher quality images need to be used for this purpose and that it can be much more useful to include promotional videos in the Web site. It is thought that too much use of animations could result in distraction and disturbance of the eye sight. As far as text properties are concerned, the teacher candidates believe that readability of the Web site is good.

The following recommendations could be made as a result of the analyses:

- It was understood that the lack of an intra-site search engine is a disadvantage according to the students. Adding a search engine to the Web site should be considered.
- Students have reported that the images used in the Web site are of amateur quality. The images therefore need to be replaced with more professionally acquired ones.
- It has been understood that the students could not be well informed about the faculty and its departments due to lack of promotional videos. Such promotional videos need to be prepared.
- It was found out that the Web site does not feature language selections for international visitors, such as exchange students from the Erasmus program. For this reason, translated versions of the Web site need to be developed.
- It was found out that photographs of faculty administrative staff are not present on the Web site. The photographs of the administrative staff need to be uploaded.

THE DEVELOPMENT OF SOCIAL AND EMOTIONAL ABILITIES OF PRIMARY SCHOOL CHILDREN

Mirela Claudia Dracinschi[a][79]

[a]Alexandru Ioan Cuza University, 11 Carol I Boulevard, Iasi,700506, Romania

Abstract

This paper aims to identify the progress of social and emotional abilities and resilience to a group of Romanian primary school children after attending the Program *Playing the Life.* The experimental study was made on 27 subjects in two stages, before and after the program, from children and teacher point of view. The main result refers to the increasing of social and emotional abilities (raw score, T score and category) and their factors (self-regulation, social competence, empathy and responsibility) from self-assessment of children and teachers assessment

Keywords: social and emotional learning; self-regulation; social competence; empathy; responsibility; strengths-based assessment;

Introduction

Social and Emotional Learning (SEL) is a new issue in the sciences of education field and represents a reaction to challenges from social context regarding subjective children wellbeing. In the last decade there were developed many different social and emotional learning programs especially in the U.S. and U.K. These programs were sustained by scientific research which highlighted their key benefit: greater academic and professional success, behaviour improvement, increased inclusion, learning improvement, growth social cohesion and mental health improvement (Weare, 2003). An important meta-analysis found that students who received social and emotional learning had more positive attitude about school and improved an average of 11 percentile points on standardized achievement tests compared to students who did not receive such instruction (Durlak & Weissberg 2010, Durlak & Weissberg, 2011). The review indicates that SEL programs are effective in both school and after-school settings and for students with and without behavioural and emotional problems (Durlak, Weissberg, Pachan, 2010). School-based programs improve students' social-emotional abilities, attitudes about self and others, connection to school, and positive social behaviour and it reduces conduct problems and emotional distress. In conclusion, social and emotional abilities can be taught in school by teachers and in this form are most effective (Durlak & Weissberg, 2011, Merrell & Gueldner, 2010).

The experimental approach is based on the theory of positive psychology as it was initiated by Martin Seligman and Mihaly Csikszentmihalyi (2000) and the program evaluation is consistent with Strength-Based Assessment. According to this, the focus is on the positive attributes, assets and subjective wellbeing rather than deficits, pathology and mental illness (Cowen, Kilmer, 2002, Keyes 2002, Jimerson, Sharkey, Nyborg, Furlong, 2004, Keyes, Corey 2005, Suldo & Shaffer, 2008, Gilman, Huebner, Furlong, 2009, Bird, Markle, 2012).

Our study is included in wider range of researches concerning the SEL benefits and evidence-based programs. We aim to enrich the practical review of Strength-Based Assessment accomplished with children in after-school settings. We hope to validate the *Program Playing with Life* as developing the social and emotional abilities and resilience of primary school children. Social and emotional assets and resiliencies represent a set of adaptative characteristics that are important for success at school, with peers and in the outside world as follows: friendship skills, empathy, interpersonal skills, social support, problem solving, emotional competence, social maturity, self-concept, self-management, social independence, cognitive strategies (Merrell, 2011).

[79] Mirela Claudia Dracinschi. Tel.: +4-0742-154-545;
E-mail address: doxamus@yahoo.com

Resuming, the two goals of the study were as follows: 1) to validate the Program *Playing with Life* and its benefits for children; 2) to identify a progress in development of children's social and emotional abilities after program participation.

Having these goals in mind we propose one general hypothesis: *The proposed program has positive effects on the development of children's social and emotional abilities;* and three specific hypotheses: 1) The children's implication in the program will increase their level of social and emotional abilities from their self-assessment perspective; 2) The children's implication in the program will increase their level of social and emotional abilities from teachers' assessment perspective; 3) The children's implication in the program will increase their level of social and emotional abilities separately on each of the factors *self-regulation, social competence, empathy, responsibility* from teachers' assessment perspective.

The *independent* variable of this research was the educational program for the development of social and emotional abilities identified in two periods of time: before the intervention (pre-test) and after the intervention (post-test). The *dependent* variable – the global development level of social and emotional assets and resilience operationalized in several categories: self-regulation, social competence, empathy and responsibility.

Research Method

Participants

The sample included 27 children aged between 8-12 years old from 6 urban public schools. Depending on the subject gender, there were 55% girls and 47% boys. All participants come from families with medium high standard of life and level of education, in a proportion of 22% disorganized by divorce. The student attended the schools as follows: 26% in grade 2, 4% in grade 3, 41% in grade 4, 22% in grade 5, 7% in grade 6.

Assessment instruments

The instrument used in assessment before and after the program is Social Emotional Assets and Resilience Scales (SEARS, Merrell, 2011). SEARS is a complex evaluation system of social, emotional and behavioural characteristics based on positive psychology and strengths assessment model. There are four primary rating scales within SEARS system, for children (ages 8 to 12 years), for adolescents (ages 13 to 18 years), for teachers (with students ages 5 to 18 years) and for parents (with children ages 5 to 18 years). The forms are short (ranging from 35 to 41 items) and each rating scale has o companion short form comprising 12 items that possess the strongest item-level psychometric properties. Each item has four-point ratings scale varying from 0=Never to 3=Always; higher score values (raw score, T score, percentile) are indicative of a child or adolescent possessing more of the desirable social-emotional characteristic. With exception of SEARS-Child (SEARS C) all other forms has four empirically derived scales: Self-Regulation (SR), Social Competence (SC), Empathy (E) and Responsibility (R). After summing the values can be calculated total raw score, T score, percentile and tier that corresponds to the examinee's total raw score. A profile for each subject can be constructed and after this the values are integrated in a category: Tier 1 *Average to High Functioning,* Tier 2 *At Risk,* and Tier 3 *High Risk.* The author mentioned in Professional Manual that internal consistency for the total score of each of the four SEARS measure range from .80 to .95 whilst the scale score internal consistency coefficients range from .80 to .95 and for short form is between .82 and .93.

Procedure

The experiment was a longitudinal one with repeated measures, developed between December 2011 and March 2012 through children assessment with SEARS C and SEARS T (2 teachers). The answers from full forms where then taken over in short forms in order to obtain different types of integrated and progress monitoring reports for every child. The *Playing Life* Program developed in 8 modules made up of 2 weekly themes each; every theme took 2 hours.

The first phase was *The Initial Evaluation* of children social-emotional assets by self-assessment and 2 teachers assessment and the second was *The Final Evaluation* held with the same group of children in the same conditions. The third phase consists in uploading the values from scoring sheet to computer program (SEARS Scoring Program) in order to calculate the total raw score, the T score, percentile and place the children in the proper tier. In this moment the researcher also constructed a SEARS individual profile of each subject and also generates The SEARS Integrated Report (with protocols from children and teachers) and SEARS Progress Monitoring Report (with short form protocols pre-test and post-test separately for children and teachers). In the fourth phase the overall data for each subject were selected and then transferred to SPSS for processing. In the fifth phase there were made the statistical operation in order to check the hypotheses and it was done the qualitative interpretation.

Results

The data were processed with the program SPSS 10.0 for Windows. We used the following main statistical operation:

The Paired Sample t test in order to compare the raw score and T score at variables *social and emotional abilities* and their factors depending on the variable *testing moment*

The cross-tabulation technique in order to compare the categories of variables *social and emotional abilities* and their factors depending on the variable *testing moment*

To check the hypotheses we made comparison between initial and final evaluation (pre-test and post-test) for variables *social and emotional abilities* and their factors (*self-regulation, social competence, empathy and responsibility*) taking into account three types of measures (raw score, T score and category) achieved from two perspectives: children's self-assessment and teacher's assessment. We present below the obtained results for each of the three specific hypotheses.

The specific hypothesis 1

Comparisons regarding global children's self-assessment – social and emotional abilities (raw scores, T scores) before and after the program

Sustained by the obtained results, we consider that:
- There were significant differences on the significance threshold $p \leq 0.05$ between the raw scores at variable *social and emotional abilities (children's self-assessment)* measured pre-test and post-test [t (26) = 7.344, p = 0.000], the participation at the program directing to a significant increase of raw scores at variable *social and emotional abilities (children's self-assessment)*, (Table 1).
- There were significant differences on the significance threshold $p \leq 0.05$ between the T scores at variable *social and emotional abilities (children's self-assessment)* measured pre-test and post-test [t (26) = 7.485, p = 0.000], the participation at the program directing to a significant increase of T scores at variable *social and emotional abilities (children's self-assessment)*, (Table 1).

Table1. Means and results at t test of means comparison at variables raw score and T score of *social and emotional abilities (children's self-assessment)* before and after the program

Variables	Means	Results at t test of means comparison
Raw scores social and emotional abilities (children's self-assessment)		
Before the program	47.07	t (26) = 7.344
After the program	64.59	p = 0.00
T scores social and emotional abilities (children's self-assessment)		

		37.51	t(26) = 7.48
Before the program			
After the program		**48.37**	**p = 0.00**
Figure 1. Comparative illustration of means at variable T score of *social and emotional abilities (children's self-assessment)* before and after the program

The category comparison at social and emotional abilities (children's self-assessment)

before and after the program

We used the cross-tabulation technique to check this comparison. The results are presented in Table no.2. We notice that before the program, 6 children were placed in *High Risk* Tier, 16 were placed in *At Risk* Tier and 5 were placed in *Average to High Functioning* Tier. After the program no child was placed in *High Risk* Tier, 5 were placed in *At Risk* Tier and 22 were placed in *Average to High Functioning* Tier. We observe that the participation in the program make that children be placed in superior categories regarding the social and emotional abilities and also no one in *High Risk* Tier 3.

Table 2. The categories crossover regarding *social and emotional abilities* level
(children's self-assessment), before and after the program.

	Total category initial assessment (children's self-assessment)			
	Average to High Functioning	At risk	High risk	Total line
Total category children initial assessment (self-assessment)				
Average to High Functioning	5	13	4	22
At risk	0	3	2	5
High risk	0	0	0	0
Total column	**5**	**16**	**6**	**27**

The specific hypothesis 2

Comparisons regarding global teachers' assessments – social and emotional abilities (raw scores, T scores) before and after the program

Sustained by the obtained results, we consider that:
- There were significant differences on the significance threshold $p \leq 0.05$ between the raw scores at variable *social and emotional abilities (teachers' assessments)* measured pre-test and post-test [$t(26) = 22.287$, $p = 0.000$], the participation at the program directing to a significant increase of raw scores at variable *social and emotional abilities (teachers' assessments)*, (Table 3).
- There were significant differences on the significance threshold $p \leq 0.05$ between the T scores at variable *social and emotional abilities (teachers' assessments)* measured pre-test and post-test [$t(26) = 22.745$, $p = 0.000$], the participation at the program directing to a significant increase of T scores at variable *social and emotional abilities (teachers' assessments)*, (Table 3, Figure 2).

Table 3. Means and results at t test of means comparison at variables raw score and T score of *social and emotional abilities (teachers' assessment)* before and after the program

Variables	Means	Results at t test of means comparison
Raw scores social and emotional abilities (teachers' assessment)		
Before the program	55.88	t (26) = 22.287
After the program	76.81	p = 0.000
T scores social and emotional abilities (teachers' assessment)		
Before the program	44.51	t (26) = 22.745
After the program	52.68	p = 0.000
Figure 2. Comparative illustration of means at variable T score of *social and emotional abilities*

(teachers' assessment) before and after the program

The category comparison at social and emotional abilities (teacher A and teacher B assessments) before and after the program

We used the cross-tabulation technique to check this comparison. The results are presented in Table no. 4 and Table no.5. We notice that in teacher A assessments before the program, 6 children were placed in Tier *At Risk* and 21 were placed in Tier *Average to High Functioning.* After the program 1 child was placed in Tier *At Risk* and 26 were placed in Tier *Average to High Functioning*. We observe that participation in the program makes children be placed in superior categories regarding the social and emotional abilities, 5 out of 6 children initially placed in Tier *At Risk,* passed in Tier *Average to High Functioning* after the program and also no one is in Tier 3 *High Risk* (Table 4).

Table 4. The categories crossover regarding *social and emotional abilities level (teacher A assessment)* before and after the program.

	Total categories initial assessment (teacher A assessment)			
	Average to High Functioning	At risk	High risk	Total line
Total categories initial assessment (teacher A assessment)				
Average to High Functioning	21	5	0	26
At risk	0	1	0	1
High risk	0	0	0	0
Total column	**21**	**6**	**0**	**27**

Concerning the Teacher B assessments of social and emotional abilities, before the program 4 children were placed in Tier *At Risk* and 23 were placed in Tier *Average to High Functioning*. After the program no child was placed in Tier *At Risk,* all 27 children being placed in Tier *Average to High Functioning*. We observe that participation in the program make that children be placed in superior categories regarding the social and emotional abilities, all 4 children found initially in Tier *At Risk* has moved after the program in the top Tier *Average to High Functioning* (Table 5).

Table 5. The categories crossover regarding *social and emotional abilities* level *(teacher B assessment)* before and after the program

	Total categories initial assessment (teacher A assessment)			
	Average to High Functioning	At risk	High risk	Total line
Total categories initial assessment (teacher B assessment)				
Average to High Functioning	23	4	0	27
At risk	0	0	0	0
High risk	0	0	0	0
Total column	23	4	0	27

The same progression tendency was discovered from category comparison for both teachers (A and B) at all dimensions of social and emotional assets (*self-regulation, social competence, empathy and responsibility*) accomplished before and after the program.

The specific hypothesis 3

3.3.1. The comparisons of raw scores, T scores (teachers' assessments) of every factor of social and emotional abilities - self-regulation, social competence, empathy and responsibility - before and after the program

Sustained by the obtained results, we consider that:
- There were significant differences on the significance threshold $p \leq 0.05$ between the raw scores at variable *self-regulation (teachers' assessments)* measured pre-test and post-test [$t(26) = 9.598$, $p = 0.000$], the participation at the program directing to a significant increase of raw scores at variable *self-regulation (teachers' assessments)*, (Figure 3).
- There were significant differences on the significance threshold $p \leq 0.05$ between the T scores at variable *self-regulation (teachers' assessments)* measured pre-test and post-test [$t(26) = 25.360$, $p =$

0.000], the participation at the program directing to a significant increase of T scores at variable *self-regulation (teachers' assessments)*, (Figure 3).

- There were significant differences on the significance threshold p ≤ 0.05 between the raw scores at variable *social competence (teachers' assessments)* measured pre-test and post-test [t (26) = 16.015, p = 0.000], the participation at the program directing to a significant increase of raw scores at variable *social competence (teachers' assessments)*, (Figure 3).
- There were significant differences on the significance threshold p ≤ 0.05 between the T scores at variable *social competence (teachers' assessments)* measured pre-test and post-test [t (26) = 12.848, p = 0.000], the participation at the program directing to a significant increase of T scores at variable *social competence (teachers' assessments)*, (Figure 3).
- There were significant differences on the significance threshold p ≤ 0.05 between the raw scores at variable *empathy (teachers' assessments)* measured pre-test and post-test [t (26) = 14.141, p = 0.000], the participation at the program directing to a significant increase of raw scores at variable *empathy (teachers' assessments)*, (Figure 3).
- There were significant differences on the significance threshold p ≤ 0.05 between the T scores at variable *empathy (teachers' assessments)* measured pre-test and post-test [t (26) = 19.023, p = 0.000], the participation at the program directing to a significant increase of T scores at variable *empathy (teachers' assessments)*, (Figure 3).
- There were significant differences on the significance threshold p ≤ 0.05 between the raw scores at variable *responsibility (teachers' assessments)* measured pre-test and post-test [t (26) = 14.905, p = 0.000], the participation at the program directing to a significant increase of raw scores at variable *responsibility (teachers' assessments)*, (Figure 3).
- There were significant differences on the significance threshold p ≤ 0.05 between the T scores at variable *responsibility (teachers' assessments)* measured pre-test and post-test [t (26) = 14.610, p = 0.000], the participation at the program directing to a significant increase of T scores at variable *responsibility (teachers' assessments)*, (Figure 3).

In order to facilitate the understanding we present a global graph comparative for T scores means at variables *social and emotional abilities, self-regulation, social competence, empathy and responsibility* (teachers' assessment) before and after the educational intervention.
Figure 3. Comparative illustration of T scores means at variables *social and emotional abilities, self-regulation,*

social competence, empathy and responsibility (teachers' assessment) before and after intervention

Discussion and conclusions

The general hypothesis showed how children's participation in a social and emotional learning program helps to increase social and emotional abilities. The social and emotional skills level was established from two perspectives, one of children's self-assessments and the second of two teachers who worked in teams to run the program. We considered three types of measurements: raw score, T score and the development category of social and emotional abilities. Moreover, if students did an overall assessment of skills, the teachers also took into consideration the 4 scales of SEARS: self-regulation, social competence, empathy and responsibility. In all experimental conditions (different assessors, at different times of testing, different types of measurements, different scales) there were recorded increases in levels of social and emotional abilities statistically significant at threshold $p \leq 0.05$. These findings based on scientific evidence are of outstanding importance in terms of teaching since it shows that socio-emotional development of children can be influenced in a constructive manner through consistent and systematic educational programs and it is not only a duty of family or wider social context. This means that the social-emotional skills development (vital for a balanced functioning of the individual and for an optimal social integration) best be addressed in the school curriculum under the guidance of competent teachers and with adequate teaching resources. Although socio-emotional aspects of child development have been neglected for various reasons (difficult to quantify, superfluous values, variability and complexity of mental phenomena, or the pathological view or the perspective of natural development, by imitation, without the need for systematic intervention), this research is in line with Anglo-Saxon extensive studies. These studies show that social-emotional skills can be effectively increased through school and after-school programs. A relevant fact is that the increasing of children's socio-emotional skills and resilience produced regardless of the level where they were at the beginning of the program.

Apart from the obvious improvement in the level of socio-emotional skills and resilience of children, this approach opens two perspectives: the first refers to skills rising of children with normal development, and the second to the increase of the level of children who already manifested behavioural/emotional problems or had a degree of vulnerability to later manifestation. This is a harmonious union of the benefits of social and emotional learning programs for children between the *preventive* character for those with average to high functioning and the *interventionist* character for children at risk for serious deficits in social skills or emotional problems. This opens the way for the unification of all preventive initiatives from school (regardless of their purpose or theme addressed), and for the broad addressability of different categories of children (regardless of the initial level of social and emotional abilities). This finding is supported by the statistical confirmation of the hypotheses and the individual profiles/monitoring reports of children's progress. However, this increase is limited by the participants' number in the experiment and could be continued through the hypotheses confirmation for nationally representative samples. Likewise, this increase is valid for trained educators to address social and emotional learning curriculum, for a previous pilot program, for appropriate resources and active inclusive strategies, for team teaching and for various grouping ways of students. The difficulty, but at the same time, the merit of the study were marked by the absence of running on a large scale (e.g., in schools) of such programs to allow access to a large group of subjects and the researcher to be released by additional responsibility of organizing the program implementation. Despite the limitation due to the number of participants we believe that investigative study is among the first steps to integrate the social and emotional learning in the Romanian educational system based on scientific evidences.

In conclusion, the results confirm the hypothesis launched. Thus, application of the intervention program helps children to develop social and emotional abilities and their factors: self-regulation, social competence, empathy and responsibility. Also it was found that the program intervention makes that student to be placed in top categories regarding their social and emotional abilities. The full confirmation of hypotheses (from all perspectives of measurement) gives confidence to practitioners to design and implement social and emotional learning programs and support for decision-makers to introduce it in the curriculum. However, experimental

research is in line with global scientific research, bringing evidence to support the idea that social and emotional skills can be developed through educational programs in the Romanian context.

THE EFFECTS OF CULTURAL FAMILIARITY AND READING ACTIVITIES ON L2 READING COMPREHENSION

Serkan Gürkan

Kocaeli University, Faculty of Education,41380, Turkey

Abstract

This study examines whether cultural familiarity has an influence on reading comprehension and whether using a set of reading activities compensate for the absence of cultural familiarity. 60 junior Turkish EFL university students participated to the study. A 2×2 true-experimental research design was used in the study. The results revealed that the nativized version of a short story from the target language culture contributes to comprehension of L2 readers' significantly and the use of activities facilitated for better literal understanding of the original text. It also emphasizes a strong influence of cultural schema on comprehension.

Keywords: reading comprehension; schema theory; foreign language culture; nativization.

1. Introduction

Reading has been regarded as interplay of text-based and knowledge based processes of readers. Since comprehension is a gradual process which involves the coalescence of information from disparate parts of text, the construction of text meaning necessitates a hybrid of text information which is explicitly stated in the text in addition to relevant knowledge stored in long-term memory (Koda, 2005). Thus, the processes readers go through while reading are regarded to be active and interactive. That is, readers use a combination of both literal and inferential comprehension during reading. The former is based on lower-level cognitive processes including lexical access and syntactic parsing while the latter is based on higher-level cognitive processes including textbase of comprehension, which is about understanding what the text says and the situation model of interpretation which is about understanding what the text is about (Alptekin,2006). In literal comprehension, being part of lower-level cognitive processes, lexical access -also referred to as data-driven process- necessitates a high degree of text-dependence in which words in a text are assigned meaning, whereas in syntactic parsing words or constituents come together to form semantic propositions. On the other hand, inferential comprehension requires the combination of successive propositions to make a meaningful whole by using reasoning and drawing conclusions about the relationships between or among bits of information that are not explicitly stated within the text. Two types of inferences, bridging and elaborative, have been reported (McKoon & Ratcliff, 1989). While bridging inferences are related with the semantic connection of two unrelated statements, readers apply elaborative inferences when they have a need to predict upcoming consequences of information (McKoon & Ratcliff, 1989). For instance, in the following sentence "The actress fell from 14th floor", readers may predict that the actress died. Hence, they generate a predictive or forward inference (Ezquerro & Iza, 2001). Both types of inferences requires reading beyond the literal meaning of explicitly stated text elements in the text, including prior knowledge and monitoring comprehension to aid better comprehension outcomes. That is, prior knowledge activation should be brought to the text to resolve relational gaps stemming from inferences (Brantmeier, 2004; Koda, 2005).

2. Working-Memory

Many micro-level and macro-level processes demand an invaluable storage and computational area from working- memory, which is limited in capacity. Miyake and Friedman (1998) define working memory as:

> *" a computational arena or workplace, fuelled by flexibly deployable, limited cognitive resources, or activation that support both the execution of various symbolic computations and maintenance of intermediate products generated by these computations" (p.341).*

The resources of working memory are said to be restricted, thus its limited capacity make it hard to display its dual function, storage and computation, simultaneously and efficiently. High correlations have been found between working memory capacity and reading performance in a number of studies in literature (Daneman & Merikle, 1996).

3. Schema Theory and reading comprehension in L2

It is stated that the interpretations of the readers vary according to their background knowledge in that a major task in discourse processing lies in discriminating thematic information from peripheral information (Singer, 1994). The influence of background knowledge on inferences is indisputable since inferences are driven by schemas. There have been many discussions on schema theory (Ketchum, 2006). A schema is defined as an abstract knowledge structure (Anderson & Pearson, 1984). The theory is closely associated with how readers combine their previous knowledge with the text (Alderson, 2000; Alptekin, 2006; Carrell, 1983; Grabe & Stoller, 2002; Rumelhart, 1980).

4. Reading Activities

There have been many studies on the effect of background knowledge and cultural schema on reading comprehension, yet studies which explore whether the use of reading activities can compensate for the lack of cultural knowledge are not much.

Following Alptekin's ideas, Erten & Razı (2009) carried out a replication study named "The effects of cultural familiarity on reading comprehension" with an aim to extend Alptekin's work to achieve a better understanding of his work. They added reading activities to the methodology to see if reading activities such as pre-reading, brainstorming, pre-questioning, scanning, skimming, clarifying, reciprocal teaching, inferring, thinking aloud, asking and answering questions can compensate for the absence of cultural familiarity. That is, they hypothesized that reading activities will affect readers' literal understanding positively. The results of their study revealed that activities contributed to the comprehension of the original story, yet the effect of nativization remained intact specifying a strong effect of cultural schema on comprehension.

5. Aim of the Study:

Supporting Alptekin's approach, Erten and Razı's extension of the previous study with the inclusion of reading activities would be worth replicating to have a better account of the issue with the use of a similar design in a different context with different groups. Therefore the aim of this study is to find out to what extent both cultural knowledge and reading activities are effective on the comprehension of short stories. The research questions and the hypotheses of the study are as follows:

RQ1) Does cultural familiarity of the participants have an effect on their reading comprehension?

RQ2) Can reading activities compensate for the absence of cultural familiarity?

H1-) Cultural familiarity will have a significant impact on reading comprehension.

H2-) Although reading activities contribute to comprehension, the impact of cultural familiarity will remain a significant factor.

6. Method

The study was conducted in an English Language Teaching Department of the Faculty of Education at a public university in Turkey in fall term of 2010-2011 academic year. The department in which the study was carried out was regarded appropriate for the study since the program contains reading classes where lecturers make use of many diverse short stories and literary works.

6.1.Participants

60 juniors took part in the study. The ages of the participants ranged from 20 to 24. At the time of the study they were having a training so as to become teachers of English. They all shared similar educational backgrounds. In assigning participants, their GPAs at the end of their fourth term in the department were regarded in order to form 2x2 true-experimental research designs. In calculating their GPAs, only the English-based courses and English-medium-teacher-training courses were considered. In order to achieve this, marks gained by each student from courses were multiplied by the number of credits of the course and then the sum of multiplied course loadings was divided by the total number of credits earned by the participants. Junior students who had failed any English-based courses were ignored as they were thought as those who cannot meet the minimum language requirements to be included in the study. Hence, L2 competencies of the control and experimental groups were considered to be equivalent in terms of their proficiency levels.

Ultimately, fifteen students from each range of GPAs were assigned to four diverse groups. This placement was done to create homogeneous groups in which participants were believed to display similar scores in accordance with their similar GPAs. With this in mind, four treatment groups were labelled as *Treatment 1* (Original no activity- ONA), *Treatment 2* (Original with activity- OWA), *Treatment 3* (Nativized no activity- NNA), and *Treatment 4* (Nativized with activity- NWA). The participants in first treatment group (ONA) read the original text without the use of reading activities, whereas the second treatment group of participants (OWA) was supposed to read the original text with the accompaniment of pre-reading, while reading and post reading activities which were thought to contribute to the comprehension of readers. The third treatment group of participants (NNA) was required to read the nativized version of the text without the use of reading activities and finally the fourth treatment group of participants (NWA) were given the nativized version of the text with reading activities. Mean GPA values for each treatment group are given in Table 1.

Table 1. Mean GPA values for each treatment group

Name of the Group	N	M	SD
Original text with no activities	15	2.58	0.41
Original text with activities	15	2.54	0.32
Nativized text with no activities	15	2.62	0.28
Nativized text with activities	15	2.59	0.40

An analysis of variance revealed that there were no significant differences among the treatment groups, $F = 0.094$, $p < .95$, indicating a reasonable homogeneity of these groups.

6.2.Instruments

6.2.1.The reading text

The short story 'The Girls in their Summer Dresses' by Irwin Shaw (2000), which was first published in 1939, was chosen for "Turkification" (Alptekin 2002). The short story tells us a day of a couple trying to spend a Sunday off in the city of New York. Due to the purposes of research the story was nativized and adapted to

Çanakkale context in the original study. In this replication study the same story was nativized and adapted to Kocaeli context so as to make the readers imagine that story takes place in the city of Kocaeli.

In nativizing the story, the names of the characters were substituted with Turkish names. Care was taken while adapting the city plan of New York to Kocaeli. All the names of the places, streets, and buildings had to be logical in readers' minds so as to activate their schemata about the city of Kocaeli. For instance, in the original story the couple leaves the Brevoort and starts walking towards Washington Square along Fifth Avenue. In the nativized version of the story, the couple leaves Yahyakaptan (a suburb in the city of Kocaeli) and starts walking towards Anıtpark (a well-known place for each citizen in Kocaeli). To have a better account of the nativization some conceptual cues were also changed to complete the nativization. For instance, in the nativized version of the story, the characters planned to eat fish instead of steak since Kocaeli is a coastal city and the fish is consumed as much as steak.

6.2.2. Reading Test

Once participants completed the reading session a post-test, which was recall type in nature, was administered. As the research design includes both the nativized and the original versions of the story, the post-test was also written for two different versions of the story. Three different elicitation techniques constituted the post-test. The first set of ten questions contain True/False/Not Given items, whereas the second set of eight questions were related with putting some scrambled actions into correct order. Eventually, ten open-ended pen and paper type of comprehension questions were used as the last set of questions to check comprehensions of the students in all treatment groups. During the post-test period, not only the students were not permitted to refer to the reading text but also they were not permitted to use their dictionaries. Due to the fact that the students had not read the story before the experiment a pre-test was not considered.

6.3. Procedure

The participants in first treatment group (ONA) read only the original text without activities, while the second treatment group of participants (OWA) read the original text with a set of reading activities. The third treatment group of participants (NNA) read the nativized version of the text without activities and finally the fourth treatment group of participants (NWA) was given the nativized version of the text with reading activities. Table 2 shows the procedures applied for each group of students in four different treatment groups.

6.3.1. Pilot Study

The items of the post-test were piloted with 12 students who have similar educational backgrounds with the participants in the study, with GPA scores in the same range as those of the participants. The aim was to identify test items that were too easy or too difficult. The study revealed that each item performed satisfactorily, suggesting that the post-test had high Cronbach's alpha ($r = .84$ and $p < .01$), which was considered to be consistent enough to go on conducting the post-test to the real sample.

Table 2: Procedures for each treatment group

Treatment 1 (ONA)	Treatment 2 (OWA)	Treatment 3 (NNA)	Treatment 4 (NWA)
The original text was given without activities (30″)	*Pre-reading activities:*	The nativized text was given without activities (30″)	*Pre-reading activities:*
	Brainstorming (3″)		Brainstorming (3″)
	Pre-questioning (3″)		Pre-questioning (3″)
	Reading the story (35″)		*Reading the story* (35″)
	While-reading activities:		*While-reading activities:*
	Scanning (2″)		Scanning (2″)
	Skimming (2″)		Skimming (2″)
	Clarifying (2″)		Clarifying (2″)
	Reciprocal teaching (2″)		Reciprocal teaching (2″)
	Inferring (2″)		Inferring (2″)
	Post-reading activities:		*Post-reading activities:*
	Thinking aloud (2″)		Thinking aloud (2″)
	Question / Answer Relationships (2″)		Question / Answer Relationships (2″)
Post-test given (15″)	Post-test given (15″)	Post-test given (15″)	Post-test given (15″)
Total 45″	Total 60″	Total 45″	Total 60″

Note. ONA = Original text with no activities; OWA = Original text with activities; NNA = Nativized text with no activities; NWA = Nativized text with activities,' = minutes.

6.4.Data Analysis

6.4.1.Marking the papers

The open-ended question part of the post-tests including students' answers was marked by two independent raters. Papers were only rated for comprehension purposes ignoring grammatical mistakes so as to minimize the influence of any variation among the writing skills of students.

In the part of the post-test where students were asked to order some events from the story was marked according to the Weighted Marking Protocol (Razı, 2005). Such protocol has a nature of partial evaluation as the marking procedure of the protocol is based on correcting the wrong order of events provided by the participants and reducing their marks with reference to their mistakes. In this protocol students are given some marks even if they do not put all the events in the right order. Marks given to student papers by two independent raters were analysed through Pearson Correlation Coefficient Procedure. A high correlation coefficient was detected among the two sets of marks ($r = .84$ and $p < .01$), which was regarded to be consistent enough to go on further statistical analysis.

6.4.2.Statistical analysis

The participants' post-test scores were analysed through the use of ANOVA to see whether there were differences among the treatment groups according to their gained scores. After the results of ANOVA revealed that there were differences across the treatment groups, a Post Hoc Scheffe test was employed to find out where the group differences occurred.

7. Results

Table 3 demonstrates descriptive statistics giving the mean scores gained by each treatment group included in the study. As seen in the table, the participants who read the nativized short story with reading activities outscored the other groups and outperformed them with having the highest mean scores gained according to the results of post-test. The participants who read the nativized short story without reading activities scored higher than those who read the original short story both with and without reading activities.

Table 3. Mean scores of groups

Treatment condition	N	M	SD
NWA	15	72,26	3,53
NNA	15	68,40	2,94
OWA	15	63,66	2,31
ONA	15	61,06	5,39
Total	60	66,35	5,66

Note. ONA = Original text with no activities; OWA = Original text with activities; NNA = Nativized text with no activities; NWA = Nativized text with activities.

Table 3 indicates, there are some differences among the mean values of the groups gained in the study. Table 4 indicates statistically significant differences between groups where p <.05. The results of One-Way ANOVA Test point out that the mean values of the treatment groups gained in the study are not the same.

Table 4: One-Way ANOVA Test Results

DependentVariable		Sum of Squares	df	Mean Square	F	Sig.
	Between Groups	1114,85	3	371,61	26,72	,000
Post-Test						
Score	Within Groups	778,80	56	13,90		
	Total	1893,65	59			

The differences observed between different treatment conditions were statistically significant, $F = 26,72$, $p < .001$. Group differences were examined through a post-hoc Scheffe Test. The results are illustrated in Table 5.

Table 5: Post Hoc Scheffe test for the total score of the post-test

Conditions	Mean Difference	p	Cohen`s d
ONA vs. OWA	-2,60	,313	0.30
ONA vs. NNA	-7,33(**)	,000	1.35
ONA vs. NWA	-11,20(**)	,000	1.63
OWA vs. NNA	-4,73(*)	,012	0.64
OWA vs. NWA	-8,60(**)	,000	1.46
NNA vs. NWA	-3,86	,055	0.87

Note. ONA = Original text with no activities; OWA = Original text with activities; NNA = Nativized text with no activities; NWA = Nativized text with activities. **$p < .01$. * $p < .05$.

Table 5, demonstrated that there are highly significant differences between the treatment groups. With regard to the first hypothesis of the study (that cultural familiarity has a significant impact on reading comprehension) was sufficiently supported by the between-group differences confirming that cultural familiarity influenced the students' comprehension. The NNA group outperformed ($M = 68.40$) the ONA group ($M = 61.06$), with a considerable effect size ($d = 1.35$). The second comparison was done between activity groups and a significant difference was found. The NWA students ($M = 72.26$) did significantly better than the OWA students ($M = 63.66$), indicating a large effect size ($d = 1.46$).

The second hypothesis (that although reading activities contribute to comprehension, the impact of cultural familiarity remains a significant factor) was also supported by the results obtained from the comparisons between the groups. Unexpectedly, although the NWA students ($M = 72.26$) performed better than the NNA students ($M = 68.40$), the difference was not found as statistically significant, with an effect size of ($d = 0.92$), implying that reading activities on reading comprehension with nativized texts were effective as it was thought to be but this effect was not found to be statistically significant. Another finding revealed that the NWA students ($M = 72.26$) also performed better than the ONA students ($M = 61.06$), with a large effect size ($d = 1.63$). However, the difference between the OWA ($M = 63.66$) and ONA students (M= 61.06) was not statistically significant ($d = 0.30$), implying that the activities did help students to comprehend better to a small extent. Although there was a rise in mean scores, indicating the effect of reading activities, this effect was not found as statistically significant.

Another difference was observed between the OWA ($M = 63.66$) students and the NNA students ($M = 68.40$, $d = 0.64$) implying that students who read original text with activities did not perform better that students who read the text in the nativized version with no activities.

Students (NNA) who read the nativized text without the aid of reading activities ($M = 68.40$) performed better than those who read the original text with activities (OWA, $M = 63.66$) indicating that even without the use of reading activities effect of nativization on reading comprehension remains intact.

8. Discussion

The present replication study aimed to concentrate on the investigation of cultural familiarity effect on reading comprehension. It also aimed to discover whether activities can make up for the absence of students' relevant cultural schema.

Not surprisingly, the students who read the original story with or without reading activities scored lower than their counterparts who read nativized version of the story due to the fact that the readers who read the nativized version did not have to deal with unfamiliar names and culturally distant contextual clues, resulting in worse comprehension gains. Thus, they could process new input in their short-term memory since their working memory was not overloaded. Therefore, it would be logical to assume that readers who read the original text in this study had to use controlled processes which required greater effort overloading the working memory. On the

other hand, nativized text readers used automatic processes as they were familiar with the new information and that would enable them to free up space in their short-term memory (Erten 1988; Alptekin, 2006; Erten & Razi, 2009).

The fact that the students who read the nativized text performed better might also be related to motivational issues. Dörnyei (2003) claims that motivation is related to achievement, stresses that who is motivated will possibly be successful. On the other hand, Lightbown and Spada (2006) join the argument by asking a question. Is a student successful because (s)he is motivated or is a student motivated because s(he) is successful?

One cannot underestimate the effect of interest on learning. Promoting interest in classrooms is believed to increase the intrinsic motivation of students (Pressley et al., 1992). In research field, two types of interest have been proposed, namely, situational interest and personal interest (Krapp et al,1992). While the former is spontaneous, transitory and environmentally activated, the latter is less spontaneous and activated internally (Schiefele, 1999). The situational interest factor might be facilitative in explaining individual performance diversities in this study. Therefore, it would be logical to comment that situational interest might be aroused by the nativized text with culturally familiar words and expressions that might contribute to better comprehension.

As for the effect of reading activities on comprehension, their value in reading comprehension cannot be ignored, yet the original study and this replication study both did not have an aim of comparing the effectiveness of activities. Rather, both studies intended to explore whether the use of reading activities can compensate for the absence of culturally familiar knowledge. Actually, it would not be wrong to comment that activities contributed to comprehension since pre-reading, while-reading and post-reading activities facilitated these two groups of readers (OWA, NWA) for better comprehension. This is in accordance with the statements by Carrell and Eisterhold (1983), Ur (1996), and Karakas (2002). Pre-reading activities enables teachers to activate readers' schemata before reading. While-reading activities do also have a facilitative role on the comprehension of the short stories. Post-reading activities also aid to clarify any unclear meaning (Chastain 1988).

The results of this replication study accord well with the results of the original study (Erten&Razı,2009) since a powerful effect of cultural familiarity on comprehension in L2 reading has been found in both studies. The use of reading activities was found to be facilitative but its effect was limited in that activities fail to make up for the absence of cultural knowledge in the texts.

9. Conclusion and Implications

With regard to the results of the study, the following conclusions can be drawn. First, cultural familiarization to the text has a significant effect on reading comprehension. The second conclusion that can be drawn is that nativization contributes to reading comprehension since readers are provided with cultural familiar texts. Another conclusion of this study is that reading activities have an effect on reading comprehension and finally the fourth conclusion reveals indicates that reading activities have an impact on reading comprehension but the impact was limited, thus they cannot make up for the lack of cultural familiarity.

There are some limitations listed in the original study. Since this study is a replication of the original one, most of the limitations which will be given below are shared by both studies. Firstly, this study did not aim to measure the effectiveness of individual reading activities. Furthermore, care was not taken in selecting the activities used in the study, indicating that this selection is far from experimental scrutiny. Hence, the diversity in the results gain from the post-test might stem from the use of different activities that aim to activate cultural schema and further elaboration on text.

The use of GPA scores in assigning the students constitutes another limitation for the study as results gained from a more standardized, globally accepted and prestigious proficiency test such as IELTS or TOEFL (e.g. Alptekin, 2006) could have been used so as to keep the groups homogenous.

Another limitation of the original study is that the post-test was not piloted to identify the items in the test which were relatively too east or too difficult. But in this replication study post-test items were checked with a

pilot study which was carried out with a relatively small group. The results revealed that all of the items perform satisfactorily.

The findings of the study recommend that motivational and attitudinal factors are also related to reading comprehension, therefore, the phenomenon could be illuminated with a more-controlled measurement where the reading processes and involved variables are analyzed in depth. The original study was conducted with a small sample size of forty-four participants. In this replication study the number of participants increased to sixty. However, to have a better account of the phenomenon a further study with a large sample size would be helpful in increasing the reliability of the gained results and in enlightening the individual variations better with the use of statistical analysis.

Although both studies, the original and replicated one, have a number of limitations, the results of this study may yield important pedagogical implications. As noted earlier, the highest score were obtained through the use of nativized short story. In culturally familiar or nativized texts readers can use top-down reading models due to the conviction that their relevant schemata are activated but, on the contrary, in texts which are not culturally familiar or are not nativized, readers cannot use top-down reading models as the background knowledge that they bring to the text is different from the writer's. Therefore, the use of nativized texts that contain culturally familiar words and expressions, with a facilitative effect, might be increased in language classes. However, care must be taken in order not to underestimate the importance of reading activities in comprehension.

This study did not investigate the efficiency of a single pedagogical reading activity in promoting reading comprehension. Instead, using disparate activities that cater to different types of comprehension can contribute to a fuller understanding of texts. Thus, it enables learners go beyond literal comprehension of the text.

Finally, throughout the treatments a high degree of teacher-centered manner was displayed resulting from the whole-class teaching style. Therefore, performance differences among individuals during the activities could not be observed. An in-depth analysis where different data collection methods are use could be beneficial in illuminating the contributions of individual activities and cultural familiarity to comprehension. More student-centered classrooms should be created to encourage more autonomous learners.

THE EFFECTS OF INTERACTIVE EXERCISES ON STUDENTS' ACHIEVEMENT: USING THE OPEN SOURCE AUTHORING APPLICATION

Ömür Akdemir[80], Kürşat Kunt, İnan Tekin

Bülent Ecevit University, Zonguldak 67300, Turkey

Abstract

Freeware open source authoring tools are available and easily attainable over the internet for teachers to develop their own interactive instruction. This study investigated the effects of interactive exercises developed using the open source authoring tool on students' achievement using the pre-test post-test with the control group research design with 35 seventh grade students in the Science and Technology course. Findings showed that the use of interactive exercises embedded in the instruction improves the achievement of students more than the instruction having traditional exercises. Further research should compare the effects of interactive exercises completed individually and in a group format.

Keywords: Interactive exercises; Authoring Applications; Instructional Design; Computer-Based Learning; Science Education

Introduction

The amount of information produced has been going beyond the boundaries of human mind and becoming hard to keep up with. In the same way, technology develops at an enormous speed with the developments that shape our life. Each day new technologies are invented and enter our life. High science and technology level contribute the economic, social and cultural development. The development in science and technology gains ground at an enormous speed. In today's world where information increases accumulatively, it has been crucial that people should be educated as the ones doing investigations and questioning, producing information and knowing how to attain it, not as the ones being passive learners. Science and Technology course comes first to make students have such abilities (Tatar & Kuru, 2006).

The Science and Technology course is an interdisciplinary course utilizing information from physics, chemistry and biology. Due to the complex nature of the course, there are many abstract concepts in the Science and Technology course that makes it difficult to understand (Özseveç, 2006). The use of visual materials to teach abstract concepts is recommended (Yalın, 2007). The usage of visual materials in teaching of abstract concepts facilitates the recall of information. Karamustafaoğlu (2006) emphasizes that material usage plays an important role especially in Science and Technology programs' achievement.

Technology has been widely used in education. The presence of technology in education system made learning and teaching activities easier (İşman, 2005). Another effect of technology in education is that it assists students to have positive tendency towards lessons during learning process. Learning environments empowered with technology arouse interest among students and raise learning motivation. Students learn willingly in classes equipped with technology.

Besides the quality of learning outcomes, using computer technology also saves time in teaching and learning. Computers have become the most common devices for teachers to present information. Reduced cost,

increased speed and diversity of programs used in computers are important reasons for computers to become common as part of the instructional process inside the classroom.

Providing visual instruction to students has the potential to improve students' interest and motivation. Besides visuals, being able to interact with the instruction through exercises enforce students to actively participate class activities. Interactive exercises utilized in the classroom can be used effectively in teaching abstract concepts. However, most of the time teachers can not develop their own interactive instructional materials due to the lack of knowledge and expertise in computer programming. However authoring applications provide user friendly environment for teachers to develop their own interactive instruction. Yet their high license fee prohibits teachers from obtaining them. Nowadays, freeware open source authoring tools are available and easily attainable over the internet for teachers to develop their own interactive instruction. However there is a limited study on the effects of interactive exercises developed using open source authoring tools on students' achievement in the science and technology course. This study is designed to address the following research question:

Does the use of interactive exercises embedded in the instruction improve the achievement of students more than the instruction having traditional exercises?

Method

2.1. Context

The study was conducted at the private educational institute preparing primary school students for the nationwide exam that has to be taken by all eight graders. Therefore students attending the private educational institute are highly motivated for learning. Socio–economic status of students attending the course is above the average.

2.2. Participants

The study group consists of 35 students attending the Science and Technology course organized for the seventh graders in 2010. The experimental group has 20 students and the control group has 15 students. The experiment and the control group were assigned randomly from the available two classes in the private educational institute.

2.3. Research Design

The quasi-experimental research design with existing groups is used to investigate the effects of interactive exercises developed using the open source authoring tool on students' achievement in the science and technology course. The pre-test post-test with control group research design was used to investigate the research question. The achievement test consisted of sixteen multiple-choice questions with five options was administered to the participants in the control and experimental groups before and after the study.

2.4. Experimental Treatment

The course module to teach the subject of "Atom's structure" was designed and developed by researchers using the freely available Open Source authoring application (http://exelearning.org) which can be exported in IMS Content Package, SCORM 1.2, or IMS Common Cartridge formats or as simple self-contained web pages. In this study developed course module was exported as a self-contained web page and saved on the local drive of the computer to be used offline during the four-week application of the course offered in weekends. The course module was designed to include nine events identical to the ones recommended by Robert Gagne. Special

emphasize was given to eliciting the performance (practice) while developing the instructional module. Students in the experimental group completed the practice as a whole class activity and the teacher entered the group responses to the computer to receive feedback. Screen views from the developed instructional module's exercise and feedback pages presented at Figure-1 and Figure-2.

Figure-1: A Screen View from the Exercise Page

Figure-2: A Screen View from the Feedback Page

2.5. Activities of the Control Group

The control group received the instruction in a traditional manner. Participating students used the text-book and completed the exercises on the blackboard. Similar to the experimental group, participants in the control group were also received instruction in a four-week period offered in weekends.

2.6. Data Collection Instrument

Students' achievement on the subject of "Atom's structure" was measured through a multiple-choice test. The multiple-choice test had sixteen questions with five options for each question. The measure of internal consistency of the multiple choice test was found as 0.671. Twenty minutes were given students to complete the achievement test before and after the study.

2.7. Data Analysis

Students received one point for each of their correct answer in the pre-test and post-test. Scores of the students ranged from 0 to 16 in the multiple-choice test. In order to answer research questions, descriptive statistics, Shapiro-Wilk test, independent t-test and the Mann Whitney U test were used for the data analysis.

Results

The descriptive analyses of pre-test and post-test results of participants are presented in the Table-1.

Table-1: The Descriptive Analysis of the Pre-test and the Post-test Results of Participants

		N	Mean	Std. Deviation
Pre-test	Experimental Group	20	8.25	2.67
	Control Group	15	6.66	2.25
Post-test	Experimental Group	20	15.3	0.73
	Control Group	15	12.26	1.98

Before testing the hypothesis, the tests of normality were conducted to determine which types of test were going to be used for analysis. The results of the Shapiro-Wilk test (see Table-2) revealed that only the post-test scores of the experimental group are not normally distributed. Therefore non-parametric test was used for hypothesis testing when the post-test scores of the experimental group are analyzed.

Table-2: The Results of the Shapiro-Wilk test

	Shapiro-Wilk		
	Statistic	Df	Sig.

Ex_pretest	.885	15	.056
Ex_posttest	.783	15	.002
Cont_pretest	.964	15	.756
Cont_posttest	.937	15	.342

* This is a lower bound of the true significance.

a Lilliefors Significance Correction

Initially students' prior knowledge was compared in the experimental and the control group. The result of the independent t-test revealed that there was not any significant difference between the pre-test scores of the experimental and the control groups (t(33)= 1.85; p>0.05) (See Table-3). This finding shows that before the study participants' knowledge in the control group on the subject of "Atom's structure" is not different from the study participants' knowledge in the experimental group.

Table-3: Pre-Test Comparison of the Experimental and Control Groups

	t-test for Equality of Means						
	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
			Lower	Upper			
Experimental-Control	1.58	0.855	-0.15	3.32	1.85	33	0.073

In order to investigate whether the use of interactive exercises embedded in the instruction improves the achievement of students more than the instruction having traditional exercises. The post-test scores of students in the experiment and the control groups were compared. The result of the Mann-Whitney U- test revealed that there is a significant difference between the post-test scores of the experimental and the control groups (U= 18.5; p<0.05) (See Table-4). This finding indicated that achievement of the students in the experimental group is higher than the achievement of the students in the control group.

Table-4: Mann-Whitney U for the Post-test Comparison of the Control and Experimental Groups

Groups	N	Mean Rank	Sum of Ranks	U	p
Experimental	20	24.58	491.5	18.5	0.0
Control	1	9.23	138.5		

Results and Conclusion

Findings indicate that the use of interactive exercises embedded in the instruction developed with the open source authoring application improves the achievement of students more than the instruction where traditional exercises are used. This result supports the promise that improving skills of teachers in the instructional design and development is necessary to improve the quality of the instruction. Schwarz, Jason & Ajay (2007) emphasize that integration of interaction through computer modelling tools in courses; teachers can become more knowledgeable consumer of computer technology to foster learning. In conclusion, it is recommended that using interactive exercises developed with the open source authoring application improve student learning more than exercises used in traditional format in the Science and Technology course. Improving the skills of teachers in the instructional design helps to improve the quality of the instruction and learning of the students. Therefore in order to expand the influence the use of open source authoring applications should be the compulsory part of the instructional technology course in teacher education programs to furnish prospective teachers with such skills. Further research should compare the effects of interactive exercises completed individually to the effects of interactive exercises completed in a group format to present the effects of the individual and the group work.

THE EFFECTS OF "LIVE ONLINE COURSE" ON STUDENTS' ACHIEVEMENT AT DISTANCE EDUCATION

Ozgur Yilmaz[a]

[a]Istanbul University, Hasan Ali Yucel Education Faculty, Computer Education & Instructional Technology, Istanbul, Turkey

Abstract

This study was performed to investigate the effects of live online course on students' achievement at distance learning. 63 second-year Distance Computer Education & Instructional Technology students enrolled in this study. At the live online course, the instructor presented physics lessons. Midterm, final and make-up scores were examined after the LOC instruction. Students who are LOCFF (n=32), joined over 50 % percent and they had significantly higher scores than students who are LOCFR (n=31), joined below 50 % percent to the lessons. According to t-test result, LOCFF group more successfully than LOCFR group (p=.006*).

Keywords: Distance education; Live online course; Web-based instruction.

1. Introduction

Distance education is a field of education that focuses on, technology and incorporated in delivering education to students who are not physically "on site" to receive their education (Potashnik & Capper, 1998). Distance education is going to become more popular and accepted approach for education in the modern age. Several considerations have led to wide acceptance and sustained growth of distance education in all over the world. First, it is recognized that education is a key factor in economic development and social change (Rashid & Elahi, 2012). Distance education activities are designed to fit the specific context for learning, the nature of the subject matter; need and goals of the learner, the learner's environment and instructional technologies methods.

Use of the web based instruction for educational purposes is widespread and rapidly growing. Thousands of university courses have been developed for delivery entirely via the web. This approach accelerates more colleges and universities urge faculty to create online versions of their courses (Dutton et al., 2002). Online course is one of the most dynamic and enriching forms of distance learning that exist today. Online course is a subcategory of distance education, which has been defined as the formal delivery of instruction in which time and geographic location separate students and instructors (Holmberg, 1989; McIsaac & Gunawardena, 1996; Verduin & Clark, 1991).

The Online course overcomes the time and place constraints that restrict access to instruction in traditional educational settings. In addition it includes the relatively low cost and availability of computer technologies, increased pressures relating to employment, financial and family responsibilities, as well as the high cost of higher education and the limited availability of scholarships. Online course offers appealing educational alternatives and provides lifelong learning opportunities for those whom a traditional university setting does not work.

The online course consists of computer oriented communication for the instruction. There are interactions which are learner-content, learner-instructor, and learner-learner in the online environment (Riel & Harasim, 1994; Hillman et al., 1994; Moore, 1989; Miltiadou & Savenye, 2003). Many researchers have indicated that interaction in the distance course and considered it as an important factor that can influence the success or failure of a course (Moore, 1989; Miltiadou & Savenye, 2003; Kearsley, 1995; Keegan, 1988; Ross, 1996; Tsui, 1996; Vrasidas & McIsaac,1999). Kearsley (1995) find out that a high level of interaction has positive effects at distance learning courses. Moore (1989) examined distance course's interaction types. Tsui and Ki (1996)

indicated that students interacted more frequently over the course of the semester, as they became more comfortable using technology and more successfully.

In the light of these findings this study was aimed to investigate the effects of live online physics course on students' achievement at distance learning.

2. Methods

2.1. Purpose of the research

The purpose of this study is to investigate the effects of live online physics course on students' achievement at distance learning. In the context of this study, "Is live online course effective in terms of student achievement at distance instruction?" research question was investigated and examined.

2. 2. Participant and procedure

The participant of this study was 63 second-year Distance Department of Computer Education & Instructional Technology students. At the live online course, the instructor presented one-dimensional motion, Newton mechanic, force, two-dimensional motion, energy conservation and momentum subjects in each week. Students were able to ask questions to instructor at the misunderstanding points and the instructor had solved physics problems in detailed online with students. In addition, students could follow the recorded lessons whenever they want.

In this study, midterm, final and make-up exam scores of students were examined after the Live Online Course (LOC) education.

3. Findings

In order to investigate the effects of live online physics course on students' achievement at distance learning, students' midterm exam, final exam and make-up scores were examined in detailed and the results were presented for *Live Online Course Followers Rarely* (LOCFR) and *Live Online Course Followers Frequently* (LOCFF) groups under the 3.1. and 3.2. sub-headings as follows.

3.1. Live Online Course Followers Rarely (LOCFR) Findings

In the analysis of live online course data, *Live Online Course Followers Rarely* (LOCFR) group's content following numbers, live online course following numbers, scores and grades frequencies according to months during the semester were determined and graphs were presented.

Table 1. LOCFR group's numbers of content following, numbers of live online course following, scores and grades frequencies.

LOCFF: Live Online Course Followers Frequently

As seen in Table 2.; when examined LOCFF group's the lowest and the highest scores were determined. The student who was numbered as 2 followed content and Live Online Course, 52 and 1 respectively. The student numbered as 12 followed content and Live Online Course, 94 and 38 respectively. While student 2 failed at distance physics course, student 12 finished physics course with the highest score.
It was shown in Fig 2., general frequency distributions of LOCFF Group's Content Following (Total) and Live Online Course Following (Total) during the semester.

Table 3. Comparison of LOCFR and LOCFF groups' scores of students' according to independent group t-test results.

Groups	Mean	N	Std. Deviation	Std. Error Mean	Independent group t test		
					t	SD	p
LOCFR	49,12	31	17,006	3,006	-2,859	61	,006*
LOCFF	65,74	32	27,980	5,025			

As shown in Table 3.; LOCFF group had significantly higher mean score (65,74) than LOCFR group's mean score (49,12) during the online physics course and independent group t-test results showed that there was statistically significant difference between LOCFR and LOCFF groups' scores (p= ,006*).

Fig. 3. The comparison between the LOCFR and LOCFF groups were presented according to general frequency distributions of content following (total) and live online course following (total) during the semester.
In addition, the comparison between the LOCFR and LOCFF groups were presented according to general frequency distributions of Content Following (Total) and Live Online Course Following (Total) during the semester in Fig 3.

4. Conclusion

The purpose of this study is to investigate the effects of live online physics course on students' achievement at distance learning. In order to investigate the effects of live online physics course on students' achievement at

distance physics course, students' midterm exam, final exam and make-up scores were examined in detailed. According to data analysis, it was found that LOCFF group had significantly higher mean score (65,74) than LOCFR group's mean score (49,12) during the online physics course and independent group t-test results showed that there was statistically significant difference between LOCFR and LOCFF groups' scores (p= ,006*). According to the findings, it was seen that LOCFF group more successful than LOCFR group. This result supports previous works (Miltiadou & Savenye, 2003; Potashnik & Capper, 1998; Riel & Harasim, 1994; Verduin & Clark, 1991; Vrasidas & McIsaac, 1999) and implicates the importance of the live online course on students' achievement at distance learning.

THE EFFECTS OF MYTHOS' ON PLATO'S EDUCATIONAL APPROACH

Derya Çığır Dikyol[a]

[a]Istanbul University Hasan Ali Yucel Education Faculty, Department of Social Science, Istanbul, Turkey.

Abstract

The purpose of this study, by examining the findings related to education in Greek mythos, is to reveal Plato's contributions to the educational approach. The similarities and differences between Plato's educational approach and the education in Mythos are emphasized in this historical - comparison based study. The effect of mythos, which in fact give ideal education of the period, with the expressions they made about Gods' and heroes' education, on the educational approach of Plato, known to be intensely against the mythos, is rather surprising.

Keywords: educational approach, educational history, mythology.

1. Introduction

Plato is the first thinker of philosophy as well as of education. His ideas about education still have influence on schooling. Thus; Plato is a decent starting point in the studies over the meaning and the philosophy of education. Thinkers like Aristoteles, John Locke, J. J. Rousseau, and John Dewey, who produced education theories couldn't help challenging Plato. However; Plato's challenge was mostly with the mythos. In ancient Greece, one of the three words meaning 'say' is 'mythos'. Epos and logos are the other two. The exact meaning of mythos is considered as 'word', 'tale', 'story' or 'myth' which are said or heard. Logos, however, means the utterance of the truth with human sayings. That is; mythos and logos are two opposite words. Therefore, Plato despises mythos as he did to Heraclitus and describes it as fake, vain and ludicrous. However, it is known that Plato couldn't think separately from mythos and even created his own mythos as mythos is identical to Greek thought and language and therefore is impossible to isolate mythos from Plato's thoughts. (Erhat, 1996)

Over the past few decades many emphasis has been given to the importance of myth in Plato's philosophy (Hooger, 2010). A rational philosopher, Brunschvicg, sees Plato's making use of mythos as a forceful return of a primitive way of thinking which means questioning the state before the existence of the earth and alike the sort seen in Hesiod. Burn, however, sees Plato's making use of mythos as an essential part of philosophy. V. Broachar also defines mythos as a complementary parts of Plato's teachings. (Brun, 2007)

The purpose of this study was to analyze the effects of Greek mythos on Plato's educational approach.The writing out of the Greek myhtos began with Homer and Hesiod, yet further flourished with new narrations and interpretations. For this reason, mythological sources, starting with Homer, spans to the explanations of the twelfth century Byzantanian scholars. Of course, the works of Homer and Hesiod on which Plato frequently emphasized were used in this study. However, not limited with those above, some mythological dictionaries prepared with the use of a great many mythological sources were also taken advantage for this study. Also the study focuses on Plato's educational thought in *Republic* and *Laws*.

1.1.Mythos

In advance of the twentieth century, mythos was regarded as 'tale' or 'fiction', but in this century, addressing mythos as adopted in archaic societies enabled itself to be considered as historical knowledge. 'Myth narrates a

sacred history; it relates an event that took place in primordial time, the fabled time of the "beginnings." '(Eliade, 1993, p.13). Mythos, which usually carries a cosmogenic meaning, appeared as an effort to descibe natural events. For humans, mythos is a symbolic instrument that helps understand the world, the cosmos and he himself.

Myth is covering stories that utilize fantasy to teach people about the nature around them (Hooper, 2010). Myth tells only of that which really happened, which manifested itself completely. (Eliade, 1993). The basis of Greek education was poetry and the content of Greek poetry was the myths. Mythos is the oldest education system and in this respect it is not surprising that Homer and Hesiod were used in ancient Greek education. Herein Dupont is noteworthy with these words: 'Homer's poetry is the only educational book for common saga, poetical memory, the guardian of the culture and for all children' (Dupont, 2001). In *Republic*, Plato mentions that as a result of a mythos which brought all the Greeks together, Homer with *Iliad* describes it as the foundation of the Greekness (*Republic*, 607a). However , his poems , tragedies and the sources of these describes Homer and Hesiod as figures who could never reach the reality, create fictional characters and are of no help to the society (*Republic*, 595-601).

Plato is known to have great influence on mythos gaining such meanings as 'tale' 'history' (Peters, 2004). He registers his objections to some of the dangers of an educational program which are based on the myths (*Republic*, 398a-b). But he also supports the use of children in education, but only the beautiful ones (*Republic*, 377c).

1.2. Traces related to education in Mythoses.

When mythoses are analysed, it is possible to reach some information, although limited, about the education of some mythological characters. That from infancy, how some gods and heroes are raised is cited in mythoses. It is known that wetnurses, nannies and nymphas, known as natural and heavenly bodies living in the moorland, waters and forests played some roles during the infancy of gods and heroes. Even the king of the Gods, Zeus, was brought up and breastfed by nymphas (Grimal, 1997). Plato leaves the role of nursery and nutrition of the babies to wetnurses and nannies (*Republic*, 460d).

In mythoses, as an instructor there were gods and semi-gods, but the most commonly aforenamed instructor is Centaur (Kentaur), which is a creature made up of half man and half horse called Chiron. The name of Chiron (Kherion), which is the most famous, the wisest and the best horseman, derives form 'Kheir' meaning 'hand'. (Çelgin 2011). This centaur who was seen as instructive roles in mythoses is a man of nature and with the lessons he learned from the nature, he raised gods and heroes. In addition to gods such as Apollo and Asclepius, the instructor of Achilles, one of the main actors of *Iliad*, was Chiron (Erhat, 1996). The lessons that Chiron taught can be listed as arts of war and hunting, medicine, ethics and music. By saying that Achilles, brought up by Chiron, cannot be bad (*Republic*, 391c).

Achilles is the hero who was the most commonly referred subject in Greek myhos. *Iliad* is more of a saga of Achilles than Troia. Achilles was taught by the horseman, Chiron. As well as music education like playing the reed, singing and elocution, Achilles was educated in such physical education lessons as spear throwing, fighting, war making, riding and running. He learned the art of medicine and making drugs. In addition to these, he is said to have had any kind of virtues. These virtues can be listed as resisting to pain, not telling lies and being sober and sturdy in Mythoses (Erhat, 1996). In his work *Republic*, Plato criticizes Homer saying that Achilles cannot foster evil in him as he is   not only the descendant of God but also being well educated (*Republic*, 391c). What attracts attention here is Plato's complete approval of the education that Achilles, a fictional character, received.

When the disorganized data in mythoses is analysed together, it can be perceived that education can be classified under two main headings as mental and physical education as in Plato. However, another point that attracts attention is especially musical education is more emphasized in mythological stories. For Plato, the education of the guard of the state starts with music (377 a) and that education should be based on music is

emphasized (*Republic*, 401a-e), for spiritual education can be realized through music and the music symbolizes the universe (Nietzsche, III,9 (90)). Here it is necessary to mention inspiration fairies (muses) called 'mousa' in Greek mythology. Deriving from the root of 'men' meaning mind, thought and the power creativity as a word, 'mousa' constitutes the etymologic root of 'music'. Mousas are the daughters of Mnemosyne and Zeus (Hesiod, *Theogony*, 75). Zeus took the lead by defeating the tough powers and so as to establish his sovereignity he adopted powers which are creative in proportion to regular and moderate. Mouses are the products this power (Erhat, 1996). Here the terms regular and moderate are important as the order and harmony that Plato constantly emphasized (*Republic*, 410a ff; 430 e ff.) are valid in Greek mythologhy too. These terms are stressed with Zeus' being the father of Mousas and that the new order is moderate and harmonious is emphasized. Mousas defined as heavenly singers are also the managers of the thought (Grimal, 1997). Music is known to have a fundamental role in enabling the oral culture to be kept in mind and passing over to the next generations. In this respect, Mousas are accepted as references by poets, for they have a broad memory, tactful thinking and conscience (Dönmez; Kılınçer, 2011). Two great sagas of Homer, *Iliad* and *Odyssey* start with an addressing to Mousas. Hesiod begins *Theogony* with a praise to Mousas. Plato is known to refer to Mousas and praise them as poets. (*Republic*, 545e-549a). Moreover as an actual Mousa, he points at dialectical and philosophical Mousa, namely Mousa Ourania (*Republic*, 548c).

Another mythological entity interested in music is Apollo. Apollo, known as the manager of Mousas, is a one of the second generation gods. He is mostly viewed as the god of poetry, dance and prophecy. One of the musical instruments played by Apollo is the lyre. In one of the traditions, the lyre is written to have been given to Apollo by his father, Zeus, yet in another generation is narrated to have taken the lyre from Hermes in return for his herds (Grimal, 1997). Plato is known to have mentioned about Apollo's lyre in ideal education about musical education (*Republic*, 399d).

Marsyas is regarded as the founder of two – hole shepherd's pipe. Marsyas, mastered at playing the pipe, becomes the manager of the Mousa choir. In an Anatolian based legend, Marsyas maintains that the reed could compete with the lyre of Apollo and as referees Mousas and Midas, the Phrygian King, were chosen. When Mousas chose Apollo and Midas chose Marsyas, Apollo changed his ears into those of an ass and punished Marsyas by excoriating (Erhat, 1996). As mentioned above, the preferring of Apollo is ture for mythos.

Apart from this, the fact that Apollo is a bright god emitting light can be understood from the adjective Phoibos (bright). Apollo, as the god of sun, is the successor of Hyperion and is associated with Helios (Bulfinch, 2011). Considered to be the father of Pythagoras, Apollo was thought to have lived on the Leuce Island (White Island), known to be the heaven for orpheusisicm and pythagorascism (Grimal, 1997). Apollo symbolizes the enlightened, stagnant and moderate power. It is the light, the power of seeing the nature and perceiving the entity with mind and the power of shaping (Erhat, 1996). For this reason, Plato interpreted Apollo as 'mask of the Form of the Good'. The significance of Apollo in Platoic philosophy has been suggested in Christina Schefer's book (Schefer, 1996). Apollo has the power of inspiration as Dionysos, yet the difference of him is his moderate power of inspiration (Grimal, 1997). Plato talks about Apollo as the god who first makes the nicest *Laws*.

"For us nothing, but for the Apollo of Delphi, the chief, the fairest and the first of enactments." "What are they?" he said. "The founding of temples, and sacrifices, and other forms of worship of gods, daemons, and heroes; and likewise the burial of the dead and the services we must render to the dwellers in the world beyond to keep them gracious. For of such matters we neither know anything nor in the founding of our city if we are wise shall we entrust them to any other or make use of any other interpreter than the God of our fathers. For this God surely is in such matters for all mankind the interpreter of the religion of their fathers who from his seat in the middle and at the very navel of the earth delivers his interpretation." (*Republic*, 427 b-c).

The son of Apollo, Asclepius, is known as the god of medicine in the Greek mythology. The one who taught Asclepius the art of medicine is again the horseman Chiron. Asclepius taught his daughter Hygieia and the sons of Asclepius the art of medicine (Erhat, 1996). While Asclepius was growing up, he was becoming even more famous as a highly-regarded healer with exceptional skills. Aside from the art of surgery, Chiron had also taught him the effective use of drugs, incantations and aphrodisiacs as aids to healing (Grimal, 1997). Chiron, however, is stated to have learnt all this from the nature (Erhat, 1996). Plato's description of Asclepius is as:

"Then, shall we not say that it was because Asclepius knew this—that for those who were by nature and course of life sound of body but had some localized disease, that for such, I say, and for this habit he revealed the art of medicine, and, driving out their disease by drugs and surgery, prescribed for them their customary regimen in order not to interfere with their civic duties, but that, when bodies were diseased inwardly and throughout, he did not attempt by diet and by gradual evacuations and infusions to prolong a wretched existence for the man and have him beget in all likelihood similar wretched offspring? But if a man was incapable of living in the established round6 and order of life, he did not think it worth while to treat him, since such a fellow is of no use either to himself or to the state." "A most politic Asclepius you're telling us of," he said." (*Republic*, 407 d-e).

As a result of Apollo's and Mousa's copulation, musicians Linos and Orpheus, who were yet again mentioned as an instructor in mythological tales, were born (Graves, 2010). There are legends saying Linos was the person who invented melody and the rhythm (Grimal, 1997). Linos is known as the music teacher of Heracles. He punished Heracles as he didn't have the talent for music, but Heracles got furious and killed his teacher. We can conclude from this mythos that Heracles having brute force cannot be educated as he has lacking in music, or rather delicate thinking (Dönmez,Kılınçer, 2011). Linos, thought to have universal wisdom, was the teacher of Thayris and Orpheus (Graves, 2010). There are mythoses saying that Linos also learned Phoenician (Fenike) alphabet from Kadmos and the name of each letter and the final form was given by Linos (Grimal, 1997).

Another musical instrument that Plato introduced in education is the cithara. In some traditions, cithara is described as an instrument invented by Orpheus, yet in some other traditions it is stated that Orpheus increased the number of cithara's strings to nine from seven as is the number of Mousas. Orpheus could also play the lyre apart from the cithara. As an instrument of harmony, with seven sympathetic strings, the lyre also represents the harmony of the cosmos. Thracian hero Orpheus is stated as Kalliope from the Mousas or the son of Polhymnia. There are mythoses as regards to the fact that Orpeus learned musicianship from Linos or Apollo. He sings in Olympos as Mousas and with his music he soothes animals, plants, humans and genies (Grimal, 1997).

Another musician that is referred as the teacher of Orpheus in some traditions and as a student in some others is Mousaios. Mousaios is the son of goddess of Moon known as Selene and was brought up by nymphas as many other mythological characters were. The music of Mousaios were used to heal patients (*Republic*, 365a; Grimal, 1997).

Heracles, about whose education we know more than that of any other heroes, were taught by many different teachers for physical and spiritual education. However he is known to be better in physical education. It is stated that he was educated in not only calisthenic subjects such as car driving, swordplaying, war techniques on horse or without horses, fighting, archery but also playing the lyre and singing, literature , astronomy and philosophy (Graves, 2010). The education that Heracles received in classical period is the education that Greek kids received, but the teachers of Heracles were mythological characters just like himself. Heracles killed Linos, who taught him music and literature, as a result of anger fit and   later were taught to shoot arrows from an Scythian cowman called Teutaros.

1.3.Plato's Educational Approach

Plato is described as the first great educator and founder of educational thought (Cooney, Cross and Trunk, 1993). With Academy, Plato became the founder of the first systematic education and the school where the education would be conducted. The intellectual environment of his Academy continued activities more than 900 years and in A.D. 529 it was closed by the emperor Justinian (Cooney, Cross and Trunk, 1993). However, although the Academy was closed down later, the philosophy (teachings) of Plato lasted throughout Archaic Age and the Renaissance and reached to the modern day (Brun, 2007).

Plato's educational approach can be found in Dialogues of the *Republic* (Politeia) and the *Laws* (Nomoi) in which he develops his ideas about education (Lodge, 1947). As in many other examples presented in the history of thought, Plato's educational idea appeared in association with idea cumulation, understanding and views of the period when he initially lived. The educational approach of Plato, who went after 'good' as a perfect Socrates follower, was deeply affected by the educational approach of two crucial city states, Sparta and Athens. Especially in the *Republic*, it can easily be understood that the model he presented in Sparta is the idealized sample of the education named agoge he practised (Russell, 2000). Plato thinks that education is the main responsibility of the state as in Sparta. According to Plato, only a state established within a proper system is perfect.

Plato classifies people as having gold, silver, iron and bronze in their nature. According to him, people with gold in nature are the managers, the silver are the assistants of them and, the iron and the bronze are farmers and labourers. This metaphor is like the mythos in which Hesiod tells the creation of the roots of human beings (Hesiod, *Works and Days*, 106-200). In the *Republic*, Plato talks about the necessary education that the managers would receive in his ideal state. Education is a part of Plato's ideal state in which philosophers should rule. According to Plato, for the education of these ideal prospective managers verbalized as wardens (gatemen) there are two important ways are Physical education and music. There are also rhetorics in musical education (*Republic*, 376e). In this part of the dialogue Plato describes the role of poetry in education and criticizes Hesiod and Homer (376d- 412b). Music educates the soul but the significant role of music education for Plato is that it educates philosophical part of the soul.

For Plato, physical education is important, yet just because the physical condition is good doesn't mean that the mankind is 'good'. However 'good' man is the one who looks after his body well (*Republic*, 403 d). In the '*Laws*', it is stated that after the age of six, irrespective of their being girl or boy, every kid is supposed to go through physical education (*Laws*, 794 c). Plato's sayings about girls' education are different from the ones expressed by mythoses. Because, in mythoses, it is generally seen that female characters were engaged in handcrafts. Plato begins his physical education with nutrition and recommends the diet expressed in Homer's epic stories (*Republic* 404 c). For Plato gymnastic is not only produces bodily health, also diciplines the psychological element of the spirit.

Plato emphasizes the role of abstract sciences in education for the age group between 20-30 which are choosen to be soldiers and guardians They should be trained in abstract sciences, numbers, astronomy, geometry and harmony. After this stage comes the dialectical education. With the help of this education, they go into the way of discussing the universe of ideas and gaining the actual knowledge. (Aytaç, 1992).

Cave allegory in the *Republic*, the myth itself is nothing but a shadow, a mere likeness of reality, and not reality itself. But a myth, if it is to be at all useful as a means for education, must inform the audience of its own nature: the best myths, then, will be shadows that inform the reader of their shadow-like nature. With the cave allegory, Plato turns the underwold of Hades, expressed by Homer, upside down and hence emphasized the immortality of spirits (Arent, 1996). Homer's lines about Hades are as such:

"How didst thou dare to come down to Hades, where dwell the unheeding dead, the phantoms of men outworn" (Homer, *Odyssey*, XI, 475).

With these lines of Homer, that souls lacking in the power of thought without their own bodies is expressed and the life on the earth is dignified. The perception expressed by Homer with this passage is a prevalent idea in the whole Greek mythology. However, Plato thinks just the opposite and criticizes Homer by the cave allegory stating that what is essential is the soul itself and the earth where we have the body is not the real world but the shadow. In Plato's theory of ideas, what is important is not the body that mythoses dignified but reaching the world of ideas which is the source of eternal life. Here, the effect of Orphic –Pythagoric approach is felt in Plato's philosophy. With this allegory, Plato tries to associate his ideas of theory with the teaching that things are composed of numbers (Zeller, 2008). To Plato, reaching the world of ideas is only possible through education.

"... But, at any rate, my dream as it appears to me is that in the region of the known the last thing to be seen and hardly seen is the idea of good, and that when seen it must needs point us to the conclusion that this is indeed the cause for all things of all that is right and beautiful, giving birth1 in the visible world to light, and the author of light and itself in the intelligible world being the authentic source of truth and reason, and that anyone who is to act wisely in private or public must have caught sight of this." (*Republic*, 517b-c).

In the *Laws*, Plato discusses a practical code of *Laws* for a state (Cooper, 1997). Education is the most important thing in Plato's ideal state in which philosophers should rule. In this dialogue, he insists on the dogma that virtue is knowledge. Edelstein says, Plato bases the life of the ideal state not on philosophy but on mythology (Edelstein, 1949).

2.Conclusion

Plato had two programs of education: unphilosophic and philosophic man. In *Republic*, the education of unphilosophic is also for the early education of philosophers. And this early education has two parts as in mythoses: music and gymnastic. Music education includes myth, rhythm and harmony to make the soul graceful and harmonius. In the myth in which Hercules, who cannot use his power moderately, killed Linos, it is seen that the mental state of the hero who had no talent for music was not in an order and continuously in pain. (Grimal, 1997). Hercules seen as the mythological interpretation of the disorder which was brought on by those who only trained their bodies as stated in the *Republic* of Plato(*Republic*,410d). For Plato gymnastic education is also necessary to the health of soul. In the ideal education of Plato, musical and physical education are to be given moderately (*Republic*, 411e-412 b).

Myth plays a continuing role in Plato's education. The presence of myth in his dialogues is the strongest evidence. Plato uses myths to teach his paradoxial views. He thought myth to be a kind of logos, a likely logos. In *Republic* Socrates says" the myth, taken as a whole, is false, but there is truth in it also". (*Republic*, 377 a). Plato uses myth as pedagogical devices. He found myth to be a perfect means for teaching crucial doctrines. A principle used by educators is that one leads the student from what is better known to what is lesser known. It seems Plato's technique is this principle (*Republic*, 368d-369a).

Most scholars argue that mythos and logos are on occasion interchangeable in Plato's dialogues. Indeed, sometimes Plato writes of myth as a kind of logos. Plato uses images in his dialogues because the images help a student to understand and learn. Finally, for Plato education is to create in young people an imagination because without imagination education is useless and he creates this imagination with myths in his dialogues. Also he doesn't create his ideal education apart from Greek mythos that it seems on his works.

THE EFFECTS OF PROBLEM-BASED E-LEARNING ON PROSPECTIVE TEACHERS' ACHIEVEMENTS AND ATTITUDES TOWARDS LEARNING MATHEMATICS

Devrim Üzel[a,81] , Emine Özdemir[a]

[a]Balıkesir University, Educational Faculty of Necatibey, Balıkesir 10100,Turkey

Abstract

The aim of this study is to investigate the achievements and attitudes of prospective teachers towards mathematics in problem based e-learning. Experimental research model was used to determine the achievements and attitudes of prospective teachers towards mathematics in Problem based e-learning. The participants of this research include 73 (36 in experiment and 37 in control group) prospective teachers, who take course from the first researcher. The assignment form and attitude scale which were developed by researchers was applies before and after the course at 2010-2011 spring semester. Data received by assignment form and attitude scale, were analysed with t test for dependent samples and t-test for independent samples. The differences between prospective teachers' mean scores of assignment form and attitude scale were found statistically significant in the level of p=.05. These differences were found significant in favor of prospective teachers who took the course on problem based e-learning.

Keywords: Problem based e-learning; mathematics education; prospective teachers; attitude; t-test for independent samples and dependent samples.

Introduction

E-Learning is a contemporary teaching method supported by the use of information and communication technologies. E-learning enables the use of a much broader pedagogical strategy when compared to classical education and learning activities. The most important advantage of e-learning when compared to other traditional methods is that it significantly decreases the costs when compared to the other educational methods (Terzi, nd).

In this context, the study's frame is created by using Problem-based learning (PBL) and e-learning approach together within the scope of coeducation models. PBL was first developed in medical education in the 1950s(Barrows, 1996).The adoption of PBL in education outside the medical field started and carried out in 1990s. PBL has been applied globally in a variety of professional schools and teacher education (Oberlander & Talbert-Johnson, 2004). It is a pedagogical strategy for posing significant, contextualized, real world situations, and providing resources, guidance, and instruction to learners as they develop content knowledge and problem-solving skills (Mayo, Donnelly, Nash, & Schwartz, 1993). According to the study of Günhan (2006), PBL increased the geometrical thinking levels of students in mathematics lesson, created a positive attitude towards mathematics and increased the level of access. In the study of Uslu (2006), it was seen that PBL in mathematics has a meaningful positive effect on students' attitude towards mathematics when compared to the traditional method. In the study of Luck & Norton (2004), online problem based groups success was found higher than the face to face problem based groups in terms of cooperation sub-dimension.

When the literature is analyzed, it is seen that learning purpose web contents are not sufficient. Content of the web pages of schools that are bound to the ministry of education is no more than the presentation of institution, so academic level information sharing is almost non-existing. Universities have the same problem. Another significant situation is that individuals are still afraid of computer usage which is a negative effect; these kinds of

E-mail address:duzel@balikesir.edu.tr

attitudes will surely create problems in transition to e-learning. Today, in Turkey, some institutions that do not get government grant have to take some of the expenses from workers; managers of primary and secondary schools sometimes have to take support from the parents of students in order to build and update computer laboratories. Employment problem has a negative effect on transition to e-learning in education. E-Learning practices' areas of appliying in Turkey are divided into four categories: Universities, companies, public and individual directed practices. In universities, certificate and post graduate programs are mainly practiced in e-learning model. During university education, some lessons in universities are presented completely with e-learning model (Çınar, 2010; Göktaş & Kayri, nd.). But this can not be generalized for every university. According to the results of many researches, PBL has a more positive impact on students' attitude towards lessons when compared to traditional method (Goodwin, 2006; Tavukçu, 2006, Çiftçi et al. 2007; Akınoğlu & Tandoğan, 2007). This is why, this study is important in terms of determining the efficiency of sufficient knowledge of prospective teachers in the faculty of education by using problem based learning and e-learning approach on the issue of e-learning and problem based learning on students' success and attitudes.

The purpose of this study is to examine the effectiveness of problem-based e-learning on pre-service teachers' achievements and attitudes towards learning mathematics. The study includes an attitude and achievement test in order to examine changes in pre-service teachers' achievements and changes in the attitudes from pre-test to post-test. Two research questions guided this study: 1. What is the effect of PBeL environment on pre-service teachers' achievements? Are there any differences in learning methods knowledge between experiment and control groups after using the program? 2. What is the effect of the PBeL environment on pre-service teachers' attitudes? Are there any differences in attitudes between experiment and control groups after using the program?

Method

Research model and study group

Experimental design with pretest posttest control group was used in this study. There were randomly chosen two groups in pretest-posttest control group design. One of the groups was experimental while the other was control group. In both groups, measurements were made before and after the experiment (Karasar, 2005). Experimental design with pretest posttest control group was used in this study. Randomly chosen 2 classes out of 3 which were equal in terms of academic success constituted control and experiemntal groups. The study was carried out in the second semester of 2010-2011 academic years. The participants of this research included 73 (36 in experimental and 37 in control group) students from department of elementary mathematics education, who were taking courses from the researchers.

Data collection and analysis

In this research, a teaching material presented in web environment was prepared in order to enable students practice problem based learning activities. Blackboard Learning Administration System that enables students design learning materials on web was used for this purpose. In our day, many universities (*For instance; Hacettepe, University of Cincinnati, University of Newcastle, University of Leicester, Ohio University, and University of Cambridge)* use Blackboard Learning Administration System which is used for problem based learning practices.

In the study, online problems that were qualified enough to develop prospective teachers' analysis and synthesis abilities were prepared. After problems were created, 3 experts' opinions were taken. On the bases of feedbacks, problems were re-shaped and presented to prospective teachers. Problems were discussed in 2 or more sessions for 2-3 hours, that were generally organized successively, sometimes with a few days off for free study. Prospective teachers worked individually and within a group. Academic success evaluation form in this study was prepared by researchers. While preparing the evaluation form, questions that are used in Teacher Selection Examination for Anatolian High Schools, whose validation-reliability are ensured, are analyzed and 20

of them were chosen for the study. In order to evaluate the reliability of the test, it was conducted on 68 randomly chosen 4th and 5th grade students of Mathematics Education. According to the reliability analysis that was made with SPSS 16.0 program, Cronbach Alpha reliability coefficient was found to be .81. This value was the desired level and was accepted to be sufficient (Büyüköztürk, 2006). In order to determine attitudes towards mathematics, 5 point likert-typed attitude scale towards mathematics developed by Üzel (2007) was used. Factor loads of the items in the scale varied between 0.454 and 0.730. Total Cronbach Alpha reliability coefficient was found to be .88. This result shows that the scale is reliable. Both in the control and experiment group, the topic were "derivative practices". The goal was to define the changes in students' success in mathematics and their attitudes towards it in a way that can be associated to "derivative practices" at the end of the process.

t-test is used for related and unrelated samples in the analysis of research data. Statistical processes are made with the use of SPSS 16.0 package program. p= .05 meaningfulness level is taken as the basis in all statistical solutions.

Findings

This part of the research consist findings that are achieved at the end of statistical analysis of the data gathered by the methods which are used in solving the problem and interpretations about these findings.

The aim of the first sub-problem of the research is to see if there is a meaningful difference between the knowledge levels of the experiment and control groups in terms of developing prospective teachers' success in mathematics. T-test is made for unrelated samplings with the calculations by SPSS 16.0 package program. At the end of the pre-tests and last-tests of experiment and control groups, a difference occurrd in favor of experiment group as .85 and 16.2 points respectively. T-test points of unrelated samplings which are respectively t = 0.876 and t = 4.02. When p values are analyzed, there is not a meaningful difference between experiment and control groups in terms of mathematical success before the teaching; at the end of last-test, p = .000 < .05 which means that there is a meaningful difference in favor of experiment group (Büyüköztürk, 2006). This result shows that in terms of efficiency, PBeL based teaching is more effective that traditional teaching method. In order to assess the effect of this efficiency on knowledge, difference between the average differences are analyzed. T-test is used for independent samples. In .05, meaningfulness level is t=3.713 and p=.000 < .05; so there is a meaningful difference in knowledge level which is supported by the findings. In other words, in terms of developing mathematics success, teaching based on problem based e-learning is more effective than the traditional teaching method.

The aim of the second sub-problem of the research is to see if there is a meaningful difference between the attitudes of prospective teachers' mathematics success in the experiment group educated with a PBeL based method and control group educated with traditional teaching method. "Mathematics Attitude Scale" is conducted and t-test is made in order to assess the attitudes of experiment and control group prospective teachers. Between the pre-attitude points of experiment and control group, there is a 3.22 points difference in favor of the experiment group. In order to see if this difference is meaningful, SPSS 16.0 package program is used and t-test is applied and it is found that t = 0.898. p value calculated in %95 confidence interval is found to be p= .334 > .05 which shows that difference between both groups' attitudes aren't meaningful. In other words, there is not a meaningful difference between experiment and control groups' attitude towards mathematics lesson before the experiment. In order to assess the changes of the experiment and control groups' attitude after the experiment, last attitude scales differences are taken into consideration. There is 11.52 points difference in favor of the experiment group in the last attitude points. In order to see if this difference is meaningful, t-test is used with SPSS 16.0 package program and t= 2.120. p value calculated in %95 confidence interval is found to be p= .334 > .05 shows that there is a meaningful difference between both groups' attitudes; and when the averages are taken into consideration, the difference is in favor of the experiment group. This result shows that PBeL based teaching affects attitudes towards mathematics more positively than traditional teaching method.

Discussion and conclusions

In this study, problem based e-learning teaching is made with prospective teachers. At the end of this teaching, prospective teachers' success on "Derivative Practices" and their attitudes towards mathematics are determined. At the end of analyzing the findings, it is found out that PBeL positively develops success and attitude towards mathematics. In his study, Günhan (2006) found that PBeL based teaching creates a positive attitude towards mathematics and increase the level of knowledge. In his study, Uslu (2006) mentioned that problem based learning method in mathematics teaching have a more meaningful positive effect on the attitude of students' attitude towards mathematics when compared to traditional method. In this sense, the study's findings are similar with the findings of the studies of Günhan (2006) and Uslu (2006). In this study, the result that prospective teachers develop positive attitude towards mathematics conflicts with Gürsul's (2008) study results which includes the information that difference between pre-attitude scale point and last-attitude scale points aren't statistically important (development level of the attitude towards mathematics). Similarly, this study's findings don't coincidence with Luck&Norton's (2004) study which has the result that PBeL based teaching doesn't increase success. At the end of the teaching in which problem based learning and e-learning approach is used together, prospective teachers had enough knowledge on learning and their attitude towards mathematics positively developed. In this context, it can be said that mutually complementary and supportive learning occurred. Similar studies can be carried out on the departments that educate secondary education mathematics teachers and possible contributions can be researched. Knowing PBeL based teaching's practicalability on other lessons in mathematics education license program is important in terms of understanding the effectiveness.

THE EFFECT OF PARENTAL ATTITUDES ON BULLYING AND VICTIMIZING LEVELS OF SECONDARY SCHOOL STUDENTS

Tuncay AYAS [82]

a Sakarya University, Education Faculty, Sakarya, 54300, Turkey

Abstract

The aim of this research is to examine the effect of parental attitudes on bullying and victimizing levels of secondary school students. In order to determine the victim and bully levels of the students in this research, "Determination of Peer Bullying Scale – Adolescent Form" developed by Ayas and Pişkin (2007) was used. In order to determine the attitudes of parents, "Parental Attitude Scale" adapted into Turkish by Yılmaz (2000) was used. The study group of the research consists of 300 students studying in three different secondary education schools which are a Science high school (n=107), a general high school (n=97) and a teacher high school (n=96) in province of Bilecik in second term of 2010-2011 education year. 157 of these students are female and 143 are male students. The schools and the students in these schools were selected with the random method. When the research results are examined, the level of being subject bullied does not significantly change according to parental attitudes. It was found that the children of families with negligent parental attitudes are bullied more than those of families with Permissive and democratic parental attitudes. Similarly, the mean score of exhibiting bullying behaviors does not show a significant difference according to parental attitudes. It was found that the children of families with negligent parental attitudes exhibit more bullying behaviors than those of families with Permissive and democratic parental attitudes.

Keywords: Parental Attitıte, Bullying, Victim, secondary school

Introduction

The duty of schools in traditional education term requires them to be interested in the academic achievements of students, however with contemporary education, important responsibilities such as gaining students physical, sensorial and social skills were added to the duties of schools. For the schools to be able to fulfill such important responsibilities, the schools should be safe and peaceful. Negative events to be experienced in school environment will cause the students to lose their interest in school, to withdraw from school and in parallel with this they will be psychologically affected in e negative way with the decrease in their academic achievements.

Although there are many events which may affect the students negatively in schools, one of the events that is one of the most important negative ones seen among students is the bullying cases experienced among them. It has been recently stated that bullying has become an international fact which affects the general ambiance of schools negatively. Many studies on bullying carried out in different countries show that it is a problem which is experienced in almost every part of the world (Ayas, 2008). The first definition of bullying was made by Olweus (1993) who initiated the first studies on this subject: "A person is bullied when he or she is exposed, repeatedly and over time, to negative actions on the part of one or more other persons". Bullying is not limited to physical aggression. Hurting others' feelings, oral insult or discrediting their self-respect through socially excluding them can be included in bullying (Hazlar, 1996).

* Tuncay Ayas. Tel: 90-264-614 10 33; fax: 90-264-614 10 34

E-mail address: tuncayayas61@hotmail.com.

As a result of examining different definitions of bullying, Pişkin (2002) defined bullying as a type of aggression which leads one or more students to intentionally and continually disturb those who are weaker than them and in which the victim cannot protect himself or herself.

Bullying behaviors lead to many negative effects on students. In the studies, it was seen that the absence of bullied students increased, their success decreased, their self-respect was negatively affected, they experienced sleeping and eating problems, and it led to problems such as drug use, antisocial behaviors and gun use (Anderson and Swiatowy, 2008)

The ones who carried out researches on the subject state that bullying behaviors are learned in very early periods of life. Bullying behaviors are also seen as an acquired attitude like other social behaviors (Crick and Bigbee, 1998). It is seen that the reactions given to the behaviors of their children by their families and the behaviors of the family members among themselves affect the behavior types of the children. Misguidance, punishing them severely, failing in drawing the lines of the children, making mistakes in awarding them may lead to bullying behaviors in peer relationships of the children (Amy, Adamski and Ryan, 2008).

It was determined that parenting style of families is very effective in showing bullying behaviors of children who are bully in their school years. The children of families who prefer physical punishment, who exhibit hostile and repudiative attitudes, whose problem-solving skills are not sufficiently developed, who teach their children to hit even in the smallest provocation are very likely to be bully in the upcoming years (Demeray and Malecki, 2003; Fitzpatrick, Dulin and Piko, 2007).

There is no relationship between bullying and authoritarian parental attitude, absence of intimacy and warmth in the family, inconsistent discipline methods, absence of common activities, lacking of communication between parents and the child (Baldry and Farrington, 2000; Curtner-Smith, 2000) In a study carried out by Farrington on 411 male children whose ages varied between 8 and 12, he found that the negligence of the children by their families was the most important determinant of bullying (Cited by: Smith, 2006).

In a study by Toksüz (2010), it was found that the children who spend time with their parents, who feel that their family love and are interested in them are less inclined to bullying; as the respect of the parents to the individuality of the child and levels to permit their children to express themselves increase, the bullying tendency of the children decreases; in addition as the control and supervising of the parents on the children decrease, the bullying tendency of the children increases.

The studies show that bullied and bullying students are negatively affected by these events and they also affect school environment in a negative way. This study is carried out to determine what kind of effect parental attitudes have in case individuals are bully and victim.

METHOD

In this part, the model of the research, study group, data collection tools and statistical techniques used in the analysis of the data will be given respectively.

The Model of the Research

The study was planned and performed in conformity with cross sectional survey method which is one of survey methods. Cross sectional survey method is a research model which aims to determine if variables differ or not according to other variables which are measured once.

Study Group

The study group of the research consists of 300 students studying in three different secondary education schools which are a Science high school (n=107), a general high school (n=97) and a teacher high school (n=96) in province of Bilecik in second term of 2010-2011 education year. 157 of these students are female and 143 are male students. The schools and the students in these schools were selected with the random method.

Data Collection Tools

In order to determine the victim and bully levels of the students in this research, "Determination of Peer Bullying Scale – Adolescent Form" developed by Ayas and Pişkin (2007) was used. Determination of peer bullying scale adolescent form consists of two parallel scales which are called "bully scale" and "victim scale" and in which same items are asked in a different way. The students are expected to mark how often they do the words and actions written in bully scale and how often they are subject to such words and actions in victim scale. Psychometric studies regarding these subscales are summarized below.

a) Victim Scale: Victim scale consists of six factors which are 1) Physical victim, 2) Oral victim, 3) Exclusion, 4) Being Rumored, 5) Harming of the Belongings and 6) Sexual Victim. For the validity study of this scale, experts were asked for their opinion and then confirmatory factor analysis was carried out. As a result of first level CFA, fit index was found as X2= 5407.73 (sd=1307, p.= .00), X2 / sd = 4.13 RMSEA= 0.041, GFI= 0.90, AGFI= 0.89, CFI=0.90, NFI=0.96 and NNFI= 0.97. As a result of second level CFA, fit indexes were found as X2= 5959.71 (sd=1315, p.= .00), X2 / sd = 4.53 RMSEA= 0.043, GFI= 0.89, AGFI= 0.88, CFI=0.97, NFI=0.96 ve NNFI= 0.97.

Cronbach's α internal consistency reliability coefficients of victim scale were found as 0.93 for Total Victim Scale, 0.82 for "Physical victim" subscale, 0.75 for "Oral victim" subscale, 0.77 for "Exclusion" subscale, 0.75 for "Being Rumored" subscale, 0.80 for "Harming of the Belongings" subscale and 0.88 for "Sexual Victim" subscale.

b) Bully Scale: This factor also consists of six factors and these factors are 1) Physical Bullying, 2) Oral Bullying, 3) Exclusion, 4) Rumoring, 5) Harming the Belongings and 6) Sexual Bullying. For the validity study of this scale, experts were asked for their opinion and then confirmatory factor analysis was carried out. As a result of first level CFA, fit index was found as X2= 6461.32 (sd=1307, p.= .00), X2 / sd = 4.94 RMSEA= 0.046, GFI= 0.89, AGFI= 0.88, CFI=0.96, NFI=0.95 ve NNFI= 0.96. As a result of second level CFA, fit indexes were found as X2= 7298.38 (sd=1316, p.= .00), X2 / sd = 5.54, RMSEA= 0.049, GFI= 0.87, AGFI= 0.86, CFI=0.96, NFI=0.95 and NNFI= 0.96.

Cronbach's α internal consistency reliability coefficients of bully scale were found as 0.92 for Total Bully Scale, 0.83 for "Physical Victim" subscale, 0.74 for "Oral Victim" subscale, 0.75 for "Exclusion" subscale, 0.66 for "Rumoring" subscale, 0.79 for "Harming the Belongings" subscale and 0.88 for "Sexual Bullying" subscale.

In order to determine the parental attitudes, Parental Attitude Scale developed by Yılmaz (2000) was used. 9 items in acceptance/interest dimension and psychological autonomy dimension which were prepared on 4-point Likert Type scale and first two items in control/supervision dimension were 7-point and there are 8 items in 3-point Likert type scale. Cronbach's Alpha internal consistency coefficient in the first dimension was .72, internal consistency in the second dimension was .76 and internal consistency coefficient in the third dimension was .82.

FINDINGS

Table 1. Change of levels of being bullied according to parental attitudes Anova Results

	PARENTAL	N	$\bar{x}$	SS		Squares	Sd	Squares	F	P

	ATTITUDE					Total		Average		
	Permissive	205	84.79	26.27	Intergroup	10936.42	2	5468.12		
VICTIM	Democratic	63	76.20	19.60						
	Negligent	32	104.87	35.80	Intragroup	194920.49	297	656.29	8.33	.000
	Total	300	26.23		Total	205856.92	299			

When Table 1 is analyzed, the mean score of being bullied does not show a significant difference according to parental attitudes ($F_{(2,297)}=8.33$, $p<.05$). Being bullied does not change significantly according to parental attitudes. Accordingly, parental attitudes affect levels of being bullied.

Table 2. Change of levels of exhibiting bullying behaviors according to parental attitudes Anova Results

	PARENTAL ATTUTUDE	N	$\bar{x}$	SS		Squares Total	Sd	Squares Average	F	P
	Permissive	205	76,7511	25,34	Intergroup	3945,48	2	1972,741		
BULLY	Democratic	63	69,6349	17,67					3.44	.033
	Negligent	32	85,0000	25,05	Intragroup	170079,91	297	572,660		
	Total	300	75.69	24.12	Total	174025,39	299			

When Table 2 is analyzed, mean score of exhibiting bullying behaviors does not show a significant difference according to parental attitude ($F_{(2,297)}=3.44$, $p<.05$). Exhibiting bullying behaviors does not change significantly according to parental attitudes. Accordingly, parental attitudes affect levels of exhibiting bullying behaviors.

Result and Suggestion

The recent studies on bullying carried out in Turkey show that bullying events are important problems in schools. The schools where bullying events are experienced are also negatively affected by this problem and it is seen than it affects education activities negatively. Such events which are seen in schools constitute a condition in which previous process should be considered. According to the studies (Demeray and Malecki, 2003, Fitzpatrick, Dulin and Piko, 2007), it is seen that the period before starting school, in other words, the family process where they get their first education is influential in occurring of such behaviors.

When the levels of being bullied are examined according to parental attitudes, it is seen that the children of families with negligent parental attitudes are bullied more when compared those of families with Permissive and democratic parental attitude. Parents with Permissive attitudes are the parents who have no time and energy to spend for their children, who are indifferent to them, who never supervise their children in any way, who do not fulfill any emotional needs of their children apart from their basic needs such as their meals. Such families are also not interested in school or out-of-school activities (Yılmaz, 2000). In a study by Farrington, it was found that being neglected by their families is the most important determinant of bullying (Cited by: Smith, 2006). In families with negligent parental attitudes, the children do not feel themselves safe enough. The children who do not feel save enough are inclined to be victims (Anderson, Swiatowy, 2008).

Another finding of the study was that the children of families with negligent parental attitude exhibit more bullying behaviors than those of families with Permissive or democratic parental attitudes. Families with negligent attitude do not control their children sufficiently. As the control of the control and supervision of the parents on the children decrease, the bullying tendency of the children increases (Toksöz, 2010). Sarıtaş stated that the children of families who do not show sufficient interest in their children become bullies.

In studies carried out to prevent the bullying events experienced in children, it should be ensured that the families actively participate in such studies and awareness should be raised on what kind of attitude they should exhibit towards them. If the children teach their children positive and negative behaviors and they show a democratic attitude, it is considered that their children should be less affected by bullying events.

Abstract

In this study, it was aimed to determine the effect of activity-based teaching methods to students' achievement on "Permutation" unit in elementary program. Our study was carried out on in elementary school which is located in Sakarya in first semester of 2010-2011 academic years. The sample composed of total 72, 7th grades students. Two intact groups were assigned randomly as control (36) and experimental group (36). During four weeks, while permutation subject was taught by activity-based teaching methods in experimental group, it was instructed using traditional approach to teaching in control group. Data was gathered using an achievement test of permutations with 20 items developed by the researchers. Mathematical achievements were taken into consideration when creating the experimental conditions and making statistical analysis. The data were examined by independent t-test and ANCOVA. The findings of the research showed that achievements of both groups increased significantly after the study. But achievements scores in experimental group are statistically significant difference. As a conclusion, activity-based teaching methods can be efficiently implemented in 7th classes and helped students improve meaningful learning.

Introduction

The information society that is developing and changing in a fast manner requires changes also in education systems. How the qualified individuals who will be able to meet the necessities of the information society, and with which aims and methods the so called individuals will be improved should be determined in consideration with the necessities of the information society. This change makes it necessary to reconsider the changing social conditions, the results of scientific researches and the concept of learning. Critical thinking, systematical thinking, problem-solving and adaptation to the new and changing conditions of life are among the most important skills that the individuals need in terms of learning in a future world. And there has to be an effective learning method in order to enable it.

Mathematics, considered an indispensible tool in science and technology, is also a part of daily life. If a person needs to come up with a solution to the problem encountered, he/she has to use his/her analytical thinking power. And approaching rationally to the problems and developing solution offers with analytical thinking is directly proportionate to the quality of the received mathematics education (Bayraktar, 1998).

In this respect, mathematics and the necessity of mathematics education are accepted indisputably in our country, as in every country, and mathematical behaviours are tried to be earned from elementary school programs to the higher education programs (Altun, 1998).

[83] Corresponding author. Tel.: +90 554 842 34 62; fax: +90 264 614 10 34.

Developing the existing structure and relations of mathematics, which is accepted as a system consisting of relations developed with consecutive abstractions and generalizations requires intuition. Intuition includes inductive thinking and surprising thinking processes. Inductive thinking can be defined as the process of reaching generalizations from the relations between the events taken separately. As for surprising thinking, it is the process of putting forward an idea that has not been set forth before in any subject and the process of leaping to mind of different ideas (Baykul, 2001). Consequently, the duty of teachers should not be to make the students memorize a heap of certain stereotyped rules but to guide them to discover the mathematical principles and generalizations themselves.

If one examines the historical processes in respect for guiding, mathematical teaching was attached importance also in the years of World War Second as much as mathematics which is a language that has the power of affecting in every field regarding the structure of universe- regardless of language, religion and nation difference (Karaçay, 1985)

The need to perform reforms in mathematics teaching was realized especially in the period after the Second World War (Yıldırım, 2000). Till the beginning of 20th century, mathematics teaching consisted of introducing operation skills in a mechanical way. But after 1930s, the meaning part of mathematics gained importance and studies in that direction started to show affect in mathematical programs. Early on, associationist, then Gestalt School affected mathematical teaching considerably. Another important view which still continues to be a problem and which affected mathematics teaching is the Piaget school. Piaget's views regarding mathematics teaching and the earning of mathematical concepts are discussed even today and are seen as a key theory in the improvement of education quality (Clark, 2005).

The negative attitude towards mathematics in our country develops as the students have difficulty in learning the mathematics subjects and as they think they will not succeed in the mathematics class. It begins in the elementary school and unfortunately continues increasingly with each school year. Eventually the students develop negative attitude and disconfidence. What is worse, they deduct that they are not clever enough to get the best of mathematics and that mathematics is not among the subjects they cope with. The teaching and the approach of the teacher have important role in these wrong views. Mathematics teachers sometimes make use of different methods so as to increase the mathematical comprehension abilities of the students, to teach them that mathematics is not a subject to be afraid of and to make them like it.

An effective and good learning is realized when the student actively participates in the classes and when the student is involved in the learning process as he/she learns the information during the learning process. As mathematics is based on mental visualization and perceptions, it cannot be transferred to a passive student via direct manner of teaching as if pouring water into an empty container. The best known way for a student to be active is to make them participate in solutions activities of problems which do not include algorithms the solutions of which are not known easily or which have not been solver before (Bayraktar, 1998).

There are not any subjects among the mathematical concepts that the students of the primary stage of elementary school cannot learn. Every student with no serious mental obstacle can learn these concepts. Mathematics education, which is anticipated to make the students get into the habit of independent and correct thinking, should now be relieved of such state that connotes fear for children. It is necessary for the students to get a decent education in order for them to enjoy problem-solving and to learn enjoying mathematics. Since this education cannot be conducted with only teaching the subjects and loading the students with homework, the mathematics class should be supported with various activities (Koç, 1996).

If we examine the renewed elementary school mathematics program, the program has been prepared as a result of a very extensive research in the field of mathematics education. The mathematics program is based on the principle of "Every student can learn mathematics." Mathematics-related concepts are by definition abstract. If the development levels of the children are taken into account, it is rather difficult for them to be directly perceived. Operation skills along with conceptual learning are given importance in the program. Learning mathematics also includes thinking with regard to mathematics, comprehending general problem solving

strategies and recognizing mathematics as an important tool in real life as well as earning basic concepts and skills (MEB, 2001).

The learning field of the research is probability and statistics, which includes the research. The concepts of the learning field of probability and statistics that the student will need and encounter the most have been discussed. It has been attached particular importance to the development of estimation skills as well as the development of probability and statistics in students. The learning field of probability and statistics consists of 3 sub learning fields on the level of 7th graders. These are determination of possible situations, types of events and kinds of probabilities. Due to the content arrangement understanding of the program, as the grade level increases sub-learning fields and contents vary in relation with the previous learnings.

Skills of mathematical thinking can be developed as a result of the association of different disciplines with mathematical subjects. And in this study, the subject of permutation has been explained on the basis of the production system of zip codes and a presentation of the subject has been performed with work sheets of teachers and students and various activities. The study has been started with the assumption that the zip code activities upon which the study is focused in teaching the subject of permutation may affect the success in this subject.

Method

In this past are given such information as the research method used in the research, the universe and sample of the research, the development and implementation of measuring tools, collection of data and analysis of the collected data.

2.1. Research Method

With this research, the effect of activity-based teaching method and traditional teaching method in the teaching of permutation sub-learning on the academic success and permanence level of 7th graders has been tested

'Testing Model" will be conducted in this research which aims to compare activity-based teaching method and traditional teaching method in terms of their effect on success and permanence levels. "Testing models are research models where the data that is desired to be observed is produced under the direct control of the researcher in order to reveal the cause and effect relations". This method is carried out with the use of pre-test and post-test control group pattern. Pre-test and post-test control group pattern is implemented through the subjection of the experimental subjects to the measurement regarding the dependent variable both before and after the experimental study. Experimental subjects are divided into two as experiment group and control group (Karasar, 2002:87).

In Pre-test and post-test control-group model, there are two randomly generated groups. Symbolic expression of this model are as follows:

Figure 1*: Pretest - Posttest Control Group Model*

		Pre-test		Post-test
GE	R	O1.1	X	O1.2
GC	R	O2.1		O2.2

G_E: Experimental Group

G_C: Control Group

R: Subjects selected randomly

$O_{1.1}$ and $O_{1.2}$ Pre-test and Post-test Measures of Experimental Group

$O_{2.1}$ and $O_{2.2}$ Pre-test and Post-test Measures of Control Group

X shows the independent variable which was applied to subjects in experimental group (Karasar, 2005).

In this study, two separate classes - one experiment and one control group- have been determined so as to test the effectiveness of the activity-based teaching method in the targets and behaviours regarding the "Permutation and Probability" unit of the mathematics class of the 7th graders in elementary schools. In the experiment group activities supported with the activity based teaching method (Zip Code activity) has been performed while in the control group the traditional teaching is conducted. Before the experimental process has begun, both groups have been tested with pre-tests and after the experimental process both groups have been tested with post-test as the same test. Experimental phase of the research lasted for one week. It has been thought that different variables that could emerge in time other than the independent variable can be controlled.

2.2. Experimental Design

Experimental design used in the study shown in Table 1.

Table 1: Experimental design applied in the study.

Grup	Class	Method
Experimental	7-B	Pre-test + Activity-Based Teaching + Post-test
Control	7-C	Pre-test + Traditional Teaching Method + Post-test

2.3. and Population   **Samples**

Our study was carried out on 7th grades students in elementary school which is located in Sakarya in first semester of 2010-2011 academic year. Our experimental and control groups consisted of 72 students (7th grades).

Classes	Class-B	Class-C	Total
Numbers of Students	36	36	72

Table 2: Distribution of students in research

Classes and the numbers of students which are constituted for our research study are showed in Table 2. In sample of study, our experimental group (7-B grade) consisted of 36 elementary students, and our control group (7-C grade) consisted of 36 elementary students.

2.4. Method and Tools of Data Collection

The source of the data obtained from the research method is made up of the pre-test and post-test points that the experiment and control group students received from the success test of mathematics class.

"Mathematics Enhancement Programme" "Zip code" activities suggested by the program and the activity samples created by the researcher have been used and a learning situation has been realized that is appropriate for the qualities stated within the class. After the performed teaching, the students were subjected to some activities and the results have been examined. A lesson plan similar to the one below has been implemented in the teaching.

2.5. Success Test

In this experimental research, after the unit of "Permutation and Probability" has been determined, success test has been developed with respect to this unit. With this success test, the differences in successes of the students of the experimental and control group have been measured. The following steps have been followed in the development of this test:

1.While the success test has been prepared, target behaviours have been determined belonging to the Permutation and Probability unit of the Mathematics Class in elementary schools. Test articles have been created that has the scope validity so as to satisfy these behaviours.

2.Before the tests were developed, the relevant literature has been scanned and the previous researches conducted before on this subject have been examined. A test draft consisting of 15 questions have been developed by the researcher.

3.The validity of the success test that has been prepared has been determined after expert opinion has been obtained. Accordingly, the opinions of 2 academics at the Department of Mathematics Teaching at the Faculty of Education at Sakarya University and 3 mathematics teachers have been asked.

4.The prepared draft have been performed on 54 students who are still 8th graders and the reliability works of the test have been performed. The test has been shown to the experts and their opinions have been asked and in line with these opinions the errors have been corrected and the test has been given its final form.

5."Reliability is the resolution among the independent measurements of the same things. It is the state of a thing which is desired to be measured and which continually acquires the same symbols. It is the following of the same processes and the use of the same measures and obtaining the same results. It is the state of the measurement free from accidental mistakes. Reliability is determined with correlation coefficient and it takes values varying between zero and one. If the value approaches one, the reliability is considered to be high." (Karasar, 2002).

There has been no need to omit any one of the articles of the 15-article test prepared at the beginning with reference to Cronbach Alpha reliability coefficient. After these procedures the 15-article test has become ready. As the $r = 0.7782$ as a result of the applications, it was accepted that the success test has a high reliability.

Some examples from Success Test

Question 2: How many double digit numbers can be written smaller than 300 with elements of (0, 1, 2, 3, 4, 5) ?

Question 5: How many nine-letters words which are meaningfull- meaningless and different from each other can be written starting with the letters M and ending with K using letters of word "MATEMATIK"?

Question 8: How many different post adress in Istanbul can be given using elements of (0, 1, 2, 3, 4)?

Question 13: How many post adress in Sakarya can be written using elements of (0, 1, 2, 3, 4) without repetition?

Question 15: How many seven-digit numbers can be writen using the numbers in 1102333?

2.6. Analysis of the Data

Microsoft Office Excel 2003 has been used in order to calculate the reliability of the success test, the article-total correlation and the difficulty degrees of the test articles. Associated t-test has been used in order to measure whether there is a significant difference between the pre-test points of the students. Associated t-test has been used for the intragroup comparison of the pre-test and post-test success points of the both groups within the group.

2.7. Research Process:

The implementation phase of the research is as follows:

1. 36 students in the 8-B class of the Elementary School has been chosen as the experiment group and 36 students of the 8-C class, as control group.

2. Before the application success test has been applied as pre-test to the students of the both groups in order to measure the pre information of the students of experimental and control groups

3. The implementation started in the last week of December in both classes. It lasted for one week in both groups.

Findings and Interpretation

Pre-Test Scores of students in Experimental Group:

Figure 2: Pre-test Scores of Experimental Group
Post-Test Scores of students in Experimental Group:

Figure 3: Post-test Scores of Experimental Group
Processed in the form of Activity-Based Teaching on subject of permutations in the experimental group was found to significantly increase the student's academic success. (Table 3).

Table 3: Pretest and Posttest Mean Scores of Experimental Group (p < 0.05)

		Measure	N	$\overline{X}$	sd	df	t	p	
Pre-Scores	Experimental Group	Pre-test	36	28.47	9.98	35	-15.7	.000	**Test of**
		Post-test	36	68.05	13.32				

students in Control Group:

Figure 4: Pre-test Scores of Control Group
Post-Test Scores of students in Control Group:

Figure 5: Post-test Scores of Control Group
Processed in the form of Traditional Teaching Methods on subject of permutations in the control group was found to significantly increase the student's academic success. (Table 4).

Table 4: Pretest and Posttest Mean Scores of Control Group (p < 0.05)

Measure	N	$\overline{X}$	sd	df	t	p
Pre-test	36	21.94	8.80			
				35	-11.6	.000
Post-test	36	60.69	17.03			

Contr ol Group

Associated t-tests have been used for the purpose of measuring the intragroup changes of the success points of the pre and post mathematics tests of the both groups. The results of the analysis show that the post-test points of the both groups are significantly higher than their pre-test points ($p < 0.05$). This finding may be interpreted as that the teaching implemented in both groups significantly increases the geometry success of the students. ANCOVA has been used for the comparison of the post-test geometry success points. Pre-analysis data reveal that the data meet the assumptions for the performance of ANCOVA.

Table 5: Descriptive Statistics of Post-test Scores of Groups

Group	Mean	Adjusted Means	N
Experimental	68.05	67.88	36
Control	60.69	60.86	36

Table 6: ANCOVA Results of Success Test

Varyansın Kaynağı	Sum of Squares	df	Mean of Square	F	p
Pre-test	16.446	1	16.446	.069	.793
Group	790.593	1	720.59	- 12.3	.043
Error	16355.082	69	237.85		
Total	315725.00	72			
Adjusted Total	17346.875	71			

Results

According to the findings obtained from the research, the following results have been obtained.

1.It has been seen that the activity-based teaching implemented in the experimental group increases the academic success of the student in a significant manner.

2.It has been seen that the lessons performed with traditional teaching in the control group increases the academic success of the student in a significant manner.

3.It has been found that there is a significant difference among the post-test success points that have been adjusted according to the pre-test points of the students of control group where the activity based teaching method is used and the control group where the lessons are performed with the traditional method. In other words, significant difference has been seen among the success levels of the experimental and control groups after experimental procedures.

4.It seems that the use of activity-based teaching method in education has an effect on the academic success of the students. After all, success is obtained with the activity based teaching and visuality comes into prominence.

Suggestions

•It must be paid attention that the activities and teaching designs to be prepared for the students to learn mathematics more efficiently, more attractively and productively should be appropriate for the individual features of the students and should develop their high-level thinking skills.

•Methods should be used designed according to the contemporary teaching methods that include higher interactions for a more efficient and productive realization of the prepared activities.

•Experts from every field must participate in the design team in the preparation of the activities. Because those activities where experts without enough number and quality participates in the development process will decrease the efficiency of the teaching.

THE EFFECT OF THE INTERNET AND MOBILE PHONES ON THE HABIT OF TEACHER CANDIDATES' USING TURKISH LANGUAGE AS WRITTEN LANGUAGE

Nilgün Tosun[a]

[a]Assist. Prof. Dr., Trakya University Faculty Of Education CEIT Department, 22030 Edirne, TURKEY

Abstract

In this study, it is aimed to reveal whether the habit of teacher candidates' using mobile phones and the internet has a negative effect on writing Turkish texts. In accordance with this purpose, the data collected via surveys from 405 teacher candidates, it was determined that students preferred mobile phone short text messages in written communication rather than chat and e-mail. Students stated that they used Turkish word abbreviations in chat, e-mail and short mobile phone texts. They also expressed some justifications as a result that using abbreviations is time saving, even though they do not write the entire word, the reader will understand what is written and they also think that writing entire word is more difficult. According to the data gained from the same survey, the majority of the students do not use a word or word abbreviation from another language in electronic media correspondence. The rate of male students using spelling and obeying punctuation rules is higher than the rate of female students while writing e-mail.

Keywords: Turkish language; internet; mobile phone; teacher training; writing habits.

Introduction

Language that is the most important tool for communication between people can be influenced by the other languages and change in an international platform like internet. That a language changes the other languages depends on the number of its users, use of frequency, namely on the domination in the environment. The dominant language on the internet is English. According to statistical results of Internet World Stats, 536.6 billion users used English language on the internet in 2010 [URL1]. Since most of the internet sites are English, it has been experienced shortage to use Turkish language characters. The characters (letters) ç, ğ, ı, ö, ş and ü are not used. Due to the domination of English language on the internet, Turkish language has changed with the effect of English today.

It can be given as an example that the use of strange words which are the mixture of Turkish and English words in internet correspondence can cause the changes in Turkish language as well. The expressions such as hacking (hacklemek), downloading (download etmek), flash memory (flash bellek), chatting (chat yapmak), e-mail address (e-mail adresi) have been involved unfortunately not only in internet environment but also in the colloquial and written language of youth. Even though Turkish Language Institute has found Turkish equivalents to many of these statements, they have not still involved in our language. This is why some of the equivalents are long, difficult to pronounce, and they do not create awareness in the society.

The word abbreviations which are used especially in chat areas, blogs, e-mail, social networking sites, and forums are the indicators of the emergence of a special Turkish language that belongs to internet. For example instead of 'selam (hi), slm; instead of 'merhaba (hello)', mrb; instead of 'ne haber? (what's up?), nbr; instead of 'tamam (it's okay)', tmm; instead of 'hoş geldin (welcome)', hg are some of the most common Turkish words abbreviations.

There are some typographical errors which young people often repeat on the internet such as English words shortenings as well as Turkish shortenings. The shortenings such as instead of 'Teşekkürler (Thanks)' they use 'thnx'; instead of 'senin için (for you)', they use '4u'; instead of sana/size (to you), they use '2u' are some examples of these. Sometimes while writing Turkish words, instead of using Turkish letters in correspondence, English letters are preferred. Particularly, it has been seen frequently instead of Turkish letter k, they use 'q',

instead of 'v' they use 'w', instead of 'u' they use 'ou', instead of 'ş' they use 'sh', instead of 'ç' they use 'ch'. For example, Buqet, Turkish name (Buket); Haroun, Turkish name (Harun); Pasha, Turkish name (Paşa); Chetin, Turkish name (Çetin) are the examples of this wrong kind of uses.

Writing and the Internet

Writing is the most common expression type that we refer to in our daily life after speaking and its basic aim is to transfer a message about a specific topic to the reader. Writing is also a need like speaking. Furthermore, it is one of the communication ways in the society. Writing is a necessity for transferring the feelings and thoughts as well as for sharing the professional knowledge and experiences. Additionally, it is extremely important for the development of language (Özbay, 2006).

With the spread of Web 2.0 applications, social networks, blogs and wikis have been new favorites of young internet users. Social networks are the sites in which it is aimed to create a virtual community to act together, share ideas and produce new solutions (Özmen et al, 2011). Facebook, Twitter, Linkedin, Badoo, and Flickr are the most common social networks. Today, Facebook has over registered 500 thousand users and half of these users log in every day. Three million messages are sent every 20 minutes on Facebook and one user writes 25 comments on average per month [URL2]. In 2010, with 18.679.460 Facebook users, Turkey was in the fourth place in the world [URL3]. Blogs, without requiring technical knowledge, are the log-like web sites in which people can create what they want and write about them according to their wishes. Readers can comment on according to the choice of publisher. Comments are an important dynamic of blog culture; in this way, an interaction is created between the writer and readers [URL4]. Wiki is a web site which allows the visitors, without requiring membership, to add some contents, edit, delete and modify. Discussions about available data and changing these data can be made and these discussions and changes can be stored (Karaman et al, 2008).

Mobile phones are one of the most important communication tools as well. They are the most important technological products which young people use very commonly recent years because they have voice, text, and video communication support and can connect to the internet.

Today, e-mail, chat software, social networks, blogs, wikis, and forum correspondence and the mobile phones are the primary preference of young people for written communication. The most notable feature in these types of correspondence is the flexibility and irregularity of the written language. Yet, a regular and formal language is used in the texts such as letters, petitions, and reports in daily life. That mainly the electronic media correspondence is used reflects as a complicated Turkish language on the daily correspondence of young people. This reflection has become a serious concern as it is seen in the example of a college student who has written his surname 'Kahramanoğlu' as 'K.oğlu'.

Objective and Importance of the Study

Language is an integral part of national culture and an important tool to transfer the national culture to the next generations. Teachers who teach basic language skills can be more effective guides to make students meet cultural products and understand to improve these (Oğuz, 2010, Coşkun transmitting from 2009). Considering this fact, this study was realized with the aim of determining the writing habit of teacher candidates and the effect of internet and mobile phones on their writing habits. It is thought that this kind of academic studies are very important in order to determine the negativity of the topic and take necessary precautions.

Method

Research Model

In this study, descriptive scanning model was used to determine the effect of the internet and mobile phones on the writing habits of the teacher candidates.

Population and Sample

The sample of the study includes the students who study in the various departments of Education Faculty of Trakya University in 2010-2011 academic year. 405 students in total participated in the study voluntarily. 284 of the students are females (70.12%) while the 117 of them are males (28.89%). 4 of the students who participated in the survey did not specify gender. Table 1 shows the distribution of the students according to gender.

Table 1. The distribution of the students participated in the survey according to gender.

	f	%
Female	284	70.12
Male	117	28.89
Unanswered	4	0.99
n	405	

Data Collection Tools

A survey improved by the researcher including 25 questions was used as a data collection tool. The first eight questions of these have been prepared in order to learn the demographic information of the student. The others are related to determining the habits of using internet and mobile phones of the students and also revealing the reflections of these habits regarding the accurate use of Turkish language.

Findings and Interpretation

When the answers students gave to the survey were analyzed in terms of gender, the following findings were obtained:

76.41% of the female students answered 'yes' to the question "Do you have your own computer?" while 69.23% of the males students answered the same question as 'yes'. Most of the students participated in the survey have computers. This finding indicates both students are willing to have computer and having a computer is not a luxury but a need. At the same time it can be said that the purchase conditions of computers are getting easier.

70.25% of the female students answered 'yes' to the question "Do you have internet connection (where you live such as home, dormitory, boarding-houses, etc.)?" while the rate of the male students answering as 'yes' is 61.61% for the same question. These values show that internet connection has been spread over a large area and available in many environments. Additionally, since the dormitories and boarding-houses serve on this issue, it is easy in terms of the access to the internet of the students. Regarding this finding, we can reach a conclusion that students use the internet in a multi-purpose way.

Almost all teacher candidates (99.65% of the girls and 99.13% of the boys) have their own mobile phones. This rate indicates that young people use mobile phones for both verbal and written communication quite often. No relation was found between the gender of the students and the time they devoted on average a day on the instant messaging (chat). The question "How many hours a day do you devote to the instant messaging (chat) on the internet?" was answered by the 39.55% of students as 'less than 1 hour', 25.94% as 'between 1-2 hours', 7.81% as 'between 3-4 hours', 2.27% as '5 hours or over five hours'. 24.43% of the students stated that they never devoted their time to instant messaging (chat) on the internet (Table.2). According to these findings, most of the students participated in the survey don't prefer to use internet with the aim of instant messaging (chat).

Table 2. The average time students devoted to instant messaging (chat) per day according to sex

n= 405	Female		Male		Total	
	f	f%	f	f%	f	f%

8.91	5	-	25	2

There is a relationship between the variable of gender and the use of word abbreviations in the instant messaging (chat) correspondence on the internet (χ^2:5.24 df:1, p<.05). According to the answers to the question "Do you use word abbreviations in your instant messaging (chat) correspondence?", 81.14% of the female students, 70.69% of the male students use abbreviations in instant messaging (chat) correspondence (Table 3). Female students use abbreviations in their correspondence more than male students.

When asked whether they use a word or words abbreviations from different languages in their instant messaging (chat), 90.42% of the female students and 85.44% of the male students answered as 'no'. There is no relation between their genders and the time they devoted on average a day to e-mail processing. When we analyze the answers to the question "How many hours do you devote to reading-writing-answering e-mail a day on average?", 66.08% the students spend less than 1 hour, 9.87% of them spend between 1-2 hours, 1.27% spend 3-4 hours, 0.25% spend 5 hours or more than 5 hours. 22.53% of the students never spend time on e-mail

processing (Table 4). According to these findings, many of the students participating in the survey do not prefer e-mail as a communication tool.

Table 4. Average time the students devoted to e-mail processing a day according to sex

Chi-square	df	p	%fe<5	fe=0
4.02	4	-	40	0

There is a relation between the gender of the students and the use of word abbreviations in e-mail correspondence (χ^2:11.38 df:1, p<.01). 57.30% of the female students and 38.39% of the male students answered as 'yes' to the question "Do you use word abbreviations in your e-mail correspondence?" (Table 5).

Table 5. The circumstance of students' using word abbreviations in their e-mail correspondence according to sex

Chi-square	df	p	fe<5%	fe=0
11.38	1	p<.01	0	0

There isn't a relationship between the gender and the reasons why students use word abbreviations in their e-mail correspondence. Students were asked "What are the reasons to use word abbreviations in your e-mail correspondence?". According to the answers given to the question, 'saving time' is one of the primary reasons (44.13% of female students and 37.78% of male students).The answers 'Even though I don't write the word in its complete form, it is understood' (28.49% of female students and 31.11% of male students) and 'it is tiring to write it in its complete form' (25.14% of female students and 22.22% of male students) are among the other reasons (Table 6). The reasons of using abbreviations of male and female students in their e-mail correspondence and the reasons of using abbreviations in instant messaging (chat) are the same. While it is important to the female students to express many more ideas in the shorter time, the situation is different to the male students. Male students use Turkish language more accurate than female students in terms of using fewer abbreviated

words in their instant messaging (chat) in the internet correspondence. The reason that everyone understands even though 'I do not write the complete word' means that these students, at the same time, are accustomed to understanding these abbreviations.

Table 6. The reasons why students use word abbreviations in e-mail correspondence according to sex

	Female		Male		Total

There is a relationship between the gender of the students and their paying attention to obeying the punctuation and spelling rules while they are writing e-mail (χ^2:4.01 df:1, p<.05). 56.63% of the female students and 67.54% of the male students answered the question "Do you pay attention to using punctuation marks and obeying spelling rules while writing e-mail?" as 'yes' (Table 7). Female students pay less attention to using punctuation marks and obeying spelling rules when we compare them to the male students. It can be said that male students are more sensitive to this issue.

Table 7. The circumstance of students' using punctuation marks and obeying spelling rules in e-mail correspondence according to sex

4.018 1 p<.05 0 0						

When students were asked whether they used different word or word abbreviations from another language in their e-mail correspondence, 85.61% of the female students and 81.08% of the male students answered as 'no'. There is a relationship between the gender of the students and the number of average short text messages they sent daily (χ^2:16.66 df:4, p<.01). When the answers given to the question "How many text messages do you send per day on average?" were assessed in terms of gender, while 9.22% of the female students and 22.52% of the male students send 1-2 short text messages per day on average, 67.38% of the female students, 61.26% of the male students send 9 or more than 9 short text messages per day on average (Table 8). Female students send more short text messages than male students for communication. Students prefer to text messages instead of e-mail for communication. To obtain this result, the affordability mobile phones can be effective. In addition, reasonable call and text message packages offered by the mobile phone companies especially for the students are one of the important factors for the students to prefer communication via mobile phones. Sending 9 or more than 9 text messages per day supports this result. Information and Communication Technologies, according to the report of Market Findings of The Electronic Communications Sector in Turkey related to the fourth quarter of 2011, the number of the sent text messages via mobile phones in Turkey is described as 161,4 billion in 2011. In 2011, Turkey was ranked as the first among the European countries with an average of 212 short text messages per person in 2011 [URL5]. Taking this finding into consideration again, it can be said that female students are more enthusiastic in written communication and allocate more time.

Table 8. The average number of the short text messages sent per day by the students according to sex

n= 405	Female		Male		Total	
	f	f%	f	f%	f	f%
1-2	2	9.22	25	22.52	51	12.98
3-4	27	9.57	12	10.81	39	9.92
5-6	20	7.09	4	3.60	24	6.11
7-8	19	6.74	2	1.80	21	5.34
9 and over 9	190	67.38	68	61.26	258	65.65

Chi-square	df	p	fe<5%	fe=0		
16.66	4	p<.01	0	0		

There is a relation between the gender of the students and using word abbreviations in short text messages they sent (χ^2:9.78 df:1, p<.01). When students were asked the question "Do you use word abbreviations while writing short text messages?", 82.44% of the female students and 67.89% of the male students stated that they used word abbreviations in short text messages (Table 9). Female students used more word abbreviations in short text messages than the male students.

Table 9. The circumstance of using word abbreviations in short text messages according to sex

n= 405	Female		Male		Total	
	f	f%	f	f%	f	f%

Chi-square	df	p	fe<5%	fe=0
9.78	1	p<.01	0	0

There is no relationship between the gender of the students and the reasons why they use word abbreviations in short text messages. While 39.07% of the students use word abbreviations to save time, 22.95% of the students stated that writing entire word is hard for them (Table 10).

Table 10. The reasons why students use word abbreviations in short text messages according to sex

	Female		Male		Total	
n= 405	f	f%	f	f%	f	f%
To save time	100	39.68	34	37.36	134	39.07
İt is hard to write entire word	70	27.78	19	20.88	89	25.95
Even though I don't write complete form, it is understood	58	23.02	23	25.28	81	23.61
For everyone writes in this way	3	1.19	1	1.10	4	1.17
Other	21	8.33	14	15.39	35	10.20
Total	252	73.47	91	26.53	343	84.69

Chi-square	df	p	fe<5 %	fe=0
4.72	4	-	20	0

89.06% of the female students and 86.36% of the male students stated that they didn't use words or abbreviations that belong to a different language in their short text messages. The majority of the students participated in the survey don't use words or abbreviations from another language in their e-mail, instant messaging (chat) and short text message correspondence. The words used most commonly by the students in their e-mail, instant messaging (chat) and short text messages and their equivalents are presented in the Table 11 considering the frequency of use.

Table 11. Abbreviations most commonly used in the electronic correspondence and their equivalents.

ABBREVIATIONS	EQUIVALENT
nbr (what's up?)	ne haber
slm (hello)	selam
sa (hello)	selamun aleykum
mrb (hi; hello)	merhaba
kib (take care)	kendine iyi bak
iim (i'm fine.)	iyiyim
tmm (okay)	tamam
inş (i hope..)	inşallah
eet (yes)	evet
hg (welcome)	hoşgeldin
hb (thank you: as an answer to 'welcome')	hoşbuldum
cnm (dear,honey,etc.)	canım
gzl (good, fine,nice,etc)	güzel
npyn (what are you doing?/how are you doing?)	ne yapıyorsun
aeo (god bless you)	Allah'a emanet ol
msj (message)	mesaj
bb (bye bye/good bye)	bay bay
öpt (kiss you/kisses)	öptüm
glyrm (i'm coming)	geliyorum
grşrz (see you)	görüşürüz
nie (why?)	niye
hyr (no)	hayır
aro (may god bless you/thank you ,etc.)	Allah razı olsun

dbu (do not forget me in your prayers/ pray for me)	duanda beni unutma

The most attention-grabbing thing in the Turkish abbreviations written above is that words are written omitting the vowels especially all or some of the letters. Only the initial letter of some words was used in several abbreviations. Since the students have frequently used this kind of abbreviations for a long time, they can easily understand and analyze these abbreviations. For example, none of the students recognizes the abbreviation 'hyr'(no) as 'hıyar'(cucumber). Because previous experiences allow this abbreviation to be recognized as 'hayır'(no). Regarding the distinction of being organizational of perception (by Gestalt), the stimulants which affect sensory organs are perceived in meaningful relations but not one by one. When there are gaps between the stimulants affecting sensory organs, these gaps are completed. Thus, a figure or an object which has a clear meaning is perceived instead of a range of meaningless stimulants. The experiences a person had in the past and his/her learning process play an important role in perception. Considering this reality, it is possible to explain how easily young people perceive the abbreviations in electronic correspondence. Most of the students participated in the survey don't use abbreviations from another language in their e-mail, instant messaging (chat) and short text message correspondence. The most widely used abbreviations of words or phrases which belong to different languages and their equivalents in electronic media correspondence are: instead of "see" they use "c", instead of "for" they use "4", instead of "to" they use "2", instead of "you" they use "u".

Conclusion and Suggestions

When considering each of the students participated in the study is a teacher candidate, the difference between their writing habits and how it should be is easily seen. Taking the writing habits of the students in general into consideration, most of them abbreviate the Turkish words and very few of these abbreviations belong to a different language which is English in the correspondence.

Regarding using punctuation marks and obeying spelling rules in the electronic media correspondence, the desired situation is not available. While female teacher candidates participated in the study use abbreviations in the electronic media correspondence mostly with the aim of saving time, male students use abbreviations since the people reading them can understand easily. The remarkable findings of the research are that male students use abbreviations less while writing e-mail compared to the female students and show more care to use punctuation marks than female students.

Using abbreviations, avoiding the discrimination of small/large letters, forming texts ignoring punctuation rules are the major problems for teachers and teacher candidates who are the most important people should use Turkish language accurately. Since the concern of handling electronic media correspondence to real life correspondence has arisen, it has become a serious necessity to educate teacher candidates starting from their early education years about using Turkish language according to its rules. During this training, some competitions can be held to encourage students with the aim of creating awareness about the richness and beauty of Turkish language and some award-winning projects can be given to them. It will be convenient to add a criterion like "using Turkish language accurately" among the assessment criteria for the homework, project, and presentation given to students.

It is known that education continues outside the school walls in the family environment. For this reason, Turkish Education and use of Turkish language activities should be arranged for the families. Furthermore, families should be asked to support their children about the effective use of Turkish language in electronic media correspondence.

Today there are 11.5 billion web pages and more than 2 billion Turkish internet sites in the world [URL6]. The difference between the numbers is easily seen. In this context, international legal regulations can be done to increase web sites having Turkish content.

Young people and children use mobile phones very often for the written communication. Considering this reality, it has become easier to write text messages since the newly produced mobile phones are loaded with T9 predictive text messaging software. With T9 software, instead of pressing buttons repeatedly to write a single word, pressing only one button, many words will be listed to choose the necessary one. In fact in terms of learning correct writing of the words and not being able to use abbreviations, it is a good application, but, since most of the words installed in the software are English and this can create problems. It can be possible to teach Turkish words to young generation that uses mobile phones intensively and make them use properly via this kind of software. English T9 software can be uninstall from the mobile phones offered for sale in the boundaries of the country, and it is possible to install a program including only Turkish words.

It is an important issue that Turkish language which is the constant part of culture should be used accurate and effective by the teachers who have an important role to transfer Turkish culture to new generations. The most important task of the teachers is to be a good role-model in terms of using Turkish language not only in words but also in performance.

THE IDENTIFICATION OF GIFTED AND TALENTED STUDENTS

Siti Fatimah Mohd Yassin[a][84], Noriah Mohd Ishak[a], Melor Mohd Yunus[a], Rosadah Abd Majid[b]

[a]Pusat PERMATApintar Negara, Universiti Kebangsaan Malayia

[b]Faculty of Education, Universiti Kebangsaan Malaysia

Abstract

The PERMATApintar High School at Universiti Kebangsaan Malaysia (UKM) is the first fully residential school for gifted and talented students in Malaysia. An action research approach has been employed to develop and implement the identification and selection system of gifted students for the school. The participants are 487 Malaysian students aged 15-year-old. After two years, a stable blended assessment system is formulated which consist of three screening approaches: UKM1 and UKM2 online intelligence tests, and UKM3 comprehensive assessment. This system can be enhanced to develop electronic portfolio for planning, monitoring and assessing the gifted and talented students for the enrichment and intervention programs.

Keywords: gifted; talented; identifying gifted and talented; talent search

Introduction

The existence of the gifted or superior individual is undisputable. The science of identifying them has been debated continuously. According to Goodhew (2009, pg.8) "Identifying potentially gifted and talented (G&T) students has never been an exact science", and it cannot be captured by a single number that measures only one domain of the giftedness. However, there are many strategies and policies of identifying gifted and talented students (Brown et al., 2005; Putallaz, Baldwin, & Selph, 2005; Rigby, 2005). A research conducted by Brown et al. (2005) has shown that strategies for identifying G&T students should include the followings: individual expression criteria, ongoing assessment, multiple criteria for identification and consideration of contextual factors. Concomitantly, identification program conducted on gifted and talented students should take a multidimensional approach (Davis, Rimm, & Siegle, 2011) and not restricted to only academic performance.

The various talent search programs established in many countries have used different testing instrument and procedures. Davis et al. (2011) and Percell and Eckert (2006) suggested that effective procedures to identify gifted students must also involve the use of standardized tests that have been researched extensively. However, Callahan, Tomlinson, Hunsaker, Bland, and Moon (1995) and Han and Marvin (2000) suggested that for a successful identification process, it must take into consideration the following recommendations:

clear definition of giftedness,

avoid using a single cut-off score,

consider the multiple manifestations of giftedness,

use separate tools/instruments to assess the different areas of intelligence,

be aware that giftedness may come in different forms,

base identification on students' educational needs and not on program quotas, numbers or slots, and

E-mail address: sfmy @ukm.my / sitifatimahmy@gmail.com

repeat assessment over time to identify additional gifted students.

Several researches have shown that gifted students can be found among students who do not perform well in examination (Davis et al., 2011; Goodhew, 2009). These students are grouped under a category known as underachiever. If not identified, they will be a lost to the society and the country which can gain benefits from their existing potentials. Underachievement is defined as a discrepancy between the child's school or academic performance and some index of his or her actual ability, such as intelligence (Davis et al., 2011). As such, by eliminating the non-performing students, the school will not be able to identify gifted students, and thus unable to provide the necessary learning environment that can optimize their full potentials.

Gifted and Talented Education in Malaysia

The Ministry of Education (MoE) Malaysian states that its philosophy is to develop every student's potential to the fullest. "Education in Malaysia is an on-going effort towards further developing the potential of individuals in a holistic and integrated manner, so as to produce individuals who are intellectually, spiritually, emotionally and physically balanced and harmonious, based on a firm belief in and devotion to God" (Educational Planning and Research Division, 2008, pg. xi). Though the system has put considerable effort to educate special children with disabilities, it has not fully acknowledged the needs of gifted students. These students need challenges that match their abilities, in order to illuminate their full potential. The field of gifted and talented education is not well spelt out in the Malaysian system of education.

There had been several attempts by the MoE to provide educational programs that cater for high achiever students within the national school system. It began with express class program in 1962 until 1970 (Noriah, Rosadah, & Siti Fatimah, 2009). Students who qualified to enroll in this program had to show excellent educational performance. This program was not so much of an acceleration program, but it was indeed grade skipping. Students skipped one year of learning and joined their seniors who were one year ahead. This program was in place for a while before it was put to a stop for some unknown reason. In 1996, the MoE initiated another grade skipping program. Students in year two (8 years old) had to sit for a competency test called Level One Evaluation (*Penilaian Tahap Satu* – PTS). Those who passed PTS at a certain level of competency had been offered to skip year three and proceed to year four. Like the express class program, PTS was abolished in 2002 (Noriah, Rosadah, & Siti Fatimah, 2009). One of the set back was that parents took the effort to coach their children to answer questions similar to PTS. They hoped that their children to score in the real PTS. While conducting those two educational programs to serve the high ability students, the ministry had not mentioned that those were actually an approach of gifted education program.

PERMATApintar High School is the first fully residential school for gifted students aged 16 to 17 year-old. It has been established since 2011. The school prepares students with an early experience of studying at higher education. It utilizes the national curriculum for upper secondary as a basis, several first year university courses and international curriculum to challenge students' intellectual minds. The number of students in the class is not more than 20. The students have to sit for pre-test for each subject in a class. They are grouped for the implementation of differentiated instruction. The curriculum is organized using concept-based approach to enable students to see the relationship of the content knowledge among various subjects and real life situation. The instructors have to prepare lesson and materials to cater the needs of each group. The National Philosophy of Education and National Principles of Malaysia underpin the curriculum to produce the holistic, creative and innovative academic talented students. The school adopts the Development Model for Gifted and Talented (DMGT) by Gagné (2010). It is one of the most comprehensive model that explains the transformation of giftedness to talented. In this model, the domain of giftedness (natural abilities) is categorized as Intellectual, Creative, Social, Perceptual, Muscular and Motor Control. The school provides students with a conducive environment and intrapersonal activities as a catalyst in the developmental process. Every corner of area in the school can be a place for teaching and learning process.

This paper presents a research on how the gifted students for this school are being identified and selected. The aim of the research is to develop and implement the identification and selection of gifted students for the schools. At the moment, the intellectual, creative and social (socio-affective) domains are being considered in the selection process of gifted students.

Methodology

The setting of the study is the PERMATApintar school holiday camp for students aged nine to 15 year-old. It is a three weeks program which has the affiliation with the Johns Hopkins University Center for Talented Youth, Baltimore, United States of America. It has been conducted since 2009. The writers are the active participants in this research involved in the planning, developing and implementing of the identification and selection system. The three researchers are the administrators of Pusat PERMATApintar Negara (PPpN) which is the National Center for Gifted Education at UKM. One of the researchers is from Faculty of Education, UKM who was an administrator at the center in 2009-2010. 487 students aged 15 year-old from various type of schools all over Malaysia have participated in this two years research: 2010 (n=312) and 2011(n=175). An action research approach has been employed to get the in-depth understanding and establishment of the identification and selection system. The data is collected and analyzed based on researchers' reflections, observation, online intelligence tests, and comprehensive assessment.

Findings and Discussion

The Demographic of the Students

The participants were 15 year old students who enrolled in PERMATApintar school holiday camp for three weeks from November until December in 2010 and 2011. They were identified and selected to the camp based on the standardized UKM1 and UKM2 online intelligence tests (Table 1). Most of them have taken UKM1 and UKM2 test every year and attended the camp for two or three times since 2009. Most of the students have increased their scores in UKM2 test. The number of students who sat for UKM1 in 2010 was higher than 2011. This was due to the problem of Internet and ICT facility in schools. Thus, the school administrators and teachers select only high academic achievers to sit for the UKM1 online test with assumption that they could be gifted students in school. Within 15% of the school population could be gifted and talented (Piirto, 1999; Renzulli et al., 2002). Some schools arrange almost 100% of population to sit for UKM1 test.

Giftedness is seen as the possession and use of natural abilities (non-systematically trained) in at least one ability domain to a degree that places an individual at least among the top 10% of same-age peers (Gagné, 2010). Allowing top 10% instead of 5% as suggested will give the school a wider range of gifted students. It is suggested within 10% mildly gifted, the students can be categorized as moderate gifted (top 1%), highly (top 1:1,000), exceptionally (top 1:10,000), and extremely (top 1:100,000) (Bélenger & Gagné, 2006; Gagné, 2010). In Malaysian context, the categorized of giftedness is depended on the number of students who sit for UKM1. Therefore, the number of students who sit for the UKM2 test and UKM3 comprehensive assessment and the selected students to enroll for gifted school are still below 10% of same-age peers. In 2010, two of the students could be the exceptionally gifted students and 19 highly gifted students. In 2011, because the number of students who took the UKM1 was lower than in 2010, only four students could be highly gifted. There are several gifted underachievers in this school. They did not perform well in the standardized academic examination - Lower Secondary School Assessment (*Penilaian Menengah Rendah*) before entering the school. Some students have not performed well in the academic subjects after entering the school, but they do well in other fields such as robotic and arts. They put the concentration and interest on non-academic rather than academic activities.

Table 1. The number of students for each screening process and the enrolment of the school

Year	Screening Process	n	%
	UKM1 online test	21,330	
	UKM2 online test	396	1.86
2010	UKM3 comprehensive assessment	312	1.46
	Selected students	139	0.65
	Enrolment	116	0.54
	UKM1 online test	4607	
	UKM2 online test	366	7.94
2011	UKM3 comprehensive assessment	175	3.80
	Selected students	152	3.30
	Enrolment	125	2.71

As shown in Table 2, the students were from various type of schools and majority of them were from regular schools. Malaysia is a multiracial country. However, the selection to the camp and school is not based on the quota for each ethnic, but the results have shown that the number of students for each ethnic proportionate to the Malaysian population. Based on the final evaluation reports for each student prepared by the instructors of the school holiday camp, they have learned fast when learning about new advanced knowledge and skills. The students have actively engaged in their learning process as well in sosial aspect. They like to explore more by doing activities in group. They have enjoyed learning in this new environment that they never get in their schools.

Table 2. Demographics of the students who sit for UKM3 comprehensive assessment

	2010 (N=312)		2011 (N=175)	
	N	%	N	%

Private School	0	0.0	1	0.6

The Identification and Selection Process

Three standardized assessment are used to measure the following group of natural abilities: intellectual, creativity and socio-affective. The standardized tests are useful especially in identifying students with exceptional academic potential who are underrepresented in gifted and talented program (McBee, 2010; Peters & Gentry, 2010). It provides consistency in the selection process. In Malaysian context, the identifying and selecting of intellectual gifted students for PERMATApintar High School, it uses UKM1 and UKM2 online intelligence tests and UKM3 comprehensive assessment.

The first screening process is using the UKM1 online intelligence test that has been used since 2009. It is captured the interest and potential students from different families background and school types throughout the country. The test is used to assess a nonverbal and verbal abilities. The students can choose preferred language either Malay or English. It is an open test, but some schools do the test in controlled environment. The assumption is that most of the students are honest, responsible and well-disciplined when they register and sit for the test. However, there is a filtering system to delete the false records before the data being calculated for the selection to the second screening test. The test is opened for three months every year.

The second screening test is the UKM2 online intelligence test. It measures perceptual reasoning and organization, attention, concentration and working memory as well as the speed of processing. It has 15 modules. The test is in two languages: Malay and English, thus providing enough language flexibility for all students to response to the items (Noriah, Rosadah & Siti Fatimah, 2009). The students sit for the test at the selected UKM2 test centers throughout the country. It is a controlled environment test and there are invigilators to monitor the process. There is an online system to monitor the test virtually by PERMATApintar's administrator. Since, this is an online test, the test center schools have to provide a functional computer laboratory that can access to the Internet with high speed bandwidth. The test is done in batches of 15 to 20 students for each session to avoid congested of data traffic flow at the center.

The third screening approach uses the UKM3 comprehensive assessment. It consists of pencil-and-paper test for mathematics, science and languages competencies tests; Malaysian Emotional Quotient Inventory (MEQI); Torrance Tests of Creative Thinking; students' project presentation; observation in the class, and final evaluation report for academic performance during three weeks school holiday camp. The school emphasizes on the development of academic talent in mathematics and science. Therefore, the students take the mathematics and science competencies tests. The tests consist of extended questions that suitable for the gifted students. The students do not need to prepare themselves for the test because the schools search for natural abilities. The tests measure how they can solve problem using their existing knowledge and skills. The student's creative scientific writing is assessed for the Malay and English Language competencies tests.

The Torrance Tests of Creative Thinking is used to uncover the creative abilities of the students. It consists of three picture-based exercises to assess five mental characteristics: fluency, elaboration, originality, resistance to premature closure and abstractness of titles. It can also uncover the following creative strengths: emotional expressiveness, storytelling articulateness, movement or action, expressiveness of titles, synthesis of incomplete figures, synthesis of lines or circles, internal visualization, extending or breaking boundaries, humor, richness of imagery, colorfulness of imagery, fantasy and unusual visualization (Almeida, Prieto, Ferrando, Oliveira, & Ferrándiz, 2008). The picture-based exercises reduce the culture bias of the items. In summary, the Torrance Test measures Fluency, Flexibility and Originality.

Malaysian Emotional Quotient Inventory (MEQI) is used to uncover the socio-affective abilities of the students. The inventory measures among others perceptiveness, empathy, tact, leadership, communication and persuasion. The inventory has 11 sections with reliability values ranging from 0.91 to 0.97. The inventory has 182 items that was developed based on the Malaysian context. Although MEQI is an on-line test, it also has the paper-and-pencil version that can be distributed to the students. MEQI will produce an index of emotional intelligence of the individual student.

During the camp, the students have to produce a group project and present individually their contributions. The students are being assessed based on the rubric for presentation and cooperation. The inter-raters are the PERMATApintar's administrators and course instructors in school holiday camp. The instructors rate the sensory-motor abilities (strength, endurance, reflexes and coordination) of the students using the behavioral observation form in spreadsheet format. The teaching assistants record the daily assessment. Later, the instructors analyze the data to produce a weekly assessment and final evaluation report for each student. The instructors nominate the students to be candidates for the school.

The mean, standard deviation and percentiles for each component of UKM3 comprehensive assessment are calculated. The percentiles are used to determine the band score from 1, 2, 3 to 4 for each component. The

overall scores are calculated and sorted to rank the students. The enrollment is based on merit. The school is for science and mathematics stream. The high ability students can study and sit for the international examinations. Therefore, the band for Mathematics, Science and English competencies tests are the major aspects in selecting the students. However, other components of UKM3 comprehensive assessment are also being triangulated for the final selection.

Conclusion

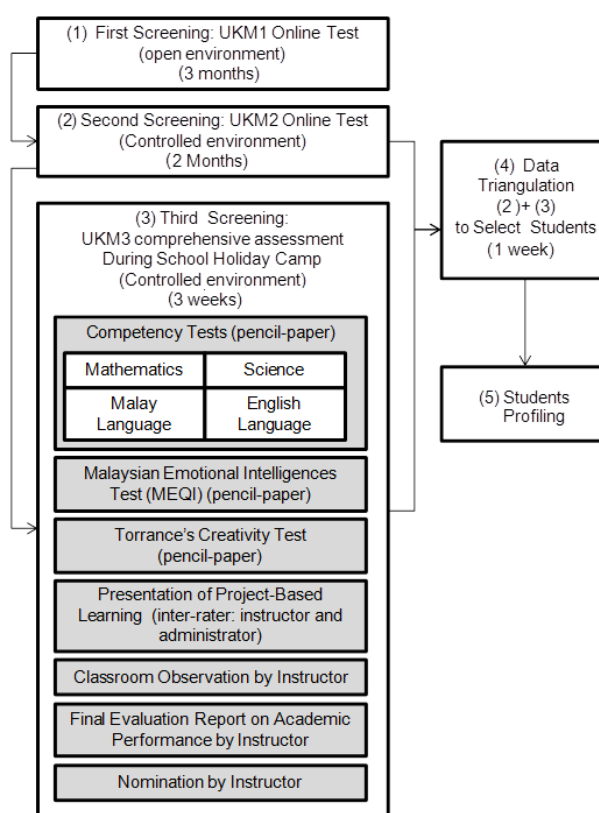
This two years study has established the blended assessment of the identification and selection system for gifted students (Fig 1). The information yielded from this system can be used for developing electronic portfolio system for the gifted and talented students. It will help the program to plan, monitor and assess students' progress for the intervention or enrichment programs to overcome their weaknesses and to strengthen their abilities.


Fig. 1. The Model of Blended Assessment of Gifted and Talented Identification and Selection System

In the future, the analysis part in UKM3 comprehensive assessment can be fully computerized as a decision support system. It can also be integrated to electronic portfolio system. This system can help administrators, instructors and counselors to plan suitable intervention and enrichment programs; monitor students progress in academic and non-academic activities; and assess students' performance formatively in many aspects in school.

THE IMAGINARY ABOUT THE SCHOOL AND THE POSSIBILITIES OF AN EQUALITARIAN SCHOOL: A STUDY ON THE BRAZILIAN STATE SCHOOLS

Adam,J. M..; Salles, L.M.F[85]

Universidade Estadual Paulista-UNESP/Rio Claro/São Paulo

Abstract

The main objective of the article is to reflect on the imaginary that the teachers of two public schools have of their students and the school they work in and the ideal of an inclusive and democratic school. In this article, we reflect on the image that the teachers of two public schools in the city of Rio Claro, São Paulo State, Brazil, have of their students and their school as an institution. We use the studies of imaginary sociology as a theoretic reference base. Castoriadis (1986); Taylor (2006); Legros et al (2007) and Baczo (1984) are the referenced authors of this article.

Keywords:imaginary and school; equalitarian school; youth and school; education and democracy

Introduction

In this article, we reflect on the image that the teachers of two public schools in the city of Rio Claro, São Paulo State, Brazil, have of their students and their school as an institution. We use the studies of imaginary sociology as a theoretic reference base.   Castoriadis (1986); Taylor (2006); Legros et al (2007) and Baczo (1984) are the referenced authors of this article.

The main objective of the article is to reflect on the imaginary that the teachers of two public schools have of their students and the school they work in and the ideal of an inclusive and democratic school.

The loss of faith in the legitimacy of the school by poor youths in the city outskirts, indicate a resistance to school derived from a feeling that the knowledge obtained from school and the diploma itself are not enough to allow social ascension. Educators, such as Charlot (2002), Willis (1988), Molpeceres, Lucas and Pons (2000) point out that the loss of faith in the school as a source of relevant knowledge and as an instrument for social mobility leads the school authorities to lose their legitimacy, bringing about a feeling of a lack of sense and of arbitrary imposition of the school norms and activities. Bourdieu (2001) also points to a crisis in the school system that, at the same time as it allows the new echelons of the population to have access to schools, in contradiction, it maintains the mechanisms of social exclusion.

The analytical referential provided by the sociology of the imaginary is a fundamental contribution as a methodological reference in the study of the school institution, as we consider that the concept of the imaginary goes beyond the intellectual constructions that can be formulated by the subjects, manifesting itself concretely in the images, history and legends created by them (Legros,2007). In this manner, the imaginary is as much present in the structure and in the daily acts as it is in the values, principles and culture of each social group.

Taylor (2006) distinguishes the social imaginary and social theory, firstly because he considers the imaginary as being the manner in which people "imagine" their social surroundings presented through culture; secondly, as he considers that the theory is limited to a small minority, while the imaginary is a collective conception of vast groups of people, if not by the society as a whole; and finally, he considers that the social imaginary is what allows for common practices and their legitimacy, giving sense to these actions as a group. According to Taylor,

[85] Corresponding author. Tel.: +51-19-35264259; fax: +51-19-33740302.
 E-mail address: joyce@rc.unesp.br

the social imaginary is not only an ideology, but it defines concepts and practices that characterize the different historical, economic and social contexts. This author further elucidates that modernity, in its origin as in actuality, with its multiple modernisms, should be understood from the different social imaginaries constructed.

Castoriadis (1986) is another author who works with the concept of the social imaginary and its importance for the understanding of institutions. He tells about the significance of the imaginary in the constitution of institutions, joining the imaginary and functionality as complementary elements in this process. He states that the institution is a symbolic network, socially sanctioned, where a functional component and an imaginary component are combined in varied proportions and relations. (p.159). These statements by Castoriadis reaffirm the role played by the imaginary in the constitution of society's structures, as from human action.

Synthesizing the ideas of these two authors we can come to the conclusion that they emphasize the role of the imaginaries created in the different economic and social contexts, as guides to the design of the social structures, as well as truths, values and actions that are legitimized by the individual. In this manner, at the same time that the imaginary guides the format of the institutions, it is built by the subjects in their day-to-day.

Adopting this referential to analyze the school, we consider that the imaginary about the school construed by its participants is an important element for the understanding of the day-to-day actions, the structures, power relationships established and the conflicts arising from these interactions. In this manner, the relationships that are processed in the school's day-to-day are practices established and legitimated by the imaginary minimally shared and negotiated among its members, that are manifested in daily acts.

Therefore we consider that the relations in the school must be understood in the larger dimension of the individual not only as an individual conscience, but also as a social being that makes and remakes concepts, impressions and feelings based on the relationship with the world he lives in and experiences inside as well as outside the institution.

Social Imaginary and the School in the Current Context: the backing for the Study of school violence

Getting back to the idea of the imaginary of each era as an important element in the constitution of the actions practiced by the different social sectors, we reflect here on some of the characteristics that constitute to imaginary of the current economic, political and social context.

Taylor (2006) brings up the issue that what we imagine can be something new, constructive, something that opens up new possibilities, but it also can be pure fiction, maybe dangerously false. He questions the possibility of the distortion of the imaginary in the sense that this may hide or conceal certain crucial realities. To this doubt, he answers that clearly yes, and he gives as an example our self image as equal citizens in a democratic State, ignoring the exclusion and inequality in our society. His argument is that if we understand "equality" as something more than a legitimizing principle, or in other words, if we imagine this as a totally effective reality, what we have done is a distortion of reality. It is looking the other way so as not to see the various excluded or dispossessed groups or to imagine that they are the only ones responsible for their situation (p.211).

The consequence of social inequality to the production of social violence and its reflection on the life of the young people has been studied by many researchers all over the world. In Brazil, Zaluar, in various articles (2001, 1994, 1998 and 1999), points out the institutional factor in Brazil's inequality, and its consequences on the vulnerability of the young poor. Citing Dellasoppa et al (1999), he emphasizes that the authors consider that the model of social inequality in the country as what best explains the "causes" of violence in Brazil.

In this line of thought, when we analyze the school imagined as an equalitarian and fair institution, we see that we fall into the same distortion of reality described by Taylor, and well expressed by Dubet (2004) and Martucelli (2001). These authors raise questions that lead us to reflect on the role of the school and the imaginary that surrounds the current society which are important for discussions on the production and reproduction of violence in it.

On discussing what a fair school would be, Dubet (2004, p.540) poses the following questions:

- Should it be purely meritocratic, with a fair school competition between socially and individually different students?

- Should it be concerned mainly with the integration of all the students into society and with them being able to use their education?

- Should it try to make sure that the school inequalities do not have too much of a consequence on the social inequalities?

Questions such as these put into check the idea of the model of equality of meritocratic opportunities that assumes that it is fair to offer totally equal and objective schooling, ignoring the social inequalities of the students. This is an issue existent all over the world, Dubet points out, in different countries research show that that the schools that are attended by less privileged students, in general, show similar problems, such as: there are more obstacles for the poorer students, the teaching teams are less stable in difficult neighborhoods, the teacher expectations are less favorable to the less privileged families who seem to be more absent and less informed in guidance meetings, etc.

In this vein, Martucelli raises a thought that contributes to the discussion, which is the expectation that involves the school in terms of its responsibility to the forming of ethical and moral concepts. He states that in modern times, the school, further to its functions of transmitting knowledge and social selection, has been associated with a double process: on the one hand, it should permit the integration of the individuals in their society, guaranteeing the continuity of social life. On the other hand, it is guided by an ideal figure of the individual, a collective representation to which all adhere in one way or the other. (p.258). However, one comes to the conclusion that what has concretely happened is the development of an empty individualism, more and more focused on individual techniques and skills and less and less sure of their ideas.

As a consequence of this process, Martucelli points out the utilitarianism that permeates the education offered by the school system, transforming its inside actions into mere processes for the preservation of the life of the organization.

As a consequence, the actions that are carried out will be restricted merely to the preservation of the school as an organization, making the teachers and the administration abdicate their own tasks of educators, as those who provide the universal values of the human being, further to technical and scientific knowledge.

The imaginary of a school in these molds is that of a school for an ideal individual who fits in or who should perfectly fit into the idealized organizational model as well as into an equalitarian society that is based on the principle that all have the same opportunity and the same economic and social origin. For the teachers, the students fit neither into an imagined equalitarian school organization, nor into the image of the idealized student. This imaginary enters into shock with reality, provoking conflicts that not only put the students into opposition with the school, but also the teachers with the school.

In Taylor's thoughts on the social imaginary, he points out the inseparability of the social imaginary from the time and space in which it is created, in this way, we call attention to aspects of the social imaginary from a perspective that Sennett (2006) calls the "New Culture of Capitalism".

This new culture of capitalism, defined by Sennett, helps us understand the school organization not only as the relationship of the student with the school, but also of the teacher with the school, when we reflect on the characteristics of the teachers in the context of today's school.

Sennett (2006,) makes reference to the three social deficits in this context of new capitalism, as being: the low institutional loyalty; the lessening of the informal trust between employees and the weakening of institutional knowledge. These three deficits are connected by an intellectual tool that is the "social capital", which consists of the relationship networks that the person is linked to. Organizations with higher social capital

have more loyalty and vice-versa, according to Sennett.   The other deficit, the lessening of the informal trust between employees, refers to the issue of knowing on who one can count on in a situation of pressure or necessity.   Sennett states that the informal trust between employees needs time to be developed and in the context where relationships and institutions are "liquid", as Bauman (2004) states, the difficulty in the establishment of this trust is hindered.   The third deficit highlighted by Sennett, the weakening of institutional knowledge, refers to the certainties that went along with the bureaucratic organizational structure, job and social security that were weakened in this new context where work has become flexible and precarious.

Further to these deficits, Sennet calls attention to the concept of the citizen as a consumer, that has permeated the social relationships in the context of what is called the new capitalism.   He considers that when citizens act as modern consumers, they stop thinking as artisans, and as a consequence no longer have the commitment to knowledge and to what they do, in order to become simply a consumer.

Using Sennets's aforementioned thoughts to analyze what happens in the day-to-day of the school organization, we can see that the characteristics described by this author have an intimate relationship with the imaginary about the school and the conflict and violence present within it.   The imaginary of an equalitarian school that is safe and that favors the integration of the individuals into society conflicts with the lack of loyalty, informal trust and of different aspects of organizational knowledge.

Research Methodology and techniques

The research technique utilized was in first place to ask the teachers to answer an individual questionnaire (attachment A).   After the individual responses the answers were collected, groups were formed and the answers were distributed randomly, in such a way that whoever responded the questions would not be part of the group analyzing the answers.   The answers were analyzed by each group and the each group was asked to make a poster using magazine cut-outs, to express the principle responses given by their colleagues.

Due to the above thoughts and to the referential of the imaginary to analyze the state schools in this research, the following main analysis categories were used:

1)   The imaginary about today's school and the real students in this context.

2)   The imaginary about the role the school plays in the life of the students.

3)   The imaginary about the students' families.

4)   The imaginary about the social reality and the school in this context.

The research was carried out in two schools located in a neighborhood in the outskirts of the city of Rio Claro, São Paulo, Brazil.   These schools are attended by students with precarious socio economic conditions who live in the neighborhood.

In the analysis of the data, the answers given to the questionnaire as well as the posters made by each group were taken into account.   The selection of the issues expressed on the posters was considered an important factor form analysis as this corresponded to what the teachers considered to be the fundamental issue.

In School 1, 21 teachers participated in the activity and in School 2, 33 teachers did.

Conclusions

In the two schools where the study was made, we came to the conclusion that the imaginary of school and of student built by teachers is based on the model of school and of students of the times when the school was a place for just a few.   These imaginary students are the students who come to school neat and clean, well fed and

well dressed; they do their homework with the support of their families; they recognize the importance of knowledge in their lives and therefore respect the teachers. The real and concrete school for them, as Dubet & Bellet (2000) state, is an island of order and of culture in the midst of an ocean of disorder and ignorance. The students are disorderly, have "unstructured" families and some of them should not even be attending school.

In this manner, we arrive at the conclusion that there is a vast distance between the school with the imagined student and the concrete reality of the lives of the real students. In our view, this fact creates significant difficulties as much for the learning process as for the human relationships within the school. We propose that activities for the continued development of the teachers be carried out so that they are able to analyze the school, taking into account the aspects presented here.

THE IMPACT OF THE SYMPTOMS OF SPECIFIC LANGUAGE IMPAIRMENT ON CONTEMPORARY EDUCATION AND COUNSELING – THE NECESSITY OF SPEECH AND LANGUAGE THERAPY APPROACH AT SCHOOLS

Renata Mlčáková, Kateřina Vitásková, Alena Říhová[86]

Faculty of Education, Palacký University in Olomouc, Institute of Special Education Studies, Žižkovo nám, 5, Olomouc, 771 40, Czech Republic

Abstract

The authors would like to stress the importance of diagnosis and intervention of the specific language impairment (SLI). The symptoms of SLI vary and occur in the language-related areas, from specific impairment in language areas (mostly morphological-syntactical, lexical-semantic or pragmatic) to non-language - e.g. motor skills, graphomotor skills, emotionality and adaptability, cognitive functions (memory, perception, in particular hearing perception, attention and cogitation). Lower functional literacy, difficulties in understanding of spoken and written forms of speech, dysgrammatism in expressive language, are typical symptoms, which may persist and become a disadvantage for successful education or success in choosing or maintaining a job.

Keywords: specific language impairment; graphic and orthographic component of writing; dysgrammatism; comprehension difficulties; functional literacy; speech and language therapy; education; school counselling

Introduction

Impaired speech development may be the dominant symptom of language difficulties of a person. In such case it represents specific language impairment (SLI), in the context of Czech and European terminology often narrowed down to the issues of the so called developmental dysphasia, which is displayed by "…reduced ability or inability to learn verbal communication, although the conditions for speech development are adequate…" (Dvořák, 1999, p. 44). In the broader Anglo-Saxon perception of disorders, on the basis of specifically impaired language development, the so called semantically-lexical syndrome or semantically-pragmatic speech disorders and other forms of impairment are also mentioned (e.g. Adams in Bishop, 1989; Griffits, 2007). A disorder on the level of perceiving or expressing mimic representatives of emotional state is frequent (Vitaskova, 2005). However, impaired speech development may be a symptom of another developmental disorder or deficit, as well, often related to e.g. hearing impairment, intellectual disability, or autistic spectrum disorders. In this case we can speak about so called symptomatic speech disorders (see below).

Adequate reception or even assessment of the level and quality of individual's communication ability is one of key prerequisites for successful information presentation in today's communication-demanding society, which works with large amounts of information that are difficult to combine and are presented in different forms, and categorizing, analysis and differentiation of such information requires a remarkable degree of daily concentration and highly advance cognitive activities, which also applies to production and perception of speech. In school settings, in the classroom, all the demands related to information processing and expressing are even multiplied and may strongly influence, either positively or negatively, the evaluation process of the students and perceiving of his/her abilities and learning competencies by teachers in general.

Speech and language therapist can, in terms of his/her basic expertise or extended specialization, significantly participate in identifying abnormalities, specifics or deformation of the communication process in the form of

[86] Corresponding author. Tel.: +420-58-563-5003; fax: +420-58-563-5009.
E-mail address: katerina.vitaskova@upol.cz

input, gradual or output and partially prognostic processes, or possibly even in all of these phases. Speech and language therapist should cooperate on differential diagnosis with specialists – psychologist, teacher, psychiatrist, neurologist, phoniatrist, and audiologist. They identify the aetiology of difficulties in speech development of the child and they specify a proper diagnosis, which is necessary to speech and language therapy. Nevertheless, making a proper diagnosis of specific language impairment may be problematic in some cases. Many symptoms in language areas as well as those not related to the language may resemble autistic spectrum disorder or intellectual disability (see e.g. Říhová, Vitásková, 2011).

In the paper we will, therefore, briefly point out some selected examples where the necessity or primary significance of the input of a specialist in the area of communication – a speech and language therapist (in Czech terminology officially called logopedist) – is often the basic prerequisite for successful capturing of progressive, diagnostically indistinct or hidden pathological conditions in which SLI is present. We would like to emphasize the need of close, effective and intensive cooperation of speech and language therapists with schools, as we consider this cooperation to be essential, or even crucial for the relevant and objective assessment and evaluation of the school achievements and behavior of the student with SLI.

Specific language impairment and its symptoms in school age

General symptoms of SLI

The occurrence of the specific language impairment in school population is stated from 2% (Krejčířová, 2001), up to 7% (Bishop, 2009), or even more, depending on the national recognition and acceptance of the definition of SLI and related types of language impairment. At the forefront deficits in the structure and system of language are obvious, which are dominated by dysgrammatisms displays (Owens J., 2008; see bellow), persisting until adult age, also speech prosody impairment (dysrhythmia, dysmusia) is more pronounced (van der Lely, 2005). The reason for this are probably disorders of processing shortly presented or quickly alternating complex auditory stimuli (especially words) (Dlouhá, 2003; Tallal in Clark et al., 2000; Tallal, Gaab, 2006), disorders of short auditive-verbal memory (Briscoe et al., 1998; Gathercole et al., 2005), phonological deficits (Dlouhá, 2002) and bilateral organic diffusive damage to the cerebral cortex, which often develops as a hereditarily conditioned predisposition (Laie et al. in Merricks et al., 2004).

However, displays of specific language impairment are not only the difficulties in speech; behavioural, emotional and social rarities have been proven (McCabe&Meller, 2004; Willinger et al., 2003). Such stated rarities are e.g. psychomotor agitation, activity and attention disorders, impulsiveness, clinging to routines, eccentric mannerism, organicity signs, inequality in performance owing to individual intellectual functions and discrepancy between verbal and nonverbal elements of intellect. Easy fatigability, attention concentration disorders, retardation in fine motorics development, right-left orientation and seriality disorders, dichotic listening deficits, visual perception disorders, disorders of perceiving physical constellation on the basis of kinaesthetic perception disorders and disorders of spatial and right-left orientation, perceiving of depth and three-dimensional space, colour sense disorders and other deficits are also frequent (compare e.g. Haslum&Miles, 2007; McCabe&Meller, 2004; Moncrieff&Black, 2008; Vitásková, 2004; Vitásková 2005; Vogel, 2003; Willinger et al., 2003;). It is often a case of borderline diagnosis, exceeding from the area of special education to the area of psychology, psychiatry, or others.

The development of speech and language in children with developmental dysphasia (as a specific sub-type of SLI) shows specific features. Mikulajová&Rafajdusová (1993, p. 30) define developmental dysphasia as follows: "Developmental dysphasia is diagnosed if it concerns impaired development of language skills that may not be explained on the basis of mental retardation or physical handicap, hearing impairment, emotional deprivation or emotional disorders, or negative impacts of the environment and upbringing." To a varied extent, the disorder affects understanding and speech and language production; the child has difficulties with processing semantic information. The symptoms are varied and occur in the language-related areas - specific impairment in language areas as well as those not related to the language - e.g. motor skills, graphomotor skills, emotionality and

adaptability, cognitive functions (memory, perception, in particular hearing perception, attention and cogitation) (Vitásková, 2005).

Among the significant symptoms of developmental dysphasia, which to a smaller or greater extent continue to exist in children and students with developmental dysphasia even in their adulthood, we include dysgrammatism – inadequate speech production reflected in morphology and syntax. Mikulajová (2009) states that syntax is currently considered the main criterion for speech and language development.

Symptoms of SLI in graphic form of language

Most of students with developmental dysphasia (specific language impairment) have difficulties in graphic and orthographic component of writing. Student with graphomotor (graphic) difficulties, such as excessive pressure on the mat, spasmodic, intermittent, discontinuous, trembling graphical line etc., exerts a lot of effort to form the shape of a line. The student also needs more time for the orthographic component of writing, which includes for example phonemic awareness, the feedback of what had been written, completing punctuation and correct ortography. There is a lack of time for appropriate expressive writing in students with graphomotor disabilities due to the necessity of using the most of the time on forming the graphic component of the written text and therefore they have not enough time to self-check the orthographic component.

Symptoms of SLI related to spoken and scripted speech and their consequences

The second significant symptom that usually continues to exist in adulthood of person with SLI concerns difficulties to understand spoken and scripted speech. Students with developmental dysphasia understand the speech of the communicating partner, e.g. a teacher who speaks fast and uses long and complex/compound sentences, only with difficulties and not accurately. Similarly, they have difficulties in understanding scripted text, especially if the text contains long sentences and complex/compound sentences. Since the problems with scripted text comprehension of many students with dysphasia are usually not fully adapted at primary school, the difficulties with reading comprehension continue to exist at secondary school or even at work and everyday activities of an individual with developmental dysphasia. Persons with developmental dysphasia show lower functional literacy. Průcha, Walterová&Mareš (2009) define functional literacy as a set of skills of a person to cope with activities required by modern civilization, e.g. the ability to understand more complex texts, complete a form, write a written request, understand a newspaper article, understand a washing machine manual and reproduce the meaning of what was read.

What is important to emphasize again is the fact that speaking, writing and reading of persons with SLI reveal an insufficient understanding as so as speaking and writing usually show inadequate morphology and syntax – dysgrammatism (see above). Consequently, difficulties to understand spoken and scripted speech, dysgrammatism in expressive language may persist and become a disadvantage for successful education or choosing a job.

SLI as a symptomatic speech disorder in persons with autistic spectrum disorder

Symptomatic speech disorders (SSD) form a fairly large and heterogeneous group of impaired communication ability. These represent abnormalities in communication, which are primarily or secondarily associated with a specific type of health impairment, disorder or another pathological condition. Symptomatic speech disorders are aetiologically and symptomatically related to them. The term and qualification of this group result from Lechta's classification of ten areas of impaired communication ability (2011), which forms the basis for the most frequently, used classification of forms of communication ability impairment in the Czech and Slovak Republics so far. Even though the issue of symptomatic speech disorders permeates many relatively independent and unique diagnoses, this group of disorders has one common guide line that can be followed. The character of specifics or abnormalities in communication can be defined by certain social symptomatological

categories or markers, which can be perceived as leading, and they enable for them to be taken into account in social as well as educational context. And although this somewhat generalised concept of "typical" signs in the area of communication, which are typical for a certain group of people (e.g. with hearing impairment), can be criticised for its exploitability (risk of simplification and insufficiently individual perspective on a person with symptomatic speech disorders, based on perceiving only summarised knowledge of the given category of a symptomatic disorder), we consider knowledge to be, at the least, the main (or even better the specific, unique) possible symptoms of symptomatic speech disorders to be essential for adequate assessment of the signs in individuals with such disorders. It should also be emphasized that the particularities of communication, its anomalies, specifics or even pathological symptoms can also be a significant diagnostic, differentially-diagnostic or a prognostic indicator of light, medium, or also severe forms of various types of health impairments or illnesses, or other pathological conditions.

Autism spectrum disorders (later also as ASD) represent a heterogeneous, and not always strictly defined, group of specific and non-specific symptoms characterized by pervasive manifestation of the partial symptoms and the cardinal differences in the development of an ASD child when compared to the healthy individual. Despite the given fact, all nosological units of autism spectrum disorder comprise of a markedly deficient field – impaired communication ability. The professional speech and language therapist should play a major or even a key role in ASD diagnosis or differential diagnosis, and such statement seems a relatively natural conclusion (Říhová&Vitásková, 2011). As demonstrated in the study by Conti-Ramsden et al (2009), the ASD prevalence in children diagnosed with specific language impairment (SLI) is ten times higher than in normal population – the approximate coincidence of ASD and SLI is 3.9%; on the other hand, only light or some ASD symptoms were observed in many more adolescents with positive SLI history (as much as about one quarter of the sample). The authors maintain that the risk of coincidence with ASD is higher in persons with SLI; consequently, the current excluding criterion to diagnose SLI, which is the absence of autistic disorders (compare Vitásková, 2005, for instance), should not be accepted, especially in contemporary, modern tendencies facing the issue of establishing and guaranty of inclusive school environment. There are many students with ASD with heterogeneous symptoms of their SLI who are educated in primary and secondary schools in Europe, so the importance of at least basic knowledge concerning SLI is more significant and the collaboration between teachers and speech and language therapists will be probably more frequently mentioned in many legislative and stakeholders recommendations, as well as during professional discussions, as we believe.

This is to corroborate that autistic spectrum disorders are primarily impaired communication skill and that early and effective speech and language therapeutic intervention (including the part of the professional speech and language therapist in differential diagnosis, and prognostic and continual longitudinal diagnostic monitoring) plays an important role in and has a major impact on the comprehensive development of ASD persons and the success of intervention. Nevertheless, as our previous research outcomes revealed, other professionals, even those working at counseling centers, still do not see this interdisciplinary collaboration with speech and language therapists as a priority; also, many speech and language therapists are dissatisfied with what they were taught about ASD at university, having to study these topics on their own to complete their expertise (Říhová, 2010; Říhová&Vitásková, 2011).

Therefore, and in respect to all the symptomatic inter-relations and consequences mentioned above, we decided to continue our research in specific language impairment (even in those forms related to symptomatic speech disorders) in interdisciplinary assessment, educational, and counseling approach as a sub-part of a specific research project nr. Pdf_2012_012 "Impaired communication ability in terms of the impacts of its symptomatology on interdisciplinary co-operation of professionals and family in comprehensive intervention - specific role of a special pedagogue and speech therapist (Main investigator: Vitaskova; co-investigators: Mlčáková, Říhová, Langer, Čermáková, Weilová, Kunhartová). The project focuses on impaired communication ability in terms of the impact of apparent as well as more difficultly identifiable or hidden symptomatology on the everyday diagnostics and education of individuals in the context of interdisciplinary co-operation of professionals engaged in their comprehensive intervention. The objective is, based on selected partial surveys, to analyze the specific impact of a priory selected representative types of impaired communication ability and the degree of perception and identification of these impacts on the objectivity, quality and efficiency of interaction

and communication of professionals participating in their diagnostics, education and comprehensive intervention. The selected types of impaired communication ability include speech fluency disorders, hearing impairment and autism, and combined impairments (in the context of the so-called symptomatic speech disorders). For the purposes of the project, the principal objective has been divided into 4 partial tasks, the fulfilment of which will enable the comparison of collected data in order to establish a synthetic perspective of the monitored objective. The research methodology will be combined as both quantitative and qualitative methods will be applied - exploration (questionnaire, interview), diagnostic testing, diagnostic interview and casuistic method, and the analysis of video recordings of conversational and communication samples. The individual parts correspond with the specialization of doctoral studies students, i.e. the principal members of the team who focus on very specific areas in their research. The project is based on the results of our previous research activities (see e.g. Říhová, 2010; Říhová&Vitásková, 2011)

The partial research on SLI and symptomatic speech disorders

The methodology of the partial research

In our partial research related to the SLI we individually tested three respondents – one girl and two boys - with specific language impairment (Čechová&Mlčáková, 2010). The number of the respondents is relatively small, but we concentrated more on a qualitative and individual analysis then a statistical data. The respondents were represented by 6-year 5-month-old girl (R1), and two boys; one was 8-year 4-month-old (R2), and the second was 9-year 3-month-old (R3).

In fact, the whole examination of the respondents included several tests focused on: auditory analysis and synthesis, rhythmic reproduction test, phonemic differentiation, picture naming, sentence forming, and laterality. However, in order to more clearly demonstrate the symptoms of SLI in language expression at the moment, we chose some specific results of The Sentence Repetition Test by Grimm. The Sentence Repetition Test by Grimm is as a set of ten sentences adapted from German into Slovak (Mikulajová&Rafajdusová, 1993). We translated those sentences into Czech language. The sentences were arranged in order to have increasing grammar difficulty. The requested task for each child was to repeat the sentence they had listened to. The precondition of sentences repetition is processing them into the grammar system of a child. We have to realize, that repeating sentence is not only a simple mechanical reproduction. Seven-year old children should deal with these tasks properly and well (Mikulajová, 2003).

The Sentence Repetition Test by Grimm contains these sentences: 1. Is the kitten nice? 2. George is giving a chocolate to children. 3. There is not good weather today. 4. Martin visited his aunt yesterday. 5. You pang to the finger! 6. A dog was chained. 7. Do not step into a puddle! 8. Mother has a lot of washing, ironing and cooking. 9. He plays with little Mary's doll. 10. I would rather have a bigger car.

Children with SLI have specific symptoms while doing The Sentence Repetition Test. We can observe skipping words in the sentence, particularly prepositions, conjunctions, changes in the morphology of words, incorrect syntax and dysgrammatism. In our research we evaluated each properly repeated sentence by one point. Incorrect repetition of the sentence was evaluated by zero points.

The results of the partial research

R1 repeated properly two of all sentences, her result was two points. Other eight sentences were incorrect, she missed a noun, missed an adverb, missed first three words in the sentence, she repeated the same word two times, she changed the meaning of the sentence and she changed the structure of the spelling word.

R2 repeated properly four sentences and his result was four points. In other four sentences he missed a noun. He changed an adjective by another adjective with similar meaning of the word in two sentences.

R3 repeated properly five sentences and his result was five points. He missed one word in a sentence three times – a noun, an adverb, an adjective. He added one word in one sentence and he did not repeated two of the words but replaced them by another word.

We analyzed the results of all children in The Sentence Repetition Test using proportional percentage evaluation to get more explicit information concerning the achievements of the respondents. As we can see in Figure 1, 6-year 5-month-old girl (R1) properly repeated 20% of all sentences, 8-year 4-month-old boy (R2) correctly repeated 40% of the sentences and 9-year 3-month-old boy (R3) achieved the best result. He was successful at 50% of all repeated sentences. All the three children with specific language impairment have difficulties in expressive language – verbal skills (see Fig 1).

Fig.1 Results of the children in Sentence Repetition Test

Figure 1 Results of the Children in The Sentence Repetition Test - Percentage of Properly Repeated Sentences
Discussion of the partial results

The test we used is an example of assessment material enabling speech and language therapist to detect the deficits on the morphological-syntactic language level in children with impaired language development. Grimm, Schöler & Mikulajová (1997) state that sentence repetition can be used for the identification of adequate developmentally specific syntactic rules, e.g. sentence reducing. As we mentioned above, in 7-year old children hardly any difficulties in sentence repetition should be present. However, in our respondents the individually variable deficits in syntactic rules were proved.

Such deficits could cause many consequent problems of the students during school attendance. Moreover, it is needed to be point out that regular teachers or even special educationists without the specialization in speech and language therapy are usually not familiar with such kind of tests, and moreover, without proper knowledge and training they are not able to use them for assessment of the student. Therefore the student expressive and impressive language difficulties may be easily mistaken misunderstood and consider as being a consequence of general intellectual deficits. If 9 year-old boy cannot repeat properly 50% of simple sentences, his ability to understand the content of the learning presented by the teacher in an ordinary way and with common speed of

spoken speech is endangered. He would be hardly able to fulfil all other educational demands, and may fail at school very easily. His primary learning competence based on the ability of using his language ability is disturbed, and he needs an adequate, specific and professional assessment and treatment.

Conclusion

To conclude, we would like to highlight the necessity of linking the contents of pregradual education of not only speech and language therapists but also other experts with special education knowledge and knowledge from related disciplines, which fall into the group of the so-called symptomatic speech disorders connected to specific language impairment, or developmental dysphasia itself. In this sense, a speech and language therapist has a very significant, although also very responsible, role. He/she can be the first person to detect and identify these disorders, which in consequence can have a negative reflection on the overall development of a student, especially if the significant markers are not recognized and evaluated in time. However, he/she must be prepared for this role within his/her pregradual or continuing educational framework, which not only includes theoretical and practical knowledge of the subject of communication disorders and impairments (from areas of special education, psychology, linguistics, medicine and other disciplines), but also awareness of his/her role in interdisciplinary teams and the need to keep promoting his/her part in the process of diagnostics and intervention within specific language impairment. On one hand, the partial results of our research reveals that SLI symptoms are easily misunderstood or neglected by teachers, on the other hand they show that the transdisciplinary educational and counselling involving primary and secondary teachers, speech and language therapists and special educationists can positively influence the effectiveness and quality of educational process and protect the student of the failure in a learning activity and school achievement, as well as in his/her social inclusion and professional career.

THE IMPORTANCE OF ICT SECTOR AND ICT UNIVERSITY EDUCATION FOR THE ECONOMIC DEVELOPMENT

Milos Maryska[a], Petr Doucek[a], Renata Kunstova[a]

[a]University of Economics, Prague, Faculty of Informatics and Statistics, W. Churchill sq. 4, 130 67 Prague, Czech Republic

Abstract

ICT (Information and Communication Technology) industry is an important contributor to growth almost every economy. Its contribution to the growth represents 5% of GDP and ICT also drive 20% of overall productivity growth in European Union (European Commission, 2010). In order to hold such portion of ICT sector on total GDP in the future, continuous supply of relevant qualified ICT professionals into this industry is required. These new jobs will have to be saturated by adequately qualified ICT specialists but this is not supported by the number of live births. This paper identified the most important factors that influence economic growth through ICT sectors in EU and especially in the Czech Republic.

Keywords: tertiary education; ICT related study programs; ICT specialists; economic

Introduction

ICT is one of the most important factors for development and economic growth in the globalized economy. Currently is our community solving following questions: How much are we depended upon ICT? What will happen after losing ICT support for our processes?

In the context of the previous questions we have to mention that ICT (Information and Communication Technologies) industry seems to be also an important contributor to growth of European economy. Its contribution to the growth represents approximately 5 % of GDP (€592.6 billion in 2007) and ICT also drives 20 % of overall productivity growth (European Commission, 2010). The ICT industry includes ICT services and ICT manufacturing from general point of view. ICT manufacturing contributes by approximately 1 % to GDP (€130.6 billion in 2007) and ICT service sector is responsible for a little less than 4 % of GDP (€462 billion in 2007). These contributions seem to be quite effective, but in comparison to other big players in world economy it is not enough. For the USA is the contribution of ICT manufacturing 1.33 % of GDP and ICT services represent 5 % of GDP. For Japan is the value of this indicator 2.9 % for ICT manufacturing and 3.95 % for ICT services (European Commission, 2010). Other Asian countries as Korea or China etc. show growing specialization in ICT manufacturing. Using ICT is important step for competitiveness of each economy. ICT are key drivers for innovation putting into work. Improvement of ICT and related innovation activities are permanent processes that combine business processes, organizational structures, competencies and responsibilities, human resources, personal skills, knowledge, hardware, software and other components of organization (European Commission, 2010). These components represent only elements of system, new quality and innovation potential takes with it rethinking of the whole system applying appropriate ICT principles.

One of the main problems of ICT adoption in global society and in corporations is caused by lack of ICT professionals (European Commission, 2010) with appropriate knowledge (Maryska, Novotny & Doucek, 2010) in networked economies (Kelly, 1998). Low number of ICT experts in economies of European countries cause lower innovation activities in this region in the comparison to USA, Japan and Canada. Low number of ICT experts in economies of European countries cause lower innovation activities in this region in comparison to USA, Japan and Canada. One way, how to limit this disadvantage of European countries is to increase investments into ICT education. (European Commission, 2010), (Doucek, Maryska &et al., 2012)

Knowledge of ICT specialists are in the current situation of the existing information technology world characterizes the increasing demand for different roles of Information and Communication Technology (ICT) specialists in different countries and regions. "Fundamental" ICT skills (e.g. programming, development and testing) are more required in countries with emerging economies as opposed to stable and developed countries where the demand is not so massive. In some regions, for example in Australia the rate of unemployment in these professions is permanently increasing according to some sources (Vorisek & Feuerlicht, 2006). In contradiction is (Hagan, 2004). On the contrary, there is an increasing demand for "new" ICT skills (e.g. sourcing, business analysis, multimedia working out, presenting information on social network) (Helfert & Doucek, 2010). We cannot forecast mechanically the demand for ICT specialists – each country and region has its own features and specific character.

As a reaction to the relatively low flexibility of the institutional education system in the ICT skills area, the research team on Faculty of Informatics and Statistics decided five years ago to initiate research activities in order to map:

- ICT education offered in the Czech Republic,
- Demand for ICT skills in the Czech Republic,
- Influence of ICT graduates and ICT sector on GDP.

University education (tertiary education) forms an important component of the education system in each country in the world and this level should be one of the most effective and required in the area of ICT. Other aim of these research activities was to motivate universities and formulate recommendations for further development of the Czech university education in the area of ICT. To set up and formally pass the accreditation process of a new study program takes in minimum one year (only under conditions that relevant school or university has enough experts in required knowledge areas).

The last goal was to carry out a survey of the ICT graduates skills requirements in the Czech business. This survey was performed for three times (2006, 2009 and 2011). Further facts are presented as result of the last survey in year 2011.

Problem formulation

Several new questions without answers appeared in our research team during our survey work. How many ICT professionals will be needed in the Czech economy in oncoming years? At what degree are the domestic universities able to cover this need? Does the lack of ICT professionals endanger Czech economy in the period of recovery after economic crisis? Is the knowledge of graduates in ICT study program appropriate for companies? The aim of this article is to present possible scenarios in requirements on ICT specialist up to 2015 in the Europe with methodology that is presented on the example of the Czech Republic and to evaluate impact of this fact on the Czech ICT job market.

Based on these facts, our team started to formulate the model of possible requirements on numbers of the ICT professionals (Doucek et all, 2007), (Maryska, Novotny & et al. 2012). Relations in this model are based on actual economic trends in ICT sector, partially taken from literature and partially based on our survey's results of Czech reality. The first part of this model is presented in this contribution.

Methodology

The first activities for this model formulation focused on number of required ICT professionals in the Czech economy in the future. We had three main sources. The first one - results of our surveys. For this model we used results from 2011 surveys, although actual data from 2011 were not completely evaluated by statistical (cluster analysis) methods yet (some other facts will be presented on conference event in September of this year). Methodology: There were identified main ICT business roles, their key competences, in business informatics in the first phase of the project. After this role definition phase were defined knowledge domains and metrics for measurement level of knowledge in each knowledge domain. The level of knowledge was graduated in relation to ECTS credits on HEIs and in relation to number of necessary training days for appropriate position by business organizations – details in (Doucek et all, 2007), (Maryska, Novotny & Doucek, 2010), (Doucek., Maryska & Novotny, 2012).

The second main source is the future economic development scenarios prognosis (McCormack, 2010) and data concerning ICT industry in the Czech Republic, collected by European Commission in Digital Competitiveness Report 2010 (European Commission, 2010). Data from UIV (Institute for Information on Education) are the last source of information in this contribution. These data deal with number of students and graduates in ICT - related study programs in the Czech Republic's HEIs (Higher Education Institution). Prognostic model was formulated based on demographic projection applied on data from surveys - ICT related study programs enrolled students and required numbers of ICT specialist for ICT business roles now and in the future. Results of this model are combined with conclusions of McCormack's (McCormack, 2010) prognosis in this contribution.

The third main sources are data provided by the Czech Statistical Office (CSU, 2010), Eurostat (Eurostat, 2010) and UIV (UIV, 2010) that are connected with number of tertiary education students, trends in population etc.

Results

During our research we find out three factors that are mutually interconnected and strongly influence economic development of each country through evolution in the ICT sector. These factors are:

- Investment into ICT,
- Knowledge of ICT specialists,
- Number of ICT specialists,

Investments into any sector of economy represent essential instrument for its further expansion. Some aspects of ICT investments are presented in (Delina & Vajda, 2005).

Another, more detail, synthetic indicator of the ICT sector contribution to the economic growth is share of added value of the ICT sector on the whole GDP. Evolution of the added value of the ICT sector to the Europeans countries and to Czech economy is presented in (Doucek, Nedomova & Novotny, 2011). „Productivity" of Czech ICT sector and its portion on GDP is shown in comparison to other selected countries on Fig. 1. Other general aspects of productivity of Czech Economy are presented for example in (Vltavska & Fischer, 2010).
Fig. 1. Comparison of ICT Sector Added Value in Per cents of GDP for Selected European Countries, source: (CSU, 2010)

The largest contribution of ICT sector to GDP in EU is in Finland – 8 %, where is also large ICT manufacturing industry. The largest ICT service industry is in the United Kingdom – 4.7 % of UK's GDP. From the Figure 5 is visible that there are only few countries, where the share of ICT services on GDP is more than 4 %. Behind the UK are with 4.2 % Finland and Netherlands, followed by Hungary 4.1 % and Czech Republic 4.0 %. For other countries is the share lower than four per cents. Detailed analysis of ICT sector´s influence on economic development and how can be measured costs on ICT are in (Novotny & Doucek, 2010), (Novotny & Doucek, 2007), (Maryska, 2008, 2009) and (Sudzina &Kmec, 2006).

These figures prove our statement, that investments into the ICT in the economy are really important because portion of ICT sector on GDP is high and still increasing. If we want to hold this portion and make stronger increase of GDP through ICT we need enough ICT specialists with appropriate knowledge and education.

The second one factor is total number of ICT specialists and trends in their numbers. Majority of developed countries (China don´t show up) can be characterised by decreasing population rate in the EU 27 countries. The same situation is in the Czech Republic (see Fig. 2.). Graph presented in the Fig. 2 is number of live births in the Czech Republic (dotted line on right axis) in time series from year 1980 to year 2009. These numbers are important for future situation in the tertiary education system. We see that future years will be difficult for universities and also for quality of tertiary education system as a whole because numbers of potential students (based on number of live birth) was decreasing until year 2001. When we take into account average entering age to the tertiary education system, the difficult times will be for tertiary education system till year 2020. Trends in this indicator are the same as in the Czech Republic also in the EU 27 countries. Really interesting is similarity both curves in the Fig. 2.
Fig. 2. Time Series of Live Births in the EU 27 countries and in the Czech Republic   source: authors, (Eurostat, 2010)

This findings don´t give us to good prospect in tertiary education in general and also in education of new ICT specialists. In the situation the population rate and number of live births is decreasing we cannot increase number of student at universities.

These findings provide important data for another analysis that is based on McCormack book (McCormack, 2010). In this book are also noted that countries have one of the last opportunities to make arrangements to prevent the lack of ICT specialists. In the case that they find out no solutions, they can expect difficulties in providing ICT services in the future that also influence GDP and other indicators describing analysed country.

We have said that the information society requires sufficient number of ICT specialists with adequate knowledge and education. A fulfilment of this requirement is based combination of these three factors (Doucek, Kunstova & Maryska, 2011):

- People – to make an ICT related study programs more attractive for students,
- Knowledge – to better up and raise up knowledge of people working in ICT and also people working in other sectors. This is closely connected with the third factor - education,
- Education – this is the most important opportunity to change current trend and the fill the gaps that were shown in (Doucek, Maryska & Kunstova, 2011). Education can be provided in various forms:
  ○ Lifelong learning.
  ○ University education at public and private universities.

The second and the third point influence the third factor. Detailed analyses of these factors are devoted for example (Doucek et all, 2007) and (Maryska, Novotny & Doucek, 2010). In this place we can mentioned that the situation in the Czech Republic is not good because knowledge expected by companies aren´t fulfilled by university graduates in ICT related study programs. On the defence of the tertiary education system we have to accent that business sector usually doesn´t define requirements on knowledge future graduates. One of examples for this is dynamical changes in internet technologies and mobile application (Apple, Google).

Our analysis of the situation in the Czech Republic in the context the Digital Competitiveness Report 2010 (DCR) (European Commission, 2010) takes into account above mentioned facts. In DCR is mentioned that the share of Czech work force in ICT sector on the whole European ICT sector work force is approximately 2.8 %. Because the number of ICT professionals in the Czech Republic is, from this "European" point of view, constant, we propose the same share for oncoming years also. Applying this approach on data presented in (McCormack, 2010), (CSU, 2010), (Eurostat, 2010), the following prognosis of the gap between supply and demand in ICT professionals till the year 2015 in our country could be expected. McCormack (McCormack, 2010) distinguishes five scenarios in the evolution of economy. These scenarios are presented in the Table 2 that compares demand and supply of ICT specialists.

The Czech education system is very strong limited in ICT area. The first limit is real number of HEIs realizing ICT study programs. From other point of view this fact represents a lack of ICT teachers in ICT tertiary education. The number of students involved in the ICT study programs in 2004 – 2009 is presented. These data are adequate to our contribution, as we are not so much interested in students, but in the graduates and the students of 2009 will graduate on bachelor level in 2012. If they start their master studies, they will graduate as masters in ICT in 2014.

In UIV database the number of graduates of ICT-related study programs since 2001 was identified. In Table 1, the numbers of graduates since 2007 – 2009 are presented.

Table 1. Number of Graduates of ICT Related Study Programs, Source: (UIV, 2010), authors

Study program/Year	2007	2008	2009
Bachelors	3,636	4,137	4,194
Masters 5 years	1,165	894	510
Masters 2 years	982	1,672	2,123
Total	5,783	6,703	6,827
Reduced number of graduates	3,359	3,945	4,031

Numbers presented in Table 1 show that Czech education system offer approximately 7,000 ICT professionals in Czech economy in year 2005. In the book (Doucek et all, 2007) is mentioned that required number of graduates covering reproduction is 4,200 annually. There are identified two main problems in the table. The first problem is all the more important, as not all the bachelor graduates do enter the labour market. Approximately 2/3 of them enter master study level in ICT - related study programs (see row "Reduced number of graduates" in Table 1) (conclusion from survey 2011). Also, the **bachelor-level qualification of graduates is not commonly accepted by all corporations looking for ICT professionals**. **Especially in ICT corporations, the master level of graduation for higher managerial positions is strongly required.** Approximately one third of graduates in all ICT-related master study programs are not sufficiently qualified for business informatics, but reports finished tertiary education formally.

"For what scenarios do our politicians prepare Czech economy?" The Czech Republic's education system delivers approximately 4,000 ICT graduates annually according to the information from UIV (Table 1). Our demand for reproduction of existing level of ICT services and manufacturing is approximately 4,200 ICT professionals. Comparison of these two numbers gives us a warning that the actual gap between supply and demand on ICT professionals is approximately 200 persons annually. Future scenarios in ICT professional's requirement development represent another aspect: increasing gap between supply and demand. Missing numbers of ICT professionals on the Czech labour market up to 2015 are presented in Table 2.

Table 2. Missing Number of ICT Professionals in Czech Economy for Different Scenarios, Source: authors

Year	Turbo Economy	Investing in the Future	Back to Normal	Traditional Wins	Stagnation
2010	1,180	200	-1,060	-1,200	-1,480
2011	2,440	1,600	200	200	-1,480
2012	4,400	3,000	1,600	760	200
2013	5,800	5,240	3,000	1,600	1,040
2014	12,240	10,700	7,200	2,720	1,740
2015	19,240	16,720	11,120	3,840	2,860

Numbers presented in the Table 1 informs us (positive numbers in the table take with them negative information) that the Czech Republic is not prepared neither for real evolution of information society in our country (number of ICT professionals reproduction is 4,200 annually) nor for any of the above presented scenarios. Numbers in Table 2 represent real gap between demand and supply in ICT professionals on our labor market (negative bold number represents overhang of qualified ICT professionals entering Czech economy in certain year). We have enough ICT professionals up to the 2011 in case of the "Stagnation" scenario in our economy. There is no efficient number of qualified ICT professionals for other scenarios at all. These numbers of well qualified ICT professionals will be missing on Czech market annually and no matter what scenario will come true.

Conclusions

All of developed countries are depending on ICT. This dependency is represent by increasing investment into the ICT, and also increasing required number of ICT specialist. Still increasing are also requirements on knowledge of non-ICT employee.

The Czech Republic would like to be developed information society supporting dynamical trend in increasing of GDP. Current situation in the tertiary ICT education doesn´t support this aims because the gap of ICT

specialists is increasing and potential number of tertiary ICT related students is on the contrary decreasing. General trend in Czech education system is stagnant number of ICT students. These facts have following consequences.

Lack of ICT educated professionals will have an impact on decreasing competitiveness of the whole economy, decreasing global innovation potential and this could start degeneration of our population.

Without adequate number of ICT specialists cannot be achieved required increase in GDP not only produced by ICT sector but all sectors in the Czech economy.

The Czech Republic has opportunity to change education system with accent on tertiary education in order to prepare the ICT professionals in ICT business and for the roles of key users in public administration and in business corporations as well. These changes are connected with financially abilities of the Ministry of Education, Youth and Sports that is responsible for education in the Czech Republic and that is providing financially support to the universities for providing education.

THE INFLUENCE OF ENVIRONMENT EDUCATION ON CRITICAL THINKING AND ENVIRONMENTAL ATTITUDE

Serhat ARSLAN [87]

ªSakarya University Faculty of Education, Sakarya, Turkey

Abstract

The purpose of this study is to investigate the influence of environmental education on students'critical thinking and environmental attitudes. The sample of the study included 8th grade students from five schools which were randomly selected from different districts of Sakarya.

Survey research method was employed in the study. The Critical Thinking Test in Environmental Education (CTTEE) was used in order to measure critical thinking skills of the students in environmental education. The test is comprised of three lower dimensions titled as "Conclusions, Inferencesand Identifying Bias". The environmental attitude scale, which was also used in the study. In this study, it was attempted to determine the variability in the outcome variable and to question whether critical thinking is attributable to gender, socio-economic status and school type. The results of the study suggested that the subjects in the sample have an average critical thinking skills level in environmental education. Ancova and t-test results also showed a meaningful statistical significance in the students' critical thinking skills and attitudes towards the environment in terms of gender, socio-cultural level and school type.

Moreover, in accordance with the results obtained from the study, it could be stated that The Critical Thinking Test in Environmental Education (CTTEE) may be used to identify critical skills of primary school students and the Environmental Attitude Scale may be employed as a useful measurement tool to determine the attitudes of the primary school students toward the environment.

*Keywords:*Environmental Education, Critical Thinking, Environmental Attitude

1. Introduction

Developments about economics, society, science and technology have affected our life styles to a great degree. Especially the effects of scientific and technological developments in our lives and enviroment can be seen in present day more than it was the case in the past (Kaushik & Kaushik, 2010). New dimensions which the notion of the enviroment (Bary, 2007) carry have exposed that the enviroment should be examined not only at the national level but at the international level with new approaches.

Enviromental problems (Bonnett, 2007; Mert, 2006), have reached to the important points in 21 th century and continue to grow rapidly. Global warming, deterioation of the natural life, perferotion of the ozon layer, conservatory effect, rise in the solid waste, nuclear pollution, decrease in green areas, extinction of some kind of animals and plants can be showed as some enviromental problems. Moreover, parallel to the rise in the population of the World, increase in the necessities of the people and their consuming of the natural sources uncounciously, and again uncouncious works in order to save the nature can be seen as reasons of the enviromental problems (Symth, 2004). In 1972 Stocholm Conference which was orginised by the UN the enviromental problems were put forward for the first time and from that time onward te enviromental problems have become one of the most important topics which preoccupies the world agenda (Young, 2009).

[87] Serhat ARSLAN
E-mail address:serhatarslan@sakarya.edu.tr.

The most effective way in order to solve the enviromental problems (Pooley & O'Connor, 2000; Stevenson, 2007) is the education of the societies. Education about enviroment has become an individual and social necessity which was caused by the enviromental problems that have been at the top on the world agenda all the time. As the problems about enviroment grow and as the sensitivity about the enviroment increases, the importance of the enviromental education also becomes more important. (Alım,2006; Dunlap & Liere, 1978). The education about enviroment aims not only an increase in the educational knowledge of the individuals but also turning the positive attitudes about the enviroment into behavior.

While the education about the enviroment gets more importance in the changed world, as a natural consequence of it, enviromental education gets higher attention in the educational curriculums of the countries (Jensen&Schnack, 1997). However, it is impossible to say that the point we have reached is enough.

It can be seen that (Palmer,1998; Shapiro,2005) both in the world and in Turkey there have been an important developmency about the enviromental consciousness about the understanding, preveting and solving of the enviromental problems in last years. At last we know that in the origin of the enviromental problems, there are social, economic and cultural factors and they will not be able to be solved by using technology solely. So, the basic tenet for the enviromental education is to continue to educate people about their values, attitudes and behaviors which they hold towards the enviroment (Rempel, 2009; Wilson, 2004).

When the new educational programs about the enviroment is examined, it can be seen that in Turkey the education about the enviroment takes an important place in programs. In primary school educational program, the enviromental education starts with the grade 4 and it aims to make the students gain the very consciousness and knowledge of the enviroment.

In the new education programs about the gainings of the enviromental education are the representing the enviroment in phisical, social and biological sense as a whole. Moreover, finding the factors that affect the natural enviroment, the negative results of the having damaged enviroment on people and societies, teaching the bad results of the wasteful behaviors and preventing them are the main targets.

Furthermore, critical thinking which has an important place in the programs of the primary schools is a subject that has been worked on for a long time in Turkey. Critical thinking (NAS,1996) is an ability that is among the abilities studied in the primary school programs. By changing the educational programs, teaching approaches that increase the critical thinking are given importance. With renewed primary school programs, growing critical, creative, searcher, inquiring, entrepreneurial individuals are targeted.

Among these basic abilities (Bailin, 2002 & Phan, 2010) critical thinking provides people looking at the subjects with suspicion, making interpretaion about them, deciding and teaching the learning effectively. When the relationship between the place and importance of the critical thinking in education is described clearly (Nolan, 1997) the necessity of the critical thinking in education shows up itself naturally.

2. Research Method

The sample of the study was composed of 346 students of eight grade secondary schools in Sakarya, Turkey. A sample of classes of five middle school representing five demographically different schools were included in the study. The schools included in the study ranged from low socio-economic status to high socio-economic status. 173 male and 173 female subjects took part in the study.

The Critical Thinking Test in Environmental Education (CTTEE) was used in order to measure critical thinking skills of the students in environmental education. CTTEE was developed by Chiek (1999). CTTEE was adapted in Turkish by the researcher. The test was comprised of three lower dimensions titled as "Conclusions, Inferences and Identifying Bias". The CTTEE covered three of many broad areas of critical thinking skills and abilities in the domain of environmental education. Section one measured students' critical thinking ability in the area of conclusions. Section two measured students' critical thinking related the area of inference making.

Section three measured students' abilities to identify the bias. The length of time for taking CTTEE was set at 45 minutes to fit into a course.

Before conducting the research necessary permissions were taken from the instititons in charge. The field test of the CTTEE was conducted during one class period at each of the respective schools. The field test of the CTTEE was conducted during one class period at each of the respective schools where the sample was formed by random sampling . Specific directions were given to the eigth grade teacher for administration of the test to ensure that the testing environment and procedure was identical for all participants. Participants were informed of the purpose of the study and understood that any data collected had no bearing on their course grade and would be kept confidential by the researcher. Respective teachers were unaware of any individual participant's score on the CTTEE or other data collected on the subject. Data collected via the test which could damage the reliability and validity of the research were eliminated and were not used for analysis.

The field test of the CTTEE was conducted during one class period at each of the respective schools. Specific directions were given to the eigth grade teacher for administration of the test to ensure that the testing environment and procedure was identical for all participants. Participants were informed of the purpose of the study and understood that any data collected had no bearing on their course grade and would be kept confidential by the researcher. Respective teachers were unaware of any individual participant's score on the CTTEE or other data collected on the subject.

This research attempted to address the effects of specific published environmental education curriculum guides on secondary school students' (eighth grades) critical thinking skills. Two paired sample t test and ANOVA was used to compare the differences in variables in question which are gender,socio-economic status and school type. Effect size was also calculated for differences between independent and depended variables and the significance level of the research questions was set at .005. Before the statistical analyses were conducted, distributions of the data were examined for underlying assumptions and it was concluded that distribution of data met the assumptions of normality and linearity. These analyses were carried out via SPSS 13.0

3. Results

An item analysis of the CTTEE was accomplished using a point-biserial correlations on each item, determination of the difficulty level of each item and descriptive statistics. This involves a process of reviewing each individual test item as a way of informing the contribution of that item to the quality of the test as a whole. Data were gathered to determine the difficulty level of each item. The difficulty level should range between .25 and .75 for the purpose of norm-referencing the test. The difficulty level refers to the proportion of subjects who respond correctly to an item. The point-biserial is a special case of the Pearson r, with one variable a quantitative variable measured on an interval scale (score on the CTTEE). Descriptive statistics were calculated to give a measure of the high and low score, the range of scores on the test, the mean and the standard deviation for primary school.

Table 1: Analising the results of the items		
İtem N	P	rjx
1	.70	.65
2	.55	.50
3	.88	.51
4	.77	.40
5	.82	.47
6	.38	.40
7	.78	.39
8	.59	.50
9	.38	.40
10	.74	.42
11	.55	.54
12	.73	.57
13	.88	.51
14	.67	.38
15	.74	.45

When hardness indexes and differentiations of the items were examined, none of the items were put out of the test. If the value of the differentiation of an item is above 30, it shows that the item differentiates the students who know and who do not know.

A measure of reliability is important information to gather on a test to determine the quality of the internal consistency. In this sense, reliability is a measure of the extent to which the CTTEE measures one underlying ability. Acceptable reliability estimates on critical thinking tests range from .65 to .75 and tend to increase with the level of sophistication of the examinees. The Cronbach's alpha was used to determine the reliability of the CTTEE for primary school.

Table 2: Analising results about the critical thinking in enviromental education

N	$\overline{X}$	S	P	Realibility	Differentation
73	10.15	3.03	.67	.73	.63

When the Table 2 is examined, the analising results of the test according to 73 students can be seen. The arithmetical average of the test is ( )=10.15, Standard deviation is (s)=3.03. the average value of the hardness of the questions in the test is (p)= .67 the level of the hardness in the test shows that the questions are hard in the medium level, that is they are neither difficult nor easy for the students. Generally the average value the hardness of the item is wanted to be .50 in the tests that measure the success, this very value is highly suitable for the students that have been tested. The reliability of the results is .73. that means the test is highly reliable. In the studies it is expected that the value of the differentiation of the test is .40. The analising reports has showed that value of the differentiation of the test is .63. with this value it can be said that the differentiation value of the test which differentiates the students who know and who do not know is quite well.

The research also investigated the extent to which middle school students' critical thinking was influenced by students' gender, socio-economic status and school type. An analysis of variance was used to test assumption that the variances of mean scores between groups were different. To investigate whether the CTTEE test scores of students differ according to gender, a t-test for an independent sample was applied to the data and the results are shown in table 2.

Table 3: Independent Sample t-test results regarding CTTEE test score according to gender

Variable	School type	N	$\overline{X}$	Sd	t	df	p
CTTEE test score	Female	173	10.5	3.12			
					1.48	344	.000*
	Male	173	8.3	3.38			

p<.05 *

The results of t-tests indicated that, the mean values of importance were different when average scores of female participants were taken into consideration. A significant and meaningful difference was found in female students' average scores of critical thinking skills in environmental education. For the girls, a independent sample t test revealed a significant difference.(t (344)=0,00, p < .05). The mean scores of critical thinking skills in environmental education of the girls was 10.5, whereas the mean scores of male students' skills of critical thinking in environmental education was 8.3.

The results of ANOVA indicated that there was a significant difference between groups according to students socio economic variable as measured by the scores on the CTTEE. Levenes's test of homogeneity of variance test was conducted and it was concluded that variance of dependent variable was equal across groups when controlled for the effects of the test scores.

Table 4: ANOVA test results regarding the CTTEE test score according to students socio-economic variable

Source of Variation	Sum sq	df Mean sq	F	Sig.(p)	Tukey HSD(Sig.Dif.)
Between Groups	254,299	4 431,735	6,33	,000	L.I.-M.I. L.I-H.I M.I. H.I
Within groups	3421,458	341	115,964		
Total	3675,757	344			

L.I .low income, M.I. Medium income, H.I High income, p<.05 *

The results of ANOVA indicated that there was a significant difference between groups as measured by the test scores on the CTTEE (F(4;341) =6,33; p < .05).At the end of the analysis conducted by using Tukey HSD test to determine the direction of this meaningful difference, it was concluded that the Cttee test score of high income level students (x=10.2) were significantly higher than the medium income level students (x=7.6). Cttee test score of medium income level students were significantly higher than low income students (x=5.4).

To investigate whether the CTTEE test scores of students differ according to school type, a t-test for an independent sample was applied to the data and the results are shown in table 5.

Table 5: Independent Sample t-test results regarding CTTEE test score according to school type

Variable	School type	N	$\overline{X}$	Sd	t	df	p
CTTEE test score	S.S.S.	201	7.6	3.4			
					4.3	344	.000
	P.S.S	145	10.3	2.8			

S.S.S. State school students, *P.S.S.* Private school students p<.05

The results of t-tests indicated that, the mean values of importance were different when average scores of private school were taken into consideration.. As seen in table 5, private school students' have a mean CTTEE test score of 10.3 and state school students' have a mean CTTEE test score of 7.6. A significant and meaningful difference was found in private schools' students average scores of critical thinking skills in environmental education (t(344)=0.00, p < .05)

4. Conclusion

The purpose of this study is to investigate the influence of environmental education on students' critical thinking. The findings of the research are extremely significant for educators and elementary school students. A

significant difference was found between students' socio-demographic variables and their critical thinking skills in environmental education. Socio-economic level of the individual with the rise of the social environment was effective in this result.The extent and range of facilities provided by the families make it easier for the individuals to have the opportunities that they desire. The socio-economic levels of students (Buntod, Singseevo & Suksringam,2010; Cheung, Rudowic, Kwan, Lang, & Yue, 2001; Öztürk, 2006) affects critical thinking skills. There was a positive correlation between socioeconomic levels of students and their critical thinking skills in environmental education. In this case, the results revealed that there were differences between children belonging to upper socioeconomic level and lower socio-economic level families in terms of opportunities they had. Thanks to the technological tools which give the opportunity to explore and ease access to information children can develop themselves, participate in educational activities, become more self-confident, have the ability to think critically and catch up with the latest advancements.

A meaningful difference was found between students' gender and their average scores in critical thinking in environmental education test. It can be concluded due to some features of cultural and social constructs female students become much more attentive to the environment and the events happening around them when compared to the male students. Also it could be said that another impact of social and cultural constructs on female students is that, female students show a tendency to use crtitical thinking skills in dealing with the problems and situations related to environment. Several studies (Bartosh, 2009;Shepardson,2005; Yıldırım, 2009) examining the issue also revealed similar findings. Because social identity, once formed, after the detection of individuals styles and forms of motivation, attitude and behavior patterns can lead to differences in terms gender. Approaching the issue from this perspective, it could be said that the social structure and social learning, may help girls grow up as individuals who have to deal with more problems when compared to men, become more attentive to details, have more confidence in themselves and their thinking processes and possess the abilities to think flexibly

At the end of the analysis conducted, a meaningful dfference was found between students school type and their average scores in CTEE test in terms of independent sample t test results. Besides the facilities provided by private schools and the endeveour to use existing resources for the benefit of students, the quality of teaching staff that private schools have could be said to have an effect on the difference in results obtained from two groups. It can also be concluded that facilities conducted to increase students awareness towards nature and environment and encouraging the students to participate in such kind of activities improved students critical thinking abilities. Besides, success of a primary school program formed taking general aims of environmental education into consideration is directly related with undergraduate education and pedagogical formation that the teachers have received. It is of great importance the pre-service and in-service education that the teachers receive in order to help the students develop active critical thnking skills in environmetal education at the utmost level. It could be said that teachers' pedagocial formation on the subject, the extent they believe in its importance and the attitudes they hold towards it, are probably the most crucial features of the issue. In order to set students critical thinking skills in environmental education permanent, environmental education should be given in such a way to help the students recognize the environment and culture in which they are living, should be relevant to real life experiences and sequenced from concrete to abstract and should include techniques such as thinking big, thinking linking, thinking for decision making and analytic thinking.

The reasons for this kind of result can be showed as disapplication of the educational activities in the way of developing some abilities of the students like critical thinking, logical thinking, inquiring etc. The most important reason of this disapplication is the inefficiency of the teachers who were educated in traditional schools in traditional ways. Moreover, the study has showed clearly that the teachers who are the applicators of the educational programmes that target critical thinking and other important values in students must be having these very features for themselves. The results of the study also have showed that all lessons are responsible for teaching the critical thinking to the students but it has been emphisized wrongly that especially the lesson of science and technology is made responsible for the such kind of abilities.

5. Recommendations

In the light of this study, some suggestions can be offered for both education and future studies in this field.

Teaching programs written for enviromental education should not just teach qualitative information but it should increase the awareness of the students towards nature and enviroment. Beginnig from the preschool period, practical enviromental education should be given more importance. In educational programs, beside introducing the enviroment to students, giving messages that makes students love the enviroment, especially the danger that the enviromental problems cause should be emphisized. In primary schools, again practical enviromental education programs should be given importance, at the level of units practical education should be practiced.

In the education of enviroment, individual differences, needs, abilities, viewpoints of the students should be realised and teachers who apply these teaching programs should be having great task. Teachers should develop programs about the enviromental education, they should be giving importance that these programs are increasing the awareness of students about the enviroment. The strategies that are suitable to the needs and abilities of the students should be selected. Democratic enviroment should be formed by supporting activation of the sudents and their solutions developed about the enviromental problems

Furthermore, voluntary establishments should be take a part in this education. Various civilian establishments, associations, clubs, unions shoıuld arrange some activities in order to increase the awareness of the students towards the enviroment. By providing the active involvement of the induviduals and taking attention of the public opinion, some applicable activities and competitions sholuld be arranged. seminars, symposiums, open sessions, panels and likewise meetings should be organized and the public should be made conscious about the subject. By using the mass communicative instruments, enviromental education should be extended and the big amount of the society can be reached especially through internet and media.

THE PROFILE OF ACADEMICALLY TAUGHT TRANSLATORS AND THEIR ROLE IN THE PRACTICE

Muharrem Tosun[a], Sevinc Kabukcik[b][88]

[a]Sakarya University, Fen Edebiyat Fakültesi, Çeviribilim Bölümü, Esentepe Kampüsü, Sakarya 54187, Turkey

[b] Sakarya University, Fen Edebiyat Fakültesi, Çeviribilim Bölümü, Esentepe Kampüsü, Sakarya 54187, Turkey

Abstract

The translator's profession is not limited to a linguistic knowledge. A translator needs other qualifications so that he can produce qualified and reliable translations in the translation practice. These qualifications are academically taught in translation departments. An improvement in translation practice can only be possible through the influence of the translation studies on the practice.

Keywords: translator, education, qualification, profession, theory, practice, foreign language, responsibility, task

Introduce

To be able to make regulations to standardize translations and translatorship, it is necessary to change the common idea that anyone who knows a language can translate easily. Changing this idea does not necessarily mean that only translators with an academic education will translate. If each translation type and field could go through a certification or an accreditation process, this could contribute to the solution of commonly mentioned '' unqualified translations'' and translators '' with no work ethics'' (Parlak, 2011:88).

Translators complain that their occupation is not considered as a profession, they want translations to be done by competent translators and they want the readers to look for good translations and to criticize the unqualified ones on the other hand they do not want the readers to buy bad translated works.

Such complaints of the profession and bad translators are related to translators' qualifications and how people see translation. What does it mean to become a professional? It is not that hard to answer that question. When people need the translation of an official paper, they go to professionals, which is enough for us to understand the importance of translation as a profession. However it is not possible to see the same situation in unofficial establishments. It is not the professional translators but the ones who do not know the translatorship and qualifications of a translator which should be responsible for the complaints about unqualified translations.

In the market it is not regarded if a translator is professional of if he is competent in translation, which makes it hard to define translatorship as a profession. For an occupation to be a profession, the performers of that occupation should have academic education. Translatorship is not an artisanship as bakery or hairdressing rather it is an academic profession. It requires a diploma in the field, being an expert on texts and theoretical knowledge.

Unless there is a standard for the quality and the profession, neither the value people give to translators nor the value translators give to the works to be translated will change. The quality of translators is reflected on the reputations of translatorship as a profession and on the payment. The unqualified translations are the results of the uneducated translators with no competence in the profession; furthermore unqualified translations even affect the reading rate in Turkey.

2. Translator Profile Targeted In Translation Education

As long as translation departments are considered to be restricted to foreign language teaching, the approach on translation and translation departments will not change. Until they start academic education in translations, for different reasons the students do not have a solid basis neither for their mother tongue nor for the foreign language. Students should have overcome grammatical issues by the time they start academic education. For this reason there is preparatory class in most of the departments. The language acquisition is supported with related classes throughout the education process.

It is a great misconception that teaching foreign language and culture is more important than other information in the field. The translator will need his mother tongue and culture and the terminology of the relevant field in his own mother tongue more than source language and culture. Improving mother tongue, foreign language and world knowledge is not limited to the years before academic education so during five years of study, students are given classes related to improving both mother tongue and foreign language, other than those lessons about both cultures and history of culture, communication and other specialized field topics are given along with translation theory and methods. Furthermore the departments aim to create a translator profile with applied translation lessons together with theoretical knowledge and they integrate the studies with project works.

The way to translation competence is comprised of basic equipment and an improvable array of broad knowledge on culture in other words culture competence and expertise. Expertise can be examined in two categories. The first is the knowledge on translation theory, translation methods and translation studies and the second is the knowledge on other fields as translation studies is interdisciplinary. Translator has to acquire field information and text culture as well. For example one who does law translations has to be equipped with knowledge on law and the text tradition of the field (Eruz, 2004:158).

In academic translation criticism, errors occurring from foreign language deficit are not taken into account; this indicates that translation is more than merely a language transfer. According to H. G. Hönig translation errors arises from the inefficiency of mother tongue, time pressure, lack of motivation and concentration and inefficient knowledge of theory or method but he does not mention inefficient foreign language knowledge (Snell-Hornby, 1994:232-233). Foreign language knowledge cannot be the sole element in interpreting the translation process.

3. The Features And Qualifications Of A Professional Translator

Translation process starts with the need of communication of the society or the individual who needs the translation. Translator is not the one in need of communication, but the other people who need translation. In other words translator conducts a job arising from social needs. In this case translator is the expert who is assigned to provide the communication between the one who needs the translation and the source-text writer, and to fully understand the relevant text, interpret it and re-write it in the target culture with the similar communication goal. Translators and interpreters are text experts who produce texts in order to provide communication (Maenttaeri, 1984: 155). If translator regards its assignment as merely restricted to foreign language knowledge then his translations cannot go beyond language transfer. What is determinant in translation process is not the language knowledge but other factors. The translator is capable of handling the foreign language issues of the text he is assigned. The responsibility of the translator is to understand the source-text and the rest is about target-text production. There are some qualifications for the translator to be able to understand the source-text, interpret it and produce a new text with the relevant targets and functions.

When we define the qualifications of a translator, we can better understand the importance of the task he is carrying:

Broad world knowledge, culture. Translator should also have experience in specific fields. He has to have a general knowledge and culture on technique, public relations, business administration, economy, law, literature and arts.

A wide knowledge on literature and arts

An ever improving mother tongue and cultural knowledge

An ever improving foreign language and cultural knowledge

Knowledge on translation theory and methods

Ability to analyze source and target-texts, knowledge of translation strategies and terminology, ability to produce target-text and handle criticism

To have knowledge of applied translation field (Kautz, 2000: 18).

The abovementioned qualifications clearly indicate that just foreign language knowledge is not enough to perform translation task which is complicated and which requires extended experience. We can also say that language and culture knowledge are not enough to lead the translation process. A translator who is equipped with competences that can only be taught by academic education and theoretical knowledge is ready for the translation market as a professional. Translation requires expertise and it is gained through academic education. The expertise in the field cannot be obtained without academic knowledge. It is surprising that many professions such as hairdressing, cooking and repairing requires certificates of education but in Turkey translation is performed with no education at all. Translation in that sense can only be compared with engineering, law and medicine where you need to complete an academic education.

Translator is a qualified expert of communication, a conveyer of knowledge and culture and he carries social responsibility and has to be accountable. Ethics and responsibility is crucial for the profession. There is a few professions where you need to take an oath and translatorship is one of them. Translator signs a paper to guarantee the accuracy of his translation, he makes an agreement with notary and each of his translation is sealed by the notary. In publishing houses translated texts are controlled by a redactor or the editor. Even if the controllers do not have enough foreign language knowledge they can examine the translated texts with their proficiency of mother tongue and expertise with relevant texts. The controller of the interpretation is the speaker of the source-text and the audience. The speaker himself and the audience and their interaction are the keys to the control mechanism of the accuracy interpretation.

There are also some individual qualifications for a translator to perform translation task. These qualifications are as follows:

The translator should be reasonable and have the ability to analyze and assess. These qualifications are necessary in order for the translator to analyze the source-text. The translator and the interpreter can use these qualifications to make sound solutions, to keep the subject in mind and develop the subject and to foresee the expectations of the target audience.

Strong analysis ability is the precondition for creativity. Creativity is indispensible both for the translator to rewrite the target-text and for the interpreter. Such factors as individual abilities, motivation, interests, feelings and the environment where the translation is being done affect the translator's creativity. Creativity is a relative concept which changes according to different texts. Each translator can pick up a subject that is suitable for his own creativity. Curiosity, interest, stability, readiness for risk taking, being innovative rather than having a traditional approach are as important as the creativity itself. The creativity of the translator should be encouraged during education and in profession.

Intuitional experiences play important role in understanding the subject and transfer. Strong sense of intuition is important for a translator. To have such an intuition the translator has to have a good knowledge on the related subject.

For unconscious thinking and comprehension the translator should rely on his intuition, he should be able to criticize himself and his decisions consciously.

The translator can only integrate with new subject areas and the task he is doing if he has enough motivation and good world knowledge.

A wide knowledge and readiness to perceive the new one and transfer of language are indispensable for his profession as the translator and the interpreter will never come across the same subject and area of expertise. As a result he has to be open to innovations.

Translator's ability to express himself and to present arguments and his feelings are crucial for communication and communicative competence (Kautz, 2000:21-22).

4. The Importance of Responsibility and Ethics in Translation

Ethics and fidelity in translation is a sophisticated subject and is open to different approaches. What is important is that the translator does not translate word for word with goal of fidelity but he transfers the information without misconceptions and falsification. If the translator is faithful to the words of the source-text we can say that he is not faithful to the idea in general. When the translator is faithful to the message of the text rather than the words, he is usually blamed of not being faithful to the text. What is more important? The words of the source-text or the message they are conveying?

Translatorship brings about duties and responsibilities for the translator. Translator is an expert conscious of his profession and he is faithful to his task. It is important for the translator to fulfill the expectations of target audience. What determines the faithfulness and the responsibility of the translator is his faithfulness to the source-text and his ability to combine this bond of faithfulness with other factors while producing the target-text. The translator has to be equipped with academic knowledge about the possible subjects he might encounter so that he can create such a responsibility and work ethic.

Holz-Maenttaeri (1984) describes translation as an action and process where the translator fulfills specific targets in specific conditions and has a responsibility for the initiator. According to Maenttaeri the translator places his action and task in the center of all translation processes. Translator's action is goal-oriented and it is an analyzing process. In this context, faithfulness is an important concept that comes to the fore. Faithfulness in translation process is not the faithfulness to source-text or to writer but to the profession of the translator. In that sense the translator has to be faithful to the translation task he is doing. Therefore we can categorize translations into two; the first is the 'faithful translations' in which translator is faithful to the initiator, in other words to his audience and common goals of the translation and the second is the ''unfaithful translations'' where the translator is only faithful to source-text and ignores translation competence and the functions of translation. In this regard, fidelity gains a different approach than Schleiermacher's '' the spirit of the original''. It is important to convey the spirit of the writer's message rather than the spirit of the original language. When the translator follows this path he will shape the target-text according to the spirit of the initiator and the spirit of the translation.

In fidelity the translator cannot just set aside the source text writer because the most important thing here is the faithfulness of the translator to his profession, his personality and honesty. This concept of faithfulness is crucial for a healthy translation. Translator should not do a translation that he thinks is inaccurate and he should not make deliberate changes in a concept in the source-text, translator should be doing this with the consciousness of his task. Translator's responsibility and faithfulness can be named as such:

Translator should have a sense of responsibility. Sense of responsibility means discipline, reliability and punctuality. A responsible translator will correct the faults in the source-text while producing the target-text, either by talking to the writer or in some other ways.

Faithfulness and honesty is expected from the translator. Translator should be honest to the initiator, target-text audience and the source-text writer and this is not an easy task. The interpreter should be honest to his audience as well; in general the translator should be impartial.

Some translators are expected to change the idea and style of the source-text, the concept of '' customer oriented'' behavior is a complex issue. Even though sometimes translators know the subject better than the writer and can express in a better manner, translator should keep his individual thoughts to himself and should remain his ideal translator behavior. This behavior would not harm the translator's self-respect. In some extreme cases the translator has the right to expect some behaviors for himself and his work ethics. (Krşl. Kautz, 2000, 24-25).

The translator should have a balance between modesty and self-confidence; he should be confident in what he is doing and of expectations and he should rely on his own capability. If needed translator should be able to defend his work like an expert when he comes across criticism. The interpreter should not put himself in the speaker's shoes but rather stay as the mediator. It is an advantage if the translator has a healthy ego.

5. The Effects of Translation Education in Translation Market

As a profession translatorship requires a lot of qualifications; a translator should have knowledge in different fields such as economy, business administration, communication sciences, engineering, medicine, law, pharmacy, language and literature etc. The translator should have an expert-like knowledge sometimes in one or a couple of these fields. Translators working in a translation bureau can become experts in law because they are constantly comparing law system of a foreign country and theirs, they can become more equipped than a lawman as they are exposed to law all the time, they can even offer consultancy and gain expertise in law texts tradition since they are producing them continuously. It is a fact that Turkish counselors and translators in Germany, do more than translating for their Turkish clients and they represent their clients in courts, state offices and in trade affairs. For people working in abroad and seeking their rights, the translators become lawyers and counselors. Translators learn the law tradition of a foreign country and they use their knowledge and interpret law for other people. In that case people consult to translator rather than lawmen.

It is a fact that some interpretation and translation tasks are given to experts of that field such as engineers and scientists because translators do not have efficient knowledge in the field. As a result people are unsatisfied with the translation, because a translator should have undertaken the task in the first place; this unsatisfaction is a major disadvantage for translators. Translatorship has never fully acquired the respect it deserves in almost any country. In many professions the faults of the inexperienced people are easily noticeable for example if a doctor is mistaken the result is obvious or if a lawyer loses the case he can be blamed for his inefficiency even an unqualified cannot open a barbershop or bakery, but it is sad to see that even though translation affects the life, future and the culture of a society people with no qualification can easily perform a translation task. Even the publishing houses, state offices and in academic publications the situation remains the same.

As a result there is no distinction between qualified and unqualified translation and people come to the conclusion that translation is an easy task so there is no need for an expert. In translation market qualifications of a translator do not come into question at all. This tendency is the result of the inefficient number of graduates from translation and language departments. The need for qualified, professional translators is more than these departments can meet. The qualified translators are equated with unprofessional and unqualified people and as a result they do search for work in different fields; the books are translated by unqualified people and the role a translator can play in the international communication is ignored. When translators prove the value of a professional with the works they have done, they will find a chance in the market and the need for professionals will rise. This is a mutual requirement. Employers working with professional translators will see that they will have a better share in the market while the translators become more conscious that quality of their work serves to the recognition of their profession and value within the interests of the country as well.

Only in this way the public opinion about translators will change and they will widely be recognized. Professionals, who do qualified translations and fulfill the needs of their employers or somehow contribute to business connections, can change the opinion about their profession and they can also prove that translatorship is as important as medicine or law etc. Therefore translators should take this responsibility for serious. As in many business affairs translation market has a competitive environment. The rival of the translators is himself and the establishments which do not value his profession.

THE RELATIONSHIP BETWEEN ELEMENTARY TEACHER CANDIDATES' ATTITUDES TOWARDS PROBLEM BASED LEARNING AND PROBLEM SOLVING SKILLS

Mustafa KAHYAOĞLU[a][89]

[a]Faculty of Education,Siirt University,Siirt, 56100, TURKEY

Abstract

The purpose of this research is to determine the relation between elementary teacher candidates' problem solving skills and attitudes towards problem based learning. Furthermore this research intend to determine if there is a significant difference in elementary teacher candidates' problem solving skills and the attitudes towards problem based learning according to the variables of gender and their education program, or not. The research was carried out with a total of 199 third and fourth grade teacher candidates (100 female, 99 male) from Elementary Department of Faculty of Education at Siirt University in Turkey. It was used the "*Problem Solving Inventory*" which was developed by Heppner and Peterson (1982) and translated into Turkish by Şahin, Şahin and Heppner (1993) to determine the problem-solving skills of the teacher candidates' and the "*Problem-Based Learning Attitude Scale*" which was developed by Turan and Demirel (2010) was used to determine their attitudes towards problem-based learning. In our research, it was calculated that the Cronbach alpha reliability coefficient of problem solving skills as .78 and the scale of attitudes towards problem based learning as .93. As a result of this research, the problem solving skills (M=87.91) and the attitudes towards problem based learning mean score (M=68.15) of elementary teacher candidates' were found as medium level. It was found that there is no significant and negative relation between the elementary teacher candidates' problem solving skills and attitudes towards problem based learning (r= -.54; p>0.05).

Keywords: Attitudes, problem, problem-solving skills, problem based learning;

Introduction

In our day individuals are spending their energy and most of their time on problem solving and decision making progresses because of even more complicating social structure, technological developments, political, social and economical problems. D'Zurilla (1971) determines the term problem as a situation, where the individual experiences difficulties on answering internal and external missions. According to King (1981) the term problem is a situation that leads to doubt uncertainty. Morgan (1999) claims that the problem is a conflicting situation, where the individual encounters some obstacles on the way to his target. Semerci (2001) defines the problem as a situation, which the individual is unable to solve with his present reactions. According to Karasar (2004) every situation, that disturbs the individual physically and mentally and where indecision and more than one solution exists. Accordingly, a solution requires the use of the most complicated mental skills. In other words. Problem solution is an activity made for revealing the "unknown" in a systematic and analytic way, where the start point is the "known". Heppner (1982) uses problem solving as a synonym of dealing with problems. Aksu (1998) describes problem solution as a progress of winning the difficulties encountered in the way of a purpose. Problem solution is a quite complicated progress, that covers the cognitive skills, but also affective and behavioral features. Saygılı (2000) approaches the affective factors on problem solving as; individual factors (intelligence, motivation, foreknowledge-installation, function hesitation) and sociological factors (socio-economic, level and sociological development of child, child raising applications and manners of families, physical conditions of school and class size). Problem solving is closely related to psychological harmony(Bepner & Anderson 1985), confidence (Erden & Akman, 1995), communication skills and decision

[89] Mustafa KAHYAOĞLU. Tel.: +90 0484 2231224; fax: +0-000-000-0000 .

making styles (Hunsakler and Alessandra 1980), academical and social self-respect (McCobe, Balnkstein & Mills, 1999) of the individual. The lack in problem solving skills may cause in young people to results like aggression (Dodge & Feldman 1990), behavior disorders (Joffe et. al. 1990) drug use (Platt, Scura & Hannon, 1973; Korkut, 2002). Problem solving depends on the type and complication of problem. While some problems can be solved logically, some requires emotional maturity. In order for a situation to be considered as a problem, the individual must ponder upon it and perceive it as a problem (Morgan, 1995). According to Gagne, the purpose of training programs should be to teach to students own to solve the possible problems both on their branch and on real life (Yapıcı & Yapıcı, 2006; Karataş & Güven, 2003; Çalışkan, Selçuk & Erol, 2006; Polat & Tümkaya, 2010). The education mentality of today expects from students to extract distinctive meanings from their experiences and to structure what they learned with distinctive strategies by proceeding them (Açıkgöz, 2007). Problem Based Education is an approach, that aims to have students gain the skills of learning with self-governance, independent studying, questioning and problem solving, is an approach that provides the students to self-research and learn whenever they encounter similar situations during their lifetime. This approach is based upon from real situations forming problem situations and scenarios. Learners, under the guidance and management of the teacher, learn to discover, analyze, solve the problem and to gather the required data to learn both individually and in groups. Problem Based Education plays an effective role in revealing the before learned dates of student, providing the learning to happen and obtaining the permanent data by organizing and giving meaning to the data. Teacher are the main source t help the students to improve their problem solving skills. This situation provides the students with opportunities of problem solving, and helps them to raise as good problem solvers in future. In this situation teachers' understanding, belief and approaches problem solving is important. Therefore it is believed that revealing teacher candidates' skills of problem solving and approaches problem solving is important.

Purpose of these studies is to determine teacher candidates' problem solving skills and problem based learning oriented approaches. In pursuance of this purpose answers for following questions were sought:

1. What kind of relation is there between teacher candidates' problem solving skills and problem based learning oriented approaches?
2. Is there any difference between teacher candidates' problem solving skills and problem based learning oriented approaches, based upon gender and the program they study in?

2. Method

Participants

The study was conducted in the spring of 2009-2010 academic year at Siirt University in Turkey. Participants were 199 candidates of teachers who were attending at primary class and sciences education departments in faculty of education.

Data Collection

A descriptive survey research design was used in this study. As a mean of data collection; person information forms developed by the researcher and problem solving inventory which is developed by Heppner & Petersen (1982) and adapted to Turkish by Sahin, Sahin & Heppner (1993) and the attitude scale towards problem based learning which is developed by Turan & Demirel (2010) are used. Problem solving inventory aims to measure the reactions against the problems, individuals face in lifetime how they perceive their own problem solving skills. From 35 items, attained by positive and negative formulas in the scale 32 of them are taken into evaluation. Items have answers suitable for six point gradation. Confidence in problem solving skill, self control and approach avoidance subscale take place. High points indicate how low isperception of problem solving skill (Şahin, Şahin & Heppner, 1993). The results obtained from the studies of adaptation, validity and reliability show that the scale can be used for research in spite of some restrictions (Taylan, 1990, Savaşır & Şahin 1997).

Content of the inventory is consisting of 35 items as a six pints Likert scale. Some of the items are positive while some are negative. Scale shows the scores relating to the total scores of problem solving skill perception and subscales. Given answers are scored from 1 to 6. During the scoring 9th, 22nd, 29th items are excluded; therefore scoring is made out of 32 items. Items numbers 1, 2, 3, 4, 11, 13, 14, 15, 17, 21, 25, 26, 30 and 34 are scored adversely. The range of the inventory scores is between 32 and 192. Highest scores obtained from the scale indicated that individuals percept themselves inadequate in problem solving. Oppositely if the scores are low then it is the sign of positive perception of problem solving skill. The Cronbach alpha coefficient of reliability of the original scale was calculates as .88. In this study made by us the Cronbach alpha coefficient of reliability of the scale was calculates as .78. The attitude scale towards problem based learning was developed by Turan & Özdemir (2010) and consists of 20 items in 5 points likert type. Cronbach alpha coefficient of the scale was indicated as .95. in our study, the Cronbach alpha coefficient of reliability of problem based learning attitude scale was found as .93.

Data Analysis

SPSS 16.00 statistic program is used for the analysis during the analysis arithmetic means and standard deviations of the problem solving skills and attitudes towards problem based learning level scores are calculated. t-test are applied in order to find whether the differences between the arithmetic means are relevant or not and Pearson Moment Correlation Coefficient was used. The significance levels for the statistical analyses is accepted as $p < .05$.

Results

Findings of the study that aims to determine of relationship between the problem solving skills and the attitude towards problem based learning are given below.

Table-1. Pearson Moment Correlation Coefficient results about the problem solving skills and the attitude towards problem based learning of elementary teacher candidates.

		Problem solving skills
The attitudes towards problem based learning	r	-.054
	p	.448*
	N	199

As seen in Table-1, it is determined that there is a no meaningful relation in negative direction between the problem solving skills and the attitudes towards problem based learning of the teacher candidates (r= -.054; p> .05),

Table-2. Arithmetic mean and standard deviation of teacher candidates' problem solving skills and the attitudes towards problem based learning

	N	Minimum	Maksimum	$\overline{X}$	SS
Problem solving skills	199	55.00	128.00	87.91	15.65
The attitudes towards problem based learning	199	20.00	100.00	68.15	20.64

As seen in Table-1, the mean of the teacher candidates' problem solving skills 87.91; mean of the attitudes towards problem based learning 68.15. Accordingly, it is seen that the mean of the teacher candidates' problem solving skills and the attitudes towards problem based learning are the medium level.

Table-3. t-test results of teacher candidates' problem solving skills and the attitude towards problem based learning according to gender

	Gender	N	$\overline{X}$	SS	t	p
Problem solving skills	Female	100	85.99	15.11	-1.75	.081*
	Male	99	89.85	16.02		
The attitudes towards problem based learning	Female	100	69.73	20.65	1.08	.281*
	Male	99	66.56	20.62		

* p> .05

As seen in Table-3, the mean of male teacher candidates' problem solving skills (89.85) was higher than female teacher candidates (85.99). This means female teacher candidates' problem solving skills are higher than male ones. The mean of female teacher candidates' attitudes towards problem based learning (69.73) was higher than male teacher candidates (66.56). This means of female teacher candidates' attitudes towards problem based learning was positive than male teacher candidates. It was determined that problem solving skills and attitudes towards problem based learning of the teacher candidates show no meaningful difference in the dimension of gender (p> .05).

Table-4. t-test results of teacher candidates' problem solving skills and the attitude towards problem based learning according to department

	Department	N	$\overline{X}$	SS	t	p
Problem solving skills	Elementary class	123	89.91	16.11	.862	.390*
	Elementary science	76	87.73	14.39		
The attitudes towards problem based learning	Elementary class	123	68.22	18.69	.280	.780*
	Elementary science	76	67.27	22.15		

* p> .05

As seen in Table-3, the mean of elementary class teacher candidates' problem solving skills (89.91) was higher than elementary science teacher candidates (87.73). This means elementary science teacher candidates' problem solving skills are higher than elementary class teacher candidates. The mean of elementary class teacher candidates' attitudes towards problem based learning (68.22) was higher than elementary science teacher candidates (67.27). This means of elementary class teacher candidates' attitudes towards problem based learning

was positive than the elementary science teacher candidates. It was determined that problem solving skills and the attitudes towards problem based learning of the elementary teacher candidates show no meaningful difference in the dimension of department (p> .05).

Conclusion and Discussion

In the study, no statistically meaningful relation in negative direction between teacher candidates' problem solving skills and problem based learning oriented approaches was found. In a similar study made by Serin (2004) it is indicated that there is a meaningful relation in negative direction between the problem solving skills and the approaches for the sciences of the students of Faculty of Education, while there is a statistically meaningless relation in negative direction between problem solving skills and sciences successes of the students. Kocabaş et. al. (2006) stated in a study, that there is a highly meaningful relation between the problem solving skills and the approaches for the program of Class Teaching Master Students, while there was no meaningful relation found for Doctorate Students. In our study, teachers' s and teacher candidates' skills of problem solving and their approaches to problem based education was determined as mid-level. Saracaloğlu, Yenice & Karasakaloğlu (2010) have indicated that class teacher candidates' skill level of problem solving is sufficient. İnel, Evrekli & Türkmen (2011) have stated that class teacher candidates' skill level of problem solving is high. Aslan (2007)stated that Turkish lesson teacher candidates' skill level of problem solving is sufficient. It was determined that teacher candidates' problem solving skills and problem based learning oriented approaches do not differ in regard to gender variables, that female teacher candidates' problem solving skills and problem based learning oriented approaches are higher than male ones. In similar studies, besides the studies that show there is no meaningful difference for teacher candidates' skills of problem solving in regards to the gender (Çam, 1995; Kasap, 1997; Erdem, 2001; Güven & Akyüz, 2001; Serin, 2001; Özkütük et.al., 2003), there is also some studies that contradict (Korkut, 2002). Study of different subjects might have caused to current situation. There is no statistical meaningful difference confirmed between teacher candidates' study program, problem solving skills and problem based learning oriented approaches. As conclusion, problem solving skills and approaches for problem based education of teacher candidates must be determined and time must be taken for improving the problem solving skills and problem based education oriented approaches of low level teacher candidates. If needed, training programs should be prepared in a fitting way with the purpose of improvement of problem solving skills and problem based education activities.

THE RELATIONSHIP BETWEEN THE LEARNING STYLES OF STUDENTS AND THEIR ATTITUDES TOWARDS SOCIAL STUDIES COURSE

Hüseyin Çalışkan[a][90], Güneş Kılınç[b]

[a]Sakarya University Educational Faculty, Sakarya, 54300, Turkey

[b]Yeşiltepe Elementary School, Sakarya, 54200, Turkey

Abstract

The objective of the study is to determine the relationship between the attitudes of primary school students towards social studies course and their learning styles and to put forth the change between their learning styles and attitudes towards social studies course according to their classes. Descriptive scanning model has been used in the study. The research group consists of 320 primary school students. Perceptual Learning Style Preference Survey and Attitude Scale for Social Studies Course have been used as data acquisition tools. As a result of the study, a positive and medium scale statistically significant relationship has been determined between the learning styles of students and their attitudes towards social studies course. In addition, whereas there is a statistically significant difference between the auditory kinesthetic and tactile learning styles between classes, no difference has been determined between other learning styles.

Keywords: Elementary education, social studies , learning style, attitude, grade level

Introduction

Knowing the way students think and how they learn are critical during the design and application of education systems in order to get the best output. To this end, "learning styles" stand out as an important concept. It is expected to see that knowing how individuals think and learn along with the elements that effect these processes will ease the effective learning process (Güven & Kürüm, 2006).

The concept of learning styles first put forth in 1960 by Rita Dunn has been examined many times since then and is still one of the topics that is studied (Boydak, 2006). Researchers who have put forth various models regarding learning styles have defined learning styles in different ways. Whereas Kolb (1984) who has been a resource for many studies that develop the theory of experimental learning by taking the process of learning as the basis, defines learning style as, "ways that the individual prefers in acquiring and processing information" and has explained the learning styles of individuals in four groups as divider, converter, accommodator and assimilator. Whereas Rita Dunn (1993) who has conducted long studies on learning styles has defiend it as the usage of specific ways by students when learning and remembering. According to Cesur and Fer (2009), learning style is the method that the individual has come to get used to for acquiring, processing and storing new information and skills. In other words, learning style represents the approach of the individual to the learning process and his/her general attitude. What determines style in this process is the unique style of perception of the individual and his/her interaction with the learning mediums.

Learning styles are inborn character traits. They have effects on each moment and dimension in the life of an individual. They affect individuals while walking, lying down, sitting, talking, playing, writing and individuals carry out these actions according to this trait (Boydak, 2006). Determining the learning styles of individuals and arranging their learning mediums will undoubtedly increase their success (Dunn & Dunn, 2002). Learning style is the method with which students learn best. The perception of a student, his/her relationship with other people

and the cognitive, auditory and physiological structures that affect his/her behavior define the learning style. There is no good or bad learning style. What matters is to arrange learning activities that are in accordance with the learning style of the student. If the learning styles of individuals are determined, it can be better estimated how they can learn and what kind of a learning activity should be applied. Thus, the teacher can prepare mediums that are suitable primarily for themselves and secondarily for their students (Sünbül, 2004).

The determination of learning styles is important the determination of the dimensions of learning methods that are suited to them through the use of their individual traits and to prepare proper learning mediums for them. In addition, the student who is aware of his/her learning style will be more successful and will have more self-esteem. Another factor that affects the success of students in a particular course is the attitude of the student towards that particular course. Attitudes which are defined as learned positive or negative responses towards certain objects, situations, institutions, concepts or other people (Tezbaşaran, 1998) have direct effects on the learning process and shape the future lives of individuals (Seferoğlu, 2004; Sünbül, Yağız & Arslan, 2003). The negative attitudes of students towards courses like social studies which is considered to be boring by many students can be prevented by carrying out learning style determination studies starting from the first stages of primary school while also increasing the success of students.

The concept of learning style has recently become one of the most examined research topics among studies carried out on science and mathematics education in Turkey. However, the same is not true for the area of social studies (Şeker & Yılmaz, 2011). The objective of this study was to determine the learning styles of primary school students along with the relationships between their learning styles and their attitudes towards the social studies course and to put forth the change in their attitude towards the social studies course according to their class level. In line with the objectives of the study, answers have been sought for the following questions:

1. What are the learning styles of primary school students and how are their attitudes towards the social studies course?
2. Is there a statistically significant difference between the learning styles of primary school students and their attitudes towards social studies course according to their genders?
3. Is there a statistically significant relationship between the learning styles of primary school students and their attitudes towards the social studies course?
4. Do the learning styles of primary school students significantly predict their attitudes towards the social studies course?

Method

Model of the study

Descriptive scanning model has been used in the study. Descriptive scanning is a model in which it is tried to define events, objects, institutions, groups and various areas and thus help to make them be more understood, be grouped and also to determine the relationships between them (Kaptan, 1998).

Group of the study

The study group consists of a total of 62 fourth grade, 96 fifth grade, 78 sixth grade and 84 seventh grade primary school students for a total of 320 attending primary schools within the city limits of Sakarya. 53,8 % of the participants were female whereas 46,2 % were male.

Data Collection Tools

"Perceptual Learning Style Preference Survey" and "Attitude Scale for Social Studies Course" have been used as data acquisition tools.

The "Perceptual Learning Style Preference Survey" has been developed by Reid (1987) and has been adapted into Turkish by Tabanlıoğlu (2003). The scale has a five point Likert type structure with six factors of kinesthetic, auditory, visual, tactile, individual and group learning styles with five items for each for a total of 30 items. During the adaptation study, Tabanlıoğlu (2003) has determined the internal consistency coefficient of the scale as .82, whereas in a study carried out using this scale, Bengiç (2008) has determined the reliability of the scale as .73. Whereas in this study, the internal consistency coefficient of the scale has been determined to be .87. Whereas the internal consistency coefficients for the sub-dimensions of the scale are as follows: .71 for visual learning dimension, .78 for tactile learning dimension, .62 for auditory learning dimension, .64 for kinesthetic learning dimension, .82 for individual learning dimension and .79 for group learning dimension. It can be stated that the reliability coefficients of the scale have much better values in comparison with other studies.

The learning style preferences of students can be determined by using the scoring table in the Perceptual Learning Style Preference Survey. The statement "I certainly agree" gets a score of 5, "I agree" gets a score of 4, "I am indecisive" gets a score of 3, "I don't agree" gets a score of 2 and "I certainly don't agree" gets a score of 1. After writing down the scores of the statements according to the scoring table, these values are added and the result is multiplied by two to determine the score obtained from each learning style. The primary learning style (scores of 38-50), secondary learning style (scores of 25-37) and negative learning style (scores of 0-24) preferences are determined by comparing the results with the intervals in the scoring table.

Another data acquisition tool used in the study is the five point Likert type "Attitude Scale for Social Studies Course" developed by Çalışkan (2009) including 21 positive and 12 negative attitude statementsThe scale has a four factor structure for the attitudes towards the importance, attraction, content and course activities. The internal consistency reliability coefficient of the scale is .93. Whereas the internal consistency reliability coefficient calculated from the data of this study is .89, .69 for the attraction dimension of the course and as .68 for the importance, content and activities of the course. The fact that the obtained values are smaller than those obtained by Çalışkan (2009) can be explained by the difference and variety of the age groups of the participants.

The analysis of the data

The data obtained from 4th, 5th, 6th and 7th grade primary school students using data acquisition tools were transferred to the SPSS package software. In line with the objective of the study, required statistical calculations have been made using correlation, variance analysis, t-test and regression analysis methods.

Results (Findings)

This section includes results obtained as a result of statistical analyses on the acquired data.

Table 1. The learning preferences of students and their attitude levels towards the social studies course

Learning Style Preferences/Attitude	4th class		5th class		6th class		7th class		Total	
	$\overline{X}$	S	$\overline{X}$	S	$\overline{X}$	S	$\overline{X}$	S	$\overline{X}$	S
Visual	39.04	7.34	38.74	7.68	39.98	7.48	37.96	7.58	38.46	6.56
Tactile	41.42	7.86	40.82	8.30	43.46	6.06	40.60	8.30	40.28	8.60
Auditory	42.36	6.22	43.60	6.22	43.66	5.36	41.60	5.20	40.70	7.48
Kinaesthetic	42.94	6.22	43.52	4.88	44.26	5.46	42.50	6.04	41.40	7.10
Individual Learning	35.32	9.86	35.20	10.30	36.60	9.22	35.34	8.88	33.92	11.34
Group Learning	38.52	8.52	37.34	8.20	39.10	8.38	37.36	8.50	39.82	8.80
Attitude	3.92	.51	4.11	.56	3.92	.48	3.74	.59	3.93	.55

When Table 1 is examined, it is seen that the primary learning style preferences of students are comprised of kinesthetic (41.40), auditory (40.70), tactile (40.28), visual (38.46) and group (39.82) learning styles; whereas the secondary learning style preferences are comprised only of individual learning style (33.92) and that there is no negative learning style. When this is evaluated in terms of class levels, it is observed that 5th grade (37.34) and 7th grade (37.36) students show similarities – apart from the fact that they prefer group learning style as the secondary learning style.

It is seen from the same table that the average attitude levels towards the social studies course of the students is 3.93; that the highest average among the classes is that of the 5th grade (4.11), the lowest average is that of the 7th grade (3.74) and that the 4th and 5th grades have the same average (3.92).

Table 2. T-test results of the learning style preferences of students and their attitude levels towards the social studies course according to gender

Learning Style Preferences/Attitude	Gender	N	$\bar{X}$	S	df	t	p
Visual	Famale	172	39.32	6.70	318	.710	.48
	Male	148	38.72	8.02			
Tactile	Famale	172	42.86	6.78	318	3.59	.00
	Male	148	39.74	8.68			
Auditory	Famale	172	43.04	5.42	318	2.10	.04
	Male	148	41.58	6.98			
Kinaesthetic	Famale	172	43.30	6.14	318	1.12	.26
	Male	148	42.52	6.32			
Individual Learning	Famale	172	35.84	5.52	318	1.01	.31
	Male	148	34.72	10.44			
Group Learning	Famale	172	38.30	8.48	318	.51	.61
	Male	148	38.78	8.58			
Attitude	Famale	172	4.01	.55	318	2.95	.00
	Male	148	3.83	.55			

When Table 2. is examined, it is seen that the tactual [$t_{(318)}$=3.59, p<.05] and auditory [$t_{(318)}$=2.10, p<.05] learning styles and the attitude levels towards the social studies course [$t_{(318)}$=2.95, p<.05] of students differ significantly according to gender in favor of females; whereas there is no difference for the other learning styles [p>.05].

Table 3. The correlation values between the learning style preferences and attitude levels towards the social studies course of students

Learning Style	4th class	5th class	6th class	7th class	Total

Preferences	r	p	r	p	r	p	r	p	r	p
Visual	.20	.12	.15	.16	.42	.00	.26	.02	.26	.00
Tactile	.28	.03	.43	.00	.31	.01	.09	.40	.28	.00
Auditory	.43	.00	.36	.00	.39	.00	.37	.00	.40	.00
Kinaesthetic	.19	.15	.36	.00	.23	.04	.05	.66	.23	.00
Individual Learning	-.05	.70	.10	.32	.20	.08	.24	.03	.16	.01
Group Learning	-.04	.75	.21	.04	.18	.11	-.09	.44	.06	.06

When Table 3 is examined, it is seen that there is a positive correlation between all learning styles and attitude levels towards the social studies course of primary school students except for group learning style, that there is a significant but medium relation between auditory learning style and a low but significant relation between other learning styles [p<.05]; whereas there is no relationship between group learning style and attitude levels towards the social studies course.

Table 4. Regression analysis results for the prediction of the attitude levels towards the social studies course of students by their learning style preferences

Grade Level	Learning Style Preferences	B	Std. Error	Beta	t	p
4th class	Visual	.88	.56	.20	1.58	.12

	Group Learning	.92	.44	.21	2.08	.04

R = .51   R2 = .26   F = 5.07   p< .05

Grade Level	Learning Style Preferences	B	Std. Error	Beta	t	p
6th class	Visual	1.74	.44	.42	3.99	.00
	Tactile	1.16	.42	.31	2.79	.01
	Auditory	2.35	.65	.39	3.63	.00
	Kinaesthetic	1.20	.59	.23	2.05	.04
	Individual Learning	.71	.40	.20	1.76	.08
	Group Learning	.68	.42	.18	1.62	.11

R = .48	R2 = .23	F = 3.50	p < .05			

7th class	Visual	1.52	.63	.26	2.40	.02
	Tactile	.43	.50	.09	.85	.40
	Auditory	1.92	.53	.37	3.60	.00
	Kinaesthetic	.27	.61	.05	.45	.66
	Individual Learning	.81	.37	.24	2.20	.03
	Group Learning	- .38	.49	- .09	- .77	.44

R = .43	R2 = .18	F = 2.88	p < .05			

Total	Visual	1.27	.27	.26	4.69	.00
	Tactile	1.32	.25	.28	5.29	.00
	Auditory	2.36	.30	.40	7.83	.00
	Kinaesthetic	1.35	.32	.23	4.22	.00
	Individual Learning	.57	.20	.16	2.80	.01
	Group Learning	.27	.24	.06	1.12	.26

R = .42	R2 = .18	F = 11.23	p < .05			

When Table 4 is examined, it is seen that the learning styles of primary school students is an important variable in the prediction of the attitude levels towards the social studies course [R=.41, R^2=.18, F=11.23, p<.05] and that the learning styles explain 18 % of the variance regarding the attitude levels towards the social studies course. When this result is evaluated in terms of classes separately, it is seen that the result for 4th grade is [R=.55, R^2=.30, F=3.97, p<.05], for 5th grade is [R=.51, R^2=.26, F=5.09, p<.05], for 6th grade is [R=.48, R^2=.23, F=3.50, p<.05] and for 7th grade is [R=.43, R^2=.18, F=2.88, p<.05] giving similar results.

Discussion and Conclusion

As a result of the study, it has been determined that the primary learning style preferences of students consists of kinesthetic, auditory, visual, tactile and group learning styles; whereas the secondary learning style preferences consist only of individual learning style; and that there are no negative learning styles. The results obtained are in accordance with the study results of Bengiç (2008) except for the fact that the visual and group learning styles have come up to be secondary. When this is evaluated in terms of classes, a high level of similarity has been determined between the 5th and 7th grades apart from the fact that they prefer group learning style as a secondary style. When the relationship between having different learning styles and learning (Kolb, 1984) is considered, it can be stated that it is very important for many learning styles to be in the primary

category and that students have no negative learning style. The results of this study and the study carried out by Tabanlıoğlu (2003) in which it has been stated that the primary learning styles of students are individual and auditory and that there is no secondary learning style but that all the other learning styles create the negative learning styles conflict with each other. This result can be explained by the difference and smallness of the sample group of Tabanlıoğlu (2003). In addition, the study results also do not overlap with those of Kaya (2007) and Biçer (2010). This difference between the study results can be explained by the fact that learning styles of students are an inner structure that develops until the age of 16 (Kolb, 1984).

It has been determined that the attitudes towards the social studies course of primary school students is at the level of "I agree". In many studies (Özkal, Güngör & Çetingöz, 2004; Tay & Tay, 2006; Sidekli, 2010; Kaya & Şeker, 2011; Coşkun & Samancı, 2011) it has been put forth that the attitude levels towards the social studies course of students is positive and high. It has been determined that in terms of classes, the highest attitude is that of the 5th grades ("I totally agree" level) and that the lowest attitude is that of the 7th grades ("I agree" level). This can be explained by getting used to the lesson and the course intensity. Because it can be stated that the attitude levels of students decrease towards this course that they first got in the 4th grade and got used to in the 5th grade decreases due to a more comprehensive content and abstract topics (especially in the 7th grade). In addition, many studies carried out regarding the attitude levels towards the social studies course of students (Corbin, 1997; Moroz & Baker, 1997; Özkal, Güngör & Çetingöz, 2004; Uzun, 2006) put forth that as the learning level progresses, the attitude of the students towards the course tends to decrease.

Whereas important significant differences are found in terms gender for both the auditory and tactile learning styles in favor of females, no statistically significant difference has been determined for other learning styles (kinesthetic, visual, individual and group). This result is parallel with the result obtained by Reid (1987) and Tabanlıoğlu (2003) stating that females prefer tactile learning more than males. In the study carried out by Bengiç (2008), gender based differences have been determined among learning styles except for tactile and audio auditory learning styles. The results about the differentiation of learning style preferences based on gender have also been obtained by Matthews (1994), Matthews (1996), Smith (2001), Honigsfeld and Dunn (2003), Güven (2004) and Yenilmez and Çakır (2005). The differentiation in the learning styles of students based on gender can be explained by the opinion of Kolb (1984) that the differences between social life and experiences may cause learning style differences for individuals, that is with individual differences. In addition, there are also results showing that learning style does not differ according to gender (Gencel, 2006; Kaya, 2007).

A statistically significant difference in favor of females has been determined regarding the gender of students and their attitude levels towards the social studies course. In various studies in literature (Corbin, 1996; Özkal, Güngör & Çetingöz, 2004;), it has been determined that the attitudes of female students are more positive in comparison with that of the males. However, there are also conflicting results obtained by various studies that examine the relationship between gender and the attitude levels towards the social studies course. For instance the studies carried out by Çalışkan and Turan (2010), Gencel (2008), Güven (2008) and Şahin, Şahin and Çakır (2001), no statistically significant difference has been determined between the attitude levels towards the social studies course for males and females.

According to another result of the study, it has been determined that there is a positive and moderate significance between the learning styles of students and their attitude levels towards the social studies course. In addition, a moderate and positive relationship has been determined between the auditory learning style preference and their attitude levels towards the social studies course; positive relationships have been determined between kinesthetic, tactile, visual and individual learning styles and it has also been determined that there is no statistically significant difference between the group learning style preferences. Accordingly, it can be stated that students that prefer auditory learning primarily and those that prefer kinesthetic, tactile, visual and individual learning styles are more inclined to social studies. Even though the results of the study are in paralle with those of Güven (2008)'s findings, it is in conflict with the result of Azizoğlu and Çetin (2009) that learning styles do not affect the attitude of students towards studies course. The reason for this conflict can be stated as the difference between the study groups and the courses.

It has been determined that the learning style preferences of primary school students are significant variables in both predicting the attitudes of students towards social studies course both in general and for class levels. It has been determined that especially the auditory learning style preferences has the highest positive affect on the prediction of the attitude levels towards the social studies course in all class levels (4th, 5th, 6th and 7th) and that in general tactile, visual, kinesthetic and group learning styles follow it and that the group learning style preference is not a statistically significant variable for the prediction of the attitude level towards the social studies course. Since education given in accordance with the learning styles affect the attitude levels towards the course (White, 1999), trainings that will be given during the learning-teaching stages keeping in mind the learning styles of students will increase the attitude levels towards the course and hence the success of the students.

THE ROLE OF HISTORY-THEMED NON-EDUCATIONAL COMPUTER GAMES ON PRIMARY SCHOOL CHILDREN' (AT GRADES 6TH, 7TH AND 8TH) PERCEPTIONS OF HISTORY

Evren Şar[a]

[a]Istanbul University Hasan Ali Yucel Education Faculty, Teaching in Primary Educatıon, Istanbul, Turkey.

Abstract

As it is known, the computer games are occupying a large part of children's daily life. In this study, we primarily aimed to put a framework based on the gender variable, and additionally how many hours a day children spend on computer games, which historical games they play and how their attitudes are towards these games.

The main purpose of the study is to understand the role of the history-themed non-educational computer games on elementary students' perceptions of history. Participants of the study are primary school children at grades 6th, 7th and 8th, who attend the Information Technologies course in the academic year of 2011-2012. The data collected from the participants is analyzed quantitatively.

As a result, the role of history-themed non-educational computer games on students' perceptions of history is interpreted in terms of positive and negative aspects and suggestions are made regarding how these games could be adapted to history education in primary years.

Keywords: Perception of history, non-educational computer games, history themed computer games, education

Introduction

Today, the computer games have become an important part of children's daily lives. However, on the other part, most of the educators and parents generally believe in that the non-educational computer games waste the time of children ineffectively and uselessly (Garris, Ahlers, and Driskell, 2002). And even, the non-educational computer games are thought to teach many harmful concepts such as "killing" etc. (Prensky, 2002). However beyond these prejudices, today, the power of computer games on children is discovered and special games are designed for educational purposes and also, these games are integrated to the academic lives of children effectively (Tüzün, 2006). Especially in the field of Mathematics, and English, the power of computer games is quite evident (Demirbilek andYücel, 2011). However, these computer games, which are planned and designed as a part of education, do not lead any decrease on children's interest towards the non-educational computer games and therefore, the non-educational computer games continue to take part in daily lives of children.

In this respect the aim of the study is to demonstrate; the role of the history-themed non-educational computer games on perceptions of history of primary school children at grades 6th, 7th and 8th, and to discuss the beneficial and harmful aspects of the non-educational games.

To reach this purpose, primarily we tried to draw the general outline of the situation by determining which computer games in general and historical games in special do the students prefer to play, how much of their time do they spend on non-educational computer games. Following that, how their attitudes towards these games are, what the role of playing these history-themed non-educational games on the history perceptions of students in terms of preference to visit historical places and having an opinion of being knowledgeable on history when they see movies or documentaries on TV etc. is determined.

In conclusion, in the light of emerging data the role of history-themed non-educational computer games on students' perceptions of history is interpreted in terms of positive and negative aspects and suggestions are made

regarding how these games could be adapted to history education in the future. In that way, this study is expected to be informative for both education specialists and computer game designers.

Method

Sample

The sample is consisted of 102 female (46.6 %), 117 male (53.4 %) in total 219 primary school children and the mean age of the sample is M=13.15 with standard deviation of SD=.97. The participants of the study attend to 6th (36.5 %), 7th (12.3 %), or 8th (46.1 %), grade levels (11 participants (5%) did not state the grade level) of a local primary school in Istanbul in 2011-2012 academic year.

Measures

A *demographic information form* and *a 11 items questionnaire* designed by the researcher, in order to gain information on the participants' computer usage, computer game and history themed non-educational computer games preferences, is applied.

Procedure

In the study the participants are applied the measure in the 2011-2012 academic year spring semester. The data collected online during the *Information Technologies Course* the students attend. Statistical analyses are applied after the data collection phase.

Results

In this part, the statistical analyses related to the data gathered by means of the measures are reported. The mean and standard deviation of daily computer usage length of the sample are M= 2.55 hours, SD= 1.20 hour. When the students asked for the usual rivals in the games they play, they reported playing against computer (59.4 %), unknown online players (20.1 %), or a group of friend in the same internet cafe (16.9 %). Three point seven percent of the participants left this question unanswered.

The sample is also questioned on what would be their reaction whether their computer usage in terms of games is rectricted. Besides, the results revealed that although 21% of the participants reported being *restless and unhappy*, 33.4 % of them stated *less unhapiness but a bit miss of the game* and most of the students (44.7 %) reported *feeling nothing against being restricted*.

When the students asked to report the computer games they play it is found that sports games like FIFA and war games like Call of Duty, which is about the Second World War, are very popular among the students. In addition Super Mario and Metin 2 seem very popular. On the otherhand, when we asked specifically which history-themed games they play, the students mentioned the following games; Assasin's Creed, Call of Duty and similar war themed games, Age of Mythology and Age of Empires.

As for the statistics related to the students computer game and history-themed non-educational computer game preferences, the results are as follows. There is a significant relationship between gender and students preference to play history-themed non-educational computer games (X^2 (1)= 12.374, p<.005). The male students are more likely to play history-themed non-educational computer games than do females.

Aside from the finding related to gender, students who reported to play history-themed non-educational computer games also found to be more enthausiastic to visit museums or other historical places (X^2 (1)= 15.241,

p<.005). Additionally, they reported an opinion of being knowledgable on history when they see movies or documentaries on TV(X^2 (1)= 15.241, p<.005). These students more likely to think that these games assist to improve students' knowledge on history (X^2 (1)= 20.448, p<.005).

A remarkable finding of the study is related to truthfulness of the knowledge given in these games. That is the truthfulness of the historical knowledge given in these non-educational computer games is found to be important for both the group of students who either play these games or not (X^2 (2)= 6.463, p>.005). That is the chi-square test failed to indicate a significant difference between these two groups of students.

Discussion

The existing literature about the non-educational computer games generally focuses on the hazardous effects of the games such as being time consuming and involving killing, violence (Anderson and Bushman, 2001; Bartholow and Anderson, 2002; Gentile, Lynch, Linder and Walsh, 2004) and on the other hand it usually overlooks the beneficial aspects of these games.

Firstly we can easily say that today the computer games are one of the most popular media tools. Then what makes them so popular? Being in competition and in challenge are stimulating for the players and thus computer games easily attract the players and makes them dependent to itself (Worderer, Bryant, Pieper and Weber, 2009). In the same line with this, in our survey we found out that children spend average 2.5 hours a day in playing computer games.

Starting from this point, we should move on by the assumption that computer games consists an inseparable part of children's daily life. In accordance, it should be stated that non-educational computer games similar to TV or Internet, which are also easily reached information sources. Then the idea comes to mind that these games could become effective tools for teaching because of their covered effects on learning. In this respect, Gee (2004) makes an important comment by mentioning the similarities between computer games and education: "You cannot play a game if you cannot learn it. If noone play a game, it does not sell. Of course, designers could keep making the games shorter and simpler to facilitate learning. That's often what schools do."

Therefore, by taking these similarities in consideration, computer games can be utilized in education depending on their features as attracting attention and interest, and they can also be used for supplying true historical information related to their subject matters. Supporting this point of view, it is reported that computer games are more effective in learning than oral instruction alone and the resistance of the knowledge is higher in the case of computer games (Kavaklı, Akça, Thorne, 2004).

In our study, students are asked which computer games they play, in relation to that question they reported generally preferring sports, war and action games. As for the history-themed ones, they mostly play games such as Call of Duty, Age of Empires, Age of Mythology, Assasin's Creed. These games main themes are war and action. By playing these games the students stated that they gain knowledge on Mesopotamia, Rome, Eastern Culture, Byzantium, Ottoman and Silk Road. It is obvious that the themes students choose to play and the history-themed non-educational games overlaps in terms of being action and war oriented. This junction also leads us to think that non-educational games can be integrated to history education.

Besides, as for the students history themed non-educational game preferences, we distinguished that they play games which take place in the civilizations existed in Anatolia or near districts in history. This preference of children could also be utilized in designing an effective history curriculum, which is supported by use of computer games.

Overall, the analyses of the present study paint a picture of the roles of the non-educational computer games on student's perceptions of history. Accordingly, the male students are more likely to play history themed non-educational computer games than do females. And the students who reported to play history themed non-educational computer games also found to be more enthusiastic to visit museums or other historical places. Additionally, they reported an opinion of being knowledgeable on history when they see movies or

documentaries on likely to think that these games assist to improve students' knowledge on history. And the most remarkable result of the truthfulness of the historical knowledge given in these non-educational computer games is found to be important for both the group of students who either play these games or not.

These findings can be interpreted in a way that the students are tend to accept the historical themes and characters as real. This tendency could be assumed as a power in terms of curriculum design, which is supported by computer games. That is the students are ready to learn history when the subject matter is presented in an enjoyable and attractive way. In doing so, the game designers could design games, which are away from racist perspectives, but instead supplying a historical understanding, which stand on realities, and designed in an entertaining fashion. In this respect, the game designers, educators and historians should cooperate in order to produce non-educational but historically real games. So the students could have a chance to learn history in a daily and enjoyable activity. Additionally, teachers should monitor their students' computer game preferences and by doing so they may manipulate the interest and curiosity of the students in history. In accordance with that they can arrange visits to museums and other historical places related to the ancient civilizations taking part in the games.

Abstract

This research aims to examine "*The role of idiomatic expressions in teaching languages and cultures as a part of a multilingual approach*" enlightening common idioms with the same meanings of different cultural aspects in class of French, English and Turkish. In this research, we tried to gather expressions in three different languages; French, English and Turkish on three feelings universal; "love, fright and sadness" which they can use in a class of language of secondary education (11-13 age) to benefit from multilingualism. Thanks to this research our learner may discover idioms with cultural differences about the same feelings.

ords: Idiomatic, language teaching, multilingual approach, motivation, interactive learning

Introduction

The purpose of this study, examining which cultural elements are used in Turkish, French, and English in expressing three feelings peculiar to humans making use of the meanings of idioms that are an important part of oral and written culture, is to build a cultural bridge in foreign language teaching to be used by secondary school students for conveying their knowledge of grammar into their lives by comparing the idioms used by three different languages through analogy.

According to Aksan (A. Doğan, 1998), idioms – if not taken or adopted from another nation as a result of cultural relations with it – are words that reflect the world view of a nation that speaks a language, its lifestyle, environmental conditions, customs and beliefs, the assets and concepts it gives importance, briefly its material and spiritual culture; displays the way that nation thinks, even its jokes and inventions, and these words are important from the aspects of literature and folklore, as well as linguistics. Besides, these elements reflect the inner structure and semantic features of each language.

Thanks to these features, the idioms constitute the distinctive, unique aspect of each language; they show the way a language expresses and understands the facts. Linguists and folklorists can analyze the whole culture of a society, and make important deductions depending solely on idioms.

On the other hand, it has been emphasized in Common European Criteria accepted by the European Council in recent years that in order to be competent in a language one has to know about the uses of that language as well as the formal features of it. Learning a language requires to learn about the social and cultural characteristics about the nation speaking that language. Considered within the scope of the relation between language and culture, it is an obvious fact that a person learning another language besides his mother tongue also learns the culture of that society which speaks that language. If idioms, the cultural heritage of languages, are

e-mail addresses: gocmene@bilkent.edu.tr, nurdang@bilkent.edu.tr, ahu@bilkent.edu.tr

considered as the reflections of culture in a language, then it would be clearly understood how important is using idioms and proverbs in foreign language teaching.

In this study multilingualism was taken as the basis and the role of idioms in teaching different cultures and languages was analyzed in the light of concrete activity samples from lessons. In order not to get lost among the abundance of idioms and arouse interest in students, idioms about fear, sadness, and love which are frequently seen in the daily life of every society were used in three different languages, Turkish, English, and French. It was especially paid attention that the chosen idioms have cultural differences. For example a person who falls in love frequently is called "*Ayran Gönüllü Olmak*" [to have a heart of "ayran"], while the same idiom is expressed like "to have a heart of artichoke" in French. Another example is "*Dara Düşmek*" [to have trouble] which is an idiom used for someone that is in deep sorrow, while its French equivalent is "to drown is sorrow" and English equivalent is "to get in a jam," all having cultural differences.

Learning the cultural differences that are reflected on the called idioms facilitates learning the target language to a great extent and enables the student to use that language fluently. It would be useful to mention the semantic features of idioms before analyzing their cultural features.

1. Idioms and their semantic features

Aksoy (1988) defines idioms, which are used for expressing the traces, subtleties, and cultural nuances of a language in an agreeable way, as "clichéd word groups or sentences comprised of words that express the concepts, and situations with a pleasant narrative or a special structure or within a syntax, and usually have a meaning other than their literal meanings in linguistics. Idioms, which are a kind of language expression made of two or more words, are linguistic structures that look like nouns, adjectives, adverbs, or combined verbs that express the feelings and ideas in an interesting way."

Idioms, which carry the traces of a certain cultural heritage and experiences of a society, generally have a specific meaning other than their literal meanings. Therefore they may not seem meaningful when translated into another language. For instance, the idiom "*Battre le briquet*" used frequently in French is translated into Turkish as "*Çakmağı yakmak*"[Burning the lighter] and does not have a special meaning. Yet in French it means "To like someone, to have a crush on someone." Another example is the translation of a frequently used English idiom "*get in a jam*" into Turkish as "Kavanozun içine girmek" [Getting into a jar]. However, its idiomatic equivalent is "*Dara düşmek*" [Having trouble].

While the idioms might have special meanings due to cultural differences, the same objects are used in some idioms to convey some universal feelings. For example, "*Kalp kırmak*" which is used very commonly in Turkish among the idioms that express sadness is used as "*Briser le cœur*" in French and "*Break a heart*" in English, employing the same verb "*kırmak*" [to break] and the same object "*kalp*" [heart] in three languages.

As mentioned above, the students' knowing the semantic features of idioms are very important for cultural education in foreign language or mother language. Because as Delisle (2001) emphasizes, it is not enough to know grammar and vocabulary for the efficient use of mother language or foreign language. The important thing is to be aware about the idioms and special uses in that language.

2. Idioms and their cultural features

It is a well-known fact that speaking a foreign language and mother language cannot be possible only by knowing the grammar rules by heart. Grammar only enables us to combine the right words and sentences structurally. However, the idioms learned during language teaching-learning process enables learning the culture of the target language being learned.

A feeling or idea that we want to express by idioms is provided with the peculiar cultural indicators of each language. For example, when we are afraid of something we use the idiom "*Tüyleri diken diken olmak*" in

many situations in Turkish. Her the indicator "diken" [thorn] is inspired from the flora structure of Anatolia. Because your skin swells when a thorn pricks your arm. This means, the swellings that occur on your arms as a result of sudden fear or excitement are likened to a thorn prick. The same idiom occurred in France using "chicken meat" indicator, "*Avoir la chaire de poule*"; and in England using "goose feather" indicator, "*To have goose pimples.*" The reason for the chicken indicator to be used in France stems from the fact that chicken is widely consumed in that country, and the goose feather indicator to be used in England stems from the fact that beds and quilts are made of goose feather. As a result, knowing the cultural features and specific meanings of idioms facilitates communicating in target language to a great extent. Reflecting the similar and different uses of idioms in the target language planned to be taught and mother language over foreign language teaching creates cultural awareness and providers learners the opportunity to make comparisons between cultures.

On the other hand, students who have received language teaching with the classical language method, grammar-translation method, are only successful in tests and exams but unfortunately have problems in speaking and oral expression. The language learned by students through a grammar focused approach is not only comprised of grammar rules but also the idioms, which are parts of effective communication in daily life, are widely used.

In this article, idioms which are used frequently, arouse interest, and support inquiry-based education in the teaching of French, and English as foreign languages, and Turkish as the mother language were chosen. The idioms were chosen among samples that express universal feelings like "fear, sadness, an love." Both the general meanings and specific meanings of the called idioms were tried to be explained in a table in English-Turkish and French-Turkish comparison, in order to convey the cultural differences between them to students in a better way. The idioms chosen are mentioned in the tables below (Kelly, 1974).

Table-1 English Idioms about "love, sadness, and fear"

English idioms about LOVE	Turkish Translation	Equivalent
1. Fall in love at first sight	İlk görüşte aşka düşmek	Yıldırım aşkı olmak [to be struck by a thunderbolt]
2. Carry a torch for someone	Birisi için meşale taşımak	Abayı yakmak
3. Fall in love	Aşka düşmek	Âşık olmak [to fall in love]
4. Have a crush on someone	Bir çarpışmaya sahip olmak	Abayı yakmak
5. To be fickle	Vefasız/karasız olmak	Ayran gönüllü olmak

English idioms about SADNESS	Turkish Translation	Equivalent
1. Be in blue funk	Mavi bunalım	Melankolik [melancholic]

2. Be down in the mouth	Ağız altında olmak	Karadeniz de gemileri batmak [sink one's ships in the Black Sea]
3. Break a heart	Kalp kırmak	Kalp kırmak
4. Get in a jam	Kavanoza girmek	Dara düşmek
5. Cry one's heart out	Birinin kalbinin ağlaması	İki gözü iki çeşme ağlamak

English idioms about FEAR	Turkish Translation	Equivalent
1. Curl somebody's toes	Birinin ayak parmaklarını bükmek	Korkudan Tüyleri diken diken olmak [(hair) to stand on end]
2. Curl up in a ball	Topun içinde bükülmek	Korkudan ölmek [to die of fear]
3. Turn as white" as chalk	Beyaz tebeşire dönmek	Beti benzi atmak [to have white skin]
4. To be chicken-hearted	Tavuk kalpli olmak	Gölgesinden korkmak [to be afraid of own shadow]
5. Scare someone out of their wits	Birinin korkudan aklını çıkarmak	Dişleri titremek [to have one's teeth chatter].

When we translate the idioms at the table above into Turkish in their general and specific meanings, a majority of them reveals cultural differences stemming from the English language. These cultural differences attract the attention of students and lead them to inquire. For example, when somebody cries hardly, we use the idiom "*İki gözü, iki çeşme ağlamak*" in Turkish and its English equivalent is "*Cry one's heart out.*" In the Turkish idiom, the severity of crying is likened to "water flowing down a fountain" which is used commonly in Anatolia. Fountain is an important part of the Anatolian culture. However, the same situation is expressed with a different object in English. The reason for this is the lack of "fountain" culture in England or America.

While there are cultural differences between idioms of different languages, some idioms have cultural similarities. In these idioms, the same feeling and object is used in all languages. For example, the idiom "*kalp kırmak*" [break a heart] which is used in Turkish for making someone sad is made of using the same object, heart, and the same verb, break, in English "*Break a heart*" and in French "*Briser le cœur.*"

Another example is the use of "aba," a type of fabric, and the verb "yakmak" [to burn] in Turkish used for expressing the situation of falling in love with someone. In French, the equivalent idiom is "***Battre le briquet***" involving "lighter used for starting a fire" as the object, and "to light" meaning start a fire as the verb. The idiom "***abayı yakmak***" comes from the old times when the dervishes used to burn the woolen vests called "aba" during religious conversations taking place in winter nights. The dervish is so fascinated by spiritual conversation that he longer feels the hot fire, he has burnt his aba. Later on, this feeling was identified with love and began to be used as falling in love.

Table-2 French Idioms about "love, sadness and fear"

French idioms about LOVE	Turkish Translation	Equivalent
1. Avoir un coup de foudre	Yıldırım darbesine sahip olmak	Yıldırım aşkı olmak [to be struck by a thunderbolt]
2. Battre le briquette	Çakmağı çakmak	Abayı yakmak
3. Tomber amoureux de quel qu'un	Birisine aşık düşmek	Aşık olmak [to fall in love]
4. Croquer la pomme	Elmayı yemek	Abayı yakmak
5. Avoir un cœur d'artichaut	Enginar kalpli olmak	Ayran gönüllü olmak

French idioms about SADNESS	Turkish Translation	Equivalent
1. Avoir le cafard	Hamam böceğine sahip olmak [to have a cockroach]	Melankolik [melancholic]
2. Se baigner dans la tristesse	Üzüntüde yüzmek [to swim in sorrow]	Karadeniz de gemileri batmak [sink one's ships in the Black Sea]
3. Briser le cœur	Kalp kırmak [to break a heart]	Kalp kırmak
4. Etre dans la purée	Pürenin içinde olmak [to be in the puree]	Dara düşmek
5. Se mettre à pleurer gros de l'eau	İri sularla ağlamak [to cry with large water]	İki gözü iki çeşme ağlamak

French idioms about FEAR	Turkish Translation	Equivalent
1. Avoir la chair de poule	Tavuk etine sahip olmak [to have chicken skin]	Korkudan Tüyleri diken diken olmak [(hair) to stand on end]
2. Attraper la chienne	Köpeği yakalamak [to catch the dog]	Korkudan ölmek [to die of fear]
3. Avoir une peur bleue	Mavi bir korkuya sahip olmak [to have a blue fear]	Beti benzi atmak [to have white skin]
4. Etre une poule mouillée	Islanmış bir tavuk olmak [to be a wet chicken]	Gölgesinden korkmak [to be afraid of own shadow]
5. Trembler comme une feuille	Yaprak gibi titremek [to shake like a leaf]	Dişleri titremek [to have one's teeth chatter].

3. Multilingual approach

Franz-Jospeh Messner, the most important figure of multilingual approach in Germany, defines multilingual approach as "a pedagogical purpose for teaching European Union citizens more than one living languages and having them acquire a multilingual identity" in his book titled "EuroComRom" (Meiβner et al. 2004:135).

In his article titled "Teaching French and multilingual approach" Meißner (2002:17) suggest that "the concept of multilingualism appeared in 1995 and is a language teaching approach that is still in progress."

The notion of language teaching in Europe has shifted towards "multilingualism" especially in recent years. The European Union which involves people from different languages and cultures requires the individuals to learn at least two of the modern European languages. Therefore, the most important concern of modern linguists is to develop the most effective learning methods that can teach learners more than one language.

As Ağıldere (2011) states it's an inevitable truth taht a language can't be learnt indepently without teaching and learning idioms which arae parts of the cultures with which they belong to. In this context, "The Eupean Framework of Language Portfolio, which is very important in the name of learning and teaching a foreing language, emphasizes that people who can use the oral and written language effectively have enough knowledge of idioms an vocabulary. For this reason, recent linguists try to develop effective methods in teaching foreing languages.

3.1. Idioms within the Scope of Multilingual Approach

Since secondary school students (12-14 age group), which constitute the basis of this article, absorb knowledge like a sponge, there are no limits to the number of languages they can learn and they are of the age

group that can yield the best results in multilingual approach. Therefore, the language teaching approach of many private schools in Turkey should focus on "Multilingual Approach."

It a well-known fact that foreign language teaching brings in the cultural features of the target language. For example, a student who learns Turkish also learns about the Turkish hospitality, tea drinking ceremony, Turkish customs, Turkish festivals, and many cultural values that are specific to Turkey indirectly through language learning. A person who learns English also learns about the English breakfast, Halloween, or five o'clock tea. Or someone who learns French also learns about eating croissants at breakfast, the wine culture, cooking crepes, or French festivals.

According to Richard and Rodgers (2001), an efficient idiom teaching process should involve activities that enable the students to identify the idioms in and out of the classroom by themselves. Therefore, it was planned in this study to make the students prepare an idiom poster and thus they were offered the opportunity to examine the idioms, and comprehend their meanings better outside the classroom. In this study, language and culture teaching was applied in the classroom atmosphere through developing a different course material. Firstly, two different classes were chosen for the activity. One class is given French idioms about love, fear and sadness, and their Turkish meanings; the other is given English idioms about love, fear, and sadness. The students were required to work in small groups. First, only the idioms were given to these groups and they were required to translate them into Turkish. After that, the literal meanings of the idioms were written on one side of the board, and figurative meanings were written on the other side. The students then drew the literal and figurative meanings of idioms on paper. Then these pictures were drawn together with their Turkish meanings as seen below. For example, the French idiom "Avoir la chair de poule" was first drawn with its literal meaning "to have a chicken's skin" and then its figurative meaning "hair stand on end because of fear" was drawn next to it. Thus, the students were able to see how the same idiom was expressed with different objects.
Figure-1 Group work on idioms. Drawing of idioms "Korkudan tüyleri diken diken olmak and iki gözü iki çeşme ağlamak" together with their French translations.

This activity revealed that multilingual approach was used very effectively in the classroom and the students made interlingual transfer. The fact that visuality was attached great importance ensured that the idioms are learned with a lasting effect and the new vocabulary is also learned with the same effect. Besides, students' learning new cultural differences in foreign languages reinforced their desire for communicating in the foreign language, and decreased their fear of not being able to understand a foreigner.

Figure-2 Group work on idioms. Drawing of idioms "*Melankolik and Korkudan beti benzi atmak*" together with their French translations.

Figure-3 Group work on idioms. Drawing of idioms "*Kalp kırmak and Korkudan ölmek*" together with their French translations.
Figure-4 Group work on idioms. Drawing of idioms "*Fall in love and To be chicken hearted*" together with their Turkish equivalents.

Figure-5 Group work on idioms. Drawing of idioms "*Get in a jam and Carry a torch for someone*" together with their Turkish equivalents.

CONCLUSION

It has been seen at the end of this study, in which we focused on the use of idioms in language teaching, that many linguists and theorists highlight the special importance of idiom use within the scope of multilingual approach. Thanks to the activities we had carried out with students, we had the opportunity to observe the role of idioms in language teaching in multilingual approach. Thus, we could test how a language lesson is applied with and without using idioms.

On the other hand, our studies on the role of idioms in culture teaching have revealed that cultural differences between languages attract the attention of students to a great extent and lead them to inquire, i.e. acquire new aspects of the language. It should be kept in mind that the most important indicator of progress in language teaching process is the learners' beginning to inquire.

The students produced quite successful results at the in-class idiom activities. Especially the game of "guessing the meaning of idioms" both enabled them to learn new vocabulary in English-French, and actively repeat their previous knowledge, while contributing to discover the subtleties in Turkish language.

Today students definitely desire change in language courses and want to communicate in the target language as soon as possible. The classical grammar-based language courses do not attract the students' attention anymore. Therefore, the idioms have an important role in language teaching as an authentic course material that increases the motivation of students regardless of their age.

As a consequence, we can say that idiomatic expressions play in important role both in Turkish as the mother language, and in multilingual language teaching. The idioms bring in a dynamic aspect to language lessons and facilitate the teacher's job. It should be born in mind that the more the cultural aspects of a language are taught, the easier the students communicate in that foreign language.

THE ROLE OF LEADERSHIP IN THE SUCCESS OF E-LEARNING PROGRAMS: THE CASE OF SAKARYA UNIVERSITY E-MBA PROGRAM

Remzi ALTUNISIK[92]

Sakarya University, Faculty of Business Administration, Sakarya, 54187, Turkey.

Abstract

Developments in information technologies have significant influence on all aspects of modern life. Especially in the area of education, information technologies has a widespread use. In this respect, the concept of e-leaning is gaining acceptance all over the world. Many universities around the World tend to implement e-learning programs for undergraduate and postgraduate programs. But, they face a number of problems in implementing these e-learning-based programs given the fact that the traditional teaching mentality predominantly prefers face-to-face classroom teaching methods which have different assessment procedures and knowledge transfer methods. In order to successfully implement these e-learning programs in traditional education settings, a clear and insistent leadership style plays a critical role. In this study I wanted to examine the e-learning practices carried out for more than ten years at the Sakarya University e-MBA program. To this end, as a researcher, a teacher and a coordinator in this program, I have witnessed the whole evolution of the e-MBA program from beginning up to now. I have done many observations, carried out various interviews with students and professors, conducted many focus group studies and run several surveys on many aspects of this distant education program in order to sort out problems, develop solutions for problems, seek for new ways to improve the program. Findings indicates that a clear and sound leadership is critical in establishing and implementation of e-learning programs successfully. Also, many of the factors affecting student satisfaction and the success in e-learning based programs are discussed in the study.

Introduction

Developments in information technologies have signifcant influence on all aspects of modern life. Education is no exception to this indfluence. In this respect, the concept of e-leaning is gaining acceptance all over the world. Many universities around the World tend to implement e-learning programs for undergraduate and postgraduate programs. But, they face a number of problems in implementing these e-learning-based programs given the fact that the traditional teaching mentality predominantly prefers face-to-face classroom teaching methods which have different assessment procedures and knowledge transfer methods. In order to successfully implement these e-learning programs in traditional education settings, a clear and insistent leadership style plays a critical role.

In an increasingly digitized society, both the profile of universities, as well as the role of its faculty, are experiencing profound changes. Universities and other education institutions as both providers and consumers of educational services have no other option but to adapt to new ways of teaching and learning across time and space. In today's job market workers at all levels and capabilities are seeking additional competence and

---

[92] Corresponding author. Tel.: 0090+264 295 6261; *E-mail address*: altunr@sakarya.edu.tr.

certification through more flexible and convenient part-time study programs. In this vein, many universities around the World are searching new ways to establish and implement new education programs not only in their own markets but on a global scale.

Changing Education Environment

Many years ago, as Kurt Lewin had pointed out that "*Every organization structures itself to accomplish its goals in a way that is in tune with or responsive to its environment*", in today's changing education environment, all institutions and universities will be successful as long as they adapt the environmental changes (Lewin, 1936). It is clear that different problems require different solutions at different times.

In today's highly dynamic and turbulent times, we have to look at the higher education with a different paradigm in mind. Traditional teaching paradigms in education is clearly lacking to meet the needs and requirements of the new era which is characterized as the era of information and knowledge. Instead, we have to be adept in the new learning paradigm of teaching. Hence, this new education environment requires new set of methods, materials and approaches to teaching in higher education. This is a difficult and threatening situation for teachers, most of whom are themselves products of classroom-bound education and whose professional identities are linked. Rather than transmitting information in person, many faculty will have to make the adjustment to monitoring and evaluating the work of geographically distant learners. Those faculty accustomed to more conventional teaching modes will have to acquire new skills to assume expanded roles not only to teach distance learners, but also to organize instructional resources suitable in content and format for independent study. This represents a major shift from the European model of the teacher as the exclusive source of information to being one of several resources available to learners who become more active participants in the process.

In the new millenium, a new role for the academics has been recognized and encouraged, especially as technology-assisted instruction has proliferated and changed the way teachers and students interact, as well as the manner in which educational entities must now do business to meet the demands of a digitized society. The literature describing the rapid evolution of distance education delivery systems over the past twenty years has frequently categorized it into three stages, from correspondence education, to technology-assisted education and, more recently, networked education.

In traditional teaching practices and methods courses were designed as an intimate roundtable seminar involving a dozen students or face-to-face instructional teaching in a 50 minute classical classroom context. The emergence of increasingly student-centered learning activities in the 1970s, facilitated by new instructional technology introduced in the 1980s, is contributing to a dramatic evolution in faculty roles, and raises fundamental questions within the professoriate about how it will contribute to the teaching-learning process in the 1990s and beyond. Information technologies can assume many of the roles that instructional staff have traditionally played, thus freeing them for new roles in assisting students. But the members of faculty often do not understand partnership roles they can play when allied with technology in the teaching-learning process. Indeed, many simply conclude that technology has usurped their function as educators.

Faculty need assistance in order to understand and adapt to new roles; if they resist, the technology probably will not be used effectively and learning goals will be compromised. But this does not mean the teaching function is becoming obsolete, but the role is being transformed dramatically. In addition to being adept at both content and process, faculty must recognize the role of instructional technology as a learning resource. The teacher is increasingly an intermediary between students and available resources. Teachers must know something about the potential of technology to facilitate learning and to enhance their own effectiveness. They must come to recognize how technological applications can create greater access to education by overcoming time and distance problems, and how it provides for diverse learning needs because it has the capacity to deliver material in many different formats.

Despite significant progress in the use and suitability of technology for educational purposes- computers are more user friendly and more compatible; there is more available software and increased access, etc. - technology still remains complex, especially when media are combined (e.g., visual, text, audio, data). Significant difficulties remain, particularly for those new to these modes of instruction, in effectively integrating the latest technologies with pedagogy and curricula (McNeil, 1988).

Distance Education and Leadership

Distance education means that the learners are physically separated in space and time from the teaching institution and its staff (www.openpraxis.com). Distance education revolves around a learner-centered system with teaching activity focused on facilitating learning. The teacher augments prepared study materials by providing explanations, references, and reinforcements for the student. Independent study stresses learning, rather than teaching, and is based on the principle that the key to learning is what students do, not what teachers do. It is a highly personalized process that converts newly acquired information into new insights and ideas. This new process has distinct features and needs to be carried out and managed carefully in order to succeed.

Leadership and management are both important functions, but they have different purposes and they seek to obtain different outcomes. These two terms are indispensable to each other. Bush (1998) links leadership to values or purpose, while management relates to implementation or technical issues. Leadership and management need to be given equal prominence if university programs are to operate effectively and achieve their objectives. While the tasks and functions of management and leadership are unique, there is a link between them. Rather than being mutually exclusive, these two competencies are interdependent. For example, once a leader articulates the intended direction, plans must be put in place to provide concrete ways to move in that direction. Once people have been hired into an organization, a leader must align those people with a vision. Furthermore, the leader must motivate and inspire people to overcome the challenges that management processes of controlling and measuring have uncovered (Adamchik, 2005).

Leadership is not so much about technique and methods as it is about opening the heart. Leadership is about inspiration. Great leadership is about human experiences, not processes. Leadership is not a formula or a program, it is a human activity that comes from the heart and considers the hearts of others. It is an attitude, not a routine. Similarly, Drucker indicates that leadership is not magnetic personality, it is not about making friends and influencing people. Leadership is lifting a person's vision to higher sights, the raising of a person's performance to a higher standard, the building of a personality beyond its normal limitations (Drucker,2005). According to well known management guru Warren Bennis, management is getting people to do what needs to be done. On the other hand, leadership is getting people to *want* to do what needs to be done (Bennis, 1994). Leaders are likely to ask questions like, "What is really going on here? How do we become relevant again? How do we fulfil our goals in these new times? What will prompt people to think that what we do is meaningful?"

In relation to formal education quality covers different components of face-to-face teaching like the infrastructure and basic facilities, social and geographical environment, professional aptitude in teaching, administrative and finance staff, suitability and significance of the curriculum, teaching-learning materials, teaching and learning processes, community support to the institution, performance evaluation of the teachers, students and the entire system. Distance education is different from formal education. The profile of the distance learner has different profile: their main objective of higher education through the distance mode of education is always different from the 17-23 age-group of other formal students. Hence, five areas of quality concerns need to be dynamically applied to the following elements of distance education to guarantee that no element lacks the probable degree of quality: (1) curriculum design, content and organization, (2) teaching, learning and assessment, (3) student progression and assessment, (4) student support and guidance.

The task of the distance instructor or mentor is much more than merely grading students' submitted material. Ideally, the instructional process should involve:

- Diagnosing the student's readiness to learn,

- Monitoring student progress toward objectives sought,

- Recognizing and discovering a student's learning difficulties,

- Stimulating and challenging students to further efforts,

- Evaluating the quality of a student's learning, and

- Assigning a grade to estimate learning outcomes (MacKenzie, Christensen & Rigby, 1968, p. 137).

Beaudoin (2002) argues for the research and examination of the specific type of leadership needed in distance education leadership. Distance education has been based both on traditional education leadership and business/industry leadership. He points out some specific characteristics that a distance education leader needs: (1) creating conditions for innovative change, (2) enabling individuals and organizations to share a vision and move in its direction, and (3) contributing to the management and operationalization of ideas. While these traits are implicit in transformational leadership, the method of applying and utilizing them is unique for the distance education leader. Leaders do not appear overnight. An effective leader will be able to foster change and be able to move large numbers of staff in the same positive direction. Leaders in traditional academia and online academia share equal responsibility.

In transformational leadership, only focusing on information will not be enough to implement transformation in an institution. Leading in a culture of change does not mean placing changed individuals into unchanged environments. Rather, change leaders work on changing the context, helping create new settings conducive to learning and sharing that learning. Most organizations have invested heavily in technology and possibly training, but hardly at all in knowledge sharing and creation. And when they do attempt to share and use new knowledge, they find it enormously difficult. Take the seemingly obvious notion of sharing best practices within an organization. Identifying the practices usually goes reasonably well, but when it comes to transferring and using the knowledge, the organization often flounders (Brown and Duguid, 2000). Besides, Goleman, Boyatzis and McKee (2002) claim that emotionally intelligent leaders and emotionally intelligent organizations are essential in complex times. They identify 18 competencies around four domains: self-awareness, self-management, social awareness, and relationship management. Such leaders are aware of their own emotional makeup, are sensitive and inspiring to others, and are able to deal with day-to-day problems as they work on more fundamental changes in the culture of the organization. Blase and Blase's (1998) indicated that there are three aspects of effective instructional leadership behaviour. These aspects are, (1) talking with teachers (conferencing), (2) promoting teachers' professional growth, and (3) fostering teacher reflection.

The origin of the term 'instructional leadership' is North America and it has been superseded in England and elsewhere by the notion of 'learning-centred leadership'. Rhodes and Brundrett (2010) argue that the latter concept is broader and has greater potential to impact on school and student outcomes. Southworth (2004) says that leaders influence learning through three main strategies, namely, modelling, monitoring and dialogue.

In order to ensure excellence in distance education we have to establish an education environment fostering information and experience sharing among the whole distance education system partners. Digital technologies in association with new teaching methods can help develop new approaches to distance education possible and support excellence in teaching. To this end, we have several challenges to overcome. First, we have to create rich learning environments which progressively enhance resourcing for production of high quality distance learning material and the development of excellence in teaching in digital spaces. Second, we have to make wise choice decisions in relation to technology. We have to select an effective suite of core digital learning tools and support innovation and research activities. Third, we have to provide a coordinated and systematic support for the widely distributed distance education participants such as staff and students, and sustain it across the institution. Lastly, we have to develop processes and implement them to ensure appropriate and consistent standards of course quality and student experience across all distance education offerings.

The case of Sakarya University e-MBA program

As John Dewey said "if we teach today as we taught yesterday, we rob our children of tomorrow", we need to think about our teaching methods and assessment tools for student success at our universities. In today's complex education environment, the goal of university education is no more information transfer, but the ability to create, use and manage knowledge.

For over fifteen years of experience in teaching, managing and coordination at the Sakarya University, I have witnessed the evolution of eMBA program and experienced many challenges and helped sort out problems and bring solutions to the problems in the design and implementation stages of the program. Here I try to share some of these experiences in order to help others in the implementation of distance education programs.

My experience has shown that the most important thing in such an endeavour like distance education is the change management. Distance education is not something that is an extension of existing teaching education system. Although we were trying to implement the distance learning system which has its own paradigms and methods, with an instructional education mind-set into the traditional face-to-face classroom education environment, we did not thought we needed a change management plan. Throughout the years we have developed some guidelines in order to eliminate the hurdles we face when implementing new programs and improving existing distance education programs at the university. All these guidelines were tried-and-tested procedures and principles designed and developed during our 15 years of experience in our eMBA distance education program.

In the implementation of our distance education program we had encountered various problems which can be classified under three headings: teaching methods and assessment problems, managerial problems and regulatory problems. The most difficult to overcome and the most frequently encountered problem is related to teaching methods and assessment of student performance. Although distance education requires different teaching methods, different materials and different assessment methods, our lecturers have a tendency to use traditional classroom methods in the new programs. But the result was failure and dissatisfaction from the point of student satisfaction point. At this point, the role of leadership was utmost importance in taking responsibility and the initiation in order to lead the change in the minds of lecturers and in the methods of teaching adopted in traditional classroom settings.

As the program coordinator (and leader), the most difficult part was to persuade lecturers to become an intermediary in the transfer of information rather than the source of the information. In addition to this, lecturer tend to use traditional assessment methods, use general textbook materials and teaching methods lecturing have led to various undesirable outcomes leading to unhappiness for both lecturers as well as students. Furthermore, many of the lecturers were not adept at using information technology and education technologies. This has led us to train lecturers by developing applications and exemplary contents and lecture materials suitable for distance education. On this matter, a support from an experts from the education faculty would shorten the time required to train the lecturers and other support staff.

The second type problems were related to managerial issues. Especially the lack of leadership in motivation, technology selection, setting up operational guidelines and the organization of the programs.

The third type problem was related to lack of rules and regulations at national level established by the Higher Education Council of Turkey. Since the distance education is different from traditional instructional education system, all regulations and rule should be revised and developed in order to meet the needs of distance education systems.

In distance education, lecturers should play the role of coordinator and organiser in the learning process. Hence, the directors or managers, whatever is called, in distance education must see themselves as educational leaders who, through less directing and more motivating, facilitate the articulation, development, implementation and stewardship of a visionary of learning that is shared and supported by a wider academic community.

In distance education, program leaders or managers need to pay attention to various areas of the program. These areas can be briefly summarised as follows:

- Needs assesment: distance education leaders must assess the needs of students, lecturers and support staff.
- Selection of right technologies: distance education is technology bound system. In the market there are a number of vendors supplying various software and hardware technologies, selection of right technology is of critical importance for the success of the program. Sometimes purchase of different technologies may lead to lack of communication between the existing systems and new technology, hence causing problems in the conduct of the live lectures and other teaching methods.
- Development of best practice exemples: these type of practices help lecturers and other support staff give direction and vision in the design and implementation of programs, lecture contents ve presentations.
- Resource mobilization: program coordinators and leaders need to take initiative in the mobilization of resources halping improve the effectiveness of distance education programs.
- Establishment of good online infrastructure: the performance of a distance education program is very much highly dependent on the availability of a fast and effective online infrastructure.
- A good strategic plannig: since the education technology is rapidly changing and the competition among institutions is intensifying, all institutions should have strategic plans for the future of the distance education programs. In that respect, especially the attractivenes, currency, ease of use, usefulness, effectiveness and the interactivity of these programs should be updated frequently.
- Continuous market analysis: as mentioned above universities and other institutions compete with each other in enrolling students to their programs. Hence, program leaders need to assess the needs of the market and the developments in distance education area.
- Policy formulation: the success and seriosness of a distance education program is determined by the seriousnes of the program owners in following the rules and requlations developed for distance education.
- Program evaluation and assseement: leaders need to reassess and reevaluate their programs with respect to student satisfaction, program effectiveness and material apropriateness.
- Collaboration with partners: since the education technology is expensive and there is a lack of expertise in some areas, different institutions may collaborate in conducting and implementing distance education programs in order to capture economies of scale and resource utilization.
- Continous training and support programs for program improvement.

Hence, in today's complex education environment, the success of distance education programs will depend on:

- learning how to cope with the change taking place in education environment,
- have a transformational leadership mentaility
- the adoption of new teaching paradigm – networked learning,
- the adoption of an interdisciplinary perspective in thge selection and use of teaching and assesment methods and tools
- driving the change in distance education practices, methots and techniques, not driven by the change.

Conclusions

As a result, the challenges of change associated with the issues of technology and distance education can be handled through the planning and implementation of a comprehensive professional development program that is grounded in well-established, basic principles of effective leadership. All participants may never be comfortable with technology, computers, or distance education. With the guidance of sound principles of leadership, all faculty should feel ownership of the vision, mission, and values of the organization.

THE ROLE OF THE SIGNIFICANT OTHERS IN THE TRANSITION OF CZECH PUPILS BETWEEN THE LOWER AND UPPER SECONDARY EDUCATION

Petr Hlaďo [93]

Institute of Lifelong Learning, Mendel University in Brno, Czech Republic

Abstract

The paper deals with the evaluation of the role of the significant others in the transition of Czech pupils between the lower secondary education (ISCED 2A) and the upper secondary education (ISCED 3). In the theoretical introduction, attention is paid to the importance of choosing a further course of education in human life, the specifics of the decision in the context of the Czech educational system and the maturity of adolescents for independent decision-making. The core lies in an empirical investigation designed by the National Institute of Education, School Counselling Centre and Centre for Further Education of Teachers carried out in 2011 at forty Czech primary schools. The instrument of data collection was paired questionnaires for pupils of the 9th grade of lower secondary school and their parents (N = 779). Presented here are the views of pupils and parents as to who the expert in choosing a secondary school is, i.e. who in the family should decide in the choice of a secondary school, whether pupils or their parents. Furthermore, social influences reflected in the students' decision-making (parents, siblings, peers, friends from social networks, teachers, educational consultant, school psychologist and other counselling staff) and the most frequently used information sources are specified, and their significance is evaluated from the perspective of students as well as their parents.

Keywords: secondary school choice; career choice; career decision-making; lower-secondary school; upper-secondary school; family; significant others

Introduction

The present empirical study deals with the role of significant others in the transition of Czech pupils between lower secondary education (ISCED 2A) and upper secondary education (ISCED 3) with emphasis on the role of parents and family.

This topic has received considerable attention in economically developed countries. This is evidenced by a number of studies, mainly in the United States, Great Britain, Germany, Switzerland, Austria, France, etc. (cf. Hlaďo, 2010b). The number of published works that focus primarily on the investigation of the influence of parents and families in this decision-making process is increasing. Important works are overviews by Schulenberg, Vondracek and Crouter (1984) and Whiston and Keller (2004) that provide a complex evaluation of studies published in 1984—2004 in the United States; White (2007) maps studies in Great Britain and Görtz-Brose and Hüser (2006) present the most important research projects in Germany.

The choice of upper-secondary education determines not only the individual educational trajectory of pupils, but it can also represent a potential risk of exclusion in the economic, individual, social, group or spatial dimension (e.g. long-term unemployment and a related loss of self-confidence, self-esteem and income, social isolation, exclusion in certain social groups, socio-pathological phenomena, etc.). Whether the chosen educational path corresponds to the possibilities and interests of an individual is also important in terms of healthy personality development, individual satisfaction, success and use of his or her social potential, which may be reflected in the mental health of the individual.

Although the choice of a secondary school (*note:* secondary school throughout the paper means upper-secondary school at level ISCED 3), which pupils are to make at the end of compulsory schooling, is not an irreversible act, any revision or change of the original decision is associated with expenditure of considerable effort. The transition between lower and upper secondary education therefore rightly draws the attention of many teachers, career consultants, educational consultants, psychologists, sociologists and researchers, but also parents, the professional public and other interested persons in many countries around the world. Secondary school choice is a specific and unique process that takes place in the given circumstances in which an individual lives. The theoretical and empirical evidence presented in this paper will therefore focus on clarifying the issues discussed with Czech pupils, whose decision is carried out primarily in a family context, but at the same time it is limited by the Czech education system and its characteristics.

Decision-making in the context of the Czech education system

The Czech education system features a high degree of stratification and professional specialization, which makes matters difficult for pupils deciding on the further course of education at the end of compulsory schooling (*note:* a detailed description of the Czech education system is available in the publication *The Education System in the Czech Republic*, see The Ministry of Education, 2011). Pupils terminate compulsory school attendance mainly at *primary school* (lower secondary school—ISCED 2A). In the 9th grade, i.e. approximately at the age of 14—15, an adolescent individual has to answer the serious question of whether he or she wants to study or seek employment. The fact remains that in the Czech Republic and abroad, most students continue in education at different types of upper-secondary schools and only a small part directly enter the working process (cf. Organisation for Economic…, 2011; Organisation for Economic…, 2010).

After finishing ISCED 2A, most Czech pupils choose branch-oriented secondary education completed by a school-leaving examination (ISCED 3A) or a vocational/apprenticeship certificate (ISCED 3C). This is also evidenced by the current statistical data. In the academic year 2010/2011, almost 72% of pupils enrolled in secondary vocational education with a school-leaving examination or secondary education with a vocational/apprenticeship certificate. Approximately 18% of lower secondary school graduates enrolled in general education at secondary general schools, *gymnázium* (Statistická, 2011). The data indicate that the choice of secondary school also means for the majority of Czech pupils a choice of a profession which is carried through the choice of a specific field of study. This trend is different from other countries of the Organization for Economic Cooperation and Development *(OECD)* where a greater part of the population than in the Czech Republic goes through general education at the upper-secondary-school level (see Organisation for Economic…, 2009).

Maturity of pupils for independent decision-making

Psychologists agree that pupils are, given the specifics of adolescent development, not yet sufficiently mature for a responsible choice (e.g. Hirschi & Läge, 2007; Nilsson & Åkerblom, 2001; Super, 1990). Young people lack information about educational possibilities and the world of work and due to their low level of self-knowledge they do not know how high their individual potential is (cf. Gati, Krausz, & Osipow, 1996). They are incapable of fully embracing and understanding all important objective determinants of such decision-making and do not know themselves very well. The result is that in the transition between lower and upper secondary education they often do not make an optimal choice and soon recognize that their decision was not correct and in many cases they have to re-orient themselves. The cause of dissatisfaction is not usually the level of chosen education but preparation in a field which does not correspond to their interests or represents certain restrictions of the choice of further studies in tertiary education (Trhlíková et al., 2008). The overall unfavourable situation is also evidenced by the fact that the proportion of secondary-school students who stay after graduation in their field, is decreasing (cf. Křížová et al., 2008).

Empirical survey methodology

The empirical survey focuses on the role of significant others in the transition of pupils between lower and upper secondary education with an emphasis on parents and family. Partial findings of the presented research are based on a quantitatively oriented survey designed by the *National Institute of Education, School Counselling Centre and Centre for Further Education of Teachers*.

The instrument of data collection was paired questionnaires for pupils of the 9th grade of *základní škola* and their parents. The questionnaires were administered in 2011 at forty primary schools in four of the fourteen regions of the Czech Republic. The first half of the regions is characterized by long-term problems with unemployment among the population and the second half of the regions has average or higher employment. Ten primary schools were randomly selected in each region. The sample consisted of 779 pupils and the same number of parents. When designing the questionnaires, we drew from the findings of earlier studies (e.g. Walterová, Greger, & Novotná, 2009; Walterová et al., 2009; Hlaďo, 2009; Trhlíková, Vojtěch, & Úlovcová, 2008; Katrňák, 2004; Smetáčková, 2005).

The data were first analysed using descriptive statistics. Subsequently, hypotheses were tested. Dependencies between variables were determined by a goodness of *fit chi-square test*, the closeness of the relationship by *Cramér's contingency coefficient* and the strength of differences using *odds ratios*; the right-sided alternative was tested. All statistical tests were performed on the asymptotic significance level of 0.05.

Opinions of pupils and parents: who is an expert when choosing a secondary school?

As mentioned in the introduction, the decision-making processes related to various stages of choosing a further course of education are considered one of the most difficult and most complicated in one's life. With regard to this assumption we raised the question of who in the family is considered an *expert* in this area.

Pupils consider themselves experts in the choice of a secondary school. With them expressing their attitudes, it was possible to observe a high degree of radicalism and refusal to compromise due to ongoing emancipation from dependency on the family. Pupils are not willing to accept a subordinate position of themselves, neither a superior position of an authority. On that basis, they declared that they wanted to decide themselves, regardless of the parents. 87% of surveyed pupils believe that the choice of secondary school is their affair and their parents should not interfere in it at all. Only 12% of pupils think that school choice should be influenced mainly by parents. An explanation can be found in the findings of a qualitative study conducted by Hlaďo (2009). In the view of pupils, parents intervene in the decision-making to very little extent. Their task is to help pupils if they need this kind of help. Pupils are willing to attribute this particular role to parents only if they are aware of their own insufficient ability to deal with the challenges related to secondary school choice.

Hlaďo (2009) in a longitudinal case study also found that parents intensively think about the matter of expertise and they feel that they bear a great deal of responsibility in secondary school choice. These findings were also confirmed in a representative sample of respondents in our empirical survey. 33% of surveyed parents think that they as parents should decide on the choice of a secondary school for their child and 67% of parents stated that the choice of secondary school is the child's concern. A comparison of parents' and pupils' responses showed that pupils more often than parents think that the choice of secondary schools should be their autonomous affair ($\chi^2(3) = 126.048$, $p < .000$, OR = 3.293).

Parents' attitude towards the choice of upper-secondary education and the strategies used are largely influenced by the *socioeconomic status of the family*. Parents from the middle class, professionals with higher education are more active in the selection of secondary school and leave the choice of education to pupils less often than parents of lower socioeconomic status (David, West, & Ribbens, 1994). In our study, however, the hypothesis that fathers with higher education often believe that as parents they decide on the choice of secondary school of their child was not confirmed ($\chi^2(2) = 4.592$, $p = .101$). We had similar findings with mothers, where a statistically significant relationship between educational attainment and claiming that as parents they decide on

the choice of secondary school of their child was proved. The interval (0.9728; ∞) of *odds ratios* included the value 1, therefore we rejected the right-sided hypothesis that mothers with higher education more often believe that as parents they decide on the choice of secondary school.

Differences in opinions were identified between fathers and mothers. With a margin of error of 5% it was proved that fathers were more likely than mothers to believe that as parents they decide on the choice of secondary school for their offspring ($\chi^2(1) = 4.922$, $p = .027$, OR = 1.551; the interval of right-sided hypothesis did not include the value 1, therefore the null hypothesis was rejected in favour of the right-sided alternative).

A deeper understanding of the issues discussed is provided by a description of strategies applied by parents in the transition of pupils between lower and upper secondary education. Hlaďo (2010a) found that parents not only take into account the fact that the chosen secondary school should be of interest for the pupil and should correspond to his or her skills, but they also try to anticipate future risks. In steps therefore a critical assessment of the pupils' ideas about his or her further course of education and on that basis they select one of the parental strategies. Besides the factors mentioned, there are other influences on the parents' strategies. These include the parents' educational aspirations, the perceived role of a parent in secondary school choice, assessment of the materiality of the decision for the future life of the pupil, the career maturity of the pupil, the degree of distinction of his own ideas about his own future, his own activity during the decision-making process, etc.

The role of the significant others in the decision-making process

Some researchers in their studies of the transition of pupils between lower and upper secondary education distinguish between sources of influence and sources of information. However, in reality it is very difficult to isolate the two components (cf. White, 2007).

In order to determine what *influences* actually interfere in the decision-making of Czech pupils, they were presented with a scale question of what and to what extent influenced them in making a decision of where to go after primary school. To map the most important *sources of information*, pupils were asked where they got the information needed for their secondary school choice, and thus also the future profession, and how it helped them. We investigated the same information in the questionnaires for parents in order to compare views of both actors in the decision-making process.

Social influences on the pupils' decision-making

Pupils attributed the greatest influence in deciding where to go after the primary school to *their own decisions* (91.2%). Approximately 40% of respondents attributed a great influence to *parents*. In decision-making, pupils are influenced by their own decision more than by the influence of parents ($\chi^2(2) = 446.693$, $p < .000$, Cram. $V = .537$, OR = 15.207), which corresponds with the findings of Czech studies (e.g. Walter, Greger, & Novotná, 2009; Trhlíková, Vojtěch, & Úlovcová, 2008) as well as studies carried out abroad (e.g. Beinke, 2006; Smyth, 1993; Forster, 1992; Walford, 1991; Thomas & Dennison, 1991).

This fact was also investigated from the perspective of parents. With the question of who influenced the pupil in secondary school choice and how, 78% of parents responded that pupils were influenced by their own decisions and 34% of parents think that it was them who influenced the pupil. With a margin of error of 5% it was proved that according to parents, pupils are in their secondary school choice influenced by their own decision rather than by their parents' ($\chi^2(2) = 290.825$, $p < .000$, Cram. $V = .441$).

In earlier studies carried out abroad, there are also different empirical findings stating that neither pupils nor parents have a dominant role and the decision is a result of consensus (cf. Hirsch, 1994; Smyth, 1993; Devlin & Knight, 1990), or the decision is made by their parents (cf. David, West, & Ribbens, 1994). White (2007) concludes that the published studies cannot clearly identify how the roles of individual players change over time and the extent of the influence of parents on the final decision is not sufficiently apparent. According to his

findings, parents do not decide but rather create imaginary boundaries within which decision-making is carried out by pupils.

Other social sources had an influence on pupils' decision-making to a lesser extent. The descriptive statistic shows that parents are followed by friends ($M = 2.32$, 9.6%), siblings ($M = 2.58$, 7.4%), teachers ($M = 2.60$, 4.2%), form teachers ($M = 2.62$, 2.3%), educational consultants ($M = 2.63$, 5.2%), pedagogical-psychological consultants ($M = 2.70$, $M = 2.09$, 5.9%), the employment office expert ($M = 2.75$, 2.6%) and other subjects (details are given in Table 1).

We found that pupils are in their secondary school choice influenced more by parents than siblings ($\chi^2(2) = 651.001$, $p < .000$, OR = 8.508), friends ($\chi^2(2) = 389.331$, $p < .000$, OR = 6.349) and form- and other teachers ($\chi^2(2) = 941.352$, $p < .000$, OR = 20.105). We got the same results by testing responses of parents.

Table 1. Social influences on the pupils' decision-making (evaluation by pupils)

Social source of influence on decision-making	Relative frequencies (in %)			Arithmetic mean (M)	Rank order according to arithmetic mean
	Great influence (1)	Little influence (2)	No influence (3)		
My decision	91.2	8.2	0.5	1.09	1
Parents	40.3	55.5	4.1	1.64	2
Siblings	7.4	27.5	65.1	2.58	4
Friends	9.6	48.5	41.9	2.32	3
Friends from social networks	2.0	11.2	86.9	2.85	10
Teachers (other than form teacher)	4.2	31.3	64.5	2.60	5
Form teacher	2.3	33.9	63.8	2.62	6
Educational consultant	5.2	26.4	68.4	2.63	7
School psychologist	1.6	7.1	91.3	2.90	11
Pedagogical-psychological consultant	5.9	18.1	76.0	2.70	8
Employment office expert	2.6	19.8	77.6	2.75	9

Another issue that appears in studies is the influence of *peers, peer groups and friends*. Beinke (2006) believes that the influence of peers and peer groups on the choice of further course of education has been increasing lately. The research shows that peers play a major role especially in providing information relevant to pupils' secondary school choice, although also this has been dominated by parents for a long time (Taylor, 1992). In connection with the influence of peers, Beinke (2006) points out the possible transmission of distorted information, but also the positive influence of peers in stabilizing the emotions of pupils in a period of uncertainty, which relates to the secondary school choice.

The data analysis also shows that pupils' decision-making is influenced by friends more than by teachers ($\chi^2(2) = 117.750$, $p < .000$, OR = 3.167) and siblings ($\chi^2(2) = 82.902$, $p < .000$, OR = 1.340).

For today's generation, known as the computer generation, new media and the Internet are a normal part of their everyday life. For this reason, we investigated how the pupils' decision-making is influenced by friends with whom they communicate through social networks (e.g. Facebook, Google+, Myspace, Twitter, etc.). We found that friends from social networks have no influence for almost 87%. Pupils are therefore far more influenced by friends with whom they interact face to face rather than by friends from social networks ($\chi^2(2) = 339.491$, $p < .000$, OR = 5.352).

Another issue discussed in connection with the pupils' decision-making in the transition between lower and upper secondary education is the role of *teachers* and *career advisers*. Several studies have emphasized the marginal role of teachers (Harris, 1992), career counsellors (Lawrence, 1992) and career education and counselling in general (Bates, 1990). The findings about Czech pupils correspond with those studies. The influence of advisers and teachers ranked not only below that of parents, but also of siblings and friends. Despite these findings, teachers' support of pupils is important, because together with parents they aid in shaping educational and professional aspirations. Since pupils spend a great deal of time at school, teachers and career advisers have a considerable potential to become the key source of information, advice and assistance.

Sources of information

A sufficient amount of information, its relevance, accessibility and clarity are the key conditions for making a successful choice of the further course of education. From interviews with pupils, Hlaďo (2009) found that they use a variety of formal and informal information sources in their secondary school decision-making. Formal sources have an institutional form and provide objective information, while informal sources have a non-institutional form and provide information based on a subjective basis. *Formal sources of information* used are magazines, newspapers, school websites, databases of educational institutions, secondary school fairs, open days at secondary schools, information provided in the formal curriculum or during career guidance, information available on bulletin boards at school, etc. *Informal sources of information* are parents, siblings, friends, friends and acquaintances, classmates and other significant others of the pupil.

We investigated the structure of formal and informal sources of information used by pupils in secondary school decision-making (see Table 2). *Information provided by the secondary school where they want to apply* is of the greatest help ($M = 1.57$, 39%). In terms of pupils' decision-making, open days at schools seem to be very important. Visits during open days are discretionary and according to circumstances, pupils come accompanied by their parents, often alone or together with classmates. Such a visit is a unique opportunity for pupils to get personally acquainted with the environment and atmosphere of the school, the staff, to learn specific information about the school, study conditions, admission procedures, the degree of selectivity of the school, the educational programs taught there, etc.

Table 2. Information resources used by pupils in secondary school selection (evaluation by pupils)

Sources of information	Relative frequencies (in %)				Arithmetic mean (*M*)	Rank order according to arithmetic mean
	Helped a lot (1)	Helped partially (2)	Did not help (3)	I did not have the information		
Parents	39.1	51.2	4.6	5.1	1.64	3
Classmates and friends	11.5	50.6	23.9	14.0	2.14	5
Základní škola (lower secondary s.)	18.9	47.4	22.2	11.4	2.04	4
School where the pupil is applying	48.6	37.2	8.3	6.0	1.57	1
Information and counselling centre at the employment office	3.9	20.8	29.1	46.3	2.47	6
Pedagogical-psychological counselling	4.5	13.4	25.8	56.4	2.49	7
Television	0.8	7.1	31.0	61.2	2.78	9
Internet	44.7	41.5	7.8	6.0	1.61	2
Newspapers and magazines	4.8	15.9	31.0	48.2	2.51	8

Pupils positively assessed information obtained from the Internet ($M = 1.61$, 45%). Pupils use mainly official websites of secondary schools and databases of secondary schools, where they search for specific information about particular educational institutions (educational programs, conditions of admission, number of students accepted, success of secondary school graduates in entering tertiary education, etc.). In addition to these Internet resources, pupils also consult Internet sites with information on how to proceed in secondary school selection and how to prepare for entrance exams. They also consult personality tests, which provide pupils with self-knowledge important for the choice of secondary school as well as future profession.

The most important informal source which greatly helped pupils is *parents* ($M = 1.64$, 39%). Information for the secondary school choice provided to pupils by their parents helps nearly 8 times more than the information supplied by classmates or friends ($\chi^2(1) = 137.304$, $p < .000$, OR = 7.603) and nearly 7 times more than the information provided by the primary school ($\chi^2(1) = 115.614$, $p < .000$, OR = 6.626).

A positive finding is that the choice of secondary school is a frequent topic of family discussions. According to the pupils' statements, 96% of their parents talk to them about what they would like to do after primary school. Only 3% of pupils stated that this topic had been the subject of discussion with their parents only once. Only a small part of parents do not talk to their offspring about secondary school choice at all. Almost three quarters of pupils (74%) believe that their parents provided them with as much information as possible for the decision on where to go after primary school. 20% of pupils surveyed looked up all information about post-primary education and 6% looked up some of such information. Information related to secondary school choice

obtained from family members is of greater help for pupils living with both parents than pupils living with only one parent ($\chi^2(3) = 8.725$, $p < .05$, OR = 1.791). This fully confirms the importance of family not only for the healthy development of the human personality, but also for one's career.

Although pupils tend to disparage their parents' influence on their decision-making, they in fact use their advice in their decision-making. Approximately 20% of pupils are fully advised by their parents in their decision on where to go on to after primary school and 69% of pupils use their advice in part. Only 8% of pupils do not use their parents' advice at all. The remaining 3% of pupils either did not receive any information from their parents or were not able to answer the question.

In everyday communication, parents pass their life experience, knowledge of the education system and the world of work onto pupils. Parents explain to them what the requirements of certain types of secondary schools are and what each occupation involves. The objectivity of the information provided is disputable, because some parents do not have up-to-date information, or the information transmitted from parents to pupils is filtered on the basis of subjective criteria.

Information sources that *do not help* pupils include television ($M = 2.78$, 31%), newspapers and magazines ($M = 2.51$, 31%), pedagogical-psychological counselling ($M = 2.49$, 24%) and information and counselling centres at employment offices ($M = 2.47$, 29%). The comparison of earlier Czech studies and findings from our research confirms the long-term low degree of use of counselling services provided by information and counselling centres and pedagogical-psychological counselling. We see the causes of this trend in the lack of awareness among parents and pupils of the counselling opportunities at both institutions, little or negative experience with their use and unsatisfactory accessibility.

Conclusion

The research shows a significant influence of the family on the choice of secondary school. We concluded that it is not only the pupil who should receive grounding and information necessary for decision-making, but also parents. In addition to career education at schools, education and information support to the parents should also be emphasized (cf. Watson & McMahon, 2007). One partner which has the potential for systematic collaboration with parents is in particular the primary school. The school should motivate parents for a responsible approach to the choice of secondary school, provide them with basic information and acquaint them with opportunities for career counselling. Pedagogical staff and consultants should also thoroughly inform parents how, how regularly and in what depth they prepare pupils for such decision-making. Strengthening of constructive cooperation and regular communication between the primary school and parents therefore seems essential.

The survey suggested possible directions of investigation and provided information which can be a constructive basis for designing studies with narrower scope of content and more depth. If there is success in targeting the research so as not to replicate surveys carried out earlier in the Czech territory, it will be a contribution not only from a scientific point of view, but especially for the practice of teaching and counselling at schools and education of pupils in families.

THE SELECTED ASPECTS OF EDUCATION PURSUED BY DIVORCED FATHERS

Anna Dudak [a] [94]

[a] Department of Pedagogy and Psychology, Maria Curie-Skłodowska University, Narutowicza 12, Lublin 20-004, Poland

Abstract

A person's increased interest in education is motivated by different life situations: the loss of job, the necessity to improve one's competence, and the willingness to pursue one's interests. Yet another factor that may influence people's need to develop their knowledge and skills is parenthood as it makes them realize how important it is to display high level of competence in the process of upbringing. It should be also noted that the growing number of divorces causes fathers to take interest in the family law. The aim of the research was to analyse divorced fathers' motivations and the forms of education they pursue in connection with their claim for custody or their need to establish contact arrangements. The study revealed that fathers claiming custody were interested mainly in gaining knowledge concerning the court requirements and completing the divorce documents. They also wanted to acquire knowledge and skills needed to be successful in court. Moreover, the study group sought to improve their social competence, especially dealing with stressful situations that are caused by loneliness, or lack or weakening of their emotional bond with the child. Among the forms of support most often chosen by the members of the study group were legal and psychological counselling, support groups and the internet portals.

Keywords: Fatherhood, divorce, custody of a child, educational pursuit

Introduction

Contemporary world forces people to constantly improve their competence, to expand their knowledge in various areas, and to pursue different forms of education. One of such forms is lifelong learning discussed by many researchers, among others by Kargul (2008), Aleksander (2008, 2010), Banach (2008), and Kwiatkowski (2008). Another issue more and more often dealt with in numerous publications is the family education. According to J. Kargul, the interest in this field stems from the specificity of family life in the contemporary world, which is full of offers, services and novel phenomena, social changes and processes, as well as intense political and cultural activity. Kargul states that contemporary world "is a world of new meanings brought about evoked by the transformations in virtually all spheres of social life" (2001, 51). He adds that family life is determined by new situations and this triggers the need to pursue education. These situations, with their unpredictable or upsetting influence on everyday life, often result in tension and stress, and they can cause crises between the family members. One of such situation is family break-up. Many researchers consider divorce to be a critical event in one's life and claim that it is characterized by "destabilization in the relation between the subject and the surrounding, the necessity to change one's functioning, the risk of pathology, significant emotional tension, and by the disorganization of the subject's habits" (Beisert 2000, 44). Beyond doubt, both parties face the consequences of a divorce: they need to deal with stress and adjust to the new reality. However, the situation of fathers seems more difficult. The custody of the child is usually granted to the mother (in Poland only 7% of fathers have custody), therefore fathers also have to deal with the feeling of loneliness and the weakening of the emotional bonds with the child. This situation is particularly difficult for the fathers who are aware of their parental role and want to actively participate in the process of upbringing. Changes in the stereotypical division of parental roles encourage more fathers to gain knowledge and acquire skills necessary to

[94] Anna Dudak. Tel.: +48 606-462-274
E-mail address: annadudak@wp.pl

fulfil their roles properly. The increasing number of divorces and the growing interest in the situation of single fathers and their difficult experiences connected with seeking custody of the child have caused the emergence of different organizations and associations offering an array of educational services, among others legal and psychological counselling. These organizations are most active and popular in the United States and they include: Parents Without Partners Association, Father United for Equal Rights, American Divorce Association for Men; American Society of Separated and Divorced Men; Free Man; Men`s Resource Center; Men`s Rights` Association; National Congress for Men; National Association for Widowed Persons (Stojanowska 2000, 25). Their main aim is to support parents in their struggle for the custody of the child. There are also organizations such as Child and Family Centers, Solo Parents and Preschool Nurseries that offer courses on caretaking and upbringing.

In Poland, there are also several institutions providing help to fathers claiming custody of children, for instance Fundacja Akcja (Action Foundation), Stowarzyszenie na Rzecz Dzieci Rozwiedzionych Rodziców "Tato" ("Dad" Association for Children of Divorced Parents), Stołeczne Stowarzyszenie Obrony Praw Ojca ("Metropolitan Association for the Defence of Fathers' Rights), Stowarzyszenie Centrum Praw Ojca i Dziecka (Centre for Father and Child's Rights Association), Stowarzyszenie na Rzecz Poszanowania Prawa Dzieci i Rodziny (Association for Respect for Children and Family Rights), Stowarzyszenie Obrony Praw Ojca SOPO (SOPO Association for the Father's Rights), Fundacja Cyryla i Metodego (Cyril and Methodius Foundation), tato.net initiative, Komitet Przestrogi Przed Oddzieleniem Rodzica (Committee of Warning Against the Separation of the Family), Fundacja Ojców Pokrzywdzonych przez Sądy (Foundation of Fathers Wronged by the Court), Stowarzyszenie Ochrony Praw Dziecka SOPD (Association for Protection of the Child's Rights), Centralne Stowarzyszenie Obrony Praw Ojca i Dziecka CSOPOiD (Central Association for Protection of Fathers' and Children's Rights), Inicjatywa społeczna „Porozumienie Rawskie" ("Rawskie Porozumienie" social initiative), Stowarzyszenie Przeciw Bezprawiu Sądów (Association against the Lawlessness of Court), Forum Matek Przeciw Dyskryminacji Ojców (Mothers Against the Discrimination of Fathers Forum), Stowarzyszenie na rzecz równouprawnienia i poszanowania prawa ojca (Association for Equality and Respect of Fathers' Rights).

The aim of the empirical analysis was to discuss the educational pursuits of fathers who claimed the custody of the child after a divorce and wanted to establish contact arrangements. The research focused mainly on the issues concerning the motivations behind educational pursuits and on the forms of counselling chosen by fathers wanting to gain or expand their knowledge. The analyses presented below continue and expand the research undertaken by the author in 2009 (See Dudak 2010).

Method

The research material was collected in a poll using the author's questionnaire. It was conducted in cooperation with Stowarzyszenie Centrum Obrony Praw Ojca i Dziecka (Centre for Father and Child Rights Association) and Fundacja Akcja (Akcja Foundation) that offer support in the field of family law, as well as psychological counselling to fathers seeking custody of children. The research was carried out among 115 fathers seeking custody of a child or wanting to establish contact arrangements after the divorce. The men were 19-59 years old, and the average age for the study group was 38.52. The majority of men had a university diploma and one child. The research revealed that the majority of the respondents were divorced (33.92%) or married but going through a divorce (20.87%). 19.13% were bachelors, 15.64% were remarried and wanted to establish contact arrangements, and 10.44 were separated. Over half of the respondents were deprived of custody by the court and the rest, despite having parental authority, were undertaking educational pursuits in the field of family and custody law in order to prepare for the proceedings, which may stem from the fact that many fathers expect an unfavourable court decision as far as custody is concerned. It is undoubtedly connected with the stereotypical belief that after a divorce the child should stay with the mother.

Results

The research into the motivations and forms of educational pursuits undertaken by fathers who claim custody of their children revealed that fathers are aware of their role in the child's life and of the necessity to improve their knowledge not only to regain custody but also to develop their parental competence.

The research aimed to analyse the educational pursuits of fathers who aspired to improve their post-divorce situation mainly in order to regulate the contacts with their children. The results of the empirical analysis (Table 1) allowed for identification of the motives behind fathers' decisions to pursue education. It has been established that 95.65% of the study group wanted to expand their knowledge of family and custody law and to acquire new skills, such as how to complete court documents, especially responses to court decisions or collecting certificates and evidence (photos, recordings) that may prove helpful in changing the unfavourable court decisions. The vast majority of fathers benefiting from the help (85.22%) wanted to expand their knowledge about proper behaviour during the divorce proceedings. It should be emphasized that the organizations providing reliable educational courses for fathers seeking custody of their children stress that the father's behaviour during the trial may significantly influence the court decision. They also point to the fact that, according to their experience, the least effective way to defend oneself and claim parental authority is to attack one's ex-wife.

The publications discussing the problem of men going through the post-divorce crisis emphasize that fathers face a very difficult situation (Dudak, 2010ab, Baskerville, 2002, Hetherington & Kelly, 2002, Wallerstein & Blakeslee 1989). Not only do they feel defeated, lonely and stressed (it also proves true for the ex-wives), but they also have to deal with the pain of separation with the child, longing, and the weakening or even lack of the emotional bond with the child. The empirical analyses showed that less than one-third of the respondents admitted that they pursued education to find new ways to deal with stress. This relatively low percentage may point to the fact that men are not willing to express their emotions and show their weaknesses. The research also proved that over half of the respondents decided to pursue education to increase their parental competence. Despite numerous opinions, fathers claiming custody of their children after a divorce are not driven by revenge against their ex-wives, but by the willingness to gain knowledge and parental skills that will provide protection for the child and a relatively stable situation during the divorce conflict.

Table 1. Motivation of fathers behind pursing education

Motivation of fathers behind pursing education	N	%
Gaining knowledge about completing court documents	110	95.65
Gaining knowledge about dealing with stress	32	27.83
Gaining knowledge about proper behaviour during the divorce proceedings	98	85.22
Developing parental competence	58	50.43

The research presented in the article attempts to discuss the forms of education most often chosen by fathers who want to gain or expand knowledge in certain fields. The research revealed that all fathers seeking custody or establishment of contact arrangements benefitted from legal and psychological counselling (Table 2) as it allowed them to receive the necessary help and support from the experts. Over two-thirds of men were members of support groups in which they could share their problems with fathers in similar situation. This form of support, however, was least popular among the study group. Little interest in the support groups may be

connected with the traits of men's personality, for instance with the fact that they are not willing to express their emotions in public. On the other hand, however, this form of activity proves to be extremely helpful in overcoming difficult life situations. The majority of respondents were quite satisfied with the internet portals; two-thirds regarded them <u>as</u> sources of information about single fatherhood, about family court proceedings, or about ways of fighting for one's rights. The respondents considered this form of activity to be a quick way to find some general tips and possible solutions. It should be stressed, however, that men treated the pieces of information available on the net as the inspiration to gain more knowledge and as a confirmation that other men experience similar problems.

Table 2. Forms of education pursued by fathers seeking custody of their children

Forms of education pursued by fathers	N	%
Legal and psychological counselling	115	100.00
Support groups	42	36.52
Using the internet portals for fathers	78	67.83

Conclusions

The aim of the research was to analyse the motivations and forms of education pursued by fathers claiming custody of a child. Their pursuits are an example of informal adult education in the contemporary society and show the importance of this form of education in the world that constantly undergoes changes and transformations. What is more, it also illustrates the contemporary people's willingness to gain knowledge in order to protect one's rights, fight with discrimination, and improve one's living conditions. The educational pursuits undertaken in order to become a better parent are exceptionally significant in the case of fathers who are aware of their important role in the process of upbringing and shaping proper behaviour in children. First of all, these pursuits increase fathers' chances to be granted the custody of a child and help them develop parental competence. What is more, the activities contribute to the changes in the image of a contemporary father who no longer wants to be "an absent father" but aspires to become "an involved father." The results of the empirical analyses presented in the article show that fathers' activities do not usually stem from the need to revenge themselves on their ex-wives (such motivations, however, cannot be excluded), but are connected mostly with the drive to maintain relations with the child and with the necessity to overcome the stereotypical attitude towards men as less competent and less needed parents.

Abstract

In this study at the first stage, alternative assessment techniques were constructed to determine students' misconceptions in the electromagnetic field-magnetism contents and at the second stage, effects of video-based experiments on students' achievement were examined. The participant of this study was 55 first-year students from science teaching department. Students' misconceptions were determined using by alternative assessment techniques which are branched diagnostic trees, structured grid and concept map constructed and used as pre-test. Then, video-based experiments were used and the alternative assessment techniques were conducted to students. Paired-samples t-test results indicate that video-based experiments have significant effect on students' achievement.

Keywords: Physics education; Computer Education; Alternative Assessment Techniques; Electromagnetic field; Magnetism; Misconception.

1. Introduction

Assessment is formally defined as a measure of performance (Gagne et al., 2005). Educational assessment is the process of documenting, usually in measurable terms, knowledge, skills, attitudes and beliefs. Assessment is a mechanism for providing instructors with data for improving their teaching methods and for guiding and motivating students to be actively involved in their own learning. As such, assessment provides important feedback to both instructors and students. In addition to providing the instructors with valuable information about our students' learning, assessment should assist the students in diagnosing their own learning (Angelo & Cross, 1993). Traditional testing methods have been limited measures of student learning, and equally important, of limited value for guiding student learning. These methods are often inconsistent with the increasing emphasis being placed on the ability of students to think analytically, to understand and communicate at both detailed and "big picture" levels, and to acquire life-long skills that permit continuous adaptation to workplaces that are in constant flux. The new studies are more focused on alternative assessment and evaluation approach and include techniques that consider not only the product but the process along with it (Taşdere & Ercan, 2011). Three of these techniques are the concept map, branched diagnostic tree and structured grid.

"Concept map" is graphical tools in order to summarize understandings acquired by students (Mintzes et al., 2000). "Branched diagnostic tree" can utilize much of the information content in quantitative measurements to make efficient and accurate diagnoses (Jolly & Zalondek, 1989). "Structured grid" is an important assessment tool in that it provides assessment of meaningful learning and manifests the shortcomings and defects in knowledge network and in misconceptions in student cognitive processing (Johnstone et al., 2000).

One of the frequently studied topics in science teaching is misconceptions. There are identified student misconceptions related to many learning field and topic (solubility, electric, photosynthesis-respiration, diffusion, osmosis etc) (Chambers& Andre, 1997; Mikkila, 2001; Çalık & Ayas, 2003; Sencar & Eryılmaz, 2004; Köse & Uşak, 2006). Bahar et al (2002) identified levels of student understanding and student misconceptions regarding Newton's law of motion, work, force and energy in 10th grade physics topics by using structured grid technique. According to the results and misconceptions in understanding the effect of force on motion (Bahar et al., 2002). Bahar & Hansell (2000) prepared a structured communication grid of 16 items in order to identify student views on vitality and questioned 1000 students in primary and secondary level students about the items on the grid. Results displayed that a substantial number of students had misconceptions.

Undergraduate students and in-service teachers have some difficulties especially in alternative assessment methods at learning and application (Ozen, 2006; Birgin & Gurbuz, 2008). Science teachers prepare alternative measurement tools according to students' levels. But, there are difficulties in the effective usage of the alternative assessment tools such as project, performance task, portfolio, concept map, structured grid, branched tree, rubric, interview, etc.. To overcome application problems, 3 different teaching and assessment techniques were used in this study. When studies in literature are reviewed, we find some application of alternative assessment techniques. However, we cannot find the application of three alternative assessment techniques together in higher education. In this context, in our study we applied three alternative assessment techniques in higher education for the purpose of alternative assessment in higher education and determining of misconceptions.

In this study at the first stage, alternative assessment techniques were constructed to determine students' misconceptions in the electromagnetic field-magnetism contents and at the second stage of the study, effects of video-based experiments on students' achievement were examined.

2. Methods

2.1. Purpose of the research

The purpose of this study is to determine science education pre-services' misconceptions in the electromagnetic field-magnetism contents using by alternative assessment techniques and to examine the effects of video-based experiments on pre-services' achievement. In the context of this study, the following research questions were investigated.

Do students have misconceptions about electromagnetic field and magnetism?

Are the alternative assessment techniques effective to determine pre-services' misconceptions?

How effective is video-based experiments in preventing pre-services' determined misconceptions about electromagnetic field-magnetism contents?

2. 2. Participant

The participant of this study was 55 first-year undergraduate students (average age 19-20years) at Department of Science Teaching in a public university in Istanbul, Turkey. The socio-economic status of the undergraduates was similar and the majority of them are coming from middle-class families. According to Turkish Educational Curriculum students learn electromagnetic field and magnetism subjects under general physics II course at the second semester.

3. Instruments

In this study; alternative assessment techniques which are branched diagnostic trees, structured grid and concept map were selected to identify students' misconceptions about the electromagnetic field - magnetism contents. Many physics educators have indicated that students' knowledge plays an important role on conceptual learning (Bodner, 1986). Therefore, many researchers have investigated students' knowledge known as students' misconceptions (Osborne, 1983). They reported that the most important significant things that students bring with them to class ideas, notions and explanations of natural phenomena that are inconsistent with the ideas accepted by the scientific community (Osborne, 1983; Ausubel, 1968; Ausubel, 2000; Driver, 1986; Driver, 1978). If students' these existing conceptions are scientifically incorrect, they are called as "misconceptions" (Driver, 1978).

Students' misconceptions were determined using by alternative assessment techniques which are branched diagnostic trees, structured grid and concept map constructed and used as pre-test by researchers electromagnetic field-magnetism concepts. The prepared alternative assessment techniques' scores classified as correct (1 point), incorrect (0 points) and blank answer (0 points). Each of the answers was evaluated by the researchers and the scores were compared and discussed until an agreement was reached. Then 3 different experiment videos which are prepared by researchers were used to teach more detailed for each concept. After the video-based experiments, the alternative assessment techniques were conducted to students as post-test.

4. Findings

Paired-samples t-test results was used to compare pre-services' pre-test and post-test scores. The analysis showed that there was statistically significant difference between pre-test and post-test scores (p= ,001*). Paired-samples t-test results indicate that video-based experiments have significant effect on students' achievement.

Table 1. Comparison of pre-test and post-test scores of pre-services according to paired samples t-test results.

Groups	Mean	N	Std. Deviation	Std. Error Mean	Paired samples t test		
					t	SD	p
Pre-Test	33,44	55	6,256	0,844			
Post-Test	38,75	55	8,327	1,123	-3,673	54	,001*

Responses of the students to the pre-test and post-test showed that they had 7 misconceptions about magnets, magnetic field, magnetic poles, charged particle in a magnetic field, magnetic field of a wire, magnetism properties of the matter, magnetic field effect of electric current concepts (Table 2.). These misconceptions were not seen as much as after the detailed video based instruction.

Table 2. Percentages of students' misconceptions determined at the pre-test and post-tests in experimental and control groups.

Students' Misconceptions	(N=55)	
	Pre-Test (%)	Post-Test (%)
1. Magnitude of the magnetic force does not depend on velocity	47.0	23.0

of charged particle.		
2. Magnetic force is parallel to the plane formed by magnetic field and velocity vectors.	45.0	30.0
3. The magnetic force acted a positive charge is the same direction with the magnetic force acted a negative charge.	53.0	29.3
4. Two wires conducting in the same direction current pull each other.	34.8	12.0
5. Two wires conducting in opposite direction current attract each other.	38.3	24.5
6. A magnet attracts all metals.	51.3	32.3
7. Right-hand rules.	63.1	25.5

5. Conclusion

Gilbert, Osborne and Fensham (1982) suggested that students brought their views to science lessons. These are logical to students and have a considerable influence on how and what they learn from their classroom experiences. For meaningful learning, one alternative way is to change the instruction using a constructivist approach. In the conceptual change based instruction, several instructional tools or strategies can be used frequently for determining and eliminating misconceptions in science called as alternative assessment techniques.

The purpose of this study is to determine science education pre-services' misconceptions in the electromagnetic field-magnetism contents using by alternative assessment techniques and to examine the effects of video-based experiments on pre-services' achievement. To determine students' misconceptions about the electromagnetic field - magnetism contents, alternative assessment techniques which are *branched diagnostic trees, structured grid and concept map* were used. In the beginning of the study, alternative assessment techniques conducted to students as pre-test and misconceptions were determined.

According to the results, students had 7 misconceptions about magnets, magnetic field, magnetic poles, charged particle in a magnetic field, magnetic field of a wire, magnetism properties of the matter, magnetic field effect of electric current concepts. In this study, alternative assessment techniques were used to determine students' concepts in detailed. After the determination of the misconceptions, 3 different experiment videos which are prepared by researchers were used to teach more detailed for each concept and alternative assessment techniques were conducted to students as post-test. The results showed that determined misconceptions were not seen as much as after the detailed video based instruction.

This study makes a huge contribution using by three alternative assessment techniques together in higher. In this context, in our study we applied three alternative assessment techniques in higher education for the purpose of alternative assessment in higher education and determining of misconceptions successfully.

Abstract

In this study at the first stage, alternative assessment techniques were constructed to determine students' misconceptions in the electromagnetic field-magnetism contents and at the second stage, effects of video-based experiments on students' achievement were examined at distance physics course. 60 second-year students were enrolled in this study from computer education and instructional technology department. Students' misconceptions were determined using by alternative assessment techniques which are branched diagnostic trees, structured grid and concept map constructed and used as pre-test. Then, video-based experiments were used and the alternative assessment techniques were conducted to students. Paired-samples t-test results indicate that video-based experiments have significant effect on students' achievement at distance physics course.

Keywords: Distance Education; Computer Assisted Learning; Physics education; Alternative Assessment Technique; Electromagnetic field-Magnetism.

1. Introduction

Nowadays, the multidimensional and complex character of the domains to be assessed is clearly recognized in distance education. And so is the need to assess them in combination with the application contexts in distance education (Sangra, 2007). However, today's distance education systems, learning has been traditionally measured quantitatively, basically through written examinations, objectives and contents (Brown et al., 1997). Today, the paradigm in distance education assessment has changed. Some of these changings are "tool to certify" to "tool to promote learning", "academic disciplines" to "professional competencies", "uniformity of techniques" to "diversity of techniques" and "final assessment" to "continuous assessment". Under the basis of the mentioned emerging trends in distance education, we would assume these trends are making the scenario change when using technology in education (Badía, 2002). Therefore, theorists tried to find the most recommendable assessment approaches to open and distance education (Morgan & Reilly, 1999). Web-supported materials and assessment tools are of great importance in technology-supported science education. But, studies have been focused on technology supported material development. It has been reported that these types of materials have positive effects on learning (Gabbard, 2000; Wen et al., 2004; Chuang & Tsai, 2005). The new studies are more focused on alternative assessment and evaluation approach and include techniques that consider not only the product but the process along with it (Taşdere & Ercan, 2011). Three of these techniques are the concept map, branched diagnostic tree and structured grid.

"Concept map" is graphical tools in order to summarize understandings acquired by students (Mintzes et al., 2000). "Branched diagnostic tree" can utilize much of the information content in quantitative measurements to make efficient and accurate diagnoses (Jolly & Zalondek, 1989). "Structured grid" is an important assessment

tool in that it provides assessment of meaningful learning and manifests the shortcomings and defects in knowledge network and in misconceptions in student cognitive processing (Johnstone et al., 2000).

One of the frequently studied topics in education is misconceptions. There are identified student misconceptions related to many learning field and topic (solubility, electric, photosynthesis-respiration, diffusion, osmosis etc) (Chambers& Andre, 1997; Mikkila, 2001; Çalık & Ayas, 2003; Sencar & Eryılmaz, 2004; Köse & Uşak, 2006). These studies have often made use of similar type tests (multiple choice, open-ended questions, two-stage tests, interviews etc) in order to identify misconceptions. According to Çalık & Ayas (2003) although multiple tests provide us with information related to student misconceptions, they do not allow for deeper understanding of the issue. In this context it becomes more important to use alternative assessment techniques that evaluate meaningful and deeper learning and that expose the relationships among concepts in the cognitive structure (Taşdere & Ercan, 2011).

When we look at the literature in distance education, we find some application of these alternative assessment techniques in distance education. However, we cannot find the application of three alternative assessment techniques together in distance education. In this context, in our study we applied three alternative assessment techniques in distance education for the purpose of alternative assessment in distance education supported by video based instruction and determining of misconceptions.

2. Methods

2.1. Purpose of the research

The purpose of this study is to determine distance education students' misconceptions in the electromagnetic field-magnetism contents using by alternative assessment techniques and to examine the effects of video-based experiments on students' achievement. In the context of this study, the following research questions were investigated.

Do students have misconceptions about electromagnetic field and magnetism?

Are the alternative assessment techniques effective to determine distance education students' misconceptions?

How effective is video-based experiments in preventing distance education students' determined misconceptions about electromagnetic field-magnetism contents?

2. 2. Participant

The participant of this study was 60 second-year distance learning students (average age 20-21years) at Department of Computer Education and Instructional Technology in a public university in Istanbul, Turkey. The socio-economic status of the students was similar and the majority of them are coming from middle-class families. According to Turkish Educational Curriculum, students learn electromagnetic field and magnetism subjects under distance general physics II course at the second semester.

3. Instruments

In this study; alternative assessment techniques which are branched diagnostic trees, structured grid and concept map were selected to identify students' misconceptions about the electromagnetic field - magnetism contents. Many physics educators have indicated that students' knowledge plays an important role on conceptual learning (Bodner, 1986). Therefore, many researchers have investigated students' knowledge known as students' misconceptions (Osborne, 1983). They reported that the most important significant things that students bring

with them to class existing ideas, notions and explanations of natural phenomena that are inconsistent with the ideas accepted by the scientific community (Osborne, 1983; Ausubel, 1968; Ausubel, 2000; Driver, 1986; Driver, 1978). If students' these existing conceptions are scientifically incorrect, they are called as "misconceptions" (Driver, 1978).

Students' misconceptions were determined using by alternative assessment techniques which are branched diagnostic trees, structured grid and concept map constructed and used as pre-test by researchers electromagnetic field-magnetism concepts. The prepared alternative assessment techniques' scores classified as correct (1 point), incorrect (0 points) and blank answer (0 points). Each of the answers was evaluated by the researchers and the scores were compared and discussed until an agreement was reached. Then, 3 different experiment videos which are prepared by researchers were used to teach more detailed for each concept. After the video-based experiments, the alternative assessment techniques were conducted to students as post-test.

4. Findings

Paired-samples t-test results were used to compare students' pre-test and post-test scores. The analysis showed that there was statistically significant difference between pre-test and post-test scores (p= ,000*). Paired-samples t-test results indicate that video-based experiments have significant effect on students' achievement.

Table 1. Comparison of pre-test and post-test scores of pre-services according to paired samples t-test results.

| Groups | Mean | N | Std. Deviation | Std. Error Mean | Paired samples t test | | |
					t	SD	p
Pre-Test	42,9667	60	6,36986	,82235			
Post-Test	47,7833	60	5,14235	,66387	-10,934	59	,000*

Responses of the students to the pre-test and post-test showed that they had 7 misconceptions about magnets, magnetic field, magnetic poles, charged particle in a magnetic field, magnetic field of a wire, magnetism properties of the matter, magnetic field effect of electric current concepts (Table 2). These misconceptions were not seen as much as after the detailed video based instruction.

Table 2. Percentages of students' misconceptions determined at the pre-test and post-tests in experimental and control groups.

| Students' Misconceptions | (N=60) | |
	Pre-Test (%)	Post-Test (%)
1. Magnitude of the magnetic force does not depend on velocity of charged particle.	37.0	12.0
2. Magnetic force is parallel to the plane formed by magnetic field and velocity vectors.	33.0	10.0
3. The magnetic force acted a positive charge is the same	37.0	13.4

direction with the magnetic force acted a negative charge.

4. Two wires conducting in the same direction current pull each other.	28.7	10.0
5. Two wires conducting in opposite direction current attract each other.	32.4	22.0
6. A magnet attracts all metals.	45.6	26.4
7. Right-hand rules.	33.6	21.8

5. Conclusion

There is a direct relationship between technology and constructivism. According to constructivism, an individual does not accept the knowledge without any qualification, but constructs discursive, defending opinions, hypothesizing and questioningly (Hendry, 1999; Shunk, 1996). Constructivist learning predicts a rich and interactive learning environment. To provide this, students requires reaching the knowledge, results and data using by analyzing arranging and using them. In this regard, constructivist learning theory encourages the students doing about something instead of learning about something (Demirci, 2009). This learning approach is a consistent way with alternative assessment techniques.

The purpose of this study is to determine students' misconceptions in the electromagnetic field-magnetism contents using by alternative assessment techniques and to examine the effects of video-based experiments on students' achievement at distance physics course. For the purpose of determining students' misconceptions about the electromagnetic field - magnetism contents, alternative assessment techniques which are branched diagnostic trees, structured grid and concept map were used. In the beginning of the study, alternative assessment techniques conducted to students as pre-test and misconceptions were determined.

According to the results, students had 7 misconceptions about magnets, magnetic field, magnetic poles, charged particle in a magnetic field, magnetic field of a wire, magnetism properties of the matter, magnetic field effect of electric current concepts. In this study, alternative assessment techniques were used to determine students' concepts in detailed. After the determination of the misconceptions, 3 different experiment videos which are prepared by researchers were used to teach more detailed for each concept and alternative assessment techniques were conducted to students as post-test. The results showed that determined misconceptions were not seen as much as after the detailed video based instruction.

This study has a great importance and makes huge contribution using by three alternative assessment techniques together in distance education. In this context, in our study we applied three alternative assessment techniques in distance education for the purpose of alternative assessment in distance education and determining of misconceptions.

THE VALIDITY AND RELIABILITY OF THE TURKISH VERSION OF EDUCATIONAL STRESS SCALE FOR ADOLESCENTS (ESSA)

Ahmet AKIN[*], Emel GEDIKSIZ, Serhat ARSLAN, Ümran AKIN

*aakin@sakarya.edu.tr

Sakarya University Faculty of Education, Sakarya 54300, Turkey

Abstract:

The purpose of this study is to examine the validity and reliability of the Turkish version of Educational Stress Scale for Adolescents (Sun et al., 2011). Participants were 340 (160 were female and 180 were male) secondary school students. ESSA loaded on five factors. The results of confirmatory factor analysis for ESSA indicated that the four dimensional model was well fit and Chi-Square value (x^2=123.49, *df*=88, p=0.00001) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of the model were RMSEA=.037, NFI=.97, NNFI=.99 , CFI=.99, IFI=.99, RFI=.96, GFI=.95, AGFI=.92 and SRMR=.041. The Cronbach alpha value of the scale was .87. The corrected item-total correlations of ESSA ranged from .40 to .60. Factor loadings ranged from .68 to . 95.

Overall findings show that SASS had high validity and reliability scores and that it may be used as a valid and reliable instrument. Nevertheless, further studies that will SASS important for its measurement force.

Abstract:

The purpose of this study is to examine the validity and reliability of the Turkish version of Social-Emotional Learning Scale (SELS) (Coryn et all., 2009). Participants were 350 (193 were female and 157 were male) elementary students. SASS loaded on three factor. The results of confirmatory factor analysis for SELS indicated that the three dimensional model was well fit and Chi-Square value (x^2=264.67, *df*=153, p=0.00000) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of the model were RMSEA=.049, NFI=.96, NNFI=.97 , CFI=.98, IFI=.98, RFI=.95, GFI=.92, AGFI=.89 and SRMR=.095. The Cronbach alpha value of the scale was .90. The corrected item-total correlations of SELS ranged from .30 to .64. Factor loadings ranged from .33 to . 78.

Overall findings show that SELS had high validity and reliability scores and that it may be used as a valid and reliable instrument. Nevertheless, further studies that will SELS important for its measurement force.

Abstract:

The purpose of this study is to examine the validity and reliability of the Turkish version of Student Academic Support Scale (SASS) (Mazer & Thompson, 2011). Participants were 300 (173 were female and 127 were male) university students. SASS loaded on four factors. The results of confirmatory factor analysis for SASS indicated that the four dimensional model was well fit and Chi-Square value (x^2=140.62, df=79, p=0.00002) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of the model were RMSEA=.051, NFI=.98, NNFI=.99 , CFI=.99, IFI=.99, RFI=.97, GFI=.94, AGFI=.91 and SRMR=.044. The Cronbach alpha value of the scale was .92. The corrected item-total correlations of SASS ranged from .50 to .75. Factor loadings ranged from .52 to . 90.

Overall findings show that SASS had high validity and reliability scores and that it may be used as a valid and reliable instrument. Nevertheless, further studies that will SASS important for its measurement force.

TRAINING FUNCTION OF MEDIA: A RESEARCH ABOUT UNIVERSITY RADIOS IN TURKEY

Özge U. Yurttaş[a], Başak Şişman[b][95]

[a] Communication Faculty, Istanbul Aydin University, Istanbul, 34295, Turkey

[b] Communication Faculty, Istanbul Aydin University, Istanbul, 34295, Turkey

Abstract

Today, radios which began gradually to lose importance, one of the most important function is public service broadcasting. Public broadcasting, public service point of view, one of the most important elements is education. The purpose of the study, university radios in Turkey, as a result of the investigations in accordance with program content, radios adequately perform the function of the implementations of education will be put forward.

Education, Radio, Public Service Broadcasting

Introduction

The human being is in need of education as a requirement of his nature. The education plays an effective role in the transmission of beliefs and values as well as modes of behaviours of adult generations into new generations related thereto. It teaches the individuals the art of living, namely his beliefs and modes of behaviours, within the society. The education begins within family and in the meantime, continues at school and social environment.

At our current period, all sorts of information, views and opinions are transmitted to large group of people through the media covering the visual, oral and printed media (press) communication, used for the description of mass media as a whole, namely, radio, television, books, magazines, cinema and theatres and so on. The media offers the modes of various feelings and behaviours to the large group of people with rich alternatives and by doing so, it also fulfils the educational function in the meantime.

The radio playing an effective role among the mass media has entered in the life of societies for a period of time exceeding fifty years and it turns out to be a means trying to set up the connection with the universe beyond it through by way of sound. Individuals are taken out of their worlds through the radio and are able to experience what have been happening throughout the world either instantly or after a short period of time. The aim of the research will be to evaluate the role of the program contents of the universities, engaged in radio broadcasting in Turkey, within the educational process by taking the effective role of the media in the socialization and education into consideration. Relevant field scanning has been carried out is made as a research method and following this, university radios are determined and their program contents evaluated accordingly. In the evaluation of findings and conclusion part, however, new idea pertaining to the subject matter thereof is discussed and relevant assessments are made on the proposal of an effective program model.

Public Service Broadcasting

The broadcasting is a public activity! This is because the frequencies are the property of the society. The "Public Service broadcasting" concept starting from this reality is based on the principle pertaining to the messages, transmitted by these frequencies, for the provision of service to everybody at different socio-economical level, raising their standards of living and getting information and expressing themselves freely (Aziz, 2009). Public service broadcastings are the broadcastings of autonomous and impartial institutions or establishments that are established by the state in accordance with applicable laws and have a public legal entity and of which financial sources are provided by public income. The fundamental principles of these broadcastings are as follows: to provide news and information, transfer of education and culture, entertainment, and respect to plurality in ideologies. Notwithstanding that private broadcastings take up these kinds of functions, the entertainment in this broadcasting understanding is transformed into magazine and constitute two third of the programs. Since the public broadcasting is designed for the entire population of country, the programs take place predominantly for enlightenment of the viewers on social, economical and political matters and especially in interactive communication, education and cultural services. The collection of any advertisement (commercial) does not take place in the programs of an institution that is under the administration of the state. The public service broadcasting cannot be in the service of any person/party, organization and ideology (http://www.iletisimarastirma.org/haberler/48-kamu-hzmet-yayincilii.html, 15.04.2012).

According to the social responsibility theory dwelling upon the functions of the fact that the mass media have responsibility in the social lives of individuals, it is necessary to grant right to everybody, who want to reveal an important matter, to express their opinions. As a requirement of the theory, the mass media are obliged to constitute principles such as authenticity, definiteness, objectivity, equability and so on and professional criteria that will provide the functionality of them while they carry out duties that they may have responsibility towards the society. It is also necessary to attain the principles such as giving opportunity to the revelation of opinions of different sections compatible with the principles of plurality-participation, permitting the same to give answer within this framework an so on, as a mission. It is also necessary for the media to keep the educational function in the forefront and provide the transmission of culture and art. Along all these, they must not give coverage to any broadcastings that may encourage the involvement in crime and violence, and humiliate any individuals and groups (Tüfekçioğlu, 1997: 63-64).

The Democratic participation approach concentrating on the requirements, interests and wishes of active receivers are mostly seen in liberal societies. It refuses the media under the control or guidance of the state, standardization, central structuring, theory supporting the interaction and reach to the entire society and location of plurality. According to the theory defending the fact that the groups and local communities should create their own media, the mass media has to make a viewer-focused broadcasting (Tüfekçioğlu, 1997: 71-74).

Mr. Özden, who emphasizes the importance of a public in a democratic and participative society, defends the fact that it is necessary to grant a share to the section, which does not have financial capacities or opportunities within the society to set up a radio and television, from the field of the public broadcasting under the inspection and supervision of the state. It is a necessity in the broadcasting model, suggested by Özden, to transmit the problems of the institution that is engaged in the public broadcasting, create an atmosphere for discussion and vest a right of broadcasting to different sections of the society (Cankaya, 2003: 338).

From the point of view of a general aspect, the public institutions providing services are established and administered (managed) as organizations that may be autonomous and independent from the state (central authority). The state that especially takes up the transmission section of broadcasting service does not have to go beyond the boundaries of its duty of inspection in the determination of budget and general policies of the institution and appointments, made by the broadcasting organization (Pekman, 1997: 15).

Radio Broadcasting on the Basis of Mass Media as a Field of Application of University

While the 21st century witness innovations in revolutionary nature in the field of the mass media, the grounding of the radio in these mass media is based on the 20th century. The works pertaining to the radio began in advance of television and radio has been the first electronic means offering services for public (Aziz, 2006: 5). The radio together with its participation in the social life in 1920s contained a much stronger competence of persuasion in its own structure than those of mass media available in advance of that era.

Following the launch of first regular radio broadcastings in 1920 in the USA and in 1922, however, in Europe, "it was decided in our country just a short while after as long as 4 years to launch radio broadcastings in the first years of the foundation of the Turkish Republic" (Aziz, 2008: 86) and the first radio broadcasting was initiated in 1927 in Istanbul. (Cankaya, 1997: 2).

Radio Broadcasting at Universities

The educational structures of the universities ranking among the most important institutions within the transformation process to the information society are described in Article 5 and the subparagraph no. d of the Higher Education Law no. 2547, entered in force in 1981, saying "The education-teaching plans and programs shall be prepared and permanently developed in short and long term according to scientific and technological principles, and requirements of the country and local areas" (http://www.yok.gov.tr/ content/view/435/, 08.05.2012). In this context, the universities are expected to make contribution to the social structure and way of living as a requirement of their main principles, objectives, structuring and activities. As a consequence, it is necessary for the universities to take up and support the functions with the understanding of social responsibility of being an educational institution taking place within the scope of public service understanding such as setting up ties and communication with regional environment and society where they are located, not only for its students. The development of the publication structure of the university beyond fundamental concerns such as rating, listener increase of commercial publication gives opportunity to the approaches of the public service model.

It is seen that the first university radios in our country have gone back to 1946 when the matter is taken into consideration in respect of radio broadcasting. Pursuant to Article 2 of the Wireless Law and based on the principle of ability to engage in radio broadcasting by the educational institutions, the Istanbul Technical University Radio was established in 1946, Istanbul technical School radio in 1950 and Radio of the Faculty of Science of the Istanbul University, however, in 1951 and they have taken place among the first university radios in Turkey. The university radios have the potential of some sorts of values be acquired by its listeners that are the important natures of the public service broadcasting such as pluralism, diversity, critical view and so on by means of alternative broadcasting understanding that they developed within the scope of localization. (Saran&Tunç, 2004:650).

The university radios were regarded as illegal pirate radios in Turkey at the beginning as it used to be in other countries as well and then, the university radios were given permission through relevant legal arrangements, made in subsequent periods (Özer, 2006:73). The legal arrangement that allowed the universities in Turkey to have and use the mass media opened the door to allocate frequencies and free of charge channels by the Law no. 3984 on the Establishments and Broadcasts of Radio and Television on local basis to the related faculties (http://www.rtuk.org.tr/sayfalar/IcerikGoster.aspx?icerik_id=8e56c98d-e0fd-4c25-a9c4-1c615a431b71 08.05.2012). However, the Law no. 6112 on the Establishments and Broadcasting Services of Radios and Televisions that was newly arranged at the beginning of 2011 abolished this right, given late by the Law no. 3984.

However, it is known that the university radios create a ground where it will be possible to be able to offer the functional structure of the mass media, which can assure democratic participation away from the understanding of commercial broadcasting to the society in correct, accurate and proportional manner for the

society as of its positioning within a structure both as a field of education-application of the students of the universities and attached to the university especially in this progress of becoming an information society.

Radio Programming and Features of Radio Programs, Designed for Education

The main starting point of the radio programming begins with the determination of the characteristics and requirements of the listener mass. However, this structure will contain features varying in parallel with the coverage area and location of the radio. The structure of the radio programs within this scope have to be handled basically from the point of view of the functionalities of the radio and the listener-mass and other features of the radio – technical specifications, coverage zone and so on – have to be mixed and formed accordingly. The functionalities of the radio, however, are taken into consideration under following topics:

- Provision of news, informing,
- Educating, acculturation,
- Introduction of goods and services,
- Entertainment,
- Persuasion and mobilization.

While the provision of news and informing takes the priority among all these functionalities, the use of the radio and television as an educational means especially in the countries that could not achieve so far to complete their national developments is regarded as the most effective mode of education of the last 30-40 years (Aziz, 2006: 70). The duty for the realization of programs, designed especially for educational function, of the radio in our country is granted upon the TRT by Article 121 of the 1961 Constitution as is indicated in the Radio Broadcasting section in Turkey.

Notwithstanding that frequent amendments were made in the radio and television broadcasts from the establishment of the TRT up to the private radio-television broadcasting process, the programs, designed for education, have continually find place at these arrangements even if their scope and form might show changes.

Article 4 of the Law no. 3984 on the Establishment and Broadcasts of Radios and Televisions explains the idioms, mentioned (experienced) in the application of the regulation related thereto. According to this Article, the educational programs:

Educational Programs: These are the sorts of programs that are formed up in order to contribute to the development of individuals, who form up the society, in terms of social and cultural aspects and make possible for them to have knowledge on social, cultural, economic and legal developments and contain educational elements in the context of relevant subject matters, presentations, modes, methods and techniques. The principles pertaining to the educational programs are indicated in Article 26 of the same Law: The educational programs are the types of programs that aim the information and development of the indicated group of people where it is addressed and made in accordance with the principles of broadcasting, provided to be designed for children, youngsters, families, general listeners and/or audiences, farmers and peasants as well as for various business and profession groups. It is necessary for the educational programs within this scope to be prepared by taking advantage of consultants having expertise on the matter whereof and to allocate 5 % of the total weekly broadcasting period to the education contents. (http://www.rtuk.org.tr/ sayfalar/IcerikGoster.aspx?icerik_id=f512243b-b2c1-4a77-9d93-d6d2aa5b5543, 08.05.2012)

The program structure with educational content can comprise the basic education or auxiliary, enhancing-promoting education (Aziz, 2006:176-177). While the educational broadcasts with narrow-scope cover the content of formal education, it is possible for the educational broadcasts to be consisted of contents that are related to the social life, all knowledge and information beyond the boundaries of basic education and in the meantime, they cover the program features supporting the individuals as of its general culture aspect.

No clear arrangements pertaining to the education, programs, designed for education, and their rates of broadcasts are not available on the Law no. 6112 on the Establishments and Broadcasting Services of Radios and Televisions, entered into force finally with relation to the radio and television broadcasts.

Research

Importance and Objective of the Research

The importance of universities and mass media cannot be denied within the process of formation of the information society. The inclusion of a mass media (instrument) such as radio especially in the broadcasting structure through the universities bears a significant importance within the social education process.

Private radios operating under the dominance of commercial broadcasting offer contents for entertainment within the framework of concerns such as program contents and broadcasting structures as well as rating, profitability, more listeners and so on. In this context, it is extremely important for the university radios to become a part of the broadcasting field from the point of view of the social education and public service model.

The aim of the research is to assess the role that the program contents of the universities, engaged in radio broadcasting in Turkey, play within the education process by taking the effective role of the media in the socialization and education into consideration. It is aimed to make evaluations on the proposal of an effective program model by assessing related evidences and discussing new ideas pertaining to the subject matter hereof.

Assumptions of the Research

The university radios are also within a structure away from a public service broadcasting model even if for causes different than the radios, engaged in commercial broadcasting.

They leave the entertainment function behind the educational and cultural functions and adopt a broadcasting understanding, predominantly music based.

Methodology of the Research

Relevant field scanning has been made in summer as a research method and afterwards, the flows of broadcast and program contents of the universities pertaining thereto were reached. The broadcasting periods of the programs and classifications of program contents have been made and they are examined comparatively.

All university radios operating in Turkey have been taken into consideration at the research as a main mass. Since the number of the main mass is limited, sampling have been used, research has been applied the whole main mass. Thirty university radios that are on air over internet and FM band have been determined and reached twentyeight of those radios.

Programme contents and broadcast streams of twentyeight radios are seached on the internet first. Remainings were studied through phone call with the radio officials. Radio programme contents are classified into two main groups as verbal and musical programmes in this article.

The verbal programmes are studied in the category of magazine, culture-art, education, news and sports headlines.

Model Proposal in the Context of Findings

That 20% of the pragrammes are verbal, 80% of them are musical has been determined in the research. The percentages of programme kinds in the category of verbal programmes are presented in Graphic 2.
Graphic 1. Programme Contents
Graphic 2. Verbal Programme Categories

When it is taken into consideration of the fact that 20 % of the content, determined within the scope of the research, consisted of talk (oral) programs and remaining 80 %, however, of music programs, it is seen that the radios are converted into music boxes that commence to lose their educational and cultural functions gradually. However, on the basis of the fact that this structure exhibits a behaviour away from the corporate structure of both the university and radio, an opinion has been created that a university radio due to be structured under the proposed topics will take the social merits into consideration more.

It is necessary for the university radios to exhibit a closer standing to the public service broadcasting differently from private radios, engaged in local, regional and national broadcasting being structured with commercial broadcast understanding. In this context, they should arrange the broadcasting contents by taking the cultural, artistic and educational aspects of the society into consideration and in a direction to meet the expectations in these fields.

An understanding of broadcasting that may constitute an example to other radios should be adopted within the framework of the public service broadcasting.

It is necessary to give coverage to the programs attaching importance to the people's voice, participation committed to the principle of democratic participation, apart from unique broadcasting being a consequence of globalization within the framework of an understanding of a democratic broadcasting.

It is necessary to increase the publications that contain periodical activities, sporting and cultural activities, developments on environment, art and health as well as renewals, and bring forward the problem of the university youth as well as any changes and transformations in the training and education.

It is necessary to concentrate on the contents supporting social life by mentioning about the problems of the region, city and people.

It is also required to prepare related research results that the universities may determine according to the country and local requirements and develop within scientific and technological framework and also various programs where they may offer information therein, and the information has to be shared with the society through the programs due to be conducted by university experts at independent institutions.

Within the light of all proposals, brought forward in this respect, the university radios should not be perceived as institutions that contribute only to the social life and do not have to give place to any other content apart from the implementation of educational functions, and the duty, taken up within the scope of its students being the requirement of being an university unit, should not be taken into consideration within the scope of contribution only to the social living. The demands and expectations of the students, academicians and their requirements or studies as well as institutional successes should be presented to the society. A mode of broadcasting where an excessively boring and didactic structure becomes predominant should not be adopted by keeping the "comprehension of educating while entertaining" in the preparation and presentation of all program contents especially.

Conclusion

The importance of education that gains an effective function during the life is significant to transfer the beliefs and values certain modes of behaviours to the new generations. The education that is one of the most important functions of the mass media should effectuate the entertainment function jointly with it in order to get away from a didactic mode. The education within a narrow scope transmits the information allowing the integrity of individual with society; it takes up a function for the socialization of individual, facilitation of his life and provision of necessary information to allow him to make his living. When the matter is evaluated out of the radio broadcasting that especially constitutes the main subject matter of the research, the information and cultural programs comes into the scope of education in its broad meaning. At this point, the education in broad meaning contributes to the education in a narrow sense, and takes its place from time to time. The radio ensures the transmission of information that will replace basic education and teaches occupation and knowledge.

At our current period, the offer of only service by mass media to the society is not seen as sufficient. It is necessary for them to constitute a participation that will ensure the individuals within the society to put forward their opinions within the framework of democratic participation and social responsibility theories. The radios should express the good tastes and problems of the mass (group of people) that they may address at local and regional arena, and take place within the comprehension of programming that will ensure the individual to integrate with the society. However, it appears that a great proportion of the radios, examined within the scope of the study, get away from the understanding of necessity making broadcast towards the educational function within the scope of public service broadcasting.

The radios should offer alternatives to the private radios along with the public service understanding on the basis of the concepts of public service understanding, educational and cultural functions of the mass media - information society. It is necessary to bring the local matters on the agenda more often with the purpose of the development of local one in the radio broadcasts in order to prevent the uniformity that becomes prevalent within

the framework of globalization. The number of the music programs in Turkish should be increased as well along with those of programs in foreign music.

In conclusion, the university radios, engaged in public broadcasting, should make contribution to the formal and informal education, and adopt a broadcasting comprehension reflecting the plurality that invite the people for participation where the democratic participation is kept in the forefront, "education with entertainment" by giving place in the culture-art, news-sporting, magazine and so predominantly beyond the music programs.

Özet

Bu çalışmada, Türkçe metinler, işitme engellilerin konuştuğu Türk İşaret Diline dönüştürülmektedir. 3B sanal bir insan modeli kullanılarak işaret dili kelime ve harf animasyonları gerçekleştirilmiştir. Türkçe metindeki aktif kelimenin işaret dili karşılığı Tük İşaret Dili (TİD) veritabanında araştırılmakta, eşleşmesi durumunda da geliştirilen ara yüzde kelimenin animasyonu oynatılmaktadır. Kelime veri tabanında bulunamadığında, işaret dilinde heceleme gerçekleştirilir. Önerilen sistem televizyon yayınlarında, konferans ve okullardaki ders sunumları gibi ortamlarda kullanılarak işitme engellilerin yaşam kalitesi artırılabilir. Sistemde 40 kelime bulunmaktadır, ancak işaret dili hecelemesi ile bütün kelimeler hecelenebilir durumdadır. Yeni kelimeler ve animasyonlar eklenerek sistem kolaylıkla genişletilebilir.

Anahtar Kelimeler: Türk İşaret Dili; Yazıdan İşaret Diline Dönüştürme; İşaret Dili Heceleme

Abstract

In this paper, Turkish texts are converted into Turkish Sign Language which deaf people speaks. Sign language word and letter animations are carried out with using a 3D virtual human model. Sign language corresponding the current word in Turkish text is searched in Turkish Sign Language (TSL) database, in case of a match, the animation of the word is played in the designed interface. When the word is not found in the database, spelling is carried out in sign language. The quality of life of deaf people will be improved with the use of the proposed system such as telecasts, conference presentations and lecture presentations in schools. 40 words exist in the proposed system, but all words can be spelled with sign language spelling. The system can be easily expanded by adding new words and animations.

Keywords: Turkish Sign Language; Text to Sign Language; Finger Spelling

Giriş

Türk İşaret Dili işitme engellilerin kullandığı görsel, karmaşık hareket yapısına sahip doğal bir dildir. İşaret dili evrensel bir dil değildir. Hemen hemen her ülkenin kendine özgü bir işaret dili vardır. Örneğin Amerikan İşaret Dili (ASL), Alman İşaret Dili (GSL), farklı alfabe ve kelimelere sahiptirler. İşaret dilleri arasındaki benzerlik sağ el, sol el ya da her iki el hareketleri gibi insan vücudunun karmaşık hareketleri ile oluşturulmasıdır. Konuşmacı yapmış olduğu işaretleri yüz ifadeleri ve gözleri ile de destekler (Öz, 2004).

İşaret dilinin yapısı hakkında yapılan ilk çalışmalarda, Amerikalı Wilbur (1987), işaret dili işaretlerinin oluşumunu analiz etmede ASL yapısını kullandı. Amacı el şekillerini, ellerin konumlarını ve hareketlerini içeren sembolleri kullanarak bir ulusal işaret dili yazma sistemi geliştirmekti. Daha sonra Stokoe (1978), işaret dilini analiz etmede üç önemli özelliğin; el şekilleri, el konumu ve hareketinin dikkate alınması gerektiğini belirtmiştir. Battison da (1978) dilin yapısını anlamada ilave olarak avuç içi yönünün dikkate alınmasını önermişlerdir. Bu ve benzer işaret dili çalışmaları sonraki işaret dili araştırmacılarına yardımcı olmuştur.

İşaret dili çalışmaları iki farklı ama birbirlerini destekleyici yönde yürütülmüştür. Birincisi, işitme engellilerin vücut hareketleri ile konuştukları dili işitme problemi olmayanlar için sese ve yazıya dönüştürme yönündedir. İkincisi ise sesi ve yazıyı işitme engellilerin anlayabilmeleri için animasyon şeklinde işaret diline dönüştürmedir.

Algılayıcılar ve bilgisayar teknolojilerindeki gelişmelere paralel olarak bazı başarılı bilgisayar görmesi tabanlı işaret dili araştırmaları yapılmıştır. İlk işaret dili tanıma araştırmaları 1990'lı yıllarda görülmeye başlanmıştır. Charahpayan ve Marble (1992) Amerikan İşaret Dilinin işaretlerinin oluşturulmasında elin hızını kullanarak bilgisayar görmesi tabanlı bir sistem geliştirmesi üzerinde çalışmışlardır. Takahashi ve Kishimo (1991) ise VPL veri eldiveni ve range sınıflandırması kullanarak 46 Japon İşaret Dili alfabesini tanıma üzerinde çalışmışlardır. Bu çalışmalar basit olarak eklem açıları ve el yönelmesinin kodlanması şeklindedir.

1990'da, Kramer ve Leifer veri eldiveni kullanarak Amerikan İşaret Dili heceleme sistemi geliştirmişlerdir (Kramer 1990, Kramer 1996). Murakami ve Taguchi (1991) 110 farklı Japon İşaret Dili işaretini tanımayı gerçekleştirmişlerdir. 1995'de Waldron ve Kim yapay sinir ağları metodunu kullanarak, el şekli, el konumu ve oryantasyonunu kullanarak 14 Amerikan İşaret Dili kelimesi tanıma gerçekleştirmişlerdir (Waldrom, 1995). Wysoski ve arkadaşları 2002'de görmeye dayalı bir Amerikan İşaret Dili tanıma sistemi gerçekleştirmişlerdir (Wysoski, 2002). Yapay sinir ağı kullanarak 26 sabit el şekli tanıması gerçekleştirmişlerdir. Allen ve arkadaşları Amerikan işaret dili için heceleme sistemi gerçekleştirmişlerdir. Bu sistem 26 el şeklinden 24'ünü tanıyabilmekte idi (Allen, 2003). 2004'de Wang, ÖZ ve arkadaşları, Amerikan İşaret Dili el şekilleri tanıma sistemi gerçekleştirdiler. Sistem veri eldivenleri ve motion traker kullanmakta sınıflandırmada ise yapay sinir ağları ve markov modeli kullanılmıştır (Wang 2004).

Konuşma dilinin işaret diline dönüştürülmesi çalışmaları, modelleme programlarının ve ses tanıma sistemlerinin gelişimine bağlı olarak literatürde 1990'lı yıllarda görülmeye başlamıştır. Önce basit iki boyutlu figürlerle yapılırken günümüzde 3B insan modelleri ile gerçekleştirilmektedir. Bu çalışmalar genellikle hava durumu sunularının, hava yollarındaki uyarıların çevirisi vb. konulardadır (San-Segundo, 2008, Reyers, 2006).

Bu çalışmada, Türkçe metinler, işitme engellilerin konuştuğu TİD dönüştürülmektedir. Bu çalışmada sanal insan modeli kullanılarak TİD kelimeleri ve harflerinin animasyonları gerçekleştirilmiştir. TİD'nde 750 civarında kelime bulunmaktadır. Bu kelimelerden 40 tanesinin animasyonu oluşturulmuştur. TİD kelime listesinde yer almayan kelimeler, işaret dili alfabesi ile hecelenerek gerçekleştirilebilmektedir. Bu yüzden 29 harfin de animasyonu oluşturulmuştur. 750 kelimenin tamamının animasyonu oluşturularak sistem daha verimli hale getirilebilir. Uygulamada geliştirilen ses tanıma ara yüz programı ile gerek mikrofondan alınan sınırlı ses ile gerekse kayıtlı dosyadaki sesler Türkçe yazı diline ve karşılığında TİD animasyonuna dönüştürülmektedir.

Türk İşaret Dili

Türk İşaret Dili (TİD) Türkiye ve Kuzey Kıbrıs Türk Cumhuriyet'indeki işitme engelliler tarafından kullanılan dildir. İşaret dilleri birbirinden farklıdır. Genelde her dil için bir de işaret dili geliştirilmiştir. İşaret dili aynı zamanda yörelere göre kendi içerisinde farklı kelimelere de sahip olabilmektedir. İşaret dilleri farklı olmakla birlikte türetildikleri işaret dili ile benzerlikler göstermektedir. Türk İşaret Dili İngiliz İşaret Dilinden etkilenmiştir. Bu yüzden de İngiliz işaret dili ile benzerlikler göstermektir. Amerikan İşaret Dili ise Fransız öğretmenler tarafından geliştirildiği için Fransız İşaret Diline benzemektedir. Diğer işaret dilleri gibi Türk İşaret Dili de Türkçenin gramer yapısından farklı olarak kendine özgü bir gramer yapısına sahiptir.

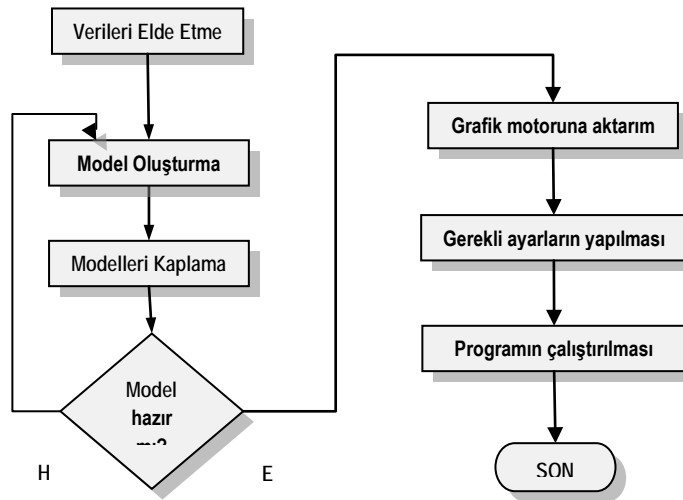
Türk İşaret Dili kelime listesinde yaklaşık 750 işaret bulunmaktadır. Bu kelime listesi, çoğunlukla İstanbul'da kullanılan işaretlerden oluşmaktadır. Bunun nedeni işaret dili bilen kişilerin çoğunun İstanbul'da doğmuş ve okula gitmiş kişiler olmalarıdır. Kelime listesi kategorileri; alfabe, sayılar, zamanla ilgili kavramlar, görsel kavramlar, hayvanlar, meslekler, yer isimleri, zamirler, anlatımlar olarak gösterilebilir (http://www.turkdeaf.org/01turkisaretdili/01AnaSayfa/inind01.asp).

TİD'nde bir kelimeye karşılık birden fazla işaret olabilmektedir. Bu, yöresel değişikliklere ve konuşmadaki ağız ifadelerine benzetilebilir. İşaret dili kelimelerle konuşulur. Bu kelimelerle konuşmak hızlıdır. Ancak kelimelerin yeterli olmadığı, özel isimlerin söylenmesi gerektiği gibi durumlarda harf işaretleri ile heceleme yapılmaktadır.

Konuşma dilindeki bazı kelimelere karşılık işaret dilinde bir işaret belirlenmiştir. Bunlara işaret dilinin kelimeleri denir. Bu kelimeler kısıtlıdır. Amerikan işaret dilinde 6000 tane, Türk işaret dilinde 750 civarında toparlanmış kelime vardır. İşitme engelliler genellikle bu kelimelerle konuşurlar.

Heceleme ise konuşma dili kelimelerinin, konuşma dilinin harflerine karşılık gelen el şekilleri ile tek tek yapılmasıdır. TİD'nde yer alan 29 harf Şekil 1'de gösterildiği gibi iki elin çeşitli şekilleri ile oluşturulmaktadır. Ancak tek el ile de alternatif bir Alfabe ifadesi söz konusudur.
Şekil 1: Alfabe işaretleri (Hazırlayan: İşitme Engelliler ve Dostları Kulübü)

Sanal Model Oluşturma

Video oyunları, animasyon film geliştiricileri ve simülatör gerçekleştiricileri, 1970'lerin sonundan beri gerçeğe yakın sanal karakterlerin oluşturulması ve bunların kaplanması problemleriyle uğraşmaktadırlar. Sanal modelleri geliştirmek, sırası ile iskeletlerinin oluşturulması, kaplanması, anime edilmesi ve grafik motorlarının kabul edeceği formatta sunulmasıdır. Bu, modelin işlevi ve özelliklerinin belirlenmesi, modelin karalama çizimlerinin oluşturulması, modelin 3B model tasarım programları ile gerçekleştirilmesi, görüntü işleme programları ile kaplamaların hazırlanması, modele kaplamanın giydirilmesi ve grafik motorunda etkileşime izin verecek şekilde animasyon ve sıralamalarının gerçekleştirilmesi gibi sıra ile takip edilecek çok sayıda ara işlemlerin yürütülmesini gerektirir [5]. Bu aşamaların genel yapısı Şekil 2'de verilmiştir.


Şekil 2. Sanal modellerin oluşturulma aşamaları

Sanal İşaret Dili Konuşmacı Tasarımı

Türk işaret diline ait kelime ve harflerin sunulması için 3B sanal bir kadın modeli oluşturulmuştur. Bu model ile işaret dilinin kelimeleri, rakamları ve alfabedeki tüm harflere ait animasyonlar tasarlanmıştır. Sanal kadın modeli ve animasyonu için 3B insan modelleme programları kullanılmıştır.

Günümüzde 3B modeller oluşturmak için çok sayıda program mevcuttur. Bu programlar, film ve oyun sektörü için hızlı model oluşturmayı sağlayan birçok bileşenle gelirler. DI-Guy, DAZ 3D, Poser vb. programların yanında MAYA, 3DStudio MAX, MultiGen Creator programlarıyla 3B modeller üretilmektedir. Ancak bu programların birçoğu yüksek maliyetlidir. Bu çalışmada Poser ve Daz 3d programlarının demo versiyonları kullanılmıştır. Poser, üç boyutlu insan figürü modellerini tasvir için optimize edilmiş, daha çok poz ve animasyon yapmak için kullanılan 3D CGI render ve animasyon yazılım programıdır. Poser programının hayvan, robot, insan ve çizgi film kahramanlarının bulunduğu temel bir kütüphanesi vardır. Bu kütüphanede ayrıca pozlar, saç parçaları, sahne, dokular, el hareketleri ve yüz ifadeleri bulunur. Birçok Poser figürü Daz 3D de kullanılabilir. Daz 3D, Poser dosya formatlarıyla uyumlu olacak şekilde tasarlanmıştır. Bu projede Daz 3D ile uyumlu Poser programının kütüphanesinde yer alan "Business Woman" modeli kullanılarak Daz 3D' de animasyonlar oluşturulmuştur.

Gerçekleştirilen Çalışma

Kullanıcı ara yüzü programını oluşturmak için Microsoft Visual Studio 2010 kullanılmıştır. Türkçe metinler, metin dosyası (text) olarak veya kopyala yapıştır şekliyle programın metin penceresine aktarılır. İşitme engelli kişi TİD düğmesine tıklayarak sıra ile metindeki kelimelere karşılık gelen animasyonların oynatılmasını sağlamaktadır. Kullanıcı, sınırlı sayıda canlı veya kaydedilmiş, sesli Türkçe kelime ve cümleyi de programın ses tanıma modülünü kullanarak işaret diline çevirebilmektedir.

Harflere, rakamlara ve belirlenmiş kelimelere ait animasyonların bilgisayardaki klasörü ilgili öğe ile eşleştirilmiş bir şekilde veritabanında tutulmaktadır. Bu animasyonların bilgisayar üzerindeki konumlarının bulunması aşamasında Microsoft SQL Server 2008 ve T-SQL dili kullanılmıştır. Kullanıcı tarafından girilen ses verisinin HTK (Hidden Markov Modelling Toolkit) (http://htk.eng.cam.ac.uk) kullanılarak akustik özellikleri çıkarılır ve daha önceden eğitilmiş saklı markov modeller sayesinde tanınır ve ilgili metne dönüştürülür.

Yazılı metin işaret diline çevrilirken metin içerisinde bulunan her bir kelime sırayla ve tek tek ele alınır. İlk olarak kelimenin animasyon karşılığının veritabanında olup olmadığına bakılır, var ise uygun animasyon oynatılır. Veritabanında kelimenin işaret dilindeki karşılığının animasyonu bulunamadığında ise şu yol izlenir; Türkçe sondan eklemeli bir dil olduğundan bu kelimenin bir kökünün olabileceği ve bunun işaret dilindeki karşılığının veritabanında bulunabileceği düşüncesinden hareketle, kelimenin sonundan bir karakter atılarak tekrar veritabanında aranır. Sondan karakter atma işlemi kelimenin ilk üç karakteri kalana kadar devam ettirilir. Eğer bu işlemler sonunda da kelimenin işaret dilindeki karşılığı bulunamazsa işaret dilinde bu kelimenin karşılığı olmadığı kanısına varılır. Kelimenin hiçbir şekilde işaret dili karşılığı bulunmadığında ise kelimeyi oluşturan her bir harfin işaret dili karşılıkları ekrana basılır, yani heceleme yapılır. Şekil 3'de örnek harf işaretleri verilmiştir. Şekil 4'de ise geliştirilen programın kullanıcı ara yüzü verilmiştir.

Şekil 4: TİD için geliştirilen programın kullanıcı ara yüzü

Sonuç ve Öneriler

İşitme engellilerin toplumla bütünleşmesinin önünde birçok sorun bulunmaktadır. Normal insanlarla iletişim kurma, basılı eserlerin okunması, TV programlarının ve sesli sunumların anlaşılması bu problemlerden bazılarıdır. Bu sorunlar, engelli bireylerin içinde yaşadıkları toplumla işlevsel bir bütünlük içinde yaşamalarını güçleştirmektedir.

Bu çalışmada, Türkçe metinler ve sınırlı sayıda sesli kelime, işitme engellilerin konuştuğu Türk İşaret Diline dönüştürülmektedir. TİD vücut hareketleri ile oluşturulan görsel bir dildir. Resimlerle ifade edilmesi anlamayı yavaşlatmakta ve zorlaştırmaktadır. Sanal bir insan modeli ile işaret dilinin gerçekleştirilmesi daha anlaşılır olmaktadır. Bu çalışmada, 3B sanal insan modeli kullanılarak TİD kelimeleri ve harflerinin animasyonları gerçekleştirilmiştir. TİD de 750 civarında kelime bulunmaktadır. Bu kelimelerden 40 tanesinin animasyonu gerçekleştirilmiştir. TİD kelime listesinde yer almayan kelimeler, işaret dili alfabesi ile hecelenerek gerçekleştirilmektedir. Bu yüzden 29 harfin de animasyonları tasarlanmıştır. 750 kelimenin tamamı gerçekleştirilerek sistem daha verimli hale getirilebilir Uygulamada geliştirilen ses tanıma ara yüz programı ile gerek mikrofondan alınan sınırlı ses ile gerekse kayıtlı dosyadaki sesler Türkçe yazı diline ve karşılığında TİD animasyonuna dönüştürülmektedir. Önerilen sistem televizyon yayınlarında, konferans ve okullardaki ders sunumları gibi ortamlarda kullanılarak işitme engellilerin yaşam kalitesi artırılabilir. Sistemde 40 kelime bulunmaktadır, ancak işaret dili hecelemesi ile bütün kelimeler hecelenebilir durumdadır. Yeni kelimeler ve animasyonlar eklenerek sistem kolaylıkla genişletilebilir.

TURKISH VERSION OF SHORTENED FAMILY RESILIENCY SCALE (FRAS): THE STUDY OF VALIDITY AND RELIABILITY

Mehmet Kaya [a] Neslihan Arici [b]

[a] Department of Guidance and Pyschology , Sakarya University, Hendek, Turkey

[b] Department of Guidance and Pyschology , Sakarya University, Hendek, Turkey

Abstract

Walsh (1998) conceptualized family resiliency as strength-oriented family paradigms and proposed three over-arching constructs (family belief systems, organization patterns, and communication processes) with nine sub-constructs. According to the Walsh (1998) model, Sixbey (2005) developed shortened Family Resiliency Scale (FRAS) with total 54 items, including 4 reverse items, formed by 4 Likert type. FRAS which consists of six factors, has α = 0.96. total reliability and has good concurrent criterion validity with three well known scales. The aim of this research is to adapt to FRAS into Turkish and to examine its psychometric properties. The study was conducted on 433 students from Sakarya University Educational Departments. The participants were 304 (70 %) female and 129 (30 %) male, the mean age of the participants was 22 years. Firstly the language equivalency of the scale was found equivalent. Then total reliability was found α is .92 And to confirm the original scale\'s structure in Turkish culture the confirmatory factor analysis (CFA) was executed and found that the model was well fit and Chi-Square value (x2/degree of freedom= 2.18, N=433) which was found to be significant for the adaptation of the model. The goodness of fit index values of the model were RMSEA=.058, CFI=.93, IFI=.92, GFI=.92, AGFI=.93, SRMR=.066). According to these values it can be said that the structural model of Family Resiliency was well fit to the Turkish culture.

Keywords: Family Resiliency, Validty and Reliability

Introduction

Family therapy researchers have recently examined normal family functioning and family strengths and competences instead of family pathology (Walsh, 1996). Based on this premise family resiliency that describes the healthy family functioning in adverse situations has gained importance in mental health research (Sing & Yu, 2010; Walsh, 2003). Although many researchers (Hawley & DeHann, 1996; McCubbin & McCubbin, 1996; Patterson, 2002; Walsh, 1998) have defined different features of family resiliency all of them based their definition on systematic, ecological and developmental views. In consistent with systematic view, the family is seen as a system not only based on dyadic relations but also broader social relations. According to ecological view, family one of the system has mutual interactions with other systems (e.g., school, job settings, peers) and has been impacted by them on its capabilities in problems solving, risks etc. As said by developmental views a family within its life cycle faces many different stressors and uses many different coping and adaptation strategies over extended times (Rutter, 1987; Wash 1996; 1998; 2002).

Based on these premises, McCubbin and McCubbin (1996) offered the Resiliency Model of Family Adjustment and Adaptation and defined family resiliency as the family's capability to use their behavioral and functional resources during the crises. His resiliency model was much more based on ecological view consists of adjustments and adaptation phases. In adjustment phases a family passes through five appraisal process (5: family schema, 4: family coherence, 3: family paradigms, 2: situational appraisals, 1: Stressor appraisal). In adaptation phases a family utilize problem solving strategies and coping mechanisms. In consistent with his model McCubbin and McCubbin developed many valid and reliable scales (e.g., the Family Inventory for Life Events and Changes : McCubbin, Patterson, & Wilson, 1983; Family Hardiness Index : McCubbin, McCubbin, & Thompson, 1986 , etc.) In consistent with McCubbin and McCCubbin (1996), Hawley ve DeHann (1996) indicated that family resiliency includes adaptation of family to stressors in a positive way and growth of family

depending on risk and protective factors and contexts. And also Patterson (2002) explained that a resilient family's adaptation to crises and maintaining its functions, which are related to its competence and coping style (e.g., meaning of significant risk exposure, distinctions between family system competence and protective factors).

Walsh pointed that a resilient family has an ability to recover from adversity in stronger and more resourceful way proposed three over-arching constructs (family belief systems, organization patterns, and communication processes) with nine sub-constructs (Walsh, 1996, 2003). The family belief system construct including making meaning of adversity, positive outlook, and transcendence and spirituality sub constructs has an valuable power to normalize adversity, to make sense of the experience and to mitigate the negative reactions of family members and to build and increase the confidence of family during the crises. The organization patterns construct consisting of flexibility, connectedness, and social and economic resources has a crucial role to prepare a family for many transitions (e.g., divorce, death, remarriage, etc.) and to guide in tumultuous changes and rearrange family structure. The communication processes comprised of clarity, open emotional expression, and collaborative problem solving especially has an essential resource in adversity for family to delineate ambiguous situations, to induce open emotional expression and empathic behaviors, and to increase cooperative problem solving (Walsh, 1996; 2002; 2003).

The concept of the family resiliency has been studied in different problems and adversities [a family living with chronic illness or disabilities (e.g.,Rolland, 1994; Rolland, 2005; Rolland & Walsh, 2005, divorced family (e.g., Hethertingon & Hagan, 1999; Kelly & Emery, 2003; Whiteside, 1998) ; a family encountering with trauma (e.g., Agani, Landau & Agani, 2010; Landau, Mittal & Wieling 2008; Landau & Saul, 2004; Walsh, 2007); a family member suffering with substance addictions (e.g., Launda & Garret, 2008)] . In parallel with these studies, many preventive and developmental family resiliency programs have been developed, especially Chicago Center for Family Health developed and applied many family resiliency programs for serious and chronic, illness, disability, and loss; divorce, lesbian and gay couples, war related trauma, job loss, transition and etc. The family resiliency programs consist of psycho-education, workshops, conferences, periodic consultation with family, intense family therapy. In psycho education, workshop and conferences families get information about crises management, coping with stressful events in a concrete and practical ways. In intense family therapy; families are assessed within their socio-cultural context, the families' problems are defined, families' strengths and hopes are revealed collaboratively, effective coping mechanism against problems are taught (Rolland & Walsh 2005; Walsh, 2002; 2003).

All of these mentioned family resiliency studies have used qualitative methods in their studies (Sixbey; 2005). Therefore Sixbey (2005) has developed Family Resiliency Scale (FRAS) to examine family resiliency with quantitative methods. The original version of FRAS based on Walsh's family resiliency model and nine sub-constructs of his model consists of 66 items, including six reversed items, formed by 4 Likert type (*from (1) strongly disagree to (4) strongly agree)*. The total score of the FRAS can range from 66 to 204. The factor analysis of the original version of FRAS did not confirm Walsh's nine sub-constructs and the original version of FRAS was reanalyzed by decreasing items and high level of the internal consistency and reliability was obtained. The shortened version of FRAS has 54 items, including 4 reverse items, formed by 4 Likert type. The total score of the FRAS can range from 54 to 188. And the shortened version of FRAS comprises of six factors (*family communication and problem solving, utilizing social and economic resources, maintaining a positive outlook, family connectedness, family spirituality, ability to make meaning of adversity)*. The shortened version of FRAS sub-constructs' factor loading is .45-.77 for family communication and problem solving, .54-.78 for utilizing social and economic resources, .53-.63 for maintaining a positive outlook, . 00-.20 for family connectedness, .-01-.14 for family spirituality, .49-71 for ability to make meaning of adversity. The shortened version of FRAS has α= 0.96. total reliability (. 96 for family communication and problem solving, .85 for utilizing social and economic resources, .86 for maintaining a positive outlook, .70 for family connectedness, .88 for family spirituality, .74 for ability to make meaning of adversity) and a good concurrent criterion validity with three well known scales [.91 for Family Assessment Device 1 (FAD 1; Epstein, Baldwin, & Bishop, 1983) , .85 for Family Assessment Device 2 (FAD 2; Epstein, Baldwin, & Bishop, 1983), .85 Personal Meaning Index (Reker & Fry, 2003; Reker, 2005)].

However it was seen that the two factors [the family connectedness (.00- .20) and the family spirituality (.01 - .14] have low individual item factor loading and family connectedness Cronbach alpha level are not quite high comparing with the other factors of the scale, the total reliability and the total internal consistency of shortened version of FRAS was very high level for using in research area and clinical settings . Furthermore, there are many studies (Buchanan, 2008; Plumb, 2011) utilized FRAS for their studies. Thus the aim of this research is to adapt to FRAS into Turkish and to examine its psychometric properties.

Methods

Participants

Adaptation of shortened version of FRAS was executed on two samples. The first group was 30 English language specialist (23 (83%,3) were female, 5 (16,7 % male) and the mean age of them was 28.8 (sd= 2.3) . Language was executed on this group. The second group was 433 university students   (304 (70 %) were female and 129 (30 %) were male) from Sakarya University Educational Departments in Turkey. The mean age of the participants was 21.83 (sd=2,11) In this study, construct validity, and internal consistency reliability coefficients were calculated according to data obtained from the second group.

Measure

Family Resiliency Scale: Family resiliency was measured using the Family Resiliency (Sixbey, 2005). Adaptation of Turkish version of this scale was done by Kaya and Arıcı (2012). This scale is a 54-item self-report inventory (e. g. Our family is flexible to deal with the unexpected) and each item was rated on a 4-point scale *(1=strongly disagree to 4=strongly agree)*. Items 33, 37, 45, 50 are reversed scored and the total   scores ranged from 66 to 204, with higher scores indicating higher family resiliency. The internal consistency reliability coefficient was .96 .And three well known scale scales [.91 for Family Assessment Device 1 (FAD 1; Epstein, Baldwin, & Bishop, 1983), .85 for Family Assessment Device 2(FAD 2; Epstein, Baldwin, & Bishop, 1983), .85 Personal Meaning Index (Reker, 2003; 2005)] have a good concurrent criterion validity with FRAS (Sixbey, 2005).

Procedures

Translation of the shortened version of FRAS into Turkish was based on the recommendations of Sixbey (2005). Primarily three specialists who were a native Turkish speaker and have fluent English translated English version into Turkish. Discrepancies between original version and initial translations were addressed, controversial items were determined and necessary modifications were done with the assistance of three independent translators. Then the completed Turkish version and original version of FRAS was executed by thirty English language specialists who were blinded to the original scale and the objective of the study. In parallel with this, language equivalency of the scale and the correlations between Turkish and English forms were attained with a high correlation. These results confirm that Turkish and English forms of the shortened FRAS might be regarded equivalent. In addition to this the validity and reliability were examined with the assistance of the second group participants of the study. The permission of second group participations was attained from chief of departments. All participants were voluntary in the research and were informed about purposes of the study. Self-report questionnaires were administered in a quiet classroom setting and participants 'confidentiality and anonymity were assured. In this study confirmatory factor analysis (CFA) was executed to confirm the original scale's structure in Turkish culture. Also internal consistency reliabilities, and item analysis of the shortened Turkish version of FRAs were examined. Data were analyzed using LISREL 8.54 and SPSS 13.0 package program

Results

3.1. Language equivalence

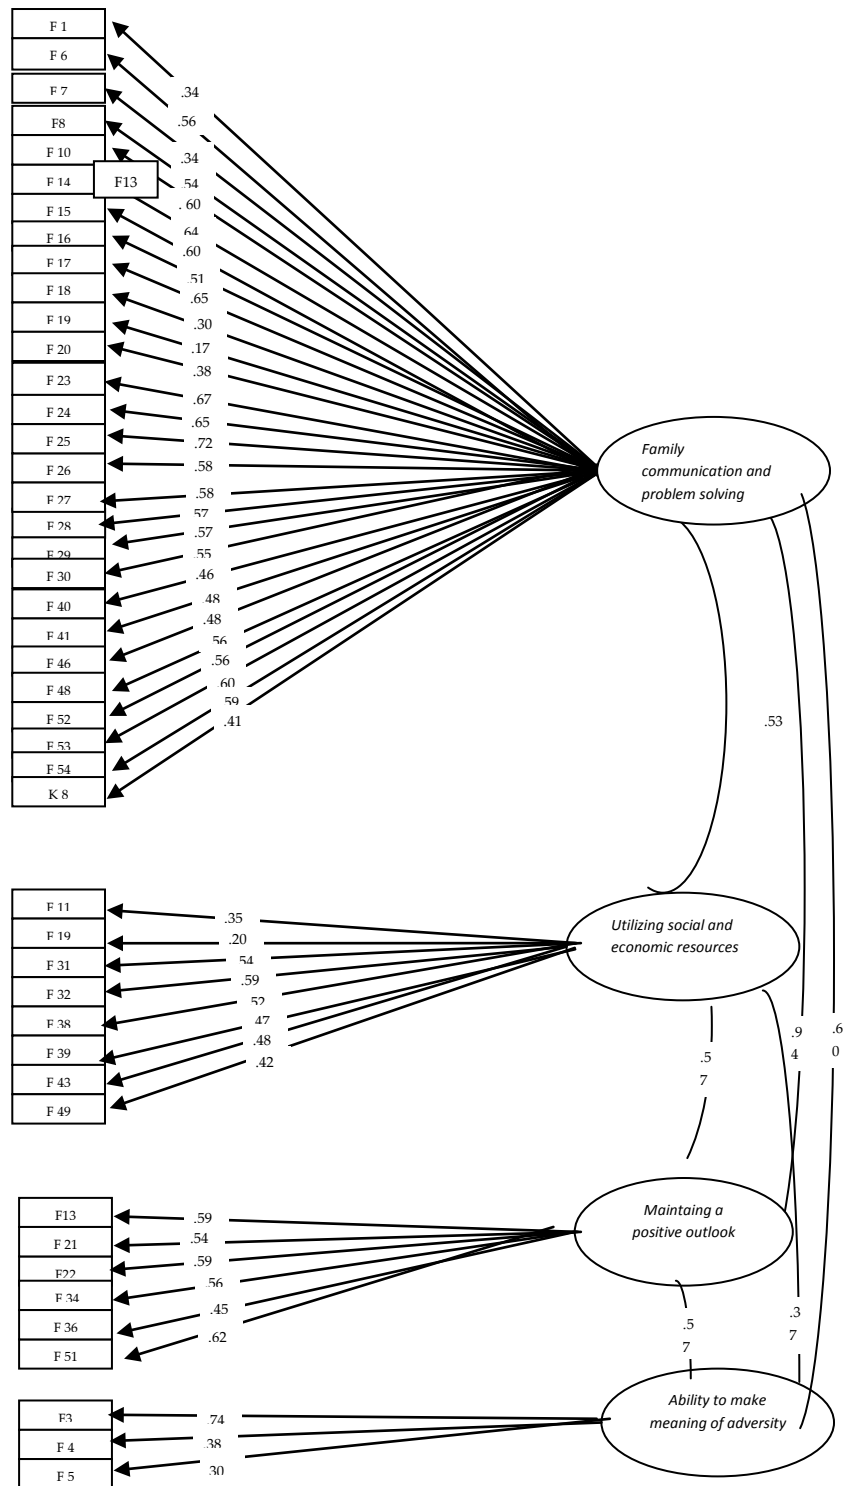
Language equivalence study demonstrated that correlations between Turkish and English forms of shortened version of FRAS were high (.99 for entire scale, 99. for family communication and problem solving, .98 for utilizing social and economic resources, .98 for maintaining a positive outlook, .96 for family connectedness, .97 for family spirituality, .93 for ability to make meaning of adversity).

3. 2. Reliability

For reliability studies of the Turkish version of shortened FRAS Cronbach's Alpha internal consistency coefficient were used. The Cronbach's Alpha internal consistency coefficient for the entire scale was .92.

3.3. Construct Validity

Confirmatory factor analysis demonstrated that the model was well fit. Also, Chi-Square value (x2/degree of freedom= 2.18, N=433) which was found to be significant for the adaptation of the model. The goodness of fit index values of the model were RMSEA=.058, CFI=.93, IFI=.92, GFI=.92, AGFI=.93, SRMR=.066). In the factor analysis 4 factors was found as the original shortened version of FRAS. And two factors (the family connectedness and the family spirituality) have low individual item factor loading as the original shortened version of FRAS. The factor loadings for entire scale ranged from .17 to .74 (for family communication and problem solving ranged from .17 to .67 for utilizing social and economic resources ranged from .20 to .59 , for maintaining a positive outlook ranged from .45 to .62 , for ability to make meaning of adversity ranged from .30 to .74). Factor loads of items belonging Turkish version of shortened FRAS are presented in Figure 1.

Figure 1. Factor loadings for the shortened version of FRAS


As   above it was
showed that the 4 factors are fairly correlated with each other. The correlation between family communication
and problem solving a   53. The correlation between family
communication and pro   94. The correlation between family
communication and pro   ty were. 60. The correlation between
utilizing social and economic resources and ability to make meaning of adversity were . 37. The correlation
between utilizing social and economic resources and maintaining positive outlook were .57. The correlation
between maintaining positive outlook and ability to make meaning of adversity was .57

4. Discussion and Conclusion

The aim of this research is to adapt the shortened version of FRAS to Turkish and to examine its psychometric properties. Results of language equivalency showed that the correlations between Turkish and English forms were high. These results confirm that Turkish and English forms of the shortened version of FRAS might be regarded equivalent. In this study, the factor structure of the Turkish version of shortened FRAS was examined via confirmatory factor analyses. The confirmatory factor analysis showed that the factorial model of FRAS that consists of 4 factors were at an acceptable degree of goodness of fit for Turkish sample (Hu & Bentler, 1999). The internal consistency of the factors of Turkish version of shortened FRAS showed acceptable reliability. In consistent with these findings Turkish version of shortened FRAS can be termed as a valid and reliable instrument that could be used in fields of in psychology.

Limitation and Implication

The limitation of this study was the reliance on self-report measures. Also, the sample presented here is limited to university students, which makes this study questionable whether the findings can be generalized to different age or student groups. Therefore examination of the factor structure of shortened version of FRAS for targeting other populations should be made..

Another limitation of study was taking total 54 items with six factors although total 44 items with four factors were found valid and reliable . Thus, further studies should use total 44 items of FRAS

TÜRKİYE' DE KALIPÇILIK EĞİTİMİ SORUNLARININ İRDELENMESİ VE ÖNERİLER

Oğuz Girit[a] **H. Fuat Atahan**[b] **Bilçen Mutlu**[c] **Mustafa Kurt**[d]

[a,c,d]Marmara Üniversitesi Teknik Eğitim Fakültesi Makine Eğitimi Bölümü,İstanbul, 34722,Türkiye

[b]Marmara Üniversitesi Fen Bilimleri Enstitüsü,Makine Eğitimi Anabilim Dalı,İstanul, 34722,Türkiye

Özet

Türkiye' de, kalıpçılık sektörü kalkınma ve ilerleme yarışında önemli bir yer işgal etmektedir. Bu sektörün kalıcı katkılarını devam ettirebilmek için meslek liselerinden, mühendislik ve teknik eğitim fakültelerinden mezun olanları istihdam eden kalıpçılık sektöründe çalışanların yeterli bilgi ve beceriye sahip olabilmelerini sağlamak mevcut kalıpçılık eğitim programlarının yeniden yapılandırılması, teknolojik gelişmelere göre düzenlenmesi ihtiyacı bulunmaktadır.

Kalıpçılık sektörünün aradığı nitelikli elemanların Meslek Liselerinde yetiştirilebilmesi için yapılması gerekenlerin belirlenmesi amacıyla İstanbul pilot bölge seçilerek mevcut kalıpçılık eğitiminin öğretmenler ve işverenler tarafından değerlendirildiği bir çalışma yapılmıştır.

Anahtar Kelimeler : Kalıpçılık, Kalıpçılık Eğitimi,

Giriş

Türkiye ekonomisi modern işgücüne ihtiyaç duymaktadır. Bilgi çağı birden fazla dalda uzmanlaşmış nitelikli insan gücünü ön plana çıkarmaktadır. Mevcut iş gücünün yarısından fazlası ilkokul veya ilköğretim okulu mezunudur. Günümüzde, uygulanmakta olan piyasa ekonomisinin ihtiyaç duyacağı rekabetçi pazar taleplerini karşılayacak vasıflı ve uyumlu ve motivasyonu yüksek bireylerin yetiştirilmesi, ülkemizin kalkınma hızının yükseltilmesi açısından son derece önem taşımaktadır. Ekonomisi sağlam, dünya ile rekabete hazır, refah düzeyi yüksek bir Türkiye, ancak "eğitim" ile mümkündür[1].

Uluslararası rekabete duyarlı bir eğitimin sağlanması için uygun teknolojilerden yararlanılmaktadır. Devletin rolü azaltılmakta ve sosyal taraflara belirleyici roller yüklenmektedir. İşçi ve işveren kuruluşlarının mesleki eğitim sistemi içinde aktif biçimde rol alması sağlanmaktadır. Meslek standartları ve sertifikasyon sistemleri sürekli geliştirilmektedir. Türkiye dünyadaki bu değişimlere uyum sağlamak zorundadır.

Kalıpçılık sektöründe faaliyet gösteren firma sayısı Türkiye genelinde 5 bin civarındadır. Bu firmaların yarıya yakını İstanbul'da faaliyetlerini sürdürürken, geriye kalanı ise ağırlıklı olarak Bursa, İzmir, Ankara, Eskişehir, Kocaeli, ve Samsun' da yer almaktadır [2,9].

Bu çalışma ile kalıpçılık sektöründe, Kalıpçılık Eğitimi konusunda sektörün yaşadığı problemler incelenerek, eğitim sorunlarının çözümü için AB eğitim kriterleri de dikkate alınarak eğitim programının hazırlanması için öneriler yapılmıştır.

Araştırmanın Modeli

Araştırma, ilişkisel tarama modeli çerçevesinde ve anket uygulaması şeklinde yürütülmüş; "iki veya daha çok sayıdaki değişken arasında birlikte değişimin varlığı ve/veya derecesi" belirlenmeye çalışılmıştır [5].

Bu çalışmada Kalıpçılık eğitimi problemlerinin tespiti için alan çalışması yapılmıştır. Sektörde sistemin aktörleri olan her grup, araştırma içine katılarak düşüncelerinin ortaya çıkarılması hedeflenmiştir.

Evren ve Örneklem

Mesleki eğitimin yapılandırılmasında özellikle sistemin birer parçası olan öğretmen-öğrenci, işveren-çalışan gruplarından Mesleki ve Teknik Eğitim eğitimin geliştirilmesinde yararlanılmalıdır. Araştırmanın çalışma evrenini; İstanbul ilindeki Plastik ve Makine Teknolojisinin bulunduğu endüstriyel teknik okullarında görev yapmakta olan Teknik Öğretmenler oluşturmaktadır. Yaklaşık 370 öğretmenden, 183 öğretmene ulaşılmıştır. Ayrıca bu okullardaki 50 adet öğrenciye tesadüfi olarak röportaj formu uygulanmıştır.

Veri Toplama Teknikleri

Araştırma verilerini toplamak amacıyla, öğretmen ve işverenlere yönelik "Mesleki ve Teknik Eğitimde Kalıpçılık Eğitimi Problemlerinin Tespiti Anketi" uygulanmıştır. Kalıp bölümü öğrencilerinin sosyal, teorik ve uygulama yeterlilikleri hakkında katılımcılara ifadeler ve yargılar yöneltilmiştir. Bu yargı ve ifadelere katılıp katılmama derecelerini belirtmeleri için, yaygın olarak kullanılan 5'li Likert ölçeği kullanılmıştır. Kesinlikle katılmıyorum, katılmıyorum, kararsızım, katılıyorum, kesinlikle katılıyorum seklindedir. Bu ifadeler değerlendirilerek, kalıpçılık eğitim programlarının vermek istediği mesleğe yönelik beceriler ve mesleki gelişmişlik düzeyi incelenmiştir.

Araştırma öncesinde Kalıpçılığın Eğitim Problemleri hakkında sektör temsilcileri ile mülakatlar yapılmış elde edilen veriler ve literatür taraması sonucunda, konuyla ilgili araştırmaların bilgi toplama ölçeklerinden, uzman görüşlerinden ve araştırmacının tarama sırasında edindiği bilgilerden yararlanılarak anket formları oluşturulmuştur. Bu anket formları geliştirilirken, 50 kişilik gruplara uygulanıp, onların görüşleri doğrultusunda eksik yönler tamamlanıp gerekli düzenlemeler yapılmıştır.

Anketler üç bölümden oluşmaktadır.

Meslek Lisesi Mezunlarının Mesleğe İlişkin Teorik Yeterlilikleri,

Atölye ve Uygulama Ortamına İlişkin Yeterlilikleri

Meslek Lisesi öğrencilerinin Sosyal Yeterlikleri, olmak üzere toplam 67 maddeden oluşmaktadır.

Çözümleme Yöntemleri

İstatistik çözümlemede SPSS 11.5 paket programı kullanılmıştır. Öğretmenlerin demografik özelliklerinde, yüzde (%), frekans(f), Crosstabs analizleri yapılmıştır. Bağımlı değişkenlerin analizlerinde yüzde (%), frekans(f) ve değişkenler arasındaki farklılığın belirlenmesinde, ikili karşılaştırmalarda Mann Whitney-U testi ve üçlü karşılaştırmalarda ise Kruskal Wallis-H Testi analizi yapılarak manidarlık düzeyi $p<.05$ olarak kabul edilmiştir.

Bulgular ve Yorumlar

İşverenlere Uygulanan Anketlerin Değerlendirilmesi

Araştırmaya katılan İşverenlerin, %18,2'si Kuramsal bilgi eksikliğini, 71,1'i teknik donanımı, %75,2'si yetişmiş işgücü eksikliğini, %23,1'i mevcut işletmelerin kurumsallaşamamasını, %95,9'u devlet teşvikinin olmamasını, %76,9' u mesleki örgütlenmenin yetersizliğini, %80,2'si küresel rekabetin olumsuz etkilerini,

%28,9' u küçük işletmelerin yaygın olmasını Türkiye'de kalıpçılık mesleğinin sorunları olarak gördüklerini (Tablo I) belirtmişlerdir.

Tablo I. **Türkiye'de Kalıpçılık Mesleğinin Sorunları Değişkenlerine Göre Yüzde ve Frekans Değerleri [7]**

Türkiye'de Kalıpçılık Mesleğinin Sorunları Nelerdir?	Frekans (f)	Yüzde (%)
Kuramsal bilgi eksikliği	22	18,2
Teknik donanım	86	71,1
Yetişmiş işgücü eksikliği	91	75,2
Mevcut işletmelerin kurumsallaşamaması	28	23,1
Devlet teşvikinin olmaması	116	95,9
Mesleki örgütlenmenin yetersizliği	93	76,9
Küresel rekabetin olumsuz etkileri	97	80,2
Küçük işletmelerin yaygın olması	35	28,9

Türkiye'de kalıpçılık eğitiminin geliştirilmesi için sizce neler yapılabilir sorusunun değişkenlerine göre yüzde ve frekans değerleri verilmiştir. Araştırmaya katılan İşverenler, %43,8' i ders içeriklerini okul ile sanayici birlikte belirlemelidir, %48,8' i kalıpçılık eğitim programları gelişen teknolojiye göre sürekli yenilenmelidir, %86,8' i okullardaki teknik alt yapı iyileştirilmelidir, %25,6' sı sanayiciler okullara temrinlik malzeme desteği sağlamalıdır, %75,2' si sanayideki ustalar/usta öğreticiler tecrübelerini okulla paylaşabilirler, %60,3' ü, öğretmenlere yılın belli dönemlerinde sanayide çalışma zorunluluğu getirilmelidir, %27,3 'ü öğretmenlerin hizmet içi eğitimleri gerçek iş ortamında verilmelidir şeklinde görüşlerini (Tablo II) belirtmişlerdir.

Tablo II. Türkiye'de Kalıpçılık Eğitiminin Geliştirilmesi Değişkenlerine Göre Yüzde ve Frekans Değerleri [7]

Türkiye'de kalıpçılık eğitiminin geliştirilmesi için sizce neler yapılabilir?	Frekans (f)	Yüzde(%)
Ders içeriklerini okul ile sanayici birlikte belirlemelidir	53	43,8
Programlar gelişen teknolojiye göre sürekli yenilenmelidir	59	48,8
Okullardaki teknik alt yapı iyileştirilmelidir	105	86,8
Sanayiciler okullara temrinlik malzeme desteği sağlamalı	31	25,6
Sanayideki ustalar/usta öğreticiler tecrübelerini okulla paylaşabilirler	91	75,2
Öğretmenlere yılın belli dönemlerinde sanayide çalışma zorunluluğu getirmelidirler	73	60,3
Öğretmenlerin Hizmet içi eğitimleri gerçek iş ortamında	33	27,3

verilmelidir.		

İşverenlerin %4,1'i meslek liselerinde verilen eğitimin sanayi için yeterli olduğunu, %95,9' u ise meslek liselerinde verilen eğitimin sanayi için yeterli olmadığını belirtmişlerdir.

İşverenlerin %76' sı meslekte teknik eleman sıkıntısı yaşadıklarını, %3,3' ü meslekte teknik eleman sıkıntısı yaşamadıklarını, %20,7' si ise kısmen meslekte teknik eleman sıkıntısı yaşadıklarını belirtmişlerdir.

Öğretmenlere Uygulanan Anketlerin Değerlendirilmesi

Araştırmanın bu aşamasında; Öğretmenlerin; cinsiyet, yaş, mesleki kıdem, eğitim durumu, meslekle ilgili fuarlara katılım durumları incelenmiştir. Ayrıca; kalıpçılık mesleğinin sorunları, kalıpçılık eğitiminin geliştirilmesi için yapılabilecekler, hizmetiçi eğitime katılma sayıları, okuldaki görevleri ve eğitim verdikleri dallar incelenmiştir.

Tablo III. Türkiye'de Kalıpçılık Mesleğinin Sorunları Değişkenlerine Göre Yüzde ve Frekans Değerleri[7]

Türkiye'de Kalıpçılık Mesleğinin Sorunları Nelerdir?	Frekans (f)	Yüzde (%)
Kuramsal bilgi eksikliği	114	62,3
Teknik donanım	121	66,1
Yetişmiş işgücü eksikliği	124	67,8
Mevcut işletmelerin kurumsallaşamaması	86	47,0
Devlet teşvikinin olmaması	81	44,3
Mesleki örgütlenmenin yetersizliği	88	48,1
Küresel rekabetin olumsuz etkileri	47	25,7
Küçük işletmelerin yaygın olması	61	33,3

Araştırmaya katılan Öğretmenlerin, %62,3 'ü Kuramsal bilgi eksikliğini, %66,1'i teknik donanımı, %67,8 'i yetişmiş işgücü eksikliğini, %47,0 'ı mevcut işletmelerin kurumsallaşamamasını, %44,3'ü devlet teşvikinin olmamasını, %48,1 'i mesleki örgütlenmenin yetersizliğini, %25,7 'si küresel rekabetin olumsuz etkilerini, %33,3 'ü küçük işletmelerin yaygın olmasını Türkiye'de kalıpçılık mesleğinin sorunları olarak gördüklerini belirtmişlerdir.

Öğretmenlerin %65,10'u öğrencilerin; yeterli iletişim becerilerine sahip olduklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %72,50'si ise yeterli iletişim becerilerine sahip olmadıklarını ifade etmişlerdir.

Öğretmenlerin %78,10'u öğrencilerin; takım arkadaşları ile birlikte çalışabildiklerini ifade ederken; bunun tam zıttı olarak, işverenlerin %72,50'si ise takım arkadaşları ile birlikte çalışamadıklarını ifade etmişlerdir.

Öğretmenlerin %77,10'u öğrencilerin; çalışma disiplinine rahatlıkla uyum sağladıklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %70,80'i ise çalışma disiplinine rahatlıkla uyum sağlayamadıklarını ifade etmişlerdir.

Öğretmenlerin %39,40'ı öğrencilerin; sosyal ve kültürel yönden kendilerini sürekli geliştirdiklerini ifade ederken; bunun tam zıttı olarak, işverenlerin %48,30'u ise sosyal ve kültürel yönden kendilerini sürekli geliştiremediklerini ifade etmişlerdir.

Öğretmenlerin %50,90'ı öğrencilerin; çalışma ortamının kurallarına uyum sağlamada zorlanırlar ifadesine katılmadıklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %73,30'u ise çalışma ortamının kurallarına uyum sağlamada zorlanırlar ifadesine katıldıklarını ifade etmişlerdir.

Öğretmenlerin %67,70'i öğrencilerin; bilgilerini paylaşmaktan kaçınmadıklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %48,30'u ise bilgilerini paylaşmaktan kaçındıklarını ifade etmişlerdir.

Öğretmenlerin %83,00'ı öğrencilerin; iş güvenliği kurallarına uyduklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %67,50'si ise iş güvenliği kurallarına uymadıklarını ifade etmişlerdir.

Öğretmenlerin %80,90'ı öğrencilerin; meslek etiğine (ahlakına) uyduklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %64,10'u ise meslek etiğine (ahlakına) uyduklarını ifade etmişlerdir.

Öğretmenlerin %57,90'ı öğrencilerin; Türkçe'yi doğru kullanırlar derken; bunun tam zıttı olarak, işverenlerin %41,60'ı ise Türkçe'yi doğru kullanmadıklarını ifade etmişlerdir.

Öğretmenlerin %54,60'ı öğrencilerin; mesleki konuları öğrenmeye istekli olduklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %80,00'i ise mesleki konuları öğrenmeye istekli olmadıklarını ifade etmişlerdir.

Öğretmenlerin %55,20'si öğrencilerin; iş motivasyonları yüksektir derken; bunun tam zıttı olarak, işverenlerin %79,10'u ise iş motivasyonları yüksektir ifadesine katılmadıklarını belirtmişlerdir.

Öğretmenlerin %85,80'i öğrencilerin; amirlerine ve arkadaşlarına karşı saygılı olduklarını ifade ederken; bunun tam zıttı olarak, işverenlerin %55,00'i ise amirlerine ve arkadaşlarına karşı saygılıdırlar ifadesine katılmamışlardır.

Öğretmenlerin %57,40'ı öğrencilerin; eleştirel düşünebildiklerini ifade ederken; bunun tam zıttı olarak, işverenlerin %60,90'ı ise eleştirel düşünebilirler ifadesine katılmamışlardır.

Öğretmenlerin %49,10'u ve işverenlerin %85,80'i öğrenciler; yabancı dildeki mesleki dokümanları okuyabilirler ifadesine katılmamışlardır. Her iki grupta aynı görüşü paylaşmıştır.

Öğretmenlerin %47,00'ı öğrencilerin; aldıkları eğitim mesleki gelişimlerini sürdürme için yeterlidir derken; bunun tam zıttı olarak, işverenlerin %86,60'ı ise aldıkları eğitim mesleki gelişimlerini sürdürme için yeterlidir ifadesine katılmamışlardır.

Öğretmenlerin %82,50'si öğrencilerin; ölçü ve kontrol aletlerini doğru kullanırlar derken; bunun tam zıttı olarak, işverenlerin %73,30'u ise ölçü ve kontrol aletlerini doğru kullanırlar ifadesine katılmamışlardır.

Öğretmenlerin %79,80'i öğrencilerin; kalıp parçasının görünüşünü çıkarabilirler ifadesine katılırken; bunun tam zıttı olarak, işverenlerin %64,10'u ise kalıp parçasının görünüşünü çıkarabilirler ifadesine katılmamışlardır.

Çalışanlara Uygulanan Anketlerin Değerlendirilmesi

Araştırmanın bu aşamasında kalıpçılık sektöründe hali hazırda çalışmakta bulunan işçi, kalfa, çırak ve CAD CAM operatörü seviyelerinde çalışanlarla anket çalışması yapılmıştır. Kalıpçılık eğitimi alarak işletmede meslek eğitimine gelen öğrencilerde gördükleri eksiklikleri değerlendirmeleri istenmiştir. Belirtilen problemler teorik eksiklikler, uygulamaya yönelik eksiklikler ve genel olarak ifade edilen problemler şeklinde üç grupta incelenmiştir.

Sektörde çalışan ve bu işin temelini oluşturan bu grubun görüşleri son derece önemli olup aşağıda incelenmiştir.

Meslek Lisesi Mezunlarının Mesleğe İlişkin Teorik Yeterlilikleri

%48 oranında; Teknik Resim konusunda yetersizlikleri olduğu ifade edilmiştir. Teknik resim derslerinin EML ve Çıraklık Eğitim Merkezlerinde genelde teorik olarak işlenmesinin önemli bir eksiklik olduğunu ifade etmişlerdir.

%44 oranında; Genel teorik bilgi eksikliğini ifade etmişler, güncel teknolojiye uygun kalıp çeşitlerini bilmediklerini, bu kalıplarla ancak iş ortamında karşılaştıklarını ifade etmişlerdir.

%32 oranında; Plastik hammadde konusunda eksiklik gördüklerini ifade etmişler. Mezunların plastik hammaddeyi tanıyamadıklarını belirtmişlerdir.

%32 oranında; bilgisayar konusunda eksikleri olduğunu ifade ederek, CAD CAM konusunda yetersiz de olsa bilgi sahibi olduklarını ancak takım yolu oluşturamadıklarını vurgulamışlardır.

%28 oranında; Kalıplık çelik hammadde konusunda eksiklik gördüklerini ifade etmişler. Mezunların çelikleri tanıyamadıklarını, özellikle kalıplık çelik seçiminde yetersiz olduklarını belirtmişlerdir. Genel olarak tüm çelikler hakkında malzeme bilgilerinin yetersiz olduğunu belirtmişledir.

%22 oranında; Kalıpçılığı yeterince tanımadıklarını, kalıpların çalışma sistemlerini bilmediklerini, kalıp çeşitlerini tanımadıklarını ifade etmişlerdir.

Matematiksel hesap yapma yönlerinin zayıf olduğunu belirtmişlerdir.

%6 oranında; Kalıp içerisinde plastik hammaddenin akışı ile ilgili çok zayıf bilgiye sahip olduklarını, toleranslar konusunu bilmediklerini, alıştırma çeşitlerini seçmeyi ve kullanmayı bilmediklerini, temel İngilizce bilgilerinin zayıf olduğunu ifade etmişledir.

Atölye ve Uygulama Ortamına İlişkin Yeterlilikleri

%30 oranında; Mezunların, CNC ve erozyon tezgahlarını hiç kullanmadıklarını veya kullanmış iseler çok yetersiz olduklarını belirtmişlerdir.

%28 oranında; Ölçü aletlerini özellikle kumpas kullanmayı bilmediklerini, markalama konusunda yetersiz kaldıklarını ifade etmişledir.

%26 oranında; eğitim ortamında demode olmuş tezgahları kullandıklarını, bazı üretim tezgahlarını ise ilk defa işletmede çalışmaya başladıktan sonra kullandıklarını ifade etmişlerdir.

%16 oranında; Kalıpçılıkta imalat aşamalarında kullanılan tezgahların tamamında çalışmadıklarını belirtmişledir.

%16 oranında; Enjeksiyon tezgahlarını tanımadıklarını, bu tezgahlarda parça basmadıklarını ifade etmişlerdir. Ayrıca baştan sona bir kalıp imalatı hiç yapmadıklarını, imal ettikleri bu kalıplarla üretim yapmadıklarını ifade etmişlerdir.

%12 oranında; İmal ettikleri kalıplarla üretim yapmadıklarını ve üretim aşamalarında meydana çıkabilen problemleri bilmediklerini ifade etmişledir.

%10 oranında; piyasanın şartlarını tanımadıklarını kavrayamadıklarını ifade ederek, kalıpçılık eğitiminin piyasa şartlarından kopukluğunu göz önüne sermişlerdir.

%10 oranında; Pratik bilgilerinin çok zayıf olduğunu, bir çırak kadar bile yetkin olmadıklarını çok yetersiz kaldıklarını ifade etmişlerdir.

%10 oranında; Karmaşık işlemleri yardım almadan yapamadıklarını, bütün bu olumsuzluklara rağmen işe adapte olmak için gayretli olduklarını belirtmişledir.

%6 oranında; Kesici takımları bilemekte zorluk çektiklerini ifade etmişlerdir.

%2 oranında; İş güvenliği kurallarına uymadıklarını belirtmişledir[7].

Değerlendirmeler

Kalıpçılık Eğitiminin gerektiği gibi verilebilmesi için esasen belli bir formasyona ve teorik alt yapıya ihtiyaç vardır. Uzmanlaşmış kalifiye elemanlarla kalıp tasarımı ve imalatı yapılmalıdır. Bu çalışmada sektörde kalifiye eleman sıkıntısının olduğu net bir şekilde ortaya konmuştur. Ayrıca sanayicilerin Meslek Liseleri eğitiminden de habersiz oldukları görülmüştür. Mesleki Eğitim, MEB 'in görevidir. Kalıpçılık eğitiminin en önemli koşulu yatırımdır. Tahta ve tebeşirle Mesleki Eğitim asla düşünülemez. Dolayısıyla gerekli donanımı olmadan açılan eğitim programlarından, eksik yetişmiş teknik elemanları mezun etmek, hem sanayimizi hem de gençlerimizi hayal kırıklığına uğratmak demektir. Piyasanın ekonomik rekabet şartlarından dolayı, işletmeler her yönüyle mükemmel yetişmiş EML mezunu aramaktadırlar. Adeta Meslek Lisesi mezunu değil de; piyasa şartlarında 3 yıl çalışmış tecrübeli eleman seviyesinde EML mezunu istemektedirler. Fakat bu yüksek beklentiye rağmen her tür eğitim yatırımını da devletten beklemektedirler. Bu ise gerçekçi bir davranış şekli değildir. Sanayici son yıllarda şartlarında zorlamasıyla mesleki eğitime sınırlıda olsa yatırım yapmaktadır. Fakat bu yeterli değildir. Mesleki eğitimin yükü MEB ile ortaklaşa paylaşılmalıdır.

Yerel, bölgesel, ulusal ve uluslar üstü yönetimler giderek değişen sektörel taleplere göre bölgesel eğitim olanakları artırılmalıdır. Pek çok ülkede bölgesel yönetimler eğitim ve yetiştirme faaliyetleri ile sektörleri kontrol etmektedirler.Ulusal standartlar doğrultusunda bölgesel farklılıklar meslekî ve teknik eğitime yansıtılabilmeli ve meslekî eğitim faaliyetleri yerel düzeyde de yürütülebilmelidir[6].

Değişen koşullara hızla uyum sağlayabilmek için meslekî ve teknik eğitimcilerin geniş bilgi ve beceri birikimine sahip olmaları gerekir. Geleceğin nitelikli iş gücünü yetiştirmeyi amaçlayan meslekî ve teknik eğitimin geniş tabanlı, meslekî yeterliklere dayalı, yenilenen ya da değişen mesleklere uygun biçimde, öğrencilerin sürekli eğitimi için temel oluşturması gerekmektedir[7].

Birbiri ile ilişkili alanlar ve meslekler bütünleştirilerek meslek grupları oluşturulmalıdır. Meslek grupları, birbiriyle ilişkili birçok meslek alanını kapsayan sektörel bir bütündür. Meslek grupları etrafında planlanan eğitimde, öğrenci kazandığı bilgi ve becerileri geniş bir alanda kullanabilmekte ve değişikliklere kısa sürede uyum sağlayabilmektedir.

Kalıpçılık eğitiminde en temel konularından biri olan Teknik Resim konusunda öğrenciler yetersizdirler. Teknik Resim derslerinin içerikleri gözden geçirilerek, günümüzde geçerliliğini yitirmiş kısımlarının müfredattan çıkarılması gerekmektedir. MEGEP sistemindeki ders modüllerinin sonlarında bulunan Modül Değerlendirme sayfaları son derece yetersiz ve yüzeyseldir. Sadece Modül Değerlendirme sayfaları ile öğrenci piyasanın istediği donanıma ulaşamamaktadır. Her bir meslek dalı için Uygulama Kitapçıklarının oluşturulması son derece gereklidir. Perspektif dersi konulmalıdır. Bu sayede soyut düşünceden somuta geçiş ve karmaşık parçaları kavrama yeteneği artacaktır.

Modüler sisteme geçilmesi nedeniyle hazırlanan ders modülleri yeterince güncel veriyi kapsamamaktadır. Bazı modüller güncelliğini yitirmiş kaynakların fotomontajı olarak karşımıza çıkmıştır. Eğitim programlarındaki teorik kalıpçılık bilgisi çok yüzeyseldir. Şuan kullanılmakta olan bir takım kalıp çeşitleri bulunmamaktadır. Kalıpçılık teorik bilgisi hakkındaki; kalıp, kalıp çeşitleri, çalışma koşulları vb. gibi bilgilerin güncellenmesi için özel sektörün işbirliği sağlanmalıdır.

Kalıp derslerinde malzeme bilgisi konular içerisinde dağıtılmıştır. Bu yetersiz olmaktadır. Plastik İşleme dalında Polimer Kimya ve Polimer Malzemelerin Özellikleri derslerinin olmadığı görülmektedir. Plastik İşleme ve Makine Teknolojisi Alanlarına Malzeme Bilgisi dersi; uygulamalı ders olarak konulmalıdır. Bir önceki sistemde sadece teorik ve güncel olmayan bilgi içerdiği için verimli bir ders değildi. CAD-CAM konusunda Meslek Liselerinde genel bir yetersizlik görülmektedir. Öğrenciler çok fazla uygulama imkanı bulamadıkları için programları yeterince öğrenememektedir.

Ayrıca kullanılan programlar deneme sürümleri olup, lisanlı değildir. Piyasa şartları göz önüne alındığında tek bir programın eğitiminin verilmesi de doğru olamaz. Bunun yerine, öğretilmesi gereken iki ve üç boyutlu tasarım programlarının isimleri belirlenmelidir. Alan zümre öğretmenleri okulun bulunduğu sanayi çevresini dikkate alarak gereken programı seçmelidir. Tüm öğretmenlerin bu programların eğitimlerini almaları gereklidir. Fakat hizmetiçi eğitim başvurularında hizmet puanı dikkate alındığından, hizmet yılı az olan öğretmenlerin bu eğitimlere katılımı mümkün olmamaktadır. Bunun yerine bir alan veya daldaki öğretmelerin tamamının aynı zamanda kursa gitmeleri sağlanmalı ve aynı zamanda bu programları öğrenciye öğretmeleri son derece önemlidir.

MEGEP ile Ölçme Bilgisi Dersi konuları atölye modüllerine dahil edilmiştir. Öğrenci bu ölçme konusunu ayrı bir ders olarak görmediği için yeterince ilgilenmemektedir. Ölçme Bilgisi Dersi tekrar ayrı bir ders haline getirilmelidir. EML' nin bünyelerinde Ölçme Laboratuarları kurulmalıdır.

Modüler eğitim programlarının hazırlanmasında sanayiciden alınan destek ve görüşler gibi: okullara temrinlik malzeme sağlanmasında; özel sektör firmaları kanunla tanımlanacak bir mekanizma ile eğitim sistemine dahil edilmelidir. Okullarda temrinlik malzeme sıkıntısı çekilmektedir. Bu yüzden tüm aşamaları ile birlikte kalıp imalatı yapılamamaktadır. Gerekli temrinlik malzeme sağlanan öğrencilerin başından sonuna kadar kalıp tasarım, imalat ve üretim safhalarında uygulama yapmasının sağlanması son derece önemlidir.

Öğrenciler piyasa şartlarından habersizdirler. Mesleki farkındalık sahibi değildirler. Özellikle 10 ve 11. sınıflarda Teknik Geziler eğitim programlarına dahil edilerek, Teknik Geziler zorunlu hale getirilmelidir.

İşveren ve öğrencinin buluşacağı bu tür etkinlikler, öğrencinin ilk elden bilgi sahibi olmasını sağlayacaktır. Aksi takdirde şuan olduğu gibi; mezun olduktan sonra işveren istekleri ile karşılaşmakta ve yetersiz öğrenme isteklerinden dolayı, başka alanlara yönelmelerine sebep olacaktır.

CNC tezgahı olmayan, CAD laboratuarı yetersiz olan EML' ler bünyesinde, yeni kalıp dalları açılmamalıdır. Öğrenciler okulda güncel tezgah ve laboratuar kullanamamakta, meslekte yetişememektedir.

Öğretmenlerin kalıp tasarım ve imalat aşamalarında bizzat çalışmalarının sağlanması gereklidir. Bunun için gerekli altyapı Mesleki Eğitim Akademisi kurularak sağlanabilir. Kurulacak bu akademideki eğitimler özel sektör ve üniversiteler tarafından verilmelidir.

Gelişmekte olan ekonomiler arasında bir fark yaratabilmek ve buna bağlı olarak da rekabet avantajı sağlayabilmek ve sürdürülebilir kalkınma için, ülkenin sanayi kesiminde üretenlerin iyi eğitim almaları her düzeydeki tüm öğretim programlarının çağımızın şartlarına göre sürekli değiştirilmeli ve yenilenmelidir. Özellikle Mesleki ve Teknik Eğitimde ilerleme ülkemiz için önemli bir stratejik hedef olmalıdır.

UN REGARD SUR LA CULTURE SOUS L'OPTIQUE DE LA PERSPECTIVE CO-ACTIONNELLE DANS L'ENSEIGNEMENT/APPRENTISSAGE DU FLE.

Maître de Conference Adjointe Dr. Melek Alpar, Maître de Conference Adjointe Dr. Ümran Türkyılmaz

Abstract:

In the 21th century, the foreign language teaching fulfills the function of not only informing or being informed as stated in the communicative approach, but also putting into action and interaction as stated in the co-actional approach of Puren. As of 1990s we have been observing that the objectives of foreign language learning are changing. As a result of touristic activities and professional exchange of know-how, in particular, the necessity of learning foreign languages increased continuously between individuals. In this context, The European Council stimulates and supports multiculturalism and multilingualism, respect for other languages and cultures in order to spread mobility among European citizens across the whole continent.

Therefore, exchange of students as well as free movement of goods and services have led to the European Union Language Criteria. Turkey, which would like to be the full member of the EU, has the target of teaching at least two foreign languages to the upcoming generations.

In this study, we will elaborate on the difficulties experienced by students, who learn French as a foreign language and the cultural interaction in the target language.

Key Words: co-actional approach, language teaching, European Council, multiculturalism, multilingualism.

Introduction

Depuis 1990, nous constatons un changement dans les objectifs d'apprentissage d'une langue etrangere. Plus particulierement tant les echanges professionnels que les echanges d'etudiants ont donne naissance a un besoin de « Cadre europeen » dans ce domaine. Cette approche considere en premier lieu, l'apprenant d'une langue comme un acteur social qui doit accomplir des tâches dans l'enseignement/apprentissage de langue etrangere.

Pour ce qui est de cette etude, nous allons essayer de nous pencher sur la notion de culture et de l'etudier d'apres la perspective co-actionnelle en nous basant sur les recommandations du Cadre europeen de reference pour les langues (CECRL).

Le Cadre europeen commun de reference pour les langues et la perspective co-actionnelle.

Le Cadre europeen commun de reference pour les langues (CECRL) est conçu par la division des langues vivantes du Conseil de l'Europe:«Cet organisme, dont le siege est a Strasbourg, mene ses activites en faveur de la diversite linguistique et de l'apprentissage des langues dans le cadre de la Convention culturelle europeenne, ouverte a la signature le 1 er decembre 1954. (...). Son action promeut des politiques visant a approfondir la comprehension mutuelle, a consolider la citoyennete democratique et a maintenir la cohesion sociale » (Goullier, F., 2006 :5). Le CECRL est un document qui repond a la politique linguistique du Conseil de l'Europe. Son but etait de mettre sur pied un cadre commun de reference pour l'enseignement/apprentissage des langues a tous niveaux. Voici la repartition des niveaux de competence dans le cadre (2006:37):

Utilisateur elementaire		Utilisateur independant		Utilisateur experimente	
A1 Introductif ou decouverte	A2 Intermediaire ou de survie	B1 Niveau seuil	B2 Avance ou independant	C1 Autonome	C2 Maitrise

L'objectif de cette politique linguistique est realise autour de 3 axes : favoriser le plurilinguisme et le pluriculturalisme des personnes dans le but d'ameliorer la communication et la comprehension mutuelle entre les personnes, et de lutter contre l'intolerance et la xenophobie.

a- Faciliter la mobilite des personnes et l'echange des idees a travers le developpement de competences communicatives dans une variete de langues, afin de permettre a chacun de cooperer plus efficacement.

b- Developper une conception de l'enseignement des langues en se basant sur des principes communs par le biais de la cooperation internationale, de l'experience et des competences des pays membres en ce domaine (CECRL 2008).

Le CECRL s'adresse aux personnes qui evaluent, c'est-a-dire les ceux qui sont charges d'examens et de diplömes. Ceux qui enseignent et ceux qui apprennent.

Le CECRL plaident aussi pour une approche actionnelle. C'est pourquoi l'enseignement/apprentissage des langues est realise sur l'accomplissement des tâches communicatives et sur les activites de communication langagiere. D'apres le Conseil de l'Europe, l'usage et l'apprentissage d'une langue est : « comprendre les actions accomplies par des gens qui, comme individus et comme acteurs sociaux, developpent un ensemble de competences generales et, notamment une competence a communiquer langagierement. Ils mettent en reuvre les competences dont ils disposent dans des contextes et des conditions varies et en se pliant a differentes contraintes afin de realiser des activites langagieres permettant de traiter des textes portant sur des themes a l'interieur de domaines particuliers, en mobilisant les strategies qui paraissent le mieux convenir a l'accomplissement des tâches a effectuer » (Conseil de l'Europe 2001 :15).

En 2001, le CECR met a la disposition de l'apprenant un outil de travail appele "portfolio europeen des langues" (PEL) qui va l'accompagner tout au long de son apprentissage. Le PEL est une application du Cadre Europeen. Il appartient a l'apprenant et il developpe l'autonomie dans l'apprentissage et favorise le plurilinguisme. Le PEL est compose de 3 parties: passeport des langues, biographie langagiere et dossier.

Comme nous l'avons deja cite dans les lignes precedentes, le CECRL definit une echelle a 6 niveaux (A 1, A2, B1, B2, C1, C2) avec 4 competences de base qui sont declinees sous formes de 5 actes: ecouter, lire, prendre part a une conversation, s'exprimer oralement en continu et ecrire. Ainsi nous constatons que le Cadre definit des niveaux de competences mais n'impose pas une methodologie particuliere mais plaide pour une perspective actionnelle.

La part de la culture dans la perspective co-actionnelle.

Dans l'enseignement/apprentissage d'une langue etrangere, nous remarquons que la notion de culture est indissociable de la notion de langue. Selon Courtillon:«Apprendre une langue etrangere c'est apprendre une culture nouvelle, des modes de vivre, des attitudes, des façons de penser, une logique autre, nouvelle, differente, c'est entrer dans un monde mysterieux au debut, comprendre les comportements individuels, augmenter son capital de connaissances et d'informations nouvelles, son propre niveau de comprehension» (Courtillon 1984

:52). De, cette definition, il en sort que la langue contient en elle tous les elements et les traces culturels d'un pays. Afin de mieux comprendre le mot « culture » voyons la definition faite par Porcher : « une culture est un ensemble de pratiques communes, de maniere de voir, de penser et de faire qui contribuent a definir les appartenances des individus, c'est-a-dire les heritages partages dont ceux-ci sont les produits et qui constituent une partie de leur identite » (Porcher 1995: 55).

Quant a Bourdieu, il divise la culture en deux : la culture cultivee c'est-a- dire la litterature, la musique, la peinture et la culture anthropologique c'est-a-dire toutes les façons de vivre et de se conduire (Cuq, Gruca 2005 : 83).

En prenant compte de toutes ces definitions concernant la culture, nous avons bien vu que la langue d'une nation reflete bien sa culture. C'est pourquoi elle occupe une place primordiale dans l'enseignement/apprentissage d'une langue etrangere.

Pour notre part, en nous basant sur ces definitions, nous allons essayer de voir de pres la situation de « la culture » dans la perspective co-actionnelle lors de l'enseignement/apprentissage d'une langue etrangere. Mais au par avant, il est preferable d'etudier « la culture » dans le domaine de la didactique des langues.

Lorsque l'on observe l'histoire seculaire de la methodologie, nous constatons qu'avec l'approche communicative, dans l'enseignement/apprentissage des langues le but etait «la communication ». Voici la pensee de Puren sur ce point: «(...) apprendre une langue, c'est apprendre a se comporter de maniere adequate dans des situations de communication oü l'apprenant aura quelque chance de se trouver en utilisant les codes de la langue cible » (Puren 1998:372). En prenant cette definition comme point de repere, nous pouvons dire que c'est l'approche communicative qui a devance les travaux interculturels. Car pour cette approche la culture se rapporte a la vie quotidienne telle que les conduites et les regles sociales des gens. Ainsi, lors de l'enseignement/apprentissage des langues vous, en tant qu'enseignant, afin d'empecher les malentendus et les blocages, vous devez prendre en consideration les differences culturelles des differents systemes linguistiques.

Arrivee au XXIeme siecle, avec le CECRL, nous voyons la naissance d'une nouvelle methode intitulee : «Perspective actionnelle». Selon Puren, «la perspective actionnelle » doit etre appelee « perspective co-actionnelle » car: « elle met en avant la dimension collective des actions et la finalite sociale des actions, (...) les progres previsibles de l'integration economique dans l'Europe des annees 2000 exige un objectif [plus] ambitieux, en l'occurrence la capacite, pour chaque citoyen europeen, non seulement vivre mais aussi de travailler collectivement avec des etrangers tout autant dans le cadre de ses etudes que dans sa vie professionnelle. C'est pour cette raison que la didactique europeenne qui va emerger dans les annees 2000 devra sortir de l'approche communicative (...), en passant en particulier du concept d'interaction (qui est un parler avec et un agir sur l'autre) au concept de co-action (qui est agir avec les autres), et du concept d'interculturalite (designant principalement les phenomenes de contact entre les cultures differentes chez l'individu) a celui de co-culturalite (designant les phenomenes d'elaboration d'une culture commune par et pour l'action collective) » (Puren 2004 :11).

En ce qui nous concerne, en nous basant sur la definition de Puren, nous voulons employer dans notre communication l'appellation «perspective co- actionnelle » au lieu de « perspective actionnelle » pour marquer le concept d'interaction qui est « agir avec les autres ».

Quant au concept de culture dans la perspective co-actionnelle, elle est defime par Puren comme «co-culturalite» qui est une notion d'action de collectivite a travers les tâches « designant les phenomenes d'elaboration d'une culture commune par et pour l'action collective». Pour une meilleure comprehension, le mieux serait d'observer le tableau ci-dessous que nous propose Puren concernant «la perspective culturelle» a travers l'evolution de la methodologie. Il dit: «(...) j'aboutis a la modelisation suivante de l'evolution historique des formes d'adequation entre perspectives actionnelles et perspectives culturelles en didactique scolaire des langues-cultures » (Puren 2002 :60):

méthodologie		1. méthodologie traditionnelle	2. méthodologie active	3. approche communicative	4. perspective co-actionnelle co-culturelle
objectif social de référence		compréhension des grands textes de la littérature étrangère	accès à tous documents culturels en langue étrangère	échanges ponctuels avec les étrangers	réalisation commune d'actions sociales
perspective actionnelle	opération	traduction	explication	interaction	co-action
	moyen	reproduire	parler sur	parler avec/agir sur	agir avec
perspective culturelle	type	universaliste	civilisationnelle	interculturelle	co-culturelle
	orientation	valeurs	connaissances	représentations	conceptions

Selon Puren, la perspective co-actionnelle et co-culturelle :« n'est pas seulement necessaire pour mettre notre discipline en adequation avec le nouvel objectif social de reference. Elle est indispensable pour au moins les quatre autres fortes raisons suivantes: (...) la motivation et la responsabilisation des eleves, (...) la realisation d'action conjointe entre l'enseignant et l'apprenant, (...) l'enseignement/apprentissage de la langue pour et par l'action a dimension sociale et (...) aider les utilisateurs a realiser un travail collectif par le biais de l'internet » (Puren 2002 : 65-70).

Toujours d'apres Puren le prefixe « co » employe pour « co-actionnelle et co-culturelle » est utilise pour attirer l'attention sur la notion « d'action sociale » du Cadre europeen. Voici sa pensee concernant ce sujet: « (..) reintroduire clairement en didactique des langues-cultures la dimension collective qu'avait fait oublier dans l'AC le developpement unilateral des notions de «centration sur l'apprenant» et d' «autonomie». L'objectif de l'enseignement/apprentissage scolaire des langues-cultures, en effet, n'est pas seulement la formation d'individusautonomes, mais egalement celle de citoyens tout a la fois creatifs et responsables, actifs et solidaires » (Puren 2002 :71). Car pour lui l'individu vit en collectivite dans une societe ou il en depend.

Apres avoir etudie les traits essentiels du CECRL et la culture a travers la perspective co-actionnelle, nous allons voir comment l'apprenant turc du FLE est influence par la culture française.

L'influence de la culture cible sur l'apprenant turc du FLE.

La Turquie qui est un pays en voie de developpement souhaite un jour entrer a l'Union europeenne. En attendant ce jour, elle fournit des efforts pour repondre aux criteres d'adhesion. Dans le domaine de l'enseignement/ apprentissage des langues etrangeres, elle essaye d'appliquer les criteres du CECRL a travers la perspective co-actionnelle mais n'y arrive comme on le souhaite. Car elle a un systeme educatif different des pays europeens malgre les reformes realisees en 1997 et une derniere fois l'annee courante. C'est une societe particuliere qui merite d'etre observee de pres.

Avant d'entrer dans le vif du sujet, il serait interessant de se pencher sur la societe turque car la Turquie est un pays qui reflete des differences incroyables dans tous les domaines tels que : la cuisine, style de vie, habillement etc. Cette mosaique nous l'avons heritee grâce a la position geographique de notre pays car en tant qu'enseignant on verra que l'apprenant d'Istanbul n'est pas le meme que celui de Van une ville a l'extreme est du pays et c'est pourquoi on sera oblige de suivre differentes strategies d'apprentissage. Nous pouvons dire aussi que la Turquie est un pays de contradictions : par exemple, a l'ouest du pays vous avez des jeunes filles libres dans leurs mouvements tandis qu'a l'est c'est le contraire. Par consequent, l'enseignant de FLE doit tenir compte de toutes ces differences lors de la realisation de son cours de langue. Ainsi cette difference entre les apprenants de langue etrangere va influencer la perception de la culture cible car chacun aura sa propre façon de voir et de capter la culture de la langue etrangere. C'est pourquoi lors de l'enseignement/apprentissage du FLE, pour certains apprenants turcs qui vivent dans des grandes villes, par rapport a ceux des regions moins developpees, meme des le debut du cours, n'auront pas de difficultes a faire la rencontre de la culture cultivee et de la culture anthropologique. On peut meme dire que la presence des particularites culturelles motivera les apprenants car parfois la culture devance la langue en question et attire l'attention du public meme si toutes les nouvelles notions culturelles lui sont etrangeres et qu'elles n'ont pas d'equivalent dans leur culture maternelle. Comme on le voit nous vivons un paradoxe. C'est-a-dire nous essayons d'enseigner le FLE a travers la perspective co-

actionnelle mais nous faisons un transfert culturel par le biais de l'approche communicative. Puisque, comme le mentionne Puren, celle-ci soutient le concept d'interculturalite designant principalement les phenomenes de contact entre les cultures differentes chez les individus et non pas celui de co-culturalite designant les phenomenes d'elaboration d'une culture commune par et pour l'action collective.

Conclusion

Finalement, depuis 1990, le but de l'enseignement/apprentissage d'une langue etrangere n'est plus "s'informer, informer" comme c'etait le cas dans l'approche communicative mais "agir, interagir" comme l'indique Puren dans la perspective co-actionnelle. En particulier, de nos jours, les voyages et les echanges d'etudiants ont incite les individus a apprendre des langues etrangeres et ont donne naissance au CECRL.

Nous avons bien vu que lors de l'enseignement/apprentissage d'une langue etrangere, la langue et la culture sont deux elements inseparables.

En nous basant sur la variete culturelle et educative entre les regions de la Turquie, nous constatons qu'il est difficile pour nous, enseignants turcs, d'enseigner la culture de la langue cible comme le souhaite la perspective co- actionnelle. C'est-a-dire d'obeir au concept de «co-culturalite (designant les phenomenes d'elaboration d'une culture commune par et pour l'action collective) » comme nous l'indique Puren. Quant a nous en tant qu'enseignants turcs, comme les circonstances actuelles l'obligent, nous continuons a faire un transfert culturel par le biais de l'approche communicative qui defend le concept d'interculturalite des phenomenes de contact entre les cultures differentes chez l'individu.

UZAKTAN EĞİTİMDE KRİTİK BAŞARI FAKTÖRLERİNİN YAPISAL EŞİTLİK MODELİ İLE BELİRLENMESİNDE SAKARYA ÜNİVERSİTESİ E-MBA ÖRNEĞİ

Metin ÇENGEL[1], Hayrettin EVİRGEN[2]

Sakarya Üniversitesi, Sakarya, Türkiye

cengel@sakarya.edu.tr, *evirgen@sakarya.edu.tr*

Özet

Günümüzde F2F(yüz yüze eğitim) eğitim modelleri alternatif olacak Uzaktan eğitim modelleri hızla yaygınlaşmaya başlamıştır. Web tabanlı öğrenme uzaktan eğitimin önemli bir parçasıdır. Web'e dayalı uzaktan eğitim, kısaca eğitimcilerle öğrencilerin aynı mekânda olmadan gerçekleştirdikleri bir eğitim türü olarak tanımlanabilir. Bu eğitim modeli öğrenci merkezli bir eğitim modeledir. Bu modelde öğrenciler zamandan ve mekândan bağımsız olarak verilen dersleri öğrenebilmekte ve eğitici ile iletişimi çeşitli teknolojiler vasıtasıyla kurabilmektedir. Web üzerinden uzaktan eğitimde öğrenci başarısını etki eden bir çok faktör bulunduğu bir gerçekliktir. Başarıya etkileyen faktörlerden ağırlıklı faktörlerin neler olduğu iyi belirlenirse öğrencinin başarısı artırılabilir.

Bu çalışma, Sakarya Üniversitesi E-MBA öğrencilerinin başarılarına etki eden faktörlerinin yapısal eşitlik modeli ile belirlenmesi amacıyla yapılmıştır.

Anahtar Kelimeler: İnternet, Web dayalı uzaktan öğretim, başarıya etki eden faktörler,Yapısal Eşitlik Modeli.

GİRİŞ

Günümüzün gelişen teknolojisi ve değişen ihtiyaçları, yaygın olarak kullanılan eğitim ve öğretim metotlarında sürekli olarak değişikler yapmaktadır. Eğitim ve öğretim talebindeki artış sebebiyle, eğitim öğretim alanında ciddi tartışmalar ve radikal arayışlar ortaya çıkmıştır. Geliştirilen alternatif eğitim öğretim modellerinin birleştiği ortak nokta, sınıfta yapılan geleneksel eğitim ve öğretimin yetersiz kaldığı ya da işlemediği durumlarda daha değişik ve daha elverişli eğitim modellerinden yararlanılması sağlanmalıdır. Uzaktan Eğitim modelleri içinde son yıllarda en revaçta olan modelde WTE(web tabanlı eğitim) eğitim modelidir

Bilgi ve iletişimi teknolojilerinin kullanımının artmasıyla eğitimciler "küresel eğitim"e doğru gidişin kaçınılmaz olduğunu ve küresel eğitim uygulamalarının mutlaka başlatılması gerektiğini belirtmektedirler. İletişim teknolojilerindeki bu hızlı gelişmeler eğitimin yapısını ve biçimini etkilemekte, eğitimcileri yeni eğitim programları ve öğrenme öğretme modelleri geliştirmeye zorlamaktadır. (İşman, 2005).

Web teknolojilerine dayalı uzaktan eğitim modellerinde sitenin ulaşılabilirliği, kolay ve sade oluşu, sayfalar arası tutarlığın olması gibi konuların öğrencisinin başarısına katkı yapacağı düşünülmektedir. Bu nedenle site özellikler ile başarı arasında doğrudan bir ilişki olması beklenmektedir. Buradan hareketle araştırma kapsamında test edilecek birinci hipotez şu şekilde belirlenmiştir.

H_1: Öğrencilerin sitenin özelikleri ile ilgili algıları, başarıları üzerinde doğrudan etkilidir.

Uzaktan eğitim uygulamaları sitelerinde derslere erişim yöntemlerinin ve dersi veren Öğretim elemanları ile iletişimde bulunulmasının öğrencisinin başarısına katkı yapacağı düşünülmektedir. Bu nedenle sitede kullanılan teknolojilerle başarı arasında doğrudan bir ilişki olması beklenmektedir. Dolayısıyla araştırma kapsamında test edilecek ikinci hipotez şu şekilde belirlenmiştir.

H$_2$: Öğrencilerin sitede kullanılan teknolojilerle ilgili algıları, başarıları üzerinde doğrudan etkilidir.

Uzaktan eğitim sistemlerinde kullanılan web sayfaları arasında kolay dolaşacak önlemlerin alınması, kolayca tahmin edilebileceği gibi öğrencilerin başarıları üzerinde de olumlu yönde etkili yapacaktır. Bundan dolayı sitenin kullanılabilirliğiyle başarı oranları arasında doğrudan bir ilişki olması beklenmektedir. Bu nedenle araştırmanın üçüncü hipotezi de aşağıdaki gibi belirlenmiştir.

H$_3$: Sitenin Kullanılabilirliği, öğrencilerin başarıları üzerinde doğrudan etkilidir.

Web teknolojilerine dayalı uzaktan eğitim modellerinde sitenin ulaşılabilirliği, kolay ve sade oluşu, sayfalar arası tutarlığın olması gibi konuların öğrencisinin memnuniyetini artıracağı ı düşünülmektedir. Bundan dolayı site özellikler ile memnuniyet arasında doğrudan bir ilişki olması beklenmektedir. Araştırma kapsamında test edilecek dördüncü hipotez şu şekilde belirlenmiştir

H$_4$: : Öğrencilerin sitenin özelikleri ile ilgili algıları, memnuniyet üzerinde doğrudan etkilidir.

Uzaktan eğitim uygulamaları sitelerinde derslere erişim yöntemlerinin ve dersi veren Öğretim elemanları ile iletişimde bulunulmasının öğrencisinin memnuniyetini sağlayabilir. Bu sebeble sitede kullanılan teknolojilerle memnuniyet arasında doğrudan bir ilişki olması beklenmektedir. Araştırmada test edilecek beşinci hipotez şu şekilde belirlenmiştir.

H$_5$: Öğrencilerin sitede kullanılan teknolojilerle ilgili algıları, memnuniyet üzerinde doğrudan etkilidir.

Uzaktan eğitim sistemlerinde kullanılan web sayfaları arasında kolay dolaşacak önlemlerin alınması, kolayca tahmin edilebileceği gibi öğrencilerin memnuniyetini üzerinde de olumlu yönde etkili yapacaktır. Sitenin kullanılabilirliğiyle öğrenici memnuniyetini arasında doğrudan bir ilişki olması beklenmektedir. Araştırmanın altıncı hipotezi de aşağıdaki gibi belirlenmiştir.

H$_6$: Sitenin Kullanılabilirliği, öğrencilerin memnuniyet üzerinde doğrudan etkilidir.

Şekil 1. Araştırmanın hipotezleri
2. ARAŞTIRMA METODOLİJİSİ

2.1 Araştırmanın Amacı

Bu çalışmanın amacı, yüksek lisans düzeyinde uygulanan E-MBA programlarında kayıtlı öğrencilerin kendi görüşlerine, sistemden alınan log bilgilerine ve öğrenci işleri veritabanından alınan öğrencilerin yılsonu notlarına veri madenciliği tekniklerini uygulayarak E-MBA eğitimi alan öğrencilerin başarılarına etki eden faktörlerin neler olduğu belirlemek, E-MBA Programlarındaki **Başarı Faktörleri** tespit etmektir. Ayrıca, bu çalışmanın ikinci amacı da, belirlenen faktörlerle öğrencilerin başarıları ve memnuniyetleri arasındaki ilişkileri incelemektir.

2.2 Örnekleme Süreci

E-MBA programlarındaki başarı faktörlerinin belirlenmesi, bu faktörler arasında ve faktörler ile öğrencilerin başarıları arasındaki ilişkileri belirlemeye yönelik bu araştırma kapsamında, 2008-2009 öğretim yılında, Sakarya Üniversitesi E-MBA programında kayıtlı 350 öğrenciye Internet üzerinden anket uygulanmıştır. Araştırmada kullanılan veri toplama aracı, araştırmacılar tarafından literatür incelenerek oluşturulmuş ve öğrencilerin başarısına etki eden faktör sayısı üç olarak belirlenmiştir. Anketin birinci bölümünde demografik yapı ve olgu soruları sorulmuş, ikinci bölümde faktör sorularına yer verilmiştir. Birinci faktörde teknoloji ilgili 6 soru, ikinci faktörde **özeliklerle** ilgili 7 soru, üçüncü faktörde **kullanılabilirlikle** ile ilgili 6 soru, dördüncü faktörde **memnuniyetle** ile ilgili 6 soru öğrencilere yöneltilerek görüşlerine başvurulmuştur.

Ayrıca, Sakarya Üniversitesi UEYS(Uzaktan Eğitim yönetim sistemi) loglarından, öğrencilerin bir dönem boyunca sisteme giriş sayıları veri madenciliği uygulanarak elde edilmiştir. Öğrenci başarısı bakımından da öğrenci işleri veri tabanından öğrencilerin dönem sonu ortalamaları alınmıştır.

2.3 Veri ve Bilgilerin Analizi

Araştırmada belirlenen hipotezleri test edebilmek amacıyla yapısal eşitlik modeli kullanılmıştır. Araştırma modeli ile veri arasındaki uyumu gösteren yapısal eşitlik modelinin kullanılmasından önce araştırma kapsamında kullanılan ölçeklerin güvenilirlikleri belirlenmiştir. Ölçeklerin güvenilirliklerini belirlemede kullanılan, her bir değişkenin veya göstergenin aynı yapıyı ölçtüğünü gösteren içsel tutarlılıktır(internal consistency). İçsel tutarlılığın ölçümü için bu araştırmada Alfa Katsayısı(Cronbach Alpha) yönteminden faydalanılmıştır. Araştırmada ölçeklerin Alfa katsayısı için alt sınır 0.70 değeri esas alınmıştır. Alfa katsayısı için 0.70 değeri kabul edilen alt sınırdır (Hair vd.,1998). Araştırma verilerinin analizi sonucunda elde edilen Alfa katsayıları ve ölçeklerin değişkenleri Tablo 1'de gösterilmiştir.

Tablo 1. Araştırma Kapsamında Kullanılan Ölçeklerin Güvenlik Katsayıları

Teknoloji	Alfa Katsayısı
C1. Derslere ulaşabilmek için içeriklerin asenkron yöntemlerle sunulması başarıyı etkiler C2. Derslere ulaşabilmek için içeriklerin senkron yöntemlerle sunulması başarıyı etkiler C3. Öğretim üyesi ile e-mail kullanarak iletişim kurulması başarıyı etkiler C4. Öğretim üyesi ile forum aracılığı ile iletişim kurulması başarıyı etkiler C5. Öğretim üyesi ile haftada en az bir defa, önceden belirlenmiş zamanlarda online iletişim kurulması başarıyı etkiler (Chat ,Msn ,Perculus v.b) C6. Sitenin sosyal etkileşimli olması başarıyı etkiler..	0.94

Ölçeklerin yapısal geçerlilikleri Doğrulayıcı Faktör Analizi ile belirlenmiştir. Doğrulayıcı Faktör Analizi genellikle bir olgunun ölçümüne yönelik olarak ölçek geliştirme ve geçerlilik analizlerinde kullanılmaktadır (Sütütemiz N.,2006). Bu araştırma da Doğrulayıcı Faktör analizi kullanılarak ölçeklerin yapısal geçerlilikleri belirlenmiş ve faktörlere ait değişkenlerin hata değerlerinin, birbirleri ile ve diğer değişkenlerle yüksek oranda kovaryans değerine sahip olanlar analizden çıkartılmıştır.

Teknoloji faktörüne uygulanan Doğrulayıcı Faktör Analizi sonucunda C1 gözlenen değişkenine ait hata değerlerinin, diğer değişkenlerle yüksek oranda kovaryans değerine sahip olduğu gözlenmiş ve bu nedenle C1 değişkeni analizden çıkarılmıştır. Bu değişim gerçekleştirildikten sonra değişkenler arası ilişkiler şekil 2'de, faktöre ait nihai uyum indeksleri tablo 3'de verilmiştir.

Şekil 2. Teknoloji Faktörü DFA(1.Modifikasyon)

Araştırmada kullanılan ölçeklerin güvenilirlikleri ve geçerlilikleri belirlendikten sonra, web teknolojilerine dayalı uzaktan eğitim modellerinde özellikler, teknoloji, kullanılabilirlik,, öğrencilerin başarıları ve memnuniyeti arasındaki ilişkilerin belirlenmesi amacıyla yapısal eşitlik modeli uygulaması gerçekleştirilmiştir. Yapısal eşitlik modelleri ölçülen(gözlenen) ve gizli değişkenler arasındaki ilişkileri sınamada kullanılan kapsamlı bir istatistiksel yaklaşımdır (Hoyle, 1995). Yapısal eşitlik modeli son yıllarda model sınama ve veri analizlerinde, sosyal bilimcilerin gittikçe daha çok kullandığı bir yöntem olmuştur (Sütütemiz, 206). Yapısal Eşitlik Modelinin sosyal bilimciler tarafından yaygın olarak kullanılmasının nedeni, modelde yer alan bütün gözlenen ve gizli değişkenler arasındaki ilişkileri aynı zamanda test etme fırsatı sunmasından kaynaklandığı düşünülebilir.

3. ARAŞTIRMA SONUÇLARI

Araştırmanın bu bölümünde, araştırmaya katılanların demografik yapısına ve araştırma hipotezlerini test etmek için kullanılan yapısal eşitlik modeli uygulamasına ve uygulamanın sonuçlarına yer verilmiştir.

3.1 Araştırma Örneğinin Demografik özellikleri

Araştırmaya katılan ve Sakarya Üniversitesi E-MBA programında 2008-2009 öğretim yılında öğrenci olan katılımcıların demografik özelliklerine ilişkin frekans ve yüzde dağılımları gibi istatistiki bilgiler Tablo 7'da verilmiştir.

Tablo 7. Araştırmaya Katılanların Demografik Yapısı

Cinsiyet	Frekans	Yüzde
Erkek	207	74,2
Kadın	72	25,8
Toplam	279	100
İş durumu		
Çalışıyor	237	88,5
Çalışmıyor	42	11,5
Toplam	279	100
Eğitim Durumu		
İşletme	187	67
Fen	9	3,2
Mühendislik	56	20,1
Diğer	27	9,7
Toplam	279	100

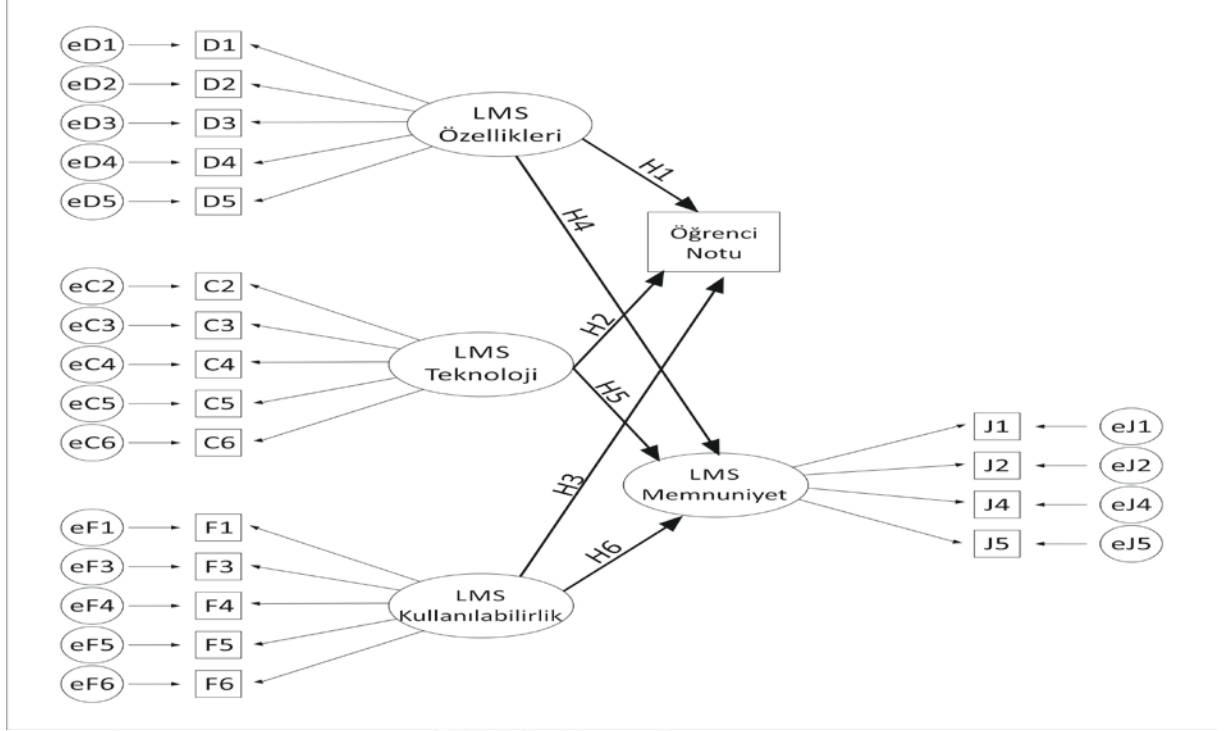
Tablo 10'den de görülebileceği gibi cinsiyet bakımından erkeklerin sayısı yaklaşık bayanlardan üç kat fazladır. Araştırmaya katılanlardan bir işte çalışan öğrencilerin sayısı çalışmayanlara göre yaklaşık 8 kat fazladır. Bu beklenen bir sonuçtur. Çünkü uzaktan eğitim programlarında okuyan öğrencilerin bir işte çalışma fırsatları her zaman vardır. Araştırmaya katılan öğrencilerin E-MBA programına katılmada önce tamamladıkları eğitim bakıldığında, öğrencilerin büyük bir çoğunluğunun(%67) 4 yıllık işletme fakültesi mezunu, olduğu görülmektedir. Öğrencilerin %20,1 'i de mühendislik fakültesi, %3,2 'si Fen Fakültesi ve %9,7 'si diğer fakültelerden mezundur. E-MBA programlarına kayıtlı öğrencilerin mezun oldukları okul türü dağılımlarının bu şekilde olmasının nedeni olarak, E-MBA programının İktisat-İşletme fakültelerinin devamı niteliğini taşımasından kaynaklandığı düşünülmektedir.

3.2. Yapısal Eşitlik Modeli Uygulaması

Sakarya Üniversitesi E-MBA programlarına kayıtlı öğrencilerin, web tabanlı uzaktan eğitim sistemlerinin özellikler, teknoloji, kullanılabilirlik,, öğrencilerin başarıları ve memnuniyet arasındaki ilişkileri belirlemeye yönelik olan bu araştırmanın hipotezlerini test etmek amacıyla yapısal eşitlik modeli kullanılmıştır. Yapısal eşitlik modeli için AMOS programından yararlanılmıştır.

Öğrencilere web sayfalarının Özellikleri ile ilgili algılamalarını **7** değişken, Teknoloji ile ilgili 6 değişken**,** Kullanılabilirlikle ilgili 6 değişken ve memnuniyetle ile ilgili algıları 6 değişkenle ölçülmüş ve öğrencilerin yıl sonu notları da öğrenci işleri veri tabanından elde edilmiştir. Yukarıda da vurgulandığı gibi, araştırma hipotezlerini test etmeden önce araştırma kapsamında kullanılan ölçeklerin güvenilirlikleri alfa katsayısı yöntemiyle, hangi değişkenin hangi faktörden yük aldığı Açıklayıcı Faktör Analizi yöntemiyle ve kullanılan

ölçeklerin geçerlilikleri Doğrulayıcı Faktör analizi yöntemiyle belirlenmiştir. Doğrulayıcı faktör analizi sonunda, hata değerleri birbirleri ile veya diğer değişkenlerle yüksek oranda kovaryans değerine sahip olduğu gözlen değişkenler analizden çıkarılmıştır. Bu şekilde toplam açıklanan varyansın artması sağlanmıştır. Doğrulayıcı Faktör Analizi sonucunda öğrencilerin web sayfalarının Teknoloji ile ilgili algıları 5 değişken, Özelikler 5 değişken, kullanılabilirlik 5 değişken ve memnuniyetle 4 değişken olmak üzere toplam 19 değişken yapısal eşitlik modeline dahil edilmiştir. Şekil 6 'de E-MBA öğrencilerinin uzaktan eğitim sisteminin tasarımı, gezinme, sunum ve öğrenci notları arasındaki ilişkilere ait model verilmiştir.

Şekil 6 'de E-MBA öğrencilerinin uzaktan eğitim sisteminin Özellikler, Teknoloji, Kullanılabilirlik, Memnuniyet ve öğrenci notları arasındaki ilişkilere ait model


Sakarya Üniversitesi'nde E-MBA programlarına kayıtlı öğrencilerinin uzaktan eğitim sisteminin Özellikler, teknoloji, Kullanılabilirlik, Memnuniyet ve öğrenci notları arasındaki ilişkileri belirlemeye yönelik olarak uygulanan yapısal eşitlik modeli sonuçları Tablo 11 ve Tablo 12'de verilmiştir.

Tablo 8: Araştırma Modelinin Uyum İyiliği İndeksleri Sonuçları

Uyum İndeksleri	Model
X^2 (Chi Square) (Ki-Kare) değeri	112,88
Serbestlik Derecesi	101
p (Anlamlılık Düzeyi)	0,001
x^2/df	1,047
GFI (Uyum İyiliği İndeksi)	0,923
AGFI (Düzeltilmiş Uyum İyiliği İndeksi)	0,891
RMR (Artıkların kök ortalama karesi)	0,026
IFI (Artırımlı Uyum İyiliği İndeksi)	0,938
CFI (Karşılaştırmalı Uyum İyiliği İndeksi)	0,958
NFI (Normlaşmış Uyum İyiliği İndeksi)	0,969
TLI(Tucker-Lewis Index)	0.923
RFI (Göreceli Uyum İyiliği İndeksi)	0,920
RMSEA (Yaklaşım Hatasının Kök Ortalama Karesi)	0,027

Yapısal eşitlik modeli uygulamalarında, veri ile model arasındaki uyum değerlendirilirken üç temel ölçüt incelenir. Bu kriterler; Chi-square/df, uyum iyiliği(goodness of fit) ve RMSEA değerleridir. Analiz sonucunda, bu ölçütlere ait elde edilen değerler, beklenen değerler ile aynı veya kabul edilebilir sınırlar içinde ise veri ile model arasında uyum vardır.

Araştırma modelinin uyum istatistikleri tablo 8 'de yer almaktadır. Tablo 9 'de araştırma modeli ile veri arasındaki uyumu gösteren değerler Araştırma Modeli sütununda, model ile veri arasındaki uyumun mükemmel olduğu durumu gösteren değerler İdeal Model sütununda gösterilmiştir.

Tablo 8 'deki sonuçlar incelendiğinde, analiz sonucunda elde edilen Chi-square istatistiği 0.01 anlamlılık düzeyinde istatistik bakımından anlamlıdır. Ancak, Chi-square değeri örnek büyüklüğüne çok duyarlı olduğu için bu değer tek başına model ile veri arasındaki uyumu belirlemek için yeterli değildir (Baker, Parasuraman, Grewal, Voss, 2002). Bu nedenle model ile veri arasındaki uyumun değerlendirilmesi için diğer uyum ölçütlerine bakmak gerekmektedir.

Model ile veri arasındaki uyumun testinde bakılan değerlerden biri CMIN/DF değeridir. Bu oranın sıfıra yakın olması veya en azından beşin altında olması gerekmektedir (Yoo, Donthu, Lee, 2000). Araştırma modelinde CMIN/DF değeri 3,674 olarak tespit edilmiştir. Bu değer model ile veri arasında uyumun kabul edilebilir sınırlar içerisinde olduğunu göstermektedir.

Veri ile model arasındaki uyumu değerlendirmede kullanılan diğer bir ölçüt ise uyum iyiliği indeksidir (Goodness of Fit Index-GFI). GFI, sıfır ile bir arasında bir değer alır. Ayrıca, GFI değeri dışında model ile verinin uyumlu olduğunu gösteren CFI(Comparative Fit Index), NFI(Normed Fit Index), TLI(Tucker-Lewis Index), RFI(Relative Fit Index) ve IFI(Incremental Fit Index) uyum kriterleri de incelenmelidir. Bu indekslerin değerleri de sıfır ile bir arasında değişir ve bire yakın olmaları model ile verinin uyumlu olduğunu ifade eder.

Tablo 8'den görülebileceği gibi, araştırmada GFI değeri 0.923, NFI değeri 0.969, RFI değeri 0.920, IFI değeri 0.9381, TLI değeri 0.925 ve CFI değeri 0.958 olarak bulunmuştur. Araştırmamızda bu değerlerin bire yakın olması model ile veri arasındaki uyumun olduğunu gösterir.

Model ile veri arasındaki uyum değerlendirilirken kullanılan bir diğer kriter ise RMSEA değeridir. Araştırmamızda RMSEA değeri 0.027 olarak tespit edilmiştir. RMSEA değerine göre de model ile veri arasında uyum olduğu söylenebilir. Hoelter ,05 ve ,01 indeksleri araştırma hipotezinin test edileceği güven aralığındaki minimum örnek büyüklüğünü vermektedir. Araştırma hipotezinin %95 güven aralığında ve 0.05 anlamlılık düzeyinde test edilebilmesi için ihtiyaç duyulan örnek büyüklüğü 99, %99 güven aralığında ve 0.01 anlamlılık düzeyinde ihtiyaç duyulan örnek büyüklüğü 110 olarak belirlenmiştir. Araştırmada yer alan örnek sayısı 350 olduğu göz önüne alındığında örnek sayısı açısından araştırmanın yeterli örneğe sahip olduğu söylenebilir.

Tablo 9   Yapısal Modelin Hipotez Testi Sonuçları

	MLE	Std olmayan MLE	St. Ht.	t	Hipotez Sonucu
Özellikler ➜ Öğrenci Notu	0,228:0307	0,138	2,229		H1 :Evet

Kullanılabilirlik ➜ Ö.Notu	0,208:0,207	0,139	1,229		H3 :Evet
Özellikler ➜ Memnuniyet	0,218:0307	0,138	2,129		H4 :Evet
Teknoloji ➜ Memnuniyet	0,256:0,042	0,141	3,621		H5 :Evet
Kullanı. ➜ Memnuniyet	0,049:0,017	0,122	1,121		H6 :Hayır

H1, Özelikler ile Öğrenci notu arasındaki ilişkiyi test etmektedir. Modele göre, Site özellikleri (r = 0,228) Öğrenci başarısı üzerinde pozitif ve anlamlı etkisi bulunmaktadır (t =2,229; p<0,05). Özellikler faktöründe artış öğrenci başarısını 0,228 standart birimlik bir artış meydana getirir. Dolayısıyla H1 hipotezi kabul edilmektedir.

H2, Teknoloji ile Öğrenci Notu arasındaki ilişkiyi test etmektedir. Modele göre, Teknoloji ile öğrenci notu arasında anlamlı ilişki bulunmamaktadır (p:0,587). Dolayısıyla H2 hipotezi kabul edilmemektedir.

H3, Kullanılabilirlik ile Öğrenci notu arasındaki ilişkiyi test etmektedir. Modele göre, Site Kullanılabilirliği (r = 0,208) Öğrenci başarısı üzerinde pozitif ve anlamlı etkisi bulunmaktadır (t =2,209; p<0,041). Özellikler faktöründe artış öğrenci başarısını 0,208 standart birimlik bir artış meydana getirir. Dolayısıyla H3 hipotezi kabul edilmektedir.

H4, Özelikler ile Öğrenci memnuniyeti arasındaki ilişkiyi test etmektedir. Modele göre, Site özellikleri (r = 0,218) Öğrenci memnuniyeti üzerinde pozitif ve anlamlı etkisi bulunmaktadır (t =2,129; p<0,04). Özellikler faktöründe artış öğrenci başarısını 0,218 standart birimlik bir artış meydana getirir. Dolayısıyla H4 hipotezi kabul edilmektedir.

H5, Teknoloji ile Öğrenci memnuniyeti arasındaki ilişkiyi test etmektedir. Modele göre, Site ö Teknoloji i (r = 0,256) Öğrenci memnuniyeti üzerinde pozitif ve anlamlı etkisi bulunmaktadır (t =3,621; p<0,044). Özellikler faktöründe artış öğrenci başarısını 0,256 standart birimlik bir artış meydana getirir. Dolayısıyla H5 hipotezi kabul edilmektedir.

H6, Kullanılabilirlik ile Öğrenci memnuniyeti arasındaki ilişkiyi test etmektedir. Modele göre, Kullanılabilirlik ile öğrenci memnuniyeti arasında anlamlı ilişki bulunmamaktadır (p:0,637). Dolayısıyla H6 hipotezi kabul edilmemektedir

3.3 Sonuç

Web teknolojileri kullanılarak yürütülen E-MBA programlarında öğrencilerin site özellikleri ,teknolojileri, kullanılabilirlik algılamaları, öğrencilerin başarıları ve memnuniyeti arasındaki ilişkiyi belirlemeye yönelik modelde kullanılan gösterge değişkenleri . Tablo 9 'den anlaşılacağı üzere, tüm gösterge değişkenlerinin regresyon katsayılarına ilişkin değerler oldukça anlamlıdır (p=0.000). Başka bir ifade ile, oluşturulan model için hipotezlerden H_1, H_3, H_4 H_5 hipotezleri kabul edildiği anlaşılmıştır. Ancak model üzerinde H_2, H_6 Hipotezlerininim üzerinde doğrudan etkili olmadığı gözlenmiştir.

UZAKTAN EĞİTİMDE KULLANILAN TEKNOLOJİLER

Hüseyin YAŞAR[96]

Sakarya Üniversitesi, BÖTE ABD- Uzaktan Eğitim Dalı YL Öğrencisi, Türkiye

hsyasar@hotmail.com

Özet

Uzaktan eğitimde çeşitli teknolojiler kullanılmaktadır. Bu çalışmada uzaktan eğitimde kullanılan uzaktan eğitim teknolojileri, sınıflandırılmış bir şekilde tanıtılmaktadır. Uzaktan eğitim teknolojilerini basılı teknolojiler, işitsel teknolojiler, video teknolojileri ve bilgisayar-internet teknolojileri olarak sınıflandırılmaktadır.

Anahtar Kelimeler: Uzaktan Eğitim, Basılı Teknolojiler, İşitsel Teknolojiler, Video Teknolojiler, Bilgisayar-İnternet Teknolojileri

Abstract

Different Technologies are used for Distance Education. In this study, technologies used for distance education are defined in classified way. Distance Education Technologiesa are classified as Print Technologies, Audio/Voice Technologies, Video Technologies **and Computer-Internet** Technologies.

Key Words: Distance Education, Print Technologies, Audio/Voice Technologies, Video Technologies, Computer-Internet Technologies

Giriş

Sürekli eğitim arayışı geleneksel eğitimin yanında başka eğitim arayışlarına da yönelmeyi gerektirmiştir (Lewis ve Romizsovski, 1996). Bu yönelim sonucunda ortaya çıkan uzaktan eğitim kavramı gün geçtikçe önemli bir hal almaya başlamıştır. Uzaktan eğitim düşüncesinin 18. yüzyılın ortasına kadar uzandığı bilinmekle birlikte, ilk kez 1972 yılında Uluslararası Eğitim Antlaşmaları Birliği (ICCE) tarafından "mektupla öğrenim" tabirinin karşılığı olarak kullanıldığı belirtilmektedir(Moore,1993). Uzaktan eğitim kavramı ise ilk olarak Wisconsin Üniversitesi'nin 1882 yılı Kataloğu'nda geçmiştir. Yaygın olarak ise 1960'lı yıllardan başlayarak kullanılmıştır (Kaya, 1998). Uzaktan eğitim tüm dünyada 1980'li yıllarda televizyon yayıncılığındaki gelişmelere bağlı olarak canlanmış, 1990'ların sonlarına doğru bilgisayar ağlarının gelişmesi ile birlikte ivme kazanmıştır(McIsaac,2002).

Uzaktan eğitim, eğitilen kişi ile eğiticinin coğrafi olarak ayrı olduğu durumlar için kullanılan öğrenme-öğretme düzenlemeleridir (Yates ve Tilson, 2000; Moore ve Thompson, 1997). Çeşitli iletişim araçları ve etkileşim kanalları kullanılarak eğitici ve eğitilecek kişiler bir araya gelir (Moore ve Kearsley, 1996). Bu araçlar, basılı materyaller, kitaplar olabileceği gibi ses-görüntü kayıtları, kablo, uydu vb. etkileşimli telekonferanslar da olabilir (Moore ve Thompson, 1997).

Williams ve Pabrock uzaktan eğitimin geçirdiği evrimlerin üç aşamadan oluştuğunu belirtmişlerdir(Williams ve Pabrock,1999). Birinci aşama (1860-1960), basılı materyallerin, radyo iletişiminin ve video teyplerin kullanıldığı dönemi kodlamaktadır. İkinci aşamada (1960- 1990) iki yönlü ses ve video iletişimi ile bilgisayar temelli eğitim diskleri uzaktan eğitim teknolojisini oluşturmuştur. Üçüncü aşama ise (1990'lardan günümüze)

---

hibrit teknolojilerin kullanılmaya başlandığı, uzaktan eğitimde sanal sınıfların oluşturulduğu ve öğretimin büyük ölçüde internet teknolojileri kullanılarak gerçekleştirildiği dönemi temsil etmektedir.

Uzaktan eğitimde yeni teknolojilerin kullanımının artması ile birlikte etkileşimde de pek çok çeşitlilik oluşturulmaya başlanmıştır. Bu da uzaktan eğitimin alanının genişlemesini sağlamıştır (O'Malley, 1999). Yeni teknolojiler, uzaktan öğretimde yeni vizyonların geliştirilmesine yardımcı olmuştur. Teknolojideki değişiklikler eğitimde de bazı değişiklikleri beraberinde getirmiştir. Teknoloji, uzaktan eğitimin en iyi nasıl gerçekleştirileceği ile ilgili geniş yollar sunmaktadır (Berge ve Collins, 1995; Betts, 2002).

Uzaktan eğitimin ilk başladığı yıllarda genelde posta kullanılarak kitap ve basılı materyallerle yapılan eğitim, daha sonra diğer teknolojilerin kullanımını da beraberinde getirmiştir. Radyo-ses kasetleri, televizyon, video, telekonferans, bilgisayar, internet vb. katılımı ile birlikte, uzaktan eğitimde teknolojilerin kullanımı da çok önemli yer tutmaya başlamıştır.

Basılı Teknolojiler

Basılı teknolojiler uzaktan öğretimin başladığı zamandan beri kullanılmaktadır ve uzaktan öğretimde kullanılan diğer iletişim yöntemleri için de temel oluşturmaktadır. Tarihteki ilk uzaktan verilen dersler basılı teknolojilerin öğrenciye posta yoluyla gönderilmesi sayesinde yapılmıştı. Teknolojik gelişmeler uzaktan ders veren eğitimciye ders iletiminde kullanabileceği çeşitli araçlar sağlamış olsa da, basılı teknoloji kullanımı tüm uzaktan öğretim programlarında yaygın kullanımını sürdürmektedir. Uzaktan eğitimde kullanılan basılı teknolojilere örnek olarak kitap, çalışma rehberleri, çalışma kitapları, faks, resim, grafik, şema, broşür, gazete ve dergi verilebilir.

Basılı Teknolojilerin Avantajları

    a.   **Doğallık:** Basılı teknolojiler her ortamda ve çok kapsamlı araçlara gerek duyulmadan kullanılabilir.

    b.   **Öğretimsel açıklık:** Kullanılan iletim yöntemi dersin içeriğini öğrencinin dikkatini çekecek şekilde zenginleştirilmelidir. Yöntem ve içerik birbiriyle karşılaştırılmamalıdır. Öğrencinin iyi bir okuyucu olması durumunda, basılı teknolojiler en iyi öğretim malzemesidir.

    c.   **Kullanım kolaylığı:** Sadece okuma için yeterli ışığın sağlanması ile basılı teknolojilerin zaman ve yer sınırlaması olmadan ve elektrik, özel tasarlanmış sınıf, bilgisayar gibi ek donanımlara gerek duyulmadan kullanılması mümkündür. Kolay taşınabilir olması özellikle kırsal kesimde yaşayıp ileri teknolojiden uzak olan öğrenciler için önemlidir.

    d.   **Tekrar ve başvuru kolaylığı:** Basılı Teknolojiler(BT) öğrenci merkezlidir. Bu nedenle öğrenci gerekli gördüğü ya da özel ilgi gerektiren bölümlere dikkat gösterip bildiği bölümleri hızla geçebilir.

    e.   **Maliyet uygunluğu:** BT diğer öğretim araçlarına göre hazırlama maliyeti en az olandır. Ayrıca çoğaltma kolaylığı ve çoğaltma maliyetinin az olması da önemlidir.

    f.   **Hazırlama ve yeniden düzenleme kolaylığı:** Elektronik ortamdaki öğretim malzemelerinin teknik karışıklığı ile karşılaştırılınca, BT'lerin yazımı ve yeniden düzenlenmesi kolay ve ucuzdur

    g.   **Zaman uygunluğu:** BT hazırlanmasında üreticinin ilk hedefi teknik özellikler değil içeriktir.

Basılı Teknolojilerin Dezavantajları

    a.   **Gerçeğin kısıtlı görüntüsü:** Kelimelere bağlı olunmasından dolayı BT'ler gerçek hayattaki olayların sözsel taklitleridir. Art arda gelen resim ve fotoğraf kullanımı dışında BT'de hareket oluşturmak mümkün değildir. Birçok çalışmanın sonucunda görülmüştür ki BT ile verilen dersleri başarıyla tamamlamak için öğrenci motivasyonunun yüksek olması gerekmektedir. Düzenli bir öğretim tasarımının yardımıyla pasif durumdaki öğrenciyi teşvik ederek BT deki pasiflik özelliğini aşmak mümkündür. Ancak, bir kitabı okumak veya yazılı bir alıştırma üzerinde çalışmak için gerekli motivasyon TV programı seyretmek veya öğretmenle sesli bir ortamda diyalog kurmak için yeterli olandan fazladır.

    b.   **Karşılıklı etkileşim ve dönütler:** Öğrenci-öğretmen arasında bir etkileşim olmadıkça hangi sistem kullanılırsa kullanılsın öğretim sıkıntısı yaşanır. BT'ler pasif ve birey yönetimlidir. Dönüt sağlamış BT'lerde bile, öğrencinin yanıtların bulunduğu bölüme geçmesi engellenemez.

    c.   **Okuma yeteneğine bağlılık:** Okuma yeteneklerindeki eksiklik öğretimsel yönden en iyi basılı öğretim malzemesinin bile başarılı olamamasına yol açabilir. BT'nin başarılı olması bu eksikliğin aşılmasına bağlıdır.

İşitsel Teknolojiler

Uzaktan öğrenme derslerinin geliştirilmesinde işitsel veya ses teknolojileri uygun maliyetli yollar sunar. Uzaktan eğitim derslerinde işitsel bileşenler sesli bir telefon kadar basit olabilir veya mikrofonlu sesli konferans, telefon köprüleri, hoparlörler kadar karmaşık olabilir.

Uzaktan eğitimde kullanılan video teknolojilerine örnek olarak sesli mesaj, ses dosyaları ve optik diskler, sesli konferans, podcastler, radyo ve telefon verilebilir.

İşitsel Teknolojilerinin Avantajları

   a.   **Ucuz olması.** İşitsel/ses teknolojileri nispeten ucuzdur.
   b.   **Kolay erişebilir olması.** Gelişen iletişim teknolojileriyle birlikte çok rahat ulaşılabilir.
   c.   **Kullanım kolaylığı.** Neredeyse herkes bir telefonu ve bir ses kasetini rahat bir şekilde kullanabilir. Ses teknolojilerinde yazılım kurulumu ve donanım konfigürasyonu yoktur.

İşitsel Teknolojilerinin Dezavantajları

   a.   **Programlama gerektirebilir.** Bazı ses teknolojileri(örneğin sesli konferans) senkrondur, bunun anlamı öğretmen ve öğrenci için uygun zamanın planlanmasıdır.
   b.   **Görsel bilgi için elverişli değildir.** Öğrencilerin birçoğu ses girdileri yoluyla odaklanmayı ve öğrenmeyi zor bulabilir.
   c.   **Kişisellikten uzak olabilir.** Sadece işitsel etkileşim ile göz teması ve beden dili yoktur.

Video Teknolojileri

Öğretmenin görülebilmesi ve duyulabilmesi becerisi, davranışların modellenmesi, gösterilmesi ve soyut fikirlerin öğrenilebilmesi için fırsatlar sunmaktadır. Uzaktan öğrenmede video teknikleri için çoğu zaman iletim ortamları (videokasetler, uydular, televizyon kabloları, bilgisayar ve mikrodalga) ile karakterize edilir. Ortamların her biri bağlantılı oldukları video ve ses sinyallerinin yönü ile tanımlanır(Tek yönlü video, çift yönlü video, tek yönlü ses ve çift yönlü ses).

Uzaktan eğitimde kullanılan video teknolojilerine örnek olarak videokaset, uydu videokonferans, kablo ve televizyon yayınları, masaüstü ve internet videokonferans verilebilir.

Video Teknolojilerinin Avantajları

   a.   **Hem ses ve hem de video iletişimine izin vermesi:** video teknolojileri yüz yüze sınıftaki gerçekliği ses ve görüntü olarak sağlar. Genellikle "burada olmanın sonrasındaki en iyi şey" olarak kabul edilir.
   b.   **Kişisel duyguları kolaylaştırması:** Video teknolojileri yüz ifadelerini ve vücut dilini görmede, iletişime kişiselliği katarak öğretmen ve öğrenciyi etkinleştirir.
   c.   **Etkileşimi yüksek düzeyde tutar:** Çoğu video teknolojileri senkrondur. Etkileşimi, soruları cevapları vb. yüksek derecede sağlar.

Video Teknolojilerinin Dezavantajları

   a.   **Çok Pahalı olabilir:** Kamera ve düzenleme ekipmanları çok pahalı olabilir. Ek olarak her yerdeki altyapı ve yerler arasında bağlantı maliyetli olabilir.
   b.   **Oldukça çok planlama ve ön hazırlığa ihtiyaç vardır:** Etkili olabilmesi için, kamera ekibi ve eğitmen pratik yapmalı ve bir ekip olmalıdır. Bu alanda etkili olması için birim elemanları eğitimden geçmeli ve pratik yapmalıdırlar.

c. **Programlı olmalıdır:** Çoğu video konferans spontane değildir. Bunun yerine kaynaklar belirlenme ihtiyacı ve planlanmanın yapılması gerekiyor.

d. **Teknik Destek Ekibi İhtiyacı:** Video kayıt işlemi karmaşık olduğundan karıştırma ve yayın teknik destek ekibine ihtiyaç vardır. Ek olarak Alıcı istasyondaki ekipmanların doğru çalışmadığından emin olunmalıdır.

Bilgisayar ve İnternet Teknolojileri

Gündelik yaşamda her geçen gün "bilgi toplumu / bilgi çağı" sözcüklerini daha fazla duyar olduğumuz bir ortamda bilginin idaresi (saklanması, derlenmesi, işlenmesi) için vazgeçilmez araçlar olarak karşımıza bilgisayar çıkmaktadır. Bunun en önemli nedeni birim zamanda insanın bunca bilgi yığınını kontrol edebilmek, yönetebilmek için kendisinden daha fazla işlem yapabilen araçlara ihtiyaç duymasıdır. Bilgisayarların temel işlevleri ve çıkış noktası da zaten budur. Çeşitli eğitim-öğretim etkinliklerinde bilgisayarın kullanılması giderek yaygınlaşmaktadır [Kaya,1999]. Öte yandan iletişim yöntemlerinin içerisinde de artık vazgeçilmez bir unsur olmaya başlamışlardır. Yoğunlaşan iş ve eğitim akışları karşısında geleneksel posta ve yayın yöntemleri, özellikle bireysel iletişim açısından son derece yavaş ve yetersiz kalmaktadır.

Gelişen teknolojiye ayak uydurabilmek için her geçen gün daha fazla beceriye gereksinim duyulmaktadır. Uzaktan eğitimde şu an gelinen son nokta internet yoluyla öğretim uygulamalarıdır [Önder, 2001,2002].

Son yıllarda, bilgisayar ve İnternet kullanımının yaygınlaşması, gelişen İnternet teknolojileri ve ADSL gibi çevirmeli bağlantılara göre daha ucuz, hızlı ve sürekli İnternet bağlantılarının kullanılmaya başlanması, İnternet üzerinden yayımlanan eğitim ortamlarının oluşmasına neden olmuştur (Doruk, 2005).

Türkiye'de İnternet'in kullanılmaya başlanmasından önceki dönemlerde yapılan uzaktan eğitim uygulamaları tek yönlü iletişime dayandığı için etkileşim eksikliği, bu konuda yapılan çalışmalarda sık sık dile getirilmiştir. Diğer taraftan, bilgisayar ve ağ teknolojilerinin, özellikle İnternet'in giderek yaygınlaşması ve karşılıklı etkileşime olanak sağlaması yeni umutların doğmasına yol açmıştır (Özen, 2001).

Özellikle 1990'ların sonlarından itibaren, öğrenme- öğretme etkinliklerinde yoğun olarak kullanılmaya başlanan bilgisayar ağları Internet ve World Wide Web teknolojileri ile uzaktan öğretimde önemli açılımları sağlamıştır (Aydın, 2002). Bu dönemden sonra uzaktan eğitim geniş bant teknolojilerinin desteği ile hız kazanmış ve web tabanlı uzaktan eğitim öğrenme-öğretme amacına hizmet etmeye başlamıştır.

Günümüzden uzaktan eğitim ağırlıklı olarak çevrimiçi ortamların desteği ile yürütülmektedir. Çevrimiçi eğitime olan ilginin temelinde, Internet ve World Wide Web gibi teknolojilerin, bilgiyi yaratma, saklama, dağıtma ve paylaşmada sağladığı olanaklar yatmaktadır. Eskiden saatler, haftalar ve hatta aylarca beklenerek elde edilen bilgilere şimdilerde birkaç dakika da ulaşılmaktadır (Aydın, 2002).

Teknolojik gelişmeler birbirinden uzaktaki bireysel kullanıcıların yalnız başlarına değil grup halinde ortak uygulamalar üzerinde çalışmalarına olanak sağlamaktadır. Yakın geçmişe kadar yalnızca metin tabanlı olan bu ortak uygulamalar artık eş zamanlı görüntü ve ses paylaşımlı olabilmektedir. Bu durumun farkına varan bazı uzaktan eğitim uzmanları, sanal gerçeklik gibi yöntemleri uzaktan eğitim amacıyla kullanma yönünde uygulamalar başlatmışlardır. Gelişmeler bu tür işbirliğine dayalı benzetimlerin, oyunların uzaktan öğretimde kullanılacağını göstermektedir (Aydın, 2002).

Uzaktan eğitimde kullanılan bilgisayar ve internet teknolojilerine örnek olarak e-posta, sohbet, web tabanlı kaynaklar, videokonferans, bloglar, vikiler,sosyal işaretleme, sosyal ağlar ve öğretim yönetim sistemleri verilebilir.

Sonuç

Uzaktan eğitimde kullanılan teknolojiler, bilgi ve iletişim teknolojilerine paralel olarak gelişmektedir. Uzaktan eğitim teknolojilerine her geçen gün bir yenisi eklenmektedir. Basılı teknolojilerin kullanıldığı uzaktan

eğitimin ilk dönemlerinden, bilgisayar-internet teknolojilerine kadar birçok teknoloji uzaktan eğitimde kullanılmış ve kullanılmaya devam etmektedir.

"VAKIF UNIVERSITIES" IN TURKEY: SOME PROBLEMS AND PROSPECTS

Asst.Prof.Dr.Aygul Oktay[97]

Abant Izzet Baysal University, Bolu, 14280, Turkey

Abstract

Vakif universities in Turkey are established and run by some private groups,called as "vakifs",may also be named as the "revolving funds" in terms of financial aspects and being "voluntary" and "non-profit" organizations.They are included within the university system,but,both organizationally and administratively,they have some differences.

Vakif universities in Turkey have been established to meet some of the needs in education. In this small study we discussed the place of these institutions within the regular system of higher education, to illustrate their significance and some of their problems in terms of organization,administration and the other aspects related to the general system.

These institutions are not "special" or "private" universities in their general,or "known"senses.They are more or less,somehow, "original" institutions in Turkish higher education.Naturally,they have been experiencing various problems since their establishment.Some of the problems and issues they have been faced are mostly related to the other problems and issues within the formal higher education, as well as secondary education and the others;such as the ;population growth and financial aspects and demands. In addition,the new and existing legal and practical rules and practices have not been good and functional enough to meet the the needs within the system. So,it seems quite clear that, first, it must be understood that these are and have to be higher education instutitions different from the "formal" and "traditional" ones.Our experienses as well as observations and studies illustrate that there is a need to look at the "vakif universities", their problems and their prospects seriously.Only then they would be able to meet the needs and fulfill their functions in a better way.In this respect,their organizations,administrations and their "academic freedom" may be some of the "main"topics to start with.

Keyvords: Vakif ; university; private,; council

Introduction

Since the establishment of the new Turkish Republic,education in general has been considered as one of the main,vital areas to be dealt with.Even before the establishment,the Founding Fathers,especially Ataturk had serious thoughts and preparation.Because,they knew that they were creating a new, modern and different society and it was naturally required a modern system of education in it.They put native educators as well as well-known foreign philoshopers and educators at work. Istanbul and Ankara Universities were two main institutions to start with and another possible university,a third one, around Van Lake to go ahead. After Einstein's letter to Turkish President during the Second World War,several Jouish scientists were accepted to Turkey and those scientists played very important roles in improvements of Istanbul University. In addition, John Dewey was invited to Turkey (1924) and prepared two reports.Later,Advisor for German Ministry of Commerce and Industry came to Turkey and prepared a report on "Technical Education" (1925)and,specialist in technical education Omer Buyse from Belgium prepared a report on programs of our new vocational and technical schools (1927).Later,Miss Parker's Report (1934), the American Group's Report (1933-1934), prepared by Walker D.Hines and some others on Turkish economy,can be stated among some of the important events in Turkish Education. The years

[97] Corresponding author. Tel.:+0903742541000- 1642 ; fax: +0903742534641
E-mail address: oktay_ a@ibu.edu.tr.

were passed by and both the "pictures", problems and issues as well as the "approaches" in education as well as in higher education have been changed and required some different "solutions" rather than thr conventional ones. The vakif universities then came into existence as a hope,or a "new approach" to deal with some of the higher education problems, such as demands, finance and even somewhat an "innovation"or "innovative institutions."

Universities in Turkey

As Sarason also pointed out "The decision making group is usually small and not representative of all those who will be affected by its decision," (Sarason, Boston 1971,p.59).

In addition, according to Okcabol,in Turkish situation, "Members of the Higher Education Council and members in academic councils at the universities,instead of directing the work at these councils,try to be quite and in accord with the higher administrators," and "universities and their administrators are apart from the society." (Okcabol, 2007, p.325). Another point related to these would be the "readyness of both the society and universities,for developing systems such as Turkey.

For instance the following list of the laws related to the universities in Turkey can give us an idea to show the picture of development in this respect.

Table 1 The University Laws in Turkey

31 May 1933	The University Law (# 2252)
13 June 1946	The University Law (#4936)
27 October 1960	The Law for Changes in the Law (#4936, # 115)
20 June 1973	The University Law (#1750)
4 November 1981	Higher Education Law (#2547)

The laws and the other regulations in higher education of course were changed, according to the other changes to meet the needs and solve the existing and new problems in the society and this way to keep up with world-wide developments.For instance, there was only one state university and no vakif university in 1933 inTurkey, but the number of state university became 27 in 1982 and no vakif university again. But, in 2011 there was 103 state and 62 vakif universities.With 17 other higher institutions total numbers became 182 (Table 2).

Table 2. Numbers of Universities in Turkey (Selected Years)

Year	State Universities	Vakif Universities
1933	1	-
1974	13	-
1982	27	-
1992	53	2
1997	53	16

2006	68	25
2008	94	36
2011	103	62

On the other hand,the numbers of students at state universities was 1,869.911 in 2010 (excluding open university). This number became 193.244 at vakif universities (Table 3).

Table 3. Numbers of Students in Turkish Universities (2010-2011)

State Universities (%)	Vakif Universities (%)	Total
1.869.91 (88.9)	193.244 (9)	2.103.163 (x)
		(x)Excluding open university
		By including,total 3.583.834 (%93.59)

When we checked with the numbers of the numbers of teachers (including their assistants),we see that total number in all higher institutions ,at the 2010-11 educational year again, is 111.495.Having 95.831 at state and 12.392 of them at vakif universities (512 members at the other higher institutions). It seems clear that, in order to keep up with the changes , universities in Turkey have been increased quite drastically, especially in their numbers, to meet demands. Along the same line we observe an ever-increasing financial efforts,as well as preparing academic manpower for the new institutions.

Vakif Universities Within the System

Higher education has been a world-wide phenomenon at least for the last fifty or one hundred years. It has different pictures of understanding and development for different countries.But,for those who think of education,as well as higher education, as the right of their citizens universities and higher education in its different forms have been considered and worked on continiously. The situation has been different aspects to be considered by developing and developed nations with different issues and problems, atdifferent levels and types of difficulties. The modern,democratic states in this century aim to provide her citizens equal opportunity and facilities in education. This was accepted as the "equal opportunity" before,but later on it is understood as the "equal opportunity and facilities."In this respect, in relation to the higher education,Turkey is somewhat located below the middle,or "avarege"among the other nations.

As it was stated in a Unesco Report in 2006 (Cepes,Unesco.2006,p.27),the fallowing problems were identified in

Turkish higher education:

1) Resource problem

2) Entrance to the higher institutions

3) Establishin a national "system of quality"

4) The problem of vakif universities

5) Insisting on traditional ways (of curriculum development,autonomy,demands) in higher education

6) Levels of tuition and fees at the vakif universities

Along the same line,it is also important to notice that:

1)It must be undersood that the university entrance exams means only a kind of "ordering",rather than indicating the assumed "success" levels

2) It seems vital to look into the main goals of the secondary institutions and their places and roles in education for the future

3) Establishing a university indicates and means an "investment in education", rather than an investment only directed economical gains and profits.It is very closely related to the future and the goals of the country.

As we know, by considering as a part of the "solution" to the higher education problems,especially in terms of demands and financing, since 1984,vakif universities in Turkey have been establishing.Their numbers became 62 in 2011.

Vakif universities are not "private " or "special " universities in a sense that they are neither "profit" oriented, nor "religious" institutions.They are established according to the article 130,and the item 3 of the Law numbered 2547,by the "vakifs" which also have the same place with the state universities,as public institutions.Only these "vakifs" can establish these universities, after getting permission from the Higher Educational Council (Yök). Administration of the vakif universities is carried out by a council called as the "mütevelli heyet",but this group-especially on administrative and financial aspects- is supervised by the Higher Education Council. Improvements of vakif universities in numbers is illustrated below (Table 4):

Years	Numbers of universities
1984	1
1993	3
1996	8
1997	16
1998	18
2001	23
2006	25
2007	30
2008	36
2009	45
2010	56
2011	62

Table 4. Improvements of Vakif Universities in Numbers (Selected Years)

Vakif Universities have the fallowing financial resources:

Vakif's share (Vakif's financial impact)

Students'share

State's share (State's help)

All of these shares are different among these universities and this affects both facilities and performances seriously.

In addition:

1) Vakif universities are not placed within the studies in strategic plan carried out by the Higher Education Council and the general methods and legal procedures in their supervision are not clear enough,

2) The composition of the "mutevelli heyet", the power and responsibilities of the head of this group are to be questioned and dealt with and improved,

3) Methods of appointment,very limited administrative authority of the rector have some problems,

4) Vakif universities are transferring their teachers and all of their personnel from the state universities, but they do not seem to be planning to prepare their "cadro",especially their academicians,

5) They,in general, stress on the most wanted programs of study and do not have sound scholarship programs,

6) There seems very serious differences in terms of their facilities and quality of education among these institutions,

7) The fees and tuitions they charged in almost all cases are abowe the average,or mid-level incomes of the citizens,

8) Their scientific as well as educaional impacts for the country are questionable.

For these and similar reasons,the country needs the services of these institutions,but it also seems vital to look into these institutions in a serious and scientific way, rather than by "orders" or personal decisions of the higher authorities, to improve for the benefits of the country's higher education,and her education in general.

Another aspect is that,since the Higher Education (YÖK) has the main power and responsibility for entire higher institutions as well as for vakif universities,there is a need to look at her composition,examine objectively if it really fits to carry out her functions. For instance, in 1995 there were 27 universities and 24 full-time officials were working at this council;now,in 2011 there were 130 state and 62 vakif universities. Nine of the 21 members are full-time and 12 of the others are attending the meetings once a month.The numbers of the supervisors of the Council is 11,as it was in 1995. So, it seems quite clear that,vakif universities are not and can not be somewhat entirely "innovative" institutions within the general system of higher education in Turkey and cannot fulfill their functions easily.Because they are expected to fulfill their functions in a way by using "old" and traditional mentality and methods.Yet,the country seems to be in needs of these institutions.namely "vakif universities" and in spite of various problems they have been facing,they actually have potentials for fulfilling their functions and in this respect they seem to be having some "prospects" for the future.

Conclusions

Education and higher education in Turkey have been among the main areas to work on.For this reason,native and foreign experts held responsibilities.It was always considered as a matter of "nation building" and modernization. As the state universities, Istanbul and Ankara Universities became two centers of developments in higher education. The numbers of state universities reached to 130 in 2011.

During those years,population growth,financial burdens,demands for higher education after having an increasing numbers of graduates of secondary schools became important problem areas. Vakif universities,as different and original institutions were established in order to help with solving some of the problems in higher education.Their numbers arrived at 62 in 2011.

These institutions are not "special",or "religiously oriented" universities in their traditional sense.They can be established by a "vakif" by the related Law,responsible to the Higher Educational Council.The vakif is not a profit making organization and "vakif university" is located within the general-public-system of higher organization. For instance some problems like the "autonomy" is the same for public as

well as vakif universities to be worked on.

Since their first years,vakif universities were appeared as "beneficial" institutions within the system,but they have been experiences various problems on the way.For this reason and in order to make them capable enough to fulfill their functions there seems to be having an urgent need to examine their problems and work on them,scientifically.

WEB-SUPPORTED EFFECTIVE HUMAN RIGHTS, DEMOCRACY AND CITIZENSHIP EDUCATION?[98]

İsmail ACUN[99]

University of Usak, Usak, Turkey

Abstract

The aim of the study is to investigate the possible effect of web-supported teaching on students' academic achievement in Human Rights, Democracy and Citizenship education. There is a strong emphasis on ICT integration in schools and higher education institutions in Turkey in recent years. Advocates of technology claim that it has a positive effect on students' academic achievement. The research is carried out to understand weather web-supported instruction will improve test scores on achievement test designed for this study to measure citizenship subjects.

To examine weather web-supported instruction would make a difference in attainment level of the subject, Solomon four-group design was employed. Subjects of the study were the student teachers of social studies education attending to school of education of two state universities located at Konya and Usak, Turkey. Second year students were assigned to form two experiment and two control groups in each universities. Thus, each university had its own Solomon four-group design.

An achievement test designed for this study was employed to collect data on dependent measures. The data was analyzed by using t test and one-way ANOVA. There was no statistically significant difference between experimental and control groups in achievement post-test scores.

Keywords: Web-Supported Learning**;** Web-Supported Teaching; Citizenship Education; Teacher Training, Achievement

Teacher Education and Human Rights, Democracy and Citizenship Education

In recent years, Turkey has been under immense change due to both internal and external factors. Among many tiers in societal level, the change process is observed in education and political arena. Turkey is evolving towards a more democratic country especially after its direct negotiations started with EU for the accession as a full member in 2005 (Wilkins *et al., 2011).* This process has an effect on the education system too. There is an emphasis on a democratic education. As part of the democratic education Human Rights, Democracy and Citizenship Education as embedded in social studies curricula and later a separate subject is integrated into school curricula. Instructors in teacher education institutions need to adopt their pedagogy to address student teachers' skills and knowledge on affective domain.

The affective domain in Human Rights, Democracy and Citizenship Education is very important as well as skills and knowledge domain (Kerr, 2010). What educators are trying to do is to provide students with skills and knowledge that will be necessary for them in life. Moreover, they may also try to help them form opinions and attitudes. In order to provide quality education in Human Rights, Democracy and Citizenship Education, it is a must to address affective domain. Otherwise, the education process will be about Human Rights, Democracy and Citizenship Education but not to persuade pupils to uphold the principles of democracy and human rights. Hence, student teachers have to be equipped with the know how to be able to utilize methods, techniques and

---

E-mail address: ismail.acun@usak.edu.tr.

materials in their teaching practice later in service. There are more possibilities to address affective domain with new media, especially with the internet.

Constructivism and ICT

Proponents of constructivist approach argues that the more real life problems integrated into teaching and learning process the more meaningful learning is for pupils (Yucel *et al,*. 2010). Subjects like Human Rights, Democracy and Citizenship Education require students actively engaging in issues such as protection of environment, helping people in need, participating in students' rights action in school etc. There are some social issues can be brought to the classroom but some cannot be. There are restrictions too for students to carry out teaching and learning activities out classroom walls. ICT, and the internet especially, allow teachers and students to carry out activities that were not possible in traditional classroom environments and/or in real life situation Furthermore, students can interact with each other and teachers, do research, and compose their own work by using internet thus making use of higher order thinking skills.

Method

Research Design

The study employs a Solomon four-group research design in order to reduce confounding effects of pre-test (Pedhazur and Schmelkin, 1991). The subject of the study included all the 2nd year students studying at education faculties of Usak and Necmettin Erbakan Universities. The second year students were assigned to form two experiment and two control groups in each universities for a quasi-experiment. Thus, each university had its own Solomon four-group design. Since random assignment of students to the groups was not possible, such variables as university entrance score, was taken as a covariate. Also gender compositions were also examined to see similarity of the groups. Control and experiment groups in each faculty had 30 to 32 students each.

Table 1. Solomon Four Group Design in both universities

Groups in Usak	Pre-test	Treatment	Post-test	Groups in Konya	Pre-test	Treatment	Post-test
Experimental	O	X	O		O	X	O
Control	O		O		O		O
Experimental		X	O			X	O
Control			O				O

Data Gathering Tools

An academic achievement test designed for this study was employed to collect data on dependent measures. Academic achievement test was prepared by a team of experts. First a table of specifications was prepared. Content and the face validity were ensured by the team of experts in accordance with table of specifications. Then, the test items were subjected to difficulty coefficient and discriminant coefficient analysis. The items which had less .30 discriminant indices were omitted. For the remaining 38 test questions Kuder-Richardson (KR_{20}) coefficient was computed, and it was found .84. The test was applied to one experimental and one control group in Usak University and one experimental and one control group in Necmettin Erbakan University at the beginning of the term as pre-test.

For attitudes a-ten-item general attitude measurement scale towards Human Rights, Democracy and Citizenship Education with .82 Crombach's Alpha reliability and a-twenty-one item attitude measurement scale towards ICT with .93 Crombach's Alpha reliability were developed.

Data Collection and Treatment

After subjecting experimental group students to a-12-week-long web-supported learning, the same test (as post-test) was applied to all control and experiment groups in both universities, 8 in total. The treatment lasted 12 weeks. The course was integrated into a teacher training programme for social studies education. The course content covered all the regular necessary elements of Usak and Necmettin Erbakan Universities requirements. In addition to those elements, there were extra themes informed by the international literature and theory. There were 11 themes covering Human Rights, Democracy and Citizenship Education subjects. Student teachers were actively involving group work, web-quests, doing research on the data base, watching movies and documentaries etc. in experimental groups. Student teachers in control groups were also involved in group work and research about the same subjects but in traditional classroom environment with instructor's costmary way of delivery of education.

Analysis

The data was subjected to t-test and one-way ANOVA by using SPSS 19.00. In order to test the two prerequisite for variance analysis is met i.e. the data is relatively appropriate for normal distribution and the

variance between groups is homogenous, the data was subjected to Test of Normality (Kolmogorov-Smirno; p> .05, Stem-Leaf, Skewness-Kurtosis: between -1,+1, Box-Plot, Histogram, Normal Q-Q Plot) and Levene Test (p<.05). It is found out that apart from Kolmogorov-Smirnov test the data is suitable for relatively normal distribution according to all indicators. Thus, it is decided to run parametric tests. Levene test shows that variance is homogenous (see Table 4). Therefore, ANOVA was used.

Findings and Discussion

In order to test the effect of web-supported learning on student teachers' achievement t-test was carried out for control and experimental groups.

Table 2: Differentiation of Achievement Post-Test Scores According to Control and Experimental Groups (t-Test)

Post-test	Group	N	Mean	Std. Deviation	Std. Error Mean	t	p
Scores	Control	140	26,42	3,08878	,26105	1,573	.117
	Experimental	130	25,78	3,63929	,31919		

As seen at Table 2, there is no statistically significant difference between control and experimental groups in terms of achievement post-test scores (t:1,573, p>.05). It means, the treatment i.e. web-supported constructivist teaching of human rights, democracy and citizenship education did not affect students' achievement meaningfully. In fact, student teachers in control groups scored higher on post-test achievement test higher than experimental groups. However, there might have statistically significant differences among groups.

Table 3: Differentiation of Achievement Post-Test Scores According to Control-Experimental Groups with Pre-Test and without Pre-Test (One Way ANOVA-Post-HOC TUKEY)

Post-test Scores	Sum of Squares	df	Mean Square F		Sig.	Differences (Group No)
Between Groups	233,176	3	77,725			1-2
Within Groups	2829,490	266	10,637	7,307	,000	1-3
Total	3062,667	269				2-4

Differentiation of achievement post-test scores according to control- experimental groups with pre-test and without pre-test, created via Solomon Four Group Design is shown at Table 3. According to findings there is a statistically significant difference between at least two groups (F: 7,307, p<.01). According to findings of ANOVA, achievement post test scores of control group with pre-test, is higher than experimental group with pre-test and control group without pre-test meaningfully (Table 4). It means didactic power of pre-test is more effective than the effect of treatment -based on using technology at teaching activity- on the achievement. And the achievement post test score of the experimental group without pre-test is meaningfully higher than the experimental group with pre-test. There is no explanation for this finding.

Table 4: Statistics About Test Groups

		Descriptive Statistics				Levene Statistics	
Nu	Group	N	Mean	Std. Deviation	Std. Error	Value	p
1	Control with Pre-Test	73	27,1096	2,54166	,29748		
2	Experimental with Pretest	64	24,7500	3,85450	,48181		
3	Control without Pre-Test	67	25,6716	3,45704	,42235	2,010	.113
4	Experimen. without Pre-Test	66	26,7727	3,13686	,38612		
Total		270	26,1111	3,37422	,20535		

The data was subjected to correlation analysis. The independent variables such as students' test scores of university entrance exam, grade point average score for 3 terms, parents' education levels, etc. were included into the analysis. There was a positive significant correlation between student teachers' achievement test post-test score and their technology attitude pre-test scores.

Conclusion

The fact that the treatment did not create any statistically significant difference between experimental and control groups, it is worthwhile to be cautious about ICT's impact on students' achievement. It is also worthwhile to explore different ways of testing students' achievement. The fact the matter is that student teachers were subjected to a constructivist learning environment with web support. However, due to scientific reasons to have an objective criterion they were tested with a multiple choice test measure which contradicts with the constructivist idea of formative assessment. The kind of treatment applied for this research may need different kinds of tools for truly measuring students' achievements.

WHAT IS IT ABOUT FIELD TRIPS? PRAXIS, PEDAGOGY AND PRESENCE IN VIRTUAL ENVIRONMENTS

Dr. Lesley Procter[100]

University of Otago, Dunedin 9054 New Zealand

Abstract

Teaching Faculty in Humanities and Social Science disciplines often struggle to find ways to facilitate students' understanding of theoretical concepts. In the Higher Education environment, we may neglect the "hands-on" strategies used so effectively in earlier educational contexts—to our students' detriment in some cases.

Recent moves towards situated and problem-based learning in Higher Education offer productive possibilities to incorporate all these modes of learning. In this paper, I argue that one specific pedagogical initiative—the field trip—offers productive opportunities for praxis in disciplines where it is not commonly considered as a teaching strategy. More specifically, I shall suggest that the traditional field trip can be usefully situated within an emerging field—virtual pedagogy—through the delivery of teaching strategies in virtual environments. I shall argue that, far from rebottling old wine, the virtual field trip combines situated, problem-based learning with praxis in excitingly new ways. Further, I suggest that the enhanced sense of presence provided by multi-user virtual environments (MUVEs) offers Teaching Faculty in Higher Education contexts a surprisingly effective way to introduce students to complex theoretical concepts through playful experimentation. To illustrate my argument, I shall draw on personal experience of one such teaching initiative at graduate level—a Sociology graduate field trip to a MUVE called Second Life.

Key words: Multi-User Virtual Environments, praxis, presence, Second Life, situated learning, virtual field trip

Introduction

Those teaching social science disciplines in Higher Education contexts seldom question the necessity of social theory. However, as Silver and Perez (1998) point out, attempting to follow through with that viewpoint in the classroom is often frustrating—even more so when we attempt to encourage students to relate theory to their own experiences. Kindling nascent sociological imaginations requires overcoming student passivity and fear about theory (Rinehart, 1999). Because theory challenges students to question taken for granted assumptions about familiar issues, it is seldom easy. Familiar habits of thought and the emotional ties to these may cause students to resist analysing them in new ways. This resistance can foster 'traditional' teaching, in which instructors lecture about theories drawn from assigned texts. This approach discourages creative thinking. Students may learn theories by rote and thereby fail to connect them to their own lives" (Silver & Perez, 1998).

In my experience these comments are especially pertinent in the micro-sociology classroom where students grapple with identity, subjectivity and complex theoretical concepts. Such concepts are not only harder to achieve "distance" from, but are also often personally threatening. If, for example a class session involves the social construction of gendered identity, how difficult might it be for individuals —who, in their late teens or early twenties, are in the "thick" of constructing such an identity—to engage intellectually with concepts of normativity, gendered hegemony, or performativity? Passive and shallow learning of enough concepts to "pass the test" reduces the threat level, allowing students to demonstrate a degree of mastery without grappling with the underlying, and perhaps threatening, issues.

[100] *E-mail address*: lesley.procter@otago.ac.nz

As teachers, how do we overcome these problems? Various pedagogic strategies exist to foster active rather than passive learning. Although it lies beyond the scope of this discussion to enumerate these in any depth, many such strategies fall within a broadly constructivist learning paradigm that advocates learners be "immersed in situated, problem-based learning environments that replicate real-world activity structures" (Albon, 2003). Despite the undoubted efficacy of such strategies, within the micro-sociology classroom the problem of personal immersion within the very phenomena under analysis may remain and continue to affect students' willingness to engage in critical reflection. Ainley observes, for example, that students are reluctant to contextualise "the 'choices' they believe they have freely arrived at" (Ainley, 2006 p.74). Despite the slightly different context to which he applies his observations, Ainley's students are remarkably similar those in a micro-sociology class who may reject arguments for the social construction of identity and gender with assertions of individuality and arguments that there are 'always exceptions,' resulting in a superficial engagement with 'just enough' theory to complete assignments.

Pedagogies grounded in preferences for active, reflective, and critical engagement with concepts are, therefore, often in tension with students' reluctance to think about how "you 'Become What You Are'" (as Ainley puts it). Students' immersion in the instrumental logic of their times, and the commodification of contemporary Higher Education[101] may exacerbate this reluctance. Since understanding this "becoming" is fundamental to micro-sociology, finding strategies to overcome such reluctance is vital. If, as Gadamer (1975) suggests, everyday life consists of the challenge posed to the familiar by the unfamiliar then how can we encourage our students to participate in this challenge? What means can we deploy to startle students out of themselves or to offer them the opportunity to re-assess their opinions in unforeseen ways (Kerdeman 1998; 2003)? Whatever strategies we employ to these ends, they must engage the student with theory so that the familiar may be viewed differently and connections between individual biography, history, and social structures that shape the life-course explored. I argue that the quotidian may supply "the bridge between fear and curiosity" (Sutton, 2006, p.209), by making theory less intimidating (Holtzman, 2005). I support this contention by discussing what I call praxis pedagogy and providing a brief overview of the Field Trip as an exemplar. I shall then describe a specific learning task, and briefly evaluate its effectiveness in promoting critical reflective engagement with theoretical concerns.

Praxis Pedagogy

Without doing undue violence to the rich tradition and variety of practice pedagogy, I believe that these varied forms may be combined under the heading of 'praxis'. Within the social sciences praxis is traditionally defined in the interstices between social action, social change, and practice-based reflexivity. A more nuanced definition adds an understanding of praxis as a cycle of activity including philosophical, contextual, needs, and pragmatic considerations forming a framework designed to bridge disciplines and integrate values, research and action (Prillittensky, 2001). Praxis should be based on criteria capable of facilitating completion of the cycle of reflection, research, and social action. It comprises the interconnection between actions of different, dispersed individuals and those socially, politically, and economically embedded institutions within which individuals act and to which they contribute (Jarzabkowski, Balogun, and Seidl, 2007). Praxis has a dual nature as both an embedded concept—able to be operationalized at different levels from the micro to the macro—and also dynamic as it shifts fluidly through the interactions between levels. I am mindful of these varied perspectives on praxis as I deploy the term in a slightly different way refer to the act of putting theoretical or normative assumptions into critical, reflective practice.

With this definition in mind I approach praxis pedagogy as activity-based and inherently reflexive. Keeping practice firmly in view as a strategy, we can augment the insights offered by constructivist learning models to maximise the immersive and collaborative processes, supporting knowledge construction within the classroom learning community as a social experience (Dewey, 1973). Pedagogic strategies drawing upon Dewey's insights include those emphasising experiential learning, authentic learning experiences and problem-based learning

---

[101] For further commentary on instrumentality, commodification and the effects of neo-liberal political agendas upon higher Education, see McManus (2006), Naidoo and Jamieson (2003), and Olssen (2002).

(PBL). These strategies have become widespread within all levels of education. Experiential learning makes the education-life-society connection clear, leads to personal growth, puts the learner directly in touch with the realities being studied (Scarce, 1997), and often involves links between out-of-classroom experiences and in-class teaching through "authentic" learning experiences (Wright, 2000). This link is one made strongly by learning experiences that are "authentic". Authentic learning experiences arise in circumstances where the learner constructs meaning and produces knowledge; uses disciplined inquiry to construct meaning; and aims her or his work towards discourse, product and performance creations that have value or meaning beyond specific academic successes. Additionally, an authentic learning experience will involve disciplined inquiry that allows students to engage in higher order thinking and deep knowledge acquisition. Such learning is personally meaningful to the student, relates to the real world outside the classroom, and provides opportunities to think in the modes of particular disciplines (Stoddard, 2009). Opportunities for self-constructed knowledge through experiential and authentic learning contexts often also involve PBL contexts where students engage in self-paced and self-constructed knowledge acquisition by grappling with multifaceted and realistic problems requiring self-directed learning skills.

Earlier I suggested that students might be encouraged to reassess their opinions by creating links between individual biography and social milieux, and by encouraging students to explore the familiar. Such opportunities for self-constructed knowledge may not reduce the inherent threat levels, but one specific strategy might. Whereas talking about personal experience within a classroom setting might be ineffective at reducing such threat, a one-step-removed self-experience may allow just enough distance to allay anxiety. A properly constructed immersive experience such as a field trip (FT) can act in this way, taking students out of the classroom and immersing them in an environment where they can act as observers while simultaneously being participants. I see the FT, therefore, as a remarkably effective context for praxis pedagogy. FTs are exercises in 'walking the sociological imagination talk' in specific contexts beyond the classroom walls. Before discussing this strategy, it is useful to provide a brief pedagogical context.

Field Trips as learning tools

I have argued elsewhere that both the FT and its virtual equivalent, the VFT, arise out of broadly constructivist learning approaches, fostering active rather than passive learning styles (Procter, 2011). The FT also draws on understandings of the social roots of learning developed by Dewey (1973), encouraging students' sociological imaginations by challenging preconceived notions and breaking down stereotypes (Scarce, 1997). During an FT students may be engaged in pursuit of a problem, gathering and analyzing data needed to answer their questions (Boyle, 1995). The benefits inherent in these short-term, experiential learning experiences may be categorized as substantive, methodological, pedagogical and transitional (Wright, 2000). Substantively, FTs assist students to make connections to subject matter at a deeper level than can be achieved with traditional instructional methods (Wright, 2000). Methodologically, FTs allow students to actively test and generate theories (Scarce 1997). Further, observational assignments of the type undertaken during FTs are remarkably effective for research methods that rely upon and validate the use of personal experience. Pedagogically, experiential learning experiences such as the FT combine abstract, concrete, reflective, and active learning styles; encourage participants to actively participate in their own and others' learning; and provide multisensory involvement (Wright, 2000). The FT may bridge formal education and future career settings, exposing students to unfamiliar environments and teaching social interaction skills. FTs can, however, easily become disconnected from the classroom curriculum (Klemm and Tuthill, 2003) or even reinforce students' stereotypes by engaging little more than 'zoo phenomena' approaches. Additionally, unless properly planned, an FT's geographical, psychological and cognitive novelty may hinder the meaningfulness of the learning experience (Robinson, 2009). Encouraging students to make links between their personal lives and the surrounding world may also expose them to potentially traumatic matter (Wright, 2000).

The Virtual Field Trip (VFT) has similar pros and cons to its traditional counterpart and arises from similar pedagogical paradigms. A VFT is most commonly defined as an instructional approach in which a multimedia presentation brings the sights and sounds of a distant place to the learner through a computer (Klemm and Tuthill

2003). Recently, a new development has increased the 'reality quotient' in student experiences, offering increased opportunities to maximize the learning potential of the VTF. These new three-dimensional virtual environments (3-DVEs) should be defined as computer generated displays giving users a sense of being present in, and interacting with, a three dimensional environment other than the one they are actually in (Warburton, 2009; Eschenbrenner, Nah, and Siau, 2008). This sense of 'being there' generates more dynamic environments within which individuals can view objects, simulations and other users in a shared virtual space (Eschenbrenner et al. 2008). Amongst various descriptive terms for 3-DVEs, the one I find most useful is 'multi-user virtual environments' (MUVEs). A 3-DVE offers a simulation of a three dimensional world (Inoue, 2007) and is distinguished from other forms of interactive media by three characteristics: increased immersion; increased sense of fidelity in relation to immediacy of control; and higher levels of active participation (Dalgarno and Lee 2012).

More specifically, MUVEs, as a subset of 3-DVEs, possess recurrent features that reflect their genesis in the gaming worlds of multiple user domains (MUDs) and massively multiplayer online (MMO) contexts (Warburton, 2009). MUVEs are persistent in world environments, which continue to exist even when no avatars are present. Within a MUVE, interactions between individual users and between users and objects, occurs in real time, providing a sense of immediacy of action in a shared space in which multiple users may participate simultaneously. Communication within these environments is both synchronous (allowing real-time interaction through various forms of communicative capabilities such as chat and instant messaging) and asynchronous (through connections between the MUVE and various forms of social networking media such as Twitter). A MUVE possesses similarities to the real world in such features as topography, movement and physics (Warburton 2009). MUVEs allow a range of activities beyond social meetings (DeFreitas and Veletsianos, 2010), frequently promoting first person viewpoints by utilizing avatars as digital representations of users. The avatar is the key to the immersive experience. As the user's bodily representative within the MUVE, an avatar allows both a greater sense of control and a more effective engagement with the experiences as they unfold in real time (DeFreitas and Veletsianos, 2010). Each of these characteristics has significant consequences for the use of such environments as learning spaces.

One such MUVE, Second Life (SL as it is referred to by residents), is the most mature example of a new generation of immersive virtual worlds. [102] In SL, residents have freedom to design their avatars, create unique environments within the world that may either mirror or radically diverge from the real world. Such freedoms provide an environment where social interaction is open-ended rather than a precursor to overt goal oriented action; where transactions may occur via a tangible economic structure (Warburton, 2009); and where boundaries are persistently blurred between corporeality and transcendence, the real and the virtual, where and nowhere, and single and multiple selves (Jones, 2005). Residents do not typically think of SL as a "game," since there is no "win" scenario or any specific objective. MUVEs like SL provide a supportive platform for project-based experiential learning through experimentation, exploration, task selection, creation, and dynamic feedback (Jarmon, Traphagan, Mayrath, and Trivedi, 2009). SL provides a good fit with the constructivist learning philosophies discussed above. In SL understanding is constructed through experience and reflection, and occurs in social situations (Santo 2009), students can explore the subject matter in a sensory-rich environment, direct their own learning, see their own and each others avatars, and interact both with other avatars and with objects. Teachers can utilize various inworld systems of communication to provide prompts for learning, build their own teaching environment, or import audio and video items. All residents can purchase objects, store them in their inventories, or share them in various ways (Jarmon et al., 2009). Experiences avatars have in these interactions can correlate to challenges met outside the MUVE itself due to elided distinctions between real and make believe

---

[102] SL is the creation of Linden Lab, a San Francisco-based company set up by CEO Philip Rosedale to launch a 3-D world. SL went live in June 2003 and its growth has been widely cited as exceptional. Numbering still only 180,000 residents in April 2006, SL has grown to over 25 residents worldwide by 2012. Use rates number some 1.3 million log-ins over a 60-day period, with between 45,000 and 70,000 regularly online at any one time (Shepherd, 2011). SL appeals to a very broad demographic: 57.2% of users are male; 42.8% are female; and 72.1% of the population is over 25 years of age (Worldwide, 2011). SL statistics are somewhat unreliable however because more people register than actively participate and many users have more than one account (called "alts" in SL parlance), making the actual demographics of SL questionable. Users online at any one time may also include "bots" which are accounts operated by a computer program rather than human user. For these reasons, user statistics may be inaccurate.

that occurs as a result of playing social roles and imitating others' social roles (Jarmon et al., 2009). SL does have some disadvantages however. To run the software requires a computer system with high-end graphics capabilities, high screen resolution, and a high-speed Internet connection. The platform itself takes time to master even basic skills such as moving and communicating and advanced skill such as building, scripting and animating take further time to acquire (Santo, 2009). The harassment of residents through such activities as shooting, object destruction, or sexual advances—known as 'griefing'—may also expose students to risk (Kluge & Riley 2008; Santo 2009). Despite these issues SL has many characteristics that can facilitate innovation in pedagogy. The richness of the environment maximizes interaction, visualization and contextualization. The immersive 3-D environment, simulation, increased sense of presence and community combine to make content production and identity play inherently social and experiential processes (Macedo and Morgado, 2009).

Presence is a characteristic of persistent, synchronous MUVEs, describing the effect people experience when interacting with a computer-mediated or -generated environment. Presence is the illusion that a mediated experience is unmediated (Lombard & Ditton 1997), involving a sense of being present in the environment. We do not leave the real world behind when we enter a MUVE. Instead we bring our experiences inside the MUVE and integrate it into our experiences there (Carassa, Morganti, and Triassa, 2004). Action and presence are dialectically intertwined as we recognize the meanings of what we see and do through presence and those understandings become integrated into our future. MUVE presence offers users a first person action participation that has an enhanced sense of 'really' being there. The more immersive the system becomes, the more it cuts students off from the real environment and gives them a sense of personal identification with their avatar, favouring the egocentric model for students' representation (Mikropoulos, 2006). Social presence—or co-presence (the sense of being there together)—further enhances this identification. The enhanced sense of presence created by the latest MUVEs allows students to bring their real world with them, identify with their avatars, and yet maintain a sense of real world/MUVE separation. It is in this space, I believe, that critical analysis may flourish.

Taking a virtual field trip

In 2009, 2010, and 2012 I taught a micro-sociology Bachelor of Arts Honours class,[103] that focused on issues of identity and tensions between visible and invisible options for identity construction. The theoretical framework centers on the social constructionist paradigm primarily, but students were also expected to be familiar with the concepts of subalternity and Foucauldian discourses of power. Within this framework the course concentrated upon the interplay of individual agency and social structures at the micro (or individual) level, enabling students to examine the degree of agency individuals might (or might not) have in the construction and maintenance of identity.

In keeping with University regulations for assessment, students in this class were assessed in a range of different tasks. Their final assessment comprises a long essay examining the issues focused upon during the course. Leading up to this essay, students were given opportunities to engage in "field work" to test the theoretical concepts discussed in class, allowing them to begin with personal experience and move from there to a more theoretical understanding of the relevant issues. The fieldwork task required students to create a Second Life account; modify their avatar as they chose and document the decisions they made during this process in their field notes. At the conclusion of this part of the course, students were required to write a Field Report, which included a short description of their experience and an analysis of both the constraining and the enabling factors they experienced. The Field Report was intended to act as an illustrative exemplar for the theoretical analysis required of them for the final essay. The VFT provided practical experience of identity construction, requiring conscious awareness of the choices made during the avatar creation and modification. It was intended to mimic the unconscious choices individuals make in the presentation of their identity in everyday life. By

---

[103] In the New Zealand system the Honours year is a fourth year of study, completed after a three-year course of Undergraduate study, and ending with the submission of a short Dissertation on a research topic of the student's choice. Students also complete courses for credit during this fourth year. The Honours year is therefore a mix of guided study and individual research and students are referred to as Postgraduates for administrative purposes although they do not graduate with their degree until the end of this year.

extension, the task aimed to get students to notice the implicit elements at play in identity construction and presentation, and to "bring to life" the theoretical concepts arising out of the set reading for the class.

Prior to undertaking the VFT class time was dedicated to reading and discussing research articles on SL, viewing video tutorials provided by Linden Lab employees, and clarifying the specifics of the task. Students then spent a total of 6 hours of supervised computer laboratory time during which they created their SL account, made basic modifications to their avatar and completed the tutorials provided for new Second Life residents. Once students had learned the basics of moving about inworld and had made some basic modifications to their avatars, they were shown some virtual malls and given "spending money" to further modify their avatars in any way they chose. I remained on site inworld with them to answer any questions they might have but took no part in their explorations.[104] Each lab session was followed by discussions to enable students to reflect on their experience and to take any further notes they felt they might need.

Evaluating The Initiative

My decision to treat this initiative as a scoping study of practical factors and limitations and the small class sizes, meant that I initially chose not to formally evaluate the project through quantitative means. In 2012, however, a slightly larger class (7 students) meant that I could conduct a very limited survey using Likert scale and open-ended questions to gauge their prior MUVE experience and their pre-VFT and post-VFT perspectives on the task. The reflexive nature of the assessment task also allowed me to use the Field Report as feedback on students' experiences during the VFT because they were asked to comment on enabling and constraining features they encountered. Feedback from the students suggests that the practical problems associated with creating their avatar brought the theoretical considerations to life, fleshing out the degree to which social construction guided their choices and opinions in-world. Students also reported conflicts between the normative appearances available to them and their desired identity outcomes. From a teaching perspective the task worked remarkably well in practical terms. Students were quickly engaged in the practical aspects of the task. In 2009 and 2010, only one student in each year had any prior MUVE experience and none had ever had an SL account. In 2012 all but one student had prior MUVE experience and one had briefly created a previous SL account. The pre-VFT theoretical and orientation discussions were valuable preparation and saved time when students were faced with the practicalities of SL existence in the computer lab. Difficulties in mastering basic skills took more time than anticipated, however, and one student was very difficult to keep 'on task', frequently distracting other students. This student had a number of years experience in World of Warcraft and his Field Report indicated that he found the "pointlessness" of SL "annoying."

The Field Reports in each year indicated that significant learning gains occurred. One student wrote: "meanings are constructed as humans engage with Second Life through their virtual selves … I often unconsciously ascribed meanings to the different appearances available and mad conscious choices whether to include or exclude those appearances from my avatar." This student concluded, "My own cyber-ethnographic experience in constructing an avatar in Second Life showed me that the possibilities to create a unique identity are both seemingly infinite and constrained simultaneously". For her, the virtual experience emphasized the continuum between agency and structure that epitomises identity construction in real life. All students were able to reflexively analyse from the particular of their experience to the general of wider societal forces. Thus the VFT successfully overcame any nascent reluctance to engage intellectually with theoretical concerns.

All students commented on the importance of appearance in SL and were able to identify tensions between apparently limitless opportunities and actual constraints. A student from the 2010 class wrote "in my experience in constructing my avatar, it was clear that I experienced definite restrictions on what I could and could not

---

[104] Due to the public nature of malls (virtual or real), this exercise did not require ethical approval as it came under the category of naturalistic observation in a public place. However, the author's personal understanding of ethical implications for research in virutal worlds—which are not, as is often assumed by inexperienced researchers, always understood by residents to *be* public space— necessitated instructing the students not to respond to any communication from non-class members; and asking them not to take any screen capture shots that included anyone but themselves or other class members.

fashion her to be … the large majority of my choices were limited to highly provocative, loud items that expressed sexual desire. This supposed liberating form of power that I was meant to be employing was being suppressed by another power above me. The biggest constraint I noticed was the pressure to conform my avatar to absolute, hegemonically normative, femininity". By personalising her avatar experience, this student expresses a willingness to think about ho 'you "Become What You Are'" (Ainley, 2006).

Students reported some anxieties that would need to be carefully managed in a larger class. A student on the 2009 class commented that "as a computer game virgin, I was daunted because I was unsure whether I would have enough technology skills to firstly download Second Life, and secondly to be able to work it. I also felt somewhat worried that I may enjoy it so much I would become 'addicted' to the online virtual world." Another student commented on the speed with which she identified with her avatar—"I wanted to buy lots of different hot outfits for my avatar, who, at this point, I've become quite fond of." These are significant issues not only in terms of the positive elements of "presence" and "fidelity" discussed in the literature as amplifying the sense of immersion in MUVEs, but also as potentially limiting factors on students abilities to engage in analysis.

I was able to compare final essays for this class for 2009, 2010, and 2012 with those from 2008 when no VFT was undertaken. On the basis of this admittedly limited sample I am convinced of the benefit of the initiative, although I would refine the experience further. Students in 2008 had struggled to really understand the course material and to apply it to examples they chose as case studies. In subsequent years, SL was the only case study and all students had practical in world experiences on which to focus as they engaged with the classroom work. A 2012 students commented in the post-FT responses that "for the whole time I've been at Uni [sic] I have never put theory into practice, so I absolutely loved being able to get amongst what we had been learning and better understand it." Another in the same year commented that one of the positive aspects of the VFT was "seeing everything that we had discussed in class from the various readings play out in front of me." As a learning strategy, therefore, the VFT facilitated deeper understanding by placing the learner's experience at the center of the learning process. Students benefited more fully, therefore, from the four steps of the experiential learning cycle: concrete experience, reflective observation, abstract conceptualization, and active experimentation (Jarmon et al., 2009).

Best Practice Suggestions

From past iterations of the SL VFT I can comment on best practice aspects for field trips or immersive experiences in MUVEs. Prior to the VFT, teachers should familiarise themselves with the environment and ensure that they are able to assist students in basic skills as required. Students should be well prepared to engage in actual onsite activities by undertaking orientation discussions and viewing any tutorials provided by the MUVE operators. Purposeful planning of the trip should include a clearly identified purpose for the visit, specific activity guidelines, and careful alignment of the VFT with classroom content. Students should be have enough autonomy during the VFT to effectively engage in the activities, but regular "check ins" are advisable to ensure students remain on task and do not succumb to the distractions MUVEs like SL provide. After the VFT, allow discussion time for students to 'de-brief' and to add to their field notes. These discussions provide valuable opportunities to assist students in interpreting the actual experience and to connect their learning with the classroom curriculum. Finally, it is worth attending to the practicalities of computer lab set-up. Ideally there should be enough terminals for students to have one each, the teacher should be able to move freely around the class to assist where needed, and it is helpful if the teacher's terminal is linked to a large screen that all students can see. One final comment—always allow twice as much time as you think you need!

In conclusion, I found this learning task remarkably effective as a means to engage students in theoretical concepts. The VFT provided students a one-step-removed space, allowing their avatar to operate as a projection of self that protected them from any perceived threat to their personal philosophies, but at the same time also challenged them through the avatar's perspective to confront the reality of those philosophies interacting with social structures. Class discussion prior to the VFT had frequently returned to restatements of the potential for

agency and the exception-to-the-rule argument. After their inworld experience students were able to question these assumptions and their final essays reflected a willingness to contextualize their quotidian in the structural milieu.

WHAT IS LEISURE FOR TURKISH PARENTS?

Neşe Aslan[a][105], Kadir Aslan[b]

[a]Assoc.Prof.Dr, Ege University Faculty of Education, Izmir, Turkey

[b]Prof.Dr, Ege University Faculty of Education, Izmir, Turkey

Abstract

In shaping individual's perceptions, attitudes, and participation in leisure, culture has an important role. While Turkish society is undergoing rapid social change from being traditional to modern, it still carries characteristics of traditional norms and values even in urban families. Study explored the role of interdependence within 65 Turkish urban parents' perceptions and participations for leisure. Descriptive analyze was used. Findings indicated that they perceived leisure spending time with family, valued leisure in their social circles and participated in some home-centered activities.

Keywords: Turkish urban parents; Turkish culture; leisure perceptions; leisure participation; interdependence Theory.

Introduction

In recent leisure studies, researchers have begun to investigate leisure paying more attention on cultures being different in their worldviews, and as a result, they recognized that members of different cultures can have different norms and values which shape their leisure. In a cross-cultural study, Markus and Kitayama (1991) compared American culture's emphasis on individual, inalienable rights (life, liberty and the pursuit of happiness) with Chinese culture's emphasis on hierarchy and group harmony.They stated that while people in the U.S., Canada and in Western Europe were more likely to have independent self-construals which means to value being unique, asserting oneself, promoting one's own goals and expressing one's inner attributes; Asian, African and Southern European people were found more likely to have interdependent self-construals that means to value belonging, fitting in, maintaining harmony, restraining oneself, and promoting other people's goals (Walker, Deng and Dieser, 2005). They argue that the type of self-construal an individual has also affects his cognitions, emotions, and motivations. Individuals with interdependent selves may be more attentive and sensitive to others than those with independent ones. In individualist societies, there is an emphasis on individual rights, and the goals of groups are subordinate to the goals of the individual (Yetim, 2003). However, in collectivist societies, the great emphasis is placed on others than on the individual which leads to an emphasis on harmony and conformity and also on subordination of one's own goals to the goals of the group (Üskül, Hynie and Lalonde, 2004). Thus, the characteristics of cultures being individualist or collectivist shape the perceptions, and also participation of an individual as in all spheres of his life including his leisure.What is perceived as leisure, its subjective and behavioral outcomes and the motivation to repeat or continue this leisure will be influenced by the particular nature of the self-concepts supported in a given culture (Mannell, 2005). Because of cultural and developmental differences, individuals in Turkish society have not yet developed an understanding of leisure as it has been in Western societies (Aslan, 2004; 2009; Aslan & Arslan Cansever, 2007; 2009a; 2012- in press). In this study, we are likely to gain significant insight into cultural characteristics of Turkish society by examining parents' leisure perceptions and participations.

Literature Review

Turkish Urban Family and Leisure

As Turkish society is undergoing rapid changes from being traditional to modern, family structure has been deeply affected in this process. Some researchers (Kağıtçıbaşı, 1996a, 2007, 2010; Duben, 1982) studied the changes in Turkish families within the cultural context. Kağıtçıbaşı (2010) developed a model of family change which involves decreasing material interdependencies but continuing psychological interdependencies with socio-economic development (particularly urbanization) in societies with collectivist cultures of interpersonal connectedness. Despite increased urbanization and industrialization in collectivist cultures, closely-knit interaction patterns continue. Differing from the people in Western individualist cultures, the individuals in Turkish collectivist culture are socialized into gender roles that are strictly defined by cultural norms and values. In Turkish society, the "ethic of care" (Henderson & Allen, 1991) for females is so imposed that whether she is a daughter or wife or mother, she always acts for "others" in her family except for herself. The socially learned ethic of care in this culture prevents females from doing the activities they desire by the belief that doing this would be selfish (Aslan, 2004). It is important to emphasize as Henderson and Allen (1991) stated **"the problem for women is not in the value of care, connection and "other-centeredness"; rather the problem is in *giving only to others* and to consider it "selfish" to care for the self, particularly in regard to basic human activities like leisure, recreation and relaxation."** (p.100). This is a common female attitude in Turkish culture even in modern nuclear families (Aslan, 2004). Besides the clear and strong role difference that explains the family functioning, leisure has not been valued in Turkish society, yet (Aslan, 2004, 2009; Aslan & Arslan Cansever, 2012-in the press). Only some highly educated members of the society started to value leisure. Therefore, within the developmental process, it seems that leisure will take time to become a life-style in Turkey. The activities for leisure being mostly home-based and socially structured as visiting friends and relatives are commonly shared in this culture (Aslan, 2004, 2009). Within the family circle, the individual's choices are not self-determined but depend on the others' in the family (Aslan, 2004). Therefore, usually husband and wife have similar choices and decisions as couples, while the young adult in the family differs a little in their choices (Aslan, 2009).

Interdependence Theory

It has frequently being acknowledged that family members influence each other's behaviors, attitudes and experiences. Influences are two sided in social interactions involving pairs as husband-wife or parent-child. The theory of interdependence emphasizes that the heart of social interaction occurs in dyadic relationships. Rusbult and Arriaga (1997) explained interdependence as the manner in which –as well as the degree to which- interacting individuals act upon or influence one another's experiences, in reference to the fact that the preferences, motives and behavior of the individual are relevant to those of the interaction partner (p.222).

When individuals interact verbally or nonverbally, they influence each other's preferences and choices. In long-term relationships, partners exercise important influence on each other. This can shape attitudes and behaviors in constructive or destructive ways. Being in a family system, individuals have multiple partners with whom they engage in long term relationships as it is with parents and children (Siegenthaler & O'Dell, 2000). Thus, family unit provides an excellent context in which to examine the effects of interdependence on aspects of leisure because of the acknowledged influence of family members on each other.

Parents' (as partners) Leisure Perceptions and Participation

One of the major factors in determining if a relationship will develop appears to be similarity of backgrounds (Kenny, 1996). Choosing a partner is based on suitability of partners, which is often a function of similar values norms and attitudes. As many studies suggested, when a long-term relationship is established, the partners have considerable influence on each other in shaping dispositions (Kenny & Kashy, 1991; Rusbult & Arriaga, 1997; Weigel, Bennett & Ballard-Reisch, 2006). Over time, while they carry on their togetherness and interact in the

same context and are exposed to similar influences, their perceptions and preferences are likely to become more similar (Kenny, 1996). The combination of attitudes may result in the development of behavioral norms, regarding what is acceptable and appropriate within the relationship (Rusbult & Arriaga, 1997). In other words, the arrangement of roles and interaction within the relationship help define who the partners are, and it is within this framework that couples come to interpret their relationships.

However, some research have shown that women with traditional gender role attitudes spend more of their leisure time with kin, whereas men with traditional gender role attitudes spend more of their leisure time with friends (Huston & Geis, 1993). But, coupled partners who had similar attitudes, either both partners with traditional attitudes or both with modern attitudes, reported higher marital quality, and their family leisure increased family satisfaction (Johnson, Zabriskie &Hill, 2006; Aslan, 2009). As in the framework of this study, if the development of leisure perceptions and preferences are influenced through interactions within family, one might theorize that parents would have similar views. So, the purpose of this study was to explore the potential of interdependence theory to explain parents' perceptions and participations in leisure among Turkish urban families. Besides, no previous study has examined leisure perceptions, and participation of Turkish urban parents utilizing the interdependence framework based on the cultural background in Turkey.

Methodology

Sample

The sample consisted of 65 dual parents(65 mothers & 65 fathers) of the second and third class students who were attending Ege University Faculty of Education. All the participant parents of these students were living in Izmir which is the third biggest city in Turkey. The participant mothers' ages ranged from 38 to 60 (M= 45.40, SD= 5.21), the fathers ranged from 40 to 64 (M= 49.91, SD= 5.64). All the participant families (100%) consisted of two-parent nuclear families having two or three children. Educational status of the participant mothers were rather low: 46,2% had only Elementary school education or less (6,2%), some (7,7%) had Middle school education, and 16,9% had High school education. Only 9,2% had College (two year vocational higher education), and 13,8% had University education. The mothers' occupations did not vary much. Few mothers (4,5%) worked as doctors, lawyers or as professionals. 15,4% were officials, 3,1% were workers, 10,8% were retired and 66,2% were housewives – a typical characteristic of the female population in Turkish society. The mothers' monthly income was between 300 TL (Turkish Lira) and 2000 TL. However, fathers were found to have higher educational and occupational status than mothers: One-fourth (25,6%) were Elementary school graduates, 6,2% were Middle School , 27,7% were High school, 10,8% were College graduates, and 24,6% of them were University graduates while 4,6% of them had M.A degrees. The fathers' occupations varied with 4,6% professionals, 10,8% doctors, lawyers or engineers, 12,3% traders or store owners, 23,1% officials, 7,7% technicians, 7,7% workers, 3,1% farmers and 30,8% retired. The fathers' monthly income level was between 1000 TL and 3000 TL.

Instrumentation

The research instrument which was improved by the researchers covered two parts:

a) Demographic questions identifying the characteristics of the sample included age, gender, marital status, educational and occupational status, family structure and monthly income. b) four open-ended questions that analize the individual parent's perception of leisure and participation in leisure activities. The research instruments were sent to the parents by the young adults who were attending the Faculty, and collected back in a week by the same way. The self-administered questionnaire required approximately 20 minutes to complete.

The open-ended questions were: 1-What does leisure mean to you?, 2-What type of leisure activities do you participate?, 3-Why is leisure important for you? 4-With whom do you enjoy sharing your leisure?

After the research instrument was developed, it was consulted by two experts related with the subject to test the validity. The pilot study was applied by 10 parents, and positive feedbacks were taken. According to the expert contribution and the results of the pilot study, the last version was shaped to be applied. For the reliability of the research instrument, the open-ended responses were examined by the researchers and the experts to clarify the unique and different perspectives, and were evaluated according to Miles & Hubermas (1994) formula.

Analysis

Descriptive analysis was used. Within this framework, open-ended responses were grouped and analyzed. The findings were explained and discussed by the tables. In descriptive analysis, the original sentences of the participants were quotated to emphasize the subject (Yıldırım & Şimşek, 2006).

Findings

The open-ended responses were gathered under four themes as: perception of leisure, type of activities participated, importance of leisure participation, and preference for leisure partner. Considering that gender difference will be a discriminator in parents' leisure perceptions and participations, the data were analyzed within this perspective.

Perception of leisure: The descriptive statistics showed that leisure meant as affiliation referring to specifically "spending time with the family" (mothers, 23.0%, fathers 18.0%).

"Leisure is doing something with my children, and sharing time with them" (mother- 42, working, two children).

"Spending time with my family and doing something to make them happy." (mother, 43, housewife, two children).

" The time to spend with my loved-ones; this is leisure for me." (father, 53, working, two children).

Spending time with the family has always been valued culturally in Turkish society (Aslan, 2004; 2009). Besides, some of the parents described leisure "Doing something useful/ functional for home/ family" (mothers 25.0%, fathers 35.0%).

" After work, I come home, rest a while, and enjoy doing something as repairments, I am with my family and I like this." (father, 48, working, two children)

"I think, leisure is being useful for my family" (mother, 43, housewife, two children).

These parents perceived leisure related with home and with their family circle, as well. However, the participants' responses as "Resting, releasing from stress/ doing something. enjoyable" explained leisure as self-expression and self-oriented (mothers 52%, fathers 47%).

Type of activities participated: When analyzing the open-ended responses, leisure activities were grouped as, a) home based and b) cultural and outdoor activities. The home-based leisure activities parents participated were visiting relatives, watching TV, and walking which were similarly stated by these parents, and may be considered as shared/joint activities. However, visiting friends and neighbors were common among the mothers, and spending time in 'kahve' (tea shop) were common among the fathers. Cultural and outdoor activities: Having picnics, nature walking, eating out and travelling were very rare but similarly stated in the responses and are thought to be shared/joint activities among those Turkish parents. However, fathers' popular outdoor leisure was 'going to the matches' which is considered to be a male activity.

Importance of leisure participation: "I can spend time with my family" (mothers 54%, fathers 40%) was stated by more mothers than fathers may be explained by the ethic of care for the family circle (Henderson,

2002). "I can have an opportunity to visit/meet my friends" (mothers 18%, fathers 30%) were more common for the fathers. In traditionally structured Turkish culture, females' activities are mostly home centered (Doğan, 2009; Aslan, 2009). Also, females and males usually spend time separetely within their own gendered social network, except home. However, "Leisure provides me freedom from responsibilities and I feel relaxed" was stated by both parents (mothers 28%, fathers 30%) very similarly.

Preference for leisure partner: Most of the participant parents (mothers 79%, fathers 71%) enjoyed being with their families in leisure. Moreover, some of them very similarly (mothers 13%, fathers 14%) enjoyed sharing their leisure together, and also, some preferred (mothers 8%, fathers 15%) being with their friends in spending leisure time.

Discussion

This study provided some support for the Interdependence theory as Turkish urban parents most likely shared similar perspectives on several leisure measures. In expressing the meaning of leisure, nearly half of the parents described it as affiliation which refers to interacting and sharing oneself with others which is basically other-oriented (Freysinger, 1995). Being members of a collectivist / traditional culture, individuals are socialized into given norms and values of Turkish culture, internalizing the specific gender roles. They are socialized as interdependent selves having choices made by relevant in-group members instead of making their own choices (Kağıtçıbaşı, 2007, 2010). "This seems consistently more intrinsically motivating, because it provides a greater opportunity to promote harmony and to fulfil the goal of belonging to the group (Iyengar & Lepper, 1999; Aslan, 2004, 2009). The reason why comparatively more mothers than fathers described "leisure" meaning as affiliation may be explained with the women's inequality regarding opportunities for leisure (Kay, 1998), being more likely to establish their leisure around their family responsibilities and tasks (Thompson, 1995; Aslan, 2004), feeling guilty when having leisure for themselves when they could be with their families (Peters & Raaijmakers, 1998; Aslan, 2004). This also explains the lack of importance of private time and the lack of personal leisure for women, and reflects the culturally bound meanings of leisure (Henderson, 2002). Consistent with the studies of Henderson & Allen (1991) and Aslan (2004), the women in this study described leisure within the framework of their responsibilities and commitments to others. However, in expressing the meaning of leisure, similarly one-fourth of the parents reported it as "resting, releasing from stress, having good time and doing something they enjoyed" which may be explained as 'self-oriented' (Freysinger, 1995) reflecting self-determination or self-expression. When investigating the parents' home-based leisure activities, "visiting relatives" was found to be one of the most common leisure activities in which parents participate similarly. Mostly, it is imposed by the values in this culture, so, the individuals do it whether they enjoy or not. As Kağıtçıbaşı noted (1996a, 2007, 2010), individual in a Turkish family is embedded in an ever-widening network of close ties, beginning with the nuclear family and extending out to the relatives and close neighbors. Moreover, another similarly participated home-based leisure activity by the parents was "watching TV". The popularity of watching TV may come from being a cheap entertaining facility, and this keeps people staying home together. From this perspective, it may support the values of closeness in Turkish families, but may cause conflict, as well. Besides, "walking" was found to be a very popular leisure activity that shows similarity for the couples. However, within their own social networks, mothers "visited/met their friends and neighbors", but fathers did this twice as much. Gender separation appears to be marked on the dimension of social interaction that reflects the socialization of each individual into male or female identity, respectively from the childhood. Although mothers' participation in this activity was less than fathers, it has always been very popular among urban or rural Turkish women. Because most of the women still do not work in a paid work for cultural and social reasons - traditional gender related values, lacking social status or being uneducated- they are almost isolated from the outside world, so, this activity contributes satisfying their needs to be social (Aslan,2004). This is one of the most important occasions giving them the opportunity for sociability, a feeling of satisfaction and enjoyment. However, the parents' cultural and outdoor leisure activities were so few and rare. This may be explained by the traditional structure of the Turkish families having closed- family socialization (Aile yapısı Araştırması,-Family structure research, 2006) based on   relational   communications (Doğan,2009). Supporting this study, some researchers (Siegenthaler & O'dell, 2000; Kenny, 1996; Rusbalt & Arriaga, 1997) stated that couples were most

likely to have similar scores on the leisure constructs. This is consistent with the idea that in long-term relationships, partners' behaviors tend to merge. Also, similar views about leisure could play a role in the development and continuation of their marriages (Orthner et al.,1994), and spending time with their family may contribute increasing their family satisfaction which is already structured by traditional family values and norms in marriage (Aslan, 2009). However, it is important to state that Turkish society is undergoing rapid social change from being traditional and rural society into an increasingly urbanized, industrial society. In this process, values and attitudes, however seem to lag behind changing social structures and functions, and may be the case in terms of leisure perceptions. As Jeffers and Dobos (1993) stated, "People's leisure perceptions are thought to be deeply related to their values and actual behaviors. Leisure values refer to personal assessments of the worth or utility of leisure" (p.205). Although family bonds are typically strong among Turkish families and some leisure has been common and valued, rapid social change in society has led to concern about quality and satisfaction within Turkish family life today. Thus, further studies are needed to examine the role of the family in establishing values and attitudes and beliefs about leisure.

WHERE HAVE WE BEEN? WHERE ARE WE GOING? THE EVOLUTION OF AMERICAN HIGHER EDUCATION

Deborah E. Bordelon, Ph.D.

Governors State University, 1 University Parkway University Park, IL 60484-0975

Abstract

American Higher Education has been engaged in a journey from a knowledge-centered focus towards a performance-based emphasis. What does it mean to prepare students to learn as opposed to disseminating the knowledge base? The federal government, accrediting bodies and educational organizations are demanding that higher education critically examine the purpose of a higher education. What does it mean to prepare students to enter into the work force and the citizenry? Comprehending this journey into this realm of measurable outcomes and accountability is critical for understanding the implications for program development and the advancement of higher education.

Keywords: Higher Education; Accreditation; Student Learner Outcomes; Assessment; Accountability

Where have we been?

American Higher Education has its roots in the fundamental Jeffersonian principles of preparing individuals to be informed and active citizens, limiting federal control of higher learning, and fostering the ideas and actions needed to develop an economy that could compete in a global setting (Eckel & King, 2004). Until the late 19th and 20th centuries, higher education was generally limited to an exclusive few who had the means to pay for an education in the United States or who had the pedigree and money to attend elite schools in Europe. With the Morrill Acts in 1862 and 1890, the federal government began to take a more active role in addressing access to higher education. The 1862 Morrill Land Grant Act provided 30,000 acres of land to each state's senators and representatives to establish endowments to support higher education institutions ("Morrill Act", 2003). The focus of these institutions was to provide education primarily in the areas of agriculture, mechanical education, and other practical professions. In the Morrill Act of 1890, these grants expanded to include institutions for black citizens; therefore establishing what we now know as historically black colleges and universities (HBCUs). Through these efforts, access to higher education was vastly increased and resulted in individuals achieving social mobility through education. Access to higher education continued to be addressed on a national level through the passage of the first GI bill in 1944 and the expanded access to federal financial aid through legislation in the 1970s (National Center for Public Policy and Higher Education, 2008).

As access improved, higher education became available to all citizens regardless of income level, gender, race or social class. Community colleges were created as early as 1901 to provide individuals with a two-year associate's degree in a variety of disciplines as well as numerous certificate programs in various trades. The associate's degree enabled students to either enter the workforce or transfer into a four-year institution with the foundation for a baccalaureate degree.

Greater access and choice leads to competition among institutions for students, faculty, and funding. Thus, all four-year institutions must actively engage in recruiting students from high schools, community colleges, and the community at large to maintain their enrollment numbers. The goal then becomes to balance your institutional mission with the need to expand your student base and compete for those tuition dollars.

Social, political and economic influences are constantly shaping higher education as well (National Center for Public Policy and Higher Education, 2008). Costs of higher education are rising; at the same time, having a

college education is increasingly essential for attaining success in the professional and personal arenas. By 2018, the percentage of jobs that will require postsecondary education will rise to 63% and continue to rise. There will be a shortfall of 3 million credentials to meet this need, if we do not change how we are preparing students (Reindl & Reyna, 2011). Institutions must be guided by their missions and visions, while becoming more forward thinking in addressing these demands.

Many state institutions have seen their funding from state legislatures dwindle over the past decades. Instead of referring to themselves as state funded, numerous public institutions see themselves as state assisted or aided. As a result, many state institutions have to adopt a funding model that is more aligned with private institutions with a heavy emphasis on tuition dollars to fund faculty, programs, and administrative costs. Tuition increases have a powerful impact on access as a college education becomes less available to students who are not eligible for financial aid. Student debt can be a barrier to a productive and active life in a career and as a citizen. As evidenced by recent events, there has been a tremendous push by the federal government, state governments, and the general public to reduce the rising costs of higher education while increasing the number of college graduates (Obama, 2012).

As a result of state funding dollars becoming more scarce, there is greater scrutiny of how those public dollars are being spent at all levels. In the United States, one mechanism in place to ensure accountability is regional accreditation. In order for a college degree to be meaningful, a regionally accredited institution must award the degree. This regional accreditation ensures that the degrees granted meet recognized standards and represent a level of rigor in the program of study. There are five regional accrediting bodies in the United States: the Higher Learning Commission of the North Central Association of Schools and Colleges (HLC), The Southern Association of Schools (SACS), Middle States Commission on Higher Education (MSCHE), New England Association of Schools and Colleges Commission on Institutions of Higher Education (NEASC-CIHE), and Western Association of Schools and Colleges Accrediting Commission for Senior Colleges and Universities (WASC-ACSCU). The federal government through the Council for Higher Education Accreditation (CHEA) must approve these regional accreditors.

For the purposes of this paper, the standards of the Higher Learning Commission (HLC) will be the focus of the discussion, though similar standards are emphasized by all of the regional accreditors. Outside influences such as the federal and state governments, media agencies and the general public are making demands on higher education to ensure that funding is well spent; however, the definition of quality becomes clouded by perceptions of relevance and the pragmatics of a college degree in a competitive job market (Eaton, 2010).

The demands for greater productivity and data driven assessments are evident in the scrutiny of higher education institutions. How can we demonstrate that our graduates know what is needed to be successful in their professional and personal lives? The Association of American Colleges and Universities (AACU) has fostered a dialogue of universities and colleges across the country to develop the Liberal Education and America's Promise (LEAP) which champions the benefits of a liberal education that focuses on preparing students for an active professional, personal, and civic life. There are four areas that comprise this initiative: 1) Essential Learning Outcomes, 2) High Impact Educational Practices, 3) Authentic Assessments and 4) Inclusive Excellence. Through LEAP, students are expected to acquire professional, civic, and multicultural knowledge; intellectual and practical skills, and civic and intercultural knowledge. Students must also be able to demonstrate their knowledge and skills through authentic assessments focusing on real world complex problems and challenges (Association of American Colleges and Universities, 2005).

A college degree opens doors for individuals in the job market; however, a college education has to be more than simple job preparation. It is undeniable that programs of study must provide graduates with the knowledge, skills and professional dispositions to be effective in a global and competitive economy. However, the more valuable component of higher education is the goal of creating resilient and flexible learners who can easily adapt to intellectual and creative demands of a fluctuating job market and economy. The cognitive and technological demands of the student's life and career will evolve over the coming decades. In the last three decades alone, the increased and expanded use of the Internet, social media, tablet computers, SMARTPhones, and other digital devices have changed drastically the way we obtain, utilize, and create information. Learners

must be equipped to move effortlessly from one medium to another as well as be able to synthesize and evaluate the information that bombards them through these media.

Higher Education along with the P-12 schools must also take an active role in addressing the disparities that currently exist in educational opportunities. Colleges and universities must address closing the achievement gaps between those students who are advantaged (educationally, culturally, economically) and those who are not (National Center for Public Policy and Higher Education, 2008). This becomes increasingly difficult in the face of skyrocketing tuition and other costs associated with obtaining a degree. In addition, more adult learners are entering or returning to higher education. Their needs are significantly different from the traditional college students. Resources have to be put in place to ensure their success as well. (Reindl & Reyna, 2011). Higher Education must be a beacon of opportunity for all individuals who desire to pursue a postsecondary education, while operating under greater scrutiny and diminishing financial support.

Regarding the role of accreditation in the accountability of higher education, student learning is paramount. The Higher Learning Commission (HLC) has one criterion, Standard 3- Student Learning and Effective Teaching, dedicated to examining the impact of teaching on student learning. This area is targeted under *Core Component 3c*: *The organization creates an effective learning environment*. In the examples of evidence provided by HLC for this component, emphasis is placed on the use of assessment results to inform improvements in curriculum, pedagogy, instructional resources and student services. In order to meet this criterion, institutions must also demonstrate how they provide an effective learning environment that addresses diversity, supports all learners, and provides advising and infrastructure to support and enhance high levels of learning. This process involves targeting key outcome areas that students need assistance in mastering as well as providing services that will directly meet their needs. Effective oral and written communication skills are often targeted by institutions as critical learner outcomes. In order to effectively provide services to students, the institution has to look at where these skills are being assessed across programs; how students are being assessed; how the student's performance is being communicated to the student and to the program; and how are students accessing the services on campus to provide the needed support for success. Providing this range of services is a long term process, not one that can be done haphazardly or sporadically.

Assessment provides the critical link between the teaching and learning process (Parkes, 2010). The focus has shifted from inputs (enrollment, degree programs, course offerings, syllabi) to outputs (student performance on designated learning outcomes, time to degree completion, employment). Institutions and programs have to identify appropriate and measurable Student Learning Outcomes (SLOs). Faculty, alumni, current students, and community members should be involved in identifying the critical knowledge, skills, and dispositions that students are expected to have mastered by the time they graduate. No longer can an institution assume that all of their graduates are well-prepared; the proof will be in the data collected, analyzed and used based on student performance.

Where do we go from here?

Accountability is driving the evolution of American Higher Education. It can be daunting, but it is essential in making informed decisions. Whoever controls the direction of this evolution will determine the directions in which higher education will go. Higher Education must be proactive and engaged in this process or outside forces will define who were are and how we shall educate our students (Eaton, 2010). A college education cannot be defined only as job preparation, but also as a means for preparing individuals to be critical and informed thinkers.

In addressing the demands of greater accountability, it is essential for institutions to define the critical components and learning outcomes of a higher education. The work of AAC&U provides a solid guide for having these conversations regarding the knowledge, skills and professional dispositions we expect of our graduates regardless of their discipline. Not only must the student learning outcomes be identified, but meaningful assessments must be developed and implemented. These assessments must be authentic and tied to performance measures. Passive assessments, such as many paper and pencil tests, do not provide the rich and

multilayered picture of a student's knowledge and skills. These performance assessments cannot be designed by a chosen few individuals. Dialogue within programs and across the disciplines is essential to have consensus on the designated student learning outcomes and the key elements of the assessment. Faculty members, students, alumni and community members should participate in this process. Having these different perspectives during this process will provide for a broader understanding of what it means to be a college graduate. It also promotes the support needed for successful implementation. If the university community feels connected to the overall assessment plan, then there is a strong likelihood that there will be follow-through with the process.

After data are collected on these key assessments, the data have to be analyzed and shared across all constituencies. Designated collection times have to be established and maintained. It is through this process that meaningful data-driven program and institutional changes can take place. Decisions cannot be made solely on a hunch or anecdotal information. The process has to be systematic, data driven and transparent to everyone. Collecting the data is not enough; it is how the data are being used in transformative ways that is critical. Documentation of these data-driven decisions are shared through multiple venues, such as governing boards, accrediting bodies, alumni, potential donors, and current and potential students. For example, a program may want to take a look at the effectiveness of its culminating project. The description of the culminating assessment, a copy of the rubric used to score the assessment and a summary of student performance on that culminating project are shared with the program's advisory board. This advisory board may include alumni, current students, program faculty and community members. The discussion would focus on the expectations of the assignment and the level at which the students performed. Are the expectations of the assignment aligned with the expectations in that discipline? Are students excelling in one area, but having difficulty in another? How can this be addressed in the program? What changes need to be made to strengthen the program? Input from multiple constituents provides for a more in- depth and richer examination of the data and the next steps needed for the program.

Another key component of this accountability process is the strategic review of how programs are designed and delivered. This may involve critically reviewing which programs of study should be added, revised, redesigned, or possibly eliminated. This critical review involves examining the best practices occurring in the field as well as the performance of the students on key assessments that are aligned with the professional standards. Are the assessments designed in such a way that students have to be actively engaged with the material? Are the graduates able to transform and create knowledge as opposed to just restating what is already known? How do the instructors know that the students truly understand and are able to effectively to use the knowledge and skills gained through their program of study.

A careful examination of how courses and programs are being delivered must also be addressed. The manner in which courses are being delivered is changing at a rapid pace. The institution and the classroom are no longer confined to one geographic location. Interactions with students may take place face to face within the classroom, but may also occur face to face with technology eliminating the geographic separation. As stated earlier, these types of transformations cannot take place in a vacuum. Discussion and debate among all of the constituencies must take place in order to generate viable solutions. Change can be daunting, but through open discussions and the brainstorming of solutions, change can lead to rewarding and positive results.

Higher education cannot afford to be stagnant and resistant to the forces of change and accountability. The economic, social and political pressures are not going away; they are increasing as we face more financial challenges. How we engage in the process will ultimately determine our success or demise. It is up to us to be the leaders in this transformation. There is much at stake; however, the opportunities abound to be innovative and creative. By being responsive and focused, Higher Education will continue to be the venue for all individuals to achieve professional and personal success.

WORKING CONDITIONS OF SCHOOL AND TEACHER TRAINING IN SCIENCE: A STUDY WITH TEACHERS OF BIOLOGY OF BAHIA, BRAZIL.

Baptista, Geilsa[a][106], Carvalho Graça[b]

[a]Doctoral Student in Education, Philosophy and History of Science (State University of Feira de Santana and Federal University of Bahia, Brazil).

[b]Teacher of the Institute of Education (IE) of the University of Minho (UM).

Abstract

We identify what are the influences of working conditions for school science teachers training that is sensitive to intercultural dialogue. The study was conducted in 2009, based on semi-structured interview, and involved nine teachers of biology at Bahia, Brazil. The results indicate that several factors of the schools where the teachers interviewed work interfere negatively in their teaching and their training with regard to intercultural dialogue. Mobilizations are necessary to obtain changes in this way, especially by teachers, schools, universities and decision makers in the field of public policy education.

Keywords: Teacher trainig in science; intercultural dialogue; school work conditions.

Introduction

The Brazil, by the proper history of its people formation, is a rich country in the cultural standpoint. However, in fact, it has not been recognized in their education systems that wealth, since the pedagogical practices has not allowed over the years the inclusion of representations of cultural knowledge by students. Even though the documents prepared by the national education policies bring indicative of the importance of recognizing ethnic and cultural diversity that makes up the country, school education in Brazil has not entered a significant attempts of dialogue with different cultures and forms of knowledge in the country, remaining bound to the idea that Western science is the only legitimate source of valid knowledge (Lopes, 1999).

Although the causes for the exclusion of several views of the world beyond the scope of education, factors within schools contribute to the perpetuation of the problem, including among them the conceptions and expectations of teachers (Canen, 2001, p. 208),

(...) teachers' expectations regarding the performance of students from different cultural patterns of the dominant are often permeated with stereotypes that are reflected in teaching practices that, under the veil of technical neutrality, justify the silencing of different "voices" that come to our schools.

According to Cobern & Loving (2001), it is important that teachers consider the students' cultural knowledge, as this will help students broaden their world views and nature. Meanwhile, it is essential a specific teacher training (Canen, 2001; Baptista, 2010). This is, a training that may program pedagogical practices favorable to the intercultural dialogue between the scientific knowledge that are the subject of education and the knowledge from the various cultural and social environments of students. For Lopes (1999), the dialogue in science education is an argumentative process in which the reasons that lead individuals to think as they think are exposed, considered and evaluated by the criteria of validity and legitimacy that are proper and their contexts.

E-mail address: geilsabaptista@gmail.com

Considering that teacher training is an ongoing process, which involves everything from his life story and initial training to the conditions of their teaching activities (Selles, 2002), this study aims to identify and discuss the influences of the school work conditions for the continuing education of science teachers to be sensitive to intercultural dialogue. It is understood by continuing education, training stemming from the social relations that are established by teachers in schools with students and peers in education. In terms of school work conditions to understand, the circumstances arranged by schools for teachers to raise their physical, cognitive, psychological and social ties with the specific purpose of achieving the goals of education in these spaces.

It is hoped that the study reported herein may contribute to the discussions in the specific literature on training of science teachers and school work environments, specifically in relation to the consideration of their views, their aspirations and needs, as a form of professional development and improvement of the quality of teaching for cultural diversity and, similarly, for learning in this area.

Methodology

The study, of qualitative nature, was developed in 2009, with teachers of biology at the public schools of the state of Bahia, Brazil, specifically using semistructured interviews. The study included nine teachers whose age will vary between 28 and 41 years. They answered the following questions: - What are the influences of school environment on teaching practice in biology regarding the establishment of cultural dialogues? Specifically, between traditional and scientific knowledge of students in school? The teachers signed Terms of consent, as required by Resolution 196/1996 of the Ministry of Health of Brazil, which deals with research involving humans (Brazil, 2003).

Data were recorded with the aid of a digital recorder and transcribed into a text editor (Microsoft Word ©). The analysis was carried out according to the logic sequence of submission of responses by the teachers, trying to respect their opinions, speculations and feelings in the contexts in which they were placed (Ludke & André, 1986). For each teacher interviewed, codes were created in order to ensure confidentiality, as follows: PE1 (Professor Interviewed 1), PE2 (Professor Interviewed 2) and so on.

The researcher sought throughout the course, leaving participants free to express their experiences, difficulties, needs and ideas since, in agreement with Campos (2005), freedom of expression on the part of teachers contributes to become reflective and thus subject their own formations.

Results and discussions

Overall, the results indicate that several factors of school environments where the teachers interviewed work interfere negatively to teacher training that is sensitive to intercultural dialogue, namely:

- Exhausting working hours. According to the participating teachers the long teaching activities propel the lack of sufficient time for the preparation of lesson plans that consider cultural diversity. Serves as an example the speech of PE5: "*It is not easy for us the life of a teacher. We have many activities to do and it does not allow us to have much free time ...*". To Dos Reis et al (2005), an excessive load of work hours can directly affect the health of teachers, resulting in the low frequency of these professionals for medical leave and permanence of a large number of students stranded in the corridors of schools.
- Classrooms with large numbers of students and excessive amounts of scientific content to be completed during the school year. For De Paula (1999), the school that shows openness to the consideration of cultural diversity present in it, cannot repeat the assimilationist model, which takes place through repetition and simple transfer of content regarded as finished and ready for the student who takes the role of passive recipient. The teachers said their schools overestimate the performance of a large amount of scientific content and therefore they are unable to provide an acceptable time to occur the argumentations of the individuals involved. In speaking of PE1, "*... but how to dialogue if the rooms are always full? It turns out difficult. We have content to meet and how provide a time for reasoning for each student?*" The science education within a multicultural perspective should not repeat planning of teaching as a science, while cultural activity did not

pass through transformations and as the students knew nothing about the issues that are worked in classrooms. It is needed an investigative position by teachers, attention to the pedagogical aspects, including the planning of teaching, the selection of content, strategies, how to assess (Candau, 2002), so that changes occur in order to take account of diversity cultural.

- Inadequacy of didactic materials. For the participants, didactic materials available in their schools difficult the establishment of relationship between the content of teaching and the realities of the students. According to Baptista (2007), a science education that claims to be sensitive to cultural diversity needs of the appropriateness of teaching materials so that it is possible to establish relations of similarity and / or differences between scientific and cultural knowledge of students. Serves as an example of this problem the speech of PE8: "*Another thing I find difficult... is ... the didactic material not allows us to make any relationship with the local reality of our school and students*".

- Violence among students. Finally, the participating teachers have argued that there is violence in schools, especially among students, and this difficult the establishment of peaceful interpersonal relationships in the classroom. Consequently, it ends up interfering in their teaching. For PE3, "*They fight with each other and with us when we try to resolve disputes... This discourages, even discourages people as a teacher. We stressed to the point of not be able to give a lesson of good quality*". On this issue, it is important to note, in agreement with Ferrari & Araujo (2005), that school violence eventually leads the teacher to feel, too, violated, as far as he tries to intervene to resolve conflicts among students, which are disrupting their classes. The feeling of violence on the part of teachers is related to something called "contemporary symptom", which is the declining authority of the teacher, which, in turn, leads to loss of desire to teach and consequently, learning (Ferrari & Araujo, 2005).

Conclusions

The study reported herein showed that for the biology teachers of public schools in the state of Bahia working conditions influence negatively in their school teaching and, tied in their training and quality of given education in relation to the intercultural dialogue.

In fact, the environments of schools are amalgams between the physical and behavioral characteristics of individuals who are part of it. Such mixtures form the school cultures which, in turn, influence the pedagogical practices. However, it should be noted, the school cultures, as well as all others, are neither static nor immutable. In contrast, the cultures may vary according to time and posts (Chartier, 1990). Therefore, it is important the teachers to identify working conditions as part of a culture that may undergo changes. However, it is necessary that they feel committed and want these changes.

The teacher – in front of the problems they face in school regarding the importance of cultural diversity and dialogue - aims to decide whether or not that significant change occurs. In this sense, we suggest actions by teachers and their schools to manage opportunities for teachers to reflect and discuss with their pairs the problems experienced with respect to cultural diversity present in those spaces. Similarly, decision makers in the field of public policy education in the country, to improve the working conditions of teachers, a key variable for the progress in relation to indicators of quality of education that often is left aside in government policies.

WRITTEN PROMOTIONAL MATERIAL CONCERNING THE THERMAL SPA INDUSTRY IN VISEU: COMMUNICATION STRATEGIES

Maria José Lisboa Antunes Nogueira[107]

Instituto Politécnico de Viseu, Repeses, 3500 Viseu, Portugal.

Abstract

Today, the spa industry has a crucial role on developing the economy of a region. The Spa industry is surrounded by places for both the treatment of diseases and for the wellbeing of the body, of the mind and of the spirit. Viseu is situated in the centre region of Portugal; it has 38 spas, five of them in Viseu, offering both therapeutic and wellness treatments. Spas in Viseu do not seek for efficacy in its communication, once their promotional materials are only in Portuguese. Its flyers or even their web pages are only in Portuguese, they do not have a second language to communicate their products or services. And as we know foreign clients and the spa industry professionals need to find a common language in order to be able to communicate to each others. According to the Spa Association of Portugal, we need to bring foreign clients to the country once the statistics say that most of the clients are Portuguese. This study presents a brief overview of Communicative Competence and discusses Language for Specific Purposes, as well as the importance of Needs Assessment in the Spa industry in Viseu.

Keywords: Communication Efficacy; Language Learning; Second Language Teaching, Spa Industry.

Introdução (Introduction)

Atualmente estamos perto de tudo e de todos, o turismo é um mercado mais competitivo do que antes, principalmente devido a essa proximidade. Nós viajamos para encontrar culturas diferentes, por isso é importante que sejamos capazes de manter as características locais do nosso país, da nossa cidade, para promover essas mesmas singularidades aos turistas potenciais dentro e fora da nossa terra. A globalização, que pode ser definida brevemente como uma combinação de democracia, mercados livres e rápida comunicação de experiências, liberta a mente, estimula a criatividade e aumenta a prosperidade. Hoje as pessoas deparam-se com uma enorme diversidade de experiências e estão expostos a uma variedade de culturas enorme (Chuck & Gee, 1999 e Church & Coles, 2007). O mundo encolheu, há mais variedade e tudo está mais perto. Isso é benéfico para a indústria do turismo e para o setor do termalismo, pois tem alcançado uma importância significativa como força económica no mundo e especialmente em Portugal.

Revisão da Literatura (Literature Review)

O principal objetivo da Língua para Fins Específicos é o de preparar os alunos para que eles possam se comunicar mais eficazmente numa língua e que eles possam adquirir competências para desenvolver determinada profissão (Halliday, McIntosh & Strevens, 1964, Mackay e Mountford, 1978, Hymes, 2001 e Johnson, 2008). Esta abordagem ao ensino de línguas permite que o professor se concentrar nas necessidades específicas de um grupo de estudantes. As necessidades apresentadas por um determinado conjunto de pessoas são, necessariamente, diferentes da de outro conjunto, revestidas de contextos diferentes.

A Organização Mundial da Saúde afirma que o indivíduo deve ser visto como um todo, ser saudável é "o completo estado de saúde física e bem-estar mental e não meramente a ausência de doença de enfermidade" (World Health Organization, 2008), hoje, ser saudável é mais do que não ter uma doença, é sentir-se bem fisicamente mas também mentalmente, psicologicamente, espiritualmente e socialmente, "o bem-estar é um processo holístico" (Cohen, 2008, p.31).

A AIDA de Mankletow's aplicada às Brochuras Termais (Spa Brochures and Mankletow's AIDA)

A presente pesquisa tem como objetivo verificar a qualidade dos materiais promocionais escritos atualmente gerados pelas termas da região de Viseu, nomeadamente pelas Termas de Alcafache, São Pedro do Sul Termas, Carvalhal e pelas Caldas da Felgueira e Sangemil. Em termos metodológicos optou-se por aplicar as categorias desenvolvidas por Mankletow, AIDA (2010). A crescente importância da qualidade do serviço leva a uma das fontes de informações não-pessoais, brochuras, quer as institucionais quer as comerciais.

Estes materiais devem ser cuidadosamente preparados (Shimp, 2002) e podemos afirmar que, às vezes, isso não acontece. Está a ser feito um esforço para promover as características físicas do produto, as instalações, o ambiente termal, mas as vantagens pós-tratamento também são relevantes e não estão a ser promovidas. Tanto a descrição detalhada de vários produtos e serviços como a explicação dos benefícios físicos e psicológicos que ocorrem devem ser exploradas.

A fórmula AIDA - Atenção, Interesse, Desejo, Acção (Manktelow, 2010), é importante para captar a atenção dos consumidores, mostrando-lhes os benefícios do serviço, a riqueza e a singularidade do produto, para que se sintam interessados em experimentá-lo, o que os leva a agir, realizando assim o desejo que sentem. Com a globalização, o mercado está cada vez mais competitivo pelo que o modo, a sofisticação com que aplicamos esta sigla - AIDA - é muito relevante (Manktelow, 2010):

• Atenção, através do uso de imagens, frases-chave

• Interesse, levar o consumidor a passar da capa do folheto, levá-lo a lê-lo totalmente

• Desejo levar o cliente a desejar ter um produto ou serviço de qualidade

• Ação, levar o cliente a agir, a telefonar, a fim de reservar um tratamento, ou tão só a visitar o site. Os objetivos comunicativos (Uysal & Fresenmaier, 1993) são muitas vezes esquecidos, não lhes sendo dada a devida importância. O fato de se elaborarem brochuras baseadas na premissa de que o público é geral, não é correta. Diferentes públicos, como crianças, por exemplo, requerem cuidados comunicativos especiais. A fim de avaliar os materiais promocionais termais escritos, foi desenvolvida uma grelha de análise baseada em Fresenmaier e Uysal (1993), Kotler (1998), Poncini (2002) e Manktelow (2010). Foram selecionadas as seguintes categorias:

Conteúdo geral, design, aspectos linguísticos e físicos, tais como a qualidade do papel, por exemplo.

Tipo de abordagem, seja ela direta ou indireta

Público-alvo, se houve uma tendência para generalizar ou se há uma audiência definida

Capa, a primeira página é o que nos leva a ler o resto do folheto.

Título / frase-chave, se a frase é simples e atraente, se é fácil de lembrar.

Cor e fonte, se é contrastante, se é atraente. A fonte usada também é importante e é muitas vezes a identificação de uma empresa particular.

Tipo de vocabulário, se é especializado, se o texto é coerente, se é facilmente compreendido pelos leitores comuns.

Variedade de informações, se fala de alimentação, meio-ambiente, atracções turísticas e atividades disponíveis.

Tipo de discurso, se é meramente informativo ou se é multimodal, se combina no mesmo texto, o discurso informativo com um discurso poético ou argumentativo.

O uso de pronomes pessoais. O idioma Português é pro-drop (Cook & Newson, 2007, p.91),

Gráficos / Design, a verificação da existência de um equilíbrio entre texto e imagem, verificando o tipo de imagem que aparece, se ela está relacionada com a envolvendo, com os tratamentos termais,

Línguas disponíveis além do Português.

Descontos

Depoimentos de outros clientes, saber que há pessoas que tentaram e conseguiram obter benefícios físicos e / ou psíquicos, é muito importante.

Fotos de pessoas conhecidas, o que ajuda a captar a atenção do consumidor, faz com que o folheto se torne mais familiar.

Certificação, é essencial que o cliente se sinta seguro.

Logotipo da empresa, se este está visível.

Contato / Localização. Verificar se os contatos são disponibilizados, para um público letrado as coordenadas GPS podem ser úteis, mas para um público com uma cultura mais elementar, o mapa pode ser melhor. Conhecer o público é fundamental.

Leva à ação, o leitor deve sentir a necessidade de agir, seja através da marcação de uma consulta ou simplesmente para visitar o site, mas tem que ser levado a agir.

Resultados (Results)

A abordagem, em geral, é directa. O público alvo é, em todas generalizado, não especificado. Nas Termas de Alcafache, nas Caldas de Felgueira e nas Termas de SPS existe uma distinção entre os aspectos curativos e os aspetos da saúde e bem-estar. Ao enfatizar a possibilidade de se desfrutar de termalismo, em ambas as vertentes percebemos, claramente, a vontade dessas instituições em promover as duas variantes. A diferenciação dos grupos alvo é de extrema importância porque permite comunicar com os clientes de forma mais eficaz, pois uma brochura geral é para todos, mas ao mesmo tempo, não é para ninguém.

Em Portugal, mais especificamente em Viseu, ainda há alguma resistência da parte de equipas médicas em permitir o acesso à componente de bem-estar de forma rápida, o que pode ser feito tão só com a eliminação, por exemplo, da obrigatoriedade de uma consulta médica.

As frases expostas nas capas de todas as brochuras são atraentes e fáceis de lembrar, o que responde ao A de Atenção (Manktelow, 2010) e leva ao I de Interesse (Manktelow, 2010), e ao D de Desejo, pois leva a que o cliente deseje ler o resto da brochura. A brochura de Alcafache é a exceção, pois não apresenta nenhuma frase-chave.

A cor e o tipo de letra apresentados são contrastantes e atraentes. O tipo de linguagem utilizada por todos os folhetos é atual, fácil. Mas a diferenciação do público, a segmentação do mercado-alvo, requer necessariamente a diferenciação do tipo de discurso utilizado. A brochura para um cliente instruído não pode ser o mesmo que para um consumidor com um menor formação académica ou com pouco poder económico.

Sobre o desporto e gastronomia, áreas-chave em matéria de saúde e nutrição, não há nenhuma alusão em qualquer um dos folhetos. Quanto aos locais a visitar ou atividades de lazer nos folhetos de Alcafache e Felgueira não há menção a tais informações. Quanto ao tipo de discurso, podemos considerar que há um discurso multimodal em todas as brochuras analisadas.

Os folhetos apresentam um atraente conjunto de imagens, de clientes que efectuam tratamentos vários nos arredores. O design da brochura das Termas de SPS foi feita por uma empresa externa, recorrendo ao outsourcing «Comportamento Digital». A brochura com os preços dos tratamentos está disponível em versão em espanhol, quer em Alcafache ou em Carvalhal. SPS apresenta uma brochura multilingue, situação rara, em Inglês, Espanhol e Alemão, mas a qualidade da tradução não é boa. Em Carvalhal, Felgueira e SPS não há referência a descontos.

Nenhum dos textos estudados menciona a certificação dos produtos e serviços, apesar disso sabemos que as Termas de SPS são certificadas por uma organização independente. Não há menção de depoimentos de clientes ou uso de fotografias de pessoas conhecidas. O logotipo da empresa aparece, invariavelmente, na capa, no canto superior esquerdo, com exceção das Caldas da Felgueira, onde este não aparece. Todos os contectos estão presentes, número de telefone, número de fax e o endereço do site.

Conclusion

No geral, podemos concluir que as brochuras são eficazes, adequadas ao conteúdo que desejam transmitir. A linguagem é adequada mas a falta de outras línguas é latente. Note-se que a brochura das Termas de SPS foi elaborada com recurso a uma empresa externa. Os folhetos são considerados eficazes para o público nacional, mas a falta de multilinguismo não permite que turistas de outras nacionalidades percebam a qualidade do parque termal Viseense e se sintam motivados a visitar o mesmo. Tem sido feito algum trabalho, nomeadamente através do Turismo Centro de Portugal, entidade estatal, mas entendemos que há que ser feito um esforço maior, por parte das termas, na promoção dos seus produtos e serviços além fronteiras.

YABANCİ DİL ÖĞRETİMİ SUNAN WEB SİTELERİNİN DEĞERLENDİRİLMESİ

Elif KIR[108], Selda Kayak [109]

Özet

Yabancı dil öğretiminde en çok tercih edilen ortamlardan birisi de web siteleridir. İnternet erişimin artmasıyla birlikte, internet siteleri popüler eğitimsel kaynaklar haline gelmiştir Bunun sonucunda öğretim amaçlı birçok site geliştirilmeye başlanmıştır. Sayısı giderek artan öğretim amaçlı web siteleri, öğrenenlerin bu web sitelerinden hangisinden daha etkin bir biçimde yaralanacakları konusunu gündeme getirmiştir. Bu nedenle, web sitelerinin nasıl olması gerektiği konusunda değerlendirmenin belirleyici bir rol oynadığı düşünülmektedir.

Bu araştırmada,web sitelerinin dil öğrenimindeki önemi dikkati alınarak "yabancı dil olarak Türkçe" öğretimi için yayınlananüç internet sitesi, öznelliği azaltması ve daha ilkeli ve güvenilir bir değerlendirme sağlaması amacıyla geliştirilen bir kontrol listesi yardımı ile değerlendirilmiştir.

Literatür taraması sonucu dil öğretimi sunan araçların değerlendirildiği çalışmalar incelenmiş ve bu çalışma için özgün bir web sitesi değerlendirme kontrol listesi geliştirilmiştir. Geliştirilen kontrol listesiyle ilgili uzmanların görüşleri alındıktan sonra bu kontrol listesine göre yabancı dil olarak Türkçe öğreten web sitelerinin değerlendirilmesi yapılmıştır.

Web siteleri biçimsel görünüm, içerik, öğrenen özellikleri ve genel değerlendirme başlıkları altında incelenmiş ve elde edilen sonuçlara göre önerilerde bulunulmuştur.

Anahtar kelimeler: Öğretim amaçlı web siteleri, değerlendirme, yabancı dil olarak Türkçe öğretimi

THE EVALUATION OF WEBSITES TEACHING FOREIGN LANGUAGES

Abstract

Websites are one of the most preferred learning enviroments in foreign language teaching. With the increasing of internet usage, internet sites have become popular learning resources. As a result, lots of websites which focus on teaching have been developed. Increasing numbers of this kind of websites has brought the question of from which sites will the students get benefit in an effective way. So, it is thought that the evaluation of websites plays a major role.

In this study, three websites prepared to teach Turkish as a foreign language were evaluate with the help of a checklist in order to provide more objectivity and more reliable evaluation. Firstly, the studies focusing on the evaluation of websites were examined. Then, an original checklist was prepared fort his study. After getting the views of the experts, websites teaching Turkish as a foreign language were evaluated according to the checklist.

Websites were analyzed under the headings of appearance, content, learner characteristics and general evaluation. Some suggestions were made according to the findings.

Key words: Websites for teaching, teaching Turkish as a foreign language

[109] Araş. Gör. Yıldız Teknik Üniversitesi, Eğitim Fakültesi

Giriş

Yabancı dil öğretiminde araç geliştirmenin başlıca konularından biri olan "dil öğretim araçlarının uyarlanması ve değerlendirilmesi" dil öğrenme sürecine ilişkin değişik bakış açıları sunmaktadır.Ayrıca, dil öğrenme süreçlerinde yapılan çalışmalar (güdülenme, öğrenme stratejileri, vb.), araçların niteliklerinin nasıl olması gerektiği konusunda belirleyici rol oynamaktadır. Araç geliştirme ilkeleri incelendiğinde araçların genel niteliklerine ilişkin bir dizi önerinin öne çıktığı da görülmektedir (Peçenek, 2005: 87).

Bu çalışmada,"yabancı dil olarak Türkçe" öğretimi için hazırlanmış olan web destekli beş internet sitesi öznelliği azaltması ve daha ilkeli ve güvenilir bir değerlendirme sağlaması nedeni ile geliştirilen bir ölçüt yardımı iledeğerlendirilmiştir. Ölçüte dayalı değerlendirme aynı zamanda araştırmacıların birbirinden bağımsız olarak değerlendirme yapma ve sonrasında farklılıkları karşılaştırmalarını kolaylaştırmıştır. Araştırma sürecinde izlenen yol aşağıdaki gibidir;

1) Web destekli öğretim sitelerin belirlenmesi
2) Kaynak taraması yapılması
3) Araç değerlendirme ölçütünde yer alacak belirtkelerin saptanması
   a) Yabancı dil öğretimi açısından
   b) Teknik açından
4) Ölçütün oluşturulması
5) Ölçüt ile ilgili uzman görüşü alınması
6) Ölçütün uzman görüşü ile yeniden yapılandırılması
7) Web destekli öğretim sitelerinin ölçüt yardımı ile değerlendirilmesi
8) Öğrenici ve öğretmenler için öneriler hazırlanması

Ölçüt Geliştirme

Tomlinson (2003: 26) dil öğrenme kuramlarının araç değerlendirmede temel ilkeler sunabileceğini ve bu kuramlardan yola çıkarak evrensel ilkeler geliştirmenin mümkün olabileceğini belirtmesine karşın tek bir çerçevenin kullanılamayacağını ve evrensel ölçütlerin yanı sıra özgül ölçüt grupları belirlenebileceğini savunmaktadır (akt. Peçenek, 2005: 93). Ders kitaplarının seçiminde ve değerlendirilmesinde çok çeşitli öneriler sunulmakla beraber genel olarak iki türlü değerlendirmeden bahsedilmektedir. Bunlar "üst-düzey" (macroevaluation) ve "alt-düzey" (microevaluation) değerlendirmelerdir. Üst-düzey değerlendirme uzun süreli projeler ve daha merkezi değerlendirmeleri içerirken; alt düzey değerlendirmeler ise uzman ve kullanıcılar tarafından yapılan değerlendirme biçimidir (Rubdy, 2001: 41).

Ölçüt geliştirmede yabancı dil öğretiminde son yıllarda benimsenen yaklaşımlar ve yapılan çalışmalardan yararlanılmıştır. Örneğin, Avrupa Konseyi tarafından basılan "ortak başvuru metninde" (CommonEuropean Framework) "eylem odaklı bir yaklaşım" benimsendiği belirtilmekte ve öğrenicinin çok çeşitli dil süreçlerini içeren etkinliklere katılarak en uygun stratejileri harekete geçirmesi beklenmektedir. Öğrenici böylece çok çeşitli bağlamlarda sahip olduğu dil yetilerini kendisi kullanabilecektir (CEF, 2000: 19). Ayrıca bu metinde sıklıkla "kendi kendine dil öğrenme ve yaşam boyu öğrenme" sürecinin desteklenmesi salık verilmektedir. Bu açılardan OBM oluşturmacı yaklaşımın özelliklerini vurgulamaktadır. Oluşturmacı bir yabancı dil öğretiminin özelliklerini sıralayan Reinfreid (2000) benzer bir biçimde bu yaklaşımda öğrenen odaklı öğrenme, öğrenimin bireyselleştirilmesi, dil ve kültürlerarası farkındalık kazanılması, öğrenen özerkliğinin sağlanması ve gerçek dil kullanımının sunularak bütüncül bir dil deneyiminin sağlanmasının vurgulandığını belirtmektedir.

Bu çalışmada, alan yazınında yabancı dil öğretim sitelerinin değerlendirilmesi için özel olarak hazırlanan bir ölçüt bulunamadığından yeni bir ölçüt hazırlanmaya çalışılmıştır. Bu amaçla yabancı dil öğretim araçlarının değerlendirilmesinde sunulan örnek kontrol listeleri ve çeşitli ölçütler incelenmiştir. Alan yazınında verilen değerlendirme kontrol listelerinin birçoğu belli başlıklara bölünmekte ve ders kitaplarının bu başlıklar altında öğrencilerin gereksinimleri ve diğer hedeflenen özellikleri karşılayıp karşılamadığı saptanmaya çalışılmaktadır.

Bu değerlendirmelerin çoğu genel olarak "öğretmen", "öğrenci", "içerik" ve "görünüm" açılarından ele alınmıştır. Hall (2000: 229-230) araç geliştirme ve değerlendirmede ilk basamağın dil öğrenme kuramlarından yararlanmak olduğunu vurgulayarak üç ana başlığın değerlendirmeye alınmasını önermektedir. Bunlar; "iletişim ihtiyacı", "gerçek dil kullanımı", ve "öğrenici merkezlilik".

Örnek ölçütlerin incelenmesi ve kaynak taraması sonucunda web destekli öğretim sitelerinin değerlendirilmesi ölçütünde olması gereken konu başlıkları ve bu konu başlıklarının altında sunulması gereken belirtkeler belirlenmiştir. Hazırlanan ölçüt üç ana başlığa bölünmüştür;

Biçimsel Görünüm

İçerik

Öğrenen Özellikleri

Seçilen internet sitelerinin her biri ayrı bir kontrol listesi ile değerlendirilmiştir.

Sunulan Dil Düzeyi ve Planlama					
Konu Başlıkları	Türkçe dersler bölümünün sayfası açıldığında toplam 85 adet üyenin ayrı isimler altında dersleri gözüküyor ancak çoğu kullanıcının 0 dersi var sadece çok az bir kısmın dersleri yüklenmiş. Bu dersler çok karışık tamamen dilbilgisi odaklı. Hikayeler başlığı altında iki kişi tarafından yüklenen resimli ve yazılı 3 hikaye var. Kelime öğretimi 10 düzeye bölünmüş ve sonunda bir test var. Sesletim bölümünde toplam 7 tane text var. Bu textlerin İngilizce ve Türkçesi verilmiş. Sesli olarak da dinlenebiliyor. Classes bölümünde Türkçe öğretimi var. Toplam 4 başlangıç ve 1 orta seviye.				
Odaklanılan Dil Becerileri	Gramer, okuma, yazma				
Alıştırma Biçimleri	Çeviri, boşluk doldurma, soru yapma, cümle yapma ve soru-cevap.				

Sonuç ve Öneriler

Bu çalışmada, araştırmacılar tarafından geliştirilen ölçek yardımı ile "Yabancı Dil Olarak Türkçe Öğretimi" için hazırlanan üç websitesi incelenmiştir. Bu websitelerinin hepsi Türkçe öğretimini İngilizce açıklamalar ve yönergelerle gerçekleştirmektedir. Sitelere giriş ücretsizdir. İncelenen websitelerinin sadece bir tanesi için üyelik gerekmektedir.

Geliştirilen ölçüt yardımı ile çalışma kapsamına alınan websitelerinin değerlendirmesinin her biri ayrı olarak ele alınmıştır. Websitelerinin biçimsel görünümleri incelendiğinde bu başlık altında yer alan ölçütlerin çoğunu karşılamadıkları görünmektedir. Websitelerinin hepsi kullanıcıya karışık gelebilecek bir biçimde hazırlandığından kullanım kolaylığı sağlamamakta ve bu nedenle websitesi içinde bilgiye ulaşma zaman almaktadır. İncelenen websitelerinin ikisinde ses ve video dosyaları bulunmaktadır ancak bu dosyalar kaliteli bir biçimde hazırlanmamıştır.

Websiteleri içerik bakımından incelendiğinde genel olarak yetersiz oldukları görülmüştür. Öncelikle belirtilen dil düzeyi ile içerik arasında uygun bir düzenleme bulunmamaktadır. Bir site dışında diğer ikisinde düzeyler de belirtilmemiştir. Tüm websiteleri dilbilgisi ve dolaylı

olarak okuma ve yazma becerilerine odaklanmaktadır. Bu nedenle, öğrencilerin dil gelişimlerini destekleyici bir içerik sunulmamaktadır. Sunulan içerik diğer disiplinlerle de ilişkili değildir ve öğrencileri dil öğrenmeye motive edici düzeyde hazırlanmamıştır. Bir web sitesi dışında diğer iki websitesinde gerçek dil kullanımı ile ilgili bilgi ve örneklere yer verilmemiştir. İçerik bütünsel olarak sunulmadığından anlamlı bir dil girdisi hazırlanmadığı söylenebilir. Bir başka anlatımla, dilbilgisi yapılarına odaklanıldığından içerik birbirinden kopuk biçimde sadece bazı yapılarla ilgili yapısal alıştırmalar sunacak biçimde hazırlanmıştır. Websiteleri sunulan dil birimlerin tekrarı konusunda yeterli bulunmamışlardır. Ayrıca, kullanıcılara bilinmeyen kelimeleri açıklama ve bilgilendirici cevap anahtarı sunma konusunda da yetersizdirler. İçerik başlığı altında yer alan kültür ile ilgili değerlendirme ölçütleri incelendiğinde yabancı dil öğretiminde önemli bir yeri olan kültürün websitelerinde gerekli biçimde içeriğe alınmadığı görülmektedir.

Websiteleri öğrenen özellikleri bakımından incelendiğinde hepsinin bu başlık altında çok yetersiz olduğu görülmüştür. Dilbilgisi odaklı ve kısıtlı bir içeriğin sunulması öğrencilerin dil öğrenme stratejileri önbilgilerini kullanma ve kültürel yetilerini geliştirmelerine imkân sağlamamaktadır.Ayrıca, websiteleri yabancı dil öğretiminde yine önemi bir yere sahip olan bilginin yapılandırılması ve bireyselleştirilmesinden yoksun bir biçimde hazırlanmıştır.

Bu çalışmada, yabancı dil olarak Türkçe öğreten websiteleri değerlendirilmiştir. İngilizce, Almanca gibi dilleri öğreten websiteleri incelendiğinde içerik ve görünüm olarak etkin bir biçimde hazırlandığı ve öğrenci özelliklerini dikkate aldığı görülmektedir. Ders dışı öğrenme ve kendi kendine öğrenme gibi birçok açıdan yabancı dil öğretimine katkı sağlayacak websitelerinin işlevsel bir biçimde hazırlanması kullanıcıya birçok katkı sağlayacaktır. Bu nedenle, yabancı dil olarak Türkçe öğretimi sunan sitelerin geliştirilmesi ve diğer dilleri öğreten sitelerde olduğu gibi işlevselleştirilmesi gerekmektedir.

YÜKSEKÖĞRETİM KURUMLARINDA UYGULANAN ÖZEL YETENEK SINAVLARININ ÖNEMİ VE BİR MODEL ÖNERİSİ

Arş. Gör. Dr. Mehmet Emin KAHRAMAN

İstanbul Kültür Üniversitesi, Sanat ve Tasarım Fakültesi, Sanat Yönetimi Bölümü

m.e.kahraman@iku.edu.tr

Özet

OSYM, Yüksek Öğretim Kurumlarında lisans eğitimine başvuran adaylara YGS ve LYS sınavlarını uygulamaktadır. Araştırmada YGS ve LYS sınavlarının içerikleri, puan türleri ve tercih süreçlerine etkileri incelenmiştir. Araştırma sonunda YGS ve LYS sınav sorularında sanatla ilgili soruların sayıca yetersiz olduğu görülmüştür. Sanat eğitimi almak isteyen adayların yetenek sınavlarına başvuru yapabilmeleri için zorunlu tutulan YGS sınavlarında sanatla ilgili soruların olmaması sınavın önemini azaltmakta ve sanat eğitimi almak isteyen öğrencilerin alan dışı konulara hazırlanmasına neden olmaktadır. Bu kurumlarda sanat eğitimi almak isteyen adayların kalitesini yükseltebilmek için yeni bir sınav modeli geliştirilmiştir. Yeni model iki aşamadan oluşmaktadır. Birinci aşamada YGS sınavında sanat la ilgili soru sayısının on olma zorunluluğunu getirmektedir. Ortaöğretimde sanat okullarında mezun olan adayların bu soruları cevaplayarak alacakları katsayı puanları arttırılacaktır. Birinci aşamada yeterli görülen adaylar ikinci aşamaya başvurma hakkı kazanacaktır. İkinci aşama olan LYS'de ise aday yeni bir alan olan ve elli sorudan oluşan Kültür ve Sanat (KS) bölümünden sınava girecektir. Bu aşamadan alacağı puanla sanat eğitimi veren bölümlere girebilme hakkı kazanacaktır. Yetenek sınavı uygulayan bölümler ise sınav sonrası mülakat aşamasıyla seçecekleri öğrencileri daha iyi belirleyebileceklerdir. Araştırma sonucunda gerekli önerilere yer verilmiştir.

Giriş

Ülkemizde nüfus ve okuma-yazma oranı paralel şekilde artış göstermektedir. Üniversitelere başvurunun artmasıyla kurumların kendi sınavlarını yapmalarında, donanım ve imkan yetersizliğinden başvurularda sorunlar yaşanmıştır. Öğrenci adaylarının üniversitelere ve bölümle daha düzenli ve sağlıklı yerleştirilebilmesi için ilk kez 1974 yılında merkezi sınav sistemi uygulanmaya başlamıştır. ÖSYM, 19 Kasım 1974 tarihinde, Üniversitelerarası Kurul tarafından, 1750 sayılı Üniversiteler Kanununun 52. Maddesine göre, "Üniversitelerarası Öğrenci Seçme ve Yerleştirme Merkezi (ÜSYM)" adıyla kurulmuştur. 1981 yılında yürürlüğe giren 2547 sayılı Yükseköğretim Kanunu ile Yükseköğretim Kuruluna (YÖK) bağlanarak "Öğrenci Seçme ve Yerleştirme Merkezi (ÖSYM)" adını almıştır (OSYM, 2012). OSYM kurumu hizmete başlayarak merkezi sistemle sınavları yürütme görevini üstlenmiştir. Kurumun iş tanımında "Öğrenci Seçme ve Yerleştirme Merkezi, Yükseköğretim Kurulunun tespit ettiği esaslar çerçevesinde yükseköğretim kurumlarına öğrenci alınması amacıyla sınavları hazırlayan ve yapan, öğrenci isteklerini de göz önünde tutarak Yükseköğretim Kurulunun tespit ettiği esaslara göre değerlendiren, öğrenci adaylarının yükseköğretim kurumlarına yerleştirilmesini sağlayan ve bu faaliyetlerle ilgili araştırmalar ve diğer hizmetleri yapan Yükseköğretim Kuruluna bağlı bir kuruluş" olduğu belirtilmiştir. Sanat eğitimi veren bölümler ise öğrenci adaylarına sadece yetenek sınavı uygulamaktaydı. Öğrenci adayı yetenek sınavı sonrası bölüm yetkilileri tarafından mülakata tabi tutulmakta ve sanatla ilgili bilgisi ölçülmekteydi. OSYM'nin kurulmasının ardından sanat eğitimi veren bölümlere başvurabilmek için sınava girme şartı konmuştur. Bu şartı taşıyan adaylar yetenek sınavına girebilmektedir. Öğrenci adaylarının sayıca artmasıyla üniversitelerin sayıca yetersizliğinden dolayı yetenek sınavından mülakat aşaması çıkarılarak sınav süreci kısaltılmaya çalışılmıştır. Çünkü mülakat aşaması çizim sınavı sonrası uygulanmakta ve birebir görüşme sürecini kapsadığı için aday sayısına oranla uzun sürebilmekteydi. Fakat son on yılda üniversitelerde sanat eğitimi veren bölümlerin hızla artışı ile bölümlere başvuran aday sayısında azalma görülmektedir.

Merkezi Sınav Sistemi

Yarımağan, OSYM'yi "Öğrenci Seçme ve Yerleştirme Merkezi 1974 yılında üniversiteye giriş sınavlarının merkezi yapılması ihtiyacı üzerine kurulan ve 1982 yılında çıkan Yükseköğretim Kanunu ile çeşitli aşamalarda ve çok geniş kitlelere sınav yaparak faaliyetlerini sürdüren bir kurumdur" şeklinde tanımlamaktadır (Yarımağan, 2009, s.1). 1974 yılı sonrası uygulanmaya başlayan merkezi sınav sistemi ile üniversitelerde eğitim alacak öğrenciler eşit şekilde dağılabilmiştir. Günümüzde sınava başvuran sayısı bir buçuk milyona yakındır. Sınava giren adaylara farklı sınav türlerinin uygulanmasının ve değerlendirilmesinin zor olması nedeniyle bilgilerini ölçebilecek en etkili yöntem olarak çoktan seçmeli test tekniği belirlenmiştir.

Çoktan seçmeli testin içeriği, öğrencinin sayısal ve sözel bilgilerini değerlendirmesine yöneliktir. Adayın doğru cevap sayısı başarısının göstergesi olarak kabul edilmektedir. Çoktan seçmeli sınav OSYM'nin uygun gördüğü hakem kuruluyla hazırlanmaktadır. Sorular sayısal, sözel, fen bilimleri ve sosyal bilimler alanında konulardan oluşmaktadır. Soru içeriklerinin genel tutulmasının nedeni sınava her bölümden ve seviyeden öğrencinin başvurması ve adayların farklı bölümleri tercih etmek istemesidir. Sorularda sanat eğitimi içeren soru sayısı oldukça az ve yetersizdir. Tamamıyla uygulamaya yönelik disiplinler içeren sanat kurumları, ÖSYM'nin düzenlediği sınavdan başarılı olan öğrencileri alabilmektedir. Günümüze kadar yapılan en büyük yanlış, sanat eğitimi almak isteyen adaydan YGS sınavından yeterli puan alma şartı aranmasıdır. Sınavın ardından yetenek sınavlarına başvuru yapılabilmektedir. Düzenlenen sınavın amacı öğrencinin alacağı eğitime uygun çizim/çalgı bilgisinin olduğunu araştırmaktır. Çünkü öğrencinin alacağı 4 yıllık eğitim içinde dersleri takip edebilmesi ve başarılı olabilmesi için çizim yapabilme veya enstrüman çalabilme özelliklerine sahip olması gerekmektedir. Yetenek sahibi olan fertlerin başarılı olabileceği bu bölümlerde uygulamalı sınav aşaması gerekli görülmektedir. Sanat eğitimi veren yüksek öğretim kurumlarımız görsel/işitsel/gösteri sanatları adı altında üç grupta inceleyebilmektedir. Yüksek öğretim kurumlarında bu fakülteler kısaca sanat ve tasarım fakültesi ile konservatuar olarak iki gruba ayrılmaktadır. Bu fakültelerin altında, anabilim dalları ve bölümler bulunmaktadır. İç mimarlık ve çevre tasarımı ile peyzaj mimarisi bölümleri gibi LYS sınavında başarılı öğrencilerin eğitim alabilecekleri bölümler olabilmesine karşın resim, tasarım, şan, sahne tasarımı gibi tamamıyla eğitim öncesi belli bilgi ve çizim/çalgı bilgisi gerektiren bölümlerde bulunmaktadır. Daha öncede belirtildiği gibi bu bölümler LYS sınavı sonrası uygulamalı sınavlara tabi tutulmaktadırlar. Fakat sanat ve tasarım fakülteleriyle konservatuarlara bağlı sanat yönetimi, iletişim sanatları, oyunculuk, tiyatro gibi bazı bölümler ise yetenek sınavı dışında öğrencinin kendini ifade edebilme yeteneğini ölçebilmek için mülakat aşaması da uygulanmaktadır. Mülakatın diğer seçme yöntemlerine göre sağladığı avantajlar, adayla birebir iletişime geçildiği için tepkilerini ölçebilme, konuşma tarzını kavrama, beden dili ve dış görünüşleri ile ilgili bilgi toplayabilme imkânı vermesidir.

YGS ve LYS Sınavlarının İçeriği, Puanlanması ve Tercih Edilebilen Bölümler

Yüksek öğretim kurumlarında eğitim almak isteyen öğrencileri belirlemek için iki aşamalı uygulanan Yüksek Öğretim Geçiş Sınavı (YGS) ve Lisans Yerleştirme Sınavlarını (LYS) düzenlemektedir. İlk aşamayı geçebilen öğrenciler Sanat eğitimi veren ve yetenek sınavıyla alan kurumlara ve Açık öğretim Fakülteleri'ne başvuru yapabilmektedir.

Uygulama ile ilgili bilgiyi ölçmede çoktan seçmeli test yönteminin sağlıksız ve yetersiz olacağı da anlaşılmaktadır. Öğrencinin gelişimini sağlaması için verilecek derslerden ziyade öğrencinin özellikle kendini ifade edebilmesi ve topluluk karşısında konuşma becerisine sahip olmasını da ölçmek mülakat sınavlarının amaçları içerisindedir. Örneğin Sanat ve Tasarım Fakültelerine bağlı bulunan Sanat Yönetimi programının içeriği sanatçının reklamını yapabilen ve sanat piyasasında sanatçıyı temsil ederek destekleyebilecek bilgili, yönetici vasfı olan sanat yönetmeni yetiştirmektir. Sanat yönetimi ve benzer bölümlerde adayların, LYS sınavındaki başarısının yanı sıra konuşma ve hitabet başarısının da bulunması gerekmektedir. mesleğinde başarılı başarılı bireyler yetiştirebilmek için LYS sınavı sonrası mülakat aşaması gerekmektedir.

Sanat Eğitimi Programlarında Uygulanan Sınav Metotları

Sanat ve Tasarım Fakülteleri ile Konservatuara bağlı anabilim dalları ve bölümlerde öğrenci seçiminde uygulamaya yönelik aşamalı sınavlar uygulanmaktadır. Yetenek sınavları adıyla uygulanan bu sınavlar, çizim, imgesel, desen, enstrüman uygulaması, ses bilgisi ölçme, performans uygulamaları gibi çeşitlilik göstermektedir. Sanat ve Tasarım Fakültelerine bağlı; baskı sanatları, animasyon, endüstri ürünleri tasarımı, eski yazı, geleneksel Türk el sanatları, grafik tasarım, halı, kilim ve eski kumaş desenleri, heykel, iç mimarlık ve çevre tasarımı, iletişim tasarımı, moda ve tekstil tasarımı, plastik sanatlar, resim, sahne dekorları ve kostümü tasarımı, sanat tasarımı, seramik, cam, tekstil tasarımı, tezhip gibi bölümler bulunmaktadır.

Konservatuara bağlı alt bölümlerinin sayısıyla birlikte sanat disiplinlerinin fazla olması uygulamalı sınavların aşamalarını ve içeriklerini de arttırmaktadır. Günümüzde sanat eğitimi programlarına ve Spor Akademilerine başvurmak için adayların LGS'ye girmeleri zorunludur. Sanat programlarında okumak isteyen adaylar öğrenci seçme ve yerleştirme sınavı sonrası doğrudan istediği yükseköğretim kurumuna başvuruda bulunmaktadır. Sınav ve değerlendirme işlemleri de ilgili yükseköğretim kurumu tarafından yürütülmektedir. Uygulamalı olan bu yetenek sınavı sonrası eğitime uygun olduğu görülen adaylar seçilmektedir. Uygulamalı sınavda öğrencinin çizim yeteneği, enstrüman kullanabilme özelliği, bilgisayar bilgisi yada oyunculuk yeteneği ölçülebilmektedir. Yetenek sınavları adayların bilgisini ölçme ve değerlendirmeye yönelik olduğundan, adayın psikolojik yapısını ve bölümle ilgili bilgi düzeyini ölçmeye yönelik değildir. Yazılı sınav uygulamasıyla bu açık kapatılmaya çalışılsa da yetersiz olmaktadır. Yazılı sınav uygulaması ise lisans eğitimi sürecinde fazla kullanılmayıp, lisansüstü eğitim programına öğrenci alımında daha fazla uygulanmaktadır. Bunun nedeni başvuru sayısının fazla olmasından dolayı yazılı metinlerin okunup notlandırılma sürecinin uzun sürmesidir.

Yetersiz sınav programı sonrası öğrenci profiline uygun kişiliğe sahip olduğu bilinmeden eğitim-öğretim sürecine başlanmaktadır. Dört yıllık süreç sonrası kontenjanın tamamı doldurularak eğitime başlanan öğrencilerin bir bölümü eğitim sürecini tamamlamaktadırlar. Uygulanan yetenek sınavı sonrası sanat eğitimi alacak öğrencilerin kapasitesindeki yetersizlik eğitim kurumunun kalitesinde önemli gerilemelere neden olmaktadır. Yetenek sınavı uygulamasını sanat eğitimi alacak öğrencilerin seçiminde yetersiz olarak gören bazı vakıf ve devlet üniversiteleri farklı teknik ve aşamalar gerçekleştirerek öğrenci kalitesini yükseltme çabalarına girişmektedir.

Öğrencilerin bölümden beklentilerinin öğrenilebileceği ve öğrenciyi bekleyen eğitim döneminin içeriğinin anlatılabileceği mülakat aşaması sayesinde daha bilinçli ve istekli öğrencilerin seçimi sağlanabilmektedir. Bölümün seçici kurulu tarafından yöneltilecek sorularla öğrencinin kültürel durumu, bölüme ve sanata olan ilgisi öğrenilebilmektedir. Bu sayede dört yıllık eğitim görecek öğrencinin önceden tanınması ile alacağı eğitim sürecinde öğrenciye uygulanacak eğitim modellerinin hazırlanmasına da imkân vermektedir. Önceden eğitim alacağı öğrenim kurumunu yakından tanıyacak öğrenci adayları da doğru karar verebilecek ve eğitim sürecinde yüksek başarı gösterebilecektir. Ayrıca öğrenci seçiminde uygulamalı yetenek sınavı sonrası mülakat aşamasıyla yaşanılacak yanlış seçimlerin önüne geçilmektedir. Öğrencilerin dört yıllık eğitim sürecinde göstereceği başarı; genel kültür birikimi ve sanatsal aktivitelere olan ilgisiyle doğru orantılı gerçekleşeceği için mülakat aşamasında özellikle bu sorulara cevap aranmaktadır. Doğru kararın anlaşılması için de fakültelerin oluşturduğu jüri üyeleri uygun mülakat tekniği kullanmaktadır. Sınav sonrası sağlıklı bir ölçme ve değerlendirme işlemi de yapılmaktadır.

Mülakat Yöntemleri

Mülakat veya görüşme, belli ve ciddi bir amaçla yüz yüze gelen iki veya daha fazla kişinin soru-cevap yöntemiyle nesnel ve öznel bilgi toplamak için, etkileşim içinde yaptıkları bir seçme yöntemidir(Çetin, 2004, s:23). Seçim aşaması bireyin ihtiyaca karşı yetkinliklere sahip olmasını sorgulamaktır. Mülakat tekniği ferdin kendini ifade etmesi yönünden sınav teknikleri içinden etkili olanıdır. Mülakatlar, işletmelerin eleman seçiminde sıklıkla kullandıkları bir araçtır. Testler ve değerlendirme merkezi gibi yöntemlerden daha fazla tercih edildiği görülmektedir (Erdoğan, 1991, s:65). Eleman alımlarında işverenlerin kullanıp geliştirdikleri mülakat teknikleri

bulunmaktadır. Kullanıldıkça beğenilen ve iyi sonuçlar veren bu tekniklerden öne çıkanları şirketler ve yüksek öğretim kurumlarınca uygulanmaktadır. Mülakat tekniklerini Sayın Koç, dört ana grup altında toplamaktadır.

Yapılandırılmış Mülakat Tekniği: "Yapılandırılmış mülakat sorulacak temel ve anahtar sorularla ilgili üst düzey bir hazırlığın yapıldığı, böylelikle bütün adaylara benzer soruların sorulduğu bir tekniktir."(A.S. Denisi, R. W.Griffin, 2008, 231) Bu teknik ile sanat eğitimi alacak öğrencilerin eğitim sürecinde bilmesi gereken temel bilgileri ölçme ve değerlendirmeye yönelik bir tekniktir.

Durumsal Mülakat Tekniği: Bu teknikte adaya ilgili pozisyonda karsılaşabileceği olayları içeren senaryolar verilir. Önemli olan senaryolar hayal bile olsa is ortamında karşılaşılabilecek nitelikte olmasıdır. Bu teknik; reklam, grafik gibi iletişim tasarımı gibi bölümlere öğrenci alımında uygulanabilecek düzeye sahiptir.

Davranışsal Mülakat Tekniği: Bu tekniğin temel varsayımı adayın gelecekteki davranışlarının, geçmiş davranışlarının bir yansıması olacağıdır. Bu amaçla adaya geçmişte yaşamış olduğu olayları nasıl ele aldığına yönelik sorular sorulur. Stresli bir ortamda nasıl karar aldığı, hangi verileri değerlendirdiği, takım arkadaşları arasındaki koordinasyonu nasıl sağladığı ve niye bu şekilde davrandığı gibi sorular bu teknikte sıklıkla karşılaşılabilecek türdendir (Dessler, 2008, s.258). Bu tür bir mülakat tekniği liderlik ve yöneticilik vasfı gerekli olan, iş performansını arttırmak için düzgün kipler oluşturması gereken, sanat yönetimi ve işletmeciliği gibi bölümlerde uygulanabilir.

Stres Mülakatları: Stres mülakatlarında amaçlanan, adayın dengesini nasıl koruduğu, uyum yeteneğini ve beklenmeyen olaylar karsısında kendisini ne kadar çabuk topladığını görmektir. Daha çok fínans ve bankacılık sektörü gibi stresli ortamlarda yürütülen isler için uygulanan bu mülakat tekniğinde mülakatçı farklı yöntemler kullanarak adayda stres yaratılmaya çalışılır ve sonuçları gözlemlenir. İhtiyaca cevap verecek bir teknik olduğu için sanat eğitimi veren kurumlarda değerlendirilebilir.

Mülakat aşamaları lisans eğitimine geçişle birlikte yüksek lisans eğitim sürecine geçişte de kullanılan bir tekniktir.

Mülakatın Değerlendirilmesi: Ölçme işleminin doğru teknikle uygulanmasının ardından değerlendirme aşamasına geçilmektedir. Fakat mülakat tekniğinde değerlendirme aşaması ölçme sürecinde de işleyebilmektedir. Yani aday mülakat yapılan mekandan ayrılırken hakkında verilen olumlu/olumsuz karar hakkında bilgilendirilebilmektedir. Bu tür bir uygulama dışında mülakat aşamasının ardından jüri üyeleri ölçme sürecinde verdikleri puanların ortalamasını hesaplayarak değerlendirme sürecini tamamlayabilirler. Doğru değerlendirme süreci için ölçme sürecinin yani mülakat aşamasının yeterli ve düzgün olması gerekmektedir.

Jürinin adaya ait cevapları doğru yorumlayabilmesi çok önemlidir. Mülakatçı adayın kullandığı sözcüklerden, sözcüklerin söylenme seklinden ve en önemlisi adayın vücut dilinden faydalanmalıdır. Vücut dili, kişinin içinde bulunduğu psikolojik durumu, duygu ve düşüncelerini istemsiz olarak, görülebilen beden hareketleri, giyim tarzı ve vücuttaki fiziksel değişiklikler yardımıyla ortaya çıkaran bir iletişim aracıdır. Beden diliyle ifade edilenler kullanılan sözcüklerle birlikte değerlendirilmelidir. Ancak bazı durumlarda sözcüklerin arkasında yatan gerçekleri istem dışı olarak sallanan bir ayak, öne eğilmiş bir bas ya da kasınan bir burun gün ışığına çıkarabilir. Önemli olan tüm verilerin birbiriyle tutarlı olmasıdır. (Fisher, 2006, s. 342.) Mülakat esnasında adayı tüm yönleriyle tanımaya çalışmak ve pozisyona uygunluğunu araştırmak için sözlü ya da sözsüz olsun iletişime büyük önem verilmelidir. Etkin bir iletişimin en büyük düşmanı ise mülakata odaklanamayıp adayı dinleyememektir.

Sonuç ve Öneriler

OSYM tarafından gerçekleştirilen YGS ve LYS sınavlarının içerikleri ve puan türleri incelenmiştir. Çoktan seçmeli sınav sisteminin sanat eğitiminde yetersiz olduğu anlaşılmıştır. Ayrıca aday seçiminde daha önce uygulanan sınav türlerinin de yetersiz olduğu gözlenmiştir. Gerekli bilgi ve donanıma sahip öğrencilerin seçiminde izlenen yolların başında uygulama sınavı gelmektedir. Fakat bu sınava girebilmek için YGS sınavından belirlenen puanı almak gerekmektedir. OSYM düzenlediği YGS sınavını sanat eğitimi veren

bölümlerin ihtiyacına göre yenilemelidir. Öncelikle YGS'nın içeriğinde sanatla ilgili sorular eklenmelidir. Yeni planlanacak bölümde; sınavın düzenlendiği yıl içerisinde yurt içinde düzenlenen etkinlikler, konserler, tiyatrolar, bienaller, sergiler ve festivallerle ilgili sorular sorulmalıdır. Ayrıca ünlü yönetmenler, artist ve müzisyenlerin hayatları ve eserleri hakkında sorular planlanmalıdır. Bu sayede hem sanat eğitimi alacak öğrencilerin belirlenebilmesi sağlanacak hem de sınava girecek tüm öğrencilerin bu bölüme ait soruları cevaplayabilmeleri için sosyal olabilmeleri sağlanacaktır. OSYM ilk yıl bu uygulamayı sadece YGS içinde 10 soruyla sınırlı tutacak sonraki yıl LYS aşamalarında Kültür ve Sanat (KS) olarak yeni bir sınav kitapçığı şekline çevirmelidir. KS kitapçığında öğrencilere çoktan seçmeli sınav türüyle 50 soru sorulmalıdır. Sınava hazırlanacak öğrencileri sosyal yaşamdan koparmamak için sorular sanat tarihi ile ilgili konuları fazla içermemelidir. Müzelerde sergilenen önemli eserlerle ilgili soruların olması yeterli olmalıdır.

KS puan türünden yeterli puan alan adaylar yetenek sınavına girebilmeye hak kazanacaktır. Fakat her sanat disiplini farklı bilgi ve beceriye ihtiyaç duymaktadır. Sanat eğitimi veren bölümler, KS sınavından sonra uygulamalı sınav aşamasına geçmeli, daha sonra da ihtiyaç durumunda mülakat yöntemiyle de öğrenci adaylarını yakından tanıma fırsatı yaratmalıdır. Mülakat aşamasında ise bölümün ihtiyacına yönelik uygun bir sınav salonu ve alanında uzman jüri üyeleri belirlenmelidir. Sübjektif davranılması gerekilen mülakat aşamasında jüri üyelerinin şahsi fikirlerini adaylara dayatabildiği bilinmektedir. Yaşanan her türlü hataların en aza indirilmesi için yüksek öğretim kurumlarınca gerekli önlemlerin alınması gerekmektedir. Jüri üyelerinin dikkat etmesi için önerilen şartlar şunlardır;

Adaylara ön yargılı yaklaşılmamalıdır.

Aday özgeçmişi iyi incelenmelidir.

Mülakat soruları ve içeriği önceden hazırlanmalıdır.

Mülakat esnasında sorulacak sorular önceden planlanmalı ve aynı konuyla ilgili soruların ardı ardına gelmesine dikkat edilmelidir.

Amaç adayla ilgili bilinmeyenleri öğrenmek olduğundan hiçbir soru anlamsız olmamalıdır.

Mülakat öncesi adaya bölüm hakkında bilgisi ölçülüp gerekirse bilgilendirilmelidir. Daha sonra mülakata geçilmelidir.

Adayın mesleğinde engel teşkil etmeyecek fiziksel görüntüsü veya eksikliği mülakat sürecine yansıtılmamalıdır.

Zıtlık yapılmamalıdır. Yani jüri üyesi mülakat aşamasında adayı daha önceki adaylarla karşılaştırma yapmamalıdır.

Bölüm içeriği kavranmalıdır.

Vücut dilini iyi kullanmalıdır.

Çok az/fazla konuşulmamalıdır.

Adayın yanlış bilgi beyanında bulunması doğrultusunda karşılaşacağı hukuksal aşamalardan yazılı ya da sözlü şekilde bilgi verilmelidir. Ve bu sürecin mülakat aşamasında da geçerli olduğu belirtilmelidir.

Adayın konuştuğu zaman sözü kesilmemeli veya bir konu hakkında yoğunlaşmışken başka konular hakkında sorular sorulmamalıdır.

Kapalı sorular sormak ya da ayrıntılarla gereğinden fazla uğraşmamak gerekir.

Adayla göz teması kurulmalıdır.

Mülakat süresince aday ya da jüri dışında başka şeylere odaklanılmamalı, huzursuz görünmemeli ve fiziksel ortamın eksiklikleri de konuşma sürecine yansıtılmamalıdır.

Jürinin adayı çağıracağı mekânın mülakata uygun fiziksel şartlar bulunmalıdır. Dışarıdan gelen fazla ya da yetersiz ışık, ses, ısı gibi olumsuz ortamlar olmamalıdır.

Adayların mülakat bitimi diğer adayları etkilememesi için salonda birden fazla giriş çıkış olmalıdır. Bu sayede içeri alınacak aday mülakat bitiminde farklı bir kapıdan mekândan ayrılmalıdır.

Mülakat süresince sakin olunmalı ve ani tepkilerden kaçınılmalıdır.

Araştırma sonuçları ve önerileri farklı disiplinlerde kullanıma hazır olup değişikliğe uygundur.

EK

LYS'de puan türleri ise MF-1, MF-2, MF-3, MF-4, TM-1, TM-2, TM-3, TS-1, TS-2 ve DİL-1, DİL-2, DİL-3 olarak değişmektedir. MF grubu eski sistemde "Sayısal", TM grubu "Eşit Ağırlıklı", TS grubu da "Sözel" puan türlerine karşılık gelmektedir. MF ile ilgili puan türlerinde, Matematik, Geometri, Fizik, Kimya ve Biyoloji sorularının ağırlığı çeşitli oranlarda değişmektedir. TM ile ilgili puan türlerinde Matematik, Geometri, Türk Dili ve Edebiyat ile Coğrafya-1 testleri, TS ile ilgili puan türlerinde Türk Dili ve Edebiyatı, Coğrafya-1, Tarih, Coğrafya-2 ve Felsefe grubu testleri yer almaktadır. DİL puan türünde ise LYS'de dil sorularının ağırlığı alt puan türlerine göre değişmektedir. DİL-1'de ikinci aşama sınavındaki dil sorularının ağırlığı yüzde 65, DİL-2'de yüzde 50, DİL-3'de yüzde 20 olacaktır. Sınavın birinci aşaması olan YGS, DİL puanlarını, DİL-1 alt puanında yüzde 35, DİL-2 alt puanında yüzde 50, DİL-3 alt puanında ise yüzde 80 oranında etkilemektedir (OSYM, 2012).

MF-1 puanı ile İlköğretim Matematik Öğretmenliği, Matematik Öğretmenliği, Matematik, Bilgisayar Bilimleri, Astronomi ve Uzay Bilimleri programlarına,

MF-2 puanı ile Fen Programları, Biyoloji, Biyoloji Öğretmenliği, Fizik, Fen Bilgisi Öğretmenliği, Kimya programlarına,

MF-3 puanı ile Tıp, Eczacılık, Veteriner, Ebelik (Fakülte), Hemşirelik (Fakülte), Beslenme ve Diyetetik (Fakülte), Biyokimya, Fizyoterapi ve Rehabilitasyon (Fakülte), Genetik ve Biyomühendislik, Moleküler Biyoloji ve Genetik programlarına,

MF-4 puanı ile Bilgisayar Mühendisliği, Bilişim Sistemleri Mühendisliği, Elektrik Mühendisliği, Elektronik Mühendisliği, Endüstri Mühendisliği, Balıkçılık Teknolojisi Mühendisliği, Kentsel Tasarım ve Peyzaj Mimarlığı, Biyomedikal Mühendisliği, Çevre Mühendisliği, Uçak Mühendisliği, Deri Mühendisliği, Peyzaj Mimarlığı, Orman Mühendisliği, Otomotiv Mühendisliği, Nükleer Enerji Mühendisliği, Kimya Mühendisliği, Tekstil Mühendisliği, Yazılım Mühendisliği, Uzay Mühendisliği programlarına puan türü ile öğrenci yerleştirilmektedir.

TM-1 puanı ile Ekonomi, İktisat, Maliye, Muhasebe ve Finans Yönetimi, Bankacılık ve Finansman (Fakülte), Çalışma Ekonomisi ve Endüstri İlişkileri, İnsan Kaynakları Yönetimi (Fakülte) programlarına; TM-2 puanı ile Hukuk, Sınıf Öğretmenliği, Kamu Yönetimi, Siyaset Bilimi, Uluslar arası İlişkiler, Avrupa Birliği İlişkileri; TM-3 puanı ile Arkeoloji, Antropoloji, Çocuk Gelişimi (Fakülte), Felsefe Grubu Öğretmenliği, Psikoloji, Sosyoloji programlarına girilebilmektedir.

TS-1 puanı ile türüyle Coğrafya Öğretmenliği, Sosyal Bilgiler Öğretmenliği, Halkla İlişkiler ve Tanıtım, Medya ve İletişim; Radyo, Sinema ve Televizyon; TS-2 puan türüyle Tarih, Tarih Öğretmenliği, Türk Dili ve Edebiyatı Öğretmenliği, Türkçe Öğretmenliği, Sanat Yönetimi gibi programlara girilebilmektedir.

Dil puan türlerinde ise genellikle İngilizce, Almanca ve Fransızca ile ilgili bölümler DİL-1, Batı dilleri ile ilgili bölümler DİL-2, Doğu dilleri ile ilgili bölümler de DİL-3 puan türüyle öğrenci almaktadır.

Puanlama kategorisinde MF-1, MF-2, MF-3, MF-4, TM-1, TM-2, TM-3, TS-1, TS-2 ve DİL-1, DİL-2, DİL-3 puanlarından hiçbir kategorinin sanat eğitimi içerikli değerlendirme sonucu olmadığı görülmektedir.

Maître de Conférence Adjointe Dr. Ümran Türkyılmaz[**]

Abstract:
In the 21th century, the foreign language teaching fulfills the function of not only informing or being informed as stated in the communicative approach, but also putting into action and interaction as stated in the co-actional approach of Puren. As of 1990s we have been observing that the objectives of foreign language learning are changing. As a result of touristic activities and professional exchange of know-how, in particular, the necessity of learning foreign languages increased continuously between individuals. In this context, The European Council stimulates and supports multiculturalism and multilingualism, respect for other languages and cultures in order to spread mobility among European citizens across the whole continent.

Therefore, exchange of students as well as free movement of goods and services have led to the European Union Language Criteria. Turkey, which would like to be the full member of the EU, has the target of teaching at least two foreign languages to the upcoming generations.

In this study, we will elaborate on the difficulties experienced by students, who learn French as a foreign language and the cultural interaction in the target language.

Key Words: co-actional approach, language teaching, European Council, multiculturalism, multilingualism.

Introduction

Depuis 1990, nous constatons un changement dans les objectifs d'apprentissage d'une langue étrangère. Plus particulièrement tant les échanges professionnels que les échanges d'étudiants ont donné naissance à un besoin de « Cadre européen » dans ce domaine. Cette approche considère en premier lieu, l'apprenant d'une langue comme un acteur social qui doit accomplir des tâches dans l'enseignement/apprentissage de langue étrangère.

Pour ce qui est de cette étude, nous allons essayer de nous pencher sur la notion de culture et de l'étudier d'après la perspective co-actionnelle en nous

basant sur les recommandations du Cadre européen de référence pour les langues (CECRL).

1- Le Cadre européen commun de référence pour les langues et la perspective co-actionnelle.

Le Cadre européen commun de référence pour les langues (CECRL) est conçu par la division des langues vivantes du Conseil de l'Europe: « Cet organisme, dont le siège est à Strasbourg, mène ses activités en faveur de la diversité linguistique et de l'apprentissage des langues dans le cadre de la Convention culturelle européenne, ouverte à la signature le 1 er décembre 1954. (…). Son action promeut des politiques visant à approfondir la compréhension mutuelle, à consolider la citoyenneté démocratique et à maintenir la cohésion sociale » (Goullier, F., 2006 :5). Le CECRL est un document qui répond à la politique linguistique du Conseil de l'Europe. Son but était de mettre sur pied un cadre commun de référence pour l'enseignement/apprentissage des langues à tous niveaux. Voici la répartition des niveaux de compétence dans le cadre (2006:37) :

Utilisateur élémentaire		Utilisateur indépendant		Utilisateur expérimenté	
A1	A2	B1	B2	C1	C2
Introductif ou découverte	Intermédiaire ou de survie	Niveau seuil	Avancé ou indépendant	Autonome	Maitrise

L'objectif de cette politique linguistique est réalisé autour de 3 axes : favoriser le plurilinguisme et le pluriculturalisme des personnes dans le but d'améliorer la communication et la compréhension mutuelle entre les personnes, et de lutter contre l'intolérance et la xénophobie.

a- Faciliter la mobilité des personnes et l'échange des idées à travers le développement de compétences communicatives dans une variété de langues, afin de permettre à chacun de coopérer plus efficacement.

b- Développer une conception de l'enseignement des langues en se basant sur des principes communs par le biais de la coopération internationale, de l'expérience et des compétences des pays membres en ce domaine (CECRL 2008).

Le CECRL s'adresse aux personnes qui évaluent, c'est-à-dire les ceux qui sont chargés d'examens et de diplômes. Ceux qui enseignent et ceux qui apprennent.

Le CECRL plaident aussi pour une approche actionnelle. C'est pourquoi l'enseignement/apprentissage des langues est réalisé sur l'accomplissement des tâches communicatives et sur les activités de communication langagière. D'après le Conseil de l'Europe, l'usage et l'apprentissage d'une langue est : « comprendre les actions accomplies par des gens qui, comme individus et comme acteurs sociaux, développent un ensemble de compétences générales et, notamment une compétence à communiquer langagièrement. Ils mettent en œuvre les compétences dont ils disposent dans des contextes et des conditions variés et en se pliant à différentes contraintes afin de réaliser des activités langagières permettant de traiter des textes portant sur des thèmes à l'intérieur de domaines particuliers, en mobilisant les stratégies qui paraissent le mieux convenir à l'accomplissement des tâches à effectuer » (Conseil de l'Europe 2001 :15).

En 2001, le CECR met à la disposition de l'apprenant un outil de travail appelé "portfolio européen des langues" (PEL) qui va l'accompagner tout au long de son apprentissage. Le PEL est une application du Cadre Européen. Il appartient à l'apprenant et il développe l'autonomie dans l'apprentissage et favorise le plurilinguisme. Le PEL est composé de 3 parties: passeport des langues, biographie langagière et dossier.

Comme nous l'avons déjà cité dans les lignes précédentes, le CECRL définit une échelle à 6 niveaux (A 1, A2, B1, B2, C1, C2) avec 4 compétences de base qui sont déclinées sous formes de 5 actes: écouter, lire, prendre part à une conversation, s'exprimer oralement en continu et écrire. Ainsi nous constatons que le Cadre définit des niveaux de compétences mais n'impose pas une méthodologie particulière mais plaide pour une perspective actionnelle.

La part de la culture dans la perspective co-actionnelle.

Dans l'enseignement/apprentissage d'une langue étrangère, nous remarquons que la notion de culture est indissociable de la notion de langue. Selon Courtillon : « Apprendre une langue étrangère c'est apprendre une culture nouvelle, des modes de vivre, des attitudes, des façons de penser, une logique autre, nouvelle, différente, c'est entrer dans un monde mystérieux au début, comprendre les comportements individuels, augmenter son capital de connaissances et d'informations nouvelles, son propre niveau de compréhension» (Courtillon 1984 :52). De cette définition, il en sort que la langue contient en elle tous les éléments et les traces culturels d'un pays. Afin de mieux comprendre le mot « culture » voyons la définition faite par Porcher : « une culture est un ensemble de pratiques communes, de manière de voir, de penser et de faire qui contribuent à définir les appartenances des individus, c'est-à-dire les héritages partagés dont ceux-ci sont les produits et qui constituent une partie de leur identité » (Porcher 1995: 55).

Quant à Bourdieu, il divise la culture en deux : la culture cultivée c'est-à-dire la littérature, la musique, la peinture et la culture anthropologique c'est-à-dire toutes les façons de vivre et de se conduire (Cuq, Gruca 2005 : 83).

En prenant compte de toutes ces définitions concernant la culture, nous avons bien vu que la langue d'une nation reflète bien sa culture. C'est pourquoi elle occupe une place primordiale dans l'enseignement/apprentissage d'une langue étrangère.

Pour notre part, en nous basant sur ces définitions, nous allons essayer de voir de près la situation de « la culture » dans la perspective co-actionnelle lors de l'enseignement/apprentissage d'une langue étrangère. Mais au par avant, il est préférable d'étudier « la culture » dans le domaine de la didactique des langues.

Lorsque l'on observe l'histoire séculaire de la méthodologie, nous constatons qu'avec l'approche communicative, dans l'enseignement/apprentissage des langues le but était « la communication ». Voici la pensée de Puren sur ce point : « (…) apprendre une langue, c'est apprendre à se comporter de manière adéquate dans des situations de communication où l'apprenant aura quelque chance de se trouver en utilisant les codes de la langue cible » (Puren 1998:372). En prenant cette définition comme point de repère, nous pouvons dire que c'est l'approche communicative qui a devancé les travaux interculturels. Car pour cette approche la culture se rapporte à la vie quotidienne telle que les conduites et les règles sociales des gens. Ainsi, lors de l'enseignement/apprentissage des langues vous, en tant qu'enseignant, afin d'empêcher les malentendus et les blocages, vous devez prendre en considération les différences culturelles des différents systèmes linguistiques.

Arrivée au XXI ᵉᵐᵉ siècle, avec le CECRL, nous voyons la naissance d'une nouvelle méthode intitulée : « Perspective actionnelle ». Selon Puren, « la perspective actionnelle » doit être appelée « perspective co-actionnelle » car: « elle met en avant la dimension collective des actions et la finalité sociale des actions, (…) les progrès prévisibles de l'intégration économique dans l'Europe des années 2000 exige un objectif [plus] ambitieux, en l'occurrence la capacité, pour chaque citoyen européen, non seulement vivre mais aussi de travailler collectivement avec des étrangers tout autant dans le cadre de ses études que dans sa vie professionnelle. C'est pour cette raison que la didactique européenne qui va émerger dans les années 2000 devra sortir de l'approche communicative (…), en passant en particulier du concept d'interaction (qui est un parler avec et un agir sur l'autre) au concept de co-action (qui est agir avec les autres), et du concept d'interculturalité (désignant principalement les phénomènes de contact entre les cultures différentes chez l'individu) à celui de co-culturalité (désignant les phénomènes d'élaboration d'une culture commune par et pour l'action collective) » (Puren 2004 :11).

En ce qui nous concerne, en nous basant sur la définition de Puren, nous voulons employer dans notre communication l'appellation « perspective co-actionnelle » au lieu de « perspective actionnelle » pour marquer le concept d'interaction qui est « agir avec les autres ».

Quant au concept de culture dans la perspective co-actionnelle, elle est définie par Puren comme « co-culturalité » qui est une notion d'action de collectivité à travers les tâches « désignant les phénomènes d'élaboration d'une culture commune par et pour l'action collective ». Pour une meilleure compréhension, le mieux serait d'observer le tableau ci-dessous que nous propose Puren concernant « la perspective culturelle » à travers l'évolution de la méthodologie. Il dit: « (…) j'aboutis à la modélisation suivante de l'évolution historique des formes d'adéquation entre perspectives actionnelles et perspectives culturelles en didactique scolaire des langues-cultures » (Puren 2002 :60) :

méthodologie		1. méthodologie traditionnelle	2. méthodologie active	3. approche communicative	4. perspective co-actionnelle co-culturelle
objectif social de référence		compréhension des grands textes de la littérature étrangère	accès à tous documents culturels en langue étrangère	échanges ponctuels avec les étrangers	réalisation commune d'actions sociales
perspective actionnelle	*opération*	traduction	explication	interaction	co-action
	moyen	reproduire	parler sur	parler avec/agir sur	agir avec
perspective culturelle	*type*	universaliste	civilisationnelle	interculturelle	co-culturelle
	orientation	valeurs	connaissances	représentations	conceptions

Selon Puren, la perspective co-actionnelle et co-culturelle :« n'est pas seulement nécessaire pour mettre notre discipline en adéquation avec le nouvel objectif social de référence. Elle est indispensable pour au moins les quatre autres fortes raisons suivantes: (…) la motivation et la responsabilisation des élèves, (…) la réalisation d'action conjointe entre l'enseignant et l'apprenant, (…) l'enseignement/apprentissage de la langue pour et par l'action à dimension sociale et (…) aider les utilisateurs à réaliser un travail collectif par le biais de l'internet » (Puren 2002 : 65-70).

Toujours d'après Puren le préfixe « co » employé pour « co-actionnelle et co-culturelle » est utilisé pour attirer l'attention sur la notion « d'action sociale » du Cadre européen. Voici sa pensée concernant ce sujet : « (..) réintroduire clairement en didactique des langues-cultures la dimension collective qu'avait fait oublier dans l'AC le développement unilatéral des notions de « centration sur l'apprenant » et d' « autonomie ». L'objectif de l'enseignement/apprentissage scolaire des langues-cultures, en effet, n'est pas seulement la formation d'individus autonomes,

mais également celle de citoyens tout à la fois créatifs et responsables, actifs et solidaires » (Puren 2002 :71). Car pour lui l'individu vit en collectivité dans une société ou il en dépend.

Après avoir étudié les traits essentiels du CECRL et la culture à travers la perspective co-actionnelle, nous allons voir comment l'apprenant turc du FLE est influencé par la culture française.

2- **L'influence de la culture cible sur l'apprenant turc du FLE.**

La Turquie qui est un pays en voie de développement souhaite un jour entrer à l'Union européenne. En attendant ce jour, elle fournit des efforts pour répondre aux critères d'adhésion. Dans le domaine de l'enseignement/ apprentissage des langues étrangères, elle essaye d'appliquer les critères du CECRL à travers la perspective co-actionnelle mais n'y arrive comme on le souhaite. Car elle a un système éducatif différent des pays européens malgré les réformes réalisées en 1997 et une dernière fois l'année courante. C'est une société particulière qui mérite d'être observée de près.

Avant d'entrer dans le vif du sujet, il serait intéressant de se pencher sur la société turque car la Turquie est un pays qui reflète des différences incroyables dans tous les domaines tels que : la cuisine, style de vie, habillement etc. Cette mosaïque nous l'avons héritée grâce à la position géographique de notre pays car en tant qu'enseignant on verra que l'apprenant d'Istanbul n'est pas le même que celui de Van une ville à l'extrême est du pays et c'est pourquoi on sera obligé de suivre différentes stratégies d'apprentissage. Nous pouvons dire aussi que la Turquie est un pays de contradictions : par exemple, à l'ouest du pays vous avez des jeunes filles libres dans leurs mouvements tandis qu'à l'est c'est le contraire. Par conséquent, l'enseignant de FLE doit tenir compte de toutes ces différences lors de la réalisation de son cours de langue. Ainsi cette différence entre les apprenants de langue étrangère va influencer la perception de la culture cible car chacun aura sa propre façon de voir et de capter la culture de la langue étrangère. C'est pourquoi lors de l'enseignement/apprentissage du FLE, pour certains apprenants turcs qui vivent dans des grandes villes, par rapport à ceux des régions moins développées, même dès le début du cours, n'auront pas de difficultés à faire la rencontre de la culture cultivée et de la culture anthropologique. On peut même dire que la présence des particularités culturelles motivera les apprenants car parfois la culture devance la langue en question et attire l'attention du public même si toutes les nouvelles notions culturelles lui sont étrangères et qu'elles n'ont pas d'équivalent dans leur culture maternelle. Comme on le voit nous vivons un paradoxe. C'est-à-dire nous essayons d'enseigner le FLE à travers la perspective co-actionnelle mais nous faisons un transfert culturel par le biais de l'approche communicative. Puisque, comme le mentionne Puren, celle-ci soutient le concept d'interculturalité désignant principalement les phénomènes de contact entre les

cultures différentes chez les individus et non pas celui de co-culturalité désignant les phénomènes d'élaboration d'une culture commune par et pour l'action collective.

Conclusion

Finalement, depuis 1990, le but de l'enseignement/apprentissage d'une langue étrangère n'est plus "s'informer, informer" comme c'était le cas dans l'approche communicative mais "agir, interagir" comme l'indique Puren dans la perspective co-actionnelle. En particulier, de nos jours, les voyages et les échanges d'étudiants ont incité les individus à apprendre des langues étrangères et ont donné naissance au CECRL.

Nous avons bien vu que lors de l'enseignement/apprentissage d'une langue étrangère, la langue et la culture sont deux éléments inséparables.

En nous basant sur la variété culturelle et éducative entre les régions de la Turquie, nous constatons qu'il est difficile pour nous, enseignants turcs, d'enseigner la culture de la langue cible comme le souhaite la perspective co-actionnelle. C'est-à-dire d'obéir au concept de « co-culturalité (désignant les phénomènes d'élaboration d'une culture commune par et pour l'action collective) » comme nous l'indique Puren. Quant à nous en tant qu'enseignants turcs, comme les circonstances actuelles l'obligent, nous continuons à faire un transfert culturel par le biais de l'approche communicative qui défend le concept d'interculturalité des phénomènes de contact entre les cultures différentes chez l'individu.
